

We are happy to announce a new scholarly journal in the field of transport and infrastructure: The European Journal of Transport and Infrastructure Research (EJTIR). This refereed quarterly covers the field of transport, infrastructure, logistics and their mutual relationships.

The aim of our new journal is to give international exposure to recent theoretical and analytical research and technical design in the field of transport and infrastructure. The specific scope of the journal is to integrate technological, behavioral and political aspects of transport and infrastructure research. EJTIR opens up a forum where researchers and designers exchange ideas and develop fruitful contacts. EJTIR seeks to enhance the quality of research and technical design in the field of transport and infrastructure, and to disseminate the results to a wider audience. The scope is first of all European, but also contribution from other continents are welcomed which could be relevant for scientists and policymakers in Europe, both in government and in organisations dealing with issues of transport and infrastructure. One of the aims is to link research and design of transport facilities of all modes.

Papers published in EJTIR describe scientific work of a high international standard, advancing topics related with the fields of transport, infrastructure and logistics, such as:

- sustainable transport of persons and freight;
- theoretical research of personal mobility and freight transport;
- technical design of transport facilities including infrastructure;
- transport automation; design and impacts;
- intermodality of persons and goods transport;
- interconnectivity of transport infrastructure;
- mobility pricing.

We look forward to scientific contributions of researchers, and comments and suggestions of the readers.

Hugo Priemus
