From about 1880-1914 in large-sized provincial British settlements numerous significant civic design schemes, of varying scales and natures, were proposed and undertaken. Although many of the most important undertakings were found within the largest places at that time arguably the two most significant ventures – one proposed but not undertaken due to the onset of World War One in 1914, and the other a built scheme – occurred within settlements of smaller demographic stature. These two foremost schemes, in Cardiff and Dundee, not only were of the largest spatial scale of all projects suggested in Britain (discounting London) but moreover explicitly demonstrated how local authorities could, if they so wished, employ civic design as a means to allow their settlements to punch above their respective weights in terms of their demographic size and resources. Importantly too these large-sized projects displayed an international design and planning character, highlighting in particular the influence of the US City Beautiful Movement in British urban development. Whilst the creation of a civic centre in Cathays Park, Cardiff, aimed at establishing a quasi national image of the newly formed Welsh capital city, in Dundee the scheme put forward by City Architect James Thomson in 1910 not only aimed at giving architectural character to a city previously derided for its environmental quality, e.g. by *The Builder* in 1898 - partly a result of the Corporation’s prudent attitude to public spending in preceding decades, furthermore encouraged the development of the cultural status of an industrial settlement known previously as ‘Juteopolis’. Utilizing the British experience for remodelling and aggrandising existing urban cores in the late-1800s and early-1900s, this proposal for conference will thus outline not only the ambitious nature of Thomson’s 85 acre redevelopment project with its eight distinct components, which included the reclaiming of land, the removal of insanitary properties, the erection of a bridge and numerous grandiose public buildings, the laying out of garden spaces, avenues lined with trees and formal approaches to the proposed edifices, but will in addition examine the scheme’s management, with the municipality’s intention to not induce heavy local rates due to implementing the project, and its position within the evolution of the transforming of British town centres and British civic design prior to 1914. Described by the *Town Planning Review* (1913: 177) as being “interesting”, “important” and offering Dundee “the most magnificent river front in Britain”, the abandonment of the scheme due to the onset of World War One in 1914 thereby not only robbed Dundee but also Scotland and Britain of a unique monumental civic design scheme, a project on a par in terms of scale and pretension with those proposed and/or undertaken in the largest cities of contemporary America (e.g. Washington DC, Chicago and San Francisco). Nonetheless the implementation in 1918 of a much reduced version of the original plan despite being a loss to the civic design of the settlement was of national appeal and helped the Dundee Corporation quickly gain a reputation in the immediate post war era as being progressive and of a broad minded nature, a perception that was hardly applicable prior to Thomson’s proposal in 1910.

Keywords: Civic Design, City Beautiful, Municipal Policy, Scotland.

## Background

“Considering the age, the historic importance and the present size and wealth of Dundee, it is disappointingly wanting in architectural interest”, remarked *The Builder* (1898: 139) upon a design situation had arisen by the end of the 19<sup>th</sup> century as a consequence of four factors. Firstly, Dundee was located between the Law and the Tay estuaries, a picturesque site that contributed to the settlement’s standing in the 1700s as a place renowned for its prettiness (Walker, 1977), a reputation that, upon the arrival of modern industry in the settlement in the 1800s, was made somewhat erroneous. Secondly, Dundee had developed during the nineteenth century with a townscape along the shoreline and hills largely with a built form of lesser stature when compared with large-sized Scottish settlements like Aberdeen, Edinburgh and Glasgow (*Ibid.*: 3), places lauded for the Classical design styles practised within them. Thirdly, much of Dundee’s historic architecture was cleared between 1871 and 1891 as part of the local government’s slum clearance/urban improvement programme and, finally, a wholly significant factor that contributed to Dundee’s 19<sup>th</sup> century architectural reputation (or lack of) was the development of industry, or more accurately jute manufacture, an industry that was so important to Dundee during the Victorian period that the settlement became known as ‘Juteopolis’ (Whatley, 1992.: 7). Collectively therefore these elements had the effect, according at least to *The Builder* (1898: 139) at the end of the 1890s, of producing a Victorian settlement with a population of about 150,000 (source: HMSO Census, 1901) that was filled to a great extent with just tenements, huge factories (see figure 1) and model dwellings (*The Builder*, 1898: 139).

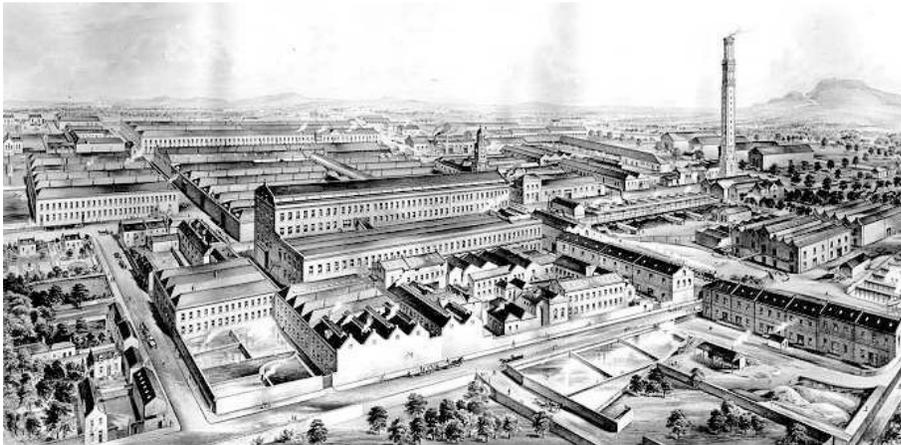

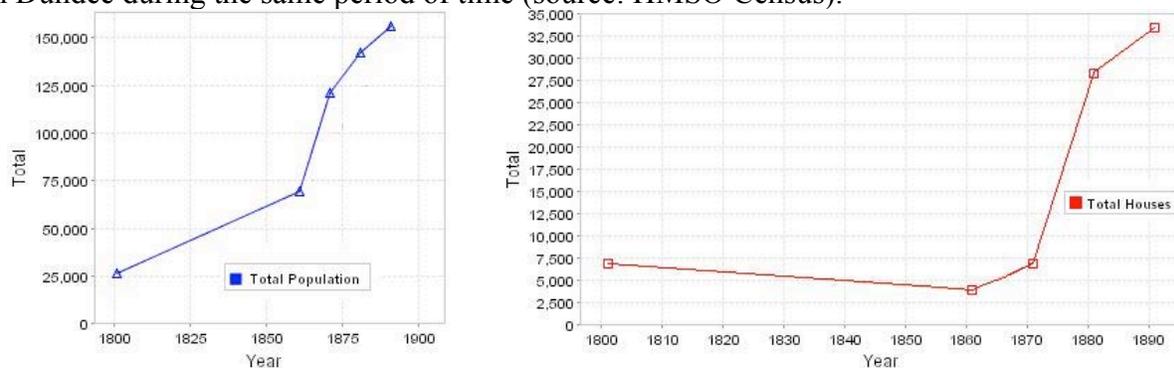

Figure 1. An example of the scale of jute manufacture in Dundee: A late-Victorian picture of Camperdown Works, once the world’s largest jute factory (source: University of Dundee Archive Services, MS 66/II/12/1 (1)).

Although at this point it is not necessary to appraise in detail the economic growth of Victorian Dundee certain factors that influenced the subsequent development of the local urban form should be noted. These include, by way of example, the actuality that Dundee’s economic development from the early-Victorian period was not only rapid but also of a large scale, being only surpassed by Glasgow in the Scottish context (Lenman, Lythe and Gauldie, 1969: 7). Moreover the economic booms experienced within Dundee helped produce a significant increase in the town’s demographic size, in part due to the arrival of rural migrants pouring into the settlement in search of employment. Consequently by 1851 the town’s population has risen to almost 79,000 (source: HMSO Census, 1851), and continued to rise in the following years, assisted by influxes of migrants from as far a field as potato-blighted Ireland, until it was in excess of 150,000 persons by the early-1900s (source: HMSO Census, 1901). However,

significantly, the waves of migrants that followed local economic booms affected Dundee's social composition to such a degree that it emerged as an industrial settlement with a proportionately smaller middle class population than other urban places in Britain. By 1861, for example, the middle classes comprised a little over 10% of the total population of the town. Furthermore as the settlement expanded a number of other significant incidences materialised. Firstly, like elsewhere in Britain, the pressure of rapid urban population growth led to the degenerating condition of the local environment so that vast sways of slum housing were produced. Secondly, as the town expanded the price of land rose considerably which made the cost of any proposed public architectural or planning scheme utilised as a means to rectify problems established by industrialisation and urbanisation thus very costly with, for instance, properties along central thoroughfares (e.g. the High Street) trebling their value between 1858 and 1875. Crucially too, Dundee's demographic expansion prior to 1860 occurred at a time when the settlement's total housing stock somewhat astonishingly decreased (as shown by figure 2), thus placing added pressure onto an already overcrowded and strained environment, thereby exacerbating existing urban environmental problems and other nuisances established by industrialisation and urbanisation.

Figure 2. Left: Total population of Dundee from circa 1800-90 and (right) the total housing stock in Dundee during the same period of time (source: HMSO Census).

### Dundee and the Unfolding Political Culture of Frugality

For reasons already noted by the early-1870s environmental conditions in Dundee were so poor that the Corporation passed an Improvement Act in 1871 which permitted over the course of the next two decades 20 central slum removal schemes in order to improve the settlement, the first public attempt to shape Dundee's urban form since the mid-1820s when the town's council permitted a ruling to open new streets including Union Street (McWilliam, 1975: 132). Although the post-1871 schemes were a major undertaking and a crucial part of establishing environmental betterment in Dundee it should be noted in many ways they were, as emphasised earlier, essential given the expansion of the settlement, the deteriorating condition of many districts and the general lack of public planning and architectural activity that had occurred in the early-mid Victorian era, a consequence of the town council's financial problems which between 1842 and 1864 meant that the local council was effectively insolvent (RCAHMS, 1992: 27) and accordingly severely constrained in its remit. Hence public building schemes during that time tended to have a utilitarian as opposed to a more extravagant, aesthetic inclination. Nonetheless some notable public buildings were erected, such as the Infirmary (1852-5 by Coe and

Figure 3. The Town House, designed in 1731 by William Adams, as it looked in the late-1800s (source: Dundee Central Library, reference number WC0273).

Goodwin), the neo-Gothic styled Royal Exchange (1853-6, by David Bryce), and the French Gothic styled Morgan Hospital, erected during the 1860s. The seat of local government, the Town House, a building dating from the 1730s, was restored in the 1850s and not replaced with a new building as was common in other British cities, such as in Bradford, Leeds or Liverpool at about the same time, again as a result of fiscal limitation within the local government.

To sustain the flourishing administrative and cultural life of expanding Dundee during the Victorian era, as was the case in other British settlements in the 1800s, new quasi-public and public edifices were necessary and by the mid-1860s with the corporation now on a better financial footing than it had been for many a year new projects were undertaken. A Royal Infirmary, for instance, was erected, designed by Peddie & Kinnear, and after 1872, a proliferation of new schools were erected at a number of locations within Dundee's bounds - a direct response to a new parliamentary act (the Education (Scotland) Act), and not a direct initiative of the local government. Moreover, with regards to civic design from the mid-1860s scant attention was given to it by the town council and only the privately funded, Gothic-styled Albert Institute (1865-8, designed by Sir George Gilbert Scott but extended in 1873 and used as a museum and library following the 1874 Free Libraries Act) was of any note. This was a somewhat unusual occurrence given the general growth in public building in Britain and given the relatively large size of the settlement at that time (Morley, 2002). Such inactivity, apart from in field of Church building, which flourished in Victorian Dundee, may be attributed as being a hangover from the economic problems experienced within the town's government in previous decades and the town council's focus upon slum clearing, street widening and rebuilding too as opposed to the construction of grandiose civic edifices. Instead it was thus left to private benefactors, like the Baxter Family, to patronise civic design schemes like the Albert Institute, to sponsor education via the creation of the college (now University of Dundee) and the landscape through the establishment of public parks like Baxter Park (opened 1863), designed by Joseph Paxton. Other notable architectural sponsors in Dundee were Andrew Carnegie (1835-1919), who donated sums of money to pay for local libraries, and James Caird (1837-1916) who bestowed land for Caird Park and money for civic buildings, e.g. Caird Hall (1914-22).

### **Urban Remodelling and Aggrandisement in Dundee**

In 1868, with the town council's financial problems largely resolved and the appointment of William Mackison as Burgh Engineer and Surveyor the prospect for public design and planning

within Dundee noticeably altered when compared to prior years. Without a doubt the appointment of Mackison was a turning point in the employment of design and planning in Dundee for he embraced the issue of urban betterment in a ruthless manner, in so doing from 1871 to 1891 utilising the town's Improvement Act of 1871 in order to remove and rebuild many dilapidated districts that posed an affront to local civic dignity, in so doing supervising works like the Commercial Street and Whitehall Street Improvement schemes by controlling the design of new buildings in the area so as to ensure stylistic uniformity was established (Walker, 1977). Such was Mackison's urban clearance appetite that under his guidance existing approaches to roadways improved and more than 150 new streets were formed (see figures 4) - a monumental number and especially extraordinary given the high value of land in Dundee at the time. The clearing and rebuilding evidently had a number of immediate benefits. It provided many new housing units for the expanding local population, establishing a large number of new shops and other business premises which helped ensure the local economy buoyancy, local traffic movement improved. Yet in contrast much local architectural heritage was destroyed and many edifices of historical interest were lost as a consequence of Mackison's amputations, hence *The Builder's* observation at the start of this paper (1898: 139).

The clearing of land around the central core of Dundee from the 1870s to 1890s, an era within which city status was granted (in 1889), despite offering great potential for civic lauding, pride and designing by the possible construction of new grandiose edifices and the laying out of urban spaces, did not result in a proliferation of new public buildings or open areas that might have been expected and instead established in a boom in tenement building, typically four storeys in height, to house those displaced by the slum clearances and to help resolve the huge housing problem in Dundee. But while the 1870s onwards did bring to the fore a period within which a lack of public architectural buildings at the urban core were constructed it nonetheless represented a watershed of sorts in the history of Dundee's public designing due to the unfolding domination of local design and planning matters by a small group of individuals before 1914. These individuals were David Mackenzie, Charles Edward and James Maclaren, (Walker, 1977) as well as William Mackison, William Alexander and James Thomson (1852-1927) who were employed by the corporation. However, as described subsequently, some unsavoury legacies of the local political past remained and these restrained civic design practice for many more years.

Figure 4. Left: Whitehall Close, part of a district where slums, disease and poverty was endemic, was demolished in 1883 and replaced with, right, Whitehall Crescent (source: Dundee Central Library, reference numbers WC0705 and WC3370).

In contrast to most other large sized provincial towns and cities in the late-Victorian period Dundee's local governments did not erect large-scale civic buildings (Morley, 2002) and instead, from the latter years of the 19<sup>th</sup> century onwards, concentrated on erecting maybe more cost effective small-scale public buildings which were to scattered throughout the settlement so as to help uplift the standard of the local environment. In aesthetic terms though by the 1900s was to be achieved through the use of Classical design styles for public buildings. But as already documented in this study, the mid and late-Victorian period was an epoch of financial prudence for Dundee's councils and this must be further understood in order to comprehend the nature of civic design practice in Dundee, even by the time of James Thomson, the focal individual of this paper. Thus to grasp somewhat why such fiscal cautiousness persevered attention must now be given to the financial income of Dundee's town councils. In terms of collected revenue town councils were able to draw upon 'common good' sources that included land, churches, houses and salmon fisheries yet, significantly, this income was only obtainable from sources found within the municipal and parliamentary constituency of Dundee, i.e. a small defined piece of land which in 1881 had a population of less than 16,000 (source: Census, 1881) even though Dundee as a whole at the same time had a population size of more than 140,000. Importantly as well, given that Acts of Parliament at intermittent times in the Victorian period had resulted in the town council establishing several boards, e.g. Police, Gas, Harbour, Parochial and Water, all of whom raised yet disbursed capital and so were at constant risk to debt, the town council walked a constant financial tightrope which with the introduction of arrears became increasingly more slippery. By 1881, with the boards having a collective level of debts of over £1.74 million, the town council had no option but to be parsimonious with regards to civic designing and other civic enterprises.

### **British Civic Design: An Overview**

The late-Victorian and Edwardian period was an era of much social, political and cultural movement in Britain. Among the matters to evolve was civic design which was influenced by a range of factors. These included the development of legislation relating to the control and laying out of the urban form, such as local Improvement Acts, plus national legislative pieces like the Public Health Act (1875) and the Artisans and Labourers Dwellings Improvement Act (1875) in England and Wales. These two legislative pieces, for example, had major implications for civic design as they permitted the clearance of tracts of land containing insanitary or poor quality buildings within or close to the central core (Morley, 2002). This was of significance to civic design as previous research by this author (Morley, 2002) has recognised that most schemes in provincial Britain occurred on central brownfield sites, i.e. sites cleared and then redeveloped for the purpose of constructing a public building upon it. Therefore any legislative developments which permitted the clearance of urban land were of significance to civic design practice for they had the potential to open the supply of 'new' sites even though the passing of such legislative rulings were dependent upon the attitude of local authorities and their willingness to implement existing national environmental/building legislation or to pass new Acts in order to practice civic design. Moreover, with regards to the form of civic design the new rulings were of note for they effectively ensured that many civic design schemes that were to be undertaken would be done so on cramped sites with unequal boundaries that offered little or no available areas for laying out spaces other than that of a local roadway. Yet despite most civic buildings being erected upon somewhat cramped or irregular shaped sites civic designers in Britain generally tried to adopt the

same approach to the design and planning process as was evident on buildings erected on unencumbered sites. As the paper given by this author at the IPHS 2004 Conference in Barcelona, Spain, highlighted, British civic design from about 1880-1914 despite variances in the amount of schemes undertaken from place to place, and the often smaller scale and use of less civic design features within smaller-sized settlements, employed numerous universal elements including symmetrically formed main elevations and internal arrangements (Morley, 2004). Hence it can be argued that just as contemporary American civic design practice was systemised and based on a somewhat settled policy (Mawson, 1911: 255) so too was practice in late-Victorian and Edwardian Britain. Importantly as well, the author's aforementioned research has uncovered little evidence to reveal that characteristics, such as the degree of openness or the unencumbered nature of a site, affected the form and plan of civic architecture erected on it as symmetrically composed elevations were discovered on buildings of varying types, e.g. Town Halls, City Halls, Municipal Offices, Public Libraries, Museums, Art Galleries, Central Fire and Police Stations, and Public Halls - building types erected not only as a consequence of municipal pomp and circumstance. It was recognised thus that the shape of the site had little affect on the overall treatment of the elevations (Morley, 2002: 593).

Many of the largest and strongest British civic design schemes undertaken in Britain between 1880 and 1914 were noted, e.g. at the star of this work, to have occurred within the largest cities of Britain. Reasons as to why this situation arose include the larger settlements had corporations with an ability to possibly better establish large budgets to finance building schemes, a consequence maybe of high civic status which was especially significant after the 1888 Local Government Act was passed – an Act that gave the largest urban settlements County Borough status, a greater tax base, possibly the greater needs of the large local population than in smaller places, plus civic rivalry and the desire to be acknowledged as the 'second city of the empire' after London, the cultural, economic, political and social centre of Britain and empire. However it would be misleading to ignore smaller sized British settlements for many significant schemes, both suggested and built, occurred in lesser sized places. For example, undoubtedly the most successful civic design scheme undertaken during the period about 1880 to 1914 was the City Hall and Law Courts project in the Cathays Park district of Cardiff (population of about 164,000 in 1901: source, HMSO Census), an area developed with an apparent American City Beautiful influence which helped present a quasi-national image as the proto-capital of modern Wales rather than a "straggling and irregular" place that it was prior (*The Builder*, 1897: 239). The close proximity of the Cardiff edifices, their common colour, building materials, scale, style, axial planning lines that helped to relate the internal arrangements of each building together, detailing, symmetrical form, building lines and other common features all contributed to making Cathays Park a unique example of British civic design prior to 1914. A synopsis of some of British civic design's principal features before 1914 now follows.

As has already been mentioned, regardless of the shape of the site the vast majority of civic buildings erected from 1880-1914 invariably had their main and sometimes other elevations composed on symmetrical lines. Of note too the use of symmetry was irrespective of the size of the building and the overall design style employed. Both the largest and smallest sized public buildings were noted to be composed in symmetrical ways with the same kind of design features, highlighted subsequently. Explanations as to why symmetrical forms dominated British designing involve the rising significance of the Beaux Arts system of architectural education in the late-Victorian period which helped to dictate a balanced and axial disposition of the main

elements of a civic edifice, and this evidently had a major influence on the placing of prominent spaces within the internal arrangement, and the positioning of entrances and staircases too.

Within British civic schemes it was repeatedly discovered that one elevation was given greater attention than the others within the overall composition. The importance of one particular elevation over other ones, regardless of design form, was recurrently shown by it containing the principal entrance and, in some instances, it would face towards an open space other than that of a roadway. In many schemes it was noticed that the designer would give the principal elevation a treatment that included features like a broad flight of steps and sometimes lamp posts in front of the main entrance. Sometimes where an open space was created architectural elements like statuary would be sited in positions relating to prominent axial lines or design features of the building which helped create a sense of association between the edifice and its surroundings. Concerning the composition of the main elevations certain design elements were commonly employed, e.g. gables, pediments, rustication, window openings designed with arched or semi-circular heads, and columns and pilasters which would be placed at regular intervals along the main elevation(s) creating orderly bays between within which window openings were placed. The position of these bays frequently reflected the degree of regularity in the building's plan and the effect of the ordered bays consequently reinforcing the composition's symmetry.

The planning arrangements of civic buildings were noticed to take many forms although their overall manner was regularly dominated by symmetrical lines, like that of façade design. A common element observed in the planning process was that a main feature in the internal arrangement might be placed centrally on an axial line that was usually reflected in the treatment of the main elevations. Elements identified to be positioned along the central alignment of the principal elevation included the main entrance, vestibule spaces, main staircases, prominent, large-sized spaces and possibly a vertical element. The placing of important features or spaces within the internal arrangement was noticed too to often suggest its presence upon the design of the main elevations. This was typically indicated by the use of extra decoration, the positioning of design elements at each side of the main entrance or by the placing of features, such as a gable or portico, from which regular bays would be put along the main elevations where fenestration and details such as columns or pilasters would be found. Fenestration on the principal floor level, where important rooms would be found, usually the ground or first floor level and noticeable by the increased floor-ceiling height, was commonly different than for other floor levels.

To conclude this section of the paper two brief, generalised points concerning civic design practice shall be raised. Firstly, the emphasising of corner points was an additional weighty element of British civic design practice, frequently accentuated by a change in the roofline above with the roof being given, e.g. by a steeper gradient than for other parts of the scheme. Rusticated masonry as well was sometimes applied at the corners of a composition. Secondly, for some civic design schemes the local road pattern was utilised and the direct alignment of an oncoming roadway was used to meet with prominent sections of the main elevations. While roads were not always utilised in most schemes due to cramped sites used for public building they were an integral element of many of Edwardian Britain's proposed urban redevelopment schemes, like Stanley Adshead's Liverpool scheme (1910), Thomas Mawson's Bolton proposal (1911) and James Thomson's plan for Dundee (from 1910), to which this work now turns.

## James Thomson and the Rejuvenation of Dundee

In 1910 James Thomson, then Dundee's City Architect, proposed plans for the redevelopment of the centre of Dundee, a scheme very much in contrast to the small-scale civic architectural work that was being practised in the settlement then even though in the immediate decades prior the place's civic status had grown – an increase in civic status being a plausible motive for increasing the volume and scale of local civic design practice (Morley, 2002). In 1889, for example, the settlement was awarded city status and in 1894 an additional civic peak was reached when the city was given the rank of 'County of a City', an honour only enjoyed by two other settlements in Scotland, Glasgow and Edinburgh (Whatley, 1992: 7). Yet regardless of such advances in Dundee's civic standing local public design remained on a comparatively lesser scale than in other large-sized British provincial settlements at the very same time. Nonetheless, with the appointment of James Thomson as City Architect in 1904 (until 1924) and City Engineer (1906-22) a new civic design energy was injected into the city, a dynamism expressed in the following years by architectural and planning values prevalent in contemporary British civic design in order to instil greater municipal order. By way of illustration, Thomson's designs for the Coldside Library (opened 1908), Blackness Library (1909), St Roque's Library (1910), and Barrack Street Museum (1911) made use of styles popular in Britain at that time, the symmetrically formed neo-Classical and Baroque styles – design forms thus perceived by Thomson as appropriate for the instating of civic stateliness in industrial Dundee. On the other hand Thomson after his professional advancement began to express a growing interest in large-scale urban redevelopment and design, a curiosity sparked by his street-works for the town council where he would redraw street lines and redesign road junctions to allow trams to better travel, and within just a few years this appreciation led to the evolution of his 50 year vision for Dundee, a remarkable project that employed design and large-scale planning as a vital means to improve both Dundee's civic dignity and central environment.

Figure 5. Thomson's interest in Dundee resulted in him taking countless photographs, like those of Union Street (top left) and (bottom left) High Street-Overgate. His photographs have provided opportunities to appraise how Dundee would have altered (see top and bottom right pictures) had his numerous proposals been implemented (Dundee City Archives, GB251 TC/MP37/8).

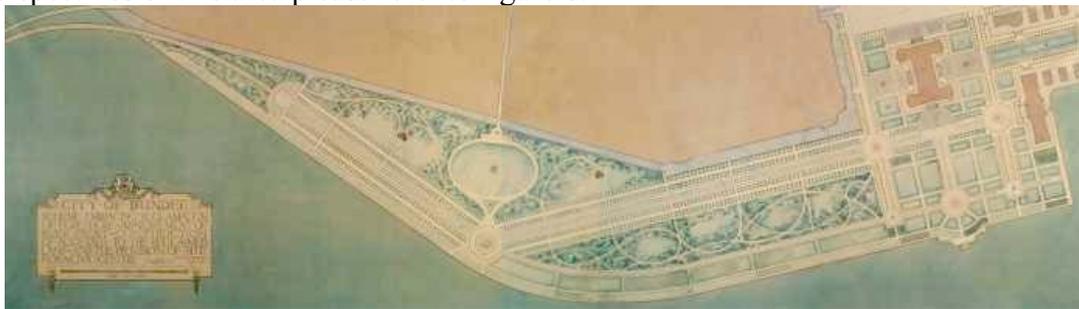

In 1910, when Thomson's initial city-wide proposals were composed - on the initiative of the Lord Provost Sir James Urquhart, it was evident from his work how he already possessed a City Beautiful-esque idealised view of what a modern, industrial settlement such as Dundee should be like. As part of his idea to redevelop the city Thomson recommended a plethora of features, such as a new covered market, Parisian styled boulevards terminated by statuary, broad road junctions (figure 5), symmetrically formed garden spaces and neo-Classical buildings arranged as a civic centre so as to establish what he clearly perceived as being the cornerstones of 'good' urban development (figures 7 and 8), that is order, beauty and convenience. His detailed perspectives for Dundee's redevelopment, along with a similar British scheme, Thomas Mawson's for Bolton (1911), for example, evidently demonstrate an abstract fondness in British civic design for the US City Beautiful style of urbanism, a style that in practice was only shown once in Britain, in the Cathay Park development in Cardiff. Significantly too, the large-scale stratagem put forward by Thomson exhibited a paradigm in British civic design due to his far sightedness. His 1910 redevelopment plan for Dundee, arguably his masterwork despite it never undertaken in the way it was originally intended, contained facets unique to British urban development pre-1914.

On a site to the west of the city centre, on land reclaimed from the dock lands, Thomson planned his most comprehensive improvement project for Dundee. The 1910 scheme was multi-faceted, consisting of erecting a Railway Station, a host of municipal edifices, and the laying out geometrically formed garden spaces and avenues lined with trees that acted as formal approaches to the proposed buildings of the civic centre. The *Town Planning Review* (1913: 177) described Thomson's scheme as being "interesting", "important" and providing Dundee with "the most magnificent river front in Great Britain" (1913: 177), and such was the scale and ostentation of the suggested project that it may be argued that the scheme verged upon civic design megalomania. Certainly no built scheme in Britain and few proposed prior to 1914 could compare with its grandiose pretension, disposition and scale. In December 1911 Thomson presented his plan to the Town Council and in 1914 the administration accepted the scheme in spite of the 1912 setback when the Harbour Trust decided to retain the Earl Grey Dock.

A fundamental element to the success of Thomson's Dundee scheme was the reclamation of land. Like the early-1900s Pier Head development at Liverpool, Thomson sought to open up part of the dock area which by the early-twentieth century was inadequate to the needs of modern industry in Dundee. So, as a result of reclaiming land, and thereby obtaining a vast tract of land for a relatively small economic cost when compared to clearing central brownfield sites - something of local worth given the Dundee's local governments' history of fiscal quandaries during the Victorian era - Dundee would be presented with "a splendid site for its new municipal building and public market, and a fine open space on the river front." (*Town Planning Review*, 1913: 177) *The Builder* (1915: 31) stated that the scheme "although appearing somewhat ambitious at first sight, is both practicable and economic in its adaptation of means to ends", added that it "is also so arranged that it can be carried out in sections, none of them of great size or cost, which can be put in hand at intervals of a long period of time, avoiding a heavy charge of rates." (1915: 31) Unfortunately though Thomson's scheme, in keeping with so many improvement schemes of the Victorian and Edwardian era, was abandoned (in 1914) and given the history of the Corporation in Dundee in the previous decades this retreat is not too surprising. In fairness wider circumstances were not sympathetic to the town council. The onset of World War One inevitably was to disrupt its civic enterprises, just as it did elsewhere in Britain.

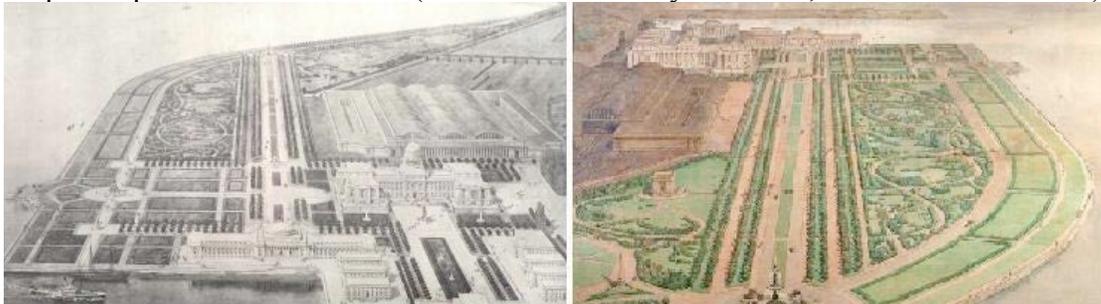

Nevertheless a brief description of James Thomson's original plan is necessary at this point and the point needs to be emphasised that had the scheme been laid down in the manner initially intended Dundee would have been given a monumental civic design scheme on a par with those undertaken in the largest (state capital) cities of contemporary America under City Beautiful-based activity. Instead when the idea of the scheme was reborn in 1918 following the end of the Great War it was greatly revised but the implementation of the amended scheme along with other projects which Thomson was involved in from 1918, particularly in the field of municipal housing, led to Dundee in the immediate post war era quickly assuming a reputation as being a progressive settlement with a local government of a broad minded nature. A short description of Thomson's original idea is now provided.

Figure 6. Part of Thomson's Dundee Improvement Plan (from *Town Planning Review*, 1913). For perspectives of this area please refer to figure 8.

The total spatial area of Thomson's initial scheme was almost 70 acres, a substantial tract of central urban land and the overall project consisted of many elements, including the removal of many insanitary properties close to the area of redevelopment (*The Builder*, 1915: 585) and the building of a new road bridge across the Tay. The reclaimed land from the Tay Estuary was to be laid out formally (figure 7) in a manner which Thomson described as a pleasure ground and wide esplanade (*The Builder*, 1915: 585). The primary architectural structures in the plan, the Rail Station and Municipal Building, were to be designed in a classical fashion by Thomson and in many respects formed a civic core.

Figure 7. Perspectives of what central Dundee's central would have appeared had Thomson's redevelopment plan been undertaken (source: Dundee City Archives, GM 251 TC/MP37/6).

Thomson's plan for Dundee was guided, as shown by figures 7 and 8, by the employment of symmetrical planning lines on a monumental scale and the use of vistas to create grand visual effects. Surrounded by water on three sides of the reclaimed site, the civic buildings were placed together by Thomson at the eastern end of the land close to Earl Grey Dock so as to form a

group. Although Thomson gave no detailed perspective sketches of his buildings, or detailed plans of the buildings either, he did produce a number of pictures showing the anticipated completed form of the civic district. The most prominent of the buildings was the large Municipal Office (see figure 8), designed in a highly symmetrical form with a plan of a rectangular shape marked at its centre by a huge dome that was reminiscent of Sir Christopher Wren's St Paul's Cathedral in London. Statues were to be placed in front of the building in prominent locations like in at the centre of the end sections and centre of the main elevations. In terms of detailing the Municipal Office was decorated by a large number of paired columns.

To the west of the central point of the Municipal Office Thomson placed the centre of the Rail Station's main elevation and to the east he placed a statue. Located nearby were additional civic buildings which were also composed and arranged in a symmetrical manner, thus forming an orderly group. To the south of the Municipal Office the central line of axis through the edifice was continued towards the waterfront and was terminated by another statue. Around this particular statue Thomson designed a garden area with a geometric plan with alignments also terminated by further statuary. A large glass rotunda was erected in this section of the reclaimed land as well and the large axis from the centre of the principal civic building, the Municipal Office, was continued across the reclaimed area for many hundreds of yards and was terminated by a huge fountain placed near to the banks of the Tay Estuary. A footpath from the fountain lead west towards a new bridge which spanned the Tay Estuary and statuary, as mentioned earlier in spite of being placed in positions relating to the main sections of the principal elevations, the internal arrangement of buildings and the position of main entrances, etc., also had a beauty, i.e. a functional use, being utilised in some instances as turning circles for trams.

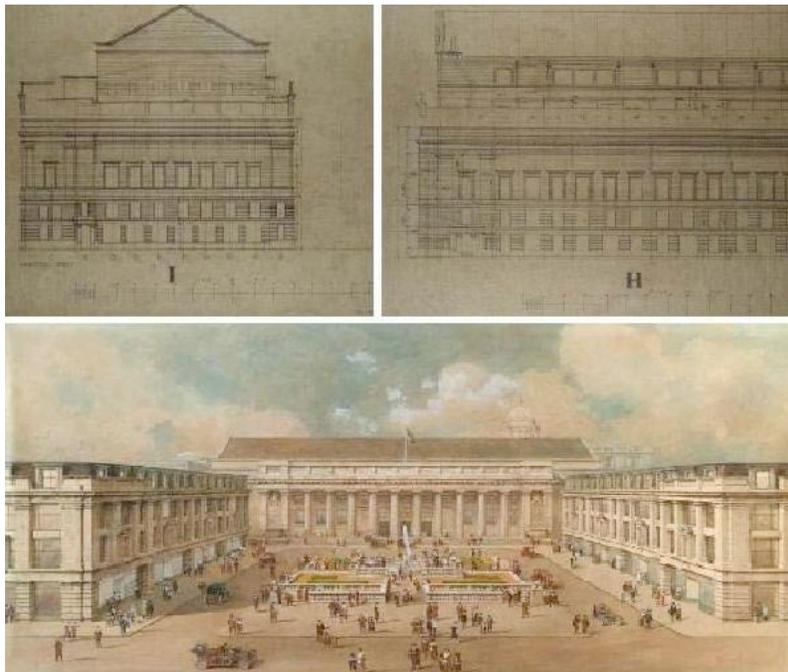

Figure 8. Left: View towards the new civic centre and (right) a perspective of the roof garden placed over the public market (source: Dundee City Archives, GB 251 TC/MP 37/8 and GB 251 TC/MP 37/18). Bottom: Perspectives of the Municipal Offices and surroundings.

As stressed earlier in this section with the onset of World War in August 1914 came the suspension of Thomson's scheme and when it was undertaken again, in 1918, the monumentality of the original plan was lessened to a considerable degree. Gone was the notion of using

Figure 9. Drawings from the City's Architect's Office of the elevations of Caird Hall in Dundee. Left: The elevation facing Crichton Street and

reclaimed land and instead Thomson had to be content with planning a far more moderate civic project consisting of a public building, to be known as Caird Hall, and a public space, to be referred to as City Square. Although the history of Caird Hall effectively begins before 1914 due to local concern that the 18<sup>th</sup> century Town House (figure 1) did not have enough dignity for a settlement of Dundee's demographic and civic size and importance. In addition, the site of the Town House had become inconspicuous during the nineteenth century due to the plethora of buildings erected around it. In 1914 a local industrial (ute) magnate, James Caird, donated money (£100,000) to pay for a new City Hall and Concert Hall building, and played a determined role in the project, stipulating that the new edifice was only to be erected if the Town House was cleared so as to enhance the setting of his munificence (McKean and Walker, 1984: 14). The resultant Caird Hall (1914-22) by Thomson was thus erected with an open space, City Square, in front of it. The grand impression of this building (see figure 9) was further enhanced by it being set on a stone plinth which raised the building above the ground and by huge colonnade of stone Doric pillars which dominated the front elevation (added later following a donation of £75,000 by James Caird's sister, Emma Jayne Marryat.

It has already been emphasised that Thomson from the early-1900s onwards was a founder of modern city thinking in relation to urban development, design and planning. As has been noted earlier too Thomson was active in pushing forward the boundaries of the civic design cannon although his forward thinking abilities with regards to civic design were maybe too advanced for the Dundee council given its history. But with regards to housing Thomson had much practical municipal success. In 1907, he persuaded the local authority to establish a Housing and Town Planning Committee, a very progressive move that anticipated what was to be Britain's first town planning legislative piece, the Housing, Town Planning Etc. Act (1909), and notwithstanding his dedication to aspects of civic design he preserved an active interest in residential architecture/planning to such a level that Dundee became the first Scottish city to establish large-scale municipal housing schemes. In March 1917, notwithstanding the

uncompleted status of World War One, he presented a *Report to the Housing and Town Planning Committee of the Dundee Town Council on Preparation for Work after the Termination of the War and Proposed Housing Schemes* and without any kerfuffle once war ended he produced an additional commentary on a broad range of urban development/planning issues imperative to ensuring Dundee's sustained growth and civic success. On this occasion attention was given to traffic, hence dual carriageways were suggested, as was a new Tay Road Bridge planned on the site of the original rail bridge. With reference to municipal (garden city type) housing it was to be zoned and when undertaken in 1919 it included residences with experimental heating and electricity devices. At the peak of his career by this time Thomson was awarded the presidency of the Institute of Municipal and County Engineers (in 1920) yet adverse publicity surrounding his electrified 'Specimen House' – the high cost of which excluded it from subsidy under the 1919 Housing Act, and the fact that no one wanted to move into it – coupled with his increasing age led to the commencement of the closing stages of his professional work. Thomson finally retired from public duty in 1924 at the age of 72.

## **Conclusion**

It has been revealed in the course of this paper that the practice of civic design in the Victorian period was extremely limited in Dundee and had it not been for James Thomson's activities, encouraged and often financed by philanthropists, in the Edwardian period then there would have been even less civic architectural and planning activity within the city, which is unsatisfactory given the demographic size and economic extent of the settlement by 1914. However this situation must be placed in context as firstly Dundee was not too dissimilar from other large provincial towns and cities in Britain during the late-Victorian and Edwardian period (Morley, 2002) who also tended to erect few public buildings, and secondly there was the issue of the corporation's poor financial footing during the mid-Victorian period which unquestionably still cast a shadow up to the final years of the nineteenth century. Hence few public building schemes were undertaken during that time. However, the local government from 1871 onwards was heavily involved in urban improvement schemes in part due to the emergence of dire living conditions within many of the districts of historic Dundee as a consequence of industrialisation and rapid urban growth. Obviously such improvement work touched upon notions of urban planning and questions of design which possibly established a new tradition upon which Thomson could put his master plan by 1910, a radical project for a settlement with a modest reputation for civic architecture.

On the subject of the proposed plan for Dundee by James Thomson it was an undeniably strong, arguably idealistic, piece of urban planning which revealed the influence of the American City Beautiful Movement in British urban planning circles in the Edwardian period. The scheme, for example, was of a scale and pretension not seen in Britain at that time in either schemes that were erected or proposed, and highlighted the contemporary possibilities of urban planning in Britain under ideal conditions. Had the scheme been undertaken then Dundee would have developed with an urban form and face on a par with the large American cities of Washington DC, San Francisco or Chicago (had Daniel Burnham's plan (1909) been adopted). Sadly, as highlighted previously, the scheme was not implemented in its original form and this was not only a loss to the civic design of the settlement but arguably to civic design in Britain.

To conclude, this paper has provided an overview of possibly the most comprehensive urban project put forward for a British industrial city pre-1914, a scheme largely overlooked in the formulation of British urban design and town planning history. Adopting Burnham's dictum to 'make no little plans', given the City Beautiful belief that small plans lack fascination and so would never be achieved, Thomson has been shown to have initiated a direction of redevelopment to reinvigorate Dundee's civic and environmental disposition. His course, based on the employment of large-scale neo-Classical architecture, broad and lengthy boulevards and walkways, symmetrically arranged public spaces filled with statuary, themselves sited in accord with prominent sections of the nearby building's principal elevations and planning form which would act as focal points, emphasised the importance of the vista which could be so clearly seen in US city plans. Although many aspects of Thomson's plan were prevalent in British civic designing before 1914 what was spectacular about his Dundee concept was that it not only incorporated a monumental scale, it involved land reclamation to reduce costs, and involved the unifying of spaces and buildings into harmonious accord, which like Mawson's Plan for Bolton was to establish a municipal heart sustaining the whole (1911: 255) - an ideal of civic design.

**Introduction**

The urban and architectural development of Sydney, Australia occurred at two critical moments in the first 30 years of settlement. The most influential governors who were responsible for shaping Sydney's future in a major way were Arthur Phillip (Governor 1788-1792) and Lachlan Macquarie (Governor 1810-1821). The five governors between Phillip and Macquarie contributed little to Sydney's urban identity. While much of the settlement of the city involved technical expertise, the focus of this paper is on those people who contributed to and supported *design* ideas in the flourishing city. Arthur Phillip with his vision of an elegant colonial city set the tone for the settlement, by securing an ongoing relationship between Sydney and its harsh but inspiring landscape. Governor Lachlan Macquarie [Fig 1] surrounded himself with people of similar aptitude and delivered Georgian and Gothic style to the young settlement.

Arthur Phillip commanded the first dispatch of convicts to the penal colony of New South Wales, Australia. A career in the British Navy took him to many ports around the world, exposed him to different cultures and political regimes and trained him as a sailor, navigator, military tactician, leader and administrator. His experience, and personal qualities of courage, preparedness, rigour and compassion assured he was an appropriate choice as first governor of New South Wales. Lachlan Macquarie continued this slim tradition of humane and erudite governors. He emerged from the discipline of a military career, and had, like Phillip, travelled extensively. He was therefore attuned to the aesthetic qualities of the different environments he encountered in his journeys from Seringapatam in India to St Petersburg in Russia.

Citing the Macquarie manuscripts in the Mitchell Library, State Library of New South Wales, this study documents the extensive life of travel engaged in by Lachlan Macquarie, interrogates how he encountered the city as a military man, and speculates about his lifelong apprenticeship in urban design which was ultimately to inform his work in Sydney.

**A soldier's life**

Lachlan Macquarie was born in Ulva, Scotland in 1761. He volunteered for the American Wars in August 1776 at the age of 14 and was stationed in Halifax, Nova Scotia until 1780. He was subsequently stationed variously in New York, Charleston and Jamaica until the end of the War of Independence. In 1788 he sailed to Bombay with the 77th Regiment. In 1791, the regiment trekked through mountainous jungle to rendezvous at Seringapatam with regiments from Madras for a drawn out and

frustrating campaign against the French backed Tippoo Sahib. 1793 saw him married to his first wife Jane Jarvis and living quietly at Calicut. In July 1795 and January 1796 respectively, the regiment took possession of Cochin and Colombo on behalf of the Prince of Orange. Macquarie returned from action against the Dutch at Point de Galle to find Jane gravely ill with consumption. She died in July 1796 in Macau where Macquarie had taken her to convalesce. Macquarie's bereavement was acute and only the thrill of battle distracted him. Tippoo Sahib was finally defeated at Seringapatam in May 1799 this time the 77th participating in the full glory of the assault. In 1800 Macquarie visited Fort William, Ganges, Kippengunge, Calcutta (the centre of British India) and Trincomalee. His final task on the Indian subcontinent was to negotiate the surrender to the British of the city of Serat.

The British Army in India was then called to supplement troops already fighting Napoleon in North Africa, with Macquarie being appointed Adjutant General and Chief of Staff of the 86th Regiment and dispatched to Egypt. They landed in Gulf of Suez at Cosseir, travelled to Mocha and Jeddah, marched to the oasis at Kenne on the Nile opposite the temple of Isis, and sailed to the island of Rhoda in the Nile, off Cairo. Macquarie visited Cairo in August 1801. The onset of illness saw Macquarie back in Bombay, from where he sailed for London in 1803. He stopped at Cape Town and St. Helena on his journey home. During 1803 and 1804 Macquarie made trips to Cheltenham and Bath via Gloucester and Tewkesbury Cathedrals, and Oxford and Cambridge Universities. In June 1804, he experienced another exemplary model of urban design, staying in Dumbreck's Hotel in the New Town in Edinburgh. There, Macquarie met Elizabeth Campbell and proposed to her on the eve of his return to India.

Back in India in 1805, as Lieutenant Colonel of the 73rd Regiment, Macquarie found himself in Guzerat serving at Baroach, Dohud, Baroda and Gaikwar, in more peaceful circumstances, and in 1807 he sailed from Bombay to Busrah on his way home to England. Since the Turks had attacked the Russians, closing the Aleppo Road, Macquarie travelled instead via the Caspian Sea. He had letters to deliver on behalf of the East India Company, necessitating short stopovers in Baghdad, Baku, Astrakan, Kolomna, Moscow and St. Petersburg. Having sailed through the Baltic Sea from Russia, Macquarie was able to view the great dockyard at Kronstad, the British Navy with the captured Danish fleet at Copenhagen, see the Swedish King and Queen meeting the public at Helsingborg, and walk in Hamlet's garden at Elsinore. Once back in England he married Elizabeth in Devonshire on 3 November 1807. In 1809 Macquarie sailed to Australia as 6<sup>th</sup> Governor of New South Wales, stopping en route once more at Rio de Janeiro and Cape Town.

Macquarie's diaries indicate the profound influence his travels had upon his thinking about cities. His enhanced understanding of urban design was critical to his future position as Governor of New South Wales where he would be in a unique position to understand, sponsor and support a small coterie of talented urbanists.

### **Sydney 1809-1821**

The Macquaries, with their passion for landscape and architecture, arrived in Sydney in December 1809. Elizabeth Macquarie had some experience as a landscape designer, having planned a garden walk for her father's estate in Argyllshire and later a road through the government domain in Sydney. She has been credited by some

historians for bringing a Palladian ‘pattern book’ to New South Wales, and assisting in the commissioning of ‘excessive’ buildings such as Gothic castellated turnpikes at the entry points to the city, a Chinese pagoda built as a lighthouse at Newcastle, and a Grecian obelisk milestone [Fig 2] at Sydney’s heart.

The Macquaries were fortuitously joined by convict architect Francis Greenway [Fig 3] direct from the genteel drawing rooms of Bristol and the Second Fleet, and Irish aide-de-camp architect John Watts. This was a remarkable assemblage of talent and motivation with an extraordinary tapestry of precedent. From the urbane provincial centres of the British Isles they transported ideas more in keeping with polite society than the wretched underclass they encountered in New South Wales. However their determination prevailed, and Sydney’s footprint began to reflect a certain urban sophistication. Professionally executed works were principally those of Francis Greenway and John Watts. A disciple and contemporary of England’s famed architect John Nash (Kerr 1984: 38), Greenway had practiced in Bristol working on speculative housing projects until the time of his conviction in 1812 for forging a non-paying client’s signature on a contract. Transported in the notorious *General Hewitt*, he barely survived the journey (of the 1038 on board there were 759 casualties, due to the withholding of supplies from the prisoners to effect sale and profit at Port Jackson). The colony was fortunate to ultimately benefit from the talent and dedication of Greenway. His rigour and artistry, combined with Governor Macquarie’s executive power and vision, produced works that grace the city of Sydney today. These include the Hyde Park Barracks, St James’s Church, the Courthouse, the Macquarie Lighthouse at South Head (reconstructed in 1883), the Government House Stables (now the Conservatorium of Music), the Female Factory at Parramatta, and St Matthew’s Church and the Courthouse at Windsor. Although less educated and experienced than Greenway, Watts designed simple elegant buildings during his five-year stay in the colony. These include the Military Hospital Sydney, additions to Government House Parramatta, Parramatta Hospital, and the remodelled dual steeples of St John’s Parramatta.

Macquarie clarified and embellished the town’s nascent structural rigidity. Streets were repaired, straightened and widened to curb further civil disobedience. Control points were multiplied and decentralised with police watchhouses being set up in five sectors of the town. The town plan was adjusted for “the ornament and regularity of the town of Sydney ...more effectually securing the peace and tranquillity of the town”, (Macquarie, *Sydney Gazette* 6 October 1810, 1) [Fig 4]. His model had been John Craig’s Edinburgh New Town, which was constructed to house an image-conscious middle class, and separate them from the disheveled rabble of the old city.

In time, further public space was embroidered into the city. Hyde Park was dedicated to “the recreation and amusement of the inhabitants of the town, and as a field of exercise for the troops...” Buildings were demolished to create the triangular space named Macquarie Place, and the Tank Stream was protected from contamination. A market wharf was constructed at Cockle Bay, and the city markets proceeded on the current site of the Queen Victoria Building, although not in the grand style that Greenway had envisaged; Commissioner Bigge, sent by the Home Government to audit the colony, objected to such extravagance. A grandiose scheme for a Gothic cathedral precinct and town hall in the genre of the colleges at Oxford and Cambridge was also in train, but Bigge predictably also put an end to this.

By the time the Macquarie retinue departed the colony in 1822, the city boasted several urban design improvements:

- The urban structure had been made more legible and convenient with the widening and straightening of streets.
- New public spaces had been inserted into the urban fabric in Macquarie Place, the squares adjacent to the Town Hall and City Markets, and at the top of Macquarie Street where St James's Church and the Barracks bracketed the termination of a public street at Hyde Park. [Fig 5]
- The relationship of the Government Domain with the harbour (instigated by Arthur Phillip) was highlighted by the Gothic jewels of The Government House Stables on the knoll overlooking the cove, and Fort Macquarie at the water's edge. [Fig 6]
- The Macquarie Lighthouse at South Head provided a beacon of safe passage to mariners navigating the treacherous New South Wales coastline. [Fig 7]

The result was a city well attuned to its native landscape, with a clearly legible urban structure, ample public space, both hard and soft, embellished with some fine Georgian and Gothic edifices, all within 30 years of settlement; a spectacular achievement by any standards of city building.

### **The apprenticeship**

Macquarie's biographer Ellis tells us that Lachlan Macquarie, who oversaw a critical period in the growth of Sydney, is known to have definitively read at least two books in his life: one was Boswell's *Journey to the Hebrides* and the other was that late eighteenth century favourite, Voltaire's *Candide* (Ellis 1947: 4). Superficially they are both about travel and adventure in foreign lands. Anyone who has read *Candide* and is interested in cities, cannot help but be astonished at the fabulous description of the mountain city of El Dorado:

In the meantime they were shown the city. The public buildings seemed almost to touch the clouds. The marketplaces were adorned with thousands of columns. Fountains of clear water, rose-water and liquors drawn from the sugar-cane played incessantly in the squares, which were paved with jewels that gave off an odour like that of cloves and cinnamon. (Voltaire: 1993: 51)

Macquarie travelled the globe as extensively as *Candide* and his accomplices, and also left many fabulous descriptions of the wonders of his journeys. He methodically described each city as he mentally absorbed it, and a pattern of urban exploration is established. Firstly he navigated the town's principal streets and squares, noting the city's setting and landscape features. Then he focussed on monuments and buildings of note. The layers of the city come alive to this traveller through its primary elements: structure (streets and squares) and monumental architecture. This is precisely the typological method of understanding the city espoused by Rossi (1982) and Krier (1985).

The Indian subcontinent, with its sumptuous gardens and palaces draws particularly eloquent commentary from Macquarie. He was transfixed by the extraordinary sight of Periapatam, after campaigning through intractable jungle and steep terrain in 1791.

The description attests to Macquarie's acute receptivity to visual beauty and his powers of observation:

I have had many fine views and prospects, but the *one* I was gratified with today from the top of this hill surpasses in beauty and variety everything of the kind I ever yet beheld. The Fort and Town of Periapatam; and the rich luxurious fertile plains of *Mysore*; clothed with the most beautiful verdure, with the fine large tanks, or large ponds of water and elegant gardens interspersed through these plains as far as the eye could reach, formed in my opinion, the most beautiful landscape, and the most ravishing and enchanting sights in the world...that I feasted my eyes with it a full hour...(A768: 260-61)

In 1792 he catalogued sights of Seringapatam:

I rode to see the Pettah, the Palace, Hyders Tomb and the garden (called the "Loll Bang") on the island of Seringapatam... and I was very highly gratified with the superb magnificence and grandeur of these places; particularly so indeed with the elegance of Tippoo's New Palace in the Loll-Bang which is only as yet about half finished. (A768: 363)

At Cape Town [Fig 8] he begins with the landscape and proceeds to the attributes of the town:

...The town with the bay and surrounding hills form a very agreeable and beautiful prospect (A768: 91), and  
The town of Table Bay, or as it is most commonly titled, Cape Town, is a very neat regular built town; the streets are not paved, but are straight and cross each other at right angles; the houses are built of brick in general and some of wood, they are neat light and airy; the town itself is most beautifully and romantically situated - at the bottom of a very fine bay and at the foot of very high hills which overlook it and all the plains below...(A768: 97)

Macquarie's descriptions of cities become more complex and interesting the more he travelled. During a trip to Egypt in 1801 he visited Cairo. His comments indicate an ability to comprehensively see cities in plan, and as complex three-dimensional compositions:

We first rode through all the squares, principal streets, and public markets within the city. We afterwards proceeded to the ancient citadel on the mountain close to the town - and which it completely commands and entirely overlooks from its very elevated situation. From the citadel we had a very noble grand view of the whole of this immense extensive city, the River Nile for a great distance above and below the town, the seaport town of Bulac with its harbour full of shipping, the island of Rhoda with the encampment of the Indian army, the town and fortifications of Giza, and the distant view of the Pyramids and surrounding country, together with the grand immense aqueduct that formerly conveyed the water from the river into the city, formed altogether such an assemblage of grand and beautiful objects of nature and art as I had ever seen combined before. (A769: 674)

Macquarie saw Joseph's Well and the Great Hall in the ancient citadel. His description of the Sphinx and the Pyramids on May 20 1802 indicate a sharp appreciation of scale:

I rode out in my dooly this day after breakfast in company with Colonel Murray and Major Torrens, as far as the Pyramids and the Sphinx, these most wonderful and stupendous monuments of art, and was highly gratified with the grand height of them. They are situated about six miles to the westward of Giza and are seen at an immense distance (A770: 55)

At Pompey's Pillar on 5 September 1801 he was mesmerized. In the pre-photography era, one forgets the time and concentration required to commit a sight to long term memory in the absence of sketching ability:

This grand and elegant column is of the Corinthian order - and ninety feet in height - the shaft formed of a single block of most beautiful red granite, retaining the finest polish imaginable, is sixty-six feet in height and above eight feet in diameter. After staying for near an hour feasting our eyes with this elegant and most beautiful object, Colonel Abercromby and myself bent our course by a different road from that which we had come out. (A769: 714)

On a trip to Bath in 1803 [Fig 9] he showed a great interest in the structural and ornamental aspects of cities:

I walked out with her (Mrs. Carnac) and Mrs. Woodington in the evening through all the principal squares and streets in the city of Bath worth seeing - namely the Upper Crescent (Landsdown Crescent), Lower or Royal Crescent, Circus, North Parade, South Parade &&. (A770: 221)

In July the same year he was as impressed with Oxford, as he would be in 1804 with Cambridge, visiting at the time "the different churches and colleges of this ancient and celebrated university" (A770: 495). The two academic communities presented yet further models for urban design:

As soon as I had breakfasted at the inn, I went to see all the principal colleges and grand public buildings in this old and celebrated city of Oxford: Namely the Magdalen, the New, and Christ-Church colleges the grand library, theatre, walks &&. (A770: 222)

Travelling overland from India to England in 1807, Macquarie visited Russia. Due to time constraints he was only able to see a fraction of Moscow's charms. He did however comment:

It is certainly however a most elegant city, and one of the largest in the world. (A771: 188)

At St Petersburg, which was a contemporary exemplar of good urban design derived from French and Italian practice, [Fig 10] the stay was longer and the impressions more vivid:

I spent the rest of this day in riding through and viewing the different parts of this most magnificent elegant city which is certainly by far the finest and the most beautiful I have ever seen, and I believe is the finest and most regular built city in the whole world; at least it far exceeds every idea I had formed of its grandeur and magnificence; which are greatly heightened by the three beautiful branches of the Neva running through the city, with elegant bridges of boats across each branch, none of which is less than half a mile broad. (A771: 197)

Macquarie's urban design inclinations which were to be given full reign during his political career in New South Wales, were most obviously expressed with the announcement of his intention to found the village of Salen in Scotland. In July 1804, 5 years before his arrival in Sydney, on a trip back to Ulva, he had expressed this proprietorial impulse to improve his ancestral lands, and the lives of his relatives:

I am the more particularly anxious to have the whole of the farm of Callachilly at my own entire command, as it is my intention to drain and improve the great Moss of Salen, and to build a neat village there for crofters and a certain number of useful tradesmen, together with a new good inn, a smithy, and a shop for merchandise: The point of Salen being a most central and very eligible situation in every respect for erecting a village of this description. (A770: 366-7).

Returning to the Highlands in 1807 he founded Salen, subsidising the expense of building his relatives' homes. His prescriptions read like a modern day compilation of urban design guidelines:

Being very anxious that all the crofters should have good comfortable houses built on their own respective crofts-close to and facing the High Road; I beg you will inform them, that, on condition they build for themselves comfortable good houses, pointed with lime, and each having two glass windows, I shall willingly pay a reasonable portion of the expense thereof - I could also wish that all the crofters' new houses should be built of nearly the same size, and they should have all of them high stone gables (sic). (A796: 4 letter to McTavish 15 August 1808)

## **Conclusion**

Lachlan Macquarie had traveled the globe in his military career absorbing information about the places he visited. He clearly had a passion for the cities and beautiful landscapes he had seen, and he wrote eloquently about them in his diaries. For his highland home at Salen, in Scotland he had even created a small settlement, governed by simple *aesthetic* rules,. Because of his global apprenticeship in urban appreciation Macquarie was able to recognize good urban design. As Governor of New South Wales between 1810 and 1821 he was fortuitously surrounded by an assemblage of talented individuals all of whom could make some contribution to the construction of the built environment. Macquarie used both his judgment and his executive power to harness these attributes and create the foundations of a great city. He was assisted by the fact that this small group of individuals worked coherently and constructively to this end. The Macquaries, Watts, and Greenway, in spite of their differing circumstances in New South Wales, had much in common. All came from urban

societies that emphasised the aesthetic and embodied an urban sensibility. Eighteenth century Dublin, Edinburgh and Bristol were all exemplars of the city as a work of art, and a cultural artifact. These were cities of elegant streets and squares, fine public buildings and impressive assemblages of Georgian homes. As Governor of New South Wales, Macquarie was well equipped to provide intelligent patronage to a talented group of professionals. During his governorship, the structural imprint of Sydney was clarified with the widening and straightening of the central grid of streets. He supported the insertion of public space into the city with the forming of new squares at Macquarie Place, the market and the town hall. Finally he commissioned architects Francis Greenway and John Watts to design many handsome public buildings to grace the city. The resulting city attests to a timely convergence of a patron and a group of urbanists at the outer reaches of the British Empire.

It was not long after the first production automobiles rolled out of American shops that the newfangled machines found their way to the East. Ransom Eli Olds sold one of his electric cars to an intrepid buyer in India in 1891, becoming the first to export an American automobile overseas. As early as 1902 exports of American automobiles to China totaled \$6,645, with an additional \$1,175 going to British Hong Kong.<sup>ii</sup> Ten years later, Chinese consumers were buying nearly \$500,000 worth of motor vehicles annually from Germany, France, England and the United States. After a lull during the first World War, demand for imports jumped again, and in 1917 some \$942,000 worth of foreign automobiles were imported to China.<sup>iii</sup> Industry analysts swooned over the potential goldmine in the China market. "This virgin field," offered the *New York Times* in 1910, "should absorb in years to come all the automobiles that America and other countries produce over and above their own actual needs."<sup>iv</sup>

Western observers marveled, in a typically patronizing tone, at the popularity of motoring among China's merchant class. In a 1913 *New York Times* article entitled "Mandarins like Motor Cars Now," M. A. Greenfield reported that "On any pleasant day" in Shanghai, "you meet mandarins and merchants with their families, behind well-groomed chauffeurs, enjoying themselves exactly like prosperous Americans." An importer who specialized in American automobiles, Greenfield related that there were "few automobiles in the whole of China until about two years ago"; but "the advent of the republic has quickened progress along all lines, and, of course, the automobile is one of the most distinguishing marks of progress." By his estimate there were some 800 motor cars in Shanghai as of 1913.<sup>v</sup>

The Yankees soon dominated this nascent market. Even the *British Chamber of Commerce Journal of Shanghai* had to concede that "One only has to walk the streets of this city to see the undeniable predominance of the American car." American cars were lighter and less expensive than British models, and also more powerful. Detroit was soon the choice of both the expatriate European community as well as affluent Chinese. The latter showed "a decided preference for American styles," the *Journal* sniffily noted; "They like the American car's clear-cut body as opposed to the more massive body of the British car." Even the wire spoke wheels of the Yankee autos were more popular than the solid, wooden "artillery type" wheel on the British cars. At China's first automobile show in 1921, Americans stole the show. Housed in sheds of bamboo and rush matting, the Shanghai exhibit covered some 260,000 square feet; half of the vehicles displayed were American.<sup>vi</sup>

The pole position of Yankee automakers was also the result of aggressive marketing. Unlike the staid British salesmen, the Americans employed a range of creative marketing ploys, and even "stunt advertising" to spread word about their wares. One common ploy involved sending a convoy of automobiles off to places the machines had never before been seen. "As this always calls for journeys over almost impassable roads or where roads do not exist," wrote William Irvine, "it affords a fine advertisement of the ability of the cars," as well as "an effective appeal" to local Chinese who might understandably question the capacity of the automobiles "to perform when they are out of the range of prompt attention from the foreigners."<sup>vii</sup> In 1932, the Reverend Hewlett Johnson, a missionary who traveled extensively in China, reported that in Sian (Xi'an)--the ancient terminus of the Silk Road and one the great cities of the ancient world--American automobile dealers were "straining every nerve to gain a footing."<sup>viii</sup>

*Henry Ford Goes to China*

Ford himself took a keen and early interest in China, first as a potential market for farm tractors and later for passenger automobiles and trucks. Ford was also an amateur sinophile of sorts; he had an extensive collection of Chinese coins, and frequently expounded on the industrial potential of soy beans, one of China's principle crops.<sup>ix</sup> The Chinese were equally fascinated by Ford. In 1924, Sun Yat-sen, founder of the Republic, wrote to Ford to commend him on his "remarkable work" building an automobile industry. "I think you can do similar work in China on a much vaster and more significant scale," he wrote, and would "have the opportunity to express and embody your mind and ideals in the enduring form of a new industrial system." Ford apparently never saw Sun's missive, which was handled by some flunky in public relations; all the company sent in response was a form letter to the effect that Mr. Ford had no plans to visit his country.<sup>x</sup> But Ford was no stranger to China by now; he had been selling cars there for more than a decade, and was even training Chinese mechanics and service personnel in Michigan. In 1924 Ford hosted a visit by Chinese Trade Commissioner Chang Chien, Jr., who gave a speech in Mandarin to a large group of Chinese trainees in residence at Highland Park. Chang predicted an extraordinary future for motoring in China, claiming that more than 100 million automobiles, "or five times the present world total," would be required to provide the nation's 400 million people with the same ratio of cars as Iowa.<sup>xi</sup>

Ford flourished in the China market. There were two dozen Ford dealers operating in the Republic by 1930, when the company's market share hit 43.6 percent.<sup>xii</sup> But while Ford had dealers and even a service branch in Shanghai by 1928, the automobiles were still being assembled in Japan and "knocked down" for shipment to China--an arrangement that became increasingly problematic as the relationship between these two countries deteriorated.<sup>xiii</sup> To amend this, Ford considered investing in an assembly plant in Shanghai in 1932, but the plans were scuttled as war with Japan became inevitable. Yet even with the Japanese invasion in 1937, Ford maintained the company's presence in Shanghai. Its service facility in the Shanghai suburbs kept operating in spite of sniper attacks on its employees and the bombing of nearby neighborhoods. Ford and other auto companies stayed put in China partly in the hope that the war clouds would soon blow over, but also because they had calculated on war driving up demand for their products. General Motors managers, for instance, described the Japanese occupation as a potential boon to business: In 1938, a regional director remarked that "From the automotive point of view, it is possible that complete domination of China by Japan would mean an upturn in business."<sup>xiv</sup> Ford continued selling cars and trucks to Japan in spite of the invasion, and many of their vehicles were eventually used by the Japanese expeditionary forces in China.<sup>xv</sup>

### *"Coolie Tracks and Mule Paths"*

An automobile is only as good as the road it is operated on, and China's roads were sorely lacking in the early 20th century. In fact the Chinese had built an extensive system of highways centuries before. An office of road construction and maintenance was established in China as early as 1129 BC, during the Zhou dynasty. Evidence indicates that many of these Zhou-era roads were flanked with planted trees. Numerous highways were also constructed during period of the Warring States (475-221 BC). The sovereign Shih Huang Ti, credited with unifying China in 221 BC, built routes connecting Xi'an and Beijing, Guangzhou and Chengdu, which were partly shaded by pine trees planted at 30-foot intervals. Many of these early roads were later widened and improved for military use, and during the reigns of Kublai Khan and Ghengis Khan most of China's 2,000 miles of imperial highways were repaired and upgraded. But later Ming rulers evidently did not take road maintenance as seriously, and evidently "allowed the splendid old imperial highways to fall into ruin,"

wrote A. Viola Smith and Anselm Chuh in 1931, "until to-day a bit of causeway and a half-hidden stone pavement are all that remain." By 1911, the nation's road system had changed little in the past 500 years.<sup>xvi</sup> In 1916 the *Times* reported that most Chinese roads, even courier routes, were mere "coolie tracks and mule paths . . . impassable to anything on wheels except a wheelbarrow." With the exception of the Treaty Ports, "no roads are to be found in any part of China," the article claimed; and only in Shanghai was motoring "indulged in to any extent."<sup>xvii</sup>

### *Red Cross Roads*

Given that the future of automobiles in China was dependent on good roads, it is hardly surprising that Americans would play a role in building a modern highway infrastructure. What is surprising is that it was missionary relief work that led to such an undertaking. As the summer of 1920 drew to a close, Chinese authorities began receiving reports of vast crop failure in north China. Relief efforts were hurriedly organized, and appeals made to foreign aid organizations. By chance, the annual meeting of the Association of Chinese and American Engineers (ACAE) was being held in Tientsin in early October that year. Determined to act, a group of ACAE engineers formed to "urge the adoption of a program of construction" of public works--mainly roads, bridges and dams--"to be carried on coincident with the issuing of food to the destitute." Crop failure and subsequent food shortages in rural China tended to be localized; there was often plentiful grain in nearby provinces, but a lack of transportation made it virtually impossible to move large quantities of food to needy areas. The ACAE engineers argued that good roads, speedily built by famine-idled laborers, would enable relief organizations and the government to expedite food shipments. The men succeeded in convincing the American Red Cross to undertake highway construction in Shandong province--one of the regions hardest hit by the famine. Within months, the Red Cross launched similar efforts in Shanxi, Henan and Hebei provinces.<sup>xviii</sup>

John Earl Baker, American advisor to the Chinese Ministry of Communications, directed these Red Cross relief operations, and from October 1920 to August, 1921 he oversaw the expenditure of \$1.2 million on road construction in the four famine-struck provinces.<sup>xix</sup> The most ambitious work took place in Shandong, where Baker's man in charge was a Michigan native named Oliver J. Todd. Todd studied civil engineering at the University of Michigan and later served as chief hydrographer on the Hetch Hetchy dam in the Sierra Nevada mountains. He served as a Captain in the US Army Engineering Corps in World War I, and made his first trip to China shortly after being discharged in 1919.<sup>xx</sup> For an engineer who had masterminded state-of-the-art public works in the United States, the Shandong roads were more an organizational than an engineering challenge. But because the Red Cross was prohibited from expending funds on land acquisition or grave relocation--a major impediment to siting any new road in the Chinese countryside--many of the Shandong highways were forced to follow deeply rutted centuries-old roads. Where a new roadbed had to be constructed, the builders were aided by geography and geology. The great level plain of the Huang (Yellow) River delta was an engineer's delight; surveying instruments were hardly needed, and most alignments were simply "put in by eye." There were also "few bridges to build and no grades of any consequence," and the soil, "Yellow River loess with a lime content but practically no clay" was easily worked: "By tamping and rolling the damp earth as it was thrown up in 6-in. layers," Todd recounted, "new roads were made hard enough for immediate use so that autos could traverse them at 30 miles an hour."<sup>xxi</sup>

The real challenge for Todd and Baker was the care and feeding of an army of field hands. As supervisor of Red Cross operations in Shandong province, Todd had as many as 35,000

laborers on his payroll at one time, and some 70,000 in all worked on the roads under his direction. The majority of the men were farmers idled by drought and desperately in need of sustenance. Families in the afflicted region would receive "grain and fuel" in exchange for the labor of one adult male, whose daily wages--"five catties of mixed grain and a little over a catty of coal"--were austere but often meant the difference between life and death for his family.<sup>xxii</sup> Only men under age 50 were employed. Widows and orphans and the elderly had to rely on other relief organizations or the generosity of neighbors. The workers chosen were organized into gangs of 30 men each, led by a "headman," who in turn answered to a salaried foreman responsible for ten gangs each. At first the foremen were selected from local communities, but Todd soon replaced them with more experienced men who had worked on railroads and surveys; not surprisingly the laborers chafed under these more demanding taskmasters.

As the once-starving men grew stronger and more fit, Todd replaced the daily wage system with one based on incentive, paying each five catties of grain for every *fang* (100 cubic feet) of tamped earth--a decision he credited with greatly increased construction speed. Quality control was assured by running an automobile at high speed over each completed section; if the vehicle "sank in so that it would no longer run on high gear, the road was condemned and the men were required to retamp it at their own expense." At the end of the workday the men were billeted in whatever accommodations could be rented along the route, including temples. Work went slowly in the winter months, largely due to the frozen earth; but with the spring thaw the pace of construction picked up. By July, 503 miles of modern road had been constructed--an extraordinary achievement given the weakened condition of the laborers at the outset and the primitive tools they were forced to work with. Todd estimated that the Shandong road project furnished food and fuel to some 500,000 men, women and children in all.<sup>xxiii</sup>

Red Cross trunk lines were also built in Henan and Shanxi, where the roadbuilders had to cut through rock for most of the route across the mountains to the Yellow River. This road assured that neighboring Shaanxi province just to the west would not be cut off from food supplies as it had been in past famines.<sup>xxiv</sup> All told, the Red Cross road builders constructed nearly 1,000 miles of "standard earth motor roads" in northern China in 1920-1921.<sup>xxv</sup> As a relief operation the roadbuilding was a great success, credited with significantly reducing mortality. While 500,000 people died in the 1920 famine, the toll was far less than that extracted by a similar famine that struck northern China in 1876, when as many as 13 million perished.<sup>xxvi</sup> The Red Cross roads were primitive by today's standards, but orders of magnitude better than what had been. "They were a great improvement over the old native country roads," Todd later wrote, "which often became pond holes in low places during the rainy season, and elsewhere were long stretches of deep sand . . . Except in extremely muddy weather Ford cars could travel on them at a rate of 30 miles an hour."<sup>xxvii</sup>

### *"The Civilizing Road"*

Todd went on to spend the next 18 years in China, working with missionary zeal on a scores of highway projects for the Chinese government, the China International Famine Relief Commission and other organizations. The scale of the work was breathtaking: on a single road project in 1928 Todd supervised an army of 200,000 men and women--more than were at work on all the roads in the United States combined at the time.<sup>xxviii</sup> In all, Todd and his crews built more than 3,000 miles of motor roads in 14 provinces, from Mongolia and Tibet

to the Vietnamese border. Todd endured banditry, feuding warlords and the constant hazards of travel. He was shot at, and had assistants murdered or kidnapped in front of him.<sup>xxxix</sup> But the roads Todd built had a profound impact on China's development; by overcoming age-old impediments to communications and transportation they made the likelihood of uniting the vast nation much more real. Todd hoped that this evolving highway system would help China literally pull itself together, overcoming civil strife and regional feuds that had bred warlordism for centuries and made ruling the nation so difficult. Using the old imperial roads it took a government official almost three weeks to travel from Xi'an to Lanzhou; once Todd completed the 500-mile Si-lan Road, travel time was reduced to a mere three days.

Todd also believed that good road transportation would help eliminate China's catastrophic addiction to opium. Poppy fields covered thousands of acres of fertile land in remote western China, land that had effectively been removed from contributing to the nation's food needs because opium cultivation was so profitable--as much as two to three times more profitable than growing wheat. This was mainly due to its light weight and transportability.<sup>xxx</sup> Todd and others argued that good roads would help tilt the economic scales in favor of food crops, making them cheaper to get to market; the likelihood of famine would thereby be reduced and millions would be spared the evils of opium. It was a paternalistic vision, to be sure, but also one rooted in Todd's deep commitment to China and its people. Highways and motor vehicles were essential development tools, Todd believed, that could help China shed its image as the "sick man of Asia." As Jonathan Spence put it in *To Change China*, Todd had high hopes for his highways: "that one day trucks would roar down them, carrying grain and rice to stricken areas, while the private cars of officials and merchants would speed by with the promises of fairer administration and wider trade."<sup>xxxi</sup>

It is also clear that, altruism aside, Todd understood that modern roads in China would pay dividends of another sort. They were a smart investment for the United States--not only in terms of stabilizing a potential trading partner, but by seeding a potential future market for American trucks, buses and cars. For a Michigan boy it is perhaps only natural that Todd warmed at the thought of a convoy of Detroit-made cars and trucks motoring along the roads he built on the other side of the world. After a torturous journey on horseback to Guiyang in 1927, the provincial capital of landlocked and roadless Guizhou province, Todd was delighted to be greeted several miles outside the city by an American automobile on a section of highway he engineered a year before. The eight-mile route, looping about the city, had been built by soldiers and "all able-bodied students over the age of fourteen" in town (the boys worked one week, the girls the next).<sup>xxxii</sup> The motorway was the city's pride and joy. To christen it, an appropriately modern seven-passenger American sedan had literally been hauled in pieces across the mountains, carried from Canton "in boats and on bamboo litters or in parts on men's backs"--a 50-day journey. Another sixteen American automobiles were on order.<sup>xxxiii</sup> To welcome Todd, the re-assembled automobile (which had arrived three days ahead of him) was paraded about by the provincial governor, while 10,000 local troops and a military band played "Swanee River" and the "The Red, White and Blue."<sup>xxxiv</sup>

Todd also looked to Michigan in mentoring his Chinese assistant engineers. Most of the young men who work with him in the field had studied in the United States, and some had even worked on American highway projects. On a field trip to Canton in 1927, Todd related proudly how the macadamized Canton-Whampoa motorway, built in the early 1920s between the old city and the new port at Whampoa, had been designed by a Chinese graduate of Michigan State University who later apprenticed with the state's Highways Commission.<sup>xxxv</sup> American automobile companies often sponsored such exchanges, well aware of the potential

future payoffs. Todd himself proposed a "Michigan in China" program to train young Chinese road builders, a "school in the field . . . mobile and highly practical."<sup>xxxvi</sup> He practiced what he preached. In 1927, Todd turned over supervision of a 350-mile road from Guiyang to Changsha to a Chinese assistant who had trained at the Ford auto works in Detroit; the assistant in turn tutored some 80 cadet engineers--China's next generation of road builders.<sup>xxxvii</sup> Two other Chinese colleagues, both graduates of the University of Wisconsin, set out that same year to construct a 500-mile motorway network from Nanning in Guangxi Province.<sup>xxxviii</sup>

While it seems that Todd never formally represented American automobile interests, he was an enthusiastic--if unofficial--apostle of Detroit. On numerous occasions he demonstrated a keen personal interest in the success of the American car in China. As *The Christian Science Monitor* noted in 1934, building highways in China meant "that motorcars, including passenger cars, trucks and busses, would soon be along, and in every case this assumption has been proved right." And typically, the writer added, "the cars in question turned out to be sturdy American vehicles," which, unlike their British counterparts, were designed for operation on primitive roads or on no road at all.<sup>xxxix</sup> Todd himself understood the great chain of enterprise that this would set into motion: "American autos are being brought in to be used on these roads. American mining machinery will follow as will a hundred other things American."<sup>xl</sup>

#### *The "Good Roads Movement"*

The Red Cross roads were ambitiously maintained in subsequent years, even in the face of continuing civil unrest. Todd had left the Shandong roads in the hands of a trusted Chinese assistant--an American-educated engineer named E. L. Tang. Revisiting the Henan Red Cross roads in 1925, Todd found that had been vastly improved. "Where formerly only Ford motor cars could run," observed Todd, "we now find heavier automobiles, including the Dodge and Buick, as well as motor busses, operating over a good network highways, comprising many hundreds of miles." Albeit, the public at large was only an incidental beneficiary of such improvements, which were undertaken by warlords keen on increasing "the efficiency of their commands" and by wealthy families with interests in locales connected by the road. But however haphazard, a regional highway system had begun to form around the first strands laid down by the Red Cross. As Todd put it, "This network of roads has proved to be a nucleus on which more roads have been built, and it is to the credit of the people of North and Central China, acting through their officials and various organizations, that the good roads movement has continued popular up to the present time." Even as early as 1924 the initial Red Cross routes had expanded into a system encompassing some 3,000 miles of highway.<sup>xli</sup>

The famine-relief roads had another unintended effect: they helped spawn a Chinese version of the "Good Roads" movement that had begun a generation or so earlier in the United States. Both the government and the private sector took up the banner of road improvement during the Republican era. The "Good Roads" movement was part of a larger trend toward modernization and urban renewal that came to life after the collapse of the Qing dynasty and the founding of the Chinese Republic in 1911. A young and idealistic generation of Chinese reformers sought to replace the seeming chaos and anarchy of the past with what Michael Tsing has called "a new political rationality"--one based largely on Western scientific knowledge and professional expertise.<sup>xlii</sup> This vortex of modernization created a whole new spatial order in the Chinese city, one that included China's first modern department stores, new parks and recreation facilities, exhibition halls, electric trolleys, street lighting, water and

sewer lines and other public-health works to promote *weisheng* or "hygienic modernity."<sup>xliii</sup> The new spatial order also transformed the cluttered, claustrophobic streets of the old Chinese city into bright, wide modern thoroughfares upon which motor vehicles could travel.

J. Morgan Clements, American Trade Commissioner in Shanghai, reported that a Good Roads Association of China had been launched in Shanghai in 1920 by "progressive Chinese" and sympathetic Western expatriates. One of their first projects was to organize a public exhibition on the movement and the economic value of modern highways for the Republic. By 1922 the group, led now by Shanghai physician C. T. Wang, formulated a development program that included "a triangle of roads" linking Shanghai to Suzhou and Hangzhou and eventually continuing on to Nanjing, capital of the Republic. So enthusiastic was the governor of Chekiang (Zhejiang) province about the proposed motorways that he offered soldiers to be employed on the project "at a nominal charge of \$1 Mexican per soldier."<sup>xliiv</sup> Elsewhere, Clements reported, modern roads were being built by coalitions of local merchants, often in conjunction with plans to operate motor bus service over the route.<sup>xliv</sup>

In Foochow (Fuzhou) construction of a road around the city had begun in April, 1915, along with the rebuilding of streets within the old walled city. The latter involved "replacing the uneven stone-paved streets with a local cement surfaces," along with extensive demolition of houses and shops to widen street rights-of-way. By 1918, 3,710 houses had been razed for this purpose. Several miles of modern motorways had also been built on the city's outskirts, along with 45 new bridges. In nearby Amoy (Xiamen), another treaty port, Clements reported that the city's streets were too narrow to accommodate an automobile, and indeed "none so far has been brought to the city." But Amoy was also home to many affluent Chinese merchants, who helped launch a movement to widen the streets for the purposes of pleasure motoring, "in spite of the expense incident to purchasing property along the streets in this densely built-up city."<sup>xlvi</sup> Further inland at Chengdu, the warlord Yang Sen carried out an extraordinary modernization campaign in the 1920s, which involved extensive street-widening projects and road construction on the outskirts of the city, preparing ground for the first automobile in the city in 1926.<sup>xlvii</sup>

In other cities, modern streets were built using the stones of ancient city walls, and new motorways often constructed in the space once occupied by the ramparts. Few acts of urban modernization in the Republic period were more symbolic of China's longing to sweep away its past and opening up to the world. The Good Roads Association of China made a clear stand on the issue, urging that "all the city walls . . . be demolished to construct loop highways."<sup>xlviii</sup> In Canton the ancient city walls were torn down in 1919, replaced by a "broad macadam boulevard." Elsewhere, ancient canals were filled and new streets built above them--some as wide as 150 feet. "In making these improvements," Clements reported in 1922, "6 1/2 miles city walls, 15 city gates, and 5,000 houses" were torn down, and 13,000 feet of canals filled-- "the materials from the walls and houses having been used as filling and for road construction." As a result of this work, the Cantonese had "taken rapidly to the use of automobiles." In 1919 there were all of two motor vehicles in the ; by the summer of 1921 there were 150 cars and 25 motorcycles, nearly all of which were American.<sup>xlix</sup> Further north, in Changchow (Changzhou) 52,000 linear feet of new street had been completed by the spring of 1921--the best of which were "surfaced with granite slabs 7 inches thick, taken from the city walls."<sup>l</sup>

In Nanjing, American city planner E. P. Goodrich, one of the founders of the American Institute of Planners, was retained as an engineering advisor to the national government, and

was busy prepared a plan that would make the city "the most beautiful and the most scientifically planned capital in the world." This involved, in part, transforming the old city wall into an elevated highway.<sup>li</sup> The Goodrich plan also involved the construction of a parkway on the outskirts of the city. The road was to be patterned on the recently-completed Bronx River Parkway, only featuring "Oriental landscape adaptations" instead of the usual picturesque amenities derived from the English landscape gardening tradition. According to Goodrich, this involved a "setting of pagodas and gate houses at intervals along the way, with the beautiful bamboo trees which the Chinese highly esteem."<sup>liii</sup> As with the Bronx River Parkway, the Nanking road was meant to be the start of a metropolitan-wide system of parks and scenic thoroughfares on the order of the celebrated Westchester County Park System. Chinese planners requested copies of the Westchester park commission's annual reports, and later sent the city's chief engineer to tour the Westchester roads personally.<sup>liiii</sup>

### *Collegiate Diaspora*

Even those road improvement projects not directly related to American interests benefited from United States technological expertise once removed. American values were infused into the modernization process by scores of Chinese architects, planners and engineers who studied in the United States. During the Republican period, thousands of China's best and brightest students traveled to the United States for their educations. This tradition began, ironically, in connection to an immense sum--more than \$300 million--that the Qing court was forced to pay Britain and the United States in 1901 for having balked at quelling the Boxer Rebellion several years before. Part of the "Boxer Protocol" funds went to establish Tsinghua University in Beijing, which began as a preparatory school for students planning to study in the United States. The rest of the money was used to fund scholarships that enabled promising students to attend a range of American colleges and universities. In 1931 alone some 4,300 Chinese pupils were enrolled at U. S. institutions of higher learning.<sup>liv</sup>

The scholarships had a profound impact on China's modernization drive. Boxer students studied municipal administration, city planning, architecture and highway engineering, and returned to China anxious to drag China out of its feudal past and into a new day of modernity and "municipal progress." Among the many evangelists of modernization returning to China was Otis S. O. Lee, whose masters thesis--"A Study of the High-Roads of China and Discussion of Methods for Improvement"--was completed at the University of California in 1911, entitled. Sun Yat-sen's son, Sun Ke, also attended California and later became keenly interested in urban planning; he published an influential article in 1919 on the uses of scientific knowledge in planning and managing cities.<sup>lv</sup> It was another such returnee--Cheng Tien-tow--who advised Canton's Governor Cheng Chun-shun to "construct a Bund of commercial structures along the banks of the Zhujiang (Pearl) River" and to pull down the city's 800-year old walls for a motorway.<sup>lvi</sup> A similar set of recommendations were set forth by Han Veng Woo in a thesis prepared at Iowa State College in 1930--"Design of Streets and the Use of City Walls in the Development of Highway Systems in the Municipalities of China."

The embrace of Western modernization, in the form of new ideas about highway engineering and municipal planning (as well as the automobile itself), was not without its critics. The anti-imperialist boycotts of the Republican period were aimed at resisting the influx of imported goods, which were accused of seducing the Chinese and eroding national identity. While American goods were boycotted in 1905 in reaction to racist United States immigration policies, most anti-imperialist activism focused on the British and Japanese. The United States was perhaps the least disliked of the three nations. Antipathy toward the

British, in particular, may well have helped give American automobile companies an added edge in the China market. Moreover, resisting the automobile was not easy--especially for some of the very class of elites who most vocally advocated the boycotts. One critic, writing in 1934, scolded intellectuals for "riding around in foreign cars" while preaching about buying Chinese. In fact, some of the very organizers of a major China national products exhibition actually affixed "Buy National Products" pennants to their imported cars!<sup>lviii</sup> The great usefulness of the automobile and its role as a harbinger of modernization may well have deflected much of the anti-imperialist fervor of the period.<sup>lviii</sup>

### *The General's Legacy*

In spite of the growing road infrastructure, wholesale adoption of American automobiles in urban China faced another glaring obstacle. China simply drove on the "wrong" side of the road. To make it in the China market, American auto makers would have to produce a separate line of vehicles equipped for right-hand operation. For obvious reasons, the British had a major advantage here. But for the Americans this problem vanished on a single night in 1945, thanks to a largely forgotten American army general.

By 1943 the Allies were airlifting tons of men and materiel over the "Hump" to supply the Chinese Nationalist army in its struggle against the Japanese. Chennault's "Flying Tigers" had become the 14<sup>th</sup> Air Force, stationed in Kunming, and General "Vinegar Joe" Stilwell, commander of the China-Burma-India Theater, was pushing a new road from Ledo (Assam) in northern India to the old Burma Road--the back-door supply route to China built in the 1930s.<sup>lix</sup> Stilwell had by this time begun to run afoul of both the Nationalists and the Washington high command. He clashed with Chennault over strategy, and was scornful of Chiang Kai-shek. Even less palatable to Washington (and the Nationalists) was Stilwell's admiration of the scrappy Chinese Communists, whom he sought to partner with in the fight against Japan. By October, 1944 President Roosevelt had relieved Stilwell of his duties.

His replacement was a West Point strategist named Albert C. Wedemeyer. Born in Omaha, Nebraska, Wedemeyer studied at the German *Kriegsakademie* in the 1930s, and later helped plan the Normandy invasion. His new assignment was to command the China Theater and serve as Chief of Staff to Chiang Kai-shek. In this capacity he was to "advise and assist" Chiang in planning operations against the Japanese. He soon planned an offensive code-named CARBONADO to drive the invaders south and liberate Hong Kong and the south China coast. CARBONADO required marshalling a huge force of men and equipment, including two divisions of American-trained Chinese troops airlifted from Burma. Thousands of vehicles had to be moved south toward Hong Kong, a 700-mile trek across. Wedemeyer's chief concern was simply keeping the great green column moving.<sup>lx</sup>

In support of their China operations, the Americans had naturally hauled in thousands of American-made jeeps, trucks, and other vehicles. But because traffic in China moved to the left, the vehicles were in effect not properly equipped for safe operation on Chinese roads. The result was a large number of accidents, a situation that driver-education programs initiated by the Americans did little to ameliorate. This seemingly prosaic matter threatened the very success of the offensive. Wedemeyer had a remedy: "I decided that drastic measures must be enforced," Wedemeyer recalled, "to prevent our truck convoys moving supplies to the front for the CARBONADO offensive from meeting with accidents." If the vehicles themselves could not be changed, why not change the traffic? Wedemeyer proposed to Chiang that "all traffic in China be transferred to the right side of the road."<sup>lxi</sup>

The Generalissimo approved, and Wedemeyer ordered a publicity campaign to apprise the population. "Posters were placed on telephone poles and shop windows, showing diagrammatically how traffic would move and giving instructions to pedestrians in order to minimize accidents. Articles were published in newspapers throughout the country." But the news did not go down well by all. Shortly after change-over was announced in the spring of 1945, Wedemeyer was informed that "articles were appearing in the vernacular press strongly criticizing the idea of breaking an old Chinese tradition and urging the Generalissimo to reconsider and uphold the old and the tried method of moving traffic." Wedemeyer was suspicious. He ordered one of his intelligence officers to investigate the matter, and the source was soon traced to none other than the British Embassy.<sup>lxii</sup>

The British, it turned out, were convinced that Wedemeyer was acting on behalf of Detroit, surreptitiously preparing a vast new market for American automobiles. As far as they were concerned, Wedemeyer was about to "destroy their market in China for British cars." At a dinner party in Chongqing, Wedemeyer raised the matter with the British ambassador, Sir Horace Seymour. Seymour was evasive, and responded by asking the General whether he had ever driven a British car before, and whether doing so presented any undue difficulties. Wedemeyer responded that, indeed, he had experienced the pleasures of British motoring--in England. In China, things would be different. Though he personally had no trouble adjusting to the operation of American vehicles on British-style roads, his countrymen in the auto business might find it challenging for other reasons: "I added in carefully phrased words that the American motor industry would probably not be interested in changing its tooling to produce cars for left-hand driving."<sup>lxiii</sup>

Regardless of British opposition, Wedemeyer's traffic law was to go into effect on the first of September, 1945, in time for the launch of CARBONADO. But the Japanese surrendered shortly before and the operation was called off. Chiang Kai-shek ordered that the lane-change be made regardless, though it was postponed for several months so that drivers and pedestrians could become familiar with the new way. Finally, on New Year's eve, 1945, Wedemeyer's mandate went into effect. "I had the thrilling experience of standing on the balcony of my tower apartment in the Cathay Hotel in Shanghai," he later wrote, "to watch the traffic at midnight change over to move along the right side of the road." Remarkably, there were few mishaps. By the next day, vehicles all over south China, from Army trucks to horse-carts, were legally required to move along the road as did the Chevys and Fords in Wedemeyer's hometown of Omaha.<sup>lxiv</sup>

Whether he intended to or not, Wedemeyer rolled out a red carpet for American automobile manufacturers by ordering the great lane change of 1945--something the British left China utterly convinced he had done on purpose. And had the Nationalists prevailed in their fight with Mao's ragtag troops, it's likely that many a fortune would have been made putting China's millions on the road. But Wedemeyer's carpet would lay untrodden for many decades. The trade embargo imposed by the United States at the outbreak of the Korean War forced Beijing to seek its motor vehicles from the Soviet Union and Eastern Bloc countries--and to begin manufacturing its own vehicles. Notwithstanding Mao's decision to keep the American traffic configuration, American cars quickly vanished from China's roads. By 1954, the *Far Eastern Economic Review* reported that "American cars are now rare in China, and imports for American cars are almost nil."<sup>lxv</sup>

## *Conclusion*

Whether they intended to or not, Ford, Todd, Wedemeyer and others helped plant the seeds of American motoring in China. When the People's Republic opened again to the West in the late 1970s, as Deng Xiaoping's economic reforms began to take root, the American automobile industry was quick on the scene. On January 6, 1979, only five days after president Jimmy Carter formally recognized China's Communist government, a delegation of executives from American Motors Corporation arrived in Beijing. Greeted by martial music and a large portrait of Mao Zedong, the businessmen soon sat down to negotiate a joint venture with the Beijing Automotive Works; their objective was to produce Jeeps for the Chinese market. The mission was a success, and the resulting deal made front-page news in the United States, hailed a "bellwether joint venture between the West and China."<sup>lxvi</sup>

Overlooked in the excitement was the fact that it had been done before--that Detroit had decades ago made a significant and lasting imprint on motoring in China. This was, after all, a return to well-traveled roads. Today the Americans have plenty of competition from automobile manufacturers from Japan, Europe, Korea and, more recently, from a nascent but promising indigenous Chinese motor industry. But beneath all these wheels, buried perhaps below many layers of gravel and concrete, lay the strands of a Yankee contribution to what may one day be the most extensive and most heavily traveled highway system in history.

## Introduction

In Venezuela the meaning of the transformations of the main cities among 1950- 1958 cannot be valued only from the physical point of view. Together with the remarkable changes in the inherited reticular urban structure of the XVIII and XIX centuries, a restructuring process and consolidation of the engineering and the architecture took place, aided by institutions like the *Colegio de Ingenieros de Venezuela* and the role of the professionals during these years.

The political context in which these transformations were inserted is of particular importance for its concretion. Marcos Pérez Jimenez's government (1950-1958) maintained as motto the "*Nuevo Ideal Nacional*" together with the slogan of making changes in the physical means. This *Ideal* was shown in the execution of public works and had as main interpreters the engineers and architects. It is during the *perejimenista* government that the country was the scenario of the development of more spans in communications and of the urbanization process consolidated as unit of organization of the Venezuelan society.

The "*Nuevo Ideal Nacional*" ambitious objectives could be materialized after the great oil dynamic that, allowed the demarcation of the agrarian and urban structures and it contributed to the economic growth, of the public and private investment, of the immigration, the industrialization, the construction and the occupation of the urban centers.

To carry out the changes in the urban structure, the proyectual activity was aided by legal and technical mechanisms formulated inside the instances of the State. To value the participation of the professionals in the application of the knowledge to produce these changes on the base of the planning, of the formulation of norms and rules for the normalization in the execution of public works is the objective of this report.

The changes were gestated in the main urban centers of the country. However, the process of urban transformation of Caracas, when beginning the years fifty, was of space meaning. In the capital of Venezuela the most important migratory process in the country converged, providing symbol of prosperity, the concentration of the public powers in Caracas, transformed it into the scenario to rehearse the newest proposals in communication roads and to harbor the most modern buildings.

We will find a distancing with the traditional urban forms, of location of buildings that limited the alliances with the modernization, by means of the creation of commissions, the writing of technical norms and ordinances that directed the urban interventions, the construction of buildings and communication roads with the use of new techniques and

technology. Although this was a process that affected the main urban Venezuelans center notably, in this report, the same ones will be exemplified with some of the changes in the urban structure of Caracas, which have been considered as the most representative in the modernization of the city in Venezuela.

### **Toward the modernization of the city**

The urban characteristics of the main Venezuelan cities until the first years of the decade of the forty still showed inherited features of the XVIII and XIX centuries. Located constructions on an orthogonal layout that structured a low profile in the city, conformed by thin streets flanked by constructions that still maintained the windows and wooden bars with covered tile in slope. **Figure 1**

Due to the economic conditions and correlate of the modernization an intense constructive and urban activity was developed since 1946. The consolidation of a State structured nationally and the high revenues that were perceived by the exploitation of the oil, inside the frame of World War II, allowed a significant commercial exchange that articulated Venezuela with the world capitalist system. The modernization level was adjusted to the capacity of the State and of the growing private companies of materializing edilicias and urban proposals in the main capitals of the country.

The first changes were structured on the base of the construction of buildings of more than two floors of height answering to the vertiginous increase of ground prices; the gradual substitution of the residential use, which identified the urban centers, due to bureaucratic activities and third parties. That is to say, you began to predict the modern city to come.

The concretion of these changes took place on the base of the planning and of the formulation of legal instruments that directed the architectural and urban interventions of the city. Engineers and architects impatient for the modernization, found in the planning the way of solving the weaknesses that showed the execution of public works in the previous decades: the improvisation, the economic waste and some administrative incongruities in the grant of contracts.

The *Colegio de Ingenieros*, institution which had been founded in 1870, participated actively in the urban planning of the city, in its functions the direct inherency on the constructive activities was found. By the engineers and architects' initiative of The *Colegio de Ingenieros* the technical organisms that responded to the modernization process were created and they assisted part of the objectives proposed during Marco Pérez Jimenez's government: to build a (worthy, prosperous and strong) Venezuela and the (moral, material and their inhabitants' intellectual improvement. Martin. 1999)<sup>1</sup>

The State should legitimate the protagonism that characterized it since the ending of the XIX century in the coordination and administration of the national public works. In the first years of the decade of 1950 the only entity able to approach the physical transformation of the city was consolidated, which resulted in a decisive participation in the modernization of the academic institutions and of the organisms that form it.

Among these organisms we have the *Comisión Nacional de Vialidad* (1945) and the *Comisión Nacional de Urbanismo* (1946). Both commissions were integrated by the most important architects and engineers of the country, mean while the *Colegio de Ingenieros*

institutionally contributed for its creation. It is for this reason that the professionals and the organizations of the State were met in the first years of the decade of the fifty to project the changes in the urban structure of the city, by means of the rehearsal of the first practices of planning at a national level. The *Comisión Nacional de Urbanismo*<sup>2</sup>; dependable in his first years of operation of the *Ministerio de Obras Públicas*, had among its functions to organize, to control and to normalize the character of the metropolitan processes. The administrative legal instruments and regulation of the urban public and private developments were discussed<sup>3</sup>

The urban projects of the regions and populations of the country were carried out based on specific technical analysis which included the conditions of feasibility. At the same time, the ideology of forming urban developments in an isolated way was substituted by the planning that considered an urban conglomerate and (the different regions of the country like integral element as a whole. Martin. 1994)<sup>4</sup>.

Since 1950 the favorable economic conditions in which Venezuela was, allowed a great constructive unfolding in the main capitals of the country. The situation was comfortable as for the supply of machineries, equipment and materials on the part of United States; this way the most important public works at national level was possible.

The rehearsal of modern urban devices applied by engineers and architects can be exemplified in the urban transformations of the capital of Venezuela, Caracas. In the plan of public works of Pérez Jiménez the radical transformation of the image of the main Venezuelan cities and the consolidation of Caracas as modern capital of an emergent oil country was found.

Caracas was transforming since 1946. The lands that were part of the agricultural production were being occupied gradually for residential neighborhoods. Their characteristics that conferred the title of the "city of the red roofs" were disappearing to assume those characteristic of the "great city"<sup>5</sup>: (the City of the Red Roofs is today in the route of a great exodus. This humanity brings its own architecture. Perhaps tomorrow, some writer could be counted among its descendants. Sat down by the window he or she will contemplate the serene night, the wandering stars. The breeze will spread in his or her surrounding the secrets of the past; and moved by the fondness of the sky, for the memories of the missing gardens, maybe could write a beautiful book. Núñez. 1988)<sup>6</sup>

Without any doubt, Caracas began to turn out to be in its urban and architectural structures. Its population increased vertiginously, and due to this, it extended, in 1952, from 542 to 4.256 hectares. The city grew up with urbanizations and there were necessary urban general plans to connect the city through a designed vial infrastructure. The technical analyses that were carried out on Caracas were supported by the hiring in the *Comisión Nacional de Urbanismo* of Maurice Rotival and Francis Violich as foreign professionals with experience in formulation of instruments and urban normative of the Latin American cities and the architects and engineers Leopoldo Martínez Olavaria, Carlos Guinand, Carlos Raúl Villanueva, Cipriano Domínguez, Brown Edgar Stolk, Gustavo Ferrero Tamayo, Armando Vegas, Luis Malaussena, among others, as Venezuelan professionals experts on the characteristics and necessities of the city.

The modernization of the urban stuff deserved the demolition of a good number of inherited constructions of the colony and the XIX century, among them the reduced roads of

communication of the business district of the city together with some important constructions that flanked them. In this way buildings were disappearing such as the *Teatro Municipal*, the *Escuela de Chavéz*, the *Edificio Junín*, *La Casa de Miranda*, among many others. The streets which during the colony, were identified with the names of the episodes of the life, passion and death of Jesus Christ, harbored wall constructions and rafa, covered with tile that during the last third of the XIX century, were transforming to reflect an in agreement image with the political function, so the constructions of the colony that were not demolished, were this way covering of Gothic, neo-Gothic ornaments, neoclassicist, renaissance and eclectic versions.

In the modernization process the technical, technological unfolding and legal instruments for the transformations of the vial structure was developed to the interior of the *Comisión Nacional de Vialidad*. Its active participation in the urban matters reached its peak in the years fifty: to assist in a technical way the primitive situation in which were the communication roads, was one of its objectives: (to elaborate a general plan that includes highways, railroads, waterways, marine and air roads, of national, state and municipal character, keeping in mind the technical and economic and financial aspects, and closely coordinated with the development plans and development of the production and with the points of social and military views. Memoria del Ministerio de Obras Públicas. 1946)<sup>7</sup>

The Venezuelan vial system gives a balance at the present time of the significant progresses as a result of the modernization. The intention of facilitating the flow of the capitals during these years resulted in the application of the most advanced techniques for its realization on the part of the engineers. Result of these big operations of infrastructure vial is the *Autopista Regional del Centro*, the *Autopista Valencia-Puerto Cabello*, and the *Autopista Caracas-La Guaira*. In each one of them big earth movements were intended, the use of technical equipment as mechanical shovels, the application of the mathematical calculation on the geographical knowledge of the diverse sectors to allow a less outing and the use of minimum slopes. An entire technical and technological operation in the road projects was carried out on the part of Venezuelan engineers together with the participation of specialized foreign engineers.

For the first time, in Caracas, there were rehearsed the construction of freeways and big avenues as elements of quick traffic with which were granted characteristic of "great city", in correspondence with the consolidation of the automobile as a device of emblematic communication of the modern life in the country. There the professionals demonstrated their technical knowledge, of design, technical knowledge of calculation on the *Autopista del Este* (1951-1956), built in the periphery of the city in order to connect the business district of the city peripherally with the East part; in *Avenida Bolívar* (1953) that would have as primordial objective to connect the city center with the emergent residential areas located toward the east of the city and, later on, in the avenues *Urdaneta*, *Fuerzas Armadas*, *Sucre*, *San Martín* and *Nueva Granada* (1953-1959). These new roads were characterized by bifurcations in the ends with streets in diagonals, parallel and perpendicular, different levels separating circulations and circulation channels and return vials, among other urban elements. **Figures 2 and 3**

At the time that the traditional urban stuff was transformed the formulation of legal instruments accorded with the changes were concentered. These instruments were studied and approved by the commissions constituted for it inside the *Colegio de Ingenieros*. In these years this institution participated openly in matters of the national life.<sup>8</sup>

With the endorsement of the *Colegio* and the modernization of the organizational structures of the State, as the *Comisiones de Vialidad y Urbanismo*, the engineers and architects tried the most modern urban devices: they reconsidered the retirements of the constructions related to the axes of roads in proportional increase to the widths of these; new heights were established for the constructions and population's densities for square meters. As design strategy a system of use, a general plan and a zone for the main cities of the country was proposed; in the mean time, technical studies were carried out and the application of modern technologies, design methods and calculation for the construction, were considered.

Among these instruments one can find the elaboration of *Proyectos de Ordenanzas y Plano de Zonificación* for Caracas in 1951 and 1954, together with the *Plan Regulador*; the writing in 1953 of the first technical norms and regulations for the use of the armed concrete; the technical analysis in 1957 of low quality steel used in the constructions in Venezuela. That is to say that during the years fifty a technical and legal answer was given for the organization and the building of new constructions in the city with the purpose of representing the level wanted by the "*Nuevo Ideal Nacional*".

The formulation of the *Plan Regulador* of Caracas in 1951, elaborated by the *Comisión Nacional de Urbanismo*, is one of the proposals of engineers and architects which, after being approved, allowed representing in good part, the level of the "*Nuevo Ideal Nacional*". It was an instrument that though did not consider the social and productive rationality of the "great city" as the urban structure, it pretended to plan the urban thing starting from the technical description of the city. Uses of the floor, prices and type of property, population's forecast, programs of public and private investments, space distribution of activities and functions were constituted on the base to plan the Venezuelan capital in twelve communities ideally with sectored work places in certain areas, green and recreation areas, articulated by freeways, avenues and streets.

The *Plan Regulador*, the legal and technical instruments, had their effects in the lack of organization with which Caracas began to be formed such as a "great city." Certain contradictions among the different legal instruments, impacted in the lack of organization of the city. However, from the architectural point of view the possibility to build constructions of more than five floors of height, combining residential, commercial uses and services in a same group, particularizing the location of the buildings related to the orthogonal ways of the urban plot, opened the action scope in the elaboration of projects for the architects.

There are countless examples that the history of the architecture counts with in Venezuela among 1950 -1958. Nevertheless, in Caracas two icons of the architecture exist with which one can represent the process of city modernization, in the same ones the ideas of planning, the application of legal and technical instruments converge, while the newest technologies were used for their construction, they are the *Centro Simón Bolívar* and the *Ciudad Universitaria* de Caracas.

The architectural proposal of the *Centro Simón Bolívar* (1949-1952) like one of the symbols of the new modernized city, on the axis of the great *Avenida Bolívar*, conceived according to the proposal of the *Comisión Nacional de Urbanismo*. Several downtown squares were demolished for their construction since 1949. In this architectural urban complex there were combined administrative, commercial and services activities, without bigger considerations on the traditional reticular plot. The proposal contained underground roads that allow the communication among the off streets, on which two symmetrical towers

of up to 30 floors of height rest, where the practice of the most modern projection and calculation methods were rehearsed by the architect Cipriano Domínguez and a team of specialized engineers. **Figure 4**

To give a new urban structure to Caracas, according to the modernization of the country became the panacea of engineers and architects. The construction of the *Ciudad Universitaria* (1944-1958) by Carlos Raúl Villanueva is a statement of it. An audacious urban proposal in which a group of dispersed buildings on a great surface is articulated by a vial system and curved roofed corridors and built wavy armed and pre compressed concrete. The operation proyectual not only contemplate the use of materials and modern technologies, but also diverse devices of environmental conditioning even the convocation of diverse national artists and foreigners in order to implant sculpture and painting works in the urban group. **Figure 5**

### **Architects and engineers in the modernization**

The role of the engineers can be valued as decisive in the passage from the tradition to the modernization of the city. An ideology change among engineers and architects is evident in the decade of the fifty; they were able to stay active in an outstanding way in the architectural means. They expressed a masterful domain in the linguistic signs of the architecture of the XX century, in the use of materials, in the application of technical norms and regulations.

In the first three decades of the XX century the architecture had as responsibility to rescue the national identity and the presumption of ordering the society. The appraisal of elements of the colonial architecture given that consideration of this as revival, by means of the recurrent use of patios, corridors, arches, tile roofs and bars on windows were one of the recurrent characteristics. At the same time continuity was given to the characteristic eclecticism of the XIX century, using the elements according to the architectural typology, the neoclassicist was used this way in the constructions that should represent the power of the public institutions, elements of the medieval architecture in the military constructions, the neomorisco in some popular housings of the *El Conde* and *San Agustín* in Caracas, among some others.

Since the decade of the fifty the architecture was distanced from the codes with which could stay the harmony and the order of the previous traditional times. The metropolitan experience of unity of objects and anonymous production of buildings are ignored by the architects who state the necessity to demonstrate their responsibility in the projects these years.

Such a situation in the professional exercise of the architecture does not seem to be adjusted to the transition process in which the Venezuelan cities are in the modernization required of a dynamic in the edilicia production characterized by the production in masses industrialized with agile construction processes that allowed building the biggest number of works in the less possible time. However, in the years fifty, the architects affirm the avoiding of this dynamic to produce modern unique pieces.

Indifference was shown this way by the architectural legacy and the urban inheritance of the XVIII and XIX centuries and to preserve the identity of the urban centers. The engineers and architects assumed the role of interpreters of the modernization and of the

applications of the Venezuelan State, with the production of architecture with its own characteristic in one of the most important moments for the history of architecture and the urban thing in Venezuela.

The same architectural production of the architects Cipriano Domínguez (1904-1995) and Carlos Raúl Villanueva (1900-1975) show the incidence of the modernization in the activity proyectual and it can be exemplified with the characterization of the work of the architects Cipriano Domínguez and Carlos Raúl Villanueva. Domínguez, Doctor in Physical Sciences and Mathematics of the *Universidad Central de Venezuela* since 1928, he carried out post-grade studies in the Ecole Speciale d'Architectue up to 1933. In his first works he shows an approach to the use of the neocolonial and of the prehispanic one, mentioned in the building for the Passengers Terminal of San Antonio's Airport (1944) in Táchira State, the country property house with corridors. Villanueva, architect of the Ecole des Beaux-Art since 1928 rehearsed in 1945 in the urbanization *El Silencio*, the disposition of constructions around generous patios, while the front of the buildings were adapted to the neocoloniales codes: potbellied columns, arcades in the piazzas, portals in the main accesses, among other elements. **Figure 6**

The work of both architects shows the adaptation that is made of the transition from the tradition to the modernization. Producing an architecture able to interpret the socio-political and economic Venezuelan development, by means of the instrumental articulation of the functional with the artistic, they moved to the production of a representative architecture of the knowledge, singular characteristic, which were distanced from the rationality, the massive production of objects and the non identity with the traditional thing innate of the big cities.

The condition that Caracas experienced in the years fifty accused of the architectural unity as an answer to the technique and the distancing between the architect and the user of its productions. However, the architects persisted in the idea of producing buildings like the old artisan, that is to say, to stamp to the work a condition of singularity particularizing the way of producing it. For the German sociologist of the modernity Georg Simmel (1858-1918) in one of the most important rehearsals that treat the topic of the "great city", the man "reacts with his head, instead of doing it with the heart"<sup>9</sup>, the intellectual architect who develops his professional activity in the conformation of "the great Venezuelan city" shows the continuing reacting with the heart as long as non assimilation of the traffic from the tradition to the modernization of the city.

## **Conclusions**

The correlate between the modernization processes and the urban and architectural transformations is aided by the planning and the formulation of legal instruments as control mechanisms and normalization of the urban and architectural interventions of the Venezuelan cities. The years fifty were characterized by important changes in the social, economic, political and cultural structures, in this scenario of changes, the engineers and architects carried out their role as interpreters of the modernization in Venezuela. That is how starting from this role commissions were created where the most important urban projects and the architecture operations were gestated, impregnated in new techniques, materials and location ways, at the time that adjusted to the legal control mechanisms molded as alliances with the modernization.

Figure 1. Plane of Caracas, 1946

Figure 2. Plane of Caracas and its environs, 1954

The devaluation of the urban structures precedents to the XX century became evident in the use of modern urban devices as avenues and freeways that were articulated with the characteristics of a modern life. In addition, the architectural production became a vehicle which architects expressed new constructive forms, at the time that they demonstrated their capacity to produce pieces with heterogeneous architectural codes as long as their work was shown as exclusive product of each one of them, in a moment in which the accumulation and the industrialization did not maintain alliances with the "exclusivity."

<sup>5</sup>The term "great city" corresponds to the identification that is made of the city in constant transformations product of the dynamics far from the passive life, the traditions, and the customs. The changes are shown in different scales in the Venezuelan cities and they can never be comparable with the processes experienced in the big Capital. However, when in this work the "great city" is mentioned it refers to the urban space affected by the new structures that do not accept bucolic behaviors neither the actors' interventions that participate in it.

The Urbanization San Blas (1962-1967) is conceived under denomination of *Programa Experimental de Vivienda*. Organized by architect Henrique Hernández, the *Programa* designates to the first stage of a pilot program who reaches between 3,600 and 4,000 houses in three years for Valencia, Carabobo State Capital, Venezuela.<sup>2</sup> San Blas constitutes the realization of a project and construction model meritorious of being examined by the architectural transformations that it locks up. There are elevated near 450 units (of the 563 considered), with houses in bands of 1 and 2 plants and buildings of 4 plants. Diverse systems of prefabricated components are used to develop a peripheral land of about 87,800 square meters near the road distributor of San Blas in that city.

The *Unidad de Diseño en Avance*, the specialized one and just created technical office of the renewed *Banco Obrero* (the most important and significant institution on massive housing in Venezuela, founded in 1928) of beginnings of years 60, developed a singular process of design for the city-planning configuration of San Blas. It defined the “flexible constructive systems” (technical prefabricated of construction) and received a studied program of 294 apartments, 85 houses of one plant and 184 houses of two plants, numbers that went away fitting in the own experience. On that base it made volumetric models on scale of the constructions and a study scale model through which it tried different alternatives. The office was registering them photographically and once obtained the most adapted design to the objectives of the program, it came to elaborate the definitive planes on a suitable scale to the handling of the work.

It must stand out as much then that the urbanization is the product both of a work of technical rationalization of the massive house, as of a sociological investigation on identity and familiar diversity. This communication will critically approach this relation first describing the product of its application, that is to say, displaying to the urbanization in as much so, and, later, debating on its socio-political meaning in the scene of one decade of increasing urban life of the country, that is to say, discussing on the relation between society of masses and architectonic and city-planning technique.

### **1. A conjugation between constructive systems and socioeconomic information**

---

<sup>1</sup> This communication is based on the thesis of doctorate presented in the Facultad de Arquitectura y Urbanismo of the Universidad Central de Venezuela in 2005 on the part of the author.

<sup>2</sup> Valencia is one of the more important Venezuelan capitals. It initiates his economic height from the Forties. Such height counts on several impelling factors: a policy of municipal incentives from which several industrial zones are developed; the facility of communication with the most important markets of the country (Barquisimeto, for example); the neighborhoods with Puerto Cabello (the second port of the country), a petrochemical industry, a petroleum refinery, an enormous plant of electricity. It accompanies to these factors the growth of population and of commercial and bureaucratic activities in this capital.

The lot of San Blas, almost flat, is sectioned in six parts to organize the allocation of space to the six concurrent companies in the experiment. **(Figure 1)** A central street winds as axis of this lot in form of "L" dividing it in two, but uniting the sectors through six bifurcations that take to parking. Each part integrates single-family houses of one and two plants with multi-family house of four plants, to obtain a solution of intermediate density respect to the experiences previous of the *Banco Obrero*, that is to say, respect to the low density of the urbanizations of popular house of the decades of 1930 and 1940 and to the high density of the superblocks of the decade of 1950. It is a density that anticipates a well-known urban image in urbanizations for the middle-class of Caracas (for example the Urbanization Las Mercedes), where are combined villas and buildings of four plants to obtain an atmosphere of low density.

The first sector is constructed under the urgency that implied good part of the ordinary programs of the *Banco Obrero*, therefore does not have to surprise that it takes control of traditional techniques, that is to say, framed structure of concrete and closings of hollow clay blocks. It allows neutralizing the pressure that diverse critics exerted on *Diseño en Avance* about the relative slowness of their operations. In this first sector in addition green paths and areas for the circulation between the houses are used, a criterion that will be left because the same existence and the maintenance of such areas meant "a very great load for the Institute." (INAVI, 1988, p. 334) It was replaced by the criterion of increase de density and decreases the green areas.

In the second lot the first building erected in the country by means of a great panel designed between the company *Vivienda Venezolana* and *Diseño en Avance* is tried in Venezuela, the first structure of four floors prefabricated of concrete. Towards the gravity center of the lot constructors *Creamer y Denis* tries the system lift-slab erecting a prefabricated slab structure that rises by means of hydraulic cats, soon to use traditional elements of closing. To the front the company *Vivienda Venezolana* also tries a system of beams, columns and prefabricated slabs of two and four plants, the two variants of the defined one as System C, in the following buildings, whereas *Van-Dam* constructor develops the bended lamina system in houses of one and two floors. After the previous ones, the designers of San Blas, directed by the architect Alejandro Galbe, anticipate a space for the construction of a building of 7 floors, which was not gotten to erect, with base in the idea of the "house deep", that is to say, a minimum in front and extended towards its internal part.

Towards the South end a building is elevated whose structure was designed by Waclaw Zalewsky, a Polish engineer that works during the first years of *Diseño en Avance* making numerous proposals with base in a simultaneously "creative" and geometric conception and of the structural design.<sup>3</sup> The building of the fifth sector counts on structural elements whose dimensions are same of the closings, avoiding the problems of joint between structure and partition wall, but whose form in "T", of the C-7 System, means a structural capacity superior to the one of the conventional columns and beams.

In the development of San Blas the personnel of *Diseño en Avance*, doing pursuit of works and the production of components, introduces changes, new dimensions and improvements during the construction, although maintaining the principle basic that it governs them. In the case of the concrete systems adopted, it was necessary to mount factories of production of components prefabricated in the site of the construction.

---

<sup>3</sup> On the conception of the structural design of the Dr Zalewski, it sees: ZALEWSKI, Waclaw (1987), *Mecánica de las estructuras* (mimeo), Caracas. ZALEWSKI, W., *Cálculos versus diseño* (mimeo), s/p.

The four constructive systems that *Diseño en Avance* altogether with representatives of the producing companies develops for the experimental program of San Blas, are "flexible constructive systems". **(Figure 2)** Under this denomination it enunciates the possibility globally of including the constructive range of the popular house, being able to have the technical instruments by means of which to generalize the industrialization of the sector.

In that attempt of generalization the decomposition of the plot of relations of the sector plays a fundamental roll construction, whereas the successive logical resetting of the elements allows that architects and producers integrate themselves in "a teamwork where the cost goals, design and speed of production face of unitary form, instead of a series of isolated contributions". (Banco Obrero, 1964, s/p) *Diseño en Avance* supports the coordination of the diverse capacities and experiences of the members of such equipment, trying the correspondence between project and execution of the house, to the time that constructs the bases of the unification of the productive relations.

The will to dominate the massive construction of house through a plural but unified industrial development characterizes, then, the activity of *Diseño en Avance*. The *Programa Experimental de Vivienda* of 1963 reduces such plurality unified in the same systems, worked hard in obtaining the elementary and universal catalogue of the massive construction of house. Assigning letters to each one of the four constructive systems, A, B, C and D, the *Programa* contains different options (some already mentioned) that go from a construction based on walls of load and slabs prefabricated to another one of plates of concrete armed to cover extensive surfaces (the future lift-slab), passing through systems of columns and beams, ceilings and slabs as much in steel as in concrete. The different elements would be unified through the system of dimensional coordination, which is developed in parallelism to the accomplishment of the "opened constructive systems". Each system is put under aid between several concurrent companies, which are identified with a number that finally, when selecting itself one of them, it is added exactly corresponding and it serves as specific identification (A-3; B-7; etc.).

The System A is based "on the advantage of the walls like lifting elements." (Banco Obrero, 1963, p. 21) When being located peripherally in the house, they make possible certain inner flexibility, whereas the little constructive components of concrete, walls and prefabricated or constructed modular slabs in site, mobilized and mounted partitions, covers and complementary elements with the support of cranes, facilitate the use of the system for constructions of one, two (A-3 System, of the *Vacoven* company) and four plants (A-4 System, of the company *Vivienda Venezolana*). The principle of lifting walls finally will be extended for constructions between 9 and 15 floors (A-10 System, of *Técnica Constructora* Company) in the UD-7 of Caricuao developed between 1965 and 1975.

System B is developed from the conditioners that the structural steel offered by the metallurgical industry of the country raises, in order to the manufacture of easily manipulable light pieces. The supports are based on an angular or tubular element that is added when their loads require it, with beams welded and slabs elaborated from timbering of drained steel laminate and of concrete in site. Its most tried application received the name of System B-5, a modular system of steel used by the company *Talleres Metalúrgicos Van-Dam*, made in the enormous factory of La Victoria, near Valencia, with the consultant's office of Henrique Hernández and the architect Mariluz Bascones, who completed the system.

System C is based on the prefabrication and assembly of columns, beams, ceilings and slabs of concrete. Their variations are defined for houses of one, two plants and four plants (C-4 System, of the company *Vivienda Venezolana*) and for constructions of four plants with sup-

ports and beams in form of T (C-7 System, used by the company *Tuven C.A.* from the project of *Diseño en Avance* in which engineer Zalewsky worked).

Finally, System D is based on the use of a cover, under which several units of house are defined simultaneously, with the consequent diminution of costs that implies the elimination of individual ceilings for each house and the smaller amount of manual labour. In his development collaborates the architect Jorge Castillo but actually its contribution does not take shape and derives in the famous D-6 System (of the company *Creamer y Denis S.A.*), a mechanized technique called "lift-slab", which uses hydraulic cats that raise, through tubular steel columns which they serve as guide, great prefabricated plates. The system anticipated the drained one of the walls in concrete with foam through perforations left in the plates.

With the constructive experience of San Blas one begins in Venezuela, and Latin America, the use in great scale of systems industrialized in the massive production of houses on the part of the State. Several of these systems were used later of extensive way in the Urbanization the Isabelica, in Valencia, between 1965 and 1975.

The experimental program of *Diseño en Avance* generates an ample combinatorial synthesis of minimum spaces of the house and group of units in which a remarkable effort of evaluation of the use of the house constructed by the *Banco Obrero* in previous years converges, effort in which concurs the results and recommendations of the socioeconomic analysis of the institution *División de Programación*.

In the *Banco Obrero* of 1961 the institutional instruments of planning are reframed. Respect to the national economic objectives is acted thus to coordinate the work of the housing organism as much as the directed ones to elevate the social conditions of the Venezuelan population. Economic and social objectives constitutes a unit after whose profit one traditional informed expectation of elites is shown already, the one to make of the city and the architecture civilizing instruments. Consequently, the socioeconomic investigation is necessary within the *Banco Obrero*, in an operation that will be fundamental to try a management of the population in harmony with the readjustments that go ahead like capitalist development of the country.<sup>4</sup>

In fact, one of the dimensions of the approach of the *Banco Obrero* to the productive process of the massive house was defined as necessity to know the socioeconomic behaviour of the popular sectors that are going away to lodge in such house. That knowledge would sustain to the effective accomplishment of the more general policies of "social development" of the country. The popular housing planners would be helped by the disciplines of the economy and sociology, in a process in which the investigation is valorised like one of the most significant new features for those years.

Between 1961 and 1963, under the headquarters of the architect Alfredo Cilento, the *División de Programación* of the *Oficina de Programación y Presupuesto* (OPP) produces three im-

---

<sup>4</sup> From principles of the decade of 1940 indications of the allocation of an educative paper to the architecture of the *Banco Obrero* can be, specifically with the Reurbanización of El Silencio in Caracas. In the *Plan Nacional de Vivienda* of 1951 it has like basic instrument the work of the *Departamento de Investigaciones Sociales, Económicas y Tecnológicas* of the institution. Throughout the years that follow the dowry of house annual quotas to the cities of greater growth of population supposed one of the most significant entrepreneurs of the *Banco Obrero* from an educative point of view: "the importance of this work of the State through the *Banco Obrero* does not constitute only the capacity to equip from room to the greater possible number of Venezuelan families by means of the construction of houses or the granting of credit, but also in the parallel work of economic-social investigation in the field of the house. The massive construction, the simplification of the distribution, the elimination of the accessory in the home in favour of the essential in their construction, the education of the family by means of the practical demonstration, helps in the same sense that the monetary investment to the approach every greater time of the family of modest means to the obtaining of a house". (*Integral* N° 7, 1957, s/p).

portant reports on the problem of dwelling of Valencia. First of them it is the denominated *Valencia, Informe Preliminar* of 1961, whose methodology has in the statistic the most important tool of information collection, to the time that the quantification of items and percentage in tables is the base for the comparative analysis. One is a methodology that is applied both in remaining works, the *Informe General de Valencia* of 1963 and the *Programa de Viviendas para Valencia* of this same year. In the three reports they appear, with diverse levels of detail and cover, the analyses of population, economic activity (emphasizes the unfolded one like industrial work) and of the city next to the house, with estimations of the tendencies and projections in each area for the future Valencia. They are made by the sociologist Jaime Cornivelli, the economists Francisco Urdaneta and Emperatriz Gómez and architects Leonardo Hernández and Henrique Hernández. With them the state housing policy arranges, although without taking into account to that population like interlocutor of its own performance, of the basic information to incorporate to the Valencian popular masses within her, as well as to take part in the destiny of the same ones.

The team of programmers confronts phenomena whose reality can be questioned and that, in any case, are boarded with a dose of morality. It is the case of the increasing urban crowds that "is reflected in the physical aspect of the new zones of houses in bad conditions" (Banco Obrero, OPP, 1963, p. 17), crowds that lives in farms "accompanied by small *conucos*", which reveals his rural origin. **(Figure 3)** Before the rationally incomprehensible thing of that phenomenon, the team of programmers proposes a reception and direction of the farmers, to standardize them by means of an "induction" to the industrial Valencia, supporting the rehabilitation of the deteriorated areas and avoiding "the problem of the formation of anarchical districts by invasions." (Banco Obrero. OPP, 1963, p. 35)<sup>5</sup>

The study of conditions and characteristics of the population, made by the team of programmers, has as aim to establish the bases for the design of houses that would lodge such population. (Banco Obrero, OPP, Programa..., 1963, pp. 33-47) **(Figure 4)** The definition by a side of the types of house was in apartments and houses with or without possibilities from expansion. On the other hand, the classification of the families according to the entrance threw four great groups of such. The relation of the obtained data allowed to arrange in a picture summarize the essential information to the aims of architectonic design.

With such information a new tool of understanding of the population took shape, which corresponded to the idea of the variety of the "opened constructive systems" (or flexible), basing the one that will be the search of a culturally "specific image", rather picturesque, in the urban set of San Blas.

## **2, Technique and identity: the political and propagandistic roll of San Blas**

The conjugation (or synthesis) between rationalized techniques of construction and socioeconomic data of the examined population leads to that in the *Programa Experimental de Vivienda* of San Blas the result of the constructive investigation does not take until its last consequences.

---

<sup>5</sup> The diverse qualifications of the areas of farms of Valencia are accompanied of the calculation of their relative urban magnitude, settling down that for 1961 it before exceeds the double of the area occupied by the city ten years. Nevertheless, the *División* selectively operates when defining the addressees of the house that it programs: the "workers" of the "industry", who would lodge, according to a presidential recommendation of those years in the "working city". For other groups he suggests plans of reorientation of immigrations and remodeling of existing districts. But the resulting numbers of the calculation, 4,000 new houses between 1963 and 1966, sufficiently do not leave paid field to the justification of the possible industrialization of the massive house in "the working" Valencia. (Banco Obrero. OPP, 1963, p. 34).

It is certain that in San Blas the validation of the technique takes place in the land of the rationalization of the constructive work in as much technically supported. Often at the moment of the assembly, the solution of the unions of the components, including from prestressed beams of mooring to metallic pieces leaned to the prefabricated elements simply to weld them. Other times it is valued in the stage of the assembly, since impressive cranes facilitate the elevation of the pieces and the mobility of the same ones in the area of a construction. But it is a deepening in the technique that arrives until certain magnitude.

Also is verifiable that the considerations of *Diseño en Avance* on the work supported in the technique and the machines are diverse. Some cases contemplate the construction of pieces as process of their piling up on work foot, or anticipate the facility of manipulation of the components on the part of the workers. Inclusively it is gotten to take into account early the simplicity from manufacture from the same pieces and the relation between the elements required for his manufacture and the complexity from the component to prefabricate. Also the inclusion of the traditional construction is considered if the case requires manual labour of the place where the program takes place.

But the value of the final object (from the simple or complex component to the house) does not provide in dominant form the amount of work inverted in its construction. The value of products is rather, for *Diseño en Avance*, the capacity to give answer to an aspect of the programming, the particular family (or according to the "economic group"). Therefore, the destiny of the process of constructive work is the assembly in "a variety of forms so that they allow to the adjustment of different plants and sections" (Banco Obrero, OPP, Programa..., 1963, s/p), more than the rationality and the economy of this technical process referred back briefly. **(Figure 5)**

The constructive system, when considering as beginning of an assembly process whose nature assures the "variety" in the adjustment plants and sections of the constructions of house, means to introduce a contradictory mandate, no longer respect to the relation between project and construction, but between system and production. Indeed, the complications that generates an aim that tends to be distinguished between the diversity (the house unit) and a principle that aspires to being generalized between each constructive unit (the constructive type), implies to overvalue an abstract modular coordination over an effective repetition of the common thing between several.

The *Programa Experimental de Vivienda* of 1963 and the set of later versions of the same one, particularly the one of 1964, are exhausted then in demonstrating the high capacity of space cover of the four systems. Next to the description of each one of such and to the respective schemes of assembly, are inserted in the *Programa* of *Diseño en Avance* numerous graphical (plants, combinatorial schemes of areas and grouping of houses, examples of use, combinations of densities and volumetric variety) like wanting to demonstrate that the technique is still matter of living, that their consequences logics and the eagerness to give a content to the constructive elements are subsume in the intentionality of the designer.

The adaptability of the systems to the familiar diversity, on the one hand, and to the enterprise heterogeneity, on the other hand, would be in the base of progressively extended industrialization under open systems. In that adaptability the creator, the creative subject survives, that being architect, and as saying "I propose", he is responsible for the force of his thought and its creativity to the "social diversity" that defies it and demands it. Mythical diversity, nevertheless, every time in the great city the multiplication on great scale of the specificities constitutes an unsuspected and extraordinary social homogeneity.

But in addition it can admit that the *Programa Experimental de Vivienda* of 1963 constitutes a technical instrument whose meaning is above of the task of defence of the creative architect (the artist) who underlies in all the operation that synthesizes the writing, since in him decants several processes and searches: among them, on the one hand, the crisis of identity of the later *Banco Obrero* to 1958; on the other hand, the "social mission" of the institution that was intuited from 1958; but also other flanks like the one of the diverse indications of specific studies to articulate the massive construction from house to the economic development planned and to make correspond characteristic of the inhabitants and space configurations; correlatively to this, the comparative calculations of the program of houses of the *División de Programación*; but also the notion of the "working city" that in 1962 president Rómulo Betancourt idealize constructed next to the "great industrial zone" of Valencia.

The *Programa Experimental de Vivienda* is an instrument that is constructed, then, from a diversity of forces, without a doubt, between which there are to count in the fundamental thing with that it is called on directly to the idea to recognize the "variety" of the urban crowd through few space combinations. Like it was anticipated, is a potentially conflicting crowd indeed in his diversity of interests, "cultures", of origins, etc., in addition politically manageable. To gather it, to understand it, to do it "one", like a harmonic totality, unit agreed through the architecture, constitute one of the fundamental meanings of the *Programa*. The interesting thing of this characteristic is that it reaffirms to the architecture like object, and not like subject, of the socioeconomic planning.

The *Programa*, therefore, stipulates a technique that includes in a system the variety of private construction companies and the "flexible constructive systems" that it impelled, as much as the project activity of the members of *Diseño en Avance*. But also it made system to the unconformity (if not exasperation) that represented, on the one hand, the "different" adjustments of the plant of the unit of house and the bands of groupings and, on the other hand, the "planimetric and volumetric alternatives" put under on approval to give form to the "high density with low height" urbanism of San Blas.

San Blas, the urbanization of the *Programa Experimental de Vivienda*, tries therefore an urban calm that already seems excluded from the Valencia in growth of first half of the Sixties. **(Figure 6)** It's there present the unit between art and industry and between art and daily life that they persecute, from William Morris, several architects of the called Modern Movement.

The atmosphere in certain bucolic degree is able, when finally the development of San Blas is finished towards 1967, by means of attempts to conform warm spaces of transition, that is to say, small seats for the neighbourhoods meeting, scattered paths and foliage-like strolls in the set, like relaxed ambient. Also through varied housing volumes and types, in short, diverse figurative resources that evoke the domestic thing and the harmonious thing of this dwelling. The architecture and the urban set artistically rose would contribute in the old ethical mission, architectonically assumed, of the social reform.

Also it is an atmosphere product of an arrangement of the set in form of windily route. Throughout that route are opened surprising perspectives and vegetal masses of different species, conforming a stimulating passage that fights to compensate, through those "emotional tracks", challenged monotony of the technique exhibited in the simple architectonic volumes and of the own existence of the nomad and uprooted metropolitan worker.

With the relation between constructive technique and organizational schemes of the space of the house and the urban set of the experimental program, Henrique Hernández and *Diseño en Avance*, maintaining active the work of operative analysis, although until an elementary degree, makes specific architecture like instrument of socioeconomic knowledge. This architec-

ture defines the base of an integration structure, in other words, of a fundamental tool of continuation of the management of the popular sectors by means of "a modern" architecture in its codes but not "international" like the one of the previous perezjimenista regime. Since one has treated previously, that governmental roll in as much so already was announced in the conclusions of the works of the *División de Programación*, attributing almost exclusively an educative paper to the disciplines of urbanism and the architecture. With the *Programa Experimental de Vivienda* such unifying and managing roll, that operates to neutralize the processes of socioeconomic disintegration generated by the growth of cities like Valencia, took control systematic technique towards 1963.

For that reason in the *Diseño en Avance* office the technological diversity is considered like line of work proposed by architects, but mainly like line required of publicity and acceptance through its capacity to conciliate itself in the design of the set. From this point of view, it would be necessary to observe the experience of San Blas from the considerations that historian of architecture Manfredo Tafuri does to the experimental set of the Weissenhofsiedlung of 1927 in Stuttgart, "a collage of single-family dwelling types [...] a propaganda display of the new architecture, without a doubt effective" (Tafuri-Dal Co, 1986, p. 161), although without the organic conception that had exhibited masterful Germans as Ernst May and Martin Wagner in their siedlungen of years 20. If it is taken into account, since it were made above, than the feasibility of the proposals of use of industrialized systems is not sufficiently favourable, it does not seem dangerous to raise the hypothesis that *Diseño en Avance* strives in developing the set of San Blas thinking about the public and demonstrative effect that would have the same one.

It could be admitted, then, that *Diseño en Avance* tries in the project of San Blas "the organic" instruments of artistic possession of the technique, treating to also hit on the public opinion and professional, often adverse to the technology by those years.

By the others, the possibilities of survival on the attempt of technological renovation of the massive construction of houses more and more were reduced, been account that the entrepreneurs did not accept it because it implied discharges investments. Some labour unions were against because it did not imply a sufficient use of manual labour, whereas in the high government the problem of unemployment and the objective to neutralize the confliction assured a "low profile" to industrialization the construction. Alfredo Cilento remembers that towards 1965 Leopoldo Martínez Olavarría, the great defender and propellant of the test of *Diseño en Avance*, recommended to study thoroughly and to try the first new schemes before trying to impose them generically, without a doubt, all a realistic suggestion before the pompous voices that the prefabrication generated.

The possibilities that formulate San Blas, then, become involved in a complex game of situations that go from the agreements that the definitive formulation of a national policy of 1965 house imposes until the internal problems to the own production of the massive house.

## **Conclusion**

San Blas, the most remarkable test of architectonic vanguard in the matter of massive house in the Venezuela of century XX, constitutes in any case the scene of an intense confrontation between the subjects of the amount and the quality, the technique and the identity.

On the one hand, the experimental program of San Blas confronts the subject of the architecture understood like "object", like material totality that absorbs qualities architectonic that make unique piece. It confronts it when evaluating in terms of costs, productive efficiency and flexibility this object, inclusively typified. Then taking position facing the subject of the "amount", that is to say, operates on the productive processes and the relations of production,

on the "productive technique" by means of which to unfold the massive construction of house.

On the other hand, the experimental program represents a modernization of forms and codes of the popular construction, of a way related to the processes of adjustment of the modern architecture to particular national characteristics that come being developed from years 50 in diverse countries. That is to say, tries a conciliation between the practice of "an own" architecture and languages tie to the technique. The architectonic searches unfold by the route of the popular character, that is to say, of the image that can serve as communicative structure for inhabitants who must be educated and activities in the metropolitan Valencia. For that it's recurred to the free joint of the space, with the consequent kinships respect to the "poetic of the green" and the Anglo-Saxon design.

The Urbanization San Blas, the most important work of *Diseño en Avance*, can be designated like technical episode without devaluation, like negative thought in crisis, but also in fact like technical optimism that does not get to conjugate respect to the conditions that tries to improve.

Tourism is a significant activity in a number of cities and its importance is likely to grow in the future. A large number of cities which have become tourist destinations attract tourists with their rich, unique, and culturally diverse townscapes as well as their settings in a natural landscape. A unique urban landscape is the result of the weaving together of topography, architecture, the arrangement of streets, urban spaces, and vistas. Architecturally significant buildings, landmarks, and areas with a distinctive character or history create 'a sense of place' which makes a city memorable (Law 1993, 1996). Christian Norberg (1979) uses 'the genius loci', an ancient Roman term, to describe a 'sense of place.' This concept still remains important in the design and management of cities and regions.

Creating a sense of place is an important component of architecture and urban design and it plays a key role in developing urban tourism. Unless planners understand the various ingredients which come together to provide the essence of a place, they cannot modify it without risking the destruction of its valuable characteristics. Haywood (1992: 17) and Mehrhoff (1999: 61) suggest that tourism planners and city planners need to become familiar with the aesthetic aspect of cities in terms of sense of place, social setting, and visual identity. There is need to expand tourism research in the area of landscape assessment, aesthetics, attractiveness and quality of cities.

The relationship between tourism and the physical environment has been recognized by tourism planners worldwide. Many world renowned cities, such as Salzburg in Germany, Innsbruck in Austria, and Banff in Canada are widely acclaimed and popular among tourists for their physical setting and townscape quality. In the words of Tringano (1984:20), 'tourism and environment are inseparable.' Thus, environment, which attracts tourists, needs to be protected. This study of townscape character deals with the urban environment which consists of both the cultural and natural elements of the city. The cultural landscape which include landmarks, unique historic buildings, and public spaces form the backbone of the urban fabric. Lynch (1996) identified landmarks as important features of cities. They provide them with visual identity. They can be described as the urban signatures by which cities are remembered. The natural environment may include the topographic character, wooded areas or water bodies. Natural settings provide a backdrop for the city and play an important role in lending character to well known cities. Krippendorf (1997) clearly articulated that urban and natural landscape quality are the capital in tourism and so must be managed properly. Tourism planners need to realize that it is the quality

of the urban environment which attracts tourists. The lack of planning and management of the urban landscape will result not only in loss of visual aesthetics but also environmental degradation which may cause natural disaster and safety concerns.

In the past many researchers such as Kavallins and Pizam (1994), Canesday and Zeiger (1991), Lawson, et al.(1998), Jurowski, et al. (1997), Ryan, et al.(1998), Allen, et al.(1988) and others have conducted a number of studies in the areas of perception and attitudes of residents and tourists. These studies have examined issues of tourism, recreational development, and tourist destinations in terms of the social, economic and environmental impacts. Both Page (1995) and Law (1996) pinpoint that little has been done to examine urban tourism in terms of the visual image of urban tourist destinations.

Law (1993) and Gunn (1994) suggest that in order to create successful economic development and tourism strategies, the visual aspect of urban tourist destinations must be addressed. The study is important because in recent times, cities in North America have started to look alike thus losing their visual identity. Building facades are standardized and have become homogenous. This is evident in the downtowns of many small towns in Canada and the United States. They have recently experienced a decline in economic health and a degradation of physical conditions.

This is because they failed to adapt to a changing lifestyle. For example, downtowns in small towns upgrade their facilities after the arrival of malls in the surrounding areas but by then it is too late since people have already become used to a new style of shopping.

The cities are dominated by traffic even in smaller communities, and safe pedestrian environment is the thing of the past. This study attempts to fill in this gap in the existing literature by dealing with issues of the urban image; how the city is perceived by tourists and its residents. This research provides tourism planners and city planners with an insight into the way people perceive the built environment in which they live or visit. The results of this study provide important information for the improvement and management of townscape character based on residents' and tourists' perception of the city.

The study has three objectives. First, it examines the townscape character of the downtown of Niagara-on-the-Lake in terms of resident and tourist perception. Secondly, it compares and contrasts residents' perception of the downtown with that of the tourists'. The third objective looks at the forces which attract the tourist influx into the downtown. The results of the study explain why tourists are attracted to this particular town and discuss the factors which make it unique and successful as a tourist destination. Lessons learned from this small town can be applied to a number of towns of similar size across North America.

## **THE SITE DESCRIPTION**

This study explores the city of Niagara-On-the-Lake focusing on its downtown. Niagara-on-the-Lake, a small town located in Ontario, Canada has a population of approximately 14,000. It is a popular tourist destination attracting about 3.5 million tourists all year round. The town has a number of unique buildings in the Georgian and Victorian architectural styles, a waterfront park, grape orchards, and wineries.

### **Niagara-on-the-Lake: unique building facades.**

Tourists come to Niagara-on-the-Lake to experience its beautiful parks and re-created eighteenth and nineteenth century building facades, and historic sites. The town houses public and private art galleries, world renowned theaters, museums, and public parks and playgrounds. The town has been named “the prettiest town in Ontario” in 1995-1996 among towns of similar population.

### **METHODOLOGY**

A questionnaire based survey was administered at the site during the summer of 2004. Forty tourists and forty residents were interviewed face-to-face in the downtown area of Niagara-on-the-Lake. Personal interviews were considered the most effective and reliable means of data gathering. Going to the homes of residents to conduct interviews was difficult and time consuming. The idea of a mail survey was discarded because people may have problem with understanding some of the terminology and may need clarification. In addition, the mail is also slow and unreliable.

Data collection from tourists was problematic. The attempt was made to conduct face to face interviews at some hotels, but hotel administration was not cooperative. They refused to allow surveys to be conducted on their premises. As a result interviews had to be conducted on the site in the downtown area.

The downtown area was selected because it is a major activity area in the town. The area consists of fine restaurants and shops, which sells specialty items of the region. A good mix of residents and tourists from all over the town are represented daily. The interviews were conducted over a period of two weeks from Monday to Friday, from the middle to the end of July. This is the peak tourist season and many families from the different parts of Canada and the United States can be found. The sample included those residents older than twenty years of age and who were residing in Niagara-on-the-Lake for at least five years. Also only one person per household was eligible to participate in the survey. The five year residential requirement was included to ensure respondents' familiarity with the town. The tourist population was defined as all those who were not native to the city of Niagara-on-the-Lake.

The questions were based on the information derived from informal meetings with residents and tourists as well as from personal observations of the city. The questionnaire was divided into three sections. The first section contained questions pertaining to demographic information such as age, place of residence, and profession, and was identical for both target groups. The second section of the questionnaire contained questions targeted to each group. Residents were asked about their length of residence in the town and about their satisfaction with it. Tourists were questioned about their reasons for visiting Niagara-on-the-Lake, their accommodation, their place of residence, and vacation period. They were also asked what makes a town attractive to visitors.

The majority of the questions were close-ended since many of them entailed a comparison between the two groups: residents and tourists. Although Pearce et al. (1996) suggest the use of open-ended questions in social impact tourism research, Tomljenovic and Faulkner (2000) have convincingly questioned this approach where the research objective is to compare and contrast two target groups. At the end of the questionnaire, an open-ended question was included to allow residents and tourists the opportunity to add any observation from their own personal experience of the city. The questionnaire was pilot tested for clarity with fifteen residents and fifteen tourists. The majority of the questions were found to be clear and responses showed that both groups had no difficulty in answering them.

## **ANALYSIS AND DISCUSSION**

Data from the survey was analyzed and age was classified into three categories: the first, between 20 and 30; the second, between 40 and 50, and the third over 50 years old. Data compilation shows that 20 % of the residents interviewed for the study and 26% of the tourists were between the ages of 20 and 30. In the 30-40 age group, 38% residents and 20 % tourists were surveyed, and lastly 42% residents and 54% tourists interviewed were over 50 years old (Table 1). This selected sample of residents and tourists represented a wide range of occupations which included military personnel, health care professionals, educators, businessmen, students, factory workers, and taxi drivers.

**Table 1: Age Structure of Residents and Tourists:**

Age Categories	Residents	Tourists
20-30	20%	26%
30-40	38%	20%
50+	42%	54%

Fifty percent of the residents who were questioned were born in Niagara-on-the-Lake and have lived there all their lives. When residents were asked whether they liked living in Niagara-on-the-Lake, eighty percent responded that they were satisfied with living in the town. They stated that they enjoyed living in the town which they described as beautiful, quiet, safe, and pollution free as opposed to the hustle and bustle of big Canadian cities. The remaining twenty percent of the residents said that Niagara-on-the-Lake was unexciting and would like to move to a bigger city in the future. When asked about the influx of tourists to Niagara-On-the-Lake, 54% of the residents had a strong positive attitude and felt that tourism should be further encouraged.

Twenty six percent were somewhat positive while the remaining 20% had a negative attitude and did not think tourism should be encouraged. In response to the question of tourism impact, eighty percent residents strongly agreed that tourism is making positive impact on the city of Niagara-on-the-Lake in terms of economics. Ten percent somewhat agreed and the remaining ten percent did not agree at all; they complained about traffic congestion and parking, especially in the downtown area.

Forty percent of the tourists were from the United States vacationing in Canada, fifty five percent from the surrounding communities of Ontario which included Toronto, St. Catherine, Hamilton, Burlington, Guelph, and Oakville. Five percent were from outside North America from the United Kingdom and the Caribbean. Sixty percent of the tourists visited Niagara-on-the-Lake on more than one occasion.

In order to examine what tourists look for when they were deciding to visit Niagara on-the-Lake, a number of choices were given and respondents were asked to select as many as they wanted (Table 2). Ninety percent tourists indicated that there was a sense of safety in this area. This was especially expressed by tourists from the United States. They said that it was safe to walk around not only during day but also at night time. The city has good maintenance and cleanliness; both of these are important components for security. For fifty eight percent of tourists surveyed, location and accessibility was an important factor. Location and accessibility can be defined as a measure of how easy it is to reach the place of destination. Niagara- on- the-Lake is well connected with Toronto, Ontario and Buffalo, New York. By car it can be reached within two to three hours from both these cities which are serviced by major national and international airports.

Fifty four percent tourists responded that they came to Niagara-on-the-Lake because of its affordability. This was expressed by American tourists who indicated that because of the exchange rate, the American dollar had more buying power. Sixty two percent responded that they came here for a number of tourist attractions located in the vicinity. For example, the world famous Niagara Falls is located in close proximity; it is only about a twenty minute drive away, along the Niagara Parkway. There are also many historical sites in the area. Eighty five percent of the tourists surveyed came here because of the uniqueness of this town and its surrounding area. Almost all the tourists commented that their reason for visiting was because it is a very charming town with beautiful historic buildings, parks and pretty flowers everywhere. Eighty percent of the respondents selected this town for its beautiful landscaping and scenery, for fifty two, percent upkeep and maintenance was an important factor in choosing this town. Many of the tourists who responded to upkeep and maintenance had visited this town before. Fifty percent said that they selected Niagara-on-the-Lake because of the fine restaurants in the area; these respondents had previously visited the town.

**Table 2: Tourists’ Reasons for selecting Niagara-On-the-Lake as a Tourist Destination**

Criteria	Percentages
Safety	90%
Location & Accessibility	58%
Affordability	54%
Tourist Attractions	62%

Uniqueness	85%
Landscaping/Scenery	80%
Upkeep/Maintenance	52%
Area Restaurants	50%

Eighty percent of the tourists surveyed said that they would definitely return to Niagara-on-the-Lake. The other twenty percent responded that they would like to visit some other new destination. Ninety percent of the tourists stayed in hotels while the remaining ten percent stayed with their relatives and friends living in the area. On the average, visitors spent between three to five days.

**Table 3: What makes a tourist town more attractive?**

Criteria	Residents (response %)	Tourists (response)
Safety	90%	100%
Pedestrian environment	80%	80%
Well Lighted Streets	90%	90%
Friendly environment	60%	75%
Uniqueness of the area	90%	95%
Opportunities for Activities	50%	80%
Social and Cultural diversity	55%	70%
Parking facilities	70%	100%
Festivals and attractions	80%	100%
Affordability	60%	80%

In order to examine what factors make a tourist town more attractive, residents and tourists were both given a number of choices and were asked to select as many as they wanted. Their responses are summarized in Table 3. For ninety percent of the surveyed residents and one hundred percent of the tourists, safety was a prime important factor. They were asked to explain what safety meant to them. They expressed it as a crime and drug free urban environment where they can walk freely during the day as well as night time. For eighty percent of residents and eighty percent of tourists a pedestrian environment was found to be important. They expressed that they did not believe that traffic should be totally discarded throughout the town – but the built up environment should be made safe. Well lit streets were found to be important for ninety percent of residents and ninety percent of tourists. Well lit streets and public spaces also cater to improving a sense of security. Although traffic is allowed on the main street of Niagara-on-the-Lake very attractive street walkways and crosswalks are also provided. Traffic moves very slowly through the downtown where tourists spend much of their time.

### **Niagara-on-the-Lake: well maintained landscape.**

In response to the importance of the friendliness of people in making a town an attractive tourist destination, sixty percent residents and seventy percent tourists thought this was important. A number of comfortable sitting benches are provided on the main street where people can not only sit but can also look at unfolding drama of social life on the street. Ninety percent of residents and ninety five percent tourists responded positively to the importance of uniqueness of the town and its surrounding area. They stated that this was an important factor in making a town a major tourist destination. Tourists described Niagara-on-the Lake as a very unique and picturesque town in terms of its historic buildings and landscaping. Both residents and tourists agreed that Niagara-on-the- Lake has a sense of place. Nasar (1998, pp.62-73) has identified five sets of broad urban criteria which are preferred by people in general. They include: naturalness, upkeep, open spaces and defined spaces, historical significance/content, and order. As most of tourists spend much of their time on the main street in the downtown of Niagara-on- the Lake, this street is an important part of pedestrian movement circulation area for both residents and tourists. It provides a visually rich experience to its residents and tourists. The main street importance of movement system in the planning and designing of cities has been emphasized by Cullen (1961) and Bacon (1976).

The public space movement network of Niagara-on-the Lake creates a series of townscape effects, such as, changing view and vistas, the interplay of landmarks, and open spaces. In terms of Gordon Cullen when a pedestrian moves through this environment a visual drama which results from the weaving together of urban elements, such as buildings, open spaces, trees, advertisement signs, and streets, is unfolded .

Fifty percent of residents and eighty percent of residents thought that opportunities for activities are important. The town provides a number of activities in this area. They include attending the Shaw festival theater. This is the only theater in the world which specializes in plays written by Bernard Shaw and his contemporaries (1856-1950). Some of the other exciting activities mentioned by tourists include Whirlpool Jet Boat Tours which are held about half mile below Niagara Falls. Fort George is another well known historic site of the battle of 1812 where visitors

can experience soldiers' barracks. Beside these, tourists can also take a wine tasting tour of the wineries of the Niagara-on-the-Lake which are open seven days a week. Many visitors also visit the Niagara Historic Society & Museum, The Court House, Brock's Monument, Mackenzie Heritage Printery, the Newspaper Museum, and the floral clock which is maintained by Ontario Hydro. In response to the importance of the social and cultural diversity dimension, fifty five percent residents and seventy percent tourists responded positively. The town draws people from not only surrounding communities of Ontario, but also other parts of Canada, Europe as well as the United States of America. Many annual festivals and parades which are celebrated in the area also draw a large number of tourists.

The importance of ample parking was emphasized by seventy percent of residents and one hundred percent tourists. Many tourists complained about the shortage of parking. Sixty percent of residents and one hundred percent of the tourists thought festival celebrations and tourist attractions help in attracting visitors and it also helps the local economy. For sixty percent of residents and eighty percent of tourists affordability is an important factor. Both groups said that hotels, motels, and bed and breakfast places should provide a wide range of options to tourists.

## **CONCLUSION**

The paper met its first objective by concluding that a sense of safety, a sense of place, and landscaping as the most important ingredients for the selection of Niagara –on –the-Lake as a popular tourist destination. The town has a visual identity which creates an everlasting memorable experience for tourists and a sense of civic pride for residents. Other factors included area restaurants and tourist attractions in and around the town. Location and easy accessibility were also very important for making Niagara–on-the-Lake a popular choice for tourists. It is well connected in terms of transportation to the major urban centers of Toronto and New York City.

The paper met its second objective by comparing the perception of residents and tourists in order to understand what makes a tourist town more attractive. The most important factors were found to be a sense of safety, a pedestrian friendly environment, well lit streets, and the uniqueness of the area. The first three factors are related to each other. For tourists, a sense of place or the character and uniqueness of the area was emphasized as an important factor in attracting visitors to a town. For tourists who drove their vehicles, parking was found to be critical. Many tourists came to Niagara –on-the-Lake for the festivals and the tourist attractions. For American tourists it was affordable because of the strong American dollar against the local Canadian currency.

The paper met its third objective by concluding that a sense of safety, a sense of place, and accessibility were found to be very important in developing a town as a major tourist destination. Niagara on the Lake has an excellent location. It is easily accessible to Canadian as well as American tourists. Many small towns throughout North America lack a sense of place. They have no visual identity; they all look same, if you have seen one you have seen all. They do not create any memorable image in the minds of visitors. Planners and designers can learn from this study that every small town has unique features which set it apart from all others. These unique features include the existing historic fabric, the natural environment, manmade features or community activities. Historic fabric reflects a community's past and its heritage; the natural

environment includes the topography and water features; and community activities include farmers' markets, sidewalk sales, festivals, and parades. These unique features should form the basis to build upon a sense of place. Decorative design or a quick fix lipstick approach can fade easily but revitalization based on unique features achieves long term results.

It is important to remember that “flashy new trends” in art and architecture generally appeal to a small segment of society and is transient. The image of a town should be based on a consensus of both residents and tourists who experience it either by living or visiting it. Research done in the past shows that aesthetics or the appearance of the physical environment is less qualitative and subjective than many people think (Nasar, 1998). If planners and designers want to create a successful tourist destination, they must address the issue of distinct visual identity. Towns should be planned safe for all age groups and attractive for pedestrians, cyclists, and cars. Planners must understand the relationship between people and the physical environment. There should be a holistic approach to the planning and designing of towns in which building fabric, street network, landscaping, and street furniture should be treated as equally important in designing, creating or strengthening a sense of place. A sense of place, a sense of safety, and ease of accessibility can create a successful tourist destination; they lead to the power of place

## 1. INTRODUCTION

With the rapid growth of urban spaces, concerns over the ‘sustainability’ of a city-as applied to development, societies, and livelihoods-has become an increasingly essential objective for most countries over the past two decades. Most countries, including Japan, have recognized the importance of sustainability and have established numerous plans and regulations to ensure the sustainability of their cities. Of these plans, urban open space<sup>1</sup> plans have played an important role in achieving long-term sustainability in terms of the environment, aesthetics, recreation, and the economy, as urban open space, which provides opportunities for recreation, rejuvenation, and restoration, is a vital resource for all communities, especially for densely populated cities. In Tokyo, one of the most densely populated cities in the world, urban open space is now seen as a cornerstone of building a sustainable society.

Until recently, cities’ sustainability or regeneration strategies have mainly focused on the man-made built environment, as the concept of ‘sustainability of a city’ originated from the concept of ‘sustainable development,’ and little attention was paid to the natural components and open spaces of the urban structure. In addition to the fact that the concept of ‘sustainable development’ has reached a dead end<sup>2</sup>, urban open spaces are strategically important for the sustainability of our increasingly urbanized society in cities such as Tokyo<sup>3</sup>. Numerous empirical studies have indicated that the presence of natural assets and components, i.e., open spaces such as green belts, trees, and water in an urban context, contributes to the sustainability of a city in many ways. Urban open spaces not only provide essential environmental functions such as air and water purification, noise reduction, and microclimate

---

<sup>1</sup> The use of the term ‘open space’ started from the enactment of the Open Spaces Act 1906, which provided a definition of ‘open space’ which referred to, “...land...enclosed or not, on which there are no buildings or of which not more than one twentieth part is covered with buildings, and the whole or remainder of which is laid out as garden or is used for purposes of recreation, or lies waste or unoccupied”. In general, open space indicates undeveloped land or common areas in a planned community reserved for parks, walking paths or other natural uses.

<sup>2</sup> Christopher S. Sneddon (2000), p.524

<sup>3</sup> According to the World Urbanization Prospect, Tokyo has the highest population of any city in the world.

stabilization, but they also provide social and psychological functions that are crucially significant for the sustainability of modern high-density cities and the well-being of residents.

In the light of the above, the aim of the present paper is to verify the condition of urban open spaces in Tokyo, whether to satisfy basic criteria suggested through this study, in terms of creating a sustainable city. This aim is achieved by examining comprehensive conceptual frameworks and the present situation of open-space plans for Tokyo, focusing on central areas in Tokyo. In this manner, where urban open spaces should head for to achieve sustainability of a high-density city will be suggested, by regarding them as providers of social and psychological services that are essential to the quality of human life, which in turn is a key component of sustainability<sup>4</sup>.

## **2. SUSTAINABILITY**

In this section, the concept and characteristics of sustainability are briefly stated. In addition, criteria for sustainability are categorized via a review of recent studies, as criteria for sustainability are needed to make the complexity of sustainability more understandable when evaluating the accomplishments of sustainability in a city. Sustainability is then considered with regard to urban open spaces, and criteria are reselected to evaluate the sustainability of urban open spaces in Tokyo in terms of the criteria identified previously.

### **2.1 Concept of sustainability**

From late in the 20<sup>th</sup> century, city planning has turned its focus from economic development and industrial progress to environmental sustainability. Especially following the 1987 Brundtland Report and the 1992 Conference of Rio de Janeiro held by UNCED (United Nations Conference on Environment and Development), policies on the environment have considered visions of the future as well as present issues. In here, ‘sustainability’ is a systemic concept, relating to the continuity of economic, social and environmental aspects of human society, as well as the non-human environment. It is intended to be a means of configuring civilization and human activity so that society, its members and its economies are able to meet their needs and express their greatest potential in the present, while preserving biodiversity and natural ecosystems, and planning and acting for the ability to maintain these ideals in a very long term<sup>5</sup>.

The concept of sustainability originated from the idea of sustainable development, which some consider to be closely connected to ‘unceasing development’ and as such should be limited only to the field of development. Ongoing sustainable development is of course essential to complete a city in which to live, work, and play, but the location, composition,

---

<sup>4</sup> Prescott-Allen (1991)

<sup>5</sup> From Wikipedia, the free encyclopedia

density, and design of new development projects can have an immense and cumulative impact on a city in many negative ways in addition to positive impacts; consequently, some people prefer to use the term sustainability as an umbrella term. The term sustainability can also be defined as a focus on environmental protection in order to achieve well-being and the enjoyment of a high quality of life. Despite these differences in definition, the following common principles are embedded in the concept of achieving sustainability and sustainable development<sup>6</sup>: dealing cautiously with risk, uncertainty, and irreversibility; ensuring appropriate valuation, appreciation, and restoration of nature; integration of environmental, social, and economic goals in policies and activities; equal opportunity and community participation/sustainable community; conservation of biodiversity and ecological integrity; ensuring inter-generational equity; recognizing the global dimension to our lives; a commitment to best practice; no net loss of human capital or natural capital; the principle of continuous improvement; and the need for good governance.

## 2.2 Criteria for sustainability

To date, city developers and their consultants have endeavored to determine the adequate sustainability criteria to ensure that development projects are sustainable; however, following the establishment of the 1992 Local Agenda 21, there have been increasing problems associated with the opinion that the sustainability metric and established criteria do not consider sufficiently diverse opinions, do not consider fundamental functions, and are subdivided into too many indices<sup>7</sup>.

In addition, in response to consultations on Local Agenda 21 or government guidelines, cities have already been developing their own sustainability criteria to evaluate quality of life. For example, the Japanese Ministry of Land, Infrastructure and Transport established principles for river water in March 2006 to preserve the natural environment and maintain human living conditions. However, there are some criteria that need to be assessed with considerable forethought when developing sustainability principles for individual cities, as the principles should be appropriate for the unique circumstances of each city and current ideas and situations. In the present study, criteria of sustainability are outlined in Table 1; these were derived from a number of previously published sets of sustainability criteria<sup>8</sup> and reorganized into nine items.

**Table 1 Sustainability criteria**

9 Sustainability criteria	
<i>Community participation</i>	- Encourage local action and decision making - Involve your community in developing the proposal - Take into account under-represented groups
<i>Economy and work</i>	- Link local production with local consumption

<sup>6</sup> Hargroves K. and M. Smith (2005)

<sup>7</sup> For examples, 134 indices of DSR model by CDS, 218 indices of DSR model by Dutch government, and 60 indices of PSR model by OECD.

<sup>8</sup> Richard E. Saunier (1999), for examples, the Wingspread Principles, British Columbia's Principles for Sustainability, the Habitat Agenda Principles, UNs' World Commission on Environment and Development Principles of Sustainability, etc.

	<ul style="list-style-type: none"> <li>- Increase employment/vocational training opportunities</li> <li>- Improve environmental awareness of local business</li> </ul>
<i>Transport</i>	<ul style="list-style-type: none"> <li>- Encourage walking or cycling</li> <li>- Encourage use of public transport</li> <li>- Discourage use of cars/lorries</li> </ul>
<i>Pollution</i>	<ul style="list-style-type: none"> <li>- Reduce/prevent pollution</li> </ul>
<i>Energy</i>	<ul style="list-style-type: none"> <li>- Maximize energy efficiency</li> <li>- Generate energy from renewable sources or waste</li> </ul>
<i>Waste and Resources</i>	<ul style="list-style-type: none"> <li>- Reduce waste and/or maximize resource use</li> <li>- Encourage reuse and/or repair</li> <li>- Encourage recycling or use of recycled products</li> </ul>
<i>Building and Land Use</i>	<ul style="list-style-type: none"> <li>- Provide local amenities</li> <li>- Improve access for disabled</li> <li>- Reuse/conservate buildings</li> </ul>
<i>Wildlife and Open Spaces</i>	<ul style="list-style-type: none"> <li>- Encourage use of open spaces for community benefit</li> <li>- Encourage natural plant and animal life</li> </ul>
<i>Integration</i>	<ul style="list-style-type: none"> <li>- Seek to combine the social, economic and environmental</li> <li>- Seek to integrate the efforts of partners involved</li> </ul>

### 2.3 Urban open spaces for sustainability

As stated above, economic and ecological factors have always been paramount in defining sustainability, but recent trends have seen an emphasis on criteria related to human and cultural aspects such as quality of life and landscape aesthetics in terms of achieving sustainable city. As significant components of a sustainable city, factors related to urban open spaces-amount of open spaces per resident, number, distribution, accessibility, and system of open spaces-are often discussed because urban open space can act as a provider of social services that are essential to the quality of life, which in turn is eventually the key factor of sustainability<sup>9</sup>. Many previous studies have reported that urban open spaces satisfy the substantial and spiritual human need for nature, as well as the fact that people who encounter nature in the city experience positive feelings such as freedom, unity with nature, and happiness. For example, Renema et al. (1999) found that people visited urban open spaces to relax, experience nature, and escape from the stressful city life. Bishop et al. (2001) suggested that green spaces in a city played an important role in helping residents and visitors to escape temporarily from crowded streets and buildings. Klijn et al. (2000) also recognized that freedom and silence are central values in the way that urban residents appreciate nature. Namely, these studies identified open space as an important factor for sustainability through investigating its physical characteristics in common.

Accordingly, sustainability indicators for a city should include more parameters and indices related to urban open spaces as stated above, and should reflect residents' preferences and satisfaction concerning their city environment. This can be taken into account by managing urban open spaces in various ways, so as to fulfill the needs and expectations of all the residents. To this end, relevant topics on urban open space are considered in the next section.

---

<sup>9</sup> Prescott-Allen (1991)

### 3. URBAN OPEN-SPACE PLAN

#### 3.1 The meaning of urban open spaces: social and psychological perspectives

In his 1999 Urban Task Force Report, Lord Rogers said, “to achieve urban integration means thinking of urban open space not as an isolated unit - be it a street, park or square - but as a vital part of urban landscape with its own specific set of functions. Public space should be conceived of as an outdoor room within a neighborhood, somewhere to relax, and enjoy the urban experience, an venue for a range of different activities, from outdoor eating to street entertainment; from sport and play areas to a venue for civic or political functions; and most importantly of all a place for walking or sitting-out. Public spaces work best when they establish a direct relationship between the space and the people who live and work around it.” Namely, he emphasized aspects of the urban open-space network as *social* space. Given that humans are social animals that crave real contact with each other and with nature, urban open space will always be used as a place with significant meaning within which to meet with people and nature.

To access some form of nature, open space, is clearly a fundamental necessity and a critical part of life. Numerous studies and experiments have emphasized the *psychological* benefits of gaining access to nature in the city. Failure to provide such natural relief within the urban environment can lead to substantial health costs in the long term. In addition, urban open spaces have been depicted as places for both “meeting of strangers<sup>10</sup>,” and finding “privacy” in the busy and dense city, thus providing residents with *psychological* stability.

While much less attention is paid to open spaces than to the built environment in most cities (including Tokyo), an increasing number of studies indicate that the presence of open spaces in a city contributes to the quality of life in various ways, as mentioned above. In addition to many environmental and ecological functions, urban open space provides important social and psychological benefits to human societies as a place to meet strangers and escape crowds, thereby playing an important role in the existence of the city, especially in the case of high-density city. In other words, urban open spaces are socially and psychologically essential for the well-being of citizens and the sustainability of the entire city within which they live. Therefore, for encouraging these social and psychological functions of open spaces for community benefit, we should support the development conditions of open space to reach at a certain level.

#### 3.2 Urban open-space plan for Tokyo

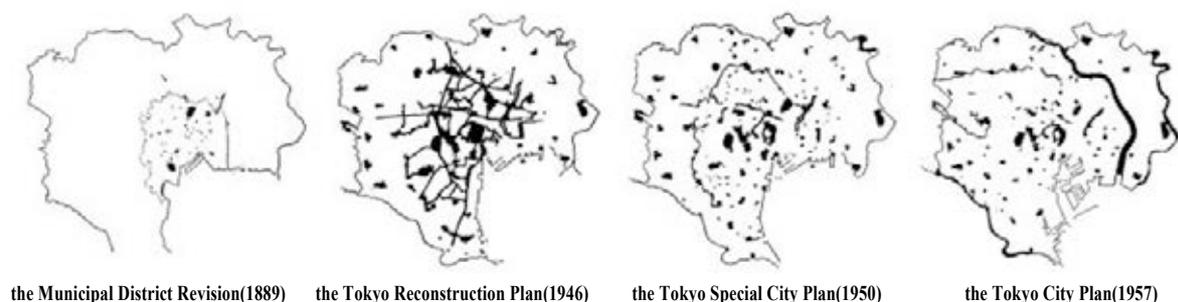

To understand the nature of open-space plans and regulations for Tokyo from a perspective of sustainability, we now briefly address the features, historical evolution, present situation, and vision of the open-space plan for Tokyo.

---

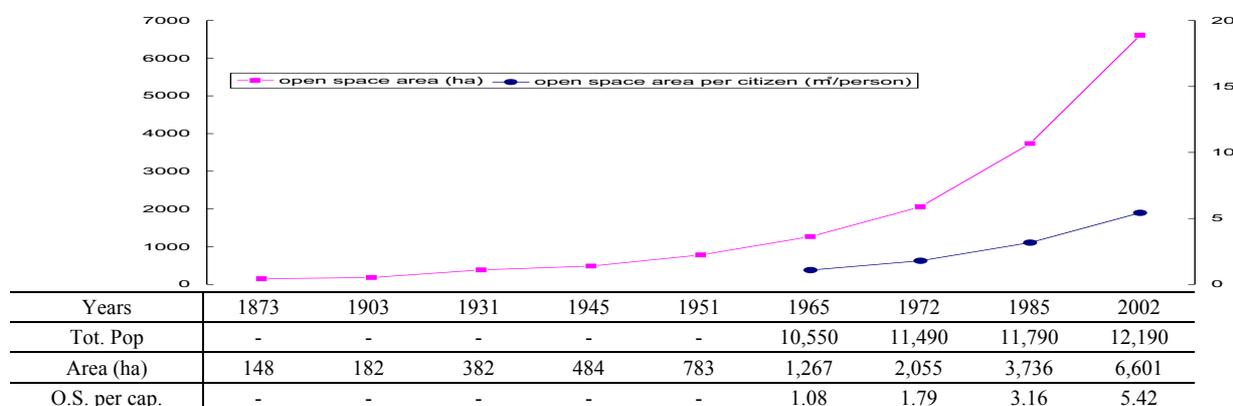

<sup>10</sup> Ward Thompson (1998)

Above all, the most important feature of the open-space system in Tokyo is the emphasis on sustainable safety: protecting the city from natural disasters. Because there have been several large fires in the past following major earthquakes, Tokyo has developed its open-space plans to prevent the spread of fires and to provide amenities for its citizens.

In terms of the historical evolution of open-space planning in Tokyo, we recognize four stages: (1) the period from 1923 to the 1950s when the open-space system was introduced as a disaster-prevention measure and large parks were constructed and connected to major roads as part of the reconstruction plan following the Kanto Big Earthquake; (2) the period following World War II (1950s and 1960s) when planning for the open-space system occurred as a reconstruction project and a green belt was designated along the fringes of Tokyo to prevent urban sprawl; (3) the period 1995-2002 when planning of the open-space system functioned as a reconstruction project following the large Hanshin-Awaji earthquake and diverse reconstruction projects were implemented, including various community parks intended to mitigate damage during natural disasters, and the introduction of streams to the open-space plan; (4) the period of revitalizing the open-space system, creating the Safe Living Environment Zone, and reinforcing the metropolitan park system, including the area of the Imperial Palace, the waterfront area along Tokyo Bay, and riverside areas. In particular, revision of Japan's Urban Green Spaces Conservation Law in 1994, enabled municipalities to draw up master plans for parks and open spaces, although the amount of open space per resident in Tokyo is only 5.42 m<sup>2</sup>, far less than that in other international cities.

**Figure 1 Transition of distribution of open spaces in Tokyo**

**Figure 2 Increase of open spaces in Tokyo<sup>11</sup>**

<sup>11</sup> 日本の都市公園 (2005), p.191

In terms of the present status of the open-space system in Tokyo, a zoning system is currently being implemented, whereby green area<sup>12</sup> is maintained in the form of public facilities such as parks, green belts, forest, and agricultural areas. As of April 2000, the 23 wards of Tokyo contained 2,907 ha of parks and 2,886 ha of green areas, while the rest of Tokyo (Tama and Islands regions) contained 2,445 ha of parks and 2,209 ha of green areas. Therefore, the total area of public parks and green spaces in Tokyo is 10,473 ha, with nine public cemeteries covering an additional 429 ha. The urban planning system for regional green areas designates scenic beauty districts, green zone conservation districts (Urban Green Zone Conservation Law), productive green zone districts (Productive Green Zone Law), and national capital suburban green zone conservation districts (designated by the government).

Mar. 31. 2001

<sup>12</sup> As city facilities, includes parks, green areas, open areas, and cemeteries.

There are three types of city parks in Tokyo in terms of the development process: (1) planned parks created as urban facilities with consideration of the scale and type of park; (2) memorial parks established to commemorate national events or preserve natural and cultural heritage; (3) and public spaces developed from vacant areas donated to the city by the Imperial Household, the repossession of leased land, landfill, and the utilization of riverbeds.

**Figure 4 Hibiya park**

**Figure 5 Miyamoto park**

**Figure 6 Tsukitikawa park**

**Figure 7 Hamamachi park**

**Figure 8 Shiba park**

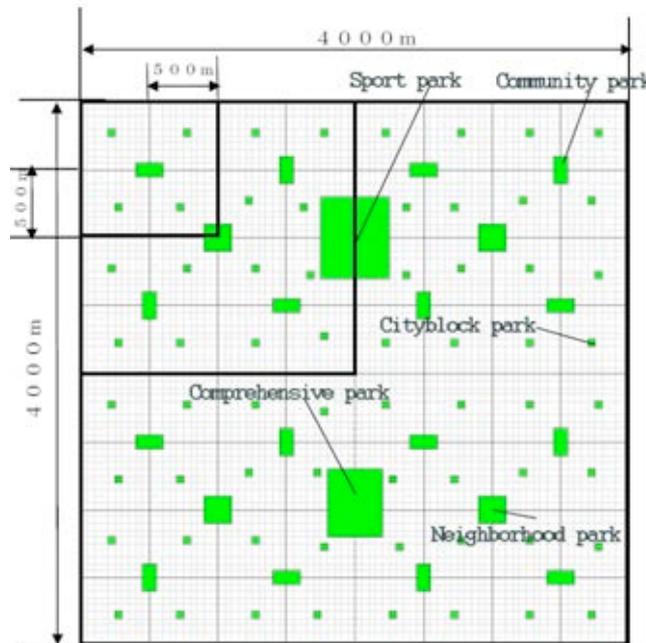

**Figure 9 Waseda park**

Finally, to enrich open spaces within the overall urban structure, the government of Tokyo announced "The Green Tokyo Plan" in December 2000. The target size for such open spaces is 12.9 m<sup>2</sup> per citizen in the ward area and 21.9 m<sup>2</sup> in the Tama area. The target percentage of open spaces plus regional green areas is generally 20% in the ward area and 48% in the Tama area. This plan also defines Tokyo in 2050 as the "dignified city Tokyo with a network of water and green" and states policies to be implemented by 2025 to achieve this vision of Tokyo from the following five viewpoints: an urban environment protected by greenery; a disaster-resistant city, supported by green; the lure of Tokyo created by green; a green habitat for living creatures; and Tokyo citizens are to perform the main role in generating green.

### 3.3 Plan for the distribution of urban open space

The distribution plan of Tokyo's open space reviewed with reference to relevant literature<sup>13</sup> is as below. Factors to be considered are the number and location of open spaces and accessibility to these sites.

- City block park(2500 m<sup>2</sup>): one in every 500 X 500 m area
- Community park(2 ha): one in every 1000 X 1000 m area
- Neighborhood park(4 ha): one in every 2000 X 2000 m area
- Comprehensive park(20 ha), Sports park(30 ha): one in every administrative district
- One administrative district is assumed to be 4000 X 4000 m in size (16 km<sup>2</sup>.)

City block park: 16 ha (0.25 ha X 64)  
 Community park: 32 ha (2 ha X 16)  
 Neighborhood park: 16 ha (4 ha X 4)  
 Comprehensive park: 20 ha  
 Sports park: 30 ha

---

Total: 114 ha (7.125 m<sup>2</sup>/resident)

Regional park: 1 m<sup>2</sup>/resident  
 Specific park: 1 m<sup>2</sup>/resident  
 Green belt: 3 m<sup>2</sup>/resident

---

Total: 5 m<sup>2</sup>/resident

Total Area = 1600 ha  
 Open space Area = 194 ha  
 Population = 160,000  
 Density = 10,000 / km<sup>2</sup>

### 4. APPLICATION TO THE STUDY AREA

A study area was selected which was the most representative area of the densely populated Tokyo and therefore significant to maintain adequate open space plan within the framework of the sustainable city environment. The study area comprises Chiyoda ward, Chuo ward, Minato ward, and Shinjuku ward within central Tokyo. While collecting data on open spaces in the study area, the physical conditions of open spaces were examined, including site density, location, and accessibility. We consulted maps and photographs and assessed whether the open spaces satisfy sustainability conditions.

The total amount of open space in Tokyo's four central wards totals approximately 1,100 ha, and the amount and types of major open spaces is respectively 590 ha, and divided into six categories, including the Imperial Palace, Akasaka Palace, the grounds of the State Guesthouse, Aoyama Cemetery, etc. (Table 3).

---

Table 5 Conditions of open spaces in the study area

City	General conditions			Open space conditions			Other features
	Area(km <sup>2</sup> )	Population <sup>14</sup>	Density (people/km <sup>2</sup> )	Open space area(m <sup>2</sup> )	Open space area <sup>15</sup> per citizen(m <sup>2</sup> )	Open space rate(%)	
Chiyoda	11.64	855,000	73,453	2,211,600	2.50	19.1	-Mainly large-scale open spaces with few small-scale open spaces
Chou	10.06	648,000	64,413	905,400	1.40	9.1	-Green spaces are unevenly distributed throughout the ward. -There are insufficient open spaces with easy access..
Minato	20.34	838,000	41,199	4,474,800	5.34	22.3	-Target open-space rate by 2010: 30% -Green areas are unevenly distributed (concentrated at the specific region.)
Shinjuku	18.23	799,000	43,828	3,463,700	4.34	19.8	-Green areas are poorly distributed (concentrated at the specific region.)
Total	60.27	3,140,000	52,098	11,055,500	3.52	18.3	-The average open space area is 9,338 m <sup>2</sup> . -The average grid of city blocks is 1,000 m <sup>2</sup> .
Manhattan	61.39	3,389,200	55,207	15,715,840	4.70	25.6	-The average open space area is 339,690 m <sup>2</sup> . -The average grid of city blocks is 11,700 m <sup>2</sup> .

<sup>14</sup> In the present paper, the term ‘population’ indicates the ‘daytime population’, not the resident population.

<sup>15</sup> ‘Open space area per citizen’ means the area of open space for the daytime population who use open place practically.

For structural comparison, one of the high-density cities, Manhattan<sup>16</sup> was selected because Tokyo's four central wards (Chiyoda, Chuo, Minato, and Shinjuku) occupied roughly the same land area as the island of Manhattan (approximately 6000 ha.) Also, both have daytime populations around 3 million, although the nighttime population of the four wards is around 500,000, about 1/3 that of Manhattan's. In terms of open space conditions, however, Manhattan's total open space area covers 1,571 ha which is almost time-and-a-half as much as the 1,105 ha of open space in Tokyo's four central wards. Also, the study area has lower open space area per citizen (3.52 m<sup>2</sup> to 4.70 m<sup>2</sup>), and lower open space rate (18.3% to 25.6%) than Manhattan.

**Figure 122 Open spaces in Manhattan**

In terms of the accessibility to open space of the four central wards, the average distance to the nearest subway station is approximately 340 m, which can be reached in 2-3 minutes, even though few of them have bus stations close by. Also, about the distribution of open spaces in the study area, the average distance to the nearest open space, that is, adjacent nature, parks and other facilities, is approximately 630 m, almost satisfying the distribution plan of Tokyo's open space.

In conclusion, open spaces in the four central wards of Tokyo have good accessibilities, because they are distributed within proper distance, and the access to them is supported by the mass transport system that can be easily used by citizen. However, the view to the open spaces from the outside is not secured sufficiently because of crowded buildings and narrow street system of Tokyo, and also, the amount and the rate of open space are numerically insufficient compared to those of Manhattan. To make a sustainable city in the social and psychological view points, the city should have enough open spaces qualitatively as well as quantitatively, which means people should be able to visit open spaces whenever and wherever they want. In the qualitative aspect regarding the accessibility and the distribution, we could recognize through the present study that the open space plan of four central wards in Tokyo was implemented with satisfying social and psychological sustainability, but in the quantitative aspect, still did not have sufficient amounts. Through creating and ensuring more open spaces with enhancing their accessibility, therefore, sustainability of Tokyo in the social and psychological perspectives will be completed.

<sup>16</sup> The sample of open spaces in Manhattan was adopted other than the cases of Paris, or London, because the basic circumstances of the city such as area, population, and characteristics were similar to those of open spaces in Tokyo.

## 5. CONCLUSION

The availability of open space is an important contributor to sustainability of a city. This study examines a set of present conditions of open spaces in Tokyo, intended to secure improved urban open spaces within the framework of sustainability. A comprehensive check-up for availability of open spaces such as amount and accessibility was performed in this study in order to evaluate the equity of the distribution of and access to open space. As a result, we can learn that Tokyo has good accessibility to its open spaces within proper distance, but the amount of open spaces is still not enough. More open spaces are believed to help the high-density city Tokyo to articulate commonly shared values which, in turn, can serve as reference criteria to envision more sustainable city strategies. In all of this, urban open spaces will continue to serve a central function for a city's sustainability.

### **Introduction**

This paper examines the diachronic changes that the microdistrict schema underwent in China's modernisation process. First used in the 1935 Moscow Plan, the 'microdistrict' (*mikrorayon* in Russian) schema constituted a series of basic principles of spatial organization, including the integration of housing and facilities, optimum service distances and the hierarchical spatial structure (Sawers, 1978; Bater, pp. 109–111). These basic principles of spatial organization were essentially similar to those of the neighbourhood unit, the schema of a planned neighbourhood first articulated by the American social reformer Clarence Perry in the 1920s.

Introduced from the Soviet Union to China in 1956, the microdistrict schema was employed as the basic unit for residential planning in the 1957 preliminary master plan and the rural planning proposals during the people's commune movement in 1958. Planners envisioned that all urban residential districts could be designed and constructed based on the microdistrict schema. Yet despite a few built examples, planners failed to expand the implementation of the schema to a larger scope under socialist planned economy. A characteristic urbanism which integrated production and residence was widely adopted in Maoist China.

Economic reforms since 1978 have created new opportunities for the implementation of the microdistrict planning principles. At the turn of millennium, the microdistrict schema gained new vitality as a national 'community building' (*shequ jianshe*) campaign was launched to establish the residential community as the new basic unit of urban governance.

This paper is divided into three sections. The first is a brief introduction of the neighbourhood unit and the superblock as competing residential paradigms in the early 1950s. The second section discusses the early experiments with the microdistrict since the mid 1950s. The final section seeks to understand the emergence of the microdistrict as a norm for residential planning and its new roles in the reform era. The study demonstrates that the microdistrict schema has been through intercultural appropriations, episodic transformations and successive discursive conversions within the specific historical context of Chinese modernity. The paper concludes that the microdistrict schema is far more than another instance of uniform technologies of homogenization. Instead, it has been variously localized into modernisation programs in new times and places.

### **The Neighbourhood Unit and the Superblock: A Prehistory**

The neighbourhood has long been the basic spatial unit to organize cities and towns. In ancient China, a normative principle of urban planning which organized the city into separate wards had been established since Zhou times (c. the eleventh century BC to 256 BC) (Wheatley, 1971; Yang, 1993; Heng, 1999). The medieval European town consisted of autonomous quarters, each with its own centre and market (Mumford, 1961). The new scale of industrial production, however, severed intimate human associations of the pre-industrial era. Based on an impersonal

spatial system, the modern city supported a new way of life hostile to neighbourliness. By the late nineteenth century, the Western social elite had identified the rehumanization of the modern city as an urgent obligation (Boyer, 1983).

Starting his career in teaching service, Clarence Perry was attached to the Playground and Recreation Association of America in 1909 as its second field officer, whose main responsibility was to investigate the prospects for promoting an extended use of public schools for after-hours social and civic uses (Birtles, 1994, pp. 1–3). Perry gave an illustrated lecture on the ‘socially planned neighbourhood’ idea at a joint meeting of the National Community Centre Association and the American Sociological Society in Washington on 26 December 1923 (Dahir, 1947, p. 24). The concept found its most complete description in Perry’s treatise ‘The neighbourhood unit, a scheme of arrangement for the family-life community’ (Perry, 1929) and gained wide acceptance shortly thereafter.

The neighbourhood unit served to bring together a range of early twentieth-century visions and actions and turn them into tangible design principles. First, clear boundaries determined by wide, arterial streets to control the movement of through traffic past the neighbourhood; second, a primary school within easy walking distance; third, grouped local shops located at the periphery of the neighbourhood; and fourth, neighbourhood parks and playgrounds to comprise about 10 per cent of the whole area (Perry, 1929). The neighbourhood unit represents a design solution that brings together urban functions and social interactions. With schools, shops, parks and community facilities connected with but not bisected by main traffic arteries, residents can find convenience and safety. The provision of community facilities on a manageable scale creates an environment which strengthens neighbourliness and moral bonds.

The neighbourhood unit concept provided the basis for the development of British new towns after World War II, which in turn offered important lessons for other countries around the world (Dahir, 1947; Goss, 1961; Burke, 1971). With the wide international recognition it has received, the neighbourhood unit is arguably a ‘global urban form’ of the twentieth century. Its spread has been characterized by an internationalization of modern planning knowledge, large-scale residential developments, and the rise of welfare society.

One of the earliest residential developments in China, which was based on the neighbourhood unit concept, was developed by Japanese colonial planners in Changchun in 1934.<sup>1</sup> Planner Hideshima Kan classified urban neighbourhoods into different types according to life style, profession, city scale and the distance to urban centre (Li, 1997, p. 228). The neighbourhood unit schema was employed to plan modern ‘new Manchurian’ residential districts, serving the elite class – the Japanese. Each unit consisted of 6,000 residents and 1,500 households in an area of 1.7 square kilometres (*Ibid.*, p. 226). Public facilities were divided into two levels: the first consisted of schools, community centres, clinics, shops, parks, sports fields, police stations and so on, located on the periphery of the central square; the second consisted of kindergartens, sports fields and offices, placed at four different locations according to their optimum service radii. The Shuntian residential district (1934–1941) located near the palace area was the first project built according to these principles. By 1942, it had a population of 16,760 (mostly Japanese) and 3,504 households (Li, 1997, pp. 231–32). Following Japan’s occupation of Datong in 1937, in June 1938 the North Shanxi Autonomous Government began to consult Tokyo University professor Uchida Yoshikazu (also written as Yoshizo) about the expansion of the city as a mining, transport and political centre (Tucher, 1999, p. 153). Uchida and his team incorporated some of the most advanced standards and up-to-date planning concepts in their Datong plan, including the satellite city, the neighbourhood unit and the greenbelt (*Ibid.*, 153–

59). Yet despite the fact that the military occupation provided cheap land and financial investment, most projects in the Datong plan were never realized.

It is unclear how far the Japanese planning experiments influenced the spread of the neighbourhood unit concept in China. After the war, Chinese planners embraced the latest planning techniques to rebuild the nation. Among others, the neighbourhood unit was widely adopted by Chinese planners in the organization of several major cities such as Chongqing (Gordon, 1946; Dong, 1999, pp. 257–59) and Shanghai (Dong, 1999, pp. 209–212; MacPherson, 1998; Wang, 2004). Due to civil unrest and war, neither the Chongqing plan nor the Greater Shanghai Plan was realized. Yet through the proliferating discourses of the neighbourhood unit and other modern planning ideas, a new spatial conceptualization for society was gradually established: one in which planners claimed legitimacy in the name of the welfare of the population. Despite the fact that Republican urbanists consistently expressed frustration with social and economic constraints, their practices provided elements and techniques for later experimentation.

The founding of the People's Republic in 1949 marked a major turning point in urban development, yet there were far more continuities with what had gone before than what one would envisage (Ma and Hanten, 1981). In the field of residential planning, socialist experiments during the transition period (1949–1952) were heavily influenced by developments that had already taken place in the Republican era. As massive construction programme was launched to ease housing shortages, the neighbourhood unit schema was adopted to plan large-scale residential development (Kwok, 1981). The planning of Caoyang New Village in Shanghai is exemplary. Its chief designer, Wang Dingzhen, a graduate of the University of Illinois at Urbana-Champaign, learned the neighbourhood unit idea from a booklet published by the Shanghai Public Affairs Bureau in the mid-1940s.<sup>2</sup> In a 1947 *Construction Review* article, Wang proposed that housing scarcity (*fanghuang*) in post-war Shanghai could be solved by large-scale redevelopment projects (Wang, 1947). He suggested that the adoption of the neighbourhood unit schema could improve housing conditions and the welfare of urban residents. While Wang's proposal was never implemented in the Republican era, the socialist ways of distributing material, financial, and human resources provided an optimum environment for the realization of his ideas.

Built between 1951 and 1953, Caoyang New Village occupied a total area of 94.63 hectares and provided an integrated residential area (Wang, 1956a). While accommodating a larger population than a neighbourhood unit normally would allow, Wang admitted that the village plan followed the basic principles of the neighbourhood unit with some minor adjustments. The plan was divided into three hierarchical levels: neighbourhood, cluster, and village. Each cluster had its own nurseries, kindergartens, and elementary schools. Elementary schools and kindergartens were located within easy walking distance (less than ten minutes) but on independent sites. The village had community facilities such as co-op shops, post offices, cinema theatres, and cultural clubs at the centre, while commercial establishments at the periphery. Bounded by city thoroughfares, the village street system was laid out in a flexible pattern to accommodate the unevenness of the site. Shortly after the completion of Caoyang, four Hudong villages were constructed based on similar principles. Together they provided housing for 20,000 residents.

The neighbourhood unit idea was adopted in Beijing's master plans (Zhang, 2001, pp. 126–127), and several residential districts were built according to the schema. Yet the triumph of the neighbourhood unit was only provisional. Very soon, Soviet influence began to permeate every aspect of Chinese urban reconstruction. During the 1950s, more than 10,000 Russian advisors were invited to assist various modernization programmes in China, and their opinions often

outweighed local objections to key decisions (Spence, 1969, p. 282). In the sphere of residential design, Soviet advisors sought to transplant to China the superblock (*dajiefang*) schema. This consisted of a grouping of four- to six-storey blocks of flats arranged around a quadrangle with public facilities in the centre. The schema stressed symmetrical axes and aesthetically coordinated street façades, which was more directly influenced by the Beaux-Arts concern for formal grandeur than by Marxist theory. During the Stalin era, Soviet planners set their superblock schema against its Western counterpart – the neighbourhood unit – by arguing that unlike the latter, which was isolated in the suburb, the superblock remained ‘the organic component’ of the city and was a most economical approach to urban construction (Wang, 1956, p.2).

As links with the Euro-American world were cut off, theory and practice from the Soviet Union and Eastern European socialist countries was promoted in every way. A large volume of books and articles translated from Russian strongly influenced Chinese professionals. Half of the articles in the 1954 *Journal of Architecture* (*Jianzhu xuebao*), the nation’s most influential journal in the field, were about architecture and urban planning in Russia and Eastern Europe. As the superblock schema was established as the new ‘orthodoxy’, there was a major shift in the connotations of the neighbourhood unit, which was now considered bourgeois in nature and fell into disrepute. In his 1956 article on Caoyang New Village, Wang provoked self-criticism for not including the latest Soviet techniques in planning but adopting the wasteful bourgeois neighbourhood unit idea (*Ibid.*, p.2). During the early 1950s, quite a few residential districts and factory living quarters were designed according to the superblock schema. Famous examples of this included Baiwanzhuan Residential District in Beijing and the living quarter of the No. 1 Automobile Plant in Changchun (Li, 1956; *Huadong gongye jianzhu shejiyuan*, 1955).

Yet Chinese planners soon found that the superblock model was problematic in several aspects: the perimeter layout caused a large number of westward windows, street-facing units suffered from noise and pollution, and it was difficult to achieve cross-ventilation. In a 1956 article on residential planning, architect Wang Ye pointed out that it was unfair to make people live in westward-facing dwellings for no other reason than formalistic concern (Wang, 1956). Meanwhile, the Soviet leader Joseph Stalin died on 5 March 1953; references to him gradually disappeared in various realms (Åman, 1992). Internally, since 1955 the Chinese Communist Party had increasingly put economic emphasis on industrial development. As a result, economy and utility became new priorities in housing construction. The stern layout of the superblock was abandoned and more flexible plans were favoured (Lü, Rowe and Zhang, 2001, pp. 128–130).

### **Early Experiments with the Microdistrict**

After the Chinese planners’ experimentation with the superblock was suspended, some basic principles of the neighbourhood unit concept reappeared, but in a new guise. First used in the 1935 Moscow Plan, the ‘microdistrict’ (*mikrorayon*) was defined as a self-contained residential district with an area of 75–125 acres and a population ranging between 5,000 and 15,000 (Sawers, 1978; Bater, pp. 109–111). Four to five microdistricts, each with a service radius of 300–400 metres, made a residential complex. Although the microdistrict schema articulated a more sophisticated hierarchy and allowed a larger scale, its basic principles of spatial organization (i.e., the integration of housing and facilities, optimum service distances and the hierarchical spatial structure) were essentially similar to those of the neighbourhood unit. During the Stalin era, the use of the microdistrict was supplanted by the superblock schema. After Stalin’s death, as the new Party leader Nikita Khrushchev was determined to set the Soviet

Union on a modified path, the microdistrict idea re-emerged and received wide acceptance almost immediately.

The microdistrict concept was introduced to China in a 1956 article translated from Russian (Tewei'ersikiyi, 1956). It was soon employed as the basic unit for residential planning in the 1957 preliminary master plan proposal for Beijing (Sit, 1995, pp. 96–97). Yet the concept did not receive any systematic treatment until the following year. The first issue of the 1958 *Journal of Architecture* featured four articles related to the microdistrict. A detailed introduction of the concept was offered in the article titled 'Planning and construction of an urban residential district' by Luben Taneff (1958), a Bulgarian professor and architect. Taneff explained the rationale and application of the microdistrict as a socialist planning device. He argued that well-organized, self-contained microdistricts could strengthen local-level political participation. Examples from Sofia and other Bulgarian cities were cited to illustrate the microdistrict planning principles. The other three articles were case studies of residential planning in Shanghai and Beijing, in which the term 'microdistrict' received frequent usage without further explanation of the sudden shift in planning discourse (Xu and Fang, 1958; Fu, et al., 1958; Zhao, *et al.*, 1958). In the concluding section of the article on Hudong development in Shanghai by Xu Qingqiu and Fang Renqiu (1958, p. 9), a brief discussion of the neighbourhood unit and the Soviet microdistrict was provided. The authors divided the Soviet model into the superblock type and the neighbourhood group type. The authors acknowledged that the planning principles of the latter, the scheme adopted in their design, were similar to those of the neighbourhood unit. The discussion indicated that the adoption of the microdistrict did not involve essential changes in basic residential planning principles. The transition from the neighbourhood unit to the microdistrict, therefore, was largely a strategic manoeuvre to revive the old practices under a new name.

The microdistrict received frequent discursive usage in the rural planning practices during the people's commune movement launched in August 1958. Concurrent with sweeping institutional changes, designers boldly experimented with commune planning between 1958 and 1960 (chapter 5). Planners believed that peasants could be rehabilitated fundamentally by revolutionizing rural settlements. They proposed a complete reorganization of scattered, small villages into concentrated, large residential clusters (*jumin dian*) according to modern urban and regional planning principles (Pei, Liu and Shen, 1958; Wang and Cheng, 1959; Wu, 1959). The microdistrict planning principles were adapted to plan the commune as a combination of economic activities, civic administration and residence. Proper links between the agricultural field, the industrial area and the residential quarter were stressed, and efforts were made to integrate social facilities and parks. Based on commune planning experiences in northeast China, for example, Wang Shuo and Chen Jingqi (1959) proposed that population size should be between 4,000 and 10,000, based on factors such as population density, geography and production scale. Their article established a number of principles for site selection and development scale, and suggested four types of residential clusters: the central town (3,000–100,000 residents) complete with social, cultural and educational facilities; the satellite residential cluster (10,000–15,000 residents), accommodating major agricultural and industrial production; the specialized residential cluster (3,000–4,000 residents) for small production units such as pastures and orchards; and the work station (300–400 residents) for resting and storage. Wu Luoshan (1959) proposed the establishment of proper links between agricultural land, residential quarters, social services and green spaces. The influence of Ebenezer Howard's garden city idea was evident.

The distribution of residential clusters was based on the optimum distances between central residential clusters and satellite clusters. Similar to the microdistrict, the organization of community facilities within each residential cluster was based on the 'service radii' of the facilities and the number of residents they served (Liaoningsheng jiansheting, 1958). Nurseries, kindergartens, primary schools, social halls, canteens, sports fields and gardens were arranged within easy walking distance. Unlike the microdistrict, which was purely residential, however, the residential cluster was to be a multifunctional unit that integrated industry, agriculture, trade, education and military. The scale and content of commune planning was hence close to those of regional planning. The plan for Xiaozhan Commune in Tianjin is a case in point (Tianjin daxue jianzhuxi, 1958). The commune occupied an area of 2 million *mu* (134,000 hectares), encompassing a population of 60,000 and 19 villages. The commune plan reorganized the population into seven residential clusters. The central residential cluster, situated at the site of the existing town, was the commune's political, economic, cultural, and administrative centre. Regardless of the original locations of existing villages, six residential clusters were placed near the intersection of major highways, each accommodating several neighbourhoods. In the plan for the Southwest Settlement, for example, an 'L' shaped territory was divided into five neighbourhoods, each of which was about 5 acres and consisted of 1,000 residents belonging to two production teams. The per capita land-use standard was set at 40 square metres, slightly higher than that used in the city (35 square metres). One canteen was provided for every 500 residents, two nurseries and one kindergarten for each neighbourhood, and two neighbourhoods shared one primary school. Each residential cluster had a park, a community centre and an industrial district.

Modern neighbourhood planning principals were sometimes adapted to new functional requirements; a target range, for example, was incorporated into many design proposals as peasants were to be organized into commune militias (*Ibid.*). In keeping with the goal of collectivizing rural life, some designers adopted radical standards to weaken the family unit and free women from the drudgery of housework. Families were to be separated and housed in different buildings or apartment units. Except married couples, adults were assigned into dormitory rooms where three to four persons of the same sex shared the same space (Wang *et al.*, 1958). Aged people stayed in retirement homes, and young children boarded at kindergartens or residential schools. All were expected to eat at public canteens. In a housing proposal for Suicheng People's Commune, for example, kitchens and living rooms were abolished from the floor plans, while shared restrooms were provided on each floor (*Ibid.*).

Despite the energy and enthusiasm instilled in countless rural utopias and commune proposals, they remained castles in the air. It soon became apparent that the communes neither increased individual income nor raised the level of satisfaction obtained from working (Lethbridge, 1963, pp. 121–122). The egalitarianism adopted by the commune system resulted in slacking off at work. Meanwhile, in 1960, the Soviet Union not only withdrew its technicians and terminated its aid to China, but also imposed pressure for repayment of debts (Liu and Wu, 1986, p. 265). The combined effects of these factors and agricultural disasters resulted in a severe famine, which claimed millions of lives between 1959 and 1961 (Becker, 1996, pp. 266–274). The leadership, seriously demoralized, considered planning impractical. The state announced at the 1960 national planning meeting that urban planning practice should be suspended for three years (Tongji University *et al.*, 1981, pp. 24–25). Planning departments were dismantled, planners were forced to find jobs in other professions, and universities were forced to eliminate their Departments of Urban Planning (*Ibid.*).

Although the experimentation with rural planning was soon stifled, the microdistrict gradually became a well-established fixture through the discussion of commune plans. The notion was systematically explicated in 1962. Wang Shuoke (1962) summarized Shanghai's residential planning experiences in his article and proposed a three-tier system consisting of the basic living unit, the neighbourhood and the residential microdistrict. A later article by Wang Dingzeng and Xu Chunrong (1962) divided the residential system into four levels: the residential group (300–500 residents), the neighbourhood cluster (2,000–3,000 residents), the microdistrict (8,000–10,000 residents), and the residential district or satellite city (50,000–60,000 residents).

The microdistrict has since been established as a planning norm in China. A few design principles for residential districts were firmly established. First, housing and facilities should be integrated. Second, through traffic should be discouraged. Third, residential grouping should be determined by the 'service radii', the optimum distances between housing and services. Fourth, the levels of hierarchy and the optimum numbers of community facilities should be based on the number of residents they served. Planners envisioned that all urban residential districts could be designed and constructed based on the microdistrict schema. Some microdistricts were built in major cities between 1950s and 1970s (Min, 1993; *'Juzhuqu xiangxi guihua' keti yanjiu zu*, 1985). Yet when planners attempted to expand the implementation of the schema to a larger scope, they encountered tremendous difficulties. Piece-meal development model prevailed under Mao. A characteristic urbanism which integrated production and residence was widely adopted throughout China (Committee of Concerned Asian Scholars, 1972).

Under planned economy, most construction funds were distributed through ministries while municipalities received only a small share. The ministries would in turn distribute construction funds to individual work units (the state-run factories or institutes). Despite the fact that only a few work units were planned following the company town model, most work units developed their own housing and services over time. This was because, on one hand, that the work unit was designed as an urban institution that integrated political, economic and social functions so it was encouraged to meet the various needs of its workers (Bray, 2005; Lu, 2006). On the other hand, there was a constant scarcity of urban facilities as the surging increase in labour force was not matched by a corresponding increase in social provision at the municipal level (Lu, 2006). Despite the fact that social provision by the work unit posed a severe liability (e.g., low return on investment and periodic maintenance expense), the political pressures from both employees below and administrators above strongly prompted the work unit to provide the necessary means of consumption (Lu, 2006).

Therefore, although the microdistrict schema was established as the dominant residential planning paradigm since the late 1950s, in effect piece-meal development of the compact variant of the company town model prevailed under Mao. While the site planning of a new work unit was conducted by professionals, the subsequent development was often planned by the work unit's own Department of Basic Construction (*jijian ke*). Beginning with essential production structures and dormitories for single workers, the work unit grew as the enterprise matured. In the early years, a few basic living facilities were built: apartment buildings, canteens, boiler rooms, public bathhouses and nurseries. Depending on the availability of construction funds and land, the work unit might gradually build more apartments and other supporting structures such as guesthouses and primary schools. Rather than being built in a detached area, housing and facilities often occupied space adjacent to workplace. In this way, the work unit gradually grew into a semiautonomous entity with work, habitation and service integrated in close spatial proximity. By 1989, work units owned 90 per cent of urban public housing, while only 10 per

cent was controlled by the municipal government (*Zhongguo chengshi jianshe nianjian*, 1989). As different work units provided different levels of services and mostly for the exclusive use of their own employees, the result was an uneven and fragmented welfare system.

### **The Microdistrict in the Reform Era**

The shift from planned to market economy since 1978 has created new opportunities for the implementation of the microdistrict schema (Yeh and Wu, 1999). With a series of reforms targeting housing commodification, the task of residential development was gradually transferred from the government to private developers (Chen, 1993; Wang, 1995; Wu, 1996). Meanwhile, the central and local planning departments created an arsenal of codes in line with the inherited microdistrict schema to ensure an adequate provision of social facilities in commercial residential developments. Thanks to the unprecedented rate of construction and the planning department's increased power to regulate construction through planning codes, the design principles of the microdistrict schema were for the first time widely implemented. Most commercial residential tracts were planned in conjunction with nurseries, parks, stores and recreational facilities.

Driven by commercial interests and new consumption needs, a number of features were introduced by developers. First, the community clubhouse (*huiguan*), comprising various recreational and dining facilities, was gradually established as a normative component in new residential developments and well received by consumers. Second, many services are now undertaken by professional property management companies, which collect service fees from residents. Third, despite the fact that most urban housing in China (including all work-unit owned housing) is enclosed within walled compounds, new commercial housing developments are equipped with more elaborate round-the-clock security systems than older residential areas. The wide implementation of the microdistrict schema, therefore, does not lead to a more open and even urban service system. Instead, enclosed commercial residential tracts reproduced the exclusive feature of the Chinese work units and the 'gated communities' found in other parts of the world (Wu, 2005; Huang, 2005; Blakely and Snyder, 1999). Meanwhile, the term 'new urbanism' is sometimes invoked in marketing the microdistricts, but the original connotations of the term are largely lost in the Chinese context. The post-reform residential developments in major Chinese cities have been dominated by large-scale, high-rise and high-density projects due to the scarcity of urban land, rather than due to the concern for the workable neighbourhood. The microdistrict schema has been the decades-old socialist planning paradigm which is reinforced (rather than reinvented) through planning codes as the dominant model for these large-scale real estate developments. As such, China's urban residential landscape is unfolding according to its inherited blueprint rather than becoming Western.

As income disparity is increasingly widening, housing supply has diversified to meet the needs of different income groups. The microdistricts in the reform era can be broadly classified into three types. First, the residential districts with single-family detached houses, often located in suburban or far suburban areas. Their planning meets the requirements of the microdistrict schema, on one hand, and incorporates some physical features of Western suburban neighbourhoods. Such residential districts often feature high-quality design; both neighbourhood layouts and house floor plans are heavily influenced by Western design. As each house may cost millions, only the most affluent can afford it. Second, the microdistricts developed by private developers for the urban middle class. This is the most common type of residential districts, which may be located in urban or suburban areas, and can be further differentiated in terms of

unit prices and locations. Third, the subsidized microdistricts developed by the state or private developers for the lower middle class, usually located in suburban areas and connected with the city via public transit system. The size of apartment units is relatively small, and the design standards are considerably lower than the second type of the microdistricts.

The microdistrict bears certain similarity with the work unit in terms of overall organization. Like the work unit, it occupies a territory bounded by arterial roads with an internal circulation system designed to discourage through traffic. Within this territory, they both support a variety of community facilities and green areas for the exclusive use of their residents. Yet there are some essential differences between the two. The scale of the work unit is usually smaller than the microdistrict, so social bonds are easy to develop. A microdistrict, in contrast, is much larger than the work unit and often fails to foster neighbourliness. Despite the emphasis on social provision, the microdistrict performs the single function of residential accommodation, while the work unit is essentially a production unit with mixed economic, residential, administrative, welfare and political functions. Consequently, while the work unit is centred on the workplace with the main building on the commanding site, community facilities are given pivotal importance in the layout of the microdistrict. Unlike the work unit, residence in a microdistrict is based on consumption capacity and personal choice rather than work relationship. As its residents come from different backgrounds and do not have many opportunities to form neighbourly bonds, the microdistrict does not provoke the kind of dense network of human relationship fostered by the work unit.

Economic reforms led to the decline of the work unit system and the increased mobility of the population, which created new challenges for urban governance (Wu, 2002; Howell, 2004; Bray, 2005a, chapter 7). An official discourse on ‘community building’ arose in the mid-1990s in response to the changed urban conditions. Under the new initiative, the ‘community’ is conceptualized as a form of grassroots organization with a defined territory. As there are more and more urban residents who move from urban-block-type and work-unit-type to microdistrict-type communities, the microdistrict has emerged as the dominant basic unit of urban governance. Each microdistrict has a Residents’ Committee (*jumin weiyuanhui*), which operates as a mass organization under the Street Office (*jiedao banshichu*), the sub-district urban government. The main function of the Residents’ Committee is to organize a corps of volunteers to perform daily maintenance and security work for the community; each apartment building has a volunteer ‘building leader’, and each building in turn has ‘floor leaders’ or ‘section leaders’ (*Ibid.*). The volunteers help to collect maintenance fees, organize group leisure activities, disseminate official and community notifications and so on.<sup>3</sup> Together these volunteers form a seamless network to link residents in individual microdistricts to the local government.

### **Concluding Remarks**

This paper has traced the diachronic changes that the microdistrict schema in China. It shows that some seemingly long-established Chinese norms for residential planning are results of transnational appropriations and successive conversions. In particular, the paper shows that the development of Chinese residential planning was informed by events, sources and inspirations from various parts of the world. It reveals the history of modern planning as a narration of intertwined global and local experiences. The paper also shows that the interpretations and revisions of the schema are often conjunctural and cannot be deduced purely from theoretical principles. Various disruptions such as the commune movement and the reforms were continuously brought into the itinerary of the concept. The microdistrict schema, in the end, is far

more than another sign of globalized repetition; instead, it has been constantly tamed into different programmes of modernization in new times and places.

### Notes

1. Although Japan imported many Western planning ideas at the time, there were few opportunities to apply them in Japanese cities due to the land ownership system and weak planning powers. Japanese colonies offered new laboratories for the realization of modern urban plans. See Hein, 2003; Tucher, 1999, chapter 3.

## **The Impact of joining the European Union on the Built Environment in Lithuania**

Lithuania is the largest of the three Baltic Countries which became a member of the European Union in May 2004. At 65,300sq kms, it is around twice the size of Belgium and consists mainly of fertile lowland areas interspersed with lakes. Its highest point is only 294m. Lithuania is serviced by air, sea and rail and road links. It's port city, Klaipeda, is a major centre of shipbuilding, ship repair and transportation.

From 1940 to 1991, Lithuania was part of the Soviet Union, having been forcibly annexed by Russia in 1940. Like the other soviet Baltic countries, Lithuania was an important source of industry and knowledge, producing a range of electrical goods and providing much needed quality produce to the rest of the soviet dominions. The 3 Baltic countries were considered to have the "high end" industries and products in the Soviet Union, although the quality of these products fell short of western expectations and quality control. The necessity to produce goods for the entire Soviet Union created an interesting dynamic in Lithuania. Factories and collective farms were massive entities, in size and scope well beyond what was required in a normal situation, even considering export potential. The Baltic countries, with a total population of around six million – of which Lithuania has 3 million – were required to produce goods which could be required to reach over 220 million people across the vast expanse of the Soviet Union. Needless to say, even with major installations and full production, goods produced in this way were never enough to sufficiently fill the needs of the union, with products chronically in short supply. What applied to industry also applied to agriculture. Most of Lithuania's farms were collectivised

under the soviet regime, with groups of farms bundled together and with the normal family holdings overtaken by large scale enterprises usually producing one type of product to be distributed amongst the soviet republics. Again in this model, while supply overall fell well short of demand across the whole system, it was far too much for one small country.

The same situation applied to the military. Lithuania is no stranger to occupation by foreign armies, with the penultimate most recent release from Russian rule (in this case, Tsarist Rule) occurring in 1918 with the fall of Imperial Russia, only to be occupied again by the Russians during WWII, ostensibly to protect Lithuania against the German invaders of the time.

Each of these invaders brought with them military manpower and infrastructure designed to maintain the status quo and to subjugate the local population.

In a visual sense each of these factors: industrialisation on a grand scale, collective farming and major military presence has left an imprint on the built environment, and on the challenge of urban renewal in a new Europe.

Other issues such as the rapid growth of the retail sector, desire for foreign companies to enter the market and establish offices, and the need to upgrade transport and communications to the standard expected of a European Union country, also have impacted on urban planning decisions and on the visual landscape of both towns and country.

It is these impacts which I am going to describe and explore in this presentation.

### Rapid growth of the Retail Sector

Before independence in 1991, Lithuanian retail reflected its position as a soviet state. Small single purpose shops sold individual goods; butchers; dairy products and

bakeries. “New” suburbs (that is post-second world war and later) usually featured a multi-goods store selling canned or preserved products. Fruit and vegetables were mainly purchased at the markets. Variety was very limited, as stores were supplied on an allocation basis decided from the centre, meaning the whole cities supplies could be limited to a single line, for example, tinned fish in many soviet cities meant “Ryga Sprats”, a type of sardine. Each major city was also served by a sort of department store known as the “Universal Store”. These stores were an amalgam of non-food item stalls such as clothing, footwear, stationery, souvenirs. Again, variety was very limited and presentation basic. Service was all over the counter, with small areas of goods serviced by counter staff. Very few goods were available on open shelves, and often the goods displayed were not actually available for sale, or were, in the example of shoes, actually available only in one style, one colour and one size. Display of goods was not considered to have any purpose except to show what was for sale (or not, depending on supply) and service was at best perfunctory. Fitout of shops was at the most basic level. The one positive aspect of this situation was that heritage buildings utilised for retail purposes were left virtually unchanged.

Fast track to 2005. Retail sales are growing by around 12.5<sup>1</sup> percent, with strong sales of household appliances and building construction materials reflecting the frenzied housing boom in all cities across Lithuania. A series of supermarkets have made their mark. Two chains, Iki and Rimi, are Belgian and French, the third chain, Maxima, is Lithuanian. Euro stores such as Benetton are appearing on the streets of Vilnius. New hotels are appearing across the cities, with a particular preference for modernisation of historic buildings in the city centres to satisfy the demand for centrally based accommodation. So how this impacting on the

landscape? In Vilnius, the capital, the impacts are very obvious in two specific areas, on the banks of the River Neris, and in the historic centre.

On the banks of the Neris River, in an area that before 1945 comprised villages quite separate from Vilnius, a vast new urban area is taking shape. In the first phase, 120 hectares of land was developed, with more to follow according to demand. The Municipality of Vilnius describes it as the biggest urban development in the Baltics; certainly, the commercial and retail space that will be created by 2010 will transform a non-descript area and enhance Vilnius's amenities.

Following on from the expansion of the nearby Akropolis shopping centre, which is now the biggest in the Baltics, in 2004 the Europa Centre opened. The Europa is a state-of-the-art shopping and office development that includes the Baltic's tallest tower block. Sold by Lithuanian developer Hanner to Baltic Property Trust Secura for €37m, it is already the focal point of what will be an €800m urban redevelopment project<sup>2</sup>.

Vilnius's main commercial thoroughfare, Gediminas Prospekt, has attracted substantial investment: there is a new Novotel Hotel and several new shopping centres. A historic building was purchased by the Irish-based Duke House Asset Managers in June 2004 for €13.2m; Gediminas 9 is to be turned into a shopping centre; a further €35.5m is due to be invested before completion in 2006. With an area of 18,000m<sup>2</sup>, Gedimino 9 will be to Vilnius what Bloomingdale's is to New York. And is this all good? Well, not according to town planning experts. The area by the River Neris may have become a shopping and commercial mecca, now easily reached from the main shopping precinct by new pedestrian walkways across the river, but it is also a region of new skyscrapers where building height limits and sightlines appear to have been subsumed by commercial priorities. The only saving

grace, from a planning perspective, is that currently this development is restricted to a virtually greenfields area on the other side of the Neris River to the historic centre and the commercial area on Gediminas Prospekt. Most of this large scale development occurred between 2003 and 2004, when commercial space was expanded by 162,800m<sup>2</sup>: the office market added 52,800m<sup>2</sup> and the amount of retail space doubled<sup>3</sup>. More is to come, with many major investments underway, with projects encouraged by rapidly rising prices for residential, retail and commercial real estate and many new market reforms to encourage investment.

Foreign ownership has been strongly encouraged and supported by easy access to land, to capital and to planning approvals, in a way not conceivable in established economies, but all part of the great desire for “europeanisation” and change in this country.

I mentioned the Novotel Hotel development in Gediminas Prospekt. This exemplifies the sort of current debate between planning professionals and the city developers. Gediminas Prospekt is an aesthetic and balanced mainly 19<sup>th</sup> century collection of mixed commercial, retail and residential buildings. Building heights are at 3 - 4 stories. The new Novotel site is in the middle of the Prospekt. With its mansard roof and at 7 stories in height, it is not so different from the surrounding buildings, but it's black glass frontage and its central positioning has angered planners. The adaptive reuse of buildings (as planned for Gedimino 9) is preferred to the injection of a plain glass box which looms ever so slightly above its surrounding landscape.

A similar dilemma has occurred in the old town, where retail has had to survive in unaltered buildings of 300 and 400 years. Narrow doors, narrow windows and interiors divided by walls are the norm. Restaurants have adapted easily to the

constraints of these places, indeed, capitalised upon their quaintness, and even opened up the extensive and deep cellar spaces in many of these buildings. However, the story is different for retail, with a push to punch out walls and windows to create an inviting interior from the street, where the retail offering is visible. This change has been of particular concern to locals, who fear the very heritage elements which give the city its Unesco World Heritage Status are being compromised.

Historic buildings are not the only areas being rapidly developed. Whole streets and squares are being reconstructed in a whirlwind of activities – services are being relaid (or laid) as whole streets are pulled up and repaved and landscaped. Gediminas Prospekt is the most obvious area of such renovation.

#### Upgrade of transport and communication

This sort of street upgrading is part of the overall huge effort to bring Lithuania in to line with other European countries in terms of its transport links. Both the airport and the railway system are clear examples.

Vilnius Airport, although it has been overhauled since soviet times, is still unable to handle large capacity planes, and therefore attracts only feeder planes from hubs at Helsinki, Copenhagen, Amsterdam, Vienna and London. These planes handle loads of approximately 80 passengers. Companies such as the Meridien Villon which has recently opened an international conference centre in Vilnius for 1,800<sup>4</sup> people, are concerned about airport through flow, as at present the airport cannot handle this number of people simultaneously. This means that the airport must expand. Planning for a new terminal in 2006 expects the airport's capacity to be lifted to 2 million passengers per month, whereas currently the airport can only handle a quarter of this amount.

Lithuania's national railway company Lietuvos Geležinkeliai has recently completed a project that installed a state-of-the-art computerised traffic control system for stations. The new system, which conforms to European standards, has enabled it to improve safety and increase speed of trains along its two international transport corridors, from Kaišadorys, in central Lithuania, and from the northern part of the country, connecting with St. Petersburg and with Warsaw in the south. The new system has also helped the company to cut management costs.

This project is one of a number of redevelopments of the railway network. The main railway stations in Kaunas and Vilnius have completed major refurbishment with new ticketing facilities, and much better access to platforms, as per the highest European standards. Simultaneously, track work and minor stations along the main routes have been overhauled and upgraded, with 169km of outmoded narrow gauge railway suspended except for the transport of agricultural products<sup>5</sup>.

Most of Lithuania's rail track is broad (Russian) gauge, necessitating a change of wheels at the Polish border on international through trains as the gauge changes there from standard to broad – a definitely outmoded practice in today's Europe. As part of the upgrading of the system, railway track from the Polish border to Kaunas in central Lithuania will be replaced with European standard gauge. However, elsewhere broad gauge will remain indefinitely.

There are more than 2000km of railway lines in Lithuania. In 1996, over 29.1 million tons<sup>6</sup> of freight were carried. Most of this freight comes from Byelorussia, and the Russian Federation with goods transported to and from the ice-free port of Klaipeda. This huge enterprise means that the current rail track will remain as is, except for the passenger link mentioned. Considerable state investments has been allocated for the further development of railway freight transport.

Other infrastructure projects include ports and roads. Sea routes through Klaipeda State Seaport extend the road and rail lines of the east/west corridor to other European seaports. Klaipeda Seaport the only ice-free winter port on the eastern coast of the Baltic Sea, and is able to receive ships up to 200m in length and with a draught of 10.5m.

Every year about 7000 ships enter the port from over 45 countries, and the port handles up to 21 million tons of cargo.

From Klaipeda Seaport there are regular ferry and cargo services to Germany, Sweden, Denmark, the Netherlands, Belgium, Russia, Poland, Great Britain and other countries. The infrastructure of the port is being modernised and expanded, including projects such as the construction of container and bulk-cargo terminals, reconstruction of the facilities for oil products and ferries, improvement of the port entrance infrastructure, dredging of the water territory of the port to a depth of 14m, and reconstruction of the quay walls and development of the port's railways.

As Klaipeda has always been a port of some significance in this region, these changes to the built environment – that ensure future and continuing port uses, have had a limited impact on the cityscape, and indeed have enhanced the landscape by upgrading and improving former soviet facilities. The extensive port area sits across a narrow body of water and faces the Curonian Spit, a narrow spit of land in the Baltic sea which has significant ecological significance, being mainly a national park.

While it is not the scope of this paper to dwell on roadworks, it can be mentioned that part of the upgrading of the road network includes the upgrading of the Via Baltica which connects Finland and the Baltic countries with the road networks of Central and Southern Europe. This is considered a major European Union priority, as it will bind the area's transport network's firmly into EU structures<sup>7</sup>.

## The impact of Collective Farming

A major divergence between Western European and Soviet Agricultural policies was the introduction of collective farming. This involved the forcible takeover of numerous farms and villages and the replacement of those with large landholdings often producing a single agricultural product. These landholdings were supported by major production centres for these products. Thus, in theory, if the farm was a dairy cattle farm, it would contain on the farm a barn and milking area for all cows and often, facilities to process dairy products which could then be distributed. Work was carried out by work teams. The impact on the landscape of these farms was firstly, removal of traditional villages often with buildings of historic and heritage merit and small farm holdings, and replacement of these with massive barns or warehouse style structures. These structures were quickly and cheaply constructed of the most basic materials and both in their scale and appearance were out of proportion with the landscape. At the most they can be described as ugly blights. When Lithuania regained independence, there was a massive shift in land ownership, with land reverting to pre-collectivisation original owners. This has caused a major problem; both with the collective farm buildings and with land use. Having stripped use down to one use only, it has been difficult for the new small holdings to survive with a small plot of land. This has resulted in migration away from agricultural pursuits – an action of concern to the EU which strongly protects its primary producers. Today only 31.8% of the population lives in rural areas<sup>8</sup>. This migration has led to a second issue – the abandonment of the buildings used for collective farming. These ugly monoliths are scattered throughout the countryside, and no-one wants to claim them or reuse them. Basically they are not fit for re-use, being too big for small farming;

too poorly constructed to be used for another purpose; and the materials used to construct them also being unsuitable for reuse if the building were to be demolished. In the early period of independence, an attempt was made by some farmers to reuse the bricks used in some farm buildings to build houses. Regrettably, due to the poor quality of the bricks, the smell of the farm (in the case I refer to, the previous use had been a piggery) was so impregnated into the bricks that the new houses were uninhabitable.

### The Military Impact

A similar situation has occurred with buildings built and utilised by the Russian military. Some of the buildings used by the soviets had been constructed in Tsarist times, during the previous Russian occupation. The buildings used as military barracks from this era are particularly worthy of note. Built of a typical deep rust coloured rough brick their proportions are classic and simple – rectangular, two story constructions with large arched windows running the length of each side. Regrettably, after independence these fine heritage buildings were looted for materials – whole windows, great wooden beams and heavy wooden doors were pillaged, leaving shells of buildings scattered throughout the country, particularly in areas which were designated critical for defence. The main problem here is that no-one has claimed ownership for these buildings and they are left as they are. Other military impacts on the landscape include sentry boxes and military airfields. During soviet occupation, there was concern that Lithuanians would endeavour to escape along the 90km stretch of Baltic coast. In order to prevent this happening, a number of measures were undertaken, including the construction of numerous sentry boxes in the low sandy pine forests next to the shore. These boxes, while not large were

constructed of massive reinforced concrete. The thickness of the concrete and the sensitivity of the landscape in which they are placed has created a significant headache for the local administrators, who would rather spend limited resources on beautification works in the main tourist area; and indeed, new paving, roadworks, tree planting and street furniture have been the priority in the main seaside resort of Palanga, site of the world's first amber museum and a mecca for Northern European tourists in the summer months.

In terms of heritage preservation, Lithuanians are concerned that they are unable to fund reconstruction and repair of the thousands of heritage buildings (in particular churches and religious buildings) dilapidated by soviet occupation, to bother with repairing the very objects which represent occupation and subjugation. The loser is the built environment, and it will be many years until this is resolved.

The military impact is also visible through the remarkable size of some airfields. Šiauliai, in the north western part of Lithuania, was considered to be of military importance, given it's easy proximity to the coast and to main centres. The road from the Baltic coast at Palanga to Šiauliai was utilised as a secondary airfield, so the road has been reinforced and widened, to allow aircraft to land here. This in itself has not caused significant impact, but the airfield is a conundrum. By far the biggest airfield in Lithuania, it has never been redeveloped for commercial / tourist use, and indeed it is not located close enough to the tourist hubs to be of real use in assisting with the capacity issues which Vilnius Airport is experiencing. At present it is being used by NATO as a base for their activities in Lithuania, and may indeed remain as such.

## Soviet Tourism

The soviets were surprisingly enthusiastic about inter-soviet tourism, promoting summer holidays across the union as an essential part of the reward structure of communist life. These holiday places of rest were built in the best locations across the union. These were varied to suit different groups. At the most basic level, camps were built in forests and near the sea for children to experience nature. The structures for this group were mainly of rudimentary cabin style without facilities. Closer to beaches and rivers were built single room “cottages” for tradespeople and factory workers. Again these were similar in style, wooden and without facilities, usually at secondary resort areas. Thus in Lithuania, the most northerly resort, Šventoji, much more down at the heel than its posher neighbour, Palanga, is full of these one room cottages. While these within themselves do not form a visual blight, their positioning is causing a problem for local planning authorities. Following the downfall of the Soviet Union, these cottages were privatised and sold, and those who bought them want to stay there; however, many of them are built right up to the sand dunes on an estuary which authorities want to develop as a secondary port area. At the time of construction this area was not viewed as anything but a “rest area” but with the joining of the EU, the potential of such a site has much broader implications.

Further down the coast, a different problem occurs. In Palanga, recreation accommodation took a different form with individual apartment blocks designed for more important professional and communist party officials. These blocks are generally 5-6 storeys in height and feature wings of bedrooms, some with facilities, some not and usually sharing a kitchen so not of a standard to which European tourists would necessarily wish to rent. However, as a “prime recreational area”,

there are scores and scores of these buildings. In keeping with the simplicity of the accommodation, food was normally supplied in canteens or “family restaurants” and these can be found right along the coast in the resort towns. The more recently constructed ones are massive barn-sized buildings, some with a certain soviet style charm, but in terms of scale, not really usable for the modern tourist trade. Along with these, Palanga features a number of enormous concrete shells of half-finished apartment blocks, on which construction was abandoned towards the end of the regime. Such buildings can be found elsewhere in the country. The scale of Lithuania’s second city, Kaunas, is dwarfed by a massive concrete shell across the banks of the Neumunas River – it was to be a giant Intourist hotel and was abandoned three quarters through construction. The design and construction methods do not conform with European standards, and as it’s not owned by anybody, no-one has come forward with the money required to pull it down and reuse the land for a better purpose, so too the half finished apartment blocks remain in Palanga – reminders that political change can indeed have unexpected ramifications for the built environment.

#### Where to from here?

Planning academics Jonas Jakaitis and Narimantas Paliulis<sup>9</sup> highlighted the critical requirement of standardising current planning instruments to create a national standard, complimentary to the planning systems of Europe and the Baltic sea area.

In Vilnius, Algis Vyšniūnas expresses the need to reach a landing on the issue of balance between heritage protection, ecology, environmental protection and necessary and desirable city development<sup>10</sup>. In a practical sense, the answer to this particular conundrum has resulted in major development and height study research

undertaken by the university, including production of a model of the whole inner city showing desirable and manageable height limitations, while embracing development. But, as his colleague Salvinija Kirvaitiene attests, a free-market environment involves a tension between the needs of the market and the wishes of the administrators approving new developments<sup>11</sup>. Regrettably, in Lithuania, this tension in the last 5 years, has swung towards the desire of the market.

Until Lithuania authorities can define a national sustainable development strategy, Lithuania's urban environments will continue to bear the brunt of a built environment which has developed in a context of inconsistent economic policy and weak strategic planning<sup>12</sup>, while rural environments, subject to diminishing populations and anomalies around ownership of abandoned soviet constructions, will remain stranded with a disused built environment reflecting a past political era. In time though, the link with Europe through the joining of the European Union, will produce benefits in urban planning, as EU euro subsidies and grants include stringent planning and sustainability guidelines, and it is hoped that these plans will set benchmarks for the development of national standardised planning guidelines in Lithuania.

# **Diffusionist Impacts, Opportunities and Constraints in Environmental Policy Making in Turkey**

Sevin Aksoylu  
Anadolu University  
Department of Architecture  
[saksoylu@anadolu.edu.tr](mailto:saksoylu@anadolu.edu.tr)

## **ABSTRACT**

General population explosion and growing industrialisation have resulted in the rapid urbanisation and this led to an ecological and economic imbalance in many developing countries. It's necessary to find ways to make fundamental trends in economic and population growth more sustainable and to reverse the pollution and resource degradation trends that are already apparent in developing countries. The world must quickly design strategies that will allow nations to move from their present, often destructive processes of growth and development to sustainable development paths. This will require policy changes in all countries with respect to their own development and to their impacts on other nations' development possibilities.

Economic growth and population densities especially in the big cities have had severe negative impacts on Turkey' environment such as water pollution, air pollution, inappropriate land use, destruction of forests etc. The main causes of these problems are ; growing urban population, fundamental market and policy failures that encourage inefficient resource use, institutional weakness in formulating, implementing , enforcing and monitoring of environmental policies, multiplicity of actors with overlapping, uncoordinated responsibilities. From the beginning of Republican Period, many laws which are related directly or indirectly to preserve natural and urban environment were enacted, many regulations were determined. Sensitivity of people to the environmental problems and establishments of new institutions have increased. Although, there is a relative increase in the domestic concern for the environmental problems, internationally renowned policy ideas played a major role in the Turkish environmental policy . Depending on this , sustainable development became the main point of the environmental policy. But, necessary legal and institutional reforms and changes for the sustainable development were not developed and the ministries related to environment preferred to continue their works as usual.

This paper will analyse; the environmental policy of Turkey, the role of diffusionist ideas , institutions and actors in the Turkish environmental policy , opportunities and constraints in policy making and proposed actions related to sustainable urban environmental development strategies.

**KEY WORDS:** Sustainable Development, Environmental Policy, Environmental Problems.

## **INTRODUCTION**

During the last few decades, environmental problems have become important issues for both developing and industrialized countries. Environmental problems are growing and will continue to grow to the end of this century. (EPFT, 1988b:5) In particular, the 1960's and 1970's were marked by the concern about pollution. The publication of Silent Spring of Rachel Carson (Carson, 1962) had contributed to rise of environmental concerns about the use of pesticides, chemicals and fertilizers in agriculture and their impact on humans and environment. As Weale has pointed out, 1970's pollution control strategies involved institutional adjustments in the form of new organizations and institutional forms (Weale,1992:22) They were also marked by an awareness that environmental problems arise within the context of a complex interrelationship between the humankind , the global resource base and the social and physical environments. As a result, questions about the acceptability

of conventional growth objectives, strategies and policies were brought to the forefront of public debate. (Baker et. Al, 1997:2)

During the mid 1980's, it became apparent that the environmental policy strategies of the 1960's and 1970's were not adequate for the emerging, second generation of diffuse-source, transnational environmental problems. (Lundqvist, 2001:1) Throughout the 1980's and 1990's new policy ideas and policies were accepted as environmental policy strategies. Sustainable development and ecological modernization are two main discourses of this period. These policy ideas reacted against prevailing environmental policy paradigm.

Turkey is as a developing country, environmental issues have taken more public attention for the last few decades in there. There are serious problems as urban environmental degradation, atmospheric emissions, soil erosion and land degradation, water resource degradation, air and water pollution, deforestation and loss of natural habitat. The first of the several underlying causes of environmental issues in Turkey is the strain on the resource base imposed by Turkey's large and growing urban population consisting of 16.869.068 million in 1975 increased to 44.006.274 in 2000 and the ratio of population has increased from 40% to 59% in the same period. ( DİE,1991; <http://nkg.die.gov.tr>) Rapid population explosion was concentrated in the big cities. In these cities, environmental issues are largely caused by the high concentration of domestic and industrial wastes.

It is a well-known fact that the legal arrangements required for dealing with these problems are correspondingly broad and divergent in scope. From the beginning of the Republican Period, many laws which are related directly or indirectly to preserve natural and urban environment were enacted, many regulations were determined. Sensitivity of people to the environmental problems and establishments of new institutions have increased. Although, there is a relative increase in the domestic concern for the environmental problems, internationally renowned policy ideas played a major role in the Turkish environmental policy.

Environmental problems started to come to the attention of the public authorities during the early 1970's. After the Stockholm Conference, a new institution was established by the Turkish bureaucracy to deal with environmental problems and environmental problems appeared in the Third Five Year Development Plans (1973-1977) under a separate section. The first Environmental Law of Turkey was issued in 1983 and it endorsed the Polluter Pays Principle and handled environmental issues.

Institutionalisation of environmental policy continued during the 1980's and 1990's. Sustainable development started to become influential towards the end of the 1990's and it was adopted as a central concept in the Sixth Five Year Development Plan (1991-1996).

By the 1990's, we can see a change in the approach of the Ministry of Environment to environmental issues. Like its predecessor in Stockholm, the Rio Conference had a significant impact on the attitudes of the actors in Turkey. Protection and improvement of the environment became a major objective for the Seventh Five Year Development Plan (1996-2000) and sustainable development and the discourse of ecological modernization started to be spelled in many areas, industrialization was seen to be replaced with sustainable development. (SPO, 1995) National Environmental Action Plan (NEAP) was prepared by the State Planning Organisation with the financial support of World Bank and adopted in 1998 as part of the national development plan.

Development of the capacity of environmental management, use of the economic tools in the integration of the environmental policy with economic and social policies are the some objectives of the Eight Five Year Development Plans. Parallels would be drawn with EU norms and international standards by considering country' realities. (DPT, 2006)

Historical developments in the field of environmental policy of Turkey, the role of international ideas , institutions and actors in the Turkish environmental policy , opportunities and constraints in policy making and proposed actions related to sustainable urban environmental development strategies will be summarised in the following sections..

### **Environmental Policies in Turkey**

The first efforts for environmental protection in Turkey can be dated back to the 1920's. Some measures were taken for the prevention of deforestation, soil erosion and for the protection of public health. The Municipal Law and the Public Health Law of the 1930's contain some articles related to environmental issues. At the same time, the Forest Law of the 1930's , regulated the ownership, management and the other matters concerning forests. These acts regulated the areas of forestry, public health and hygiene for decades. (Algan, 2003;EPFT,1988b:25,29,33; Municipal Law No:1580, ; Forestry Law No:6831; Public Health Law No: 1593)

At the beginning of 1960's , Turkey transformed its development strategy into an Import Substitution Industrialisation strategy and strategy of central planning was introduced. The State Planning Organisation was established and five year development plans and annual programmes were established. Following the 1960's governments supported private industry by using incentive mechanisms and industrial establishments were protected from the protectionist tariffs and duties. Depending on these efforts, industrialisation and substantial urbanisation of the country has developed to some extent but Turkey ended up with several forms of pollution stemming from industrial production and pseudo-urbanisation.

Environmental problems started to come to the attention of the public authorities during the late 1960's and and early 1970's. Firstly, these problems were ignored or dealt with by individual branches of the bureaucracy. Environmental policy was developed by separate public organisations, especially local governments not national in scope. (NEAP,1997a:16) Earlier environmental problems have been accounted as technical and economical problems: however, these problems have been accounted as their societal dimensions as well as technical and economical dimensions for last few decades. The societal dimensions of environmental problems and environmental issues attracted more public attention and social scientific concern in the second half of the twentieth century especially after the 1970's . (Tuna) Environmental policies of Turkey after 1970's were focused on repair of damage such as rebuilding urban environments, restoration of natural and cultural habitats and rehabilitation of wild lands, reforestation, reclaiming of desert lands after the fact, the sources of environmental problems were not analysed by the authorities. (WCED 1987:39) It was believed that environmental protection and economic growth were incompatible.

Environmental planning has been part of Five Year Development Plans since the mid 1970's due to the impact of the Stockholm Conference in 1972. (Egeli,1996: 110; Okumuş,2002; DPT,1972) During the Third Five Year Development Plan Period (1973-1977) , in which the environmental issues were on the agenda of the world, it was emphasized that, the ecological balance was disturbed due to industrialization. But environmental policy in the plan was not

clear and definite enough. This hesitation has been originated from the doubts about the possibility of negative impacts of environmental protection efforts on industrial developments.(DPT,1972; Bektaş,1988) Prime Ministry Undersecretariat of Environment was established in 1978 .

In 1982, new Constitution was enacted and it accepted the protection of environment in the article of 56 . According to this article “ everyone possesses the right to live in a healthful and balanced environment. It’s the duty of the State and its citizens to develop the environment , to protect environmental health and to prevent environmental pollution. (The Constitution, 1982; EPFT,1988b) In continuation of the Constitution, The Environment Law (coded 2872) was passed in 1983. The purpose of this law defined as, to govern according to definite legal and technical principles and in conformity with the goals of economic and social development, the arrangements to be made and the measures to be taken in order to protect and improve the environment which is the common property of all citizens; to protect and make optimal use of land and natural resources in rural and urban areas; to develop and guarantee the standard of health, civilization and living of the present generation and of future generations by preserving the nation’s plant and animal life and its natural and historical wealth. (The Environment Law No:2872, 1983) As it was seen, law considers the environment as a whole not only to prevent and eliminate pollution but also to allow for the management of the natural and historical values and the land in such a way as to utilize and preserve such richness to concern for the future generations as well. The measures to be taken and the arrangements to be made should be compatible with the economic and development targets. (Tütünlü et all; Aksoylu,1994:28;EPFT,1988b:11) This law starts from the principle of the " the polluter pays" and handles the environmental issue on a very broad scope. (The Environment Law No: 2872,1983) Polluter pays principle was introduced but was taken to imply the cleaning up of pollution after it happens. Although some improvements were observed, this strategy did not produce much for the solution of environmental problems. The polluter pays principle and fines remained ineffective given the high levels of inflation. According to the basic principles that govern the application of the Environment Law and as stated in constitution of 1982 , citizens as well as the state bear responsibility for the protection of the environment. (Budak,2000:364) The principle in economic activities for determining the implementation of production methods to minimize and solve environmental problems is one of the basic principle of the Environment Law.

In 1983, the General Assembly of the United Nations set up the World Commission on Environment and Development which was formed by representatives from 21 countries in all regions of the world. In April 1987, the results were published in the form of a book entitled “Our Common Future” (WCED,1988; Court,1990; Pearce,Markandya and Barbier,1991; Backstrand et al., 1996) The Brundtland Report firmly established the concept of sustainable development as the basis for an integrative approach to economic policy in the coming decades.(Pearce,Markandya and Barbier,1991) Evolution of sustainable development as a world strategy has been a political process involving several global actors.

The idea of sustainable development in Turkey started to become influential towards the end of the 1980’s and Ministry of Environment was established by Government Decree No:443 in 1991 which empowers it to conduct activities to protect and improve the environment. These activities involve ensuring appropriate land use, protecting natural resources, plants and animal species and preventing pollution. Its duties include drafting laws, preparing rules and internal regulations, creating institutions such as village environment associations and commissions to manage waste, supervising and planning environmental designs, creating

environmental policies and strategies, coordinating environmental activities at international and national levels, applying measurements, monitoring, collecting data, managing finances and carrying out extension and training.(Ural,1993:477; NEAP,1997a:20; EU,2004) Decree on the Establishment and Duties of Ministry of Environment stated that “the Ministry of Environment is responsible for preparing, ratifying and implementation of environmental loans for the objective of rational use of natural resources in consistent with sustainable development objectives which require taking economic and ecological decision together.” With the establishment of the Environment Ministry in 1991, Turkey began to make significant progress addressing its most pressing environmental problems. The most dramatic improvements were significant reductions of air pollution in Istanbul and Ankara. However, progress has been slow on the remaining--and serious--environmental challenges facing Turkey.

Sustainable development was adopted as a central concept in the Sixth Five Year Development Plan (1991-1996) and The Environmental Impact Assessment Regulation was put into force on 7<sup>th</sup> of February, 1993. Protection and improvement of the environment is a major objective for the period 1996 to 2000 (Seventh Plan) . In this context, administrative and institutional problems as well as deficiencies of legal framework and environmental management are defined in a detailed manner. It's aimed that conservation of the environment will be handled as a whole in modern sense with coherent components of economic, commercial and political nature. The 1998 National Environmental Action Plan is a leading example of national environmental planning , given its high quality and comprehensive analysis, setting of orientations and objectives and action-oriented proposals. (OECD Report,[www.oecd.org/dataoecd/8/30/2452088.pdf](http://www.oecd.org/dataoecd/8/30/2452088.pdf))

In 2003, the Ministry of Environment was merged with the Forestry Ministry. With its goal to join the EU, Turkey has made commendable progress in updating and modernizing its environmental legislation. However, environmental concerns are not fully integrated into public decision-making and enforcement can be weak. Turkey faces a backlog of environmental problems, requiring enormous outlays for infrastructure. The most pressing needs are for water treatment plants, wastewater treatment facilities, solid waste management, and conservation of biodiversity. The discovery of a number of chemical waste sites in 2006 has highlighted weakness in environmental law and oversight.

### **Diffusionist Impacts on the Environmental Policy of Turkey**

External pressure plays a major role in the policy change in Turkey. For early developments in the field of environmental policy of Turkey, the first push came from abroad. The United Nations Conference on Human Environment having considered the need for a common Outlook in the preservation and enhancement of the human environment. Attention was drawn to the need to preserve natural habitats to produce a sustained improvement in living conditions for all and the need for international cooperation to achieve this. The emphasis was on solving environmental problems but without ignoring social, economic and developmental policy factors. (UNEP, 1972) Turkey sent a delegate to the Stockholm Conference and it influenced the Turkish bureaucracy in establishing a new environment institution, (Özdemir,1988) Although the first two Five-Year Development Plans ( 1963-1972) do not have specific sections on the environment, Third Five Year Development Plan which covers 1973-1977 contains seperate section for environmental problems. (DPT,1972 ) In this plan, the establishment of a central organisation to deal with environmental problems were suggested. (DPT,1972; EPFT,1987:38-39) The environmental problems of the developed and

developing countries were also considered separately and it stated that the real environmental problems of the country were soil erosion and environmental health stemming from inadequate use of natural resources and from insufficient levels of income and education. (EPFT,1987:38-39) The strong impact of the Stockholm Conference on the 3<sup>rd</sup> Five Year Development Plan is evident.

Turkey has some international connections and commitments and he cannot stay outside of these developments. Turkey adopted all the environmental legislation of OECD and recently that of the EU following the Custom's Union and copied their organizations, adding them on to existing systems without making necessary changes in its wider legal and institutional system. (Budak, 2000:358) For example; Air Pollution Regulation is based upon the German short and long term limits and the Environmental Impact Assessment regulation is a combination of US and EU regulations. (Orhan, 2002:131) This is very similar to other examples of environmental policy around the world. For instance, after their accession to European Community, Greece, Portugal and Spain downloaded the European Community's environmental legislation. (Weale et al, 2000) The role of EU is much more important than the other institutions. Because he holds the legislative and implementing powers into his hands. (Kepenek,B.) As the other contemporary states, Turkey signed almost every international convention on environmental protection and pollution control except some international conventions at the Rio Summit ,Turkish state did not signed them because they categorise Turkey as a developed country which requires Turkey to assist developing countries for environmental protection. (Orhan, 2002:163) Some commentators mentioned the influence of German legislation on Turkish environmental policy.

Similarly , the Ministry of Environment was established in 1991 as part of the process leading to the Rio Summit in 1992. ( Ertuğ,1999; Somersan ,1993) The Rio Summit was formally called the "UN Conference on Environment and Development" held in Rio de Janeiro. The Conference led to agreements on a declaration on environment and economic development and sustainable development is the real key word. (Rio Summit, 1992) By the 1990's and especially following the Rio Conference, several changes in the approach of the Ministry of Environment to environmental issues have been observed. Like its predecessor in Stockholm, the Rio Conference had a significant impact on the attitudes of the key actors in Turkey. Sustainable development started to become influential towards the end of the 1990's and it was adopted as a central concept in the Sixth Five Year Development Plan (1991-1996). Protection and improvement of the environment became a major objective for the Seventh Five Year Development Plan (1996-2000) and sustainable development and the discourse of ecological modernization started to be spelled in many areas, industrialization was seemed to be replaced with sustainable development. (SPO, 1995) Environment and development have been accepted as inseparable parts of a whole and environmental protection has been considered of equal weight as development. Turkey would industrialise and develop without devastating its environment. (Cumhuriyet,1992)

Nowadays, Turkish environmental policy at cross –road. As part of its attempts towards full membership to the European Union. The October 2004 Report of Eu noted that despite some progress, the overall level of transposition of the environment acquis remained low. Moreover, weaknesses in implementation and enforcement were stil sources of major concern. Considerable investments needed to be secured. Turkey is under significant pressure to recognize the conditionalities of the Kyoto Protocol to reduce its CO<sub>2</sub> emissions and other gaseous pollutants over the next six years. ((EU,2004; Goulder and Pizer,2006;Adkins and Garbaccio, 1999)

The second set of pressure comes from international economy . An important issue in developing policies for the mitigation of greenhouse gas emissions is to determine a feasible set of policies to generate emission reductions and to make investments in energy-saving technologies Industries need to be green, environmentally friendly and efficient for export competitiveness. This factor led to a major change in the behaviour of the industry.

Finally we could talk about the pressures coming from international environmentalist organizations. The International Energy Agency (IEA) has criticized Turkey's efforts to reduce air pollution, saying that current measures do not go far enough. In its annual report on member countries, the IEA stated that Turkey needs to maintain and possibly increase investments in public transport, especially in urban areas, as well as improve the implementation of existing regulations on air quality.

In May 2001, Greenpeace activists climbed the chimney of a waste incinerator in the northwestern city of Izmit to protest pollution from the plant. In 1998, the plant was closed by the Turkish Energy Ministry due to potential health hazards. The plant was reopened, however, in 1999.

### **Constraints in Environmental Policy Making**

From the beginning of Republican Period, many laws which are related to preservation of natural and urban environment were enacted, many regulations were determined. Sensitivity of people to the environmental problems and establishments of new institutions have increased. Although these laws which give more importance to environment, environmental deprivation still increases and it will increase in the near future.

The main reasons of this policy failure are different kinds. First, sensitivity to the environmental problems has started very slowly in recent years. Although many laws include some preventions and limitations related to environment, they are not sufficient. The Environment Law was a bad translation , there was a lack of coordination between institutions ; there was no transparency and democratic participation in the process of environmental protection. Environment Law foresees a conflict between environmental protection and social development and gave higher priority to the development (1,3b,c) The Turkish State had introduced an Environment Law, but it was the main polluter itself and that was why there are loopholes in the legislation.(Güneş Gazetesi,1987)

Secondly, the lack of strong environmental institutions capable of formulating , implementing, enforcing and monitoring of environmental policies. Weak institutional capacity is further weakened by jurisdictional complexity, insufficient information and lack of broader participation. There is limited co-ordination between sectoral ministries and different levels of government on environmental matters. The Ministry of Environment is in practice relatively new, with limited resources and limited competence, several functions are carried out by other government agencies. Institutional weakness is especially acute at the level of local governments and agencies who are responsible for monitoring and enforcement. Municipalities and local authorities have low status in the bureaucracy, have restrictive responsibilities to support environmental management, lack adequate staffs, skills and equipment, and also its contribution to integration of environmental concerns in other national policies is also restricted. (Aksoylu,1994; [www.oecd.org/dataoecd/8/30/2452088.pdf](http://www.oecd.org/dataoecd/8/30/2452088.pdf))

The development, especially industrial development is regarded as more important than the environmental protection. On the one side, environmental protection is taken as a goal, on the other side developments which destroy the environment are defined as major objective. High rate of urbanization and population increase create demand for different facilities such as job opportunities, housing, social services and infrastructure which are necessary for men's survival. New job opportunities have to be provided, new investments related to economic activities and services have to be met. But insufficient solutions for basic needs resulted in crowding, pollution, concrete piles and so destruction of both urban and natural environments. Lack of analytical frameworks for understanding the problems, most of the governments are not fully aware of magnitude of the problems or the impacts of on the population. As a result, effective control of the environmental problems can not be realized.

A multiplicity of actors with overlapping, uncoordinated or poorly defined responsibilities aggravates institutional weakness and hampers the development and implementation of a broader environmental management strategy. There was insufficient dialogue between the actors and institutions in the field of the environment. There is limited co-ordination between sectoral ministries and different levels of government on governmental matters. The Ministry of Environment is in practice relatively new with limited resources and limited competence. Several administrative functions are carried out by other ministries or other organizations. Its contribution to integration of environmental concerns in other national policies and to supporting environmental management by municipalities or local authorities is also restricted. ([www.oecd.org/dataoecd/8/30/2452088](http://www.oecd.org/dataoecd/8/30/2452088). pdf)

Regulation, guidelines and standards are often not well developed nor do they reflect the institutional capabilities and scientific knowledge available within the country. Lack of the capacity of governments to carry out and implement effective environmental planning and management is another reason. Pressure groups who want to maximize their benefit effect the government decisions. So, investments which can be used for rehabilitation and development of quality of life elements are directed to other investment areas which is more beneficial for the pressure groups.

There is a lack of adequate enforcement capability. In order to provide some effectiveness, fines and penalties for non-compliance with environmental regulations would need to be revised. The Ministry of Environment would also need to develop an inspection and enforcement branch and strengthen its territorial capability.

Political and economic stability is important for long term plans for environmental protection. Whereas, political and economical instability in Turkey forced both governments and investors to follow short term solutions for their economic problems which deterred them from pursuing long term approaches to environmental problem solving.

Although participation mechanism such as local environment committees, the EIA procedure and Councils for the Environment and Forestry exist, public participation is a relatively new process in many instances. Environmental NGO's will need to address a range of issues in order to establish themselves as stimulating and constructive partners for environmental progress.

## CONCLUSIONS

External pressure plays a major role in the domestic environmental policy change in Turkey. Stockholm Conference, Rio Summit, international conventions and Commission Reports of EU have affected the definition and changing of the environmental policy in Turkey. Turkey tried to adopt these regulations and targets of declarations to his environmental policy.

As it's said before, one group of pressure comes from international organizations such as OECD, EU. Turkish State signed almost every international convention on environmental protection and pollution control except some international conventions at the Rio Summit. That's why, he necessitated to make some arrangements, changes and adoption from these conventions and also he made some arrangements according to the report and declaration of these organizations.

The second set of pressure and obligation come from the international economy and export conditions. According to the international rules and regulations, industries need to be green, efficient for export competitiveness and environmentally friendly. This factor also led to some changes in the environmental policy and behavior of the industry in Turkey.

Finally, international environmentalist organizations play a role in the definition and changes of the environmental policy of and prevention of pollution based applications in Turkey.

Till now, the development of Turkish environmental policy making has been slow. Successive governments have consistently resisted, delayed or willfully misinterpreted environmental legislations and taken positive steps only in response to international developments. Turkish State had make progress in transposing the environmental acquis of EU and improving administrative capacity. Further efforts were needed to improve the situation and particular attention should be given to the implementation and enforcement of environmental legislation. But during the diffusion and harmonization of the international ideas and legislation; local conditions and realities must be considered and interactions between importers and local actors must be incorporated. In other words, environmental policy can be shaped by domestic realities such as economic and social structures and political intends as much as the international conventions and legislation. We must keep in mind that, the success of the external pressure groups is upon the local support of the indigenous environmentalist actors and perception of economic interests in this process.

# Japanese Ordinary Town's Historicity and Townscape Management

Keiichi KOBAYASHI

Department of Environmental Design, Tohoku University of Art and Design  
Kamisakurada 200, Yamagata, 990-9530, Japan / kvyz@env.tuad.ac.jp

## 1. Introduction

The modern era has been greatly characterized by tremendous urbanization, with townscapes in this period being markedly changed. In Japan, only the conserved districts seem to have been able to keep their original townscape as it had been in the past, but the scenery of such districts, which are tightly controlled under a strict conservation system, have come to be disparately contrasting to places where everyday life occur, and thus have an artificial feeling about them.

The typical conservation tool for historical districts in Japan is one that is used to designate areas as the “Preservation District for Groups of Historic Buildings,” which was implemented in 1975 by amendment of the Cultural Properties Protection Act. This appeared not long after the new Town Planning Act, which was established in 1968, in order to make urban developments ordered under planning controls just before the rapid growth after the Second World War. Up until now (2006), sixty-six traditional districts have been preserved in accordance with this regulation system, under which typical traditional buildings are designated as elements to be preserved, and design guidelines are made for other buildings in each selected district. Such a strong system of preservation was needed to protect the traditional Japanese townscape of the pre-modern age or early modern era<sup>#</sup> from being lost to the surrounding rapid urbanization and change of lifestyle that was taking place, yet it was inevitable that such efforts also made the protected districts so distinct that they became common tourist attractions.

Meanwhile, there are many other cities and towns founded in the pre-modern age with a historic core or kernel that have been transformed by modern urbanization. In the kernel districts of such historical cities and towns, there is a feeling of historicity, although not as attractive as a conserved area due to the mixture of buildings of many different styles and age, and, also due to streets that were reformed to accommodate modern automobile traffic not matching the townscape of old which had been based on a scale for pedestrian traffic. While a strict conservation system such as the Preservation District for Groups of Historic Buildings is not applicable to the kernel districts of such ordinary towns, it is not adequate to simply disregard them in a town planning system because such districts truly have been a stage of history. Recognizing the value and need for preserving the fragmental historical elements and historicity of such kernel districts in town planning can be a preface to improving the quality of the town's environment as well.

Japan is just at the turning point in her history of urbanization with the national population beginning to decrease in 2005, and the ratio of urban population seeming to be at the ceiling. In such a period, new types of urban issues, such as degeneration of central commercial districts and fall of land prices in local cities,

---

<sup>#</sup> Edo Period (1603-1868), Meiji Restoration (1868), Meiji Era (1868-1912). In this article, “modern age” in respect to Japanese history refers to the period after the Meiji Restoration, or, post 1868.

occurred. When thinking about how to revitalize the central part of cities, the question of “What is the proper treatment for the historicity of such ordinary cities?” also arises.

The main purpose of this article is to make clear how the central parts of ordinary cities and towns have been reformed or conserved through the modern urban planning system based on two samples, and to outline and discuss necessary considerations in the treatment of such districts in city planning and management.

## 2. Urban core formed in pre-modern age

In the first step of this study, cities and towns with historic cores formed in pre-modern age in the Dewa Region, the ancient name for the present-day Yamagata Prefecture and its neighboring Akita Prefecture in the northern part of the main island of Honshu, were identified. It is interesting to note that in this region, only one district in the present-day Kakunodate Town, is designated as a Preservation District for Groups of Historic Buildings. This fact causes the observer to wonder about how other historical cities that did not receive designation for special conservation measures under this preservation system have fared or been reformed up to the present.

The process of identification of towns with historic cores is as follows: (1) Estimate the scale or size of the settlement in pre-modern age by evaluating its position in the urban system in those days based on data from two references published during the same era. (2) Compare how the historic area of the past has developed to the present in terms of population. "Azuma-kou Akindo Kagami" and "Kyobu-seihyo" are the titles of two references used in the first step of identification of towns with historic cores, and are considered reliable sources of data in order to estimate the scale of each urban settlement and the urban system in pre-modern age for this study.

Fig.1 Historical districts in "Dewa" region

"Azuma-kou Akindo Kagami," which was published in 1855, is a member list of a merchants' group and inns used by the membership. Although the number of listed merchants of a city does not directly show the size of the city in terms of population, it does serve as an indicator of size in terms of trade in the urban system of those days. The vertical axis in Figure 1 is divided into the category of number of merchants listed in the membership book.

"Kyobu-seihyo," which was published around 1879, does, on the other hand, contain actual statistical data surveyed by the General Staff Corps of Japan. In this survey, settlements with more than 100 people were surveyed and their population and main production are listed. However, the data may not be so accurate since the survey was not necessarily conducted systematically, and do not directly show the scale of the settlements in pre-modern age because the population of "Samurai," or governmental officers of the pre-modern system in Japan, had been rapidly decreasing after the Meiji Restoration in 1868. Therefore, using data from the publication, which was compiled a little over ten years after the Restoration, to extrapolate the pre-modern population may not be exact. Nevertheless, it is a sufficiently competent source for estimating the rank of a city in the urban system, especially in terms of economic activity. Figure 1's horizontal axis is divided into the category based on the population noted in "Kyobu-seihyo."

Upon examination, the two categories of data in Figure 1 are found to almost correspond. The upper left area of the chart contains castle towns and big port towns which were the center of their respective regional area in those days. The rest, which can be called sub-center cities, consist of little castle towns and local centers of trading functions.

The right column of each cell in Figure 1 also shows the population of the Densely Inhabited District (DID) in the year 2000 for each city or town. These DID population figures show that some comparatively large regional centers with a population of more than 10,000 at the beginning of the modern age continued to develop. Some of the sub-centers in pre-modern age, which had a population of several thousand in 1879, have grown, while some have not developed so much. The towns which did not form a DID as reflected in the chart means that the current developed area which includes the historic core does not have a population of more than 5,000 or a density of more than 40/ha, also suggesting that the current size is quite similar to the pre-modern one.

Of the cities and towns listed in Figure 1, only the Samurai's residential district of Kakunodate (which is underlined in the chart) has been designated for preservation under the Preservation District for Groups of Historic Buildings. Even if – and it is probably so that – the other listed cities and towns in the chart have not developed with traditional building artifacts grouped together spatially, they must at least have a historical core which has some historicity. One possible and common reason for historical cities not being able to keep a grouped area of traditional architectural artifacts is that quite many of them had suffered fire disasters – natural and man-made – such as caused by earthquake, accidents, or battles, as during the Meiji Era in the early days of the modern age. Another reason is that traditional buildings and townscapes gradually changed and disappeared in the process of modernization.

In the following sections, examination will be made of how these historical districts have been reformed in the modern age and how they have kept their historicity based on two example districts. One is a district in a regional center city and the other one is a small local town.

### 3. Changes in townscape of Yamagata City's historical district

Yamagata City greatly developed after the Meiji Restoration, as it was selected as a capital city of prefecture. The population of the city was 48,399 according to the first census taken in 1920 and 256,012 in 2005. Figure 2 is a map of the city in 1901 showing the densely built-up area, almost all of which is a castle town's residential area of citizens and temple area. In the modern age, the castle town was structurally reformed as follows:

1) two rings of moat were buried and the traditional social based zoning was abolished.

2) a railroad was constructed across the abandoned Samurai house area and the area around the station was developed.

3) crank roads and T-crossings, which were typical in traditional castle towns, were changed by extending a new road from the turning or cross point.

4) a new civic core including, especially, a new Prefectural Office and Assembly was made in the adjoining area just the north of the central commercial district by expanding a road.

The area inside the broken line was designated as a commercial zone with limits of 400, 500 or 600% as a floor area ratio (FAR) according to the Town Planning Act established in 1968. Such high FAR, in contrast to the 200% limit of the other areas, allowed for the construction of high rise buildings in this zone.

By the end of 2005, 49.3% of planned road network according to the act was constructed. This percentage seems insufficient or insignificant in view of the plan's completed target, but Figure 2 shows a near grid pattern of road network already emerging in the modern age; also, at only this half-completed stage of road system development, it is already difficult for pedestrians to find the traditional road network in this area.

Although road construction has changed the scenery of the streets, historical elements still are remaining dispersed throughout this area. Public and private conservation activities can be found and are listed as follows:

1) Remarkable historical elements and landmarks are preserved or restored. An example of the former case, historical preservation, is the Prefectural Office and Assembly building (renovation completed by 1995), and of the latter is the main gate

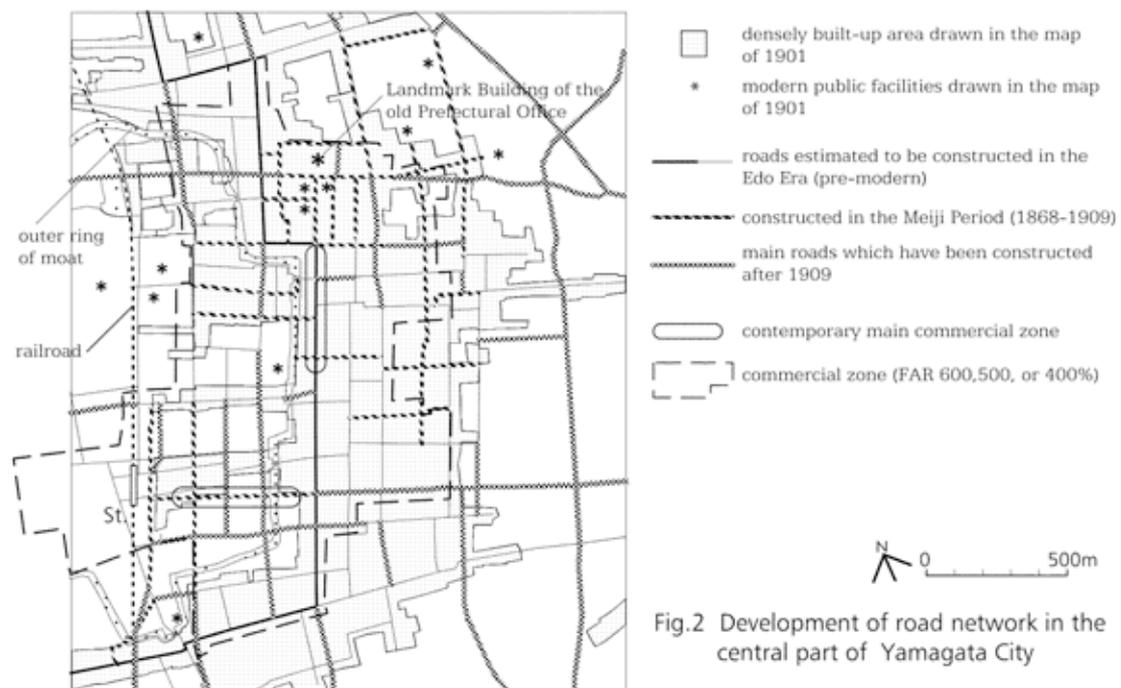

Fig.2 Development of road network in the central part of Yamagata City

of the castle (restoration completed by 1993).

2) Yamagata City established a municipal ordinance for townscape in 1996 and enacted the policy for improving the townscape including honorable recognition of efforts to protect and maintain historicity of its district. To date, under this ordinance, ten notable examples of conservation activities in this area have received distinctions of honor. This ordinance also has a system which can be used as a designation tool for selecting or determining artifacts to be preserved, although there is currently no example yet of an actual artifact that has been designated under this system.

3) The title of Registered Tangible Culture Properties, which is a newly made category of properties by amendment of the Cultural Properties Act in 1996, was conferred to ten buildings and structures (such as walls and gates) in this area.

4) Yamagata City improved the municipal facilities in the area in various stages in order to enhance its historical atmosphere; for example, some part of the protection work for the old stream in the castle town was made with large stones in a way similar to the traditional method of construction, and part of a narrow lane was paved with interlocking blocks instead of asphalt or concrete.

5) Negotiations and agreements about the nature or design of construction are made among the area residents along newly developed roads and back side of preserved landmarks. Notably, for example, a movement took place in 1999 against a plan for a high-rise building just behind the preserved Prefectural Office and Assembly.

6) Some private storehouses are renovated and being used as shop and residence.

Although the road network has been almost completely reformed, historical elements (i.e. landmarks, storehouses, streams, and area configuration of property lot boundaries and patterns) still remain until now. Several kinds of activities in the public and private sectors to promote the historicity of this district appear to be taking place. Upon closer inspection, many more historical elements which have not been made much of must surely be found.

#### **4. Changes in townscape of Yachi District in Kahoku Town**

##### **(1) Development of infrastructures in Yachi District**

As indicated by the number of merchants (20) listed in "Azukmakoh-Akindo-Kagami," Yachi greatly flourished in the Edo Period based on flower production which was used to make dye. Yachi seems to have developed through the early modern age, as the population, which was noted at 5,181 in the "Kyobu-seihyo," increased to 11,000 according to the census of 1920. But since Yachi is located outside of the new regional axis which was formed by a railroad network around 1902, this district now shows a population of 12,221 in 2005 as a part of present-day Kahoku Town which has a population of 21,268.

Figure 3 shows how the road network in Yachi District had developed by 1901(a), 1931(b), 1970(c), and 2005(d). At first, as shown in Figure 3a, access roads were newly constructed and a shortcut was made in the central area. By 1931, access from east was improved by further road development because a railroad station was made on the east side of the city in 1917 by constructing a branch line. The major development issues by 1970 centered on the widening of the main street which ran through the built-up area from north to south. But it is also a surprise to find that the pattern of almost all the pre-modern roads are still functioning and the configuration of built-up area in 1970 is not so changed compared to before. Thus, it may feel as if the pre-modern age were not so distant in this town. However, between 1970 and 2005, this district underwent remarkable changes. The built-up area was expanded by land adjustment projects and the network of new roads formed a grid pattern characteristic of modern developments. As a result of this new townscape of modern road configuration, the traditional road network fell to the background and can scarcely be

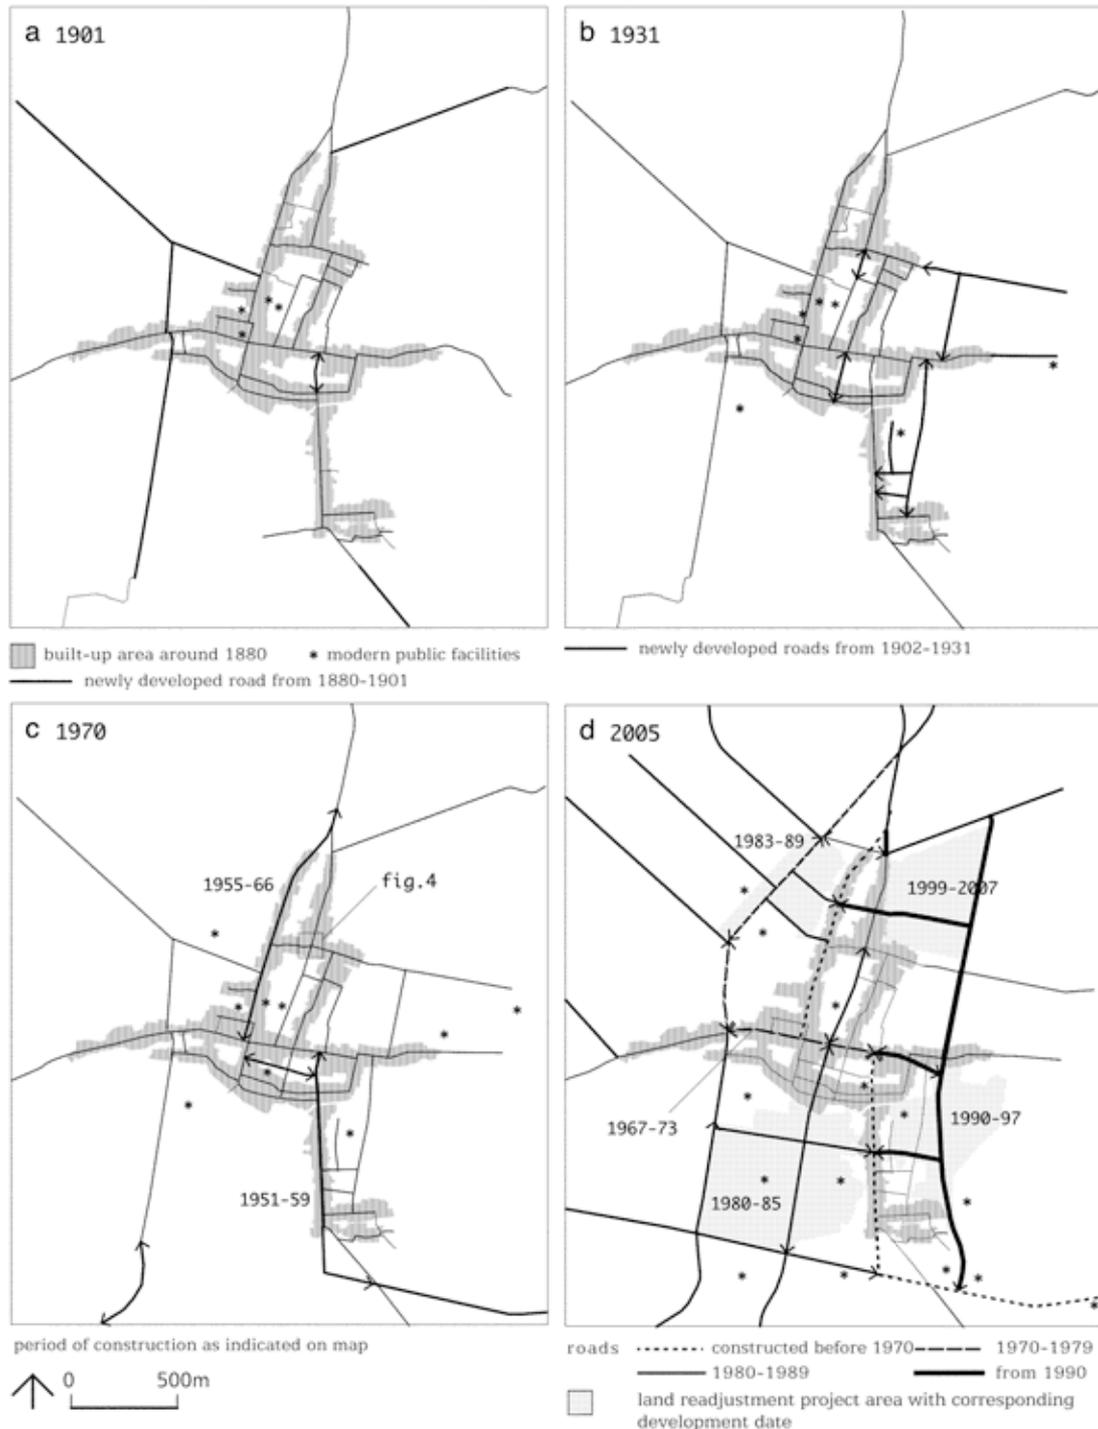

Fig.3 Development of road network in Yachi District in Kahoku Town

recognized by visitors.

## (2) Comparison of townscape changes in Yachi District

Photo 1 shows the buildings along a main street running north to south, which was named "Kudoh-koji," taken in the end of Meiji Era (around 1911). Buildings which have hipped roofs with reed roofing line up along the street and make the traditional townscape.

Photo 2 shows the scenery of a main street running east to west (named "Mae-koji") in 1957. It has a feeling quite similar to Photo 1, but upon closer look, buildings of a different type can be found mixed among the more traditional ones. For example, the three-story house is remarkable and gable roofs on some of the main

houses on the front or street-side of their respective lots are also new. However, if we see these “new” elements in retrospect from the present, they may be also viewed as being very historical or “old.” Sign boards stand at the gate of each building, which show how commercial functions are developed in this area and may be taken to

Fig.4 Change of building type in Yachi District

indicate the shop-owner's intent to make their shops appear modern.

Photo 3 shows the contemporary scenery of the same place, "Mae-koji," pictured in Photo 2. The arcade alongside the road was made in 1976. The street has been widened to accommodate automobile traffic. Many kinds of buildings of wooden and steel construction can be seen.

Figure 4 shows that such kinds of changes in townscape as previously described were caused by changes in roads and building type. Fig.4a is a cadastral map depicting the individual lots in an area of Yachi District in 1877. Figure 4b shows that the main houses on each lot were of the traditional building type with hipped roof and were the main element which characterized the townscape. Figure 4c shows the present condition of the same area. To make roads wider and to build new types of buildings – both have been proper cause for change of townscape. Figure 5 shows the location of the merchants listed in "Azumakoh-Akindo-Kagami."

The scenery of this Yachi District seems to have changed so completely in the past thirty-five years as all buildings with hipped roof of reed have disappeared. Only lot patterns, storehouses, temples and shrines, narrow lanes, and the like seem to be the remaining historical elements that compose the historicity of this district. Nevertheless, the scenery of the life and days of pre-modern age is not so far gone in this district. Not only do the local citizenry seem to have memory of events and places of only thirty-five years past, but this district also has a legacy of twenty merchants' houses which played an active role in the development of the district towards the end of the Edo Period.

## **5. Townscape management for improving urban quality**

### **(1) Basis for discussion of necessary conditions in townscape management**

In this paper, we have taken two settlements in different class rank as examples of ordinary towns with history dating from pre-modern age, and traced how they have changed in this modern period. Information from such investigation also illustrates how they have managed their historicity up to the present.

The central district of Yamagata City was formed as a castle town. Although the territory belonging to the castle lord was mid-sized, its great role in trade had made the city a regional main center by the end of the Edo Period. Road developments restructured and reformed the castle town after the Meiji Restoration, and high floor area ratio led to changes in the scenery with high-rise buildings being constructed during the period of rapid urban growth. On the other hand, public and private conservation activities, for example preserving landmark buildings, restoring traditional gates, remodeling private storehouses for innovative uses such as distinctive commercial space, have come to gradually increase later in the urbanizing movement.

Yachi District in Kahoku Town, which did not have a castle in the Edo Period, had developed as a trading center and flourished especially in the latter part of the era, but comparatively declined in the Meiji Period because its location had become out of way of main traffic routes of that time. After 1970, road and land development changed the town in a short period. Road construction influenced changes of building type in the modern age, which then resulted in the townscape changing from historical to confused. Yet, past remnants such as narrow lanes which had been main streets of the town in the pre-modern age, storehouses from the past era located on the back side of the lots of old houses, centuries-old shrines and temples, traditional festivals, and the like are existing indicators of the historical legacy of this town.

The described aspects of change are the same in these two examples, Yamagata City and Kahoku Town. Differences are only in the starting period of rapid change and in land use intensity which is reflected in each respective townscape. Despite these two subjects' rich historical heritage, applying the guidelines of

Preservation District for Groups of Historic Buildings to them would not yield any qualified areas as candidates for conservation efforts because traditional old buildings are located dispersively and not all of them are old enough to be considered for preservation as historic properties. One of the main reasons for the dispersed pattern of old buildings and non-uniformity in age or era of buildings is because both districts suffered great fires around the beginning of the modern age, e.g., Yamagata in 1896 and 1911, Yachi in 1866 and 1869.

## (2) Management approach to improve urban quality based on historicity

The purpose of this study has been to find how to improve the urban quality, especially in terms of townscape, of such historical districts, which are common or ordinary in Japan. Our target is not the typical historical district which can be preserved under the provisions of the Preservation District for Groups of Historic Buildings, but rather such ordinary historical districts – as in the two examples of Yamagata City and Kahoku Town, and, which must be numerous – as we have seen in chapter two of this paper.

In order to understand that a strong preservation tool is not adequate for such districts, it is necessary to review the townscape ordinance in Yamagata City. As already noted, Yamagata City established a townscape ordinance in 1996 which contains provisional implements for use in townscape planning, for example, designation of buildings and structures to be preserved, designation of area that is to be controlled by design guidelines and building codes, agreement of building types, system for awarding honorable distinction or recognition, design control of high-rise buildings. The latter three tools have already been utilized, but the former two tools of designation, which have regulations that are less stringent than those of Preservation District for Groups of Historic Buildings, have not yet been used in these past ten years since their inception.

A new Townscape Act was established by the national government in 2004 based on the past experiences of local governments' townscape ordinance. One of the notable features of this act is to provide two kinds of area control tools to regulate buildings in terms of form and design. It is estimated to allow for relatively more freedom in the process of conserving historical districts than the Preservation District for Groups of Historic Buildings in that it can be customized by each local government, but since it contains a legal order, its legislative power is greater than that of local governments' ordinances. However, in view of Yamagata City's past ten years' experience, regulatory control tools, even such as this new Act, can only be used by a few cities or towns with clear targets that fit the regulation requirements. Difficulties in making a consensus among the residents or inhabitants who have a variety of hopes and differences in vision about the future of the district, who are at different points or standings in their life stage, and who hold few if any expectations for the area to become a tourist spot, have been gathered as reasons for why the effectiveness of a regulatory tool is limited in such ordinary districts that do not qualify for preservation efforts as viewed under regulatory guidelines. An approach different to that of regulatory guidelines and control needs to be devised.

In thinking about a new approach for such ordinary historical towns considerations should be based on their features in the post-urbanization period. From the previous chapters' discussion, the types of districts to be selected as targets and the characteristics or conditions of their historicity are listed as follows:

1. The historical elements are located dispersively but contribute to make the district's townscape or image historical.
2. The historical elements do not always have high academic, aesthetic, and/or historic value.

3. The historical elements are conserved by the individual inhabitants who have continued to use the element in their daily life or activities until now.

4. Each inhabitant has hopes to maximize the value of their real estate within reasonable time in terms of private enterprise and business opportunities, and to appreciate or secure the worth of their asset in terms of contribution to society, cultural and historical heritage.

The above-mentioned conditions require that our planning considerations adopt the following attitudes (listed respectively) in regard to such kind of ordinary historical district:

1'. The aim should not be to make a perfect, traditional landscape, but to keep and foster the historicity of the district and to improve the quality of environment.

2'. The evaluation of the elements should be based on how they contribute to the quality of the environment and/or benefit the inhabitants (human-environment transaction).

3'. To hold as a desired purpose, the support of each inhabitant's hope and efforts to use and revitalize the historical artifact while enhancing its historical and social value.

4'. To design an effective treatment plan which will maintain and revitalize the historicity of the artifact while responding to the needs that arise as new activities develop and evolve, and to enable the inhabitants to strengthen their role in contributing to the local community.

Such thinking leads us to a new planning approach or schema completely different from that of temporary preservation system and regulatory townscape control (Fig. 6). Based on this new schema, the planning approach to dealing with the historicity of ordinary historical towns should be changed from a regulatory one to one which can be referred to as "townscape management."

The meaning of "management" in "townscape management" is that the planning system will commit to the districts' townscape-related needs or requirements for the long term or indefinitely. Adequate and quick reactions or responses to changes in situation is important. Extensive interest and commitment to the economic, social, cultural, and environmental conditions of the district is desirable, and, as the planning system is based on each inhabitant's activities, methods and ways to assist in the implementation and actualization of these ongoing "living conservation activities" while improving the townscape will be required.

	Regulatory Control	Townscape Management
Features of the target areas or districts	Existence of historic townscape having high academic, aesthetic, and/or historic value	Ordinary town with confused townscape that contains some historical elements
Aim of planning	To keep the traditional townscape and historic value of the district through preservation of historic artifacts	To improve the quality of the town environment through conservation efforts with a view for developing future potential
Allowance for mix or non-uniformity of elements in the target area in terms of historical period or design	Denied or refused as much as possible	Given as a premise including accommodation for ongoing change in target environment
Policy of design control	Strongly controlled by guidelines based on principal idea of historical authenticity and uniformity	Individual ideas are considered or valued, with flexible policy guiding different activities
Assumptions about the target area community	Collective decision-making based on group consensus in regard to preserving the historic environment	Decision-making based on individual valuables or differences in conditions allowed

Fig.6 Two types of planning systems for conservation of historical districts

This townscape management approach, which is intended to support and promote the activities of each inhabitant, to further develop social networks through various channels in order to use and revitalize the historical artifacts, and to improve urban quality, also requires the innovation and creativity of the individual and community. To nurture creativity and advance the wishes of the owners for the future use and role in the community for their artifacts, interaction and stimulation within the community, incentive from and cooperation of the public sector, influence and examples of experienced communities, and participation of professionals, for example designers and architects, are desired.

Some of these ordinary historical towns are trying to revitalize their historical districts and enhance their historicity, including Yamagata City and Kahoku Town. Such planning movements are called “machi-zukuri (town fostering)” in Japan. If planning is based on the concept of “townscape management” as described in this paper, candidates for townscape planning will be more practical and readily obtainable, and possibilities will become more apparent and available.

**Key Words:** City. Identity. Polyphony. Cascavel. Southern-Common-Market

### **Previous Considerations**

The region where today is the city of Cascavel, was historically the scenario of Jesuit action in the beginning of Brazil's colonization. There, in the XIX century, took place the extrativist process of yerba mate. In the XX century, Cascavel and its surrounding cities were culminant for the end of the Revolution (revolução tenentista), one of the biggest rebellions against the Republic. The migratory movement towards the city of Cascavel, in the 1930s, is a consequence of this political movement. The people who headed Cascavel were looking for the obscurantism of the region as a way of protecting themselves against political persecution. (DIAS, Caio et al, 2005). Due to the entrepreneurship of those who have migrated, allied to its natural resources, the city is so-called today "*The Southern Common Market Metropolis*". After this migratory outbreak there were others due to the opportunities generated by the city: in the end of the 1940s, pioneers established themselves there due to its rich forests; in the 1970s due to the richness generated by the "green gold" (soybean); in the 2000 decade due to the university teaching expansion. The 2000 decade migratory process brought up intellectual

elites that, after instituting the city as regional education center, planted the seed of academic research. (DIAS, Bruno, 2005).

The present text is the consequence of an investigative academic experience for both authors; and existential for Ms Dias, who settled down in the city of Cascavel as an urbanist architect in the 1974 migratory cycle to plan the city. The matter is the dialectic analysis of the historical process of the territorial space occupation. The research field is the comparison of the modern urbanism precepts with the urban identity and the Cascavel citizen. The research was carried out in 2006, the year which was approved the new Urban Plan law. The foundations of this research are, specially, the theoretical fundamentals of Stuart Hall and Mikhail Bakhtin, compared to the progressive urbanism concepts declared in the Charter of Athens. The investigative actions lead to some thinking about the urban identity, the urbanists actions in the city, and about the success (past, present and future) of such actions; they also reflect about the Cascavel citizen identity, who is the subject of this research. It has been verified the necessity of having some changes in the local urbanists attitude.

### **1. Urban character and morphology**

The ones who immigrated to Cascavel were young entrepreneurs, attached to the material, looking for tangible wealth, which they would not have in their place of origin. Working and its financial results were their priorities. Their individual and material enrichment happened in a very fast and intense way. In the imaginary, the gain of things acquired by the money would give its detainer social recognition and “respectability”. Wealth generated wealth. The material enrichment stood out against the cultural, the community, the solidary, the one of common interest. (PIAIA, 2005).

The region became very attractive in the 1960s due to the wood extraction advent, which demanded, as the urban population increased, the transference of the road that

connected the state Capital to Foz do Iguaçu. During the road transference process an innovator project is created, the Brazil Avenue, the main street of the city. That is the initial mark for the future actions of urban planning, strongly identified as modernistic urbanism. The consequence is that the imaginary Cascavel citizen has something to do with its urban morphology, which prioritizes the vehicle, emphasizing the streets. They were large and paved but in many places did not have sidewalks, landscaping or even public illumination. In such an imaginary, the places of financial profit and work had priorities over the places of leisure, cultural or environmental preservation places. (PMC, 2005).

Searching for wealth they did not have in their places of origin, the residents looked for urban properties that, in the future, could be commercialized, becoming a currency. (PMC, 1978). Then the city grew larger, considering the economical interest and not the social one. The peripheral expansion, in the 1980s, brought up migrants even from the West region. (PMC, 1987). So, at the same time that Cascavel was recognized on a state and national perspective as an island of prosperity (in the economical crisis that Brazil went through in the 1980s), its peripheral area diverged from its central area. (PMC, 1992). In fact there were two cities that, in common, had only the name. It has been verified that, during the institution process of the city of Cascavel some antagonisms had been found: city center versus suburbs; individuality versus collectivity; middle-class versus working class; etc.

## **2. History of Cascavel urbanism**

The Brazil Avenue creation, in the city center, which was projected in the beginning of the modern urbanism, is the initial mark for the future actions of Cascavel Urban Planning. In the 1960s, besides by the construction of Brasília, the Brazilian urban model was strongly identified with the precepts of the Charter of Athens, a solution which was presented as a salvation and able to solve the cities existent problems. With the advent of the modernist

urbanism, Plans of Use and Occupation of Land and Urbanistic Laws were initiated all over Brazil, which were, in general, elaborated by technicians and approved by politicians. They were many times legal actions that occurred through decrees and without any popular support. Such situation occurred by to the fact that Brazil, at that time, was under Military Dictatorship regime. During the dictatorship there were no democratic rights, and the decisions were made by military authorities, supported by technicality, the same happened in the Brazilian urbanism.

In Cascavel the first action of urban space organization happened in 1974, with the Construction Code, Zoning Law and Allotment Law elaboration, all three for the city. In these three laws and the ones that came after, we emphasize that the model was the one stated by the Charter of Athens. These laws were elaborated to discipline and control urban growth, which was now in expansion by the international recognition of soybean cultivation, or “green gold”, as it was known and called.

In 1978 the city elaborated its first Urban Plan. From this Plan originated new Zoning and Street System laws. In the process of political alternation, self characteristic which is unchanged in the city until today, the power established through the technical language combined with the political discourse, elaborates another urbanist work. This city administrative management finished in 1988, without having the technical document being transformed into a draft.

The next city administrative managements from 1989 to 1992, also contrary to the one before, have the responsibility of following the rules of the new Federal Constitution regarding the Urban Plans. Not having forgotten that at that moment Brazil was already a democratic country, as the Military Dictatorship regime had come to an end. It gets started a new work: the third. Although this new plan was concluded in 1992, it became a law only in 1996, due to political and administrative interference from the executive and legislative

powers of the city. Among the interferences, there is also the alternation of the city administrative management, which was politically opposite to the previous one.

Although there were all these technical works (or exactly for having many technical works without communitarian participation), the city grows randomly. Around 50% of the urban edifications are illegal, and do not follow the urbanistic laws: the real city is different from the planed one.

As the urban occupation was illegal the process of construction sites legalization by political acts, which did not have any technical argumentation, becomes common and frequent. As a result, the population in general (and stimulated by the lack of fiscalization), disobey the land appropriation laws. Such a situation generates serious social and environmental problems in the city urban area. We can then notice the dissonance between the real and the planned, between the beliefs of the technical group of urbanists and the community reaction to that. Thus, the urban discourse in Cascavel is not harmonious. As a result, the Law elaborated in 1992, which still did not represent the popular will, when it was approved in 1996, did not also represent the technical will of local urbanists.

In the third millennium, we could see a different Brazil, after its Military Dictatorship of the 1960s and democracy being instituted in the 1980s, we get to the populist govern of the XXI century. In this populist govern, concerning the basic urban concepts, the tenacity that privileged the automobile in detriment of the human being, the constructions in detriment of the people, the technical-political imposition in detriment of the democracy, the profit in detriment of the environment is criticized. The modern urbanism concepts are revised. Nevertheless, the population in general, and specially in Cascavel, is not interested in discussing, and when it is, usually ask for improvements such as: pavement, viaducts, etc. The Cascavel citizen imagetie is strongly connected to the automobile.

In 2001 is introduced a Federal Law named City Statute and once more, the new city Mayor belongs to a political party opposite to the previous one. There is a political promise of establishing the Cascavel Urban Planning and Research Institute – CUPRI, whose objective is to urbanistically plan the city. Such a promise is not kept. During the 2000 - 2004 representation, motivated by the statute and the dissatisfaction with the 1996 law, the city begins, for the fourth time in thirty years, other new studies and discussions about the Cascavel Urban Plan. During this process, as stated in the Statute, a new methodology of popular participation is adopted, which is made through Public Audiences. By the end of 2004 representation this technical-comunitary work is still unconcluded.

The 2005 urban scenario of Cascavel keeps the tradition of having a new Mayor belonging to a party opposite to the previous one. However, regarding the Cascavel Urban Plan discussion process, this time the new administration gives sequence to the technical studies started in the previous representation. By the end of 2005, after three years of technical and communitarian debates all over the city (rural and urban areas), the Cascavel Urban Plan is approved by law. It is verified, as we compare to the previous ones, that the main difference of such plan is the discussion: as in having wide-ranging themes or through democratization due to popular participation. The guidelines of the 2005 Urban Plan were defined with participation of the society of Cascavel. They were called and heard as the decisions were made, as stated in the City Statute.

### **3. Social identity and urbanism**

Identity is not something you are born with, it is formed over the years and through an unconscious process (HALL, 1998). During the post-modern desterritorialization, as the elite could construct its own territory in the world-citizenship, the excluded ones grouped in fundamentalist identities (national, ethnical, religious), assuring their survival as a very well

organized group, instituting their individuality (HAESBAERT, apud LOPES, 2003). In the city debate and in its territorial-political matter as a symbolic game, with recurrent representations, the city founding discourse keeps its secrets, which are inherent since its origin and generates the city desire (OLIVEIRA apud LOPES, 2003). How would the people's identity connotation be perceived during a contemporaneous territorial disorder, which is called post-modernity and lives side by side with globalization, allied to the city founding discourse and its vocation?

Nowadays the conceptual Cascavel citizen, which can be considered a world citizen, is the one who belongs to the 1950 migration period, and which today is the city elite. This group is characterized by individual and non communitarian actions (PIAIA, 2005), and strong connection to the family here established. These characteristics make these citizens, when socially grouped or concerning urban or rural territorial interest, pursue the family wealth and well being in first place. Concerning the present Cascavel peripheral dwellers, which had established themselves in the 1980s, they have brought habits, culture and ideologies already disseminated throughout a net world sponsored by the *mass media*, mainly by television. Besides the *mass media* such people have got together looking for working place and conditions, churches and leisure activities. Leisure activities mainly selected for their economical conditions, consequently generating cultural groups. (BORGES, 2005).

It is verified that the founding discourse of Cascavel, its character, in the 1930s was to maintain distance from strangers due to political dissonances and retaliations. In the 1950s it was to give opportunities to pioneers, which were coming from the Southern States and wanted to be settlers in the West Region of Paraná (PIAIA, 2005). Although the discourse had two sides (1930 and 1950), they do not contradict: they complete each other. In both moments of the colonization the pioneers were determined people looking for a new life, new future and new spaces. This is the city character, its primary identity. In the discourse it is possible

to notice clear characteristics that still persist: political contestation, search for opportunities (if necessary, not following instituted patterns); the fight for individual recognition, for its values, for its space.

Thus, the city social-economic movement that occurs in the beginning of the new millennium is justified: the universities. They materialized the dream of the Cascavel citizen, the dream of improving oneself to get better jobs, better economical situation and better lives. (DIAS, Bruno, 2005). As in the 1950s, the search is for jobs, but this time for qualified jobs. It is another characteristic of the founding discourse, which confirms itself in the present time. However, if the city of Cascavel is a place of confront concerning the power of microphysics (FOUCAULT, 1979), how can we pactualate the common well being above the dispute of individuals, groups, classes, corporations? It is clear that the contextual matter of Cascavel goes through the association of territory and class identity, due to the modern identity matrix disruption. In this city, there is no doubt about the relevance of the social action concerning the space, configuring new urban spaces which were defaulted created and not contested by the instituted legal power.

In this scenario, the failure on the discourse of its urbanists is verified, who have tried, for over 30 years, to “organize” and “discipline” the city urban space. This failure is the confirmation of the modern identity annihilation, represented by the technocratic proposals of land occupation laws and rules.

If the present alternative is the hope of a social behavior change through academic thinking supported by the university class, what is the proposal for those excluded from this process of reeducation? If the identitary matter is connected to the spatial segregation process, which occurred by the lack of alternatives for the ones who have established themselves in the peripheral areas, what is the dream, the hope and the real possibilities for this population? How could we put such dreams into action? The answer, in the modern urbanism discourse,

was of adequating them to the land use regulations. The present democratic process discourse is to strengthen the groups to stand up for their rights. The groups, after having their rights conquered (citizen education in the same process that the university offers to its students), will promote reflection, becoming citizens with post-modern identity and demanding responsibility for the pacts assumed.

Then, who is responsible for defining Cascavel social identity: its elites, the middle class, the peripherals, the excluded, the urbanist class, the established Citizens or the temporary citizens? Now the analysis becomes dialogic and polyphonic.

#### **4. Urbanism, dialectic and polyphony**

Bakhtin's dialectic, as a discourse theory, makes us question the abstract objectivist rationalism of the enunciations in the universe of denotations that impregnate social, political and economical life (HENRIQUES, 2004). For Bakhtin the interaction between speakers instituted in specific contexts in a continuous process, centered in dialogism, is the language social conception. In this concept, there are no limits for communication, as the enunciation is already constituted of ideological materiality, used by the individuals as a set of voices that elaborate knowledge. For Bakhtin the universe of denotations concretizes itself in the social historic plurality. In the semiotic ground, the visibility of the urbanistic conceptions in the form of work, leisure, cultural places or many others are rich. (BAKHTIN, 1999). The relation between individuals and urbanism is a two way conversation: as the abstract projection of the urbanist, of his comprehension of the world; or the comprehension of the effective materiality of the one who uses it, who inhabits it: the citizen. If the subject is an acting part of the social environment, he is also an interaction factor. The subject is not only a spreader of an existent discourse but also makes part of the discursive process, interfering, modifying or improving the social discourse. He is an active subject who is capable of using

the language to form his individual conscience and also capable of using his individuality to interfere in the social language process, constantly interacting with the society. This view of Bakhtin presupposes that urbanists, elites and periphery can fit in this subject profile.

### **Final reflections**

The social identity of the city of Cascavel is characterized by political contestation to the instituted authority and as a social practice, by consecrating the material, by the iconoclasy of egoism. It is clear, in the identity of the citizen, the inexistence of a monolingustics identity and the highlighted polyphony of the identitary segments. Under these circumstances, how can we create general contexts of affection and signification in the same urban environment? If the signs came true in the plurality, they would create the symbolic game of the city. This symbolic game works through the founding discourse of the city, its political dissonances, its individualism, its entrepreneurship and also for not following the urbanistic rules proposed by the modern urbanism. According to the concepts of Bakhtin, the identitary situation of Cascavel is natural, contrary to the view of the modern urbanism, which presupposes the “ideal pattern man”. There is no pattern man in Cascavel, therefore it is impossible to plan for such a man, since he does not exist in this urban reality. If the urbanistic signs are composed of essence and appearance, the relations between physical spaces and imaginary spaces must tend to satisfy, in the appearance, the imaginary essence desired by the majority.

About the real efficacy of the proposals pactuated in the present legal and technical document named 2006 Urban Plan, only the future will be able to judge, since the plan advanced from the modern urbanism technocrat process of the past to the democratic process of the present. The following questions remain: Was the democratic discourse perceived by the citizens, as co-responsible for creating it? Although the democratic process on the

elaboration of the Plan was followed, will the social actors, which agreed on it, carry out their roles on the implantation of it? Does the character, personality and local identity presuppose the accomplishment of what was accorded?

Considering the perceived characteristic of non agglutination within communitarian interests, how can we define the indentity of Cascavel? In 2006 a pact between the society and the public authorities was held, which became a contract: Cascavel Urban Plan Law. This is the legalization, in enunciates, of the identitary polyphony of the self intituled *Shouthern Commom Market Metropolis*. Therefore, the classes that accorded and elaborated the enunciates had to readapt themselves as subjects. For this pact to be effectivated there is the necessity of a permanent discussion between all social actors. If this management style is restored, the polyphony and dialectic will be present on the elaboration of its enunciates.

If the Cascavel citizen is ready to keep his part of the pact, it will depend on the shared management effectiveness, through successful actions that contemplate the majority, which will necessarily go through polyphony and dialectic. Concerning the questioning of until when will this social actor carry out the post-modern subject identity, the answer is that he will carry his role out until the moment he thinks he has to, since the post-modern identity presupposes the sum of several identities in the same individual, and all these identities search for fulfillment, which is material, in the specific case of Cascavel.

### **Introduction**

Modern liberal democracies can be conceived as consisting of three coordinating domains: The state, the market and the civil society. A basic premise is that each of the domains fulfils a function that cannot be fulfilled by the other domains:

- The state is responsible for an orderly society;
- The market for its economic basis; and
- The civil society for social and community relationships.

In the classical image of governance boundaries between the public and private realms cannot be surpassed. Governance is equated exclusively with government, and has to be organized only in hierarchies. As a consequence responsibility for public issues is fully relegated to the public domain of the state. The strict separation of public and private responsibilities has also been a characteristic of natural resources management. The use of resources might be a private affair, but to safeguard sustainability the public domain of the state had to put restrictions on the use. As a consequence, private parties were only held responsible for preservation if the rules imposed by governments demanded accountability from them and placed the responsibility on them. Both at the national and international level this governance has engendered a policy on natural resources that is largely government-initiated, rule-oriented, legalistic, and rather formal. Recently, however, we observe a shift in this concept of governance. This shift puts less emphasis on the autonomy of the three domains and instead stresses their interdependencies. It is assumed that public choices have to be made in a multi-actor context, in which private actors from the market and civil society need to, and are able to take responsibility for public issues as well. This new image of governance recognizes their self-governing capacities. The shift towards a new form of governance particularly influenced sustainability issues and issues related to natural resources (Glasbergen and Driessen, 2002). It has been institutionalized in all kinds of collaborative arrangements, which I address as partnerships, between representatives of the state, the market and civil society. With partnerships the well established boundaries between the state, the market and civil society seem to destabilize. Hierarchy is replaced by more horizontal relationships. As a consequence societal governance has become more dynamic, more complex and more heterogeneous. Instead of a strong *state* to govern natural resources, we now need to face the opportunities of a strong *society*, which is at least partly based on private initiatives from the market and the civil society. Discussing the management of natural resources thus brings us at the heart of the debate on public and private responsibilities, their relationships, and even the possibilities to unite them into a forceful management strategy within the liberal democratic order.

In this paper I will first specify some characteristics of typical cases. These are the complex ones, covering both representatives of the North and the South. Next the new management strategy will be characterized as the partnership paradigm. To understand and evaluate this paradigm I will present two related analytical models. Both help us to go to the essence of the partnering process and its implications. The first one takes a behavioral approach. This approach looks inside-out at the activities of partners and partnerships. The second model takes an institutional approach. By looking outside-in this approach particularly takes the contextuality of partnerships into account. I will conclude with some comments on the new roles of governments and the evaluation of partnerships with the help of the models.

### **Some practices**

Let us first look at some typical cases to get a feeling of the new forms of governance.

\* The first case is a tree uniting Unilever, nongovernmental organizations, and local businesses and communities.

The Allanblackia tree is commonly found in several parts of Africa. It grows primarily in tropical rainforests, but can also be found on cultivated farmland. The oils obtained from the seeds are used by the local population, but until recently, the extracted seed-oil has never been used on a commercial basis. Some years ago Unilever, a big international producer of consumer goods, joined forces with some leading development and conservation organizations to form a partnership project in Ghana to extract, on a commercial scale, edible oil from the seeds of the indigenous tree. The partners will help in local capacity building, set up the logistics, and ensure that the proceeds from this business benefits local communities, thus contributing to the fight against poverty. The partnership will also help to achieve greater sustainability by protecting trees that now got an economic value.

\* The second case regards shrimp uniting governments, environment and development NGOs, shrimp farmers and European importers.

As part of the broader WSSD partnership on market access, the Netherlands concluded a partnership with Indonesia and Malaysia at the Johannesburg Summit in 2002. The main ambition is to improve market access of farmed shrimps on the European market and therefore solve the food safety problems. An added ambition is to improve the ecological and social sustainability of shrimp farming. Even though this is primarily an agreement between governments, industry representatives and, until recently, environment and development NGOs are involved. In the Netherlands both the Ministries of Agriculture and Development Aid are involved. This partnership is dependent on government funding.

Both are very specific cases, rather local and time and place dependent, although there also is a North-South relationship involved. They are *symbols* of change in the management system, perhaps also indicating new opportunities, but they do not have the intention to change the broader system of management of resources in a more structural and fundamental way.

\* If we move from the local to the global we can meet many counterparts of these cases. The Stewardship Councils, dealing with sustainable forestry and sustainable fishery, are perhaps best known. Both are initiated by WWF and are collaborations of industry representatives and NGOs, sustained by research institutes. Governments do not take part. The aim of the stewardship councils is to secure the long-term viability of the sectors by promoting a management that is environmentally appropriate, socially beneficial and economically viable. Therefore they link market incentives to consumer preferences by an eco-labeling programme.

Certification is the mechanism through which global resource use is coordinated. Both councils are inspired by actors who are disillusioned by the formal government regimes for sustainable forestry and fishery, though there also is an economic interest involved. These stewardship councils represent attempts to change the management system of trees and fish system-wide. They aim to show the opportunities of an alternative private management system. Next to an orientation on self-interests the partners involved intend to serve a public interest.

### **Common features**

I will regularly come back to these cases throughout my presentation. For now I am particularly interested in their common characteristics:

- First, they all aim for the sustainable use of natural resources.
- Second, they address natural resources as commodities in a supply chain.
- Third, they represent new governance arrangements. All include private sector initiatives linking local producers to mostly western consumers.

In our cases protection and use are not separate entities anymore, which should be covered by different societal domains; respectively the state and the market. It is not only assumed that the market mechanism could be the medium through which protection could be realized, but also that market parties are able to take this responsibility. In other words, sustainable *use* has become a method for fair protection. Making natural resources productive, which is the driving force of private actors in the supply chain, might go together with protection by the same actors, even though protection is a public interest. We might expect such an approach advocated by the economic actors in the supply chain, because they have an economic interest to defend, however, environmental and development NGOs are fully involved as partners in these endeavors. Part of the societal organizations, which used to constantly press governments to develop stricter formal protection regimes and to enforce them better, have now also set their hopes on collaborative frameworks with their former opponents to promote sustainable resource management. Governments also take a new role; sometimes they initiate partnerships and are a full partner, and sometimes they only facilitate a partnership, for example as a network broker in case of a partnership between businesses and NGOs. In all cases they withdraw from their role as autonomous decision-maker.

### **Partnerships as forms of governance**

The new governance arrangements, represented by the cases, are typical forms of partnerships. The concept of partnerships is rather flexible. It not only refers to new relationships between corporations and NGOs, but also to new forms of cooperation between these actors and governments. A useful definition is:

*Collaborative arrangements in which actors from two or more spheres of society (State, Market and Civil Society) are involved in a non-hierarchical process through which these actors strive for a sustainability goal.*

Partnerships are self-organizing and coordinating alliances. They are set up to solve societal problems. They do so, on the basis of a commitment that is formalized to some extent. And their problem-solving task is accomplished, either partially or exclusively, by private parties.

As forms of governance partnerships have specific characteristics. What makes them distinctive from other forms of governance is the combination of characteristics of the relationships between the agencies, their focus, and the function of their relationships:

- In partnerships agencies from different networks in society, both public and private, with a tendency to operate independently, meet each other, and talk about the developments they would like to see. They discuss the underlying concepts of that development and their relationships to it;
- Participation is voluntary and the partners aim to exclude hierarchy from their interactions as much as possible;
- In their interactions the partners aim to develop some common normative framework as a basis for further collaboration, they discuss pooling their resources, and activities they would have to do separately and they would have to do jointly to deliver a specific public service;
- In the interactions the public service that is the objective of the collaboration will be (re)defined in such a way that each of the participants can connect the public goal to its own private interests;
- In the course of the interactions the relationship becomes more and more functional, i.e. dedicated to a task that will be fulfilled in co-production, resulting in a regulatory structure for a joint management practice;
- This practice, often enshrined in a more or less binding package deal, sets forth development actions and timetables that will have to be followed, will be worked out among the constituencies of the participants, and brought up in other forums to enlarge the commitment to the service;
- Once concluded, participation is not an uncommitted activity any more. Each of the partners can be held responsible for the agreed upon contribution and together they take responsibility for the final results of the endeavor. The collaboration has some permanency. Regularly the partners meet again to adapt their agreement to new circumstances.

### **The partnerships paradigm**

Partnership arrangements differ in the type of actors involved, their intensity, scale, intentions and activities:

- Partnerships unite around area-specific sustainability issues; within (inter)national product chains; in the service of specific natural resources; and through environmental reporting and other such functions that support sustainable management of resources.
- Some partnerships focus on global issues, for example on sustainable coffee or sustainable cotton, whereas other partnerships on the same issues work at the local level. Some take the form of institutionalized interactive platforms in which complete sectors are involved (e.g. the roundtables on palm oil and soy), while others take the form of a onetime collaboration between one company and one non-governmental organization.
- They also vary considerably in size (that is, in the number of partners) and in geographic scope. But they also differ in terms of their time frame and access to funding.

Together they represent a new management paradigm. Management paradigms filter our way of looking at reality. They interpret reality; highlight the essentials, with the objective to formulate specific guidelines for the deliberate governance of progressive societal change. The partnership paradigm is based on the following assumptions (Glasbergen, 2006):

- Each of the parties from the public sector, the market, and civil society has an interest in sustainable management of resources.
- A constructive dialogue among these interests can be convened in a setting that excludes hierarchy and authority.
- Dialogue can produce a shared normative belief that provides a value-based rationale for collaborative action.
- Collaborative action based on voluntarism, joint resource commitment, and shared responsibility of all actors for the whole project can serve private interests as well as public interests.
- Collective action can be commercial in nature; the market mechanism can promote more sustainable practices through the leverage and spin-off of private-sector investments.

The supposed strength of partnerships, particularly the tri-sector ones, is the combination of the moral authority of NGOs, the market principles of businesses, and the public authority of the state.

### **Incentives to create partnerships**

Partnerships have been formed exponentially since the 1990s of last century. Collaboration across the state, market and civil society domain has become a policy goal at national and international levels. In particular it has become the main strategic approach of the UN policy on sustainable development. Underlying incentives are both normative and structural.

- A more general normative incentive is the concept of sustainable development itself. This concept is broadly defined and covers both the protection of the environment and the development of the economy. Both interests are accorded their own positive value. In this way, both the environmental movement and the private sector are engaged. By definition a relation is forged between them; they have become mutually dependent stakeholders with respect to one and the same issue (Glasbergen and Groenenberg, 2001).

- A general normative incentive, but more looming at the background, also is to be found in the changing consumer preferences. Consumers, backed-up by NGOs, have begun to ask for more environmentally friendly and socially responsible products. Together with some government pressure for Corporate Social Responsibility, this is gradually changing the market conditions. Some companies recognize this fair trade as a profitable niche market. In development and environmental NGOs these companies easily find a natural ally.

- In the more operational normative sphere the partnership paradigm fits very well in the striving for privatization, deregulation and decentralization. The reflex of creating law does not work as good anymore as it did in the past, and governments are looking for additional strategies to realize their objectives. The (re)appreciation of private initiatives also influences the internal structures of governments. The private sector has become a role-model for their organizational identity and influences the roles they take upon them. The entrepreneurial government is a popular slogan expressing this change in attitude.

- A more structural incentive is to be found in the globalization process, which not only made economic actors stronger as political players, but also led to a more professionalized international NGO community able to influence public policies worldwide. The large transnational corporations recognize that NGOs have acquired power and legitimacy as agents of social change and NGOs acknowledge that these corporations are both cause and solution of environmental problems. Even if they wished so they cannot avoid meeting each other. Even so governments can neither neglect businesses nor societal organizations anymore. They have become indispensable to any definition of public problems and their solutions.

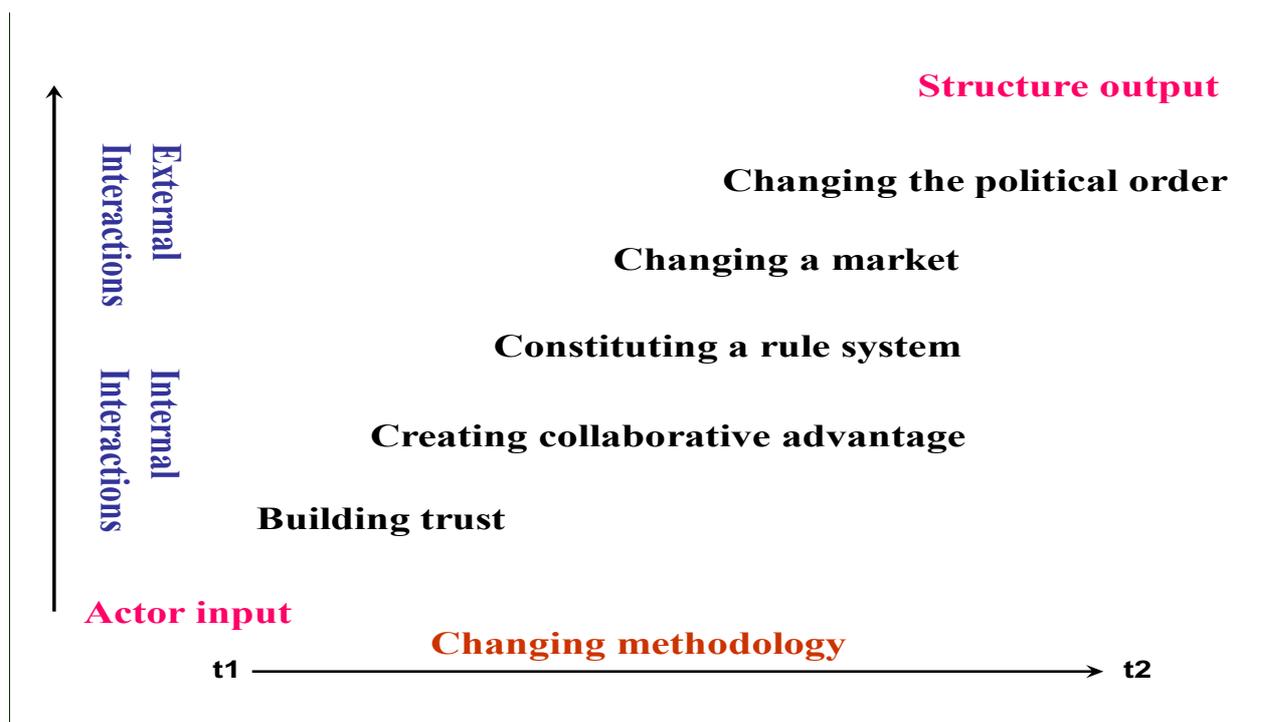

Another explanation often given is government failure. Sure, formal regimes for the protection of natural resources are often poorly developed and more often poorly implemented. The promotion of partnerships at the Johannesburg Summit might be interpreted as a move to mask the inability to develop meaningful public regulations on many sustainability issues; a move of governments running away from obligations and making an attempt to shift the burden of public problem solving to others (Norris, 2005, p. 229).

However, most natural resources are important economic assets. Saving these resources is in the long-term interest of the private sector as well. Unsustainable fishery is digging its own grave. In the long run unsustainable industrial logging is suicidal too. Therefore we could address market failure as an incentive as well. Government failure seems to be only secondary to the more fundamental market failure that underlies most natural resource management.

### **The first model: The ladder of partnerships activity**

To further understand partnerships analytically I constructed a ladder of partnership activity. Behavioural approaches to partnerships are rather popular. Most of them take a narrow view on the partnering process, focusing on how the actors directly involved develop their communality. They distinguish phases of collaboration (Gray, 1989). Here I take a broader view. The ladder is based on the premise that partnering is a process in which actors restructure and build up new social relationships to create a new management practice.

The ladder consists of five core steps, set in a time frame. Each step is represented by a core activity. The first step is an *exploratory* one. This step refers to the attitudinal preconditions to start a partnering process and the underlying mechanism of trust building. The second step refers to the *formation* of the partnership as a new arrangement. The central mechanism is specified as creating collaborative advantage. This step refers to businesslike characteristics of partnering. The third step, constituting a rule system, specifies the governance regimes partnerships develop. Here we look at the interim effects in terms of *outputs*. The fourth step refers to *implementation* of the rule-system. Gaining legitimacy in the relevant issue area of the partnership is the main mechanism. The last activity, changing the political order, may be a deliberate *outcome*, but also the unintended societal consequence of the partnering process.

This ladder is further encapsulated in three dimensions.

In the course of the partnering process a gradual shift will take place from interactions among the partners themselves to interactions of the partnership with its relevant external environment. These are indicated as internal and external interactions.

The second dimension of changing methodology refers to the shifting technology of the partnering process; the core methods applied to bring the partnership forward.

The dimension of actor versus structure indicates the objects that are influenced: from the intentions of actors in a process, and their collaborations, to the more permanent impacts in the issue area the partnership is active and on the characteristics of the governance system.

The ladder of activity of partnerships represents an idealized form of the full partnering process. In reality the logical steps do not follow on that neatly. Actually partnering is a continuous process with many feedback loops. However, the ladder helps us to better understand the heuristics of the partnership concept in terms of the critical issues and key challenges that arise in each of the phases. These will be discussed in the following.

### **The first level of activity: building trust**

In the first phase potential partners need to define a common objective. Actors who are sometimes rivals outside the context of the partnership, and represent different interests, need to develop awareness that they might be allies on specific instances. As many partnerships arise from some form of conflict, partnering implies both cognitive and behavioral shifts from the participating actors. Preliminary dialogues and explorative talks need to lay the foundations for further collaboration. Part of this foundation relates to emotional issues. Most important at this phase is an attitudinal readiness to collaborate. The potential partners need to be open about their particular interests related to economy and environment, and their options available. This attitude, successively, will largely determine the options for interaction available (see also Gray, 1989).

If a conflict between the economy and the environment is assumed the effect will almost automatically be a form of adversarial interaction among the stakeholders involved. They will perceive each other as opponents and act accordingly:

- They will emphasize their differences, not what they might have in common;
  - They will only provide information that can reinforce their own position;
  - They will try to restrict any discussion to policy alternatives that serve their own interests.
- Adversarial interaction is competitive and takes place in an atmosphere of distrust. One side's gain is always seen as another side's loss.

Alternatively, assuming that in principle the environment can be reconciled with the economy, another form of interaction is to be expected; collaborative interaction. With this form of interaction the parties seek opportunities to achieve consensus on a policy problem:

- They will look for solutions that do justice to as many of the diverse interests as possible;
- They will examine the available information jointly or might seek it together;
- They will try to widen the range of policy alternatives rather than narrowing them down.

Collaborative interaction is constructive and takes place in an atmosphere of mutual trust.

The pivotal mechanism to make the shift from a form of adversarial interaction to a form of collaborative interaction is trust. Trust particularly encapsulates the emotional argument: the reduction of feelings of risk and vulnerability in the partnering process. To some extent, the reciprocal relations between the partners have to be predictable. Trust in partnerships builds on mutual respect for what a potential partner can offer to the partnership. The parties will not enter into a partnership if they do not have some positive pre-conceived ideas about overlap in agendas and the potentially valuable input of each of the other partners. Mostly, this initial trust will be based on reputations, past behavior, or pre-existing informal relations between the parties. However, it also requires some institutionalization of the relationships. Conditions to facilitate trust encompass creating a minimal structure and ground rules to provide security, equity and fairness. A first set of rules pertains to securing that the members' presence is legitimate and that they will be heard despite differences in status or power; they will be respected and treated with dignity. Another set of rules must secure that serious collaborative work can be done: rules dealing with agenda building, provision of valid information, confidentiality and a code of conduct (Schruijer and Vansina, 2004, p. 229).

Take the Stewardship Councils, for instance. Fundamental mistrust has been expressed because of the fear of domination of the perspective of the North; that it privileged Northern consumers and corporations over Southern producers and consumers. One critic of the Marine Stewardship Council was that it imposes its Northern view on what responsible fisheries are upon developing countries; ignoring the livelihood interests of the fisheries communities in the South. It could easily become another example of Northern eco-imperialism (Constance and Bonanno, 2000). The Forest Stewardship Council had to face more or less the same critics (Murphy and Bendell, 1999). Only by giving the Southern interests a place in the decision-making processes, and including social criteria in the certification schemes, this distrust could partly be taken away. The practices need to sustain the future trust in the Council's activities.

Trust is not created for once and ever. Trust building is a social process that needs to be maintained and supported by positive experiences throughout the whole partnering process.

## **The second level of activity: creating collaborative advantage**

Next to the development of trust, the parties need to nurture their special interests. NGOs are bound by their identification with and loyalty to civic values. The market mechanism forces businesses to act in their own direct economic interest. In principle, governments cannot share the political mandate that the public has vested in them. Because the interests are fundamentally different, the elasticity of representatives of each of the domains is restricted. Each of the partners may have an incentive to participate, but also takes risks with particular commitments. Role-conflicts seem to be immanent of a partnering process.

\* A government participating in a partnership acts as one of the interest groups. This might be interesting from the perspective of enlarging the responsibility for specific policies and gaining institutional capacity to implement the policies. However, because of their institutional position as democratically legitimized actors, governments have some specific decision-making responsibilities. Sharing responsibilities is not only constitutionally risky, but takes place in the wake that they will ultimately be held responsible for any failure by the public.

\* For market parties participation is interesting as part of their reputation management strategy. But an economic actor is also restricted by its existence as part of a supply and demand chain. Altruism is per definition excluded from their core businesses. For example, saving nature can never be the goal of a company. Saving resources can be a goal only if this resource can be made economically profitable.

\* Non governmental organizations can scale up their work and scope in partnerships. They can also secure a better funding base. So, next to an idealistic interest they may have an economic interest. They take the risk that they are used as a cheap marketing tool for a private interest; lose their organization identity and therefore their relationship with their constituencies.

Attitudinal readiness and trust are not enough. Partnerships should not be idealized. At the end of the day partnering is about doing business in another way. Of course, collaborating partners can challenge each others stereotypes and assumptions. Partners can explore how they can work together and find a common ground for action. But a partnership is a contractual arrangement as any other political and economic arrangement within which the partners distribute opportunities and risks. For each partner the opportunities should outweigh the risk. This is captured with the concept of collaborative advantage. Collaborative advantage encapsulates the synergy argument: to gain real advantage from collaboration, something has to be achieved that could not have been achieved by any one of the partners acting alone, but nevertheless is in its interest. This may be the acquisition of additional resources, but also skills, relationships, or consent (Brinkerhoff, 2002, p. 16). Collaborative advantage refers to making the mutual benefit of collaboration explicit. It postulates the possibility that each of the parties can connect its own interest with the common (i.e. public) objective of the partnership. In other words, potential partners will only collaborate structurally if each of them is convinced it stands to gain from the partnership.

Consider the Marine Stewardship Council again. The retailers and wholesalers are primarily interested in the fish stocks as a tradable resource. No fish no trade. The economic actors aim to secure a long-term supply. Product differentiation also plays a role, as well as the added value of the product, and credibility to the public. NGOs are primarily interested in conservation of the marine ecosystems. The agenda's of the partners are different, but they

also partly overlap. In the overlap they can each gain their advantages. However, these agreements are vulnerable. The MSC can only remain advantageous for multinationals like Unilever, one of the largest consumer product corporations very active on manufacturing frozen fish, if several of the larger fisheries can be certified. If not, it will recall its interest.

As trust, collaborative advantage needs to be maintained throughout the partnering process.

### **The third level of activity: constituting a rule system**

The success of partnering in the first two phases of our model both depends on the ability of self-reflection of the partners, an important aspect of trust building, and their ability to develop a reciprocal relationship, which is related to collaborative advantage. The output of successful partnering so far will be a new social contract with which the partners formally invest in each other. This contract will specify their future relationships in terms of:

- Reciprocal commitments to a specific problem definition;
- Reciprocal commitments to a set of rules.

The definition of the problem refers to the social issue the partners are connected to. This issue will be partly exogenously defined; for instance, striving for a more sustainable forestry. However, the output of the foregoing phases will be a more specified definition. This specification is endogenous, i.e. the product of the interactions of the partners (Selsky and Parker, 2005, p. 866). As a social construct this definition will mirror the power relationships in the partnership. This explains why partnerships dedicated to the same issue represent quite different interpretations of sustainability. The set of rules specifies both internal and external obligations. Internal rules are not meant to have an external effect. Regarding these rules the social contract will not be fundamentally different from any standard contract in economic transactions. Only the sanctions of free riding may be different. Sanctions for failing to comply are often restricted to expulsion from the partnership. This seems to be a weak sanction. However, companies who reverse their decision to support a partnership contract may suffer more boycotts and societal scrutiny than if they had never committed at all (Cashore, 2002, p. 521). Governments and NGOs will also lose some of their credibility if they refrain from their obligations.

Some partnerships are not quite different from what we used to call a project. The Allanblackia tree and shrimp case are examples. They only have an internal rule system. Others, such as the Stewardship Councils, introduce an alternative rule-system for the governance of a whole issue area. These often take the form of a code of conduct, an eco-label, or a certification scheme. These schemes take on more of a traditional regime character; they will resemble government regulation. Here one of the fundamental weaknesses of partnerships as system innovators comes to the fore. This is their restricted repertoire of technologies of governance. As private entities their strongest outputs, the certification schemes, primarily address the supply of information, ultimately directed at the end of the supply chain. Some of the weaknesses of this technology can be clarified by looking at the Marine Stewardship Council again:

- In the end the success of marketing a sustainable product, such as fish, largely depends on the will and ability of the consumer to pay extra for a sustainable product. Up to now this is only a niche market.

- There are many small-scale fisheries all over the world. The diversity and amount of fishery communities, who are not organized around a stock, makes certification hardly possible. For example, certification of Thames herring was initially not possible because of big trawlers fishing the same stock, which resulted in overexploitation.
- Certification is dependent on the guarantee of sales. The retail will only be interested if the supply is constant and big enough. This is not possible yet. In the same way fishermen will only become interested in certification if sales are secured. In this way retail and fishermen hold each other captive in a vicious circle of constraints on sustainable change.

Nevertheless, the contractual nature of the relationships in this third phase changes the partnering process fundamentally. Voluntarism is replaced by dedicated commitment. Provisions in the contract, and the degree to which the parties live up to them, then define for a large part the continuity of trust and collaborative advantage. This stability can be turned into dynamism again, for instance when new partners join up or the initial circumstances change in the implementation phase that comes next.

### **The fourth level of activity: changing a market**

An important outcome of this phase should be ensuring that the agreement generated in the foregoing phase is implemented. In this phase the internal oriented horizontal relationships enter the vertical, hierarchic structures of the larger-scale social systems that partnerships associate with. In the types of partnership I addressed in the beginning of this paper this implies entering a specific market to improve its sustainability or resilience. To analyse this phase a commodity chain perspective will be helpful. With this perspective sustainable resource management is conceptualized as a set of activities spanning both production and extraction of resources in developing countries and processing and transport, trade and consumption in developed countries. Although not all partnerships aim to mainstream their activities, some of the most interesting do. They create incentives for the transition of a conventional commodity chain to a more sustainable one. The difference between the two lies in the values attached. A conventional chain is solely focused on the value of economic profitability. A more sustainable one expands the concept of value to ecological and social issues in the chain. Partnerships that aim to change a commodity chain in a sustainable way need to become professional bureaucracies able to influence the governance structure of the chain, i.e. the authority and power relations that determine how financial, material and human resources are allocated and flow within the chain.

The central mechanism in this phase is legitimacy. Legitimacy refers to the process whereby the rule system of the partnership gains recognition and becomes accepted as a relevant alternative – or supplement – in the supply chain. To gain legitimacy a partnership needs to develop functional relationships with other market parties and the formal political regimes influencing that market. The successfulness depends among others on the extent to which they seize the most relevant sustainability aspects of the chain, the extent to which the most powerful actors in the chain are addressed, and how powerful the partnership is in moving these actors. To analyze the process of legitimization we need to broaden our research methodology. The strength of the partnership will find its counterpart in supply chain constraints and even often constraining government policies. Partnerships that aim to introduce new standards are not neutral tools. They should be considered political spheres of action; they are embroiled in the struggle of steering power on economic and political markets (Glasbergen, 2006).

Take the Allanblackia tree partnership. This project has to compete with other economic activities, such as cocoa farming and oil palm cultivation. The revenues from the tree should be attractive and competitive. If not, other forms of land use will shove the project away. This example illustrates the more or less permanent vulnerability of a time-restricted partnership.

Often, multiple partnerships are formed in a commodity chain. Take the Forest Stewardship Council. This partnership has to compete for legitimacy with many partnerships on the same issue which have set their own standards either for sustainable industrial logging, or sustainable conversion of land, control of illegal logging, or a combination of these. These partnerships exhibit a wide diversity of sustainability ambitions. Some of them concentrate on economic sustainability, others on social and/or environmental dimensions. While some focus on the characteristics of the product itself, others are concerned with production and process qualifications. Furthermore, there is quite a regional differentiation among partnerships. Some operate nationwide, while others span a continent. In all of these partnerships, governments, NGOs, or businesses are represented in different combinations.

Some partnerships are little more than a purely economic reaction to previously established partnerships that are pursuing more ambitious goals for sustainable change. Regarding the protection of forest biodiversity, these are mainly partnerships between governments and businesses. On the political market, we see that governments also take part in the struggle, seeking out and stimulating those partnerships that do the most to protect their own markets (Visseren-Hamakers and Glasbergen, 2006).

From an economic perspective, the competition between partnerships and their standards may be seen as a positive development. Competitive relations ensure that the most viable alternative will prevail. But things could turn out differently. The mainstream markets could force the sustainable niches out of the market or replace these niches with their own 'light' versions. The end result of these types of partnerships may be more product differentiation, an attractive niche market in the western world, and a shift of international trade patterns, with certified timber going to Europe and North America and non-certified timber going to Japan and China, but hardly any change in the market share of sustainable products.

Effective private action often needs an element of public recognition, but what we observe in this issue area, as in many others, is a sometimes corrupting role of governments.

### **The fifth level of activity: changing the political order**

On a more abstract level studying the primary processes of partnerships, and their use as media of change, gives insights into the diversity, dynamics, and complexity of governance in modern societies. It may help us to understand and evaluate the shift in the pattern of governance in liberal-democratic societies.

From its inception the concept of sustainable development has been associated with reforms of the political structures of decision-making (Lafferty and Meadowcroft, 1996; Eckersley, 2004). By providing an alternative model of governance, the partnership paradigm introduces such a reform agenda. Therefore we need not only evaluate partnerships on their own merits, but also on their impact on the political order of our societies. Here we enter a phase of our model that has hardly been empirically explored yet. However, general reflections are abundant. Partnerships have been welcomed as an expression of a new form of governance and a reviving of democracy (Hajer and Wagenaar, 2003), as well as an erosion of public authority, undermining democracy instead (Saurin, 2001). Some authors take a more

utilitarian approach; they assume that partnerships represent a still unexplored potential for governance and may contribute to an improved functioning of the public sector (Ronit and Schneider, 1999; Murphy and Bendell, 1997). These contradictory views reflect the prevailing uncertainty. They are more ideologically inspired than based on facts.

To assess the outcomes of partnerships we should ideally take the whole configuration of public, public-private, and private regulatory incentives in an issue area into account (Arts, 2000). A specific question would be how partnerships, through their interferences with the other regulatory schemes, improve the governability of these issue areas. Governability refers both to the content of the political choices and the structures of political decision-making.

Up to now, only incidentally such outcomes have been recognized. For instance, the most tangible outcome of the FSC has been that some developed countries adapted their procurement policies, facilitating the FSC label or one of the other labels. Some governments also based their forest law on the FSC premises. Less tangible, but perhaps even more important, is the influence of the FSC on the international discourse. The FSC definition of sustainable forestry is more or less recognized as a benchmark; this concept now plays a central role in any discourse on forest management (see also Pattberg, 2005).

There is no doubt that partnerships sustained the involvement of the business community and the community of NGOs in national and international political decision-making. However, looking the structure of policy-making the effects seem to be small. Indirectly the WSSD partnerships provide us some insights into the structural outcomes. These are the more than 300 partnerships officially recognized by the UN. The shrimp case is one of them. Analysis shows the following pattern:

- Only the largest and richest governments and international organizations have taken an active lead in promoting partnerships;
- The vast majority of the partnership funds come from governments;
- It is unclear how much of that money had already been directed toward sustainable development before the WSSD;
- Most of the NGO partners are large Northern based transnational organizations;
- The private sector hardly ever takes the lead and is only involved in a small part of the partnerships;
- Only a small portion of the partnerships involve all significant stakeholders;
- The partnerships tend to focus more on capacity-enhancing functions than on targeted and outcome-oriented management of natural resources (Hale and Mauzerall, 2004; Andonova and Levy, 2003/2004).

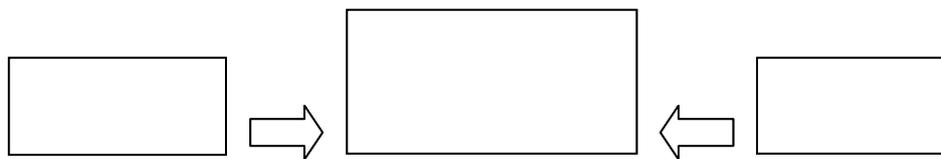

So far there are not enough indications that partnerships fundamentally change the world of politics. The WSSD partnerships are largely supply-driven (by what powerful actors have to offer) rather than demand-driven (by what is needed to fill key implementation gaps). They reflect ongoing implementation efforts more than new ideas for bridging core implementation gaps (Andonova and Levy, 2003/2004). However, this might be due to the specific category of partnerships and a time lag; the facts mirror the early stage the WSSD programme is in.

### **The second model: on the contextuality of partnering**

The ladder of partnership activity discussed so far helps us to understand and evaluate partnerships in a specific way. Mainly we were inside-out looking. As a consequence, the

focus was on intentional aspects of the partnering process; the sense-making activities. Relevant questions were: how do the actors involved shape their relationships, develop a shared meaning of reality, translate this in a change strategy, and what are the effects outside the partnering initiative? In this model the institutional context was more or less handled as a decor. However, the intentional interactions of partnering do not take place in a void; they are always contextually situated. To further understand partnerships we need to add an institutional analysis to the behavioural analysis. This analysis focuses on how the activities are structurally embedded.

Taking an analytical perspective, partnerships operate at a level between the particular organization and society. This implies that they are part of an outside social causality structure that pre-structures for a large part the range of matters on which they can take actions and the way the social actors are able to interact.

The reference made earlier to the interests of the three domains referred to the context of a particular organization. Each partner embodies a different segment of the world, represents specific hopes, expectations, and claims based on its core logics. The core logics represent the specific organizational entity an actor is part of: the formal public sector, the economy or the community. Connected to them are specific expectations and requirements; they pre-structure the roles the actors are able to play. Next table presents an overview of some of the aspects:

*Core logics of State, Market and Civil Society*

	State	Market	Civil society
Central unit	Voters	Owners	Members
Goods produced	Public	Private	Common
Power form	Law	Money	Group
Primary goals	Societal order	Wealth creation	Community building
Temporal framework	Elections	Business cycles	Regeneration cycles

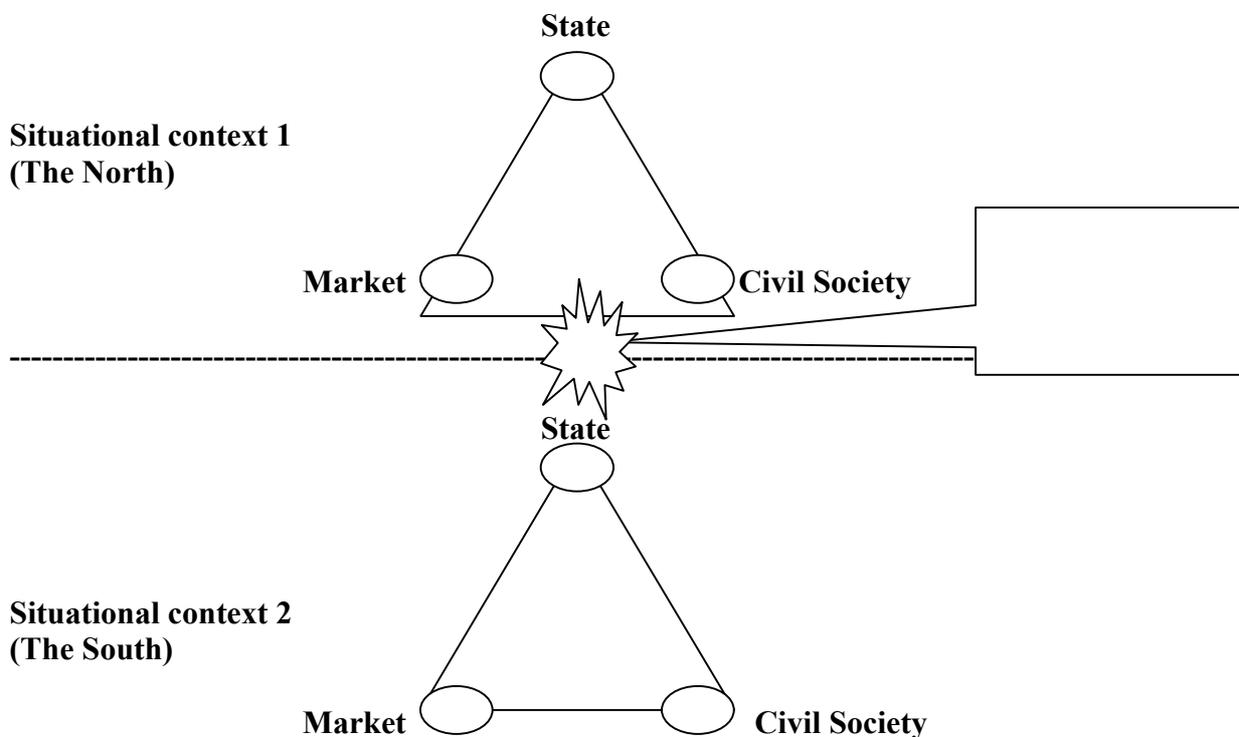

Based on: Waddell, 2005

However, these core logics do not exist independent from each other. They are embedded in situation-specific formal and informal rules, behavioural codes and norms that constitute the interdependent relationships of the actors. Another part of the causality structure relates to commitment of each of the partners to its specific role and place in these interdependencies; the rules of the game that together form the institutional societal context of the partnerships.

With this analysis we are looking outside-in. In the institutional analysis it is assumed that the transaction-specific activities of the partnering process are embedded in the structural positions and roles of the partners outside the partnership. These roles are connected by rules which specify what actions are required, prohibited or permitted. These structural properties of the relationships are more or less permanent and hardly changeable in a single partnership. In other words, the pattern of the outside relationships creates a more or less enabling or constraining environment for the partnership and, next to the intentional aspects of the activities of the partners, may explain part of its success and failure as a form of governance.

**An institutional analysis; the shrimp case as an example**

The basis of our second analytical model consists of the three domains constituting modern societies: the state, the market, and the civil society. These are placed in their societal context: for example a developed and a developing country. The partnership is indicated with a star.

This model particularly helps us to understand and evaluate the partnering process of regional and global partnerships. The analysis takes place at three levels: the level of the situational context 1 and 2, the relationships between the actors on each level, and the relationships of the actors over the two levels. However, to fully understand the functioning of the partnership we also need to analyse the basis of each of the actors involved; the relationships within each of the domains and how they constrain or enable the actions taken up or not in the partnership.

Let us take the shrimp case as an example of working with this model. This partnership originates from the Johannesburg Summit on Sustainable development in 2002. The objective is to improve market access of tropical shrimp while at the same time improving the sustainability of shrimp farming. This is a partnership that did not make much progress so far. Particularly the second objective related to ecological and social aspects of shrimp farming seems to recede into the background. The explanation is particularly institutional:

In the upper Northern triangle the problems of sustainability are mainly discussed. However, the problems should particularly be solved in the lower Southern triangle.

a) A first feature of the relationships is that the governments do not take a critical stance toward each other.

- The Southern state has hardly any intention to push its own shrimp farmers towards sustainable farming. Sustainability is not seen as an urgent problem. Even its own regulations are not or poorly implemented. Its main interest is to create a bigger market for the shrimps.
- The Northern state is hardly able and also not quite willing to press the Southern state to pay attention to the sustainability aspects. This does not fit into diplomatic relationships. They do not ask difficult questions nor do they formulate hard conditions for collaboration.
- Inside the Northern state the main responsibility for the partnerships is within the ministry of Agriculture. This ministry is focused on the issue of market access. Its main interest is the European food safety requirements. The ministry of Foreign Affairs, particularly its agency of Development Aid, addresses the sustainability issues, but is not the first responsible. The ministry of the Environment is not involved. So, sustainability issues are weakly represented.

b) A second feature of the relationships is the weak position of the nongovernmental organisations.

- The Southern NGOs were very sceptical about the partnership, since they are against large scale shrimp farming for the export market only. In the beginning of the partnership, the Northern NGOs were able to convince their Southern colleagues to participate in the partnership. However, the doubts of the Southern NGOs were confirmed; in their opinion, the sustainability issues were not adequately addressed by the partnership. The Southern NGOs increased pressure on their Northern colleagues to withdraw from the partnership.
- The Northern NGOs decided successively to withdraw. According to their view the sustainability aspects – such as questions of land use, destroyed mangroves, and pollution were neglected. They were not strong enough to change the process to the better on the Northern part and also their relationships with the Southern NGOs did not open up this opportunity.
- The Southern NGOs are in a very weak position. They hardly have any possibility to influence their own state, nor the farming entrepreneurs. However, a local branch of WWF is still participating in the process. Combined with the withdrawal of the other NGOs we observe a lack of countervailing power on the side of civil society.

c) A third feature of the relationships is the passive approach of the economic actors.

- The involved economic actors on both sites are unsure about their roles in this government inspired partnership and take a wait and see approach. Their main interest so far is food safety; the leading sector is the export sector that needs to produce according to requirements of the importer.
- Another partnership between two Dutch NGOs and the main importer may be more successful in addressing sustainability issues. Through this partnership, sustainability issues have been translated into certification criteria. The Dutch shrimp import sector has agreed to these standards. The criteria may be adopted by the European retail sector.

In this case we recognize both uncertain positions and roles of some of the participants and a lack of structural balance in the relationships. The interactive process within the partnership reflects the implications of the power relationships in the relevant context of the partnership.

## **Conclusions**

I started this presentation with the debate on public and private responsibilities regarding the management of natural resources. The partnership paradigm introduces a change in governance: from governance based on a strong state towards governance based on a strong society.

With the partnership paradigm classical political power loses its previous central position; it gets dispersed among a variety of public and private actors. A new governance structure is formed with nodes, meeting points, power centers you might call them too, where specific functions related to private and public affairs are performed.

A main element of this new governance is the idea that sustainable use of resources should be realized through the market. As the unsustainable use of resources primarily originates from market failure, responsibilities taken up by private actors from the market and civil society, whether in collaboration with governments or not, should be welcomed.

The two models presented may help us to better understand partnering processes and evaluate the partnership paradigm as an explication of a new form of governance for sustainable development.

The behavioural approach helps to study partnering as sense-making interactive processes. Here the focus is on the development of managerial potentials through deliberate activities. Each activity could be analysed as a process itself. Most partnership studies do just that and only address the first two steps on the ladder. A full evaluation, however, would include the relationships between activities and analyse how and why partnerships proceed on the ladder. Looking at our cases from this perspective reveals that the results are still very uncertain. In fact governance through partnerships seems to be not quite different from government policies. Though they promote a sense of collective responsibility to sustainable resource management their power to bring about sustainable change is as piecemeal and incremental.

The institutional approach helps to study the conditions that provide the opportunities for collaborative social action. Partnerships are not autonomous entities, but embedded in wider societal structures. Here the focus is on the factors that constrain or enable the partnership. Looking at our cases from this perspective reveals that partnerships are virtually never completely autonomous with respect to government policy. Partnerships derive partly from the powerless role of governments. However, their success is also largely dependent on them.

- First, the success of many partnerships depends on specific government policies. For example, overcapacity in fishery and illegal fishery can hardly be dealt with by private initiatives on their own. The same holds for sustainable forestry, which is dependent on a strict land use planning and a formal policy against illegal logging. Up to now governments fail to develop these necessary back up policies. They are part of the problems that partnerships address.

- Second, governments also fail in their meta-governance role. Because governments take a very pragmatic approach to partnerships they have not been given a logical place in public governance yet. The result is much duplication of efforts, disjointed actions and incoherent partnership programmes. Governments take up a role in the hierarchy they are part of; for instance, the UN. At the same time they engage in occasional roles in the horizontal structures of partnerships. Via the backdoor they aim to realize what they cannot via the front door. This creates a situation in which responsibilities are diffusely spread over public and private actors.

The behavioural and institutional model present two sides of one coin. Through their activities partnerships may modify the structural conditions within which they started functioning. In

this way they change the conditions for further collaborations. Partnerships certainly improve the deliberative capabilities of societies. In this way they may contribute to the progressive dynamic of actor and structure that is necessary to develop a progressive sustainable change.

Interested in the diffusion of the town planning movement in the early 20<sup>th</sup> century, Christiane Crasman Collins (2006) traces the roles played by Raymond Unwin, John Nolen and Werner Hegemann as ‘couriers’ of Camillo Sitte’s urban design ideas to America. She argues that there were two modes of diffusion. The first involves the transfer of what she calls ‘specific imported blueprints’ that implies the imposition of a foreign typology in a host culture, examples of which abound. In the case of New Zealand, the ‘blueprint’ for colonial settlement was the orthogonal grid with perimeter green belt, conceived by the New Zealand Company and laid out by surveyors in locations selected for town building. The second method according to Collins (2006) was the ‘diffusion of ideas with an emphasis on concept and process, rather than structure’. She argues that this led to a ‘meandering typology’ that absorbed the various features of the target location, ‘transformed by encounters on routes, and then once more setting out in new directions’. The specific example cited is the English Garden City that, she argues, was soon divested of its cooperative and social principles in its application in foreign lands. The notion that colonised countries were more than passive recipients of foreign ideas is important in understanding how planning ideas were diffused across the world. With the conference theme of ‘cross national transfers’ in mind, this paper traces the roles played by three ‘couriers’ central to the transfer of the English Garden City Movement to New Zealand, namely William Davidge, Charles Reade and Samuel Hurst Seager.

### **The Garden City Idea**

The notion of the Garden City has its roots in the work of Ebenezer Howard and the publication of his book *Tomorrow: a Peaceful Path to Real Reform* in 1898. Republished four years later in a slightly revised form as *Garden Cities of To-Morrow* Howard set out his solution to the appalling problems of the 19<sup>th</sup> century industrialising city in terms of both necessary social reforms and physical design. The *Garden City* sought to combine the best advantages of both the countryside and the city in a striking new urban form independent of existing cities. Howard also recognised that achieving his vision required land reform to be the ‘foundations on which all other reforms must be built’. He thus envisaged that the *Garden City* would not be open for private sale and speculation, but held in common ownership and leased to land users with increases in land values eventually funding social services. Despite the radical implications of these reforms and other aspects related to the establishment of the garden cities, Howard eschewed more radical methods of achieving his vision. He took pains to argue that this was to be achieved not by revolution, but by ‘peaceful’ means through ‘the force of example’. Setting such an example was the task of the Garden City Association established in 1899 led by Howard and, as Freestone (1989) points out, by an ‘earnest little group with radical overtones’ whose primary purpose was to promote ‘by educational and other means, the project suggested...in...*To-Morrow*. However as Freestone (1989) also asserts, the formation of the Association while successful in promoting the Garden City Movement, also initiated its de-radicalisation in the hands of more powerful stakeholders and interest groups.

Houses set in private gardens had historically been the preserve of the affluent, but in the 19<sup>th</sup> century detached houses in cities became affordable to the emerging middle class, with Bedford Park (1875-81) being an early and seminal example. Set among

an existing stand of trees with an unremarkable road layout, it is distinguished by most houses being detached, and according to Creese (1996:90) in which the 'lot was the badge of distinction' as a symbol for upward social mobility. Meeting this demand was the province of land speculators and developers whose purpose was profit, not social reform.

Responding to this demand became the hallmark of the architectural practice of Raymond Unwin and Barry Parker. In common with many other architects at that time, they made manifest the social and aesthetic theories long espoused by the English Arts and Crafts movement. However, it is their specific achievements in this context that bears noting. One aspect was their preoccupation with the 'art of designing small houses and cottages', a chapter title to their 1901 publication: *The Art of Building a Home*. Equally notable, are design principles devised for the layouts of residential areas, later to be published by Unwin (1909) in *Town Planning in Practice*. Building at a lower density was another imperative for Unwin, an argument set out in the essay, *Nothing Gained by Overcrowding*. Advantages are argued to arise from lower development costs and the opportunity this created for a detached house typology. Critical of high density speculative row housing, Unwin (1909:320) underscored his conviction that 'twelve houses to the acre...has proved to be the right number to give gardens of sufficient size'.

Unwin and Parker's design of the model factory town of New Earswick (1902) for the industrialist Joseph Rowntree, that provided an opportunity to put these ideas into practice at a large scale. The opportunity was repeated in 1903 when selected to design Letchworth, promoted by Ebenezer Howard's Garden City Association, and the design of Hampstead Garden Suburb in 1905. Houses set in private lots at relatively low density unpins the common approach. Illusions of the countryside are created by the encirclement of the development by a 'green' belt, and ensuring as far as possible, that all houses are able to view out over this public amenity. The picturesque is achieved by the use of curvilinear roads, generous street tree planting, and houses arranged to create visual townscape effects that mimic the informality of the traditional village. Economy is achieved by minimising street lengths by grouping houses around common greens with cul-de-sac access ways. As Freestone (1989) points out the development of Letchworth cemented the 'nexus between the garden city and town planning'. Moreover he also suggests that the garden city was 'inevitably deflected towards the most natural form of urban development – suburbia', of which Hampstead Garden Suburb is a seminal example. Reflected is divided opinion concerning urban development at the turn of the 19th century. On the one hand, a decentralised development strategy in the form of Howard's 'Garden City' was proposed as an alternative to the outward sprawl of existing cities. On the other hand, the reality of outward sprawl in the form of suburban growth was considered desirable, provided controls were put in place to ensure quality environmental outcomes.

The need to regulate urban growth had long been an issue in 19th century Britain, leading to various legal measures to empower local authorities to set development standards. Enforcing these measures proved difficult, and minimum standards (largely focussed on health) did not in any way guarantee that the resulting environment would be, from Unwin's viewpoint, 'orderly and aesthetically pleasing' (Unwin, 1906). Town planning was intended to compel local authorities to plan in advance,

over both developed and undeveloped land. In so doing, required standards would secure 'proper sanitary conditions, amenity and convenience in connection with the laying out and use of the land and any neighbouring land' (Baillie Scott, 1910). Propelled by the Member of Parliament, John Burns, the British '*Housing, Town Planning, etc. Act*' was passed in 1909.

The Garden City Association itself became a potent force behind the promotion of town planning, which by this time included Raymond Unwin, George Baillie Scott, William Davidge, and Charles Reade. The changing of the organisation's name in 1907 to the Garden Cities and Town Planning Association acknowledges this fact. Advocacy for town planning and the 'Garden Suburb' by the Association was achieved, although with opposition from those members unable to reconcile the perceived contradictions this created. Support for the 'garden suburb' was given impetus at the 1910 RIBA conference in London. William Davidge (1910) in summing up the views expressed by delegates thought it wise of Unwin to 'concentrate the attention of town planning in England mainly on the development of still unbuilt-on areas around existing towns', as opposed to Howard's proposals for a decentralised urban growth strategy.

Purdom (1913) expresses his concern that the 1909 Act sets up machinery for the extension of towns in the form of garden suburbs, 'the very thing which the Garden City declares to be fundamentally wrong'. With obvious frustration over this matter, Howard himself resorted to writing a letter to the London Times:

Will you allow me to protest against the use of the term "Garden City" as applied to the Tottenham Housing Scheme...It is a complete misnomer. True, the Act of 1909 speaks of the land laid out on the lines of a Garden City. But that is because neither the framers of the Bill, nor the Committee who passed, knew what the term "Garden City" implied. I was the first to use the term in my book *To-Morrow*, published in 1898...But the phrase "Garden City" quickly caught on, and soon became used for all sorts of housing ventures and building speculations...some of very little value. (cited Purdom, 1913)

Despite the protest, the fact was that in 1913, the only example of a 'Garden City' was Letchworth, but over forty residential developments existed in Britain that were described as 'garden suburbs' (Purdom, 1913:201).

### **Charles Reade and William Davidge**

Promotion of the garden city in New Zealand appears to have first received direct exposure at the 1907 International Exhibition of Arts and Industries in Christchurch. Publications displayed included Howard's 1902 *Garden Cities of Tomorrow* and the Garden City and Town Planning Association's handbook *The Garden City Movement*. The exhibition catalogue explained the Association's aim to be 'the relief of overcrowded areas...by the establishment of garden cities on a predetermined plan, to secure healthful and adequate housing, in which the inhabitants shall become in a collective manner the owners of the sites', clearly reflecting Ebenezer Howard's 'garden city' vision (Cowan, 1910).

A more vigorous promotion came in 1911, when Charles Reade undertook a lecture tour of New Zealand. A New Zealander by birth then working as a journalist in Australia had published *The Revelation of Britain: a Book for Colonials*, revealing his perceived horror of the English city as a condition to be avoided in the colonies. His solution however, was not civic improvement strategies of the 'City Beautiful' Movement then being promoted in New Zealand, but a call for town planning regulations. The Reade lectures led to a heightened public debate about 'town planning' in New Zealand. Editorial comment in the *NZ Building Progress (NZBP, 1913:751)* contemplated 'What town planning is', and cites the clearance of slums and the establishment of Myers Park in Auckland as an example of the 'beginnings of town planning on systematic lines'. Whilst clear about this 'City Beautiful' intervention, the *NZ Building Progress* declares that the 'general idea (of town planning) is hazy in the direction of building new towns somewhere away from old towns, and making them up-to-date in every way' (*NZBP, 1913:751*).

Some of that haziness may have lifted in 1914 when Charles Reade returned to New Zealand with William Davidge under the auspices of the Garden Cities and Town Planning Association to present a further series of lectures in the main towns. Lectures were given in Auckland (following Davidge's arrival in that city in July 1914), Hamilton, New Plymouth, Wanganui, Palmerston North, Napier, Christchurch, Oamaru, Dunedin and Invercargill (*Chch Press, Mar, 1914*). The titles of the lecture were *Town Planning in New Zealand, Economics and Aesthetics of Town Planning, and Garden City vs. New Zealand Slums*. In August of that year the *NZ Building Progress*, carried the following report on the visit:

'Those New Zealanders who are sufficiently wide awake to the advantages and benefits of Town Planning, have recently had a feast of lantern slides and information given to them by Messrs. Davidge and Reade who have just passed through this Dominion on a mission to spread the Town Planning movement from the Garden Cities & Town Planning Association of England. It is not to be expected that such a mission would attract enormous crowds, but those who went to hear the lectures with their minds open, cannot have failed to get a greater insight into this modern movement for the betterment of the people' (*New Zealand Building Progress, 1914:1183*).

The lectures were illustrated with lantern slides of Unwin's residential designs presented as examples of good town planning practice. This led the *NZ Building Progress (1915)* to clarify their understanding of town planning as being 'the principle of the one family house', and that this be 'firmly maintained'. An attempt was made by Arthur Myers to introduce a private town planning Bill in 1911, withdrawn after government promises to introduce its own legislation (Ferguson, 1994:76). With perceived tardiness in mind, Reade asserted in his lectures that town planning was a necessary step towards 'civilisation' and rebuked New Zealand for dragging its feet, pointing out that 'New Zealand is behind the Old Country as much as she is behind European Countries and even small places like Nova Scotia' (*Chch Press, July 15, 1914*). Reade was later appointed first Government Town Planning of South Australia, and in 1917 was responsible for the design of Mitcham Garden Suburb in Adelaide (Garnaut, 1998). However, the role of promoting the Garden City Movement and town planning in New Zealand had by this time passed to the Christchurch architect, Samuel Hurst Seager.

## Samuel Hurst Seager

Samuel Hurst Seager emerged as a significant figure in these matters. He trained as an architect in London between 1882-84, immersed in the neo-vernacular of the Arts and Crafts movement. He returned to practice in Christchurch, and produced a convincing Arts and Crafts architecture using timber construction. He also designed a housing development, the '*Spur*', at Sumner in 1902, on the outskirts of Christchurch, modelled on London's Bedford Park (Lochhead, 1988). He was drawn into the campaigns of the beautification societies and to emerge as the principle champion for the Garden City Movement in New Zealand.

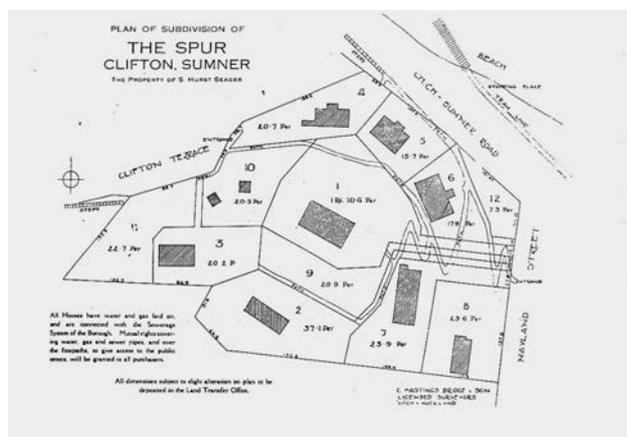

Fig 1 Layout of “The Spur”, Sumner, Christchurch, 1902, Samuel Hurst Seager.

Not only did Hurst Seager attend the 1914 Reade-Davidge lectures in Christchurch, but he also chaired the session and presided over the subsequent discussion. Hurst Seager also claimed some authority, from having visited ‘several garden cities’, naming the factory towns of Port Sunlight and Bournville (Hurst Seager, 1911). For the advocates of the ‘City Beautiful’ movement, he suggested, town planning offered a strategy for achieving civic improvement projects, hence the discussion raised about the beautification of the Christchurch Cathedral Square at Davidge’s lecture. He was also clearly familiar with Ebenezer Howard’s work, and very likely to have attended the 1907 International Exhibition of Arts and Industries in Christchurch where his work was exhibited. Following an overseas trip that included visits to Rome, he argued in the RIBA Journal (1913) for a further typology of self-contained ‘Garden Industrial Cities’. Following the 1914 Davidge-Reade lectures he went on to present his own lecture series in which an affinity with the neo-vernacular of Unwin’s ‘Garden Suburbs’ is also clearly discernable. This is revealed somewhat dramatically by the *NZ Building Progress* in a report on a series of lectures entitled ‘Practical Town Planning Hints’ that Hurst Seager delivered to the Christchurch College in 1916:

‘He then threw on the screen pictures of garden cities as they should be, and his view of places of this nature was exquisite. The roads followed the contour of the ground. There were corners set apart for beauty spots and vistas down

which one watched the traffic of the streets winding in and out among the avenues, gardens and greenery of every description. He illustrates... a garden city at Hampstead, London and contrasts the views of Christchurch streets and other places. He stated that the city should be limited, and that there should be garden suburbs connected by tramway or railway, set a distance away among parks and gardens'. (NZBP, 1916:715)

Despite the growing enthusiasm for town planning in New Zealand at this time, there was ongoing opposition from business and landowners, and a lack of interest from the government who were preoccupied with the First World War. But as the *NZ Building Progress* (NZBP, Dec 1915:261) reported the '...war has not dampened the ardour of Town Planning advocates; rather it has stimulated them to prepare for a time when...things will go ahead at a fast pace'. Hurst Seager's enthusiasm was certainly not dampened, and he arranged to be the government representative at the 2nd Australian Town Planning Conference held in Brisbane in 1918. He presented a paper, arguing for the construction of 'Garden Cities and Villages' to provide the Australasian nations with a means to settle soldiers returning from the War, illustrating his concept with a Howard-like diagram.

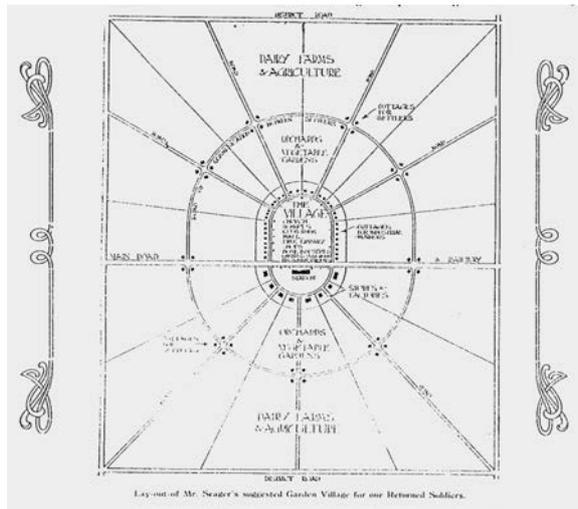

Fig 2 Lay out of Hurst Seager's Garden Village for Returned Soldiers, presented at the 1918 Brisbane Town Planning Conference (NZ Building Progress, September 1917:9)

He also published an extensive report on the proceedings, which included a reproduction of Raymond Unwin diagram from his 1912 article *Nothing Gained by Overcrowding*, to which Hurst Seager (1919: 20) adds the following caption:

'The Garden City Principle applied to Suburbs: Mr Raymond Unwin here illustrates the application of the garden-city principle of a belt of green encircling the whole community to the extension of new suburbs. The suburbs on the left are seen separated from the city by belts of land, which will remain open for all time'.

Fig 3 'Garden City Principles applied to Suburbs', Unwin diagram reproduced in the Proceedings of the 1919 Town Planning Conference, Wellington. (Proceedings, 1919)

Hurst Seager used both the experience of the Brisbane conference and his influence to persuade the New Zealand government to sponsor a Town Planning conference in Wellington in 1919. The underlying agenda was for the introduction of town planning legislation, and Hurst Seager repeated his recommendation for the New Zealand Government to build 'Garden Villages' defined as garden cities in miniature centred on an industry citing Bourneville and Port Sunlight as examples (Proceedings, 1919). On the question of town planning, the opening addressed by the Acting Prime Minister, Sir James Allen must have been a disappointment. With little more than passing reference to Town Planning and a reminder to the delegates that they should not 'forget art' in their deliberations, he went on to use the conference as a political platform to rally support for the building of overseas War Memorials. But other officials must have been more to the liking of Hurst Seager and his agenda. Russell (the Minister of Internal Affairs) commented:

'Great Britain has realised her mistake, and during recent years town planning associations and activities have been strongly in evidence. As a result various garden towns have been laid off, suburbs have been created for the purpose of improving conditions, and higher standard of living for the masses is being looked for' (Proceedings, 1919)

The idea that both the Garden City Movement and town planning were modern progressive ideas was also emphasised, noting government minister H.F. von Haast remarks that '...our New Zealand idea of laying out roads in new towns is absolutely out of date... Nowadays the gridiron type of plan is universally condemned and abandoned by the great authorities on town-planning. Look at any plan of the garden city and it will be seen that it is the diagonal and curving streets that gives them their charm.'

Some doubters dampened the enthusiasm. Salmond (Proceedings 1919: 127) raised a question about the extent to which conditions in New Zealand were similar to those in the Britain, and therefore the extent to which the British solutions were appropriate?

On the question of Hurst Seager's suggestion that the Garden Villages should be built for returning servicemen, Salmond retorted that 'it is a pity that soldiers who wished to be farmers apparently also desired to have the advantages of the city. Country life has its own attractions apart from those of the city...It was a mistake to encourage the soldier to expect to have the amenities of city life while working on his farm in the country'.

Despite the doubters, the conference concluded with a resolution proposed by Hurst Seager (and unanimously adopted), that: 'this...meeting is in favour of a special propaganda being started throughout the country with a view to impressing upon local authorities...the importance of applying the complete garden-city principles to the schemes of reconstruction which are to be undertaken after the war'. (Proceedings: 1919: 115)

A competition was organised as part of the Conference, inviting submission for the design of a 'Garden City', a 'Garden Suburb', and a set of photographs illustrating civic improvement. Surprisingly there were no entries to the 'Garden City' category, but a Silver and a Bronze medal was awarded respectively to H.G. Helmore and Miss A Sleigh, both of Christchurch, for their *Garden Suburb* designs.

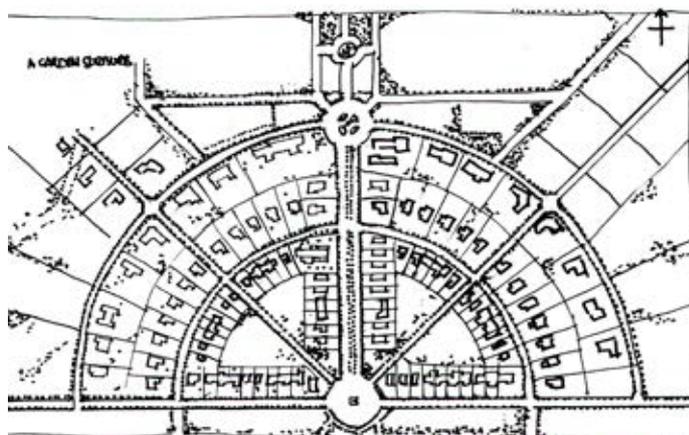

Fig 4 Garden Suburb competition entry by Alison Sleigh to the 1919 Town Planning Conference, Wellington (NZ Building Progress, 1919)

Immediately following the 1919 Wellington conference, Hurst Seager (*letter 6/6/1919*) wrote to Ebenezer Howard claiming that 'it is the result of your work...which has induced the Dominions to seriously consider garden city activity', and reports on his proposals for 'Garden Villages', and his desire to meet with Howard. In the same month he also wrote to Raymond Unwin (*letter 18/06/1919*), to whom he sent a copy of his Brisbane conference report, and expressed a desire to also meet with him. The NZ Building Progress (July 1919) reports that Hurst Seager did go to England 'with the object of getting to know the inner workings of garden cities and industrial cities in the Old Country', although no evidence for meetings with Howard and Unwin have been found.

An opportunity arose in 1920 for Hurst Seager to design a private residential

development in which he applied 'Garden Suburb' principles: Durie Hill Garden Suburb in Wanganui. With a site set on a hill it uniquely had an elevator to transport residents to the summit. The layout had a system of curvilinear roads organised around internal parks and garden allotments, but it lacked a 'park belt'. It was Hurst Seager's intention to control development to achieve aesthetic aims. But as Schrader (1993) comments, the developers sold sections without the restrictions and conditions to enforce Hurst Seager's intentions, and Durie Hill became little more than a subdivisional plan for quarter acre lots.

There is further correspondence in 1926 between Samuel Hurst Seager (newly elected at the time as the President of the New Zealand Institute of Architects and Charles Reade, by that time the Government Town Planner to the Federated Malay States in Kuala Lumpur. Reade commiserates with Hurst Seager about the fact that New Zealand had still not promulgated a town planning regulations noting surprise that New Zealand remains 'behind practically all modern countries in taking up and working out, to her advantage, the economic results obtained under town planning...' (letter dated 09/04/1926). There is further correspondence with Raymond Unwin over the town planning legislation, Hurst Seager having sent him a draft on which to comment.

### **The Legacy**

In 1925 the New Zealand Government sponsored two competitions for the design of 'Garden Suburbs', one in Auckland at Orakei, the other in Wellington at Lower Hutt, and both entries submitted by Hammond were placed first. The Plans of both submissions, and to a greater extent in the Orakei submission, exhibited a planning arrangement that had 'garden suburb' features of the kind Unwin prescribed. But absent is any reference to a 'park belt'. The Orakei scheme combines axial main streets and curvilinear residential roads, something lacking in the less distinguished plan for Lower Hutt. More remarkable is that in the architect's own account of his winning schemes published in 1925, he makes no reference to Garden Cities or Suburbs, with comments restricted to technical descriptions. (Hammond, 1925a & b)

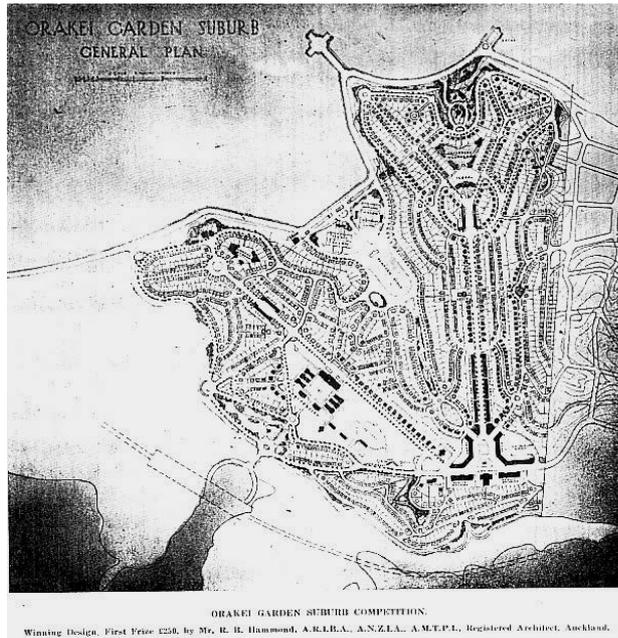

Fig 5 Orakei Garden Suburb, First Prize entry to the 1925 New Zealand Government competition by R B Hammond. (Hammond, 1925)

The New Zealand Government did not promulgate Town Planning Legislation until 1926, and Garden Cities were never built. But as Ferguson (1994:88) reports, cheap government housing loans and the release of Crown land on the outskirts cities in New Zealand, resulted in what she describes as a 'frenzy of speculative development' in the 1920's. She comments further:

The emphasis on subdivision and expansion meant that subdividers paid only lip service to the ideas of the garden city and town-planning movements. Suburban local authorities were keen to promote subdivision, and made few demands. Estates were usually subdivided on a grid pattern, any hint of a curved street lay-out or a (park) bringing boasts that the estate was organised on the most progressive town-planning lines. (Ferguson 1994:88)

Such a boasts can be witnessed in the sales brochure for the Tamaki Garden Suburb (designed by Evans who was place second for his entry to the 1925 Orakei Garden Suburb competition). Tamaki was essentially a sub divisional plan with roads laid out in concentric semi-circles pattern. There is no park belt, no curvilinear roads, and no unified built form. The Garden City and the Garden Suburb became reduced to a real estate marketing slogan.

In 1935, the election of the first Labour Government in New Zealand saw the introduction of a public housing programme, which utilised parts the Garden Suburb competition layouts of Orakei and Lower Hutt for first state housing projects in New Zealand. Whilst these partly followed the original Garden Suburb layouts, by this time new influences were being felt from America, in the work of Perry and Stein and the concept of the 'neighbourhood unit'.

Fig 6 Sales brochure for Tamaki Garden Suburb, Auckland, New Zealand (1932). The image reproducing the idealised countryside setting for the ‘garden suburb’ set below between the overtly contented women and the distant views of the Huaraki Gulf. The basket contains rose petals, and the axe is crossed by an electric light bulb, perhaps signifying modern advancement.

To claim that Howard’s Garden City alone has been seminal in 20th century urban formation is to overlook the significant distinction between the concepts of ‘town and country’ and ‘house and garden’. Overlooking this distinction, however, is precisely what the Garden City and Town Planning Association did when they appropriated the ‘Garden’ image to support the low density, suburban model advocated. Presented as a modern innovation in New Zealand, this suburban vision paralleled a pre-existing antipodean expectation for the quarter acre lot where, as suggested by Ferguson (1994:26), the pre-eminence and virtue of nature is emphasised, ‘tamed and enclosed behind garden walls’. Further bolstered by the ‘neighbourhood unit’ arrangement of suburban communities which facilitated the privatisation of transport in the form of the family car, these forces have combined to shape the sprawling suburban city form that continue to dominate cities in the New World.

### *ACKNOWLEDGEMENTS*

The author expresses thanks to Watershed Organization Trust (WOTR) Head office Ahmednagar for extending full cooperation in helping prepare this paper. Special thanks to the Marcella D'Souza, Executive Director, WOTR for giving us access to the information and to Vivek Kumar Mishra, Assistant Manager, WOTR for support and fruitful discussions, which helps to develop this study along with all other staff members of WOTR who extended their full support in helping us gather and compile information. The author is also thankful to the Maldevi watershed development committee and Sangamner Bhag Sahakari Sakhar Karkhana who implemented this project\*.

### *Abstract*

*According to Kevin Cleaver, Director Agriculture and Rural Development, World Bank, (reference & year) "About 60% of the extra food to meet the increasing demand will come from irrigated agriculture. At the same time, we face the challenges of increasing farmer incomes, reducing rural poverty and protecting the environment, all from an increasingly constrained water resources base."*

\*Watershed Organization Trust (WOTR), 'Paryavaran', Behind Market Yard, Ahmednagar-414001, Maharashtra, India.

*Agricultural water management lies at the crossroads between four important areas of public policy: water resources; agriculture; rural development; and environment. Each area can make important contributions to the development and productivity of agricultural water management.*

*Farmers must have reliable access to water, cost-effective means of growing their crops, and markets to sell into. In other words, an integrated approach is essential. Keeping this in mind farmers, governments and a range of other stakeholders frame critical policy choices regarding the management of agricultural water. These choices try to strike a balance between water demand across a range of sectors, not just agriculture, and at the same time address issues relating to environmental risks and benefits.*

*India's is Semi-Arid Tropical (SAT) region characterized by seasonally concentrated rainfall, low agricultural productivity, degraded natural resources, and substantial human poverty. The green revolution that transformed agriculture elsewhere in India had little impact on rain fed agriculture in the SAT. In the 1980s and 1990s, agricultural scientists and planners aimed to promote rain fed agricultural development through watershed development. A watershed is an area from which all water drains to a common point, making it an attractive unit for technical efforts to manage water and soil resources for production and conservation.*

*This study is an effort to understand the effectiveness of Indo German Watershed Program undertaken in many parts of Maharashtra and Andhra Pradesh.*

*This research on Indo German Watershed Project has been taken up to study the following hypothesis*

- 1. Watershed projects perform better when there is full participation of project beneficiaries and careful attention to social organization.*
- 2. The second hypothesis is that a variety of factors determine the incentives for people to manage and protect natural resources and invest in increased agricultural productivity. These factors are very important in determining the outcomes that projects seek to achieve.*

*The above framed hypothesis is tested through a case study on Village Mashvandi in Sangamner Taluka of Ahmednagar District*

## **INTRODUCTION**

Water sustains life having blessed with it as a natural resource we have to understand its true value. The alarming rate at which it is depleting is a cause for concern and action. One of the biggest challenges facing us today is availability of good quality of water. This has to be tackled effectively through good management.

Today the demand of water far outweighs its supply, more so for freshwater.” The world water cycle seems unlikely to be able to adapt to the demands that will be made in the coming decades” (UNEP, 1999)

Farmers must have reliable access to water, cost-effective means of growing their crops, and markets to sell into. In other words, an integrated approach is essential. Keeping this in mind farmers, governments and a range of other stakeholders frame critical policy choices regarding the management of agricultural water. These choices try to strike a balance between water demand across a range of sectors, not just agriculture, and at the same time address issues relating to environmental risks and benefits.

## **RESEARCH PROBLEM**

The future of agriculture development and food security is critically dependent on the Development of rain fed agriculture. This is not only due to the fact that these regions account for more than half of the total cropped area but also due to the reason that the productivity levels of the irrigated and green revolution belts has saturated. As a result, returns to investment in agriculture are found to be substantially higher in the rain-fed regions when compared to irrigated regions (Fan and Hazell, 2000). Incidentally, majority of the poor lives in these regions. Therefore, development of these regions helps in solving the twin problems of poverty and agricultural production. Besides, it would help in reducing the regional inequalities as well.

While providing productive irrigation facilities to these regions is an effective solution it would be a time consuming (long run) and costly proposition given their geographical disadvantages. On the other hand, watershed development is proved to be the most suited technology for improving the conditions of these regions at least in the short and medium runs.

Watershed development helps in improving agriculture productivity of rain fed areas through *in situ* moisture conservation, vegetative cover, increased availability of water, etc. It can also lead to sustainable irrigated agriculture in moderate rainfall (above 750 mm) conditions<sup>1</sup>. A watershed is an area from which all water drains to a common point, making it an attractive unit for technical efforts to manage water and soil resources for production and conservation.

## **AREA OF STUDY**

In Maharashtra, a narrow coastal plain separates the Arabian Sea from the Western Ghat Mountains. On the eastern side of the mountains, the majority of the state is spanned by the large Deccan Plateau, which covers much of south-central India. Rainfall is very high in the coastal mountains, but the western part of the Deccan Plateau (in the rain shadow of the Ghats) is very dry. In western Maharashtra, the scarcity of water and favorable topography make water harvesting a high priority and the focus of major water shed projects.

The Watershed projects covered operate under the Ministry of Agriculture, the Ministry of Rural Development, non-governmental organizations (NGOs), and in collaboration between NGOs and the Government.

The government projects are more technocratic in focus, whereas the NGO projects focused more on social organization, and the government-nongovernmental collaborative projects tried to draw on the strengths of both approaches.

In Maharashtra for collaborative programs between government and nongovernmental agencies the two main examples are the Adarsh Gaon Yojana (Ideal Village Scheme, or AGY), and the *Indo-German Watershed Development Programme (IGWDP)*. The IGWDP is an example of collaboration between government and non-governmental organizations. Initiated in 1993 with capacity building, the IGWDP develops micro watersheds in a comprehensive manner through the initiative taken by village groups. Its guiding philosophy is the need for collaboration among village level organizations. It accepts that although indigenous knowledge and practices are important, they need to be augmented by modern techniques and management practices.

#### **WATERSHED ORGANISATION TRUST (WOTR) OF IGWDP**

As mentioned above in Maharashtra, the problem is one of scarcity of water. Most of these water deficit villages are characterized by successive failure of harvest due to poor monsoons, dry wells and acute shortage of drinking water. This results in dislocation in livelihood sources especially of the poor suicides, this resulting immigration, distress sale of livestock's, indebtedness, lack of fodder hunger and destitution.

What is required is decentralized and community driven resource conservation and management. Watershed based natural resource conservation and management provides a ray of hope and way out of vicious cycle of drought and despair times when the rainfall is below average.

WOTR is a NGO established in 1993 to undertake developmental activities in resource-fragile-rain-fed areas, mainly to motivate village communities for water conservation. It has in the process created a huge pool; of socially and technically trained practitioners within Maharashtra and Andhra Pradesh.

The main focus area of WOTR are Capacity Building of village groups and NGO's for participatory watershed development, self-help promotion, direct implementation of watershed projects, micro-credit activities, training and extension for organization and practitioners, development of concepts, pedagogies, training manuals, awareness generation tools and media aids, documentation and research.

### **Capacity Building of NGO's and CBO's for Watershed Development**

Capacity Building of NGO's and village Self Help Groups (VSHG's) is realized through Participatory Operational Pedagogy (POP), which is a step-by-step interactive strategy for awareness generation

WOTR has introduced the concept and practice of community based house water budgeting, which involves the entire village community. The community assesses how much rainwater has actually been collected in their catchments during rainy season and plans its optimum use both for livestock and agriculture purposes so to get maximum output per drop of water harvested.

The methodology adopted for the planning of the watershed is called Participatory Net Planning (PNP), in which planning is done for each gat/survey number in consultation with the concerned farmer couple. WOTR assists NGO's and VSHG's by providing technical support in planning, project formulation, implementation, documentation, monitoring and evaluation of their watershed projects.

### **Direct Implementation of Watershed Projects**

In order to constantly test concepts with ground realities, as well as to improve the competency of its own staff, WOTR directly implements several large-scale watershed projects. These are implemented in remote and backward tribal areas and cluster approach is adapted to more cumulative impacts.

### **Training and Extension**

WOTR regularly organizes a large number of training and exposure programs for government and non-government organizations from various parts of country as abroad, who are

undertaking watershed development, natural resource management activities and promotion of development.

### **Women's Development Activities**

Any intervention in natural resource regeneration and management in rural areas has to address the concerns of women, since the regenerated resources respond to immediate household needs such as water fuel and hence involvement of women requires special attention.

Formation of SHG's for savings and credit, which later move on to take up developmental and income generating activities is basic strategy followed. Till 2005 WOTR has organized, with the support of 55 NGO's 3,174 SHG's involving 42,882 members.

### **Micro-Credit activity**

WOTR micro-credit initiative extends timely credit through self-help groups (SHG's) for value addition and livelihood diversification in regenerated environment.

### **Support to DPAP projects in Ahmednagar district as "Mother NGO"**

With the objective of providing support to NGO's watershed communities and local institutions of Drought Prone Area Programme (DPAP) projects financed by the government of Maharashtra, WOTR as "Mother NGO" of Ahmednagar District. In this capacity, WOTR

conducts training programs for participants from the project Implementing Agencies (PIAs), Watershed Development Teams (WDT), Watershed committee (WC) and Watershed secretaries.

WOTR has introduced the concept and practice of community based house water budgeting, which involves the entire village community. The community assesses how much rain water has actually been collected in their catchments during rainy season and plans its optimum use both for livestock and agriculture purposes so to get maximum output per drop of water harvested.

*WOTR is involved in 3 states (Maharashtra, Madhya Pradesh and Andhra Pradesh), As of March 2006 it has network of collaborating partners of 147 NGO's/ agencies, Development work in 1053 villages, No. Supported 3,981 women SHG's, Total number of persons who have availed of trainings and exposure are 121,696 persons from 22 states of India and 18 countries, 49,026 women have availed of Micro finance, 4278 SHG's are involved in Micro-finance, amount of money disbursed in Micro-finance is Rs 138,238,936*

## **CONCEPTUAL FRAMEWORK**

One continuing challenge to all projects is in designing interventions and organizing communities so that benefits of watershed projects are distributed more evenly to all sections of community. The needs and interest of least influential community members require special attention. This is one challenge which is handled much better by the NGO working on watershed projects because the major difference between Government and NGO watershed programs are their scale of operations and their staffing structure. While government programs have huge

budgets and work in hundreds of villages, most NGOs work in only a handful of villages. They devote more staff time per village, and they often work on a variety of activities in addition to watershed management. NGO staff members include many non technical staff too trained in community organization. They believe that social organization contributes as much too successful watershed development as technical input.

### **HYPOTHESIS OF THE STUDY**

1. Watershed projects perform better when there is full participation of project beneficiaries and careful attention to social organization.
2. The second hypothesis is that a variety of factors determine the incentives for people to manage and protect natural resources and invest in increased agricultural productivity. These factors are very important in determining the outcomes that projects seek to achieve.

### **OBJECTIVES OF THE STUDY**

This case study is an attempt to understand the potential of watershed development in addressing the issues of poverty alleviation. The important issues in this regard include:

- Assessing the linkages between watershed development and rural livelihoods & poverty,
- Type and nature of benefit flows accruing to various sections of the community, and

- Challenges in making the watershed programme pro-poor and sustaining it in the long run.

## **METHOD OF STUDY**

In this research paper an effort to understand the effectiveness of Indo German Watershed Program through a case study on Village Mashvandi in Sangamner Taluka of Ahmednagar District.

The study is based on field visits and discussions with various sections of society and also other stakeholders in the programme such as NGOs, administrators, policy makers, etc. The main focus here is to understand the socio-economic transformation brought in the lives of villages with the implementation of the watersheds projects by Maldevi watershed development committee and Sangamner Bhag Sahakari Sakhar Karkhana with hand holding and capacity building support of Watershed Organization Trust (WOTR).

## **ANALYSIS OF THE CASE**

This case study is organized in three parts.

1. Brief description of the case study region.
2. The linkages between watershed development, water and poverty.
3. Last section is conclusion.

## ***Part 1***

### **Case Study Region –Mhaswandi Village**

Mhaswandi is in the Sangamner taluka of Ahmednagar district. Once a remote and isolated village of 253 households, located in the rain shadow belt of Maharashtra, was a picture of despair; depleted natural resources necessary for rural livelihood. Even drinking water was not assured. Villagers had to move to resource-endowed areas working seasonally. Some herded sheep, which further depleted the already fragile ecosystem. Agriculture production even in a year of reasonably good rain- was not good enough. Women had to work very hard to fetch water and fuel from long distances and for their other basic needs.

Mhaswandi was under the verge of desertification when it was taken up by WOTR under the IGWDP. The challenge was to win the confidence of the people and make them aware of the inter-relationship between environment and the health and quality of human life- social, economic and cultural. Awareness generation was achieved through constant interaction, audio-visual aids, exposure visits to area where people have conserved and mobilized resources for betterment of their own life. The next stage was to mobilize and capacitate the community to undertake watershed development. People agreed to contribute voluntary labour and follow the social fencing principles such as ban on free grazing and tree felling.

## ***Part 2 of the case***

### **Analyse the linkages between watershed development, water and poverty**

*Impact was to be understood under following heads*

- 1. Geographical Changes*
- 2. Economic Impact*
- 3. Social Changes*

To understand the impact of watershed projects information was collected by interacting with various sections of village community directly or indirectly related and benefited by the project.

The section of community who were contacted for the information are

- 1. Capacity Building organization.*
- 2. Village Watershed Committee*
- 3. Self help Groups*

*Capacity building Organization CBO at Mhaswandi*

As mentioned earlier building up capacity of the CBO's is the core function of the WOTR.

In Mhaswandi NGO, Cooperative Sugar factory, agriculture departments played an important role in creating CBO. According to the members of the CBO the main reason for which they were brought together was to

- Improve agriculture productivity
- Improving the storage and usage of water

- To improve the quality of life.

Simple scientific and people-oriented technology was imparted to understand about soil conservation, arresting the rainwater runoff and harvesting water, as well as greening hills and waste lands. A series of technical treatments (contour trenches, gully plugs, farm bunds, check dams, etc) along with bio regeneration (plantation, grass seeding, etc.) were undertaken.

CBO's have their functional activities in the areas of public facilities, agriculture developments providing loans and sanitation.

Decision taken by CBO is in proper consultation with Gram Sabha and Gram Panchayat.

According to CBO members, watershed project has transformed the whole village from poverty stricken backward village to prosperous happy place to live in. Prior to implementation of watershed project the village had no scope for farmers to produce due to lack of water, which had caused a chain reaction of unemployment and migration of villagers to seek to more green pastures. But now after 12 years since the implementation of watershed project in 1994 agricultural productivity has improved, income level of people have increased scope of employment has improved, villagers have become more aware of health and sanitation.

### ***Local Institution- Village Water Shed Committee***

Village Watershed Committee (VWC) is the official project holder having representation from all primary stakeholders, VWC plans, implements and monitors all the activities and evolves systems and procedures for management and conflict resolution. Mhaswandi VWC is a registered body; it has 24 members with women representatives too who are nominated by Village Assembly (Gram Sabha). The president of the VWC is Subash Ithape.

VWC started in 1994 with the implementation of watershed project. These local institution are created by the WOTR and given continues training to be able to manage the watershed projects on their own. The functions include looking into loan requirement, requirements in term of seeds and fertilizers. Further on they have to take care of other social aspects too like settling disputes among people, creating healthier environment with proper sanitation, providing with clear cooking fuels, water supply system, toilet construction, etc.

This is a institution created with the representatives of people from all walks of life from the village, trained by WOTR who are not only looking into the progress of watershed projects but also take care of other aspects to improve the quality of life.

Interaction with the VWC members indicated that they are very positive in out look and are very involved in their work. They have played a major role in the transformation of the village since the implementation of the watershed project in 1994. They have seen the whole village working jointly towards the goal for making the village a better place to live in thus they

are now more committed to the work and plan to work harder to improve it further more in future.

### ***Local Institution - Self help Group***

Women development and empowerment is one of WOTR's priorities. Formation of SHG's for savings and credit, which later move on to take up developmental and income generating activities is the basic strategy followed. It targets women because women are the ones who mostly deal with small monies and who also save in small amounts. Women take up small-scale income generating activities as a side job, besides their routine household and farm work. By giving her an opportunity to improve her economic independence she also gains social status and thus is actively included in the functioning of the village activities.

Total of 2 women in each SHG was contacted to understand their view about watershed project and the benefits of SHG's.

The total women population in Mhaswandi is 541 in number; literacy level among women is very low. There are 23 SHG's in the village of this 8 are granted and rest are non granted. Members of each SHG range from 10-15 women per group. Two women from each SHG is member of the Village level Apex Bodies Sanyukt Mahila Samithi (SMS). SMS is linked to micro-finance Sampada. SAMPADA is a sister concern of WOTR and is dealing with the issues related with micro-finance, micro entrepreneur development, health and insurance. SAMPADA

's Micro credit was initiated in the year 1997-98, initially as pilot initiative of WOTR in response to the demands of capitalizing of the rural women's through SHG's.

Women who had attended the awareness camps got motivated to improve their life economically and thus enrolled themselves to SHG's. They basically liked the idea of being able to supplement their family income without having to disturb their daily chorus. Very small portion of money transaction of SHG is for personal consumption and insurance and major portion is for enterprise building.

Initially the money was majorly borrowed for consumption but later once they gained confidence in handling money transactions they started investing money in micro enterprise. Small loans are taken to start business like petty shops, poultry dairy, kitchen garden, bangle shops, small trading which includes selling of seeds, fertilizers etc, and presently work is in progress to train women in producing detergents. These women who although started in small way have become very confident in handling their business and most of them have paid back their loans on time, very few defaulters. SAMPADA's experience since its inception in 1998 shows that women always borrow small mainly because their capacity to pay back is small and they always plan business in a way that they are able to manage home and business. Thus most of them don't aspire to grow very big. Average loan to per SHG is 28,996 and average loan size per individual is 3,067. The defaulters among them are very few.

Most the women in Mhaswandi are busy productively either directly in watershed activity, or they have taken up activities for drudgery reduction and enhancement of quality of

lives, such as soak pits, kitchen gardens, using cleaner cooking fuels, water supply system, toilet construction etc or involved in income generating activities mentioned above.

The enhanced capacity of the villages and their determination to take charge of their own development has also had its effect on overall social structure of the village. The sarpanch of the village is a woman Chaya Ethape who is very actively involved in the taking right decisions for the development of the village.

### **Quantitative and Qualitative Impact of Watershed Project As perceived by Villagers**

<b>Impact on Land Productivity</b>	<b>Pre-Watershed (Prior to 1994)</b>	<b>Post – Watershed (2001)</b>
Land holding	1145 hectare	1145 hectare
Land under Irrigation	-	205 ha
Waste Land	252.75 ha	31.5 ha
Average Depth of Water Table below ground level	7.5 m	2.5 m
Water Bodies	2	8
Number of Wells	33	77
Electric motor for pumps	5	75+
Tree covers	Very less	Upto 6 lacs
Crop	Production very low	Good
<b>Socio-economic Impact</b>		
Level of literacy	20-30%	60%

Land in women's name	nill	Slowly improving
Women entrepreneurship	Negligible	Almost 100 women are self employed
<b><i>Sanitation</i></b>		
Kitchen garden	nill	30
Individual latrines	nill	20
Soak pits	nill-	21
Smoke Less Chulla and LPG	Nill	SLC-87, LPG-160
<b>Economic Impact</b>		
Employment	3 months	12 months
Agriculture employment	3 months	9 months
Wage rate	Rs 20-30/day	Rs 40-50/day
<b><i>Assets owned</i></b>		
Televisions	1	41
Cycles	13	69
Motorcycle	1	17
Tractors	1	4
<b><i>Live stock</i></b>		
Crossbreed cows and buffalos	C-8, B-3	C-110, B-14
Goats and Sheep's	271	93
Fodder production	950 tones	1920 tones

**Objectives of research -Impact of watershed project in Mhaswandi,**

1. Assessing the linkages between watershed development and rural livelihoods & poverty,
2. Type and nature of benefit flows accruing to various sections of the community, and
3. Challenges in making the watershed program pro-poor and sustaining it in the long run.
4. Understand the factors, which lead a village to self-sustainability.

**Summary of the impact of the watershed project as perceived by the villagers POSITIVELY answers the linkages between watershed and the rural livelihoods and poverty and the benefits flowing to various sections of community.**

- Increasing water levels
- Better agriculture yields
- Work available within the village so no need to migrate
- Wage level has gone up.
- Living standards has gone up accordingly.
- Working together for watershed projects has increased unity among the people.
- Women of the village have become participant both socially and economically.
- Empowerment of women has made the coming generation see gender equality.
- Villagers look at the future very positively with lots of scope for improvement and development.
- Village is self-sustainable and the watershed work is also sustainable with positive impacts.

**The third objective of the research of Challenges in making watershed program pro-poor and sustaining in long run is answered in Difficulties encountered in implementing the Watershed Project – views of villagers and organizers**

- First difficulty in implementing the project was to change the mindset of the people. Mistrust towards the results projected. Several meeting and sincere involvement of the WOTR members in the implementation of the project slowly changed the attitude of people.
- There are several rules to be followed by the villagers in being accepted for the final implementation of the watershed project. Few of them were very difficult for them to follow. Grazing was banned to improve the soil erosion, but this was not acceptable by the villagers as income from the animals was the major source of income for them due to continuous failure of the crops. Secondly felling of trees was also banned to bring ecological balance but this was difficult for the villagers to understand as wood was the basic requirement for them. Gradually as more and more land got treated and more land became available for agriculture and the income level started rising the attitude of the villagers changed and became more cooperative.
- Letting women be part of local institution like VWC or Gram panchayat was not easy to happen. But as they became part of SHG and slowly started becoming economically independent automatically they started gaining respect in the social setup.

**QUOTE SOME OF THE WORK DONE TO STRESS THE SUCCESSFUL FUNCTIONING OF IGWDP**

***AN EVALUATION OF DRYLAND WATERSHED DEVELOPMENT***

## ***PROJECTS IN INDIA***

**John Kerr, with Ganesh Pangare, Vasudha Lokur Pangare, and P.J. George.**

**International Food Policy Research Institute, N. W. Washington, D.C., 20006 U.S.A.,**

**October 2000**

“This study has found that participatory watershed projects managed by NGOs have made a significant contribution to agricultural productivity and natural resource conservation in the study villages. More technocratic, top-down government projects, on the other hand, have fared less well. In fact, for many performance indicators the government projects did not perform any better than non project villages. The AGY and IGWDP, two collaborative projects between NGOs and government agencies have performed particularly well, and this appears to bode well for the Ministry of Rural Development’s efforts to expand participatory approaches to a large scale.”

### **Approaches to Watershed Development in**

#### **Maharashtra and Andhra Pradesh**

“The IGWDP, another example of collaboration between government and nongovernmental organizations, seeks to replicate the success of small NGO programs at a larger scale (Farrington and Lobo 1997; WOTR 2000; NABARD 1995). Initiated in 1993, the IGWDP develops micro watersheds in a comprehensive manner through the initiative taken by village groups. Its guiding philosophy is the need for collaboration among village level organizations, NGOs skilled in social organization, and government organizations skilled in technical work. Further, it accepts that although indigenous knowledge and practices are important, they need to

be augmented by modern techniques and management practices. The IGWDP has developed elaborate procedures to cut through bureaucratic turf wars and red tape, ensuring that funds move quickly (Farrington and Lobo 1997). As of June 2002, the IGWDP had undertaken development programs in 146 villages, covering about 137,000 hectares and involving 78 NGOs (WOTR 2002). As with the AGY, the emphasis on developing the village's social capital is as strong as that on developing its natural and physical capital, and the villagers must submit to similarly strict social conditions. The work begins with 12 to 18 months of social organization work. This is almost 12 to 18 months longer than the social organization phase of a typical government watershed program at the time of the survey, but it is shorter than that of many NGOs, which conduct work on several other areas of village development before Venturing into watershed development. One important early project activity under the IGWDP is to plant trees and grasses in the catchments area. This is done prior to building water harvesting structures in order to force the inhabitants of the village to show that they can enforce social fencing .self-policing without the use of fences. To protect natural vegetation. Only after people demonstrate the ability to discipline themselves does the project invest larger amounts of funds in new watershed structures. The NGO helps organize and develop a Village Watershed Committee, which is essentially a village-based NGO. The idea is that the committee will eventually outgrow the need for support from the original NGO.”

## **CONCLUSION**

Fresh water is a scare resource. Even though three fourth of the surface of our planet is water, the available fresh water is only 2.5% of the total; the rest is salt water. Of this 70% is in form of ice or snow. According to WHO estimates, only .00075 % of all water available for

human consumption. Population increase with corresponding increase in demand from different sectors affecting the availability of the resource. Estimates show that the per capita availability of renewable fresh water in India fell from 5,227 cubic meters in 1955 to 1869 cubic meters in 2001.

We need to have a nation wide decentralized and community driven resource conservation and management. Watershed based natural resource conservation and management provides a ray of hope and a way out of this vicious cycle of drought and despair in times when rainfall is below average. Watershed development is necessary for strengthening the ecological resource base and improving the carrying capacity of the fragile environments. (WOTR Annual report 2003-2004).

The research was based on the following HYPOTHESIS

3. Watershed projects perform better when there is full participation of project beneficiaries and careful attention to social organization.
4. The second hypothesis is that a variety of factors determine the incentives for people to manage and protect natural resources and invest in increased agricultural productivity. These factors are very important in determining the outcomes that projects seek to achieve.

Mhaswandi village is a very good example which justifies the above framed hypothesis and also helps us to understand to what extent watershed based project can make a difference to the lives of the village both economically and socially. The centre point to the success of the project depended on being able to get the villagers totally and completely involved in its implementation of the project. The lesson learned here is that success depends more on social transformation as

much as it depends on geographical transformation. Another important lesson learnt is that this change does not happen overnight, it takes lot of sincere and dedicated of working hours put in by the members of the WOTR and the beneficiaries to see it happen. Since 2001 the implementing agency as well as WOTR is not having any direct and day to day interaction, except as and when required support from WOTR, the village is still moving ahead to make a positive and sustainable impact.

### **Successful implementation of the watershed program depends on following points**

- Abundance of patience and dedication is required on the part of the organization which is implementing the watershed program.
- Trust in the NGO staff is fundamental and improper expectation should be rectified at the beginning of the program.
- Quality and visible success of the watershed work is very essential for beneficiaries to develop trust and faith in the project.
- Culture of people and tradition of the people should not be taken for granted. It needs to be handled very carefully. It has to remember all through that change can never come overnight, it is always gradual.

*Availability of fresh water is a national problem which is growing worse as the day is passing. We see some ray of hope of being able to handle the fresh water problem in our country if programs of this kind could be implemented village by village all through India. NGO's are doing there bit sincerely but if this program has to be taken nation wide if the kind*

*of effects show by the WOTR project has to be replicated in other villages too than the major role has to be played by the government because it is the biggest power in terms of physical, human and capital resource.*

*While implementing the project one also has to keep in mind that man has to live with nature and abide by its rules. Development plans implemented by taking nature into consideration is always sustainable in long-term. It is important to appreciate and understand such projects with work with nature and learn from it. Methods should be devised to gather support for efforts made in this line and make efforts for its benefits to reach wider section of people.*

## **Introduction**

While the international dimension of the British garden city movement has been well documented (Ward 1992), the global reach of American-style city beautiful ideas in the rise of modern urban planning has been relatively understated. Yet from the late nineteenth century into the 1920s, moves toward the aesthetic re-planning of cities variously based around grand manner planning, more informal but contrived landscape beauty, and their admixture, were an equally global phenomenon, if not more connected into the mainstream processes of city development. The reasons for this imbalance lie in the undoubted distinctiveness and nationalism of the American experience and its iconographic narrative (The World's Columbian Exposition, Washington DC, The Chicago Plan etc), but have been reinforced by an ethnocentric American literature focused comprehensively on domestic concerns (e.g. Silva 2005).

Critical interest in the export of American planning, architecture and urban design ideas has picked up on the wider dissemination of city beautiful ideas through competitions, consultancy and neo-colonial expansionism. But with few exceptions (Stelter 2000), what is missing is a broader appreciation of the worldwide move toward aesthetic issues at the turn of the twentieth century characterized by a diversity of approaches, exchanges, contestations and cultural expressions. The conception of the city as a work of art was not new (Olsen 1986). The rise of interest in interrelating beauty and planning as a global movement had different strands, including civic art (major buildings and public spaces), civic design (master planning), and civic improvement (upgrading of towns) (Pregill and Volkman 1999). These different responses took shape via a global diffusion and adaptation of ideas facilitated by study tours, conferences, international consultancies, books and journals.

Bypassing American narratives, this paper provides a brief overview through vignettes of multinational and contemporaneous moves toward making cities beautiful to convey a pervasive global aspect to the early planning idea of the city as a work of art. It is most concerned with the origins and early years of the movement and draws upon research on the Australian experience (Freestone 2007) where notions of the city beautiful, as in other nations outside the United States, were ultimately shaped by a distinctive cultural mix of imported and indigenous ideas.

## **The city beautiful agenda**

In 1910 the distinguished British architect Sir Aston Webb assembled what were widely agreed contemporary ideals in a word picture of the ideal city:

The centre is on an eminence facing south. Round it are grouped the municipal buildings ... the centre is laid out in terraces and flower gardens with fountains ... the buildings have statues of famous citizens forming part of their architectural decoration. Trees are planted around .... From an archway in the centre of the south side of the square a great avenue some 200 feet wide starts ... The great avenue forms also a park-like promenade for the citizens and binds the whole city together as a unit ... Outside this avenue lie the professional and commercial centres. The streets running east and west ... are the shop streets with tramways ... Further south is a belt of park land with a drive round the city in which are theatres and refreshment rooms ... the residential streets running north and south, so that the houses may get all the sun, for in 'the city beautiful' the inhabitants believe 'where the sun does not enter the doctor does'. The residential portion is small in proportion, for with increased locomotion facilities, more people live away; and for the same reason no huge barracks of dwellings for the working classes are required ... Two railway stations off the centre Mall, with large places in front, stop important vistas ... Churches and other places of worship are all given important positions, ending vistas or marking the junction of important roads... In the residential quarter there is a total absence of front walls and railings, but instead grass margins to footways, and hedges mark the boundaries ... No advertisements are allowed except on special places appointed for them, and even shop names and signs have to be submitted to the commission, as do all lamp posts, letter boxes, and other designs (Webb 1910).

This captures many of the strands which ebbed and flowed in aesthetic city planning projects around the world: the balance of formality and informality, an eclectic agenda stretching from grand central city gestures to parklike residential streets, and an overall commitment to the desirable nexus between spatial order and social cohesion. There was more at stake than aesthetics and city beautiful aspirations everywhere aligned variously with wider themes of efficiency, technocracy, morality, loyalty, and autocracy.

The relevance, impact and expression of these ideas, stirred by an intermingling of responses to local conditions in the light of global trends, was varied as seemingly common aesthetic aspirations were refracted through a diversity of planning cultures. In political terms, city beautiful-like aims were pursued through different models. Stelter (2000) identifies three types of leadership: 'the baroque cult of power' with authority (and patronage) exercised top-down; the 'professional and bureaucratic' mostly associated with architecturally inspired planning; and 'populist initiative' forged through civic and commercial coalitions (the dominant American model).

It could be argued that from a shared mission to makeover the unplanned urban environment, each nation, as for planning generally, ‘drew according to its own needs and possibilities’ (Sutcliffe 1981). Sutcliffe (1981) has written that ‘although aesthetics greatly strengthened the appeal of planning, it nearly swamped it in the process’. Yet while the city beautiful was a touchstone of early town planning, especially in the United States, the lustre faded. The city beautiful lacked the comprehensiveness to which city planning aspired. It tended to ignore social welfare concerns and left issues like affordable housing for others to solve. Supplanted by more pragmatic paradigms through the professionalisation of the planning movement, the city beautiful seems to have endured as a city planning issue into the 1930s in the subsidiary realm of ‘civic art’.

### **Exporting the American city beautiful**

Just as the garden city had its major impact in the 1910s and was adopted and adapted in various guises around the world, the city beautiful usually as a combination of home-grown and foreign inspiration also called forth a diversity of interpretations. In some instances, to draw upon Ward’s (2002) paradigm of global diffusion, the ideas were ‘exported’ as much as ‘imported’. The American city beautiful was exported vigorously via various channels.

The turn-of-the-century presidency of Theodore Roosevelt cast the United States ‘as a civiliser of the world’ (Yetter 1981). Opportunities arose for architects and planners to export their expertise via city and institutional plans, engineering works, and architectural commissions. City beautiful influences inevitably surfaced through their American heyday. In the thick of things was Daniel Burnham, lured on an imperial mission to the Philippines in 1904–05 to prepare plans for the redevelopment of Manila and the hill town of Baguio, which he conceived as a Washington in miniature (Hines 1979). Elsewhere in Asia, Chiang Kai-shek’s vision for Shanghai as a premier world city drew upon Washington and New Delhi with its cruciform axes, memorials and crescents of public buildings. The master plan was the work of Chao Chein, a graduate of the University of Pennsylvania (Balfour and Shiling 2002). Working more unobtrusively were other Americans such as Henry Murphy, a member of the Municipal Society of New York, who prepared city beautiful-style plans for Guangzhou and Nanjing in 1927–28, along with college campus plans merging Chinese and western influences for Beijing, Shanghai, Suzhou, Fuzhou and Nanjing (Cody 2000).

However, such direct impositions were resisted in continental Europe. Steeped in their own traditions, European cities shared little enthusiasm for re-importing the ersatz inspirations of the New World. The French were completely unimpressed, although the pillaging of beaux arts principles had not gone unnoticed (Cohen 1995). The United States ‘had little to offer Europe’ (Sutcliffe 1981). Nevertheless, the projects of Burnham and others may have been a timely reminder for Europeans as to ‘the qualities of their own towns’ (Hall 1997). The American emphasis on parks, park systems and parkways in ordering the city, the production of handsome planning reports, and community-driven civic improvement campaigns were being noticed.

### **Continental Europe and diffusion of the Haussmann aesthetic**

Nineteenth century continental European cities were a key source for the American city beautiful movement. A considerable theoretical body of work on city design had already been evolved by urbanists such as Charles Bulfinch, author of *Aesthetics of Cities* (1898). There were spirited debates on urban form and structure, the most iconic between the Viennese contemporaries Camillo Sitte and Otto Wagner. As a ‘conservator-protagonist of an artisan-made environment’, Sitte seemed unable to satisfactorily reconcile the modern and the artistic. He saw modern city planning as too geometric, formulaic, materialistic and bureaucratic. By contrast, Otto Wagner looked to the future rather than the past, valuing rationality, functionality, and uniformity. Sitte saw the Ringstrasse in Vienna as ‘a cold sea of traffic-dominated space’. Wagner like many others saw it as a step toward the planned modernisation initiated in Paris by Haussmann (Schorske 1981).

The de-medievalisation of Paris had commenced before Georges-Eugène Haussmann was appointed Prefect of the Seine in 1853 to oversee arguably the greatest urban renewal project in history. But his name is inseparable from the memorable assemblage of wide streets, star points and monumental vistas that defined planning in the grand manner. Paris was transformed into an almost permanent construction zone, with implementation of Haussmann’s work continuing into the 1920s. Haussmann was a classicist in architectural taste, but the significance of his large-scale interventions lies more in the all-of-a-piece aesthetic uniformity imposed through regulation. Using secret and unorthodox financing methods, which created a massive long-term debt for the city, Haussmann’s work also confirmed the embourgeoisement of the central city with the working class displaced to the suburbs; tourists became more visible than the poor (Jordan 1995).

The Haussmann approach was copied in other French cities, such as Marseilles, Lyon and Lille, as well as being exported abroad. Haussmann was consulted by Mayor Jules Anspach of Brussels about that city’s plans to cover over a waterway through the city centre with a boulevard flanked by apartment blocks. Through a variety of cultural and colonial linkages, cities such as Rio de Janeiro, Hanoi, and Thessaloniki looked to France for planning inspiration. Without leaving Paris, Joseph Antoine Bouvard reconceived Istanbul through an arbitrarily artistic plan based around a disconnected series of set-piece monuments (Celik 1984). Into the 1920s grand manner plans could mingle various influences – evident in JCN Forestier’s projects for Buenos Aires (1924) and Havana (1926), which drew upon both Haussmann and the American city beautiful (Almandoz 2002).

### **The authoritarian landscape**

Authority everywhere was receptive to bombast with planned capital city landscapes disarmingly sharing the rationality and modernity of more democratic conceptions, albeit in overdrive. The recurring design vocabulary of authoritarian planning was an assemblage of ceremonial axes, lavish neo-classical buildings, and nationalistic artwork, breaking with historical continuities to showcase political prestige and power in new, monumental settings. Massed structures and grand spaces had an obvious appeal to authoritarian regimes seeking to transcend the fragmentation and backwardness of the old order.

Largely designed by British architect Edwin Lutyens, New Delhi was to be the showpiece of the British Empire on the sub-continent. Its formal classical plan of fanning radial boulevards and polygonal geometry suggested ‘uncanny similarities with L’Enfant’s plan for Washington’ (Hall 2002). The centrepiece of Albert Speer’s New Berlin for the Third Reich was a five-mile-long, 400 feet wide north-south boulevard, with an associated Great Hall and triumphal arch (Helmer 1985). Mussolini’s new Roman empire was headquartered at the Esposizione Universale di Roma (EUR), an efficient and clinical town centre of muted classical inspiration. A ‘pall of repugnant ideological implications’ may well have helped to suppress civic art enthusiasm for a generation as designers became more circumspect about such projects (Collins 1988).

### **Great Britain**

The history of planning in Great Britain is dominated by public health reforms, the garden city movement, the passage of town planning legislation, and countryside preservation. Aesthetics were allied but more muted, and more obviously associated with the architectural profession. Civic art and design were almost invisible in Patrick Abercrombie’s *Town and Country Planning* (1933) except as historical preamble, but they gathered more visibility from the 1930s as notions of urban townscape became more compelling, in part as critique to the spread of endless garden suburbs.

The vision of a city beautiful as a planning goal was promulgated by early leaders in the field, as captured in the words of Sir Aston Webb above. He did his personal best to dress-up central London in grand fashion in his work at Buckingham Palace, Admiralty Arch, and The Mall. His vision of the ideal city was shared by many of his peers, nowhere more so than in Liverpool, which emerged as an extraordinary locus of activity.

Britain’s first degree in planning was established within the Department of Civic Design at the University of Liverpool in 1909. The *Town Planning Review* under the founding editorship of Liverpool University lecturer Patrick Abercrombie became a vital organ on all aspects of planning and design. These initiatives were underwritten with a generous endowment by the local businessman William Lever, whose own Port Sunlight model village bore the impress of a city beautiful-style classicization at a time when suburban planning was dominated by a more informal aesthetic (Ward 1994). Liverpool staged a ‘City Beautiful’ conference in 1907, formed a pioneering City Guild to work for city improvement in 1910, and the city engineer, John A Brodie, who was involved in the planning of New Delhi, worked towards a city-wide system of ring boulevards. Liverpool’s status as an Atlantic port perhaps served as a conduit for the introduction of progressive American ideas.

A key figure at Liverpool was architecture professor Charles Reilly. With an urbane and cosmopolitan view of city life drawn from the inspirations of Paris, the beaux arts, and the Worlds Columbian Exposition, he conceived the emerging discipline of planning as an aesthetic activity working in partnership with concerns of traffic and sewerage ‘which have till now completely held the field’ (Crouch 2002). His colleague Stanley Adshead, the first Lever Professor of Civic Design, shared these views. Adshead contributed a series of articles on ‘The Decoration and Furnishing of the City’ to the *Town Planning*

*Review* in 1912–14. His discussion of even the humblest ‘utilitarian furnishings’ such as telephone boxes, newspaper kiosks and public lavatories lamented how such items were ‘thrown about’ with no connection to a city plan.

The distinguished landscape architect Thomas Mawson also lectured part-time at the University of Liverpool. His background was as a nurseryman and garden designer and he equated planning with civic art. Mawson was offered prestigious commissions, including Lord Lever’s ‘Beautiful Bolton’ campaign, and was active in ‘stirring up an interest in civic betterment’ through many public addresses. He was active abroad, particularly in Canada, where he produced a number of overly ambitious civic centre and campus plans. Mawson admired the American city beautiful; he personally found Burnham an individual ‘with all the simplicity and modesty of those truly great’ and regarded his Chicago plan as ‘stupendous’. He felt CM Robinson had authored ‘the most delightful works on modern civic art in the English language’ (Mawson 1927).

The maintenance of high aesthetic standards of development could be delivered by different mechanisms. The president of the local government board, John Burns, in introducing the *Housing, Town Planning Etc Act 1909* into the British Parliament saw its gains in ‘the home healthy, the house beautiful, the town pleasant, the city dignified, and the suburb salubrious’, although in practice it became enmeshed in administrative regulation. Voluntary organisations such as the Birmingham Civic Society worked locally for more beautiful towns in the manner of American improvement associations. Following the example of the Commission of Fine Arts for Washington, DC (1910), royal fine arts commissions were instituted for England (1924) and Scotland (1927) to report on matters of public amenity and ‘artistic expression’ referred to them, such as the design of monuments and modification of public buildings. Early members of the English body included Aston Webb, Edwin Lutyens, and Thomas Mawson (Youngson 1990).

City beautiful ideas were also expressed in various development projects. The two most notable were the Kingsway in London and Cathays Park in Cardiff. The Kingsway project, carried out by London County Council in 1905–20, was the most significant civic improvement undertaken in London since the construction of Regent Street in the early 19th century. It involved a new thoroughfare, three-quarters of a mile long and 100 feet wide, a subway for trams and underground railway line, and sites for new commercial buildings in a slum clearance involving the displacement and re-housing of thousands of people at a net cost of £2 million. The aesthetics of the project drew inspiration from imperial London as well as the stripped neo-classical commercial architecture of the late city beautiful. In spirit there was also a debt to Haussmann’s work, ‘to such an extent that it became the kind of location an impoverished film crew might choose to make a Maigret film without going to Paris’ (Schubert and Sutcliffe 1996).

Cathays Park was a grouping of major public buildings on a prominent 58-acre site acquired by Cardiff City Council in the late 1890s. It was a grand gesture expressing how the city saw itself – as the Chicago of Britain. The complex was initiated with a new City Hall and Law Courts by Lanchester, Stewart and Rickards, in the Edwardian Baroque style. Adshead (1910) criticised what he saw as ill-informed departures from the original

site plan, but Mawson's judgment was more favourable: 'Unquestionably the finest example of forethought, enterprise and grasp of the underlying principles which make for civic art which this country can at present show' (Mawson 1911). Other civic centre complexes would follow, including Southampton and Nottingham (both from 1929), but the real enthusiasm awaited the end of World War II.

Despite these ventures, compared to continental Europeans and the Americans, the British generally seemed more interested in municipal housing schemes than civic splendour. Australian planner John Sulman observed this in the early 1920s. He characterised the British planning movement as 'rather humanitarian than artistic ... the artistic self-expression of the town or city taking a secondary place', noting only some attempts to give new town halls 'a proper setting' (Sulman 1921). A British engineer explained this lukewarmness as a national trait: 'We are proud to consider ourselves a practical people, and, unfortunately, ideas of beauty are not bound up with this. Anglo-Saxons are too prone to consider art as a luxury' (Hayler 1913). Weaver (1925) put it more eloquently: 'The English character does not happily consort with visions of the Grand Manner. We are so desperately afraid of being pompous that our schemes generally issue in a small banality. Much, however, is due to a difference in general attitude towards the fine arts, and to a desperate unwillingness to spend money freely and gracefully on any object which is not utilitarian'. Great Britain's dominions and former colonies responded in different ways to this reservedness.

### **Canada**

One country destined to be influenced by American city beautiful developments was its northern neighbour. Similar stimuli intermingled – the Worlds Columbian Exposition, the repulsion at urban ugliness, and most certainly the inspiration of Paris. Interest was fostered by top-down political interest, professional encounters, and popular involvements.

Political patronage drove the replanning of Ottawa, which was ordained rather than conceived as a capital city, and a city beautiful ethos with beaux arts themes characterised its early 20th century development. The Frederick Todd plan of 1903 with an emphasis on boulevards, parkways, open spaces, and natural beauty sought to align the industrial and aesthetic development of the city. Edward Bennett's plan for Ottawa and adjoining Hull (1915) recommended a major government centre near the parliamentary buildings. A proposed national war memorial drew a memorable and revealing quotation from the 1930s prime minister, McKenzie King: 'I at once saw that I had my Champs Élysées, Arc de Triomphe and Place de la Concorde all at a single stroke' (quoted in Gordon 1992). Jacques Greber's regional plan of 1950 also had its monumental qualities. David Gordon argues that these early plans are often too easily dismissed; the background studies for Bennett's plan were 'the basis for plans which transformed the Canadian capital forty years later' (Gordon 1998).

The aesthetic principles that preoccupied professional architects were coherence (harmony and uniformity), visual variety (vistas and variation in street patterns), and civic grandeur (civic centres and campus plans) (Van Nus 1975). These were expressed

in tangible form in developments such as Maissonneuve, a new suburban town from 1912 in Montreal, University Avenue in Toronto created by a 1929 city plan, and Mawson's campus planning projects for Dalhousie, Saskatchewan, Calgary, and British Columbia (1912-13).

The activities of amateur beautification groups, horticultural societies and improvement associations in street tree planting, public grounds beautification, vacant-lot gardening, and clean-up campaigns constituted a more grassroots strand to the Canadian city beautiful. Their efforts were spurred not only by the desire to beautify but 'the persuasive reforming zeal of the period', and carried on when official programs failed (von Baeyer 1986).

Stelter's summation is that the city beautiful in Canada helped foster beauty as a desirable urban characteristic, promoted citizen action, introduced the idea of unified city planning, and produced some solid results on the ground. Its mission was undermined by naiveté in the ways of urban politics, the disruptive and draining impact of World War I, a lack of financial realism, and the pull of competing urban visions (Stelter 1993). Aesthetic reforms also tended to ignore other pressing demands such as housing shortages and the need for better subdivision regulations. The trend of planning in Canada from the 1910s shows the same shift toward a more utilitarian, pragmatic emphasis as elsewhere. Planners sought a new conception of beauty integrated within the city plan. The dominant mainstream voice of Thomas Adams argued in 1920 that 'orderly development' through planning and zoning 'will produce beauty without seeking beauty as an end in itself' (van Nus 1975).

### **New Zealand**

New Zealand as another British dominion had its quota of city beautiful rhetoric, civic centre proposals and war memorial projects (Miller 2000). The architect JF Munnings addressed the First New Zealand Town Planning Conference on 'The City Beautiful', adopting an eclectic definition from 'the smallest article of use' to 'the greatest and noblest conceptions of man' and exhorting his peers to expend 'every effort' to make the country's existing towns 'more beautiful in every respect' (Munnings 1919).

The most distinctive element was a national network of town-based beautifying, conservation and scenic protection societies. These emerged in the late 19th century, became loosely connected with the emerging town planning movement, and subsequently evolved toward gardening and horticultural societies (Miller 2006). The Christchurch Beautifying Association campaigned against public advertisements and for tree planting, promoted private and public gardening, and urged the beautification of public squares. From 1924 it issued a journal called *City Beautiful*, comprising a mix of articles on practical gardening and beautifying issues with the odd contribution on town planning and architecture. The core aim was 'to make life a brighter and sweeter thing for the citizens of Christchurch' through advocacy in which 'no matter will be too small'. Although Australia boasted a national set of town planning associations in each capital city and some regional centres, none had such an aesthetic-scenic mission as the bodies on the other side of the Tasman Sea.

## Australia

In Australia, the goal of the city beautiful was articulated through various channels, with professional and bureaucratic discourse staking out the main turf (Freestone 2007). Top-down endorsement facilitated initiation and at least partial implementation of some projects, but lacked the sustained patronage that was so often the clue to success abroad. A host of local organisations periodically pursued urban beautification: chambers of commerce, Rotary clubs, local councils, and sundry town planning, progress and improvement associations. While individuals interconnected through professional, political and social networks, there was no organised populist, political movement. Most capital cities had their own artistic aspirations towards city-defining features from the standard list of parks, public squares, and civic centres.

The city beautiful was not an overnight sensation and can be thought of as the culmination of several developments going back to the early colonial period. These included inspirational and utopian visions for better planned cities, increasing professional concern over the general aesthetic condition of cities, the beautification possibilities raised by special events, the interest of entrepreneurs, and local beautification efforts. It is a different mix to the American bellwethers of parks, municipal art, and civic improvement (Peterson 2003).

The city beautiful idea helped urban reformers make the vital breakthrough to regarding the whole city rather than any individual structure as the fundamental unit of design. A lightning rod for civic design and related questions of town improvement was the federal capital project. The idea of a new city arose out of the constitutional debates of the 1890s. This project was vital in focusing professional attention on issues of integrated design. The Congress of Engineers, Architects, and Surveyors held in Melbourne in 1901 to consider the planning of the projected federal capital, was a landmark event.

International inspiration for an artistically-inclined planning of the modern city filtered into Australia from Europe and America from the 1890s. Many architects had ties to England and imported a British sensibility. The American connotations of the city beautiful were diluted by their absorption into an architecturally inspired planning heavily informed by British ties. British hegemony meant that Australian designers were less under the spell of the strict *École des Beaux Arts* tradition that had such a stranglehold on American civic architecture and planning.

Ways of making cities more beautiful through planning were promoted through several channels. Six are readily identified. The first and most fundamental was community education. The main instruments of communication were public lectures, newspapers and popular periodicals. A second promotional strategy was for professionals to offer active support to communities forming themselves into improvement leagues to pursue local causes such as beautification and tree planting. A third pathway was through augmentation of council powers, although it was conceded that artistic salvation through regulation would only work when allied to community education and professional edification. Fourth, the ultimate planning document at local or state level was a general development plan inclusive of aesthetic content. Fifth, short of securing statutory

backing, building and, in particular, architectural journals became enthusiastic about constituting advisory bodies to help government adjudicate on the aesthetic merits of new development. Finally, government was looked to for leadership. Perth identity JS Battye contended that the typical Australian attitude of ‘expecting the Government or some other authority to do everything for him is not conducive to even the elementary stages of developing the City Beautiful’ (Battye 1934).

For inspiration, Australia could look to many countries. The glamour cities of continental Europe could not help but provide a benchmark for the city as a work of art. The United States boasted brash projects and at the same time an underlying strength in community engagement. Pulling in a different direction, Great Britain was more restrained but sporadically produced inspirational statements of imperialistic design. Other British dominions picked and mixed, with Canada in a comparable position to Australia in its openness to both new world and old world influences. Many other countries were doing similar things to reinforce a global phenomenon, but geographic and cultural distances made them less influential in Australia. The international federal capital design competition of 1911–12 which produced Canberra did provide a lens on what the rest of the world was thinking, but at the end of the day the planning agenda had still to be written locally.

Ultimately, the city beautiful as the touchstone of city planning was never more than a fleeting episode, confined primarily to the years immediately post-Federation when the idea of a new federal city was at its most beguiling and an organised planning movement had yet to crystallise. Thereafter, as in Canada, it survived as part of a more comprehensive philosophy of planning and was embodied as an aesthetic element in specific development projects.

## **Conclusion**

The idea of a beautiful city as a central goal – or at least a significant by-product – of the emergent profession of modern city planning was an international mission in the early 20th century. An utter surrender to urban artistry proved beyond all but the most authoritarian regimes. The high costs, real and perceived, of this style of urban development, was one constraint, just as the silences on certain urban problems were another. Others had to do with competing political objectives, hostile systems of governance, and obstacles to implementation. Advocates tried to stress both the broader social and immediate tangible benefits that would accompany aesthetic reforms. But after the initial flowering of city beautiful rhetoric, the relationship between beauty and practicality was more rigorously scrutinised, with a prioritisation of utilitarian aims widely evident by the 1920s. Nevertheless, the impact on the urban environment was profound and the city beautiful idea is connected with landmark public buildings, civic spaces and park systems as well as numerous small-scale beautification impacts in many cities around the world.

## The Urban and Global Origins of Color Lines in Colonial Madras and New York

Carl H. Nightingale, State University of New York at Buffalo\*

By 1700 British authorities at both Madras, India and New York City had made, by fits and starts, about thirty years of progress in their efforts to consolidate control over people officially denoted by the color *black*. Yet the residential color lines they drew in these two urban spaces contrasted sharply. In Madras, known today as Chennai, stout stone walls divided the residences of Europeans from those of Asians. Similar arrangements existed in other Asian colonial cities, but Madras was the first place in world history to officially designate its separate sections by color: “White Town” and “Black Town.”<sup>1</sup> In New York, by contrast, a small separate section of town outside the city wall sometimes called the “negro lands” was dismantled, along with the wall itself. In a pattern New Yorkers could scarcely recognize today, but which was common among slave-importing cities of the Atlantic world, authorities increasingly forced black slaves to live inside the households of whites, and especially those of the wealthiest ones.<sup>2</sup>

This tale of two cities on opposite sides of the globe tells us much about the world history of urban space. Both Madras and New York owed much of their existence to the planet-spanning economic, cultural, intellectual, political, and demographic connections of European mercantile empires. However, the cities’ contrasting structures represent the work of something much more specific: a pattern of segmentation and diversification within transnational and inter-colonial exchanges of ideas about how to defend cities and control their restive populations.

The two colonial settlements also tell us much about the role of cities in the world history of color and race. A vast consensus has grown among scholars in most disciplines that color and race categories are invented and continually reinvented within the context of social and political contestation, and that they have no all-embracing meaning outside those contexts. But, like many “origin” narratives, the search for the origins of “race” or “racism” (as well as the debate over whether it existed before the origins of slavery) remains infected by universalistic concepts. In his widely admired synthesis *Racism: A Short History*, for example, George Fredrickson defines “racism” as arising “when differences that might be considered ethnocultural are regarded as innate, indelible, and unchangeable,” and when such thinking “either directly sustains or proposes to establish a *racial order*, a permanent group hierarchy.” As he searches for the origins of this racism, a teleological narrative emerges. The “rigidity of true racial divisions” only emerged in the late eighteenth or nineteenth century, but it was heralded in the late medieval and early modern periods by numerous “prototypical forms” of racism, “protoracism,” or “functional equivalents” of racism. Notwithstanding the implications of his own hedging and several other historians’ qualms, it is common practice throughout historical literature to see “race” as existing in

---

\*The author wishes to express his deep gratitude to Professors Peter J. Marshall, Eugene F. Irschick, and Durba Ghosh for their early encouragement in taking on a study that included Madras, for orienting him to the literature and sources on eighteenth-century British urban colonialism, and for some very helpful comments on a draft of this essay. Thanks too to the staff at the Oriental and India Office Collections at the British Library for their extensive assistance, and the Interlibrary Loan Office of the University of Massachusetts, Amherst, for procuring countless texts. Professors Leonard Blussé and Remco Raben provided invaluable insights on colonial Dutch sources; thanks to Dr. Ernst Van Veen for making those contacts possible. Audience members at the Forum on Economic Expansion and Global Integration Conference in Providence, Rhode Island; the Five-College History Seminar in Amherst, Massachusetts; and the Davis Seminar at Princeton University all provided useful readings and comments on early drafts of this paper. Thanks too to Aims McGuinness and Robert O. Self for long conversations on themes related to its subject. The history departments at the University of Massachusetts Amherst and the University of Wisconsin at Milwaukee provided invaluable support and time off from teaching during the preparation of this article. Thanks to Peter Silver and Daniel T. Rodgers for their particularly extensive comments, and to Martha T. McCluskey for inspiring discussions of the bigger purposes of this essay.

any early modern encounter between Europeans and others, or in any use of color categories, or any institutions that establish European power over non-Europeans.<sup>3</sup>

One problem with ahistorical concepts, of course, is anachronism. The word *racism* was not coined until the 1920s, and though *race* did exist in English and other languages by the early sixteenth century, its relatively rare early-modern usage generally has little in common with that of most contemporary historians. More importantly, though, it is easy to forget the sheer multiplicity of early modern concepts of human difference when the predominant question we ask of them is whether they are really “race” in disguise. In Madras and New York, for example, authorities *never* used the word *race* in official documents before the late eighteenth century, and much preferred such words as *nation*, *people*, and later *color* and *complexion* as macro-categories of difference. These concepts, not *race*, served as the general term for such subcategories *Christian*, *white*, *black*, and numerous other linguistic or cultural designations. In both places, all of these categories had rich histories of their own that long predated their eventual incorporation into intellectual projects explicitly concerned with *race*. All of these categories were also variably (and often ambiguously) linked to other intellectual projects that also had their own histories before *race*, such as efforts to elaborate the permanence and the heritability of group characteristics, and efforts to establish general schemes of dividing humanity.

It is important to recognize these separate histories because the builders of early modern institutions, such as the authorities at Madras and Manhattan, saw important strategic advantages in stressing nuances of meaning associated with the varied concepts of human difference at their disposal as they consolidated their contrasting colonial regimes. In both cities, authorities made similar conceptual moves of this sort at the same historical moment. >From the founding of Madras in 1639 and 1640, authorities used the word *black* as one of several terms for local Asians, and from the beginnings of Dutch settlement in the 1620s, colonists in Manhattan used *black* or *negro* for Africans. In both places, however, Europeans preferred to call themselves “Christians” and very rarely used the term *white* until much later. One of the hallmarks of the consolidation of their control after the turn of the eighteenth century was the rapid proliferation of *white* over *Christian* in official discourse.

This play with words was essential to the local establishment of two critical institutions of Western expansion. In Manhattan, the story is most familiar: authorities transformed a “society with slaves” into a more formalized urban “slave society.” In Madras, the local representatives of the British East India Company (EIC) invented the urban residential color line. That story is less familiar, and it is often dismissed in accounts of twentieth-century segregation,<sup>4</sup> but it involved strategies of urban division later deemed critical to modern-era dual colonial cities across Asia and Africa, to South African townships, and ultimately to American ghettos. >From the seventeenth century on authorities at Madras experimented with residential separation laws (with inevitable exceptions for live-in servants), restrictions on property sales to “whites” only, wholesale property confiscation and demolition, urban *cordon sanitaires*, state-sanctioned dual housing markets, dual fiscal systems, and even a form of government-sponsored “white” suburbanization.

The politics of urban space thus deserves more scrutiny as a site for the elaboration of intellectual and institutional projects of color--and ultimately race--in the early modern period. As the stark differences and striking similarities between the two cities suggest, projects of city-building and concept formation operated on multiple geographical scopes at the same time--global, imperial, hemispheric, national, and local. The development of color lines worldwide and the contingencies of local urban politics were thus to an important degree mutually constitutive.

\*\*\*

The tale of an Asian city divided by walls into separate residential zones and an American city which forced Africans to live on the properties and in the houses of Europeans reflects a

divergence in the international trade in ideas about the geopolitics and social control of colonies. That divergence roughly parallels the hemispheric division between the Atlantic world, with its economic lifeblood based on the slave trade and the plantation system, and the Indian Ocean world, with its focus on the trade in non-human luxuries, above all spices.<sup>5</sup> But the cities' contrasting residential policies were based less in divergent economic systems than in the differing demographic and political situations associated with the conquest and exploitation of riches in the two hemispheres.

In the colonial cities of the Indian Ocean, such as Madras, a relatively small European population moved into the midst of vast and generally increasing indigenous populations, a large portion of whom lived in some of the world's largest large cities. The majority of these populations was at least nominally free and it benefitted from the protection of some of the world's richest and most powerful governments. In the Americas, by contrast, in places like New York, relatively large numbers of European immigrants and African slaves moved in amongst a generally decreasing indigenous population which was much less urbanized. It was represented by governments that, even after the fall of the Mexican and Incan empires, could be formidable by world standards, but that possessed less of the wealth or the layered subcontinental reach of Asian empires such as that of the Mughals.

In both worlds, European colonial cities were extremely "tense societies," difficult to control internally, and beset by constant external threats from local governments and the navies of European rival mercantile companies. But, in the Indian Ocean, where Europeans occupied a much weaker geopolitical position and depended much less on slaves, colonial authorities deemed the residential separation of non-Europeans essential to the defense of their cities and the defeat of local resistance. By contrast, urban authorities in slave-importing societies like New York would have recoiled from any scheme of separation, since large black neighborhoods could only provide further cover for the slave uprisings that regularly threatened to turn urban society upside down--along with the entire international economic system cities like New York were designed to serve.<sup>6</sup>

For a century and a half before the founding of Madras and New Amsterdam, ideas about the best way to defend and control colonial cities traveled between imperial metropolises and colonies and across boundaries of national influence within each of these hemispheres of the colonial world. In the east, the Portuguese built a long chain of urban forts and *feitoreas* as they made their way along the Atlantic coast of Africa and into the Indian Ocean. These were often soon surrounded by permanent cities that contained large majorities of local and mixed inhabitants. Historians have argued that this system was probably designed on the model of the Venetian mercantile *fondacchi* in the Eastern Mediterranean and the enclaves set aside for foreign merchants in cities across the Islamic world. At Goa and elsewhere in India, the Portuguese experimented with legislation setting aside separate quarters for Hindus and Muslims, some of which already existed in the cities they took over. When the Spanish founded Manila, they brought across the Pacific their experiences with founding cities in the Americas to Asia. In New Spain, the conquistadors and their successors had contended with bigger and more urbanized Amerindian populations than other colonists would encounter elsewhere in the New World. They separated Indians into barrios or *reducciones* outside mainland Mexican and Central American cities; in Lima it was a fenced quarter within the walls called El Cerrado. At Manila, authorities similarly set aside a heavily fortified "Intramuros" for Spaniards, and they banished the local Filipino, Chinese, and Japanese populations to several separate neighborhoods outside the walls.<sup>7</sup>

In the early seventeenth century, the Dutch achieved a reputation for building the stoutest forts on the Indian Ocean coasts. As Remco Raben has shown, their systems of urban segregation were also the most sophisticated, sometimes involving intricate population registration systems and pass laws. In Batavia, the system was also inspired by Javanese urban traditions: each of the many

“nations” of what we now call Indonesia who lived outside the walls of the city were allotted a separate *kampung* (village). This Malay word later spawned a critical keyword in modern-era urban segregationist politics, *compound*.<sup>8</sup> During the late middle ages the Dutch and other northern Europeans had established divided mercantile towns in the Baltic Sea, and the English had developed similar towns in Wales in Ireland. But when the founders of Madras first made the case to the reluctant East Indian Company for funds to build Fort St. George, they explicitly referred to the practice of “the Portugalls, Dutch, and Danes to frame unto themselves into more safe habitations.” The example of the Dutch was apparently important in winning the argument, for the General Court explicitly justified the expenditure in recognition of the Dutch East India Company’s enormous success.<sup>9</sup>

In Madras, local considerations dictated a scheme of wall-building that divided Europeans from Asians more sharply than elsewhere. This occurred against the backdrop of EIC efforts to establish increasing sovereignty over a tiny stretch of port-less beachfront on South India’s Coromandel Coast. The idea was to mimic the Portuguese and Dutch practice of acquiring prized local cotton cloth that was much desired by merchants farther to the east, who would trade spices for it at relative bargains. Far from being an almighty colonial overlord, the rag-tag band of EIC agents who acquired Madras in 1639 did so under an arrangement that made the Company an only somewhat privileged vassal to a petty local official of the crumbling Vijayanagara Empire, the Naik Damarla Venkatappa. Local sovereignty over the region shifted continually and unpredictably over the next seventy five years, and company authorities had to fend off several besieging armies as well as spies who mingled among the many Indians and other Asians who settled near the new commercial outpost. As the town grew around Fort St. George, Europeans appear to have built their houses closest to its walls. By the mid-1650s, a new wall had been built which formed a much larger trapezoidal perimeter around the whole European settlement, enclosing what was then called “Christian Town.”<sup>10</sup> Meanwhile, it also became clear that the rapidly growing Indian city beyond those walls posed its own security threat because it provided easy cover for enemy armies. For five decades, authorities at Madras tried to cajole the city’s wealthiest Asians to finance a wall around Black Town as well. In 1687 the Company’s powerful Court Director Josiah Child even insisted that the “black merchants” of Madras as well as the resident Armenians and Portuguese be encouraged to participate in local government as aldermen, and in exchange pay a wall tax—imitating the example of the Dutch authorities at Batavia in Java. In 1706, after seven years of periodic sieges from a particularly mercurial local sovereign, the Nawab Da’ud Khan of the Carnatic and Gingee, Governor Thomas Pitt (grand-uncle of the “Great Commoner”) used British arms to confine the “heads of the castes” of the Black Town in a local pagoda until they came up with the money. A stone wall finally went up around the Black Town in the next few years (see map #1).<sup>11</sup>

Though the cultural preferences of both English and Indians to live apart may have made the splitting of Madras easier, this was not a case of “voluntary” or “*de facto*” segregation.<sup>12</sup> The walls themselves were, of course, the work of the Company itself, and in addition the English felt it necessary either to pass or propose laws or issue proclamations in 1680, 1688, 1690, 1698, 1706, 1743, 1745, and 1751 to regulate the residence of various groups, sometimes requesting that English residents agree to restrict resale their houses to other Englishmen.<sup>13</sup> The Company designed the architecture of the fort, walls, gates, and houses of the European section to communicate commanding superiority over Indians and other Asians. Parapets and cannons festooned the roofs of all the houses in that quarter, radiating might. By the eighteenth century, most buildings in White Town were plastered with *chunam*, a substance made from the crushed shells of a local mollusk, which gave a marble-like appearance to exteriors and made them shine *whiter*--literally--than those in Black Town. Proclamations from the EIC Agent and later Governor were traditionally issued by means of a loud procession accompanied by cannon shots from Christian or White Town that passed

from the fort through the massive Choultry Gate into the Black Town. Those ordinances were later posted on the huge wooden doors of that same Choultry Gate. Because of all these measures, a dual housing market, and what South African historian Paul Maylam calls “fiscal segregation,” developed in Madras by the eighteenth century if not before. Property values were deemed much higher on average in White Town—even taking into account Indian merchants’ palatial dwellings and temples in Black Town—and tax rates for European property were set lower than those levied in Black Town to avoid excessive burdens on Englishmen. As elsewhere, the White Town walls were semi-permeable, regularly transgressed by Indian servants, sex partners, and mercantile collaborators. But they served as a primary instrument in institutionalizing what became a color hierarchy—as well as a grand stage for the theatrics of an emerging colonial authority.<sup>14</sup>

In the 1740s, as wars with France and Spain took on multicontinental dimensions, the process of fortified separation by color intensified dramatically at Madras. When the French seized the city in 1746, they completely leveled the historic Black Town, wall and all, and resettled the Indian inhabitants four hundred yards from the gates of White Town. When the British regained Madras two years later, they forbade any building in the intermediate zone, which became a military *cordon sanitaire* forcing besieging armies into the open (later it became the city’s Esplanade). Then they filled in the languid Elambore (or Cooum) River to the west of the White Town, allowing for a doubling of the White Town’s area and making room for a bristling, state-of-the-art, Vauban-style, fortification system (see map #2). Later in the eighteenth century, the Company subsidized the growth of White Town beyond the walls. Its methods, which evoke those of 20<sup>th</sup>-century South Africa and the U.S., included grants of land for suburban “garden estates,” and the construction of wider roads to accommodate increased use of horse carriages carrying commuters into the city’s historic business center.<sup>15</sup>

In the Western hemisphere, meanwhile, the traffic in ideas about the defense and control of cities also had a transnational and inter-colonial scope. The principles that went into the spatial policies of New Amsterdam and New York date back to the cities of Spanish America. Though those cities were initially built around schemes of division between Spaniards and Indians, other dynamics came into play when large numbers of slaves were imported there (Spanish-Indian separation also waned in the eighteenth century as black-white separation intensified in places like Madras). In Mexico City and in port cities throughout Spanish America, sixteenth-century slave codes forbade the arming of blacks, imposed curfews, banned gatherings of more than a few slaves, forced slaves to live with their masters, and forbade mestizos and mulattos from living outside the Spanish sections of town.<sup>16</sup> Similar laws regarding the control of slaves’ movements and residence were passed in the cities of the French and British Caribbean and at slave cities throughout the Atlantic from Rio to New Orleans and Cape Town to Charles Town. Debates over New York’s slave laws around the turn of the eighteenth century contain numerous references to Spanish and French examples, and the historian Graham Russell Hodges speculates that the arrival of many Barbadian planters in New York during the 1690s may have contributed to the hardening of the regime.<sup>17</sup>

Large-scale residential color separation of Africans was very limited in slave-importing colonial cities of the Atlantic. The Dutch East India Company’s Slave Lodge in Cape Town was probably the most important exception (the Dutch West India Company apparently maintained a smaller version of such a compound on Manhattan for a few years). Other exceptions prove the rule that urban slavery and large-scale color separation did not readily mix. The Spanish established the separate free-black city of Mose on the outskirts of Saint Augustine, Florida, explicitly to entice slaves to run away from the British plantations of South Carolina and thus weaken a colonial rival. When the first black enclaves did develop, such as Charleston’s Neck, Savannah’s Bluffs, the yards of Kingston, and Rio’s first informal hillside settlements, they all came into being in defiance of slavery not because of it. In slave societies urban residential separation was a means for blacks,

whether free or enslaved, to achieve a modicum of independent life and resist repression.<sup>18</sup>

In New Amsterdam, Governor Peter Stuyvesant built a city wall in 1658 (destined to give its name to the Wall Street financial district) to protect the city's landside approach against Indians and expansion-minded colonists from New England. The wall was never more than a wooden and earthen stockade: military engineers at Madras would have scoffed at it. Worse than that, the town's roaming hogs regularly scuffed up the sod that held the earthwork together, and residents stole the wooden palisades for firewood when it got cold. Then, worst of all, the English simply bypassed the wall when they seized New Amsterdam by sea in 1664. Nonetheless, British officials, like the Dutch, were content to leave the defense of the city to a string of palisaded settlements stretching up the Hudson River to Albany and Schenectady, closer to the heartland of the Iroquois Confederacy.

If New York's wall did separate urban "Christians" from largely rural Indians, it was never intended to separate blacks and whites. Unlike at Madras, British authorities demolished the wall in 1699 as their efforts to formalize slavery intensified.<sup>19</sup> No formal slave code had existed in New Amsterdam, and a substantial group of "Atlantic creoles" who served as bonds-people to the Dutch West India Company were able to petition for a status of "half-free" in recompense for their service to colony during a disastrous series of Indian wars in the 1640s. Half-freedom gave them access to landownership, and a number settled in what were called the "new negro lots" or the "negro lands" near the convergence of Broadway and Bowery Street well north of Peter Stuyvesant's town wall (see map #3). When the British took New York they agreed to honor this arrangement, but they also pushed for expansion north of Wall Street, which is why they eventually took down the wall. Land prices and taxes increased as the city edged northward, eventually forcing many of the city's impoverished free and half-free blacks to leave Manhattan. Thus ended the faint pattern of residential separation that had developed in the city.<sup>20</sup>

In 1665 and again in 1706, fearful of the growing slave population and its more frequent acts of ungovernability, British city authorities passed slave codes which forbade slave ownership of property and made manumissions ever more difficult, thus also undercutting the expansion of property ownership among free blacks. Finally the "Negro Act" of 1712, passed in the wake of a particularly determined slave uprising, forbade manumitted slaves from owning property, making it impossible for any free black residential community, separate or otherwise, to grow in New York. The same series of laws forced slaves to live in their owner's house and carry notes from their master when they ventured outside. As the large-scale, Company-dominated slaveholding that had characterized the Dutch period disappeared, slaves were increasingly dispersed in smaller numbers throughout the white residences of the city, usually forced to live in garrets or closets, and more rarely in alleyway shacks out back. Because the wealthiest New Yorkers owned the largest numbers of slaves, the greatest concentrations of blacks lived separated from each other on the property of the wealthiest white neighborhoods.

Such laws not only forced blacks to live with whites, they also separated blacks from each other, creating big obstacles to intimate relationships, including marriage.<sup>21</sup> Colonial authorities also tried mightily but less successfully to interpose agents of European colonial authority into black workplaces, schools, informal markets, gathering places, ceremonies, burglary rings, and insurgent conspiracies. They forbade more than four, then more than three slaves from meeting together, outlawed Sunday revelries and the sale of liquor to slaves, and set ever more stringent curfews which ultimately even made it illegal for a slave to walk about after dark without a lantern. As Ira Berlin has argued, these laws, passed, and re-passed from the 1680s through the Revolution, only document the wide extent to which they were flouted. Slaves continued to mount insurgencies, often allied with radicalized poorer whites, most notably in 1721 and 1732. The biggest conspiracy of all was that of 1741, in the midst of looming pan-imperial warfare, which resulted in another series of crackdowns on slaves' movements.<sup>22</sup> Authorities did agree to establish an African Burial Ground, but that only

proves the rule about the structure of slave cities: black people were only segregated when they were dead.

\*\*\*

Early modern discussions about the defense and control of colonial cities contain a rich language of human difference. The crucial change in this language at both places was the abandonment of religious categories in favor of the secular color categories, first *black*, and, considerably later, *white*.

Madras pioneered the use of color categories in the politics of dividing urban space, but that invention was by no means inevitable there, or for that matter anywhere else in the many divided cities of the Indian Ocean. Europeans in Asia only sporadically used *black* to describe Asians in the sixteenth and early seventeenth centuries, mostly as an adaptation of the vocabulary of the *casta* system, though the Dutch used “black” occasionally for freed slaves (*mardijkers*) and the Javanese and other East Indians they particularly feared and despised.

*Black Town* did not enter the official vocabulary of Madras until 1676. In the early years officials occasionally used *black* to describe Asians, but they most often used linguistic or religious categories such as *Malabar Town* (the word for Madras’s majority Tamil population) or *Gentue Town* (a word which either referred to the city’s large minority Telugu population or Hindus in general) to designate the Asian section of town. These were approximate translations of some of the terms Indians themselves used, which also included many linguistic, religious, and caste designations. Indians preferred to call Madras, or at least the Indian section, Chennaipattnam, in honor of the Naik’s father (the root of today’s Chennai), and they appear to have avoided “Black Town.”

Indeed, the English seem to have used “black” as a derogatory term. International commerce in color designations may have been at work here: the negative associations could well have derived from the Atlantic slave trade.<sup>23</sup> But local factors are more clearly at play. Those who did use the term *Black Town* took the hardest line on control of Indians and the wall tax. The Court of Directors itself fluctuated in its tactics, at one moment issuing thundering directives to its Agents and Governors to tax Indian merchants for a “Black Town” wall by force, and at another advising “gentleness and perswasion” to entice the “Gentues and Moores” to take seats as aldermen and pay the tax voluntarily.<sup>24</sup> The Company’s local agents, by contrast, had more at stake in being consistently respectful, since they engaged heavily in illegal trade to supplement their low salaries, and were thus dependent on good personal relationships with the *dubashes*, as they called Indian financiers and merchants. The EIC’s local agents were also much more in direct danger of rebellion, and some admired Indian culture as well. Their tendency was to use *Gentue Town* and *Malabar Town* and even some version of Chennaipattnam, though *black* grew in frequency. By the first decade of the eighteenth century *Gentue* and *Malabar* disappeared from local usage, after Pitt finally forced the “black merchants” to pay for the Black Town wall.<sup>25</sup>

*White* took an even more circuitous route to establish itself than *black* in the East. The Portuguese and Spaniards had used *white* occasionally to describe themselves in Asian contexts, but they much preferred using their respective national designations or the term “Christian.” The Dutch appear to have almost entirely dispensed with “white” in the population registration systems of Java, preferring “European.” At Madras, during the seventeenth century the European section of the city was initially called “Christian Town.” “Whyte Town” only entered the official written discourse in an isolated incident in 1693, and then not again until 1711, on a map published under the orders of Governor Pitt. Authorities were nevertheless very comfortable contrasting *Black Town* with *Christian Town* from the 1670s until about 1720, after which “White Town” took over as the most widely used designation.<sup>26</sup>

In New York and elsewhere in the Americas negro and *black* were in wide currency from the

beginning of the African slave trade, but *white* rose from a relatively obscure term to great official prominence at almost exactly the same time as it did in Madras. Historians Evarts B. Greene and Virginia D. Harrington catalogued hundreds of citations to censuses and musters undertaken in continental North American colonies. Of the subset of these documents which distinguished Europeans from Africans only one, a document from Rhode Island, used the category “white” before 1700 (in the West Indies there may have been more). Terms like *English*, *Christians*, *freemen*, and *taxables* abound, and one Massachusetts muster used the elliptical category “souls besides the blacks.” By contrast, after about 1700, and especially after 1710, *white* appears in these documents with what, in the slow pace of cultural historical change, must be called sudden profusion.<sup>27</sup> In New York, the censuses of the city and colony mirror this dramatic transformation. In 1712, the principal categories authorities used to count the population were still listed as “Christians and “Slaves.” In 1714, in nearby Dutchess County, the distinction was between “male persons” and “slaves.” By 1723, though, the census of the colony first used “white” and “black,” categories which were repeated in 1737, 1746, and 1749. A similar transformation occurs in the language used in statutes, ordinances, reports, and official correspondence.<sup>28</sup>

Why would colonial authorities abandon *Christian*, a term which for centuries had marked them as instruments of God’s will, and instead identify themselves by the color *white*? Overarching explanations about the favorable meanings of whiteness in Western culture probably do not help here, since it would be hard to argue that a sudden jump in those attributes explains how *white* so swiftly became a powerful term of group pride and solidarity. Nor does it seem likely that rise of *white* was an early signal of a secular spirit in Western civilization, given the religious enthusiasm and factionalism that persisted in Madras, New York, and across the western world throughout the Enlightenment and well beyond. Travelers who visited New York and Madras from Europe did use *white* with somewhat more regularity at an earlier time than local authorities, suggesting that the new verbal fashion may have emanated from the metropole or perhaps somewhere else in the imperial world. However, travelers’ usage seems to have reflected their greater interest in a kind of early ethnological observation. When they use *white* it is as a description of the color of people’s skins, not an effort to galvanize a group identity.<sup>29</sup>

Again, hemispheric and local developments might just as easily explain the change. In New York, Leslie Harris has speculated that as European indentured servants grew more likely to outlive their terms of service, they could put greater pressure on slave-holders to reserve certain areas of labor to them, and forcing slave-holders to negotiate across class boundaries for political support. Thelma Wills Foote also adds that authorities at New York needed to find unifying forces to unite a restive polyglot population which had come to the settlement from all across Northern Europe. Divisions of class and nation had fueled Jacob Leisler’s rebellion against British authorities in 1689-92. Since more slaves had converted to Christianity by the first decades of 1700s, whiteness could well have offered more than Christianity as the ideological basis for such an alliance between Europeans. Such arguments mirror those of historians focusing on other American slave colonies, especially Virginia, and they at least offer a plausible beginning for what W.E.B. Du Bois later identified as the “psychological wage” that whiteness could afford to even the poorest Euroamericans.<sup>30</sup> Another related explanation is that authorities embraced *white* precisely because they were under pressure from the Crown to convert slaves to Christianity, and because many slave-holders were reluctant to do so, fearing that conversion would entitle Africans to emancipation. Indeed, the prominent propagandist for slave conversion Morgan Godwyn inveighed against the tendency in which “*Negro* and *Christian*, *Englishmen* and *Heathen*, are by idle corrupt Custom and Partiality made *Opposites*; thereby as it were implying, that the one could not be *Christians*, nor the other *Infidels*.” Adopting *white* as the designation for free people instead of *Christian* would have clarified matters, diffusing dissent between the Crown and slaveholders as well as cementing

political support among Europeans of different classes and nations in defense of slavery.<sup>31</sup>

Such a politics of prideful whiteness in Atlantic slave-importing colonial cities may indeed have been imported into Madras by people who were familiar with slavery in the Americas. But the use of “White Town” seems to have served other purposes in Madras--not to create a new political alliance between whites, but to dismantle one between the Company and the city’s important populations of Portuguese and Armenians. Both of these groups had been allowed to live at Madras since the city’s origins, the Portuguese to shore up the small British army, and the Armenians because of their connections to Indian courts and longstanding trade contacts with the Middle East. Among other things, the designation “Christian Town” functioned to welcome both these two groups--indeed, authorities even circulated a plan for a while to double the size of Christian Town to allow more Armenians to settle there.<sup>32</sup>

By the early eighteenth century the Company was showing increasing impatience with its Christian allies, however. The Portuguese had long been subject to suspicion because their Inquisition-minded priests lurked in the nearby settlement of S● Thomé, and because they often deserted the defenses of Madras or spied for rivals. The Armenians increasingly fell behind on their taxes, traded with the French, Dutch, and Danes, ignored the authority of Madras courts in adjudicating their disputes, and were often suspected of treachery during wartime.<sup>33</sup> Though both groups were manifestly Christian, the British held them to be of indeterminate color--sometimes they were pigeonholed as white, sometimes as “musteez” (*mestiço*, from the Portuguese *casta* system), and sometimes they took places in a long list of Indian castes. In this linguistic context, the name *White Town* seems to have fit a general strategy among British authorities to cool their welcome of the Portuguese and Armenians, and keep disloyal members of both ambiguously colored communities on notice.<sup>34</sup>

Indeed, the new designation was increasingly invoked in the context of growing calls to kick the Company’s Christian allies out of the more privileged section of town. A long period of prosperity and relative political peace began in Madras during the 1720s, attracting more resident English merchants and soldiers, and putting competitive pressures on the finite space in the White Town. Competition over real estate, especially with Armenians, exacerbated tensions.<sup>35</sup> In 1749, when the East India Company regained Madras after the devastating French occupation, local Company officials fulfilled the veiled threat contained in the designation *White Town*. Some Armenians and Portuguese some had sided with the French and enriched themselves off of the occupation. In response the British passed new ordinances which for the first time explicitly forbade Armenians and Portuguese from settling in White Town without exception. Houses were confiscated, a pitiful sum was paid in compensation, and both groups were sent to live in the new Black Town four hundred yards distant from the fort. Forced separation, by the most exclusive possible interpretation of contemporary color categories, was complete.<sup>36</sup>

\*\*\*

Historians have long wanted to attribute these developments to “race” or “racial formation,” especially those who argue for the racial origins of slavery. At least at Madras and Manhattan, though, it would be more accurate to say that early-modern institutions of Western expansion and dominance were increasingly “colored.” Though the concept of *race* was available to colonial authorities in both cities, they never once felt the need to use it. Instead, in Manhattan they were able to rely largely on a dichotomy of two “nations,” one “Christian” and one “Negro,” to establish the slave trade in an American city. In Asia, by contrast, *black* was not necessary for the initial establishment of split cities, but it fulfilled more specific needs as time went on in some local places, including Madras. “White” eventually became useful too in both places, to formalize slavery in New York and elsewhere in the Atlantic world, and to consolidate color separation at Madras--but “race” still played no political role whatsoever in these developments. Even as late as 1744, when the New

Yorker Daniel Horsmanden chronicled the repression of allegedly one of the largest slave conspiracies in the Americas, he used *color* and *complexion* instead of *nation*—but never *race*--as a general container for *white* and *black*.<sup>37</sup>

Instead of asking when *race* definitively appeared during this period, we would do better to ask how it was that color categories could accomplish so much on their own. One part of the answer, I have argued, must be found in institutional and political matters: local contingencies in the politics of defending and controlling cities. It may well be that it was solely by chance, indeed, that whiteness emerged across world-spanning empires at the same time, in service of very different local political strategies, such as those Madras and New York.

Another part of the answer may lie in other intellectual projects which were loosely linked to blackness and whiteness, such as ideas about the heritability of human characteristics. Of the North Atlantic world, Winthrop Jordan has written of that “until well into the eighteenth century there was no debate as to whether the Negro’s non-physical characteristics were inborn and unalterable; such a question was never posed with anything like sufficient clarity for men to debate it.”<sup>38</sup> To the extent that debased characteristics were indeed attributed to “blacks” during the early modern period, it is true that Europeans at Madras and New York never clarified just how much these characteristics were linked inalterably to skin color or, more specifically, whether those characteristics were inherited along with it.

Discussions of heritability, however, clearly did matter in the politics of city building in both places. Neither *white* nor *black* was solely a term of color: both described a characteristic of human bodies which could have been plausibly interpreted as heritable. The more general terms *nation* and *jente*, the Spanish word for “people,” also both derive from Latin words for “birth” (something that is not true of *race*, incidentally, even though in its early modern usage it usually referred to the descendants of a single individual). But heritability had a history that was at least semi-autonomous from color and from other concepts of difference, and it did not always drive the strategic choice to elevate any of those concepts to political prominence. In Madras, Company officials for a time felt that the city’s future actually depended on encouraging marriage and sex across the emerging lines of religion and color. Because few European women could be persuaded to migrate to Asia, Company officials including Josiah Child thought intermarriage would be the only way to guarantee a loyal population in Madras--again, to ensure the defense of the city. As Child noted, the Dutch had long debated the merits intermarriage at places like Batavia, and it was very common there. Dissenters in this debate existed as well, like the Company Agent who in 1666 urged more imports of British women so that “your Towne might be populous of our owne and not a mixt Nac●.” However, to the extent that we can even read such things into the sources, heritability seems to have been largely insignificant to the adoption of both *black* and *white* in Madras politics. Even though considerably more British women migrated to South Asia after 1720, the embrace of whiteness does not seem to be linked to a sudden jump in the desire to restrict sex to the boundaries of the color group. Indeed, the policy of encouraging interracial marriages was not officially abandoned until the late eighteenth century, and only when concerns explicitly voiced in terms of “race” were brought up against it.<sup>39</sup>

In New York, the story was different. The biggest irony of this tale of these two cities may be that European officials encouraged cross-color sex in divided Madras while they abhorred it deeply in Manhattan where blacks and whites were forced to live in the same houses. In New Amsterdam, just as at Madras, the Dutch set the tone for this policy when they outlawed non-conjugal sex between Christians and Negroes as early as 1638. British authorities’ subsequent efforts to control slaves’ movements were heavily directed at their interactions with poorer whites in taverns where sex was presumed to be rife across the color line. Under the British, concern about heritability clearly increased by several notches in the early eighteenth century as the city took on a status of a slave society and adopted whiteness as its political cement. As Thelma Willis Foote has observed, the

city's legal code of 1706 clarified the color terms for slaves during this period, equating slavery with the small galaxy of categories "Negro, Indian, Mullato, and Mestee Bastard Child or Children" as way of establishing that slave status would follow "ye state of the Mother." The heritability of whiteness might also have been a factor in replacing *Christian* with *white* as the dominant category for non-slaves during the same period. This was not, however, as Foote describes it, "a point at which the discursive construction of *race* began to take on its modern biologized form under a racist state apparatus." It was a process of sharpening notions of heritability latent in color categories—themselves still seen as separate "nations" or "colors"—with the aim of formalizing a slave society.<sup>40</sup>

\*\*\*

In at least two colonial cities, categories of nation and color, responding to global, hemispheric, imperial and local dynamics, did much of the political work of creating the signal institutions that would much later vie for history's "highest stages" of white racial supremacy—slavery and segregation. In the process, by the 1710s and certainly by 1720, whiteness gained cultural, political institutional and economic grounding as a rallying force for a cross-class and cross-national alliances; as a source of "psychological wages" for the white poor; and as a source of unequal privileges for wealth holding, not only in slaves, as in New York, but, in both places, in urban real estate too. Thus the core attributes of "whiteness," which David Roediger and others have analyzed in much later periods, came into being in the early eighteenth century—long after blackness, but substantially earlier than both race and racism.<sup>41</sup>

By way of Epilogue: As we know well, when ethnologists and others raised *race* to prominence in the late eighteenth century, the concept became essential to the elaboration of theories of the heritability and permanence of human characteristics of all kinds. It was also connected to general schemes to categorize all human beings, to assign them "natural habitats" on separate continents and regions of the world, and to elaborate theories of inherent conflict between human groups—all projects for which colonial authorities at Madras and New York had found little use. Cities continued to play fundamental roles in conceptual innovation on a global scale, as creators and creations of racial formation, as sites of ideological contestation over race, and as symbols useful in its propagation. The varied exigencies of urban defense and control would retain a powerful role in race-making into the twentieth century and beyond. Whereas *color* for the most part surfaced as an effective tool to accomplish those tasks politically, *race* provided a profusion of new rationales for slavery and segregation. It called forth the mission to control the inevitable conflicts of different species of mankind commingled in the same continental and urban habitats; the need to control urban social problems, such as crime, vice, and disease, which were deemed racial in origin; and ultimately the need to beat back the threat that "blacks" posed to white property values.<sup>42</sup>

Race gave some new lease on life to urban slavery, and then outlived it. Madras's role as the birthplace of the residential color line meanwhile faded from memory. But the color concepts and techniques of urban division that were used there fit well with the new agendas of racial thought, and handily filled the void left by emancipation in urban politics across the modern colonial world. The hundreds of dual colonial cities that sprang up across Africa and Asia, apartheid's bristling urban *laagers*, and America's segregated metropolises would all emerge, via Madras's heavy influence on Calcutta and other cities of the British Raj, as the not-so-distant historical progeny of "Black Town" and "White Town."<sup>43</sup> By the late twentieth century, as people in cities across western Europe, Canada, Australia, and even South Africa wondered if "Harlem" or the "South Bronx" had suddenly appeared in their midst, New York City would ironically become the symbol, even avatar, of a segregationist system it could not have imagined as a slave society—a system which was actually originally a European creation in South Asia.

## NOTES

---

1. Most of the official sources of colonial Madras for the period have been published. Government of Madras, *Records of Fort St. George. Diary and Consultation Books* (Madras: Government Press, 1910-53), 82 vols., hereinafter listed as "PC" or "Public Consultations"; *Despatches from England* (Madras: Government Press, 1911-71), 61 volumes covering 1670-1758, hereinafter listed as "DfE"; *Despatches to England (1670-1758)* 61 vols. (Madras: Government Press, 1916-32), hereinafter listed as "DtE"; *Letters to Fort St. George, 1681-1765* 45 vols. (Madras: Government Press, 1916-1945); *Letters from Fort St. George* 38 Vols., (Madras, Government Press, 1914-46). Selections from these and other primary sources are collected in: J. Talboys Wheeler, *Annals of the Madras Presidency, Being a History of the Presidency From the First Foundation to the Governorship of Thomas Pitt, Grandfather of the Earl of Chatham Compiled from Official Records* (1861; Delhi: B. R. Publishing, 1982); William Foster, *The Founding of Fort St. George, Madras* (London: Eyre and Spottiswoode, 1902); and Henry Davison Love, *Vestiges of Old Madras, 1640-1800 Traced From the East India Company's Records Preserved at Fort St. George and the India Office and From Other Sources* (1913; New York: AMS Press 1968), 3 vols.

2. Published sources for colonial New Amsterdam/New York are collected in Berthold Fernow, ed., *Records of New Amsterdam from 1653 to 1674 Anno Domini*, 7 vols. (Baltimore: Genealogical Publishers, 1976); Charles T. Gehring, ed., *Council Minutes 1655-56* (New Netherland Documents Series Volume VI) (Syracuse: Syracuse University Press, 1995); Gehring, ed. *Correspondence, 1647-1653* (New Netherland Document Series, vol. XI) (Syracuse: Syracuse University Press, 2000); John Romeyn Brodhead, *Documents Relative to the Colonial History of the State of New York Procured in Holland, England and France*, ed. E.B. O'Callahan, 15 vols. (Albany: Weed, Parsons and Company, 1855); E.B. O'Callahan, *The Documentary History of the State of New-York*, 4 vols. (Albany: Weed and Parsons, 1849); Peter R. Christoph and Florence A. Christoph, *The Andros Papers, 1674-1676* (Syracuse: Syracuse University Press, 1989); E.B. O'Callahan, *Journal of the Legislative Council of the Colony of New York, 1691-1743* (Albany: Weed, Parsons, 1861); City of New York, *The Colonial Laws of New York*, 5 vols. (Albany: Lyon, 1894); Herbert L. Osgood, Frederic W. Jackson, Robert H. Kelby, and Hiram Smith, eds., *Minutes of the Common Council of the City of New York, 1675-1776* 8 vols., (New York: Dodd, Mead and Co., 1905).

3. George Fredrickson, *Racism: A Short History* (Princeton: Princeton University Press, 2002), pp. 5-6, 11, 23, 39-40, 41, 75. David Theo Goldberg, in *Racist Culture* (Oxford: Oxford University Press, 1993), pp.62-63, and Audrey Smedley, *Race in North America: Origin and Evolution of a Worldview* (Boulder: Westview Press, 1993), pp. 36-40 both trace the history of the word *race* to the sixteenth century, and both treat it as a synonym of nation and people, but neither mention that *race* was used much less often and in much more circumscribed usage. Some of the historians who have voiced qualms about using *race* for this earlier period include Barbara Fields, in "Slavery, Race and Ideology in the United States of America" *New Left Review* 181 (1990): 95-118; Bruce Dain, *A Hideous Monster of the Mind: American Race Theory in the Early Republic* (Cambridge, Mass.: Harvard University Press, 2002); and Ivan Hannaford, *Race: The History of Idea in the West* (Washington, D.C.: Woodrow Wilson Center Press, and Baltimore: The Johns Hopkins University Press, 1996).

4. See John W. Cell, *The Highest Stage of White Supremacy: The Origins of Segregation in South Africa and the American South* (Cambridge: Cambridge University Press, 1982), pp. 2-3, 55.

---

5. This distinction is “rough” for two main reasons: As noted later in the text, Spanish American cities were built on divisions between Indians and Spaniards; and slave-exporting cities on the African Atlantic coast resembled dual Indian Ocean cities in many respects, though with addition in some places of large “segregated” barracoons.

6. The phrase “tense societies” is taken from Remco Raben, “Batavia and Colombo: The Ethnic and Spatial Order of Two Colonial Cities, 1600-1800” (Doctoral Dissertation, University of Leiden, 1996), p. 162.

7. C.R. Boxer, *Race Relations in the Portuguese Colonial Empire 1415-1825* (Oxford: Clarendon, 1963), pp. 5, 9-11; M. N. Pearson, *The Portuguese in India, The New Cambridge History of India, Volume I, Part 1* (Cambridge, U.K.: Cambridge University Press, 1987), p. 30; C.R. Boxer, *The Dutch Seaborne Empire 1600-1800* (1965; London: Hutchinson, 1977), p. 187; Robert R. Reed, *Colonial Manila: The Context of Hispanic Urbanism and Process of Morphogenesis* (Berkeley: University of California Pr., 1978), pp. 38-63. On the segregation of urban Indians in Spanish America see Charles Gibson, *The Aztecs Under Spanish Rule: A History of the Indians of the Valley of Mexico, 1519-1810* (Stanford, CA: Stanford University Press, 1964), pp. 147, 370-81; R. Douglas Cope, *The Limits of Racial Domination: Plebeian Society in Mexico City, 1660-1720* (Madison, Wisc.: University of Wisconsin Press, 1994), pp. 16-21. On Lima, see Alexandre Coello de la Rosa, “Resistencia e integración en la Lima colonial: el caso la reducción de indios de El Cercado de Lima (1564-1567),” *Revista Andina* 35 (2002): 111-28. I am indebted to Jeremy Mumford for discussions on El Cercado.

9. Love, vol. I, pp. 39-40, and 217.

10. Love, vol. I, pp. 204-7

11. Child’s instructions can be found in *PC*, January 4, 1686, and in *DfE* vol. 8, June 9, 1686 #16, #27, #29. The wall tax debate can be followed in *PC*, vol. 19 January 14, 1692; vol. 28 May 10, 1699; vol. 29 December 4, 1700; vol. 31 August 3, 1702; vol. 36 July 6, 1706. Love, vol. I, pp. 497-98. On Pitt’s resolution of the matter see *PC* Vol. 34 October 25, 1705; *PC* vol. 35 July 6, July 25, and September 12, 1706.

12. Indians and other resident Asians played important roles in both the founding and dividing of Madras, and not only by threatening the city with armies. Indeed, the subcontinent’s traditional openness to outsiders, which contrasted so markedly with China and Japan, made the Company’s initial deal with the Naik conceivable in the first place. Yet Indians had long-standing, if possibly waning practices of caste segregation; they may have also preferred to live far from what were seen as sacrilegious practices of the British. Patrick Roche, “Caste and the Merchant Government in Madras, 1639-1749” in *Indian Economic and Social History Review* 12 (1975): 392-93.

13. *PC* vol. 2, September 1680, pp. 115-16; *PC* vol. 14, 27 February 1688; *PC* vol. 16, July 21, 1690; *PC* vol. 26, 25 February 1698; Love, vol. II., pp. 25, 308, 395-96, 425-26, 573.

16. Cope, *The Limits of Racial Domination*, pp. 18, 20.

17. Graham Russell Hodges, *Root and Branch: African Americans in New York and East Jersey, 1613-1863* (Chapel Hill: University of North Carolina Press, 1999), p. 36.

18. On the Company Slave Lodge at Cape Town see Robert Shell, *Children of Bondage: A Social History of the Slave Society at the Cape of Good Hope, 1652-1838* (Hanover, N.H.: University Press of New England, 1994), pp 172-205, but also see p. 143 for regulations that kept smaller cohorts slaves not owned by Company in their masters' homes. On the apparently short-lived "Quartier de Swarten de Comp Slaves" on Manhattan see Russell-Hodges, *Root and Branch*, p. 12. Another exception that proves the rule is Panamá, which was rebuilt as a dual city after being sacked by Henry Morgan in 1671. The light-skinned elite there had less to fear from slaves from a large free population of color with a long history of rebellion and alliance with the British. See Alfredo Castillero Calvo, *La Ciudad Imaginada: El Casco Viejo de Panamá* (Panamá: Ministerio de la Presidencia, República de Panamá, 1999). I am indebted to Professor Aims McGuinness for help in summarizing Castillero Calvo's argument. For other examples of urban slave laws relegating slave residence to masters' households see A.C. De C. M. Saunders, *A Social History of Black Slaves and Freedmen in Portugal, 1441-1555* (Cambridge, U.K.: Cambridge University Press, 1982), pp. 96-99, 120-25; Cope, *Limits of Racial Domination*, pp. 15-21; Colin Palem, *Slaves of the White God: Blacks in Mexico, 1570-1650* (Cambridge Mass.: Harvard University Press, 1976), pp. 55-64; Mary C. Karasch, *Slave Life in Rio de Janeiro, 1808-1850* (Princeton, N.J.: Princeton University Press, 1987), pp. 59-66; Christine Hunefeldt, *Paying the Price of Freedom: Family and Labor Among Lima's Slaves, 1800-1854* (Berkeley, Calif.: University of California Press, 1994), pp. 106-110; Frederick P. pp. 9-16; Berlin, *Many Thousands Gone*, pp. 58-59, 61-63, 162, 204, 249-50, 287, 318-321, 339.

19. Fernow, ed., *Records of New Amsterdam*, vol. I pp. 72, 78, 97-98, 177; Vol. II, pp. 51-52, 209; Vol V., p. 104; vol. VI, pp. 382, 385, 392.

20. Russell-Hodges, *Root and Branch*, pp. 34-36; Leslie Harris, *In the Shadow of Slavery: African American in New York City-1863* (Chicago: University of Chicago Press, 2003), pp. 23-24.

21. Russell-Hodges, *Root and Branch*, pp. 67-68; Harris, *Shadow of Slavery*, pp. 31-36.

22. Russell-Hodges, *Root and Branch*, pp. 48-50, 59-69; Harris, *Shadow of Slavery*, pp. 33, 39-45; T.J. Davis, *Rumor of Revolt: The "Great Negro Plot" in Colonial New York* (Amherst, Mass.: University of Massachusetts Press, 1985); Jill Leporte, *New York Burning: Liberty, Slavery, and Conspiracy in Eighteenth Century Manhattan* (New York: Knopf, 2005).

23. No one at Madras ever used "negro" to describe Indians, however. Africans in Asia were called by the Arabic-derived epithet "kaffirs" or "coffrees," suggesting that influences from the Atlantic on Asian color designations were at best limited.

24. Quote from Df E Jan 22, 1692.

25. PC, vol. 35 July 25, 1706.

26. In the 1520s, Afonso da Albuquerque, for example ordered his lieutenants to marry "white and beautiful [*alvas e de bom parecer*]" widows of Indians who had died defending Goa. In the Philippines, Spaniards often thought that the "white" or "light" skin color of the Chinese made them especially worthy. Maximilianus Transylvanus, *De Moluccis Insulis* in Emma Helen Blair and James Alexander Robertson, eds., *The Philippine Islands, 1493-1898* (Cleveland: A.H. Clark Co., 1903), vol. I, p. 309; Captain Juan de la Yula, "Relation of the Western Islands Called Filipinas," in Blair and Robertson, vol. 3, p. 205. I should note that Blair and Robertson regularly mistranslate the Spanish words *nación* and *gente* (people) as "race." On Madras, see PC, vol. 20, February 6, 1693. Thomas Salmon's *Modern History, or the Present State of All Nations* contains some references to Madras from his voyages there in 1699-1701, and he uses "White Town." These memoirs were not published until 1739, though, so he could have modified his wording to reflect later usage. See excerpts in Love, vol II, p. 73. Alexander Hamilton also uses "White Town" in his *A New Account of the East Indies*, published in 1727, but referring to visits in 1707, 1711, and 1719 (ed. William Foster; London: Argonaut press, 1930), vol. I, pp. 192-209. On dating Thomas Pitt's map, see Love, vol. II, pp. 88-90. For other references to "White Town," see PC, vol. 48 October 21, 1717; vol. 58, September 23, and October 14, 1728; vol. 58 January 8, 1733; vol. 71 June 26 and 30, 1741; vol. 73 August 22 1743, vol. 73, October 17, 1743; vol. 75 June 4, 1745; vol. 81 January 19, 1749; and Love, vol. II, pp. 395-96, 425, 451, 520, 525, 573, 604, 609, 622; vol. III, pp. 52, 80-81, 167. Also see "Madras in 1733," map insert in Love, vol. II, facing p. 624.

27. Evarts B. Greene and Virginia Harrington, *American Population Before the Federal Census of 1790* (New York: Columbia University Press, 1932). The Rhode Island document is on p. 62; the phrase "souls besides blacks" is on p. 14., see See also Department of Commerce and Labor, Bureau of the Census, *A Century of Population Growth: From the First Census of the United States to the Twelfth, 1790-1900*.

---

28. The New York colonial censuses are collected in Brodhead, *Documents Relative to Colonial New York*, vol. V., p. 340 (census of 1712); p. 702 “Census of the Province of New-York Anno 1723”; p. 929 “Abstract of the Accounts of the number of Inhabitants in the Several Cities and Counties in the Province of New York 2 Nov 1731; vol. VI, p. 133 “A List of the Number of Inhabitants Both Whites and Blacks of Each Species Within the Province of New-York Above and Under the Age of Ten Years Taken in the Year 1737”; p. 392 “Census of the Province of New-York, 1746”; p. 550 “Census of the Province of New-York 1749.” For Dutchess County see O’Callahan, *Documentary History of New-York*, pp. 368-69 “A List of the Inhabitants and Slaves in the County of Dutchess, 1714. Similar categories can be found in the “List of Inhabitants in the County of New Orange, 1702,” on pp. 366-67. In the *Journal of the Legislative Council of the Colony of New York, 1691-1743*, *The Colonial Laws of New York*, and *The Minutes of the Common Council of the City Of New York*, I found no reference to the word *white* before 1696. “Christians” is used occasionally, but the most oft-used word for Europeans is “freemen” or “masters.”

29. In his *Journal* (1679-80) Jasper Danckaerts, for example, uses the phrase “negroes, mulattoes, and whites” when he describes those who lived in the “negro lots” of New York (p. 65); and Morgan Godwyn uses “white” frequently in his *Negro’s and Indians Advocate* (1680): see pp. 4, 24, 39, 84. In Madras, turn of the eighteenth century travel writers such as Thomas Salmon and Alexander Hamilton may have been among the first to use “White Town,” but because both of their books were not printed until 1739 and 1727 respectively it is hard to know whether it reflects usage at the time of their visit.

30. Harris, *Shadow of Slavery*, pp. 16-17, 34; and Thelma Wills Foote, *Black and White in Manhattan: The History of Racial Formation in Colonial New York City* (Oxford: Oxford University Press, 2005), pp. 91-158.

31. Quote, with original emphases, from Morgan Godwyn, *The Negro’s and Indians Advocate* (London: 1680), p. 36. On the Crown’s pressure to convert slaves in New York, see Brodhead, *Documents Relative to Colonial New York*, vol. III, p. 374, 547, 690, 823; and vol. IV 138, 290, and 510-11.

32. *English Town*, which was used by some contemporaries, could have evoked another more secular, nationalist or royalist passion, but its exclusivity would have undercut the alliance with the Portuguese and Armenians. It does not appear in official documents. Wheeler, *Annals*, pp. 184-85. That *European Town* was not adopted, despite the widespread use of *European* in Dutch population registration systems at Batavia, further suggests that *Chritian Town* may have served to welcome Armenians.

33. On complaints about the Armenians, see PC vol. 22 Nov. 28<sup>th</sup>, 1695 (taxes); PC vol. 25 May 31, 1697 (interlopers); PC vol. 32, 7 May 1703; DfE April 16, 1697, #5 and #8; DfE 12 Feb, 1713, p. 94; Love, vol I pp. 231-2, 308, 425, 573; Wheeler, vol. I p. 240, vol. II, pp. 247-48.

34. In one document authorities at Madras justified the presence of the Catholic Portuguese as a way to increase “the terror and awe that many white men in the towne strikes to our neighbors.” In another, the darker skins of the Portuguese, the result of centuries of cross-color sex, prompted the Governor to request uniforms for the soldiers, “the proportion of English being so small in respect to the Portugues and Mestizos, unless we gave the same to all it would rather shew our weakness then

---

our strength.” (Love, vol. I, pp. 183, 376.) On efforts to categorize the Portuguese, see Love, vol. I, pp. 183, 376, 387-88, 441, 481, 529; vol. II, p. 128; PC vol. 17, February 7, 1690, and July 21, 1690, vol. 20, 23 October 1693, vol. 21 April 19, 1694. On the Armenians, see DfE April 11, 1688; PC, vol. 17, March 6, 1690, April 26 1690; Wheeler, *Annals*, vol. I, pp. 184-85, 204; vol. II, pp. 273-76, 247-48; PC, vol. 22, November 28, 1695; DfE, April 16, 1697, #5, #8; PC vol. 35 July 6, 1706; DfE Jan 16, 1706; PC vol. 41 June 15, 1710, vol. 45, 29 July 1714; Love, vol. 37. It is of course impossible to prove the complete absence of anything in such vast Babels as were any colonial city, and my reading of the historic record for neither Madras or New York is by any means completely exhaustive. Since I am relying on written sources, I cannot of course speak at all about the conventions of spoken language. The availability of multi-volumed and indexed collections of documents from both places have made me reasonably certain that I have not missed references in at least the documents they contain. The only use of the word *race* in either city from before 1740 is in some propositions made to New York authorities by what were called the “praying Indians of the three tribes or races of the Maquass [Mohawks]” in a 1691 document. Brodhead, vol. III, p. 770. I am certain, however, of my contention that *nations*, *peoples*, and *complexion* are infinitely more common. I have already given several prominent examples from Madras of the use of these terms, and a few others follow in the text. For New York, a few highlights include these observations: there is no use of the term *race* other than the one I have just mentioned in *any* of the collections of documents mentioned in footnote 2, which include not only all the laws of the colony, all of the minutes and ordinances of the Common Council, much of the communication between the colony and the metropole as well as with other colonies in North America, most reports of investigations, and most extant personal letters. In those collections, the use of *nation* for Indians and for separate groups of Indians was ubiquitous and virtually universal, perhaps because of the tradition of using the phrase the “five nations” and later the “six nations” of the Iroquois as well as the “remote nations” from further West and North. *People* comes up occasionally and “tribe” more rarely, and only then to describe subgroups of nations, as in the example quoted above, where *race* is given as a synonym for *tribe*. This general terminology for Indian peoples is much more commonly used in the documents than in any similar discussions of blacks, but the idea of Indian “nations” appears to be the basis for the use of the word “nation” to describe small bands of slaves alleged to be involved in conspiracies. Daniel Horsmanden’s *The New-York Conspiracy, or a History of the Negro Plot With the Journal of the Proceedings Against the Conspirators at New-York in the years 1741-2. Together With Several Interesting Tables, Containing the Names of the White and Black Persons Arrested on Account of the Conspiracy—The Times of Their Trials—Their Sentences—Their Executions by Burning and Hanging—Names of Those Transported, and Those Discharged With a Variety of Other Useful and Highly Interesting Matter* (1810; repr. New York: Negro Universities Press, 1969) is by far the most extended treatment of any incident involving people defined by color in the history of either city. In his summary, he uses the word “complexion” exclusively (pp. 354, 363, 371, 369). He also uses the phrase “the white people” throughout the text, never once giving evidence that the “white race” had been “invented” yet. In travel writing from the seventeenth and eighteenth centuries pertaining to New York I found two isolated uses of the word “race,” one in Jasper Danckaerts’s *Journal* (1679-1680) ed. Burleigh James and J. Franklin Jameson (New York: Scribner’s, 1913), p.

---

77 when referring to the descendants of a specific ancestor; and one in David Humphreys, *An Historical Account of the Incorporated Society for the Propagation of the Gospel in Foreign Parts* (1728; New York: Arno Press and New York Times, 1969), p. 311 referring to the Iroquois. There is also one mention of race in the English version in Johan De Laet's "New World," which is a mistranslation of the Dutch *natië* (Jameson, *Narratives of New Netherland*, p. 45).

38. Winthrop D. Jordan, *White Over Black: American Attitudes Toward the Negro, 1550-1812* (Baltimore: Penguin Books, 1968), p. 26.

39. Child's efforts to spur intermarriage can be found in PdfE vol. 8 April 8, 1687 and vol. 9 Jan 28, 1688. The quote from the opponent of these policies is in Love, vol. I, p. 247. On similar debates at Batavia, see Boxer, *Dutch Seaborne Empire*, pp. 219-230.

40. Russell-Hodges, *Root and Branch*, pp. 12, 48, 93-94; Foote, *Black and White Manhattan*, p. 127-28.

41. David Roediger, *The Wages of Whiteness: Race and the Making of the American Working Class* (London: Verso, 1991); *Toward the Abolition of Whiteness* (London: Verso, 1994); and *Working Toward Whiteness: How America's Immigrants Became White, The Strange Journey from Ellis Island to the Suburbs* (New York: Basic Books, 2005). Also: George Lipsitz, *The Possessive Investment in Whiteness: How White People Benefit From Identity Politics* (Philadelphia: Temple University Press, 1998).

42. I develop this argument in Carl H. Nightingale, "The Transnational Contexts of Early Twentieth-Century American Urban Segregation," forthcoming in *Journal of Social History*, March 2006.

43. This argument is also elaborated in Nightingale, "Transnational Contexts of Urban Segregation." Calcutta was founded from Madras and the influence of the Black Town/White Town system on the newer city was immense. It can be followed in the original sources in C.R. Wilson, ed. *Old Fort William in Bengal: A Selection of Official Documents Dealing With its History* (London: John Murray, 1906), vol. I, pp. 28-38, 74-78, 90-93, 158-67, 173-78, 214-222; vol. II, pp. 4-20, 112-18, 129-32. The influence of Madras on Bombay can be traced in Dulcinea Correa Rodrigues, *Bombay Fort in the Eighteenth Century* (Bombay Himalaya Publishing House, 1994), pp. 58-59, 72-115; and S.M. Edwardes, *The Rise of Bombay: A Retrospect* (Bombay: Times of India Press, 1902), pp. 104-109, 138, 146, 152-53, 170-78, 206, 229-238.

**FROM MASTER PLAN TO VISION PLAN: THE CHANGING ROLE OF PLANS  
AND PLAN MAKING IN CITY DEVELOPMENT  
(a referral study of Mumbai)**

**Abstract**

Master plans are the traditional instruments used by urban local governments in India as forward planning tools by anticipating urban development and making provisions for the same in terms of (a) the allocation of land for various uses, (b) the regulation of its development and (c) the provision of civic infrastructure. However, they failed to meet the expectations of the citizens as well as the decision makers for several reasons: their design and approach were far too simplistic in anticipating the citizens' needs and aspirations; their very long tenure has been a major hindrance to anticipate socio-economic changes over time horizon; further, the restrictive approach taken to their implementation without adequate flexibility to meet the changing needs of hour has been acting against the spirit of urban planning. Essentially, it is because of these inadequacies in the plan design, plan making and plan implementation that there is a need felt now on steering an alternative course for achieving the city development goals. Vision plans, in this context, have emerged as alternative instruments useful to achieve the city development goals over a medium to long term; and they are increasingly becoming popular in the cities across the USA as well as elsewhere. This paper describes the evolution of master plan in the Indian context and analyses its inadequacies first (as found in literature); subsequently, it explains the positive features of emerging alternative approaches like the strategic vision plans. In particular, it illustrates the specific case of the Vision Plan for Mumbai, jointly prepared through a partnership of private non-profit initiative and for-profit organisation, as to how its design is different and as how it takes in to account of / built upon some of the principles of master planning approach. It therefore lays down, finally, how the urban planning has to change the course, akin to the economic planning focus change from that in central planning [of pre-modern era] to decentralized planning [of post-modern era].

**KEY WORDS:** Master Plans, City Development, Vision Plans and Planning focus

---

<sup>†</sup> The author was formerly the Programme Manager at Bombay First (Bombay City Policy Research Foundation) and was actively involved in the preparation of Vision Plan together with McKinsey team.

## 1. Introduction

Planning has occupied much of the importance in India's past. Economic Planning had been central to its economy in the post-independence era until the 1990s<sup>1</sup>. While economic planning has been changing the course towards changing over the decade and a half, such changes in physical planning have not come forth. The physical planning, here, essentially refers to the urban planning, or urban development planning, with which we are concerned in this paper. India's strong historical past in the form of civilization and associated systems has been well researched by historians e.g., Thapar (1990), of which town planning was a characteristic of the civilizations more than 2000 years ago. However, much of this planning was a concerted effort of specific kingdoms prevalent at various points of time in history rather than an outcome of documented and institutionalized procedures, rendering it difficult to compare the ancient planning systems with the modern planning systems. The modern town planning came to vogue in a civilized society based on institutionalized systems. Like several other countries, much of the current town planning system in India owe's its origins to the British town planning system, although the features and functioning of it are very different from the British system. The British Town Planning System is rather democratic, participatory, decentralized and uses legal and economic principles in the design of its practice (Cullingworth and Nadin 2001)

The Indian Town Planning System evolved much through a variety of town planning initiatives during the colonial rule. British rulers have from time to time estimated the need for evolving the cities in the past to serve the economic needs of their mother land, and in the process have laid down some principles for organization of human settlements, laying down infrastructure, legislation for legal validity of the planning proposals. Although admirable for the society that was yet developing, the system was purportedly designed to serve the economic interests of the British first and the social interests of citizens later. The Colonial Planning had several other undesirable features associated with it. It systematically catered to the interests of colonizers rather than the servicing population, it had the draconian features that characterized the colonial rule in India, and finances for plan implementation largely came from exchequer filled by the taxes from peasants and labor. It provided a picture of Victorian grandiose of the 'rulers' within the city and contrasting poor neighbourhoods resided by the 'ruled' – reflecting the divide of Victorian and Indian cities (Mehrotra and Dwivedi 1995). However, it certainly laid down the foundations for catering to the future needs of an increasingly urbanizing society in the post-independence era.

India continued with a town planning system whose legislation was framed by the British by adapting it to the requirements of the Indian cities and this was primarily done through the town and country planning acts of various States. These acts have mandated the development of Master Plans for the development of cities conceivable in the next 20 or 25 years. The Master plans, or development plans, featured the land use plan – present and proposed – and development control restrictions. In many states, this involves estimation of future population, socio-economic conditions and their infrastructural needs

---

<sup>1</sup> A detailed discussion of the economic planning and its changes can be found in Ray (2002)

and preparation of plans for ensuring that the necessary facilities are in place when the development takes place. The plans were supposed to make proposals/schemes for the provision of various facilities and ensure that the basic amenities/services are in place; in that process, they were also to guide the urban development. This approach certainly assumes the State, or government, as the major producer of all goods and services – public and private, which was the thinking prevailing for a quite long time in the history. We will discuss in this paper this basic approach that was drawn from the colonial system has yielded the results in practice, if not so what are the new ways or methods that could replace or strengthen it. Here, though we make reference to the town planning in India, in general, our primary intention is also to make some specific observations from the experiences in Mumbai of its development planning in the post-independence era. We will first take an overview of Mumbai's historical development past and the evolution of its planning system over time before critically examining the master plan approach and practice in Mumbai. Subsequently, the need for an alternative approach of Vision Plan is discussed together with the elements Vision Plan of Mumbai and its methodology.

## **2. Evolution of Mumbai City and Its Planning System**

### ***2.1 Mumbai's Evolution***

Mumbai, earlier known as Bombay, was once a congregation of seven tiny islands mostly lived in by fishermen and farmers (Mehrotra and Dwivedi 1995) conquered by the King of Thane in the year 1400 but soon passed in the hands of another ruler. It grew at snails pace until Vasco-da-gama, the Portuguese traveller set his foot in 1453 in a bid to discover New Land. The Portuguese rulers slowly explored India and came to acquire a foothold in Mumbai by 1600 (Chandrashekhar 2005). The British had started settling in Calcutta and Surat by that time. In 1661, Mumbai was given to Prince Charles of Britain as a marriage gift in his marriage with Princess Catherine of Portugal. But, it was the East India Company which first noticed the hidden potentials Mumbai in the form of a natural harbour and it obtained a lease of Mumbai in 1668. Mumbai soon became their gateway to prosperity with the trade becoming more efficient. It also developed a naval base. A port was established and a fort was constructed in Mumbai. Trade incentive and security attracted people from the mainland. By 1720, the population of Mumbai rose to 16,000 (Chandrashekhar 2005).

### ***2.2 Rise of Mumbai as Economic Powerhouse***

By the beginning of 19<sup>th</sup> Century, the English became a major political power. This gave boost to trade an influx of population and so do the formation of a new town and extension of the city. Noting that Mumbai's climate was suited for textile mills, the first cotton mill was established in 1854, which marked the beginning of an industrial era in the history of Mumbai. With the operationalisation of Mumbai port in 1860, and the opening of the Suez Canal in 1869, the trade activity was revolutionised as it reduced the distance of Mumbai from England by almost half (Chandrasekhar 2005). British rule give full freedom for uninterrupted trade between Mumbai and the mainland. This resulted into rapid growth of commerce and industrialisation. By the end of the 19<sup>th</sup> Century, many civic services were provided - water supply, drainage system, reclamation of tidal flats, health services, cemeteries, educational institutions, street lights, markets etc.

### ***2.3 Evolution of Municipal Institutions***

The Bombay Municipal Corporation (BMC) Act was enacted in 1888 giving rise to Local Self Government. This was the first attempt to regulate the functioning of the City in a planned manner. The notorious plague of 1896 led to a quarter of the population deserting Mumbai; as the city faced commercial extinction in order to improve hygienic conditions BMC was compelled to provide proper drainage, clean water and planned reclamation (Chandrasekhar 2005). Towards this Mumbai City Improvement Trust was established in 1898. This was the first attempt to deal with the evils of unplanned development of the City. From the beginning of the 20<sup>th</sup> Century, the City has been a destination of migration and coped with development pressures.

### ***2.4 Early attempts of Planning in Mumbai***

The Bombay Town Planning Act was enacted in 1915. Under the obligatory provisions of this Act, various Town Planning schemes were framed by the BMC in the suburbs. In particular, the Bombay Development Department (BDD), established in 1920, undertook massive housing schemes in the City, now known as BDD Chawls, and also undertook Backbay reclamation (Chandrasekhar 2005). After independence, there was heavy influx to the city but the infrastructural facilities of the past considerably helped the growth of industries, business and trade. The first major effort of urban planning was the Modak Meyor Master Plan of 1948, which laid down overall growth of Mumbai as the overall objective. As the city became too congested, the limits of the city were first extended in 1950 to cover the area of near suburbs. Later on in 1957 it was extended to farther suburbs to the north. The Mumbai Town Planning Act of 1954 replaced the earlier Act of 1915. The New Act made it obligatory for local authorities to prepare the Development Plans for the areas administered by them within the stipulated period in addition to the preparation of the Town Planning Schemes. This act was later replaced by a modified Act named Maharashtra Regional & Town Planning Act, 1966, which covered the enactment's keeping in view the regional aspects of its development and growth. This paved way to the First Development Plan of 1964.

Its very interesting to note that the history of Mumbai city is replete with early colonial plans that were able to address the growth needs of the city very well, except during the time period of plague epidemic, but at the same time they were primarily catering to the needs of trade and commerce and economic growth of colonial super power. It will be interesting to note, later, that in the post-independence era the development planning of Mumbai – both policy and practice – focused much on regulation and the quality of life for improving the welfare of existing population without much attention to the economic changes, population growth and inevitable immigration. The lack of concern for these basic issues and the failure on implementation are the major shortcomings of the development planning in the post-independence era, which we will discuss later.

## **3. Master Planning in India and Its Experience**

Master planning aims at improving the urban environment as the efficiency of urban settlements largely depends upon how well they are planned, how economically they are

developed and how efficiently they are managed. Planning inputs largely govern the efficiency level of human settlements. In one sense, master planning is basically an exercise of resource planning, generation, development and management (Tiwari 2002). The master plan, which was perceived to be a process rather than a conclusive statement, provides guidelines for the physical development of the city and guides people in locating their investments in the city. In short, Master Plan is a design for the physical, social, and economic development of the city, and also to improve the quality of life as well. The functions of the Master Plan / Development plan are as follows (Tiwari 2002):

- To guide development of a city in an orderly manner so as to improve the quality of life of the people
- Organize and coordinate the complex relationships between urban land uses
- Chart a course for growth and change, be responsive to change and maintain its validity over time and space, and be subject to continual review
- Direct the physical development of the city in relation to its social and economic characteristics based on comprehensive surveys and studies on the present status and the future growth prospects; and
- Provide a resource mobilization plan for the proposed development works.

The concepts and methods of the traditional Master Planning in India owe their origin to the British town planning laws. The Master Plans have primarily confined to the aspects of land use and development control. Yet, there is a widely held view that the Master planning methods adopted over the last few decades in India have not produced a satisfactory physical environment (Tiwari 2002) and have not been effective in the outputs as well as outcomes (Meshram 2006). The planning process in the past has been unduly long and largely confined to the detailing of land use aspects. Functionally, master plans paid inadequate attention to the provision of trunk infrastructure, environmental conservation and financing issues, the last one rendering them to be unrealistic proposals without budgets (Meshram 2006). Moreover, master planning approach lacked a holistic view of urban development and did not deal with interconnecting issues. For example, in most cities, master plans have not been translated into socio-economic development plans and investment programmes and, often, the physical planning exercises were restricted to core urban areas without much integration with the peripheral areas and rural hinterlands (Tiwari 2002). Attempts to adopt an integrated development plan approach, based on national, state and regional strategies and recognition of the spatial and functional linkages between settlements of different orders have not been made much (Meshram 2006). Also, planning and plan implementation processes have not paid adequate attention to the integration of land use and transport planning. The fact that transport is a key determinant of land use and “leads” development is sometimes ignored (Meshram 2006). Therefore, it appears that the shortcomings of Master Plan approach are in design, conceptual issues and procedures rather than in applied context as implied in Box 1.

### Box 1: Shortcomings of Master Plan Approach

- \* Large Master Plans are too static in nature and they take very long time to prepare and are too infrequently updated (though frequent case-by-case relaxations in plan with a view to serve vested interests)
- \* Master plans rarely provide guidelines on the plan techniques of implementation
- \* Master plans rarely evaluate the costs of development they propose or the methods of financing them
- \* Master plans are often based on unrealistic appraisal of economic potential of the planning areas and, in some cases, on the needs
- \* Master plans seldom provide a compelling ratio of detailed land use and elaborate land use regulation or control
- \* Community or elected representatives or NGOs are not involved in the planning process meaningfully.

Source: UN-ESCAP (1984)

Besides the above principles on which Master Plans fared poor, the major criticisms of Master Plan approach adopted in the country are summarized as follows (Tiwari 2002):

- ❖ *Plan Preparation Techniques:* The Master plan details out the urbanized and urbanisable areas under its jurisdiction and suggests land use up to the neighborhood level. This minute detailing has resulted in lack of flexibility and has hindered individual self-expression.
- ❖ *Plan perspective:* The plan projects and 'end state' scenario for 20-25 years is not detailed enough for short and medium-terms actions.
- ❖ *Static Plan:* The plan is mostly static and not amendable to quick mid-course corrections.
- ❖ *Delays:* Inordinate delays in Master Plan preparation and approval and, in addition, difficulty in obtaining possession of land sought to be acquired for the purpose is one of the main hindrance to speedy and successful implementation of the Master Plan.
- ❖ *Growth of the City:* The efficacy of the master Plan is adversely affected by the divergence between the precept growth and practical reality.
- ❖ *Ineffective Public Participation:* The mechanism for public participation is ineffective in the process of development planning, in both its preparation and implementation. It is more top-down than a bottom-up approach.
- ❖ *Weak information Base:* Master Plan preparation is undertaken with a very weak information base especially on socio-economic parameters, housing and environment.
- ❖ *Impractical Physical standards:* The plans prescribe impractical densities and layout high standards in an effort to improve the quality of life in a city. These are generally higher than what the city population, particularly the poor, can afford.

- ❖ *Lack of Financing Plan:* Estimates of financial outlay do not match the development works envisaged in the Master Plan. The strategies for raising resources required for plan implementation are never an integral part of the plan.
- ❖ *Spatial Planning vis-à-vis Development Planning:* Urban planning in India has been over-shadowed by its spatial content instead of realization of social and economic objectives. Town planning exercises tended to concentrate on physical order and environmental quality of city, and were isolated from the mainstream development planning, decision-making and implementation strategies.
- ❖ *Land Policy and Management:* The absence of machinery for systematic and continuous collection of data on the movement of land and tenement prices undermines the implementation of the master Plan.
- ❖ *Private Sector Participation:* Through a significant portion of the development is due to the initiative of the private sector, this factor is not recognized in the Plan.
- ❖ *Regulatory mechanism:* The regulatory mechanisms in the Master Plan are to enable better management of the city. But, too restrictive controls are costly enough to provide incentives for breach rather than compliance.
- ❖ *Plan Implementation:* The root-cause of the urban maladies has been the divorcing of the plan preparation from plan implementation.
- ❖ *Ineffective plan Monitoring:* An institutional and information system does not, generally, exist for plan monitoring. Since the budgetary system does not explicitly take into account the requirement of plan implementation, problem of resources are not periodically highlighted.

Besides these common shortcomings cited, some specific shortcomings have also been cited by the critiques in the context of the India cities e.g., Ravindra (1997) in the case of Bangalore, Meshram (2006) in the case of Delhi and Mumbai. Yet, from time to time, especially at the time of disasters, accusations are made that the comprehensive master plan has not been prepared for the city e.g., Dossall (2005).

#### **4. Review of Mumbai's Planning Experience and the need for Vision Plan**

Mumbai's historical past and its planning system evolution until the independence has provided us an overview of how it developed from a cluster of marshy islands to the *urbs prima* of India in the 19<sup>th</sup> century. The physical development blue prints laid down by colonial traders supported the city growth well in the coming years. The post-independence era of planning in Mumbai is a stark contrast with the growth reinforcing planning approach of colonial planning approach<sup>2</sup>.

##### ***4.1 First development plan of Mumbai***

The first development plan of Mumbai was initially planned for the period of 1964 to 1977 but extended to the period of 1964-1981. It primarily concentrated on (i) providing various amenities in line with a land use plan, (ii) shifting the development to the near suburbs; (iii) restricting the operations of industries, trade and population concentration

---

<sup>2</sup> The discussion foregoing is based on the reference to the material on MCGM website

on the island city. This plan met with some inevitable failures – failure to comply with time lines, failure to expand/ improve the existing infrastructure, failure to develop amenities proposed in the plan. These are attributed to the slow pace of planning without a realistic assessment of ground situation and there was no budget or strategy to acquire land for the development of amenities. The plan made no attempts to foster industrial or economic growth but aimed to ‘decongest’ the city in all respects – population density, trade and commerce activity, industrialization and housing. The wholesale markets, port activity, manufacturing industries and bulk material handling were shifted to suburbs. Yet, the city continued to grow – both in terms of economic activity and population – as industries, particularly textiles, were increasingly becoming concentrated and reaping agglomeration benefits. During this period, the proposal for building a satellite city for Mumbai – New Mumbai on the mainland – took shape and it was ultimately realized after almost a decade long city building and has been well described by Shaw (2004). The process of this itself is complex and did not yield success until the land value has risen more than a decade later in the early 1990s.

#### ***4.2 Second development plan of Mumbai***

The Second development plan was a revised development plan prepared for the period of 1981-2001 initially and it was sanctioned in parts between 1991 and 1993, the last being in 1993. But it is reported to have been extended to the period of 1991 - 2013 now, once again exposing the inordinate delays in the making of plan proposals and getting the approvals. The plan proposals appear to be far realistic when compared to ground situation.

*First*, the plan made provisions for residential land use and housing for a population of 9.87 million by 2001, whereas the population level in 1991 itself was 9.9 million in 1991 and it reached 11.9 million by 2001, leaving a backlog population of 2 million to be accommodated. Even with this low level of growth (1.85 per cent per annum), the population by the end of plan period (2013) can be expected to be around 14 million and the backlog will rise to 4 million.

*Second*, the plan continued to place emphasis on ‘decongestion’ policy and proposed to develop industrial and office hubs in the suburbs, wherein the infrastructure is woefully inadequate as enough provisions were not made for laying down infrastructure for future growth in the earlier plan. However, it came out with some innovative methods of dealing with the land acquisition and amenity development faced in the previous plan. The use of ‘Accommodation Reservations’ and ‘Transfer of Development Rights’ have been effectively deployed to ensure a quick release of land and amenity development. Yet, the plan has not been able to achieve the targets of amenities provision even by these methods (Nallathiga, forthcoming).

*Third*, the plan came out with much restrictive development control regulations than those in the past that placed uniformly low development densities across the city. The costs of such regulation came to the fore in the form of very high property prices reducing the housing options for the middle class even, leaving aside poor and low income sections (Phatak 2003, Nallathiga 2003) and even led to the structural and behavioural changes (Nallathiga 2004). This led to a deep conflict between economic interests and planning interests as witnessed in the episode of textile mill land redevelopment / sale recently.

### ***4.3 Planning in a new economic era***

The Master plans or development plans of Mumbai serve as good examples of the shortcomings the planning can have in spite of the innovative approaches like TDR and accommodation reservations. In the post-liberalised era after the 1990s, the economic forces began to grippen the Indian cities together with the population pressures (due to changing demographic pattern) and many of them have not been able to cope-up with these pressures to provide the basic services for living, working and organizing business. The resulting effect is on the economic growth prospects of the city *per se* and the marginalization of work force (Sivaramakrishnan 2002). There appears some perceptible threat to the ‘sustenance’ of the economy growth and the quality of life of citizens, if no corrective measures were taken on account of either general neglect of these issues or the lack of will for concerted action on part of all stakeholders. In a globalised world, the competitiveness of a city in attracting the investments is critically dependent upon the factors relating to the growth prospects, access to capital and knowledge, and availability of good infrastructure facilities (Rondinelli *et al* 1998). Whereas the first factor is more related to the city’s capacity to adapt to the changing economic structure and the second factor has more links with its institutional base, the third factor is a critical element that is highly dependent upon the creation of good infrastructure through deployment of public resources, planning and management. As economic growth and competitiveness of a city assumed importance in the post-liberalised India, urban planning has to take different course and alternative approaches that complement and reform the traditional methods need to find place after economic liberalization. A city which fares poor in terms of both the provision of essential services and a good quality of life will certainly not be in a position to attract investments and businesses will not favour locating in such cities.

It becomes imperative, therefore, for the cities to perform well on both the above parameters in order to remain competitive in attracting investments (Harris 2002). This is more so in the era of globalization wherein domestic economies thrive by producing and selling goods and services in a competitive global market. What this means is that the cities not only have to compete with national peers but also with international peers in the regional blocks as well as the globe in the production of goods and services for which all factors need to contribute in an efficient manner (Scott 2001). It is in this context that the city development vision and a strategy for implementing it become important, as emphasized in this paper. The importance of having such development vision and strategy in making the city competitive and liveable has also been demonstrated by the undertaking of such plans by several cities. Johannesburg, for example, has prepared a development vision plan ‘iGoli’ to transform the city in terms of service delivery and economic growth through a city development strategy identifying various initiatives in the short, medium and long run (Joburg 2002). Vision planning has become a practice among several UK cities. The Salford city also prepared a vision plan to kick-start regeneration of the city through a variety of interventions (Salford City Council 2006).

## **5. Mumbai’s Vision Plan**

### ***5.1 Mumbai’s Development Vision***

Mumbai's historical past when it was the *urbs prima* soon disappeared when the manufacturing industry, particularly textile mills, began to move away for various reasons. With a declining manufacturing and yet emerging service sector, the hitherto position of the economic hub of the country itself came under clouds of low economic growth and declining quality of life – costly housing, poor amenities, long commute etc. At the same time in an era of globalization, it needs to compete with other cities in attracting investments from across the globe on one hand and service the global markets with competitive products of its firms. Therefore, the city needed interventions that would improve its position not only within the country but also across the world, and to steer into this direction a vision plan was prepared with the aim of transforming the city into a world class city offering globally competitive environment conducive for investment inflow from across the globe. The interventions would not only cater to the businesses but improve the quality of living of all citizens across the board. This was initiated by Bombay First, the city policy research and advocacy non-profit organization, and executed by the McKinsey, the globally renowned consulting firm. The vision statement of the plan reads as in Box 1.

#### **Box 1 Mumbai's Vision Statement for 2013**

*Mumbai's aspiration is to become a world-class city in the next 10-15 years. In order to achieve this, it needs to be distinctive on the dimension of economic growth and above average on quality of life. It will therefore need to step up economic growth to 8-10 per cent by becoming one Asia's leading service hubs, with a fast-growing manufacturing base in the hinterland. On the quality of life dimension, it needs to move from average to above average on mass transport, from poor to above average on private transport, housing, safety & environment, financing and governance. It also needs to improve to above average in water/sanitation and education to world class in health care.*

#### **5.2 Vision Setting Methodology**

The vision plan for the development of Mumbai was not done on an *ad hoc* method, but it followed a methodology that combined using the analytical, consultative and deliberative processes in setting the vision and the underlying aspirations so that they can be targeted to be achieved over a ten-year time horizon. The methodology therefore followed an analysis through benchmarking studies of the peer cities (or, emulate-worthy cities) and the learning from successful city transformations for laying down the aspirations of city development. A consensus on these aspirations was achieved through wider consultations with major stakeholders – key government institutions and agencies, business groups/chambers of commerce, and non-profit/non-government organizations.

For the purpose of benchmarking, about ten cities were considered, of which three were Indian cities, and the parameters of benchmarking included:

- Mass transport
- Private transport
- Housing
- Environment and Safety
- Water and sanitation
- Healthcare
- Education

Enable • Dramatically increase housing availability and affordability  
 Resource-generation  
 Governance

Improve and expand mass and private transport infrastructure

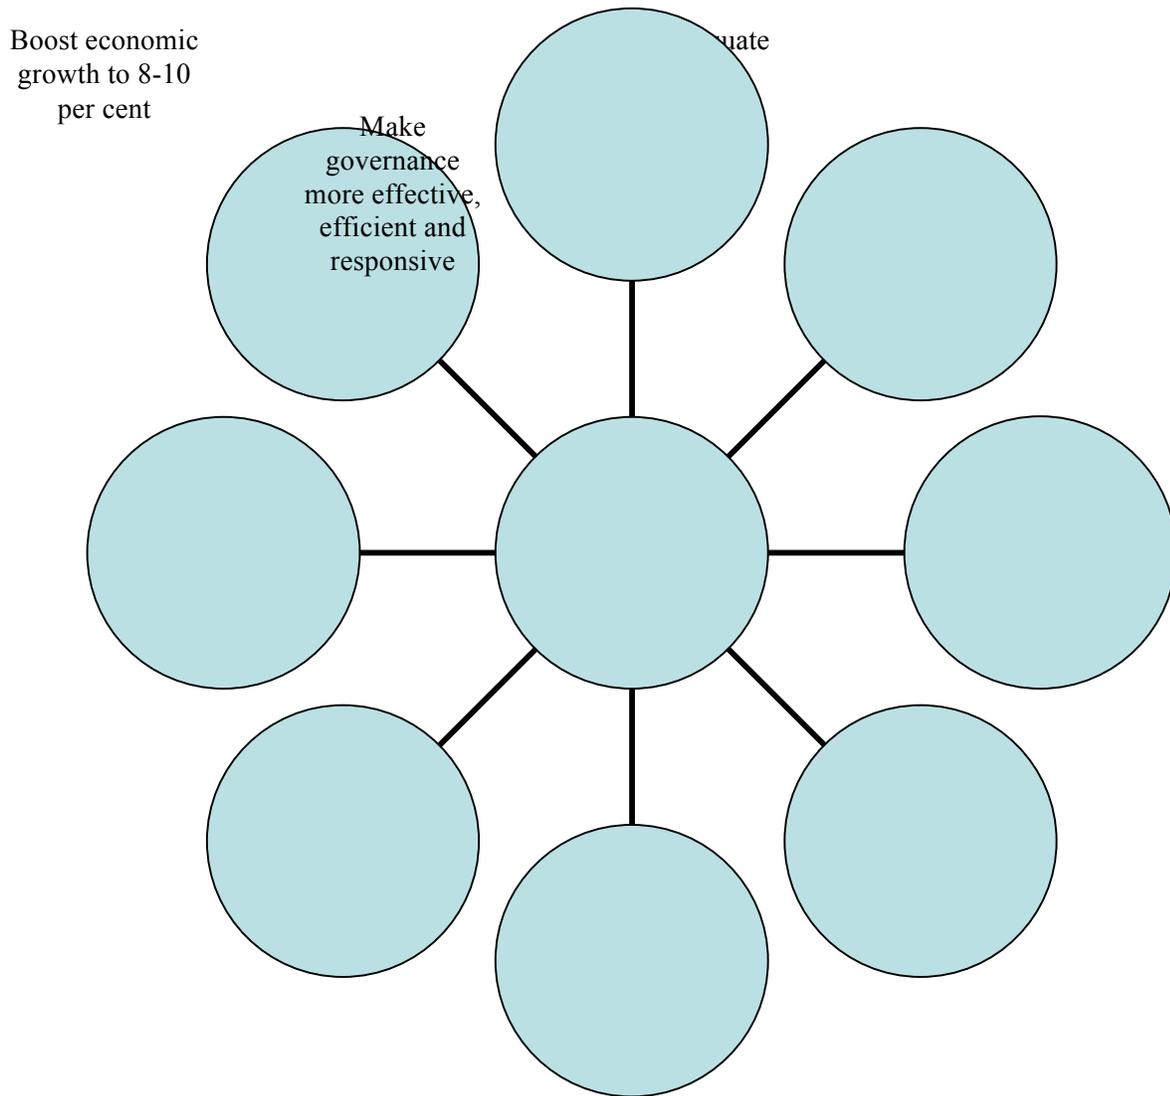

For ensuring that the aspirations based on the benchmarks would lead to right kind of transformation, it was felt that case analyses of few such successful transformations was required, for which two international cases i.e., Cleveland and Shanghai, and two Indian cases i.e., Hyderabad and Bangalore, and three recent examples – Surat, Nagpur and Thane were chosen. The learning from these cases has helped in building consensus on city development strategy in the consultative workshops with the stakeholders. The city development vision was therefore structured through combining city development needs with the aspirations laid down through bench mark studies.

Upgrade other physical infrastructure

Generate momentum through quick wins

**5.3 Structure of the Vision Plan**

The vision statement above summarized the intents and aspiration of the city’s development in the future. The broad structure of the vision plan is shown in figure 1, which features the strategic actions needed for achieving the vision goals.

The above strategic actions lay down directions for city development to primarily deal with economic development, physical infrastructure, social infrastructure, development financing, governance improvement, quick wins or immediate interventions and implementation mechanism. The strategies actions and specific initiatives for achieving the vision are outlined in table 3. Besides this structure, a blueprint outlining the interventions, institutions, financing and implementation structure for achieving Mumbai development vision has also been prepared which can be found in Bombay First-McKinsey (2003) and it is also described in Nallathiga (2006).

**Table 3: Structure of Vision Plan**

<i>Strategic Direction</i>	<i>Key initiatives</i>
<i>Boost economic growth to 8-10 per cent</i>	<ul style="list-style-type: none"> <li>• Target four high end services – financial services, healthcare, IT/ITES and entertainment &amp; media</li> <li>• Create jobs in three low end sectors – construction, hotels/tourism/recreation and modern retail</li> <li>• Convert hinterland into a manufacturing and logistics hub</li> <li>• Lower tax rates to make Mumbai a consumption centre</li> </ul>
<i>Improve and expand mass and private transport infrastructure</i>	<ul style="list-style-type: none"> <li>• Inner ring rail network for the city</li> <li>• Inner ring free-way for the city</li> <li>• Mumbai Trans Harbour Rail and Road Link</li> <li>• Tactical initiatives to optimize the current rail and road network</li> </ul>
<i>Dramatically increase housing availability and affordability</i>	<ul style="list-style-type: none"> <li>• Increase land availability by 50-70 percent</li> <li>• Create 800,000 low income houses to rehabilitate existing slum dwellers by redesigning the Slum Rehabilitation Authority</li> <li>• Build 300,000 additional low-income housing units by creating ‘Special Housing Zones’ through targeted incentives</li> <li>• Create islands of excellence through integrated development</li> <li>• Redevelop the city block-by-block</li> </ul>
<i>Upgrade other infrastructure</i>	<ul style="list-style-type: none"> <li>• Create a safer law and order environment</li> <li>• Reduce air pollution</li> <li>• Increase availability and reduce contamination of water</li> <li>• Create more viable options for the disposal of solid waste</li> <li>• Upgrade access to and quality of education</li> </ul>

	<ul style="list-style-type: none"> <li>• Improve healthcare services</li> </ul>
<i>Raise adequate financing</i>	<ul style="list-style-type: none"> <li>• Increase in user charges and collection efficiency</li> <li>• Improvement in the MCGM's own efficiency</li> <li>• Better utilization of Government land assets in and around Mumbai</li> </ul>
<i>Make governance more effective, efficient and responsive</i>	<ul style="list-style-type: none"> <li>• Create the right structure</li> <li>• Make the concerned agencies accountable by instituting target setting, MoUs and monitoring processes</li> <li>• Streamlining the key processes such as building approvals and using IT all levels of government interaction</li> </ul>
<i>Generate momentum through quick wins</i>	<ul style="list-style-type: none"> <li>• Beautify and decongest five north-south and five east-west corridors</li> <li>• Institute a report card system for all wards in MCGM</li> <li>• Improve airport ambience and emigration/immigration clearance</li> <li>• Build an additional 300 public toilets through public-private partnerships</li> <li>• Promote NGO and corporate sponsorship to restore and maintain the 325 public open/green spaces</li> <li>• Levy property tax on market value alongwith a self-assessment option</li> </ul>
<i>Enable implementation through committed public-private resources led by the Chief Minister</i>	<ul style="list-style-type: none"> <li>• Create a single coordination body</li> <li>• Make key agencies accountable for results</li> <li>• Encourage active corporate and NGO participation</li> </ul>

Source: Bombay First – McKinsey (2003)

The vision plan presented a set of actions that need to be undertaken in order to realize the aspirations spelt out in the city development vision. However, inevitably, the implementation of these actions lies in the hands of the state government, local government and other government agencies. The process would not have gone a step further without establishing an appropriate implementation mechanism. Also, legitimacy to the vision plan was possible only through official promulgation. A Task Force was therefore set up to carefully study the recommendations and suggest actions in the broad themes. The Task Force in association with the thematic sub-committees had finalized a vision plan with the suggestions more or less in line with the earlier vision plan. The various constituents of government – state, local and agencies – gave undertakings and their own set of action broadly in line with the vision plan. These deliberations and collaborations were facilitated by a host of non-profit organizations led by the Bombay

First. The final vision plan for Mumbai has been put forth by the Government as GoM (2005) spelling out proposals based on the earlier report and task force findings.

## 6. Summary and Implications

Master plans or Development plans have been the origins of change in the urban environment – both physical and socio-economic – in India for the past several decades. They were taken as given from the past colonial system prevalent before the independence without enshrining the good features. The result of this traditional planning approach in the form of master plans is turning out to be frustrating because of the unrealistic plans, long time taken for their preparation and approval, ill adequately or inadequately thought or planned proposals etc. These features of plans and plan making together with implementation hurdles are forcing the exploration of alternative methods. Moreover, urban planning in the past was primarily influenced by central planning principles of the post-independence era and assumed the characteristics of monopolist. In the liberalized era and globalised world, the planning processes have to serve the economic and social objectives of the society through creation of a growth enabling physical environment. This changing context itself calls for identifying alternative approaches and strengthening existing planning mechanisms and institutions. The latter has been discussed to some extent in the decentralization of development planning to local level under the constitutional (74th Amendment) Act, together with the responsibility of resource and financial management, but the former requires new approaches that complement the traditional planning, one of them is the vision planning or perspective development planning, which is discussed in the paper. Mumbai is one of the vibrant and historical city in India with the past glory of *urbs prima* of India. However, as development planning did not pay much attention to growth supporting environment and the master plans have several shortcomings as found in other Indian cities it began to lose on providing better environment – physical and socio-economic. The vision plan is an attempt to provide a development perspective by identifying the strategic interventions and the benchmarks so that it can move on to the growth path and provide a better economic and physical environment. It serves as an example worth emulation to other Indian cities that are aiming to improve their urban environment. Mumbai's experiment is considered as bold and highly ambitious (Cities Alliance 2006), but it is a model that is worth looking at while other cities can evolve different models to provide a perspective of the city's development in the next ten year time horizon.

## **The globalisation of the Baltimore model of waterfront development: A case study of developer as agent of transnational diffusion**

Stephen V. Ward, Department of Planning, Oxford Brookes University,  
Oxford OX3 0BP, UK [svward@brookes.ac.uk](mailto:svward@brookes.ac.uk)

In 2004 Baltimore recorded, at 41.8 homicides per 100,000 inhabitants, the worst murder rate of any American city<sup>1</sup>. Moreover, this was merely the most shocking headline from the Maryland city's unenviable portfolio of indicators of economic distress, social deprivation and community breakdown<sup>2</sup>. Between the censuses of 1950 and 2000 the city's population fell from just under 950,000 to just over 650,000. More to the point, and unlike many other American cities, this trend of decline has actually accelerated in recent years. Thus the city recorded an 11.5 per cent loss in the 1990s, the worst rate amongst the largest American cities, and not far short of twice its own rate of decline in the previous decade. These same trends were reproduced in other characteristics – low educational attainment, family breakdown, housing abandonment, drug abuse and much else. In 1999, nearly a quarter of its population (22.9 per cent) fell below the poverty line. Behind all this (though certainly not the sole causal factor) lay a huge and continuing loss of jobs. This was overwhelmingly from the manufacturing and related industrial sectors which recorded a decline of 41.7 per cent between 1990 and 2002<sup>3</sup>. The performances of many types of services were similar with finance recording a 36.3 per cent job decline and retailing a fall of 47.3 per cent over the same period. There has been only very modest employment growth in other services to offset this grim picture.

At this point the reader may quite reasonably wonder how Baltimore could ever possibly have been considered a 'model' that other cities might have wished to emulate. The answer lies in that part of the city that visitors, who still come in their millions, tend to see, namely the Inner Harbor and adjoining blocks. A quarter of a century ago, the extraordinary transformation that was then underway in this area seemed to offer a panacea for the problems of all declining industrial, especially port, cities. It seemed also to offer a vision of an urban economy that could replace the old jobs with a service economy that was based increasingly on leisure and tourism. Manufacturing production and ancillary services were to be replaced by cultural consumption. The grimy workaday cities of the industrial era would be replaced by cities that could be, in the words of Baltimore's greatest promoter, the developer James Rouse, 'fun'. Moreover it seemed to be a way of harnessing private capital to public policy, so that the model could be realised without excessive reliance on public spending. It therefore represented an urban expression of a major theme of global political economy during the last decades of the twentieth century.

For a time, at least, the Baltimore model proved very compelling and was widely received in a very uncritical manner. First other American cities and then many in other countries sought to copy or at least capture

something of what their leaders thought they saw in the Maryland city. They were aided by the active promotional efforts of those who were central to the Baltimore experience. This paper documents the formation of the model and examines its nature. It also sketches its impact on thinking about the transformation of the redundant physical and economic spaces of port and industrial cities throughout the world. In a more specific sense, it also shows how those associated with the invention of the model played a direct role in spreading this model. We also note how far the Baltimore model has become synthesised into the reservoir of global planning ideas and practice. Finally we return to the issues with which the paper began, considering the extent to which the model was disconnected from the real city whose name it took.

### **How did the Baltimore model appear?**

The story of Baltimore's impact on international thinking about the future city began as early as 1954. At that time there was growing concern within the city's business community about the decline in its property tax base as middle income population and the downtown retail activities their spending underpinned began to leave for the suburbs<sup>4</sup>. The following year this concern led to the formation of a key body for mobilising opinion, the Greater Baltimore Committee (GBC). One of the GBC's most urgent concerns was to renew the downtown area to reflect the changing realities of the wider region. In 1958 it produced its own largely private-financed plan to renew a section of downtown. The result was the Charles Center, an acclaimed mixed-use development. By 1964, the GBC was sufficiently emboldened to launch another plan to renew the moribund Inner Harbor which lay nearby. A partial clean up of the deteriorated piers and sheds had begun in 1950, followed by some landfill and road provision, but the long term use remained undetermined. Again produced by the Wallace company, the 1964 plan extended the Charles Center, also proposing new public administration buildings, educational and cultural facilities and housing, together with several visitor attractions.

Compared to the Charles Center, the Inner Harbor plan required much more public investment, especially from federal but also from city sources<sup>5</sup>. Yet the urban political regime within which this public spending occurred continued to be based on public-private partnership. This was enshrined in 1965 when the management of the transformation of the Inner Harbor's transformation was assigned to the same private non-profit corporation that had overseen the Charles Center project whose remit was now extended<sup>6</sup>. The Charles Center-Inner Harbor Management Inc brought together city government, Baltimore's business leadership and the developers of the individual projects. It thus harnessed private expertise and networks even though the developers were in many cases the city or other public agencies.

But this is to anticipate later events. The original 1964 plan did not meet with the widespread approval that had greeted the earlier effort for the Charles Center<sup>7</sup>. The greater call on public funds cast it into the very

centre of political debate at a time of growing tension in the city culminating in the race riots of 1968. There was also greater than anticipated resistance to the relocation of public administration offices. Problems were experienced securing federal funding for the middle income housing that was intended to combat the flight to the suburbs. The outcome was that much greater emphasis than originally planned was placed on visitor attractions. This pragmatic and, at times, somewhat contested shift towards a more (but not totally) touristic and cultural form of urbanism was to be crucial in establishing Baltimore's reputation.

Little happened until the election of Mayor Donald Schaefer in 1971. The first tangible sign of the Inner Harbor's changing character was the appearance the following year of the historic warship *USS Constellation* as an attraction. Public access to the waterfront was also created and the city began aggressively promoting an active programme of largely free entertainment. This generation of activity paid dividends by encouraging funders that investments to tap this potential leisure market would be worthwhile. From the mid-1970s, major developments began to appear in quick succession<sup>8</sup>. The Maryland Science Center opened in 1976, the World Trade Center office tower in the following year and the Marina in 1978, all broadly as envisaged in the 1964 plan. Then followed a series of developments which had not been in the plan – the Convention Center in 1979, the Harborplace festival marketplace in 1980 and a new Hyatt hotel and the National Aquarium in 1981. Further development continued in the eastern part of the Inner Harbor from the mid-1980s with a concert hall, museums and other cultural facilities. But by then Baltimore Inner Harbor's reputation as an national and international model of urban regeneration was already established. In 1983 alone the city was visited by an estimated 4,000 representatives from 87 cities around the world, eager to learn how its apparent renaissance had occurred<sup>9</sup>

### **The appeal of the Baltimore model**

What was it then which drew these official visitors? In some respects, and in common with all urban models, Baltimore's appeal rested in part on a series of illusions. Thus several of its admired features were, variously, not new, not particularly unique to Baltimore or not even what they appeared to be. In public-private partnership, for example, Baltimore was merely following the lead given by Pittsburgh's business and civic leaders in 1943<sup>10</sup>. Even more paradoxically, these aspects had actually been greatly modified by the time Baltimore became an object of international admiration. In 1979 the GBC's capacity for decisive action was weakened when its membership was widened to all business interests<sup>11</sup>.

Even before this time, the financial nature of the partnership was not what it seemed. The harnessing of private expertise, information networks and good will was real enough. But the amount of private *capital* that was actually being risked in the developments was less than appeared (another feature that was not peculiar to Baltimore)<sup>12</sup>. In part, this tendency to underplay the public sector role was because of the

obscure nature of many public subsidies and tax breaks. It was compounded by the huge attention which settled on a few very high profile private developments that were to play a key part in defining the Baltimore model. These features helped to foster some dangerous illusions for the leaders of many other American cities as public funds were curtailed in the 1980s.

The most significant private development in Baltimore was the Inner Harbor's major single draw, the Harborplace festival marketplace. It was developed by the well known and widely respected Baltimore developer, James Rouse. Paradoxically, most of his activities as a developer were devoted to promoting the movement of people and retailing from cities to air-conditioned suburban shopping malls (of which he was a pioneer) and to suburban residential communities, especially his celebrated private new town of Columbia, Maryland<sup>13</sup>. Towards the end of his main working life, however, he became interested in downtown revitalisation. He was to be central to the creation of the Baltimore model

In 1972, Rouse teamed up with a Boston architect, Ben Thompson, over the latter's plans to revive the historic but derelict Faneuil Hall-Quincy Market area of Boston. The area lay between the downtown offices and a waterfront that was itself being revived (with a newly opened Aquarium that was itself to be the model for Baltimore's). Thompson's plan involved maintaining the historic fabric and returning it to something closer to the idea of a market rather than following the usual shopping mall template. Shops and market stalls were to be small, individual and distinctive, with neither department or chain stores. With some difficulty Rouse won the city's approval and with even greater difficulty he secured financial backing. Actually it was not entirely without precedent because San Francisco's Ghirardelli Square which had some similar features had opened in 1964. But this had been in a much less prominent location and, at the time, had attracted little interest. This contrasted with the much-trumpeted opening and rapid success of the first section of the revived Quincy Market in 1976, with phases two and three in successive years. It triggered a huge interest in the concept which Rouse had by then dubbed the festival marketplace.

One of the first cities to take note was Baltimore, yet again borrowing the innovations of other cities<sup>14</sup>. The head of the Charles Center-Inner Harbor Management Inc was an old acquaintance of Rouse, Martin Millspaugh. He invited the developer to consider a similar development there, again reusing an old building. Though Rouse rejected the building, he pursued the idea on a better located site that took over what had been scheduled as a public open space where the Inner Harbor area met downtown. The loss of the open space was very unpopular and it was only after a closely fought city referendum that Rouse was allowed to proceed. In the first full year of operation Harborplace attracted an astonishing 18 million visitors, with sales per square foot many times greater than in suburban malls. It also exceeded even the tremendous success of its slightly older sister in Boston.

More than any other development, it was Harborplace which sealed Baltimore's reputation as a model. Yet the model was always more than Harborplace. It would be more accurate to say that the rapid completion of several key and individually successful visitor attractions in close proximity both to each other, to what was now an attractive waterfront and to downtown was mainly responsible for Baltimore's reputation. And the really astonishing fact was that all this had occurred within such an unpromising city. Boston's historic role in the formation of the United States meant that it was already an established tourist destination. Baltimore had no such prior bridgehead for economic transformation. Scarcely anyone had previously chosen to go there for any but the most utilitarian of reasons. Therefore its sudden emergence as a leisure and tourist destination in the early 1980s seemed to offer a way in which all industrial port cities could negotiate their way from the grim realities of dock closures and deindustrialisation to the sunlit uplands of a successful post-industrial future.

Like all models, objective reality was also strengthened by a large dose of conscious promotional effort. Rouse's prominence and gift for promoting his developments focused first the nation's and then the world's attention on Baltimore. Flush with this huge commercial success and popular acclaim, Rouse himself was featured on the cover of the prestigious *Time* magazine in 1981<sup>15</sup>. Above his own image and representations of his latest successes was his own slogan: 'cities are fun!' In immediately accessible language, Rouse had captured the essential feature of what is, more cerebrally, here called cultural urbanism. An increasingly leisured society with more time and wealth at its disposal now expected cities to offer more leisure and cultural diversion. And the consumption that they generated could be captured to create a new economic base for deindustrialising cities. The resultant new attractions also recycled the redundant spaces of the industrial era.

In a broader sense Rouse realised that many Americans yearned for a romanticised notion of a vibrant traditional city. In reality this was a place that had never been, a scene of happy animation where people might safely gather in large numbers. It was a scene untroubled by all the competing and troubling realities of the industrial past or the post-industrial present. Here was a carefully managed enclave from which all the many problems of urban decay, crime, social and racial tension had been banished. Here too was cultural entertainment and sanitised fragments of traditional urbanism – the market hall, the handcrafted products and local traders of cities before large scale capitalism. It was no accident that Rouse was a great admirer of Walt Disney and that the two men shared a similar vision of what an ideal American community should be<sup>16</sup>.

### **The 'Rousification' of the United States<sup>17</sup>**

As Harborplace opened, Rouse, the Baltimore model's greatest promoter, actually retired from the company which bore his name and later severed

all ties. Yet both he and the company continued to be central to efforts to spread the model. Cities wanting to 'do a Baltimore' naturally sought out the Rouse company that claimed such a central role in developing and promoting the concept. The Rouse company was already working on a waterfront development with a festival marketplace at the South Street Seaport in New York<sup>18</sup>. During the early 1980s it took on several other projects, essentially varieties of the festival marketplaces concept, in Miami (Bayside), Atlanta (Underground Atlanta), New Orleans (Riverwalk) and Portland, Oregon (Pioneer Place)<sup>19</sup>. It also undertook a further mixed-use development, albeit of more conventional type, at the Baltimore Inner Harbor.

Rouse himself, meanwhile, pursued philanthropic activity through his new Enterprise Foundation in 1981<sup>20</sup>. To provide an income stream for these this, however, he also established the Enterprise Development Company (EDC) to undertake for profit development activities. Fronting the company alongside Rouse was Martin Millspaugh, along with a few other key figures from Rouse's earlier projects. Millspaugh's presence underlined the EDC's direct association with the Baltimore model in general rather than just Rouse's particular contribution to it. Even so, the reproduction of festival marketplaces formed EDC's major development activity in the early years. However, it also built up a significant business in giving more general advice in broader development aspects of the wider areas in which these marketplaces were set. (It was later renamed Enterprise Real Estate Services.)

There were some initial tensions between the Rouse company and its founder's new creation<sup>21</sup>. Gradually, however, the two worked out a division of labour. In its early years, therefore, the EDC came to concentrate its efforts on creating festival marketplaces in several smaller American cities. The first was Waterside in Norfolk, Virginia, the first phase of which opened in 1983<sup>22</sup>. Others followed in succeeding years at Portside in Toledo, Ohio; 6th Street Marketplace in Richmond, Virginia; Water Street in Flint, Michigan and McCamley Place in Battle Creek, Michigan<sup>23</sup>. To say the least, however, none of these examples repeated the runaway successes of Boston or Baltimore. The Norfolk example managed eventually to achieve some sustained prosperity but the others, after initial interest, proved disastrous and were soon closed.

One of the key reasons was that the cities concerned were simply too small to provide sustained business for these ill-fated developments. This limited the local market, particularly since these cities' economies were also very weak. Flint, for example, had been shattered by closures in the automobile industry and had 24 per cent unemployment at the time Water Street opened. In addition, a major lesson of Baltimore was being ignored because all these places lacked the clustering of potent leisure and cultural attractors that might have drawn visitors from farther afield. Here Baltimore had a major advantage because the development of *its* critical mass of cultural urbanism had occurred during a period when direct federal funding for city or state projects or to underwrite private projects had been relatively easy to obtain. Ronald Reagan's presidency

from 1980 had seen a sharp curtailment of funding from Washington, placing what proved to be an excessive reliance on private funds. Even some of the Rouse Company's ostensibly less risky projects began to experience difficulties, especially as property boom turned to slump in the later 1980s.

### **Globalising the model**

One consequence was to push EDC increasingly to seek opportunities in big cities outside the United States, especially where public funds were still available properly to prime the pump for development. One of the first and closest of these involvements came at the Darling Harbour in Sydney. In 1983 Thomas Hayson, an Australian developer who owned some property in the area, had learnt about Baltimore initially from a newspaper article<sup>24</sup> followed by a visit to the city where he made contact with Millspaugh and Rouse. Hayson was struck by the remarkable similarities between Darling Harbour and Baltimore. At the time the New South Wales government was actively contemplating a major redevelopment of the redundant docks in time to celebrate the bicentennial of European settlement in Australia in 1988. Private developer interest was initially tepid and Hayson found himself virtually alone in making an early commitment to help implement the plans of the new public authority which was created in 1984 to expedite the project<sup>25</sup>. He brought Millspaugh and subsequently Rouse himself to Sydney, retained EDC on a long term basis and introduced them to the major decision makers<sup>26</sup>.

EDC's chief planner, Mort Hoppenfeld, played a key role and was retained for a time by the new Darling Harbour Authority authority to develop the master plan for the new area. This also helped to ensure that the similarity of settings with Baltimore was also reproduced in the provisions of the plan. Other important hands were also involved but this does not alter the fact that Baltimore was, in a very direct sense, the model. The essential elements were indeed very familiar, with a cluster of key attractions: Aquarium, Convention and Exhibition Centre, Maritime Museum, IMAX cinema (added later), attractive public open space and festival marketplace, Harbourside, developed by Hayson with an EDC stake. There were also a few individual touches and the development was executed to a very high standard, not least in the public spaces. Yet Inner Harbor's main creators were purveying a tested formula that could rapidly be applied within the tight deadline of a 1988 opening date. Despite criticisms. They provided a powerful external legitimacy for what was, at the time, a controversial project, though one which has proved a major addition to Sydney's leisure and tourist resources.

EDC was also involved in other projects with Hayson, who actually took a stake in the Rouse offshoot. They collaborated in advising Hayson at Manly Quay, also on Sydney Harbour<sup>27</sup>. EDC also became involved in Merlin, a company which Hayson established with UK investors, and undertook work on projects in three British cities, Birmingham, Glasgow

and Manchester<sup>28</sup>. Only the last of these proposed developments, of the Great Northern Warehouse area, actually proceeded<sup>29</sup>. The others fell victim to the property recession in the 1990s. However the links with Rouse and Baltimore can still be glimpsed in the others, especially so in the canalside development at Brindley Place in Birmingham, even though it was completed by other hands. This is the most completely Baltimore-like clustering of attractions of any British city<sup>30</sup>. Another later, more direct, UK connection was forged in Belfast from 1991 when EDC became part of a consortium for a mixed development with several Baltimore elements on a prominent waterfront site at Lanyon Place.

Though the English-speaking world was the most obvious territory within which Rouse's brand of the Baltimore model could spread, it was certainly not linguistically corralled. Another early and significant international involvement of the EDC was advising on the redevelopment of Port Vell in Barcelona in the mid-1990s<sup>31</sup>. In the mid-1980s, it was retained to prepare a master plan and strategy for this area, involving the creation of a Baltimore-style 'fun city' on the Moll d'Espanya and a Cruise Ship terminal. The development was completed in 1992 by the port authority, with familiar Baltimore elements such as an aquarium, IMAX cinema, maritime museum and festival-style shopping mall with food court and night clubs.

The dynamics of the connections with Baltimore cannot be established as precisely as they can for Sydney. Yet we can note that Barcelona's mayor during this period, Pasqual Maragall, architect of the city's recent rise, was actually in the Maryland city, at the Johns Hopkins University, just when 'Baltimore-mania' was moving to its height in the early 1980s<sup>32</sup>. Indeed, it was actually from there he was called back to his native city to participate in its newly democratized politics. Despite the growing misgivings of his friend at Johns Hopkins, David Harvey, it would be surprising if he had not brought back a sense of what Baltimore and Rouse had to offer<sup>33</sup>.

Another important location on the 'Rouse trail' was Osaka, Japan's second city<sup>34</sup>. In 1988 the city and port authority together formed a development corporation to redevelop the old port. EDC supplied comprehensive development advice and assistance, representing an unprecedented level of co-operation at that time between an American development company and a Japanese public authority. The result was the Tempoan Harbor Village which opened in 1991 offering the familiar mix of Aquarium, IMAX cinema, art museum, festival marketplace and other attractions.

EDC also undertook many other international commissions that showed some degree of continuities with Baltimore. Typically (though not invariably) these were waterfront mixed-use and predominantly leisure/retailing developments, or contained some of these elements. Apart from places already mentioned, the EDC website records its work in Melbourne, Izmir, Cairo, Shanghai, Freeport and Port Columbus (Bahamas), Kobe, Sakai (Japan), Rotterdam, Malaga, Rio de Janeiro, Warsaw, Puerto La Cruz and Porlamar (Venezuela), Zagreb, Kuwait City,

Cancun (Mexico), Guanica (Puerto Rico) and Bridgetown (Barbados). Nor does this list appear to be comprehensive<sup>35</sup>. For example, there is also evidence of other significant involvements, notably in Singapore and Cape Town<sup>36</sup>. There were also many American commissions and in several cases a financial stake in developments. These tend to show showing increasing diversification from the 'pure' Baltimore model. However an unusually late festival marketplace was at Aloha Tower in Honolulu (opened 1994), one of the few American examples to be built after the failures of the late 1980s<sup>37</sup>. It formed part of a much larger mixed-use waterfront development.

Not all of these commissions, especially the international ones, directly resulted in developments. One reason was that EDC was often giving advice about evolving broad development concepts rather than undertaking a detailed design and management exercise. This was the case, for example, for EDC's advice about the Kop van Zuid in Rotterdam. In other cases, developments fell victim to the uncertainties or fluctuations of the property market (such as the proposed Mall of Egypt in Cairo). But the important point is that everywhere EDC was playing an important role in spreading a common discourse about the future of cities. In effect, it was tilting the global planning and development agenda towards the particular brand of post-industrial urbanism that was associated with Baltimore.

### **Other agents of diffusion**

It is important also to stress that the diffusion of the model did not rely entirely on EDC. Some of the professionals who had been associated with Rouse and Millspaugh played an independent part in spreading elements of the model. Thus Benjamin Thompson Associates, architects of Rouse's most successful marketplaces, designed variants of the concept in Guatamala City and Buenos Aires for different clients during the 1990s<sup>38</sup>. They also prepared the master plan for the Custom House Dock in Dublin. There was also a good deal of straightforward borrowing, variously adaptive or uncritical, of ideas from Baltimore by other cities and their planners and developers<sup>39</sup>. Thus knowledge of the city (and also Boston) was particularly influential on activities of many of the British urban development corporations during the 1980s and 1990s. This was particularly so for London, Merseyside, Cardiff and other cities which were undertaking dock regeneration schemes<sup>40</sup>. Collaborative research projects between Universities and other links increased UK awareness of key American developments and helped to reinforce many similarities in urban policy between the two countries during the Reagan-Thatcher era<sup>41</sup>.

In turn cities which had been influenced by Baltimore contributed to spreading the model, or at least their own variants of it, further afield. For example, the city of Barcelona devoted much amount of effort to promoting internationally itself as an urban planning and design model<sup>42</sup>. There was, of course, much in its planning that went beyond Baltimore,

especially the new beach waterfronts created during the 1990s. Yet the most Baltimore-like part of Barcelona, Port Vell, became a partial model for the Puerto Madero in Buenos Aires<sup>43</sup>. Under a formal co-operation agreement between the two cities, architects from the Catalonian capital undertook much of the early planning of this area during the late 1980s. Another example of this tendency has been the international consultancy activities of the eponymous development company for the Victoria and Alfred Waterfront in Cape Town<sup>44</sup>. Set up in 1988, its own planning and development was much influenced by the Baltimore experience. During the 1990s it began to undertake commissions in a variety of places including Libreville (Gabon), St Louis (Mauritius); Lagos, the Black Sea reort of Gelendzhik, (Russia) as well as Portsmouth (UK) and, coincidentally, about aspects of the development of Port Vell in Barcelona.

### **Reflections on the Baltimore model**

This last example shows how increasingly interwoven the various strands of influence that originate in Baltimore have now become. The model, in other words has become increasingly globalised, spread by many hands to all parts of the world. Though such places are located within specific places with a distinctiveness that comes from their physical setting and the character of their buildings (especially so if they predate the renewal process), their essential character has become less and less local<sup>45</sup>. Their success tends to depend more on tourists than on local populations. The outlets the festival marketplaces once provided for local traders have often now become more standardised and predictable (though this depends on rental levels and management policies). And the wider economic impacts of the 'cities are fun' model have been disappointing.

No city exemplifies this more than Baltimore itself, where the workforce of the Inner Harbor and Charles Center is a microcosm of the dual labour market of the wider metropolitan area. On the one hand it provides high paid employment for a largely suburban-dwelling middle class population. On the other the much lower paid jobs of cleaning, security and retailing tend to be taken more by city dwellers. And, as we have seen, a wide section of Baltimore's population is unable to take even these. The acuteness of the city's current problems, in many respects the worst of any American city, raises the questions as to whether the Baltimore model may even have been a contributory element. There are certainly other powerful factors, notably a fiscal base that is unusually narrow for an American city, exacerbating the effects of city-suburb polarisation<sup>46</sup>. Nor can drug abuse or the particular problems of gun crime, especially amongst young black males, be attributed solely to economic causes. But there is perhaps a sense in which the perceived early successes of the Inner Harbor have allowed wider opinion to see it as a city 'on the mend'.

The wider truth is also that, over two decades on, the model of cultural urbanism and leisure consumption which the Maryland city once represented has moved on, detached from the place itself. Many other

cities, including those discussed in this book, have now mined the seam of urban opportunity that Baltimore discovered almost by accident. Inevitably most of them have tried to improve on the original and have added their own refinements. The newer attractions have become more spectacular than their predecessors with architecture ever more iconic. Inevitably, these newer attempts appear to offer more to would be emulators. And, perhaps more pertinently, many of them have been backed by greater public spending and more helpful metropolitan policies than has benighted Baltimore. Yet the city's long term impact cannot be gainsaid. This, the first realisation of James Rouse's dictum that 'cities are fun' in a troubled city of the industrial era has now become absorbed into the global repertoire of urban policies. But making sure that cities really are fun for all their inhabitants remains a distant goal.

## **1. INTRODUCTION**

### **1.1. Infrastructural Works seen as an opportunity to create “city”**

Infrastructural works in towns and cities provoke radical changes in many areas of a town, areas which don't usually have the chance to enjoy their advantages due to the fact that those structures are designed at a bigger scale. Such a scale is thought for other bigger areas but, more often than it should be desired, the problems they produce remain there for years and years before they are rectified.

The matter in question is to think and also to propose, in a creative way, how to get to produce city -new urban capital- together with the remodelling processes that are associated with the execution of big infrastructures which don't usually have anything to do with the production of specific urban quality.

Infrastructural works in towns should observe five outstanding aspects:

- The production of urban capital, seeing it as the improvement and the increase of the relationships established among social, cultural, economical and environmental capitals.
- The production –or rehabilitation- of a more friendly and more civic town for the citizens who use those public spaces.
- The creation of urban quality in an aesthetic sense.
- The creation of measures that make the urban space more environmentally sustainable.
- Citizens should be transferred the decisions about the urban space they inhabit: City participation for the construction of the community.

### **1.2. A specific case: the construction of an underground line in the former road to Cádiz in the city of Málaga.**

Line 2 of the new Málaga underground system runs along an important and historical road connecting the city centre and the western suburbs called Carretera de Cádiz (the old road to Cádiz). During the last 40 years a population of about 180.000 people (the equivalent to the whole population of the city of Huelva) has crowded round the four-kilometre-long old road to Cádiz.

Due to an obvious lack of ideas or any kind urban planning, due to the speculation, together with the quick spread of buildings, most of the area consists nowadays of a crowded and densely built suburb where the absence of open spaces (the few existing ones are taken by vehicles), and bad urban quality are the most impressive characteristics.

Amazingly, such a terrible density (which is the most serious problem) can also be the best advantage for the area. People here are used to a very crowded environment which could turn out to be an excellent social and urban capital provided we are able to take advantage of the opportunities that future events can offer.

In this sense, a street now used just by city heavy traffic, in a period of two years, can be transformed into an open space for the use of citizens, a space that might solve the lack of places where any kind of event could take place and, at the same time, a space which could solve the absence of urban equipment and, obviously, also solve the capacity to move around, the traffic problems or the number of places to park private cars (one of the most important questions for neighbours for whom this plan was thought) .

While works to build the underground are in process, that is for two years, the whole length of Carretera de Cádiz will be closed to traffic. So, new ways to connect the district and the city centre will have to be created. But once works are over, it won't be necessary to use private cars as they were used before.

An opportunity is given to the urban area of Carretera de Cádiz and it is important to get the most of it.

## **2. OUR PROPOSAL.**

### **2.1. New spaces for the community. Relationships capital for the 21<sup>st</sup> Century.**

Nowadays urban processes are associated to a strong neoliberalism and this fact involves that urban spaces gradually and almost unconsciously become private. This process no longer depends from a political ideology but from purely market-based criteria.

The proposal to reduce or to completely eliminate private transportation along the four-kilometre-long Carretera de Cádiz comes together with a system of new open spaces, a series of different squares, and green areas to make a change in the long straight way with the intention to diversify and include different types of spaces. Everywhere it is possible, these new spaces will bring new identities to the area.

If the use of public transportation is stimulated on the basis of common sense, comfort, and time and money saving, and, if a good extension of public land now used by our private cars (either parked or running) is left free, we will have the chance to plan a new urban and social scenery, which will be very different from the present one.

The fact of being a densely populated part of the town, together with the fact we are going to have new available public land can give us the advantage of offering the community a new open urban space, with a pedagogical value for the citizens, where a remarkable increase of social capital will take place, making easier the movement of ideas (and, why not, also the clash of opinions), the celebration of great numbers all sorts of events (from celebrations to demonstrations) etc. In short, the acquisition of a powerful tool for urban and social construction.

How to use the new spaces could be synthesized in a number of proposals which can be valid for the whole area:

- Bicycle lane to connect the new parks and forests on the outskirts of the town with the city centre. It would be quite easy to build the lanes since there is the space and they would be comfortable to use because the area is quite flat.
- Sports and recreation grounds: basket, table tennis, volleyball, French bowls ...
- Children games, benches, fountains, toilets ...

## **2.2. Reorganizing traffic.**

The new circumstances offered by the underground line makes us to re-plan the role played by private cars. It is not reasonable to think in an area where cars will be used exactly in the same way as they are now. Just the opposite. In a modern Málaga we can only have in mind the priority of a good public transportation system, a quality one, comfortable, flexible and fast.

In those areas where this public system doesn't exist, cars will keep their present leading role.

At the same time, the peculiar characteristics of the construction of the underground line makes us think again about how to move around the whole area without using the most important central street, that's to say, the former road to Cádiz, which will be closed to traffic for a long period of time while works are in process.

Both questions bring us to a future and logical scenery:

If people are going to have two or more new streets which connect the city centre to the western districts (and they are not the present Carretera de Cádiz), in future, once works are over, it won't be reasonable to use this same street exactly as it is used now because it would double the possibilities for private traffic. If we are trying not to encourage private traffic we can make possible for Carretera de Cádiz to become a pedestrian area generating, in this way, new spaces for the community.

Our idea is based on the following: in the former Carretera de Cádiz we would plan a lane for vehicles going to the city centre. This road will reduce gradually its capacity and will disappear completely when it gets to Héroe de Sostoa Street. That is to say: it will start with seven lanes which will be reduced to four in a first section. In a second part, six lanes will become two and, finally, in the last sector, it will start with three lanes which will finally disappear in the city centre.

The alternative roads which are going to connect the western districts to the centre of the town, will solve the traffic problem while works are in process. Once works are over, their capacity would be more than enough for cars in the first section (we must also wear in mind the probable increase of population in the western districts), the situation would remain the same in the second one, although their capacity would be a little less in the last section. This reduction can be solved if we eliminate the parking lane in Ayala Street and use it for traffic.

## **2.3. Car parks.**

The main problem for people living in the western districts of the town is where to park their vehicles. This problem is usually solved using non permitted lots, although everyone turns a blind eye, mainly at night.

Works to build the underground will necessarily mean a reduction in parking spaces, about 1000 of them will be lost.

This problem goes together with another one of no minor importance: a parked car is always occupying free spaces which can be used as public areas for the community

Projects of development works in this area include the building of a number of underground parking lots along the Carretera de Cádiz. The existing spaces, together with those in project, could reach places for up to 4000 cars.

This implies to relieve the lack of parking spaces and a great amount of surface to project new squares, wider pavements, parks and gardens, promenades, sports grounds and games for children.

#### **2.4. A sustainable project.**

Taking cars off a district as big as this one is related to the idea of sustainable development.

Parallel to this idea, the proposals to create new green spaces, new plantations of autochthon trees which could help to better the urban microclimate, will complete our proposal basic idea as a sensitive environmental one.

Even so, in future, the idea is to get a more ambitious project.

Once it is necessary to build a huge “tube” for the underground line, the new drainage systems, together with water piping, electricity and telecommunication wires can be included in this structure built for the underground.

It could also be planned modern systems for rubbish collecting, as well as cisterns for rain water (water which can be recycled in plants located in the industrial states situated at one end of Carretera de Cádiz).

In the same way, and since the underground line runs very deeply, this fact can be taken into account to generate geothermal energy. This is a source of permanent temperature that can be used to air-condition underground stations, underground car parks or even certain places on the surface.

At the same time –and on a tight budget- it would be interesting to build a series of cisterns to receive grey waters along the area we are considering. These cisterns would be connected to buildings and, once water is recycled, it could be used for domestic cleaning (toilets). This represents a considerable saving in the consumption of water.

In the open areas of the newly remodelled Carretera de Cádiz, (the urbanized highway) we can build pergolas of photovoltaic cells which can produce the necessary electricity for the area.

And Málaga relies on this sort of industry with first level technology.

Being this a sustainable project, its social aspect is obviously essential.

Even if the neighbours in these districts we are talking about show an important level of satisfaction, and most of the population is quite young, there are sectors which begin to evidence certain problems that wouldn't be difficult to solve: old and poor quality buildings, social conflicts, immigration, people who were born here now leave to other districts, poor distribution of urban spaces, certain sectors that suffer severe urban degradation, architectural obstacles, lack of connection among the different districts, poor identities ...

The revaluation of a public space must work as an incentive to accelerate the storage of social capitals which link the population to their districts and build a sort of identity on which to remake an identity, sceneries where they can show and share ideas; that is, spaces where they can show their filias and phobias.

Even more: cities which manage to get a solid social infrastructure become a reference point.

### **3. SUMMARY**

The production of the urban capital (understanding it as the improvement and the increase of a series of relationships established among social, cultural, economic and environmental capitals) through infrastructural works can be achieved thanks to the following strategies:

#### **3.1. Production –or rehabilitation- from a functional point of view , of a more friendly and civic town.**

Gradual reduction of traffic lanes from the outskirts to the city centre in different sections: from seven to four lanes in the first part, from six to two in the second one, and from three to none (a pure pedestrian one) in the last sector. The alternatives provided for vehicles during the works make unnecessary for traffic to return to the Carretera de Cádiz. If so, it would double the number of lanes and would lead to a higher demand for private traffic, something which is incompatible with the idea of encouraging public transport. That's why the idea of pedestrianising becomes an opportunity to build new public spaces in a very big district where cars had swallowed every other chance.

The new proposal and the lack of slopes in the western part of the town, makes cycling easier. Bike lanes would be situated in the street with the biggest capacity. It would only be necessary, in every other street, to elaborate projects for re-planning the usage of public spaces which are not well planned now.

Seven hundred parking lots are going to disappear due to the works to build the underground line. The plans to remodel the area don't include these spaces but will offer four thousand new underground lots. At least half this number will be situated next to the underground stations to make easier the access from other farther districts and their use by handicapped persons.

At the end of the underground line, next to the motorway and the beginning of Carretera de Cádiz, where a big parking area is in project, there will also be a halt for city and inter-city buses and trams. The station in the middle of the line will be situated on the point where the most important street crosses it and will also have a halt for trams and city buses.

### **3.2. Creating urban quality.**

Once the new space becomes a pedestrian area along the whole street, it would be a four-kilometre-long system of squares and different sorts of promenades with trees to give the area an environmental, visual and aesthetic richness which doesn't exist now here.

The new pedestrian area can be connected to other already existing spaces or those which are in project. New pedestrian, internal relations to generate a system of green squares along the whole Carretera de Cádiz.

The new Málaga Theatres Promenade projected in the port could be connected to the railway stations and all the new leisure and commercial area around it.

We also propose a series of parks associated to the remodelling and pedestrianization works, that would basically build a park along the Guadalhorce river and would enlarge other existing parks to the north of the town. We would try to connect all the existing green spaces (and those in project) using the old Carretera de Cádiz as an axis, a green axis.

### **3.3. New measures to make our urban space more sustainable from the environmental point of view.**

Works to build the underground is a unique opportunity to develop a series of urban projects, important infrastructures for the future such as:

- collecting rain water and taking it to cisterns in order to use it for watering,
  - photo-voltaic pergolas to generate electricity for lighting,
  - the incorporation to the new structure built for the underground of a general main sewer, as well as water pipes, electricity, telecommunications, or garbage collection etc.
- All companies, both public or private, would use this space, consequently, reparation works on the surface would be avoided in the future.

Parallel and simultaneously, the excavation works could be an opportunity to build a system for the production of geothermal energy and a web of cisterns connected to buildings and housing states for collecting grey waters.

### **3.4. Transferring the citizens decisions about the urban space they live in. Community participation and the construction of a collectivity.**

The general idea would be that public spaces and all the other proposals for remodelling processes on the surface were designed and built according to the neighbours' requires,

trying to develop a project with the citizens active participation, their ideas, proposals and wishes.

The most important point is understanding the whole operation as a addition of several parts and not the other way round. Then, the resulting spaces are the sum of a series of singularities avoiding a global and general imposition where neighbours' opinions are not taken into account. That's to say, authorities must leave public spaces and must facilitate the creation of autonomous identities no so attached to central political interests.

That's why our proposal is a decentralizing idea which allows social contacts in associations and other groups organised in the districts. From here new identities can be reorganised and it can be possible to increase the feeling of being a community which doesn't exist nowadays.

**Abstract:**

Historic sector are ancient buildings or history civilization sites and environment around them, which give rise to great influence to the activity of mankind and full of high historic civilization value and artistic value. The city wall and the moat are companion in Chinese history. The capital and the common cities also have the moat of their own. At present, there are moat systems that still preserved completely in many Chinese cities. However, the periphery environment and inherent function of them have occurred many changes. City moat and the sector around it have become historic sector that passing bears the history civilization, they embody the trace of city history, and they are the source in landscape creation of modern waterfront areas. And, they are important sectors of city images, embodying the city characteristic, transmitting historic information. It is a realistic subject that how to make the relation of city and moat suit the requirement of modern city life. To make the renewal and transformation correctly, we should take the city moat as a superior historic space resource of region.

By analyzing the history and reality of city moat, this thesis expounds the origin and the function development of it. Having research of many examples, this thesis sum up the relation between the city and moat and put forward difficulties that moat faces in nowadays. At last, this article put forward the way and method of renewal and transformation.

**Key words:** city moat historic sector function  
renewal and transformation

## 1 Introduction

In the China history, city appeared accompany with river. People made river by digging earth, meanwhile they constructed city wall by the earth, which made the earthwork balance.

### 1.1 Function of city moat in history

(1) Defense. For example, there're two city moats and city walls (inner and outer) in the old Suzhou City. The firm defense system are formed by them and eight city gate on water. **(Figure 1)**

**Figure 1: Old Suzhou city moat and river**

(2) Providing water for living and producing. City moat connect the river system both inside and outside the city, which make water cycling. Furthermore, it makes planting and breeding possible.

(3) Storing up, draining off water and floodwaters. City moat, together with the existing river system, can control flood effectively.

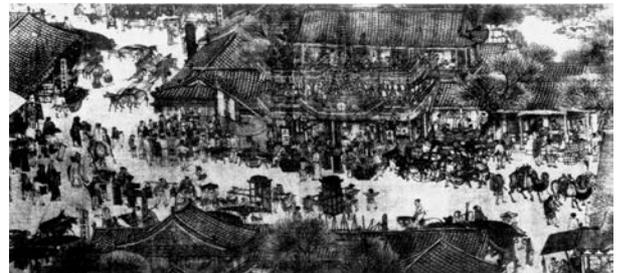

(4) Transportation. Many city moats can have cavitations.

(5) Flourishing industry and commerce. The famous drawing “Qingming waterfront” in Song Dynasty made an impressive description about this. **(Figure 2)**

(6) Eliminating fire disaster. City moat can isolate burning things, and it can also provide enough water to eliminating fire disaster.

(7) Leisure. Since city moat have good environment, people like to have rest by the waterfront.

(8) Maintaining ecological environment. City moat can keep stable of city water system, and it can also improve the quality of city air and make the city micro-weather better.

**Figure2:Qingming waterfront**

### 1.2 Development of function of city moat

The prosperous and declining of city moat have much to do with the development of its function. Since the coming out of hot weapons, the function of defense had declined. However, there're still functions of irrigating, transportation and eliminating fire disaster. In modern times, the city moat has changed from city edge to important history sector inside city. Furthermore,

**Figure 3 Past looks of Shaoxing city moat**

**Figure 4 New looks of Shaoxing city moat<sub>2</sub>**

it provides good place for modern tourism and residence. (Figure 3、 Figure 4)

### 1.3 The problems that city moat face in today

**Figure 5 pollution of Rugao city moat**

(1) Worsen of ecological environment. Since city moat always belong to old down town, there are lots of buildings, factories, store yards and small restaurants. All of these make the water dirty. (Figure 5)

(2) Decline of space. Sometimes city moat become confinement of the city expanding, so in some cities people cover up the river.

**Figure 6 Industry building around city moat**

(3) Destruction of the landscape. Since the decline of shipping, relating facilities such as wharf and storehouse become discarded. The origin graceful scenery is full of shabby buildings. (Figure 6)

(4) Reducing the ability of eliminating disasters. In some cities, the ground level is low. Moreover, pollution aggravate earth silting up on riverbed, which make the riverbed get higher and higher, and water level surface become higher too. It make tough situation in preventing floodwater.

(5) Losing of landscape characteristic. Recently, extensively urban development make city moat waterfront full of lots of high buildings, which make the losing of origin characteristic.

## 2 Explanations and Definition

### 2.1 Definition of city moat historic sector

At first, city moat historic sector means a district around city moat, and it should has relatively complete landscape. Second, city moat historic sector should form the main structure of city space, and it should have some real historic information. It should be composed with material culture and spirit culture. At last, it should have not only the historic information, but also new information about nowadays city development, and it should embody the spirit of the city and humanity value.

### 2.2 Content of renewal and transformation of city moat historic sector

Compared with other historic sector, the most important characteristic of city moat historic sector is the function change of it. The most important function of it in history is defense, but this function totally disappeared now. The problems that city moat facing today are partly came out with the change of function. However, if city moat can adapt to the needs of modern city, the changes of function also give chance to the regeneration of city moat.

There're three principles in renewal and transformation of common historic sector: Firstly, protection of real history legacy; secondly, protection of style and feature in the whole area; thirdly, reuse of the original

functions.

The protection of city moat historic sector also need protection of real history legacy and protection of style and feature in the whole area. However, the function of defense couldn't be reuse, and there's no need to do this. On the contrary, city moat historic sector is always in the downtown, it could be high quality city space with the function of leisure, tourism, commerce and high grade residence. It should be important for the planners of how to use the special value of city moat and how to fit the need of modern city life.

Thus, the content of renewal and transformation of city moat historic sector should be the following: Making good use of good space resources on the base of function regeneration; protecting and collecting the precious historic information by protecting and reconstructing civilian arteries; on the base of constructing good waterfront environment, the municipal government could promote the development of city tourism as well as real estate. By this way, urban planning could arouse the vigor of city economics, it also could promote benign development of city in many aspects.

Renewal and transformation are necessary action with setting steps about transformation of the old part of the city which couldn't adapt the modern city life. The objective of the action is to form modern function of these districts. Renewal and transformation are positive protection to city moat historic sector.

### **3 Planning Methods**

#### **3.1 Optimization of function**

##### **(1) Defining the scope of land-use**

Planners should approximately define the scope of land-use by vision line analysis. This is the first step of investigation and research. Secondly, planners should make conception scheme of the whole area, which can make further step in defining the scope of land-use, and it can also make the plan by stage and the plan by district. At last, planners should define the scope of detail planning in the near future due to economic situation of the city and the possibility of reality. On the base of that, the whole work could be gone through.

##### **(2) Defining the function**

The new function of city moat historic sector should be defined on the base of master planning of the city. The following aspects should be considered conscientiously for the function definition: At first, investigation of natural environment characteristic should be starting point of this step. Secondly, planners should collect and make proper evaluation of humanity environment characteristics which form the historic sector. The humanity environment characteristics should be composed of society, culture, economic and history of the city where the river is. On the base of these, planners should define all kinds of functions and the relationship between those functions. At last, planners should define the relationship between those functions and the whole city functions, and they should put these requirements into the construction and urban planning management.

##### **(3) Adjusting the functions**

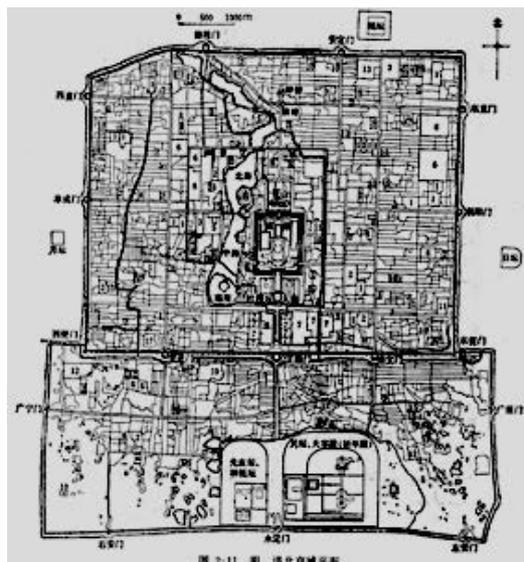

At first, planning should move factories and storehouses which are not fit the image of the defined functions. However, there're some historic buildings and facilities, as well as some functions that still necessary for living. All of these should be strengthened. For example, the functions of residence, preventing floods and maintaining ecological environment. Furthermore, planning could create new functions and landscapes by regeneration of city moat historic sector and flourishing of the district, such as commerce, tourism, culture and service. Strengthen of function of service could satisfy peoples' need of leisure and tourism.

#### **3.2 Space planning**

##### **(1) Protection of the plane form of city moat**

Plane Form of city moat is important for the historic sector, because most Chinese cities are developed from the origin form which is mostly decided by the plane Form of city wall as well as the city moat. For example, in "Beijing Master Planning", it is emphasized that the plane form of old Beijing city should be preserved. Since the city moat in Beijing is the main part of the old Beijing city plane form, it is necessary of

opening the board over the city moat and reforming the landscape of the capital which surrounding with city moat. So the characteristic of plane Form in old Beijing city and the symbol of water culture could be preserved permanently. (Figure 7)

**Figure 7: Plane form of old Beijing city**

### (2) Reconstruction of traditional space node

In city moat historic sector, the public space nodes are always at intersection of matrix formed by roads and river. There're many kinds of these nodes: market, end of a bridge, city wall, teahouse, stage, memorial archway and wharf, etc. Furthermore, the small public space that formed by old wells or old trees are important public space. All of these nodes are traditional symbols of waterfront, and they are strong direction for the special place. Planners should combine the need of modern life to the renewal and transformation, and planners should make reconstruction and restoration of these nodes so as to strengthen the traditional characteristics of waterfront of city moat.

### (3) Organization of landscape alignment

In the action of protection of tradition of city culture and history, as well as the action of preserving the plane form of city, planners should try to form unique environmental landscape and city image which means the "water and city together" on media of open space formed by rivers. The protection of nature landscape and humanity landscape should change from the traditional ways of isolated landscape to the landscape of whole area. When people enjoy the landscape, they are enjoying in alignment of time and space. Landscape alignment is the "time-space alignment" formed by transit route.

## 3.3 Continuation of city culture

### (1) Using of historic symbol

Symbol and metaphor are used in urban design to express the city memory. The historic characteristic could be expressed by historic symbol and language which are behind the image. Planners should understand profoundly the content and modes of city moat. Then they could purify model and symbol from it. Using these symbol and model in urban design could preserve the traditional characteristics of city moat. For example, the urban design in Luxun culture square in Shaoxing city use the symbol of traditional architecture in this city, which come from the origin of bridge, porch, water wharf and old ship. This kind of design is full of traditional culture and spirit of the city. (Figure 8)

**Figure 8: the water wharf of Suzhou city**

(2) Expressing of place spirit

The feeling of place spirit is a complex mentality course, which need space getting culture meaning from social culture, historic incident, human activity and special region conditions. Then the place spirit should be embodied in physical space. Through place spirit, people could find aesthetics, history, city culture, city spirit and ideology. Renewal and transformation should be full of passion, and it should inspire personal emotion and rich association of the tourist. By this way, there are resonance between tourist and landscape, which form the place spirit. For example, Hefei people constructed a park beside Bao River as souvenir for a famous official in history of Hefei. The name of this official is Baozheng, he is an honest and upright official. In this park, there're buildings full of characteristic of Anhui Province traditional architecture.

(3) Organization of society matrix

Society matrix could embody the characteristic of human society action. The objective of preservation of society matrix is to preserve the traditional mode of society association, as well as to supply the association place for residence. In recent years, large amount of deconstruction in city moat historic sector has seriously divided the origin society matrix and organization, which breaking traditional residential culture. Furthermore, new culture and matrix could not be formed in such a short time, which coming out with low mentality and decline of community. In renewal and transformation, planners should pay much attention to the investigation and analysis of the content, form and characteristic of origin area. Urban planning should pay enough respect to these conditions and make it possible to conserve the origin society matrix and residence structure. For example, around Taizhou east city moat, the residential and commercial architecture inherit traditional life style of historic city moat architecture. These are also good for the conservation of traditional space relationship between river and city. **(Figure 9)**

**Figure 9: Residence architecture around Taizhou city moat**

#### 4 Conclusions

Renewal and transformation of city moat historic sector would be a systematic plan, which is different from other waterfront because of its special geographical location and historic context. There're two important aspects in the renewal and transformation: renewal of function and reservation of traditional characteristic. By creating high quality city waterfront environment, renewal and transformation could inspire the development of city and region, and eventually realize the comprehensive objective of society, economic and environment. To realize this objective, the efforts come from official, developer, planner and residence would be necessary.

**KEY WORDS:** Roma – World's fair – Identity – Urban memory – Transfer planning – rationalism

**COMMUNICATION N° 43.**

*E.U. R.<sup>1</sup> Roma 1936 - 2006.*

*The community of memories rediscover?*

*By Patrice Ballester*

*EUR is a very congenial neighbourhood for those whose profession is representing images.*  
Frederico Fellini

*Marvellous and miserable city, you have allowed me to experience that unknown life until I  
discovered what, in everyone, was the world.*  
Pier Paolo Pasolini

*“Rome, the town of Europe which deploys in space an uninterrupted history spread out over more than 2000 years. Rome, the open city of 1945, Rome, the avoided city of harmonious colours and soft lights for the Jubilee and thousand-year-old IIIe. Rome, the standard ideal of the continuous structure and the accumulation of the styles. Here the flonor of space is made flonor of history. He discovers the astonishing mutual tolerance of the styles registered as for always in the stone: each one was born against its predecessors, at the price of destruction almost without trace; and the wear of time blunted the aggressive point and the effect of rupture meant by the arrival of each applicant to the exclusive beauty. It is an alleviated memory which the urban spectacle secret with the spirit of the visitor: the capitol drawn by Michel-Ange is supremely leaned with Tabularium of the former Romans, and the powerful cupola of the Pantheon neighbour with the slim Bell-tower of the church of the Greeks of Rome. Accumulation in space, recapitulation in time. Success when as today the city is returned to its inhabitants, to it’s become again pedestrians the flonors of their own city.”*<sup>2</sup> Such are the remarks of the philosopher Paul Ricoeur concerning the town of Rome, but these remarks can coincide perfectly with the object of our study and the search of identity of a territory which then leads us to reflect on what could represent a district of Rome to the eyes of the world, Europe and Italians but also as a matrix of a painful but salutary rediscovery of an architecture and a precursory urban installation and model with many regards: E42/ EUR.

In 1936, Mussolini decides to build a new great district, a new city - Third Rome - in the south of the eternal capital, Roma, in direction of the Mediterranean Sea. The dictator projects to celebrate the twentieth birthday of *“walk on Rome”* with a named World Fair *“Olympiads of Civilization”*. He asks at the famous architect of the regime Marcello Piacentini to plan/design and to build the new district who takes the name of *“Esposizione Universale di Roma 1942”* so, E.42. The realization of this district is intended to become the heart of a modern-rationalist agglomeration and spearhead of the fascist urban policy. Work starts in 1938 but because of the Second World War, the exhibition did not take place. The new district is equipped by Mussolini with a great administrative and juridical autonomy which it preserved well after 1945. The paradox lies in the fact that it was completed after the war and was arranged/developed on several occasions in 70 years of existence. Currently, it forms a harmony at the same time administrative (great Italian ministries), residential (private housing), cultural (the presence of many museums), commercial (fair of Rome and new centre of Congress for 2007 – registered office of many companies) and sports equipment (sports complex built for the Olympic Games of 1960). The objective of this communication is to answer the following question: (principal question) 70 years after creation and planning by a fascist system of a modern district, how did the community of memories (Romans) find itself within the context of a reinterpretation of the functions of the district through on a long time? How the Italians reconciled themselves with this district, its plan, its architecture and its functions? Which were the stages of this re appropriation of the district by the policies, architects and town planners? We will be based for that on archivistic research in Rome with the headquarter of the E.U.R., a bibliography reasoned and new on the subject, of the questionnaires addressed to the current persons in charge for the district. The cover of the study will be to take into account three dimensions of the preliminary project and to compare the evolution of the actions of the Italian Republic with the heritage of the fascist system. (1) The initial urban network respected? – (2) The functions of the district perennialized? (3) Which types of evolutions concerning the representations of this district? The whole between (a) 1936 - 1954, (b) 1954 - 1960, (c) 1960- 1990, (d) 1990 - 2006. The result of this communication will show that in spite of the bad representation of this district, the Romans took again possession of this new zone, reinterpreted this one and rediscovered the positive aspects of this planning and the architecture. The ephemeral becoming durable and even

interpretable by the new Italian political community, the contemporary economists, architects and town planners. For this seventieth birthday of his creation, one will quote the remarks of Rossana Bossaglia, commissioner of an exhibition rehabilitating the architecture of the E.U.R in 2004. *"Until little, one could not say that fascist architecture was beautiful, under penalty of being shown to find beautiful Fascism as a whole"*. Today, the experts agree to underline the coherent action of a government in this planning action coming to a continuity between ancient Rome and fascist urban sprawling, more an interesting mixture of classicism and rationalist modernity (premise of the International Style) and also to put the question of the continuity of the city's planning in extension of urban network in direction of the sea.

## **1. "EUR Urbanistica", a planning style for heritage?**

### 1.1 The inscription of Euro in the Roman metropolis.

In fact this exhibition is to be integrated in an ambitious plan of urban reform with a metropolitan dimension concerning the town of Rome and its suburbs. From the very start of work, one speaks in the Italian press and the newspapers about architectures specialized, of *"construction of a new district of Rome"* or integration in a *"Urbanistica Piano"*. It is indeed an administrative, sporting and cultural complex thought on this genesis as a structure becoming durable after an ephemeral exhibition. The occasion of an international exhibition is taken and one projects the construction of equipment and buildings permanent in what one will then call *"third Rome"* especially by the members of the regime, the creation ex nihilo of a true city. We should not either forget the symbolic character system and the will by Mussolini to leave a heritage, a trace after the exhibition testifying in time and space to the record of the fascistic capacity through an environment architectural rationalist, organisational, arbitrary and monumental. One of the most important points concerning the realization of this World Fair is that the town planners of the time took note which this event would be for them the means of partly solving the problems of the control of the urban growth of the metropolis of Rome. It is necessary via E.42 to control the urban development of the thousand-year-old city towards the sea. The creation of the new district and the network of infrastructures are projected then with an aim of urban network to shorten/link the fabric Romans with the peripheral surfaces which developed in a spontaneous way to see anarchistic for some. The objective is well to restore the historical and ideological bond of the city with the installation with its peripheries (and that along the Tiber river) and the ancient harbour city of Ostie. It is included/understood whereas the choice of the surface of exhibition is of primary importance is which a many debates in the reviews of town planning and architecture and column of the Italian press were intense. But on September 15, 1936 following a visit of Benito Mussolini, the dictator announced the final choice of the zone of the Three fountains for the realization of the zone of exhibition.

Figure 1: The Government action, visits in 1940 (?) of Benito Mussolini at the E.42. Présentation at the Agency of the model of the Exhibition. Italian Central Archives – photographic file.

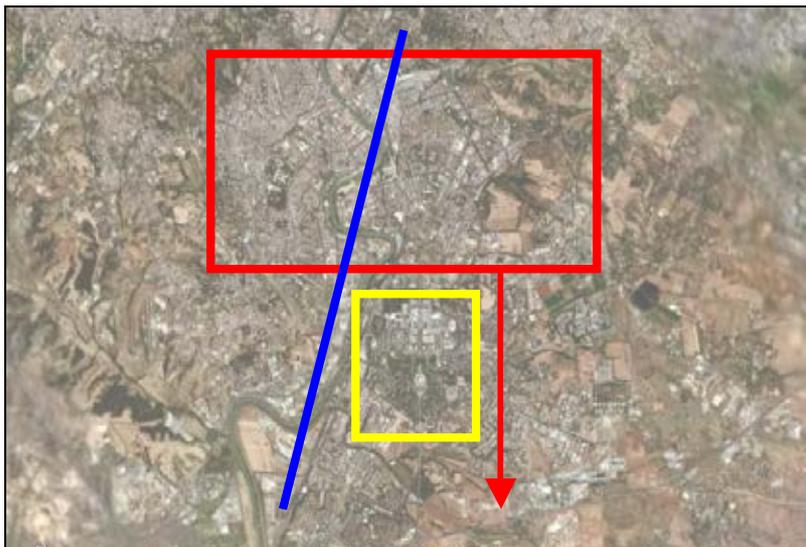

Figure 2: The inscription in 2005 of the EUR zone in the metropolitan plan (1), the south of Rome (2) and the scale of the district (3). During the conference a more complete analysis. Google Earth.

## 1.2 An impeded plan but ever forgotten: “*Third Rome*”.

It is in 1936 that east creates the organization of management of what will be called later the World Fair of Rome of 1942, E.42. The administration of management of the World Fair E.42 was instituted with like objective first directing and bringing to its conclusion the realization of an administrative complex of a park of exhibition, the whole for the year 1942. Nevertheless, the Second World War and Italian engagement at the side of the troops of the Axis led the Italian authorities to cancel the World Fair in spite of largely advanced work of a great part of the buildings. One decided as of the first times of the project to appoint the Senator Vittorio Cini, police chief general of the World Fair and President of the administrative organization. The organization of this World Fair implied all the intelligentsia of the fascistic regime. This team intervened and proposed ex nihilo solutions for the construction of a model district. The objective is that one remembers this World Fair as well as the great Parisian, London or American exhibitions. The objective was to manage to link technological and functional choices emanating from an architectural language which clearly made reference to town planning and classical architecture Roman while perennializing the ephemeral infrastructure by a countable management of finances and the will to make last the urban developments once the finished World Fair. Concerning the itself project we can be pressed on a patrimonial document concerning the presentation of the project; it is the report of presentation of work of studies for a World Fair in Rome<sup>3</sup>. Thanks to this document we know the intention and initial waitings that the whole of the professionals want to lean with this project:

- A large axis “*Rome Sea*” connecting in direction south the great central place of the exposure to the pine forest of Fusano Manor house, towards north by joining the surface of the exhibition and the S.Giovanni place. Moreover the connection with the city was ensured by four large arteries, the avenue Ostiense, a new layout corresponding to the current boulevard G.Marconi and a new connection in the west with the Magliana way which envisaged in more construction of a bridge on the Tevere river but which was never carried out.

- The zoning of the surface of exhibition was already well established with direct broad outline which remained constants for the later plans. A great central place, a central axis, an artificial lake in central position, a place towards the south, a monumental building of quadrangular form dominating all the zone of exposure and offering a panoramic sight on the valley of Trevere.
- A monumental scenography pointing out the Roman classicism in architecture. The idea of force, order, arbitrary and authoritarian. An arbitrary recombining of passed of the town of Rome by the choice of an ancient set of themes of architectural intervention.
- A great event pretexts with the unlimited budget but nevertheless depend on the international events.
- The will expresses to have an architecture allowing a simple and clear identification: Italia/Fascism/Rome/E.42.

January 5, 1937 the project was officially entrusted at a Commission on the Regulating Plan made up of the largest architects of the mode, Payent, Piacentini, Piccinato, Rossi and Vietti. It is Piacentini which strong of the preceding experiment of the University Town of Rome which was shown ready to propose median solutions and supplementing the first preliminary draft. It had according to these friends of the very clear ideas about the urban organization and of the architectural language to employ for the exhibition. It wanted an adequacy between the mode, architecture, the place and its functions. He becomes the general coordinator, the chief, of the group of architect *“the largest buildings of the World Fair which then will become durable will constitute all together immense Forum. I imagined in fact a displacement in a Roman Forum, between places, columns, landscapes, arch and to see at the bottom on the left Coliseum and the bottom on the right Campidoglio. A traditional but modern vision analogical, very modern”*<sup>4</sup> One sees well by this quotation that already all the elements of an urban scenography are created and in a coherent way compared to the ideas of the regime (monumental surface, recognizable architecture, Force and Modernism). The Place of the Forum is the central scenographic element. With the junction of the cardo and decumanus to the Roman, thanks to her structure and topography it makes it possible to the visitor to create a sequence of panorama and visions monumental reinforcing the layout and fascinating of account this zone undulating. The axis Rome Sea, *“the penetrating one”*, of north in the south is the complementary element of the place; it divides the district into two parts of equal surfaces. Along this central axis which takes not Via Imperial today Via C. Colombo, the Place of entry (the Door symbolic system of the Exhibition), the Imperial Place (today place G Marconi) is prolonged by a landscape prospect with the Central Park which in its turn dominates the artificial Lake. That the large imperial artery divides in addition. For via Imperial, one proposed at the end of the district and at the end of the way the creation of an Arc of the Empire which one finds in the poster official of the exhibition E 42 of 1939 but today another prospect is proposed at the end of this monumental boulevard, it acts of the its cylindrical form and Sport hall dominating the hill with a fall spectacular of water in the lake proposed and carried out by Vico in 1939 general consultant of the parks and gardens. In December 1937, Piacentini was named Director of the service of the architecture of the regulating organization of EUR. It acquires a total autonomy which enabled him to bring a series of modifications to the urban drawing of the district. The influence of the English cities gardens and the too sinuous roads to its taste were reorganized. Another outline this time final of the plan was carried out in March 1938. It is a question of accentuating the monumental impression of the complex. The road network was redrawn in a system of axis taking the Roman tradition like example with Cardo and Decumanus, a rigorous grid is drawn in the two parts of the district principal of the zone of exhibition, the landscape sights and prospects are accentuated and the side openings are reduced to their minimum. The buildings, of ticketing, restaurant, the Imperial door, are re-adjusted. The same applies to the principal transverse

roads (Via Europe and Civilization of work) which connects the two parts of the district creating a visual prospect for fluidity and passage on the left and on the right of the Palace of the Receptions and Congresses (A.Libera) and Palace of Italian Civilization with in more one sight on the church of SS. Pietro and Paolo. The artificial lake is also redrawn, of irregular forms in the preceding studies; it takes a rigorously geometrical form with the Italian shape of three basins intersected with two bridges connecting the two parts of the district. Normally, with the two extremes of the longitudinal axis of the lake two architectural elements owed closed the prospects for the two with dimensions ones, the theatre into full surface with G Michelucci and the building for the exposure of the Agriculture of P.Marconi, G Samonà, G Viola. However, none of both were finished and in their place during the following decade one respectively arranged the new seat of the Bank of Rome and the building of the ENI. As for the place of entry, one it thought of the Roman, one decided to create a kind of anteroom with large columns making of the exhibition a closed zone. The place was closed in the pressure of the two columns. Finally as for any exhibition one decided to create a park of entertainment in the south-western zone of the lake.

Figure 3: In 1944, the south of the Roman agglomeration offered vast agricultural fields in waste lands for some and then allowed the realization of great installations like a World Fair. Here one guesses only one part of work of the exhibition (1) the final plan of 1938 with installations of Piacentini. Italian Central Archives, EUR.

## 1.2 Change in the continuity and the example of the new Palace of the congresses.

Between 1940 and 1942, work continued with increasing difficulties until 1942 or the building sites were stopped officially. Buildings more emblematic (from only the trace that they left in the Italian archives) and which could not be carried out are the Imperial Arc, the Palace of water and the light, the Palates of the Craft industry, the Delegation of the Government of Rome and the houses intended for the Exhibition of the Dwelling. March 4 1943 closed the urban first planning sequence and the history of the E. 42. The Agency of organization was incorporated by the new Government and Vittorio Cini as all these collaborators took retreat. Cini was named Honorary General Commissar of Euro and Minister of Transport. But the year 1944 was one year terrible and E.42 was practically abandoned. Natural degradations and the process of complete abandonment of the zone began. Some infrastructures hardly started could not be saved because of the bad weather, not roof, flights night like the Large Theatre projected Imperial place of L Moretti. On these foundations the following decade the Palace of Italy will be built, the theatre in lime pit air of Michelucci and the Palace of Agriculture. In 1951, the extraordinary police chief then in load of EUR Virgilio Testa asked the government to resume not yet finished work and/or works. He is at the base of the rebirth of the district. He starts with a new team to study the possibilities of construction of building of new buildings for the zones of the Exhibition not yet built. One then notices a continuity in the change, a very large part of the buildings projected for the World Fair was supplemented and transformed to allow the installation of important administrative complexes, Ministers, Agencies Governmental, was various museums and sporting complexes. The Northern zone was devoted to the construction of buildings for the directional activities while the peripheral zones and the southern part were allocated functions of residential dwellings, services town and green zones already intended for this use within Piacentini. The project of Tested is quite simply to create a modern district including the whole of the organizations of direction of country as well as the establishments of companies to tertiary predominance while preserving monumental scenography, the green surfaces of the Plan of Piacentini as well as a residential zone<sup>5</sup>. In 1960, the Olympic Games marked durably also the aspect of the district, like the Olympic Cycle-racing track, the swimming pool of the Pinks, the Sport hall or Piacentini proposed its solutions with the assistance of Nervi. A modern functional dimension of center decisional is then ratified by the Christian Democracy and the whole of controlling Italian which have followed one another for fifty years.

## 2. The style Euro, an architectural rediscovery?

### 2.1 Birth of the "style E 42".

A kind of style "Piacentini" = a system of place, monumental door, scenographic sight, pastiche of Roman art is then set up as soon as the architect takes the control of work and the choices of the adopted projects. It is itself which decided surfaces to put at the contest and consolidated its vision of the district with the monumental complexes the surfaces of access, the borders external interior of the district. *"A through the mechanism of section of the projects winner, with the contest, it created for itself moreover a precis of architectural style which under the aegis of Piacentini and the control of the Office of the Technicians of the agency, in fact, they becomes a kind of collective language in which, separate like exception the Palace of the Congresses, it is difficult to recognize the individuality of the projects of authors. Actually, there was a regulating faculty of the Regulator Agency which made it possible to add convenient variables to the projects retained what heavily conditioned the choices of the projects of the participants, that is to say the practice of the prices ex-aequo concerning different culturally strong projects between them, that made so that so-called "the style E 42. Characterizing each realization of the Agency took an identity in a certain direction unreal and anonymity even if perfectly localisable. "*<sup>6</sup> Between 1938 and 1941 the zone of exhibition was a zone of building site where the primordial infrastructures were realised. The layout of the Imperial voice, the emblematic construction of the Palaces and the monumental buildings were largely advanced, the Palate of the offices of the Agency of construction of E.42 was the completed first but also the Palaces of Civilization, of the Restaurant, the imperial Place and its buildings, of both Esedre, the INA, of INPS, the Palace of the Congresses, the Church of Saint Pietro and Paolo, the Basin of the Lake and the theatre with the lime pit air. Inevitably, the history of the district is marked by its genesis by a will of standardization and arbitrary realization of a modernistic fascistic ideal city. It is noted that on official Internet site of EUR, one can read with the part history and urban project that this one *"represents in its complex the synthesis, still today perfectly readable between the urban operation of last and a future fact of specific interventions but by respecting the original structure, and that it cannot miss intriguing at the time of a visit of the city by having an open and cultivated vision of its most recent history..."*<sup>7</sup>

### 2.2 The rediscovery of the style E 42 by the Romans.

This rediscovery was done in several times:

- In a first the lives of the district and civil servant who live there and work have made it possible to maintain a link between the city and the district.
- In the second, the district accommodates since the Fifties the Fair of Italy and various less important fairs like that of Agriculture.
- In the third time, the cinema played a part in the fact that more and more the realizers take as decoration EUR and its scenographic value to turn of the scenes and to recall to the Romans their memory or sometimes dark history: *"Sometimes, thanks to certain adults, I went to discovered from another city: Rome always, but elsewhere in Rome. One day, my maternal uncle, the photographer Elio Luxardo, took us along by car, my cousin and me. It had taken the direction of the sea, and, from the improvisist, it took a small road which I did not know. At a certain time, one stopped, and one continued with foot. We arrived in the district of EUR, built in the south of the city by the fascists for the World Fair of Rome, which was to be held in 1942. To this end, since 1939, Mussolini had made build, in the direction of Ostie, an ultramodern district on more than 400 hectares. In my childhood, post-war period, the district*

*was almost given up, it did not have there even more road to reach it. At the beginning of the Fifties, EUR was regarded as a heritage of Fascism, and this district was cursed. There were large marble buildings, a church, a museum, an obelisk... It was an immense and deserted place. In this phantom city, the birds fluttered in the buildings, the grass had pushed back a little everywhere. This vision, this day, was one of the architectural emotions most important of my life, it was impressive. For this new film, I thus chose with attention the places of turning, of spaces either very known in the center of Rome, or ignored: large buildings with It Quadraro, prospects with Centocelle, working cities with Tor Vergata. The police officers of film, to carry out their survey, move in various points of the city. Certain people whom they meet live in the center of Rome, others in the suburbs, others still in the residential districts..."*<sup>8</sup>

- Lastly, an ambitious project of rediscovery of the style E. 42 is undertaken by the tourist route which is borrowed by the visitors of the district by means of an extremely complete layer of presentation making it possible to connect the history of this district to the inhabitants of the city: *"Exploring EUR"*<sup>9</sup> allows the Romans and tourists *"to Re-examines the entire spectrum of architectural Roman and national culture [...] At any misses the conflict between modernity and tradition had been has movement feature of the architectural ideology of the Italian fascist already since the early 1920 S "*<sup>10</sup>

- The historians of art, architecture and architecture also spoke in the debates around EUR, various publications very few at the beginning then much more important as from the Seventies brought has to requalify the image of the district. It is especially that the occasion of the fiftieth birthday which the publications pointed out the role and the importance of the EUR choice by the fascists and especially that the idea to build such a district in direction of the south, sea gone up before the fascistic era Mussolinien. It is at the time of the fiftieth birthday of the creation of EUR that one finds a will of the policies and institutional Roman to point out the importance of third Rome for Italy. It should be noted that there were works reporting the importance and the rediscovery of Euro but as from the fiftieth anniversary<sup>11</sup>. But four works refer concerning Euro now and brings more than one comment since. They are the works of Italo Insolate, Di Majo, Mariani, De Vico Fallani<sup>12</sup>. In *Casabella*, G Ciucci titrates besides: *una storia will ancora incompleta* speaking about last the publication on EUR<sup>13</sup>. At the time of the conference or in the event of publication of the acts, I would present film extracts or the tourist route.

### 2.3 The inscription of an authoritarian rationalist modernistic style in the city, the memories and the European culture?

Do the Italians have and the Romans they had shame of their urban past with EUR?

Initially, yes, because to speak about architecture during the fascistic period and to find qualities with this one were to put itself except play of the media class politico. On the other hand, it is true that the historians, geographers and architects took this way for a long time. On the other hand a last event can sweep the whole of the fears, fears and unvoiced comments on this district. It is into 2004 that it is held in the Palace of the Congresses of Libera the IGC. The European Intergovernmental Conference proceeded in the decorum of the EUR district for precisely discussing the European Constitution. *"Until little, one could not say that fascistic architecture was beautiful, under penalty of being shown to find beautiful Fascism as a whole"* explains Rossana Bossaglia<sup>14</sup>. One finds the same order of idea with the remarks of Giorgio Muratore *"Until the Sixties and ten, it was only one dark page in the history of Italian architecture. From now on, after more than fifty years, we can have retreat. An architecture of quality - even resulting one historically contestable period - can be interesting all the same"*<sup>15</sup>

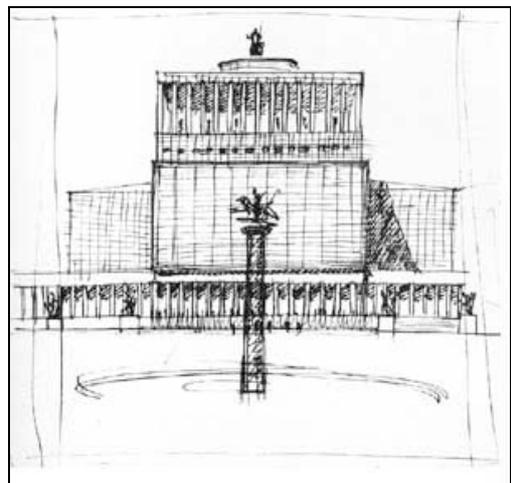

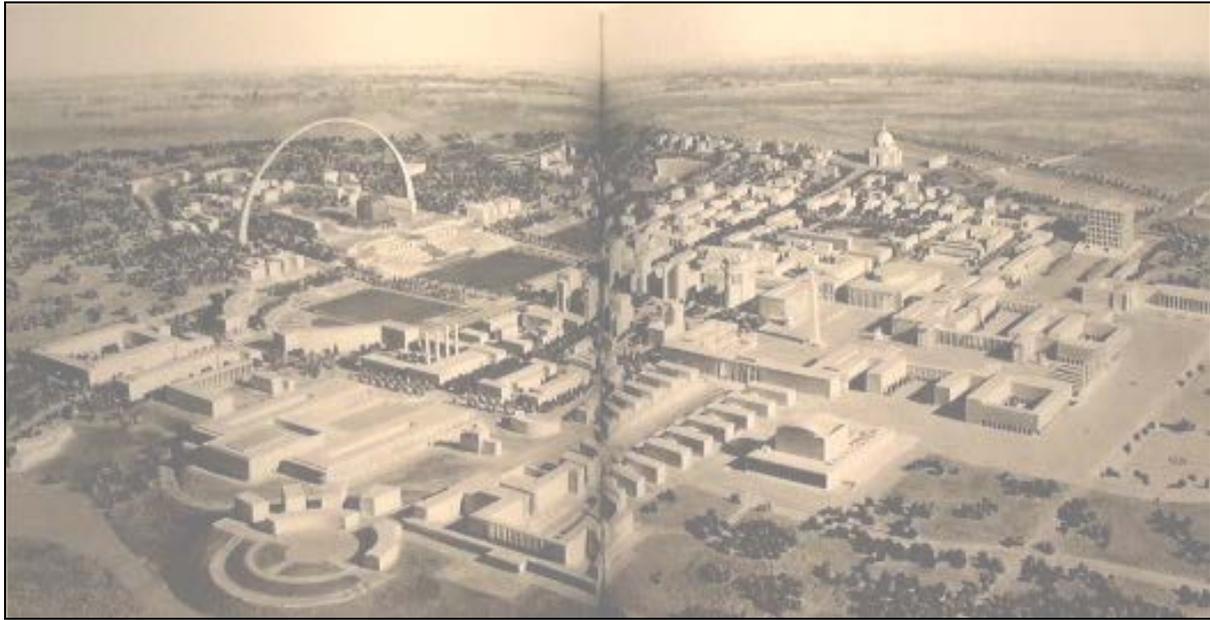

Figure 5: The E.42 style, in these various dimensions, analyzes at the time of the conference. Italian Central Archive Memoir of study on EUR 1939.

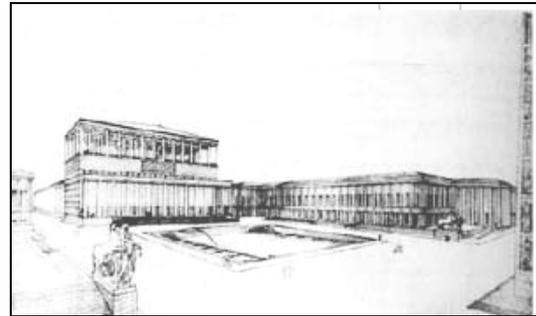

Figure 6: Continuation, the style E. 42, Central Place, obelisk and colonnade. Analyze at the time of the conference.

### **3. E42/EUR a heritage for Rome, Italy and the world?**

3.1 The great paradox: the World Fair ever carried out but most important with the plan of the territorial and functional stakes.

It is the largest of the paradoxes possible and conceivable if one is considered the history and the geography of the World Fairs in the world. The Exposure which was not carried out until the end - E.42 - left the most trace in the memories and the urban screen of a large European metropolis!

3.2 Euro a model for the mega events of end the XX 2nd century?

We will be posed like question: which place this atypical exposure and was it took used as model for other achievements of great projects?

3.3 E 42/EUR Recall memories.

In the case of a publication, I would present this third part, for the moment, I propose an explanatory diagram allowing to show via the succession of various temporalities the community of the memories found within the framework of the identification and urban reinterpretation of a district to living to imagine to discover.

EUR is the example of Italian Rationalism or functionalism combining classical architecture and modern. Nevertheless, EUR is also a perfect example of transfer of identity and of return on its past of people by the intermediary of an authoritative town planning to become a participative and regulating town planning tried.

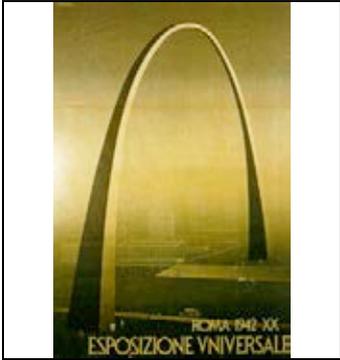

Two temporalities which class or which meet?

Paper to be delivered at the  
International Conference of Planning History  
December 2006

INTRODUCTION

In his August 1942 preface to the Industrial and Commercial Background for Planning Chicago, T. McCrosky, the executive director of the Chicago Plan Commission (CPC), predicted that the locational pattern of wartime manufacturing plants may “set the pace for a more ordered and more rational utilization of land throughout the city” (CPC 1942: preface). To his mind, the construction of large manufacturing plant on the city fringe would sort the geographic space into two zones. The first, consisting of the older central districts, would be home to “modern loft buildings suitable for light manufacturing” while the second would be the outlying districts where large heavy industries would be

located on “sites measured in hundreds of acres” (CPC 1942: preface). Despite the increasing scale of suburban manufacturing, nothing was said by McCrosky about how the city’s industrial base functioned within the broader metropolitan structure. Nor did McCrosky discuss the fact that the CPC, the leading vehicle for planning in the region, was almost entirely organized and run by private business interests.

McCrosky’s inability to link postwar manufacturing growth with metropolitan planning is reflected in the literature on postwar Chicago planning. Authors have looked at, among other things, urban renewal (Rossi and Dentler 1961), race and housing (Hirsch 1983; Seligman 2005), and private-public partnerships (Rosen 1980). What is clear from this work is that planning in postwar Chicago was driven by the need to coordinate suburban population and economic growth with new state social policies. As in St. Louis, Detroit and elsewhere, the search for solution to the problems of city growth and decline was framed within a metropolitan context (Heathcott and Murphy 2005; Sugrue 1996). However, despite the rhetoric, and in comparison to the emphasis on social reproduction issues, industry did not merit a central place in metropolitan planning and development. While the state, at various levels, fretted about the dismal showing of manufacturing and the movement of all sorts of employment out of the city to the suburbs, the economy, for the most part, was left to its own devices. Other than as a collection of relatively autonomous entities, the firms that composed the economy were not an integral part of the planning of Chicago. Until well in the 1960s, they were not part of a comprehensive plan that linked industrial growth and decline to neighborhood change, housing or social service delivery.

The absence of industrial planning in the immediate postwar period had enormous repercussions for the city and the suburbs. While issues of social reproduction were elevated to center stage, questions of industrial reproduction were relegated to the wings. Accordingly, the impacts of two critical elements of industrial change on metropolitan development were excluded from postwar planning. The first element is the long and consistent deindustrialization of the central city’s industrial base. As this paper shows, the rusting of Chicago’s manufacturing has its roots back into the 1920s. While the most obvious and glaring impacts of industrial decline were evident from the 1960s, the city suffered from a long history of decline. The second element is the disposal of state-owned wartime investment in manufacturing plant and equipment. As this paper shows, the impact of this investment on postwar metropolitan Chicago was considerable. Huge amounts of state-funded and owned manufacturing investment flowed to specific parts of the metropolitan area between 1940 and 1945. The disposal of this funding to private interests after 1945 shaped the economic parameters of the metropolis. Parameters that were controlled by private interests and did not fall within the sphere of state planning. The inability of the local state to take responsibility for dealing with deindustrialization and wartime manufacturing investments in the postwar period partly lay in the search for solutions to problems of social production. It also lay, as this paper shows, in the control over postwar planning exercised by private interests.

#### INTIMACY: THE FEDERAL STATE AND INDUSTRY

To understand how local industrial planning remained business dominated in the postwar period, it is necessary to understand how the federal state-business relationship was reconfigured during the war. Not only did postwar city planners operate in a world shaped by a rapidly changing economy, the continued dominance of the private market, and the demand for housing and transportation, they had to contend with the development of a new federal state-industry relationship. At the same time that the federal government created an elaborate social reproduction system to cope with racial and class divisions, and fought economic decline with urban renewal, it formulated a new and intimate relationship with manufacturing. This had two key features that shaped postwar planning at a

metropolitan scale. The first involved the construction of a state-business alliance that centered on strong and flexible government-firm interactions around manufacturing facilities, military research, and the supply of military products. The federal state did not intervene in industry, other than to extend prewar regulations on anti-monopoly, taxation and so forth. The second was that the focus of the federal government on the building of a state-business consensus centered on military production left little room for local government to rework the state-business relationship at the local level.

The new state-business intimacy was established during the war as the state and manufacturing capital fought over control over investment and production. Emerging out of this contestation was an intimacy that revolved around several elements. At the base of the intimacy was the massive wartime manufacturing expenditures made by the state in facilities (factory plant and production equipment) and supply contracts. More than \$23 billion went into plant and machinery and \$196 billion into supply contracts over the war period. As one government report noted, “war-created facilities represent the greatest increment to manufacturing capital recorded in modern industrial history” (CPA 1946a: 39-40). By August 1945 the state owned a substantial share of the national manufacturing assets.

This expenditure required the construction of a new state apparatus by which the massive amount of resources could be allocated to desired ends - the manufacture of war goods and the creation of profits for the firms making the war products. As a result of the new agencies, policies and regulations constructed by the state to oversee the allocation of investment, new relations and functional links were forged between the civilian state, the military and business. The intimacy, built as it was on a specific set of state-business links, reinforced and extended corporate concentration of manufacturing assets. For example, the largest 100 companies accounted for 67% of the \$196 billion of wartime prime contracts in the United States. In Chicago, 11 firms won 84% of the supply contracts flowing into the metropolitan area. Large corporations operated a similar share of the state investments in plant and equipment (CPA: 1946a; Smaller War Plants Corporation 1946).

There were three pivotal moments in the assembly of this intimacy. The first, the gearing up for production, involved the creation of agencies to deliver and allocate state investment, and the determination of how business was to be imbricated in the state apparatus. A complex of state agencies underwrote manufacturing expansion and fixed state-business relations. Existing agencies were restructured and expanded, while new ones were fashioned to allocate and dispose of capital. The second consisted of keeping the system going. It was necessary, once the various agencies had been established and the allocation of resources had been made, to ensure that appropriate and sufficient war goods flowed out of the factories. The state had to guarantee that business remained committed to delivering the goods. The third pivotal moment was related to the gearing down of production and the disposal of state-owned manufacturing facilities. Critical questions exercised all elements of the political and business worlds: how was the state to dispose of \$23 billion of plant and machinery? How was conversion from wartime to peacetime production to occur? And what was going to happen to the intimate state-business relations that had developed during the war?

The combination of the complex character of wartime relations, the imperatives of disposal of \$23 billion of wartime assets, and the political economy of the immediate postwar period ensured that the intimacy continued after the war. Postwar intimacy, however, differed from that the wartime period. It took on new forms which centered on the militarization of state-business relations. It involved the federal government taking on new functions that were linked to the state’s ability to facilitate this

militarization. This took the form of a new apparatus, one which contained a set of agencies and institutions, some of which continued those established during the war and others that were new to and functional for the postwar world.

### MANUFACTURING AND CHICAGO PLANNING

While the federal state forged a new and more active relationship with industry the local state sought different ways to plan the metropolitan industrial economy. They faced an extremely difficult situation. On the one hand, Chicago planners, like those in every other metropolis, encountered racial and class divisions, industrial change, and number of independent suburban areas, and the increasingly fragmented metropolis. On the other, the tools at the disposal of planners to deal with these problems were limited. Ironically, given that Burnham and Bennett's 1909 Plan of Chicago was the country's first comprehensive plan, postwar planners were unable to forge a thorough industrial design for the metropolis in the immediate postwar period. Rather than an extensive set of tools, agencies and regulations, the metropolitan-scale scope of planning was broken down into separate tasks coordinated by functional zoning regulations. Rather than deal comprehensively with the major issues of the day, planners were forced by the fragmented character of the metropolitan structure to deal in an ad hoc matter with most concerns.

The little coordination that took place and the few planned elements that existed were focused on social reproduction and were federally driven and funded. As with most other places, the major elements of Chicago's postwar planning was urban renewal (underpinned by the Housing Acts of 1949 and 1954), infrastructure developments (especially transportation, water and open space), and downtown redevelopment (private-public mixed land-use projects) (Abbott 2004). For the most part, private firms continued to maintain control over local manufacturing. Outside of zoning, industry was 'unplanned.' While the federal government maintained support for military production through supply contracts and an elaborate business-state infrastructure, the local state was both unwilling and unable to intervene in any viable way in Chicago's industrial planning.

A major reason for this, other than the federal focus on social reproduction issues, was the fact that planning remained in the hands of private business associations. City planning had been in the hands of various business groups from the early twentieth century. Business run organizations such as the CPC and the Chicago Association of Commerce directly shaped planning. The industrial strategy of these industrial and commercial interests was to promote city and metropolitan growth by using government resources to advertize the city's strength as an industrial, transportation and market center, while ensuring that any overall planning was either absent or done through the associations themselves. The result before the war was that the changing geography of industry was not linked to social reproduction issues or to particular neighborhoods that were experiencing change (either through economic decline or economic growth). This prewar apparatus of privately controlled planning continued to be unviable in the face of massive postwar economic growth, large-scale territorial expansion, and increasing metropolitan fragmentation. However, the ability of local government to take control of planning, at least formally, had to wait until the restructuring of the CPC and the establishment of the Department of City Planning in 1956.

### THE GEOGRAPHY OF MANUFACTURING, 1919-1963

The postwar metropolitan geography of industry continued trends that had been in place for at least a generation. A defining feature of the city's economic base was its relative decline after World War One

and its absolute decline after 1945 (Table 1). In 1919 the city's 404,000 production workers accounted for more than three-quarters of the metropolitan total. While this number was maintained during the boom years of the 1920s, the share steadily declined over the following years. Regardless of the depths of the Depression or the heights of the postwar boom, the city continued to lose a share of the total metropolitan manufacturing employment. By 1963 the city had a little over half of the total. Just as importantly, the city experienced serious absolute manufacturing loss. Manufacturing employment in the city steadily declined after 1947. By 1963 the number of city employees was 55,000 lower than it was in 1929 and more or less the same as it was at the end of the Depression. In contrast, suburban manufacturing growth continued after 1939. While not as large as the city by 1963, the suburbs were the dynamic part of the metropolitan economy in the postwar period.

Moreover, massive investment in the city's manufacturing base did not provide a substantive foundation for sustained growth in the postwar period; the immediate postwar period was the last hurrah of manufacturing employment as the mainstay of the city economy. From a high of 532,000 in 1947, manufacturing employment slid to only 350,000 workers 16 years later; the index of employment fell from 132 to 87 (Table 2). In contrast, the suburban districts experienced substantial growth after the end of the war. This was due in part to the long legacy of suburban manufacturing. From the early days of Chicago's development, firms of all types and sizes have sought out the advantages of the suburban greenfields (Lewis 2002a; Lewis 2002b; Pudup 2004). Postwar suburban expansion was also due to the particular configuration of the metropolitan district's political economy. A combination of wartime investments, the absence of industrial planning, and the development of business-state coalitions shaped the contours of growth in the postwar period.

The origins of the full-scale mobilization of state capital and intervention in the manufacturing economy can be dated from May 16 1940 when President Roosevelt outlined the necessity for military mobilization and asked Congress to approve funds for war production. Slow at first, the American war machine eventually produced on a scale never experienced before. Between 1940 and 1945, about \$23 billion was invested in manufacturing facilities - plant, machinery and equipment (Table 3). The state through its various agencies, most notably the Defense Production Corporation, invested more than \$17 billion (74%), while private investment amounted to less than \$6 billion (26%). The state, in a complete reversal of the American capitalist, market-based system, intervened in production in a way that it had never done before. Over the course of the war, this state funding transformed a fledgling industry (aircraft) into the largest industry in the world, developed ordnance-based industries (explosives and guns), and rejuvenated two old industries (ships and iron and steel). While much of this investment flowed to the older industrial districts in New England, the Mid-Atlantic and the Midwest, a significant share went to the West, especially California, and the South, especially Texas (CPA 1945, 1946a; Hooks and Bloomquist 1992; Lewis 2006; Schulman 1991).

There were two critical differences between private and public spending. The first was that a vast amount of federal money went to the construction and equipping of large factories. While more than half of the new plants cost more than \$25 million to build, the average size of federal funding in structures was ten times that of privately funded ones. Second, a large share of federal expenditures could not be converted to peacetime uses. Privately-funded wartime structures were built with an eye on peace time markets. This was not true for government built ones. The most obvious case of this was the huge ordnance plants, which, even though they made a wide assortment of war products, were of little use in the postwar period. Scattered throughout the nation, many remained closed for many years even though

the federal government continued to maintain a larger than ever share of war industry.

Chicago was a major recipient of wartime manufacturing investment. More than 1,400 different projects totaling more than \$1.4 billion were funded, making Chicago the largest beneficiary of wartime capital. Of this, \$861 million went to equipment while \$480 million went to plant. The vast majority of the investment went into a few large firms (Table 4). In some case, capital went to equipping both new and existing firms with among other things, new machinery, blast furnaces, and refining equipment. In other cases, it went to build new aircraft engine plants or aluminum refineries on greenfield sites that would be operated by large national corporations or to make extensive additions to existing plants. While some of these were easily converted to peacetime functions, many others, such as the large, single-purpose ordnance plants were not.

This manufacturing investment had a distinctive metropolitan geography in Chicago (Table 5). The suburbs were the home to the largest firms (median size of \$371,000) and the greatest investment (more than three-quarters of a billion dollars). With more than half of the investment, the suburbs clearly outpaced the city center, which had little investment despite a large number of projects. With more than a third of manufacturing investment, the city fringe was also an important recipient. As Table 4 shows all of the largest 20 investments went to city fringe or suburban locations. This pattern of placing large amounts of capital on the metropolitan fringe follows in a long tradition that goes back to the nineteenth century when large steel mills, machinery makers, meat packing plants and electric appliance factories sought out greenfield sites just inside or across the city line.

Despite the enormous scale of wartime manufacturing investment there were few new firms built during the war. The majority of firms were content to make additions rather than move to a new location. Of the top 20 expenditures, only eight went to new plant. In all cases, the new plant was leased to firms that did not already have a presence in the metropolitan area. New plant was a way for the state to entice new firms to a particular location. Indeed, a basic tug of war developed which shaped the industrial geography of the metropolitan area. On the one hand, existing firms took the path of least resistance: realigning and making additions to existing plant. Most firms made small investments in machinery for making new lines or new buildings attached to existing ones. The median spending per project in Chicago was \$79,000. The small scale of investment was reinforced by government restrictions on building and access to materials, and the reluctance of firms to become involved in over-extending facilities as this would be problematic once the war was over.

On the other hand, the exigencies of war (along with firms' reluctance to over-invest) forced the state to directly intervene in the building of plant and the provision of machinery. While the state allowed firms to make small additions, it took over the construction of large plant, which it then leased out to private firms. Much of this investment went to new firms, separate from existing firms. In contrast to the private situation, state investment per project was much larger; \$4.5 million in the US and \$5.2 million in Chicago. This was much more likely to be in greenfield areas outside the built-up metropolitan area. Some plant was scrambled with the facilities of existing firm and some were built on land adjoining the firms that operated it during the war, many were entirely new. The most obvious Chicago examples were aircraft related firms (Douglas Aircraft, Aluminum Co, Buick Motors and Dodge Bros) and ordnance plants (Sanderson & Porter and Du Pont II). The result of this complex set of state investments was twofold. On the one hand, the investment patterns of private firms reinforced the geographic distribution of prewar plant. That is, it favored the central city and some of the older suburbs. On the

other, state built new, large investments in greenfield sites away from the existing manufacturing districts.

### POSTWAR MANUFACTURING AND PLANNING IN CHICAGO

By the end of the war metropolitan Chicago was characterized by a dual geographic picture. Inside the central-city and, to a lesser extent, city fringe, firms had undertaken small expansion. These were surrounded by a suburban ring containing a significant number of large projects, some of which were entirely new while others were large-scale additions to existing plant. It is typically understood that the development of large industry complexes on, and the flow of, a large share of investment to the urban fringe had important implications for postwar development. One study of the aerospace complex that developed on Long Island, for example, notes that “wartime initiatives created much of the framework for the subsequent postwar suburbanization” (Silverman 1989:157). This point has also been made for Chicago. The most lasting legacy of wartime manufacturing investment according to one writer “was the continued outward thrust of its physical development” (Duis 1995: 210). In Duis’s opinion, wartime “plant construction at the fringe helped trigger an outlying housing boom that preceded the 1949 Federal Housing Act [and] . . . helped hasten the industrial dispersal that in postwar years would seriously undermine the economic role of traditional city neighborhoods” (Duis 1995: 210, 211). In particular, new plants, especially those with the choicest suburban location, became the site for intense competition when the state disposed of them at the end of the war.

The more than \$1.4 billion that the federal state pumped into the Chicago’s manufacturing facilities during the war had to be disposed of. Obviously, how this proceeded would have a tremendous impact on the postwar expansion and planning. Would they be taken over? What would be the effects of disposal on housing, neighborhoods and transit? How were they to be linked to industry elsewhere in the metropolis? How were the three levels of government to work together to plan this? In few, if any, of the disposal cases that I have examined, did the local state participate in disposal. Almost without exception, federal agencies negotiated with individual firms. The decision to sell or lease government plant to private firms were made on the basis of three major considerations. The state wanted (a) to receive what it considered ‘fair value’; (b) to restrict the development of monopolies; and (c) to dispose of surplus property quickly (Cook 1948; White 1980). Local government did not interact within this matrix of decision making. Nor did local or state governments, with very few exceptions, take over federal property. Again, the field was left to private firms. The local state obviously did not see any reason to buy plant and land for municipal purposes.

Many of the state-owned properties were very hard to dispose of and the federal government had a difficult time finding occupants for them. In some cases, the plants were so large that very few firms could take them over, while in others, they were single purpose and were very difficult to convert to peacetime functions. Between the beginnings of demobilization at the end of 1944 and the Korean mobilization the federal government disposed of a substantial share of the Chicago plants. Some went to manufacturing purposes, while others went into state hands, most notably the Douglas Aircraft plant at Park Ridge which was turned into the O’Hara Airport. In some cases, however, the plant remained idle for years. Regardless, the disposal of plant was difficult, onerous, ad hoc and unplanned. There was little interaction between the three levels of government. Billions of dollars of plant and equipment was sold by the state to private interests. All of it took place outside of any attempt to think through the consequences of the plant for changing economic conditions of the city or the larger issues of planning the metropolitan area.

Despite wartime investment and postwar disposal of manufacturing plant, the central city experienced a long, drawn out process of deindustrialization. Urban renewal was as much to do with how the city was perceived as it was about the city's material conditions. Wartime investment had a twofold effect on the city. First, it acted as a magnet for future investment. By locking capital to place, it resuscitated central-city manufacturing after the devastation of the Great Depression and laid the basis for postwar growth. But not only did wartime investment lock production into existing sites, it also helped undermine postwar expansion. On the one hand, it compelled firms to remain central because of the extent of recent fixed capital formation. On the other, the fixed capital put into place during the war was haphazardly made, worn out from extensive wartime use, and geared to production of wartime not peacetime lines. Together, this worked to ensure that the conditions for planning development of the industrial facilities built by the state during World War two would arrest economic decline in the central city.

### CONCLUSION

So how did wartime investment in Chicago's manufacturing facilities shape Chicago in the immediate postwar period (1945-1960)? How did it shape the postwar geography? There can be little doubt that state investments "hastened the process of suburbanization" (Duis and LaFrance 1992: 119). It is true to the extent that wartime manufacturing investments were concentrated in non-central locations. However, there are two caveats to this. First, industry had been suburbanizing for the entire twentieth century. Wartime-pushed suburbanization was not new. Second, a great deal of wartime investment occurred within the city, but on the outer fringes. Decentralization was taking place in the city as well. What wartime state-owned manufacturing did do was to both reinforce and to realign patterns of capital location.

What were the effects of wartime investment on planning? It appears very little. Even if there was the will, the local state planning apparatus was severely handicapped in at least two major ways. The first was that planning was in the hands of business and had been for several generations. Indeed, Chicago had had no relatively autonomous, state-funded planning department before the war and one would only be established in 1956. Even this did not mean the end of the CPC's role in city planning. The Commission continues to exist and acts as an advisory capacity to the planning department and has been instrumental in formulating the city's plans and planning policies. But there can be little doubt that many of the business people involved in the CPC or the Chicago Association of Commerce or the other organizations involved in planning Chicago had some vision outside of the boundaries of their own firms. However, the very structure of the system ensured that firms remained subject to their own independent logic, one that was at odds with a world planned by non-business people. As McCrosky would undoubtedly have argued, "a more ordered and more rational" organization of space required firms to maintain control over their internal decisions without any outside impediment.

Second, the intimate relations established between the federal state and business did not establish the appropriate terrain for planning at the local level. The new intimacy revolved around direct state and firm relations, with particular emphasis on the production of war materials and war-related research. Disposing of war surplus plant and equipment was essential to the formation of this postwar intimacy. However, the need to coordinate this disposal with housing, transportation and other forms of development was never undertaken. Planning industrial Chicago was to be left to individual firms and the vagaries of the market.

## **Introduction**

One's first impression of a city is generally visual. Paul Lester ([www.macalester.edu](http://www.macalester.edu)) claims, "We remember about 10% of what we hear, 30% of what we read, and about 80% of what we see." This leads one to conclude that we are a visually dominated society. Relph (1987, 3) states that landscapes are visual contexts, that buildings always belong in a certain context and are related to the spaces around them in terms of planned layouts and streets, technological developments and social circumstances. It is imperative that no element of the landscape be treated in isolation in order to avoid misreading of the landscape.

Of the many elements of the urban landscape, outdoor advertising is arguably the most prominent feature. Cullen (1961, 151) notes that outdoor publicity is the most characteristic, and potentially the most valuable contribution of the twentieth century to the urban scenery and yet it is almost entirely ignored by the town planner. At night it has created a new landscape, previously unseen in history.

Outdoor advertising in the form of billboards, banners and gantries is primarily employed as a mode of visual communication. From the oldest form of publicity discernible in the form of stencilled Egyptian inscriptions of 3200 B.C to modern-day LED displays, outdoor advertising exists in the metropolitan environment as a distinct feature along pavements, on building fronts and especially along highways to materialize as an innate part of the landscape. The manifestation of outdoor advertising in the urban setting can be seen on transport vehicles, street furniture and as an increasing development, as facades of buildings. It is indisputable that outdoor advertising be acknowledged as an important channel of urban expression.

A sign is an indicator or a symbol- a means of representation. For the purpose of this paper, a sign/signage is defined as any printed or written text, pictorial representation or other object which is a structure or part thereof, or is attached to, painted on, or in any other manner represented on a building, fence, wall, post or any other structure or surface (Batty, 1977). Through their functional purpose of identification, information, direction, and promotion it can be asserted that signs facilitate modern lifestyle.

The connotative aspect of advertising signs, often underrated by architects and urban designers, is vital in understanding the impact of outdoor advertising in the urban space. Since the visual impression of a place is decisive in its acquiescence, advertising signs have the potential to manipulate and influence one's perception. Walker & Chaplin (1997, 23) claim, "We depend on the media to form cultural opinions of the world". This indicates that outdoor advertising, as a pervasive branch of the media can be used to influence the visual culture of a society.

Signs represent a physical manifestation of an idea, held in the mind of the sign maker and hence reveal the beliefs and values of the society that they are designed for (Mahar-Keplinger, 2002). To reaffirm this thought, Marshal McLuhan believes: "Historians and archaeologists will one day discover that the ads of our time are the richest and the most faithful reflections that any society ever made of its entire range of activities" ([www.brainyquotes.com](http://www.brainyquotes.com)).

Through the ability to negotiate its impact on visual culture, outdoor advertising can be employed to extend the boundaries of people's acceptance in the society. This is a salient point in refuting the role of outdoor advertising as a form of urban expression. Where the

signage is placed and what the products sell is noteworthy as this influences the way in which people relate to, and accept the ideas portrayed in the advertisements. Outdoor signage, as a means of communication affects the visualization of the landscape and its consequent use (Jackle & Sculle, 2004) such as Times Square in New York City that is perceived as an entertainment zone, largely due to the atmosphere created by signs. In this case, advertising not only becomes a part of the nature of the city but characterizes it.

Although outdoor advertising is a dominant element of the prevailing urban landscape, the views towards advertising differ greatly. The stance taken for and against advertising is based on social, aesthetic, economic and safety grounds.

Architects like Venturi exhort the application of graphic communication as a tool of architecture. Venturi (2004, 23) asserts, "The genius of the American roadside commercial landscape will be eventually acknowledged and come to represent a significant and precious dimension within the art and architecture of our time". Nancy Fletcher, the president of the Outdoor Advertising Association of America (OAAA) declares that the future of outdoor advertising is bright. The OAAA website ([www.oaaa.org](http://www.oaaa.org)) reiterates that outdoor advertising is a feature of some of the highest value real estate in the world.

Opposed to this view, the Society Created to Reduce Urban Blight (SCRUB), an American organisation, contends that an uncontrolled environment full of billboards sends the message that a city does not care ([www.urbanblight.org](http://www.urbanblight.org)). Ian Borden (Cronin, 2004, 2) regards billboards as urban scourge: "not really buildings, not really here, they are simply a temporary covering, a mask across the face of the city at its most leprous" ([www.comps.lancs.ac.uk](http://www.comps.lancs.ac.uk)). In a similar vein, Blake (1979, 27) alleges, "When people talk of the ugliness engulfing America, they first think of Billboards.

In response to the ambiguity surrounding the opinion of outdoor advertising in urban society, Devon Ostrom ([www.eye.net](http://www.eye.net)) postulates an answer wherein he states that "Balance comes from applying the taxes collected to artistic works and green spaces that waken the mind rather than stupefy it, that challenge our emotions rather than pandering to them, that stand out and contribute to the community rather than whisper to our hidden individual dreams and conceits."

Colomina (1994) declares that systems of representation serve as masks for a city and modern architecture becomes 'modern' not only with the use of glass, steel and reinforced concrete but also by engaging with the media. Since architecture is fashioned in an environmental context and the media operates as the instigator of this environment, it is imperative for architecture to connect with the media.

Nobel (2005) maintains that when people think of the future, they think of the architecture that lodges it. However in recent times, Nobel argues that architecture has a formidable rival in the form of advertising to represent the face of the future. This is due to the escalation of advertising seen in the urban environment.

Pallasmaa (2001, 52) recognizes the might of architecture when she professes: "A building moves us when it succeeds in reverberating with something concealed in our humanity, and when it echoes images and sentiments stored in our subconscious". Since an explicit way to evoke an image in our minds, is by the apparent staging of another image in our field of vision, signs and symbols are a cinch when trying to induce an emotion or an idea in people.

Advertising signage can therefore be availed of, as a means to visually lend meaning to a structure. Advertising signage can be used as an allegory for a place.

Sutnar (1956, 257) claims, “We live by symbols...yet, the visual symbol which becomes a symbol is actually nothing but itself- a simple object to the eye- until it acquires an accretion of information and associative values.” Advertising signs, more often than not, have a story to tell through their design and composition. In places like Times Square and Las Vegas, advertising signage are used as metaphors of a ‘good time’ as they are most literal, with little scope of misinterpretation. Signs carry with them the power to induce an effect on the viewer and transport one into an illusory reality that is crafted by the visual connotations that signs imply.

These issues are explored in the paper using case studies where outdoor advertising plays an important role in the urban visual scene. Auckland, Bangalore and Panaji have been selected for their diverse urban contexts, different architectural styles, varied cultural outlooks and the author having resided in each of the three cities. The central commercial core of each these cities is applied as the context for the study and three specific streets from this core are adopted for analysis.

## **Auckland**

Apart from being New Zealand’s biggest city, Auckland is also the commercial capital. As a result of its warm temperate climate, its high standard of living, plentiful opportunities for education and employment, and brilliant scope for leisure, Auckland ranks 5th behind Zurich and Geneva in a survey of the world's top 55 cities ([www.wikipedia.org](http://www.wikipedia.org)). Although the British culture dictates the ethos of New Zealand, Auckland possesses a cosmopolitan flavour to it, evident through the presence of various ethnic groups in the city.

‘Wining and Dining’ is an important part of Auckland culture and the Auckland Central Business District (CBD) incites this way of life by brandishing the major shopping and entertainment zones in the area. The loop of Queens Street, Karangahape Road and Ponsonby Road delineates the core of the Auckland CBD.

The CBD streets include sidewalks that are shaded with canopies. These canopies are characterized by a continuous flow of advertising signs that coerce the eye to travel as one walks along the pavements (*ref. fig 1.1*). Two distinct scales of signage –for pedestrians and vehicles-are noticeable while traveling along the streets. Different types of signs in the form of overhung signs, wall mounted signs, placards and banners occur within the limits of a single wall surface which sometimes leads to a loss in coherence of the message of the signs.

The advertising signs in Auckland are restricted mainly to the ground and the mezzanine level establishing a tangible pattern. This is the single most characteristic attribute of advertising signs in Auckland-the archetype of under-canopy signs illustrating the sidewalks at the ground level. Signage in Auckland is responsive to the architecture with which it is associated in being attached to the architectural elements like columns and railings. Consideration to size and scale to accommodate them in the sign design and placement is also evident.

The type and the number of signage reflect the target audience and the commercial activity in the area. Advertising signs connote the status of the people/activity that they represent/cater for in terms of their treatment. A marked disparity is apparent in the style of signs on Queens

Street, K-Road and Ponsonby Road. While Queens Street is essentially a shopping street, K-Road is an entertainment zone and Ponsonby is famed for its cultured taste in luxury living. The brands of products available on each street embody this difference. This development suggests that advertising signs can be used to lend an identity to a place or an area.

The similar treatment of signs runs as a common thread binding the character of the three streets. Conversely, all the three vastly commercial and busy roads of Auckland CBD project a generic overall appearance in their adoption of canopy signs, response to architecture, and restriction to ground level. This leads to a loss in individual identity as at first glance, the three roads appear analogous to each other. It can thus plausibly be assumed that advertising signs can be utilized to differentiate one street from the other as and when needed.

Queen Street is the major commercial thoroughfare of Auckland's CBD. The advertising signs along Queens Street are largely aimed at pedestrians as can be observed by the meticulous explanations that the retail outlets and the restaurants offer. The display windows are smattered with pamphlets and overhung signs are placed at a respectable scale, easily perceived by the human eye. Reiterating the multinational culture of Auckland, ethnic restaurants sport signs that connote authenticity through their font, color and content (*ref. fig 1.2*). If zoomed into the bearing of these signs, the advertising displays transport the viewer to the streets of the respective locations.

Karangahape Road (or K-Road as it is referred to) is one of Auckland's most famous nightlife areas. At night its restaurants, bars and nightclubs consolidate to fashion a sizable part of Auckland's social scene. However beside lending to the color of the area and keeping alive the atmosphere of gaiety, the advertising signage does not mirror the atypical eccentricities of the street (*ref. fig. 1.3*). Signs on K-Road are treated in almost the same manner as that on Queens Street, and to a lesser extent, Ponsonby Road.

The advertising signage on Ponsonby Road is more subdued as compared to the other two streets (*ref. fig. 1.4*). The advertising signs along Ponsonby Road have an unassuming demeanor, not too loud or garish, and they attempt to engage with the architectural structure upon which they rest by utilizing the architectural features in a sensible manner.

## **Bangalore**

Previously a British army base, Bangalore is referred to as the 'Silicon Valley of India'. Globalisation has been at the forefront of transforming Bangalore's spatial structure. Mathur (2003) notes, with the impact of globalisation, the residential areas in cities are being transformed into commercial spaces. Old means of retail trading are being replaced by shopping malls and commercial spaces are continuously being added to accommodate the multinational and financial institutions. Riding high on the wave of globalisation, the lifestyle of Bangalore reflects the convergence of the East meets West phenomenon.

While it is true that globalisation has triggered the growth of the middle class in Bangalore, a significant number of people still live below the poverty line (Vagale, 2004). Class and caste compete to divide the city and affluent class is concentrated mainly in the center while the underprivileged keep being pushed to the more remote areas. As a result of this, although the cultural outlook of Bangalore borders on the modern, the suburbs maintain a predominantly conservative attitude.

The streets of Bangalore serve as important public spaces. Streets like M.G. Road, Brigade Road and Commercial Street are prime examples of streets that have evolved into mini entertainment districts. Besides the innumerable multi-cuisine restaurants and the bulk of theatres in the area, shopping is the dominant activity that supports and influences the use and the character of these streets (Vagale, 2004). This is an extremely significant argument in relevance to understanding the nature of these streets and hence the context in which they are based.

It is the advertising signs that mirror the commercial character of Bangalore's streets. Signs lend to the color and the festive nature of these entertainment zones and grasp most of the attention as one walks down the streets. It is not an uncommon occurrence to stumble upon huge hoardings at important junctions and especially on rooftops. Advertising signage is a predominant element of these shopping streets with countless signs vying for buyers' attention from all directions.

Even when the shutters of various retail outlets are rolled down, painted signs on the metal surfaces serve as constant reminders of products and services available for the expediency and the indulgence of the consumer. At certain places where the concentration of shopping is intense, every conceivable building surface is obscured with advertising signs and these surfaces get intermingled under the torrent of signs. In these cases, it is the advertising signs that pull together the architecture of the street.

An ostensible articulation of outdoor advertising is observed on Bangalore's streets during election times wherein advertisements serve as constant cues and connote solidarity and reassurance through their presence. Larger than life cutouts of politicians and film industry actors denote the semi-divine status that these personalities are bestowed (*ref. fig. 1.5*). The state of Karnataka requires that all advertising signs should mandatory have the name of the commercial establishment in Kannada (the local language) along with a sign in English. The people of Bangalore take obvious pride in their culture and this fervor sometimes takes a fanatic pitch. Signage that does not include the vernacular script along with the Roman script is targeted thus indicating an extremist attitude.

Capitalizing on this theory, albeit in a moderate fashion, sources from the native context can be extracted to launch an identity for a place. The globalization of Bangalore city entails that the signage be designed to cater to the western taste and meet foreign standards thus reaffirming the presence of two kinds of Bangalore, an actuality observed through the contemporary handling of advertising signs in shopping malls in comparison to the domesticated treatment of local retail outlets.

An extremely popular road for shopping, eating out and entertainment, advertising signs along Brigade Road resonate the importance and spirit of the area through their large sizes, bold colors and frequent numbers (*ref. fig. 1.6*). It is the advertising signs that hold one's interest as one walks down the street as each sign is bigger/smaller and brighter/darker than the other thus creating a sense of unexpectedness and suspense along the journey.

A common feature along M.G. Road is the frequent occurrence of large hoardings on building rooftops. The junction of Brigade and M.G Road witnesses a multitude of advertising signs at this tactical point irrespective of the architecture style supporting the signs or safety hazards concerning moving traffic (*ref. fig. 1.7*).

Amongst all the streets of Bangalore, Commercial Street is marked as one of the most sought after shopping streets, especially in terms of fashion accessories, shoes and clothes. The most striking feature of Commercial Street is that, arguably, it is the only street where signs are aligned towards traffic unlike the rest of the streets where most of the signs are fascia mounted (*ref. fig. 1.8*). This is remarkable in regards to the outward appearance of the street.

The configuration of the advertising signs alters the experience of the place leading to the conclusion that signage can be employed to transfigure a space. Although the street is very definitely a part of the Bangalore commercial core, the orientation of the advertising signs simulates an impression of being based elsewhere in an alternative context. If not for the vernacular script evident on the advertising signs, the manner in which the signs are treated is reminiscent of streets in Hong Kong and South-East Asia.

Due to the countless advertising signs that are mounted on building surfaces screaming for attention, the building surfaces disappear under the barrage of these signs and merge to form a seemingly combined exterior. At certain instances it becomes impossible to tell where one building starts and the other ends. This development hints at the higher preference that the use of signs is given as compared to the puritan architectural quality of the façade upon which they appear. This can be attributed to the commercial stance that the advertisers take thereby connoting the essence of signs in commercial contexts. The general impression that one gathers while walking down the street is that advertising signs are more vital than the architecture upon which they rest.

## **Panaji**

Goa, located on the west coast of India, is the second smallest Indian state in terms of size. Referred to as the “pearl of the orient” for its predominantly tropical nature, a pristine coastline and the presence of world heritage monuments, Goa is a popular national and international tourist destination. The colonization of Goa by the Portuguese yielded a blend of social and cultural conditions thus lending to the creation of a distinct cultural heritage which is revealed in its landscape, markedly different from the rest of the country. The goan bearing is more inclined towards the continental and the state projects a healthy secular outlook with all communities living together in harmony. This tolerant nature of the community indicates that the media can be capitalized upon to explore innovative forms of expression in the landscape. Not only will this assist in concocting a unique identity but will also pique the tourist curiosity.

Panaji with its fair share of exotic locales and a pleasant mélange of modern and old architecture alludes to a Mediterranean feel, thereby persevering the individuality that Goa is famed for. Being the capital city, Panaji is laced with a heavily commercial undertone. The first impression that one acquires of signage in Panaji is the haphazard manner in which it is displayed (*ref. fig. 1.9*). Advertising signs do not follow a pattern or adhere to a design outline. Signage can be seen plastered all over building surfaces blocking architectural features and display windows. Most of the signs in Panaji are wall mounted and no consistency is detected in terms of size even in the case of signs that are a part of the same building. This lack of uniformity liquidates the perception of the message of advertising signs and adversely unsettles the architecture and the appearance of the entire streetscape.

The distinguished blend of modern and old houses gives rise to a precarious situation in terms of treatment of signage. While the modern structures display some semblance of order when it

comes to the placement of signs, the older structures converted from residential to commercial use, utilize architectural surfaces to make up for the lack of display area. In order to catch up with the modern buildings and their use of flamboyant signage, the older structures sport advertising signage that is irrelevant to the architectural style of the structure on which they are placed and therefore result in an atrocious clash. The sizes of the signage strive to be large to match the surrounding signage and to be understood more loudly than the other. A large sign is used to reflect the exuberance and the enthusiasm of a business, which in turn reaffirms the size of the sign.

Being one of the oldest streets in the heritage quarter of Fontainhas, Dr.Cunha Gonzalves Road is lined with appealing houses belonging to the Portuguese period. With the growth of the economy and the increase in tourism, a fair amount of houses essentially residential in nature have been put to recent commercial use. The architecture along this street has remained but the nature of the signage has amended with the changing land use. Nevertheless, in most cases advertising signs are treated more as a convenience rather than a necessity. The worn down condition and the apathetic treatment of signs is a proof of this statement. The lack of seriousness in the treatment of signage also suggests that the area is not vastly commercial in nature as the signs are not forceful but rather weak in their disposition.

However, certain structures that have been converted from residential to commercial use grapple with the deficiency of available display area by exploiting walls as display mediums through elaborate explanations of available goods and services (*ref. fig. 1.10*). Due to the palpable disrespect to the architectural style of the Indo-Portuguese homes, the gaudy and out-of-scale signage can be termed as an eyesore along a street lined with colonial structures. Ironically, the loud advertising signage stands out against the subdued heritage background, drawing one's eyes to its huge size and flashy colour. In this manner the signage paradoxically works as a possible focal point or a landmark along the street.

Along a road that now witnesses a healthy mix of modern and old buildings, the older structures are subject to utmost insensitivity without any relation to the supporting architectural style to make up for the lack of display area. Overall, modern buildings along M.G. Road appear to have some semblance of sign design and layout in terms of a moderately regulated and uniform appearance. The juxtaposition of the old against the new reveals the muddled treatment of signage in the area (*ref. fig. 1.11*).

Signs are mounted on top of awnings, blocking architectural features. As one walks along these structures, the stacking of signs fashions a skin wall in front of the existing structure. What results is a rather messy and shoddy disposition for the older structures whereas the modern structures stand tall with their forthright and bold displays. Advertising signs transpire to be the only means of drawing attention to dilapidated structures.

Honoured as one of the most intensely commercial roads in Panaji, 18<sup>th</sup> June Road is especially known for the shopping outlets along its stretch which are announced by colourful and bold signs that strive for maximum attention of the people and reflect the modern outlook and attitude of this street. The façades of a majority of modern buildings do not make a strong statement and have a regular approach in this highly commercial zone. The signs therefore have to make up for the generation of interest in commercial activity. The signage on this road is fairly well organized and roughly sticks to the architectural outline of the modern structures, but there are no standards regarding the size and the number of these signs (*ref. fig. 1.12*).

### Preliminary Analysis

Despite the differences between cities studied, a generalised analysis that describes key features of signage has been developed in terms of sign types, scale/target audience, relation to architecture, location, and context, set out in the tabulation below.

CITY	AUCKLAND	BANGALORE	PANAJI
TYPE OF SIGN	Overhung canopy signs/awning signs	Fascia and projecting wall sign	Fascia/awning signs
SCALE OF SIGNAGE/TARGET AUDIENCE	Two distinct scales- pedestrian and automobile	Fairly distinct scale- mainly automobile	No clear distinction between pedestrian and automobile
RELATION TO ARCHITECTURE	Architectural style and elements responded to and considered in most cases	Architecture used as backdrop to mount signs in most cases. Response seen in case of malls	No apparent effort in relating to the architecture especially in the case of older buildings
LOCATION	Restricted mainly to ground and mezzanine level	No restriction	No restriction
CONTEXT	Commercial and entertainment district (CBD)	Commercial and shopping streets	Commercial

Table 1.1- Comparative analysis

Advertising signs in Bangalore and Panaji are less restrained as compared to Auckland and are hence more expressive. Advertising signs in India appear more eager to catch the eye and are splashed all over the building wall surfaces unlike in Auckland which has a clear-cut restriction to mainly the ground level. Although the advertising displays in India do not have a distinct pattern, it is the inimitable nature of advertising signs that helps to distinguish one place from another. No two places comprise of the same treatment of signs, which breaks the monotony of repetition. Due to the recurrent nature of canopy signs in Auckland, each street appears characteristically similar to the other.

In India the architecture serves as a skeleton to mount advertising signs thus indicating that in a commercial context outdoor advertising is more important than the architecture that the commercial street holds. It is noticeable that the advertising signs in Auckland strive to maintain a link with the architecture that they are attached to through the responsive incorporation of columns, railings etc. for the location of signs. In this way the signage in Auckland surfaces as a design element plying alongside the respective architecture.

Bangalore and Auckland both having been former British colonies, similar traits in architectural style exist but the advertising signage is offbeat in regard to its treatment. While local cultural factors are obviously involved, issues of pride and responsibility are raised. These phenomena can be inferred to be an indication of the consciousness of a society to respect its heritage and preserve its urban culture. Latkar (2004) remarks that considering its urban expanse, India is plagued with concerns of population, inadequate infrastructure and red tapism that accord an almost-indifferent approach to the theme of signage.

Nevertheless, the Indian approach materializes to retain a ‘bazaar’ mentality of touch, feel and see. While the display windows in Auckland often work as personal billboards, retail outlets in India are apparently keener to exhibit their products in an attempt to put their best foot forward. Signage is engaged as a means to beckon and suggest the calibre of the shop and the eminence of the area.

The potential of signs to generate an alternate dimension provoked by the presence of an image in the environment, described as 'hypersurface', can be utilized to glorify the space that advertising signs are located in. In a retail context, advertising signs define the commercialization of the area.

With their constant insistence, signages dispense an ambience of gaiety and substance to a commercial locality and add a personal touch to the public space by reaching out to every consumer. The need for advertising signs however does not justify the visual chaos that the excess in numbers of the signs breeds. In a busy commercial setting, architecture emerges to serve a purely basic function of shelter and a more convenient one as mounting backdrop or base structure.

## **Conclusion**

It can be deduced that advertising signage is a dominant element of a streetscape in a commercial context. Signage can be designed depending upon the architecture on which it rests e.g. in Auckland the presence of a canopy allows for the incorporation of under canopy signs thereby reducing the visual clutter on the building surfaces.

It is also important to identify the target audience for which signs are displayed thereby creating different scales of signage easily identifiable by the viewers. The size and the scale can thus be regulated depending upon the target audience. The purpose of the advertising sign is also an important criterion in determining the size. In this case, the context should be kept in mind such as institutions like malls and cinemas require a larger area as compared to medical stores and pharmacies.

The architectural structure upon which the sign rests is most vital in the design of signs. Advertising signs should always respect the architectural contours of a structure on which they are placed rather than deflect from it. Signage should maintain a proportion with the wall surface e.g. a façade-signage ratio could be worked out to be referred to, while designing signage. Signs should not block architectural elements.

In a context where the advertising is the architecture, signage should be devised to mould the architectural skeleton and make a positive contribution to the space generated by the presence of a sign on the building by keeping in mind the color, illumination and the context in which it is placed.

Modern buildings should be designed with signage in mind and the advertising signs on heritage buildings should be designed in a manner so as to add to the character of the architecture and not detract from it through out-of-scale sizes and garish colors. Signage for heritage buildings should be confined within the architectural elements like awnings or limited to under canopies, if available. Local materials can be utilized to relate to the architectural style and maintain the integrity of the heritage buildings and reinforce the connection with the context

Location of a sign is important as it determines the type of sign that can be used, its application and vice versa. Location can also be determined depending upon the target audience. Instead of imposing a restriction later on, it is prudent to decide a location in the planning stage. In this way the overall impression of the structure appears planned. It is the context, which should be kept in mind to decide the ultimate design for advertising signs.

Rooting of the sign to its context in terms of material, color and content can help to devise an identity for a place and enhance its character.

Advertising signs are an important means of communicating to people and since architecture entails the conveying of messages to its users, signs can be employed as elements of architecture. It is observed that when signs utilize the architectural features while respecting their scale and the proportion, the overall effect is more pleasing to the eye. Architecture can work with the advertising to craft a harmonious amalgamation between the two mediums to create public spaces that venerate both the mediums and arrest the senses.

Since the architecture of a city ought to be its truest expression, in a seemingly competitive commercial world, it is becoming increasingly important to embrace signage as an ingredient of substance to enhance the commercial architecture of a city and contribute towards creating an identity for a place. It is imperative that the architects work with planners, graphic designers, and urban designers to create spaces that truly reflect the integrity of our times.

**PLANNING TEMPLE ARCHITECTURE :  
EVOLUTION AND GROWTH OF ORISSAN TEMPLES**

**Dr. Amal Kumar Mishra  
Senior Reader in History  
P.G. Dept. of History  
Utkal University, Vani Vihar  
Bhubaneswar-751004, Orissa  
Tel : 0674-2585080  
E-mail :  
amalmishra56@yahoo.com**

Spiritualism is a life sustaining force to many like water and fire since time immemorial. Though at the time of religious frenzies it divides people, as critiques allege, yet it also works as a binding force and contributes richly to the domains of art, architecture and sculpture which mark the progress and development of human civilization from time to time. The high potentials of the people manifest itself in creative works and activities, as found reflected mostly in the religious institutions and monuments of the ancient and medieval times across the surface of the earth. On the eastern sea-board of India, the Oriyas, people of Orissa, took to temple constructions on such a massive scale and that too, in such a distinct style of their own that it created a brand name for that type of temple architecture called, Kalingan Order or style of temple architecture. It is even now considered quite unique and special in the entire Indian sub-continent.

In fact, the pall of obscurity over the exact name to be given to the Order of temples in Orissa is lifted by the Amriteswar Temple Inscription,<sup>1</sup> which categorically refers to Orissan group of temples as belonging to the Kalingan Order or style of temple architecture quite separate from Nagar, Dravida and Besar styles originating in other parts of India like north, south and west respectively. Therefore, very safely it can be told that they are ‘one of the most compact and homogeneous architectural groups in India’<sup>2</sup>.

As revealed from *Ekma Purana*, a Sanskrit religious text, and other corroborative records, the king Sasanka of Gauda, inflicted a terrific blow to the land of Buddhism, that ancient Orissa was, and conquered major parts of it in the early part of the 7<sup>th</sup> century A.D. He caused the building of the first ever Saiva temple in the very heart of Tribhubaneswar, roughly identified with the present capital of Orissa, Bhubaneswar. This very act led to a sea-change in the outlook of the people who till then largely followed Buddhism. The *Pasupata* sect with Lakulisa, the teacher-organiser of Saivism, rose so much in popular esteem and perceptions having such an impact that he got deified in no time. It very successfully, as it appears, fought for supremacy with Buddhism and got a strong foothold in the mainland of Orissa. In fact, in almost all the early Saiva temples

here, one finds invariably a Lakulisa image at the centre of the threshold or lintel in the *Jagamohana* or entrance, leading to the interior part of the temple precinct, in a sitting and meditative posture like that of Lord Buddha. The early temples like Bharateswara, Lakshmaneswar, Satrugneswara, Parasurameswara, Swarnajaleswara and a host of others were built during the period of rule (553-736 A.D) of the Sailodbhavas, who first of all accepted the suzerainty of king Sasanka of Gauda but later on declared their own independence. With the patronage given to Saivism by the Sailodbhava kings, the socio-cultural scene here also began changing and Saivism got wide acceptability and popularity in ancient Orissa<sup>3</sup>.

The next generation kings belonging to a new dynastic order called, Bhauma-Karas belonged mostly to Buddhism but the irony was that many of their queens had definite leanings towards Saktism and Saivism. Therefore, the temple building activity continued with great elan during the period, 736-949 A.D. With two Sakti shrines of a new type called *Khakhara*, planning temple architecture entered a new phase, first by introducing certain new modifications in the earlier style of temples and secondly, by creating a new form of *mastaka* in the architectural plans; the two important temples being that of Vaital and Varahi. Apart from these two, the constructions of so many Saiva temples called Sisireswara, Markandeyaswara, Taleswara, Uttareswara, Siddheswara, Bhringeswara, Kanakeswara, Manikeswara et al located at different parts of present Orissa, help the historians in determining not only their political importance but also socio-cultural grip over the popular mindset which accepted the worship of mother Goddess along with Saivism as nothing before.

The Somavamsi rule which came up in the first half of the 10<sup>th</sup> century A.D. (949-1118 A.D) virtually brought about a new impetus to the temple planning activity with emphasis on more decorative motifs and achieving greater elevations or heights. Largely following Saivism the Somavamsis caused the construction of the temple of Mukteswara, held as the gem of Orissan temple architecture for its pristine beauty, charm and style. The genius was also marked in the building of Raja-Rani temple, 59' in height. The popular demand for raising the heights of the temples with additions of more decorative motifs and artistic designs led to the building of temples like Jaleswara, Brahmeswara and ultimately Lingaraj; the latter's height attaining a record 180'. A stupendous piece of architectural marvel, the temple of Lord Lingaraj jots into the skyline of Bhubaneswar and astounds everybody from a distance for its glamour, style and sheer elevation. It truly represented the Kalingan Order or style reaching the final stage and form so far as planning temple architecture was concerned in those times.<sup>4</sup> The popularity of this shrine grew in leaps and bounds over the time and the result was, the inscriptions galore inside the temple compound. One such, tells of Jayadeva, the great poet, who composed the *Gita Govinda* in the 12<sup>th</sup> century.

Vaishnavism took the center stage due to its catching popularity quickly in the later years when Ramanuja of the south visited Puri and the ruling Gangas (1118-1435 AD) had to bow down under pressure of public opinion, as it appears. Because, not only Bhubaneswar but also Puri now became the field of temple building experiment with emphasis on more elevation and the gigantic temple of Lord Jagannath came up in a big way. It was followed by yet another at Konark, a nearby place, where a more grand structure for the worship of the Sun God was built on the sea-shore itself. The temple at Puri went upto a height of 214'8" whereas the one at Konark got elevated upto 220', a rare feat considered quite

unique and impossible in those times in India.<sup>5</sup> Besides, the Ganga rule is also credited with the construction of temples for Laxmi, Megheswara, Sobhaneswara, Madhava, Chateswara, Budhanath, Daksha-Prajapati, Chandeswara, Gopinath, Parvati, Sari, Chitra-karini, Ananta Vasudeva et al spread over a huge and extensive part of present Orissa. The moot question - how these architectural experiments became possible in the absence of modern techniques and tools?

The Suryavamsi rule (1435-1497 A.D) coming in quick succession could not however achieve such big targets in planning temple architecture. Though it is credited with building some monuments in the form of temples like Papanasini, Varuneswar, Kapileswar, Sundara Madhava, Varaha, Sakhi-Gopal, Dhabaleswara et al located at different parts of Orissa, yet a general decline had set in so far as the style, elevation and architecture of the temples were concerned. It was due to many factors which included a series of bloody aggressions beginning from 1568 and successive alien rules. As a result, the political, social and cultural scene in Orissa took a dip thereafter. The palmy days became over but, no doubt, the temples continue to remind us till to-day about the glorious past of the land and her people.

Now the technique and the methodology employed in the construction of the temples based on the baroque style need only to be analysed.

As stated, a temple in Orissa is considered quite unique for 'its plan and elevation'<sup>6</sup>. In a typical Orissan temple precinct, one finds, as per local terminology, a *Rekha* or a curvilinear spire type structure alongside a *Pidha* or a pyrammical roof type structure. The *Khakhara* or a semi-cylindrical roof type structure is very special and rare and may be taken as an exception in Orissan temple patterns. They can be seen at a few places only alongside a *Pidha* structure.

A *Rekha* temple, which is a curvilinear spire type structure, is almost conceived as a human body with its specific peculiarities. It is marked for its vertical ascent from the ground or a platform and happens to be the main sanctum sanctorium in which the chief God or Goddess, as the case may be, presides. It has three main portions. A *bada*, which is a perpendicular wall, the *gandi*, the curvilinear spire, and the *mastaka*, the top portion or the head of the temple.

The *bada* is invariably sub-divided into three portions - *pabhaga*, where the temple touches the ground or the *pista* which is a high or low platform depending on the elevation of the temple; *jangha* or the shin portion situated above *pabhaga* manifested in the form of vertical walls, and *baranda*, the upper set of the mouldings in the *bada*. The *gandi* which is the main body of the temple having vertical projections called *pagas* or *rathakas*, rises from where the *bada* ends and moves upward in curvilinear form until it reaches the *bisama*, by far, the most critical point where the *Rekha* structure takes a gradual convex curve to reach the top portion or the head, called *mastaka*. It begins with *beki* or the neck portion representing a cylindrical form followed by the *amalaka* or *amla*, which is like a disc having several projections, then *khapuri* or the skull, atop which the *kalasa* or the auspicious pitcher rests. The weapon called *ayudha*, as per the deity's costmary preference is set up only above it. The banner or the flag called *dhwaja*, attached to a mast and tied to this weapon stand, continues to wave through the air and cloud all the time throughout the day and night, drawing crowds of devotees to their popular destination from far and wide.

A *Pidha* temple took the shape of a pyrammdical structure in course of time although as a flat roof model it marked its beginning in temples like Parasurameswara. Named as *Jagamohana* first, it served the purpose of congregation of worshippers only, where they would wait or meditate. In the later period more such *Pidha* structures about two to three, were built and pressed into service for quite different purpose like solding music and dance sessions in *Nata-mandira*, a *Pidha* temple, and offering of *bhoga* or cooked food in *Bhogamandapa*, a *Pidha* temple. The temple compounds of Lord Lingaraj, Lord Jagannath and the Sun temple at Konark, all have a number of *Pidha* temples with one big *Rekha* temple in a row which give a gigantic look to the onlookers. With horizontal platforms or *pidhas* and characterized by pyrammdical roofs of receeding steps, the *Pidha* temples became more popular over the time due to their multifarious usage and utility.

A *Khakhara* temple<sup>7</sup>, having a semi-cylindrical roof, happens to be a rare specimen in Orissan temple architecture. An oblong shape and rectangular pattern give it a different look altogether. It's roof appear as a *boita kakharu* (a large pumpkin) or a *boita* (an upturned boat) from a distance.

What strikes the most to an onlooker or a visitor is the planning and construction of the temples of various sizes and shapes - small, big and gigantic in nature. A *Rekha* temple or a *Khakhara* temple added with one / two / three *Pidha* temples, as the case may be, just bewilders the imagination of the modern tourists. How much effort, planning, design and persepiration must have gone into their building are just beyond comprehension !

In the construction of Orissan temples and their enclosures in the form of huge walls generally three kinds of stones are found to be used-laterite, khondolite and chlorite. When the laterite stones are used to prepare the bedrock of the temple and it's high compound walls; the khondolite stones for the super structures and elevations that give the temple a massive look. The chlorite stones are mostly used in the making of door jambs and icons of the deities. The basic idea behind it is to ensure a fine polish, workmanship and more longevity.

Certain temples of the medieval times made of large size bricks (13"x10") are also seen in some parts including the Prachi valley of Orissa<sup>8</sup>.

It is interesting to note that in ancient and medieval periods when large pieces of stones were being transported by means of rafts in the water-bodies like the rivers and canals, small pieces were carried in land routes by means of bullock carts. Some really heavy pieces of stones were dragged by manual labour from considerably long distances to the construction sites. Again the manner, in which they were lifted up to still greater heights when the construction work proceeded, is just mind boggling. One theory suggests that the temple was being filled up with sand or earth at each step of it's progress and elevation and the blocks of stones were easily dragged over it to the desired level. Yet, another theory tells that on one side of the temple under construction an inclined plane or slope, made of wood or bamboo, was created in order to allow the movement of heavy stones to the upper limits. However, it remains an unsolved puzzle, as to how it became possible to work on temples of gigantic nature like Lord Lingaraj and others in the absence of modern know-hows, tools and techniques !

The baroque style is manifestly clear in the numerous temples for which Orissa still feels proud of. The grand ornamentation, style, elegance and fine needlework on the stones employed for the purpose of building temple structures – *Rekha*, *Pidha* or *Khakhara* are just bewitching and breath-taking. A *Rekha* temple jutting into the skyline because of its vertical ascent and seen with a *Pidha* temple having a horizontal emphasis are invariably linked within and in unison, present a superb appearance. The artisans, therefore, often describe the unique combination of *Rekha* and *Pidha* temples as the groom and the bride respectively.

By far, the most outstanding feature of the *Rekha* temple is its *paga* or *ratha* or *rathakas* which are vertical projections on the body of the main temple. Called *tri-ratha*, *pancha-ratha*, *sapta-ratha* or *nava-ratha* as per the number of these projections the temple gets a beautiful appearance and a colossus look. Also these projections produce an ‘effective play of light and shade’<sup>10</sup>.

The *Anga-sikharas*, marked for its specialty, are temples in miniature forms not exactly forming a part of the main body of the *Rekha* temple yet attached and integrated to it on the outer surface of the wall only for decorative purposes. They go up and up with the rising growth of the temple upto the starting point of the convex curve or *bisama*.

The so many decorative motifs and relief works found in plenty outside the temple walls are in sharp contrast to the serene atmosphere prevailing inside. They are in the form of stone images or icons of (1) Gaja-Lakshmi (2) Astagraha or Nabagraha (3) Dikpalas (4) Dwarapalas with Ganga and Jamuna (5) Ghantakarna (6) Kirtimukha (7) Alasakanyas or indolent maidens (8) animal figures like Bidala, Kesari, Gaja, Marjara (9) avian and aquatic creatures (10) reptiles depicting Nagas and Nagis (11) various designs of flowers, creepers, plants and different geometrical signs--all considered auspicious architectural marvels.

The images of *Parsvadevatas* or the divinities in the principal niches in the three outer walls are specimens of a very high artistic genius in the domain of iconography. The manner in which these figures are chiselled out of the stones mostly of chlorite / khondolite varieties are simply astounding especially in their depiction of the sharp features, particularly portions like the nose, earlobes and eyelids of the icons.

The conjoint erotic figures in stones sometimes depicted on the outer walls of the temple stimulate the curiosity of the onlookers, no doubt, but at once he or she is reminded of the worldly passions and hence, tries to keep away from them.

The highly ornate *chaitya* windows are ornamental motifs generally seen in the apsidal *chaitya* halls. Other than this, the latticed and balustraded windows invariably add to the beauty and charm of the *Pidha* structure.

The corbelling method adopted in the *Rekha* temples containing the *garva-griha* or sanctum sanctorium makes an interesting study. In order to give more stability as well as longevity to the ever rising *Rekha* temple which often have long elevations, the artisans have resorted to the practice of tying the opposite walls by way of fixing *mudas* or ceilings at regular intersections. Not seen from outside the first *muda* above the cella is called *garva-muda* and then, another at a still greater height called *ratna-muda* and so on and so forth in still bigger temples of Lord Lingaraj and Lord Jagannath.

By far, the most astonishing yet a contributing factor to the grandiose beauty of the temple is the fact that in the building of the temple no mortar has been used. The sandstones, just hewn out and very finely dressed, are fitted in a manner that they are 'held together mainly by a system of counterpoise, the weight of one stone acting against the pressure of another, much of the stability being a matter of balance and equilibrium'<sup>11</sup>. The joints, therefore, are hardly seen or marked from outside giving a clean look to the temple as a whole. In some cases iron clamps and dowels have been used to keep the stones intact and to remove all shreds of doubt and fear of displacement in future. In a few places like the temple at Konark belonging to the 13<sup>th</sup> century A.D. iron beams are found used as supports. Though wrought irons mostly, they certainly certify the superb workmanship and the skill of the smelters and smiths of that period.

In respect of the sculptural designs, a certain thing that is noticeable is that the outlines are marked first of all with a sharp edged tool and only afterwards the artistic designs are engraved *in situ*. This trend is conspicuously marked in at least two temples of yore, Mohini and Raja-Rani.

The plastering, lime washing and painting of the temples of the ancient and medieval periods also attract a good amount of attention<sup>12</sup>. The temple of Mukteswara at Bhubaneswar can be cited as an example where brick red paint was applied by way of mixing clay with red ochre. The temple of Lord Jagannath at Puri has been deplastered recently revealing many of the fine monuments and sculptures beneath it.

The point to be noted here is the fact that the Kalingan Order of temples found in Orissa to-day are not of a fixed type or pattern since the size, shape and style all went on changing for the better under successive generation of ruling dynasties due to their creditable patronage and support throughout the course of history. With new ideas coming up every now and then, the bulk of the artisans went on revising their course of action and adopted the path of more development and perfection. The basic formula, characteristic and plan remaining the same i.e., square inside and projections outside, an honest attempt was made to register more heights for the temples which led to a proportionate increase in the dimension of the sanctum sanctorium and the desired elevation. With continuous additions of projections, mouldings and elaborative features caused to the top of the *Rekha* temple, the entire gamut of temple architecture was recast and redesigned from time to time. The decorative motifs also underwent a change for better refinement and ornamentation.

The *Pidha* temples from a flat roof model, as found in the early temples like Parsurameswar, also increased in size under the impact by way of adopting the pyrammical roof pattern with several tiers in successive stages with many of the finer elements of the *Rekha* structure getting absorbed into it's building and preparation.

Thus, from 6<sup>th</sup> to the 16<sup>th</sup> century the Orissan temples were built in large numbers and because of their plan, technique and baroque style of architecture they are highly commendable<sup>13</sup>. All said and done, a remarkable continuity one finds in the temple patterns of Orissa down the times to the present day. In the modern times too, so many new temples have come up in a big way not only in parts of Orissa but also in other areas of India as well, constructed by the Oriyas who go out in search of new pastures or settlements. In Delhi, Chennai, Ahmedabad, Bangalore, Chandigarh and many other cities in the country, thus one finds so

many nice temples belonging to the Kalingan Order. The ISKCON movement also adds up to the number of temples on a world wide basis following largely the Cult of Lord Jagannath which has its roots deeply embedded in Orissa. Therefore, it is not at all surprising now to find temples of this style and Order in countries like the U.S., U.K., Canada, Australia, New Zealand et al. It is amazing to note that following the tradition set by the Car festival of Puri<sup>14</sup> such festivities are also being organized at these places annually on regular basis drawing a large amount of cheerful crowds. Of course, the temples of the recent times are built mostly using modern techniques including bricks and mortars unlike the past, yet the same style more or less continues to thrive with great elan and impunity. The Jagannath Cult and philosophy originating in Orissa is getting more popularity and acceptability day by day, hence, the days are not far off when the land of Orissa and her people would get their due recognition in the world as master-builders of a great and unique civilization contributing largely to the fields of art, architecture and culture.

### Introduction

During the 1920's, professionals of different fields in Brazil, such as writers, artists and architects, searched for new forms of expression in their work. They sought to respond to an understanding of Brazilian reality. Through their affinity with modernity, their work expressed new visions of Brazil. Among the themes considered are those related to rural life and changing habits; emigration, industrialization and urban life; miscegenation; and other aspects related to the characteristics of a new society under rapid change brought about by social, economic and cultural development.

An affinity for the new in the sense of "modernity" was considered. These ideas were the basis of a cultural project in which art; architecture and urbanism were instruments of change. In this sense, these professionals contributed to the development of a Brazilian identity along with national aspirations for progress in harmony with modern societies.

Under these circumstances, it could be said that the reception of the modernity was possible due to the rise of a cultural project which began in the 20's and 30's and became a political instrument of social and economic aspirations for national development in Brazil. Such historical context explains the link between the State and modernity. It is made clear in the representation of institutional buildings. This was the case of The Ministry of Education and Health Building (1936), and The Brazilian Pavilion at the New York Fair in 1939. The integration among art, architecture and landscape in these urban-scaled projects, seeks the cultural apprehension of modern spaces by a sense of belonging in the creation of a truly Brazilian atmosphere. This can be noted in the work of landscape architect Burle Marx (1904-94), in the mural paintings of Portinari (1903-62), and in the work of Lucio Costa, architect and urban planner of Brasilia city-capital (1958).

### Lucio Costa and Modern Urbanism

Costa's consistent approaches towards architectural and urban planning development through history, his theoretical and historical delineations, provide ample proof of his capacity to situate architecture and urbanism in the cultural debate. The debate was understood within a process of cross-cultural creation for the construction of a national identity, within a new conception of nation and citizenship. Within these themes, this paper highlights the importance of modern ideals in the construction of modernity. These ideals were reflected until the 50s in Brazil, as will be understood by the analysis of the urban plan conception proposed for Brazil's capital city in 1958, through an interview done with by Lúcio Costa (1902-98).

### **An interview with Lúcio Costa**

*How was the idea of the superquadra born?*

The idea of the *quadra* was due to an initial difficulty I encountered when I began elaborating the project of Brasilia. Given its singularity, it is a city that perhaps cannot set an example for other cities. As a capital and in any country, it is a unique case.

The fundamental parts that characterizes it, are the administrative and bureaucratic parts of the government they symbolize. Government buildings, ministries, the court of justice, and presidential buildings required a broad, generous scale capable of conveying a sense of adequate atmosphere and dignity to any Brazilian residing there or visiting the city.

Yet, how to reconcile such broad and generous scale with the scale of daily life, with a residential scale that is far more intimate?

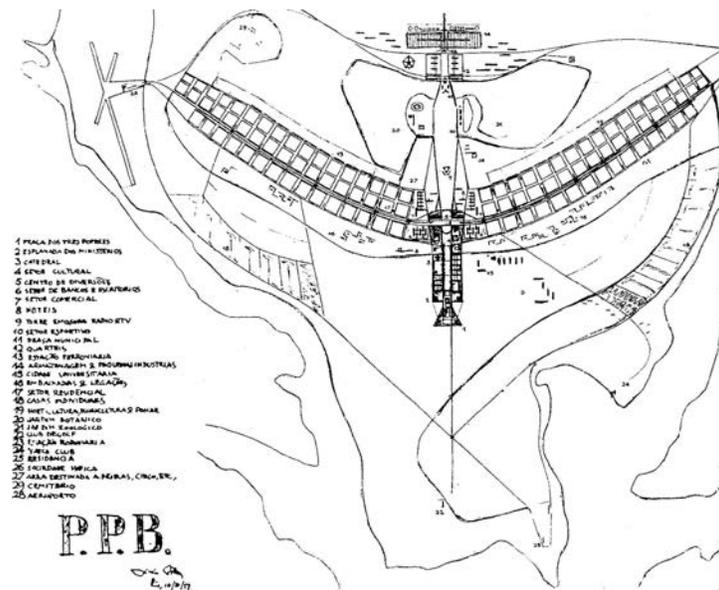

Fig 1: Pilot Plan Brasília.  
Costa(1991)

Fig.2: Monumental Axis. Costa (1991), p.304.

Hence the idea of the *quadra*, or *superquadra* as it has come to be called due to its larger size. City blocks are usually a hundred by a hundred meters; in Brasilia, they are approximately three hundred by three hundred meters.

*Quadrads* are defined in space, not by rampart-like walls that enclose the space completely, but by continuous rows of trees, which in time came to demarcate –once their canopies merged together– a real wall of foliage that unlike a medieval masonry fortification, is a wall that sways in the wind, that breathes, and which you can see through.

Regular rows of trees, two aisles along the entire periphery of the *quadra*, a kind of tree lined trail pleasant for pedestrians, all have the advantage of being both a frame and a promenade. This gave fortunate results and I left a 20m wide band around each *quadra* in order to expand its domain even further. All the *quadras* are square in plan with sides that are 240m long, there is the additional 20m wide stretch of vegetation on all sides.

Having fulfilled their framing function and having thereby delimited particular areas, these rather large squares could naturally enter in a dialogue with the monumental scale of the administrative areas, and the city would therefore not run the risk of being dividing in two.

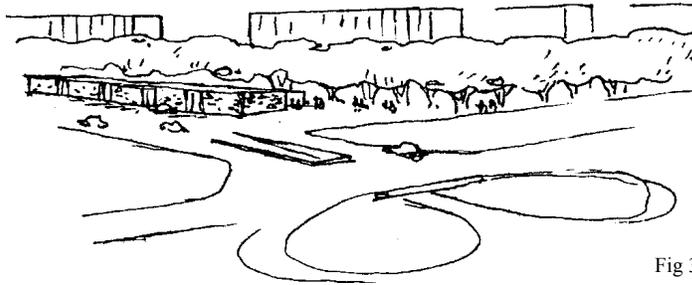

Fig 3: Super quadra - perspective.  
Costa(1995) , p.309

In due course, different criteria were adopted for different areas of the city, the characteristics of which had to be well-defined within an organic and structured whole. This allowed for the establishment of urban characteristics throughout the city; there is the administrative area, that is to say the monumental area that interconnects the two wings, each 6 km long, the so called residential axes stretching out on either side. *Quadras* were designed to always house apartment buildings, whoever needed to live in detached houses had the option of venturing further out in the lake's peninsulas.

Now, inside the *quadra* there is always that problem. Having always sought to respect those who are more reserved, who dislike mixing with others while nonetheless keeping in mind individuals who are more extroverted, I think the *quadra* caters to the needs of both. Besides, I had the fortunate idea of adopting early a height limit of six floors for all buildings, which is the height of building prior to the advent of elevators. When there were no elevators, cities had that height of five floors plus an attic. The staircase ruled and, as a result, an idea of the traditional city stayed, more human, more contained within height regulations.

Given that we had by then already adapted to new construction technologies, buildings could feature open spans and no longer needed to rest on the ground but on grids of columns held

together by the building above. This caused major changes because you could now allow people to walk through the view as well as enter the building not from the front or back, but from beneath. General access flows freely through and despite buildings.

In your entry's brief for the Brasilia competition, you established general principles for residential buildings, which you refer to as "slabs." Was it to suggest a generalized adoption of this typology?

To avoid having in the *quadras* several small, stand-alone buildings with only one entrance, it seemed opportune to have groups of three or four, with the possibility of having a long continuous building with multiple entrances. It seemed to me that by grouping them I would guaranty free space between buildings. *Quadras* would then have a certain numbers of these building that I called "slabs."

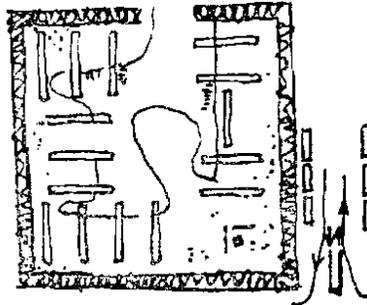

Fig 4: Super quadra  
Costa (1991), p.24.

*Why the average of eleven of these buildings per quadra?*

It happened somewhat by chance and then turned into a sacred number. That was not a pretense of mine.

*What did you have in mind in terms of open spaces?*

I had wished that they be even more free and unobstructed, in the English manner, more like those parks that have their grounds covered with lawn without really having to define circulation, just a few scattered lines of desire. Lawns are meant to be used and rather than having a sign that says "Don't step on the grass," I wish for the opposite one: "Please step on the grass," so that lawns can be enjoyed like green carpets, on which people can lay down, set up their chairs, stretch out, hang out, exercise, and play at leisure. Too much wear and tear caused by heavy circulation is of no importance, lawns can always be revived. Soon, however, a tendency to urbanize began, trails were paved over and too many areas were unnecessarily covered with asphalt.

Children as well take advantage of these open areas shaded by tree canopies. They play, run... Carefree, yes... (pause). Without it being a walled-off place, gated with a guard at the entrance, where you'd have to present an ID. The given amount of space provides the place with a degree of nobility. Children remain naturally under control due to a definition of space marked by existing buildings and the perimeter of trees as well as by the presence of many doormen who are all too familiar with resident families. And all this without any other form of a rigorous policing, so that a sensation of total freedom can indeed be achieved.

*To what extent did Guinle Park influence the project of the superquadra?*

It is where it all began. The idea for Guinle Park does appear in the *quadra*. Those slab-like buildings, six floors high, raised on pilotis.

*Is there any relation between your residential slab and Corbusier's unité d'habitation, like the one in Marseilles?*

The proposal for Marseilles, and three others I think, including one in Germany. His was a comprehensive conception, it was very communitarian in scale and called for rather large buildings containing numerous units, in an attempt to achieve a sort of autonomy.

The *unité d'habitation* in Marseilles had a commercial street internal to the building. Given the large size of the building with its large number of apartments, there was an attempt to provide a so-called *rue-corridor* for retail purposes. This way, in winter's bad weather, you would not need to go outside in rain and snow. The idea was that you would have shops, bakery, and all amenities inside the very building.

Aside from this commercial street, buildings also had parapet-walls that were rather high on the roof, which could then be used as a recreational area for children, a school, a kindergarten. Other than that, there was plenty of open area, his idea was always to create spaces that were rather free.

*And what was yours?*

I reduced the slab to the scale of the individual, closer to the ground and more in agreement with our tradition, so to speak; and this was implemented in the *quadras*, thus limiting building height to six floors.

Each set of four *quadras* was to make up a sort of neighborhood area that included shopping and other community services such as a movie theater and a church. These neighborhood areas were to be arranged in succession along the 6km long residential axis like a set of links, a chain, or a necklace that people would drive past, and yet these units were relatively independent. Everything coming together in one place.

Between one *quadra* and the next there is the *interquadra*, an intermediary strip 300m x 80m separating one *quadra* from the next. These *interquadras* are precisely destined for sports facilities, clubs, and recreational areas. Those that are located next to access roads could accommodate a movie theater, a church, or some other such thing for collective use, whereas those located further in accommodated more recreational programs.

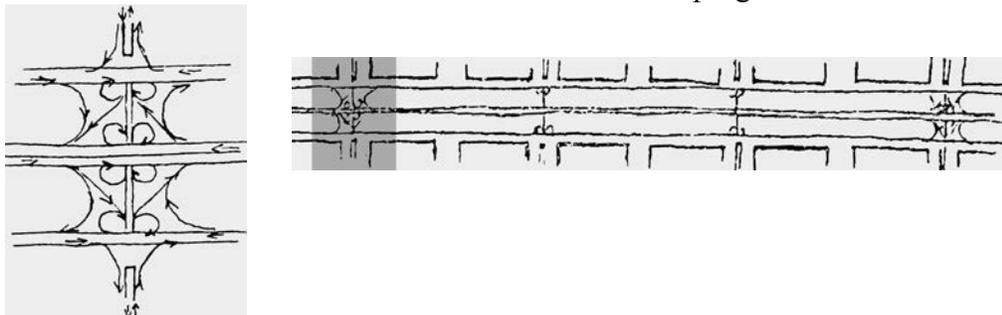

Fig. 6: Residential Axis.  
Costa (1991), p. 21

Fig. 5: Access to neighbourhood unit.  
Costa (1991), p. 21

*Was your intention to have different types of residential slabs, for the different kinds of occupants?*

I always suggested that each neighborhood area, made up by four *quadras*, should have apartments of two or three different categories to allow, as in an ideal city, coexistence in schools, or a normal coexistence of populations that belong to different economic strata.

The city's implementation scheme provided such services: schools, health centers, and social service centers, that served about three neighborhood units, they would have these centers much in the same way any other city district would.

The plan was to have an elementary school in every *quadra*, and a high-school for every four, as well as a church and a community center. Self-sufficient. Establishing a sense community. These services were very well planned, but then were set aside by city administrators who did not really take advantage of this.

*And how do you now feel while visiting Brasilia?*

I am very happy, notwithstanding all the criticism and despite certain things having been quite distorted. The project was one thing and became another, but I think many features that characterize the city have survived. It is a serene city, different from all other Brazilian cities; it has a distinctive personality.

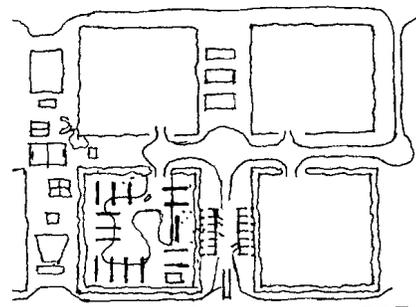

It is, in any case, a bureaucratic city, that has this characteristic of not being like a normal city. Keep in mind that the attempt to transform a city –that was to be inhabitable in three years, as the country's capital, as an administrative city, as this and as that– into a spontaneous city is absurd! Brasilia will never have the characteristics of a spontaneous city that so many people call for.

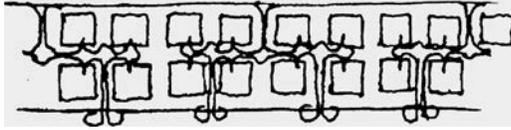

In a normal city, urbanism's objective is to create conditions that allow a city to sprout like a plant unlike Brasilia, which is a product of reason imposed by an act of will that occurred with the expressed objective of transferring the country's capital.

The intention was to create a city that had a pleasant way of life, yet that remained truly administrative with its own characteristics, well defined, meaningful.

*Thank you very much for the interview.*

Not at all, always at your disposal.

## **A Post-Occupancy Evaluation (POE) of the Super quadra**

The aim of this study is to provide evidence of inhabitants' transformations in Brasília's super quadra. The results speak in support of making possible the implementation of future guidelines for the super quadras, optimizing the application of directives to satisfy inhabitants' needs. In order to elucidate the causes of mutations arising from the inhabitant's interaction with their physical environment, a specific POE method was developed. The procedure considered field work: observations (the identification of physical evidences), surveys and interviews.

On the super quadra scale, the study takes into consideration the relation between indoor and open spaces, such as the use of common areas in the residential slabs, changes in surrounding areas of these buildings, and the modifications in the apartments.

On the neighbourhood scale, the study focuses on the inhabitants' satisfaction with the efficiency of the residential facilities planned, including public services and recreational areas. Among the conspicuous activities questioned were the daily tasks, such as going to the local commerce store, access of children to the elementary school, and social interaction.

The sample considers the neighbourhood units planned in the southern part of the Pilot Plan area, among the super quadras SQS-108, SQS-107, SQS-106, SQS-208, SQS-206 and SQS-304. The residential slabs were designed by Oscar Niemeyer (b.1907) (Fig.9). From a total of 66 slabs of the same design pattern, 10 slabs were selected in accordance with their site location. The total population sample is approximately 1500 dwellers with an average population of 150 inhabitants per slab and 4 dwellers per unit in a 3 bedroom (Fig. 10).

Mail questionnaires were applied to a total of 175 house-holds in order to incorporate the dwellers' opinion into three blocks of questions regarding the apartment unit, the slab, and the super quadra. Also, open questions were considered, enabling a better understanding of living conditions and the reasons for interventions.

### **Interventions**

The urban structure in Brasília was initially structured around public soil. This has created a particular relationship between public and private, generally limiting private areas to indoor spaces. This spatial characteristic is also notable in the inhabitants' enclosure of public spaces within the super quadra, such as the creation of barriers with shrub fences on the ground floor of the *pilotis* areas (Fig. 11). It has consequently limited public access to the *pilotis* by restricting movement.

Fig.9: Residencial slab.  
Oscar Niemeyer, architect.

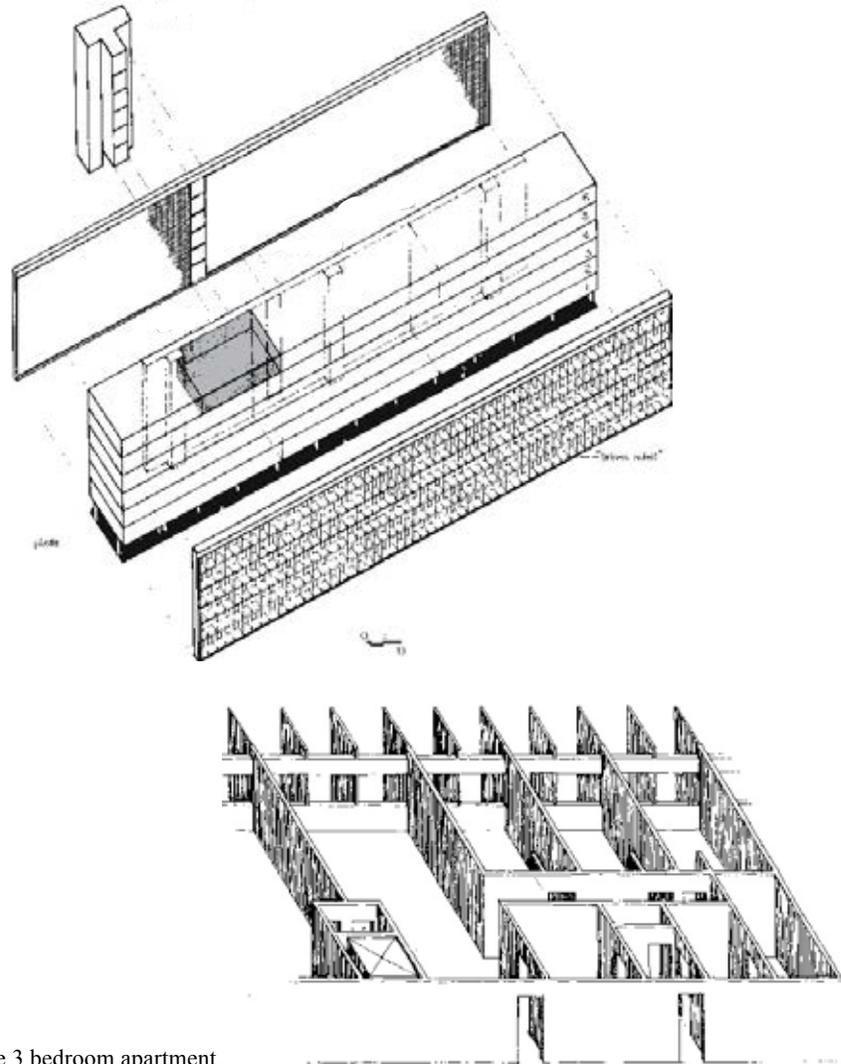

Fig. 10: Type 3 bedroom apartment.

Fig.11: Shrub fences on the ground floor of the *pilotis* area - SQS406.

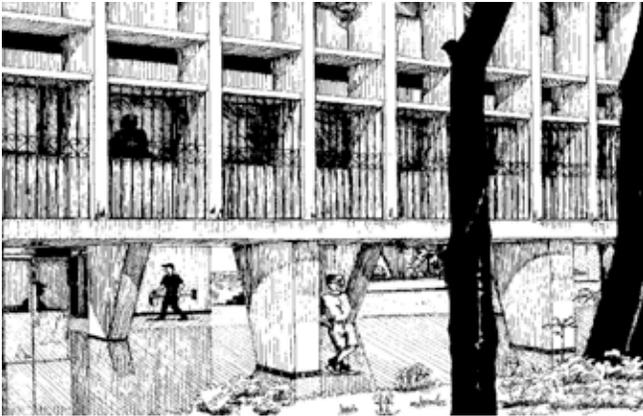

Fig. 12: Pilotis area - SQS 206.

Inhabitants also enclose public areas to create recreational spaces and parking lots in areas between residential buildings. The substitution of finishing materials and the construction of additional rooms for social and administrative purposes in the *pilotis* areas has also assisted the creation of distinctions among slabs (Fig. 12).

Some improvements are also seen in the residential units, where 82% of service areas have been remodelled. Nowadays, the use of daily services is exceptional for middle-class inhabitants. This has caused changes such as the substitution of the maid's room with a bigger laundry. Also, the original laundry room has given place for a new bathroom, giving the option of the creation of a wardrobe.

From the results obtained in the interviews and reinforced by observations, it was noticed that some physical characteristics of the super block influenced the spontaneous appropriation of the inhabitants, such as children's use of green places near the slabs to play soccer (Fig.13), and teenagers' meeting places at focal points under shaded areas. Sometimes these places were adapted by dwellers, being better equipped than the planned spaces originally proposed for those activities.

Fig. 13: Teenagers' meeting places near the slabs - SQS 206.

The sectorized **local commerce** of each super quadra was intended for daily supplies. Nevertheless, on an urban scale, the oversizing of the local shops had allowed further

commercial expansion. This contributed to commercial specialization, and favoured the creation of inter-urban poles of attraction. As a result, choice of where to buy the same type of goods is available in certain commercial areas, in addition to the daily shops originally planned by Lúcio Costa. Among five local businesses studied, it was noted that 80% of the original shops were modified in some way. Most of the transformations among the local shops are the expansion of the commercial areas into the public back courtyard (Fig. 14) of the neighbourhood and expanding marketing appeal of the facades located towards automobile traffic (Fig. 15). These entrances were originally intended to be used for stock

delivery only.

Fig. 14: Local commerce - CLS 309/308.

Fig. 15: Expansion of the commercial areas into the public back courtyard - SQS 206.

## Conclusions

Brasília was originally planned for an administrative city of 500,000 inhabitants. Forty-five years after its inauguration the city presents significant mutations. Due to its planned condition, changes in the residential areas are more specific, and could be clearly identified by comparative studies between the original plan and its actual configuration in the first neighbourhood units built in the late 50s and the early 60s.

The neighbourhood unit was intended at first thought to be similar to the residential facilities that exist in most Brazilian city districts. The urban interdependency among the residential areas was clearly defined in the urban guidelines, but Lúcio Costa's proposal was not considered entirely. The alternation of activities along the residential axis, such as public health services, cinema and churches, aimed at the self-sufficiency of the residential facilities, had changed along time.

Because of the lack of public funds, public services such as primary schools are not present in some super quadras. This is also true in relation to public health services, such as health centre within the residential axis. The situation has worsened since the 80s and its explanation lies in the lack of continuity of public policies at the district level and federal level.

One of the observed outcomes of this research is the peculiar identity of the super quadra dweller. This urban identity seems to be rooted two aspects: the urban skill needed to go about daily activities; a defined pattern slab design in the first super quadras built.

Due to design guidelines and architectural restrictions, the same residential slab pattern from the late 1950s was used predominately in the super quadras. This situation can be better understood if we take into account the demand for the mass production of housing in the earlier years at a time when the capital had to be constructed within a single presidential term.

Although the construction of different slab patterns has been introduced in large areas in the northern residential area of the city, these variations are restricted to dimensions and building envelope.

As a consequence of the residential uniformity, the monumental characterization of the political-administrative areas in the Monumental Axis has been emphasized. This has contributed to a collective urban identity on an urban scale, being peculiar to Brasília. This statement is valid for the middle-class inhabitant who mainly lives in the Pilot Plan area.

## **An approach towards defining and categorization of slums**

### **Abstract :**

The author examines the current scenario of the slum dwellers in the world and the impact of previous policies & interventions on the welfare of residents of these slum settlements, who are typically the urban poor. Author reviews the slum definitions as adopted by various nations and cities and concludes that a wide differences exist towards an approach for defining slums. With reference to India, the author analyzes the current policies like VAMBAY, NSDP towards slums and raises an issue towards its approach, effectiveness and sustainability. Author also raises an issue towards the definition of the slums adopted in various Indian states. In spite of being almost the same definition of slum in different states, the condition of the slums varies drastically from state to state infact from city to city. The situation is so severe that as per the conditions and the parameters of defining the slums, the slum of a small city can be considered a non slum in a mega/ big city. The authors appeals to the decision makers that why in real condition different parameters are adopted for notifying the slums in different cities in India. Paper is in favor of the concrete mechanism of defining the slum so that real scenario may be assessed in India and accordingly the effective policies may be framed. With a difference in concept of defining slums, it is heartrending that two renowned organizations like UN-HABITAT and Census of India reveals different estimation (with a huge difference) of slums in the country.

The paper is in favor of the universal definition and the categorization of the slums into different categories. With such a mass of population (as of now as per UN- HABITAT, 1 in every 3 urban people lives in slums) living in slums, it is vital to categorize slums into various categories. This categorization will assist the decision makers in drafting effective and workable solutions towards different categories of slums. For this author presents the mechanism of categorization of slums into various categories. To support the case, the scenario of slums in India is detailed out.

Keywords : slum, slum dwellers, policies, categorization, definition.

## **1. Introduction :**

As the arrival of the new millennium turns a new page of history, it is becoming increasingly apparent that the world is returning to some of its fundamental, unresolved questions: the issues of equity, sustainability, poverty and social justice, among others. Relatively poor knowledge of local and global forces shaping development and producing/reproducing urban poverty, the complexity of the accompanying phenomena and the uncertainty of urban decision-making processes, call for a better understanding of inter- and intra-city differentials in poverty and inequality. This basically means a need for better understanding of slum incidence.

First, the word “slum” appeared in the London Cant at the beginning of the 19<sup>th</sup> century, designating initially “a room of low repute” or “low, unfrequented parts of the town”. The word then underwent a series of changes. The term “slum” has many connotations. It often refers to settlements illegally occupying land and lacking in basic services. Slums are given various names in different contexts (such as Juggies, Shanties, Favelas, Bidonvilles, Barrios, Kampung, Tugurios, Bastis and Asentamientos Umanos), yet they share the same poor quality of living conditions. In general, the slums do not have basic municipal services water, sanitation, waste collection, storm drainage, street lighting, paved footpaths, roads for emergency access, schools and clinics within easy reach, safe areas for children to play, places for the community to meet and socialize. The few major worsening effect of slums are that while the average age of city populations is increasing, the average age of slum dwellers is decreasing. Visible disparities between slums and better-off neighborhoods increase the social tensions in poorer areas. Unplanned growth of settlements makes conventional service provision complicated and costly. Urban poor are found to be most vulnerable to the communicable disease.

## **2. Current Scenario of the Slums in the World :**

As per UN- HABITAT, more than 920 million people, or slightly less than a third of the world’s total urban

population, lived in slums in 2001 which constitutes approx. 32% of the global urban population or in other words every third person of the urban population is a slum dweller. In absolute num. the number of slum dwellers are maximum in Asia and by percentage to the urban population, Sub Sahara Africa has the highest percentage of slum population to the urban population living in slums.

**Table 1. Population of Urban Slum Areas 2001**

Major Area	Total Pop. in millions		Total Urban Pop (in millions)		Urban Pop. as % of total Pop.		Slum Population as % of total urban pop.	Urban Slum Pop (millions)
	1990	2001	1990	2001	1990	2001	1990	2001
World	5255	6134	2286	2923	43.5	47.7	31.6	924
Developed regions	1148	1194	846	902	73.7	75.5	6.0	54
Developing regions	4106	4940	1439	2022	35.0	40.9	43.0	870
Least Developed Countries	515	685	107	179	20.8	26.2	78.2	140

Source : Slums of the World -UN- HABITAT Working Paper

It has been reported that 43 per cent of the urban population of all Developing Regions combined lived in slums, in comparison to 6 per cent in Developed Regions and 78.2 per cent in the Least Developed Countries (refer to Table 1). In general terms, within the Developing Regions, the African Continent had the largest proportion of the urban population resident in slums in 2001 (60.9 per cent). Asia and Pacific Region had the second largest proportion of the urban population living in these precarious settlements (42.1 per cent) while Latin America and the Caribbean slum dwellers population was the third largest with 31.9 per cent. With respect to absolute numbers of urban slum dwellers aggregated at continental level, Asia and the Pacific Region dominate the global picture, having a total of 554 million informal settlers in 2001 (excluding China), which accounted for 63.3 per cent of the total slum population in the Developing Regions.

**2.1 Asia and Slums :**

Currently, it is estimated that one out of two urban slum dwellers in the world are from Asia. In Asia, Eastern and South-central Asia dominate the global picture with respect to absolute number of slums in the region, having about 82.2 percent of the total slum population in Asia in 2001 (34.96 and 47.33

percent, respectively). South-eastern Asia had 10.24 per cent and Western Asia had 7.4 per cent (refer Table 2). South-central Asia appears to be the poorest sub-region in the continent, having the greatest incidence of slums in the region 47.3 per cent with only 32 percent of the total Asian's urban population and the highest level of prevalence of infant mortality rates and other social indicators. This could be because South-central Asia is composed of three of the most highly populated LDCs (Least Developed Countries) in the world: Afghanistan (22.4 m.), Bangladesh (14 m.), and Nepal (23.5 m.), that along with Bhutan (2 million inhabitants).

**3. Past Approaches, Policies and its Impacts :**

Some of the policy approaches that were used in the past are explained briefly below :

**Negligence :** This approach predominated in most developing countries until 1970s. It is based on two basic assumptions that slums are illegal and slums are unavoidable but temporary phenomenon (mostly linked with accelerated rural-urban migration) that can be overcome by economic development in both

**Table 2. Slum distribution in Asian sub-regions.**

	Total Population (000)	Urban Population (000)	Urban Population as % of the total Pop.	Slum Population as % of the Urban Population	Slum Population (000)	Distribution of Slum Population by sub-regions
Total Asia	3593372	1313463	36.5	42.2	554290	100
Eastern Asia	1364438	533182	39.1	36.4	193824	34.96
South Central Asia	1506725	452484	30	58	262354	47.33
South Eastern Asia	529764	202854	38.3	28	56781	10.24
Western Asia	192445	124943	64.9	33.1	41331	7.46

Source : UN-HABITAT Working Paper – Slum of the World, 2003

urban and rural areas. The model worked well in the developed nation and assisted in elimination of slums but all this happened due to the high and steady economic growth of the country or region. This policy approach didn't worked well in the other developing nations.

**Eviction :** During 1970s and 1980s, when it became clear to the public authorities that economic

development was not going to integrate the slum populations, governments opted for a repressive option with a combination of various forms of harassment and pressure on slum communities, leading to selective or mass eviction of slum dwellers justifying it by the implementation of urban renewal projects. This approach did not solve the problems of slums, instead shifted them to the periphery of the cities – to the rural urban fringes – where access to land was easier and planning control non-existent. The continuing spatial growth of cities brought about an endless cycle of new evictions and creation of new slums.

**Self-help and in situ upgrading** : Self-help and upgrading policies tend to focus on three main areas of concern i.e. provision of basic urban services, secure tenure and the implementation of innovative practices regarding access to land. Slum upgrading initiatives carried out during the earlier period of 1970 to 1990 were merely no more successful or sustainable than sites and services. Certainly, slum upgrading appeared to be considerably cheaper than other alternatives. However, cheap solutions can have poor outcomes. Like other aid projects that focus on purely construction, the projects existed in isolation from both government and communities. Governments did not follow through with services, communities did not maintain the facilities and governance structures disappeared once the International experts were gone.

**Enabling Policies** : This emphasizes on to the need for the involvement of slum dwellers. Enabling policies are based on the principles of subsidiarity and they recognize that, to be efficient, decisions concerning the investment of resources in domestic economic, social and physical development have to be taken at the lowest effective level. The politics of devolution, decentralization and deregulation that is associated with such approaches is complex. It has been observed that communities' structures are very complex and rarely united. Still there are many examples of effective and successful enabling strategies but the process is not so easy.

**Resettlement** : It embraces a wide range of strategies, though all are based on perceptions of

enhancing the use of the land and property upon which slums are located or housed. At best, relocation is undertaken with the agreement and cooperation of the slum household involved. At worst, resettlement is little better than forced eviction with no attempt at consultation or consideration of the social and economic consequences of moving people to distant, often to peripheral, sites with no access to urban infrastructure, services or transport.

#### **4. Definition of Slums across the major cities in the World :**

The definition of slums varies to a large extent across the different cities and country around the world. The terminology and the parameters that are used in the definition also varies immensely. In general the parameters and the issues covered by the different cities in their slum definition are construction materials, temporary nature, construction legality, land legality, health and hygiene, basic services, infrastructure, crowding, poverty, low income, environment, compactness and crime & violence.

As per the study done by UN-HABITAT, it has been found that out of the 29 cities surveyed in detail, the importance was given to the term like construction material, land legality and basic services and has been included in their definition by 12, 11 and 10 cities respectively (refer Table 3 ). The interesting fact is that the term poverty only appears in the definitions applied in Ibadan, and Manila, although in other three cities – Ibadan, Jakarta and Lusaka, the term low income is a part of the definition. The cities like Bangkok and Ahmedabad has used the term Crime & Violence and Compactness in their slum definition. Another important fact that was found that inspite of being the existence of slum like situation in the 8 cities like Abidjan, Barcelona, Beirut, Mexico, Moscow, Naples, Newark and Sydney, these cities does not have any formal definition of slums.

Here are few official definition from the selected cities across the world :

**Ahmedabad, India :** According to the 49th round of NSSO (January-June,1993), a compact area with a collection of poorly built tenements, mostly of temporary nature, crowded together usually with

inadequate sanitary and drinking water facilities in unhygienic conditions. Considered “undeclared slum”, if at least 20 households live in that area. Certain areas declared as slums by respective local bodies or development authorities are “declared slums”.

**Bangkok, Thailand** : As per National Housing Authority: “a dirty, damply, swampy or unhealthy area with overcrowded buildings and dwellers which can be harmful for health or lives or can be source of unlawful or immoral actions. The minimum number of housing units per rai (1,600 sq. metres) is 30”. As per Bangkok Metropolitan Administration (since 1991): “an overcrowded, unordered and dilapidated community with unample environment which can be harmful for health and lives. The minimum number of housing units per rai is 15”.

**Cairo, Egypt** : The term “aashwa” is the only one used officially to indicate deteriorated or under-served urban areas. It actually means “random”, implying that these areas are unplanned and illegally constructed.

**Chengdu, China** : Slums are shanties in low-lying areas.

**Durban, South Africa** : The provincial Department of Housing defines slums as both “erstwhile formal settlements that have degenerated to such an extent that there exists a need to rehabilitate them to acceptable levels” as well as being “loosely used to refer to an informal settlement” (Department of Housing, KwaZulu-Natal, 2002).

**Manila, Philippines** : The Housing and Urban Development Coordinating Council (HUDCC) defines slums as buildings or areas that are deteriorated, hazardous, unsanitary or lacking in standard conveniences. These were also defined as the squalid, crowded or unsanitary conditions under which people live, irrespective of the physical state of the building or area.

**Rio de Janeiro, Brazil** : Subnormal settlements (aglomerado subnormal) according to de Statistical Bureau (IBGE) are groups of 50 or more housing units located in a dense and disorderly manner, on land that belongs to third people, lacking infrastructure and services.

**Table 3. Definition of Slums across the major cities in World**

Source : The Challenges of Slums - UN-HABITAT 2003

**Sau Paulo, Brazil** : “Favelas” are agglomerations of dwelling with reduced dimensions, built with inadequate materials (old wood, tin, cans and even cardboard) distributed irregularly in lots almost

always lacking urban and social services and equipment, forming a complex social, economic, sanitary, educational and urban order”.

Most of the definition as stated above are not complete in nature and lacks some important features and terminology in their definitions. On further analysis, one can notice the ambiguity among the different definitions. For example in the case of Chengdu, China : Slums are shanties in low-lying areas. Here, it would be a difficult task to the officer concerned to notify the slums as there is no specific viable definition or parameters and mechanism to define the slums. Though the definition in the case of Ahmedabad do contains parameters like poorly built tenements, temporary nature, crowding inadequate sanitary and drinking water, unhygienic conditions but still it is not complete as these terminologies are not further defined in detail. The perception of these used terminologies will vary from person to person concerned. There are quite good chances that the same sanitary and drinking water conditions in slums may be adequate to one officer and may be inadequate to the another official. Mostly the terms used by the different cities are qualitative in nature and needs to be further defined in detail to have uniformity of definition or certain quantitative terms may be included to have a clear understanding of the terms used. The emphasis of this paper is to have tangible definition with certain quantitative parameters to the terminology used in the definition. Such definition will present the real situation of the slums in the cities and in the different countries around the world.

## **5. Slums in India :**

### **5.1 Definition of slums in India :**

First time the slum was defined in India in 1956. As per the ‘The Slum Areas (Improvement and Clearance) Act 1956, slums have been defined as mainly those residential areas where dwellings are in any respect unfit for human habitation by reasons of dilapidation, overcrowding, faulty arrangements and designs of such buildings, narrowness or faulty arrangement of streets, lack of ventilation, light or

sanitation facilities or any combination of these factors which are detrimental to safety, health and morals. For determining whether a building is unfit for habitation, the parameters like repair, stability, freedom from damp, natural light and air, water supply, drainage, sanitary conveniences, facilities for storage, cooking and disposal of waste water will be looked into it. If one or more of the said parameters is not reasonably suitable for the occupation than it will be considered as a slum.

The different states/UT in India has also adopted the definition from Slum Act 1956 with slight modifications if required. Andhra Pradesh and Madhya Pradesh, states of India defines slum as “any area is or may be a source of danger to the public health, safety or convenience of its neighborhood by reason of the area being low lying, insanitary, squalid or otherwise, they may, by notification declare such area to a slum area”. Mysore slum Act, 1958 takes into consideration both definition i.e. Slum Act 1956 and Andhra Pradesh Slum Act while declaring slum areas.

The Census of India has also defined the slums and it covers the definition of the Slum Act 1956. As per Census of India, 2001, the slum areas broadly constitute of :-

- (i) All specified areas in a town or city notified as ‘Slum’ by State/Local Government and UT Administration under any Act including a ‘Slum Act’.
- (ii) All areas recognized as ‘Slum’ by State/Local Government and UT Administration, Housing and Slum Boards, which may have not been formally notified as slum under any act;
- (iii) A compact area of at least 300 population or about 60-70 households of poorly built congested tenements, in unhygienic environment usually with inadequate infrastructure and lacking in proper sanitary and drinking water facilities.

The definition of the slums as defined above cannot be considered as a complete definition as one can identify many loose ends while notifying the slums. Though the census definition is further elaborated

but still cant be considered as a complete definition. The definition seems to be very vague in nature as hardly any quantitative measures has been used while defining the terms. The unhygienic or inhabitable area will vary and will depend on the perception and psychological status of the concerned officers while notifying the slums. Because of an existence of such weak definition, political and other influences plays a major role while notifying the slums in the cities thus diverting the efforts from needy poors. It is heartrending that while having a discussion with officials of few cities who are responsible for the notification of the slums are unaware about the Slum Act definition. During a discussion one officer quoted a strange definition of the slums “those areas where more than 50% of the population belongs to scheduled caste are considered slums”. With such knowledge and definition it is impossible to have a clear scenario of the slum population in the country. There is an urgent need to have a effective and workable definition of slums in the country like India where a mass of population lives in Slums.

## **5.2 UN-HABITAT definition of Slums :**

UN-HABITAT has come with a tangible definition and the terms used are defined quantitatively also. As a result of the EGM (Expert Group Meeting) UN-HABITAT a slum household is defined as a group of individuals living under the same roof lacking one or more of the conditions below:

**Access to improved water:** A household is considered to have access to improved drinking water if it has sufficient amount of water (20 litres/person/day) for family use, at an affordable price (less than 10% of the total household income), available to household members without being subject to extreme effort (less than one hour a day for the minimum sufficient quantity), especially to women and children.

**Access to improved sanitation:** A household is considered to have access to improved sanitation, if an excreta disposal system, either in the form of a private toilet or a public toilet shared with a reasonable number of people, is available to household members.

**Sufficient-living area, not overcrowded :** A dwelling unit is considered to provide a sufficient living area

for the household members if there are fewer than three people per habitable room (minimum of four square meter).

**Structural quality/durability of dwellings** : A house is considered as “durable” if it is built on a non-hazardous location and has a structure permanent and adequate enough to protect its inhabitants from the extremes of climatic conditions such as rain, heat, cold, and humidity.

**Security of tenure** : Secure Tenure is the right of all individuals and groups to effective protection by the State against arbitrary unlawful evictions.

### **5.3 Highlights of Slums in India**

As per Census of India, 2001, the 640 cities/towns in 26 States/Union territories have reported slum population. Andhra Pradesh has the largest number of towns (77) reporting slums followed by Uttar Pradesh (69), Tamil Nadu (63) and Maharashtra (61). As per Census 2001, 42.6 million population live in slums. This constitutes 15 per cent of the total urban population of the country and 22.6 per cent of the urban population of the states/union territories reporting slums. The maximum number of slum population resides in Maharashtra 11.2 million (26%) followed by Andhra Pradesh 5.2 (12%), Uttar Pradesh 4.4 (10%) and West Bengal 4.1 million (10%) (refer Figure 1). It has been reported that approx. 42% (17.7 million) of the total slum population in India is living in the million plus cities (Refer Table 4). Greater Mumbai Municipal Corporation with 6.5 million slum dwellers has the highest slum population among all the cities followed by Delhi Municipal Corporation (1.9 million), Kolkata (1.5 million) and Chennai (0.8 million). In Mumbai, more than 50% of the population lives in slums and it dominates the city. (refer Figure 2).

It is distressing to know that approx. 6 million children in the age group 0-6 live in slums. Maharashtra alone accounts for 1.6 million children in slums. In the city like Mumbai 50% of the total children of the city lives in slums. Large majority of the slum dwellers has been reported from the backward classes.

Approx. 7.4 million (17.4 per cent) of the total slum population belongs to the Scheduled Castes and 1 million (2.4 per cent) to the Scheduled Tribes. With a low literacy levels, these slum dwellers are forced to do a low profile jobs at very minimal wages.

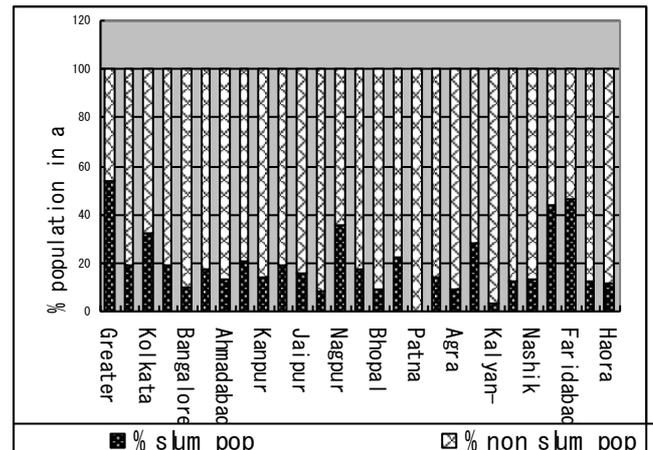

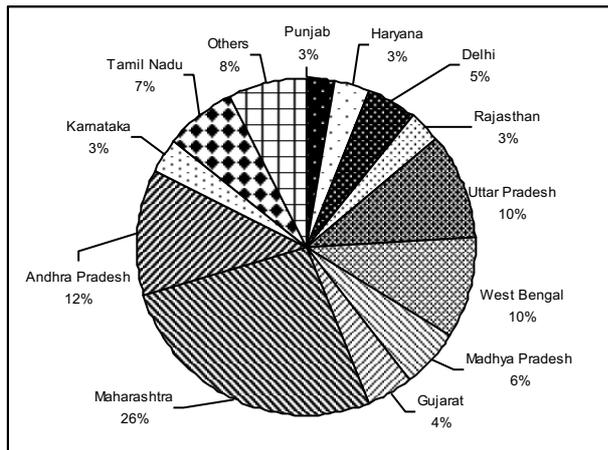

**Table 4. City Population Size and Slum Population**

City Pop. Size	Slum Pop.	Slum Pop. Share %	Slum Pop/city in millions
4 M+	11.0 M	26%	2.20
2-4 M	3.76 M	8.80%	0.47
1-2 M	2.88 M	6.80%	0.21
.5 – 1 M	5.81 M	13.70%	0.14
.1- .5 M	13.9 M	32.70%	0.04
.05 - .1 M	5.1 M	12.00%	0.02
TOTAL	42.6 M	100%	0.07

Source : Slum Population, Census of India, 2001

#### 5.4 Policies towards slums in India :

The brief analysis of the major policies deals with the slum dwellers in India are as follows :

**The National Slum Development Program (NSDP)** was launched in 1996. Annually, the program provides about Rs. 300 crores in assistance. The objective of NSDP is to provide adequate and satisfactory water supply, sanitation, education facilities, health care, housing and environmental improvement through the creation of sustainable support systems. The focus is on community infrastructure, provision of shelter, empowerment of urban poor women, training, skill upgradation and advocacy. The program has both loan and subsidy components. For the larger States, loans constitute

70% and subsidies 30% of total allocated funds. For the smaller States, the loan component is only 10% and the subsidy 90%. Up to 10% of the funds can be used for housing construction/upgradation. The Planning Commission allocates funds annually, in proportion to the share of the national slum population in each State or Union Territories (UT).

The one of major drawback of NSDP is that it doesn't targets the illegal slums or say non-notified slums in the cities. The non-notified slums settlement as per National Sample Survey Organization (NSS) 58<sup>th</sup> Round Report, 2002 are 25,000 as compared to notified slums which are approx. 27, 000 settlements. This means in actual, NSDP programme is targeting only 50% of the slum settlements. Under this programme uptill 2004 approx. Rs. 2475 corers has been released for the development of slums. Considering 42.6 million of slum population (in actual it may be more as these figures are from 640 cities in India) than it comes to an investment of approx. Rs. 580 per slum dweller for development purpose. This amount has been disbursed in 8 years meaning Rs. 72 per slum dweller per year has been invested for development purpose. The actual amount per slum dweller will be much lesser as it includes administrative and others expenditures also. With Govt limited financial resources, such a low level of investment won't be able to tackle the problems of 42 million slum dwellers. Actually whatever efforts are made by the government to reduce the slum population or to the development of the slums by their limited resources is nullified by the rapid growth of slum population in the country. As a programme is highly subsidies, it raises a question on its sustainability and its replicability. It is therefore required to look for some other sustainable approach that may benefit all. A financial contribution approach i.e. contributions from beneficiaries, local governments and the private sector needs to be mobilized.

**Valmiki Ambedkar Awas Yojana (VAMBAY)**, initiated in 2001, was designed to address housing deficits for the urban poor. It provides about Rs. 300 crores of annual assistance to designated state agencies who then determine beneficiaries and monitor the implementation. The state government must

provide the beneficiaries with a title and/or land as a pre-condition for the loan or subsidy. Its goal is to achieve 'Cities without Slums' by providing or upgrading shelter for people living below the poverty line in urban slums including members of Economically Weaker Sections (EWS) who do not possess adequate shelter. The scheme also addresses the lack of toilet facilities. Govt. of India (GOI) mandates State governments to use twenty percent of the total allocation under VAMBAY for the National Sanitation Project. The rest of the scheme funding provides matching subsidies and Housing & Urban Development Corporation (HUDCO) loans to title holding beneficiaries to build or upgrade a house. Funds from VAMBAY can only be used in notified slums. In addition, GOI does not release the funds to the state government until they receive the States' 50% matching fund.

Though this programme is based on the matching funds but still it is highly subsidized as 50% is granted as a subsidy to the beneficiaries plus a land is also provided by the state govt. With a limited financial resources and such a high subsidy, it is impossible to target 42 million slum population in the country. This scheme also targets notified slums only, thus neglecting a majority of slum dwellers living in non-notified slums. As per NSS 58<sup>th</sup> Report 2002, out of the total houses, approx. 4 million houses in slums (notified and non notified slums) are either semi pucca or kutcha in the nations and they needs an immediate improvement. From 2001 till 2006 in 5 years approx. 0.44 million dwelling units were targeted under VAMBAY scheme i.e. approx. 0.1 million targets per year. With this target rate and assuming that their wont be any rise in the slum population, which is unlikely to happen, it will take another more than 35 yrs to improve the condition of the dwelling units.

The other policies that deals indirectly to slum dwellers are The Swarna Jayanti Shahari Rozgar Yojana (SJSRY), Night Shelter For Urban Shelterless, Low Cost Sanitation (LCS) and Liberation of Scavengers

## **6. Categorization of Slums :**

Considering the fact of having such a varied definition of slums across the different part of world with an

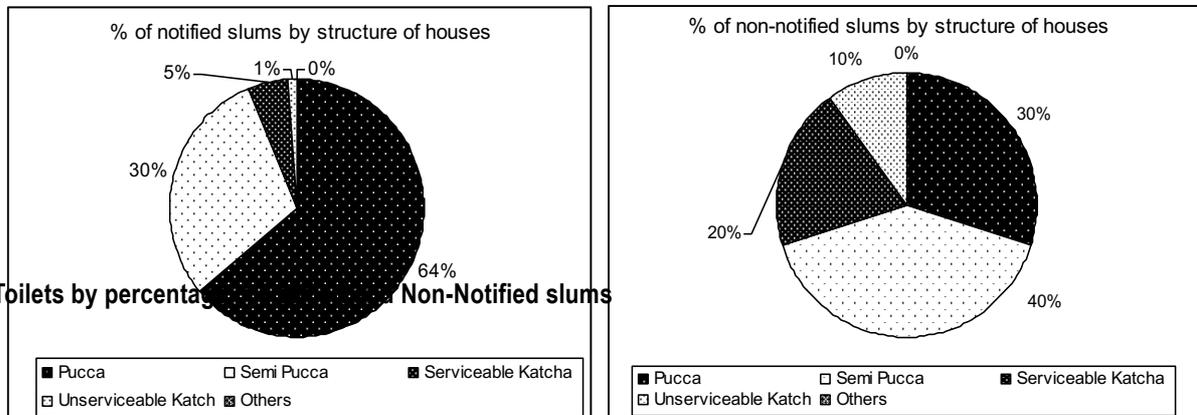

immense difference in the socio economic profile, construction material, houses, basic services, poverty level, infrastructure availability, land legality, environment etc. among the slum settlements, Is it really possible to draft the single policy that may be useful and effective to all kind of slums? Till date the cities and countries are trying to learn the lessons from the best practices related to slums from the other cities and countries. Some of the cities have also adopted these lessons and tried in their respective cities but most of them were unsuccessful and failed in delivering the desired result. Why is it so? Is it the best practice was not really good? As mentioned above each city and slum settlement has a different characteristics, profile, features, policies etc., the best practice that might have worked well in that particular context may not work so well in other cities and nations.

It is not that the slums only exist in developing or least developed nations but slums do exist in developed nations too (refer Table 1). It is quite true that the policy that has worked very well in the developed nations (due to stabilized and high economy) may not work well in the least developed nations. As per UN-HABITAT, approx. 1 billion i.e. one-third of the total world urban population lives in slums and there are more than 16 nations with a slum population more than 10 millions. The countries like China and India are having a slum population of more than 150 millions and in the nations like Ethiopia, Chad, Mozambique, Madagascar, Nepal etc., it has been reported that more than 90% of the total urban population lives in slums or in other words the slum population dominates the country. It is quite natural and a known fact that in these countries, all the slums settlements won't have same characteristics, amenities and socio economic profile. They will definitely differ in some respect or the other. The cities and nations will have different typology of slum settlements like old and new slums, legal & illegal slums, overcrowded and uncrowded slums, big and small slums, slums with better facilities and worst facilities etc.

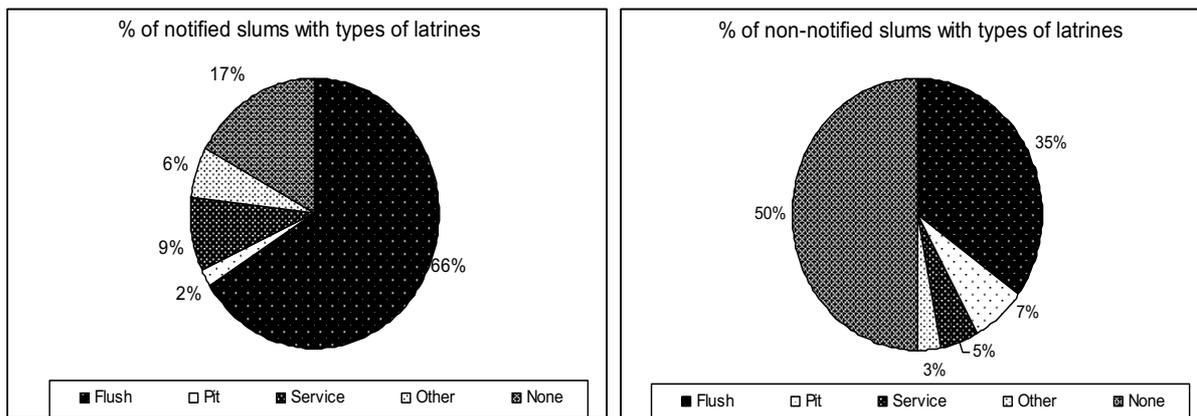

Considering the case of India, NSS 58<sup>th</sup> Report 2002, stated the slums as per the status of notification of slums (notified or non notified slums), land owner (railways, defence, airport, highway, local authority, others), types of houses (Pucca, Semi Pucca, Kutcha etc) (ref Fig 5), Source of drinking water (tap, well, tubewell, others), Electricity (household, street, no light etc), roads (motorable, non motorable, pucca, kutcha etc), water logging in monsoon, latrines types (flush, service, pit, none etc.) (ref Fig 6),

ig. 3 Type of Structures by percentage in Notified and Non Notified slums

Drainage (open, covered, pucca, kutcha etc), Garbage collection agency and school & hospital location from slum settlements.

ig. 4. Type of Toilets by percentage in Notified and Non-Notified slums

The NSS 58<sup>th</sup> Report, 2002 provides a general overview of the slums and at the same time has also classified the slums into different typologies. The slums can be categorized or typologies can be created based on notification, house types, water facility, toilet availability, electricity connection, road types, drainage conditions, location of the social facilities etc. A combination of

certain parameters may be used to categorize the slums into various categories.

Under these prevailing conditions where there is such a variety and typology of slums settlements exist in the cities/countries, it becomes vital to categorize such mass of slums into different categories. Such categorization will assist the decision makers in drafting the various policies and approaches towards the different categories of slums settlements. Once a mechanism can be established than the slums can

**Photo A (Jhansi slum)**

**Photo B (Delhi slum)**

be compared within nation and with different nations. Currently there is not a true comparison of slums between the various nations or cities as there is no categories of slums exist and all type of slums are just falling under one category called SLUMS. (Referred by different names in different countries & cities).

In case of India, the photos A and B will establish the relevance and necessity for the categorization of

the slum into different categories. Photo A is of the one of the good slum in Jhansi (UP), a small city, as notified by District Urban Development Agency (DUDA), Jhansi and the Photo B is of the slums in the capital of India, Delhi. Are both these slums are same ? Do they need same policies? Do they need the same type of subsidies and grants? Of course not. The slums with the worst living conditions need to be identified first and maximum subsidy and efforts needs to be diverted for the development of these slums. Under various program like VAMBAY, NSDP etc, thousands of slums are benefited, and after development, will it be right to consider them again a slum and provide subsidies and grants for forever?

The need is to categorize the slums into various categories and then accordingly specific policies may be drafted for the better and the worst slums.

Assuming in general that after categorization (say all settlements in the world divided into 4 categories, Slum- I is the best and Slum –IV being the worst one) the major percentage of slums of the developed nation will fall into the category say Slum –I (in the best condition with better facilities and amenities as compared to other slums settlements worldwide) and in least developed nation they may fall in the category say Slum –IV (in the worst condition with worst facilities and amenities as compared to other slums settlements worldwide). Such comparison will be true in nature and will assist the decision makers in drafting effective and workable policies. The categorization can be done using different methodology and principles but in this paper author presents certain general categories in which these slum settlements can be classified. These are as follows:

**Religion/ Caste System:** Classification using the caste system as it has been observed in the countries like India & Pakistan that the people of similar caste are living together.

**Place of Migration:** There are slums settlements comprising of people of certain region or location. Slum settlements can also be classified based on rural or urban migrating people.

**Location of Slums:** The location of slums can be good criteria for categorizing purpose. The location can be in reference to CBD or it may be as per the hazardous location like settlement along the flood plains, garbage dump etc.

**Tenure status of the land:** As tenure status has always been given the prime importance, the settlements can be classified as per the ownership of the land – legal, illegal, private or public.

**Population/Area/Density of the slums:** As slum settlement differs in population, area or density, they may be classified using such parameters.

**Age of the slum settlement:** It has been reported that some slum settlements are more than 50 yrs old and some are recently emerged. Thereby the age of a slum settlement can assist in categorizing

slums into various categories.

**Socio Economic Condition of the slum:** Various types of slums will vary in socio-economic conditions and may also be used in classification of slums.

**Infrastructure facilities in the slums:** The level of services and basic amenities like water, toilets etc that lacks in the slums will be a good indicator for the classification of slums.

Further research needs to be required to develop a workable methodology to categorize these settlements into categories. A combination of parameters as mentioned above will assist in categorizing slums into various categories.

## **7. Conclusion :**

With such a huge mass of population reported living in slums across the different parts of world, it is an urgent need to reconsider our approach towards these slum settlements. The past policies and approaches were not able to provide a complete solution to this gigantic problem. To start with, it is required to have a tangible definition of slums and if possible a universal definition of a slum worldwide will resolve certain issues & confusion. This process will be able to present the true situation of slums settlements and then only a comparison can be made within different nation and cities. To add to it if these slum settlements can be categorized into different categories just like as cities are categorized in various classes or like urban/rural areas are classified, then a priority for improvement can be set up by the respective local bodies and governments. This categorization of slum settlements with an input of effective policies may be able to control the mushrooming of slum settlements and can reduce the slum population in the world.

## **Abstract**

The most important aspects of specific identities of cities are generated through the course of their history and are based on the inherited cultural values. These values are not merely transmitted through buildings and physical elements remained from the past and often considered as museum objects. Cultural heritage, once a concept referring exclusively to the monumental remains of cultures, has gradually been extended to include a series of intangible modes of heritage reflecting the continuity in human social life. Cities, which in their entirety encompass the important parts of the material cultural heritage, bear in the spatial structures underlying their physical constructs the intangible modes of cultural heritage which are most involved in our everyday life. The urban spatial system, depending on how it becomes configured, forms patterns of movement, encounter, and co-presence, which reflect and affect the fundamental cultural aspects of our urban life. Urban spatial configurations are generated and evolved throughout the history of cities. They bear the trace of the past but they reflect living culture rather than an ossified image of the past. This paper investigates the evolvement of urban spatial systems in the Swedish city of Gothenburg and a series of Iranian cities which originally belonged to two distinct cultural types of cities. The paper discusses the impact of different urban design and planning strategies on the historic cores and old places in these cities. Space Syntax theory and methodology is applied for analysing the spatial structure of the cities in different historical periods. The analytic process in Space Syntax aims to explore the complexities of the organic

relation between urban societies to their spatial existence. This process can be described as a move from the observable feature of the built form of cities to the abstract spatial structure underlying the physical forms, and a return to the observable world through representing and modelling the spatial patterns and describing their properties by quantifiable measures and displaying correlations between these measures and observable functions. In the studies presented in this paper the existing functional situation of historic urban areas (including old bazaars in the case of Iranian cities) are explained in terms of syntactic (configurational) properties of the urban spatial structure in these areas and their structural position, as local sub-systems, in the context of the global urban system. In one case of the studied Iranian cities the modern urban development, improperly, changed the configurational position of the bazaar complex in the city causing its complete functional decline, although the bazaar was not touched directly by spatial interventions carried out, and despite that its physical construct was maintained in fairly good order. The whole study shows that places with historical background in cities in different part of the world, where they are actively used are not really old places. Although they have old buildings and we may call them names beginning with the prefix 'old'. They are, in actual fact, new places in new configurations. The main concern should not be directed only towards the preservation of the physical order of their buildings. From the point of view of content, what is and can be preserved of old places is not the exact form of their old functions and meanings, but it is their life in general, which in the context of new spatial and social configurations will bear new meaning and create new identities for cities. The results of the studies open way for developing the conceptualization of urban spatial configuration as intangible cultural heritage. These results provide measures for assessing urban design projects which attempt to counteract the process of decline and to enhance the liveliness of historic areas in cities.

### **The historic cores of Iranian cities**

In Iranian cities the historic cores, in spite of their usually central position, are not capable to accommodate the contemporary requirements of life in a modern city centre, since they were generated by quite different social, economic and material circumstances to those which prevail today (Karimi & Hanson, 1999). A comparison with a city, whose historic core does function as a modern city centre, helps clarifying the situation of the historic cores of Iranian cities. Figure 1 shows the configurational properties of the urban system of the Swedish city of Gothenburg and the city of Yazd in Iran.

The historic core in Gothenburg is the syntactic core of the existing city. It constitutes a highly intelligible substructure in the context of the whole city. These spatial properties are, if not the only but an essential, prerequisite for a local urban area to work as an active city centre. A large variety of known urban functions are concentrated in the city centre but its attractiveness goes beyond the definite functions. Hillier, pointing at the extraordinary spatial culture of the city of London, writes: "space constructs an expressive rather than instrumental sociality. More practically, the distinctive 'spatial culture' of the City is a prime component of the famous quality of life which draws both individuals and organisations to the city" (Hillier, 2001). This wide and rich function of space is also fulfilled in the city centre of Gothenburg, a city much smaller than London of course.

The plan layout proposed by the Dutchmen in the first city council of Gothenburg 1621 provided, besides defence possibilities, a distributed network of public spaces. This urban network facilitated a distributed pattern of social contacts in an urban society based on civil principles, which are still confirmed.

In the city of Yazd, figure 1, the historic zone is not the syntactic core of the existing urban spatial system. Neither does it constitute any intelligible local structure in the context of the whole city. This reflects the history of the Iranian city, the transformation of a city with quarters highly segregated from each other forming a deep spatial structure that put high control over movements and encounters into a clearly new type of city with a spatial configuration in which the traditional spatial control over social contacts is abandoned.

### **The problem of decline of the historic cores**

The problem of the historic cores of Iranian cities is not their inadequacy in functioning as a city centre. The main concern is their overall impoverishment. A study about the city of Yazd discusses that the structural changes caused by the construction of new streets through the old city of Yazd increased the spatial segregation in the traditional fabric of the city, which led to the decline of the historic core of the city (Abbaszadehgan, 2002). According to this study ruined buildings are mostly located in the syntactically deepest part of the historic core of the city. Though this has been the case in some Iranian cities, in Yazd closer investigation does not confirm this matter. Figure 2 shows the distribution of the abandoned real states in the city of Yazd. The marked patches are the areas with lowest value of integration within and around the historic core of the city. Abandoned properties are not at all concentrated in the deepest regions of the historic core of the city. They are scattered all over the old parts of the city. In figure 2 besides a large cluster of abandoned properties in the central part of the city there are 8 smaller clusters, which in fact display the locations of the previous villages that later merged into the city. Neither these clusters are located in the highly segregated areas. Some of the old villages have obtained much higher integration than their neighbouring areas but have a relatively large cluster of abandoned properties.

In the city of Yazd, the decline of old urban areas has not happened during the first phase of development of the city and the first wave of building new streets. It is the result of later expansion of the city that got a much higher speed after the land reform initiated in 1962. The growth of abandoned properties in the old parts of the city of Yazd can be related to the favourable condition for expansion of the city, social tendencies and the interest of developers.

The decline of historic cores is not common to all Iranian cities. In figure 3 the two maps display a residential area in the historic part of the Iranian city of Rasht with a traditional texture. The first map belongs to the late 1950s and the other shows the present state of the district. It is clearly visible that during a period of four decades a process of rebuilding and building new houses has been going on in this residential area. The building density has not only increased along the edge of the new streets, it has also become denser in the depth of the residential area. Obviously this is not a sign of the decline of this area.

The decline in the historic core of Iranian cities includes mostly the residential zones. The relation between a spatial factor, like configurational segregation, and the decline of these zones is a subtle issue since a relative segregation is not basically a disadvantage for residential areas in cities. In the city of Rasht, subdivision of private properties and the intensification of land use in the traditional residential areas that was a process opposite to the process of decline, naturally, made the local spatial structure of these areas even deeper. Here the relative increase of depth in neighbourhoods with traditional texture was caused by an internal local process rather than by global imposition of the (as is customarily said) incompatible modern street system. To separate spatial determinants from non-spatial factors involved in the decline of the historic cores in Iranian cities does not seem to be a simple task.

### **The traditional bazaar, the modern avenue**

Functional situation of the old bazaars in the historic cores of Iranian cities, in comparison with the condition of the residential sectors, reflects the effects of spatial factors much clearer. Retail activities and shops are the most movement related urban functions and elements. Regarding the generally proved correlation between movement and spatial configurations in cities, application of space syntax analysis makes it possible to investigate the spatial effects of the changes in the global urban structure of Iranian cities over the old bazaars. Yet more precision in distinguishing the spatial effects can be obtained by studying the changes in the social and economic status of old bazaars after the emergence of new urban forms. We need to know if, after a period of global changes in Iranian cities, there was any cultural discrimination between the bazaar and the avenue, as a new urban phenomenon, in sharing the activities that once was mostly a part of the monopoly of the bazaar.

The bazaar of traditional Iranian city was a concentrated complex of craftsmen, retailers, and wholesalers. It was the commercial centre of the city. But the bazaar was not only a locale for shopping and business activities. As an institution, the bazaar dominated all economic activities in the city and its surrounding region and, because of this, had a high social status. This was in concordance with the spatial position of the bazaar, which constituted the structural core of urban spatial system in the traditional Iranian city.

After the constitutional revolution (1906 – 1911) the bazaar began to lose its dominating status in the cities. In the later waves of economic developments at national level, a major part of economic functions moved from the bazaar. The most important wholesale merchants became involved in the emerging large-scale industries and modern shipping and trucking that bypassed the bazaar both spatially and organisationally. But this did not lead to the demise of the central bazaar. Retail activities kept it alive. However even at this level a spatial alternative to the bazaar (the modern avenue) had emerged, shopkeepers and retailer-producers did not abandon the bazaar for the avenues.

Four decades after the building of the first avenues in the city of Yazd in early 1930s, of the approximately 3,500 commercial establishments, a quarter were still concentrated in the central old bazaar of the city, a half were located on the new avenues and the remaining quarter consisted of shops clustered in the small local bazaars of traditional neighbourhoods and scattered shops (Bonine, 1981). Bonine's survey, concerning locational changes of shops in

Yazd between 1951 and 1971, shows that there was no concerted movement to the avenues. In 1971, on the avenues 12% of new shopkeepers were those who had moved from the bazaar while in the bazaar 10% of new shopkeepers had come from the avenues. These moves were much lesser than relocation of shops within the bazaar or on the avenues. Most importantly, there is no specific public attitude favouring either the avenues or the bazaars against the other. In this situation the impact of the spatial factor on the function of the bazaar can be measured with more precision.

### **The changed configurational position of the bazaar**

In the first waves of modern urban construction in Iran the bazaar was not the main concern. But it was not completely neglected. In the initial phases of urban development with abandonment of traditional pattern, the bazaar still maintained the major parts of its functions as the economic and commercial centre of the city. Accessibility to the bazaar was important and the new streets would not hinder but facilitate this accessibility. The original relation of the bazaar of all major Iranian cities with the first new streets was the foundation on which the bazaar became knitted to the emerging urban structure in the later phases of development. In the new urban system the bazaar has a structural position, different to the position of a traditional bazaar in a traditional Iranian city. In this concern, talking of “configurational displacement of the bazaar” is not relevant. The urban context in which the bazaar may be supposed to have been displaced does not exist. Neither is the existing bazaar the same urban element as the bazaar of a traditional city.

The traditional bazaar accommodated a large series of activities related to trade, production, and storage. Many of the activities of the traditional bazaar have disappeared and the placement of those that continue does not follow the original spatial logic. The growing goldsmith shops in the bazaar of Yazd, for example, expanded into the adjacent cloth bazaar and the wealthiest jewellery retailers moved to the shops closer to the avenue.

The spatial analyses of the bazaars in this study do not concern the original structure of the bazaar and its transformation. Retail is now the predominant activity in the old bazaars of Iranian cities. There are new groupings of commercial units in different bazaars. This study, without dealing with the detail distribution of different kinds of shops in the bazaars, investigates the general spatial characteristics that can be associated with the success of the bazaars as places with high concentration of retail activities.

In the studied cities the spatial relation between the new streets and the old bazaars is different. In some cases the new avenues are built right through the bazaar complexes. In others, one or two streets intersect the major branch of the bazaar on its end/ends or in its middle, and a perpendicular street crosses the minor branches of the bazaar or the old thoroughfares connected to the main trunk of the bazaar. There are also cases where the new streets are drawn close to the bazaar and are connected to it through secondary routs without destroying any part of the bazaar. The existing bazaars function in close relation to the new streets and with different grade of dependency on them. The functioning old bazaar and the new streets constitute an integrated spatial system. The analysis of the present situation of the spatial structure of nine Iranian cities shows that in eight of these cities, although the bazaar complex is not the syntactic core of the city it constitutes an intelligible substructure in connection with the most integrated lines in the

city. Only the bazaar of the minor city of Nain lacks this property. In this city the bazaar is completely inactive while its physical construction is in good condition.

Figure 4 shows the typical scattergram of global integration against local integration for the nine cities. The selected groups of lines in the scattergrams are the bazaars. The value of intelligibility ( $r$ -squared) for the bazaars in the eight cities that are functioning well are between 0.9101 (for the bazaar of the city of Semnan) and 0.5710 (for the bazaar of the city of Rasht). This value for the bazaar of Nain, which is excluded from the group of functioning bazaars, is 0.4844. This value is close to the  $r$ -squared for the bazaar of Rasht (the most growing and active bazaar in the studied cases). Seemingly this sounds strange. But the functioning bazaars, including the bazaar of Rasht, do constitute a homogeneous group, from which the bazaar of Nain is excluded. In the scattergrams in figure 4 all of the selected clusters of dots representing the functioning bazaars are concentrated around regression lines close to the right edge of the scattergram of the whole city. This indicates the easy accessibility of these bazaars in the global urban systems of the cities. The bazaar of Nain lacks this property.

Concerning the very factor of intelligibility there is a vast difference between the local structure of the bazaar in Rasht and in Nain, though the absolute values of  $r$ -squared in both cases are very close to each other. The global urban structure varies in the eight cities with functioning bazaars, concerning the value of mean global integration and global intelligibility. For comparing the local spatial systems of the functioning bazaars in the context of a differentiated global spatial configuration there is a consistent measure. The degree of distinction and intelligibility of a local structure in a global spatial system is logically related to the difference between  $r$ -squared value of the local system and the intelligibility of the global system. In the eight cities with functioning bazaars the average of the difference between the  $r$ -squared values of local and global systems is 0.49. The difference values in all of the eight cities are close to this average. This difference in the city of Rasht, with the global intelligibility of 0.1657 and an  $r$ -squared of 0.5710 for the local spatial system of the bazaar, is 0.41, which is higher than the minimum difference value of 0.37 that belongs to the city of Hamedan. In Nain the difference between  $r$ -squared values for the global system and the bazaar is 0.08 and because of this, the city is completely excluded from the group of the cities with functioning bazaars. In Nain the global urban system is highly intelligible ( $r$ -squared = 0.4066). In this spatial system, the old bazaar loosing, its spatial distinction and becoming an anonymous space, declined to a degree that it was not capable to function even as a minor local bazaar. The bazaars in the group of the eight cities are still functioning at the scale of the whole city because of their local distinction and easy global accessibility.

### **The global spatial impact and the local self-organising processes**

The process of urbanisation of the Iranian society got an accelerating pace after the initiation of the land reforms of 1960s. In a short period of time the population of Iranian cities doubled and tripled. The changes in Iranian cities during the last four decades did not only concern the expansion of cities. The cities have also evolved structurally. The bazaars were not always passively affected by global changes. There are cases where the bazaar, as a local spatial system has, constructively interacted with the global spatial structures of the cities in the process of their spatial evolution. The configurational changes of the bazaar and the whole urban system in the four Iranian cities of Nain, Yazd, Hamedan and Rasht during the last four decades have been

studied. The general information about the functional changes of the bazaar in these cities correlates with the spatial changes.

Figure 5 shows the spatial structure of the city of Nain and its bazaar in three phases from the late 1950s up to now. The global integration map of the old city is also presented to show the situation of the bazaar in the city. The bazaar had a simple structure, consisting of a slightly winding line connecting the southern gate of the city to the Congregational Mosque in the heart of the city (figure 6). Until late 1950s the development of the city did not have a destructive effect on the bazaar of the city, though the integration core of the city moved from the centre of the old city to a place outside its old southern gate. The segment of the bazaar near to this place was located 8 syntactic steps away from the most integrated line in the city (the new long east-west street). However, it obtained an integration value of 0.7817 that was very close to the highest integration value that was 0.8095 (a difference of just 0.03). The main process of functional destruction of the bazaar began with the building of a street that cut through the traditional fabric of the city and was parallel with the old bazaar (figure 7). This process has been completed now, of course without any direct construction intervention in the bazaar. The integration value of the line constituting the segment of the bazaar I mentioned above has increased to 0.8946 while the long east-west street, remaining the most integrated line, has obtained a value of 1.5331. The difference between the integration values of the two lines has increased from 0.03 to 0.64.

The process of destruction of the bazaar of Nain is also manifested in the scattergrams in figure 5. The selected cluster of dots, representing the simple old bazaar moves from the right edge of the scattergram in the old city towards the left edge. The difference between r-squared for the selected lines (the lines of the bazaar) and the global intelligibility decreases from 0.45 in the old city to 0.08 in the existing city. Until late 1950s this difference was still high ( $0.6757 - 0.3615 = 0.3142$ ). The bazaar constituted a rather intelligible local structure fairly close to the integration core in the city. It is during the last four decades that the local structure of the bazaar in Nain fades away in the global spatial configuration of the city. The changes in the structural position of the old bazaar of Nain were accompanied with its complete functional decline. This happened to the bazaar, although it was not touched directly by spatial interventions carried out, and despite that it was maintained in fairly good order. Figure 8 depicts the bazaar of Nain on a working day. Today only 11 of 154 shops in the bazaar are still active.

In the city of Yazd the first major avenue was constructed in the early 1930s through an area in the vicinity of the bazaar of the city. This avenue, from the date it was constructed, has always been the most integrated line in the city. The latter avenue was built right through the bazaar and became, and still is, an integrated part of the bazaar, figure 9. The analysis of the urban structure of the city of Yazd in the late 1950s shows that the bazaar in connection with the two major avenues forms a local structure with an r-squared of 0.5913 (0.37 higher than the r-squared for the whole city). In the present state the bazaar has become a more distinct and intelligible local system in the context of the global spatial structure of the city. The value of r-squared for the complex of the bazaar within the whole city is now 0.7497, with a difference of 0.47 to the value of intelligibility for the whole city.

A spatial characteristic of the bazaar of Yazd is its extreme and continuous dependence on the street that was built through it in the 1930s (this, we will see, is in complete contrast to the bazaar of the city of Rasht). The separate integration map of the bazaar complex shows that this avenue is the most integrated line in the complex (figure 9). Without this avenue the spatial system of the bazaar collapses. This explains the bazaar's wealthy goldsmiths' interest in moving their business to a shop closer to this avenue (Bonine 1981).

In the city of Hamedan, the construction of new streets had the most drastic impact on the traditional fabric of the old city. One of the six new radial streets cuts diagonally through the bazaar of the city, figure 10. Nevertheless, this construction, in similarity to the cases in other Iranian cities, did not have a destructive effect on the function of the bazaar in the new urban environment. Like the bazaar of Yazd, in the separate integration map of the bazaar complex of Hamedan, one of the new streets is the most integrated line. But in Hamedan the bazaar complex has a more distributed spatial configuration and the complex remains an integrated spatial system even after omitting the streets from the system.

The minor changes in the configurational position of the bazaar of Hamedan, from the late 1950s up to now, are caused by the pattern of the urban development of the city. The absolute value of  $r$ -squared for the bazaar complex in the context of the whole city decreased slightly from 0.6676 to 0.6034 (figure 10). But this does not mean that the bazaar complex of Hamedan, as a substructure in the whole urban system, has become less intelligible. Contrarily, it has become somewhat more intelligible. The difference between  $r$ -squared value for the selected lines of the local system of the bazaar and the intelligibility in the global system has increased from 0.31 to 0.37. The global integration in the city of Hamedan, in the course of four decades of urban development, has just increased slightly. Unlike the two cities of Rasht and Yazd, in Hamedan the intelligibility of the global urban system has decreased (from a rather high value of 0.3501 in late the 1950s to 0.2288 in the present state). In the scattergrams in figure 10 the cluster of selected dots representing the bazaar complex of Hamedan has become more compact but has moved away slightly from the right edge of the scattergram. This means a slight decrease in the accessibility of the bazaar complex in the city of Hamedan. This decrease in accessibility includes also the radial streets. The integration values of all the four radial streets involved in the bazaar complex have decreased under the impact of the ring road projects accomplished in recent years (see also van Nes, 2001). In the integration map of the present state of Hamedan the most integrated lines are located in the peripheral areas of the city.

In the city of Rasht the initial construction intervention in the traditional texture of the city and the later urban developments were carried out through more parsimonious plans. This provided possibilities for the bazaar of the city to interact with the global system and evolve with more independence. The first modern square with the city hall and other public buildings was built near the old bazaar of the city (figure 11). The new streets that converged in this square left the internal structure of the bazaar intact while providing new access to the bazaar complex in addition to the direct access from the surrounding areas with traditional texture.

The axial analyses based on the plan layout of the city of Rasht from the late 1950s, figure 12, shows that the city of Rasht, in comparison with Yazd and Hamedan, had a spatial structure with rather low mean global integration (0.6646) and global intelligibility (0.1635). However, the

whole quarter of the old bazaar in Rasht constituted an intelligible substructure within the global urban system with an r-squared of 0.5147, which was 0.35 higher than the r-squared of the global system. In the separate integration map of the bazaar quarter of Rasht in this period the most integrated lines in the centre of the system represent the traditional thoroughfares of the bazaar. The new streets, with their peripheral locations, have an auxiliary function facilitating movement and accessibility at the scale of the local spatial system of the bazaar. Because of this, the local system of the bazaar, even without the new streets, remains an integrated system with the same pattern of concentration and distribution of integration.

The bazaar of Rasht in the late 1950s, many decades after the building of the new streets, while being well integrated in the global structure of the city, functioned as a local spatial system with a high degree of independence. This characteristic property paved the way for the spatial evolvement of the bazaar in association with the expansion and intensification of its functions in the accelerating process of urban development during the last four decades.

The global integration map representing the present state of the global spatial structure of the city of Rasht, figure 13, shows that, unlike the case of the city of Hamedan, the most integrated lines remain in the central areas of the city. The mean global integration has increased to 0.7856. The integration value of the two most integrating streets, which constitute the northern and western boundaries of the bazaar quarter in Rasht, have increased from 1.1061 and 1.1735 to 1.2516 and 1.3076 respectively. In the local global scattergram, figure 13, the selected dots representing the bazaar quarter, in comparison to the situation in the late 1950s, form a denser cluster closer to the right edge of the whole scatter. The intelligibility in the global spatial structure of the city has increased slightly to 0.1657, but the r-squared for the substructure of the bazaar quarter has increased with a higher pace to 0.5710 so that its difference to the r-squared for the whole city has also increased from 0.35 to 0.41, which means more distinction of the bazaar as a subsystem in the city. The analyses of the spatial configuration of the present bazaar quarter, separated from the whole city, will show how the positive changes in the properties of the bazaar as a urban substructure has been generated through self-organising local processes.

The separate integration map of the bazaar quarter in its present state (figure 13) displays that the concentration and distribution of integration has acquired a yet more logical pattern, emphasising the importance of the original thoroughfares in the traditional bazaar. The internal spatial structure of the bazaar has become much more integrated and intelligible (mean  $I_n = 1.3991$ , r-squared = 0.7781). This means that movement and accessibility within the bazaar have become much easier while the accessibility to the bazaar from all parts of the city has also improved. The integration map of the bazaar quarter without the two major streets (figure 13) confirms that the improved configurational properties of the bazaar of Rasht have been the result of local processes in interplay with global spatial enhancements.

The retail activity is the most longstanding function of bazaars with potential for growth. It has been capable to replace the declined and abandoned functions of the traditional bazaars in Iranian cities. In the city of Rasht the proliferation of the retail activity entailed a spatial adaptation of the bazaar. What has actually happened in the evolvement of the bazaar in Rasht is not complicated. Shops are highly dependent on pedestrian movement. In the bazaar of Rasht, in a distributed process of reconstruction, the generic law of natural movement has been intuitively

followed. Everywhere it was possible, the existing lines with high movement densities have been linked to channel as much as possible of the movement through a property, which would be rebuilt to provide new shops. It was not difficult to understand that dead-end lines do not attract much movement. The emergence of new rings both increased the internal integration of the bazaar and made it more integrated into the global system of the city.

## Conclusion and opening

The bazaar, the core of the historic core in Iranian cities, has had the capacity to become integrated in a spatial system different from the system in which it was originally integrated. This depends on the flexibility and adaptability of the internal spatial system of the bazaar, which was historically organised to facilitate movement and accessibility. Functionally, the bazaar has proved to be a dynamic organism, which continues to change in complexion to adjust to changing economic condition but only when the global spatial prerequisites are provided. The studied cases show that the best result can be obtained when global planned interventions, while providing easy access to the bazaar as an already integrated body, leave space for local processes of evolution and growth of the bazaar. The entire historic cores of Iranian cities, confronting the problem of decline, do not possess the spatial adaptability of the old bazaars. But they may benefit from the integration of the bazaars in the existing urban system. The growth of the bazaar of the city of Rasht has upgraded it to an attractive meeting place in the city (figure 15). This has been an expansion of the sphere of influence of the bazaar of Rasht, which seems to have enhanced the improvement of its surrounding areas containing residential zones with traditional urban texture. There has not been any remarkable decline in these zones during the last decades. Finding the exact relation between the improvement of the bazaars in Iranian cities and the situation of their surrounding historic zones entails further research. But so far, the existing knowledge suggests that analysis of the condition of bazaars can be the point of departure in dealing with the question of decline of the historic cores in Iranian cities. Old Iranian bazaars or other places with historical background in any city around the world, where they are actively used, are not really *old places*. Although they have old buildings and we may call them names beginning with the prefix 'old'. They are, in actual fact, *new places* in new configurations. From the point of view of content, what is and can be preserved of old bazaars, old places, is not just the exact form of their old physical construct, but it is their *life* in general, which depends mainly on the properties of their spatial configurations and their structural position in the context of evolving cities. To preserve old places as living cultural heritage we need to consider urban spatial configuration as cultural heritage.

**ABSTRACT:**

The Ministry of Construction of the People's Republic of China is the supreme authority administrating construction activities. The quantitative standards set out in the Urban Residential Area Planning and Designing Rules (hereinafter the Rules) issued by China's Ministry of Construction are statutory rules which developers must strictly observe in developing and constructing residential areas. In 2002, China's Ministry of Construction amended the Rules has been applied since 1993.

By comparing the differences between the former Rules and that of the newly amended one, the paper found that the new Rules contains the following amendments based on the former Rules: (1) The new Rules lowered the standard of average number of people per household while increased the standard of number of households in a residential area; (2) The new Rules added the requirement to include residence for the senior in the residential area and stipulate a series of detailed standards in accordance with the requirement; (3) The residential area consists of houses, public facilities, green areas and roads, which are four different kinds of land use. The new Rules adjusted the percentages of the four kinds of land use, lowering the percentage of land use for public facilities and adjusting the composition of the public facilities as well as the scale of each facility, in which, the types of commercial public facilities were reduced; the percentage of land use for commercial and educational facilities was reduced; the percentage of land use for medical and related public service facilities was increased; and (4) The new Rules increased the percentage of land use for roads and parking facilities.

The research found the adjustments in the new Rules have the following sociological reasons: (1) The structure of Chinese families tends to be smaller- core family becomes mainstream while the percentage of empty nest families is increasing. (2) Population ageing is getting fast in China. The minorities such as senior citizens have been paid close attention to by society. (3) Expenditure structure of Chinese people has upgraded. The expenditure has shifted from for basic daily life needs to for development and enjoyment needs. (4) In order to promote the development of automobile industry, Chinese government has formulated and carried out the policies encouraging individuals buying cars, which has seen effects. The number of cars owned by Chinese households has increased rapidly. Certainly, there are some other reasons.

The development and changes of China's residential areas are profoundly influenced by various macro-economic policies made by Chinese government and traditional Chinese culture. Therefore, city planning and designing rules, e.g., the Rules, should not be fixed and unchanged. The regulative, authoritative and instructive roles of the Rules will be played fully only when it is adjusted timely to fit China's social and economic development trend and meet the requirements of other government policies.

**KEY WORDS:**

the Rules, Sociology, family structure, population age structure, expenditure structure

## **I. Comparison of the amended contents of the new Rules and the old Rules**

The Ministry of Construction of the People's Republic of China is the supreme authority administrating construction activities. The quantitative standards set out in the Urban Residential Area Planning and Designing Rules issued by China's Ministry of Construction are statutory rules which developers must strictly observe in developing and constructing residential areas. The first edition of the Urban Residential Area Planning and Designing Rules (hereinafter the old Rules) was officially published and carried out on July 16, 1993. Nine years later in 2002, the Ministry of Construction amended some of the articles of the old Rules, producing the new Rules (hereinafter the new Rules). See the amendments in Table 1.

### Abstract Ref. No. 054

#### A Dense Facade in Barcelona - The 1960s

An urban planning project –a complex project where more subjects are involved, with the basic aim of configuring open spaces and the relation of spaces between buildings and people in a specific territory– can be considered an accomplishment when it has the capacity to change the spatial and functional image of a place, while contemplating at the same time the relevance of its historical, cultural and social content, not only at the local level.

As a matter of fact, the history of urban planning uses, as a category of judgment, the relation not only between the “local” characteristics of projects, but also between the “international” traits of the large-scale urban transformation projects. This relationship should always be judged with respect to the historic moment in which the planning is drawn up and with respect to the long-term transformation of the city.

The change in the waterfront façade is the center of attention not only of a few urban planners but also of the city government and the port authorities during which process that, at the same time, drew up proposals related to their competencies. The aim of these projects was to control the waterfront figuratively, and they anticipate in this specific manner the large-scale recuperation projects of the ports of Baltimore and Boston, and above all else will definitively change the image of Barcelona's coast, which at the end of the 1980s is transformed into a leisure and residential zone.

During this time, in the western world, there is evidence of the development of large-scale urban planning theories, which attempt to recover urban complexity against the division of the city into homogeneous zones. In Barcelona some proposals are made which place it completely within the contemporary European architectural discourse, in spite of the country's strict economic, political and cultural self-sufficiency during the Franquist regime<sup>1</sup> up until the end of the 1950s, when Spain, with “developmentalism”, begins to open up to the exterior.

#### The Maritime Front in the 1960s

---

<sup>1</sup> There are many studies which demonstrate on the one hand the possibility of an autonomous discourse of the Arts, due to the minimal contact with the exterior, and on the other hand explain the lack of relationship with European cultural environments, citing as examples the experiences of the GATCPAC, Picasso, Dali, etc.

Barcelona, a Mediterranean and coastal city, loses the possibility of its contact with the sea from the end of the 19th century until the mid-20th century, as a consequence of the presence of the port, the industrialization of the entire coastal front, from the openings of sewage and storm drain openings to the sea and the spontaneous housing encampments on the beaches. In spite of the fact that the importance of the maritime front<sup>2</sup> is reclaimed during the 20th century, it's only until the 1960s that two projects are drawn up which, had they been fulfilled, would have "colonized" the entire coast along Barcelona with "residential buildings"<sup>3</sup> and drawn the façade of the city towards the sea.

The two projects in question, patronized by the private sector within the legal boundaries of the Regional Plan of 1953, are the Special Organization Plan of the Southwest Zone of Montjuic (1964-1969), carried out by the architect Antoni Bonet (1913-1989), with the participation of Oriol Bohigas (1925- ) and Josep Martorell (1925- ); and the Ribera Plan (1964-1972) by Antoni Bonet. In the second project Bonet draws up a plan specifically for the port (1965-1966) with the engineer Gonzales Isla—who carries out the plan as director of the port—with the objective of reconverting the zone into a residential neighborhood.

These two projects, together with the General Port Plan<sup>4</sup> (1964-1966), the Interconnecting Railway Plan (1966), the Barcelona Metro Plan (1966), and the proposal by the MOP (*Ministerio de Obras Públicas* or Ministry of Public Works) of a coastal throughway, give rise to a reflection about the circumstances that caused such an interest for the maritime front in the mid 1960s.

The "Special Organization Plan of the Southwest Zone of Montjuic" and the "Ribera Plan", interconnected with the future throughway projected by the MOP, proposed the construction of two neighborhoods characterized by a high density of residential buildings which would have solved the problems of congestion in Barcelona's historic center. These projects would have contrasted with Barcelona's processes of development in a centrifugal direction, especially toward the mountains, through a strategy of equilibrium that would have given more emphasis on the coastal façade.

While the first of these projects consisted of a group of residential buildings for 18,000 persons, called "Miramar" and located along Montjuic's southern slope, the second project would have occupied a wide strip of 500 meters by 6 kilometers between the Ciutadella Park and the Besos River, where 180.000 people could have lived.

The port project, which was never officially presented, included in the port itself residential buildings, commercial sites, as well as six skyscrapers in memory of the three represented in the Macià Plan (1934) by GATCPAC, with the collaboration of Le Corbusier.

These projects not only foresaw a large population density but also the integration of activities such as commerce, infrastructures for education and sports, as well as open public spaces and recreational spaces which would have been carried out in the same cross-section.

The purpose of this paper is not so much an investigation of the causes of the renewed interest for the Barcelona's seaside border, or the reason for Bonet's protagonism in these projects, but to highlight the relationship between these projects of the 1960s and contemporary projects on the same scale in the western world, and, in particular, with that architectural culture which made a schematic reading of the experiences of the 1920s and 1930s and which understood, above all else, typological

---

<sup>2</sup> It is important to remember the sequence of the projects for the seaside walkway: the Universal Exposition (1888), José Amargós (1894), Ricardo Alsina Amils (1899), Leon Jaussely (1907), José Ortega (1918).

<sup>3</sup> During these years Antoni Bonet Castellana was projecting the Llobregat Plan (1966) and the Star Buildings (1963) in the Zona Franca.

<sup>4</sup> The Railway Connection Plan foresees the elimination of the coastal Barcelona-Mataró line.

schematics as a simple formal level, proposing the recuperation of the complexity of the urban dynamic.<sup>5</sup>

The figure of Antoni Bonet, however, and specifically these projects for the coastal front reveal how a project is a work of synthesis not only of the author's professional experience but also of the socio-cultural and political movements, as well as the collective image of Barcelona's coastal border as a potential urban space, a plan which had been developing throughout a long period of time.

### **Criticism of the Coastal Reformation**

The critique of architectural history tends to resolve the evaluation of these three projects as a simple product of a speculative will, on behalf of private investors, on property that was increasing in value because of a series of infrastructure improvements that the city was planning.

A critical analysis of the Ribera Plan was published in a 1974 book, *Barcelona, Capitalist Remodeling or Urban Development in the Eastern Ribera*<sup>6</sup>, caused by the criticism made by neighborhood groups and various professional groups, and the spread of a "Ribera Counterplan". These books note that "the Ribera Plan is the first important case which marks the introduction in Spanish urban planning of a process whose social and technical resonance in an advanced capitalist country has been employed extensively (in the intensive polemic of American 'Urban renewal' of the 1960s or the French 'Renovation urbaine')", a process defined as a large-scale private/sector urban remodeling.

The large scale, the population density, the functional and typological integration, an intermediate scale of the project and the emphasis of the project as a strategy which compromises the entire structure of the city<sup>7</sup>, appear to be some of the characteristics for which these plans may be considered "urban plans" and as urban, complex and interdependent pieces in their content, surpassing in this manner the mono-functional nature of zoning.

It's worth remembering that, coincidentally, the year these plans were being drawn up was described by Reyner Banham<sup>8</sup> (1922-1988) as "1964, the mega-year", because Fumiko Maki (1928) utilized for the first time the term megastructure as *a large structure in which all or a part of the functions of a city could be carried out*. The definition ignores the mechanical aspects and the relationship between the structure and its components –modules– which characterize part of what has been defined as the megastructural experience, where the structure is characterized as being a rigid network in which the module can assume different compositions with respect to specific needs, without compromising the overall structure.

### **The Structure and the Components: Megastructuralism**

The Ribera Plan, in its purest version of 1965<sup>9</sup>, is drawn as a 500×500 meter module (the equivalent of 4 Cerdà blocks). These are repeated seven times without any deformation of preexistent areas or structures, as would be the case of the presence of the Eastern Cemetery or the consolidated urban structure of Poble Nou.

<sup>7</sup> de Solà Morales, Manel (1990), "Another Modern Tradition", *Lotus International*, No. 64.

<sup>8</sup> Banham, Reyner (1976), *Megastructures, Urban Future of the Recent Past*, G. Gili, Barcelona, 2000, pp. 60-61.

<sup>9</sup> The development of the Ribera Plan is a long process between 1964 and 1969, when it is finally presented to the city government. During this period the project is deformed or adjusted according to the criticisms received.

These *superblocks*, which constitute the module of the urban plan, are developed over a structure which constitutes an artificial ground installed six meters above the natural terrain, so that the structures acquire a favorable position facing the Mediterranean Sea, obtaining in this manner the independence of the pedestrian and automobiles movements. However, part of this artificial terrain is omitted, in the center of the *superblock*, to create a central park for each module, proposing in this manner the connection of public and private spaces.

Three different types of residential, skyscrapers, blocks and cross-shaped buildings are placed on top of this large platform, including commercial spaces and recreational services for the neighborhood, while in the two underground levels there is space for parking and storage. In this way, because of its surface area and density, each sector becomes an autonomous element where all of man's basic activities can be accomplished.

The utilization of a rigid structure, a grid or diagram in the current architectural language, as "Laying down a grid should be mapping of the possible, not restrain order" (Cecil Balmond), has been the architectural response to different aspects of the society of the 1960s.

If on one hand the large density and the modular repetition recalls Fordist production, the possibility of varying the modules within the grid introduces the flexible post-Fordist production system.

There are multiple examples in the 1960s. This is the case of some of the proposals by George Candilis (1913-1995), and in particular the 1963 proposal for the organization of Frankfurt's central region, as well as the Frei University of Berlin, or Kenzo Tange's 1961 Plan for Tokyo Bay, or Alison and Peter Smithson's 1957 Berlin Hauptstadt Project.

It's worth noting that the long-term administrative process of the Barcelona coastal project, from 1965 to 1972, caused by a large amount of signed objections, caused a series of variations which, in this sense the most notable are the variations of the module with respect to the preexistent urban structures. There is a specific, local attention incorporated into the project, to the previous territory which the network attempted to recover only based on the strictest human and not citizens' necessities, which is reflected by the specific identity spaces, which have been constructed throughout time. The signs, symbols of the territory, remain as places for civic demands.

### **The Recuperation of the Complexity of the Urban/Neighborhood Unit Dynamic**

In the memoirs of the Ribera Plan there is an explanation about how the plan attempted to construct a space where man would have the maximum possibility of development and individual liberty within an organized collective, through his active participation. As a means of accomplishing this result a direct relation with the housing is proposed, with the extensions of the habitat, the recuperation of the urban floor for man, who *can have access to all the possibilities within the basic citizens' functions*.

The structure of the Ribera Plan refers to the megastructuralist experience, while its principles and above all else the perspectives of the project for Montjuic refer to the objectives for urban planning suggested by Kevin Lynch<sup>10</sup> (1918-1984) in his studies about the "urban form". This author argues that among the aims of urban planning one must contemplate the recuperation of the city in its complex form as a place for familiarization, through a metropolis which is dense spatially and with paths which are socially planned, with the goal of the intellectual and moral development of people. As a result public meeting spaces which facilitate collective neighborhood participation and strengthen the sense of community have an important role in his proposal.

### **The Relationship with the Landscape: "Geomorphological Options"**

---

<sup>10</sup> Lynch, Kevin (1960), *The Image of the City*, Marsilio Editori, 1986.

The proposals for Barcelona's maritime front would have constructed neighborhoods which would attempt to clarify the urban scale with the landscape. On one hand they are separated from the city thanks to its own zero level, different from that which is destined for construction within Barcelona, and on the other hand they reflect the presence of the natural environment in contrast with metropolitan dynamics.

The Special Organization Plan of the Southwest Zone of Montjuic in fact foresees the transformation of the cliff which faces the sea into a residential zone which will be transformed into a large citizens' balcony over the Mediterranean and will cause an overflow of life for the large Montjuic Park, in contact with the historic and cultural center of the city, avoiding the formation of peripheral neighborhoods and providing homes for the people who lived in barracks along Montjuic's slopes.

The architects of the "Miramar" ("Seaside View") Project explain how their composition is consciously on a landscape scale, and that *it is not valid to accuse the project of giving the mountain a new "unnatural profile or silhouette" as if the unnatural were an unquestionable defect of any landscape. The only prestigious Barcelonan profiles are those that are unnatural, that is, those created with an intervention of urban and architectonic elements: Montjuic, in its southeast slope, with the castle, the National Palace, and the Tibidabo with the set of constructions at its peak.*

*It isn't necessary, either, to add that the majority of historic cities (Rome, Florence, Vienna, etc.) owe their characteristic profile to historical and artificial landmarks which have specifically marked a brilliant moment in their architectonic evolution.<sup>11</sup>*

They foresee three towers at the summit of the mountain, with the purpose of contrasting the horizontal mass of the Castle, and on the southern slope the location of staggered residential structures with gardens which constitute the landscape transition between the inferior mass and the castle's profile.

A strong density is proposed, an artificiality in contrast with the mass of the mountain. This is a large-scale project which relates with and dialogues with the landscape, with the local geography, and which aspires to create a human-scale environment which could fit into the "geomorphological options" thought out by Sybil Moholy Nagy<sup>12</sup>.

In 1968, the author, in her book about the evolution of the city, describes in the last chapter the options for the near future of architecture and among these the geomorphological option is highlighted as an alternative to the growth of the suburbs. In this section she mentions the resort city of Gozo (1967, Malta Archipelago), of Julio Lafuente (1921- ), an enormous construction located over the rocks which face the sea, similar to Bonet's proposal, and the urbanization of Telegraph Hill (1966) in San Francisco, by Burger & Coplan. This plan is situated directly in front of the city's bay and the architects project a section that joins the system of infrastructures, the residential area, the services and the parking spaces.

These last projects, which are related in their context with a landscape scale, attempt to obtain a global and powerful image and "their form" is not only the consequence of a typological rationale, but also creates a dialogue with a sufficiently characteristic location, whose final form depends on itself to a great extent.

---

<sup>11</sup> Bonet, Antonio; Bohigas, Oriol; Martorell, José M. (1969), *Commentary to the Report by the Regional Parks and Gardens Service*.

<sup>12</sup> Moholy Nagy, Sibyl (1968), *Urbanism and Society*, Editorial Blume, Barcelona, 1970, pp. 283-284.

The similarities may always be slightly risky, but in this case they may give an idea of the project as a synthesis of the complexity of socio-cultural aspects among which we may enumerate the relationship between the local and the international.

### **The Recuperation of the Waterfront as the Theme of the Project**

Bonet wished to have the figurative control from the sea in the Montjuic Project as well as in the Ribera Project.

In the sketches and scale models for the port project, which have never been officially incorporated into the Ribera Project, there are six skyscrapers that would overpass the seaside façade. The theme of skyscrapers, symbol of both the civic –the renaissance tower– and the economic power of the city, is repeated in the official proposal. Bonet projects three gigantic 84 meter tall towers in the form of a Y right in front of the Ciutadella Park, which are then repeated twice for each *superblock*, along toward the Besos River, creating a serial and almost minimalist profile for Barcelona.

It is important to note that Bonet's projects have been precursors of European and United States waterfront projects. The first port reforms, due to the impossibility of transforming them into actual port-containers, took place in the U.S., in the cities of Baltimore and Boston at the end of the 1950s, but only in terms of ceding the port spaces to the public with recreational locations (green and commercial) and not so much so as the control of the seaside façade. This theme is developed after the 1980s in the projects for the Docklands in London, Kop Van Zuid in Rotterdam and for Barcelona's *Moll de la Fusta* and *Villa Olímpica*.

The control of Barcelona's maritime façade, if realized according to the proposals made in the 1960s, would have created a dense image overall, with quantity as a value, and a serial image on the eastern side, related to massive production, which are key terms in Fordist production. However, the administrative mechanisms, together with the negotiation *between public and private interests*, the semi-privatization of collective spaces, the figurative control of the entire superblock as a theme park and the figurative control of the presentation (postcard) image of the city as the primary promotion of the project, already announce the city's current development model.

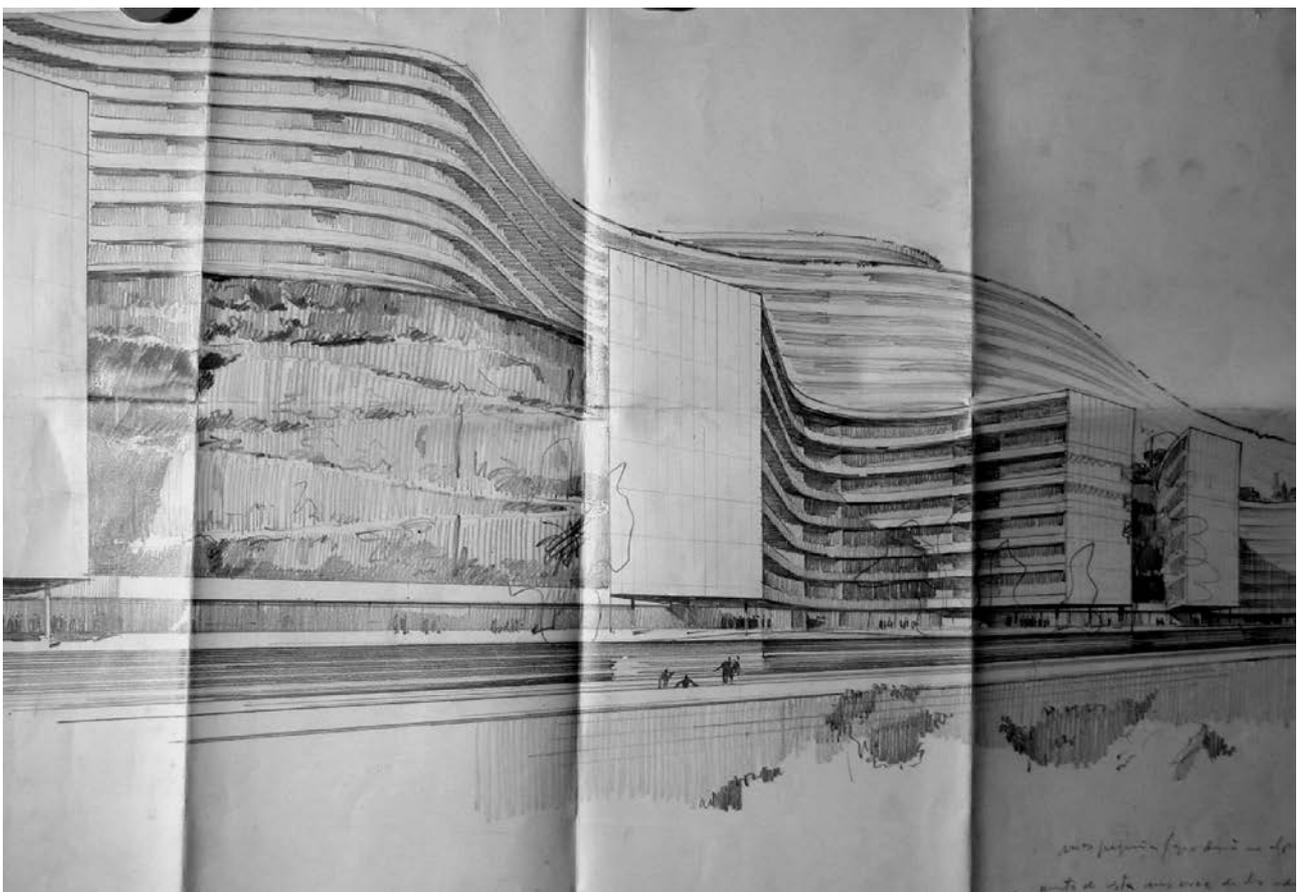

Currently, Barcelona, as many other cities of the western world, is a city in which the local and international references disappear in a context which is ever more heterogeneous and mixed, where this sort of judgment may become a question about the value of the continuity of a reality which appears to be constructed on macroeconomic parameters, difficultly comprehensible to the people who live and understand themselves in the city.

## The Formal and the Picturesque – Appropriate Ways of Describing and Improving the Urban Network? Indian and European Examples

Since Abbé Marc-Antoine Laugier's „Essai sur l'architecture“ (Essay on Architecture) of 1755, cities have been classified under the auspice of picturesque ‚variety‘. When he demanded a city to be given the impression of a forest, he meant that it should surprise and entertain the eye the way a painter does by choosing a perspective and a focus, by grouping the objects, and by cutting out the motif. This reveals that the term „picturesque“ derived from the notion of „scenery“ in the British landscape garden and designated the spatial experience of its depth. Within the same logic, the opposite concept of a „formal“ layout was connected to the preceding baroque garden which in contrast seemed to have emerged right from the drawing-board and therefore remained merely ornamental and purely two-dimensional.

From then on, the concept of the ‚picturesque‘ features these two sides, spatiality and naturalness. Both arguments served as weapons when formal conceptions of the city have been contested. This narrow polarization rules our vocabulary: plastic versus twodimensional, natural versus artificial. It was Camillo Sitte (1843-1903) who the most fervently and influentially advocated pictorial urban principles, notably by his book „Der Städtebau nach seinen künstlerischen Grundsätzen“ (City Planning According to Artistic Principles) of 1889. With all of his work, Sitte opposed to the rationalistic, pragmatic, and presumably utilitarian approach to planning which Reinhard Baumeister (1833-1917) just had cemented in his own writings, notably „Stadterweiterungen in technischer, baupolizeilicher und wirtschaftlicher Beziehung“ (City Extensions with Regard to Technics, Building Regulation, and Economy) of 1876. Sitte had Baumeister in his mind when he uttered with fear that „a large portion of the picturesque beauties we have mentioned will probably be irretrievably lost to use in contemporary planning.“ (p. 110) As an antidote he recommended an approach which was based on the perception of urban space from human perspective at eye level; he illustrated and thus connected it with the irregularity of medieval plans. These schemes immediately became icons in theory and models in practice and shaped our image of picturesque city spaces. Yet the situation proves to be paradox. For what transported the quest for a spatial perspective were two-dimensional ground plans, and again was the discussion reduced down from the third to the second dimension; ‚the picturesque‘ became identified with irregular lay-outs, and correspondingly ‚the formal‘ with regular ones.

The question arises, if this juxtaposition stands the facts and the evidence, and if it can be an apt instrument for describing, analyzing, and eventually improving cities. In order to trace the way for an appropriate statement a few interfaces between ‚the formal‘ and ‚the picturesque‘ shall be paralleled in the following.

We naturally could choose from a wide range of possible examples, and it might seem to be a distant even absurd constellation when I select as the main poles one example as Karlsruhe in Germany and one as Jaipur in India. What might predestine these very cities for a juxtaposition? Both being ‚ideal cities‘ dating back to the same time shortly after 1700, they have been laid out on ingenious regular plans which makes Jaipur the big exception in India of that time whereas it was not as rare in German states. Both cities owe their creation to a ruler's decision to shift his residential seat away from an existing older one. Other parallels shall result from the comparison.

To start with Karlsruhe which among both examples is the older one, though by twelve years only, it was founded in 1715 by Margrave Carl Wilhelm von Baden-Durlach (1679-1738). Baden is the country which he reigned, and Durlach the city where his major castle stood until he moved away into the new city which he named after his forename Carl, while „Ruhe“ means „rest“, „repose“ or „quietude“. There, his own castle was to form the centre, and no other city this can be said about more rightfully than in this case. It literally occupies the crossing point of 16 alleys which in both directions radiate from there into the forest and the landscape and outline the first settlement which filled the quadrant south to the castle.

By nature, new cities need decades or even centuries to develop, and so was it for Karlsruhe. In a first phase, rather small houses grew facing the castle. A new impulse came with his grandson Margrave Carl Friedrich (1782-1811) who ascended the throne in 1746 at the age of eighteen and immediately started lending his residential seat more attraction and durability. For example, he had his mainly wooden castle finally erected in stone, and allowed all citizens to do the same with their own houses. He sought the company of artists and diplomats, and soon Karlsruhe was called „court of the muses“. As Baden stepwise allied - and identified - itself

with its powerful neighbour France, this vicinity brought about a climate much more liberal and enlightened than in other German states. Between 1801 and 1815 the number of inhabitants doubled to 15.000. And from around the same time on, plans have been forged to enlarge the city area and to transform it into a true capital city (fig. 1).

Karl Friedrich found his architect in Karlsruhe-born Friedrich Weinbrenner (1766-1826); he developed a modern building administration, independent from the court, founded an architectural school which turned into the first German Technical University, and he immediately started drawing plans for the extension. On these, for example the „Generalbauplan“ (general construction plan, fig. 2) of 1797 for the new city centre of Karlsruhe around the Market Square, the street fronts along the main street axis looked homogenous, downright uniform. One house seemed to copy the other. But then, a second version was drawn seven years later, in 1804, and on it, you find the uniformity completely dissolved into a heterogenous composition. And it was Weinbrenner himself who was responsible for it.

In the meantime, he had designed a kind of maison particulier for a general named von Beck, with a court d'honneur breaking through the alignment and lending the street a third dimension, and for himself a house right in front of the Ettlinger Gate which lead out of the city towards the smaller city of Ettlingen. Weinbrenner's own house stretched along the main axis, but with a set-back, and this way, together with its vis-à-vis, gave way for an urban square. It formed an unusual entry into the city, monumental and urban, yet at the same time green and formally easy.

The dimensions increased towards the market square with main church and town hall; even here Weinbrenner brought the demanding functions into a balanced composition using innovative typologies. His own renderings visualize that he extended the public space into the interiors. The never realized boutiques would have dramatized the crescendo in scale even more.

How picturesque the city Karlsruhe actually was, can be judged by numerous views, among them the lithograph of 1828 by painter Ludwig Kuntz (1810-1876, fig. 3). He does not give an impression of the urban layout but of an idyllic scenery with houses and monuments lying embedded in a landscape garden. In fact, nature entered the city in the form of the surrounding forest and of real gardens.

It added to this idyllic impression that no walls were hindering the view. The opposite was the case in Jaipur the former capital of Dhundar, one of the Rajput states which make up Rajasthan. The rectangle which the walls form here is not a perfect one; yet the regularity is obvious and reveals that this city has been founded at once. The borders of approximately 200 miles length and 140 miles width are straight except where the topography is cutting in; and the interior divides into square plots. We even observe a differentiation of streets which enclose square wards.

The literature offers at least three precise dates – the 18th, 27th or 29th november of 1727 - when Sawai Jai Singh (1686/99-1743) laid the foundations for his new residence which he named Jaipur after himself - ‚Jai's city' (fig. 4). He stemmed from the Kachchwaha dynasty which ruled Dhundar and since the end of the eleventh century sat in Amber Fort on the hills five miles to the north. He received the honorary title „Sawai“ by Grand Moghul Aurangzeb (1618-1707). Yet he excelled not only as a soldier but also as a scientist, preferably in astronomy. In Delhi, he had already built a monumental open-air observatory in 1724, the Jantar Mantar. Here in Jaipur, it gained new dimensions and occupied the heart of the city (fig. 5). Its construction started parallel to the layout of the streets and ended in 1734. In the same year, a map with the accomplished quarters could be drawn. When in 1743 Jai Singh died, the city was not complete. Yet, one may say that it was built around the observatory and that the rational regularity reflects the same scientific spirit which made Jai Singh place the observatory so prominently among his subjects. A notion of enlightenment played a role just as it did in Karlsruhe.

It has often been claimed that Jaipur was laid out according to a set of rules, preserved over centuries in some sixteen Sanskrit and more local manuscripts, all of them concerning the construction of houses and cities. These rules are known as Vastu Shilpa Shastra – „the science of earthly forces in building“ – and among other aspects deal with the geometrical distribution of plots. This simple fact was translated into mandala-like forms, and hardly any author could resist the temptation to project them on Jaipur. In fact, the intrinsic grid of streets running rather precisely along the cardinal directions – east to west or north to south – follows one pattern which is usually called „prastara“ (bed of leaves or flowers). Yet the congruencies with the Jaipur plan remain very vague – even if you understand the mandalas not as a model and image but as a concept like some authors do. It does not explain the city as it grew because it had to be filled with life and forms, and we find that the original typologies which were invented to do that contradicted the rationality of the plan, or complemented it, by their richness and variety in all three dimensions, and it was this spatiality which lend the old city of Jaipur its picturesque quality.

The main axes through the city - here the Chand Pol Bazar from east to west - are often accompanied by colonnades which serve as elevated terraces or platforms. But the typologies do not always obey the logic of the plan, as we might expect it. And so, the badi chaupar for example, the crossing of the main arteria, continues these simple colonnades while right next to it, we see a highly complicated structure which serves as the entrance

to the Jam'a Masjid. Stairs are breaking through the upper platform, and a series of gates guide the eye into the depth of the plot.

Similar constructions are also to be found at profane buildings, here two mansions of mid-18th century in a street leading north to south (Khazane Walon Ka Rasta, fig. 6).

Doubtlessly, the most prominent one of the special typologies consists in the famous Hawa Mahal – Palace of the Winds (fig. 7). It stands at the main street but aside from the main crossing Badi Chaupar, and rises over the ground so dramatically that it evoked descriptions like „a vision of daring and dainty loveliness, of storeys of rosy masonry and delicate overhanging balconies and latticed windows. Soaring with tier after tier of fanciful architecture in a pyramidal form, a very mountain of airy and audacious beauty, through the thousand pierced screens and gilded arches of which the Indian air blows cool over the flat roofs of the very highest houses. Aladdin's magician could have called into existence no more marvellous abode.“ These sentences stem from Edwin Arnold (1832-1904), the translator of the Bhagavad Gita, and were proudly quoted in the official chronicle „A History of Jaipur“ by Jadunath Sarkar in 1939/40 (p. 210). In the Hawa Mahal, the scientific rationality of the Jaipur grid was turned into the highest and most romantic expression of picturesque architecture.

Judged by its two-dimensional plan, Jaipur fulfills what Camillo Sitte observed and criticized in Mannheim, baroque ideal city like Karlsruhe and in its immediate vicinity, namely: „there exists not a single exception to the arid rule that all streets intersect perpendicularly and that each one runs straight in both directions“ (p. 93). Yet nobody would deny that the appearance of the city of Jaipur is highly picturesque and pictorial. What on the plan looks like a rigid geometry, had opened up hitherto rarely known openness and range of variations.

It was already Sitte's intention to „eliminate“ – as he says - „the innate conflict between the picturesque and the practical“ (p. 111). This was the opinion, too, of followers of his, like Raymond Unwin who spread it in „Town Planning in Practice“ of 1909, particularly in the chapter „Of Formal and Informal Beauty“ (p.115-139) where he warned of imitating nature and promoted „to seek for some third course“ (p. 125). And he more than once pointed at the example Karlsruhe (fig. 8) because there, like in Jaipur, adequate typologies contributed to a spatial diversification - which moreover made these cities favourite objects of numerous pictorial representations and allowed picturesque planning within the formal frame. One can just as rightfully state that these very typologies could only evolve from these straight streets, evidently processing their linearity, balancing their intrinsic geometry and unfolding it into the three dimensions.

Regular examples like Jaipur or Karlsruhe provide the most convincing milestones for Unwin's „third course“ and prove the more plausibly that it reaches too short to judge the spatial and picturesque dimension of cities from two-dimensional plans. Another extreme and more recent evidence surrounds us here, namely Edwin Lutyens' (1869-1944) planning for New Delhi, beginning in 1911, particularly the political centre around the Rajmarg. What on the plan looks like the product of sheer geometry turns out to be a grand public space of hitherto unknown complex qualities. Monuments like India Gate and even Rashtrapati Bhavan lie embedded in a picturesque garden scenery. The dimensions are vast, the nearly endless greens are only sketchily bordered, and still the space can strongly be perceived as one because it bases upon a coherent formal structure. New Delhi gives another hint how the terminological conflict between ‚the formal‘ and ‚the picturesque‘ can be overcome and eventually converted it into a catalogue of other qualities and categories, such as relief, plasticity, depth, transparency, and perspective.

## New Delhi; Resistance And The Tensions Of Empire In A Colonial Landscape

*This paper is the property of Dr Stephen Legg, University of Nottingham (stephen.legg@nottingham.ac.uk). It may not be circulated or reproduced without his permission.*

The planned landscape of New Delhi has been hailed as a supreme manifestation of British imperial aesthetics and science (Shoosmith, 1931, King, 1976, Stamp, 1981, Irving, 1981, Metcalf, 1986, Volwahren, 2002). It has also, however, been criticised as an emblem of colonial autocratic rule and as an unexceptional reproduction of western architecture in the east (Tillotson 1989). Yet few studies have explored New Delhi as a lived landscape in order to see how its inhabitants contested the city as a material and symbolic form. The Indian National Congress party was active in the city, as were more violent and extreme anti-colonialists such as members of the Congress Socialist Party and the Hindustan Republican Socialist Army. However, there was a less extreme form of resistance that occurred throughout the city, whereby New Delhi's occupants adapted to, yet contested, the structured landscape of the city. These processes will be explored through looking at petitions, institutional campaigns, and lifestyles that contested Delhi's urban governmentalities (Legg, in press 2007).

### *Petitions*

In New Delhi one's ability to speak to the government was dictated by one's rank. Because each government employee had the right to apply for accommodation, it also gave each employee the right to address this right. The superior and subordinate members of the staff, through both formal and informal channels, used petitioning to challenge the hierarchy of accommodation in New Delhi. These channels were also taken up by non-governmental employees, although their ability to exploit these avenues of complaint were limited. Petitions were used to question the structure of the city, but also to question its *derived* contradictions, those everyday problems of existence that should have been catered for. These separate petitions, though not formally linked, can be seen to form a counter-discourse that is unified by its opposition to the accommodation scheme of the Government.

For instance, a petition was submitted to the Government in 1916, signed with fingerprints and written in Urdu, but translated in English<sup>1</sup> The petitioners had been ejected from their original inhabitation in June 1913 when it was acquired for the capital construction. They had since been living in a private garden, which they had been assured would not be acquired. When this took place in March 1916 they petitioned for compensation. The petition was unsuccessful, with notes on file suggesting that the people could simply move their houses and that, although they'd had bad luck, technically it was their own fault.

Similarly, in March 1927 the land and houses surrounding a small mosque in the New Delhi area was acquired.<sup>2</sup> The residents petitioned for compensation and for permission to take their housing materials with them when they were evicted, as the cost of such materials had been greatly inflated due to the capital construction. While compensation was paid, the material was not granted them as, the Superintendent of Monuments claimed, it was "objectionable to show charity at the expense of government..."; the materials would have to be bought back at auction. Both of these cases targeted small-scale failings of the government's aim to provide evictees with

the resources to relocate, but failed due to the legal and technical machinery at the Government's disposal.

While these people could speak, they were not speaking from positions of strength. Those people employed by the Government, rather than relocated by it, had stronger claims to be heard in their petitions. On January 2<sup>nd</sup> 1918 the clerks of the Military Department submitted a petition for house rent allowance.<sup>3</sup> The clerks had not been given housing near the Secretariat, which at that time was located in its temporary building to the north of Old Delhi, but were living in the few completed quarters in New Delhi. They complained that tonga expenses were too high, yet the seven-mile trek made it impossible for them to start work at eight AM. The Raisina quarters were also said to be solitary and prone to theft and harassment, although this criticism would continue for decades (see chapter three, section one). As such, in February 1918, the Home Department acquiesced and granted compensation.

Clerks could also adopt more aggressive stances. In February 1925 a number of clerks were accused of subletting their quarters.<sup>4</sup> Mr Ghulam Hussain replied that he had not sublet to anyone but that he had exchanged quarter with a friend "for mutual convenience", and that the maximum rent was still being paid. He even suggested that no rules against subletting existed in Delhi, and that "doubling up" was positively encouraged. Yet, while De Montmorency had tried to claim in 1912 that the city was a structure designed upon the lines of greatest convenience, the actual emphasis in the city was on people knowing their place. An unnamed official wrote on the file: "We can't have this sort of thing. It makes trouble for everybody. The rules must be observed."

Yet those in more senior subject positions had different channels for petitioning open to them. For instance, the Education Commissioner with the Government of India wrote directly to the Chief Commissioner in May 1927 claiming that his superintendent was forced to live a great distance from Raisina, and that he would appreciate a nearer house being arranged.<sup>5</sup> As New Delhi was more fully occupied from 1927 onwards, complaints from senior figures about the failure to provide housing started to flood in. Unlike the clerks, these protests did not have to take the form of petitions in order to be processed by the Government. Reports were logged from two members of the Army Department who had to pay to send their families back to Bengal as no quarter was available to house them in.<sup>6</sup> Other complaints record men having to share apartments, or to leave their families in Simla rather than bring them down to the winter capital.

While these derived contradictions between the Government's claims and reality would continue to be picked up throughout the colonial period, petitions were also used to target more fundamental, *intrinsic* contradictions. These did not address the way in which the city was realised, but the hierarchies it sought to impose. The case of a memorial submitted in 1915 highlights the willingness of low ranking government employees to criticise the intrinsic *ethos* of the city. But it also highlights that the Government had provided the opportunity for the clerks to take up this position. On September 2<sup>nd</sup> 1915 RP Russel explained that he had given clerks the opportunity to see the designs of the quarters that were going to be built for them.<sup>7</sup> Russel proposed to form a committee of clerks to feed back their ideas to the PWD, yet before he had the chance, a memorial had been submitted to the Viceroy himself. As the Home Department, who conveyed the memorial, commented of its own clerks:

"... they have already submitted a memorial in which they have taken exception to the principle of differentiation in respect of the capital

cost of the quarters intended for Anglo-Indian and Indian clerks and to the classification adopted in the case of quarters for the latter.”<sup>8</sup>

It was this objection to the principles of differentiation, and classification, that marks out the intrinsic contradiction being targeted here. The memorial begged forgiveness for troubling His Excellency in a time of war, but insisted that the matter effected the memorialist vitally, and the status of clerks generally. The initial proposals had made a distinction between the capital cost of quarters for Indians and Anglo-Indian (white) clerks.<sup>9</sup> For instance, the top grade married quarters for Anglo-Indians would cost Rs9200 to build, but only Rs4072 for Indians, which the memorialist showed was lower than for the cheapest Anglo-Indian quarter. The Indian estimates had been based on houses in the temporary capital, although it was claimed that these themselves were insufficient. But in summing up, the memorialist moved back from derived to intrinsic contradictions:

- “2. There being no difference in status, pay and allowances, between Indian and Anglo-Indian clerks of the Secretariat, it would, it is submitted, be invidious to draw a distinction in respect of quarters...
3. The proposal amounts in effect to building better quarters for Anglo-Indian clerks at the expense of Indian clerks...
5. This unequal treatment is felt as a mark of inferiority of the Indians as a class.
6. The argument, which is sometimes used, that Indian clerks generally live more economically as regards house accommodation than Anglo-Indians, fails to recognise the fact that such economy is in most cases a matter of compulsion.”<sup>10</sup>

The memorial drew out a clear use of racial categorisation, showed that it was insulting, and then showed that the essentialising stereotype that it inherently deployed, of the humble Indian, was an imposition, not a cultural condition. The Home Department stated on 6<sup>th</sup> September that it planned to cooperate with Russel in organising representative committees for the clerks. On 11<sup>th</sup> October the PWD confirmed that a committee had been established for each different housing class, and that they would be consulted as designs were produced.<sup>11</sup> They were given the chance to comment in February 1917 and some of their recommendations were taken on board.<sup>12</sup> These generally involved adding more rooms, but the clerks also insisted upon housing being provided in the “European style”, as discussed in section 2.1. This reinstalled a division of housing for people of Indian origin. Yet in this case, the division was instigated from below and was a matter of choice, not racial designation.

As in the case of the derived contradictions, the petitioners seemed to become more vociferous in their criticisms over time. In 1937 the Chief Commissioner complained that servants quarters in New Delhi were being rented out, forcing servants to live in garages, and making a profit for the home dwellers at the Government’s expense.<sup>13</sup> The Government complained to Mr Lachman Das Bhandari of this, who replied on 12<sup>th</sup> September 1937 that this activity was not forbidden in the lease. The plot was still being used for residential purposes and, as such, Bhandari stated that: “... it is my own lookout as to who should live in different rooms or parts of the house.” He went on to ridicule the Government for suggesting they could dictate what one could or could not do in the private spaces of one’s home: “I daresay such a law is unheard of and does not exist anywhere in the world... To restrict this

discretion is to interfere with personal liberty.” He also pointed out that people had actually been building extra tenancies in their plots in the more elite areas of the city, yet there seemed to be a different law for those people. However, a city engineer pointed out on 25<sup>th</sup> November that the lease dictated that each building had to serve the function allotted it in the plan, and that paying tenants could not be designated guests. Whilst falling down, again, on the legal technicality of the lease, Bhandari had picked up on a key contradiction of the British “liberal” Empire and had reclaimed one of the key organising concepts of the imperial landscape. Namely, that it claimed to respect the liberty of the individual yet intervened into the lives of its subjects to an extent that would not have been tolerated in the west.

### *Sites of institutional authority*

Institutional sites of authority describe the places at which discourses are produced and consumed. The counter discourses above issued from the site of the home, while the success of the petition depended upon the subject position of the dweller. Yet there were also representative bodies that took up both the derived and intrinsic contradictions of the Government to greater effect than an individual, irrespective of their subject position, could do. The two institutional sites that will be studied here were not marginal, occupying the space of the exiled or subaltern. Rather, they were central, occupying spaces created by the Government to fulfil its image as a liberal machine. The Legislative Assembly had not featured in the original plan for the city, as the right to wide scale democratic representation was only granted to the Indian people after the Montague-Chelmsford Reforms of 1917. The building was placed to the northeast of the North Secretariat, proving as problematic to the symmetry of the city as it had done to the authoritarian aspirations of the government. The second site was more central still. It did not have a permanent physical space but, rather, occupied the Secretariats themselves. The Imperial Secretariat Association (ISA) represented the views and grievances of all those who worked for the central Government of India, having 657 members in 1931. The ISA was a relatively conservative body, but in the liberal tradition it was a constant complainant against the Government, and did occasionally slip into more radical language. The Association had been producing a bulletin for private circulation ever since occupying the New Delhi Secretariat in 1927. In 1929 an editorial complained that the Government only ever offered compensation to those who did not need it, or could not claim it. It was concluded that such a situation could not be remedied under the present system: “And so, it will have to be relegated to the category of dreams which we trust will come true when we have Dominion Status.”<sup>14</sup>

Because the Government of India centrally administered New Delhi, its day-to-day affairs could be directly raised in the Legislative Assembly. As such, the records of the Assembly capture a host of seemingly banal questions regarding the *derived* contradictions of a government unable to deliver on its housing of 66% of the working population, or to keep the residences in a fit state of habitation. The earliest criticisms regarded *amenities*. Complaints targeted: the lack of street lighting in the centre of New Delhi (1921),<sup>15</sup> which the Government stated it could not afford; leaking apartments (1923),<sup>16</sup> which the Government claimed were still habitable; unsafe housing (1927), to which the Government did not respond;<sup>17</sup> and parts of the city that were unsanitary (1928).<sup>18</sup> The latter was with regard to a dumping ground that existed next to some E class clerk’s quarters that had caused an excess of flies, although the Government insisted it had recently removed the dump and landscaped the area. Mr Lalchand Navalrai asked in 1934, “in the interests of the smaller people”,

whether they would be graced with the flush latrines being installed in the officers' bungalows, but no plans had been formulated.<sup>19</sup>

In 1929 the ISA started to add to these calls, providing lists of the complaints its members had raised. When migrant workers returned to the capital from Simla, flats were often dirty, furniture was missing, broken, or inadequate, while the buildings themselves were in need of maintenance.<sup>20</sup> A series of recommended changes were submitted to the Government, having much in common with those of the 1917 committees, although little action was taken.

Following on from these deficiencies in amenities, a second strand of critique addressed *compensation*. The context for such requests was the popular knowledge regarding the cost of New Delhi. In 1921 the Government was forced to admit in the Legislative Assembly that the incomplete city had already cost Rs490lakh (between £3-4 million).<sup>21</sup> As such, demands were made that bus conveyance be provided for clerks living far from work (1925), while the ISA insisted that conveyance allowance be continued into 1927 for those "who have to live in Old Delhi owing to the paucity of quarters in New Delhi."<sup>22</sup> The Government's admission to the Legislative Assembly that it had cut the conveyance charge in 1929 because "the city is within comparatively easy reach of the New Secretariat" was met with incredulity and a question to the Industry and Labour Member as to whether he could talk the distance and attend his office in time?<sup>23</sup> There was no reply.

At times the criticisms of the ISA and Legislative Assembly moved beyond the derived contradictions of a bureaucracy that could not fulfil its pledge to house its workers in suitable accommodation. At the *intrinsic* level the discursive formation of the landscape itself was attacked. On 22<sup>nd</sup> February 1921 Khan Sahib M Ikramullah Khan asked the question quoted below as the first of five points criticising the *distribution* and *allocation* of governmental quarters:

"Is it a fact that racial distinction has been observed in the construction and allotment of quarters in Raisina for the Secretariat assistants and clerks? If so, will Government be pleased to take early steps to remove such distinctions?"<sup>24</sup>

Yet the racial distinction he alluded to was that between Indian and European style quarters, a distinction that had been enforced by Indian clerks themselves. The issue of race, however, was obviously one that was stimulated by a city so obviously divided upon racial lines, even if one could choose to live in the European style. Given the clear topography not just of race but also of class in the city, the question of allocation was obviously a vexed one. In September 1925 a question was asked in the Assembly regarding the "criterion or canon" by which quarters were allotted to members of the Assembly itself.<sup>25</sup> The utilitarian response was that "... the principle that directs is that of securing the greatest convenience of the greatest number", falling back on the 1913 premise of convenience when the city was proving convenient only for a very privileged minority. Further questions addressed the calculation of rent (1927), to which the government explained the system of 6% of capital outlay but not more than 10% of rent principle.<sup>26</sup> In 1931 a question was posed regarding the allotment of clerks quarters, to which the government refused to spend the labour collecting the information for such a "small benefit".<sup>27</sup> A further question pushed for more information regarding the actual system of allocation, claiming that clerks suspected that allocation was not made in strict accordance with the waiting

list, “which is said to exist but which no assistant or clerk who is affected has ever seen.”<sup>28</sup> The Government insisted that the relevant Departments kept waiting lists. These questions pushed at the mechanism by which the regular administration of the uneven resources in the city was orchestrated. However, the Government’s response to the immediate over-crowding of the late 1920s threatened to bring to light the most intrinsic contradictions of the city itself.

It has been shown that by the mid-1920s the Government had realised that there was going to be a housing shortage, but that it did not respond by building substantially more houses. While it claimed to have enforced a lower under-building rate for the, mostly Indian, clerks, the archival records actually reveal a *redistribution* of housing stock from the lower ranks to the, mostly British, officer class. The Chief Commissioner hinted at such a policy on 17<sup>th</sup> November 1926 when he suggested: “Now that the bungalows are being re-arranged in Old and New Delhi it may be possible to induce Government to add a few more residences owned by Government to the few that exist at present for the use of officers.”<sup>29</sup>

The Chief Commissioner did not give details of his plans, but three years later it became apparent that a similar scheme had been put into operation. On 24<sup>th</sup> January 1929 the ISA wrote to the Secretary of the Department of Industries and Labour, PWD, to address issues of housing shortage, classification and allotment.<sup>30</sup> The Association stressed that only 62% of unorthodox and 50% of orthodox clerks had been accommodated, and that this shortage had been accentuated by a new housing classification scheme. This reclassification of quarters according to pay had raised the emoluments necessary to gain access to an A class clerks quarter, thus excluding many senior assistants from the top grade quarters. The ISA denounced this as a “... harsh principle and an undesirable practice. This process, if continued, will gradually tend to relegate the Secretariat establishment to lower and lower class of quarters by the simple device of changing the classification.” The letter also stressed that because of the changing mode of living of its members many more clerks preferred unorthodox dwelling and very few found D quarters adequate or suitable. With the immanent arrival of the Army Department in the capital, a worsened situation was expected and the restitution of the previous classificatory system was requested.

This did not happen, however, and the reason for the stockpiling of quarters in the top bracket became clear over the following few years. The ISA had obviously grown tired of its requests and warnings going unheeded since 1927 and wrote in frustration to the Secretary of the Home Department on 17<sup>th</sup> December 1930 that: “... the object of the formation of the Association is entirely frustrated if the specific requests made by them are ignored as in the present interest...”<sup>31</sup> They included a letter that had been sent to the Superintending Engineer of the Central PWD. What the letter reveals is that housing had been stockpiled in clerk category A such that it could be converted into officer class E houses. This was the class that was identified in 1914 as being susceptible to the “ruinous” private market, although the clerks had to face the same market but with much lesser pay. The letter stressed that this system would augment the grievances of its members, dislodging men who earned Rs501-600 from A to B class quarters, where shortage was already greatest. The protest was not just at the derived contradiction of people not being accommodated in comfort, it was at the intrinsic contradiction of a government who enforced its own rules in an uneven manner:

“The members of my Association feel very strongly in this matter of such inequitable treatment and lowering of the standard of living. In this connection, I am to emphasize the fact that the principle underlying the Fundamental Rules that Government should provide accommodation appropriate to the status of the officers concerned would be infringed by the present proposal as two men drawing the same emolument would be allotted different classes of accommodation.”

The ISA levelled its suspicions at members of the Army Department, who at the time only qualified for B or C class clerks quarters, not officer’s housing. The rules governing housing allocation dictated that if an assistant could not get accommodation in their emolument class they would be offered the first class above, then the first below, then the second above, etc.<sup>32</sup> The surplus of houses in officer class E, and the deficit of clerks quarters, would allow the Army Department to barter its workers into the recently converted houses, not quarters. The Association stressed that this would lose the Government money, as rent was fixed at 10% of salary, and these men would be earning salaries equivalent to clerks class B or C. In sum, the ISA felt that:

“If more quarters are needed, then build them, do not reclassify... Instead of progressive building, the process so far has been one of reclassifying and raising the pay-limits thus lowering the standards of living contrary to admitted principles.”<sup>33</sup>

The Government, however, did not seem abashed by this penetrative analysis. On the contrary, it continued to seek out ways to alter the classifications so that fewer people could compete for the elite housing of the officers. In 1933 the rules for allotment of officer’s residences were amended to redefine emoluments.<sup>34</sup> These would no longer include benefits, allowances or pensions, so that people would technically earn less. This served to reduce demand for the more elite houses and repressed the claims of the increasingly Indianised lower ranks. In 1939 the ISA was still petitioning the Government to alleviate the hardship caused by its system of housing allocation.<sup>35</sup> By this point, however, the material environment of the capital had become so disorganised that a wholesale re-visioning of the capital was underway.

#### *Lived space*

While this section has examined the identities and subject positions that were created by, and mobilised in, the new capital, it has privileged speech over sheer existence. This is a double conditioning from Foucault’s *Archaeology*, which addressed forms of thoughts and modes of speech rather than ways of life, society or culture. But it is also conditioned by the colonial archive, which recorded petitions, statements and queries, and assessments of the material environment, more than it did the actions and everyday lives of its people. Yet this was a sphere in which people crafted their non-verbal enunciative modality, and traces of it are occasionally left in the archive. Simply through refusing to live in a certain way people could craft their identities and resist the hierarchies embodied in the city.

For instance, many people attempted to retain their lien on class D clerks quarters in the early 1920s because they were cheaper than C class and still reasonably comfortable.<sup>36</sup> This refuted the principle that emoluments should be represented in housing, and that people would want to move up the hierarchy.

Similarly, Rouse's report of 1929, when housing allowance was still in existence, showed that people would make applications they knew would be denied simply to get the extra cash.<sup>37</sup> It was also argued that people would apply for unorthodox clerks quarters simply because there were more of them available.<sup>38</sup>

People could also resist the hierarchies of imperial space by crafting very personal places within them. A report from 1937 showed that during religious festivals or weddings, electric installations in government quarters had been hacked into to provide temporary street lighting.<sup>39</sup> This was claimed to be against the provisions of the PWD code, as well as hazardous for the health and safety of the occupants. A more common, and permanent, problem was the keeping of cows and buffaloes in government quarters. Lieutenant-Governor Sir Henry Gidney raised this issue in the Legislative Assembly in 1932, claiming that the cows were unsanitary, led to a profusion of flies, and threatened New Delhi with an epidemic.<sup>40</sup> This was claimed to happen across all ranks of government servant. The issue was discussed again in 1937, when it was admitted that the milk supply in the capital was too low, but that clerks quarters below grade B were too small for the keeping of cattle.<sup>41</sup> It had been suggested that to intervene would be classed as religious interference, which was brushed aside as irrelevant. A petition with 24 sheets of signatures was even submitted to the Viceroy, defending the right of people to bring their traditional lifestyle into the heart of the capital. The practice, however, clashed with western notions of hygiene so it was continually campaigned against. By the late 1930s, however, this was the least of the Government's worries as it desperately tried to salvage an image of the ordered capital that had been designed two decades before. The result was a series of schemes that sought to save the original image of the city, rather than substantially revise it to meet the changed material circumstances that it faced. This paper does not have space to catalogue these schemes, but has hopefully presented some new ways of approaching the planned spaces of New Delhi, exposing them as spaces that required constant adaptation and that were met with differing forms of resistance and contestation at the scale of the everyday.

## **THE REFORMED URBAN BLOCK IN THE METROPOLIS OF THE EARLY TWENTIETH CENTURY – AN INTERNATIONAL MODEL WITH A LOCAL FLAVOUR**

When it comes to modern housing, the usual gospel is the myth of the dissolution of the dense urban fabric of the 19<sup>th</sup> Century city and the invention of new forms of green settlements and estates. In the background of this myth lurk the ubiquitous avantgardist models of anti-urban revolution: Ebenezer Howard's "Garden City" (1898) which aimed to create a new town-country-entity to rival with the existing cities, Bruno Taut's "Dissolution of the City" (1920) which envisaged the establishment of new settlements in the countryside and the destruction of the old cities, Le Corbusier's urban ideologies which culminated in the openly aggressive statement "The corridor street must be killed" (1925), declaring war on traditional urban spaces, Frank Lloyd Wright's "Broadacre City" (1935) which created the model for ubiquitous sprawl and Hans Scharoun's "Town-Landscape" for Berlin (1946) which aimed to generate a natural living environment instead of cities.<sup>1</sup>

All these general city models envisaged the dissolution of urban dwelling typologies which had a direct connection to the street and thus architecturally defined public spaces. This myth of the ongoing dispersion of urban dwellings in modern architecture and urban design was deliberately propagated by leading avantgardists in the 1920s. In the journal *Das Neue Berlin* (1929), Walter Gropius published a series of plans designed to underline the supposed inevitable and scientifically sustained evolution "vom Block zur Zeile" ("from the block to the bar"). Ernst May added an additional intermediary step to this diagrammatic sequence and republished it in the journal *Das Neue Frankfurt* (1930). Somewhere between the densely built-up blocks of the 19<sup>th</sup> Century city and the rigidly north-south-oriented bars of the late 1920s, the reformed urban block – a perimeter block which introduced light, air and greenery into the block with a large courtyard while still defining the public street space with continuous facades – was interpreted as only an intermediary step which must be overcome in the name of modernity.<sup>2</sup>

This article deals with examples of modern housing which attempted to reform the metropolis, not to overcome it; to define public spaces by following street lines, not to destroy it by setting autonomous patterns; to address the public sphere using urban facades, not to ignore it with a lack of meaningful design; to contribute to the vivid atmosphere of the city by including various uses, not to destroy it by functional zoning.

### 1. Berlin

All major European and North American cities practiced housing reform in the early 20<sup>th</sup> Century, all used various kinds of reformed urban blocks. Berlin with its continuous fabric of six-storey *Mietskasernen* (tenements) on James Hobrecht's extension plan from 1862 was not only the location of the densest urban development in Europe, it was also a centre of housing

reform – already 40 years before the city became ultimately denounced as "the largest tenement city in the world".<sup>3</sup> Housing reform by no means implied a general rejection of the metropolis with its block dwellings while favouring suburban settlements. On the contrary, Berlin architect Theodor Goecke, a leading figure of tenement reform and later editor of the first journal on urban design "Der Städtebau", emphatically underlined the importance of urban life not only for wealthy people but also for the working class. In an article on "Berlin's working class tenement. A technological and social study" from 1890, he rejected the idea that workers preferred living in the suburbs: "No, the worker prefers to be surrounded by the hustle and bustle of the city. He enjoys the excitement of the streets, he takes full advantage of the size of the community in satisfying his needs and it is here that he finds his pleasures. For this reason many leave their work places in the countryside every year. Therefore, nothing would be a greater mistake than building lots of workers houses far from the city."<sup>4</sup> This urban ideal was reflected in the early housing reform projects by Alfred Messel as in his model for a reformed urban block with a large green courtyard on the Weisbach'sche estate (1890),<sup>5</sup> in his two buildings in Sickingenstraße (1893-94),<sup>6</sup> in his half-block *Wohnhof* in Proskauerstraße (1897-98) and finally in his entire perimeter block in Kochhannstraße and Weisbachstraße (1899-1905).<sup>7</sup>

The question of block reform was not restricted to workers' housing, it was a question which affected all social classes and was treated as a cultural question oscillating between the ideals of rural or urban life. Hans Schmidkunz fundamentally tackled this question of "Urban and rural dwelling" and the often resulting compromise of suburban arrangements in a seminal article in *Der Städtebau* in 1908. While admitting the advantages of a real urban and a proper rural setting, he questioned the qualities of the suburban reality: "Some might say: that's OK in the centre of the town, that's OK far out in the countryside, but somewhere in-between, no way! Indeed we experience these intermediary cases extremely often. [...] It is therefore generally the case that, on the one hand, one has to renounce the advantages of intimate metropolitan life, on the other one does not yet achieve the advantages of the country while already the disadvantages of long distances come into play."<sup>8</sup> The ordinary suburb did not combine the advantages of town and country as once Ebenezer Howard had hoped for, but the disadvantages of both.

<sup>4</sup> "Nein, der Arbeiter will eben im Getriebe der Stadt bleiben; er fühlt sich wohl im Straßengewühl; er benutzt die Vortheile eines großen Gemeinwesens beim Einkauf seiner Bedürfnisse; hier findet er seine Vergnügungen. Deswegen verlassen alljährlich Viele die Arbeit auf dem Lande. Nichts wäre daher verkehrter, als im großen Stile Arbeiterhäuser fern von der Stadt erbauen zu wollen." Theodor Goecke, "Das Berliner Arbeiter-Miethshaus. Eine bautechnisch-soziale Studie," *Deutsche Bauzeitung* 24 (1890), 501-502, 508-510, 522-523, quote 501. Cf. Nicholas Bullock and James Read, *The Movement for Housing Reform in Germany and France 1840-1914* (Cambridge, 1985), 83.

<sup>8</sup> "Mancher wird sagen: mitten in der Stadt – gut! Weit draußen auf dem Land – auch gut! Aber in der Mitte dazwischen – nicht gut! Tatsächlich haben wir es mit diesen Zwischenfällen ganz besonders häufig zu tun. [...] Dadurch aber geschieht es meistens, daß man einerseits auf die Vorteile des intimsten Großstadtlebens verzichten und seine Nachteile dahinnehmen muß, andererseits noch lange nicht die Vorteile der Ländlichkeit erreicht und doch schon die Nachteile der weiten Entfernung spürt." Hans Schmidkunz, "Städtisches und ländliches Wohnen," *Der Städtebau* 5 (1908), 147-150, quote 148.

A variety of typologies have been developed for middle-class housing blocks. Riehmers Hofgarten in Berlin-Kreuzberg by the master builder Wilhelm Ferdinand August Riehmer (1881-99) showed internal greened streets. A sequence of greened courtyards was used for the Versöhnungs-Privatstrasse in Berlin-Wedding by E. Schwartzkopff (1903-04).<sup>9</sup> Albert Gessner's apartment houses in Mommsenstraße and Bleibtreustraße (1903-07) or in Bismarckstraße and Grolmannstraße (1906-07) in Berlin-Charlottenburg displayed green courtyards.<sup>10</sup> Paul Mebes' buildings at Horstweg in Berlin-Charlottenburg (1907-09) showed open courts towards the street like enlarged *courts d'honneur*. Mebes designed a central street crossing the block for his famous buildings in Fritschweg in Berlin-Steglitz (1907-08). and Paul Wolf created a central square for the Ceciliengärten in Berlin-Friedenau (1912), only built by Heinrich Lassen in 1924-28.<sup>11</sup> The Greater Berlin competition (1908-10) turned out to act as a melting pot and a laboratory for influential housing models: Hermann Jansen designed uniform urban blocks to create entire neighbourhoods, Bruno Möhring and Rudolf Eberstadt conceived a large metropolitan perimeter block containing an internal village.<sup>12</sup>

Even after the First World War, when there was strong support for rural estates with allotment gardens for a self-supporting economy, metropolitan life and the reformed urban block remained lasting ideals. Architect Heinrich de Fries, the new editor of the journal *Der Städtebau*, vigorously argued in 1920 against the "pathetic sermons by the apostles of green estates".<sup>13</sup> Fries himself had proposed a vision for future urban dwelling in his book *Dwelling Cities of the Future* in 1919.<sup>14</sup> A similar model had already been proposed by Bruno Möhring as a "balcony building" in *Der Städtebau* in 1917.<sup>15</sup> And even during the 1920s, famous for its suburban *Siedlungen*, perimeter blocks have been erected: Erwin Anton Gutkind's Sonnenhof in Berlin-Lichtenberg (1925-27) and his block in Berlin-Reinickendorf (1927-29) combined the well established typology with the avantgardist design of the *Neues Bauen*.<sup>16</sup>

## 2. Vienna

In Vienna, an early example of reformed social housing is given by the *Jubiläumshäuser*. In 1896, the Emperor Franz Joseph I. Jubilee Foundation, a philanthropic institution, asked for proposals to erect affordable sanitary dwellings. The winning architects Theodor Bach and Leopold Simony proposed a cluster of five perimeter blocks of which two were finally

constructed by 1901, namely Lobmeyrhof and Stiftungshof.<sup>17</sup> Both Camillo Sitte and Otto Wagner promoted an urban approach to housing. While Sitte proposed large green garden courts, partially even public,<sup>18</sup> Wagner propagated the metropolitan tenement as the only appropriate dwelling typology for modern life, aiming at a new kind of uniformity.<sup>19</sup>

Both these aspects were combined in one of the most comprehensive and coherent urban social housing programmes of the 1920s, the municipal building programme of the Social Democratic Party in Vienna (1923-34). The *Gemeindebauten*, mostly realised in the *Hof* typology, attempted to combine a dense urban situation with the advantages of green spaces and social institutions.<sup>20</sup> The general philosophy of these blocks was to follow the existing city plan from 1894, to fit into the urban fabric, to respect the public streets, to mix dwellings with a variety of facilities, to express metropolitan life, but also to form an alternative model, to introduce new public green spaces, to subvert the capitalist city by socialist neighbourhoods – not by destruction but by improvement. From the first *Hof*, the Metzleinstalerhof by Robert Kalesa (1919-21) and Hubert Gessner (1922-23), to the last Hof, the Engelsplatz-Hof by Rudolf Perco (1929-33), the *Gemeindebauten* followed different types as *Lückenverbauung* (infill building), *Randverbauung* (perimeter block), *Grosswohnanlage* (large building complex) and *Wohnviertel* (residential quarter)<sup>21</sup> – according to Werner Hegemann all "typically urban in character [...]. Note, however, the pleasing variety of detail in each group, and the ingenious way in which the plans of the blocks are related to existing streets and open spaces."<sup>22</sup>

### 3. Amsterdam

In Amsterdam, housing policy followed a deliberately urban approach up to the 1930s. New neighbourhoods, especially social housing after the famous *Woningwet* (Housing Law) was passed in 1901, were mostly conceived as continuous extensions of an overall coherent urban fabric. A model for a reformed perimeter block had been already designed in 1895-96 by Hendrik Petrus Berlage for a 270-metre long tenement block with luxury flats at the Museumterreinen in Amsterdam. This block contained not only two green interior courtyards and a central public passageway, but also a public square with a café-restaurant and shops, arranged as a semi-closed space according to Camillo Sitte's ideas.<sup>23</sup>

In particular, the typology of a superblock consisting of higher metropolitan buildings at its edges and lower rural buildings in the centre was used extensively in Amsterdam as in Johan

Melchior van der Mey's layout of the Zaanhof (1913-20). This large block was surrounded with metropolitan five-storey buildings by Tjeerd Kuipers and A. U. Ingwersen for Patrimonium, while the inner part with three-storey gabled houses by H. J. M. Walenkamp for Het Westen, arranged around an informal public green, evoked the image of a village or historic small town.<sup>24</sup> This was the most direct realisation of Möhring and Eberstadt's proposal from the Greater Berlin competition in 1910, but also picked up on local historic models such as the Begijnenhof in Amsterdam. This hybrid urban form was transformed into urban standard in the south of Amsterdam, the most coherent piece of Amsterdam's extensions in the 20<sup>th</sup> Century, built according to Berlage's plan from 1914-17.<sup>25</sup> Berlage's famous bird's-eye views had already highlighted the fact that the urban fabric should consist of rectangular blocks with large open courtyards, and indeed hundreds of blocks were constructed in accordance with this ideal in the 1920s. The realisation included both metropolitan boulevards and quiet neighbourhood squares.<sup>26</sup>

#### 4. Copenhagen

In Scandinavia, blocks which often used the architectural language of Nordic Classicism also followed the ideal of the reformed metropolis. In Copenhagen R. Moller and E. Schiodte's Aladdinblock (1900-01) had created an early example for an entire perimeter block.<sup>27</sup> But the most striking example of the entire type is the Hornbaekhus by Kay Fisker (1922-23).<sup>28</sup> Here, the qualities of the reformed metropolitan housing block are distilled to an almost diagrammatic clarity: the building follows precisely the form of the block and thus emphasises the role of the urban street pattern. Its façade stretching over more than 200 metres radically develops the idea of uniform apartments in a democratic society through the strict repetition of a single element - the window with its remarkably simplified frame. Nevertheless, this conceptually endless façade is carefully terminated with monumental rusticated pilasters at the corners of the building, again fixing the building exactly within its urban context. However, behind this explicitly urban façade, a large green court provides the inhabitants with all the necessities of a pleasant place to live, namely light, air, silence, trees and meadows, offering a beautiful and safe place for recreation and play despite being in the city centre. Furthermore, the block, containing 290 flats for the Hornbaekhus Cooperative Housing Association, again showed its adaptability to diverse urban functions. Due to the fact that it follows the street, the corners were preferred places for trade and this was where the corner shops were located.

The use of reformed urban blocks was quite common in Sweden for urban housing until the 1930s. In a groundbreaking study, Björn Linn coined the term *Storgårdskvarteret* (large court blocks) for these kinds of blocks with large courtyards.<sup>29</sup> In Stockholm, several quarters feature a certain variety of urban patterns for reformed blocks, most of them displaying a kind of Nordic Classicism which contributes to the impression of a long-lasting and culturally defined urban setting. The most exemplary district of reformed perimeter blocks emerged in the 1920s at Rödabergen, where a plan for a garden suburb from 1907 by Hallman had been revised in 1923 by Sigurd Lewerentz who proposed a much denser development with five-storey buildings, encircling lower green courtyards and lower buildings.<sup>30</sup>

## 6. Paris

In Paris a seminal step in the development of sanitary urban workers' housing was undertaken in 1905. The Fondation Rothschild pour l'amélioration de l'existence matérielle des travailleurs opened a competition for an entire urban block at the Rue de Prague in Paris. From the very beginning, the foundation asked for a continuation of the existing urban fabric, a variation of the traditional Parisian town house with improved sanitary conditions.<sup>31</sup> The competition, which was held in two phases, created an entire catalogue of possibilities to design an urban block ranging from large interior courtyards, smaller internal buildings, internal streets and internal squares to courts towards the street.<sup>32</sup> The winning design by Adolphe Augustin Rey, finally constructed by 1909, showed a combination of internal and external courts. Shops covered almost the entire street front. Further facilities included a restaurant, a nursery, an assembly hall, baths and artists' ateliers, while the building contained 321 flats. Specific emphasis had been put on the design of the facades which achieved a delicate balance between urban richness and low-cost housing. While the generic material of brick broke with the Haussmannian tradition and provided an industrial aspect, structural parts such as the lower floors and the projections were executed in stone masonry which alluded to luxury apartments. The result is a distinct building which nevertheless fits smoothly into the urban context.

The models invented in this competition then influenced the entire social housing programme of the Ville de Paris (HBM, *habitations à bon marché*) which started in 1912,<sup>33</sup> as well as private speculative buildings.<sup>34</sup> When in 1919 the city abandoned its fortifications and opened

a construction zone next to the Boulevard périphérique, the area was developed by the city with HBM which all followed the pre-war models of large internal courts, external courts, internal squares and streets.<sup>35</sup> The first large realisation, the Cité de Montmartre between the Porte de Clignancourt and the Porte de Montmartre with 2,734 flats designed by the architects of the Office public d'habitations à bon marché (1920-26), featured relatively artificial patterns of triangular, rectangular, pentagonal and octagonal blocks. After 1923, not only social housing was erected, but also more luxury dwellings as ILM (*immeubles à loyers modérés*, buildings with moderate rent level), and from 1930 on also purely speculative housing blocks. Furthermore, these types of metropolitan housing blocks also emerged in the *banlieue*.<sup>36</sup> With their open courts and their variety of materials, the blocks can be easily distinguished from the historic parts of Paris, but as they were still designed as urban blocks, they unmistakably continued the urban fabric of Paris.

## 7. Milan

In Southern Europe the task for reforming housing blocks required different means. As for climatic reasons there was no aim to introduce more sunlight into urban housing, there was no need for arranging large courtyards. Combined with the centuries old tradition of out-door street life, this led to an emphasis on the public parts of the tenement buildings, i.e. particularly the facades. Milan as the centre of economic development also became the centre of new metropolitan architecture in the 1920s. The apartment house *Ca' brüta* by Giovanni Muzio (1919-22) was planned as the manifesto of the architecture of the Novecento Milanese.<sup>37</sup> Typically, he did not conceive a perimeter block with a green court, but subdivided the block into two buildings by introducing a new street. The emphasis was thus put on the arrangement of new public spaces the design of the facades. Muzio's sophisticated approach not only consisted in the unclassical reinterpretation of classical motifs, but also in the unusual subdivision of the entire facade into different house units to fit the new block into the scale of the existing city, "forming a harmonious and homogeneous unit out of the complex of buildings."<sup>38</sup> After this scene-setting example Milan became the showplace of urban architecture of the Novecento Milanese, including architects like Giuseppe de Finetti, Gio Ponti or Piero Portaluppi.<sup>39</sup>

## 8. London

London was the first large city to start a consistent public housing programme with the foundation of the Housing of the Working Classes Branch in the Architect's Department of

London County Council (LCC) in 1893.<sup>40</sup> Even if London is especially known for its Garden Cities and Garden Suburbs, the major task for LCC developments was to redesign dilapidated and overcrowded inner-urban slum areas. As these areas usually consisted of two-storey terraced houses, their replacement with five-storey buildings constituted a substantial step towards a metropolitan image of the urban fabric. Moreover, due to the fact that the buildings fitted into the urban street network, directly addressed the streets, were designed with architecturally aspirational facades, and included other functions such as shopping facilities, the new estates expressed a pro-urban attitude.

These principles can best be observed with LCC's first large slum clearance project in London, the Boundary Street Estate in Bethnal Green (1893-1900), designed by Owen Fleming and other architects from the Architect's Department. It transformed this run-down slum area into a real neighbourhood by changing its informal grid pattern into a centralised plan with a circular garden square at the centre – which may well have inspired Ebenezer Howard's circular Garden City diagrams which he published just a few years later. Furthermore, the new neighbourhood not only consisted of dwellings, but formed a real mixed use urban quarter. Apart from its 1,069 flats, the redevelopment included 18 shops, several workshops, clubrooms, a surgery and a public recreational square. It also retained two existing schools, a church, a laundry and a factory, and thus served all major purposes such as dwelling, work, traffic, recreation and culture within walking distance, long before Clarence Perry "invented" the neighbourhood unit in 1929.<sup>41</sup>

This metropolitan approach to workers housing continued until around 1940, and the official report in 1937 mentioned 173 "Block Dwellings" developed since 1893 against only 20 "Cottage Estates".<sup>42</sup> However, the ideal of rural living was not only challenged by real developments, it was also vigorously criticised in theoretical discourse. The most acute condemnation of the Garden City Movement came from the architect Arthur Trystan Edwards, published in the *Town Planning Review* in 1913, usually known for its support of Garden City ideals. For Edwards, suburbs were the product of lower-middle-class narrow-mindedness: "The very word 'suburban' implies something that is second-rate, some narrow and pharisaical attitude of mind."<sup>43</sup> What is more, the incarnation of suburban lack of character was the Garden City: "But of all suburbs, perhaps the most shoddy and depressing is the typical Garden Suburb. It has neither the crowded interest of the town nor the quiet charm of the country. It gives us the advantages neither of solitude nor of society."<sup>44</sup> Inverting

X. Velarde, "A Choice of

Ebenezer Howard's ideal of combining the advantages of town and country into the new town-country-entity of the Garden City, he observed that, on the contrary, the ordinary garden suburb simply combined the disadvantages.

The block typology was also used for commercial luxury residential developments. The climax of a monumental metropolitan apartment building was reached by Gordon Jeeves's Dolphin Square in Westminster (1937). A large perimeter block extended between two public and two private streets, creating a spacious internal formal garden and two monumental facades. The main facade of ten storeys towards the river Thames celebrates the urbanity of housing, forming a massive wall where the repetition of the windows underlines the unity of the complex while the alternation of brick and stone subdivides the complex into horizontal and vertical units – into houses and storeys. Within the courtyard, the protruding wings with their set-back-storeys convey the image of towers, thus further enhancing the monumentality within the complex. The block not only contained 1,236 flats, but also included all the necessary amenities such as a sports centre with a swimming pool, an underground garage and a shopping gallery.<sup>45</sup> With such apartment blocks, London had become a place where metropolitan housing typologies provided what Charles Herbert Reilly had called "an adequate urban life".<sup>46</sup>

## 9. New York

In New York, the reform of the urban block evolved in two fields where money was no concern - in philanthropic non-profit housing and in luxury apartment dwellings. Early generous perimeter arrangements with landscaped gardens in the courtyard were the Tower Buildings (1878-79) and the Riverside Buildings (1890) in Brooklyn, both designed by William Field and Son as philanthropic projects for Alfred Treadway White.<sup>47</sup> Large perimeter blocks for luxury apartments were Graham Court in 7<sup>th</sup> Avenue, designed by Clinton and Russell and completed in 1901, incorporating a remarkable planted courtyard in the centre while the exterior was designed as a block-like Italian Renaissance Palazzo,<sup>48</sup> and The Belnord in Broadway by H. Hobart Weekes (1908-10) which covered an entire urban block and contained a huge landscaped court. Its 13-storey structure was nearly three times as high as European models such as tenements from the Vienna Ringstrasse on which its Italian Palazzo style was based.<sup>49</sup> McKim, Mead & White adapted this model to the motor age. At 277 Park Avenue (1925), the large internal planted court, again surrounded by an arcade, was

open to the street via four arches and could be accessed by cars. The entrances to the apartments were located in the court, while the entire front towards the streets was used for shops.<sup>50</sup>

The 1920s saw the elaboration of the reformed urban block and the creation of what was known as the "garden apartment" for the low-cost housing sector. One of the leading figures in this trend was architect Andrew J. Thomas, who had already invented an urban block with 14 U-shaped buildings around a common internal garden as a model project for the New York State Reconstruction Commission in 1919.<sup>51</sup> Also the two most distinguished housing architects of the period, Clarence S. Stein and Henry Wright designed reformed urban blocks – just at the time when they started to develop Radburn as an anti-urban model community in 1927. The Phipps Garden Apartments in Queens (1929-31) for the Society of Phipps Houses arranged working class flats on an indented perimeter block consisting of elements with four and six storeys, including a social room and a nursery.<sup>52</sup>

Only during the economic depression, the federal government created the Public Works Administration (PWA) and started a federal housing programme in 1933.<sup>53</sup> At least at its start, public housing did not only follow technocratic ideals and bureaucratic methods, but aimed to improve social conditions in a deliberately urban context. In an official account of the public housing programme, Michael W. Straus and Talbot Wegg, two collaborators of the PWA Housing Division, underlined the importance of multifunctional urban neighbourhoods: "Housing should not be regarded as an aggregation of houses but as complete neighborhoods,"<sup>54</sup> including "parks, playgrounds, stores, community buildings and schools".<sup>55</sup> The first realised large-scale development, the Harlem River Houses at 7<sup>th</sup> Avenue (1934-37), exemplifies this urban attitude. Designed under the supervision of Archibald Manning Brown by chief designer Horace Ginsbern, the 574 apartments were arranged on four triangular urban blocks in four- to five-storey buildings as indented perimeter blocks.<sup>56</sup> The design combined inventions from sanitary housing projects with qualities from Beaux-Arts architecture and created a neighbourhood where the buildings clearly addressed the streets, courtyards formed distinguished recreational squares, vistas continued the axis of public streets, symmetrical compositions created understandable spaces, and an out door theatre served as a focal point for the community. In a critical review of New York's public housing programme, the Harlem River Houses were the only development which obtained unrestricted praise by the American Institute of Architects: it possessed "Simplicity and domestic character. An outstandingly excellent job of planning."<sup>57</sup>

## 10. Conclusion

Werner Hegemann's volume on *City Planning. Housing. A Graphic Review of Civic Art 1922-1937*, published after Hegemann's death and conceived as a follow-up volume to the famous *American Vitruvius. An Architects Handbook of Civic Art* from 1922, offers a telling overview on the state of the art of urban housing at the end of our era. Next to garden cities, new settlements and suburban quarters, it displays international examples of reformed urban blocks, including several *Höfe* from Vienna, Fisker's blocks in Copenhagen, public housing blocks in Liverpool and Manchester, new blocks from Paris, the skyscrapers of Villeurbanne, Schumacher's quarters in Hamburg, examples from Amsterdam and Rotterdam, blocks in Stockholm, a block in Madrid and several examples from New York and Chicago. This not only reflects the continued importance of this building typology, but also its widespread international dissemination which was in turn further enhanced by this publication. The reformed urban block for the modern metropolis was neither a European nor an American phenomenon – it was truly international with numerous local characteristics in typology, material and style.

All these examples show that there has been a broad tradition of creating metropolitan dwellings in the early 20<sup>th</sup> Century. This movement aimed to reform the metropolis, not to overcome it by proposing alternative models like Garden Cities and *Siedlungen*. The generic urban typology used was the reformed urban block, a city block which continued the tradition of city building, but improved housing conditions largely by introducing green spaces into the block. A huge variety of forms had been invented ranging from spacious courtyards, internal streets, courts towards the surrounding streets and lower internal buildings, just to mention the most obvious examples. The movement for block reform must therefore be considered as highly creative. This kind of *recherche patiente* may even have involved more creativity than developing simple bars as a result of sanitary demands according to supposed scientific methods.

Finally, this movement was truly international without ignoring the local context. In all the major metropolises in Europe and America, private developers, public housing associations, architects and planners constructed examples of these reformed urban blocks. Sometimes this type of unified block arrangement was even regarded as being the result of the international economy and therefore being essentially international. On the other hand, all the different examples within the different cities show quite different characteristics. Urban typology and architectural design were able to adapt to the respective local traditions. London blocks reflected Georgian design, Milan blocks Renaissance Classicism, Paris blocks reacted against Haussmann's uniformity and Scandinavian blocks created a new tradition of Nordic Classicism. While the basic typology could be used in every urban context, the architectural design of the reformed urban block was able to develop an appropriate mode of expression for the specific local context.

# A STUDY ON SITUATION AND METHOD OF DRAWING WAR-DAMAGED AREA MAP IN EUROPEAN AND JAPANESE WAR-DAMAGED CITIES

Hiroshima International University (Dr.) Norioki ISHIMARU

## Preface

It is a well-known fact that during World War II, many cities in the world were damaged by bombing or urban battle or other disaster. After the war in several countries, war-damaged area maps for those war-damaged cities were drawn out, but in some country such area map was not made, and there not only war-damaged map itself but also related materials was not found in a case.

For example, in "Rebuilding Europe's Bombed Cities"<sup>1)</sup> edited by Jeffry M. Diefendorf, any war-damaged area map was not carried except Warsaw, where destruction map 1939-45 appeared on page. City planner seems strongly interested in reconstruction plan or planning than in war-damage area map. In short, war-damaged area map has rarely attracted the attention of urban planning researchers and the evaluation to war-damaged area map was not established or remained uncertain. Moreover, the existing war-damaged area map had been hardly compared with each other.

However, war-damaged area map has much information to consider and propose urban formation and planning history of some war-damaged city. In fact, after the war each war-damaged area map for several cities in several countries was drawn out.

In Germany, many cities had been damaged during World War II, and such as in Berlin, Hamburg, Dresden, Köln, Frankfurt am Main, Essen, Dortmund, Nürnberg and München etc. Then the war-damaged area map had been drawn out by each method. In Japan, too many war-damaged cities had occurred such as Tokyo, Osaka, Hiroshima and so on. Then mainly in Germany and Japan, how to draw the war-damaged area map and how methodologically in detail to present the war-damaged area map was examined by collecting some materials as to war-damage, by special researching and by comparing with each other war-damaged cities.

There is various drawing method for war-damaged area map, and especially the classifying type index of war-damaged building is various to each other. Therefore, it is worthy to study situation and method of drawing war-damaged area map and to compare the expression method on the whole.

## 1. Purpose and Method of this paper

Now, the definition of "war-damaged city" is the city, where the greater part of central area was destroyed by a certain reason at the war time, such as by bombing, air raid, street fighting, or strategic self-destruction. In any case, if the war has not been broken out, the city would not be suffered from the damage at large scale

Firstly, the purpose of this paper is to consider situation and method of drawing war-damaged

area map by taking up some typical war-damaged cities occurred in Germany(in fact West Germany before unification) and in Japan during World War II.

As to method of this research, how collect the materials related to those war-damaged cities is important, by using those materials it must be examined how to draw the war-damaged area map, especially how to classify war-damaged figure according to damaged degree, then it must be compared some war-damaged area map with other one. By comparison of the war-damaged area map in Germany with the one in Japan, several characteristics of each war-damaged area map will be made clear.

## 2. Object City and Whereabouts of War-damaged Area Map

Although many war-damaged cities made it appearance in the world during the time of World War II, it is rare to carry a war-damaged map in the general book as the war-damage information on each city, as mentioned above.

However, in Germany the specific reference has carried this information if materials had been retrieved in detail. As the intensive reference, there is "DEUTSCHER STADTEBAU NACH 1945" <sup>2)</sup> (German cityplanning after 1945), where the fundamental war-damaged city information is carried about 55 cities in West Germany of those days. Furthermore, we can find out "Kriegsschicksale Deutscher Architektur **Band Nord, Band Sud**" <sup>3)</sup> (Germany architecture broken by the war, the volume one is northern part and the volume two is southern part), and "Traume in Trummern — Planung zum Wiederaufbau Zerstorer Stadte im Western Deutschland 1940-1950 I **Konzepte, II Stadte**"<sup>4)</sup> (In the Ashes and Rubble — the reconstruction planning of war-damaged city in West Germany, volume1 concept,volume 2concrete cities), and"Neue Stadte aus Ruinen" <sup>5)</sup> (New city from rubble). Those references are containing the information on war-damaged cities and occasionally war-damaged area map.

Which object city is taken up from these war-damaged cities? For example, according to the reference "from Ulm to a Utopia"<sup>6)</sup>, which described history of urban formation and development, pointed out Berlin, Hamburg, Dresden, Cologne, Frankfurt am Main, Essen, Dortmund, Nürnberg, Düsseldorf and München from view point of the numerousness of the amounts of rubble in ruins. It was mentioned that those cities were destroyed with 40% or more of city regions of those days, and a especial high ratio was 72% of Cologne, 65% of Dortmund, 60% of Frankfurt am Main and Dresden.

The data in the amount of rubble etc. can be checked also by "Statistisches Jahrbuch Deutscher Gemeinden"<sup>7)</sup>(the statistical yearbook of German city).

Now it should be examined how the war-damaged cities and those war-damaged area maps are.

As for Berlin, previous mentioned " DEUTSCHER STADTEBAU" inserts the war-damaged area map (Fig.1) titled "Karte Berlin Kriegsschaden" (Berlin war-damaged area map), and according to it, it

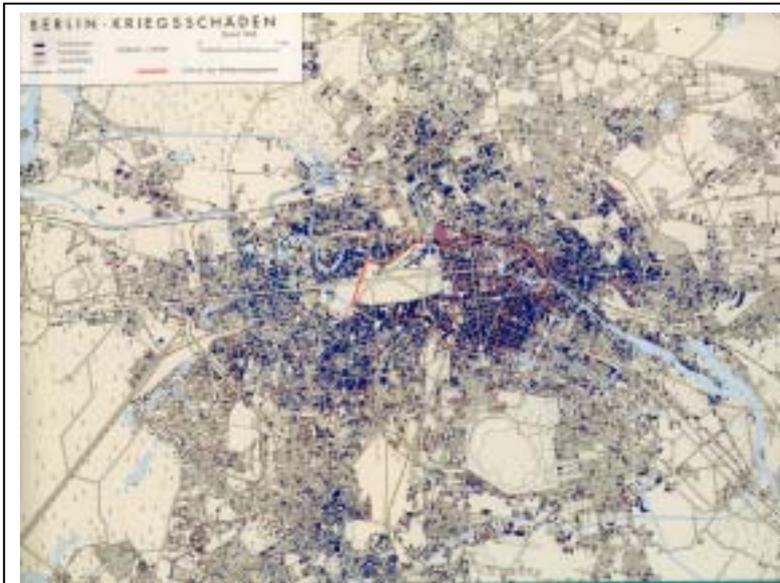

Fig.1 War-damaged area map of Berlin

Fig.3 War-damaged area map of Hamburg

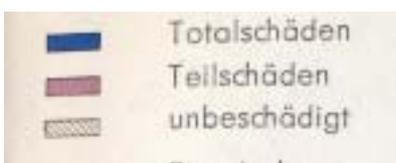

Fig.2 Index of Berlin

Fig.5 Index of Hamburg

Fig.4 War-damaged area map of Hamburg

Fig.6 War-damaged area map of Dortmund

Fig.7 Index of Dortmund

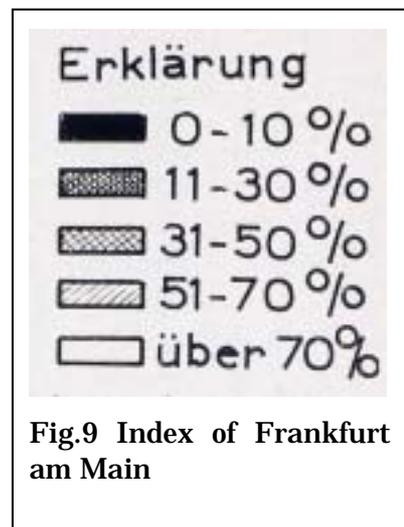

is drawn by the three classified colored index (Fig.2). That is, for ①dark blue meaning “Totalschaden” (whole damage) and ②brown meaning “Teilschaden” (partial damage) and ③right-directed hatch black meaning “unbeschadigt” (non-damage). In short, it is important that the damage is judged by building unit, that “non-damage” also is classified, and that it is drawn on the same standard for not only West Berlin of Germany but also East Berlin of East Germany in those days. By the explanatory note, it describes that there were many times bombings every month from late autumn in 1943 to early spring in 1945, that the most part of central city was destroyed, and that 1,560,000 residences those days existed in 1943 but in 1946 it decreased into 1,060,000 houses, that is about 500,000 houses were lost. Although there were the non-damage building in the surround part here and there, but the war-damaged map was drawn with thoroughly destroyed area in the central part. In addition speaking about the classification, there is a question whether non-damage means entire non-damage or non-damage included little damage.

Although a detailed war-damaged area map cannot be found in Hamburg, there is an unclear and rough war-damaged map and a war-damaged central city area map (Figs. 3 and 4), according to these the index are four classifications (Fig. 5). The classification is ①black meaning "ohne Schaden oder leichte oder mittel-schaden" (non-damage or light damage or partial damage), ②black mesh meaning "schwerer Schaden" (serious damage), ③ thin black mesh meaning "bedingter Totalschaden" (conditional total damage) and ④ almost white mesh meaning "unbedingter Totalschaden" (absolutely total damage). That is, the deeper color means light damage and lighter color means the heavy grade of war-damage, and it is a different method from the introductory-notes display of Berlin and a similar method to the display of usual Japanese index, but a little different method from the Japanese display in detail.

As for the war-damaged area map of Dortmund (Figs. 6 and 7) the index is 3 classifications, that is ①black means "Benutzbar" (possible use), ②vertical hatch means "Teil-zerstört" (partial damage)

**Fig.8 War-damaged area map of Frankfurt am Main**

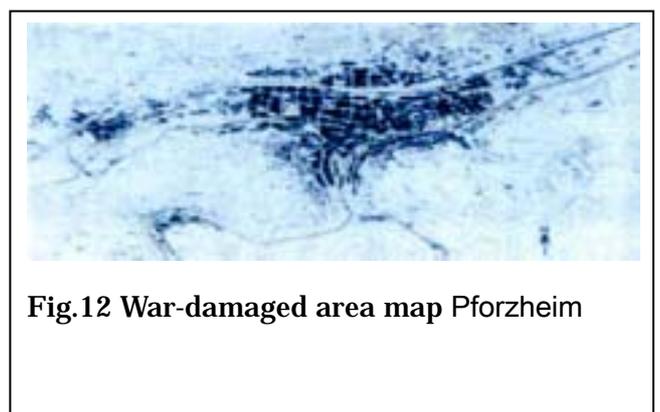

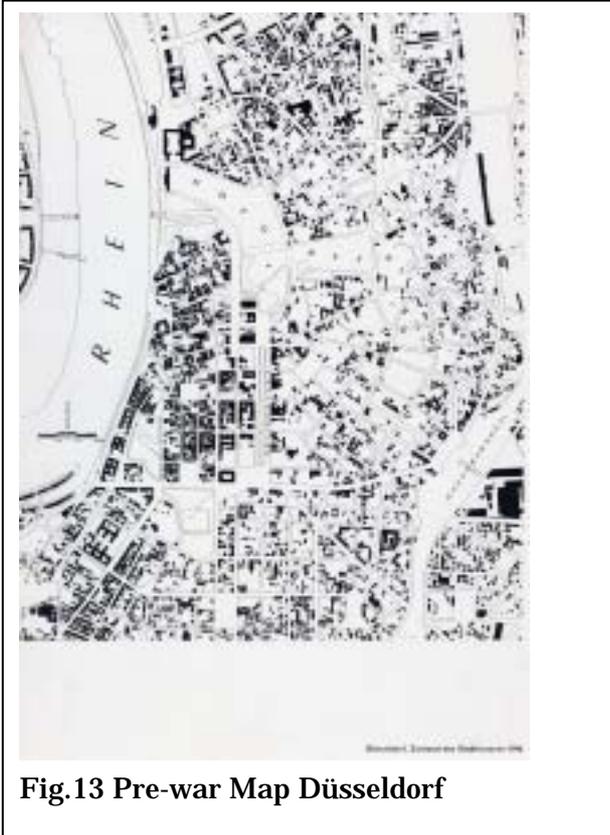

**Fig.9 Index of Frankfurt am Main**

and ③white without color means "Zerstört" (whole damage), such as a green tract of land and a railroad lot, are removed from the number of classifications, namely clear reverse order. The index of classification takes off damage without buildings such as Green land and railroad site.

In Frankfurt am Main, the index adopts more complete 5 classifications(Figs. 8 and 9), that is, ① black means 0 - 10% degree damage, ②vertical and horizontal hatch means 11 - 30% degree damage. ③from right to left direction hatch means 31 - 50% degree damage, ④right hatch means 51 - 70% degree damage and ⑤white means 70% or more degree damage, namely it is clear evaluated rank such as from partial damage to whole damage instead of an ambiguous classification. However, different from with expression of the war-damaged area map of many of other cities, it differs to evaluate the rank division of damage by the block unit instead by the building unit. Moreover, it is worthy of notice that the classification of non-damage dose not be dared, but be included into the classification of 0 - 10% degree damage. In Aachen there is "Schadenskarte" (war-damaged area map), the index is 4 classifications( Figs. 10 and 11), that is, ①black means "Unbeschädigt" (non-damage), ②thick left hatch means "Massig Weniger" (small damage), ③thin black mesh means "Mittlere Mittlerer" (middle damage) and ④white without color means "Total Schaden" (total damage).

In Pforzheim, by the method of painting out a damage building, the index is only one classification (Fig. 12), namely if the classification without damage will be counted, the index will become two classifications. Such the example extremely similar to Japanese example is also known by existing in

**Fig.13 Pre-war Map Düsseldorf**

**Fig.14 Post-war Map Düsseldorf**

Germany. If the explanatory note of war-damage is checked out, 237ha(s) of a central city area is counted in "total zerstört von weite Randgebiete teilzerstört" (from the extensive partial damage of the suburbs to total damage).

As for Düsseldorf, war-damaged area map itself cannot be found, but the area map in 1939, i.e. in pre-war, and the area map in 1946, i.e. post-war, are shown contrastively (Fig.13, 14). By those map, existing building all in those days is painted out, as a result two map play the role of the war-damaged area map. However, the grade of war-damage is not shown and it cannot be said as a general war-damaged area map in Germany.

A unique war-damaged area map is seen at Köln(Fig. 15). Although here is classified by four classifications, too, but ①most deepest dark black means 100-80% degree damage, ②next stage black mesh means 79-60% degree damage, ③gray mesh means 59-40% degree damage, and ④whitish mesh means 39-20% degree damage. It is the most remarkable damaged classification with surrounds of Kölner Dome on the left bank of the Rhine River. However, the judgment of these four classification is made not by building unit but by the zone unit with remarkable large scale, then that war-damaged map cannot be said that it is the accurate map, Nevertheless, even the most lowest degree damage is 20% or more of classification, it is turned out how the war-damage in Cologne itself was an intense thing. Although data related with war-damage about Köln came to hand in uniquely, anything other than this war-damaged area map is not found by present one.

As for Hanover, a war-damaged area map is not carried for some of these main reference, but

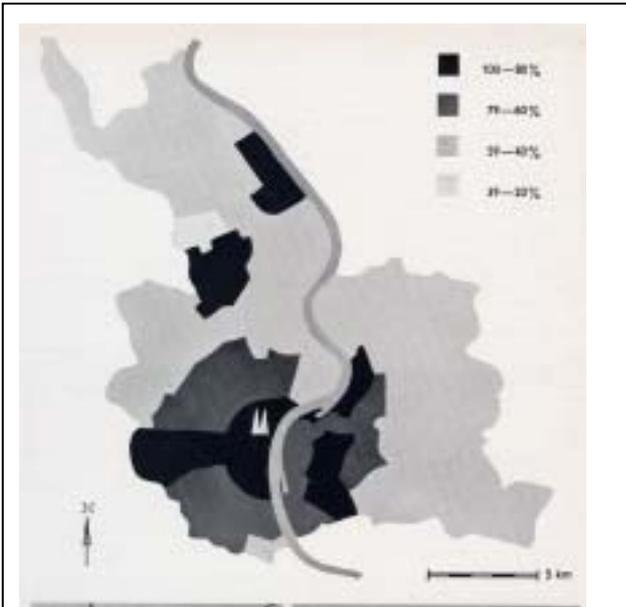

Fig.15 War-damaged area map of Köln

Fig.16-1 War-damaged area map of Hanover

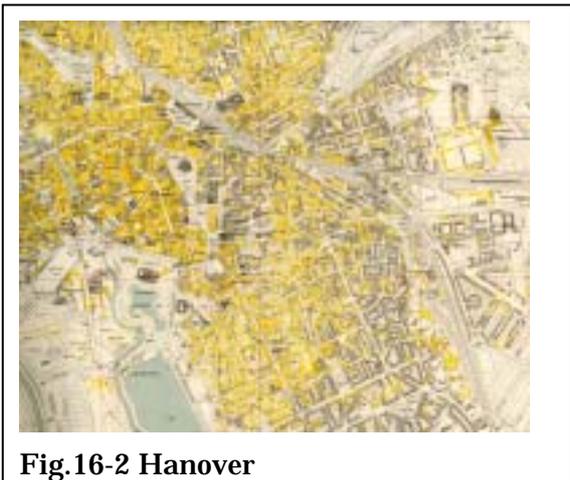

Fig.16-2 Hanover

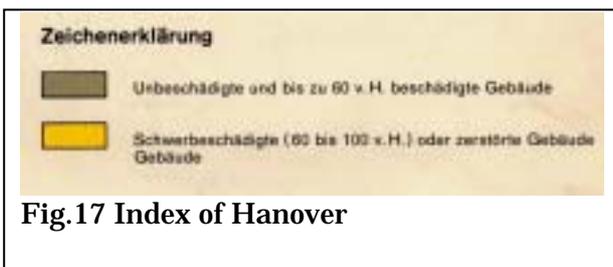

Fig.17 Index of Hanover

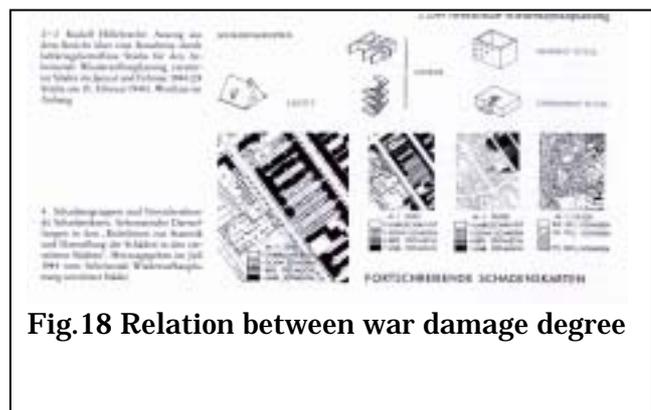

Fig.18 Relation between war damage degree

the reconstruction plan map for war-damaged area accepted by the competition is shown (Fig. 16). But if this figure is precisely seen, the existing building is written in and plays the role of the war-damaged area map as a result. However, because the damage situation of the pulled-down building is unknown, it cannot be said as the general war-damaged area map.

By uniquely correcting materials<sup>8)</sup> about Hannover, several war-damaged area maps which is not carried in common reference, was made the whereabouts clear and could be obtained (Figs. 17 and 18). According to these, ①black means non-damage and less than 60%, ②yellow(painting out)

means heavy damage (more than 60% or up to 100%) or total damage, then the index is two classifications, but the index of ① is too broad and rough classification, and the existence of detailed war-damaged area map is explained to be a base on the scale of 1:1000 or 1:2500 in practice.

**Table1 Classification method of war-damage for war-damaged area map in Germany**

Number of classification	War-damage display type	Explanation of the war-damage type display method	The example of the displayed type war-damaged city
2	2-A type	It is painting out about the building beyond fixed damage.	Pforzheim
3	3-A type	The display according to degree of war devastation, the order from heavy to light	Berlin, Hamburg, Hildesheim, Karlsruhe, Paderborn
	3-B type	The display according to degree of war devastation, the order from light to heavy	Dortmund, Wormus, Würzburg, Stuttgart, Ulm
	3-C type	The display according to degree percent of war devastation	Bremen, Bönen, Hannover
4	4-A type	The display according to degree of war devastation, the order from heavy to light	Darmstadt
	4-B type	The display according to degree of war devastation, the order from light to heavy	Aachen, Braunschweig, Keel
	4-C type	The display according to degree percent of war devastation	(Köln)
5	5-A type	The display according to degree of war devastation, the order from heavy to light	
	5-B type	The display according to degree of war devastation, the order from light to heavy	
	5-C type	The display according to degree percent of war devastation	Frankfurt, Münster
Special	Special type	Contrast of a city area figure and an after [ war devastation ] city area figure prewar days	Düsseldorf, Mayen
	Area type	The display according to degree percent of war devastation	Köln

### 3. Typology of Drawing Method

Till now, situation of war-damaged area map of German cities as the concrete object is examined.

Then, it must be examined how the number of classifications in the index are, and how the contents of classifications could be typed in the expression of war-damaged area map. Index of building damage is to be examined, but the damage without building, such as a vacant lot or a green area or the railways, is to be excepted. As a result, there are many cases of five classifications or 4 classifications, and there are two types, one is the type by the words expressed from some damage

level of damage to other damage level of damage, and another is the type classified by the degree rank. And there are the two type of method using a deep color and a conspicuous color, one is the case from heavier damage, and other is the case from lighter damage. Although it is the case that the classification of non-damage or light damage in the index is usually expressed by painting some color in Germany general cities, but it is the seldom case in Japan.

If such expressing methods will be tabled and the main concrete city example will be hung up, the result will be shown as Table 1. In addition, if the mutual relation between the words expressed of building damage with the degree rank is shown as fig.18, it must be said right that the classification of light damage, less than 50% damage, and roof damage is the same group, that the classification of heavy damage, 50-70% damage, and floor-and-stairs damage is the same group, that comparatively total damage and side wall damage are the same group, and that absolutely total damage and the total building damage are the same group, and that later both group are not classified with the group classified as 70-100

Thus, the war-damaged area map is usually drawn by building unit and in rare case by block unit, and the index is classified according to the degree of war-damage, those are the fundamental tendency in German war-damaged cities.

#### **4. Conclusion—in Comparison with War Damaged Area Map of War-Damaged City in Japan.**

Probably, that is Japan where war-damaged area map were drawn and released most early in postwar and most extensively in the world. "General condition of war-damaged area map of national main city"<sup>9)</sup> had been already edited and printed in December, 1946 after the war. According to this, the war-damaged area is drawn in 154 cities, towns and villages in those days. The drawing methods of the war-damaged area map in these war-damaged cities are two classifications fundamentally, and the index for presenting the war-damaged area was only one kind(i.e., one certain color usually red), -- being sufficient (the remaining white or blank areas being called non-damage). However, if speaking detail, there are some variations and they will be summarized, the war-damaged area map drawing methods can be typified as followed: fringing the outside fire zone as war-damaged area, and hatching the Inside(Japanese A Type). In it, there are several sub-types: one is a single zone type (A-1 type), a small-scale distribution zone type (A-2 type), the classified type of a collapsed house zone and a house-burned-down zone (A-3 type), a drawing type classified by war-damaged day (A-4 type), and a drawing type of the kind of war-damaged (for example, being what classified by the incendiary bomb attack and by the ship airplane attack, that is A- 5 type). The war-damaged area map of Tokyo in above mentioned "General condition of war-damaged area map of national main city" belongs to A-4 type. The war-damaged area is classified and expressed by every war-damaged day for 7 times (Fig. 19). However, in "History of reconstruction for War-damaged area" the war-damaged area is simply

drawing with the outside line (Fig. 20).

Although such examples of simple drawing method are most, there is one more type, that is the type of drawing the fixed zone by damage degree (Japanese B type), and as sub group one is the classification type of middle damage degree area or comparatively little damage degree area (B-1 type, for example, Kamaishi-shi), and one is the type which classified a rank division such as a total destruction and total burnt zone, a partial destruction and half burnt zone, and a partial burnt zone into it (B-2 type). There is one type(3), that is the type of drawing damage-less zone in the zone where the destruction-by-fire zone is bordered and the hatch is carried out (Japanese C type, for example, Sendai-shi), and one more type (4), that is, the type of dividing a damage-by-fire zone and a cartridge zone from war-damaged area(Japanese D type, for example, Sakata-shi).

Therefore, the drawing method in German war-damaged area map, it can be read, has an intention in order to use for reconstruction planning. The expression method and the display method of the war-damaged area map in Germany is by building units, and the degree of war damage must be judged in the unit. In short, in a case of Germany, though a building was usually destroyed by bombs occurred and the building was burnt down, the case of fire spreading to the outskirts of fringe of city is dropping from the sky, the outbreak of a fire seldom. If some building was hit by the bomb and that building were burnt down, in many case the adjacent or neighborhood building of that building was safe or suffered from little damage. Thus, in Germany the war-damage should be judged and expressed by each building unit.

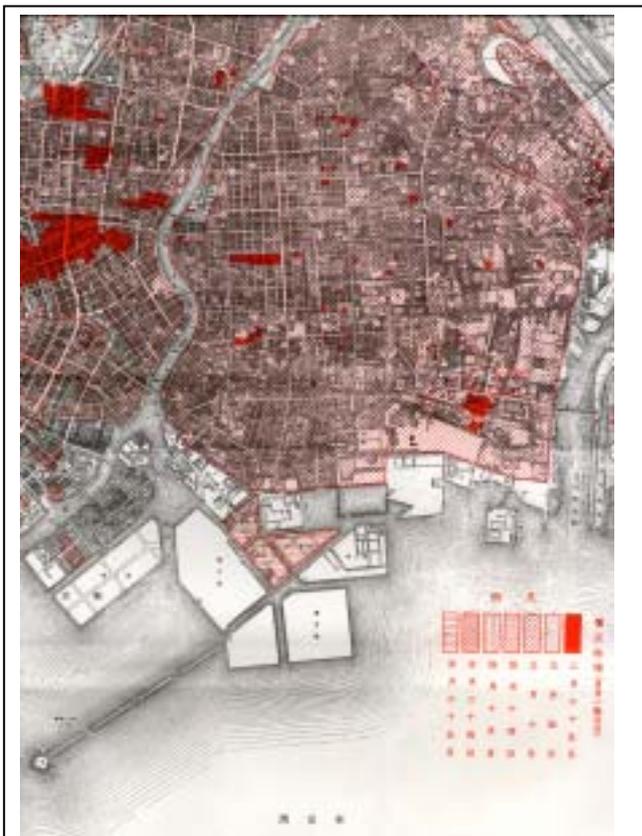

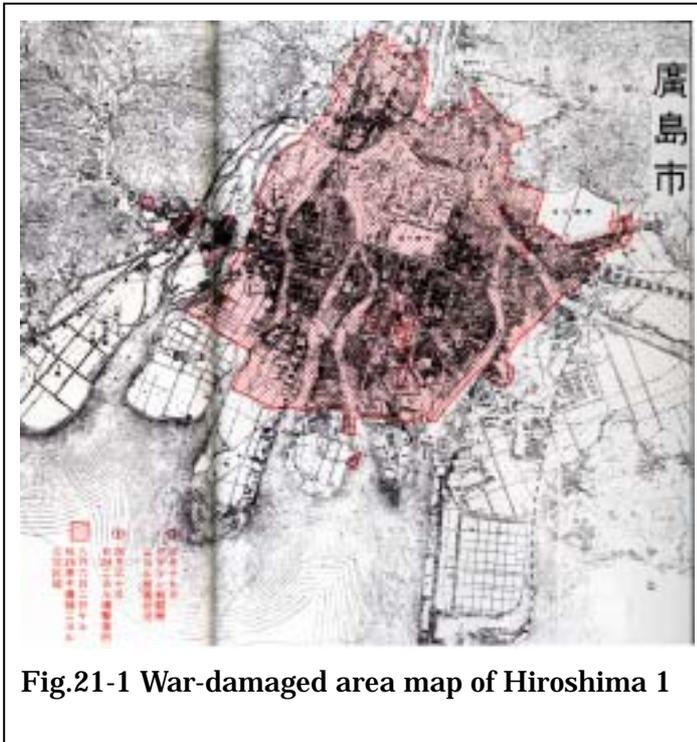

Fig.19 War-damaged area map of Tokyo1

Fig.20 War-damaged area map of Tokyo2

**Fig.21-1 War-damaged area map of Hiroshima 1**

**Fig.21-2 War-damaged area map of Hiroshima 2**

The war-damaged area map of the war-damaged city in Japan differs from Western (mainly in Germany), the display method of a war-damaged area map and the war damage in Japan itself differs remarkably from in Germany. If the outside line of war-damaged area is drawn as a rough spread-of-a-fire zone, the method in the case of Japan had achieved the objective or the intention.

In the case of Japan, it was restricted to the atom-bombed city in Hiroshima or Nagasaki, and some exceptional cities that the war-damaged area map was unexpectedly used as a role which shows the degree of war damage. As for Hiroshima, although the outside line of a spread-of-a-fire area showed the position and contamination destruction-by-fire zone of the bomb dropped before contamination with the war-damaged area map of the national version (Fig. 21), the rank part injury of the degree of damage was almost possible in the delicate revival magazine in the shape of a concentric circle like complete-destroyed / total-destruction-by-fire zone, partial destruction and a half glow zone, and a partial glow and partial destroyed area(Fig. 22). Such a classification is followed although the drawing according to grade of damage is reported by reference with various damage by contamination.

As the result it become clear that in Germany, the war-damaged area map was made by means of corresponding precisely to the degree of building damage of building unit, though the presentation of each city varies little by little. And the map is efficiently utilized in the reconstruction planning for war-damaged cities. Whether some building should be repaired, continued or not, pulled down or not , it is used by carrying out as the judgment material. Afterwards, the planning system was developed as B-plan, namely, district detail planning.

On the other hand, as for Japan, war-damaged area map becomes a figure of the

war-damaged zone. The war-damaged area map is simple comparatively. Though the outline or envelop line of the range of directly burnt zone and the spread of a fire zone, the method is not always obstacle to reconstruction planning and enterprise for war-damaged area. Because Japanese reconstruction planning and enterprise should have been projected under the land re-adjustment enterprise, namely not for building unit itself but specified block unit. Any way, there are several types of drawing method of war-damaged area map and each method or type should be made more clear, that is the conclusion.

## I. Division and definition of regions hot in summer and cold in winter of China

### 1.1 Scope and climate feature of regions hot summer and cold in winter

The majority of the regions located along and around Changjiang drainage areas belongs to that hot in summer and cold in winter (Picture 1-2). The general scope of this area is south from Longhai Line, north from Nanling, and east from Sichuan basin, including the two municipalities directly under the Central government, Chongqing and Shanghai; the total of Hubei, Hunan, Anhui, Zhejiang and Jiangxi province; the eastern part of Sichuan and Guizhou province; the southern half of Jiangsu and Henan province, the northern tip of Guangdong and Guangxi province, which involve in 16 provinces, counties and municipalities directly under the Central government. This area enjoys fairly developed economy and culture as well as important position with almost 1/3 population of the country covering about 1,800,000km<sup>2</sup> and taking up 48% of DGP.

Picture 1

Picture 2

Picture 1—2 The summer-hot and winter-cold area in china

### 1.2 The typical region hot in summer and cold in winter—Wuhan

The geographical position of Wuhan city is 113°41'–115°05' of east longitude and 29°58'–31°22' of north latitude which belongs to the north subtropical monsoon (humid) climate, having plenty rain and rich heat throughout the year and is the typical region hot in summer and cold in winter. (The figures in Table 1-1 and 1-2 shows) the average temperature in July and August of Wuhan is 29.8°C and the

highest extreme temperature reaches 39.4 °C; while the average temperature in January and February is 3 °C and the lowest extreme temperature reduces to -18.1 °C. However, during these two periods, both of the average air humidity is near to 80%. The coexistence of humidity and hotness as well as that of humidity and coldness make the outside environment in Wuhan quite tough in summer and winter.

**Table1-1: 9 cities' summer meteorological parameter in summer-hot and winter-cold area**

	Shang hai	Hangz hou	Nanj ing	He fei	Nan chang	Cu han	Chang sha	Chong qing

## II. City hot in summer and cold in winter—present situation of water environment in Wuhan

### 2.1 Present situation of water environment in Wuhan

Due to the constant expansion of cities and rapid development of economy the environment transformation changes with each passing day and the relationship between human beings and living environment becomes increasingly tense. Thus the sustainable ecological plan must be put forward. As for the present saturation of waters in Wuhan, the hardened and channelized phenomena are quite obvious and there is not the possibility for sustainable development, which is a big obstacle for the formation of ecological landscape.

As the city with hundreds of lakes, Wuhan is located in the center of China, close to rivers and lakes. Among 189 of them, 43 are distributed in the central area of the city. Currently, the water resource is enough, however, the water quality problem is rather striking, 56% rivers and 89% lakes are polluted in different degree throughout the city. The division of water system, the withering of ecological function of water and the increase of water pollution greatly prevents the improvement of living environment. Many lake net systems exist in name only.

### 2.2 The present situation of city hot island in Wuhan

The city climate effect in Wuhan is very notable, esp. after 80s of last century, the annual average temperature increases with more rain and less wind speed. At present, the city scale is constantly expanding and high buildings are standing in great numbers. Meanwhile, with the radiated energy of the sun and the city activities, the gathering of large amount of makes part sections of the city show the hot island effect. Now, the “hot island” of Wuhan is mainly appearing in the old district and Qingshan industrial district with highly dense population. Because of the lack of ecological vegetation as well as the holding back and absorbing of water surface, the city cyclone turns “scorching” into “stifling” and at the same time brings out city “rain island effect”, “fog island effect”, etc.

### III. The strategy to improve living environment by using water environment

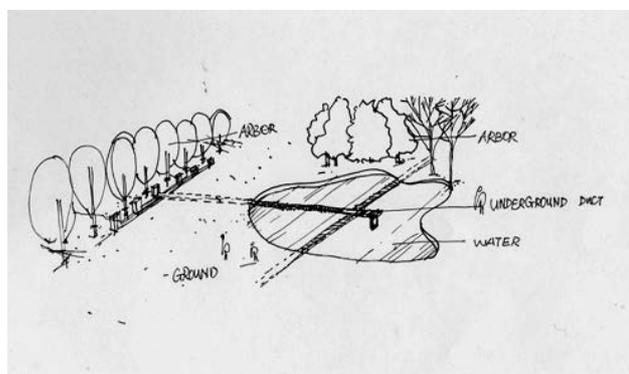

#### 3.1 The establishment of humid land system to improve living environment

Humid land system not only has the highest producing of living beings in the ecological system, which can produce a great amount of microorganisms rich on vegetation community or plants, but good to further purify water environment and then improve microclimate to optimize the living environment.

In Wuhan, the ecological humid land should be recovered for the over-developed and unduly big water environment. The hard revetment should be changed into soft one with the blend of natural water and land. Suitable development around the undeveloped humid land can also be done, keeping the integral of its ecology to the utmost. Some water plants such as canna, reed, etc., which not only provides flourishing living environment, forms blending landscape of human and nature, but also has active effect to the improvement of microclimate. The humid land environment can really optimize and improve living environment.

#### 3.2 Use underground water as the resource of cold-producing and warm-keeping

By using the cold-producing and heating potential of soil environment 2M underground, the energy can be reduced by 30%-100%. The soil temperature 2M

underground is almost the same to the annual average temperature in this area. In Wuhan, the highest extreme temperature is 39.4°C in summer, the coldest extreme temperature is -18.1°C in winter and the annual average temperature

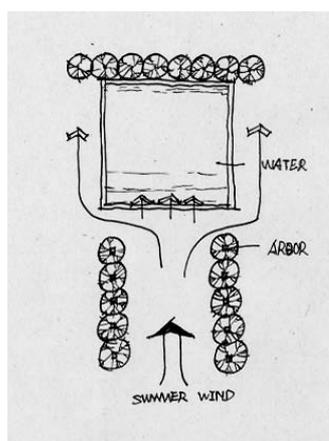

Picture 3-1

is 16.4°C. By the way of energy storing and burying, the living environment can be evidently improved. Using the temperature change at the bottom of waters between the daytime and night, the temperature difference on the land surface can be ameliorated.

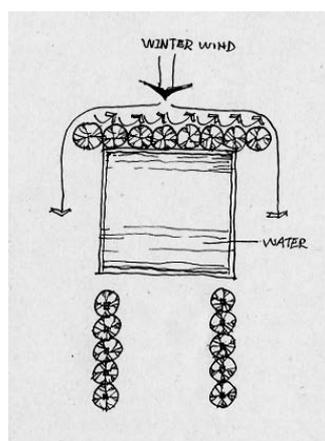

In winter, the hot pump absorbs heat from the underground cycling water and releases it indoor and outdoor, increasing the temperature inland surface, creating the comfort of human body and improving living environment.

### 3.3 Summer ventilation and winter windbreaking of waters

In the area hot in summer and cold in winter, the water surface is better arranged windward of the leading wind, which is benefit to reduce the air humidity around the water and the scope of low temperature can be expanded. The summer ventilation can be led to the surface by tall deciduous arbor.(Picture 3-2)

Picture 3-2

Picture 3-3

Planting evergreen arbor in the windward of the leading wind in summer can prevent negative wind and prevent the loss of heat from the transpiration.(Picture 3-3)

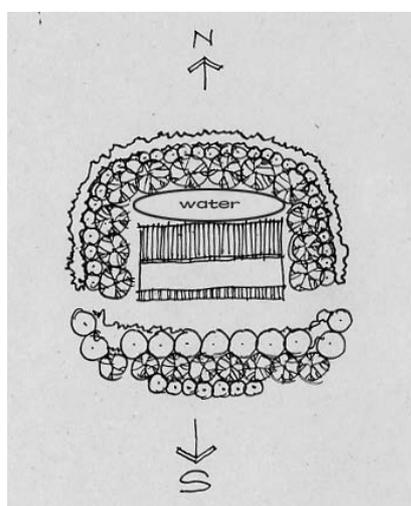

### 3.4 Water design of defending sunshine in winter and receiving it in winter

Defending-sunshine water design outside buildings: better to plant water vegetation. Thus it can not only prevent the water surface receiving excessive radiative heat from the sun, but reduce the dazzling light from water surface in summer and can create richer landscape effect. Species should be selected, according to the ecological feature of water vegetation and the demand of landscape. The

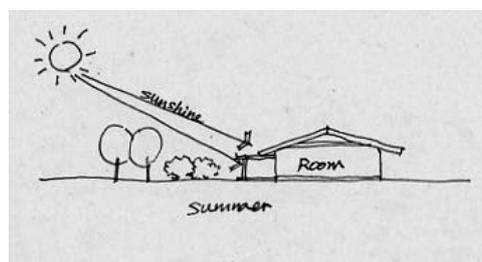

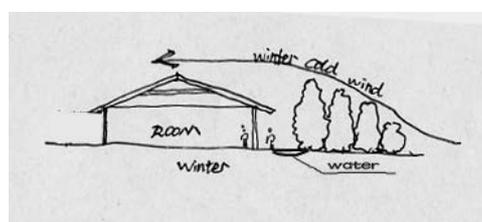

rootstock of the water-floating plants, such as lotus, water lily, etc, grows from the water soil. In order to guarantee the effect of the uneven density of water vegetation and not influence the appreciation of the inverted image besides water, it is better not to plant those vegetation on the whole bank, esp. the straightening plants(such as reed, water bamboo, etc.), but more clumps and smaller scope.

### 3.5 The importance of living environment from water steaming amount and irradiating angle of the sun

Waters arranged windward in the summer leading wind are good to reduce the air humidity and expand the scope. In summer, the tall deciduous arbor can lead air to the water surface. Planting evergreen arbor windward in winter leading wind can prevent negative wind and reduce the loss of heat from water steaming. Water design can combine the defending-sunshine design by itself and that by surroundings, avoiding the water surface receiving too much radiation and can reduce the dazzling light in summer. When the pond's bottom is paved, the changeable design strategy can be adopted to solve the heat contradict in winter and summer.

Picture 3-4

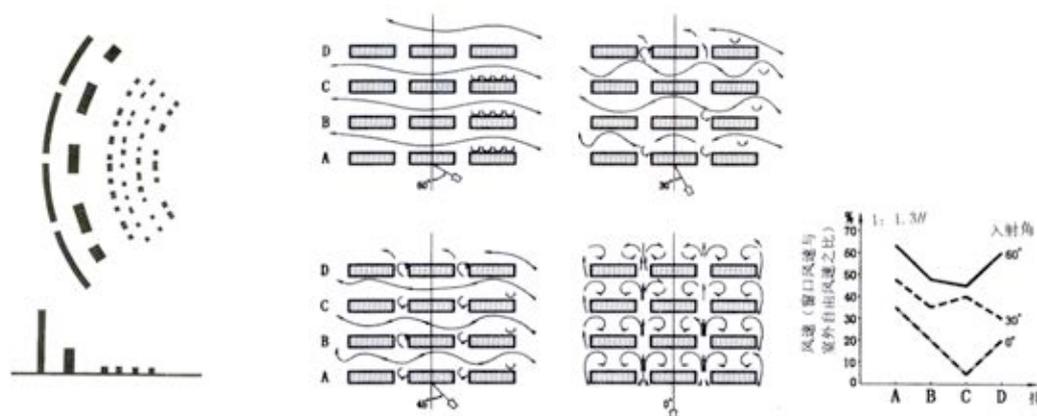

Picture 3-5 3-6

In summer, the southern part of the house can prevent sunshine or radiation by the wave structure; in winter, the obtaining of sun energy should be increased. The best way is to plant deciduous arbor. In winter, only dead branches are left, so the sun can directly radiate on the outside of the building. The heat storing work can be

transformed to the indoor through the walls and keep warm. In summer, the arbor has thriving branches and the sun cannot directly radiate on the outside of the building. The plants function to prevent heat.(picture 3-4 3-5 3-6)

### 3.6 The influence of constituting for our space of water-faced buildings to the wind environment

The constituting way for out space of water-faced buildings has something to do with natural ventilation, which can be considered from plane and stereoscopic

Picture 3-7

aspects. From the angle good to the ventilation of single building, the long side of the building is better vertical to the summer's leading wind; but from the angle good to the ventilation of building complex, it will seriously affect the summer ventilation of the bank building. Therefore, the angel should be better controlled from 30 to 60 between the planned orientation and summer leading wind.(Picture 3-7)

## Conclusion

Evaluating whether a region or city is comfortable or not, climate is the very crucial factor. Then that is the water environment and terrain condition, i.e. forming integral ecological environment. As a passive design element, water can be designed to reduce the temperature in summer and increase it in winter as well as change climate cycling. In the region hot in summer and cold in winter, water environment plays active role in optimizing and improving the living environment within fairly big size. According to the different size, different section and different physiognomy, the possibility that water, as the main body, improves the cycling of microclimate will also change. Wuhan, as a typical region hot in summer and cold in winter, has big scale, rich waters and special climate. The key point illustrated in this paper is how to scientifically use water environment to create comfortable and suitable environment for human beings themselves as well as establish sustainable close water landscape.

# CONDITIONS AND SUSTAINABILITY OF TOURISM DEVELOPMENT IN THE IMS GROWTH TRIANGLE

**Keyword:** Tourism development Regional cooperation, IMS Growth Triangle

## 1. Introductions

According to the World Tourism Organization (WTO), the international tourist arrival in 2004 recorded as 763 million. The number has increased about thirty times from the 1950's mainly due to the introduction of passenger aircrafts. The trend of expansion forecasted as continuous 5% increase every year that it would reach a billion by the year 2010. The current regional share shows the domination of Europe as 50%. However, the increase in Asia and the Pacific and Middle East were 27.9% and 18.0% between 2003 and 2004, which were higher than other regions. This tendency also predicted continuing in the future.

The positive impacts of tourism development for the regional development are widely recognized in aspects of economy, and socio-culture. Tourist spending such as accommodation, transportation, food and beverage, and shopping are direct revenue for the region. Furthermore, employment and raw material supply needs can generated as ripple effects. Facilitation of infrastructure including construction of road, water supply and sewage treatment facilities, waste management plants, and leisure facilities serves for both tourists and residents. Socio-cultural impact often noted as a human interaction with people who have different history, culture, and social background. It may enhance the understandings of different cultures and prevent conflicts between them. Therefore, the tourism development perceived as a useful measure for regional development. Meanwhile, negative impacts noted such as decline of natural environment, socio-cultural values, and increase of crime.

The positive economic impacts of acquisition of foreign currency and employment generation are highly regarded especially in developing countries that they tend to promote tourism development as a significant tool for their economic development. In order to undertake the tourism development, the formulation of master plan is essential. However, realization is not easy in developing countries due to the lack of technology, knowledge, and fund.

The study aims to find out the clues for the feasible and sustainable tourism development methodology through focusing on a unique exercise of tourism development under the multi national cooperation in Indonesia Malaysia Singapore (IMS) Growth Triangle. An example of the focal tourism development area named Bintan Island is closed up to assess the conditions and perspectives of tourism development especially on its accomplishments and perspective in the future in terms of feasibility and sustainability.

The authors carried out the survey in 1999 and 2005 that the findings should evaluate through the comparison between its early stage and present conditions. The benefits and advantages of multi co operational tourism development will discussed along with the

possibility of application to other areas. Moreover, obstacles and limitations of the methods will examine.

## 2. IMS Growth Triangle

The center of IMS Growth Triangle (GT) is two islands locate between Singapore and Indonesia namely Batam and Bintan (Figure 1). Those islands belong to Indonesia and conveniently accessed from Singapore by ferry within an hour. Taking into account the proximity of the location to Singapore, establishment of industrial park started in 1970s in Batam Island. The moderate land price and labor costs attracted foreign investments. It was agreed as Free Trade Zone in late 1970s and it aimed to be the process and export base.

The both Indonesian and Singaporean presidents encouraged the co-operative development and agreed to introduce 100% private investment as well as its application procedure in Batam. It confirmed the private investment and water resource provision for Singapore. Employment generation in the industrial park and technical transfer from Singapore contribute to Indonesia. Meanwhile, solutions of water and land resources shortages, reduction of process costs, securing regional security are merits for Singapore.

Simultaneously, the Mater Developer named P.T. Bintan Resort Cakrawala (BRC) established in 1991 based on the agreement between Indonesia and Singapore governments for Bintan Island's tourism development. The BRC is responsible for formulating master plan, infrastructure facilitation, construction of tourist's attractions, encouraging private investment for resort hotels, natural environment conservation, and maintenance and operation of resort area (Figure 2). Its operation started in 1996 and tourist arrivals increased from 113,494 to 340,465 in 2001. However, the number decreased to 263,058 due to the Bali bombing in 2002, and Iraq war and SARS in 2003. The number shows gradual improvement of 288,083 in 2005 (Figure 3).

Figure 2. Tourism Development Area in Bintan Island  
Source : <http://www.bintan-resorts.com/brcms/>

### 3. Methods

The reasons of focusing on the tourism development in IMS Growth triangle are to find clues for feasible and sustainable tourism development in developing countries. The efforts of encouraging private investments and multi-national implementation methods acknowledged as a unique technique. Therefore, the progress of tourism development in Bintan Island examined through interviews of stakeholders and field survey. Moreover, the authors' previous study in the same area in 1997 will refer to the current conditions<sup>1</sup>.

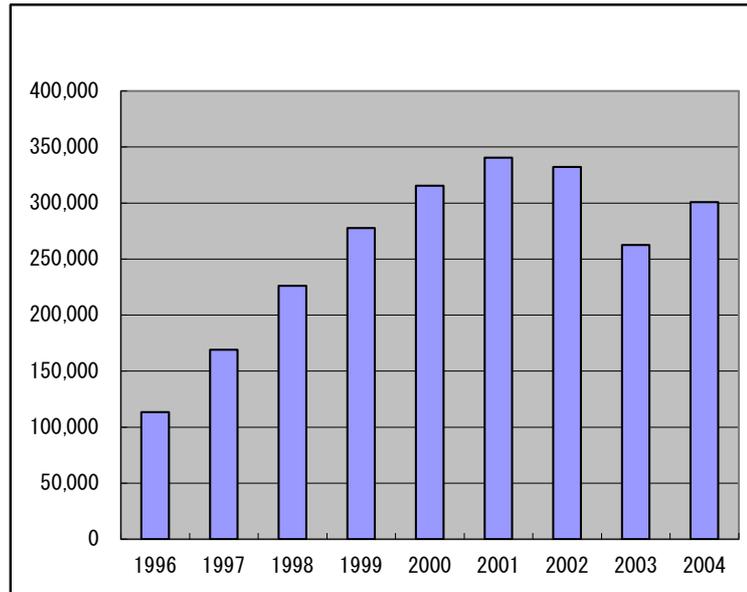

Figure 3. Tourists Arrivals  
Source: <http://www.bintan-resorts.com/brcms/>

The interview with Director of the BRC took place in August 2005 at the head quarter of BRC in Singapore. The Director was the same person whom interviewed in 1999 that the interviewed items concentrated on the progress of tourism development and its perspectives. A request for the BRC supports for the field survey in Bintan Island mentioned at the meeting.

The field survey carried out in January 2006 at Bintan Island with the cooperation of BRC local staff.

### 4. Tourism Development in Bintan Island and its impacts

The current conditions and progress of the development summarized as below (Table 1). It based on the interview with the BRC Director.

Table1. Current Conditions of Tourism Development in Bintan Island

Items	Contents
1. Overall Development	
Infrastructure and Tourism facilities	<ul style="list-style-type: none"> <li>• Opening of a new resort hotel (Number of existing resorts is 10. Different types of resorts supposed to attract diverse markets).</li> <li>• Additional tourist attraction for the existing resorts such as spas.</li> <li>• It await for the investment for phase two developments, this includes new resort hotel establishments, commercial complex, and second house complex.</li> </ul>
Customer service	<ul style="list-style-type: none"> <li>• Improvement of access for both ferry and air via Batam Island</li> <li>• Introduction of excursions such as heritage, culture, and Mangrove Forest tours.</li> </ul>
Natural Environment Conservation	<ul style="list-style-type: none"> <li>• Monitoring of marine spices (Twice a year) did not show any damage by the tourism development. It rather affected by the local fishery.</li> <li>• Mangrove tour prevents illegal cutting and animal hunting (tour guide can report the incidents).</li> </ul>

<sup>1</sup> Nami Tanaka and Kazunari Tanaka, Tourism Development Guidelines in Developing Countries: a Case of the Bintan island, Indonesia, 4th Asian Design Conference International Symposium on Design Studies, D-3, 1999

2. Profiles of Tourists	
Tourist Arrivals	<p>Figure 4. Origin of tourists number decrease: Sept.11 2001, Bali bombing 2002, SARS 2003, tsunami 2004            Source: BARS 2003, BARS 2004  <a href="http://www.batamresorts.com/">http://www.batamresorts.com/</a></p> <ul style="list-style-type: none"> <li>• Gradual increased from 2005.</li> </ul>
Origin of the Tourists	<ul style="list-style-type: none"> <li>• 76.7% is from Asia (Figure 4).</li> <li>• Domestic (Indonesian visitor) is increasing via Batam airport.</li> </ul>
Marketing Targets	<ul style="list-style-type: none"> <li>• Golfer, Conference participants (international, company meeting etc.), and family</li> </ul>
Public Relations	<ul style="list-style-type: none"> <li>• Websites: keeping high profile for search engine appearance, linkage with travel search engine, multi-language websites</li> <li>• Affiliation with JTB for Japanese market</li> </ul>
Investments	<ul style="list-style-type: none"> <li>• Sift from Singapore domination: 60%(initial) →30%(current)</li> <li>• Increase of Indonesian investments caused by insecurity of Indonesian economy. Import and export tax exemption. Batam Island becomes popular investment market.</li> <li>• Educational facilities are increasing in Batam in responding the rich Indonesian demand.</li> </ul>
3. Regional & Local Involvements	
Impacts on Regional Economy	<ul style="list-style-type: none"> <li>• Employment Generation: Out of 5,000 employers, 95% is from Indonesia, 50% is from Bintan Island.</li> <li>• On the job, trainings are under implementation.</li> </ul>
Regional Development	<ul style="list-style-type: none"> <li>• Providing medical checkups</li> <li>• Participation of heritage and cultural tour</li> <li>• Utilization of local products (fishery and crafts) at resorts introduced.</li> </ul>

The field survey in Bintan Island mainly focused on the newly developed facilities after 1999. It included interviews with local office staff of BRC as well as local residents, who are participating joint projects with BRC.

The responsibilities of BRC Bintan local office are daily operation of resorts such as supplying electricity and water, water quality management, road maintenance, and port and gate security. It also monitors tourist profiles, operate tours, and

implement regional development projects. The number of employees is five hundreds and a hundred are dealing with security section. Majority of workers are Indonesian and only thirteen administrative staff are non-Indonesian. The findings of field survey summarized as in the Table 2.

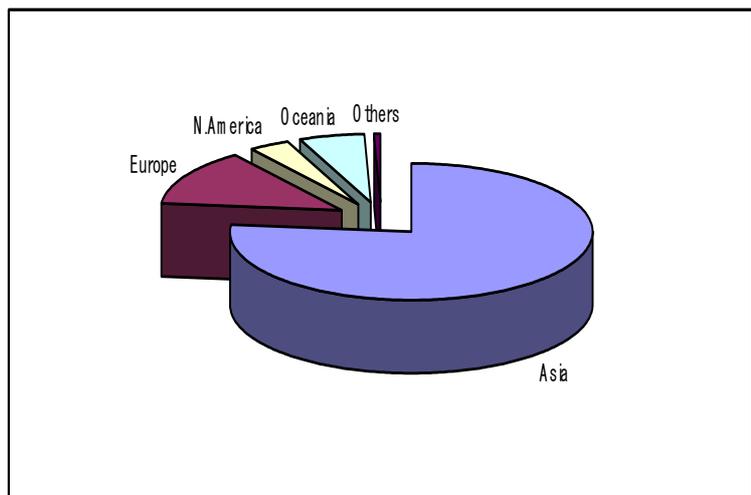

Table 2. Summary of Bintan Island Field Survey

Item	Contents
<b>1. Overall Development</b>	
Infrastructure and Tourism facilities	<ul style="list-style-type: none"> <li>• Renovation and expansion of existing visitor complex is in progress. It aimed to add variety of foods and products.</li> <li>• Renewal of exhibition at visitor center is also in progress.</li> <li>• Introduction of a new up-scale resort hotel</li> <li>• Elephant Park by an independent investor. They lend Elephants to the Hotels. Elephant ride experience and shows in the park.</li> </ul>
Customer service	<ul style="list-style-type: none"> <li>• Provide porter services for the visitors entering the Bintan via Batam airport. Visitors need not pickup luggage after the check in at Batam airport. The service received good reputation among golfers.</li> <li>• Mangrove Tour: guided tours with duration of 1-1.5hr. Maximum capacity of three boats for 10 passengers can dispatched at the same time. It operates five times a day including one night tour. English, Mandarin, and Japanese Guides tours are available. About 5% of the visitors joined the tour. It won PATA's Gold Award in 2001.</li> <li>• Heritage Tour started in 2002. The duration of the tour is one day that number of participation is small. Due to the road conditions in the local area, it is impossible to shorten the duration.</li> <li>• Malaria prevention measure is in implementation. Researches and annual blood tests of employees are undertaken. There were two death cases in 1996 (opening). None of Malaria case reported last three years.</li> <li>• Introduction of Hop-on/off free Resort bus to connects all hotels and Pasar Oleh Oleh will be in operation from 19th January 2006 with SD6 for adult and SD3 for children. Presently, each resort provides shuttle buses to Pasar Oleh Oleh.</li> <li>• It facilitated signs, which represent the natural character of Bintan and Indonesia within the resort. Sculpture of orangutan, picture of Sumatra tiger, Komodo dragon, and Dugong are on steer towers.</li> </ul>
Natural Environment Conservation	<ul style="list-style-type: none"> <li>• They plan to establish Green Turtle hatchery for the promotion of Eco-tourism. The project started in 2005.</li> </ul>
<b>2. Profiles of Tourists</b>	
Tourist Arrivals	<ul style="list-style-type: none"> <li>• Decline of arrivals: 2002 Bali Bombing, 2003 SARS, 2005 Tsunami.</li> <li>• Gradual increase is expected in 2006.</li> </ul>
Origin of the Tourists	<ul style="list-style-type: none"> <li>• China and India are emerging market</li> <li>• Increase of Korean golfers in Oct. and Nov. in 2005.</li> <li>• Visitors from Batam Island are increasing. Foreign workers (Japanese, Korean, and Chinese) in Batam spend their holiday in Bintan</li> </ul>
Marketing Targets	<ul style="list-style-type: none"> <li>• China, India, and Russia are new targets.</li> <li>• Singapore Airline operates a flight from Moscow via Dubai. They try to promote warm weather during the winter for Russian tourists.</li> </ul>
Investments	<ul style="list-style-type: none"> <li>• Korean opened Korean restaurant.</li> </ul>
<b>3. Regional &amp; Local Involvements</b>	
Impacts on Regional Economy	<ul style="list-style-type: none"> <li>• The resort contributes 70% of the tax revenue of Bintan Island.</li> <li>• Share of local employee differs from resorts (as an average, 50% are from Bintan): Club Med is less than 5% due to the operational policy of providing multicultural staff. Banyan Tree is also less than 50%.</li> <li>• Township (staff housing area) offers dormitories, market primary school, and a mosque. One dormitory building can accommodate 16 employees (8 units for 2 persons). Local workers can commute from their village as well. Housing area designated by the ranks of employees.</li> </ul>

	<ul style="list-style-type: none"> <li>• Locally caught fish sold to hotels.</li> <li>• Quality of fruits and vegetables do not match with the hotels' standard. Hotels mainly purchase foods from Singapore. The projects of establishing local SMMEs are in progress.</li> </ul>
Regional Development	<ul style="list-style-type: none"> <li>• Department of Community Development in BRC is in charge of regional development.</li> <li>• There was a demonstration by the fishermen regarding the compensation of relocation by the Resort development at the initial stage. A gate to the Resort area facilitated.</li> <li>• The BRC mainly look after two villages near the Resort area.</li> <li>• They provide traditional fishing tour, which local fishermen can participate.</li> <li>• Invited handcraft trainers from Java to teach housewives, and assisted selling products at hotels' gift shops.</li> <li>• They negotiate with Banyan Tree to produce hotel brand products by the locals.</li> <li>• Establishment of hand craft center: Trained housewives make bags and containers from plants. The tourists can observed and experience the procedure within the cultural tour. The guest book showed a few visitors per day. Housewives mentioned that they are grateful about their gained skills and exchange opportunities with tourists.</li> <li>• Assisting local chips (deep-fried) production and sales.</li> <li>• Started farming experiment in 2005: building the capacity of locals to produce good bananas. Singaporean consultant came to establish the program. Started from 300 tree planting (helped by the 65 (age between 16 and 17) students from Singapore for 3 days). Four people carry out current operation. Expecting the first harvest in May 2006 and will export to Singapore, (a local worker showed their strong ambition).</li> <li>• It introduces organic farming methods (utilizing rabbits and warms). It breeds goats for feasts.</li> <li>• Farming experiment is funded by the DFID (UK funds) along with BRT fund (availability of future funding is uncertain).</li> <li>• Scholarships select three students from primary, secondary and high school per year. It covers school tuition, stationeries, and textbook fees.</li> <li>• Training provision: 2-year program in Singapore Hotel School for accounting and front management between 2000/01. One trainee selected from 18 years old or above.</li> <li>• Teaching English at secondary schools (program is on suspension). Local language is Bahasa.</li> <li>• It facilitated school libraries in the six villages with the support of Anglo China Junior College in (ACJC).</li> <li>• Students exchange program is ongoing between ACJC and local schools.</li> <li>• It involved ACJC students for the Banana tree planting and eco-education.</li> </ul>

Based on the above-mentioned findings, the regional impacts of tourism development in Bintan Island examined. The impacts can categorize into two aspects. One is the positive aspects and the other is the rather problematic aspects, which may be the further tasks. Those summarized in the Table 3.

Table 3. Impacts of Tourism Development

Positive aspects	Reasons
Local employment generation	<ul style="list-style-type: none"> <li>• Share of Indonesian employees is high.</li> </ul>
Revenue and foreign currency earnings	<ul style="list-style-type: none"> <li>• Contribution of tax revenue</li> <li>• Local products purchase (fishery and handicrafts).</li> </ul>
Opportunity of business establishment	<ul style="list-style-type: none"> <li>• Provides craft production skill training for locals.</li> <li>• Implements experimental farm project.</li> </ul>
Supply of Infrastructure	<ul style="list-style-type: none"> <li>• Road, water, electricity, emergency (medical) care, fire station</li> </ul>
Cultural exchange	<ul style="list-style-type: none"> <li>• Several projects are implemented involving locals, tourists and students participation.</li> </ul>
Improvement of medical care	<ul style="list-style-type: none"> <li>• Malaria prevention measures</li> <li>• Medical and dental check-ups provision</li> </ul>
Educational support	<ul style="list-style-type: none"> <li>• Facilitated libraries</li> <li>• Scholarships</li> </ul>
Natural environment conservation	<ul style="list-style-type: none"> <li>• Continue monitoring of marine, fauna, and animal species.</li> <li>• Implementations of nature sound projects.</li> </ul>
eritage and culture conservation	<ul style="list-style-type: none"> <li>• Heritage and culture tour operation.</li> <li>• It preserved traditional fishery.</li> </ul>
Technical transfer	<ul style="list-style-type: none"> <li>• Advanced techniques and skills from Singapore introduced.</li> <li>• Knowledge of tourism marketing transferred.</li> <li>• Locals provided medical and educational opportunities.</li> </ul>
Further Tasks	Reasons
Disparity of Job types	<ul style="list-style-type: none"> <li>• Foreigners take administrative and high-qualified jobs.</li> <li>• Simple labor tends to offered to locals.</li> </ul>
Human Resource Development	<ul style="list-style-type: none"> <li>• Highly depends on the job training and internal training.</li> <li>• Local residents have limited access to the training opportunities.</li> </ul>
Utilization of local products and quality improvement	<ul style="list-style-type: none"> <li>• Local products not fully utilized in the resorts except fishery.</li> <li>• Need to upgrade the quality of products through technical transfer.</li> </ul>
Consumer oriented information dissemination and PR	<ul style="list-style-type: none"> <li>• Tourists do not frequently visit visitor centers. The shops and restaurants' information is not fully disseminated.</li> <li>• Need to advertise BRC heritage and culture tours to attract tourists. Some amendments of tour packages may require attracting tourists.</li> <li>• Need to observe the outcome of Hop-on/off free Resort bus.</li> </ul>

## 5. Discussions

Some positive regional impacts of tourism development are observed in Bintan's case. These derived from regional cooperation and private investments. Therefore, this section of the paper discusses the applicable measures of tourism development, which learnt from the case.

### 1) Establishment of Cooperation Structure

It is essential to secure the benefits of all stakeholders, who will take part in the development. It clearly identifies the roles of participants and generates multiple effects. We believe that the structure desirably includes countries, which are in the different stages of economic and technical developments

### 2) Establishment of master developer

It is efficient to establish Master Developer like BRC to undertake overall development including master plan formulation, infrastructure facilitation, investment promotion, natural environmental conservation, advertisement, and operation. The independent master developer can flexibly implement the plans and amend the original plans depending on the economic conditions and other factors compare to the rigid

governmental institutions. Moreover, when considering the impacts of tourism development on natural and socio-cultural environment, the master developer can monitor the conditions prior to the development, construction period, and after. The master developer can cover the entire area of development and if they detected the problems, they may be able to find countermeasures for negative impacts prevention.

### 3) Technical transfer and utilization of human resources

Involvement of multi-countries, which are in the different level of development process, can provide opportunities of skill transfers, adaptation of innovative techniques, information dissemination, and advertisement. The mass labor and special skilled human resources may utilize under joint projects.

### 4) Tourism marketing

Inclusion of countries opens access to the various tourism industries in different countries. It can maximize the existing channels such as travel agents, airlines, and tourism developers in order to promote and formulate marketing strategies. It is also useful to maintain close relationship with industries in different culture when unexpected events happened such as terrorists attack and natural disasters. They can work together in finding efficient advertisement and information dissemination activities depending on the market profiles.

## 6. Perspectives of the study

The study aimed to find clues feasible and sustainable tourism development in developing countries through referring the case of Bintan Island. As mentioned above, we observed several key factors of effective development measures in BIntan's case and these may reflected to other regions with taking into account the respective regional realities and contexts.

The perspective of study requires continuous data collection and monitoring of Bintan and overall IMS Growth Triangle area. It includes field survey of the area and interviews with parties concerned. After the data accumulation, we will aim finding the indicators of the sustainable and effective measures of tourism development in developing countries.

## 7. Acknowledgment

This is to express our sincere gratitude towards the P.T. Bintan Resort Cakrawala (BRC) for supporting the field surveys of Bintan Island. It included interviews with Mr. Bertram Wong, Director Resort Development, Island Leisure International - Bintan Resorts at the head office, Bintan office representatives, and guided site visits within the island. Finally yet importantly, we ought to mention that the study funded by the Heiwa Nakajima Foundation.

**Key words: Sustainable Development, Heritage City Space, Urban Village, Threshold, PRA, & Environmental Management**

## **Introduction:**

The world over, initiatives have been attempted to curb the unsustainable growth of urban settlements, towards directions more at tuned to environmental protection and long-term sustainability. A sustainable development of a city is one which is self reliant and healthy which is not overcrowded to jeopardise living space that is relatively easy to conceive under two broad heading:

1. Ecological sustainability
2. Economic viability

Environmental Management is the control and reduction of the negative impacts of human activities on the physical, biological, cultural and economic environments. It is an endeavor to avoid the ever use, abuse and misuse of resources in the environment.

## **Need of the Study:**

Delhi exists as capital site of India, a historic power center. It has seen the rise and fall of many empires, which have left behind a plethora of monuments along with crunched settlements. Seven principal cities were chiefly created by different rulers but when the British decided to shift the capital of their Indian empire from Calcutta to Delhi in 1911, they were laying out a city in an area that was in fact dotted out ancestral cities. Part of the planning envisaged the same way. These two threads were the warp and weft of the weaving of urbanisation in the story of a Delhi's heritage settlement. According to the urban sociologists and historians (Mumford, 1966)

all cities are “living entities”, which go through a life-cycle as the birth, growth, consolidation, expansion, decline, and quite often some kind of end, or state of decay, unless they are “turned-around” and “revived” by combined human efforts. Therefore it is need to revive remnants of the historical city space of Delhi .

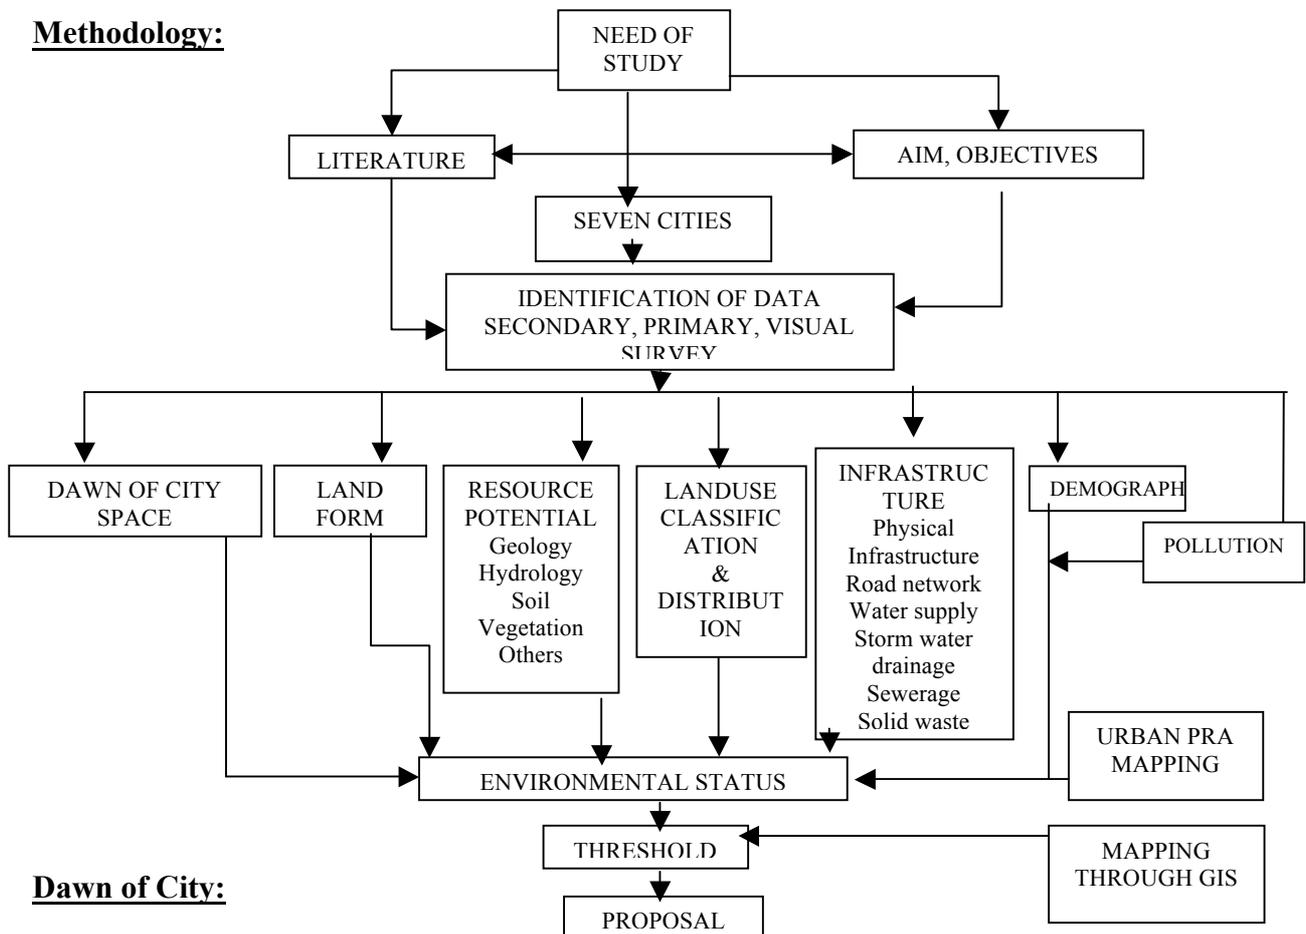

**Aim of the Study:**

Aim of this paper is to make integrated planning approach for Self Sustained Heritage City Space.

**Objectives of the Study :**

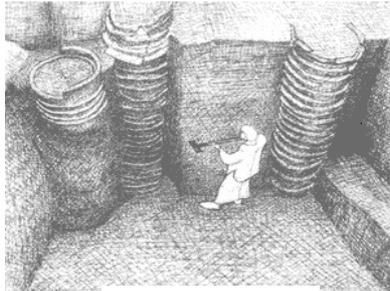

- To understand the causes and consequences of heritage city space;
- To study the present environmental status of existing heritage city space through secondary, primary, visual survey and Urban PRA mapping;
- To identify potential and critical issues of areas;
- To evolve strategies to improve the quality of environment and propose management plan of present heritage settlement incorporating participatory tool.

**Methodology:**

**Dawn of City:**

Delhi is known as one of the most fascinating modern city with the world-renowned ancient architectural and cultural heritage sites. The eternal Jamuna bears witness to the glorious at 5,000 year old history of Delhi. Indraprastha of Pandavas about 1400 BC was a huge mound somewhere between the sites where the historic Old Fort and Humayun's Tomb were later to be located. Although nothing remains of Indraprastha, pieces of old pottery known as Painted Grey Ware (PGW for short) were also found here and there. Till the end of the nineteenth century, there was a village called Indarpat (which sounds very similar to 'Indraprastha') inside the

These terracc Fig 1: Inderprashtha ana Qila. [www.dreamstime.com](http://www.dreamstime.com)

fort. The first reference to the place-name Delhi, seems to have been made in the 1st century BC, when Raja Dhilu built a city Lal Kot near the site of the future Qutub Minar and named it after himself. And some say it came from the medieval town of Dhillika means 'threshold' located near present date Mehrauli. A history which encompasses all the various kings and emperors

who fixed their royal citadels here – Indraprastha, Lal Kot, Quila Rai Pithora, Siri, Jahanpanah, Tughlakabad, Ferozabad, Dinpanah, Delhi Sher Shah or then Shahjahanabad. There have been at least major *seven cities* around modern Delhi. These are:

S.N	Name of Cities	Built by	Time Period A.D.	Area in Sq Km	Longitude D: M: S	Latitude D:M:S	Distance from Lal Kot	Present Settlement
1	Qila Rai Pithora near Lal-Kot	Prithvi Raj Chauhan	Upto 1192	3.40	77:10:58.799	28:31:51.817	0.00	–
2	Mehrauli	Qurtubuddin Ayibak	1192-1300	4.20	77:11:07.26	28:31:27.8	0.10	Mehrauli
3	Siri	Allaudin Khilji	1303-1321	1.70	77:13:00.306	28:34:21	4.40	HuazKhas
4	Tughluqabad,	Ghiyazudin Tughlak	1321-1325	2.20	77:15:37.550	28:31:33.227	7.70	
	Jahanpanah	Muhammad bin Tughlak	1325-1351	0.20	77:14:04.633	28:33:17.586	4.40

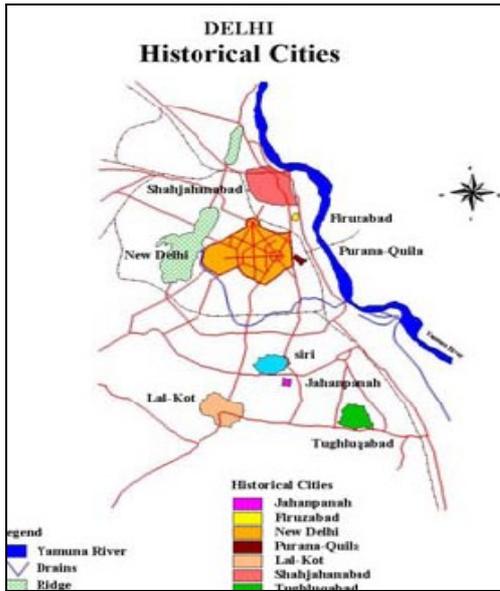

Fig 2. Location of Seven cities

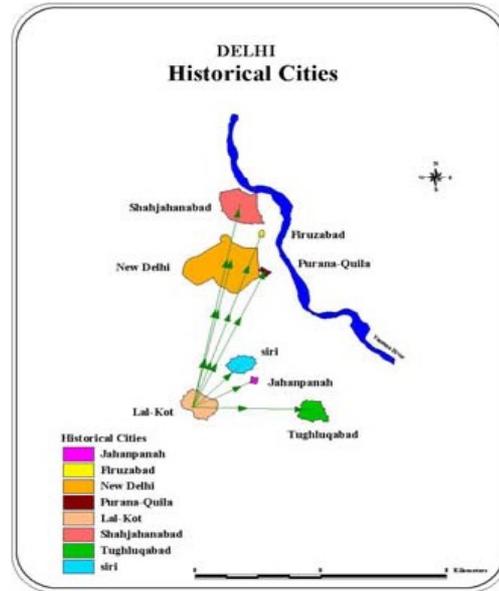

Fig3. Distance Of Seven Cities From Origin

Many of them, however, retain their Old-World characteristics. Due to fast urban sprawls

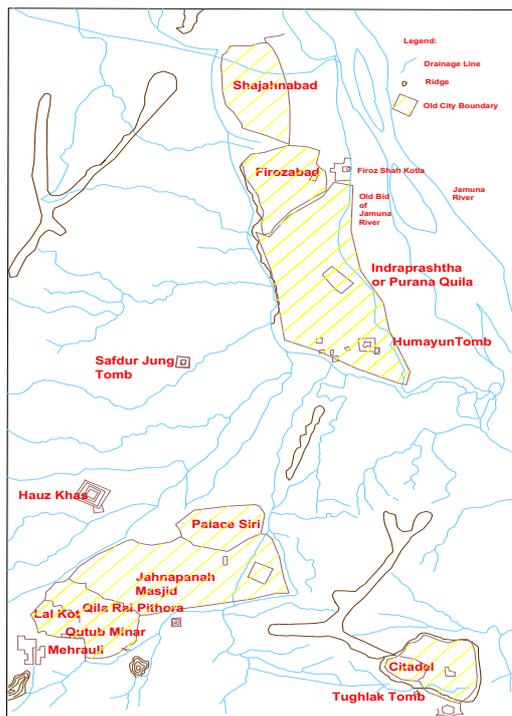

Fig 4: Extension of Ruins seven cities

and land use change, most of the cultural heritage sites are almost endangered by such changes in Delhi. The land-environment is under stress due to the fast pace of urbanisation. These spaces create spatial-social constructs that represent, invert or challenge real arrangements with their surroundings. Sustainable urban development, therefore, is the most important concern to the current urban environmental crisis for restoration and conservation of historical monuments and also cultural heritage sites along with city space in Delhi.

### Status of Heritage City space:

Now the question, the extent of this heritage space is Transgressive Space or Subversive Space or Abnormal Space or Deviant Space or Other Space or Topological Space or Chaotic Space or Nucleated Space or Disrupted Space or .....or only it is a point. Is there any other way to manage this?

#### ***1. Heritage City Space of Qila Rai Pithora:***

The 'first city' of Delhi dating to 10th century gets its recognition due to the availability of recorded historical facts. The core of the first of the seven cities was created by Anangpal Tomar who is said to have built LAL KOT. The Chauhan Rajput's Prithviraj III known as Rai Pithora extended Lal Kot, adding massive ramparts and gates, made ***Quila Rai Pithora***. The ruins of the fort are still partly visible in the area around Qutab Minar, though the city is known to have had several Hindu and Jain temples.

Fig 5. *Quila Rai Pithora*

Lal Kot was an oblong structure with seven gates – Land Sohna, Ranjit, Ghazni, Hauz Rani, Barka, Budaun and Maya. The Sohna gate, whose lake still attracts tourists is also supposed to have had a sun temple. The Maya gate was named after Jogmaya whose temple was greatly venerated by Anangpal II. The Hauz Rani, Barka and Budaun gates can still be traced, Today the walls of Lal Kot have been pierced by at least three roads leading to the Qutab. The tomb of Adham Khan in the background dwarfs its ruined walls claim to be the oldest fort city of Delhi. A conservation complex at Mehrauli now stands an 18th foot-high statue of Prithviraj Chauhan,

famous both in history and legend, for his chivalry only.

## 2. Heritage City Space of Mehrauli :

Prithviraj Chauhan was defeated by Mohammed Ghori in 1192, and left his slave Qutubuddin Aybak as his viceroy in India. In 1193, Qutubuddin Aybak captured Delhi and enthroned himself as the first sultan of Delhi a capital of Mamluk or the Slave dynasty, the first dynasty of Muslim sultans. Old settlement Dhellika turned into **Mehrauli**, by destroying Hindu temples and building Islamic structures in their place. One of these was the tower of victory - the 72.5 m tall

Qutab Minar, finally Around Qutab Minar are several

ruins from the 11th and 12<sup>th</sup> century, including the mausoleum of Saint Qutubuddin Bakhtiyar Kaki, Shamsi Talab, a mosque and tombs of rulers. The famous iron pillar near the Qutub Minar was commissioned by the emperor Kumara Gupta I of the Gupta dynasty (320-540) and transplanted to Delhi during the 10th century. Hauz-I-Shamsi is a

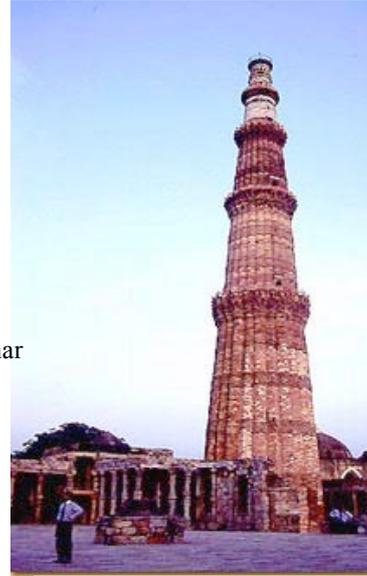

Fig 6: Qutab Minar

Fig 7: Iron Pillar in Mehrauli

Fig 8: Pillars

large tank that was built by Iltutmish on the outskirts of Mehrauli. The tank was supplied with rain water and the double storey pavilion could be reached only by boats when the

tank was at its brim. The existing domes pavilion, which rests on twelve pillars, is located near the southwestern corner of the tank. The hauz is on one side of the main market street and on the bank of the hauz is a 16<sup>th</sup> century structure perhaps built during the reign of the Lodi dynasty and known as the Jahaz Mahal. On the left side of the street is a Jharna, which takes care of the overflow from the tank. The well-known Phul Walon-ki-sair, which is held every year, begins from this Jharna. It is said that flower bedecked vans were taken to the Dargah Qutb Sahib and the Jogmaya for blessings. The main function is held at the Jahaz mahal. The festival was instituted in the 1720s as a tribute to the Mughal ruler from the flower sellers, both Hindu as well as Muslim of Mehrauli. Within the complex of the *urban village* of Mehrauli, are located a large number of baolis and other treasures that are associated with the glory of the Mughal era.

Due to the prospects of availability of jobs, education and better social and physical infrastructure facilities, low cost of living than urban Delhi influxes the rate of more migrants in alarming rate within this presently coined Heritage city as “urban village”. The total livable area is growing through horizontal expansion to vertical columnar structure. It carries multi purpose building in one plot, no open space, water channel is turned to solid waste dump site, inadequate of water supply causes under ground water depletion, lack of sewerage system storm water drainage used for sewerage,

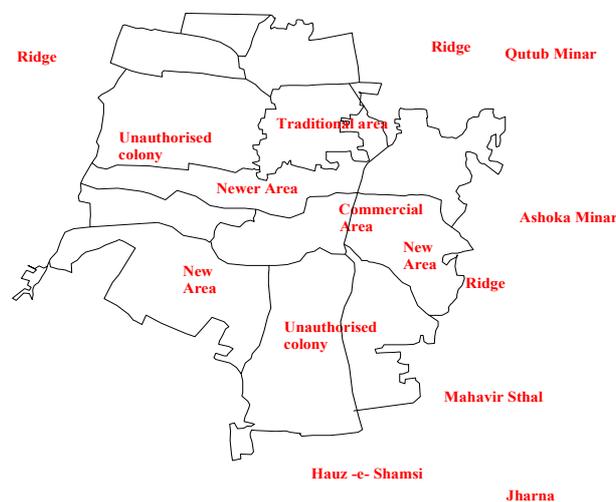

Fig 9: Map of Mehrauli

too. Even quality of water is poor. Back lane are become main access to house. Lack of implementation of planning practices in the city, haphazard development took place, overruling the environment onstrained, which has affected the potential natural resources of that area. It changes the character of Heritage space to urban space without access of urban fabric. Motor Service Centre is located near to Hauz -e-Shamsi. Even Sewrage and drainage Water are disposed off from Islam colony and Rana Colony to this Hauz-e-shamsi area. Unauthorised colony are Islam colony, Garwal colony, Rana Colony, St Joseph Colony, Church Colony .Main spine is occupied by commercial use. Kalu ram chawk is just behind the commercial area.

Heritage City	Present Area in Sq Km	Population	Threshold Analysis with respective to Population

### 3. Heritage City Space of Siri:

The ‘Slave’ dynasty was followed by the line of Khilji rulers. Allauddin Khilji created the third city of Delhi, Siri. The Saljuqian influences are the most remarkable feature in the buildings from this period. A large reservoir called Hauz Khas was another accomplishment of city of Siri. It was originally known as Hauz-i-Alai. Firoz Shah Tughlak re-excavated the silted tank A madrasa (college) was also created here by later rulers. Hauz Khas today is a complex of chic boutiques against the ruins of an ancient

Fig 12: Heritage city space is ruined

Fig 11: hauz-e ilahi

Fig 10: Heritage Site of Siri

Fort while Siri is represented by stretches of thick stonewalls and raised several buildings on its southern and eastern banks of royal tank. The enclosure wall is partly modern. A building of historical importance within this enclosure is the tomb, multi-storeyed wings, consisting of series of halls and chambers. Staircases lead down to the tank from the upper storey of the madrasa. One of the old entrances to the enclosure is from the west, now closed. The octagonal and square chattris standing here were built

as tombs over the graves possibly of teachers attached to the madrasa. Now Hauz Khas is one of a plan city space of modern Delhi but settlement termed as urban village. Old settlement now mingles with present grey shaped settlement, old fortified boundiery is converted now as backbone for poor housing.

#### 4. Heritage City Space of Tughlakabad

In the 1320s Ghiasuddin Tughlak invaded Delhi, won and gained kingdom. He created a fort here (the splendid ruins still remain). He also raised a city, Jahanpanah,

Fig 16: The walls which largely comprised a walled enclosure between Qila Rai Pithora and Siri. This is

Fig 14: Tomb of Tughlak

Fig 13: Ruined city of Tughlakabad

called the fourth city of Delhi. There were eleven rulers from the Tughlak dynasty but only the first three generations were interested in architecture-raising mosques, caravanserais, madrasas and laying canals Like Lal Kot, the crumbling walls of the fortress of Tughlakabad also make the rambler think They are thick walls and more rugged than the ones built later in Mughal times and one instinctively associates them with a tougher people of an age which was fiercer and less sophisticated. But therein lies the charm that distance in time provides. The walls of Tughlakabad are their crumbling

Fig 15: Bat cave in Tughlakabad

memorial and to view them is not only a visual experience but also something more than that. This place is now place of Army's camp and air force area. Area is well maintained.

### **5. Heritage City space of Firozabad:**

One of the Tughlak rulers, Firoze Tughlak created the fifth city of Delhi, Firozabad or Kotla Firoze Shah next to the river Yamuna. This was a large enclosure of high walls, containing palaces, pillared halls, mosques, a pigeon tower and a water tank with many step-wells, several gardens he laid. On the top of his palace, Firoze planted an Ashokan pillar from 1500 years ago. He also built several hunting lodges in and around Delhi, as well as mosques, some of which still remain. Apart from raising new buildings, Firoze Shah also repaired old ones, such as Sultan Ghori's Tomb, Qutub Minar, Suraj Kund and Hauz Khas. Today, Kotla Firoze Shah is famous for its sports stadium - a common venue for cricket matches. The Nizammuddin baoli also dates back to that time,

Fig 17: Firozabad

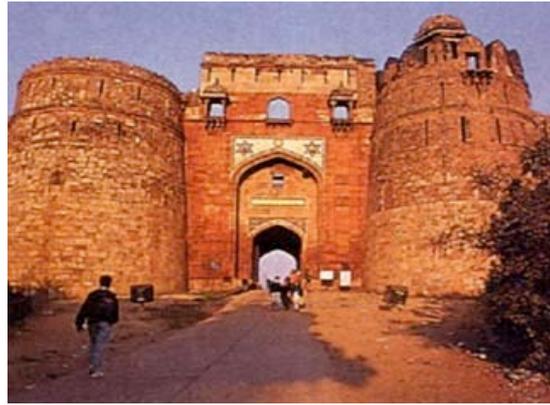

also the one near Saket. In fact, Lal Kuan, in the heart of the Walled City, too has a pre-Moghul baoli. Represent stretch of his city area. "Water flows from the step-well to the tank, as is usual with baolis." The Nizamuddin baoli, still in use.

In the old city, close to Manwari Begum-ka-Burj, a baoli was built during the reign of Feroz Tughlak. Another baoli of the time of Feroz Tughlak, a massive structure of rubble masonry was built some 50 years from Pir Ghalib near the Flagstaff Tower on the Ridge. It originally was encircled by a series of chambers, but these chambers have now practically disappeared. The whole city is now crunched with modern Delhi. Only pieces of land is left fallow is as mourn structure.

### **6. Heritage City Space of Shergarh; Purana quila**

What is known as the Purana Qila today, was the creation of Sher Shah when he wrested Delhi from Humayun in 1540, the second Mughal king. It was originally being

started building his own capital introducing ornate elements in architecture. Delhi was won back by Humayun not very many years later in 1555 and he completed parts of the

*Fig 19: Humayun Tomb*

*Fig 20: Beautiful octagonal structure in Quila*

Purana Qila left unfinished by Sher Shah. The ruins of Humayun and Sher Shah's creations are today a big tourist attraction. The beauty of the mosque lies in its architectural grandeur. White marble and bright red sandstone make for the center portion of the mosque. It is an octagonal building called Sher Mandal. After the building was recaptured by Humayun, the Mughal emperor converted it into his library. The Humayun Tomb lies just outside the gates Purana Qila. This old but wonderful fort has been a witness to some of the greatest events in the history of India. Its battle-scarred walls speak of the agony of defeat and joy of victory. It is a well-maintained archaeological site. The city space is beautifully weaved with old & new buildings. Near the Tomb, one side Mathura Road gives easy access to the place.

## 7. Heritage City Space of Shahjehanabad:

Humayun's grandson Shahjehan, the man who gave the Taj Mahal to the world, created the city of Shahjehanabad, the seventh city of Delhi - in the area that is now

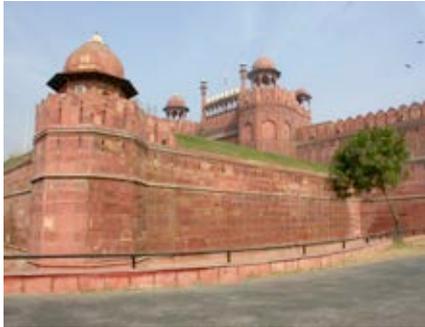

Fig 21: Fort wall of Lal Qila

Fig 22: Old layout of Shajahnabad

known as Old Delhi. The Jama Masjid and the Red Fort are two excellent examples of the architectural splendour of the 17<sup>th</sup> c. The red sandstone walls of Lal Qila, the Red Fort, extend for two km and vary in height from 18m on riverside to 33m on the city side.

Fig 23: Sketches of of Old Chandni Chawk

Fig 24: Present view of Chandni Chawk

When the emperor rode out on elephant-back into the streets of Old Delhi it was a display of pomp and power at its most. The intricate lanes of the 'walled city', its bazaars Chandni Chowk and way of living seem to exist in a time warp. These days the river is over one

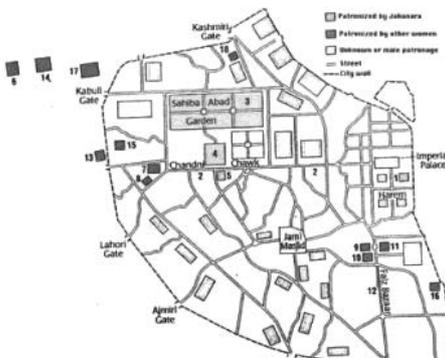

Fig 25: Map of Shahjahanabad

Fig 26: Hapazard building in Shahzanabad city space

km to the east and the moat remains empty. The need to construct water sources as seen in the presence of baolis, wells and tanks was a characteristic of the period of old city.

### **Critical Issues:**

Cities, by definition, are diverse, polymorphous and multi-layered. They have no essence, enjoy little stability and do not yield to precise boundaries. Flux, movements, flows, transgressions and intermeshing of forms are what characterize them. Such phenomenal increase in urban population resulting to the physical expansion of city like Delhi has caused a skewed pattern of development. The main issues are:

- Low rent & proximity to work center, facility of connectivity the day by day influx of population has exceeded the threshold of the area.
- Lack of fulfillment of needed supply leads to overexploitation of under ground water sources and inadequate disinfections of drinking water.
- There are no provisions for sewerage network. The septic tanks are used for each houses but division of plots and smaller size does not left space for it. As a result some places sewer are attached with storm water drainage.
- Lack of dhallao or garbage bin w.r.t population. No open space for abadi area.
- Due to additional bondage of population change the whole sole characteristics of the area. The existing social infrastructure does not cater the whole population. As a result of mismatch between need and supply.
- Illegal industries and other activities cause to air pollution, water pollution and noise pollution over the area and leads to poor quality of life.
- Gateway to heritage buildings leads the poor aesthetic view of heritage city space.
- Environmental potential areas are overlooked and un maintained.

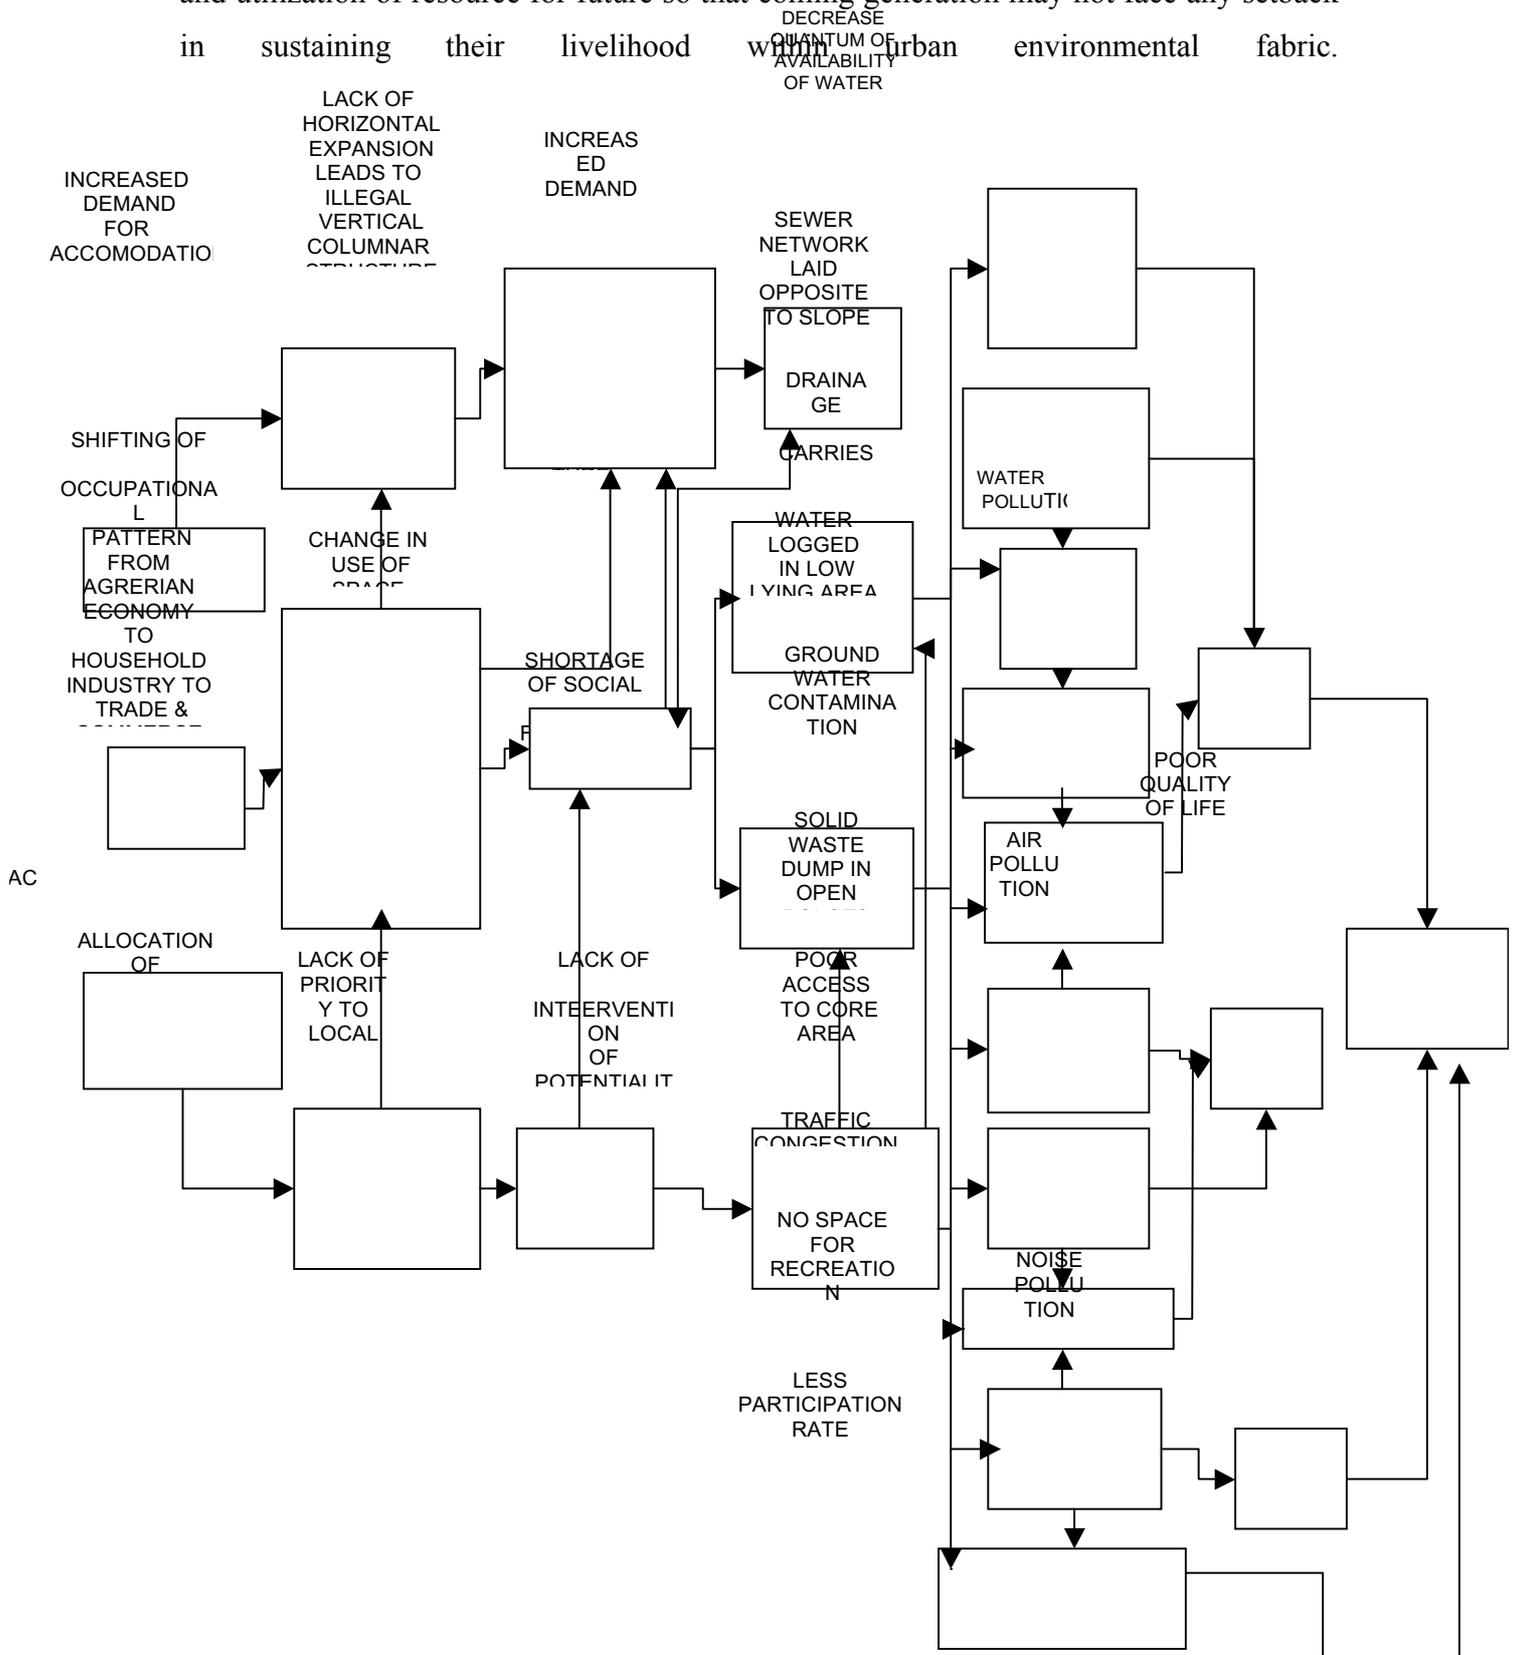

The size of heritage city has now become a hugesettlement. People are living in dark space. Human life deemed unworthy of assuming the title of ‘heritage’ is sacrificed at the

altar of formalist aesthetics. It is heritage that ultimately suffers; it is truncated. Therefore, there is emergent need for an environmental management plan for this heritage city-space, which would aim to maintain the balance growth between environmental assets

Fig 27: City at a Glance

and utilization of resource for future so that coming generation may not face any setback in sustaining their livelihood within urban environmental fabric.

- Delineation of area of along with Heritage Core and buffer zone site execution plan.
- Identification of Resource potentiality of City Space

**Proposal for Management Plan** which embraces the site of

heritage building  
 Human life deemed unworthy of assuming the title of 'heritage' is sacrificed at the altar of formalist aesthetics. It is heritage that ultimately suffers; it is truncated. Detailed Master plan of this Area and frame out

**DEVELOPMENT OF HERITAGE CITY SPACE**  
 However, the combined evaluation of all parameter shows that this area is beyond the supportive capacity of the area. So, there is need to sustain the area through the help of assimilative capacity building. The proposal for management of the area has to be done by three fold:

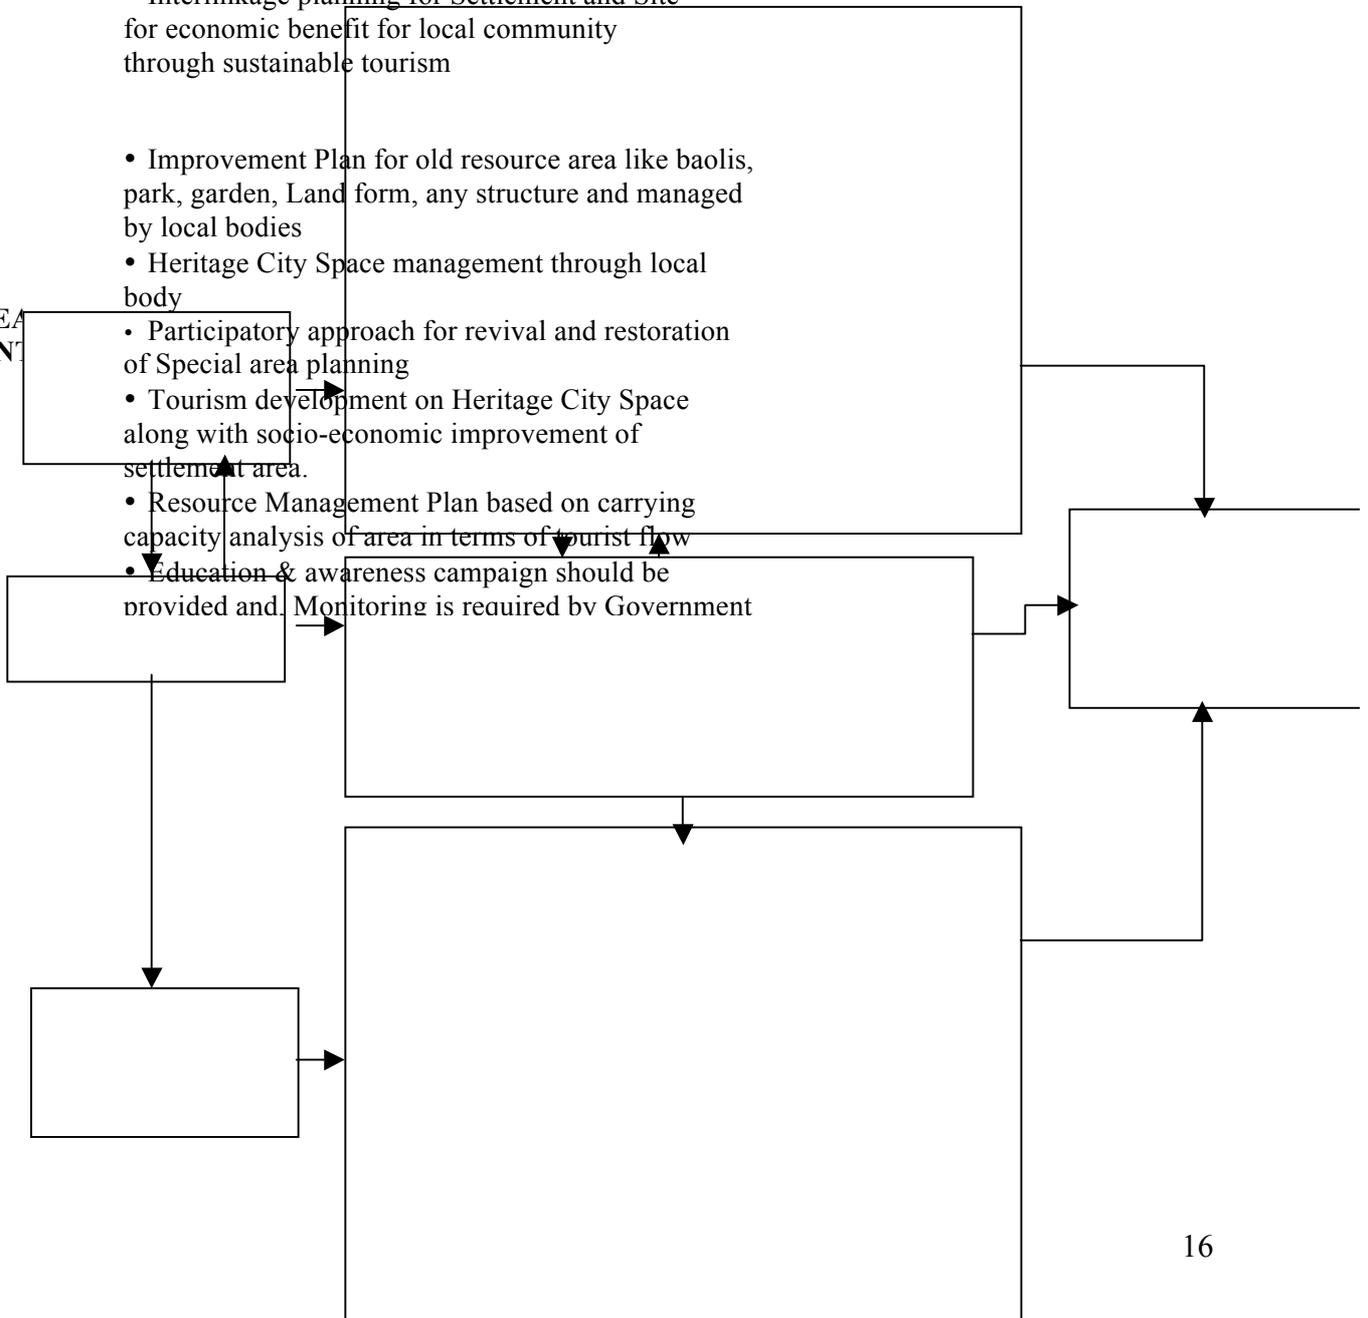

**PROPOSED LAND USE PLAN**

- Strategy planning for whole area
  - Detailed land use plan for entire settlement
  - Revival of Land use pattern
  - Proposed land use plan
  - Corridor management plan for Heritage Space
  - Special Area Management Plan
  - Interlinkage planning for Settlement and Site
- for economic benefit for local community through sustainable tourism

**ENVIRONMENTAL MANAGEMENT PLAN OF HERITAGE CITY SPACE**

**SPECIAL AREA MANAGEMENT PLAN**

- Improvement Plan for old resource area like baolis, park, garden, Land form, any structure and managed by local bodies
- Heritage City Space management through local body
- Participatory approach for revival and restoration of Special area planning
- Tourism development on Heritage City Space along with socio-economic improvement of settlement area.
- Resource Management Plan based on carrying capacity analysis of area in terms of tourist flow
- Education & awareness campaign should be provided and Monitoring is required by Government

**The *glocal* planning of Rio's port zone: from the Guggenheim-Rio to the Cidade do Samba.**

*"Innumerable port cities worldwide present well succeeded projects of revitalization of their old docks for new uses of leisure, offices, commerce, culture and residence. London, Baltimore, New York, Buenos Aires, Barcelona. Why not Rio ?"*<sup>1</sup>

Thus, related to the international experience of urban projects and also to the residential and transport local deficit, Rio de Janeiro's port region was presented, together with the center of the city, as priority 1<sup>st</sup> by the Secretary of Urbanism, in January 2001. By the end of this same year, the Project Port of Rio, elaborated by the municipal urban planning institute, was presented to the public in an exhibition at the Center of Arts and Architecture, together with images and texts about the redevelopment of the ports of Genoa, London, Boston, Baltimore, New York, Buenos Aires, Lisbon, Barcelona and Belém do Pará, in Brazil, as well as with eight projects created by local architects and urban planners, all introduced by a text entitled "*Port of Rio: Mill of Dreams*" written by the Secretary. By then, the City Hall was already negotiating with the Guggenheim Museum's former director, Thomas Krens, and the French architect Jean Nouvel a franchise project to be constructed at Pier Mauá.

The present paper compares peculiar aspects of the mentioned ports and discusses the clash and eventual merger of global planning models – urban project and strategic planning, Agenda 21, Agenda Habitat, public-private development agencies, heritage marketing and museums, teleports and intelligent offices, festival malls and theme parks, Olympic villas and loft living etc - with Rio's identity, its planning traditions, political culture and characteristic public spaces' sociability.

**Why not Rio ?**

If that would be the announcement of a Master Plan of the 70's and not of an Urban Project of redevelopment which is part of a strategic plan of the beginning of the XXI st. century, the official reference to global experiences would not have been so explicit and emphasized. While the master plans that followed the model of the National Service for Residence and Urbanism (SERPHAU), said "total plans", were part of the big

---

<sup>1</sup> Proposals for the urban management during the period 2001-2004 – Communication Sirkis - 15/01/2001 at <http://www2.sirkis.com.br/noticia.kmf?noticia=4740978&canal=257&total=24&indice=20>

national-developmental plans and justified expansionist needs in metropolitan scale, the projects for the restructuring of neighborhoods (PEUs), elaborated since 1988, the more punctual, the more global oriented they seem to be. London, Baltimore, Boston, New York, Genoa, Barcelona, Lisbon, Buenos Aires: *"Think global, plan local"*, seems to be the slogan of the 'new age' urbanism. As if the transplanting to Rio's port zone of something similar to the high-class enclaves of Battery Park City, Docklands and its Canary Wharf of New York and London, respectively 1<sup>st</sup> and 2<sup>nd</sup> on the ranking of the global-cities, could by itself make retreat and detain the derivative capitals which, in 2000, have closed the local stock market, agonizing since the beginning of the National Program for Privatizing, in 1991.<sup>2</sup> Or as if the admirable public spaces and the Olympic Park built by the socialist municipality of Barcelona, a city with approximately only 1,7 million inhabitants, once they were transplanted to Rio would transform it into a 'compact' city, with industries connected to the rest of the south continent and residences available for all its citizens.

Still in contrast to the 70's master plan, of which the ideological premises were very well analyzed by Flávio Villaça<sup>3</sup>, because its territorial ordaining proposals included broad social-economic diagnostics and innumerable recommendations for implementation of collective equipments, but never presented pre-defined budgets and timetables for execution; the strategic plan is not a speech-plan to be filed only. It is a marketing oriented plan to be executed. Nevertheless, it tends to be a ritual-plan, as Antonio Heliodoro Lima Sampaio<sup>4</sup> remarked, because although its objectives are supposedly compacted between the different governmental and non-governmental stakeholders, this participation is often ritually simulated. In this sense, the strategic plan and the urban project also differ from the participatory budget, pioneered by the city of Porto Alegre in the south of Brazil, which is not voted by the City Hall technicians. Those are allowed only to advise the counselors elected by each city's region in deciding about the new investments at the Participative Budget Council. The urban project also differs from the new master plan, which every municipal chamber in

---

<sup>2</sup> The privatizing of the port of Rio was enacted by Federal Law in 1993, but effectively it occurred only 1997, when the terminals were leased by concession contracts lasting for 25 years, in consortium with the Banco do Brasil.

<sup>3</sup> Villaça, Flávio – "A contribution to the history of urban planning in Brazil", in Deak, C & Schiffer, S. *"The process of urbanization in Brazil"*, São Paulo, Edusp/Fupam, 1999.

<sup>4</sup> Sampaio, Antonio Heliodoro Lima – *"Master and Strategic Plans: from the old myths to the new rites"*, X National Meeting of ANPUR (National Post Graduate Association of Research in Urban and Regional Planning)

Brazil will have to approve by October 2006, because it is not a conclusive and normative plan, but only indicative. In brief, it is an open territorial pact.<sup>5</sup>

In Rio de Janeiro, the strategic planning was used for the first time in 1995, as a complement to the master plan, and it “*envisaged to consolidate the city as an entrepreneurial and competitive metropolis, capable to be a business center for the country and the world*”, by means of seven strategies which would unfold themselves into 159 projects of the municipal administration.<sup>6</sup> In order to implement those strategies a variant of the Delphos method, developed by Rand Corporation, was used for marketing and perspectives. According to this method, a coordinator communicates with specialists about a certain problem and these mail back their answers, which are crossed. It is not necessary that people meet and get to know each other. Looking forward to include entrepreneurs, universities, NGOs, social movements and the three levels of government, about 800 people are said to have participated of the process in Rio. In this occasion, it was created the Municipal Council of Urban Politics – COMPUR, which is composed by 4 professional urban planning entities, 4 entrepreneurial entities, 4 communitarian entities, the Chamber of Aldermen and 13 municipal institutions. The sponsoring for elaborating and maintaining the Council is done by Rio de Janeiro’s Commercial Association, Industrial Federation, the City Hall and 40 public and private enterprises. The Strategic Plan has divided the city into 12 “cities of the city”, among which is the center, where the port zone is located. The port zone is composed by the neighborhoods of Cajú, Gamboa, Santo Cristo and Saúde, amounting to 8,4 km and 39.973 inhabitants, one of the lowest population densities of the city.<sup>7</sup>

On the other hand, according to the recommendations of Agenda 21 and Agenda Habitat, supposedly the good side of globalization, the more compact and polycentric is a city ( high density + mixed use + shorter distances, by means of public transport interconnecting the sub-centers and of pedestrian and cyclist lanes ) the more participative its managing may become, that is, more comprehensively negotiated and compacted. Logically, it follows that the cleaner and more echo-energetic is the city, the more sustainable and durable it will be.<sup>8</sup> Thus, the displacement of the shipment of

<sup>8</sup> THE EARTH SUMMIT AND AGENDA 21- general view base don the article “*The Earth Summit's Agenda for Change*”, Michael Keating in the Earth Summit Times, September 1992,published by the Centre for Our Common Future.

SUSTAINABLE CITIES – Subsidies to the elaboration of the Brazilian Agenda 21 – Ministry of Environment/ Project 1- BRA/94/016 – Brasília, 2000.

bin – coal, iron, soy etc, that is, the ‘dirty cargo’ – from the intra-urban territory to the metropolitan territory with the inauguration of the new port of Sepetiba, in 1982, and the specialization of the Port of Rio in the transshipment of iron and steel products and cars, the ‘clean cargo’, was opportune to the model of Agenda 21’s sustainable development.

Theoretically, this displacement, which has also occurred in the main city-ports worldwide, was caused and made viable, at last instance, by technological changes, that is, by the telecommunication and informatics revolution, by containerized cargo and fast stocking, ships’ automation and specialized terminals. In the new global economy, with the rise of new industrial centers of high-tech products and the concentration of financial transactions in a limited number of metropolis, the new port is a ‘logistic hub’, not only a place where freights are transported to and forth, but a place from where the total flow of commodities inside a country or a region is coordinated and conducted. In many port cities, the boom of activities in the immediate surroundings of airports and railway junctions, since 1980, testify to the importance of small and medium businesses around the ‘electronic port’. The necessity to restore the classic public domain to boost economic development is another characteristic of this phase, as Han Meyer observed.<sup>9</sup>

Thus, the dislocation of part of the port to Sepetiba and part to the extremity of the Cajú neighborhood, also served the “agenda” of the real-estate capitals’ gentrifying plans, because it liberated the old port, its obsolete quays, wharfs and railways’ patios to speculations about new investments in connection to the retake of the old centrality, disinvested since the 70’s due to the urbanization of Barra da Tijuca, a new neighborhood by the seashore in the opposite direction.<sup>10</sup>

### **Collage City = consumption + offices + housing**

Nevertheless, before analyzing the project Port of Rio from the City Hall, presented in 2001 as an ‘urban project’, it is important to trace the origins of this planning concept and its evolution. The concept of ‘urban project’ as a project of limited dimension,

<sup>10</sup> About the hypothesis that disinvestment and gentrification are often the two sides of the same coin, see Smith, Neil – *“The New Frontier: Gentrification and the Revanchist City”*, (1996) Routledge, London and New York, 2002.

About Rio’s urban schizophrenia, divided between investments in the expansion and dispersion of the city and in the revitalization proposals for the central areas, see Moreira, Clarissa da Costa – *Contemporary City between the tabula rasa and preservation: sceneries for the Port of Rio de Janeiro*, São Paulo: Editora UNESP, 2004.

conceived as an architectural-urban ensemble, within a relatively short span of time, and of strategic importance to the renovation of great urban areas, was introduced in New York, during the 70's, inspired upon the megaprojects of the architect and developer Portman: *Embarcadero Center* in San Francisco, *Renaissance Center* in Detroit, *Peachtree Center* in Atlanta. Those projects have done in the interior of the city what only Disney had done beforehand outside the city and they included an arsenal of programs – department stores, supermarkets, hotels, restaurants, accommodations for congresses, apartments and parking – which neglected the surroundings and generated fast profit. The urban project has found its theoretical founding in the concept of “collage-city” by Colin Rowe, which employs the technique of collage as a strategy that enables urban utopias to be dealt as fragmented images and not *in toto*, emphasizing the morphology of buildings to reach special coherence. The urban project became viable in New York after the approval of the law of public-private partnership, by the end of the 70's, when it was created the Battery Park City Authority, an entity which incorporated and managed the redevelopment of the west side of the south of the island of Manhattan, at the shore of the Hudson River, where innumerable piers were once located.<sup>11</sup>

In the beginning, New York's City Hall was looking for a project that would express a relationship between the new district and the rest of Manhattan; while the Battery Park City Authority searched a project which emphasized exclusivity and security, similar to the suburbs. The proposed plan included a representation of monumental public spaces from the XIX th century, squares and parks. But, once the Westway was maintained, a barrier was formed between the Lower Manhattan and Battery Park City, stressing the enterprise's characterization as an enclave. Moreover, the side turned to the city has no commerce at all, the shops are turned instead to the interior, to the seaside. The office buildings were incorporated by the Canadian firm Olympia & York and the 700.000 m<sup>2</sup> of office space and 20.000 m<sup>2</sup> of retail space of the World Financial Center, the 4 towers designed by César Pelli, together with its 12.000 apartments of the Battery City Park created 30.000 jobs and saved the City Hall of bankruptcy. The 600 million dollars invested attracted 4 billion dollars of private investors, that is, 7 times the initial amount, generating extra taxes which were invested in social housing projects in other places of the city.

### ***Fun City* = leisure + culture + consumption**

---

<sup>11</sup> Meyer, Han – *op.cit* - chapter 4 - *The North American Port City: New York, a boundless urban landscape*.

On the other hand, the South Street Seaport of New York, developed by the same impresario of the Baltimore and Boston's harborfronts, the Rouse Company, whose formula *'cities are fun'* to undue guettos consist of turning downtowns attractive to whites again and opening the suburbs to blacks; was not undertaken as in Baltimore, where conditional contracts guaranteed the provision of employment, housing and public facilities to the local population, and thus did not avoid eviction of houses, studios and small businesses. The fish market, the museum-ships, the shopping malls and restaurants formed a cardboard enclave of leisure to tourists and workers of the financial district of Manhattan that live in the suburbs and commute daily.<sup>12</sup>

While piers and molls are typical of North-American ports, the European ports use berths and basins with embarking and disembarking quays, and this explains why the majority of the port renewals in the US begin by the piers. The Port of Rio, though, built in the beginning of the XXth century, by an English company, has only one pier throughout its 6.740 m long continuous quays. Therefore, it is very significant that the majority of the redevelopment projects for the port of Rio have been designed for the Pier Mauá, inaugurated in 1952: Teleport – 1985; Project Pier Mauá – 1993; International Center of Water and Sea – 1994; Mauá Tourist Pole – 1994; Project of Docas Company and Engepasa Consortium – 1996; Rio Third Millennium – 1997 and the project Guggenheim Rio by architect Jean Nouvel – 2002, among others.

The one-track mindset was that the redevelopment should start there, near the Mauá Square, the spectacularity of which is being nostalgically rescued from the 40's and celebrated, in contiguity to the business center. Afterwards, the revitalization would follow towards the other quays and warehouses that are being liberated step by step as the containerized activities are being concentrated at Cajú's extremity.

*"Because it is logical: one cannot start from where it is degraded, nor start from the middle; the Mauá Square is a little better, it has already the new building Rio Branco nº 1. Therefore, if you start from here it will become a virtuous circle. If you make a renewal of the Mauá Pier, you will value the warehouses 1,2 and 3. Then, you will make an intervention. Because you need to attract the private investor and he will not put money to open a restaurant like of the Pier 17[ in NY] here in the middle of the slum because nobody will go. To put a theater here, it will not work (...) This Mauá Pier was used to embark steel, which was the principal cargo of the port. But steel is too heavy and, in 1992, an engineer from Docas Co. was doing a routine inspection when he found that the stakes were broken. There is a film showing this. It's amazing. This is a concrete structure supported by stakes (...) The stakes were being devoured and a diver was hired. He then saw the following: suppose that 100 stakes were broken, 10 beheaded and 200 were good. Sixty days afterwards, he would dive again and find that already 20 were beheaded*

---

<sup>12</sup> idem

and 150 were broken. So, the pier was going to tumble down, fall apart. The port concluded then that it could not continue to operate on it and, in 1993, came to Cajú. What was the logic of Docas Co ? Whenever I would dispose of an area, I would hand it to revitalization, generate money with this and invest in another area of the port, so that I may liberate a new area and so on. Therefore, at that moment, due to a physical problem, the port could liberate an ideal area to revitalization which was the Mauá Pier, from which the whole process would start. Of course, the pier was condemned only for ship anchorage and loading and unloading but not for sustaining weight under its the platform. Did you follow my argument ?”<sup>13</sup>

It is also significant that the majority of the proposed projects fit in the model ‘*cities are fun*’, privileging the leisure function, ‘culturalization’ and consumption. There was no lack of suggestions for aquariums, marines, squares for events and shows, acoustic shells, geodes, theaters, movie theaters, maritime museums with wrecked ships, submersed forests, art and historical museums, museum of precious stones and of carnival, and promenades and waterfronts with restaurants, bars, shops and hotels. These megaprojects, hedonistic enclaves with its backs turned to the poor neighborhoods and slums of the port region, would transform the Mauá Pier in a legitimate thematic park. One may say that its creators have learned very well the lessons of Disney World: to beautify differences, clean the conflicts, maintain fear under control, represent fictitious narratives of social identities and of the real history of citizens, encourage consumption, create jobs and generate income by the multiplication of sponsorships, concessions, partnerships and rights of exploitation and, above all, to create a public space managed by private administration.<sup>14</sup>

### **Business City = industry + habitation + offices + consumption + leisure**

A second urban project model, of which the slogan could be “*cities are serious*” is the redevelopment of London’s Docklands which, in connection to the Euro Tunnel, was considered, by Margaret Thatcher’s conservative party that came to power in 1980, a solution to the battle between the metropolises for the financial leadership of the European Union. Decreed a national interest area, its redevelopment was given in charge to London Docklands Development Corporation ( LDDC ), which answered directly to the federal government, received only advises from the 32 representatives of London’s neighborhoods and had all its meetings closed to the public. Between 1981 and 1985, LDDC had a budget of 700 million pounds and in 1983 it developed a plan that balanced high-tech industries inside the basins, restored the historical axis of Greenwich and privatized the Docks and the plots along the Tames river. Nevertheless, unsatisfied with the results of this plan, LDDC created the “enterprises zones”,

<sup>13</sup> Interview with the president of a maritime transport firm in 16/03/2005. Luís Henrique Carneiro — President of Multiterminais Rio.

<sup>14</sup> See Zukin, Sharon - “*Learning with Disney World*” translation in Revista Espaço & Debates, nº 43-44, jan e dez 2003.

sufficiently regulated in terms of design, volume and height of the buildings in order not to allow the polluting and dangerous industries to install themselves there and, at the same time, deregulated enough to attract investments by the light industries, 50% of which were, moreover, subsidized during 10 years. Newspapers, graphic industries, wholesale firms, mounting industries, distribution offices and transport companies were installed in these zones, specially at the Island of Dogs, causing unemployment in the old industries and promoting downsizing in the new which profited the opportunity to diminish the number of their employees. Another strategy of LDDC was to invest in spectacular transport links: the Dockland Light Railway, an elevated automatic subway, the STOL airport for international jets and a fast ferry connection to the City. On the other hand, the production of 17.000 residences, from 1981 to 1991, more than doubled the population of Docklands and the construction around the docks in the traditional style of the 'squares' of the West End was highly regulated in terms of typology, lot implantation, height, materials, colors and open spaces, characterizing those residential areas as exclusive and closed. Because of this, up to 1988, the residential projects were inhabited by "speculator-nomads". Nevertheless, afterwards, the local residents of East End were offered a special amortization system which made possible that 50% of the occupation was done by them. Even then, although there are nowadays more diversity of social-cultural groups, of economic activities and income categories, the different fragments still remain isolated from each other, at Docklands. The third stage of rehabilitation was the establishment of a new centrality, the Canary Wharf at the old West India Docks. By mid 80's, the annual rents of the City averaged 600 pounds per m<sup>2</sup>, the double of the amount demanded at the businesses offices complexes in Docklands. After the 1986 stock-market crash, the Canadian Olympia & York, the same which had developed Battery Park City, took over the entrepreneurship and made a new plan, designed by Skidmore, Owings and Merrill, with 418.000 m<sup>2</sup> of office spaces combined with public spaces of the kind that were being experimented in the US. But, in 1992, after having invested 3 billion dollars and constructed 70% of the offices of which only 40% was occupied, Olympia & York went bankrupt. And, as one of the explanations given for the "débâcle" was the lack of adequate public transport, LDDC decided to construct a new extension to the east of the Jubilee subway line, a station at the center of the Canary Wharf as well as big open spaces, parks, waterways and basins, Westferry Circus excelling. In order to undertake these projects, a bank consortium was formed, the Canary Warf Ltd. By the end of the 90's, the industries located on the enterprise zones which originated the Docklands strategy,

were considered inappropriate for the area of London's new center and there were cogitations to destruct them.<sup>15</sup> In 1998, LDDC, as it was foreseen, was liquidated and, in 1999, the group Canary Warf floated in London's stock market. In 2002, the construction of the Jubilee Place Retail Mall started, its 963 m<sup>2</sup> will sum up to 6.727 m<sup>2</sup> the total retail area at Canary Warf. Also, in 2002, the total working population was of 55.000 people and it was estimated that the whole cost of the entrepreneurship amounted to 20 billion dollars.<sup>16</sup>

### **Public City = regional transport plan + public spaces + residences**

The revitalization of Barcelona's port area, in its turn, was a consequence of a metropolitan general plan to provide traffic infrastructure for the new tax-free industrial zone, connecting it by a belt from the airport to the north, in the direction of France and the rest of Europe. The plan of the socialist municipality of Barcelona emerged from the necessity to create connections between this transport structure of the plan of the Generalitat de Catalunya and the form of the city and its districts. And also from the need to create new public spaces that could gather again the free citizens, after dictator Franco's death, in 1976. The challenge was to maintain the city compact and to avoid evasion of Barcelona's population. Therefore, we may nickname this model as "*cities are public*". Between 1980 e 1983, 62 % of the municipal budget was invested in public works. The urbanism of La Ribera was based in the importance of cultural cartography, geomorphology and topography of the territory more than in the architecture of the buildings in order to create a sense of recognition and admiration of the regional characteristics. Its creator, Manuel de Solà-Morales has emphasized the intermediary scale of the urban project, that is, specific solutions negotiated between the interventions of large and the topographic and historical context. "From plan to project" was the slogan of this approach, which searched the regeneration of diverse surroundings and a demographic equilibrium, by means of the initiative of its own residents. The projects were divided between elements directly linked to the highly public domain of the main transport infrastructure, expressed by the use of stone, and the social domain of the surroundings, expressed in the layout of the parks and gardens with sportive, educational and cultural communitarian equipments. This duality of the public and the social domains is one of the landmarks which distinguish the Barcelonese public space, from Cerdà up to the 80's.

---

<sup>15</sup> Meyer, Han – op. cit. Capt. 2 -The English Port City: London and the Wonder of Docklands – item 4 – The New Course.

<sup>16</sup> <http://www.canarywharf.com/mainFrm1.asp?strSelectedArea=History>

From the start, the waterfront was considered the most explicit characteristic of the city and the nucleus of the main engineering works. However, during the second half of the 80's, when Juan Busquets substituted Bohigas as supervisor of the department of urban planning, the focus became less the accessibility of the historical center and its seafront and more the interconnection between new areas of centrality. With this change, the pressure to implant high-rise office buildings diminished and only the Diagonal Avenue received a program of commercial offices. In the historical port and the old industrial zone, the emphasis was given to the leisure quality of the waterfront which had to be integrated to the new belt of 12 traffic lanes where 120.000 vehicles would circulate daily. In the revitalized port's waterfront, a series of cafés, restaurants, beaches, aquariums and boat stations were installed. Tunnels below the earth created high and medium zones forming a balcony with view to the sea, an esplanade of 75 m width above an arcade through which a traffic artery passes and where the parkings are located. The industrial area was transformed for residential use and for hotels. After the 1992 Olympic Games, the port authority accepted a proposal by The Rose Company to establish one of its "fun cities" in a pier, with shops, restaurants, aquarium and movie theaters. This has obstructed the view and has destructed the unity between the Moll of Spain and the Barceloneta, besides having created a traffic Gordian knot. In Barceloneta, the port authority has decided to attribute public functions to the warehouses of the quays - markets, libraries, ministries – and removed the *chiriquitos*, illegal barracks on the beach which used to characterize it as a periphery neighborhood. In their place now it is an area paved with natural stones which mark the transition between the beach and the street, which ends in a wood sidewalk along the waterfront.

The urban project for the Olympic Villa was done by Bohigas' office to accommodate 2.500 apartments, 60.000 m<sup>2</sup> of office space and 185.000 m<sup>2</sup> of facilities. After the removal of the industries located at Poble Nou, the train rails and the cars' belt were mostly located in the interior of a tunnel. At the waterfront were located the parks, a boulevard and two towers in the axis of the main street. On the embankment, superblocs were built with a series of modern buildings of free typology, aligned by the streets, and with suburban houses, small towers and classic crescents in their interior. The result was very criticized, though, because since the tunnel was not entirely constructed, a dike of 2 m was formed between the Olympic Villa and the sea, obstructing the view. Moreover, the seven avenues which cut the superblocs in the direction of the sea transformed the internal areas into public areas alike the streets,

and this has damaged the possibility of a social domain of peace and security distinguished from the public domain, as is distinguished in the Cerdá plan.

### **Event-City = leisure + culture**

The Lisbon Expo 98 Park, alike Barcelona's Olympic Villa, has profited of the opportunity of an international event to revitalize the port area by means of posterior use of the traditionally temporary and spectacular buildings of international fairs : exhibition pavilions, museums, sea-aquarium, marina, gymnasium, convention center and administrative buildings.

The proceeding of anchoring urban rehabilitation projects in leisure, entertainment and cultural facilities has been exerting a strong influence in the urban project of Rio's port and in the city's strategic planning as whole. Another model, stemming from a more sophisticated cultural background than Disneyfication, the 'event-city' as formulated by the architect Bernard Tschumi, author of the deconstructivist manifest *Parc de la Villette*<sup>17</sup>, has been merged in Rio with the 'fun-city' model.

Although the deconstructivists were great admirers of the situationists and their ludic city, they do not partake of the utopian ideals of the International Situationist (1957-1974), founded by Guy Debord, of an unitarian urbanism of which "The New Babylon" conceived by Constant is the most complete expression.<sup>18</sup> Instead, the deconstructivists presuppose that an urbanity based on unity and harmony and an architecture founded on the synthesis of form and function, as in the modern movement, are not possible anymore in contemporaneity. Therefore, they rather express the fragmentation and generalized social and cultural dispersion by means of formal deconstruction. From the urbanistic standpoint, their projects do not differ much from the late modern megastructures in that they are also enclosed in relation to the surroundings. Nor they surrender to the post-modernist contextualist approach which envisages the regenerative contamination. The case of the Park de La Villette is emblematic because in his 'hortus inconclusus', Tschumi has deliberately refused to take into consideration its context and in order to compensate for the "invisible wall", for years the government had to heavily subsidize a special multicultural and popular programming before it could attract the local residents, workers and immigrants that live in that fringe between Paris and the suburbs, and who did not understand, at first, the non-sense of the 'folies' with no pre-defined functions and over which they were

<sup>18</sup> Ver Debord, Guy -Ernest - "Society of Spectacle" (1967), Ed. Contraponto, RJ, 2000 e Constant "New Babylon" (1974) in [www.situationist.cjb.net](http://www.situationist.cjb.net)

supposed to project their own desires. Nowadays, though, the park is always full of citizens of science and music.

The architect of the Cité de la Musique of the Parc de la Villette, Christian de Portzamparc, is also the author of the City of Music at Rio's new neighbourhood Barra da Tijuca. The City Hall liked so much the concept of 'event-city' that it already inaugurated two of them: the City of Children, in Santa Cruz, and the City of Samba, at the port region. Nevertheless, the two projects have a clear Disneyfied configuration and do not present a potential for surprising events as in Tschumi's own event-cities.

### ***Spectacle City: the "Factory of Dreams"***

*"The spectacle presents itself at the same time as society itself, as part of society, and as an instrument of unification. While part of society, the spectacle is expressively the sector which concentrates all the sight and all the conscience. Due to the fact that this sector is separated, it is the place of the deluded sight and false conscience; and the unification which it realizes is no more than an official language of the generalized separation."* - Guy -Ernest Debord <sup>19</sup>

The City of Samba is of exclusive use of the carnival workers of the 14 warehouses of the best schools of samba, elected each Carnival. In the near future, tourists will be able to watch small parades and shows in its internal square, where there are food and beverage kiosks under tensed canvas. Seen from above and from outside, though, the City of Samba seems to be entirely accessible, a public space, indeed. Its form is a "glocal" hybrid : a star like the baroque ideal-city which inspired Disneyland, but broken into fragments as in Libeskind's deconstructivist style. Its warehouses' structure hesitates between that of typical XIX th c. port warehouses and that of movie and tv settings which simulate the barns and stables of the old farwest farms and villages. Inside them, the industrial production of carnival is fordist, with mechanic tracks and cranes to transport the pieces and fantasies which compose the huge allegoric cars that parade in Sambódromo, the special carnival avenue. However, the wages of the carnival workers that come and go daily from the slums to the City of Samba cannot allow them to afford any real car, as in the system idealized by Henry Ford.

The City of Samba itself was a surprising event in the strategic planning of the city of Rio de Janeiro. Back in 2001, nobody could have ever imagined that the urban project of the franchise-museum Guggenheim-Rio would literally disappear from the horizon of the Guanabara Bay and give place, instead, to a home-made City of Samba. The project by Jean Nouvel was designed for the Pier Mauá, not far from the historical and business city center and close to the tourists' ships embarkment station. The museum

---

<sup>19</sup> Debord, Guy -Ernest – op. cit. chapter 1, "The unfinished separation", item 3.

would accommodate itinerant exhibits from the collections of the Guggenheim museums as well from the Kunsthistorish Museum/Vienna and in the contract a new collection of Latin American art should be acquired by Rio's City Hall. The administration of the museum would be carried out by a Society of Friends of the Museum under the Guggenheim's administration supervision. Jean Nouvel's aesthetics of disappearance was expressed in the submerge museum and in a sinking fantastic tropical forest as well as in a huge panel that would separate the pier from the "disappearing" poor neighborhoods of the port.

The artistic class was divided, but there were many manifestations against the Gugg-Rio from the part of museums administrators and civil servants which complained that the city had already enough good museums that lacked financial support for conservation and for new acquisitions for their collections. Finally, the Aldermen Chamber embargoed the contract between the City Hall and the Guggenheim, alleging that the construction of the museum and the acquisition of new collections would seriously compromise future administrations' revenues. Therefore, after the re-elections, in 2003, the City Hall bought from the Federal Railroad Company the area of the former maritime railroad courtyard and began the construction of the City of Samba and of the Gamboa Olympic Villa. This terrain was the biggest public terrain in the port region and is located in the middle of it. The project of the Cidade do Samba was idealized by LIESA, the league of the best schools of samba, to be a "Carnival Disney" and the City Hall invested approximately R\$ 120 million in its construction and will still invest more in the construction of a virtual museum of carnival.<sup>20</sup>

Let us agree: this was a 'glocal' overturn that even the most rebellious Basque could not have planned for Bilbao. Nevertheless, this spectacular reverse of a globalized urban project was based not only in a democratic veto by the Chamber of Aldermen but also in a decision-making political system, as old as Brazil, named "clientelism" that is, patronage. Alike the patrician and the plebeian, in Rome, the suzerain and the vassal, in the feudal system, the colonial Brazilian plantation farmer, the 'colonel' after the First Republic and the rural workers, the urban populist deputies, mayors and governors exchange protection for political support from the poorest sections of the population: jobs, fiscal benefits and public services for votes.<sup>21</sup> The political support of the carnival

leaders and samba schools of the communities living in slums cost the abandonment of a residential project of approximately 3.000 apartments for families with income below 5 minimal wages. According to the Secretary of Urbanism, though, this was a claim from the local residents themselves:

*The Maritime railroad courtyard was the biggest federal terrain in the whole area of the port of Rio and for long it was the object of controversy between the City Hall and the Liquidator of the Federal Railroad Net. During Conde's administration it was tried, unsuccessfully, to expropriate the realty in order to implant there a big low income residential project. The residents of the area opposed to this project because they realized, reasonably, the risks of having a low income community of big dimensions in the immediate vicinity of the Providência Hill [ first slum of Rio de Janeiro]. The danger was to have, in the future, a situation similar to the conflict between Parada de Lucas versus Vigário Geral.”<sup>22</sup>*

Vigário Geral and Parada de Lucas are poor neighbourhoods at Rio's Baixada Fluminense, where traffic gangs compete. Vigário Geral has suffered a horrible slaughter in 1993, when 21 residents were killed by 50 policemen in vengeance for the killing of 4 military policemen, two days before. In March 2005, another slaughter of 29 people happened at Baixada Fluminense.

Ironically, as if a memorial of the burial of this low income residential project in name of peace, the City Hall has inaugurated in August 2005, “The New Black Men Portal”, an archeological site at the neighborhood of Gamboa where rests the mortal remnants of the black slaves cemetery, and which integrates a circuit composed of the Slum Museum, the Open Air Museum, historical buildings and of three belvederes. At this occasion, the works of urbanization of the Providência Hill were inaugurated with the opening of a Café Internet “*where residents may have free access to the global net of computers and do digital jobs*”<sup>23</sup>

The small Olympic Villa at Gamboa, besides the City of Samba, is a local adaptation of the ‘event-city’ model. Its name is only a fantasy name for it was not built to accommodate athletes of the international Olympic Games; it functions as an educational sports center for swimming, soccer, volleyball and basketball classes to

students of the municipal schools in the area and as a club to the communities, during the weekends. It is part of a series of 8 sport centers built in slums and neighborhoods of the periphery. Next year, though, Rio will siege the Panamerican Games 2007, but the opportunity to launch the redevelopment of the port zone through this event was lost. The residential villa for the athletes as well as the most sophisticated stadiums and sportive equipments are being constructed on 'tabula-rasae', at the other extreme of the city, at the new neighborhood of Barra da Tijuca. Thus, reinforcing the already mentioned city's schizophrenia between the expansion and doubling of its centrality and the preservation of its original center. According to the director of municipal institute of urbanism, since the proposal of making the Olympic Games at the port zone was discarded by the Committee before, the City Hall decided not to present the same option for the PAN 2007 games, in order not to lose again the competition for another city.<sup>24</sup>

### **From Project to Plan. From the new logistic center to the *Fun & Cult City*.**

If the key of the Barcelonese approach was to go 'from plan to project', and we may say this also regarding Bilbao, although the propaganda highlights the "effect Guggenheim"; the redevelopment of the port zone of Rio de Janeiro seems to be taking the inverse path, that is, it started by the urban project to comprise a strategic plan for the region and nowadays it is resenting the absence of a metropolitan plan and an entity of mixed capital for the long span management and execution.

In retrospective, we may verify that the first projects, at the beginning of the 1980's, were still closely linked to the port functions and to a conservational concern regarding the historical local heritage. In 1983, an year after the inauguration of the Sepetiba port, the Commercial Association of Rio de Janeiro has proposed the creation of an International Center of Commerce close to the quays, a showroom for Brazilian products, connected to an infrastructure of leisure and shopping, envisaging to increase exportation. In 1985, the Association presented a Teleport project, but this was dislocated to the New City, where the City Hall is located and a business convention center is also under construction. In 1989, the Ministry of Transports, the state company Portobrás and the Docas Company of Rio de Janeiro developed a plan of expansion to the city's original business center, including commercial, service, residential and leisure uses. Nevertheless, after these attempts to implant the Portman model of a mixed use enclave or new business center as London Docklands' Canary

---

<sup>24</sup> Interview with Pedro Corrêa, director of urbanism of IPP.

Wharf and New York's World Financial Center, a conceptual shift occurred in the planning of Rio's port zone.

Regarding heritage, in 1984, it was started the program Cultural Corridor in the center, a project idealized by writers and architects to rehabilitate public spaces and private houses and buildings in exchange of urban territory taxes discounts and exemptions. And in the port zone, it was begun an inventory of buildings worthwhile enlisting in the neighborhoods of Saúde, Gamboa and Santo Cristo which, in 1988, was transformed into law, also linking restoration to the reduction and exemption of territorial taxes. Approximately 1.800 buildings were enlisted. It is worth noting that the British Labor Party too has made efforts to preserve the identity and memory of the port and the port's population before the Thatcherist "tabula rasae" entrepreneurialism took over Docklands.

During the 90s, the private initiative projects to the port zone in Rio caught the "fun city" virus, a fever of frenetic entertainment which had already spread during the precedent decade, when a mega auditorium, a formula 1 race track, a marina, a planetarium and the sambódromo were built. However, to counterbalance the fun-city projects, the City Hall has presented a project to restructure the area, in 1992, indicating enlisted buildings, establishing preservation areas for housing, changes in the use of the soil legislation and in the transport system. Besides, during this decade important public investments were made in low income residential projects: 1) project Residential Opportunities ( 1993-4), carried out by the Cooperative of Professionals of Habitat, which made a survey of the private properties in order to stimulate social housing and a revision of the local legislation to allow interventions; 2) project Saúde ( 1996 – 2001), carried out by the office Invento Espaços and financed by a Federal Bank which consists of 150 units distributed in 9 apartment blocks of 54m<sup>2</sup> each; 3) program New Alternatives ( 1996 – 1998 ) for the rehabilitation of poor people home-beehives with the support of the program of historical sites rehabilitation of a Federal Bank; 4) project for the maritime railroad courtyard and the warehouse nº 10 ( 1997) with approximately 3000 residential units, for families with income below 5 minimal wages, distributed in semi-closed and closed squares or in isolated blocks and a central square. In its place now is the Olympic Villa and the City of Samba; 5) project of rehabilitation of the Conceição Hill ( 1998-2000), conceived by the municipal institute of urban planning in collaboration with the French ministries of transport, housing and culture, the consulate and other municipal agencies. It rehabilitated public spaces, revised legislation and

developed tourism potential of this place, which is the hill where samba was invented and played for the first time.<sup>25</sup>

Besides the continuation of the program New Alternatives and the introduction of the Favela-Bairro (Slum-Neighborhood) program in the Providência Hill, mentioned before, the 2001 Plan for the port presented two big residential projects for the middle-class: 8 buildings of 683 apartments of 1 room and 2 bedrooms, 47 shops and 62 commercial rooms, close to the City of Samba, and 6 buildings with 464 apartments and space for shops in the terrace, at Avenue Presidente Vargas where 22 thousand civil servants work at the City Hall's administrative center. The preference given to the middle-class in the residential projects of the 2001 plan was justified as follows:

*"It is suitable to balance carefully residential projects among the different income levels in order to avoid two types of problems that might occur: on one hand, the gentrification, when the original residents are evicted due to the raise of rents, and on the other hand, the "favelization", when the number of projects for the low income families are superior than the neighborhood may support, thus provoking evasion of the middle class. In this case, it is necessary to start with residential projects for the middle-class of good dimension, in order to create a job market to absorb the low income population, upgrading, in a first phase, the conditions of the population already living in the area and, afterwards, gradually attracting new residents to well planned projects, of small and medium size, thus avoiding the big residential complexes of sad memory, that today are vulnerable to the drug traffic control."*<sup>26</sup>

Regarding the buildings' retrofit, it is worth noting that the first and unique retrofitting in the region up today is that of the Warehouse Dom Pedro II, occupied by the NGO Action Citizenship, which will offer courses of theater, music, cinema, visual arts and cooking as well as civic activities for low income residents. Among the 13 retrofits foreseen in the 2001 Plan are 6 of the 18 warehouses of the quays, although 2 of them are already rent for shows, fairs, exhibitions and parties and 2 of them are being negotiated to be transformed into a new home-port station with shopping, envisaging to serve the tourist ships which anchor there, in growing number. The other buildings are: a) the old National Press, which presently accommodates the federal police superintendence that will be removed, and will gain an office tower. Inside its 3 ales an university and a research institute might be installed ; b) the building called "The Night", famous in the 40's for its radio hall programs, is already being restored and might be converted into a hotel; c) the historical building Praça Mauá nº 10; d) 1800 prisoners

---

<sup>25</sup> See Moreira, Clarissa da Costa – op. cit. Chapter 2

<sup>26</sup> Communication Sirkis - 21/10/2005 - Programa Porto do Rio

were already dislocated from the Polinter building, which accommodates the specialized delegacies besides the Saúde Hill and which will be demolished to give place to a residential project; d) the civil police hospital at Praça Mauá will probably be transferred somewhere else to give place to another university; e) for the Cibrazém warehouse, bought by the City Hall, a public competition is foreseen for a retrofit project of a City of Cinema, a complex of studios and projection rooms; f) for the Pier Mauá, another cultural equipment is being thought of in place of the Guggenheim museum and there might be an international contest of ideas for it.<sup>27</sup> The idea is that this equipment may retain for more than a day the attention of the tourists that disembark the transatlantic ships and stimulate them spend more. In brief, the prisoners, the sick and the police are on their way out of sight in the port zone and in their place will come into the scenery university students, artists and the entertainment entrepreneurs of the Fun & Cult City.

Nevertheless, the 2001 Plan's backbone is the transport system: an inter-neighborhoods' corridor, 4 lines of Light Rail Transit; bicycle lanes; the restoration of historical waterfront way; a new bus terminal; integrating stations for buses, taxis, LRT and boats; tunnels; underground and street level parking lots; a new road linking the Port to the Cajú neighborhood, new streets and the acoustic treatment of the perimeter viaduct. And to tie in all these new circulatory ways, the retrofit of the former railroad station Barão de Mauá to accommodate a Museum of Trains.

Regarding the land ownership situation, the largest part of the most valued land belongs to Docas Company of Rio de Janeiro, a mixed capital company, in second place comes the liquidated Federal Railroad Company, then the Union, the Army, the Water and Sewage Company, the State of Rio de Janeiro, the Municipality of Rio de Janeiro, the Fluminense Mills and the Portus, a former maritime servants pension fund. Before the construction of the City of Samba and the Olympic Villa there were approximately 400.000 m<sup>2</sup> of empty lots. The actual legislation allows the construction up to 18 floors and, with garages, up to 22 floors. As Clarissa Moreira observed, the perspective of verticality, opened by the legislation 15 years ago, has probably caused speculation and appreciation of lots and this explains the pressure for interventions of massive investments, besides the technical argument that the soil of the embankments requires foundations up to 30 meters, therefore, big scale construction.<sup>28</sup> At the quays, only the six first warehouses are enlisted because the Docas Co. and the maritime

transport concessionaries still “believe in the recovery of port activities in that area which goes up to the warehouse n° 18”.<sup>29</sup> No wonder the ideal model mentioned by a representative of a concessionary is the rehabilitation of the Hamburg port, which combines the rescue of the spectacle-port of the XIX th c. with the modernization necessary for a regional logistic port which faces fierce competitive challenges of globalization in the XXIst c..<sup>30</sup>

### **Why still not in Rio ?**

After twenty years gone by since the first initiatives and dozens of projects to revitalize the port region, a few questions remain: 1) why the real estate market has still not started to invest there ? 2) why up to now it was not created a port authority or a society or consortium of public-private partnership that could carry out the redevelopment of Rio’s port zone, as was done in New York, London, Baltimore, Bilbao, Buenos Aires etc ?

In his farewell balance, by the end of October 2005, the secretary of urbanism lamented that so little was done up to now and blamed the frustration of expectancies on the fact that “we are champions of bureaucratic-cartorial imbroglios”<sup>31</sup> Moreover, he complained the lack of long range financing of infrastructure works, the lack of convergence of expectancies among the actors involved and the lack of a public-private entity to implement the special projects for the area:

*“All the mentioned infrastructural projects are ready for bidding and immediate execution. (...) 50% of the budget was asked for the National Bank of Development, which, up to now, was obstructed by the Treasure Secretary’s interpretation about the city of Rio de Janeiro’s capacity of debt. This fact, plus the budgetary restrictions due to 2003 recession and the municipal taxes revenue fall have concurred to the delay of the construction phase.”*

*“A great variety of opinion and interests and diverse political factors were inhibiting factors. Many seminars, exhibitions, meetings and two big researches and public audiences were elaborated, during this period, for the main projects, which suffered many changes due to the discussions”.*

*“The absence in our public management culture of an instrument like the Société d’Économie Corporación Antigo Puerto Madero, of Buenos Aires is, together with the lack of metropolitan administrative mechanisms, one of our biggest institutional gaps.”*

<sup>31</sup> Communication Sirkis – RJ - 21/10/2005

As positive results, however, the Secretary observed that it was established a good dialogue between an interlocutor group and the leadership of the three neighborhoods of the port region and that important political articulations were done during his period in charge:

*“This articulation have enabled the overcoming of old conflicts with federal agencies as the liquidating Federal Railroad Company and the National Food Supply Company (...) and the reunion of an informal working group with members of the Federal Government and of the City Hall which is little by little progressing (...) Besides the Minister of Cities and the Cabinet Chief of the president of the National Bank of Development, the following institutions have also been participating of this working group: the Ministry of Planning, the Union Heritage Service, the Docas Co., the liquidating Federal Railroad Co., the Federal Police, the National Institute of Industrial Property, the National Food Supply Co. and the National Institute of Social Service”*

The decisions reached in this group were turned into an agreement, signed on March, of Technical Cooperation between the Municipality and the Ministries of Planning, of Cities, of Culture and of Transports, which comprise the rehabilitation of the neighborhoods of Saúde, Gamboa, São Cristóvão, Benfica, Vasco da Gama and Cajú, and counts upon the support of the Docas Co., the National Bank of Development and the Federal Savings Bank.<sup>32</sup>

If, after this agreement between the federal and the municipal governments, the revitalization will advance it is still unknown in this election year. But, one thing became clear with this agreement: the verticality of the decision-making process. This testifies to the difficulties and to the rhetorical aspect of the strategic planning because neither the working group nor the agreement included the participation of the City’s Council, the CONPUR, mentioned above. The inclusion of 3 more neighborhoods in the rehabilitation plans of this agreement also testifies to the characteristic territorial flexibility of urban projects and of strategic planning in comparison to the old regulatory planning based on zoning.

Considering the retardation of the port revitalization plan also advantageous because it allowed to assimilate the hits and discard the errors of previous experiences, the Secretary highlighted 5 lessons: 1) to blend the rehabilitation of the old with the keen introduction of the new; 2) to foment the pre-existing local economy and to avoid gentrification by means of microcredit, of transforming street vendors into kiosk owners or small shopkeepers, of supporting poor women, of financing the restoration of the traditional houses and by retrofitting the old industrial warehouses for services and housing ( lofts) and by financing new housing projects; 3) to guarantee the plurality of

uses and strongly stimulate the residential use; 4) to promote the participation and the partnerships between public managers, communities, public and private investors and universities; 5) to found a society of mixed economy to manage the long span implementation of the revitalization plan, because the more levels of government are involved in the negotiations, the longer the process will take.

### **Cool Port**

Of this 5 years' balance, it is still important to take notice of the revision of the international models the Secretary had praised at the beginning of his mandate and of the shift to alternative culturalization models as means of promoting the revitalization process. From New York, the South Street Seaport and the Battery Park City were not mentioned anymore, but instead, Soho's revitalization became a reference:

*"The South of Huston Industrial Area (SOHO) was condemned due to the latest of the great projects of express-ways of Robert Moses, the tzar of the roadways' revolution in New York, of which the destruction of Bronx was described in a touching chapter of the book "Everything that is solid melts in the air" by Marshall Bermann. In contrast to Bronx, in Soho, the community resisted and won, with the support of great urban thinkers as Jane Jacobs ( author of the Death and Life of Great American Cities). Once the expressway was vanquished, the big empty warehouses, devaluated, began to be occupied by artists, profiting of the low rents. Soon, behind them came the little trendy bars and charming restaurants, the qualified commerce, the charismatic neighborhood of artists. When the public power finally understood and began to support, the revitalization was already on the way."*

In accordance to this view, Rio's City Hall has been supporting the NGOs established in the old warehouses of the port zone which promote social inclusion of teen-agers of low income families by means of art-education, particularly through theater: Spectaculo and Kabum !, the Talents of the Time and the Artisans' Workshop at the Aplauso Warehouse, and the Cultural Center of Citizenship Action, already mentioned.<sup>33</sup>

However, at the Secretary's speech no negative mention was made about the intense gentrification process that Soho went through, which forced eviction of part of the so praised charismatic artists and about which many researches have written about.<sup>34</sup> In other words, the conjunction of interests between the elite of New York, the artists that occupied the lofts and the

industrial warehouses that have been abandoned by the workers, the business world of galleries and museums which injected 1.5 billion dollars, already in 1980, in the city's economy and the real estate market which discovered the gold mine called Yuppies. The result was that the middle-class fascinated by the bohemian lifestyle came to dominate the urban landscape of Soho, also coveted by the 5<sup>th</sup> Avenue stores, thus provoking the eviction of the less affluent among the responsible for the original appreciation of the neighborhood. Also note that while Soho was elevated to model for the port zone of Rio, London's Docklands were now demonized:

*"In the European experience there are two different examples of docks' revitalization which resulted in opposite study cases: the Canary Wharf, in London, is an example of authoritarian imposition made by the first-minister then, Margareth Thatcher. The "Iron Dame", without consulting the community and having dissolved London's City Council, has imposed a model of segregated uses in view of the priority to the multinational offices, which resulted in an extreme low economic maturation that was consolidated only two decades later. However, the Kop van Zuid, in Rotterdam, became an example of creative port revitalization with constant participation of local power and the communities in the vicinity, consecrated the principle of multiplicity of uses and attracted the best artists and architects available."*<sup>35</sup>

### **The 'Glocal' Port:**

The paper has tried to demonstrate the fusion between global models of planning with the local reality, its planning traditions, its national and municipal political culture. The analysis of the facts, of the lines and the between the lines of official and non-official interviews, lead to the conclusion that the power of the urban projects surpasses the federal political obstacles as well as the municipal strategic plan itself. It was observed how the City's Council CONPUR did not participate of the working group of the Union and the City Hall, and also how new neighborhoods were included in the Technical Cooperation Agreement derived from this group's decisions. Although the autonomous agency of mixed capital has not yet been created, and which probably will be a consortium composed of the federal, state and municipal governments and managed by a private concession; in practice, some negotiations and biddings for the constructions already begun have preceded the federal legislation of public-private partnerships.<sup>36</sup>

It is important to understand that this process of fragmentation of the city in many types of "cities" and special projects correspond to the strengthening of the municipal domain and to the weakening of the national domain. In the first decades of the post-war

---

<sup>35</sup> Communication Sirkis – RJ - 21/10/2005

<sup>36</sup> The case of the Convention Center at Cidade Nova mentioned by Sirkis in this communication of 21/10/2005, was a pre-paid concession for higher construction, according to the director of urbanism of IPP, Antonio Corrêa.

period, almost all of the major capitalist countries had strong central governments and national economies inside clearly defined territories, in spite of big and fast expansion of commerce exchange and international investments. The capacity of state-nations to implement the domestic policies was not questioned, as it is today. As a result many developing countries have been abandoning their regional policies that used to promote decentralization inside the national territory, provoking inter-regional fiscal wars to conquer the new investments. The decentralization of fiscal powers, of infrastructure construction and urban planning, in its turn, capacitate the richer regions to invest more resources to the solution of their own troubles, resulting in more inter-regional disparities inside the national territory.<sup>37</sup>

In order to conclude, I quote the words of a big coffee exporter and former president of the Docas Company of Rio de Janeiro, Dr. Rui Barreto:

*“But why is the city finishing? Because you have finished the port after you finished the coffee exportation. Then, you automatically finished the importation. The ships moved to São Paulo to embark and disembark merchandises. The economic and financial life of a city-port is the importation, this is what made New York build that World Trade Center. You want to revitalize the port region or the city ? Do you wish to revitalize the port region and transform it into a fantastic residential and apartment complexes, shops, business offices and provide housing for the poor ? Or do you wish to revitalize the city of Rio de Janeiro so that the slums may end, or at least that misery may diminish and employment rise and the city will revive through the port economic revival ? If you tell me: “no, I wish to revitalize that area” , then forget about the rest and construct a bunch of new buildings there. But if you tell me: “no, I wish to revitalize the city”, then we will have to look after cargo because port is cargo, port is not the sea, is not the beauty, is not the beach, is not the street, is not the people, is not the crane; port is the cargo. If it does not have cargo, nothing will help. And cargo is also a political problem of the federal government.”<sup>38</sup>*

<sup>38</sup> Interview Dr. Rui Barreto – 3/06/2005 -

In the summer of 1955, a group of prominent planners from the United States and Italy convened on the island of Ischia, in the gulf of Naples, to participate to a symposium organized by the Italian Institute of Town-planning (INU), the Italian Ministry of the Public Works, and the United States Operations Mission (USOM). Under the title of "Italo-American City and Regional Planning and Housing Seminar", the meeting aimed at comparing the latest and purportedly most advanced experiences of both countries in the fields of town and regional planning and housing policies. Italian experts were asked to comment on papers presented by the American guests. The event was marked by the high profile of the participants. On the American side were practitioners and academics of the caliber of Oscar Stonorov and Vernon DeMars. Among the Italian respondents were important planners and architects such as Ernesto Rogers or Gino Pollini, but also intellectuals and politicians of various origin and political leaning. The themes debated during the seminar ranged from the United States' South to the future of the American cities and Philadelphia's planning programs.

The meeting was held in a significant moment of the history of postwar Italian-American relations in the field of architecture and planning: in fact, the mid-1950s were characterized by a shift from a direct involvement of the US authorities in Italy's reconstruction to a more selective reception of American models and ideas on the part of the Italian design culture. Events such as the one in Ischia could no longer be viewed as initiatives meant to favor a rapid transfer of know-how from an economically and

technologically more advanced country to a political and social reality in a subordinate condition. The "Italo-American City and Regional Planning and Housing Seminar" took rather the form of a confrontation between two professional worlds that, despite frequent assertions of reciprocal equivalence, were concerned with problems of diverse nature and tackled them with quite different tools in their respective countries.

While in the official avowals the seminar sought to prompt a constructive exchange between the participants, one that would eventually lay "... the foundation for future cultural collaboration" (as it was later stated in a memorandum of the meeting), the discussions that it prompted seemed to rarely touch on a common ground: not only the cases presented by the American participants looked perhaps alien to the Italian context but some of the issues that were more cogent to Italy's postwar condition were almost ignored. Despite attempts of this kind at bridging the gap between the two countries, American and Italian planning cultures remained culturally and professionally distant. Asymmetrical local conditions as well as dissimilar backgrounds prevented from establishing fruitful forms of interchange. Almost inevitably, events such as the one in Ichbia could not steer clear of several degrees of ambiguity.

The list of the participants represents an illuminating cross-section of the debate of the time on city and regional planning. The figure of the industrialist Adriano Olivetti clearly stood out against the group of the Italian coventurers. President of the INU since 1950, Olivetti was well known for both his patronage of architecture and planning and for his first-hand knowledge of American production system and corporate world. In addition to Olivetti, the seminar was attended by personalities of the political establishment such as Camillo Ripamonti and Ugo La Malfa, architects and planners such as Giovanni

Astengo, Vincenzo De Giosa, Luigi Piccinato, Ernesto Rogers, Ludovico Quaroni, Bruno Zevi and Gino Pollini, intellectuals as diverse as the economist Manlio Rossi Doria and the sociologist Angela Zaccaroni. Interestingly, all these participants were linked by the involvement in the activities of the INU (such as Quaroni, Astengo, Piccinato -- vice-presidents of the Institute, in different years -- and Zevi, secretary from 1952) and, in general, by the proximity to Olivetti's ideas and initiatives.

Olivetti's presence was particularly significant, as the seminar broached themes very close to his cultural and political agenda. In fact, Olivetti's presidency of INU coincided with one of the most prolific seasons of the Italian planning debate: a debate that, in those years, was mainly focused on planning interventions at regional scale. Not incidentally, the memorandum of the meeting insisted on the necessity of planning, highlighting the implicit interrelation of "national, regional and local levels" in the planners' work. The need for an approach at a higher scale than the urban one was recurrently discussed in many initiatives promoted by INU: for example, the subject of regional planning was at the center of the 4<sup>th</sup> National Town Planning Congress, held in Venice in the October of 1952, an event that marked the Italian planning culture for at least a decade.

The meeting was the result of a venture undertaken by Bruno Zevi, a young professor at Venice's School of Architecture and an already well-established architectural historian and critic. Acting as the main organizer of the seminar, at the end of 1954 Zevi began to establish contacts with Italian agencies and ministries with the aim of organizing a "Town-planning Seminar" that included the participation of Italian and American experts. Zevi was surely one of the key figures in the mediation between Italian and American architectural cultures. Having left Italy before the war to Britain and then the

United States, he had received in 1942 a Bachelor of Architecture from the celebrated Harvard Graduate School of Design. Returned to Rome in July 1944 with the American Army, Zevi began to collaborate with the Italian office of the United States Information Service (USIS) in the preparation of technical bulletins and handbooks aimed at guiding Italy's reconstruction.

Zevis acquaintance with various US federal agencies proved to be instrumental. An important role in the early organization of the "Italo-American City and Regional Planning and Housing Seminar", in fact, was played by American governmental organizations such as the already mentioned USIS and the Foreign Operation Administration (FOA) that provided financial support for the initiative. With the help of the FOA and USIS, Zevi put forward the idea of a seminar "as a pure cultural proposition", as one can read in a letter sent to two prospective American participants, Frederick Guthrie and Oskar Stonorov. Even though the event was officially organized under its aegis, the INU was only involved in the financial support of the proceedings' publication, a goal that was never achieved. The organizers had indeed high expectations about the profile of the participants: in the list of the invitees initially drawn up by Zevi, were Lewis Mumford, Catherine Bauer and Kevin Lynch, familiar names to the Italian public between the 1950s and the 1960s.

The structure of the meeting reflected what organizers and sponsors wanted to realize: a comparison between the experiences in planning carried out in the two countries from the coupling of invited "experts" with local professionals, intellectuals, and politicians. For example, architect and planner Oskar Stonorov presented a paper titled "The Coming Reconstruction of American Cities" with Luigi Piccinato - another architect and planner

-- as commentator. To respond to planners Vernon De Mars and Frederick Guthrie, who lectured respectively on "Choice as an Objective in Planning" and "Plans for Today and Tomorrow", were an industrialist (Olivetti) an architect (Rogers) and a politician (La Malfa).

In the intentions of the organizers, the American case studies were presented almost as paradigmatic examples. For instance, the leaflet enclosed in the issue of the journal *L'Architettura* that informed of the seminar paid particular attention to planning techniques for which the United States were -- the text went on -- "an example" for Italy. However, how America could become a model for Italian planners was not explicitly explained: apart from generic appeals to a "humanistic approach" that would take the place in both countries of a mere "preoccupation with types of urban structure" or common-sense declarations such as "... urban and regional planning is entering a new phase all the world" (this was the tone of the memorandum of the seminar), little more was proposed. At the end, the Italian and American cases were portrayed as potentially comparable only at the level of university teaching.

Obviously, these implicit yet resolute assertions of equivalence between United States and Italy in the domain of planning bore no relation to reality. The cases discussed by the American guests represented general thematic references, hardly adaptable to the Italian context: they touched on problems and phenomena bound to become current in the years to come, though within a completely different economic and social framework. In the mid-1950s, examples imported from the United States continued to be presented to the Italian public for their implied ideological value, as a metaphor for the possible transformation of the country. In the context of the Cold War, even an oblique allusion to

American origins could help domesticate ideas that, otherwise, would have been regarded as socially and politically subversive.

A good case in point is represented by the presence at the seminar of Howard Menhinick, former director of the City Planning Division of the Tennessee Valley Authority (TVA) and Girard Davidson, another former collaborator of the Authority in the 1940s. Menhinick presented a paper titled "The South in the U.S.A." with economist Manlio Rossi Doria as respondent while Davidson lectured on the "Regional Resource Planning by the Federal Government" with a comment by Giovanni Astengo, a renowned Italian planner and the director of Urbanistica, the mouthpiece of INU, since 1949. After the end of the Second World War, the TVA had turned into a recurrent reference for Italian planners, as it is demonstrated by the translation in 1946 of David Lilienthal's *TVA: Democracy on the March* into Italian (the book had become available to English-speaking readers in 1944), and the publications of several articles and books.

At a first glance, the model put into operation by the TVA seemed to be hardly repeatable in Italy: not only orographic and hydrographic conditions were different but the size of the TVA intervention basin amounted to more than one third the entire surface of Italy. Despite this evident incongruence, however, the TVA appeared to those who advocated massive projects of land reclamation and social reform in underdeveloped Southern Italy as a legitimizing reference. Quite significantly, in his response to Girard Davidson Giovanni Astengo did not play down the differences between Italy and the United States: to the contrary, Astengo emphasized diversity in order to assert the general principle that social change could follow physical transformation. In this respect, the fact that the TVA was an exception in the American political and economic panorama seemed

to count little for Italian architects, planners, and reformers: more important were the affinities in social status between prewar American South and postwar Italian *Mezzogiorno*.

Equally interesting -- for the way they established intricate links with the Italian situation -- were the papers by Douglas Haskell, "Roadtown U.S.A.," and by Robert Mitchell, "Transportation in Contemporary City Planning," and those by Paul Oppermann, "Central City Planning in a Metropolitan Context," and Edmund Bacon, "Philadelphia's Planning Program." By considering transportation infrastructures as the subject of their speeches, Haskell (the editor of *Architectural Forum*) and Mitchell (the executive director of Philadelphia's Urban Traffic and Transportation Board) referred to a bounty of studies that had given the United States an undisputed leadership in the field since the 1930s. However, the presence of the theme of transportation among those discussed in the seminar held in Ichia was not matched by an equal interest on the part of the majority of the Italian planners in those years. It is not incidental, in fact, to remark that the Italian planning culture remained substantially excluded from the decision-making process that, from the second half of the 1950s, would lead Italy to develop one of Europe's largest highway networks.

If it was difficult to grasp how American principles concerning transportation infrastructure could be implemented into the Italian context, even more tenuous were the links between the United States and Italy on the question of the "urban centers"; the theme that Paul Oppermann and Edmund Bacon's papers touched on. Oppermann and Bacon, the directors of the City Planning Commission of San Francisco and Philadelphia respectively, discussed issues such as city form and central city development that had to

appear particularly engaging for the Italian participant to the seminar. Bacon, in particular, illustrated a case that was not unfamiliar at all to the Italian conveners: the last thirteen years of planning activity in the city of Philadelphia.

In the 1940s and 1950s, Philadelphia became a recurring paradigm, regularly mentioned in international architectural and planning debates. Not infrequently, articles dedicated to the interventions in the central area of the American city appeared in the specialized press, with a circulation that, originating initially from the United States and Great Britain, rapidly reached continental Europe. Echoes of Philadelphia's planning experience could be found in Italian journals as early as the beginning of the 1950s: in 1950, for instance, *L'Espresso* published a review of the "The Better Philadelphia Exhibition", a show mounted by Bacon and Stonorov in 1947. Not much differently from the case of the TVA, this interest was grounded on an ideological interpretation: the experiments in democratic participation carried out in Philadelphia since the early 1940s appealed to the Italian planning community for their value as an example.

An indirect sign that Philadelphia was a major subject of interest for the organizers of the seminar in Ichnia (and, implicitly, for the Italian architectural and planning culture) comes from the biographies of some of the American participants: Bacon and Mitchell were both professor at the University of Pennsylvania (the latter had founded the university's Department of City Planning) while Stonorov's firm was based in the city. In general, the plans for Philadelphia were regarded in the postwar years as a series of original proposals defining a new approach to urban design: the novelty lay in the attention to both the real-estate and morphologic dynamics of the city center, that portion of the metropolitan area that came to be known in those years as "the core of the city."

Not surprisingly, in the same period the interest of the Italian architectural culture was shifting slowly from urban planning to urban design.

It is important to remark, in fact, that 1955 is a pivotal date for the history of Italian planning. That year the proposal for a new plan for the city of Ivrea, Adriano Olivetti's hometown, was rejected by a large majority of the City Council amid fierce political polemics. Began in 1953 with Olivetti's full financial support, the plan was meant to become a model to be imitated in the rest of the country. Its preparation involved the participation of architects, planners, geographers, economists, and sociologists and relied on a large survey campaign. In the intention of the plan's promoters, the gathered information was to be transferred on punched cards and analyzed by calculating machines provided by the Olivetti company. Clearly, the plan was considered the ultimate paradigm for city planning.

The failure to put the plan for Ivrea into action was not simply imputable to local conditions. The negative epilogue was also the outcome of a process that involved the Italian planning culture as a whole: initially accompanied by the enthusiasm for a "scientific" and "all-embracing" approach to planning (thanks also to the possibility of resorting to the early advancements in the field of information technology), the plan generated skepticism about the foundations of the discipline within the same planning community. Plunging the principles of city and regional planning into crisis, the new scenario favored a growth of interest for city form. Not accidentally, Ludovico Quaroni, one of the architects called upon to work on the plan for Ivrea, developed in the following years a significant penchant for urban design.

In an attempt to compare two professional and cultural contexts, the "Italo-American City and Regional Planning and Housing Seminar" originated little more than an examination of the state-of-the-art in US planning. What was missing was a real contact between the two sides and a tangible exchange of experiences in a condition of equality. Certainly, the obstacles raised by the use of different languages were not of help. Apart from several factual errors retracable in both the memorandum of the seminar and the translation of the papers, any debate involving Italian and American planners was doomed to pay a heavy toll on language and terminology. This was a problem that affected also the circulation of texts written in English. The translation into Italian of Lewis Mumford's *The Culture of the Cities*, by Adriano Olivetti's Edizioni di Comunità publishing house, is a good example of the communication barriers existing between the United States and Italy: published in 1953, the book carried out rather different messages from the original 1938 version.

At the root of these linguistic problems was also the need to adapt the American examples to the Italian political and cultural context. For instance, one of the terms recurrently used in the seminar was "community." "Planning - one could read in a passage of the memorandum - will emphasize not static schemes of physical arrangement but schemes of development to guide the *creative evolution* of communities." This was an obvious tribute to Olivetti who had advocated the return to communitarian aggregations as the way to reform society and had even founded a political party called "Movimento di Comunità" (Community Movement). It was a predictable yet ambiguous reference: in fact, it is not easy to understand which notion of "community" American and Italian participants to the meeting had in mind, particularly

in the mid-1950s when the debate on the "communitarian" roots of American regionalism had almost completely fizzled out.

In conclusion, why American and Italian planners failed to generate successful interactions in the postwar years? When viewed by foreign audiences, American examples were rarely contextualized and more often transposed to a local perspective: not infrequently, they seemed to oscillate between the incompatibility with national conditions and a partial pre-figuration of future transformations. While Italy's planning experiences had virtually no coverage in the United States, on the Italian side American examples were either received with self-importance or used to legitimate local policies and personal agendas, with little interest for their practical usefulness and likelihood to be implemented. At the end, more than favoring a fruitful dialogue between the two sides of the Atlantic Ocean, events such as the "Intra-American City and Regional Planning and Housing Seminar" produced nothing but a chorus of dissonant voices.

## **Situating the Bungalow in Global Context: A Functional Standard for Working Class Domestic Space**

Thomas C. Hubka, University of Wisconsin-Milwaukee  
( [X] inserts mark slide-image locations)

[X] Anthony King's influential book, *The Bungalow*, gave powerful articulation to a dominant form of 20<sup>th</sup> century domestic housing: the single-family, technologically facilitated, set-in-nature, suburban bungalow. King's scholarship has been influential for understanding the phenomena of residential domestic life in Anglo-American suburban environments. Arguably the bungalow set within its suburban landscape has become a standard type in the planning discourse of early 20<sup>th</sup> century, as, in King's words, "a production of global culture."

This paper offers an interpretation of the Anglo-American bungalow based on an analysis of its most common physical/spatial characteristics during the early 20<sup>th</sup> century—the first era when bungalows were popularly built for middle-to-working class families. Unlike King's emphasis on a broad range of bungalow houses sharing similar nomenclature and ideological and cultural characteristics, this paper focuses more specifically upon the physical amenities and functional characteristics of the most popular forms of the bungalow and its environment settings that help to explain its popularity for its inhabitants and particularly for its working class inhabitants. While I will make references to Indian and British colonial examples, this paper primarily interprets the spread of houses with bungalow characteristics in England and America that became one of the most dominant forms of comfortable housing for an expanding working-toward-middle class between 1900-to-1940.

(It is important to note that although the bungalow and the ideology of bungalow domesticity became a widely accepted ideal by 1940, a majority of the working class did not actually achieve this quality of life until after WWII, during a second great era of popular housing construction after 1946.)

Anthony King's book covers 400 years of bungalow development from India to Britain and throughout the world and is necessarily a wide-ranging exploration analyzing many types and styles of homes called bungalows including vacation and second homes. This paper focuses on a much shorter period of bungalow construction between 1900-to-1940. Although shorter in scope, it was the key initial period of popular housing bungalow construction in Britain and America—a critical period when the bungalow was transformed from an alternative dwelling, primarily for the upper classes, into one of the most popular forms of middle-to-working-class housing. Although English and United States examples differed widely, I hope to demonstrate that the most common bungalow types in both countries represented a remarkably unified synthesis of technological improvements and modern life-style adjustments for their occupants. In this synthesis I will argue that these houses represented newly developing, national consensus standards about the character and quality of modern domestic life for an expanding, western-industrial, popular or working-toward-middle class majority.

[X] The success of this “domestic standard” can be analyzed and debated from many ideological perspectives, including social historical, Marxist, architectural, feminist, phenomenological, etc., but is perhaps best articulated and summarized from the value systems of its users as common physical amenities and functional characteristics of the housing. In common bungalows of the early 20<sup>th</sup> century, some of the most significant

characteristics included: the three-fixture bath, the technological kitchen, dining room, public utilities, individual bedrooms, closets, porches and landscaped yards, and in America, access to the car. [X] In both Britain and America, these characteristics were arranged in houses with standardized floor plans of four-to-six rooms with bath. Smaller versions contained a living room, kitchen, two bedrooms and bath and larger version also included a dining room and additional bedrooms. In both countries, the increasing availability of these characteristics created a type of domestic yardstick or standard for an evolving, commonly shared conception of modern or “middle class” popular domesticity. Although neither universally shared nor without flaws, this functional standard of “bungalow domesticity” has proven to be a remarkably durable benchmark in the development of domestic environments in western-industrial, popular or working class cultures and perhaps, as this audience might evaluate, for domestic cultures throughout the world.

Returning to King’s book, it is important to note the wide diversity of houses labeled bungalow from different countries and regions and especially the changes in how bungalow houses were developed over time. The originality and strength of King’s analysis was to demonstrate the commonality of these diverse houses united by common domestic ideological characteristics—a counter-urbanism or suburban expansion of modern industrial and capitalist societies in the form of a single, detached house, set in nature, separated from work, supported by modern technologies. Much of King’s book records the dissemination of these domestic themes, in diverse houses broadly labeled “bungalow,” from the English upper classes toward the working classes in England, America, the British colonies, and throughout the world.

This is where I pick up the bungalow story by emphasizing that the broader ideological themes in King's overview were articulated and standardized in popular working-class bungalows through the standardization of a consistent package of uniform domestic building characteristics. This popularization and standardization of the bungalow is simultaneously the record of how the quality of working-class domestic life uniformly improved between 1900-to-1940 and how this process significantly narrowed the historic boundaries separating the domestic spaces and amenities of upper/middle-class households and working-class households—boundaries that even in 1900 seemed unbridgeable to most social and domestic reformers.

### **Common Standards for Comfortable Houses of the Working Class**

[X] The massive production of “improved” working class bungalow housing in the early 20<sup>th</sup> century did not produce identical looking houses but rather, as I will now demonstrate, these houses functioned similarly. The slides show many different houses from different countries, all built between 1900-to-1940. Although these houses differed in size, cost, style, plan arrangement, and especially the social and economic class of their residents, the domestic spaces of these houses shared a set of basic physical and technological characteristics that unified the way these houses functioned for their diverse inhabitants. These shared characteristics can be defined in many ways such as levels of comfort, technological amenities, or social patterns of usage but are most succinctly summarized in a generic house plan containing five to six rooms with bath, including a living room, dining room, kitchen, two or three bedrooms and bath. [X] A version of this plan type is shown in an Aladdin Bungalow from 1917 one of the most popular forms of the American bungalow. It was the production of houses containing this basic plan and amenities that significantly

contributed to an improvement in the over-all quality of domestic life for the American working class. (There are also two-story versions of this generic plan which I do not have time to demonstrate.) Although beyond the scope of this paper, arguably the domestic progress associated with the production of these modest bungalows parallels the expansion of the working class as consumer-participants in an expanded industrial economy.

The way these houses functioned similarly can be summarized by a group of nine physical/functional characteristics or amenities that, I believe, defined the commonly accepted ideal for an adequate, comfortable house for working-class inhabitants during the early twentieth century—a threshold for the acquisition of middle-class housing standards. These nine functional characteristics or amenities included:

***The Three-Fixture Bath.*** The combination of a bathtub, toilet, and sink helped to solve some of the most vexing problems of domestic life related to sanitation, family hygiene, health care, disease prevention, personal privacy, and the overall quality of domestic life. The configuration of these three elements relied on a minimum, standard 5 x 7 room plan. For working-class inhabitants who generally began acquiring bathroom fixtures only after 1900, these technological improvements marked a quantum leap from primitive semi-public toilet and bathing facilities, including the outhouse, the public toilet, and public bathhouse or natatorium that had remained largely unchanged since the medieval period. In modest new houses and especially in remodeled housing, the bathroom's three fixtures were initially added in incremental fashion, often in separate rooms, when funds became available. Today, almost one hundred years later, this basic assemblage of three bathroom fixtures remains surprisingly unchanged.

***The Dining Area.*** In both England and America, progressive social reformers laid emphasis on the dining room as a desirable symbol of middle-class domesticity. In contrast, the typical pattern of working-class dining is shown in a photograph of an immigrant family in New York City having a meal in their kitchen (fig. 7). However, while a separate room for dining might have appeared extravagant, working-class families increasingly recognized this room as a potent symbol of modern, middle-class acculturation and, consequently, a desirable improvement. In addition to the status associated with it, the space of the dining room also provided practical benefits through its use for multiple activities such as home-based work as well as regular dining and special celebrations. The development of the working-class living room as a separate room, devoid of work and sleeping arrangements, engages some of the same social and functional issues as the dining room, but requires an extensive discussion of house plans and regional traditions that cannot be addressed in this article.

***Kitchen Technologies.*** Newly acquired kitchen improvements greatly facilitated the everyday work of the homemaker in the early twentieth century. In addition to the ubiquitous wood or coal-fired kitchen stove of the urban cottage and farmhouse, other features were added such as a sink with plumbed or pumped water, and later, hot water heaters; refrigeration units, from ice holding appliances to electric refrigerators; washing machines in several, increasingly mechanical phases; and, a variety of labor-saving devices, before and after the introduction of electricity, including cleaning equipment culminating with the electric vacuum cleaner, and food preparation devices of many varieties. Social and technical analysts of American domesticity are nearly unanimous in emphasizing the critical importance of these new technical features for improving the overall quality of domestic life for increasing numbers of American families. The literature on this subject, however, is

almost always based on middle-class households. Working-class families acquired these technical improvements much later; thus the overall availability and distribution of these items to the larger population came later, often by many decades.

***Public Utilities and Services.*** Before 1900, the only public utility that may have been found in most working-class households was cold running water. Equivalent rural or suburban homes generally relied on individual wells or cisterns with hand pumps, both inside and outside the home. One of the most significant accomplishments of progressive era reformers after 1900 was their success in introducing a range of public utilities and services to working-class neighborhoods, including sewage, electricity, gas, garbage collection, and other municipal services such as street lighting and sweeping. Public utilities were a critical component in the creation of “working-toward-middle-class” housing. Since such amenities generally began in the city and moved toward suburban and rural areas, urban residents were among the first of the working class to receive public water, sewage disposal, and garbage collection. It is difficult to make generalizations about the acquisition of public utilities in working-class areas, however, because of the uneven distribution of services within and between urban, suburban, small town, and rural environments. For example, the problem of sewage or garbage disposal, so critical to the improvement and success of urban life, typically had a much lower priority in rural areas. On the other hand, electrical service, although obtained much earlier in urban areas was equally transforming in both city and country settings.

***The Private Bedroom.*** Before 1900, privacy was difficult to obtain within typical working-class households of two-to-four rooms. Generally, parents appear to have obtained a minimum of personal privacy if a small separate room was available, but a separate room for

individual family members was seldom possible in traditional vernacular, immigrant, and working-class homes before 1900. One of the major, usually unrecorded, effects of housing reform in the early twentieth century was the creation of a new world of domestic privacy for working-class families. Typically this entailed the addition of private bedrooms, first for parents and then for children

***The Storage Closet.*** The closet was a new type of space in working-class homes.

Previously, there was little to store, and therefore common housing made almost no provision for built-in, enclosed storage. While the closet does not compare in importance to other features, the new availability of closets in working-class households of the early twentieth century signals a critical turning point in the common availability of industrially produced, personal, and domestic goods for the working-class.

***Porches and Landscaped Yard.*** After the turn of the nineteenth century, the front porch became a place for, and symbol of, leisure for the working class. For many non-farm residents, in bungalows and triple-deckers, the front porch symbolized the potential of a new life-style made possible by the eight-hour workday and improved living conditions.

Previously, either inside or outside the house, there was no equivalent leisure space in non-farm, working-class housing. Therefore, the modest front porch more than any other architectural feature expressed a new type of space for domestic comfort and social gathering in improved working-class housing. (Add import of green yard)

***Car and Garage.*** In America the automobile was a late addition to working-class households, arriving in large numbers in the 1920s, often as the popular, universally acclaimed Model-T. As recognized by almost all scholars of modern domesticity, the popular use of the automobile significantly contributed to the transformation of the American

home and life-style in the twentieth century. In this respect, it is one of the major differences between American and British environments where the automobile was far less available. For working class Americans, this transformation occurred with tremendous speed and impact, so that by 1928 three-fourths of all non-farm families owned an automobile. Twice as many households owned cars as owned homes.<sup>1</sup> While its impact on domestic life-style was substantive, the introduction of the car did not transform the physical shape of housing until after World War II since the car tended to be accommodated in rented garages or minimal, detached structures before that era.

[X] By 1930, the popular adaptation of these nine housing standards coalesced into generic versions of the four-to-six-rooms-with-bath house plans I have just shown to become nationally recognized standard for domestic living. These plans, although modest by the standards of upper-and middle-class families who had generally been accustomed to these amenities for many years, represented a significant progress in the quality of common domestic life for the families of the working classes especially when compared to previous, late-19<sup>th</sup> century.

### **The Development of Popular Bungalow Era Plan in America**

In America the most popular house style of the early 20<sup>th</sup> century was the versatile and durable bungalow – the picturesque poster-child of single-family housing. Yet, as I have attempted to demonstrate, it was not the bungalow’s picturesque craftsman or mission style but its function and amenities as defined by its common floor plan that truly marks this house type as a landmark in the development of popular American housing. When stripped of its architectural style, the single-story bungalow plan in its most popular five-to-six-room-with-bath configuration is indistinguishable from many of the era’s most popular houses that

evolved during the last quarter of the nineteenth-century and constituting, what I believe was, a popular benchmark for the (counter-urban) suburban home of western industrialized countries at the beginning of the 20<sup>th</sup> century.

The development and production of these houses has not been given sufficient study. There were no single proto-types, source or single creative designers nor were these houses simply poor copies of elite or upper-class residences as might commonly be assumed. Rather, vernacular or folk builders gradually evolved these plans through simultaneous development employing many sources in many regions during an extended period of popular experimentation in the late 19<sup>th</sup> century following the American Civil War. Like other popular housing inventions, such as the balloon-frame and the ranch house, the development of the bungalow plan was the product of an evolutionary process conducted within a national-vernacular building culture. Thousands of local builder-developers, aided by mass communications, industrialized product development, and a speculative housing market, designed and developed this plan type. [X] The floor plans from an 1870 Midwest-Chicago builder's catalog serves to summarize this development. In several variations, the plans demonstrate a process that essentially transformed the typical, two-room, hall-and-parlor worker's house plan, into embryonic versions of the most common bungalow plan. Over a period of twenty years, from approximately 1880 to 1900, increasingly standardized versions of these plan types appeared throughout America in evolving, new, and remodeled housing. By 1900, numerous single-family house types in one- and two-story forms, such as the evolving bungalow as well as multi-family houses such as duplexes and triple-deckers, all contained the core elements of the soon to be standardized, five-to-six-rooms-with-bath floor plan.

## **Conclusion**

Throughout this paper, I have emphasized that the usually unexamined acquisition of decent, comfortable homes for members of the working class in the early twentieth century was achieved through the attainment of a set of physical housing characteristics, such as bathrooms, dining rooms, kitchen technologies, public utilities, closets, and private bedrooms. Although we may call these houses bungalows and acknowledge the broad suburbanization and industrial capitalist themes underlying their evolution as outlined by Anthony King, the development of the common working-toward-middle-class bungalow also evolved in equal measure from popular and working class cultures and economics with similar and different ideological agendas. In either case, the key to understanding the widespread development of the bungalow is the popular selection, acquisition, and standardization of a group of domestic characteristics and amenities that constituted a fundamental underlying unity between the various houses called bungalow. I have attempted to show that these similar characteristics marked substantive improvement for families of the working class who, prior to 1900, had little exposure to domestic comforts of any kind. These improved housing characteristics were obtained for a large number of English and Americans before 1940 in a broad range of bungalow period houses such as multi-flats, semi-detached, modest single-family houses, and remodeled housing of all types. The various ways that the working-class obtained these improved houses represents a combination of technological progress, progressive reform, government incentives, and working-class initiative that occurred with quiet determination on a national scale. That they actually acquired these improvements in “modest, substantial homes” warrants acknowledgment and further, intensive study.

---

## **Reconstructing Golden v. Planning Board of Town of Ramapo:**

### **The Real Story Behind the First Major Growth Management Plan in the U.S.**

By Stuart Meck, FAICP, and Rebecca Retzlaff, AICP<sup>1</sup>

Paper for Presentation at the International Planning History Society Conference  
Delhi, India, December 10-15, 2006

September 15, 2006

#### **Introduction**

If the growth management movement in the United States could be said to have a firm start date, it was May 3, 1972, when the New York Court of Appeals, the state's highest court, released its decision in *Golden v. Planning Board of Town of Ramapo*.<sup>2</sup> Here the Court upheld a phased development timing ordinance in which the approval of a special permit for residential development was linked to the provision of public infrastructure in accordance with an 18-year capital improvement program; the developer had the choice of waiting for the infrastructure, some of it to be provided by other governmental units, or installing it at his/her own expense. The ordinance, the court said, was within the scope of the state's enabling legislation, and the limitations on development fell short of confiscation under the Constitution.

The ruling, subsequently appealed to the United States Supreme Court, which declined to hear it, represented the culmination of six years of work, in which Ramapo officials pulled together all of the conventional tools at a planner's disposal, along with some new technical twists, and combined them into the phased growth system. While it was not without its flaws and critics, the Ramapo plan influenced the design of growth management systems across the nation.

How the Ramapo officials proceeded and the circumstances in which they operated are the subject of this article. The article's first part describes the regional setting of the Town of Ramapo and surrounding Rockland County in the early 1960s. The second part reviews the emergence of the concept of growth management in the mid 1950s in the U.S. The third part describes how the need for a growth management program in Ramapo was identified, and the actors behind it. The fourth part introduces the growth management program itself, the debates over its adoption, and its eventual application to the Golden property. The fifth part turns to the litigation, and follows the case from the trial to the appellate levels. Finally, the article concludes with an account of the aftermath of the controversial decision, including the reaction of the planning and legal communities, an assessment by the authors of the strengths and weaknesses of the approach used by Ramapo, and an evaluation of decision's impact on contemporary planning practice.

## I. The Context: The Town of Ramapo and Rockland County

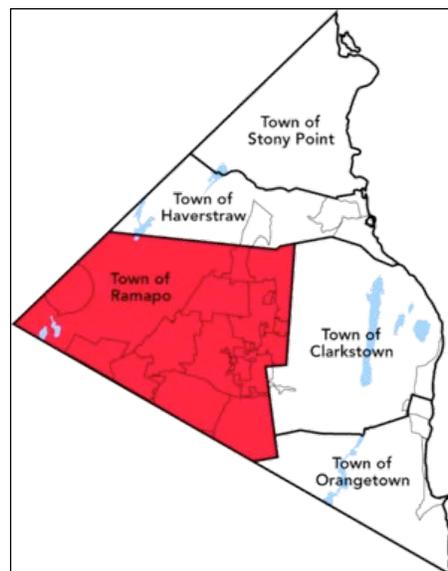

Rockland County, New York, of which the Town of Ramapo is a part, is located on the west side of the Hudson River, and is immediately north of the New Jersey state line. The county contains five townships; Ramapo, at 61.2 square miles, is the largest, bordered on the east by Clarkstown, to the north by Haverstraw, on the west by Orange County, and on the south by the State of New Jersey. The average distance from Rockland County to Manhattan in New York City is about 35 miles. (See Figures 1 and 2).

Figure 1: Rockland County in the State of New York

Source: Wikipedia (<http://www.wikipedia.org/>), 2006

Figure 2: The Town of Ramapo and Other Towns in Rockland County

Source: Wikipedia (<http://www.wikipedia.org/>), 2006

The New York State Thruway, opened in 1955, connected the Town of Ramapo and other Rockland County municipalities in Rockland County with Westchester County via the Tappan Zee bridge, which spans the Hudson River. The completion of the bridge, in late 1955, provided a direct connection from Nyack, New York to Tarrytown, to one of the main commuting lines into Manhattan, and to employment areas in Westchester County north of the New York City line. Further, the opening of the George Washington Bridge and the Palisades Interstate Parkway created easy access to Ramapo from New York City and New Jersey.<sup>3</sup> While Ramapo was far enough from New York City to miss earlier waves of suburban growth<sup>4</sup>, by the late 1950s the town was considered a bedroom suburb of New York City.<sup>5</sup>

At the time of the development of its growth management program, discussed below, Ramapo had five villages: Spring Valley, Sloatsburg, Suffern, Hillburn, and New Square, each with their own planning and zoning authority. Of the five, New Square was the newest, and its formation eventually influenced the socio-economic characteristics of the town. Established in 1961, after a battle with the town over its incorporation, the Village of New Square is a community of Hasidic Jews, who had originally moved to a farm north of Spring Valley in 1954 from Williamsburg, in Brooklyn New York, and gradually the community grew.<sup>6</sup> Today, the Town of Ramapo and its villages are home to substantial numbers of Orthodox Jews.

## **II. The Emergence of the Growth Management Idea in the U.S.; Approaches Prior to Ramapo**

The first formal effort to sketch out a rationale and approach to the problem of development timing in the post World War II period in the U.S. was that of Henry Fagin, who was the planning director of the Regional Plan Association, a private organization based in New York City. Fagin's article, "Regulating the Timing of Urban Development," appeared in a special symposium issue on planning in the law journal, *Law and Contemporary Problems*, in 1955. Fagin maintained that the coordinative aspect of planning involved both space and time; absent tools to address the dimension of time, "many attempts at space coordination must continue to fail."<sup>7</sup> Most of the motivations for regulating development timing were, according to Fagin, chiefly economic in nature: the need to economize on the costs of municipal facilities and to maintain a high quality of community services in the face of municipal growth. During periods of rapid building expansion, Fagin contended, adequate intervals of time must be assured for the assimilation of residential, business, or industrial additions to the community. At the same time, municipalities must retain strong control over the eventual character of development to ensure, for example, that low-intensity development served by private wells and septic tanks did not occur in an area where higher intensity development served by public water and sewer was desired.

Fagin outlined a system for regulating development timing. It involved establishing "zones of building priority," where building permit applications were granted on order of the individual zone priority and the order of the application dates. The assignment of building priority expressed "the sequence of development most advantageous to the

municipality for economizing on municipal services and for securing the desired character of development.”<sup>8</sup> The municipality would be responsible for fixing the number of development permits by broad zoning classifications using a series of multifactor allocations and would also be responsible by statute for carrying forward programs of facility and service expansion. A developer should have the opportunity of improving the building priority of his land by offering to construct off-site facilities and to provide services needed for development ahead of municipal programming. Under special circumstances some form of compensation would be necessary to offset individual losses when development wasn’t possible.

Fagin’s article prompted a session on development timing at the American Society of Planning Officials conference in Montreal, Canada, that same year. Phillip P. Green, Jr., the assistant director at the Institute of Government at the University of North Carolina, the session moderator, pointed out that, assuming the factual basis existed to support development timing as a lawful exercise of the police power, a substantive due process issue, the procedural due process issue had to be addressed: “enabling legislation, ordinances, and administrative safeguards must be adequate to prevent arbitrariness in applying the controls to particular property owners.”<sup>9</sup> Moreover, Green observed, if a developer offers to install utilities, pay for the increase in water and sewage plant treatment the development necessitates, build schools, dedicate parks, and pay up front for certain municipal services, “there is no basis for delaying him” in completing the development.<sup>10</sup> Developing timing controls also presented problems of inadequate jurisdiction; if a municipality that used them only covered a limited area, Green predicted, the result might be that development might “leapfrog” to the next tier of land not subject to the controls. Development timing, he declared, would only have an impact if imposed over a wide area.

Frederick P. Clark, a planning consultant from Rye, New York, described a new procedure he devised for Milford, Connecticut, where the town was organized into two priority areas: a high priority area already served with municipal facilities; and a low priority area with no or inadequate facilities. In low priority areas, the approval of the preliminary subdivision would be subject to a development schedule that would permit not less than 20 percent of the lots shown in the preliminary layout to be developed each year over a period not to exceed five years in order to permit necessary municipal facilities to be constructed at a rate commensurate with the rate of subdivision development. The developer could also elect to build the necessary municipal facilities to eliminate inadequacies and therefore the applicable subdivision area would be reclassified from low to high priority.<sup>11</sup>

Richard May, Jr., the planning director for Rockland County, New York, where the Town of Ramapo was located, explained a new zoning ordinance for the nearby Town of Clarkstown. The ordinance allowed more intensive development by special permit when the planning board made specific findings after a public hearing, although the final action was by the town board, the governing body. One zoning district would normally allow residential development on a one-acre lot, but 15,000 square-foot lots could be approved via a special permit; a second district allowed 15,000 square-foot lots, but, with a special

permit, this figure could be lowered to single-family residences on 7,500 square-foot lots, and multi-family residences at 4,000 square feet per dwelling unit. The ordinance required the planning board to make findings regarding the presence of water and sewer; proximity (within 1,000 feet) to an area already developed at a similar density; and the presence of public services, including schools, or adequate plans for them. The particular advantage of this approach, said May, is that it brought the school boards into the planning arena. "They are being officially put on notice," he commented, "as to what is coming; and under these conditions have little excuse for not making the necessary building plans."<sup>12</sup> May observed that, from the perspective of 1955, the classic American master plan had "too loose a relationship to zoning"; he favored something akin to a British development plan with "a master plan, zoning ordinance, and capital budget all wrapped in one tidy package."<sup>13</sup>

The Clarkstown ordinance was eventually challenged in court and the 1960 decision, *Josephs v. Town Board of Clarkstown*,<sup>14</sup> was the principal New York State ruling prior to the Ramapo decision. In *Josephs*, the state supreme court (the trial court in New York) upheld the action of the Clarkstown town board in refusing to approve a special permit that would have allowed residential development on 22,500 square foot lots in a district that would normally require 40,000 square foot lots. The basis in this case was lack of school capacity. The court found within the state zoning enabling legislation the authority to take into account "adequate provision of . . . schools" and that there was adequate support for the town board's denial; in any case, the applicant had no vested right to an approval of the lot size reduction. Other ad hoc growth management schemes, however, met with hostility from the New York courts.<sup>15</sup>

Thus, by the early 1960s, the stage was set for the Ramapo system. Development timing had received its first serious attention in the planning literature,<sup>16</sup> and experimentation had begun with a variety of devices, including special permits that were linked to the presence or adequacy of public facilities, and priority schemes for approving development.

### **III. Major Actors in the Growth Management Program and Litigation**

The major actors involved in the Ramapo growth management program and litigation on behalf of the town were :

(1) *John McAlevey, Ramapo Town Supervisor*. Assigning responsibility for Ramapo's managed growth program is difficult,<sup>17</sup> although by all accounts Ramapo Town Supervisor John McAlevey was a key figure. The concept of the growth management program was born at a Democratic campaign strategy meeting in 1965 attended by John McAlevey, Democratic Town Chairperson Herbert Reisman, and McAlevey's campaign manger Robert Freilich. The three agreed on two issues, first, that growth should be controlled, and second, that voters would respond favorably to the idea of controlling growth.<sup>18</sup>

John McAlevey, an attorney, was controversial long before his role in the Ramapo managed growth program. As mayor of Sloatsburg (in Rockland County) from 1960 to 1964 he brought zoning and master planning to the town.<sup>19</sup> According to one assessment:

[M]ention the name John F. McAlevey to a builder and watch for a look of disdain... Mention the name John F. McAlevey to a major land owner in Ramapo and watch for the same reaction... Mention the name John F. McAlevey to certain residents who live near the two sites of government subsidized housing...they mobbed public hearings to vilify him for placing the hated subsidized housing, to them a euphemism for slums, in their affluent midst. Finally, ask John F. McAlevey how he reacts to all the venomous feelings his name invokes – and watch him smile.<sup>20</sup>

(2) *Robert Freilich, Town Attorney.* During John McAlevey's first town supervisor campaign in 1965, Robert Freilich worked as his campaign manager, and later moved to the position of town attorney after the election. Freilich worked on all of the elements of the managed growth program until he resigned in July 8, 1968 for a visiting professor position at University of Missouri at Kansas City, where he remained. He remained involved in the program as a consultant to the town and as attorney for the subsequent court cases; he argued the case before the New York Court of Appeals. Once the decision was released, Freilich was instrumental in widely disseminating information about the program's significance.<sup>21</sup>

(3) *Manuel Emanuel, President, Manuel E. Emanuel Associates; planning consultant to the Town of Ramapo.* Manuel Emanuel worked as a consultant to the Town of Ramapo on preparing the master plan and other elements of the planned growth system.

(4) *John Keough, Director of Zoning and administrative assistant to boards and commissions.* John Keough coordinated and administered the meetings and actions of the Town Board, Planning Board, Development Easement Acquisition Commission, Community Development Review Commission, Drainage Commission, and the Board of Adjustments.<sup>22</sup>

## **IV. The Growth Management Plan and Program**

### **A. Impetus Behind the Growth Management System**

The impetus behind Ramapo's growth management system was the result of the confluence of several factors. The first factor came from impact of increased transportation alternatives, which gave greater regional access to the town, as discussed above.

The second factor was a sudden spike in population and residential construction, as a result of the first factor. Between 1940 and 1963 the population of the unincorporated area of Ramapo increased by 285.9% . During the same period, the population of the state of New York increased by 31.3%.<sup>23</sup> The town's population doubled between 1950 and

1963, and tripled by 1968.<sup>24</sup> Despite minor fluctuations in population and new residential construction in the decade in which the growth management system was conceived, the population of Ramapo increased from 35,000 people in 1960 to 76,700 people in 1970.<sup>25</sup>

The third factor was a change in political leadership and electorate composition in Ramapo. In the 1960s the electorate of Ramapo shifted from majority Republican to majority Democrat, as Table 1 shows. In 1965, the Democratic and Liberal parties of the town combined and mobilized to reform government in Ramapo, bringing new issues such as growth management, rising taxes, ballooning school enrollment, and overcrowded roads and infrastructure to the forefront.<sup>26</sup> The 1965 Democratic party platform also included the promise of removing multiple family residential units from the Ramapo zoning ordinance.<sup>27</sup>

**Table 1: Party Enrollment in Ramapo, New York**

Year	Percent Republican (Ramapo)	Percent Democrat (Ramapo)
1950	73%	27%
1955	64%	36%
1957	62%	38%
1959	59%	41%
1961	51%	49%
1963	50%	50%
1965	43%	57%
1967	41%	59%
1969	40%	60%
1971	37%	63%
1973	36%	64%
1975	33%	67%

John McAlevey was elected on this platform and his administration put not only new ideas and issues on the political agenda, but also saw themselves as reformers for a government who worked for the individual people and landowners in the town.<sup>28</sup> According to McAlevey, “the only people over the years who were consistently helped by the various Republican administrations which were in power in Ramapo were the untaxpayers,” referring to “large landowners, the landed gentry, and the speculative builders.” In McAlevey’s assessment, the citizens of Ramapo needed “relief from the rising burden of a total tax load which was spiraling upward at an alarming rate... beneficial tax ratables and a control on the rate of residential growth.”<sup>29</sup>

Despite the administrative and public discourse concerning the rate of growth in the town, Ramapo actually experienced a decline in residential growth immediately prior to adoption of the controlled growth program. In 1961 the number of building permits issued for new dwellings in the unincorporated area of Ramapo was 502. That figure rose to 535 in 1962, 620 in 1963, 726 in 1964, 798 in 1965, 835 in 1966, and decreased to 551 in 1967 and 485 in 1968.<sup>30</sup>

Taxpayers in Ramapo also experienced rapid tax growth in the years prior to adoption of the controlled growth plan. School budgets in Ramapo rose by 23% in 1964-65, 28.5% in 1965-66, 23% in 1966-67, 27% in 1967-68, and 14% in 1968-69.<sup>31</sup> Some of the most vocal supporters of the managed growth program came from school administrators and parents who were concerned about school overcrowding and facilities, and the public who was concerned about rising taxes to pay for schools.

Thus, a final factor was a perceived lack of public facilities to support the new residential development. Despite the decline in residential permits after 1966, McAlevee said in 1969, “what was wrong with the community was that it was growing too rapidly and that it was growing without a plan . . . The result was unplanned and uncoordinated growth which either taxed, or ignored the absence of, necessary community facilities.”<sup>32</sup>

## **B. Development of the Growth Management System**

Development of the system of land use controls that comprised the planned growth program began with the elimination of all multi-family housing in the zoning ordinance on February 14, 1966, and culminated with the passage of the development timing point ordinance on October 13, 1969.

The Ramapo managed growth program relied on traditional planning tools to work in concert to manage growth. As Manuel Emanuel said in a 1974 interview, “There are many communities that have the same kind of growth problems. The most significant thing about Ramapo was the fact that it had gone through the conventional cycle of planning. It actually executed all the elements of the conventional planning process. No community can initiate a growth control process without doing that.”<sup>33</sup>

The following are the elements of the Ramapo growth management system:

- (1) Elimination of apartments from the zoning ordinance (February 14, 1966)
- (2) Creation of first lateral sewer district (May 1966)
- (3) Creation of Ramapo Drainage Commission (May 1966)
- (4) Interim development ordinance (June 6, 1966)
- (5) Master plan (July 26, 1966)
- (6) Zoning ordinance implementing the comprehensive plan (December 29, 1966)
- (7) Development easement acquisition law (June 26, 1967)
- (8) Mandatory average density ordinance (August 14, 1967)
- (9) Prohibition against new village incorporations (August 28, 1967)
- (10) Official map (August 28, 1967)
- (11) Housing code (February 1968)
- (12) Soil and excavation law (May 1968)
- (13) Subdivision regulations (July 1968)
- (14) Six-year capital improvement program (November 1968)
- (15) Development timing ordinance (October 13, 1969)

While all of these elements were important links in the system of managed growth in Ramapo, the most important and controversial elements were the elimination of multi-family residential units in the zoning ordinance, the master plan, the interim development controls (building freeze), the capital improvement program, and the development timing ordinance. These elements of the program are summarized below.

(1) *Elimination of Multi-Family Housing.* In keeping campaign promises made by both Republicans and Democrats, McAlevey and the town board unanimously voted to eliminate multi-family housing from the zoning ordinance on February 14, 1966. Over objections that the ordinance was discriminatory to minorities and would undermine the town's tax base, the town board's decision rested on the desire to preserve Ramapo's open space and rural character, and put an end to rapidly rising school taxes.

In a newspaper account of the public debate over the issue, local attorney Robert Grank was quoted as saying "at the risk of being considered personally obnoxious, am I to assume that, because we have five villages, the township is to be kept 'lily white'?"<sup>34</sup> According to the newspaper, some villages<sup>35</sup> were thought of as having much larger African-American populations than Ramapo. Town board member Bernard Charles responded: "What I'm concerned about is good planning. And when I sit on the board, I'm concerned about the overall good of the people. I am aware that a number of apartments are being built in the villages, but I do not go along with any relationship between apartments and keeping the township 'lily white'"<sup>36</sup>

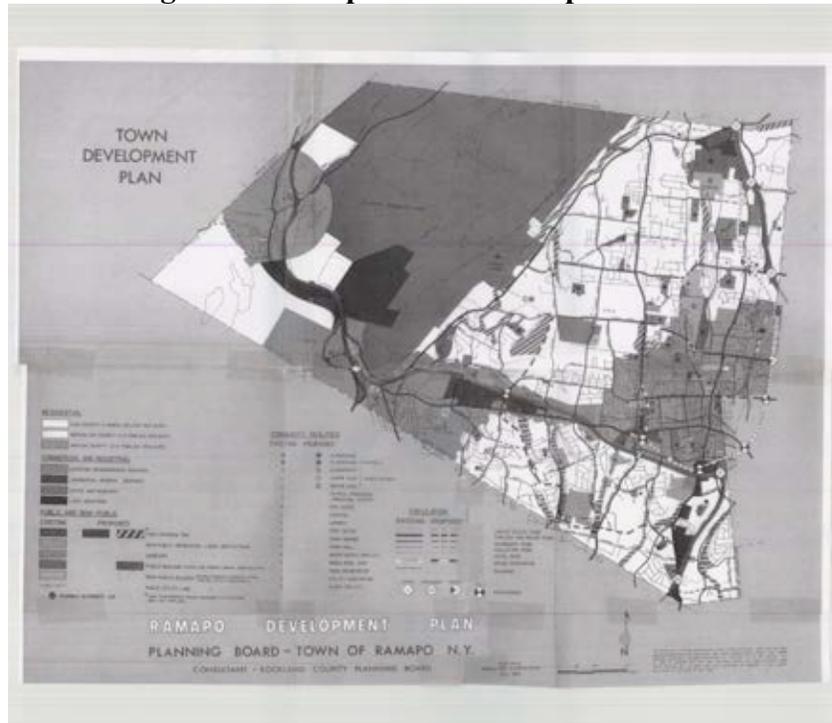

The elimination of multifamily zoning in Ramapo was done prior to the completion and adoption of the town master plan. The impression that is left by this action is that town board appears to have been motivated by a desire to make good on campaign promises rather than on an examination of the costs and benefits of the elimination of multi-family housing from the zoning ordinance.

(2) *The Master Plan.* The origin of the system of development controls that comprise the managed growth program begins with development of the master plan in 1964, funded with a federal grant. Public hearings were held over two years, and the master plan – a four-volume study that includes a set of background studies, proposed zoning and subdivision regulation, and the plan itself - was adopted by the planning board in July 1966.

A key assumption contained in the master plan study was that every developable parcel in the town would be developed by 1979 unless some form of growth management was enacted.<sup>37</sup>

Figure 3 shows the composite Town Development Plan map from the master plan.

**Figure 3: Ramapo Town Development Plan**

Source: Ramapo Planning Board, *Development Plan: Ramapo, New York* (Ramapo, NY: Ramapo Planning Board and Rockland County Planning Board, July 1966): 81.

Five policies contained in the master plan provided the basis for the growth management program.<sup>38</sup> Those policies surrounded the issues of: preserving open space and natural resources; assuring that population increases in the town were kept at a moderate level; the character of commercial development; the provision of adequate public facilities, and strengthening the tax base of the town.<sup>39</sup>

Based on the five development policies, the town board established three principles to guide the character and density of residential development in Ramapo:<sup>40</sup>

1. The areas of the greatest residential densities should be those in the villages of the Town and those closest to the villages. In general, densities should become increasingly lower as the distance radiating from the villages increases.
2. Residential densities should be consistent with the character and density of surrounding developed areas, topography, the adequacy of circulation and other community facilities and the overall objective of providing for a moderate population increase in the unincorporated portion of the Town.
3. To preserve natural features and open space and to provide for more flexible and diversified residential development, broader use should be made of the land use control device of “averaging” or “clustering” as provided for in Section 281 of the Town Law, using the rural, semi-rural,

and suburban densities provided for in the Plan as the basis for such development.

Following these principles, the planning board established three categories of residential density: low density, which included one or less home per acre; medium-low density, which included between one and two homes per acre; and medium density, which included between two and four homes per acre. The highest densities were to be near the villages of Spring Valley and Suffern, lower densities were permitted surrounding the highest densities, and the lowest densities were permitted in areas farthest away from villages.

Multi-family housing was generally excluded from the plan (except for in certain large vacant areas by means of density averaging). The plan declared: “[T]he planning board feels that there are few, if any, areas in the town where large-scale apartment developments could be located without radical change in the character of the area. Furthermore, the provision of opportunities for extensive multi-family development would be inconsistent with one of the prime objectives of the Plan, to keep future population growth at a moderate level so as to preserve the general character of the Town and to avoid overburdening public facilities.”<sup>41</sup> It should be noted that an assumption was that higher density housing, including multifamily housing, would be located within the villages; thus, the plan assumed—without any clear agreement by the villages—that this would occur.<sup>42</sup>

Given the allowable density and areas for residential development, the plan would provide for the ultimate development of some 20,000 homes in the unincorporated areas of Ramapo.

The master plan included recommended changes to local regulations, including the zoning ordinance, subdivision regulations, the official map, housing and building codes, and the capital improvement program. All of those recommendations supported the low-density development called for in the master plan. The town board later acted on those recommendations, as discussed below.

(2) *Interim Development Law*. The interim development law, known as Local Law No. 2, was adopted by the town board for the purpose of prohibiting the issuance of building permits and approval of preliminary subdivisions in certain areas, representing about 50 percent of the town, designated on an “interim development map,” to protect the new master plan from defeat before it could be officially adopted. The law was adopted on June 6, 1966 for a period of ninety days, after a stay order by the Rockland County Supreme Court was lifted which prevented the board from taking action on the law.<sup>43</sup>

As with the other components of the planned growth system, the town board was met with considerable public outcry against the interim development law. At a May 16, 1966, public hearing concerning the proposed law, at least seventeen people spoke in opposition to the ordinance. People opposed to the ordinance

were builders, attorneys, a real estate agent, and other residents. Three people spoke in favor of the proposed ordinance – a rabbi from New Square, the Hasidic community, an attorney, and a resident.

Passage of the interim development law by unanimous vote allowed the town board time to put in place the remaining elements of the planned growth program.

(3) *Capital Improvement Program*. The Ramapo Town Board adopted a six-year capital budget (effective for years 1-6) and a twelve-year capital program (effective for years 7-18) in 1968, which, together, constituted an eighteen year plan for the timing and funding of the infrastructure necessary to support residential and other development in Ramapo.<sup>44</sup>

The six-year capital budget consisted of a total of over \$4.5 million in capital improvements over six years. Of that, approximately one-third (\$1,784,400) was to be spent on road improvements and new road construction (mostly road widening), approximately one-third (\$2,046,100) was to be spent on miscellaneous items such as sidewalks, engineering, a highway garage, an incinerator, and police facilities, and one-third was to be spent on parks and recreation facilities and drainage projects such as drainage culverts along roadways (\$1,313,700 and \$590,950, respectively).<sup>45</sup>

The list of capital improvements prioritized each item into one of three groupings: improvements to be undertaken in 3-6 years (high priority), improvements to be undertaken in 6-10 years (second priority), and improvements to be undertaken in 10-15 years (lowest priority).<sup>46</sup>

Ramapo officials saw the adoption of the capital program as a key part of the growth management system, and a more proactive element than some of the other tools already in place. John McAlevey told the Association of Towns in 1970:

The zoning ordinance, fortified by the official map, constitutes the realistic establishment of a passive town development policy. I call this, even after all the work of the master plan, zoning ordinance adoption or revision, and official map adoption “passive” because it presumes to predict and/or control what the character of the town will be as it develops by circumscribing the options of the private entrepreneur. Essentially, under the conventional system, whether the town develops and at what rate is a result of a multitude of decisions made in the private sector, not only outside the pale of government but unknown to it.

If the town board wishes to be more proactive in the development of its plan than there is a third step available which raises its level of response out of the passive and into the active area – this is the development and adoption of a capital program under Sec. 99-G of the General Municipal Law. This is not an easy or common step.<sup>47</sup>

As McAlevey said in a 1974 interview, the reasoning behind the capital budget and capital program was to provide a comprehensive, long-term approach to development timing:

One of the objectives of the capital program is to crank in amortization costs of different projects which have different life expectancy so that the capital cost isn't the primary criteria. It is what is going to cost you during the five or ten or fifteen years. Then try to balance those things so that you have a level rate of debt service. Hopefully you are only going to absorb with your normal rate of growth so that it won't affect your tax rate.<sup>48</sup>

With the capital budget and capital improvements plan in place, all that was left in creating the planned growth program was the adoption of the development timing point system.

(4) *Development Timing Ordinance.* A key element of the growth management system - and perhaps the most controversial one - was adoption of the development timing ordinance that used a point system to approve residential development. To some, the point system is what constituted the managed growth program;<sup>49</sup> however, the point system was simply an amendment to the zoning ordinance adopted to implement the master plan, as required by town law.<sup>50</sup>

The town board established the point system<sup>51</sup> in order to assure that infrastructure and public facilities kept in pace with new residential development. To that end, by-right residential development was eliminated in the zoning ordinance and was only allowed with a special permit. Special permits were given based on a point system which awarded between five and zero points for improvements in five areas: sewers, drainage, recreation facilities, roads, and fire stations,<sup>52</sup> either provided privately by the developer or the town through the capital budget and capital improvement program (see Table 2). Special permits were granted by the town board to residential developments that achieved at least fifteen points.<sup>53</sup> Proposed developments that failed to achieve at least fifteen points were denied a special permit. The system only applied to residential use, not to other uses, such as commercial or industrial activities.

**Table 2: Ramapo Development Timing System**

<b><u>Capital Improvement</u></b>	<b><u>Number of Points</u></b>
<b>Sewers</b>	
Public sewers available in certain residential districts	5 points
Package sewer plants	3 points
County approved septic system in certain residential districts	3 points
All others	0 points
<b>Drainage</b>	
Percentage of required drainage capacity available:	
100% or more	5 points
90% to 99.9%	4 points
80% to 89.9%	3 points

65% to 79.9%	2 points
50% to 64.9%	1 point
Less than 50%	0 points
<b>Improved Public Park, Recreation Facility, Public School Site</b>	
Within ¼ mile	5 points
Within ½ mile	3 points
Within 1 mile	1 point
Further than 1 mile	0 points
<b>State, County, or Town Major, Secondary, or Collector Roads Improved with Curbs and Sidewalks</b>	
Direct access	5 points
Within ½ mile	3 points
Within 1 mile	1 point
Further than 1 mile	0 points
<b>Fire House</b>	
Within 1 mile	3 points
Within 2 miles	1 point
Further than 2 miles	0 points

Source: Town Board of Ramapo, N.Y. Amendments to Town of Ramapo Building Zone Amended Ordinance of 1969, adopted October 13, 1969.

If developers could not accrue the requisite fifteen points, a special permit could be also issued for some future date when the necessary improvements were planned to be completed under the capital budget and capital improvement plan, as amended, or failing to meet sufficient points then for the final year of the capital plan. Points were awarded based on scheduled improvements – not the actual existence of improvements. In other words, if the town failed to provide improvements according to the capital improvement plan, points would still be awarded according to the plan. Developers who constructed and paid for capital improvements themselves were permitted to develop their land prior to the capital improvement plan schedule.<sup>54</sup> In other words, developers who were not able to accrue the requisite fifteen points had three choices: (1) wait until the development was able to accrue fifteen points, (2) apply for a variance<sup>55</sup>, or (3) provide the capital improvements necessary to acquire fifteen points.

Landowners who chose the first option – to wait until the property was able to accrue fifteen points-- also had the option of taking advantage of the newly-created development easement acquisition program. The Development Easement Acquisition Commission (DEACOM), adopted on June 26, 1967, provided owners of developable property with a remedy to tax pressures that were forcing many of them to sell their land.<sup>56</sup> Under DEACOM, the town could acquire an easement for a property for not less than five years and the assessed value of the property was proportionally reduced because of the limitation on future use of the land.<sup>57</sup>

The capital improvements program provided that every parcel of land would accrue the necessary fifteen points at some time during the 18-year timeframe for capital improvements. However, at issue in the public discussions surrounding the ordinance was the certainty that Ramapo would be able to provide the necessary infrastructure and capital improvements. Some of these improvements were to be provided by separate boards -- sewers were provided by a special district, fire stations were provided by

separate fire districts, schools were constructed by school districts, and many of the roads were under county or state jurisdiction. Funding for these facilities was also at question and was dependent on voter referendum or federal assistance.<sup>58</sup> Only parks, sewage collection (not sewage treatment), drainage, and some roads were under jurisdiction of the Town of Ramapo.<sup>59</sup>

Nonetheless, the town was cautious about including capital improvements which it did not have control over in the point system. As Manuel Emanuel wrote in 1974, while the master plan and various studies were considerations in establishing the point system, the proposed capital budget and capital plan were the final determinants. The town decided to only include improvements for which it had direct or indirect control, some improvements were left out of the point system, “the inclusion of standards with respect to school facilities was first considered and finally rejected as inappropriate, since separate special district jurisdictions have control over this matter.”<sup>60</sup>

Emanuel noted two exceptions – some roads and recreational facilities - because of their essential place in development. “In the case of roads, state and county roads were also included with town roads, since they are all vital parts of the Town highway network.” Emanuel noted that the planning board was involved in county and state roads through requiring widening and curb and sidewalk improvements for these roads through the subdivision and site plan review process.<sup>61</sup> “In the case of recreational facilities, improved facilities on public school sites, not owned by the Town, were given equal consideration in view of the fact that they are considered an integral part of the Town’s recreation system.”<sup>62</sup>

This presented Ramapo with the problem of having a point system based in part on a capital budget and capital improvement program that relied on outside control and financing. With time, several areas of capital improvements demonstrated some of the problems with this approach. An example of one such problem that emerged was sewer system construction, which was not part of the capital budget but was part of the point system. Funding for sewer construction was severely cut back in Ramapo by the state and federal governments by 1969.<sup>63</sup> This resulted in a capital improvement program that did not exactly keep pace with assumptions built into the point system.

Even those parts of the capital budget and capital program that were under the jurisdiction of the Ramapo Town Board could not be followed exactly as written. One such problem came after the town experienced severe damage from hurricanes Doria and Agnes in 1971 and 1972, respectively. The town appropriated \$1.5 million to hurricane recovery, thus differing capital budget work for 1972 and 1973.<sup>64</sup>

A 1974 analysis of the point system by Emanuel indicates that the main capital improvements lacking in most developments that were granted special permits were related to drainage. Emanuel noted that every special permit case received all five points for sewers, every case had a recreational facility within one mile, most cases had at least three points under the road category, and most had a firehouse within two miles. However, few had more than three points for drainage.

On the other hand, development variances were denied for a number of issues, including inadequate drainage, lack of road access, and lack of fire station access. However, variances that were denied generally had more points for sewers and recreation facilities.<sup>65</sup>

The development point system – and the planned growth program in general - found many supporters in the Ramapo public school system, which was divided into two school systems: Ramapo School District No. 1 and Ramapo School District No. 2. In 1950, Ramapo School District No. 2 had 2,000 students. The growth of the town in the years prior to enactment of the planned growth system brought the district's student population to 14,600 by 1968.<sup>66</sup>

While the two Ramapo school boards did not take official positions on the development timing ordinance, the president of the Ramapo No. 1 School Board, William Ward, spoke favorably at an October 1968 public hearing, one of three held on the ordinance that year. Ward indicated that growth in the student population in the district would almost certainly lead to increases in taxes, “A pupil population that grows between 15 and 17 percent per year in the past five years almost makes it axiomatic that increases in 15 percent or more in the gross budget will be in line for some period of time.”<sup>67</sup>

The Ramapo No. 2 School Board president, Joe Caliteri, said “as a board we have not taken, and will not take a position... Our position is that this is a municipal and town responsibility. However, we do feel, and we share with you an agreement that some form of growth control must be exercised.”<sup>68</sup> Other supporters of the development timing ordinance included representatives of the North Main Street School PTA Executive Board, The PTA Coordinating Council of Ramapo 2 School District, and individual citizens.

Opposition to development timing ordinance came from some landowners and, predictably, builders and developers. In an October 1968, public hearing, Rockland County Builders Association executive director Neal Johnson argued that the point system would cause great financial hardship to small local landowners, and do little to control growth from large speculative developers, “land in Ramapo was being bought up by big speculators who had the money to either hold the land...or if the land had nearly sufficient points to build they had the money to put in a sewer plant or sidewalks and curbs where necessary in order to comply with this ordinance whereas the owner of a lot or two would not be in a position to hold on to this land in many instances...”<sup>69</sup> Other people who spoke out against the planned growth program included Rockland County Builders Association President Nathan Woolf and owners of one or several parcels of land who were concerned about being allowed to develop in future years.

## **V. The Litigation**

### **A. Golden Estates Denied “Without Prejudice”**

The litigation surrounding the Ramapo ordinance began shortly after the ordinance was enacted. It came from two directions: the Rockland County Builders Association filing with two property owners; and Ruth Golden and the Ramapo Improvement Corporation, which wanted to develop a tract of 53 acres into 41 lots, on the north side of Viola Road in the northern part of the town. The development, which was called “Golden Estates” on the northern side of Ramapo, had received “sketch plat” approval at the Ramapo planning board’s August 19, 1969, meeting, and the board directed that an advertisement for preliminary approval be placed in the local newspaper.<sup>70</sup>

This article concentrates on the litigation by Golden and the Ramapo Improvement Corporation. The challenge by the Rockland County Builders Association and the property owners intersects with the Golden challenge at the intermediate appellate level and is discussed below.

Immediately after the development timing ordinance passed, on October 13, 1969, Ramapo took steps to implement it. At an October 27, 1969 meeting of the Town Council, Deputy Supervisor Ned Siner told the Council that John Keough, the administrative assistant for boards and commissions, had prepared forms and procedures for the administration of the new ordinance, and the Council immediately ratified them.<sup>71</sup>

At the planning board’s December 9, 1969, meeting, Carl Wanderman, the deputy town attorney, appeared before the opening of the first public hearing, and reviewed the requirements of the new ordinance. Wanderman told the board that the special permit for residential development prohibited subdivision approval of any kind except where the developer or developer’s agent secured the permit, or a variance under the ordinance. “This would apply to any Planning Board approval whether the same be [a] sketch plat, Preliminary, or Final or any combination thereof,” the minutes record Wanderman as saying.<sup>72</sup>

With that, the planning board denied “without prejudice” the approval of 20 subdivisions at either the sketch plat (pre-preliminary) or preliminary stages,<sup>73</sup> One of these was the Golden tract, up for preliminary approval. Immediately after the denial of preliminary approval of Golden Estates, a planning board member, William S. Gould, requested that the minutes reflect that “he does not disagree with the opinion of counsel but, rather feels that Section 46-13.1 [the development timing regulations] of the Ramapo zoning ordinance is a BAD law.” [emphasis in original].<sup>74</sup>

### **B. Golden’s Complaint and Ramapo’s Answer**

Attorney David Coral filed a seven-page petition with the New York Supreme Court, the trial court, on behalf of Ruth Golden and the Ramapo Improvement Corporation on February 3, 1970.<sup>75</sup> The petition asked the court to review and annul the decision of the planning board in refusing to approve the Golden preliminary plan on the grounds that the board acted on a local law that was unconstitutional and void.<sup>76</sup> Coral contended the amendments to the zoning code violated both the U.S. and New York constitutions and were not supported by New York statutory law. He made essentially two arguments: (1) the amendments delayed for as much as eighteen years, or more, the effective use of

property for any reasonable use under the zoning ordinance, without compensation to the owner of the property for the restrictions and limitations; and (2) the attempt to tie in residential development with a capital improvement program (CIP) for the 7th to 18th year went far beyond the authority of a town to adopt a capital improvement program under New York's General Municipal Law. Because there was no assurance that there would be a budgetary allotment for CIP beyond any give year, municipal facilities under the program may never be erected, and "[I]f this be so, then there may be a complete cessation of residential development."<sup>77</sup>

Coral pointed out that the ordinance only affected owners of residential, and not commercial, industrial, or other property. He also argued that the traditional purpose of zoning had been frustrated by the ordinance, which was for the purpose of determining "land use" and not "'phasing' of buildings or determining when buildings may be constructed."<sup>78</sup> Finally, he maintained that Ramapo's development easement provisions, which permitted the town to grant an easement limited by time in order that the property owner could obtain a reduction in property taxes during the period that the development restrictions were in effect, were illegal under New York law.

The Town of Ramapo's answer and return, filed on March 2, 1970, by Town Attorney Thomas J. Newman, and Robert Freilich, who was of counsel to the town, contained a 34 point response, denying most of the assertions in the Golden petition.<sup>79</sup> The special permit provisions, the response contended, constituted "temporary restrictions on the reasonable and proper exercise of the planning, zoning, police power, and home rule powers of" Ramapo. The petitioners had, according to the answer, never applied for a special use permit or variance, and, because of that, had failed to exhaust their administrative remedies. Ramapo's answer contained affidavits from John Keough, the town's administrative assistant for boards and commissions, Manuel S. Emanuel, the town's planning consultant, Hyung C. Chung, a planning consultant who had conducted a cost-revenue study for the town in 1968, and John McAlevey.

Emanuel's four-page affidavit laid out the rationale for the phased growth system, concentrating on the capital improvement program itself and stressing that it was a temporary, but proactive scheme at achieving planning objectives. "All professional planners and virtually all planning literature," he stated, "subscribes [sic] to the view that programmed growth is one of the prime goals to be achieved through sound comprehensive community planning." The capital budget contemplated a rate of expenditure "considerably in excess of the programmed expenditures of other comparable townships in the New York metropolitan area."<sup>80</sup> Emanuel declared that Ramapo would reach "zoning saturation" by 1985, and at that time "sufficient capital works will have been constructed so that no further limitations on the development of the remaining acres need be entertained any longer."<sup>81</sup>

Chung's affidavit was cautiously worded. He had concluded that a controlled growth alternative would yield smaller increases in taxes over the 18 year period, but "'the net savings in tax rates is something which must be weighed carefully against the problems which the introduction of a controlled growth situation could cause. . . [T]he advantages

which would be gained must be set against such considerations as the desirability of interfering with the free market processes.”<sup>82</sup> Any “untoward social consequences” in terms of zoning control in Ramapo that would eliminate “persons of the lower bracket from residence in the community” were, he wrote, the consequence of Ramapo’s 1958 zoning ordinance, which introduced large-lot zoning to the town. The development timing ordinance, he declared, “added insignificantly to the basic inhibition created as a result of the 1958 ordinance.”<sup>83</sup>

At the time, McAlevey was in his third term as Town Supervisor. His affidavit reflected upon all the steps the town had taken under his administration to formulate the planning program that was being litigated, mentioning briefly his efforts to build public housing.<sup>84</sup> In the affidavit’s last page, McAlevey pointed out that the town’s building and development industry had long been put on notice that the program was underway, and that the builder trade association “had kept their members informed at all times about the development of the Town’s plans for stricter controls, large town capital outlays, and for planned sequential development.”<sup>85</sup>

### **C. Trial Court Decision**

New York Supreme Court Judge John H. Galloway, Jr., released his decision on October 26, 1970, finding for the Ramapo Planning Board. The opinion began by dismissing a number of defenses and objections advanced by Ramapo, including those dealing with standing to sue and exhaustion of administrative remedies, and quickly got to the heart of the matter. As to whether the development timing ordinance was in excess of the zoning powers delegated to the town board by the New York constitution and the state enabling legislation, Galloway pointed to language in the constitution and New York Town law. In particular, he noted the “purposes in view” language in the zoning enabling legislation indicated that zoning was intended “to avoid undue concentration of population, to facilitate the adequate provision of transportation, water, sewerage, parks and other requirements.”<sup>86</sup> He observed that the statute “reflects the current trend toward broadening the scope of the police power in the field of zoning.”<sup>87</sup>

The challenged ordinance, Judge Galloway wrote, was “adopted in accordance with a most comprehensive master plan, and in establishing the point value standards related to the available service categories of sewers, roads, fire protection, schools, parks, and drainage, the ordinance does not contravene the Town’s comprehensive plan.”<sup>88</sup> To Galloway, the “conclusions are inescapable” that the development timing ordinance fell within the scope of the New York town law.<sup>89</sup> Moreover, he could find no authority that barred the successive renewing of six-year capital improvement programs, so that an 18-year time span was possible.

Galloway disagreed with the plaintiffs’ contention that the ordinance “thrust upon petitioners the burden of a problem of inadequacy of public facilities, but rather it provides for a planned deferment of residential subdivision approval pending the availability of minimally adequate facilities to be supplied either by the Town over a determinable period of time or by the land owner on an accelerated time basis.”<sup>90</sup> Finally, Galloway held that the ordinance did not confiscate property without due process

and without compensation. The duration of the ordinance's restraint on Golden's land and lands similarly situated was "neither permanent nor unreasonable either on its face or in practical effect."<sup>91</sup> The ordinance also included "reasonably effective methods or remedies for the reduction of any period of deferment of beneficial use up to the potentially maximum 18-year period, and for other relief."<sup>92</sup>

The decision suggested that Galloway had been impressed by scale of problems faced by the town in terms of public facilities and services resulting from "an enormous growth in population," the planning framework presented by Ramapo, and the linkage of the development timing ordinance to the town's detailed capital budget and capital improvement program.<sup>93</sup> Adding to that was the plain language in the enabling legislation in terms of the purposes to which zoning was to serve. Nothing was said in his opinion about the potential for exclusionary mischief; indeed, the plaintiffs had not raised that issue. The issue would surface later.

#### **D. Appeals to State Supreme Court, Appellate Division**

In the appeal of Judge Galloway's decision, Attorneys David Coral and Reuben Ortenberg continued to argue the question of whether the development timing ordinance comported with the state's enabling legislation for zoning. The ordinance, Coral wrote, did not attempt to regulate use, but rather prevented use of property. The period of time that use was prevented, their brief said, was "almost a generation," and "neither a temporary or reasonable time during which the Town can demand that an owner pay taxes and have the land lie fallow."<sup>94</sup>

The reply brief filed by Max Mason, the town attorney, and Robert Freilich, reaffirmed Galloway's reasoning. But it added some new angles. The brief declared that the Ramapo program was "in accord" with recommendations of three Presidential commissions on housing and urban growth and studies by the New York State Department of Planning on planning legislation.<sup>95</sup> The brief then went on to condemn large-lot zoning, noting that while it had been held valid in New York, "[i]n many cases it is utilized to exclude lower-income families, although this alternative purpose is not expressed."<sup>96</sup> The Ramapo ordinance, the brief said, "to the contrary, insures the construction of about two hundred housing units for low and moderate income families and the Town contains about five thousand apartment units."<sup>97</sup>

This provided a new opening for David Coral because the question of whether the town's zoning ordinance provided adequate opportunities for affordable housing, either public or private, had not been an issue at the trial court level, nor had the issue of the appropriateness of the lot sizes applied to the Golden property. In his reply brief, Coral took Ramapo to task for "misstated matters of fact that do not appear in the record."<sup>98</sup>

Respondents keep referring, in their brief, to low and middle income housing. They would make it appear that such housing was in the original 1966 Comprehensive Zoning Amendment.

A review of [the zoning ordinance] will show that there was no place where a multiple residence could be built in the Town of Ramapo. . . [W]e feel it is incumbent to correct

the record. Low and middle income public housing may now be built in the Town of Ramapo, by special permit, in any residence zone, pursuant to an amendment adopted in 1970, months after the challenged amendment [emphasis in original]. . .

Appellants' property is located in a building zone . . . calling for 50,000 square feet in each lot. This is, in the opinion of the writer of this brief, a "large lot" which is condemned by respondents.<sup>99</sup>

### **E. Appellate Decision**

In a 3-2 decision by the New York Supreme Court's Appellate Division, released on July 23, 1971, Justice Henry Martuscello struck down the Ramapo ordinance, finding it was not authorized by the state zoning enabling legislation for towns, thus reversing the trial court. He conceded that it was "common knowledge that the extraordinary growth in suburban population in recent years has given rise to complex physical, social and fiscal problems and that communities have been hardpressed to solve these problems."<sup>100</sup> He pointed to the *Josephs v. Town Board of Clarkstown* case, described above, as an example that "illustrates a town's use of its delegated powers to control population density through minimum lot requirements."<sup>101</sup> But Ramapo, he wrote, "has sought not only to regulate density, but also to time its population growth rate by imposing, through its point system, restrictions on land use."<sup>102</sup>

To Martuscello, there was "a vast difference between regulating population density through such techniques as minimum lot requirements or limitations on multi-residential housing and controlling the time and rate of population growth. In essence, respondent asks us to uphold an ordinance which restricts the free mobility of population until a designated area has available certain necessary municipal facilities. I can find no authority to allow enactment of such an ordinance."<sup>103</sup>

Then, as a response to the various national reports, studies, and journal articles on urban sprawl that Ramapo had cited in its brief, Martuscello observed: "I am aware of the positions of many legal commentators who have suggested that perhaps new types of controls may be needed to prevent urban sprawl and the problems associated with it. However, the consequences of allowing municipalities to place time controls on their expansion, geared to when the municipalities can provide certain necessary facilities and services, are far-reaching in their ramifications." A delegation of power to allow that should, he wrote, "be clearly spelled out in appropriate amendments to the Town Law, the Village Law and the General Municipal Law if such be the intent of the State Legislature."<sup>104</sup>

The reversal by Martuscello validated the plaintiffs' strategy: if a development timing system were to be used, there had to be enabling legislation clearly supporting it.

### **F. Appeal to the New York Court of Appeals**

With each level of appeal, the briefs got longer, as the stakes got higher. The Ramapo brief to the New York Court of Appeals, by Attorneys Max Mason and Robert Freilich, who argued the case before the court, was 74 typeset single-spaced pages. Its central theme was this: "The Ramapo ordinance . . . was not a precipitous response to a crisis

brought about by lack of planning and foresight, but rather a well-planned, multi-faceted comprehensive plan to direct the community's growth and development rationally. Appellees are not discriminated against—they are reasonably classified with *all* other developers and reasonably restricted by a comprehensive plan tending toward a legitimate end. [emphasis in original].”<sup>105</sup> The brief reasserted arguments made at the trial and intermediate appellate levels, including the town's efforts (against great opposition of its citizens) to build public housing. Ramapo, it noted, “has made extensive, conscientious efforts to achieve balance, socially economically and functionally.”<sup>106</sup> Again the brief cited numerous studies, including those of federal commissions, that inveighed against sprawl and supported development timing.<sup>107</sup> And again, the Ramapo brief declared that “low density” zoning was used an exclusionary device in suburban communities and “was destructive of comprehensive planning.”<sup>108</sup>

The 31-page Golden brief, by David Coral (who argued the case) and Reuben Ortenberg, again noted that the Ramapo brief contained “a conglomerate of alleged facts not in the record, statements of law, the brief writer's philosophy, etc. . . . At page 7 in their [the Ramapo] brief they appear to be critical that ‘no private developer has ever met the need for low-cost housing’.”<sup>109</sup> The brief then hammered away at Ramapo's 1966 elimination of multifamily residences in the zoning ordinance and the application of a 50,000 square foot lot area requirement to the Golden property, a large lot size of the type the Ramapo brief inveighed against. “It needs neither argument nor extensive discussion to indicate that low-cost housing can only be erected in the form of multiple residences . . . . If an acre and a quarter and two acre lots are not ‘large lot’ zoning, then there seems to be no definition of that phrase.”<sup>110</sup> The brief added: “If each town were to adopt similar restrictive zoning ordinances, whether based on the same or different arbitrary standards, then others would follow suit, each town would erect a wall around its territory and keep out all but a selected few.”<sup>111</sup>

The oral arguments by Coral and Freilich before the seven justices of the Court of Appeals in Albany lasted for nearly two hours on November 17, 1971. At one point, Associate Judge Adrian P. Burke told attorneys that suburban development in New York was “in a mess” because of early court rulings allowing haphazard development. “[T]he American way of development seems to be growth of hamburger stands and pizza parlors,” Burke said. “New York City is a mess and Suffolk County is becoming a mess.”<sup>112</sup> Burke's remarks foreshadowed the views of the court majority.

### **G. New York Court of Appeals Decision**

The New York Court of Appeals reversed, upholding the development timing ordinance, in a 5-2 decision written by Judge John Scileppi.<sup>113</sup> The decision joined the Golden case with a second brought by the Rockland County Builders Association.<sup>114</sup>

The state's highest court had no problem finding the enabling legislation authority for the Ramapo scheme, even though there was no specific authorization for the development timing ordinance. “That, of course, cannot be said to end the matter,” wrote Judge Scileppi. “Our concern is, as it should be, with the effects of the statutory scheme taken as a whole and its role in the propagation of a viable policy of land use and planning.”<sup>115</sup>

Analyzing the language in the Town Law,<sup>116</sup> Scileppi concluded: “[T]his much is clear: phased growth is well within the ambit of existing enabling legislation.”<sup>117</sup>

To the court, the Ramapo scheme built on how subdivision regulation in New York towns operated, but with a distinction. A planning board always had the authority to deny a subdivision based on lack of infrastructure, but with no recourse at all for the developer. Under the Ramapo scheme, the developer could either install the infrastructure or wait until their property could accumulate the requisite 15 points. That period, however, did not rise to the level of confiscation, in the court’s view, and the procedures in place for easements that would allow a reduction in property taxes satisfied the court as appropriate mitigating measures.

The extensive planning underpinned the development timing ordinance impressed the court. It also expressed confidence in Ramapo’s commitment to carry out the capital projects. “Yet, in passing of the validity of the ordinance on its face, we must assume not only the Town’s good faith, but its assiduous adherence to the program’s scheduled implementation.”<sup>118</sup>

The court was clearly taken with the Ramapo’s extensive citations to various national and state studies and reports as the policy backdrop for the growth management system; the decision contained several lengthy references to them.<sup>119</sup>

The prospect that the system would be used to exclude low- and moderate-income persons nonetheless troubled the court. “What we will not countenance,” wrote Judge Scileppi, “. . . under any guise, is community efforts at immunization or exclusion. But, far from being exclusionary, the present amendments merely seek, by the implementation of sequential development and timed growth, to provide a balanced cohesive community dedicated to the efficient utilization of land.”<sup>120</sup> Although Scileppi did not address the fact that multifamily housing had been eliminated from the zoning ordinance, as David Coral had noted repeatedly, he did note that the town had a variety of housing types, from modest to expensive (although the elimination of multifamily zoning by the town in 1966 was not addressed).<sup>121</sup>

A strong dissent by Judge Charles Breitel concentrated on the absence of authorizing language for development timing in the Town Law. “Existing enabling legislation does not grant the power upon which the Ramapo ordinance rests,” Breitel declared, “And for policy reasons, one should not strain the reading of the enabling acts, even if straining would avail, to distort them, beyond any meaning ever attributed to them, except by the ingenious draftsmen of the Ramapo ordinance.”<sup>122</sup> Breitel’s dissent dealt as well with possibility of exclusionary zoning in developing suburbs, and the likelihood that, absent a regional approach under careful state authorization, there might be “calamitous effects of ill-advised parochial devices.”<sup>123</sup> He concluded:

. . . [W]hen the problem arose outside the State the judicial response has been the same, frustrating communities, intent on walling themselves from the mainstream of development, namely, that the effort was invalid under existing enabling acts or unconstitutional [case citations omitted]. The response may not be charged to judicial

conservatism or self-restraint. In short, it has not been illiberal. It has indeed reflected the larger understanding that American society is at a critical crossroads in the accommodation of urbanization and suburban living, with effects that are no longer confined, bad as they are, to ethnic exclusion or 'snob' zoning . . . Ramapo would preserve its nature, delightful as that may be, but the supervening question is whether it alone may decide this or whether it must be decided by the larger community represented by the Legislature. Legally, politically, economically, and sociologically, the base for determination must be larger than that provided by the town fathers.<sup>124</sup>

#### **H. Appeals: Denial of cert by U.S. Supreme Court**

The plaintiffs in *Golden v. Planning Board of Town of Ramapo* had one last option: an appeal to the United States Supreme Court of the New York Court of Appeals. Attorneys Irving Anolik, David Coral, and Milton Shapiro filed a 37-page petition with the high court on September 1, 1972. “The transcendent constitutional and legal issues are so grave and portend dire domestic problems of such magnitude,” they wrote, “that only intercession and clarification by this Court can avert a tragedy in land development and mobility of population of monumental proportions. If this decision is left undisturbed, the Ramapo ordinance may well become a model for other communities throughout the country.”<sup>125</sup> Despite the drama and urgency of the petition’s language, on November 13, 1972, the Supreme Court dismissed the appeal “for want of a substantial federal question.”<sup>126</sup>

### **VI. Aftermath**

#### **A. The Reaction in Ramapo**

The first reaction to the New York Court of Appeals decision was that of Robert Freilich. “I think this is the most important zoning decision since 1926,” he told the *Rockland County Journal News*. “I hope it will have national ramifications.”<sup>127</sup> But a Ramapo town council member, Hy Jatkoff, a critic of the ordinance, was less euphoric. He charged that the plan “will cement the trend of poor blacks in the cities ringed by white suburbs and result in further polarizing society.” Jatkoff believed, according to the *Journal News*, “only the wealthy will be able to buy land and live” in Ramapo and claimed that building permits had only been issued to development only two percent of the town’s open land in 1971.<sup>128</sup> “Any good thing has the potential of being used for bad purposes,” John McAlevey responded, noting that the town was trying to build safeguards into the ordinance to prevent its abuse. “No other area could just pick up our plan and use it for its own use without adapting it.”<sup>129</sup>

The *Journal News* itself was reserved about the Court of Appeals decision. “The master plan and court ruling appear eminently sensible,” it editorialized. “But who’s to say whether another court in another state might not have rejected an identical situation as a discriminatory subterfuge and invalidated the master plan,” comparing the Ramapo decision with the first trial court ruling in the *Mount Laurel* anti-exclusionary zoning litigation in New Jersey, which had found the township discriminated against low- and moderate-income persons through its zoning ordinance.<sup>130</sup>

After the United States Supreme Court declined to review the Court of Appeals decision for lack of a substantial federal question, the *Journal News* noted that “zoning, since its conception, has been implemented basically as a device for preserving one-family residential areas “ but that Supervisor McAlevey continued to stress the town’s efforts to create a more “balanced community”; Ramapo’s backing of the two public housing projects that had been completed in the town, according to McAlevey, showed that the zoning ordinance was not meant to be exclusionary.<sup>131</sup>

### **B. The Reaction in the Planning and Legal Communities**

The response of the professional planning and legal community on the Ramapo case focused mainly on the wisdom of the phased growth scheme, rather than the decision itself. The impact on low and moderate income housing was a central concern of many commentators. The American Society of Planning Officials dedicated two issues of its monthly journal, *Zoning Digest*, to reporting on the case and the reaction to it, “A key factor in the Ramapo situation,” wrote Sy J. Schulman, one of the journal’s reporter-commentators, “was that the town had ‘clean hands’ in that it had a successful policy of providing for affordable housing.” But Schulman observed that the local reaction in the New York area tended to ignore that fact and instead “hailed the case as judicial concurrence in the right of municipalities to restrict development, by in effect, withholding the provisions of needed facilities.” The decision, he said, “is clearly not the last word in New York or elsewhere, and, in this reporter’s opinion, should not be viewed as a new kind of suburban hunting license.”<sup>132</sup>

Randall W. Scott, director of the Urban Governmental Affairs Department of the National Association of Home Builders, contended that the Ramapo decision offered “unfortunate precedent which could encourage the adoption of unilateral policies—in pursuance of seemingly valid planning ideas—which in combined effect could severely and adversely affect the quantity, quality, cost, location, and equitable opportunities for decent housing in the country.” Scott advocated a system of state and regional planning for housing, not present in the Ramapo case, and local planning that took into consideration “overall housing needs.”<sup>133</sup>

Richard May, Jr., a Nyack, New York, planning consultant, who had been planning director in Rockland County when the Clarkstown ordinance was developed in the mid 1950s (see above), compared the Clarkstown program from that of Ramapo. Clarkstown had zoned “substantial areas” for smaller lots or apartments or were designated for development at higher densities under the development timing program. By contrast, he observed, Ramapo had “no multifamily districts whatsoever and the vast majority of the unincorporated area in the township is zoned for single family lots ranging in size from 25,000 square to 80,000 square feet. [emphasis in original] . . . Timing the development of \$50,000 to \$60,000 single family homes [in 1972 dollars] is hardly an approach to the solution of regional housing problems.” While the Ramapo ordinance “will help the suburbs meet their development problems,” May predicted, it will “do little to open up housing for middle- and lower-income families in suburban areas.” He praised the Court of Appeals majority for “a remarkable understanding of current planning problems and ideas and an impatience with the legislature for avoiding its responsibilities in revising

the planning acts” but declared that “perhaps the court was carried away by these considerations and overlooked the effect of the entire Ramapo zoning ordinance and master plan on housing opportunities in the New York metropolitan region.”<sup>134</sup>

Echoing the same concern of Richard May about the impact on low- and moderate-income housing, Herbert Franklin, a Washington, D.C., attorney, distinguished two types of urban sprawl: the first “leapfrog development” in which the private market develops land furthest from supportive facilities because it costs less to do so, while leaving large tracts of more expensive undeveloped land closer to served areas, and the second, a continued spread of low-density housing on large lots. The Ramapo system was only intended to deal with the former, he said. It did not counter the low-density form of sprawl, he wrote’ rather “it programs it.” The town’s capital plan made no effort to promote cluster or multifamily housing in areas that might be suitable for more intensive uses, Franklin said. “The capital improvement plan thus contemplated a continuation of expensive and exclusionary ‘sprawl’ which in all probably would have occurred—although somewhat faster—without the plan.”<sup>135</sup>

Robert Freilich, who by 1972 was a professor at the University of Missouri-Kansas City School of Law, contributed a *Zoning Digest* commentary that traced the development of the timing system and the litigation, and the practical problems confronting him as the town attorney in one of the most rapidly growing suburban communities in New York. “All zoning and planning tools are essentially neutral,” he wrote in countering the contention that some communities apply them in an exclusionary manner, “They can be used correctly or incorrectly depending upon the motivation of the regulators. Our efforts must be to eliminate the abuses, while simultaneously developing stronger efforts to preserve the quality of our communities and of the environment.”<sup>136</sup>

“[B]ased on past experience,” wrote Chicago land use attorney Fred Bosselman in a lengthy examination of the decision, “each town can be expected to exercise this [the development timing ordinance] and similar techniques as if were an island independent of other towns.”<sup>137</sup> If ordinances such as Ramapo’s became commonplace, he said, “they will will encourage the clustering of new development around the fringes of existing settlements and the excluding of new development from large areas where it now typically takes place. The impact of a proliferation of such ordinances would be to create a series of communities made increasingly exclusive by raised housing costs and to exaggerate the trend toward megalopolitan sprawl.”<sup>138</sup> Like Herbert Franklin, Bosselman advocated state legislation that would provide regional planning review of suburban zoning, a theme that the majority and dissenting opinions in the Ramapo case had also touched upon.

Finally, Professor Norman Williams, Jr., included an extensive dissection of the trial, intermediate appellate, and Court of Appeals decisions in his land use treatise. Williams believed the majority decision in the Court of Appeals had “reached a reasonable conclusion.”<sup>139</sup> To Williams, the question of whether development timing was lawful was distinct from whether it was exclusionary. In some cases, an exclusionary motive could be found, and that would prompt an inquiry separate from the question of the

validity of development timing provisions. However, like Fred Bosselman, he noted the difficulties that would arise if Ramapo and many other nearby towns adopted their own timing-of-development schemes, “each setting its own pace in accordance with its own preference.” If this happened, “a major and difficult readjustment will be necessary if subsequently a regional growth policy is adopted, presumably to cover allocation and timing.”<sup>140</sup>

### **C. The Plan is Discarded**

Ramapo’s Town Board decided in March 1983 to eliminate the point system due to slow growth in the New York metropolitan area and delays in providing capital improvements. By that point, the town administration had changed.<sup>141</sup> John McAlevey had won reelection as supervisor in 1969 and 1971 (when the 200 units of newly constructed public housing in Ramapo were an election issue), but family matters prompted him not to seek reelection in 1973.<sup>142</sup>

Just as a change in municipal leadership was a major factor that led to the development of the managed growth program, it was also a factor that led to its demise. Ramapo saw several administrative changes in the 1970s, including the replacement of McAlevey as Town Supervisor in 1973 and a new Republican town board. Accordingly, the town’s policies changed from seeking to curtail residential development to promoting it.<sup>143</sup>

McAlevey’s successor, Morton Baron, stopped building capital and infrastructure improvements under the capital improvements program due to the fiscal crisis that was affecting Ramapo as well as the nation and because of different philosophies about development. Without the commitment to build capital improvements, phased growth in the town fell by the wayside because the town could no longer claim reasonable timing for development phasing. As McAlevey said in a 2003 interview, “The town had no choice but to start giving variances to builders when requested.”<sup>144</sup>

In 1967 Ramapo had enacted a town law preventing new village incorporations. Prior to that law’s enactment, a new village could be established with as few as 300 people and a little as three square miles of land. However, the law was overturned by the New York Court of Appeals<sup>145</sup> in 1982, opening the floodgates for new village establishment in the unincorporated areas of Ramapo.<sup>146</sup> Without control over incorporations, the Ramapo administration was unable to prevent the formation of new villages by those seeking to bypass the planned growth system.<sup>147</sup>

In a 2003 interview, Emanuel indicated that a lack of regional cooperation was another problem with the growth management system, “Growth control would have been more successful if it had been done regionally...but there wasn’t a universal vision ... The county’s master plan had no teeth, also no comprehensive housing policy. Without zoning powers, the system breaks down.”<sup>148</sup>

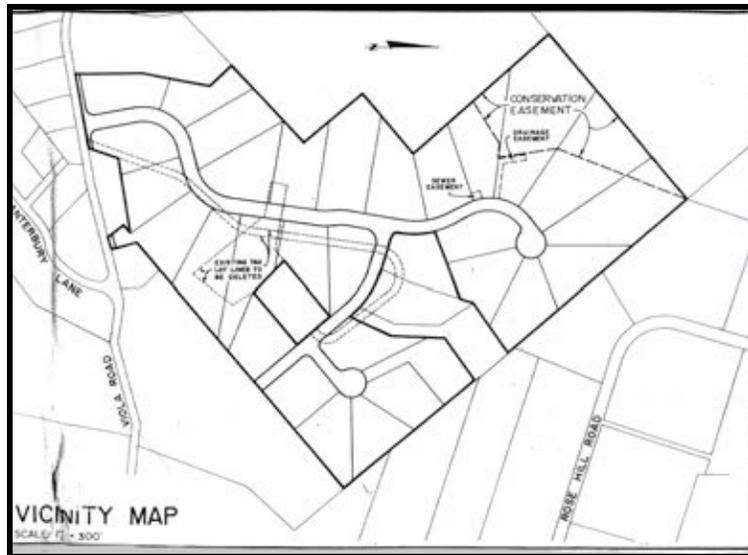

### **D. The Site Today**

The Golden property was eventually developed with low-density single family homes. Today, the Golden Estates subdivision is located in the Village of Montebello,

incorporated in 1986. The Ramapo planning board granted preliminary subdivision approval of Golden Estates on February 3, 1987,<sup>149</sup> and final plat approval on April 21, 1987.<sup>150</sup>

Figure 4 shows a schematic of the approved subdivision, 30 lots on 48.46 acres located on the north side of Viola Road, a gross density of 1.61 dwelling units per acre. The development is zoned rural residential (RR-50), with a minimum lot area of 50,000 square feet - the same minimum lot area and zoning as before establishment of the growth management program.<sup>151</sup> With its large suburban-style houses, expansive lawns, and wide streets, Golden Estates would hardly fit most peoples' perceptions of sprawl-free controlled growth. Figures 5, 6, and 7 shows photographs of the Golden Estates subdivision as it appeared in July 2006.

The growth management program did not fundamentally change the spatial pattern at Golden Estates (indeed, the plaintiffs never disputed the zoning designation in place at the time the development timing ordinance was enacted), although it did apparently delay development until 1987, presumably until adequate public facilities were present to support the development.<sup>152</sup> As a 2003 article indicated, sprawl has been the dominant pattern of development in Ramapo. “ ‘My sense is that sprawl has predominated,’ said James Cymore, Rockland County Commissioner of Planning. Perhaps if the points program had prevailed, growth would have been concentrated around that infrastructure, and would have left those other areas green,’ he adds. Then again, the Ramapo development pattern ‘is no different from other towns that didn’t have the points

system.”<sup>153</sup> Today, the Golden Estates subdivision is surrounded by similar large-lot developments, as Figure 7 indicates.

Note: The map only includes the current Village of Montebello, not all of Ramapo, Golden Estates is outlined near the upper right side of the map.

## E. Discussion

### Impact of the Decision on Other Litigation

The Ramapo system and New York Court of Appeals decision upholding it have unquestionably had an impact on American planning law and on the design of growth management programs in the United States. A search on Westlaw, the online legal database, by the authors in September 2006, found that *Golden v. Planning Board of Town of Ramapo* had been cited 108 times by federal and state courts, and five times by state attorneys general. Robert Freilich went on to design growth management systems for states, regions, and local governments in the U.S.<sup>154</sup>

### Assessment of Ramapo System and Decision

Several observations can be made about the Ramapo program and decision.

(1) *Ramapo contributed to reviving and clarifying the role of the local comprehensive plan as a supporting element for land use regulation.* In so doing, it added a new temporal element to federal takings law by articulating what was a reasonable use over a reasonable period of time; in Ramapo, “[t]he comprehensive plan provided a legal basis for reasonably delayed development”<sup>155</sup> The rationale for the delay of the development was due to the absence of any, or sufficient infrastructure, thus, Ramapo “made the

connection between comprehensive planning and the requirement for adequate public facilities and services.”<sup>156</sup>

(2) *Ramapo carefully built on existing planning practice as authorized in New York enabling statutes.* All of the basic tools were in place in the mid-1960s to formulate a growth management system: the master plan, zoning and subdivision regulations, the capital improvement program and the capital budget, and the special permit. While there were some new wrinkles introduced, such as the purchase of development easements in order to allow a reduction in property taxes from properties, the strategy was essentially a conservative one, a slight stretch of existing statutory authority.

(3) *Ramapo introduced the concept of an adequate public facilities (APF) requirement—that a development shouldn’t be approved until the facilities are either in place at the time the development is approved or guaranteed to be in place when the development is completed—into American planning law and practice.* The APF requirement seems a routine notion today, but it was not in 1969 when the development timing ordinance was adopted. It is noteworthy that the APF approach in Ramapo did not involve a quota, a fixed limit on the number of building permits that could be issued in a given year, in contrast to the system upheld in Petaluma, California.<sup>157</sup> In the Ramapo system, if you had the points, you got the right to build.

The adequate public facilities concept found its way into growth management legislation in Florida, Washington, Maryland, and New Hampshire,<sup>158</sup> and used in ordinances independent of enabling legislation by local governments in other states.<sup>159</sup> As one commentator observed with respect to Florida, which was the first to adopt a system based on the Ramapo approach, “[e]very Florida city and county has adopted a local comprehensive plan that incorporates the fundamental principles of the Ramapo Plan.”<sup>160</sup>

(4) *Ramapo aggressively argued its case through the various appellate levels using Robert Freilich’s “Brandeis brief” approach.* The Ramapo case, as noted, dealt with two issues that were not entirely clear and certainly debatable: (1) whether the language of the New York Town Law language, especially concerning the purposes to which zoning could be put and the duration of a capital improvement program; and (2) whether a development delay of up to 18 years constituted a taking. These two issues, and others, were extremely well-briefed and well argued by both sides. Freilich’s briefing strategy placed the Ramapo system in the context of national and state studies calling for expanded powers of municipalities to deal with issues of growth and included extensive citations to studies and journal articles; it allowed the New York Court of Appeals majority to feel comfortable with an expansive view of the police power and a flexible interpretation of the enabling legislation, as if they were semi-legislating by supporting this new policy direction. That it was effective clearly shows in the majority and minority opinions, which cited many of the same studies and articles listed by Freilich.

(5) *Despite the above, the Ramapo system still had significant problems as an instrument of modern planning policy.* The land use policies that the master plan advocated and the zoning ordinance implemented entailed very low-density development, the kind of

development that today is regarded as urban sprawl and is often viewed as exclusionary in places with few other development options. In reading the 1966 master plan, one finds no examination of alternative land use patterns and their impacts, no assessment of alternative population and economic projections, no evaluation of land use plans of adjoining towns, and no discussion of plans and zoning ordinances of the villages within the town. In implementing the plan through zoning ordinance amendments that same year, Ramapo lowered the overall maximum residential densities of the unincorporated area.<sup>161</sup>

That Ramapo abolished multifamily zoning in 1966 prior to adoption of the master plan is therefore revealing and it dilutes the town's later advocacy for public housing because it eliminates the prospect of true housing (and presumably racial and economic) diversity in the town, albeit diversity that does not rely on federal subsidies. Indeed, the master plan does not discuss the need for low- and moderate-income housing, or different housing types. Moreover, the approach taken in the plan was to push responsibility for multi-family and higher-density single-family housing onto the villages, without any apparent agreement that this was to happen.

A profile of John McAlevey in the *New York Times* in 1971, while the development timing system was being litigated, confirms this. The article noted that most of the unincorporated area of Ramapo was zoned residential, mainly in lot sizes of 25,000, 35,000, and 40,000 square feet, with 50,000 square foot lots boarding the Palisades ridge to the west, and some 15,000 square foot lots near the villages. According to the article:

McAlevey was asked whether these relatively large lot sizes were tending to keep out people of moderate means looking for the suburban homes, and whether the purposes of such lot sizes was to keep out minority groups.

“If I believed that were true my conscience would bother me,” he said. “But builders will build to the highest market and sell to the market regardless of lot size. When you have a seller's market they can sell on any lot of any size houses that are still out of range of the common man.

“I don't believe that all you have to do is go from the large lot to the small lot and the housing problem will be solved.”

Nor does Mr. McAlevey believe that creating zones for apartment housing or cluster housing would be wise. The proper place for apartments—usually garden apartment in the suburbs—is in the already more intensely developed villages, he said. . .

It is through public housing in some form that Mr. McAlevey believes that the suburbs must meet their social responsibility not to exclude lower income people.<sup>162</sup>

The focus of the Ramapo plan on low-density development then undercuts the rationale of the development timing system (particularly as it was presented to the courts), and whether it was in fact really stopping sprawl, or, as one critic, Herbert Franklin, said, instead actually “programming” it. If public sewers were desired, and package plants and septic tanks are relatively disfavored, as the point system shows by giving them fewer points, then what is the purpose of providing sewers to extremely large lots? And couldn’t the needs of low- and moderate-income persons be satisfied by relaxing residential use restrictions so as to authorize multifamily dwellings that were not public housing that requires a subsidy.

While the Ramapo system was a significant step forward for American city planning, these issues, which modern growth management plans in the United States have still not successfully confronted and resolved, remain troubling in 2006, 34 years after Ramapo’s victory.

<sup>12</sup> Richard May, Jr., “Clinic: Development Timing,” in *Planning 1955* (Chicago: American Society of Planning Officials, April 1956): 90-94, 93.

<sup>13</sup> May commented that his approach was a “preferable alternative to the exclusionist device of ‘upzoning’ popular in many suburban communities,” meaning the practice of dramatically increasing required minimum lot area. *Ibid.*

<sup>14</sup> *Josephs v. Town Board of Clarkstown*, 24 N.Y. Misc2d 36, 198 N.Y.S. 965 (Sup. Ct. 1960). This case is discussed in Norman Williams, Jr. and John M. Taylor, *American Land Planning Law*, Vol. 3A (Deerfield, IL: Clark Boardman Callaghan, 1988), Sec. 73.13. The late Professor Williams, a giant in American planning law, was a consultant to Rockland County in the formulation of the ordinance. He commented that “[i]n view of the court’s reference to schools it appears probable that the major reason for the success of the scheme was that the Clarkstown central school district was in fact proceeding to building

---

schools in a regular schedule. The opinion noted that ‘everything reasonably possible is being done by the local authorities to meet the urgency in the school situation’; and it seems likely that this served as a major legal bulwark of the validity of the whole scheme.” Williams, at 109-110 (quoting *Josephs v. Town Board of Clarkstown*, 24 N.Y. Misc2d 36, 198 N.Y.S. at 699 (Sup. Ct. 1960)).

<sup>15</sup> A number of early New York decisions invalidated schemes to manage growth, but these cases, which involved ad hoc devices, did not rise to the level of comprehensive systems. See *Albrecht Realty Co. v. Town of New Castle*, 8 Misc.2d 255, 167 N.Y.S.2d 843 (N.Y. Sup. Ct. 1957) (holding that town zoning ordinance providing that no more than 112 residential building permits a year shall be issued for any land that the town board shall declare to be within a special residence district was a taking without just compensation and because of lack of authority under the New York Town Law ); *Westwood Forest Estates Inc. v. Village of South Nyack*, 23 N.Y.2d 424, 297 N.Y.S.2d 129, 244 N.E.2d 700 (N.Y. 1969) (holding that village zoning ordinance amendment barring new construction of multiple dwellings throughout the village for purpose of alleviating the burden on village's sewer disposal plant and not because of any requirement of or change in comprehensive plan for development of the village was invalid as restricting plaintiff's property to a use for which it was not adaptable and because the amendment did not properly relate to zoning purposes) (this opinion was written by Justice Breitel, of the New York Court of Appeals, who would write a strong dissent in the *Ramapo* decision); *Opgal, Inc. v. Burns*, 20 Misc.2d 803, 189 N.Y.S.2d 606, affd. 10 A.D.2d 977, 201 N.Y.S.2d 831 ((N.Y.A.D. 2 Dept. 1960), affd. 9 N.Y.2d 659, 212 N.Y.S.2d 74, 173 N.E.2d 50 (N.Y. 1961) (holding that an ordinance changing a zoning classification from residential to light industry and barring use of property for residential and for heavy industry purposes was so unreasonable and arbitrary as to constitute an invasion of property rights contrary to the constitutional due process clause; here the purpose was to prevent an increase of school population and at the same time increase the tax income to the school district).

<sup>21</sup> While Ramapo was not the first effort to control growth by an American city, it is arguably the most well-known and studied. Eric Damian Kelly attributes its influence and popularity to several factors:

First, the program was viewed as an innovation in planning in the 1960s; second, the Court of Appeals decision upholding the program was the first to uphold a development timing scheme; third, it had a professional – Robert Freilich – who told the story widely; and fourth, while the Clarkstown growth management program was a predecessor to Ramapo and clearly a major influence on it, that program never achieved the notoriety necessary to influence planning practice.

<sup>28</sup> According to Gary Duberstein, a Princetown University student who chronicled the Ramapo growth management program: “He [McAlevy] then forged a new relationship between town hall and the builders.

---

As he recalls ‘The most distressingly obvious thing was that it seemed the builders were running the town. ...Certain builders walked into town hall and they brought buns and rolls and everybody sat down. ...and made a big celebration.’ McAlevey’s anti-builder attitude stemmed from the laudable premise that those in the construction trade, regulated through zoning and building codes established and administered by town hall personnel, should not enjoy too cozy a relationship with them. As an astute gauger of public opinion aided by Reisman’s skills in that area, McAlevey realized that it was politically safe to be belligerent towards builders. When some builders withdrew financial support from his campaign because of controlled growth, he said. ‘That’s all right; there are more homeowners than builders.’” Ibid., 109-110.

<sup>39</sup> The policies contained in the master plan were: (1) every effort should be made to preserve those natural resources of the Town which give it a pleasant, open setting and which serve as an attractive background to the more developed areas of the Town. (2) The population increase provided for in the Town’s Development Plan should be kept to a moderate level so that the existing rural, semirural, and suburban character in different parts of the Town can be maintained so that the existing and projected public facilities will not be overburdened. (3) Commercial development should conform with the existing pattern of development, providing for essentially local population needs. (4) Provision should be made for adequate public facilities (e.g. transportation, circulation, education, recreation, etc.) consistent with the anticipated needs of a growing population. (5) Continued efforts should be made to strengthen the tax base of the Town and local employment opportunities by encouraging properly planned and located light industrial establishments, research buildings and businesses and administrative offices. Ramapo Planning Board, *Development Plan, Town of Ramapo, N.Y.* (Ramapo, NY: Ramapo Planning Board and Rockland County Planning Board, July 1966): 20.

<sup>40</sup> Ibid., 21.

<sup>41</sup> Ibid., 24.

<sup>42</sup> The plan stated: “The areas of the greatest residential densities should be those in the Villages of the town and those closest to the villages.” Ibid., 21.

<sup>43</sup> The interim development law was later extended past the initial ninety-day period.

<sup>44</sup> The capital program and capital budget were derived from the official map of the Town of Ramapo, which was originally derived from the master plan. The town also completed several studies to support these documents: a drainage study, which provided an analysis of all drainage ways based on the capacity needed if the town was developed at its maximum density; a map and plan for future sewer development; and a recreation study which analyzed the need for public and private recreation sides. Master's Thesis (Graduate School of Planning, University of Tennessee, 1975): 41-42.

<sup>48</sup> John McAlevey, Interview with Susan Adams, May 16, 1974, quoted in Susan Adams, *Growth Control with Development Timing in Ramapo, New York*. Master's Thesis, (Graduate School of Planning, University of Tennessee, 1975): 43.

<sup>49</sup> "This is where the now famous Ramapo managed growth program began to the outside world. Actually, the plan was not altered. The managed growth program was additional amendments to the zoning ordinance, in conformance with the plan as required by Town Law." Manuel Emanuel, "Ramapo's Managed Growth Program: A Close Look at Ramapo After Five Years Experience" *Planners Notebook* 4, No. 5 (1974): 3.

<sup>50</sup> Manuel Emanuel, "Ramapo's Managed Growth Program: A Close Look at Ramapo After Five Years Experience," *Planners Notebook* 4, No. 5 (1974): 3.

<sup>51</sup> Gary Duberstein provides this account of the formulation of the development timing ordinance by John McAlevey and Robert Freilich: "Some 400 feet above Hillburn and commanding a panoramic view of the Ramapo Valley sits the Motel on the Mountain. At the base of tis [sic] craggy slope, cars hurl by on the New York State Thruway, the highway which precipitated Ramapo's growth. To the mild amusement of controlled growth's detractors, that modern day Mount Sinai was where John McAlevey and Robert Freilich went for their final inspiration. As McAlevey recalls: 'We decided that we were just so busy with day-to-day stuff. There was a problem in getting time to just sit down when we got to the crucial point of trying to make some policy decisions. We put out a cover story that we were going out of town. Nobody but our wives and my secretary knew that we weren't going out of town What we did is we went up to the motel on the Mountain and tool a suite up there, the two of us for three days. We just holed up there and spent two days rapping the whole thing day and night, back and forth. Then on the morning of the third day, we thought we had out concepts pretty well lined up. This is when we came up with the points system as the alternative we would settle upon because it satisfied the criteria we were looking for'" Gary K. Duberstein, *The Politics of Controlled Growth in Suburbia: A Case Study of Ramapo, N.Y.* Senior Thesis, (Department of Politics and the Woodrow Wilson Schools of Public and International Affairs, Princeton University, 1976): 131-132 (quoting the author's undated interview with McAlevey).

<sup>52</sup> According to McAlevey, "the elements of the point system...were principally derived from the scope of the master plan, official map, and special facility studies." Manuel Emanuel, "Ramapo's Managed Growth Program: A Close Look at Ramapo After Five Years Experience," *Planners Notebook* 4, No. 5 (1974): 4.

<sup>53</sup> The total point score of fifteen was incorporated into the zoning ordinance "after a series of extensive trial and error analysis were performed. First of all, the existing undeveloped land areas in the unincorporated portion of the Town were mapped and the potential development capacity for each area then computed based upon existing zoning. The series of different overall scoring systems were tested to determine the number of lots or building units which would become eligible for approval each year, based upon the projected capital budget and capital plan. These calculations also gave the Town a measure of the probable annual rate of land consumption measured against its ultimate capacity." Manuel Emanuel, "Ramapo's Managed Growth Program: A Close Look at Ramapo After Five Years Experience," *Planners Notebook* 4, No. 5 (1974): 5. For details about the point system see also Town of Ramapo, New York, "Amendments to the Town of Ramapo Building Zone Ordinance of 1969," October 13, 1969; the ordinance appeared as Section 46-13.1B of the Ramapo Zoning Ordinance.

<sup>54</sup> Susan Adams, *Growth Control with Development Timing in Ramapo, New York*. <sup>66</sup> Ralph Blumenthal, “The Roar of Bulldozers Marks Rockland Growth,” *New York Times* March 25, 1968: 33.

<sup>67</sup> Town of Ramapo, New York, Town Board Minutes. Transcript of Hearing, October 11, 1968, 110 .

<sup>68</sup> *Ibid.*, 113.

<sup>69</sup> Town of Ramapo, New York, Town Board Minutes. October 13, 1969, 102.

<sup>70</sup> Town of Ramapo Planning Board, Planning Board Minutes, August 19, 1969, 9.

<sup>71</sup> Town of Ramapo, Town Board Minutes, October 27, 1969, 109.

<sup>72</sup> Town of Ramapo Planning, Board Planning Board Minutes, December 9, 1969, 1. An attorney, Charles McGroddy, representing one of the subdivision applicants on the board’s agenda that evening, “stated for the record that it was now his understanding that no land may be used under this ordinance as a matter of right; that a subdivision does not give a right of use but merely a right of sale, and if the Ramapo Zoning Ordinance is construed as a prohibition of sale, it is no longer zoning.” *Ibid.*, 2.

<sup>73</sup> Denial of approval “without prejudice” meant that the denial left open the possibility for an applicant to resubmit the same subdivision at a future date, after obtaining the special permit for residential development from the Ramapo town board.

<sup>74</sup> *Ibid.*, 6. The *Rockland County Journal News* incorrectly reported that the planning board denied 19 of 20 plans that evening, but the figure was in fact 20 denied, with action with one deferred until January 1970 because of the applicant’s attorney’s contention that the subdivision in fact met the standards of the new development timing ordinance, and required approval of the special permit by the town board before the approval of the subdivision. *Ibid.*, 7-8. Compare with Scott Webber, “Ramapo Denies 19 of 20 Plans,” *Rockland County Journal News*, December 10, 1969.

<sup>75</sup> Record on Appeal, Ruth Golden and Ramapo Improvement Corporation, Petitioners-Appellants, against The Planning Board of the Town of Ramapo, Respondent-Respondent [sic], New York Supreme Court, Appellate Division, Second Department, filed March 24, 1971 (hereinafter referred to as “Record”). The record contains all of the principal documents at the trial and intermediate appellate levels.

<sup>76</sup> The particular action was called an Article 78 proceeding, after Article 78 of the New York’s Civil Practice Law and Rules. Article 78 proceedings are used to challenge action (or inaction) by agencies and officers of state and local government. In such a proceeding, a judge reviews the administrative case, scrutinizes the agency’s actions and decisions, and if necessary will reverse an agency’s decisions.

<sup>78</sup> *Ibid.*, 13.

<sup>79</sup> Answer and Return, in Record, 28-26.

<sup>80</sup> Affidavit of Manuel S. Emanuel, Record, 58-61, at 60.

---

<sup>81</sup> Ibid., 61.

<sup>82</sup> Affidavit of Hyung C. Chung, Record, 62-64, at 63.

<sup>83</sup> Ibid., 64. Conventional large-lot zoning, stated Chung, “invariably results in *de facto* discrimination of low- and moderate- income families to be located in the Town.” However, he speculated that the Ramapo “controlled growth ordinance . . . could be part of a deliberate policy of growth control to foster the development of apartment dwellings suitable [f]or low and moderate-income families without the undue fear of inducing rapid growth.” Ibid., at 65. Of course, the Ramapo zoning ordinance, as noted earlier, had been amended in 1966 to prohibit multifamily dwellings, so this policy was an unlikely initiative. It is possible that Hyung was indicating to the court that he believed that Ramapo’s large-lot zoning regime, which was in place prior to the enactment of the ordinance, was problematic, and that the entire growth management system did not alleviate the problems potentially created by it, and perhaps worsened them.

<sup>84</sup> McAlevee’s administration pushed the construction of public housing in the town, and overcame court challenges to it in the early 1970s. See Deidre Carmody, “Plan for Low Cost Housing Arouses Anger in Suburban Ramapo,” *New York Times*, Aug. 1, 1970, p. 25. See also the related cases: *Greenwald v. Town of Ramapo*, 35 A.D.2d 958 (1970); *Farrelly v. Town of Ramapo*, 35 A.D.2d 958, 317 N.Y.S.2d 937 (1970); *Fletcher v. Romney*, 323 F.Supp. 189 (S.D.N.Y. 1971).

<sup>121</sup> *Ibid.*, 285 N.E.2d at 295, fn. 2:

As of July, 1966, the only available figures, six residential zoning districts with varying lot size and density requirements accounted for in excess of nine tenths of the Town's unincorporated land area. Of these the RR classification (80,000 square feet minimum lot area) plus R-- 35 zone (35,000 square feet minimum lot area) comprise over one half of all zoned areas. The subject sites are presently zoned RR--50 (50,000 square feet minimum lot area). *The reasonableness of these minimum lot requirements are not presently controverted, though we are referred to no compelling need in their behalf* [emphasis supplied; case citations omitted]. Under present zoning regulations, the population of the unincorporated areas could be increased by about 14,600 families (3.5 people) when a suitable vacant land is occupied. Housing values as of 1960 in the unincorporated areas range from a modest \$15,000 (approx. 30%) to higher than \$25,000 (25%), with the undeveloped western tier of Town showing the highest percentage of values in excess of \$25,000 (41%). Significantly, for the same year only about one half of one percent of all housing units were occupied by nonwhite families. Efforts at adjusting this disparity are reflected in the creation of a public housing authority and the authority's proposal to construct biracial low-income family housing [case citations omitted].

- <sup>152</sup> As one analysis concludes: “Neither the Ramapo plan nor the program itself worked exactly as intended. ...Of the facilities used by the town as the basis for the program, the town of Ramapo controlled only parks, sewage collection (not treatment), drainage, and some roads. Many roads, the proposed regional sewer system, schools, and fire protection were the responsibilities of other entities, meaning that Ramapo’s ‘plans’ for construction of such facilities were more like wish lists than plans. The second problem was that the town never really followed the system, awarding unearned points because of a planning problem and approving nearly as many lots that did not meet the standards of the ordinance as it approved because they complied with it. Further, the impact of the program was probably just to reduce Ramapo’s share of regional growth, not to change the growth patterns. Like most economic trends, the growth pressures that temporarily overwhelmed Clarkstown, Ramapo, and Rockland County had waned by the 1980s...” Eric Damian Kelly, *Managing Community Growth*, (Westport, CT: Praeger Publishers, 1993): 31.

Technology, University of Newcastle.**

## **ABSTRACT**

Throughout millennia there has been a divide of cultures across the world labeled in numerous ways: East and West, Occidental and Oriental, Western/European and Asian. One clear manifestation of this divide is in the built heritage that has been produced from these cultures.

The beginnings of conservation of the built heritage in a Eurocentric sense lies in the awareness of the heritage of Greek and Roman culture and histories developing through the generations supported by a growing enthusiasm for the protection, research, studies and writings of many people. While during periods of colonial rule there were the discoveries of the richness of Asia, these were originally perceived only through colonial eyes.

While there have been recent trends toward inclusiveness of other cultures and views (Nara Documents 1994, Burra Charter 1999) the current pervasive view of conservation and restoration has been driven by Euro-centric policies forming the basis of global heritage protection enshrined in the clauses of international charters and guidelines. However, representation and interpretation of art and architecture irrevocably differs between the Eastern mode of thinking and that of the European. For example the cultural systems of the sub-continent have been based on spiritual values, norms and beliefs while western culture has evolved through values founded on the reality of the material world or materialism.

The implication of these differences are explored by firstly analysing the underpinning philosophies of current conservation theory and policy. Secondly, highlighting the possible limitations of these philosophies to the conservation of the cultural built heritage of the sub-continent, south and Southeast Asia. The paper concludes that there are limitations to approaches of current conservation in the context of attitudes of authenticity and the non-material values particularly of non-secular monuments. This paper is a component of the primary author's Doctoral work looking at these issues as a basis for developing a framework for conservation theory, practice and policy in the region.

**Keywords:** Cultural Built Heritage, conservation theory, policy, sub-continent, south and south east Asia, Eastern philosophy, cultural traditions.

## **INTRODUCTION**

Historically, the thinking, theory and practice of global conservation have been dominated by attitudes toward the protection of the Cultural Built heritage (CBH) in the European regions of the world (Jokilehto 2006, Brandi 1963, Riegl 1903). However, at the commencement of the 21<sup>st</sup> century there is increasing recognition of the need to develop different approaches to the conservation of the diverse CBH of the west and east (Taylor 2004, Seung-Jim 2005, MacKee and Briffett 2002, 2000, Nara Document 1994, Burra Charter 1999, Chiang Mai 1994). This is based on a developing body of knowledge on the unique cultural and philosophical traditions of countries of the Asian region. This has its roots in the latter quarter of the 20<sup>th</sup> century and is now finding strong support amongst conservators, theorists and policy makers in the east and west (Taylor and Altenburg 2006, Seung-Jim 1998, Chen and Aass 1989, Agrawal 1975).

The following discussion is predicated on the belief that any approach to conservation has to be based on solid theoretical foundations. Accordingly it is necessary to investigate and analyse the philosophical thinking underpinning modern conservation practices in the context of the growing scholarly work on a uniquely Asian attitude of their CBH. This analysis will be conducted with a comparison of Asian approaches to conservation identified in the literature.

This paper deals only with the cultural built heritage as opposed to the broader definitions of cultural artifacts including tangible and intangible objects. The study is geographically confined to the subcontinent, south and Southeast Asian for the purposes of the study for this paper. For this paper conservation is taken to mean the whole field of conservation and not just the physical activity on site.

The structure of the paper will be based on a review of the three major periods of conservation, then a discussion analyzing the limitations of the modern Eurocentric conservation theories and their application in the area under study.

### **BACKGROUND: Tracing the origins of conservation theory.**

To understand the development of conservation theories of the west it is necessary to step back to Europe to the period prior to the renaissance and the awakening amongst intellectuals of the richness of the history and heritage of the Greek and Roman empires; the Acropolis, the Coliseum, the Pantheon, Plato, Aristotle, Socrates. It was from this period and especially the renaissance that the need to conserve and restore heritage became valued for reasons of nationalistic pride and the developing thinking of the relationship of the past to the present and the future (Jokilehto 2006, 1999).

During this period, along with the more general and basic ideas of restoration that the broader concept of the approach to the conservation of cultural

heritage originated that of a reliance on the “material” value of a monument. This concept of the materialistic approach to the values of historic monuments lies in the Christian tradition. This belief lay behind the rituals of the cult of holy relics, being one of the bases for the doctrine of Roman Church (Tomaszewski 2003). The origins of “authenticity” of their material substance stems from this cult of holy relics.

Initially religious, the cult of relics was limited to the bodies of holy martyrs, but eventually widened to include objects connected with holy people, and with places imbued with their presence. Thus was born the beginning of the western fascination with “material” values in a monument as one of the primary determinates of authenticity and significance. Leading up to the industrial revolution this notion persisted and supported the concepts of restoration and reconstruction prominent as the major means of protecting or conserving monuments. The German Art Historian and eminent leader in the early movement of archaeology Johann Joachim Winckelmann stands out (Jokilehto 1998). Winckelmann was responsible for the very early discussions on the idea of distinguishing the original work from any reconstruction or restoration. During the earlier history of conservation practices such as reconstruction and restoration had reached the status of “art” in its own right. Winckelmann had begun considering ideas of the need to highlight the difference between the original and any lacunae, respecting the original creative effort of the artist. His work became influential in later conservation work and thinking.

From the nineteenth century and the height of the industrial revolution we begin to see the thinking and development of the ideas that led directly to the theories and principles that support modern conservation practices. Restoration and reconstruction were still the predominate practices. The first European theory regarding the restoration of historical monuments, the principle of “stylistic restoration” was based on the concept of the superiority of the ideal over the material. Original parts of the historical monument were removed in order to return the hypothetical ideal and original form (Tomaszewski 2003). The French Architect Eugene-Emmanuel Viollet Le Duc was the main proponent of this practice (Viollet Le Duc 1854, Jokilehto 1999). He believed in the process of restoration as the highest art form and should be considered with greatest respect for the “*..best thing to do is to try and put oneself in the place of the original architect and try to imagine what he would so if he returned to earth and was handed the same kinds of programs as have been given to us now.*” (Viollet Le Duc pp318, 1854).

In England John Ruskin began the fight against what he saw as the destruction of monuments through restoration. His thesis was based on the ideals of gothic architecture and the belief in the creative processes that if the original artisan could never be copied. This was the beginning of the first theory of conservation as opposed to stylistic restoration of a monument, and was the initial influences for the concept of authenticity that has underpinned all subsequent conservation approaches in the 20<sup>th</sup> and 21<sup>st</sup> centuries.

William Morris of the Arts and Crafts movement was to take these ideas to an “operational” point and brought together fellow believers into the Society for the Protection of Ancient Buildings (SAPB) and developed a manifesto that is still used by the SAPB today. The summation of their ideas was that these buildings created in the past were the result of a particular creative process of a specific milieu under different circumstances to those of the present. Subsequently they could not be recreated and if damaged or lost they could not be recreated (Morris 1877). Under these principles restoration and reconstruction would destroy the integrity and debase the original intentions of the artisan. This thinking underpins current ideas on significance, truth and authenticity and is currently implicit in many of the charters and guidelines developed by agencies such as UNESCO and ICOMOS.

Similarly guidelines are influenced by the philosophies of Plato, Aristotle, Kant, Husserl (Jokilehto 1999) developed from a rationalist and empiricist tradition of viewing the world in the western/ European philosophical tradition. The reductionist approach that these represent has been generalised as a mechanistic worldview where the behaviour of the world can be analysed in terms of the properties of its parts rather than from the whole (Du Plessis, 1999, 2000, 2001).

From its origin in England the development of modern conservation theories shifted to Europe. At the beginning of the 20<sup>th</sup> century Alois Riegl an Austrian Art Historian had written an influential piece of work the “*The Modern Cult of Monuments: Its character and origin*” was an unprecedented attempt to speculate on the popularization of the heritage in western culture (Arrhenius date unknown, Tomaszewski 2003). Riegl proposed a range of values that relate to the appreciation of a monument; in summary these are memorial value<sup>1</sup> and present-day value<sup>2</sup> (Riegl 1903, Tomaszewski 2003, Jokilehto 1999). His description of monuments also discusses the unintentional and intentional monument. Unintentional monuments are that which was not erected with the purpose of commemorating any specific event or person but become monuments due to their irreplaceable historical significance. The house that Mahatma Gandhi was born in would be an example. The intentional monument are those deliberately constructed to commemorate some event or person, such as the stupas of Ancient India or Sri Lanka. This impacts, in Riegl’s theory on the way in which the monument could be protected. With the intentional monument one could accept restoration or reconstruction to maintain those memorial values inherent in the monument. While the unintentional may not be restored as the specific values that made it a “monument” maybe lost (Riegl 1903). This later aspect has significant implications for Asian heritage.

Riegl’s greatest legacy to conservation was his discussions on values. Before Riegl’s proposition, values had not been articulated or understood as a concept in the context of appreciating monuments. In all previous considerations age, history, aesthetics had been the primary basis of

---

<sup>1</sup> This included age value, historical value, and intended memorial value.

<sup>2</sup> This includes use value, art value, newness value and relative art value.

discussion without being qualified as values per-se. Values are now considered an important basis in determining the significance of a monument, with much work having been done to quantify, qualify and understand what they mean.

During the 20<sup>th</sup> century the resurgence of Italy as the fountain of ideas and thinkers in conservation and restoration cannot be underestimated. Serious discussions revolved around concepts of architectural restoration, conservation, aesthetics focusing on scientific approaches. Contributions were made by philosophers, art historians, and conservators. People such as Giovannoni who distinguished himself from previous thinkers by looking at restoration as a cultural problem and saw Viollet le-Duc's methods as anti-scientific, identified four types of restoration<sup>3</sup>. He believed that the best restoration should not be visible. Much of this debate occurred against the background of the post second world war period and the destruction caused in Rome, Berlin and many other European cities. The destruction created a sense of urgency in terms of developing an approach and principles. Many academics contributed to the debates; Chierici believed in scientific methods and strict respect for history, Croce an eminent art historian whose thinking was based on the "organistic" Hegelian school of classical Romanic philosophy he emphasized the whole of an object over its details. Argan was another who had made significant contributions to the debate emphasising that restoration required historical and technical competence as well as sensitivity. Argan along with Cesare Brandi proposed the establishment of the Central Institute of Restoration (Jokilehto 1999). Another person who has made a significant contribution both during his life and continuing after is Brandi. As an Art historian, Brandi produced a controversial theory on restoration that has become one of the most significant and influential theories of modern conservation (Philippot 1982, 1972a, 1972b, Jokilehto 2005, 1999).

After the second world war, the "dogmas" of Croce and followers were beginning to be questioned and people such as Brandi and his generation were beginning to focus attention on German philosophy and historiography. The work of Husserl, Fiedler, Wolfflin, Benjamin, Heidegger, Panofsky as well as Riegl was prominent (Jokilehto 2005, 1999, Philippot 1996). Brandi's theory is too complex to explain in few words, however two of the core concepts of his theory is firstly the definition of art not as imitation of nature as conceived for centuries but as a result of an authentic, creative process with the artist himself (*sic*) as the active protagonist. The second is temporal in that he articulated as part of his theory the timing of the artist to realise the work, the interval from the completion of the work to the present and the instance of recognition in the consciousness of the presence.

These issues became crucial to the overall formulation of his theory on restoration. In his theory he summarised the essential concepts of conservation in relation to works of art, including architecture, and

---

<sup>3</sup>

1. Restoration by consolidation.
2. Restoration by recomposition (anastylosis)
3. Restoration by liberation.
4. Restoration by completion or renovation.

emphasised their specificity and the role of historical critical definition as a basis for any intervention. Additionally he underlined the importance of the conservation of historical and artistic authenticity (Jokilehto 1999).

Brandi's theory gained support over the years and ultimately can be seen as the paradigm recognized at international level in the development of conservation policies. It was integral in the writing of the Venice Charter and in the development of other conservation policies and guidelines. His theory has had its critics but in the end has stood the test of time as reflected in current global conservation practice (Jokilehto 1999, 2006, Philippot 1982, 1972a).

In summary, the history of ideas and theories of conservation in the west have been influenced by and evolved within the societies whose attitudes have been changed by the philosophies proposed by people like Kant, Hegel, Husserl, Fiedler, Wolfflin, Benjamin, Heidegger, Nietzsche (among many others) and the doctrines of religious movements through the ages. This has resulted in the characteristics of rationalism, empiricism and reductionism of a mechanistic worldview (Du Plessis 1999, 2000, 2001). Intellectuals in the fields of art history, architecture and conservation like Viollet Le Duc, Ruskin, Morris, Riegl, Croce, Brandi and Argan have developed theories on restoration and conservation within the influence of this worldview or milieu (Jokilehto 1999). The outcome being two theoretical issues dominating international discussions among conservators namely authenticity and values. These issues need to be explored in the context of how they may or may not be appropriate in providing a foundation for conservation theories for practice in the Asian context.

## DISCUSSION

At the turn of the 21<sup>st</sup> century two theoretical issues have dominated international conservation in the European context: the authenticity of the historical monument: and, their values (Tomaszewski 2003, Jokilehto 2006). This is where conservation has come to after centuries of the search and development of appropriate theories and ideas. It is suggested that to a large degree it is on the results of these discussions that the future development of conservation in this century will depend. However it is useful to question the appropriateness and limitation of the conservation theories developed in the west and practiced in the Asian region. The following discussion will be framed around the three issues of *authenticity*, and the *non-material values* of a monument. These are the issues framing current conservation practice as Tomaszewski argues "[C]onflict with the Far East regarding the concept of authenticity, understood in terms of form, function and tradition and based – among other things – on a belief in reincarnation led, for the first time, to a global discussion on this topic among conservators." (p1, 2003).

## ***Authenticity***

The Venice Charter of 1964, for many years the primary guiding document for the foundation of global conservation practices begins by stating that “It is our duty to hand them on in the full richness of their authenticity” (1964). Implying the imperative of ensuring that the monument that we conserve/protect is an authentic representation of the range of values they represent. This is an important tenet of modern global conservation the search for truth, the authentic monument.

The question that needs to be asked in the context of European monuments is what are we ensuring is authentic, the physical fabric or the spirit or essence of the monument. Certainly since the engineering and natural science investigations that are now at the service of preservation practice, there are possibilities that were unknown before for definitive testing on questions of authenticity; for example determining the true age of an object, researching the authentic construction or the authentic colour scheme, etc.

This "monument cult" of the 20th century, concentrating entirely on "historic fabric", regards the monument in the same way as the Venice Charter, which was strongly influenced by the new principles from the turn of the century. If it is to remain a credible - an authentic - document, the monument may be conserved, but only in special cases restored; if at all possible it is not to be renovated and it is truly never to be reconstructed. Sueng-Jim argues for a reappraisal of the use of the Venice Charter in the Asian context stating that the charter is “...strongly based on European cultural values, and thus not sufficiently universal enough to be unequivocally deployed in societies outside Europe and European cultures” (pp69, 2005). In his study of conservation in South Korea he develops a case showing how the Venice Charter by focusing on the material fabric of the building overlooks the primary concerns of the Korean and by inference Asian conservation where the concepts of spirituality and naturalistic sensibilities are used to determine values.

The case of authenticity based on the Venice Charter seems to focus primarily on the physical fabric or as Brandi defined scientific conservation. However it is the theories that evolved over the years based on the discourses of Ruskin, Morris, Dehio, Riegl, Brandi and Argan has produced a focus on authenticity and cult of the physical fabric as the only true manifestation of this (Jokilehto 1998, Philippot 1982, 1972a).

Supporting this is the “test of authenticity” developed and used by the World Heritage Centre, the name implying global usage of the test to determine the authenticity of any monuments or potential monuments. The test is built on four areas **design, materials, workmanship** and **setting**, with another group of parameters added in 2005 which include **traditions, techniques, language**, other forms of **intangible** heritage as well as **spirit** and **feeling** (Jokilehto 2006). With the recent addition of these last group of parameters there is some concession to acknowledging the different way in which Asian monuments could be interpreted, however one could argue that there is still a reductionist approach to reduce the assessment of all monuments down to a

group of individual parameters without looking holistically at the monument and the cultural and historical milieu in which it exists.

In the context of Asian monuments where the cultural heritage has undergone reconstruction or more commonly stylized restoration for various reasons of tradition or common practice this may be a difficult test to apply. However would it make the monument's assessed heritage any the less an "authentic" monument? Larsen (1995) in his *Authenticity and Reconstruction: Architectural Preservation in Japan* acknowledges the four authenticities but goes on to note that "*..it is not the original formal concept which is regarded as authentic, but the building as it has been handed down to us through history*" (Larsen, pp 1995), in this way accounting for whatever exists at the time of coming to the attention or awareness of the community as an historical monument with the implied values.

With the awareness of the differences in terms of the Asian context the Nara document of 1994 confronts the notion of authenticity with the awareness of the differences that exist between western and Asian conservation practices. The document opens by stating that "*..[D]epending on the nature of the cultural heritage, its cultural context, and its evolution through time, authenticity judgements maybe linked to the worth of a great variety of source on information.*" (Nara Document 1994). Qualifying this statement with a range of criteria used for determining authenticity including, in addition to the standard four criteria stated by the World heritage Commission, setting, spirit, feeling and "*..other internal and external factors.*" (Nara Document 1994).

This represents a considerable shift from the early World Heritage Centre definition that was developed in the mid seventies being more flexible and accommodating of other interpretations of what authenticity may incorporate. Clearly this reflects the change in attitudes based on what has been slowly appreciated of the nature of heritage conservation in those countries outside Europe, and is supported by the Larsen's (1995) work described above and a paper by Herb Stovel (1994) written as a stimulus for debate at the Nara conference. This highlights the difference in attitudes between euro-centric conservation approaches and those of Asia and the gradual acceptance of the need for a broader and flexible definition accounting for the cultural and philosophical traditions. Differences could also be framed in the context that the cultural and philosophical traditions have resulted in the current "global" theories, guidelines and policies have come from the rationalist and empiricist traditions of the west/Eurocentric, which has been described as a mechanistic worldview (Bell and Morse 2005, du Plessis 1999, 2000, 2001), while the Asian approach has been described in terms of a systemic worldview which is characterised by holism, communalism, and process orientated. These points will be referred to again in the later in the discussion.

### ***Non-material values***

The last concept is one of the non-material values of a monument that form the basis of the monuments significance or authenticity. The values can be

tangible and intangible, however, it is the intangible or the non-material values that the west has had the most difficulty dealing with, influencing their narrower perception of cultural heritage (Tomaszewski 2003). This is supported in the works of Chen and Aass (1989), Agrawal (1975) and Seung-Jim (1998, 2005) who argue that conservation in the western tradition focuses on the object reality of the monument leading to the preservation of the materials values to the point where the spiritual values of the monuments have secondary importance.

In the western tradition Riegl was one of the first to elaborate the concept of values and outlining broader memorial values and present-day values. These concepts encapsulated the non-material values, and Riegl's theory defined associations with a monument's significance or overall value. In many of the instances of the Asian cultural heritage the non-material values are often the predominant values, particularly for the non-secular monuments that make up much of the cultural built heritage of Asia (Chen and Aass 1989, Agrawal 1975, Seung-Jim 2005, 1998, Chiang Mai Conference 1991).

The western study of the humanities and conservation, which remains intellectually backward in its obsession with the material substance and unable to undertake the task of the balanced protection of both material and non-material cultural heritage (Tomaszewski 2003) has often ignored the non-material values of a monument. At the same time, other cultures regions that are not involved in deep theoretical studies of the non-material values of cultural property – but instead draw from their own cultural traditions – have long ago found practical solutions to this problem. In this respect, the West has still much to learn from the East and South. However the dominance of western thinking has not allowed this to occur.

Chen and Aass (1989) and others have highlighted that the major components of the cultural built heritage in the Asian context are the non-material or spiritual values or natural sensibilities. These have no physical form and cannot be represented in the fabric or the mortar of a monument. In the context of the Chinese painting Chen and Aass describe the differences as “*..the bulk of Western painting until very recently has been concerned with verisimilitude, leading to such techniques as chiascuro and perspective, the Chinese artists have felt for thousands of years that the goal of painting is to reflect and depict spirit of the subject of the painting. A painting of a mountain will only be rarely identifiable as a specific mountain but rather will show mountain-ness, or the spirit of a specific mountain.*” (p6-7, 1989).

While this description highlights the differences in the approach to painting it does show how the “spirit” of a monument is given more consideration than the material value. This is evident in the Venice Charter where articles like 12 and 13 emphasise the importance of maintaining the integrity of the “original” monument without considering the other values that may give integrity such as the non-materials (Chen and Aass, 1989; Seung-Jim, 2005, 1998).

In summary, the European approach to conservation focuses on the reality of the material values of the monument to be preserved, with the potential result

that this may lead to the preservation of the material aspects of the cultural built heritage and the historical facts only to the point where the spirit of the place has secondary importance or could be lost particularly in the case of non-secular monuments (Chen and Aass 1989, Seung-Jim 2005, 1998, Taylor 2004, Taylor and Altenburg 2006). These sharp differences in the views toward the emphasis on the material values of the west and the non-materials of the east provide one of the greatest points of contention and are at the base of the schism between western and Asian approaches to the conservation of monuments.

Based on these approaches to the values of a monument shows the limitations of the policies and guidelines and by implication the theories that have given rise to these views of the west in terms of values.

## **CONCLUSION**

When defining an Asian approach to the conservation of Asian cultural heritage it is essential to work from a relevant theoretical base as has been shown in the context of the development of the conservation theories in the west and applied to western cultural heritage. This paper has taken this as the beginning of a discussion of an appropriate Asian approach by looking at the limitations to the currently accepted western or Eurocentric policies and guidelines as founded on western cultural and philosophical traditions.

The lesson from the European example is that any sound theory or framework must be based on the unique cultural and philosophical traditions of the culture or milieu in which the heritage is being conserved and as even Heidegger has written “..[I]t would thus not be feasible to impose on other cultures the concepts of historicity and relativity of values as evolved in the European context; theoretically each cultural region would need to go through its own process and define relevant values.” (Heidegger cited in Jokilehto pp214,1998).

The limitations as highlighted show in the disparate attitudes to the basic tenets of authenticity and the appreciation of the non-material values in a monument. For authenticity it was shown that the “test” for authenticity applied to western monuments is founded very much in the rationalist and empiricist traditions which tends to the reductionist model and can be very limiting in the context of the Asian monument particularly the non-secular monument. While amended test accounts for other possible ways in which the monument maybe be “authentic” it is still not a holistic approach which underlies an Eastern approach to monument.

In terms of the non-material values, the Asian monuments seem to have a greater weight toward these values in terms of why a monument maybe important whereas the guidelines particularly the Venice Charter tend to focus on the material values as reflected in the fabric or historicity of the monument.

This paper has investigated the limitations that need to be addressed in any approach that may accommodate the attitude and values associated with the Asian cultural built heritage. These limitations have been explored against the background of the philosophical and cultural traditions of the western approach to conservation that has give rise to an approach as odds with that in Asia. As alluded to in this discussion the core of the problem may come down to the difference in worldviews and to acknowledge these and address the differences in these worldviews may provide the beginning of an approach or approaches that could deal with the uniqueness of the cultural built heritage in Asia.

## Preface :

Yokohama city is the second largest city in Japan having 3.58 millions population in 2005. Farmland and forests in Yokohama city have decreased remarkably in the high economic growth period since the 1960s, however still have not a few amounts of farmland and forests, not only in the Urbanization Control Areas (UCAs) but also in the Urbanization Promotion Areas (UPAs).

In 2000, sum of farmland and forests are 3,699.6 ha. in total and covers 8.7% of Yokohama city area; in UCAs 2,717.8 ha. and 26.1% of UCAs and in UPAs 946.9 ha. and 3.1% of UPAs. Farmland and forests have been preserved by using both of urban planning systems and agriculture promotion measures, in which, beside those provided by the Central Government, particular measures based on Yokohama city's policies were introduced. Both of the Greens for Farming system for UPAs by the City Planning Act and the Farmland Area system for UCAs by the Agriculture Promotion Act were provided by the Government. Exclusive agricultural zone is one of Yokohama's particular systems which was introduced in 1969 and have been applied in UCAs to preserve a fairly large area of farmland run by professional farmers.

In 1989, the Working Committee on Urban Agriculture [*Yokohama-shi toshi-nôgyô konwakai*], submitted the recommendation entitled "Yokohama city's Urban Agriculture in the 21th Century: machizukuri in cooperation with agriculture" and contributed to establish new policies on urban agriculture and citizen's participation. "Machizukuri in cooperation with agriculture" [*nô no aru machizukuri*] became a slogan of Yokohama's particular policies on urban agriculture and forests.

At present the City of Yokohama have many systems and measures to preserve agricultural land and forests in both of UCAs and UPAs encouraging professional farming and citizens' activities to participate agriculture, kitchen gardens, and caring of parks and community forests.

In this paper the author, after outlines and evaluates these many measures have executed in Yokohama city, taking up two cases which he have been involved; a work farms for the handicapped which have been supported by citizens and local farmers, and a voluntary citizens' group caring a small community wood by means of local and traditional forestry as examples, will discuss achievements and problems of Yokohama's policies and plans on urban agriculture and forestry, and the future of Yokohama's urban farmland and forests as important environmental resources.

## 1 : Changing urban farmland and forests in Yokohama city

Changing urban farmland and forests in Yokohama after 1970, when the area demarcation system or *sen-biki* was enforced, are as following tables show.

**Table 1. Changing Yokohama's land use** (taxed private land) [unit= ha]

year	total	building	farmland	forests	waste	water	others
------	-------	----------	----------	---------	-------	-------	--------

	(%)		paddy f (%)	Field (%)	total (%)	(%)			
1980	29,277	15,708	1,232 4.2%	4,691 16.0%	5,923 20.2%	5,152 17.6%	84	6	2,404
1990	28,871	17,111	568 2.0%	4,233 14.7%	4,801 16.6%	3,676 12.7%	32	5	2,646
2000	28,010	18,987	325 1.2%	3,375 12.0%	3,700 13.2%	2,732 9.8%	13	4	2,608
2005	27,821	19,475	267 1.0%	3,103 11.4%	3,370 12.4%	2,375 8.8%	11	3	2,436

Source: Yokohama city's website

In 1980, 10 years after *sen-biki*, farmland still covered 20.2% and forests 17.6% of Yokohama's total taxed land, which means private owned land. In 2005, a quarter century after, the coverage of farmland and forests in Yokohama's taxed land reduced to 12.4% and 8.8% respectively. Farmland in Yokohama city area, decreased remarkably from 5,923 ha. to 3,370 ha. or about 40% reduced during a past quarter century. While in these twenty five years Yokohama's population have increased from 2773.7 thousands in 1980 to 3561.3 thousands in 2005 or increased 28.4%.

**Table 2 : Changing Yokohama's farmland (category & demarcations) [unit= ha]**

	total	land categories		demarcations	
		paddy field	field	in UPAs	in UCAs
1975	6,104	1,548	4,556	2,808	3,296
	100%	25.4%	74.6%	46.0%	54.0%
1980	5,542(100%)	1,156(100%)	4,386(100%)	2,270(100%)	3,272(100%)
	100%	20.9%	79.1%	41.0%	59.0%
1990	4,481(80.9%)	503(43.5%)	3,978(82.3%)	1,564(68.9%)	2,917(89.2%)
	100%	11.2%	88.8%	34.9%	65.1%
2000	3,611(66.2%)	313(27.1%)	3,298(68.2%)	907(40.0%)	2,704(82.6%)
	100%	8.7%	91.3%	25.1%	74.9%
2005	3,370(60.8%)	267(23.1%)	3,103(64.2%)	751(33.1%)	2,619(80.0%)
	100%	7.9%	92.1%	22.3%	77.7%

Source: Yokohama city's website

Table 2 shows characteristics of farmland decrease from 1975 to 2005. As for land use categories of farmland, paddy field decreased more rapidly than field. Paddy field decreased to one fourth of in 1980, however, field keep about two third of in 1980. In decreased acreage of paddy field included not only those were lay down into urban use, but also those were reclaimed and changed into level upped field[*age-hata*]. This is because; in suburban area field farming for vegetables or fruits is more profitable than rice farming in paddy field. What's more in suburban areas, especially in the metropolitan region, reclamation works bring for land owners not expenditure but easy earnings, because flat paddy fields are appropriate to dispose waste soil, so construction companies would pay enough reward, and land owners can easily get rich soil.

As for city planning regulations, 751 ha. farmland or 33.1% of those in 1980 are still remaining in UPAs and it is very important how to preserve and utilize those scattering farmland effectively as environmental resources and for increasing citizens' demand of kitchen gardens etc. In UCAs 2,619 ha. farmland or 80.0 % of those in 1980 remains in 2005, and it is not too much to say that land use control measures both of city planning and agricultural promotion have been effective to preserve farmland in UCAs.

**Table 3 : Land Use Planning and Farmland in Yokohama**

demarcation area and landuse zone	total area A (ha)	farmland B (ha)	B/A (%)	field (ha)	paddy f. (ha)
total city area	43,547	3,420.0	7.9	3,148.6	271.4
UCAs	10,525	2,640.3	25.1	2,373.1	267.2
agriculture promotion area	4,926.1	1,776.4	36.1	—	—
agriculture land zone	1,066.0	1,035.1	97.1	819.5	215.6
uncontrolled zone	3,860.1	741.3	19.2	—	—
exclusive agriculture district	1,011.0	613.1	60.6	537.3	75.8
out of agriculture promotion area	5,598.9	863.9	15.7	—	—
UPAs	33,022	779.7	2.4	775.4	4.3
green for farming	350.8	348.6	99.4	346.4	2.2

Source: Yokohama city's website

Note : Dates of data : farmland January.1st, 2004/green for farming March 32, 2003/those related to the city planning are of April 1st, 2003/those related to the Agriculture Promotion Act are of March 31, 2003.

Table 3 shows the present relationship between Yokohama's farmland and land use control measures both of the City Planning Act and the Agriculture Promotion Act [*nôshin-hô*]. In 2004, Yokohama has 3,420 ha. farmland in total and 2,640.3 ha. or 77.2% in the UCAs and 779.7 ha. or 22.8% in the UPAs. 2,640 ha. farmland in UCAs are as a rule, severely restricted to lay off into urban use by the City Planning Act. Farmland of 1,035.1 ha. or 39.2% of farmland in UCAs are also in the Agriculture Land Zone [*nôyô-chi kuiki*] of the Agriculture Promotion Act. Those are under twofold land use control. On the other hand however, there are 863.9 ha. farmland in UCAs but out the Agriculture Promotion Area which are called *chôsei-shiroji* and 753.9 ha. farmland which in both of UCAs and the Agriculture Promotion Area but out of the Agriculture land zone we named this as *nôshin shiroji*. In two types of *shiroji*,<sup>1</sup> land owners can escape some of land use restrictions which twofold land use control systems intended. Further more the twofold system itself has many loopholes in their land use control systems<sup>2</sup>. Remaining 348.6 ha. or 44.7% of total farmland in UPAs were designated as the 'Greens for farming' [*seisan-ryokuch*] of the Greens for farming in UPAs Act [*seisan ryokuchi-hô*] of 1992. It is very difficult to explain the system and translate the term of *seisan-ryokuch* exactly. A lot of farmland, of which land owned farmer decided to maintain farming more than thirty years hereafter, the lot can be designated as *seisan-ryokuch* by the City of Yokohama and high property tax would be remitted

**Table 4 : Changing Yokohama's Forests by area demarcations** [Unit: ha.]

year	total rated land	total of forests	area demarcations	
			in UPAs	in UCAs
1965		9,741	—	—
1970		8,715	—	—
1975		6,452 <100%>	3,763 <100%>	2,689 <100%>

1985	28,871	4,406	2,233	2,173

<sup>1</sup> A Japanese jargon *Shiro-ji* is composed of two words, *shiro* means white and *ji* means land. Therefore *shiro-ji* means literally 'white land' and freely 'land out of land use control'. The Japanese of '*Chôsei-shiroji*' means land or area which is originally under twofold land use control, however, restricted only by UCA system and escape from those by the Agriculture Promotion Act.

<sup>2</sup> As for systems and its loopholes of land use control measures for the UCA, see Ishida 1996b.

		(100%)	(50.7%)	(49.3%)

Source : Yokohama city's web

Table 4 shows the historical situation of Yokohama's forests. In 1965, before the *sen-biki* system was provided and Japanese economy in the gate way of the high economic growth age, Yokohama still had 9,741 ha. forests or more than one third of total rated land was covered by forests. In 1975 a few years after *sen-biki*, 3,763ha. forests or more than half of total forests were in UPAs. In the next thirty years, however, forests in UPAs reduced very much to only two fifth of in 1975. In same year, in UCAs however, 1,604ha. or about 60% of those in 1975 still remains undeveloped. In UCAs the decrease of forests are more severe than farmland. Some reasons are considerable, for examples land use restriction measures for farmland were twofold but for forests only the city planning measures was available and furthermore, measures to respite or to exempt from high inheritance tax are only applicable for farmland. It is even hearsay, the author has heard a case of a farmer who was a landowner of wood in UCAs and reclaimed it into farmland to escape from predictable high inheritance tax.

## 2 : Planning policies on urban agriculture and forests in Yokohama

The Area Demarcation System which is the system to demarcate the city planning area into UPAs and UCAs had been proposed since the early 1960s<sup>3</sup> and was first provided, though a little too late, by the 1968 City Planning Act to control severe urban sprawl in those days.<sup>4</sup>

### Sen-biki in Kanagawa Prefecture

Previous to the enforcement of the Area Demarcation System, Kanagawa prefecture office introduced in its third comprehensive administration plan of 1965, a new land use planning system, in which, based upon estimated future urbanized areas, demarcated a particular land use planning area named as 'estimated future urbanized area' and thereafter new land development activities should be permitted only within the areas and outside of designated areas, developments were severely controlled and as a result farmland and forests effectively preserved. For example in Yokohama and Kawasaki areas, the then city planning area were 55,417 ha. in total, however, 17.5% of which or 9,701 ha. was demarcated as outside of future urbanized areas (Ishida 1990, 256-271). Kanagawa's system had no legal bases and was only a kind of administrative guidance, however, very effective to control urban sprawls in Kanagawa prefecture.

The 1968 City Planning Act was enforced in 1969 June and the Area Demarcation or *sen-biki* planning in Kanagawa prefecture was finished until next June, only in one year even if under the first

<sup>3</sup> The author proposed in 1960 in his doctoral dissertation the basic idea of the area demarcation system (Ishida 1960).

<sup>4</sup> As for the outline of the Area Demarcation system, see Ishida 1996a : 132, and the detail of system and problems and issues of the system see Ishida 1996b.

and inexperienced citizens' participation. While citizens' participation, the majority of farmers in Kanagawa prefecture wanted to preserve their farmland and through farmers' cooperatives and farmers' unions made campaign to designate their farmland for UCAs as much as possible. As a result, in Yokoham and Kawasaki areas, finalized UPAs fell 2,680ha below than the 'estimated future urbanized areas' which Kanagawa prefecture office decided in 1965 and designated UCAs reached 22.6% of the City Planning Area.

Kanagawa's case was exceptional in Tokyo Metropolitan Region where most of farmers requested or even claimed to designate their farmland and forests for UPAs. In Saitama prefecture as a example, land owner farmers, showing false land readjustment plans, requested to demarcate their 9,431 ha. land for UPAs. As a result the demarcated UPAs were excessively wide for future urbanization, and in 1980, that is 10 years after *sen-biki*, 31.1% or 66,152 ha. land in UPAs were still vacant and 73.3% of which was farmland (Ishida 1990:256-271).

### Detailed *Sen-biki* in Kanagawa ward, Yokohama City and Citizen's Participation

*Sen-biki* in Kanagawa ward, Yokohama city, was a typical example of thoroughgoing campaigns by Farmers' Cooperatives to preserve urban agriculture and in which as a issue of urban planning, a limited extent of 'insular UCAs' [*ananuki chōsei-kuki*] was discussed seriously (Ishida 1990, 123–164). Kanagawa ward is one of eighteen wards of Yokohama and neighboring to the CBD of Yokohama. Kanagawa ward covers 23.59 square kilometers, population and population density in 2006 is 221 thousand and 94.0 person par hectare respectively.

**Table 5: Land use of rated land in Kanagawa ward Yokohama city** (unit:ha.)

	total	building use	farmland			forests	others
			. total	paddy f	field		
1985	1483	1047	242	—	—	136	58
2003	1563.54	1126.46	212.02	0.36	211.66	86.88	138.18
	100.00%	72.04%	13.56%	0.02%	13.54%	5.56%	8.84%

Source : Website of Kanagawa ward

Although Kanagawa ward has such location and considerably high population density, in 2003 farmland was 212.02 ha. or 13.56% of rated land and forests 86.88ha. and 5.56% respectively. And in the end of March 2004, UCAs still covered 453 ha. or 19.2% of its City Planning Area. It is not too much to say that the unique land use ratios of Kanagawa ward derives from the area demarcation in 1970. Contrastively Tokyo's boroughs, even Nerima borough at the most outskirts, have no UCAs in 1970, that is at the start of *sen-biki* system.

In Kanagawa ward, *sen-biki* had been executed, from start to finish, under the initiatives of Kanagawa Farmers' Cooperative. In January 1969, a half year before the enforcement of *sen-biki* system, the cooperative established a working committee for the new city planning of thirty committees and made a precise survey on farmers intention to choose UPA or UCA for their farmland. The result of survey was that 78 ha. or 27.6% for UPAs, 200ha. or 70.7% for UCAs and for 5 ha. or 1.8% no answers. What's more 57.2% of local farmers hoped to work as full time farmers or to work mainly on farming. In April 1969, based upon local farmers' individual choice, the working committee finalized their original *sen-biki* plan and proposed to the City of Yokohama. The original plan by the working committee was 189 ha. farmland for UCAs and which was divided into 10 groups of farmland.

In July 1969, the first proposal of *sen-biki* plan by Kanagawa prefecture office was opened for public and until next June the long and zealous procedures to hear public opinions and to finalize *sen-biki* plan had been going on (Ishida 1990: 151–157). We called small UCAs designated in vast UPA as *uchinuki chōsei kuiki* in Japanese [literally stamp out UCA or freely insular UCA] and in the case of Kanagawa ward, how to designate insular UCAs was the most important and difficult issues. The exceptional size standard of insular UCA which the Ministry of Agriculture and Forestry noticed was ‘not less than ten ha.’ instead of ‘not less than twenty ha.’ in the cabinet order<sup>5</sup>. However, in the farmers’ plan there were four planned UCAs acreage of which less than ten hectare. After long negotiation between the farmers’ corporative and the City of Yokohama, 8.36 ha. insular UCA in which farmland covered only 6.07 ha. was finally approved.

### **Sen-biki in Tōkyū Tama Den'en-toshi and preservation of farmland and forests**

Tōkyū Tama Den'en-toshi projects<sup>6</sup> which is the biggest garden suburb development by private sector in Japan and planned and executed with substantial cooperation with the City of Yokohama. The area demarcation to divide the project areas into UPAs and UCAs had been done theoretically and successfully following the city planning points of view.

The first section of Tōkyū Tama Den'en Toshi, from Tama-gawa River to JR Yokohama line, was planned to be divided into three garden suburb areas and were separated each other by three confluents of Tsurumi-gawa River. Areas along the river branches, mostly paddy field, were designated as UCAs and farmland in the area simultaneously as the Agriculture Land Zone as well, and until now, have been preserved fairly well. Almost all of UPAs were developed by means of land readjustment system by land owners’ associations and have escaped from urban sprawl. Land use in UCAs of Tōkyū Tama Den'en-toshi have been relatively well controlled, however, some issues worth to mention. Loopholes of the *sen-biki* system<sup>7</sup> caused intrusions of urban land uses and because of lack of agriculture working forces or transfer of ownerships to non local farmers have caused discontinue of farming. As for UPAs of Tōkyū Tama Den'en-toshi, relatively low rates of land allocation for networks of road system and parks in land readjustment projects<sup>8</sup> has become issues in the areas which have been matured and approaching its completion.

*Yato* or *yatsuda*, a local name of small valley with stream and paddy field which are typical local micro topography in Tama hilly area [*Tama kyūryō*] and most of which in Tōkyū Tama Den'en-toshi area have been lost in the process of development. New comer citizens often campaigned to preserve remaining *yato* which still survived but scheduled to develop. Campaigns for *Akada no yato* and *Onda no yato* both of which were typical examples of *yato* in the areas. *Akada no yato* was developed and the campaign ended in the 1980s, however, the latter, name of group is ‘*Onda no yato* fan club’ have been still active. In park design of Tōkyū Tama Den'en-toshi especially in Aobadai area, preservation of village woods and water reservoirs were paid attention. For example, in Moegino

---

<sup>5</sup> According to the cabinet order and a notice of the under secretary of the Ministry of Agriculture and Forestry, the official standard of the insular UCA was ‘an area of excellent farmland not less than twenty ha.’

<sup>6</sup> Tōkyū Tama Den'en-toshi project was planned and executed by Tōkyū Corporation since the 1960s. As for Tōkyū Tama Den'en-toshi see Ishida 2006 and Tōkyū 2005.

<sup>7</sup> As for loopholes of the *sen-biki* system, see Hebbert 1994 and Ishida 1996b.

<sup>8</sup> Land allocations by *genbu* of land readjustment projects for road system and parks in Tōkyū Tama Den'en-toshi were 17.18% and 3.57 % respectively. (Ishida, 2006).

neighborhood park of 1.9 ha., the pond is a remnant of reservoir and about one third of park is the rest of village wood as it was.

### 3. Preservation of farmland in Yokohama city

#### **Machizukuri in cooperation with agriculture**

*Nô no aru machizukuri* [machizukuri in cooperation with agriculture], which appears often in local government's documents nowadays, is cleverly symbolized urban agricultural policy. Although, I don't know when this slogan appeared first in Yokohama's agriculture or urban planning policies, the recommendation by the Working Committee on Yokohama's Urban Agriculture in 1989, which had the phrase in the title, would be early example (Yokohama-shi toshi-nôgyô konwakai 1989). How relationship between city and agriculture should be has been one of the most important challenges for both of urban planners and agriculturists. The theme itself has been always vague, ambiguous and variable in changing situation. What is the most appropriate relationship between urban land use and farmland, urban activities and agriculture production, citizen life and farming?

*Sen-biki* system in the 1968 City Planning Act has been presumed as the system to divide urban land use or urbanized areas and agricultural land use severely. The original concept of the system in the early 1960s, however, was more flexible and in which the relationship between urban land use and agriculture would be easily cope with. The Green for Farming in UPAs Act of 1974 provided a system to permit farmers to have arable land in UPAs temporarily without paying high rate as high as building estate. A special system of land readjustment technique to collect farmland in special farming blocks [*shûgô nô chiku*] was provided in November 1975<sup>9</sup>. These systems provided by the Government are based on a concept to regard farmland or farming in UPAs would exist only temporarily. The Yokohama's concept of 'machizukuri in cooperation with agriculture' in 1989, on the contrary, regarded the existence of farmland and farming in urbanized areas as necessary or essential for city itself and citizen's life.

#### **Exclusive agriculture zone system since 1969**

A framework of the Kôhoku New Town project was released in 1965, in which reorganization and revitalization of agriculture in the project areas was included. The city of Yokohama organized a research group on immediate task and more theoretically about what urban agriculture should be. An idea of Exclusive Agriculture Zone (EAZ) [*nôgyô senyô chiku*] was first conceptualized in the discussion of the research group and included in Yokohama city's planning policy for the Kôhoku New Town. In September 1969, six Exclusive Agriculture Zones of 230ha., 141.5ha. farmland and 88.5 ha. forests and others, were designated. Before designation of EAZs improvement works and exchange and consolidation procedures of farmland had been elaborated. It is very surprisingly that in case of Nippa-Ôkuma EAZ, farmland in the development area and in the exclusive agriculture zone were exchanged equivalently after zealous discussion among participated farmers(Enari 1991: 94-100).

---

<sup>9</sup> The system provided by the Act to Promote Residential Areas Supply in Metropolitan Area [*daitoshichiiki no jyûtakuchi kyôkyû sokushin-hô*] and land readjustment using this system called the specific land readjustment project.

The system of EAZ is based on the particular urban agriculture policy of Yokohama city, however, the EAZs related to Kôhoku New Town, were also designated as UCAs and simultaneously Agricultural Land zones of the Agriculture Promotion Area Act. Accordingly, land use restriction in the six EAZs has been done legally.

In the end of fiscal 2005, there were 26 EAZs of 1,011 ha. in total and most of them designated in the 1970s and 1980s. The requirements to be designated as EAZ are the mass of farmland in the Agriculture Promotion Area, more than 10ha. acreage and hopeful agricultural productivity. The present states of EAZs, are a proof to successful particularity of Yokohama's urban agriculture policy.

### **Green for farming [*seisan ryokuchi*] in UPAs**

The Green for Farming in UPAs Act was first enforced in June 1974, however, have been useless for quite a long while, except for limited local governments. The act was fully revised in 1992 and farmland in UPAs should be classified into two categories those are 'green for farming' which should be used for farming for thirty years forth and farmland to be developed in near future. Forty five percents of Yokohama's farmland in the UPAs or 348.6 ha. was designated as the green for farming, however, average acreage of which is only 1761 square meters and are scattered here and there. The local governments are provided the right to buy greens for farming in UPAs when land owners inevitably have to stop farming before thirty years pass away, however, because of financial shortages, the right seldom exercised. The present circumstance of the green for farming system is not fruitful from the planning point of view.

### **Citizens' farming and citizens as local markets**

'*Chisan chishô*' is an abbreviated Japanese expression means local agricultural productions for local food markets. In Aoba ward Yokohama city, the author's neighboring area, there are still many types of *chisan chishô*, such as direct sales depots of vegetables, direct harvest orchards mostly of Japanese pears, direct harvest of sweet potatoes and contracted cultivation with neighboring stores. Until the 1980s direct harvest orchards were located mostly in UCAs, and in UPAs as well. Recently, however, acreage of direct harvest orchards in UCAs are reduced very much and seldom in UPAs. In the 1970s another style of direct harvests of strawberries, called as *une-uri* [sale row separately] were popular in which farmers sold a row for citizens before bear fruit and citizens can harvest at any time from their individual row.

The article 3 of the Farmland Act restricted legal requirement of farmland owners and tenants very severely. So, it is very difficult or even impossible for citizens to buy or to rent farmland for their farming. Allotments were difficult to realize under such inflexible system. In Yokohama city's agricultural policies many trials to promote citizens' farming have been provided<sup>10</sup>. Municipal allotments first opened in 1976, in which Yokohama city borrowed up farmland from land owner farmers, divided into lots and opened for citizens' use. This type was based on the Government notice in 1975 which introduced a soft interpretation of the Act. In the peak, the municipal allotments increased to 154 allotments of 31ha. and users of which were 14,420 households. In 2004, however,

---

<sup>10</sup> As for the detail and problems of Yokohama city's policies and promotion projects, see Gotô 2003: in which the cases of other local governments, such as Nerima borough in Tokyo and relationship between juridical system of the Farmland Act and citizens' possible utilization of urban farmland are also referred and discussed.

because of changing circumstance the city abolished the projects and replaced with other new projects.

The Act for Rent of Specific Farmland of 1989 and the Allotment Promotion Act of 1990 opened a possibility for local governments and farmers' cooperatives to borrow up farmland from farmers and legally run allotments. Farmers cooperatives borrowing farmland from their associates and managed allotment systems; one very large scale allotment in Kanazawa ward of 2.5ha. in total and small scale ones called citizens' farming gardens. In 2004 five citizen's farming gardens have opened in northern three wards and user were 201 households

Another two new allotment systems are, compared with the conventional type, rather unique to avoid severe restriction by the Farmland Act. 'Farms for exercise of cultivation' and 'harvest' opened in fiscal 1993, using farmland in UCAs or of green for farming in UPAs. This type of farm clears the restriction by the Farmland Act by means of farming are managed and practiced by landowner farmers themselves and citizens only participate farming for exercising cultivation and harvest following landowner's farming plan and guidance.

In August 2002, the City of Yokohama utilizing the Structural Reform Special Zone Act of 2002, proposed the Government to authorize Yokohama's proposal to exemplify many restriction on citizens' participation in agriculture. After negotiation the Government authorized the Allotment Promotion Special Zone for Yokohama's whole area, however, provided relaxation limited only for requirement of establishing and managing body of allotments which the Act for Rent of Specific Farmland of 1989 provided for local governments and farmers' cooperatives. As a result landowners, other individuals and corporate bodies as well can be establishing bodies of allotments. In fact many bodies such as real estate agents which have a lot of know how on rent. Allotments by the Allotment Promotion Special Zone system which called *tokku nôen* in Yokohama, opened in fiscal 2003 and 2004 were 22 cases of 936 lots and 3,36 ha.. In November 2005, however, the Act for Rent of Specific Farmland was revised and relaxation was generalized and the Allotment Promotion Special Zone system itself became of no use and repealed.

### **Preservation of agricultural landscape as a heritage**

The City of Yokohama named its north and western parts as 'Hilly Yokohama' and traditional landscapes in the area are *yato* or *yatsuda*. In 1998, the author published an article on preservation of agricultural landscape (Ishida & Hatano 1998) in which the author discussed that a traditional landscape of farming community, where local and traditional farming measures are still preserved, should be regarded as a kind of national heritage<sup>11</sup>.

In the planning concept and design of public parks recently opened or scheduled to be open such as Maioka park in Totsuka ward which opened in 1992 and Niiharu Village Wood park in Midori ward, both of which have a planning concept to preserve the traditional landscape of *yatuda*. or *yato*. In Maioka park, the zone of 28.5 ha. named 'zone to experience and enjoy countryside' and

---

<sup>11</sup> In the paper I also referred to Norwegian case which is a small and beautiful village called Havn. Recently the village with its traditional farming was designated as the area for protection as cultural environment by the Norwegian National Heritage Act.

management activities of the zone including farming and forestry are commissioned to the citizens' committee<sup>12</sup>.

Among Yokohama's policies and projects on preservation of urban agriculture and forests, some, for example the countryside zone [*furusato mura*] projects and the village of smiles [*megumi no sato*] projects, may keenly targeted on the preservation of agricultural landscape.

As for the countryside zone projects, which emphasizes the importance of agricultural landscape much more, two examples, Jike in Aoba ward and Maioka in Totsuka ward, are now running, using many kinds of measures both of urban planning and of agriculture promotion based upon agreement between the City of Yokohama and local farmers' association.

Jike countryside zone covers all area of Jike chô which is one of administrative districts of Aoba ward, a spread of which is 86.1 ha. and a population in 2006 is only 339 and are consisted of ramified many *Yatsuda*. Allmost all area of Jike-chô was designated as UCAs in June 1970 and most of farmland were included in Farmland zone in which land uses other than agricultural should be severely prohibited. In Jike countryside zone other than above mentioned legal land use control measures, Yokohama's many particular land use control measures were applied, such as a citizen's forest project of 11.7ha. in 1983 and an exclusive agriculture zone of 86.1ha. in 1986. Furthermore studios of local and traditional industries, such as ceramics, foundry, maker of special coal for tea ceremony and etc. have been invited.

As for the evaluation of project's out come, the author as a local resident have perceived and worried about changes of natural resources which resulted from, for examples, over inflow of visitors from wide catchments areas and coming by cars, excess improvement works for paddy fields and their irrigation streams, lack of careful forest caring and etc. In summer evening until the 1980s, we could easily enjoy many fireflies dancing in Jike's *yatsuda*, recently, however, fireflies reduced very much and became rather difficult to find them. It may be clear evidence of the start of environment deterioration in the area.

#### **4. Policies and measures to conserve forests in Yokohama city**

##### **Land use control by planning laws and conservation of forests**

There were some land use control measures to preserve urban greens mainly forests, woods and groves, such as the scenic zone system by the City Planning Act and the special zone of suburban valuable green preservation areas by the Act for Preservation of Valuable Suburban Greens in the Capital Region of 1969 and the special urban green preservation districts by the Act for Preservation of Valuable Urban Greens of 1974.

The scenic zone system, which first provided by the 1919 City Planning Act, intended to use for suburban low density residential areas to maintain those scenery. The two valuable greens preservation area systems aim to preserve hardly remaining forests and woods in suburban and urban areas. Even though two acts do not have the word of 'valuable' greens in Japanese titles, the author dare to add 'valuable' in translation. Because the acts surely targeted valuable or superior forests, may

---

<sup>12</sup> A citizen's group has been concerned before opening of the park and working voluntarily for farming, forestry, management of *yato*, furthermore they run a training course for activities in *yato* named *yato gakkô*.

it be in excuse, and could provide severe land use control measures for local governments and land acquisition claims for land owners.

Yokohama city designated the special zone of 100ha. in Enkaizan and Kita-kamakura suburban valuable green preservation areas of 998ha. (755ha in Yokohama) in 1969. Since then and until the end of fiscal 2001 Yokohama city have bought 56.9 ha. land receiving land owners acquisition claims. As for the urban green preservation districts, the Act set up four individual requirements and three of them are cultural value, scenic value and value as reservoirs of biology. Until the end of fiscal 2001, Yokohama city have designated 25 districts of 150.4 ha. in total. Acreage of each district is varied from 0.7 ha. to 36.7 ha. and 6.0 ha. on average. Until the end of March 2005, Yokohama city had bought 24.9 ha. land or 16.6% of total designated areas.

### **Preservation of forests by means of agreements and citizen's participation**

Other than above mentioned forest preservation projects by means of land use control and purchase, the City of Yokohama have prepared some measures to preserve woods and forests under agreement with land owners and by means of opening for citizens' use and care.

There are four types system; those are citizens' forests and community woods projects and greens or greening agreements. The first two are so to speak 'borrow up' type projects. In case of the former, Yokohama city and land owners have to exchange a land use contract for more than ten years and in the latter to make a lease agreement also for more than ten years. In both cases management of forest or wood will be commissioned to local caring club. Land owners are paid in case of the former bounty and the latter rent.

The citizens' forest projects target on forests in UCAs of more than 5 ha. The project started in 1972 and cases steadily increased and in 2005 there were 26 cases of 415.8 ha. in total. Among 26 cases the smallest is Kamoi-hara citizen's forest in Midori ward which has only 2 ha. and opened in April 2005. Kamoi-hara citizen's forest originally was designated for the urban green preservation districts in 1994. Building and development activities have been severely restricted by the Act, however, care or up keeping of wood was out of consideration. As a result, abundant garbage had been dumped in the wood. After two years voluntary care, Kamoi-hara wood was transferred to the citizen's wood system and under the citizen's care. The largest citizen's forest is Niiharu citizens' forest of 66.2 ha. also in Midori ward. A part of this forest of 15.8 ha. was devised to the City of Yokohama and was planned to reform to a city park.

In 2005 there are fifteen community wood projects of 20.4 ha. in total and the largest is Miyazawa community wood of 2.4ha. in Seya ward and the smallest is Ichizawa community wood of 0.7 ha. in Asahi ward. Detail and issues of the community wood projects will be referred and discussed later, taking up the case which the author now participated in.

### **Woods and trees in built-up neighborhoods**

As for minute afforesting measures, Yokohama city has many to preserve and increase small greens in built-up areas, such as for tiny woods, scattering stand out trees and green hedges. For examples the preservation contracts of tiny woods in UPAs are, so to speak, mini community wood projects, and tiny woods of 172.1 ha. in total were under contracts in March 2005.

Based on the Master Plan on Yokohama's Greens of 1996 and to correspond each areas' peculiarity, Yokohama city designated the important district to preserve and increase greens. It is very stimulative, however, each area already designated covers very wide areas from 160ha. to 1635 ha.. I suppose, if the comprehensive plan making should be done under citizen's participation, it is more appropriate and easy to start in smaller areas where some citizens' activities on caring, preservation and creation of greens etc. and/or other activities such as protective covenant on residential environment are already exist.

## 5. Two cases in Aoba ward

### **The organic farm by the handicapped in Tôkyû Den'en Toshi.**

The workshop 'Green' is the welfare workshop, main works of which are organic farming. The workshop 'Green' established in 1993 in Aoba ward Yokohama city by *Sakuranbo-kai* which was an early exercise course for handicapped infancy. At the end of 1980s, *Sakuranbo-kai* began farming as a trial, wet rice culture, potato growing and etc. and sent one of staff who is now a head of the workshop and a few apprentices to the precedent of farming workshop for the handicapped such as *Kokoromi gakuen* in Tochigi prefecture.

In those circumstances the author was a member of the Yokohama's Working Committee for Urban Agriculture and proposed an idea to combine two challenges, namely social welfare for the handicapped and preservation of urban agriculture and the idea was included in the proposal on "Machizukuri in cooperation with urban agriculture" in 1989<sup>13</sup>. The Department of Agriculture and Greens [*ryokusei kyoku*] of Yokohama city<sup>14</sup>, supported the start of farming by the handicapped, *Sakuranbo-kai* and "Green" in farming techniques and farmland tenancy etc<sup>15</sup>.

Since its establishment in 1998 the workshop 'Green' or the organic farm 'Green' have been growing up steadily and in 2006 spring and has 33 handicapped members called *shoin* (28 males and 5 females), 8 fulltime staff, 2 part-time staff, 4 regular volunteers and many occasional supporters, and is cultivating 0.76 ha. farmland which are broke up into 8 pieces of farmland (two paddy field of 0.26 ha. in total and six field of 0.5 ha.). Because of the restriction of the Farmland Act, 'Green' can not own any farmland and only borrows from discrete farmers temporarily and somewhat illegally. This is very serious issue for steady management of the workshop.

The workshop 'Green' now use two buildings for office, dining room and works in rainy days, and two group homes for handicapped members. These buildings were built and let by local farmers at the 'Green' request, which were the support for 'Green' by local community, however, from another view point the 'Green' offered chances of property management for local farmers<sup>16</sup>.

In 1996 three years after opening of the 'Green', the head of 'Green' co-edited a book entitled "Citizen's declaration for happy farming" and outlined three year's experiences and outlook for future

---

<sup>13</sup> In its recommendation the committee proposed clearly that the City of Yokohama should create places and systems which would afford the aged and the handicapped possibility and chances to participate farming and as a result to acquire their motivation in life and to build up their health (Yokohama-shi toshi-nôgyô konwaka 1989: 17).

<sup>14</sup> *Ryokusei kyoku* was the particular department in local governments in those days, which covered both of deferent kind administrations, agricultural administration and park and green administration.

<sup>15</sup> A for Green workshop in the history of Tôkyû Tama Den'en Toshi see also Ishida 2006 forth coming.

<sup>16</sup> As for the relation ship between property management and urban agriculture in Kanagawa prefecture, see Ishida 1990: 180-197.

of the 'Green' (Ishida & Akemine 1996: 212-226). Another book entitled "Growing up while cultivating: challenges of a workshop for the handicapped" was published in May 2005 [Ishida Shûichi 2005]. After book published the head of 'Green' have been asked now and then to give lectures about his practice and lesson, and NHK [the Japan Broadcasting Corporation] have been covering daily activities of the workshop 'Green' and producing a series of TV documentary titled 'four seasons of a workshop 'Green' for the handicapped'.

Although the activities of 'Green' deserve wide attention, the future may not be so rosy. In 2003 the workshop applied to the City of Yokohama for approval as an authorized social welfare corporation, but refused on the grounds of hopelessness of the Government's subsidy.

The author proposed in 1989 the idea to combine social welfare policy and urban agriculture policy. In fact, I have imaged to combine urban farmland, which will lose cultivating powers more severely and financial margin in social welfare sector. Although the Act to Support Independency of the Handicapped was enforced very recently and has a hopeful name, has been criticized for its two pretense key concepts, those are self responsibility and self payment.

### **Community wood in matured residential areas : the case in Moegino**

As aforementioned, the community wood project is one of the four borrow up type forest preservation projects in Yokohama city which started as a system in 1988 and the first community wood was opened for community in 1990. The community wood project targeted small woods remaining in UPAs, and borrowing up more than ten years and open for community as a space for rambling or community activities.

Land for Moegino community wood [*Moegino fureai no jyurin*] in Aoba ward is 1.4 ha. remaining wood in nearly built up residential area and located only 500 meters off from Fujigaoka station of Tôkyû Den'en Toshi line. The land lease contract between land owner of the wood and the City of Yokohama was agreed, and after finished some improvement works such as to provide foot ways etc. opened for public on August 1st, 1998. The reason why this 1.4 ha. block in Tôkyû Den'en Toshi projects had been excluded from development works and remained in original state of wood<sup>17</sup> is said that the land owner of this block, father of present land owner, raised an objection to the land readjustment project itself. The present land use condition of neighboring blocks of the community wood, three of four blocks are of low building coverage and low floor area ratio. Present vegetation of the community wood are mostly copse of oaks [*kunugi*, *konara* and etc.], and bamboo grove [*madake rin*]<sup>18</sup> and many kind of wild grasses including important species such as wild orchids of some variety.

Care and management of community woods are commissioned for caring clubs organized for every community wood. The caring club of Moegino community wood headed by the land owner<sup>19</sup> and have forty members in 2006. Most of members are the aged and one forth of them are the local and the other are newcomers settled after the late 1970s. Some of the caring club members are also members of neighboring park' caring club, another some are committees of the building covenant in the neighboring area. As a rule, club members gather monthly on the fourth Sunday and

---

<sup>17</sup> In the latter half of 1980s, four edges of this block were severe slants without any vegetation.

<sup>18</sup> *Madake* grove in Moegino community wood covers about one fourth of the area and is said as the biggest in Yokohama city.

<sup>19</sup> It is rather rare cases in fifteen care clubs that land owners act as a head of the care club.

work for care and maintenance. Eager members however, come more frequently, every Sunday or even twice a week. Care and maintenance works are basically, such as weed, mowing, pruning of trees; repairing foot ways and paling and etc. Recently we have changed method of wood caring and adopted the local and traditional techniques called *hōga-koshin* [renewal by sprouts] in which we cut down deciduous oak trees of from fifteen to twenty years old and nurse and grow up new sprouts from stumps. Cut downed trunks and limbs used for charcoal making or *shiitake* mushroom cultivation. In autumn of 2004, a charcoal kiln [*sumi yaki gama*] in our community wood was accomplished after a few years' trial and elaboration. In 2005, we made charcoal several times. We burn mostly logs of oaks such as *konara*, *kunugi*, *shirakashi* and occasionally some kind of bamboos.

According to the agreement with the City of Yokohama, the caring club should include in its schedule of activities a few events open for the community. We have planed and carried out a couple of such open events every in one year. For examples, a party to enjoy chirping crickets in summer and a grand party to taste roasted sweet potatoes in late autumn. Very recently, we received an outside school lesson for fifth grade pupils of the adjoined elementary school and we supposed this type of activities will increase hereafter.

The club issued the bimonthly newsletter of four pages. The contents of recent issue on July 2, 2006 is as follows; front page was a scientific report on *yama-yuri*[white lily], page 2 & 3; recorded our activities; right part of page 4 was a column titled 'on my childhood and nature' and left part of page 4 reported the general meeting held on April 29. We had published matters, for example a photo collection of wild flowers in Moegino community wood and a list and explanation of wild birds in Moegino community wood and Moegino park.

As for finance of the caring club, expenditure to run the club and for maintenance works and cost of open events etc in 2005 fiscal year ,are 579 thousand yen in total and mostly granted by the City of Yokohama. Members pay 2000yen for one year membership and in every attendance day bear 300~500yen for a lunch and contribution of goods are welcomed.

The anxiety of caring club members are aging of members. Many of members are over sixty five years old and are afraid of injury while caring works on many severe slants in the wood. More serious problems we are worrying are land ownership of the community wood. If the inheritance occurs, successors will not be able to bear inheritance tax which supposed to be very high. The public or community ownership of the wood would be subject of examination.

### **Concluding remarks :**

In discussing Yokohama's planning and preservation policy on urban farmland and forests many key words or key phrases may be deserved to mention and most of which have some how Yokohama's particularity. Those key phrases or key words could be categories into three, namely philosophical, technical and planning conceptual. Most of the important key phrases and key words, have been already referred to in this paper. For examples, the key phrase or slogan of 'machizukuri in cooperation with agriculture' outlined and discussed as a philosophical example and the system of 'exclusive agricultural zone' as a technical example. In this concluding remark, the author would like to refer to another category of key phrases or key words, that is to say, those on planning concept.

In the documents, which explains urban planning concept of Yokohama city or plans of a individual ward of Yokohama, we often find key phrases or key words showing planning concepts related to greens, farmland or forests. In November 1997, Yokohama city decided the Master Plan on Yokohama's Green and in explaining the plan indicated, in line with philosophical key phrase of 'machizukuri in cooperation with agriculture', two phrases as important planning concepts. Those are 'preservation and utilization of seven important mass of greens'[*midori no nana-dai kyoten no katsuyō to hozen*] and to create 'networks of water and greens'[*mizu to midori no networks*]. Both of them are the key planning concepts of Yokohama's future greens, however, the former, based upon existent large-scale pattern of Yokohama's greens and shows the key concept of the city wide plan and on the contrary the latter, imaging future of rather smaller areas, for example of wards and intends to show detailed planning concept.

In fact in the early 2000s, many of Yokohama's wards engaged to elaborate the ward's urban master plan and in those plans, especially those of northern wards such as Midori, Aoba and Tsuduki wards, though naming of each differed a little in Japanes<sup>20</sup>, had nearly same planning concept along the key concept of 'networks of water and greens'. After Aoba ward's urban master plan finalized in March 2001, which had an attractive concept of 'corridor of water and greens'[*mizu to midori no kairō*], zealous citizens supported the concept and discussed repeatedly how to realize the concept, however, nothing has practically realized yet. Differ from the philosophical key concept of 'machizukuri in cooperation with agriculture' which could be realized in many style and in many places and the key planning concept of preserve and utilize 'seven important mass of greens' which would be realized according to the definite existence of greens and the obvious plan of preservation and improvement, realization of the planning concept of 'networks of water and greens', however, it is inevitable to make the concept substantial, that is to say before realization of the concept, plan and measures to realize the plan is indispensable.

---

<sup>20</sup> Aoba ward used *mizu to midori no kairō* [literally corridor of water and greens] and Midori ward *mizu to midori no jiku* [literally axis of water and greens]

## **CROSS-TRANSFERS AND LOCAL PLANNING PATHS. THE BARCELONA MARKET SYSTEM.**

### **ABSTRACT:**

Commercial Urbanism lacks a literature devoted to retrospective planning history. Generally speaking, new retail premises (shopping arcades, supermarkets, hypermarkets, shopping malls...) have drawn much greater attention than the evolution of public markets. This is quite surprising since it is widely acknowledged that public markets “have been the driving force behind the configuration of European cities from medieval times” and that they have maintained their ability to structure the city up to the present. Indeed, this is even more striking given the importance of market regulations in planning history and the significance attributed to the market hall in urban space modernization by 19th-century council planners.

The retail revolution of the 20th century made the public markets an anachronism doomed to vanish, given the efficiency of the new commercial formats. On the one hand, the economic efficiency of the new shopping malls has had a substantial impact on the retail structures of existing cities. But on the other hand, in most cases the high survival capacity of public markets contrasts with the rapid obsolescence of new commercial formats. Even in cities where market halls had disappeared, they have showed a surprising capacity of *resurgence*.

This paper will take Barcelona as a case study in order to question the renewal of activity in connection with the city’s public market halls system, a renewal which took place in the 19th and 20th centuries. This city provides some elements for a comparative approach. Moreover, this paper shows the relevance of cross-transfers and poses the question of the importance of particular historical contexts and routes. More than the initial influence from the French experience, what characterizes the case of Barcelona, on comparing cities, is the construction of a considerable number of ironwork market halls by local industry. This first generation of market halls was joined by a new generation of such facilities in the period 1940-1970, bringing the total number of covered market halls to over forty, evenly spaced throughout the city. It is even more striking that this whole system of market halls has been preserved and that it has been turned into an asset which has been actively managed by the Barcelona City Council since 1991.

The contemporary municipal trend is to seek to balance the various commercial distribution formats and their role in neighbourhood revitalization. This represents a significant change of course in the regulation of commercial activities in the 1990s, in harmony with the changes that have come about in the selfsame discipline of urbanism. It is an urbanism that is less concerned with the arrangement of more or less permanent objects, stable configurations or definite crystallization, than with accommodating processes, with the adoption of strategic guides<sup>1</sup>. In this new context it is necessary to look to the past but not merely for instrumental reasons, and to seek to examine not only the market halls’ artistic-monumental value but also their impact on urban structuring. Likewise, it is necessary to observe the structuring of a less tangible area, that is to say, the city culture that is most visibly expressed by the municipal markets system.

### **1. Markets as the driving force of the European city**

It is widely acknowledged that public markets have been the driving force behind the configuration of European cities from medieval times. Henri Pirenne attributed the rebirth of

the medieval city to mercantile activity and to the long-distance trade in sumptuary goods<sup>2</sup>. Today, however, we think that the process was fuelled by the country farmers and that the modest trade carried out in the local markets boosted the long-cycle growth of medieval Europe<sup>3</sup>. Large-scale trade and the birth of capitalism would only be later consequences. Thus, medieval towns grew up around local markets and this can be seen in their morphology, just as has been stated in numerous studies on the medieval city and as can be easily verified in the case of Barcelona<sup>4</sup>.

It is known that around A.D.1000 there was a market outside the eastern gate of the city's Roman wall. In the 11th century the *burgus* grew up around this market, where the farmers of the surrounding countryside came to sell their produce. In the 13th century, when the new city walls began to be erected, the area around this market was already completely built up and the market trade unfolded at various squares and streets. This commercial area sprawled towards the shoreline, which served as the city's port, and towards the water channel where most of the industrial workshops (wool, leather, etc) were found. These three elements (market, port, water channel) caused this district to be denser and more active, and from the 15th to the 18th century this area, which formed about 14% of the extension of the city enclosed by the new medieval walls, contained over 41% of Barcelona's inhabitants and almost all its economic activities. This area was actually the motor that drove the whole city until the 19th century.

From the end of 13th century, with the increase of its population, the city began to depend largely on the supply of grain from Sicily and other distant places. The main goal of the city council was to manage the economic challenges: to assure, through the guilds, the quality of the products that were exported and to assure supplies in times of need. The regulation of the markets formed an essential part of this scheme, and the civil servant who was responsible for the good order of the market was called the "almotacén"<sup>5</sup>. To assure the ethics of trade, to guarantee weights and measures and the right prices, to prevent forestalling and regrating, and to maintain good order in the market were priority concerns of the city council. Market activities and craftsmen's shops invaded the public space, and it is significant that the first well-known urban reform undertaken by the city council in the 14th century was precisely in the place where the market had originated. The growth in trade and population had made it necessary to re-organize the sale of the various goods at the city's different squares and streets. The dispersed market that was established in this way formed the very backbone of urban life.

From the second half of 18th century, the urban growth problems and the emerging enlightened view of urban life caused a change in the attitude towards marketplaces and streets that opened the way for the complete renovation of markets in the 19th century. Despite this profound renewal and the disruptive effects of the capitalist economy, the public markets continued to be an example of the persistence of the inherited pre-capitalist "moral economy", and the ethics of trade continued to be regulated by a vast number of municipal ordinances<sup>6</sup>.

## **2. The market as a facility**

In the last half of the 18th century, the first market renewal was closely tied to the new enlightened ideas and to an emerging new "urban knowledge" that had in some ways been anticipated, in 1749, by Voltaire's ideas about city embellishment. He thought that such urban embellishment was not only a matter of aesthetics and that it depended essentially on the development of a set of facilities, based on numerous, convenient and safe transport means, and on the homogeneous distribution of markets, theatres and churches<sup>7</sup>. These ideas were further developed in architecture by Laugier and Patte, and they led to new planning tools, such as the

general geometrical plan, systematic street alignment, and the regulation of building by means of ordinances, which were widely used in the latter decades of the century. At the same time, new medical and police outlooks arose with respect to urban space, as did the “Ponts et Chaussées” engineers’ economic view of the territory. All this helped to create a new type of city-planning thought that flourished with the revolutionary rupture<sup>8</sup>.

Manorial rights were abolished in the France of 1790 and markets became the municipalities’ exclusive responsibility. The expropriation of ecclesiastical and émigré nobility properties allowed the replacement of the old structures by the new State institutions. The centralized organization of the French State made the replacement process unique in terms of its coherence and breadth. Under the supervision of the “Conseil des Bâtiments Civils”, a homogeneous management technique and a programmed method for the evaluation of needs, distribution and construction of areas was adopted<sup>9</sup>. City amenities became signs of institutional and technical modernity. The market areas and buildings, such as market halls, public granaries and slaughterhouses, were deemed amenities the same as prefectures, hospitals, public schools, judicial establishments, jails, police stations, theatres, museums and religious buildings, which have been considered public services since then.

Markets, which used to be mainly local features, became progressively integrated in expanded distribution networks and were influenced by the new economic criteria. In this area, the “demands of yield, effectiveness and satisfaction of `needs’ wove a network of practices, rules and laws that influenced the selfsame layout of the market buildings”. They adopted a functional logic that unfolded on three levels of organization: “the sales cell, the circulation space and the organization of cells that obeyed the will to classify and to control, as well as to isolate the trade activities from the street”<sup>10</sup>. The new trends tended to establish a clearer distinction between public and private space, and they sought to remove market activities from the street and locate them in bounded places. They also tended to impose greater hygienic demands and to add larger doses of urbanity to the markets, which were thus to become true amenities and schools of courtesy, an ideal that would imbue the whole 19th century<sup>11</sup>.

These new trends were systematized in France and many new market halls were built from the 1820s<sup>12</sup>. The French model was followed by many European countries, but there the political-legal framework changed at a different pace, with greater limitations on public intervention. For example, in England and Wales in 1888, despite the fact that municipal control was more common in large towns, 279 of the 769 known town markets were still in manorial hands. In the case of Spain, the first steps toward overcoming legally the old regime were not taken until 1834, when trade was deregulated and permission was granted to deal in “all the objects for eating, drinking or burning”, except bread. The confiscation of the religious orders’ properties in 1836 made it possible to reorganize and modernize the urban space with modern amenities, including some markets. But the precarious availability of public funds did not allow a programme like the French one to be implemented. In Barcelona, where the number of public markets had grown to a total of nine, only two were built on the confiscated plots of convents. The aim was to transfer the activities that overcrowded two of the city’s most central places. From a typological standpoint, the two solutions were rather different, as required to suit the features of their respective neighbourhoods. San Josep square, next to the Rambla, where La Boqueria market had been transferred, was designed as a homogeneous square surrounded by arcades with monumental Ionic columns, as befitted a district that had acquired a perceptibly bourgeois character. Santa Caterina market, in a more popular neighbourhood, followed the model of Paris’ Saint-Germain market, built by J.B. Blondel in 1813-1817, but it did so in a more modest way<sup>13</sup>.

In the 19th century, important changes took place in cities and in retail marketing. In the opening decades, one of the main concerns of the city council was to provide basic subsistence. In the latter decades of the century, however, the abundance of supply was assured and the consumption habits had changed completely. The main problem was the rise of prices above the working-class wages. A sign of this change was the progressive elimination of public granaries. In France, for example, numerous public granaries were built in the opening decades of the 19th century. These facilities concentrated an increasing production, assuring a more regular supply, and they were showcases lending security to an urban population that still recalled the recent crises. In 1840, however, when many of these buildings were just finished, certain doubts arose as to their utility since other distribution channels already existed. In 1849, the *Chambre de Commerce* of the city of Tours considered the cost of building a granary to be a waste, considering the growing custom among the people, even in the countryside, not to cook their own bread, preferring to buy it ready-baked<sup>14</sup>. Cerdà in his *Teoría de la Construcción de Ciudades*, of 1859, considered granaries to be very important facilities, whereas in 1867, in his *Teoría General de la Urbanización*, he wrote: “we no longer live in the times when the Public Administration had to build great public granaries to care for the common subsistence of the citizens (...); the freedom of trade now comprises everything, even the articles of prime necessity...”<sup>15</sup>. The systematic increase in the flow and the fluidity of trade would be harnessed, in the last half of the century, by the generalization of the new transport systems. This entailed an overall acceleration that fostered a speedy renewal of the commercialization channels and brought about a far-reaching change in consumer habits.

### **3. The ironwork market generation.**

(926 words)

Almost 60 markets were built yearly in Great Britain between 1820 and 1850, including the first ironwork structures, and London was, beyond compare, the world's foremost modern metropolis<sup>16</sup>. In the last half of the century, however, Paris provided the most important models. The new market proposals were included in the wide-ranging urban renewal carried out by Baron Haussmann. The influence exerted by the rebuilding of Les Halles central market and the Paris renewal processes can be compared. In both cases the decisive intervention of the State allowed systematized solutions and an unprecedented degree of ambition. The long and careful debate on the various projects and the quick performance of works give an idea of the engagement of the public authorities. The project of Les Halles obtained final approval in July 1853, and the works began in February 1854. The two previous pavilions were inaugurated in October 1857 and one year later the six pavilions were finished that completed the first section, occupying 21,080 m<sup>2</sup>. Only four pavilions of the west section, with a surface area of 12,400 m<sup>2</sup>, remained to be built. The many criticisms of the former stages were soon forgotten and, with its complete immediate success, Les Halles central market became the model of more than twenty district markets in Paris, which showed similar typological and technical features, as well as of four hundred other markets built in French provincial towns between that time and the end of the century. These structures had a great following and not only in France: they provided a useful pattern for many countries. The building of ironwork markets spread quickly throughout Europe and America. English, French and German architecture journals helped to spread the novel technical solutions for the new markets, but it seems clear that the French model also predominated in the main period of market renewal in Belgium, Italy, Germany, Austria, Spain, and in the new nations of Latin America<sup>17</sup>. This building boom has been attributed to a combination of factors, including the expansion of the railway, the rise in real wages, abundant and cheaper food, continued urban growth and improved methods of public funding<sup>18</sup>. In the United States of America, where municipal markets had been challenged by

private meat shops in the 1830s and by the authorization of private market house companies, as in Pennsylvania in 1859, “the municipality in the late 19th century rediscovered the fact that public markets could improve - not hinder - public order, hygiene and urbanity while providing cheap, affordable food for wage earners and their families. Unlike private food shops and grocery stores, market houses encouraged interaction and bargaining between buyers and sellers”, and “municipalities (...) built sophisticated market houses that were bigger and more numerous than ever before...”. In New Orleans, for example, fifteen market houses were added “to its already extensive public market system between 1880 and 1891...”. In Berlin, between 1886 and 1891, during its reorganization as a new capital, seventeen open square markets were closed to be replaced by thirteen retail market houses<sup>19</sup>.

In Spain, the new typological solutions were introduced with some delay. Although several plans to cover market areas with ironwork structures had been considered, the shortage of municipal funds had hindered their construction. After the Revolution of 1868, the new political trends fostered municipal services and began the construction of a new generation of markets. It was impossible to avoid a comparison of the Parisian markets, which had been operating for almost fifteen years, with the open-air markets of Madrid and Barcelona. La Cebada market in Madrid and El Born market in Barcelona were held outdoors, amid considerable disorder and very deficient conditions of salubrity. In Madrid, the popular city council of 1868 decided to build two new markets in order to organize the town’s chaotic supply situation and to improve its sanitary conditions. The new market halls of La Cebada and Mostense were built in Madrid between 1868 and 1875. El Born market hall was built in Barcelona between 1872 and 1876. All these markets combined retailing and wholesale as did Les Halles in Paris.

In Madrid, only a small number of ironwork market halls were built in this period. In Barcelona, on the other hand, with the Eixample expansion district at the height of its development and where most of the adjacent municipalities had been annexed by the city in 1897 and were also growing, a remarkable network of market halls was built in the space of a few years. The number and coherence of this set of ironwork markets was largely due to the fact that they were made of products from the city’s local industry. These ironwork markets were those of El Born (1872-1876), Sant Antoni (1872-1884), Hostafrancs (1881), Barceloneta (1884), Concepció (1888), Llibertat (1888), Clot (1889), Unió (1889), Abaceria of Gràcia (1892), Sarrià (1911), Sants (1913), La Boqueria (1914), Sant Andreu (1914), Galvany (1927) and Ninot (1933)<sup>20</sup>. All these market halls were built to replace outdoor markets that had supplied the various old and new neighbourhoods.

Up to this point, Barcelona - like the other major Spanish cities -, was merely a follower with a significant but relatively modest market system within the European context. The distinguishing feature of the covered markets of Barcelona and other Spanish cities is that they were not only preserved but underwent a significant increase in number in the first half of the 20th century. Moreover, and this is even more unusual, after World War II, when market halls were disappearing in most of the advanced countries, the district market systems were substantially strengthened in some Spanish cities.

#### **4. The waning markets halls and the open markets (766 words)**

In the leading countries, the market erosion was a slow and progressive process during over half a century, until it reached the point of what was practically a liquidation of the market systems as conceived in the 19th century. The circumstances in each country were different but the final results were quite similar. In Great Britain, for example, the construction of new

markets took place mainly between 1830 and 1880. The peak was in the 1870s, when 29 new market halls were built. Since then there has been a progressive decrease in the number of structures of this kind and between 1910 and 1950 only eleven new market halls were built in the whole country<sup>21</sup>. A New York magazine from 1885 wondered if the markets were doomed because of the increasing competition from the private stores established uptown. The prices were higher in these establishments, of course, but they had many advantages for customers: they were near their residences, they knew their tastes, household servants could purchase on account, and the customer service was better. The municipal markets, on the other hand, were criticized for their deficient maintenance, cleanliness and hygiene and for the coarseness of their vendors<sup>22</sup>.

In 1913, Philadelphia had already lost a considerable portion of its exemplary market system and the *clerk of the markets* did not think in those “times of the telephone and the corner grocery store” that it would be possible to return to “old custom of marketing”<sup>23</sup>. In the same way, the researchers on the case of France have observed that, in the latter years of the century, there came about a certain weakening of the markets, threatened as they were by grocers, wholesalers and cooperatives, and by the decline in traditional agriculture. During and after the war of 1914-18, the deterioration took place at a faster pace owing to the selfsame destruction of the war, the lack of maintenance and the later demolition of many of the markets. In the Interwar period, the policy of the British government was to return to free trade and to encourage the organization of central wholesale markets in large towns, in order to fight the increase in prices. This policy did not favour the farmer-producers. Meanwhile, consumer habits were changing. It was the time “of imported butter, tinned beans and tinned meat” and of an increasing standardization of products that hindered “local farmers from selling directly to their local markets”<sup>24</sup>. All these factors harassed small retailers and the public market.

Most city markets were more and more clearly oriented toward the working class. They were still lively but, as the years went by, the public budgets were less able to cover the market renewal needs. In order to meet the demand for cheap food, many towns encouraged the re-establishment of weekly open-air markets and they even allowed street vending. The open-air markets did not require large investments and were more easily adaptable to new situations, such as the needs of new neighbourhoods. In fact, the open-air markets never actually disappeared and Guadet wrote in his treatise around 1890 that, even in Paris, while several old open markets remained quite successful, other new markets that had been costly to build were closing<sup>25</sup>. The resilience and resurgence of the open markets were widespread phenomena in all countries. The open market tradition remained very alive in many provincial towns, including the very important ones. In the United States, for example, a 1918 market survey by the Census Bureau counted about 180 open markets in the 237 cities with a population over 30,000<sup>26</sup>.

The definitive market hall crisis broke out during the second post-war period. The lack of investments, the selfsame destruction of war, the post-war renewals of historical centres, the growing motorization, and the rapid spread of supermarkets, tied to the pre-packaging and branding of goods, were all working against the traditional market hall, which came to be considered an obsolete anachronism<sup>27</sup>. The rapid development of the new retail establishments in the 1950s and 1960s was combated by the representatives of traditional commerce, but that process had decisive political support because it was seen as a means to contain the persistent increase of prices. Events unfolded very quickly and, in the sixties, the bases of the present marketing system were laid in France, Germany and England. Accordingly, it is not surprising that the post-war decades were the most destructive period for market halls in the leading European countries. The market halls were often replaced by other commercial formulas or they were completely “modernized”, losing their original

character. The final demolition of Les Halles in 1971 was the most apparent and dramatic episode in this destructive process and, by receiving great international attention, it became the one that helped the most to raise the awareness of the need to preserve this kind of structures.

## 5. Barcelona and the case of Spain

(633 words)

As a result of the historical lag in the modernization of the marketing framework, the development of the Spanish markets diverged significantly from the process in other European countries. Between 1910 and 1936, a very considerable number of markets were built in the leading Spanish cities and in many smaller towns as well. In Madrid, for example, San Miguel market (1912-1916) and the small San Antonio district market were built. From 1930, a substantial renewal was undertaken and the new markets were built with reinforced concrete. In Palma de Mallorca a new market hall was designed in 1914 and several new market halls came to be built: Verónicas market (1914) in Murcia, the Central (1914-1929) and Colón (1916) monumental markets in Valencia, Abastos market (1921) in Alicante, and Salamanca market (1923-25) in Malaga. In Bilbao, Ribera market (1929) was rebuilt and, in that same year, a market was designed for the city of Vitoria. We can see a similar trend in different smaller towns, like the one at Plaza de España (1927) in Cieza (Murcia Prov.), the one in Vilafranca (Cordova Prov.), and the concrete market designed by the engineer Eduardo Torroja in Algeciras (1933).

Barcelona and the Catalan area were no exception. La Boqueria market was covered (1914) and the Sarrià market hall (1911), the two markets in Sants, the main market (1913) and Hort Nou market (1911), Sant Andreu market (1914), Galvany market (1927) and Ninot market (1933) were built in those years. Also built at that time were the market halls near Barcelona in Hospitalet de Collblanc, Sant Just Desvern, (1920-1923), Sant Joan Despí (1927), Sabadell (1927-1930), Badalona (1924-1926), Arenys de Mar (1925-1929), Molins de Rei (1932-33) and Plaza de Cuba market in Mataró (1936). Other markets were built in Calella (Girona Prov.) (1927) and in Sant Feliu de Guíxols (Girona Prov.) (1928-1930)<sup>28</sup>. Also remarkable in these years was the activity of the recently organized association of municipal architects of Spain. In its journal CAME, it published numerous articles about markets between 1929 and 1936. Moreover, the architect Giralt Casadesús, the journal's factotum, even published a monograph on markets in 1937<sup>29</sup>.

However, the most notable divergence from other countries came after the Spanish Civil War (1936-39). In the fifties and sixties, while the old markets were disappearing in other countries, in Spain a new generation of markets came to be built in the new suburban districts of the main cities. The shortage of commercial structures made it necessary to encourage open-air markets in the popular districts, and they were finally replaced by covered ones. In this respect, the case of Barcelona forms a good example of this unusual trend. Twenty-five new market halls were built there between 1944 and 1987<sup>30</sup>.

While the most outstanding ironwork markets disappeared in Madrid as a result of the market renewal of the 1930s, in Barcelona these structures have been almost completely preserved. Not even the removal of the central market from El Born was to lead to the latter's destruction. The negative example of the demolition of Les Halles helped to evidence the need for a stubborn defence of El Born market building. A popular movement arose which was politically strengthened by the circumstances in the last years of the Franco regime, and it finally saved the building. The paradox is, consequently, that a late-comer city has maintained a much richer legacy than other greater cities, not only in terms of the architectural heritage but also in those of public market halls as functioning facilities. A quick browse of diverse cities' market systems, according to the information available on the

Internet, shows that Paris, whose market system served as model for the leading Spanish cities, today has only eleven covered markets, of a total of 78 market facilities. The rest are basically open-air markets, most of which operate only two days a week, usually opening on Saturday or Sunday. Madrid, on the other hand, has 46 markets and Barcelona has 40, all of which are roofed facilities opening 47 hours a week and closing only on Sundays<sup>31</sup>.

## **6. Markets as city-planning tools.**

(1136 words)

The removal of the central markets, around 1970, from Les Halles in Paris, from the Covent Garden Market in London, and from the Quincey Market in Boston, were the most visible aspects of the old market halls' process of disappearance. Thanks, however, to the growing awareness of downtown decay and of the loss of the architectural heritage, the renewals undertaken in London and in Boston finally preserved the ironwork structures. From a functional standpoint, in any case, the old markets appeared to be definitively doomed. Nevertheless, at the same time there were some voices that defended farmers' markets as "totally functional anachronisms". Supermarkets were cheaper but farmers' markets had been able to meet consumers' wish for high-quality fresh products and, although they had long been considered inefficient anachronisms, the energy crisis of seventies and the growing environmental awareness provided convincing arguments in their favour. Open markets are held today in all countries round the world and several arguments are adduced in their defence. In the less developed areas, they are the main source of retailing while in the industrialized world they are an alternative form; and in some areas they are the only source of fresh produce. Likewise, they are useful to the small farmers, operating as "business incubators and survival safety nets for people at the economic bottom". In the same Western countries where market halls had progressively vanished, these facilities have received ever-growing support from consumers in recent decades and their numbers have significantly increased. The market tends to recover its traditional character as an event; a completely different experience from the equalized and controlled environment of shopping centres. Nevertheless, the market's impact on the urban space and its driving effect on the commercial fabric, which are key aspects today and have been so throughout city history, are rarely mentioned. No one doubts at this time that the shopping malls located on the outskirts of the big cities have weakened the traditional marketing fabric and, consequently, the life of the urban centres. In France, the Royer Act of 1973 launched a policy that is very restrictive for new shopping centres and favourable to small retailers. That law was not expressed properly in city-planning terms, seeking mainly to prevent the destruction of small companies and the loss of commercial facilities. In any case, since that time the attitude has grown more and more restrictive.

In Spain, in the seventies, retailing was in a much more traditional stage than in other European countries and the impact of the new shopping centres was delayed until the period 1984-1996. In that dynamic period, the quick expansion of the new big retail centres coincided with the adoption of French commercial urbanism's restrictive model by Spain's Public Administration. Nevertheless, this policy has been often hindered in Spain by the regionally decentralized authorities. In the Catalan region, the defence of traditional marketing has been quite strict and the act of 1987 is in many aspects like the French one. The city-planning policy in Barcelona, unfolded by the democratic city councils from the beginning of the 1980s, did not properly consider the markets but established a set of guidelines that will favour them in the long run. It envisaged the "rebuilding" of the consolidated city and preferred to design the city starting from the neighbourhoods rather than from the general plan. It revindicated the public space and the collective marks of

identity, and proposed precise programmed actions adapted to the existing morphologies and uses.

The issue of the markets arose in the last half of the eighties, when the capacity of the retail system was exceeded by its own growth dynamics and by the crisis of the whole sector. The proliferation of dispersed units was saturating the sector and the traditional retail fabric showed itself to be unable to adapt to the circumstances. In 1990 a Special Plan for Food Retail Facilities was approved by the City Council that emphasized, from the city-planning standpoint, the importance of fostering traditional food retailing. The municipal markets formed the fundamental poles of proximity retailing and they were the foremost tool for updating the whole system. The Special Plan concentrated its proposal on the renewal of the existing market network. The Barcelona Municipal Markets Institute was created in 1991 with the mission to manage, administer and modernize the municipal markets, aiming to maintain their social, civic and cultural centrality. Since that time it has carried out an integrated management and promotion of the Barcelona market halls system, and it has not only modernized and renewed the existing markets but has even built some new ones. The recent experience of Barcelona has been very different from the political choices made in Madrid, where some municipal markets have been disappearing in the last few years because of a shortage in investment.

Retailing is a multiform and turbulent environment which is increasingly segmented because today consumption depends more on desires and cultural choices than on massive "needs". In this changing environment, the various types of markets can find their own niche. Moreover, the survival of markets must be a strategic commitment to revitalize the city centres. To face the markets' future, we require a better knowledge of their past, but little attention has been given to this matter. Historically, the new retail premises, such as shopping arcades, department stores, self-service shops, supermarkets, large stores, regional malls, etc., have aroused much greater interest, as an expression of a constantly renewed modernity, than the public markets. Despite the quick expansion and great visibility of these new formats, however, they have had a very short service life, especially if compared to the market halls with their traits of resilience and resurgence.

In the present phase, experts predict a notable contraction of the big commercial centres that dominate the retail trade at this time. In the United States of America, the time spent at shopping malls has already decreased, and it is accepted that the new online trade, which can offer better prices, will cause retailing to become concentrated in a small number of giants<sup>32</sup>. In addition, the consumption sphere will be increasingly filled with 'leisure' and 'experiences', in which traditional markets provide good assets<sup>33</sup>. Face-to-face buying and selling, the various kinds of quality fresh products, and the selfsame differences between markets can offer a wide, richer and more authentic range of experiences than other generic formats. Appropriately managed, they can revitalize city centres, linking them to their own past while fitting the new urban multicultural habits. These are two positive features in a time of a 'cultural turn' in city planning<sup>34</sup>. The Barcelona market policy fits an urban cultural choice and shows some of its possibilities as a planning tool within an urbanism that can be qualified by diverse adjectives (strategic, commercial, cultural...), but that, as a general rule, is today "less concerned with the arrangement of more or less permanent objects, stable configurations or definite crystallization, and more interested in accommodating processes with the adoption of strategic guides"<sup>35</sup>.

## **1. Introduction**

This paper sets out some of the principal planning ideas of Thomas Sharp (1901-1978) a prominent figure in planning in the UK in the middle part of the twentieth century. From working class origins Sharp was one of the first planners trained as such, rather than entering planning via another profession. He established his name in the early 1930s through a series of polemical texts, starting with *Town and Countryside* (Sharp 1932). He partly wrote this whilst unemployed, which is indicative of the troubled relationships he often had with those with whom he worked and his habitual response of resigning in such cases. Subsequently he worked as an academic, was seconded to central government for part of the Second World War and became a consultant. In this latter capacity he was probably the most prolific of authors of reconstruction plans during the mid-late 1940s (Larkham and Lilley 2001), with something of a specialisation in historic towns such as Durham, Oxford and Exeter. He was also President of the Town Planning Institute in 1945 and subsequently of the Landscape Institute in 1949. With a shift to local authority planning after the introduction of the 1947 Town and Country Planning Act, combined with his obduracy, meant that his later career, in the 1950s and 1960s, was quiet compared with the peak, and rather frenzied, years of the 1940s.

---

<sup>1</sup> This paper forms part of a project *Town and Townscape: The Work and Life of Thomas Sharp*, funded by the Arts and Humanities Research Council.

In very simple terms Sharp can be summed up as an urbanist. Like many of his generation, his views were in part a reaction against the industrial and urban horrors of the nineteenth century. However, he was equally critical of what he regarded as romantic responses and was in the vanguard of a critique of garden city principles. He sought a rediscovery of a civilised urbanism that would be distinctly modern in character and was influential in then evolving ideas about the appearance of place, and the idea of townscape. A short paper such as this can only focus on a few key ideas. Also it cannot fully reflect how those ideas evolved over time. This paper principally focuses upon the two decades when Sharp when he was prominent in the profession; the 1930s and 1940s.

The paper draws from Sharp's published works and from the archive of his personal papers held as a Special Collection at Newcastle University (GB186 THS). It is very much work in progress; further work is needed on Sharp and, in particular, in contextualising his ideas in the wider planning milieu of the period.

## 2. Key concepts

### a. *The Modern Town*

Sharp initially laid out his principal ideas about planning and settlement form in his first book *Town and Countryside* (Sharp, 1932). The core principles remained through his subsequent 'general books', *English Panorama* (Sharp 1936), *Town Planning* (Sharp 1940) and substantially revised 2<sup>nd</sup> edition of *English Panorama* (Sharp 1950) (with some interesting shifts and changes of nuance from the first edition).

Sharp set out his stall early in *Town and Countryside*. In part his argument stemmed from the wider concerns of the period over the perceived desecration of the countryside as motor traffic allowed the ugliness hitherto largely associated and confined to the industrial town to spill out into rural areas. However, for Sharp, the problems of the future of the countryside were inextricably linked with the future of the town. Urban areas had lost urbanity, according to Sharp, because of Victorian industrialism and capitalism but also because of the planning response of garden cities and their suburban progeny;

'Tradition has broken down. Taste is utterly debased. There is no enlightened guidance or correction from authority. The town, long since degraded, is now being annihilated by a flabby, shoddy, romantic nature-worship. That romantic nature-worship is destroying also the object of its adoration, the countryside. Both are being destroyed. The one age-long certainty, the antithesis of town and country, is already breaking down. Two diametrically opposed, dramatically contrasting, inevitable types of beauty are being displaced by one drab, revolting neutrality. Rural influences neutralize the town. Urban influences neutralize the country. In a few years all will be neutrality. The strong, masculine virility of the town; the softer beauty, the richness, the fruitfulness of that mother of men the countryside, will be debased into one sterile, hermaphroditic beastliness' (p11).

He went on to directly savage Howard's *Garden Cities of Tomorrow*. The essence of the argument was that the correct response to the horrors of the Victorian city should have been ideas about how to improve it rather than abandon it. He mocked Howard's preoccupation with town 'evils' such as gin palaces. He lambasted the concept of Howard's idea of marriage

of town and country as 'Town-Country' as being 'a hermaphrodite; sterile, imbecile, a monster; abhorrent and loathsome to the Nature which he worships' (p143). He lamented how garden city low density ideas had been encapsulated in planning legislation and in the profession. Howard was assaulted perhaps to an even greater degree in *English Panorama*; in describing the Three Magnets he stated 'It was on pseudo-philosophical foundations like this that the New Jerusalems were builded. The acceptance of such romanticism may perhaps be regarded as an indication of the desperate condition to which sociologists had been reduced...' (p 78-79). The incorporation of garden city ideas in planning orthodoxies led to 'universal suburbia', as development wasn't restricted to new contained settlements but sprawled across the countryside, 'vague, wasteful, formless, incoherent, it slobbers over the counties' (p 86). *Town Planning* continued the assault on garden cities (now labelled 'Neither-Town-Nor-Country') and suburbanisation.

At the heart of Sharp's critique of the garden city movement and its influence on planning standards of the time was the issue of density (and how this was architecturally articulated). In *Town Planning* he assaulted what he regarded as fallacious standards of housing density and distance between properties (with the then prevalent norms of twelve houses per acre and seventy foot between fronts and backs of parallel houses). He restricted himself from making conclusive statements about population density but suggested that in the order of 150/200 people per acre might be appropriate versus the less than 50 in garden cities and the 400 suggested by Le Corbusier in *Ville Radieuse*. The task of the planner was to rehabilitate the idea of the town. He was careful to distinguish between himself and other commentators on the state of the English town, such as D H Lawrence, by establishing that poor town building was not an intrinsically English failing and indeed for Sharp there was a distinguished post-Enlightenment, pre-Victorian history of town building. This history was related to practical democratic utility rather than authoritarian show (as might be found on the Continent). London squares exemplified this. Similarly English (and some Scottish) provincial towns were compared favourably to other European countries, as pleasant towns for citizens (though as Sharp made clear, historically not all citizens benefited).

However, though Sharp's appreciation of urbanity was rooted in the past he was at heart a modernist. These historical examples were inspiring but not for imitation. In *Town Planning* he reviewed various theorists of urban form. He started with the linear city as proposed by Arturo Sona y Mata in Spain and Soviet variants. Sharp dismissed this concept on a variety of grounds, not least its inefficiency in its stimulus; in claiming to be 'Planning for a Transport Age'. He then considered ideas put forward to reformulate the big city. Though not named as such, he clearly had the MARS plan for London in mind with an old centre retained but the rest of the city rebuilt in a modified linear way, with substantial wedges of country between the urban blocks. Again Sharp was ultimately dismissive, over the desirability of having such big cities and the massive extent of such a renewed London; so this was 'not only a wild dream but rather a bad one' (p 64). Next he turned to urban hierarchies with satellite towns, a model he found more appealing and in principle more practical. This acknowledged that whilst big cities were problematic they had social attractions and might form part of a wider hierarchy in what Sharp sought to define as 'subcentralisation' (vs. decentralisation). In considering what an ideal size for a town might be, he concluded with a guess that it might generally be around 100,000 with the occasional larger city.

## b. *Town Design*

Sharp's published views on Le Corbusier were somewhat equivocal. In *Town and Countryside* he referred to 'the much-discussed frenzied theatricality that Le Corbusier has entitled "The City of Tomorrow"' (p140). In his discussion of theorists in *Town Planning* he displayed some sympathy for Corbusian ideas but considered them impractical. He was not especially adverse to high rise flats at this point and concluded the appropriate residential mix would be a combination of flats and houses. However, from the time of *English Panorama* on Sharp had pronounced, drawing inspiration from Georgian precedents, that the key urban building block should be the street. His advocacy for the street was used also to attack semi-detached, hip-roofed, 'open' development.

In *Town Planning* he analysed why the later nineteenth century street was a debased architectural form before making the case for why the terraced street remained his preferred form of urban design, providing the best picturesque (not quaint) architectural composition. As he had in *Town and Countryside* earlier, Sharp cited Trystan Edward's *Good and Bad Manners in Architecture* as a key influence on his ideas on these issues; at the level of the individual house stress was placed upon emphasising doorways as an expression of the individual house. Sharp outlined compositional principles for terraces which might avoid the monotony of the nineteenth century street. Each individual street should be regarded as an architectural composition and a town should be a continuous series of contrasting compositions. With an urban hierarchy some principal streets might be quite long and given modest monumentality but most would be short and might be in cul-de-sacs. Above all the key was held to be variety.

Similarly the partially completed draft manual, *Civic Design*, (Sharp 1942) prepared for the Ministry of Town and Country Planning in a discussion on the street opened with the bald statement that 'the axiom that the street is the urban unit of design' (p29). At the core of this was the importance of good neighbourliness between buildings; 'each street must be judged, and should so be designed, as a large-scale finite composition, a single urban picture' (p29). Monotony could be avoided by keeping streets relatively short and having variety between streets. Formal architectural 'stops' were not deemed necessary but there was considered to be a danger of anti-climax if compositional issues were not fully considered. The manual further considered issues relating to domestic streets and commercial streets. The latter included a blast against 'chain-store architecture', the practice of using standardised designs for particular companies, considering it 'a most deplorable abrogation of civic responsibility' (p37). Effectively this was recognition of what we now term 'local distinctiveness'; 'Each town differs from every other town, every site from every other site and every individual problem of design requires its own individual solution' (p37).

This consideration of the street was part of a wider approach to urban design that Sharp was formulating which he came to call townscape, a term which was of course also used by a group of writers at the *Architectural Review*, leading to Gordon Cullen's (1961) seminal text. An antecedent for a townscape approach is today usually taken to be the work of Camillo Sitte. However, Sharp's own published references to Sitte were not kind. In *Town and Countryside* he wrote,

'Camillo Sitte saw in picturesque 'natural' medieval towns a beauty that he could not find in later architectural uniformity. He set out directly to copy in modern cities the irregularities, the fumbings, the purposeless staggerings of those old towns. Where

the old builders did not plan at all he planned an imitation of their lack of planning - with such lamentable results that the whole of his theory stood condemned by his works within a few years. Of all artificiality the most barren and depressing is the conscious imitation of the unconscious and "natural" (p66).

In the early 1930s Sharp had a strong preference for the building and towns of the Enlightenment period. This was perhaps ironic given that many of his subsequent prestigious commissions as a planning consultant in the 1940s were for older medieval settlements. However, these made him more appreciative of their qualities as a comparison between the two editions of *English Panorama* shows (Lilley 1999). In the latter he did not disavow his previous analysis of the disorder of the medieval town but was now willing to celebrate its picturesque effects and also concede that the pictorial possibilities of some major sites were consciously and deliberately exploited. And certainly the detailed appraisals he had undertaken of the cities he worked upon had a major influence on his ideas about townscape.

This was evident in his first major plan produced as a consultant, undertaken for Durham, *Cathedral City* (Sharp 1945). For example, the oblique approach to the Cathedral from the town up a narrow medieval street was described as follows,

‘[Owengate] climbs steeply up to Palace Green, with a glimpse of the Cathedral at its head. Then, at the top of the rise, at the head of the curve, the confined view having thus far excited one’s feelings of mystery and expectation, the street suddenly opens out into Palace Green, broad, spacious, elevated, with a wide expanse of sky: and there, suddenly, dramatically, the whole fine length of the Cathedral is displayed to the immediate view. It is as exciting a piece of town planning as occurs anywhere in the kingdom’ (p54).

Thus, the Owengate approach to the Cathedral was not an accidental piece of townscape charm, but given further validation as a consciously planned composition.

It was in his Oxford plan, *Oxford Replanned* (Sharp 1948), though, where his ideas about townscape crystallised. The plan contained a Frontispiece and Tailpiece which effectively set out principles and components of townscape, using Oxford as an example. Together these sections totalled some 65 pages of analysis. He analysed the magnificent; Sharp considered the High Street a 'great and homogenous work of art' (p20), not due to the intrinsic quality of the buildings but because of the relationships between them. Nearby, the sequence of Bodleian Library, Radcliffe Camera and St. Mary's church was held to be 'a first class aesthetic experience... to be treated with awe' (p32). He considered that crucial to both these experiences was the experience of movement through space or, as he termed it, kinetic experience, one his fundamental townscape principles. Another can be considered to be an aversion to monumentality and ‘opening out’, honed by his work in historic cities with their intricate visual effects. This stands in contrast, to for example, other reconstruction plans of the era such as York (Adshead, Minter et al. 1948) and Chester (Greenwood 1945). His exposition of townscape also encompassed much more humble elements. For example, under the heading of 'trivia' he considered the importance of floorscape, demonstrating the significance of texture, and its erosion through tarmacing<sup>2</sup>.

---

<sup>2</sup> However, in *Chronicles of Failure* (Sharp c.1973) Sharp stated that some of the text in Frontispiece and Tailpiece was introduced anonymously by H. de Croning Hastings.

His ideas on townscape were subsequently reprised and developed in *Oxford Observed* (Sharp 1952), and in his last significant work *Town and Townscape* (Sharp 1968).

### c. *The Organisation of the Town*

Though Sharp is perhaps now best known for his ideas on the visual appearance of place he was also greatly concerned with the functionality and social and economic organisation of place. He was also angry about the social and economic conditions that prevailed in significant parts of the country. His *A Derelict Area* (Sharp 1935) was a bitter treatise on the depressed coal mining area he had grown up in south-west Durham and he considered himself a life-long socialist (e.g. letter GB186 THS).

These attitudes informed his planning principles. His first major foray into the Town Planning Institute was through a paper presented in 1937 entitled *Segregation in Town Development* (Sharp 1937). The paper was a critique of over-segregation. His particular target was the large-scale separation of social classes in housing provision, or 'snob-zoning', which he considered socially undesirable. Planning, such as it was, he held to reinforce this process through its approach to density. The delivery of this paper was a traumatic experience; nearly all the speakers in the following discussion were highly critical, some defending the practice of social segregation. *Town Planning* subsequently picked up this theme. Again, Sharp was very critical of the social segregation of the contemporary city and the attendant class snobbery, the more so as he saw planning reinforcing the separation of the social classes.

As part of the creation of satellite towns, Sharp was an advocate of the neighbourhood unit. In *Chronicles of Failure* (Sharp c. 1973) he takes some credit for the development of the idea of the neighbourhood unit although more usually it is associated with evolving ideas in the USA in the 1920s (see, for example, Madanipour 1992). He did set out ideas for something akin to the neighbourhood unit in the first edition of *English Panorama*; the smallest unit he identified was such as might exist around a crèche, a number of which might aggregate to support a health centre or primary school. The neighbourhood unit was clearly advocated in *Civic Design*, it is 'the residential unit which allows for convenient social contacts and which can provide a full range of social, cultural and technical services of a local character' (p52) and was considered to be something like 2,000 inhabitants (though Sharp soon modified this figure – for example his Durham plan referred to 6,000 to 10,000). It was considered advantageous to have each of the units between principal traffic roads with the functional centre somewhere towards the geographical centre. Again, the use of neighbourhood units was advocated by the Study Group of the Ministry of Town and Country Planning credited with introducing the neighbourhood unit into British planning (Stephenson, edited by DeMarco 1992), led by Sharp, in their report appended to the main Dudley Report, *Design of Dwellings* (Central Housing Advisory Committee 1944). This sort of thinking became generally accepted in the planning of the first generation New Towns.

Another example of Sharp's challenge to orthodox thinking on grouping of activities was his attitude to civic centres. The idea of a grouped 'civic centre' was very popular in reconstruction plans, following Edwardian antecedents. No longer was a town hall considered sufficient, it needed to be accompanied by a range of other administrative and cultural facilities which might include, for example, colleges, libraries, museums and art galleries. Sharp stood more or less apart in this fashion. Indeed he had criticised the concept before the war in *English Panorama*. He directly attacked the concept again in *Oxford Replanned* and

there is distaste for the idea expressed in the more official language of *Civic Design*. In essence he considered they were advocated out of a misguided wish for monumental display. Whilst acknowledging some groupings made functional sense, in his plans he was generally advocating a dispersal of facilities in a town and city as a functionally and aesthetically superior solution. In Larkham's work on civic centres four of the five plans he identified as rejecting the idea of such a centre were by Sharp and only one Sharp plan, for Stockport, appeared in the much longer list whereby such centres were advocated (Larkham 2004).

#### d. *Urban Roads*

The problem of managing the massive growth of motor traffic in existing settlements was to prove to be one of the defining features of Sharp's career from the 1940s on. In particular, following his reconstruction plans for Durham and Oxford he remained embroiled in the issue of how to relieve central area traffic in these cities for many years subsequently.

Sharp's approach to this key planning problem was quite distinct and different from the prevailing model evolving in the wake of the well-known recommendations of (Tripp 1942), which generally led to a tight inner-ring road with a series of precincts internal to this (though Sharp did adopt this model when applied to new development such as neighbourhood units). In *Civic Design* Sharp criticised standardised solutions not derived from proper analysis of the individual place. Like Tripp he had a general preference for roundabouts for traffic junctions though suggested that in towns they should generally be rectangular. Pedestrians should be separated in such locations by means of subways, for technical (smaller difference in height levels than bridges) and aesthetic reasons (less intrusive).

Based on consideration of his reconstruction plans Buchanan considered Sharp's approach as sufficiently significantly different to warrant a section in his seminal text *Mixed Blessing* (Buchanan 1958). Buchanan noted these plans generally did not have inner ring-roads as such and that Sharp (correctly) concluded that much urban traffic was internally generated and therefore could not be removed by bypasses and ring-roads. Sharp used the term 'substitute road' for his approach. A substitute road was a road inserted close to the main congested streets (which might be commercial or shopping) and designed to relieve the principal street of all its traffic except that directly needing to be there. Buchanan wrote 'Reading his reports now, one is impressed by his unerring eye for the choice of substitute road locations, and saddened by the way his proposals have been whittled away in the course of years of discussion' (p166). However, Sharp was not a pioneer of pedestrianisation, except perhaps for particular narrow historic streets. Indeed, he viewed a certain amount of traffic as representing the bustle and liveliness one would expect from a town centre.

#### e. *The Nature of Planning*

Though outside the main frame of this paper, it is worth briefly commenting upon Sharp's attitude towards the organisation and process of planning. In this regard, as so many others, Sharp's prominence was as a critic. A strong critic of the weak inter-war legislation his most public returns into the profession's eye were through assaults on the process of planning in the late-1950s and mid-1960s. A passionate believer in planning, in *Town Planning* he made some suggestions of how a planning system should work. At the heart of the process would be a National Plan prepared by a Central Planning Commission of experts. This would provide a framework for Regional Commissions and so on down to the level of local authorities. Elsewhere he spoke in favour of the nationalisation of land. An undoubted

technocratic Sharp nevertheless took the issue of public participation seriously. Indeed this was the major theme of his Presidential address, at a time when participation issues were not foremost in the profession's concerns (Sharp 1945). Sharp did not believe in public *engagement* in the process as such but did believe in the rights of the public to know what was being planned for them, to have the right to comment upon those proposals and if necessary to reject them. For Sharp planning was fundamentally concerned with design, a point he forcibly made to the Schuster examination of the qualifications of planners (Schuster 1950). Schuster concluded that planning is primarily a social and economic activity.

### 3. Towns that never were<sup>3</sup>

The post-war period was one era when planners can have been truly said to have designed towns in Britain, with the new towns programme and in some bomb-damaged towns, such as Coventry, substantial areas of planned development. This, however, was an area in which Sharp was to remain frustrated. Though his various reconstruction plans had varying degrees of influence it is perhaps only with bomb-damaged Exeter (Sharp 1946) that a significant part of an existing town was built in part along the lines proposed by Sharp. In terms of new settlements he was the initial master-planner of the first generation new town of Crawley before a characteristic falling-out led him to resign his position. Perhaps his most complete realisation of his ideas for a town was the hypothetical design he did which was featured in the film *When We Build Again*. He was also commissioned by the Forestry Commission to design a series of villages in Northumberland (although only three of these were built in part) and later in his career there were also plans for other new settlements; though neither of these are considered in this paper.

The plan and model he prepared for the Bournville Trust's *When We Build Again*, and exhibited in 1943, was for a small town, effectively not much bigger than concepts of the time for the appropriate size of a neighbourhood unit. A hypothetical scheme, but apparently based on a real site in the north of England, it was designed for a population of 8-10,000. The original intention was to represent a town of 50,000 people but that proved impractical for making a transportable model which was to be exhibited around the country.

A major factor immediately apparent in the plan of this satellite town was transport (*plan ref*). It was arranged either side of a railway, with an industrial area on one side and the remainder of the town on the other. There was a national highway nearby, separated from the town by playing fields. From this highway ran an arterial road, though again this did not link directly with the town. Rather, local roads ran off this into the main part of the town and the industrial area. This had the affect that there was no direct vehicular linkage between the industrial area and the rest of the town (though there was pedestrian access).

The primary local road in the major part of the centre ran through the centre. The centre itself was arranged fairly formally with a principal axis with shops on either side of this street. It was terminated at one end by a town square (off axis), with a community centre, church and cinema. At the other end of the axis was a roundabout and beyond, on axis, a 12 storey block of flats. Typically, though, the major of the housing was shown as being terraced, running in long-linked rows with semi-formal patterns of straight lines and curves. At the front, houses

---

<sup>3</sup> This section draws significantly from material in the Thomas Sharp archive at Newcastle University (GB186 THS). Full references will be added as cataloguing proceeds.

were often set around small green squares, lying in the middle of local distributor roads. Most local streets were shown as through streets with only the very occasional use of cul-de-sacs. In some places terraces backed on to linear green space, before another road and another terrace. The densities of the terraces were up to 24 houses/ acre (net). In addition to the one point block previously indicated, there was also provision of some three storey flats and, at the periphery, some detached houses. Also to be found at the periphery were the major schools, allotment gardens and so on.

Sharp's approach with this hypothetical new town can be seen replicated in some respects with his outline masterplan for Crawley, presented in early 1947 (*plan ref*). Initially employed to define a boundary for the proposed new town Sharp sought to use some of the principles he had previously developed. So, for example, at Crawley the initial idea had been for the new town to be developed either side of the main north-south London-Brighton railway but Sharp argued for keeping the town west of the railway whilst locating the major industrial area to the east (with the purpose of excluding industrial road traffic from the town) (letter and report Sharp to Silkin 6/8/46 *refs*).

Crawley was by no means a virgin site. As well as the small town of Crawley it encompassed another settlement, Three Bridges, plus a sprawl of development in the countryside. Consolidating this sprawl seems to have been one reason for its choice as a site. Curiously for someone generally looking to increase urban densities compared to his peers Sharp recommended a larger land-take than the norm that had been established for new towns (suggesting 4,677 acres rather than 4,200 acres), explaining this on the basis of land wastage arising from existing development. Sharp's report (report March 1947 *ref*) indicated the existing Crawley High Street as one of its principal town centre axes, regarded as having character due to some good buildings but 'mainly due to the directness and simplicity of the broad street, with its green strips, and the island shopping site at the crown of the rising ground' (p2). To this he added a major east-west axis, running from near the north of the High Street. In terms of traffic, Sharp described it as a 'distributed centre', with little or no cross-town traffic but with good accessibility, making the centre free from congestion but lively 'as a town centre should be' (p7).

The rest of the new town was laid out on fairly conventional principles of first generation new towns. Six neighbourhood units and two sub-units were proposed, with the main units housing 6-10,000 people. The design of these were intended to create places self-contained for daily use, to save children under eleven crossing main traffic roads, to encourage neighbourliness and a local civic sense, to be a reasonable scale for providing local community buildings and, in effect, create a series of villages which coalesced to a sum greater than the parts as a town (Explanatory memorandum 1/2/47, *ref*). Densities in neighbourhoods were higher in those nearest the town centre. Open spaces between neighbourhoods linked to provide easy access to the countryside and utilised natural features, such as streams. The road network was described by Sharp as a 'roughly radial-and-circular system', with some in 'parkway' form. Thus, overall Sharp's outline plan for Crawley was not radically different from the principles prevailing with first generation new towns (Madanipour 1992) with only the pushing of industry to the periphery and his approach to the town centre being slightly unusual. However, it should be emphasised we only have an outline plan; we do not know how Sharp would have translated this into detailed proposals.

The Chairman of the new Town Corporation, Sir Thomas Bennett, an architect seems to have been very 'hands-on' in approach. The *Architect and Building News* (23/1/48) reported the

essence of the dispute being Sharp's refusal to provide for a monumental town centre. Sharp confirmed this in *Chronicles of Failure* (Sharp c.1973) referring to Bennett's distaste for his 'organic' layout in preference for something more formal. Eventually Bennett's interference came to a head and Sharp resigned. Sharp was replaced by Anthony Minoprio. His outline masterplan did not deviate enormously from that of Sharp. The town centre was somewhat reconfigured (though no great monumentality was evident) but seems to have a more conventional precinct approach, encircled by an inner ring-road. The purity of the separation of the primary industrial area to the east of the railway was diluted by dragging it partly to the west. The road network proposed was similar and though the configuration of neighbourhoods differed in detail they were not radically different in conception.

Sharp made a brief comment on the first generation new towns in the second edition of *English Panorama*,

'the first plans for these new towns are still clouded with garden-city suburbanism: and future building in similar places, and in all old towns, will need to be more compact and more truly urban than these first new ventures are at present planned to be' (p 109).

#### **4. The Urbanism of Thomas Sharp**

Even more than the rest of this paper, this section represents work in progress.

##### *a. As appraised by others*

The memory of Sharp in the planning profession, when remembered at all, is often for the trouble he caused, for example in the Town Planning Institute as it sought to redefine the nature of planning and the profession (see e.g. Cherry 1974). Yet it is clear that his contemporaries and near-contemporaries often held at least aspects of his work in very high regard (see e.g. Stephenson, 1992), something evident in many of the reviews of his publications at the time. Equally he was known and regarded outside the confines of the planning profession; for example, a letter from John Betjeman (*insert date & reference*) was gushing in its praise for *Oxford Observed* a view also held by the architect George Pace who cited it as a masterwork (Pace 1961/62).

This brief summary concentrates, however, upon specific and extended appraisals that have been made, mostly from the early 1980s, relatively soon after his death in 1978. The most authoritative work on Sharp is by Kathy Stansfield, initially in her MPhil thesis (Stansfield 1974) and subsequently in a book chapter (Stansfield 1981). In summarising Sharp Stansfield celebrated his qualities to inspire us that the town can be beautiful, the countryside should be defended and bad planning challenged.

After Sharp's death his widow provided funds for a biannual memorial lecture at Newcastle University that continues still. The first two of these by Lewis Keeble and Gordon Cherry directly addressed Sharp and his achievements. Keeble (1981) was enthusiastic in his evaluation. For example,

'He established... the idea that there are places in which buildings should happen and other, very much larger areas in which it should not happen at all. I am not certain that

his predominant contribution to the prevalence of this view or to the astonishing success it has met is now fully understood.

He revived and re-established the idea that the street, whether in town or village, is the proper unit of design rather than the individual building.

He wrote much of the now generally accepted grammar of planning, especially in relation to residential neighbourhoods, though it is now virtually impossible to identify and detach his particular personal ideas from a general ferment of thought in the perhaps uniquely creative time for planning of the 1940s.' (p14 and 15).

Cherry's evaluation was perhaps rather more equivocal (Cherry 1983). He did state that Sharp 'stands as a seminal figure of the mid century' (p1) and that 'for particular reasons, Sharp takes his place amongst the greats' (p17). But on substantive issues Cherry tended to regard Sharp a failure (as he did himself, Sharp c. 1973) or misguided,

'First, on his conviction that country is country and town is town, we have to say that his views could not prevail....'

'Next, in respect of his view of planning and townscape, Sharp saw cities as physical artefacts; people came second.... Concepts of townscape and urban form, and the practice of environmental design, are not today major features in planning. Again, Sharp stood for things which have slipped away as the century has progressed.'

'Finally on the nature of planning itself, the single, unitary, elite profession which Sharp advocated was an impossibility.... Sharp can be presented as a tragic figure, standing impossibly resolute against things destined to come to pass, representing views increasingly rejected by his generation and finally holding onto a wrong vision of his profession. In so many things seemingly he was uncompromising, but finally wrong.' (p15-17)

Cherry went on to say,

'But in the same breath we bounce back and say he was wonderfully, gloriously wrong.... The quality of the built environment does matter; the unique qualities of the British countryside are something for special protection; the directness and unambiguity of a planning system, underpinned as it should be by clear political will, is important; and our profession does demand our care and support.' (p17)

Some of Cherry's assertions are questionable (for example, though Sharp focused on place he cared deeply about people) and time lends a different perspective on others to which we will return below.

#### *b. a preliminary evaluation*

As Cherry so aptly put it Sharp was a man 'who dared to be different'. He was original and rigorous and not someone who would uncritically adopt prevailing conventional wisdoms. Some of his ideas and arguments became, for a time at least, part of the mainstream, others had less impact. Of course though he was important in developing various ideas he was (despite his sometime protestations to the contrary) generally not completely alone. Decoding

exactly who was responsible for the germination and development of some of the concepts discussed here is beyond the scope of this paper but it is posited that Sharp was at least one of the people important in their development.

Fundamental to Sharp's impact on planning debate in the 1930s was his critique of garden city ideology, a daring assault on deeply embedded planning conventions of the time. He was certainly one of the first in the planning world to launch such a direct assault. Less contentious was his disdain for their suburban progeny, sprawling out from existing towns and cities at a rapid rate. Underpinning these views was a strong belief in the urban and the urbane and its distinction from the rural. His view of modern urbanism, with its emphasis upon the street, though, was in marked contrast with the fractures of urban form promoted by the architectural Modern Movement as exemplified by Le Corbusier. Esher (1981) credited Sharp, along with Trystan Edwards, as one of the few arguing for such urbanity in the 1930s, but said that he 'spoiled his case by naughtily picking on Welwyn as his suburban bestiary' (p28).

In the short term his ideas on urban form were more influential in the management of existing historic towns; through the analyses he undertook in his reconstruction plans and his influence on emergent ideas of townscape. He brought a sensitivity and understanding to the rich complexity of historic towns than was common in the period, both in terms of their appearance and also, perhaps to a lesser degree, in the way they functioned. Planning and design at the time were still often rather stuck with a grandiose monumentality. He also brought a distinctive approach to the overwhelming issue facing historic cities at the time, provision for the motorcar, which if somewhat romantic about the impact of new roads (Pendlebury 2004), was always thoroughly thought through and non-formulaic. His ideas about historic towns formed part of developing thinking that was, in due course, to prove influential on the developing conservation movement in the 1960s and 1970s (though Sharp was anything but a militant conservationist!).

Sharp's approach to the design of new urban form in the 1940s was less distinctive than his handling of existing places, though whether this is in part due to orthodoxy catching him up is debateable. His preference for satellite towns was conventional by the mid-1940s at least and was exemplified in the New Towns. They used the neighbourhood model that he supported and had at least some role in introducing into British planning. Indeed, his model of a hypothetical new settlement and his initial plan for Crawley show no marked divergence from the norms of the time. However, it is regrettable perhaps that we do not know how Sharp's vision of Crawley would have evolved. It may have been more 'urban' than its contemporaries, which Sharp found clouded with 'garden city suburbanism'. Indeed, one of the shifts with the second generation New Towns was an attempt to make them more urban in feel (Madanipour, 1992).

### *c. Relevance today*

Cherry's evaluation of Sharp concluded that many of his strongly held beliefs had come to naught. Yet much has changed since 1983. Certainly in some respects Sharp would have no truck with prevailing values. He (like most of his time) was a modernist and a technocrat, believing in expert knowledge, albeit tempered by a public right to challenge what was proposed. He would have struggled with post-modern uncertainties and 'relational' perspectives. But in other ways his views seem fresh and contemporary. Since Cherry's analysis the importance of design as part of a process of satisfactory urban planning has re-

emerged through American New Urbanism and a greater design focus in British planning. His ideas about the need for a contemporary modern urban form (based around the street), well designed without overly contrived 'showiness', seem as relevant as ever, if as elusive to achieve, as major urban expansion occurs in the south-east of England and as all over the country towns and cities continue to develop and evolve. We perhaps also need reminding of his belief of planning for all, not just those who can traditionally afford good design.

Finally something not so far discussed in this paper, but hopefully evident in the quotations made from Sharp's writings, is that he was a brilliant communicator. Holford reportedly said that Sharp was the only planner who could be read as literature (Horsbrugh, pers comm) and Keeble (1981; p14) said he 'wrote lovely, dense, concise English in a way which has never been excelled in writing about planning'. His ability with words helped make a deep impression on his contemporaries, albeit his maverick nature means he is now less well remembered than some of his peers. And he brought the subject of town planning to a much wider audience, with *Town Planning* often cited as the best selling text on the subject of all time. Planning and urban design needs, but rarely produces, men and women who can so forcefully and clearly argue for the need for good planning and design.

## **Introduction**

Although the vast outpouring of planning documents and plans in the busy period of immediate post-war reconstruction planning (from about 1941 to about 1952) has received much critical attention in the last decade and a half, many issues have not yet been addressed. By far the greatest consideration has been given to the major plans for heavily bomb-damaged cities, and the plans of the eminent and prolific consultant planners. Patrick Abercrombie is a good example (Jones, 1998; Lambert, 2000; Larkham, 2004; Essex and Brayshay, 2005), to such an extent that one might think from the standard planning histories of the period that he alone replanned post-war Britain (cf Larkham and Lilley, 2001, Table 1).

Amongst the unexplored questions are issues relating to the ‘bandwagon effect’: the reasons why, and indeed the extent to which, little-damaged and undamaged towns rapidly seized on the activity of replanning during this hectic period. It has been suggested that this might have been a result of civic boosterism: towns becoming conscious of the changes in the hierarchy of retailing, business and image, and seeking to use the production of a plan, or even the engagement of a high-profile consultant, to reposition themselves in the post-war urban economy (Larkham and Lilley, 2003). However, the cost implications of this activity were substantial, especially for smaller towns. Although not suffering the economic consequences of bomb damage, many had suffered significant indirect economic consequences of war (eg the absence of tourist income for resorts), and the rateable income for small towns was often tiny. Planning was not a cheap activity (Larkham, 2005), even when the plans were not implemented (for years, if ever).

This paper therefore explores issues of reconstruction in some of the much smaller, and less-studied, towns that did follow the fashion. Why did they become involved? How did they do so – who wrote the plans? What were the key issues covered? To what extent did their experiences match, or diverge from, those of the better-studied, larger and better-resourced towns and cities? The paper is focused around four case studies.

A range of towns could be subject to review. Selection criteria might include population size, area, rateable income, and the main function of the town. Table 1 imposes an arbitrary maximum population size of 60,000, which thus excludes well-known cities with well-studied plans, such as Exeter and Oxford (by Thomas Sharp, 1946a, 1948), Bath (Abercrombie *et al.*, 1945) and York (Adshead *et al.*, 1948). A wide range of historic towns, ports, resorts and industrial towns remains. All indulged in replanning. Although the historic towns are of particular interest in terms of the development of modern planning values and ideas, given the current importance of conservation and heritage (Pendlebury, 2003, 2005), the other categories are under-represented in the existing critical literature.

Of those tabulated, 18 engaged outside consultants. A distinct minority employed existing in-house staff, and this contrasts strongly with the national picture, where consultants produced just under half of the known plans (Larkham and Lilley, 2001, as amended by ongoing research). These included the most eminent (Abercrombie), the most prolific (Sharp), the then-eminent but now unknown (Alwyn Lloyd) and the young professional (Jeremiah). The towns’ wealth (its rateable value, ie income derived from rates in the year surveyed) ranged from Bewdley’s tiny £18,655 to Guildford’s £509,788. Their population ranged from just over 4,000 (Bewdley again) to Eastbourne’s 57,435 (although it should be noted that this is usually the 1931 Census data).

### **The case studies**

The four towns selected for individual consideration in this paper are Bewdley, Warwick, Durham and Todmorden. Bewdley is the smallest town in Table 1, but nevertheless engaged a professional – although he was not well known as a planner he was at least available in the later war years. Warwick, also a smaller town, engaged arguably the best-known planner, albeit towards the end of his career – Sir Patrick Abercrombie – and suffered a shock when the final account was presented. Durham and Todmorden both used Thomas Sharp, who made his reputation as a planning consultant by a substantial series of ‘reconstruction’ plans.

These examples are early in this series, and it could be argued that Durham made his reputation in this field.

### ***Bewdley***

Bewdley is a small and rather isolated town, whose main feature is its location as a crossing-point on the River Severn, allowing movement from the resource of the Wyre Forest to the industrial Midlands. It was never a significant industrial town, but the river traffic was important to its income; its location also meant that it was an easy day-trip visitor destination from the Midlands. It was not bombed. However, in January 1944 – for reasons not apparent in the surviving records – the Council’s General Purposes Committee invited the architect Clough Williams-Ellis to prepare a plan (Minutes, 31/1/44). A Development Committee was constituted “to whom be delegated the consideration of all matters relating to the preparation and completion of the report and plan for the future development of the Borough” (Minutes of special Council meeting, 3/4/44). At that time the borough’s Town Planning Committee was more concerned with wider-ranging proposals for local government reform, and with the removal of numerous temporary buildings that had been constructed without permission in the early years of the war.

Williams-Ellis was a First World War veteran and historian of the Royal Tank Corps. He was not on active service during the Second World War, and therefore might be considered to have been available at the right time. This is his first known reconstruction plan; shortly afterwards he was involved, with his partner Lionel Brett (later Lord Esher) in producing the plan for Weston super Mare, and from 1947 both were involved in designing ‘reconstruction’ housing estates in Bilston to the concepts of the architect Sir Charles Reilly (Larkham, forthcoming). Williams-Ellis is best known today as the owner, designer and developer of Portmeirion, and professionally generally worked as an architect. His autobiography hints at his erratic work practices and of the disappointments caused by government interference or inertia when working more in a planning capacity:

“once the delights of the preliminary reconnaissance and the draft proposals were behind me and one began to be impeded by the dead weight of public lethargy and official slow-motion brakemanship, I found it hard to sustain my initial enthusiasm or to persevere with whittled down schemes with the necessary patience. For some years, however, I was reasonably persistent, sometimes collaborating ... with Lionel Brett ... but the actual physical results on the ground – for all our hopeful work on paper – remain pitifully small” (Williams-Ellis, 1971, p. 255).

In Bewdley he applied his reconnaissance skills, consulted with professional officers at local and county level, and held several public meetings. A draft report was available by July 1944 (Williams-Ellis, 1944). Williams-Ellis was clearly anxious that local residents should be consulted:

“Though I can bring to the solution of the several problems that must confront the town a certain technical experience, it is the intimate practical local knowledge of Bewdley’s own citizens ... that should be drawn upon as a check to whatever I may put forward as theoretically desirable. It is in the hope of benefiting to the full by this specialised yet varied local wisdom that I ... issue this interim draft, which indeed is expressly designed to provoke discussion and evoke such alternative proposals as may seem worth consideration ...” (Williams-Ellis, 1944, Introduction).

This is unusual. Although many contemporary plans mounted elaborate exhibitions or published books and reports, and some explicitly sought local “criticism”, few issued *draft* reports in this manner.

The draft report, and papers accompanying it, highlight Williams-Ellis’s own concerns about planning as an activity. First, planning should not necessarily involve large-scale and expensive public works and rebuilding; in fact “one of the prime objects of a Planning Scheme<sup>1</sup> is to prevent the unnecessary expenditure of public money” (p. 8, original emphasis). But, more fundamentally, in a note attached to the draft, he said “I believe in Planning but do not believe in planning too far ahead, say fifteen or 20 years, as conditions change considerably in this time and what may see alright [*sic*] now may not be justified or necessary when this period of time has elapsed”.

The initial concerns of the draft report make interesting reading. The town is praised for its “higher proportion of architecturally pleasing buildings than almost any other that I know of in all England” (p. 2), though many are let down by inappropriate painting, advertising, alterations or neglect. In fact this mirrors the concerns of the inter-war Design and Industries Association with which Williams-Ellis was involved. There was no need for “radical internal re-planning” although some road widening and new roads could provide a “round-the-town circuit”.

Congestion was a major issue. Through traffic could only be dealt with by “radical re-planning” that would destroy the integrity and character of this small town, or by a ring road/by-pass. It was suggested that much traffic “will wish just to ‘see’ Bewdley” (p. 3, original emphasis), and this led to the suggestion for a river-front by-pass that would facilitate this. However, this would require a new road bridge – the alternative, of replacing or substantially widening Telford’s bridge of 1801, a scheduled monument, had been suggested but rejected.

Although the town had little industry, there was concern for provision of some new working-class housing, and a programme for immediate post-war construction was being developed elsewhere in the authority. Williams-Ellis sought to minimise further outward sprawl (again, hardly surprising given his inter-war activities as, for example, author of *England and the Octopus*: Williams-Ellis, 1928). The town could afford to “fill in its gaps” and perhaps extend the most recent fringe pre-war estate.

“That is, of course, provided that what is built is rightly built, for if it is not, the less the place is meddled with the better and what must be built had best be smuggled away as far as possible and out of sight – at any rate of the old Borough” (p. 4).

He certainly sought to restrict further industrial growth, suggesting instead that the town seek to retain its character as a residential centre and tourist destination. The town needed to remain distinct and distinctive, not “submerged and lost in an unpremeditated industrial mix-up scarcely distinguishable from that of Kidderminster or Stourport” (p. 11).

---

<sup>1</sup> ie under the pre-war Acts, and at the time of his writing the only existing mechanism for seeking planning control other than a private Act promoted by a particular town – which was being discussed within the authority.

At the public meetings, the main issues raised were the extent and severity of flooding in the town, and what replanning could do about it (Williams-Ellis noted that one could remove all river property and lay the whole out as garden – though “I risk sack here”), and that the proposed riverside road and bridge “will not look at all well”. Williams-Ellis was clearly advocating a contemporary design: he argued that “there is no reason why the new bridge should not be a great adornment to the landscape, and every reason why it should be, an absolutely plain stream-lined single-span structure in ferro-concrete probably being the most acceptable (memorandum dated 4/8/1944).

The draft plans were circulated, indeed copies were intended to be sold through local newsagents and there was a small display at the Town Hall in October 1944. Copies were sent to the County Council and the Ministry’s Regional Planning Officer. However, the County Surveyor took exception to the consultant’s proposals in terms of practicability and cost, and especially to his unwise description of an alternative by-pass as “an engineer’s by-pass” (letter dated 18/8/44). A range of responses received had been sent to Williams-Ellis, who had replied to the Committee. The Council was even discussing publishing the final report in book form (General Purposes Committee Minutes, 29/1/45).

Although Williams-Ellis was also engaged as architect for various post-war housing schemes in Bewdley, by late 1945 the Council was expressing irritation that he was not responding as they desired, and considered his appointment terminated (Minutes of special Council meeting, 29/10/45). Final revisions to the plan were also greatly delayed, and indeed were overtaken by proposals by the County Council (Council Minutes, 28/1/46). In fact no final report was ever produced or published. There were, clearly, disagreements with the County Council particularly about traffic planning and major road proposals, and this disagreement, and Williams-Ellis’s own delays, finally killed the plan. The Town Planning and Development Committees merged in November 1945. No more is heard of the plan after January 1946, although the plan is mentioned in Hussey’s chapter on Bewdley in 1952. Like Warwick, the Borough lost its planning functions after the 1947 Act, although it did consider planning issues such as the local implications of the West Midlands Plan (Abercrombie and Jackson, 1948) (Planning Committee Minutes, 25/4/49).

### ***Warwick***

Warwick is a county town, significantly larger than Bewdley, but still very small considering its historic administrative and market functions. It was virtually undamaged during the war, but nevertheless felt by January 1945 that a plan was necessary. This may have been a reaction to the replanning exercises of its neighbouring towns. The Town Clerk received a list of suitable names from the Town Planning Institute, and Professor Sir Patrick Abercrombie had been engaged by June, to begin work in September. The fee was about £500, although Abercrombie wrote to Sharp that this was low (letter 3/9/45). At the time, Abercrombie was probably the country’s best-known planner, reaching the end of his career but still seeking commissions (he said he could not afford to retire). This is not one of his more important plans, but has nevertheless attracted some critical interest (Slater, 1984; Larkham, 2004; Pendlebury, 2004).

Even while survey work was being carried out by his assistants, the Council requested details of the costs of publishing the report in book form. Their reasons are unclear, although their professional officers cannot have been unaware of Sharp’s well-reviewed published report on Durham nor press reports of his Exeter study, about to be published.

The focus of the report was explicitly on the “preservation of character”, although the full title of the published book is *Warwick: its preservation and redevelopment* (Abercrombie and Nickson, 1949). Abercrombie and his team focused on Warwick’s function as a regional tourist centre, and an architectural and photographic survey of the town centre’s buildings was carried out to support the analysis.

To retain this function and character, the town’s growth was to be restricted. Efforts were made to ensure that Warwick did not sprawl outwards to coalesce with its neighbours, Leamington Spa and Kenilworth. What was sought was explicitly a “compact development” form (Abercrombie and Nickson, 1949, p. 65). In fact, the maps show, and the text discusses, an “urban fence”, the clear physical limit of development (a Ministry of Agriculture term: Abercrombie and Nickson, 1949, pp. 112-3).

It was strongly suggested that long-term population increase should not exceed 20 per cent. There was to be no major development of the retail centre, nor of the administrative functions beyond the ‘county administrative headquarters’. Nevertheless, there were proposals for some redevelopment even within the originally-walled town core. These included the creation of small ‘precincts’ and some land-use redistribution to achieve functional quarters. The modest residential expansion was to the north, but was not to exceed one mile from the centre. One part of this extension was planned in detail, as a demonstration (Abercrombie and Nickson, 1949, p. 69).

Road development was a high priority. Changes were proposed to ‘internal’ roads in the area between Warwick and Leamington Spa. However, “unless radical changes are made ... congestion in the town will become intolerable” (Abercrombie and Nickson, 1949, p. 74). An outer bypass, first proposed in the 1930s, was designed to the west and north, and was to be extensively landscaped. Abercrombie was aware of the need that new roads “must be planned so as not to encroach unduly on valuable buildings, agricultural land, or to mar amenities by cutting through areas of natural or artificial beauty” (Abercrombie and Nickson, 1949, p. 61). An inner bypass would run around the town centre, more or less following the line of the original walls.

Implementation of the proposals was carefully organised in three phases. The first, over about ten years, would include the outer bypass and some housing. The second, “of the greatest significance”, would take about 15 years and would include the inner bypass, other major road improvements, and the remainder of the housing and commercial expansion. The final phase would consolidate improvements to the town centre, and its timing was more vague.

It was decided to publish extracts of the draft report in the local newspaper, and to hold a public exhibition. However, there was no formal consideration of the report’s suggestions: this was deferred until such time as the report could be circulated (Public Health and Housing Committee Minutes, 13/1/47). The exhibition took place in July 1947, and was visited by 665 adults and 295 children (Public Health and Housing Committee Minutes, 11/6/47), representing about 6 per cent of the borough’s population. Comments reported in the *Warwick and Warwickshire Advertiser* were largely positive, although there were some doubts about when the work would be completed, and one correspondent suggested that “it’s a waste of public money to draw it up ... It’s too vast for Warwick: the reconstruction has got

to come some time or another, but not on the lines of the Abercrombie Plan” (*Warwick and Warwickshire Advertiser* 4/7/47).

By 7/2/47 Abercrombie’s final account was presented. The costs had risen to a startling £3,200; although the Council had approved various additional surveys and expenses in the meantime. In the late 1940s the costs of publishing were rising fast, and Abercrombie’s final advice was that 3,000 copies in book form would cost about £3,000. This was agreed, not without acrimonious debate, and the report was finally published on 7 November 1949.

On publication the Council finally had sufficient copies of the report to circulate, and its contents were debated and adopted on 17/3/50. However, by this time the 1947 Town and Country Planning Act was in operation; Warwick Borough Council was no longer responsible for town planning, and the County Council was in the advanced stages of preparing an Outline Development Plan. This was adopted by Warwick Borough Council on 16 March 1951.

### ***Durham***

Durham, like Warwick, was a small county town retaining administrative functions and with a historic built environment generating significant tourism. Some of the issues which were to dominate the Durham reconstruction plan had been live planning issues for some time, such as the need for new roads and the inadequacy of significant parts of the housing stock. For example, the County Council’s planned relief road line had been approved in 1931; the convergence of a series of major roads on the three narrow streets leading into the peninsula at the heart of the city meant that traffic congestion was already a major problem by this time. By 1940 work on an East Durham Planning Scheme by a Joint Planning Committee including Durham City was being discussed (Durham City Council Works and Town Planning Committee Minutes) and subsequently a resolution was passed to prepare a planning scheme following section 6 of the 1932 Town and Country Planning Act (DCWTPC Minutes 19/3/41). In December it was reported that Ministerial approval for proceeding with such a scheme be deferred, anticipating revised post-war legislation (DCWTPC Minutes 29/12/41).

In April 1943 the Town Clerk of Durham City Council presented a report about the desirability of appointing a planning consultant (DCWTPC Minutes 27/4/43). Surviving correspondence with Sharp shows that the Town Clerk was in communication with him that May (letter 15/5/43), although it is not known who else (if anyone) was considered. In June the Town Clerk recommended Sharp’s appointment (DCWTPC Minutes 28/6/43). However, this was not uncontested. Opposition in the City was led by Councillor Smith, Chairman of the Works and Town Planning Committee, who was later one of the critics of Sharp’s proposals. Attempts were made to block the appointment and to consult the East Durham Joint Planning Committee (Durham City Council Minutes 7/7/43). The County Surveyor was reported as being strongly opposed to the appointment of any consultant ‘and to the appointment of Mr. Sharp in particular’ (DCWTPC Minutes 6/7/43).

It is not clear from local government minutes why Durham City chose to go it alone. The report of the discussion of the Council meeting in the *Durham Advertiser* (9/7/43) suggests one stimulus for the City proceeding in this fashion; a councillor suggests that the Ministry of Town and Country Planning was keen to see someone consider the planning of the City itself,

rather than through the constraints of East Durham as a whole.<sup>2</sup> Whatever the underlying reason for the appointment, the City wished to present this to the County Council as complementary to the sub-regional process in East Durham (County Council Minutes 28/7/43).

The County Surveyor's antagonism towards Sharp in person may be explained by Sharp's pronouncements over issues in Durham in the preceding years. He wrote on Durham in his contribution to the polemic *Britain and the Beast* (Sharp, 1937). It was estimated that nearly a third of the city would have to be rebuilt due to slum clearance including 'picturesque (and hygienically foul) quarters' (p. 150). He had no quarrel with this, but 'one-third of the entire city! That is surely a job of such enormous scope that it should only be undertaken to a most carefully worked out plan. And, characteristically, there is no plan at all' (p. 150). But his key target was the County Council's relief road proposals, sections of which would have been elevated on a high embankment. Sharp used this opportunity to publicize his ground-level alternative (first prepared in 1934, Sharp c. 1973 and Stansfield, 1974) to the officially-approved elevated road. Here and elsewhere in the chapter he attacked the responsible authorities, including local authorities and the cathedral and university, for their apparent lack of engagement in the city beyond their own interests.

Sharp's appointment was, however, duly approved by an agreement of 10/12/43 (GB186 THS). Amongst the key provisions were that the consultant would prepare

'an outline redevelopment plan and report for the City of Durham which plan and report shall have particular reference to the historical and architectural character of the City and to the appropriate treatment of areas which have been or are likely to be cleared of buildings under the provisions of the Housing Acts....'.

Completion was expected by 31/3/45.

What was to become *Cathedral City* (Sharp, 1945) was commissioned at a time of great interest in planning issues in Durham. In July to September 1943 the *Durham Advertiser* published a series of articles on planning issues in the city by the Bishop of Durham (23/7/43), the Dean of Durham (also President of the Durham Preservation Society) (3/9/43), Patrick Shiel (30/7/43) and Bertram Colgrave (13/8/43). The *Durham Advertiser* also published various reports of planning publications prepared by various local bodies (3/3/43, 21/4/44), and Rushford (1944) produced a book, *City Beautiful: A Vision Of Durham*, with miscellaneous interventionist proposals.

It was clear that *Cathedral City* was no ordinary commission for Sharp. It was his first significant commission as a consultant-planner (as opposed to as a writer), and he had a personal passion for Durham that led him to invest far more effort in the commission than was commercially sensible. Towards the completion of the report Sharp, in correspondence with the new Town Clerk, estimated that a true account would be 1500 guineas for his time and effort (letter 9/1/45 GB186 THS). Furthermore, he commissioned the perspectives from A.C. Webb for 75 guineas from his commission fee, and unsuccessfully sought to sell these on to the Council.

---

<sup>2</sup> Interestingly Durham County Council's minutes (28/7/43) record that the Minister of Town and Country Planning (Morrison) was in Durham on 10/7/43 and held an informal discussion about town and country planning with members of the Council.

*Cathedral City*, one of the best known of the reconstruction or advisory plans, was a handsomely-produced plan, heavily focused on the master-planning of physical form. It was published in January 1945.<sup>3</sup> The City Council viewed it as a consultation document as the proposals had not been approved before publication (*Durham Advertiser*, 12/1/45). Sharp's appreciation of Durham was largely based upon its visual qualities. Not surprisingly the Cathedral, and to some degree the castle, were central to this, although there was an appreciation of the roofscape and of the foil that domestic scaled building gave to the major monuments. Sharp also emphasised the historic and visual importance of the cathedral as part of emphasising the significance of Durham. His proposals for preservation were focused on the peninsula containing the Cathedral, Castle and heart of the University and commercial centre, although a map of buildings of historic interest included buildings across the City such as a concentration on the north side of Old Elvet, an historic street to the north-east of the peninsula. The setting of the Cathedral and Castle were given extensive discussion. Beyond the peninsula he saw the need for extensive rebuilding, whilst acknowledging that some of the buildings to be cleared had architectural merit.

A key element of the plan was his alternative to the County Council inner relief road. Sharp produced an extensive critique of this elevated proposal in terms of its impact on the character of Durham, saying of his alternative that "it will *belong*" (Sharp, 1945, p. 41, original emphasis). Also important was the suggested limit to the population growth of Durham of 4,500, from 18,500 to 23,000. He saw the appropriate function of Durham as being an administrative, shopping, educational, residential and tourist centre.

An exhibition was held in the Art Gallery in February (opened by the then Chairman of the Royal Fine Art Commission) (*Durham Advertiser*, 23/2/45), and 8000 copies of the plan printed (Durham City Council Minutes, 19/3/45). Although the report was to receive many plaudits, it was not always so warmly received locally. Councillor Smith, who had led the objections to Sharp's appointment, complained that they had paid Sharp to be their own critic (*Durham Advertiser*, 12/1/45). The editorial content in the *Durham Advertiser* was generally quite critical. The major problem was considered to be impracticality of its timespan of implementation. There were also criticisms of specific proposals, such as the intention to remove fairly new housing at Milburngate for his road line at a time of housing shortage. Sharp responded in his normal robust manner, asserting that his critics could not 'see beyond their nose ends' and defending the plan's practicality (*Durham Advertiser*, 23/2/45). The Council generally approved the plan, although not unanimously on all issues.

The planning issue which came to the fore on the back of *Cathedral City* and which was to rumble on through a convoluted series of proposals and inquiries was the relief road scheme. On this occasion the City and County Councils were in opposition, with the City accepting Sharp's proposals and the County sticking to their original preferred scheme. Sharp was employed as consultant for the City for a public inquiry in 1946. This issue dragged on until the relief road was eventually constructed in the 1960s, broadly on Sharp's line although to a detailed design about which he was highly critical (Gazzard, 1969). Sharp's relationship as a planning advisor with Durham continued from 1948 until the end of 1962.

## ***Todmorden***

---

<sup>3</sup> It was published by Architectural Press but this seems to have been arranged very late in the day with all the financial risk on the Council (and Sharp claimed have effectively put it together); the preceding August Sharp was anticipating that it would be published by Penguin (letter to Webb 1/8/44 GB186 THS). It sold for 5 shillings (*City Beautiful* was 7s 6d).

Todmorden was the largest of the small towns studied; and provides a further contrast in its industrial nature. The decision to engage a consultant was taken by the Development Sub-Committee, a newly-created sub-committee of the Finance Committee (Todmorden Development Sub-Committee (TDSC), 22/2/44). The same Committee resolved a few weeks later to approach Thomas Sharp (TDSC, 16/3/44). Planning was very much in the air at Todmorden at the time, with, for example, the creation of an Upper Calder Joint Planning Committee.

A later newspaper report suggested that Sharp was approached because of his outstanding reputation as a consultant and that he had accepted the commission, whilst turning other requests down at the time, because he viewed the very difficult topography of the town as a challenge (*Todmorden News and Advertiser*, 27/9/46, p. 10). Indeed topography was a key feature of the town, lying at the junction of three narrow valleys which quickly rise to high moorlands. Sharp was initially engaged to write a short preliminary report (TDSC, 30/5/44), which led to an invitation to consider preparing a full report, accepted by Sharp (TDSC, 28/6/44), leading the Committee to resolve to appoint him to prepare a full plan (TDSC 4/7/44).

The outline plan was received by the Council at its Development Sub-Committee meeting of 6 September 1945 (TDSC, 6/9/45). Sharp then attended a special meeting of the full Finance Committee (Todmorden Finance Committee (TFC), 3/10/45). Although there was not the build-up of planning issues evident in Durham, there were clear challenges to be faced in the post-war period. Sharp's preface identifies housing conditions as the main physical problem, but an equally profound issue he identified was the decline in the local economy. Todmorden was very much a cotton town and, at this time, in some decline. In the report Sharp discussed whether, with this steady loss of *raison d'être* it might be sensible to evacuate the town. He concluded otherwise, given the well-settled community with all its spiritual and emotional attachments. Whilst industrial relocation was outside the scope of the plan, Sharp sought to identify sites where new medium to medium-heavy industry could be housed. The sites for new industry were largely seen as being produced by house clearance. Sharp was pleasantly surprised how well cared-for the housing was, but nevertheless considered that between a third and a half of it, much of which was back-to-back, would need redeveloping. He considered, and dismissed, the rehabilitation of this stock. Finding sites for new housing was considered problematic given the topographical constraints. Sharp's goal, as with industrial sites, was to achieve reasonably large groupings of housing in order to create neighbourhoods. He recommended a density of 24 houses/ acre. He earmarked sites to the north of the town to accommodate some of this new housing but was forced to look beyond the valley floor to meet all the need he identified. His recommendations on some of his usual preoccupations of roads and the central area were limited. Given the topography, he saw no scope for a bypass and thus proposed a phased improvement of roads where they met in the centre which, in his view, gave scope also for a better public space along with the rebuilding of some public facilities.

Sharp's report seems to have been fairly well received, with the Finance Committee approving the report in principle and authorising both the publication of the report in book form and a public exhibition of the proposals with models (TFC, 3/10/45). Within a few days the Housing Committee had resolved that two sites be submitted for Ministry approval (Todmorden Housing Committee, 17/10/45). It was a while longer before the town centre proposals were considered but, in November 1946, the Highways Committee recommended

that the Council approve Sharp's proposals for the town centre with a view to submission to the Ministry of Transport and the County Council for inclusion in their programmes (Todmorden Highways Committee (THiC), 9/11/46).

Arrangements were made for the publication of the report and the exhibition. After some debate over publication costs and cover price it was eventually decided to print 2000 copies<sup>4</sup>. By the end of November 1946, 1115 copies were reported as being sold (TDSC, 27/11/46). The exhibition was arranged for September 1946 and was opened by the Minister of Works. It included a model of the proposed town centre made by local volunteers. The exhibition seems to have been much wider than Sharp's proposals, however, including showings of various relevant films and exhibitions by electricity and gas departments of Halifax Corporation (*Todmorden News and Advertiser*, 27/9/46, p. 10).

In *Chronicles of Failure* (Sharp, c.1973 p235), Sharp briefly referred to his Todmorden proposals and commented 'Whether any part of them was ever carried out I do not know – an experience that is common to planning consultants in relation to most of the plans they make'. Despite the general welcome Sharp's proposals seem to have received, with none of the controversy evident in Durham, in the speeches at the exhibition opening it is clear that full implementation was anticipated as being the work of many years (*Todmorden News and Advertiser*, 27/9/46). Visiting Todmorden today it is difficult to see evidence in the town today of any proposals having been implemented; indeed there is limited building from the twentieth century generally. For whatever reason, the town centre proposals were not proceeded with, nor was housing constructed at his preferred sites. Some housing was located in sites suggested by Sharp but, given the scarcity of sites in the town this is hardly a matter of great surprise. Similarly, some clearance of older housing took place but less than Sharp advocated, and substantial numbers of back-to-backs remain.

## Discussion

This paper is an exploration of reconstruction plans for a particular type of settlement; all the case study towns and cities being small with (at the time) populations of around 25,000 or less. There is a particular intrigue with these places. It is easily understandable why a city such as Plymouth, devastated by bombing, should commission a plan or, without that context, why a little-damaged but messy industrial town such as Wolverhampton would see it as a useful activity. However, it is less immediately apparent why small settlements not directly troubled by the war would do so.

Perhaps the first point to make is that there was a 'planning fervour' in this period probably unparalleled before or since. Council minutes inspected for this paper were full of reports of councillors and officers attending national and regional planning conferences; this was an issue of immediate and great importance.

The case study plans considered here were all commissioned by lower-tier authorities. At least some of them had been engaged in plan-making activities, but this was usually as part of sub-regional groupings to prepare a statutory scheme under the 1932 Town and Country Planning Act. It seems to have been widely understood by the early 1940s that this legislation would soon be redundant and be replaced by something more comprehensive,

---

<sup>4</sup> A substantial loss on this publication was built into the calculations, even if all copies were sold.

even if the form that this would take was unclear. The Ministry of Town and Country Planning was urging local authorities to embrace planning and seems to have been prepared to intervene directly in some small cities considered important, such as Durham. It is also clear that in some places, such as Durham again, the issues to be addressed in plans had been fermenting for a number of years. Local politics may also have had an influence, with small local authorities seeking to gain influence in the planning process.

Local government records tend to be frustratingly opaque in explaining more precisely why plans were undertaken. However, these were small authorities and the lack of internal capacity to undertake such a job must have been a factor. Nor is it clear why particular consultants were selected; but generally it seems to have been a case of invitation on the basis of reputation – there is no suggestion with any of these case studies of a competitive process or even a selection short-list. There was certainly a considerable expense to bear by employing an outside consultant to prosecute these plans. Warwick's plan and its publication cost approaching £6,500; Williams-Ellis's fee for Bewdley is unknown, but in the year of his activities, the town's rates increased from 14/10- to 17/10-(producing £13,261 in 1944-5 and £15,836 in 1945-6) when there are no records of other major expenditure changes. In comparison Durham had a bargain at £472 10s, plus probably some loss on *Cathedral City*.

In terms of the principal themes of the plans, a number were shared. Above all, there was the issue of traffic. All but Todmorden (where topography made major road proposals impractical) proposed major new roads as the principal means of removing existing or anticipated high traffic loads from the centres of small medieval towns. Bewdley's led to substantial disagreement. Warwick's outer bypass was – much later – built more or less to Abercrombie's principles, though Slater (1984, p. 333) noted that “the proposals for the [outer] by-pass are carefully related to, and use, the fine grain of the countryside – existing hedgerows, woods, paths and lanes, yet his proposals for the historic town ignore the fine grain of streets, lanes, plots and buildings, particularly where road plans are concerned”. In Durham, Sharp's substitute road was ultimately built along generally the lines he proposed, but only after many years of County Council opposition.

A secondary theme with three of these plans was the importance of their heritage, and the need to balance this with necessary modernisations. Warwick was explicit in considering the protection of the town's historic character as a fundamental part of the proposals. In Durham, the historical and architectural character was at the heart of the agreement. Despite Williams-Ellis's earlier involvement with the Design and Industries Association (eg Williams-Ellis, 1930), in Bewdley there was much less explicit concern for character or heritage; in fact demolition and replacement of Telford's bridge had been considered. Heritage was not considered a significant issue in Todmorden.

Other common themes included the need to address housing conditions; nationally this emerged as perhaps the most significant planning issue given the need for slum clearance and replacing wartime losses. Indeed, a significant start had been made upon slum clearance in the 1930s as a key element of housing policy and following the 1935 Housing Act (Cherry, 1996). Housing was at the heart of the Todmorden plan but significant in Durham and Warwick also. Although Bewdley was actively considering new post-war housing development, it was on a very small scale (50-100 houses). Otherwise there was a focus upon general tidying up and amenity improvements, such as the improvements proposed for Todmorden town centre.

It is notable that three of the plans considered here were published and, had the fourth been completed, it too would have been published. Given the expense of this, and the risk of not covering costs, this is perhaps surprising. A significant number of plans for much larger towns were never published: some are only known as typescripts marked “confidential”. In part the desire for publication in these small towns may be explained by a desire to inform people in the locality as widely as possible in response to the interest that was clearly there. In part, too, it may represent an act of civic boosterism (Larkham and Lilley, 2003); having employed an expensive national local consultant it made sense to advertise the fact. *Cathedral City* is perhaps an unusual case in that Sharp’s devotion to the publication (and project) must have been partly for self-promotion as he launched himself as a consultant.

Organising a public exhibition was also a common practice. It was common for national politicians, including Ministers, to accept invitations to open such exhibitions – as at Warwick and Todmorden. However, in many cases these attracted relatively low numbers of visitors. Local press coverage probably took the message more directly to more people. However, it was relatively rare for *draft* proposals to be circulated: Bewdley was unusual in this respect. The later planning ethos of public participation was not well developed at this time. Even so, the Warwick and Durham plans as publicised had not been discussed and adopted as policy by their respective councils.

The final issue for exploration concerns the plans’ reception and influence. Todmorden seems to have been essentially well received; each of the others seems to have been more controversial for one reason or another. In the case of Bewdley and Durham, hostility from the County Councils on highway proposals in particular was evident. None of the plans can be said to have been implemented as such. Both Bewdley and Warwick were delayed; in one case apparently by the consultant; in the other because of a reluctance to discuss the draft proposals until they had been published in expensive book form, by which time they had been superseded by new legislative arrangements for town planning. Indeed, in the wake of the particular requirements of the 1947 Town and Country Planning Act, all of these reconstruction plans soon appeared anachronistic, as well as unrealistic in the austerity of post-war Britain. Even the well-received Todmorden plan seems to have had little or no impact in practice as a result of these changes, and perhaps also for the lack of any driving force to carry proposals through; as most planning powers rested with a combination of the Ministry, County Council and Upper Calderdale Joint Planning Committee. Perhaps the one exception is Durham where, although *Cathedral City* cannot be said to have been implemented in any meaningful sense, it certainly had an influence. Here the City Council were prepared to back Sharp’s recommendations and fight the County Council over the road line and indeed the City Council continued to employ Sharp as a consultant, in an often uneasy relationship, until 1962, with Sharp winning some battles and losing others. It also had a national influence, being widely and favourably reviewed, and essentially launched Sharp’s career as a replanning “expert”. Abercrombie’s reputation was insufficient to reassure some sarcastic reviewers, however: “no doubt the people of Warwick are proud of their plan – they have now been planned, actually been planned (they don’t know what that means but it sounds good) by one of the greatest names in planning” (Anon., 1950, p. 298).

Table 1: Small towns and their characteristics

Town	Type	Population	Area (acres)	Rates	Rateable value (£)

## INTRODUCTION

*Place* is a key concept in the history of planning, as numerous classic authors (e.g.: Lynch, Norberg-Schulz, Rossi) laboriously examined the topic. In the actual shift of paradigms from modernism to postmodernism, the concept is receiving a number of contributions from authors of varied disciplines (e.g.: Casey, Fainstein, Koolhaas, Relph, Tuan, Zukin). As a consequence, a broadened transdisciplinary perspective has been conveniently appended to the basic understanding of the construct. On the other hand, in the move from internationalism to globalism, the form of cities are also experiencing drastic changes that clearly display the heavy influence market forces exert upon the shaping of the urban landscapes of globalization. One typical manifestation of such influence is the insertion of prettified images of places in order to competitively use “urbanity” - that unique quality forwarded by cities to their citizens in terms of communication and sociability - as a tool to attract people and entertain them in an exciting assortment of iconic places spread over the urban landscape. Their genesis, identified in the planning literature as “placemaking” - accompanied by a tactic “placemarketing” - already represents a global contemporary planning style, in which, the private and public sectors play, together, a crucial planning role. The paper questions the consequences the cross-national transfer of this global planning idea exercises in the context of local identities - so as not to distort them exceedingly. It is argued whether the indiscriminate use of the new planning trends - such as the reuse of abandoned historic areas as new “places” of entertainment; or the production of urban projects aiming at introducing newly and glamourized “places” - would be plainly transferable to the local scale, hence becoming just another episode to be rapidly absorbed in the local planning history, or would represent a more remarkable change in the course of that history. In other words, the paper argues if one can talk about a globalized style of places in postmodern urban planning, similarly as one had previously talked about a model for an international style in modernist architecture.

Surprisingly, as it will be discussed as follows, the answer may be positive - at least in certain cases. Present engagement on a research project led by the author on the subject of urban “places” in contemporary cities provides grounds for new arguments. The methodology adopted in the project privileges the use of environmental perception techniques and studies specific cases, three of which are covered in the paper. Initial research outcomes point out to a situation in which some of the invented places - namely, a new shopping mall, a multifunctional airport, and a reused historic area - tend to be successfully appropriated, even

by the poorer segments of the population, and hence, to function as real places of urbanity for the city as a whole. Therefore, in view of recent place theory advances, and previous examples taken from the planning history, the paper tries to raise a “reasonable doubt” about the quality and pertinence of the novel places, and about the transfer of this global planning idea to local situations. Seen from this perspective, the globalized use of placemaking-plus-placemarketing may prove useful for obtaining strategic results even in local circumstances, considering that the new places tend to be perceived as legitimate urbanity places, as the population progressively appropriates them in their daily life.

## THE CONCEPT OF PLACE

Place is a well-accepted theoretical construct of the area of spatial studies. The various disciplines involved in the area approach the concept according to each individual rationale. In this, way, one may say that there is a *psychological* interpretation of the concept, an *architectural* interpretation, and so on.

In the planning area, the concept is frequently used to facilitate the understanding of man-environment relationships, since the two major factors the concept deals with - people and space - are at the central core of attentions. On urban-architectural grounds one can say that *place* is a created environmental form, imbued with symbolic significance to its users. On those grounds, the acknowledgement of the important symbolism that places are able to confer to people has grown intensively in recent times. In effect, during the Urban Modernism times, the concept experienced a predominantly *functional* bias: *places* were understood as urban spaces carefully allocated and quantitatively dimensioned, and adequately distributed along the urban territory, to provide spaces destined to stimulate social opportunities for the city’s inhabitants. Curiously, the use of the expression *place* was not very common in the “townplanning” works of the times: *places* were frequently referred to as *centers* or as *activity centers*. In reality, *places* were strictly recognized as *functional areas*, intentionally designed to produce social interaction. Probably, the traditional neighbourhoods centers designed for British New Towns best illustrate such functional areas.

Approximately at the end of the 1950s and from the 1960s onwards, an encouraging approach was set out when joint efforts essayed by both, architects and psychologists, contributed to ascertain the scientific interest raised by the subject. “This was the time when the initial intersection between research about the formation of places and exercises of design that intended to gather together the factors that make up a place encountered a receptive handling in the linked ventures developed by architects and psychologists” (CASTELLO 2005 p.350). Important contributions were brought to the area by authors such as Kevin Lynch (1968), who advanced the idea of constructing what he called ‘place utopias’, where *people* and *place* would bond naturally, enjoying a pleasurable *sense of place*. An enlightening contribution forwarded by Lynch remarks that “A good place is one which, in some way appropriate to the person and her culture, makes her aware of her community, her past, the web of life, and the universe of time and space in which those are contained” (LYNCH 1982, p. 142). In his influential *Architecture of the City*, published in 1966, Aldo Rossi is another author to point out specifically to the extraordinary significance of *place* as a locus of collective memories, suggesting the importance of bridging the thoughts of other fields of study, such as anthropology, psychology and urban history, to those of architecture and urbanism (ROSSI 1977). On a similar line, Norberg-Schulz observes that “It is common usage to say that acts and occurrences take place. (...) Place is evidently an integral part of existence” (NORBERG-SCHULZ 1980, p. 6), in view of which, “The existential purpose of building (architecture) is therefore to make a site become a place, that is, to uncover the meanings

potentially present in the given environment” (NORBERG-SCHULZ 1980, p. 18).

Surely, thoughts like the ones issued by authors such as Lynch, Rossi or Norberg-Schulz, ended up by producing momentum for the setting up of a revisionist process about the concept of *place* on urban-architectural theory. Increasingly, authors started to acknowledge the crucial role that places had to play in humanist matters and, progressively, though slowly, the understanding of places within the profession started to move from the strict functionalist focus it had so far, to a new phenomenological approach that could rightly encompass the extraordinary importance places play in human existential matters. In other words, the concept of place progressed from its former status of *functional areas*, to a well-deserved upgrading to *existential areas*. One way or another, though, the concept of place retained its condition of being the result of a *social construction* - a very trying condition for those who, like the urban planners, intend to create a place by means of urban design.

Not surprisingly, the environmental psychology approach to *place* focuses on a very similar direction to that employed in Architecture and Urbanism: it understands the construct as units where human experiences and physical form are fused together, so as to create a unitary context. Evidently, as a general rule, there is no single factor that can explain all phenomenology involved in man-environment interactions. But, if a place is imbued with symbolic attributes that evoke the role this place played in some of the most significant times the city has experienced, then the acknowledgement of the presence of *memory* in the structure of the place must be accounted for, as an additional attribute, since it is *memory* what can bring about the good (or bad) images a place evokes. Hence, the crucial role the concept plays in the development of Planning History. Once again, however, it is worth remembering that, as a general rule, *place* may be approached through a variety of ways. As a matter of fact, as observed by the present author in a recent entry to an *Encyclopedia of the City*, places may be regarded from several perspectives:

They may be seen from the viewpoint of a behaviour setting, and, in this case, people’s environmental behaviour on them is what really matters in the analyses. Social representations of places are another way of approaching the subject, and there, the symbolic representation of society’s territorial identity is what counts best. The appraisals of the physical-spatial images of the urban form people get affectionate with, occupy the efforts attempted by researchers of the environmental design areas, and are usually captured by means of techniques such as cognitive mapping. Trying to understand why people do so, however, may be best approached through the environmental perception research (CASTELLO 2005, p.350).

## RETHINKING THE CONCEPT OF PLACE

The turn of the 20<sup>th</sup> to the 21<sup>st</sup> century has brought some motivating variations in the conceptualization of place, insofar as the application of the concept to the area of urban projects is concerned. This section tries to understand the changes and argues about the new paths possibly brought about by changes on the urban studies field.

As discussed above, there were some rising criticisms about the employment of the concept of place on urban projects. More often than not, the *design of a place* was not strong enough to *make a place* come true, but, on the other hand, certain urban spaces show an undeniable vocation towards spontaneously becoming places of conviviality and sociability - in other words, to becoming *places of urbanity* - and hence, prone to bringing a somehow disquieting provocation to the architectural thinking of the time: Could places be effectively designed?

Even considering that places are the result of a *social construction*?

Generally speaking, the criticisms were born as a reaction to the rising claims that the design of *places* might be leading to circumstances of ‘placelessness’ (RELPH 1976) or to ‘non-place places’ (AUGÉ 1994), just to name two of the most recurrent complains of the times. In the same direction, as a growing disapproval against the Modernism canons was gaining corpus, noticeable alterations to the original concept of place were ripe to be enunciated. Consequently, new interpretations about *place* began to come into light, especially in the United States, where - thanks primarily to some of Walt Disney’s most notorious experiments with *theme places* - the idea of “placemaking” soon would find fertile ground for germinating almost indiscriminately. In fact, for some authors,

There is a direct line from the historical invention of place in the American past to that quintessential and most universal of modern American inventions, the theme park. When place becomes story, or snatches of story, designed as an appealing visual narrative (...) when the story line is selected, and everything is coordinated to reinforce the illusion of reality - or of the borrowed reality - the result is, as their creators and marketers say, a ‘themed’ package (HUXTABLE 1997 p.44).

The practice of “making places” in “packages” aimed at a general target: the makers of such places wanted to create (or to *re-create*, in certain cases) lively “social” areas within the cities - *and bring them into businesses as well*. Criticisms apart, the excellent results attained by some of the initial “placemaking” projects were ultimately responsible for including the new practice within the urban designers’ preferred choices, mainly when enlivening the public realm was the primary objective of their proposals. Probably herein lies the most drastic variation to reach the core of the concept of place: thanks to that goal of transforming fantasy into materialized constructions, places became highly tied to the construction of *images*. Differently to what had characterized *place* in the Modern Urbanism period, to *make* a place now - more than merely designing a functional area dedicated to boost sociable encounters -, also entailed strategies to *marketing* that place. And a quick and safe way to market a place is through the construction of an *image*. An appealing *image*, so that places could become more rapidly included within people’s *imaginary* repertoire.

Sooner than possibly expected, the new trend of *making places* and *marketing places* spread throughout the world; and a sort of a *globalized style of planning places* became indiscriminately applied as a new (and very lucrative) planning tool. The urban planners reaction was of perplexity. Is this good? Is this bad? Will it entail a severe distortion upon local cultures, by introducing alien global ways of living? Will it induce what Benjamin Barber (1996) acidly describes as a conflict between Jihad X McWorld?

To this matter, three interesting experiences of making and marketing places happened in Porto Alegre, south Brazil. Since one purpose of the present paper is to discuss the globalized style of places, i.e., the changes noticed in the structural configuration of contemporary urban agglomerations linked to variations that are on course within the very concept of place, a description of the new invented places in Porto Alegre may bring some new arguments. In fact, changes in the concept of place and changes in the urban configuration of cities are so important, that one can even think that a global pattern of newly invented urban places is going on around the world, setting a new model for cities. To test that assumption, the following section will describe very briefly the three experiences in Porto Alegre, namely, the construction of a new shopping mall that “clones” the patterns of a city hub; a new multifunctional airport, that aims at creating a new center of activities; and a reused old

historic area, revamped according to features that try to “clone” its old configurational patterns. They can properly illustrate the point, because the new “cloning” places are being successfully appropriated even by the poorer segments of the population, and hence, may be said to function as real *urbanity places* for the city as a whole.

## CLONING PLACES IN PORTO ALEGRE

In the researcher’s work, the new invented places of today are usually called “cloning places”. This is so because the researcher regards them as efforts to replicate the spatial patterns through which the phenomenon of *urbanity* is recognized in the urban environments. Urbanity, of course, is the phenomenon already referred to as the urban quality eventually conferred to citizens through the city’s environmental values. Accordingly, since *urbanity* is found in “urbanity places”, the design of “cloning places” draws from the environmental stimuli believed to be responsible for attributing urbanity to the urbanity places. Hence, the expression “cloning” is used in a positive manner. In fact, the expression is used in order to evoke the strong human content of Architecture and Urbanism, in the first place, suggesting that whereas *bio-technological cloning may create life, urban-architectural cloning may create places where life can be lived and shared*.

### *The shopping mall as a new urban place*

A field survey actually going on in one of Porto Alegre’s most important middle-class shopping centers - the “Praia de Belas Shopping Center (PBSC)” - motivates the kind of reflections commented above (FIG. 1). In its present stage, the research permits to hint at an interesting speculation: the PBSC is being perceived as a *place* - even by the poorest segments of the population.

This conjecture was suggested by the background information obtained from the visits undertaken by poorer people to the shopping, in a precise circumstance: in the days they gain easy physical access to the mall. This occurs in the “free pass” days, that is, in the particular days in which the city’s public transport, in response to a local government policy, becomes liberated from fees. Frequency on the mall those days rises extraordinarily, with thousands of persons coming from the most recondite urban areas - even from slums - flocking into the shopping in batches, most of them just for merely strolling up and down the mall, rubbing shoulders with other people, seeing other people under an unusual angle, an angle very much detached from their familiar everyday reality.

There have been two pilot works investigating the perceptions PBSC customers have about the mall. The first of them, took place during a free-pass Saturday; and the other, on a regular weekday. Researchers interviewed clients at random, asking questions, applying apperception tests, measuring attitudes, and/or simply observing people. Their answers revealed interesting perceptions in terms of behavior, motivations to visit the mall, traditions, and familiarity with

environments showing some traits of affluence. The study indicates that in the free-pass day, over 70 per cent of patrons belong to the lower middle and lower classes. In this segment, teenagers constitute the vast majority, suggesting that among the poorer population, to pay a visit to what it is for them a hyper-real place is a favorite practice among youngsters (FIG. 2). As for the other groups, of middle- and upper middle-classes, it is not surprising to point out that their major purpose to going to the mall is unambiguously linked to consuming activities. If they want to rest or to chat with other people, contrarily to what the lower classes 'newcomers to the world of simulation' do, they will not stand or stroll in groups. They will sit at a café, go to the mega-bookshop, enter the cineplex or have a quick meal at the food parlor.

The weekday survey also brought a good amount of new informations. To start with, there are less lower classes clients, and the public is considerably more mature. The predominant age group is over 18 years. When asked whether the mall “would impress a friend, because of its classy environment”, the majority answered that their friends would surely not be impressed by the lavishness of the shopping, showing that they are clearly used to that sort of ‘reality’. They spontaneously complained that they do not like to visit the mall during free-pass days.

Lastly, the more affluent clients also stated that their preferred activity in a shopping mall was, as expected, that of shopping. But they also included within their favorite activities those of going to the movies and eating out.

Like elsewhere, in other globalized urban environments, also in Brazilian cities the downtown areas suffered a severe process of dereliction and abandonment, especially from the second half of the twentieth-century onwards. Therefore, promenading along the aisles of a shopping mall assumed, very rapidly, a crucial role in the Brazilian leisure experience. To no one’s surprise, soon the “cloning” of the hub became the favorite hub, very much in conformity with what many scholars are used to state (BAUDRILLARD 1994).

### ***The multifunctional airport complex and its complex of place***

Nowadays, cities and mega-cities present the phenomenon of hybrid complexes as a real and crescent tendency. Such complexes are projects characterized by multi-functional programs, combining diversified activities such as, among others, shopping mall, entertainment areas, transport terminals (including airfields), health services, museum, hotel. The hybrid complexes try to play a similar role to that found in urban retail and services centers, where the phenomenon of *place* can be noticed.

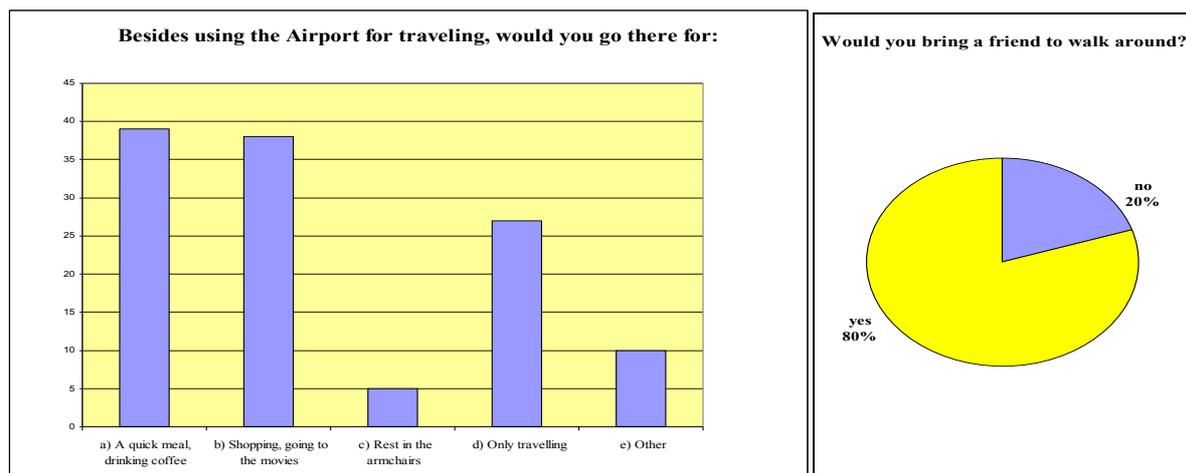

This sort of “catalysis” of different urban activities in one single building characterizes a process that is being called urban hybridism, and that is clearly designed so as to intentionally “clone” the characteristics of an urban place. This is the case with the new airport of Porto Alegre, south Brazil. The building combines a diversity of freely accessible urban functions, and introduces to the city an example of the new global tendency of gathering up under a

single roof a multifunctional compound. It constitutes a typical representative of the multipurpose buildings increasingly present in today's postmodern urbanism (ELLIN 1999) supposed to act as one of the public urban places the city has to offer to its citizens and tourists alike.

The new airport, named “Complexo Aeroportuário Salgado Filho” (even in its name it holds the expression *complex*) “landed” in Porto Alegre in 2001. A field research carried out by the author in the airport investigated: people's reactions to the new phenomenon of urban hybridism; whether the project stimulates intentional perceptions and behaviors; and whether people and tourists perceive the airport as an urban place. The choice of the Airport Salgado Filho as a case of urban hybridism is due primarily to the extreme multi-functionality the architectural program of the building comprises. More than an ordinary airport, the Salgado Filho includes, besides the air terminal, several other facilities such as: a twenty-four hours shopping mall, medical and dental clinics, food center, cineplex, cultural space, VIP room, parking building, chapel, LAN house, electronic games hall, beauty parlor, air traffic regional control center, bank agencies (FIGS. 3 and 4). The adjacent external areas are also integrated to the project, adding more functions to the multi-functional complex, such as: outlets of international hotel chains, an all-inclusive business center, express courier offices, access to the overground railway, and to the hub of regional freeways. More recently, even a gigantic stadium for musical shows opened in the immediate vicinity.

Both the quantitative and qualitative results taken from a field survey realized in the Airport revealed that all the functions offered by the complex are in full use. Furthermore, Charts 1 and 2 show that an expressive number of interviewees stated that “Yes, they would bring some friend to take a walk in the airport”; and that items such as “leisure” and “other reason” were included in their answers, when questioned about the reasons that had motivated their visit to the airport. Figures are also quite revealing. They show people at ease, taking “chimarrao” (that is, drinking mate tea, a local tradition), reading, gathering in the food parlor, shopping, going to a cinema, or simply relaxing in the armchairs. This fact is quite revealing. It shows that it is not only travelers - or some of their companions - who are attracted to the Salgado Filho Airport. Actions and activities typical of those that ordinarily take place in a *place* are now occurring in the new building: the day-to-day routine of the complex is already responsible for attracting people from the adjacent metropolis and its outskirts. It can even be said that the population at large already perceives the complex as a place.

### ***The reuse of a historic area and its transformation in a place***

Two major field works in the central area, one in 1986 and other in 1995, focussing basically on the interaction between people and physical settings, led to a collection of elements - buildings and places - perceived as the most significant for Porto Alegre's central area users. In order to provide for a qualitative subjective assessment, information was gathered by means of environmental perception techniques. Crucial to the concerns of this paper were the findings relative to one specific building, the old Gasometer plant (presently lodging a multifunctional activity center). This building is a place where interaction between people and environment is at its highest today in the Center. But it was not so in the first field research of 1986. At that time, the Gasometer plant was just an old building in ruins at the edge of the river. In spite of that, it was quite vivid in people's more recondite memory, probably by its strategical presence in the Center's visual structure. Or by its privileged location at the very interface of water and concrete, of nature and culture, at the edge of the central peninsula (FIG. 5).

It offered an image of permanence, an image of reference, an image deeply immersed in the cultural memory of the population. In the 1995 research the building had been rehabilitated by the implementation of some minimalist design strategies, mostly addressed to the old building's basic maintenance. Its surrounding areas were also requalified by a series of design strategies, providing new functional designations. Besides that, the building started to act as a multifunctional activity center (including, among the activities, a movie house, theater, art gallery, library, coffee house, workshops and assembly rooms). All this was achieved by simply "cloning" the memory images the building and its surroundings had always offered to the population. Surprisingly, interaction soon reached unexpected peaks, up to the point to confer to the place the label of being one of the most popular areas in the Center. Furthermore, it managed to develop a new "behavioural setting" for the leisure times of the community, for groups visiting the center, for offering a *place* where people can assemble to see and to be seen, to play musical instruments and to sing - ultimately - to enjoy the *urbanity*

the place has to offer (FIGS. 6 and 7). This way, the old abandoned central space gained the label of a genuine place, fully marked by sociability and urbanity. A new place, which is now one of the most popular sites in the central area, and that has surely resulted from a social construction.

The newly conserved area also gained in political status. It symbolizes, today, the awareness the inhabitants of Porto Alegre share about the political power they possess, since it is in the Gasometer newly born “*agora*” that most of the public manifestations take place. Certainly, the scale of the new place has much to do with its public acceptance, since it can provide enough physical room for any type of manifestation, either of angry political protests or just for the sheer cultural enjoyment of attending a pop concert. Popular concerts, by the way, are frequently performed there, and the Gasometer area was the place chosen by the “*porto-alegrenses*” to celebrate the emblematic New Year’s Eve of the year 2000. In sum, it is there that the city’s population likes to gather when it has to deal collectively with collective matters.

### ***Lessons from the Pilot Surveys***

Unfortunately, there are predictable and often redundant criticisms to the experiences described above. Criticisms that can be expected almost as a rule. In general terms, it is very likely that social and cultural analysts will raise their voices against at least three points involved in the experiences: (i) new *places* like shopping malls are destined to cater for elitist clientele and will, without doubt, oust poorer people from the shopping precincts; (ii) global places, such as hybrid multifunctional buildings, are alike all over the world, causing what Rem Koolhaas (1997) criticizes as a redundancy of *generic places*; (iii) the reuse of old historic areas will necessarily encompass a removal either of the former residents or of the local businessmen of the revitalizing area, causing, as an unavoidable consequence, a process of “*gentrification*” of the area.

Fortunately, from a more accurate review of contemporary bibliography on the topic of place; and from the empirical evidence obtained in Porto Alegre; it seems that a general lesson can be advanced: the usual criticisms are not necessarily imperative and applicable indiscriminately as an inevitable dogma.

Of course, to progress on a theme that is likely to experience daily changes is not an easy task. But even so, the following discussion will bring out a (sketchy) revision on the concepts of place according to the views of different disciplines. Though sketchy, this revision will indicate that one may always postulate “*a reasonable doubt*” about the urban developments that result from a cross-national transfer of planning ideas - at least, as far as place theory is concerned. Indeed, planning styles may be globally generic, but locally favorable.

## GLOBAL AND LOCAL CONTEMPORARY PLANNING STYLES

As changes in the concept of place were introducing “placemaking” and “placemarketing” as viable alternatives for the urban development of towns and cities, other important historical changes were also in motion. Among these, changes happening within the more selective arena of *urban concepts* insinuated that a drastic revolution in what used to be the *concept of public space* could soon be expected. And it indeed occurred. As observed by Denise Scott-Brown, “(...) in all cities there are private places that feel more ‘public’ than many public places: (...) Main Street in Disneyland and the interior of Quincy Market in Boston, are examples of such private-public places” (SCOTT BROWN 1990 p.21). Surely, nowadays this interpenetration between the public and the private realms is even stronger, so as to motivate some authors to recommend that urban designers should focus “(...) on the broader concept of ‘public life’ (i.e. the sociocultural public realm of people and activities), rather than the narrower one of physical ‘public spaces’”, since public life now is “flourishing in private places, not just in corporate theme parks, but also in small businesses such as coffee shops, bookstores and other such third places” (BANERJEE 2001 apud CARMONA et al. 2003 p.114).

Furthermore, the variations surrounding the concept of place cannot be confined exclusively to the boundaries of Architecture, Urbanism, and Urban Planning. But, a selective look on the bibliography of several disciplines that deal with *place* - and the different ways they employ to appraise the concept - leads to approaches that do not receive sufficient attention from the urban-architectural discipline. And that should have. Disciplines like, for instance, Economics, Administration, Marketing, Laws, and even Politics, are disciplines that can establish a fecund relationship to *place* but that, occasionally, do not pay the specific attention demanded by the topic or that, alternatively, leave the concept either completely unobserved or just superficially insinuated.

This way, from Geography, for example, it can be learned, from none less than the renowned Chinese-american Yi-Fu Tuan (1998) that the so criticized *escapism*, that usually comes associated to the creation of cloning places, is nothing more than a spontaneous manifestation of a humane act, relieving, thus, many researchers of the guilt that afflicts them when they opt to study today’s places. Besides that, Tuan cunningly teaches that the *perception of place* may vary throughout time. He alerts that it was necessary to cross one whole century so that the Tour Eiffel passed to be perceived by the Frenchmen as it is nowadays, legitimated as the place of urban quality that it exhibits today (TUAN 1980). Like this tower, many and many other examples of places all over the world have been subject to criticisms, but many of them - throughout a process of becoming popularly appropriated by the public - have finally acquired the perception that awarded them the qualification of places.

Relph, also from Geography, unadvisedly became one of the great instigators of criticisms against “invented places”, because it was him who coined the neologism “placelessness” in his book “Place and Placelessness” (RELPH 1976). Twenty years later, however, writing his “Reflections on Place and Placelessness”, he has positioned himself against the simplistic duality that he had established between “placeness” and placelessness, pointing out that, paradoxically, there are negative aspects tied to “places”, as well as unexpected positive aspects attributed to “placelessness” (RELPH 1996).

Susan Fainstein (2001), from Urban Planning, brings a totally revolutionary vision of the role “cloning places” can exert in today’s city. In her vision, also areas like Administration, Laws, Marketing, Tourism and Politics should not be absent from the *place’s* concept, since she

adds to the classic conceptualization of place as a *social construction*, an opportune opening breach for explaining place also as an *economic construction*.

HANNIGAN (1998) brings from Urban Sociology the understanding that the so-called fantasy-places may be powerful generators of sociability. And that even in face of their apparent mask of selectivity, those places are fully permeable to become publicly appropriated. Also from Sociology, ZUKIN (1996; 2002) reinforces the adjustment that must be conceded to public and private spaces of today's urban environments. Many of them, even if legally private, reveal an increased perception of being public spaces *de facto*, which entails their appropriation as such by the public. The Brazilian sociologist Rogerio Leite (2002) is another one to bring an important contribution to the public appropriation of urban spaces. His research deals with the topic of places that result from the reuse of old historic areas, areas which were usually vacant or derelict, and that experience a process of placemaking that transforms them in new places. This process, though quite common nowadays, is often criticized in view of its tendency to originate the phenomenon known as "gentrification". Leite convincingly points out that, as far as one must recognize the presence of new uses in these spaces, one must also recognize the "counter-uses" that eventually get introduced to the scenario and that concur to the reactivation of the reused spaces as *public places*.

And there are so many points raised by MAGNANI (1996) in his anthropological appraisal about place that the best thing to detach from his work is the careful attention he pays to the role played by the human tactics and strategies of everyday life. In a manner very much like De Certeau (1984) he brilliantly discusses what he calls the "morphology of the practice" in people's daily appropriation of places. In a similar line, MENDES DE ALMEIDA & TRACY (2003) try to find an explanation to what the authors call the night "circuits" through which youngsters move around freely in Rio de Janeiro, Brazil. In their considerations, those "circuits" represent a sort of a variation in the concept of place, in fact, a very important contribution to the new studies about places, since it allows introducing the idea of movement into the concept - the "displacement of places" - an idea that proves absolutely fundamental in face of the intense number of fluxes that characterizes contemporary society. In point of fact, the lack of this movement component had already been signaled by Leach, who correctly registered the discomfort he felt in the actual discussions of place about the "(...) more static notions of 'dwelling' that emanate from Heideggerian discourse, which seem so ill at ease with a society of movement and travel" (LEACH 2002, p. 9).

Finally, the rethinking of the concept of place actually happens within the Philosophy world, as well. Both FOUCAULT (1997) and DE BOTTON (2004) conclude in their reflections that it remains indifferent whether today's places result from the actions of an economic strategy or from the efforts of a subjective lucubration. In the end, *place* is always *existential*, place results from the human beings interaction with their own location, place represents our correlation with ourselves "(...) so that we can at last find it, and thus our own ineluctably implaced selves" (CASEY, 1998, p. 286).

## CONCLUSION

The concept of place, positioned as it is at the very interface of physical, social, and behavioral disciplines, seems to provide a likely means for tackling the challenge of communicating global and traditional local planning styles. The cases discussed are symptomatic of the possibilities opened by the use of the *place approach* for promoting an interconnection among diverse disciplines. Consequently, they also provide grounds for

understanding that there are benefits that may be earned when one tries to approximate place theory to the purposes of the cross national transfer of planning ideas. Certainly, the cases chosen are modest, but they surely indicate solid directions to follow when the intention is to widening up the opportunities for urban development forwarded by strategies that bridge the global disciplinary knowledge the technical side of planning has already accumulated over time, to the non-disciplinary perception people show in relation to the elements of their new urban local environments.

Although much of the evidence for these considerations must lie within the realm of conjecture, there is the possibility that within the concept of place may effectively reside a positive methodological interface for an adequate cross national transfer of planning ideas and its manifestation in local spheres. This transfer will be able to capitalize on the multifaceted dimensions involved in a place - behavioral, sensorial, experiential, historical, preservationist, economical, financial - and to indicate directions for a sustained development process for the city as a whole.

**Abstract:** This paper aims to explain Mexico City urban outgrowth between 1900 and 1933. I will analyze the proposals of urban planners to solve the anarchic expansion of its urban tissue and populations, solutions like the creation of a zonal division improving the traffic, housing, consumption, employment and the conurbation of the city.

Traditional studies about urban planning in Mexico in this period have pinpointed the influences of functional urbanism, American and ecological European zoning and the Chicago school's conception of the City as essential to the project of modernization of Mexico City. They have, on the other hand, consistently dismissed the political dimension of urban planning, eager to eliminate the old structure of municipal government. This aimed at a reinforcement of the *status quo* through centralization and simultaneous reinforcement of the state's institutional power since it better managed urban growth and the distribution of its population. This paper will thus explore the political significance of urban planning in Mexico City at the beginning of the twentieth century from an historical perspective. I will begin with a review of the urban problems of the city and the main ideas about urban planning introduced Mexican planners in the period of 1900-1933, their academic formation, their relations with the international urban planning community, their projects and the political and institutional reception of their proposal by the Mexican State.

**KEY WORDS:** URBAN PLANNING, MEXICO'S CITY HISTORY, MEXICAN STATE, MUNICIPAL GOVERNMENT

## Urban and municipal problematic of the Federal District

Throughout its history and until 1929, the urbanization of the municipalities of the Federal District, capital of Mexico founded in 1824, had been conducted by local and superior authorities without a general plan or appropriate legal frame articulating its functions, attributions, resources and actions. This gave rise to a disordered and unequal urban growth, serious and continuous problems of public health, numerous social conflicts because of the deficiency and shortage of public services, the materialization of social inequality and conflicts between federal and local authorities both simultaneously reclaiming the control of production and administration of the city.<sup>1</sup>

The negative outcomes of this secular quarrel of political and administrative nature began to problematic at the beginning of the 20<sup>th</sup> century when the population and the size of the District also registered an explosive increase as a result of the economic growth that Mexico experienced under the regime of Porfirio Diaz (1876-1910).

Thus, if in 1900 the Federal District counted 541.516 inhabitants, by 1910 it had attained 720.753 and 906,063 in 1921, to reach 1'229,576 in 1930. In the same period its urban area also registered a maintained growth of 1370 hectares in 1910, 3250 in 1918 and 6262 in 1929,<sup>2</sup> growth that was translated in the foundation of 64 new colonies between 1901 and 1926. Nonetheless basic urban services were not provided for a great number of them.<sup>3</sup>

The necessities of this enormous urban conglomerate (housing, commerce, transports, industry and services) exerted an enormous pressure overwhelming the existing urban infrastructure and the administrative capacity of the municipalities. This already complex growth was accompanied by the shortage of resources provided by city councils, the corruption and inefficiency of its authorities and the climate of political instability of the annual municipal elections.

Although as much federal as local authorities shared responsibility in the maintenance of public services and the management of the urban space in the District, municipal institutions had been subject to severe critics since the 19<sup>th</sup> century. The attacks had been made by the government and Mexican society on the grounds of the city council's administrative

anachronism, the corruption and lack of scientific and technical preparation of its members to suitably approach the solution to the problems of an increasingly metropolitan city. Even though their accusations were sustained by real facts, the critics made against the municipal government did not consider the shortenings of municipal budgets, the political and administrative interventionism of the federal government in the local management calling for the necessity of a legislation that demarcated the sphere of action and responsibility of both levels of government.

The regime of Porfirio Diaz, eager to turn the city of Mexico into the symbol of the material progress supposedly brought to the country, was first in condemning the administrative anachronism of its municipal government because it was unable to lead its urbanization suitably. The regime ideologists supported, in the Local chamber, the initiative to reform the government of Mexico City under the main argument that “the government of the cities had become an extensive and complicated art” so it had to be lead by “special civil employees whit suitable knowledge” and not by “people without theoretical studies or practical knowledge”, like the ones who already integrated the city councils.<sup>4</sup> Thus, in 1903 a constitutional reform left into the hands of an executive authority, the Superior Council of Government of the Federal District, the conduction of all the subjects related to the services and the urbanization of the District. Additionally, the city councils were reduced to consultative organs of this dependency, thus losing their resources and public functions.<sup>5</sup> Nevertheless, with this reform the urbanization of the District was far from directing itself to surpass its urban, social, material and institutional backwardness and contradictions. The Superior Council of Government promoted an urbanization plan that excluded the surrounding municipalities delaying further the solutions demanded by the metropolis. Therefore, Mexico City was the main beneficiary of the expensive public works undertook by the Superior Council. However, urban services were introduced in selective form; while a good network of sanitary services were introduced in the center and the west, the other quarters of the city lacked services until well into the 20<sup>th</sup> century. Roads, beginning to be transited by vehicles and electrical street cars, were extended and modernized, and their main arteries were upholstered of monuments dedicated to the memory of the main mexican heroes, including old Aztec (kings) tlatoanis, which in the imaginary official had contributed to the

La ciudad de México en los siglos XIX y XX*, 2 vols., México, Instituto Mora/UAM-Azcapotzalco, 2004. V. I, pp. 226-247.

forge of a national identity.<sup>6</sup> The elites erected modern and functional colonies in the neighborhoods of the old historical center that were submitted to new and diverse regulations meant to contain and correct an environment still deprived of hygiene and permeated by the hustle and bustle produced by the popular classes characterized by their pernicious customs and activities – lack of hygiene, traveling commerce, laziness, alcoholism, drug addiction, invasion of the public routes to make diverse offices, etc.<sup>7</sup>

Although the first post-revolutionary governments gave back to the city councils their old functions, these also were far from promoting an urban policy that covered the backwardness of the District and took care of its urbanization.<sup>8</sup> Still more, the political autonomy reached by the municipal corporations consequently to the constitutional consecration of the free municipality turned the city councils into the centers of fights between political parties reaching its climax in the municipal elections year after year. The offices of the city councils also served the accomplishments of private businesses while public interests were in the hands of the local authorities.

Thus, by the end of 1928 the informed public opinion believed that the frequent conflicts between the federal powers, the city councils and the government of the District had failed to serve public interests since all these authorities “attended the diverse public services of the District without a clear cut plan, in many occasions following measures that contradict one another because their administrative functions and attributions were not clearly defined”.<sup>9</sup>

<sup>9</sup> . A critic of the time offers a picture to us of the municipal disaster that affected the Federal District before of being suppressed his city councils in 1928: “The inhabitants of the DF have been witnesses of the scandalous and irregular form in which the elections for City councils were carried out. Political parties, organized by devoid individuals of all morality, but capable in you intrigue electoral, they were appropriated the city councils of the city of Mexico and the other municipalities. [...] The municipal subjects and the public services were at the hands of immoral individuals and without technical knowledge for the performance of the positions that were entrusted to them; but however, to the shelter of these they made dishonest businesses and sometimes they robbed with impunity the bottoms pertaining to the municipality. [...] Frequent were the contracts for the purchase of necessary equipment and machinery for the services public to exorbitant prices in which the ones in charge of the purchase had their participation. [...] He was public who by means of the money was feasible to obtain with the city councils any concession by immoral which this one will be. [...] The fiscal debts were object of transaction between the contributors and the municipal authorities. Many of these were boasted of which their pays did not mean anything for them and who their main entrances were in the businesses that made. [...] The anarchy in the municipal subjects was increased, to more of the immorality of its members, by the lack of regulation of the diverse services municipal public. The situation that reigned in the municipalities of the Federal District is similar to that it reigns in the municipalities of all the Republic”. Jesús Ramírez Flores, *Nueva organización del Distrito Federal. Ley del 14 de Agosto de 1928*, México, Universidad Nacional de México, Diciembre de 1928, p. 32.

### **The urban and the municipal issues in the speech of the city planners**

As we know, in general terms, modern urban planning was originated in industrialized nations where private initiative realized the convenience of organizing and of improving the conditions of life of industrial workers to multiply its gains. Secondly, the state took care to plan the housing and the growth of the city to satisfy the increasing demands of public health and services.<sup>10</sup> It was in Germany that the first steps towards public intervention in urban matters acquired the dimension of state policy. By the end of the 19<sup>th</sup> century and until before World War I, Germany was the more advanced nation in urban planning, because its great and small cities had been subjected to districts plans in which a network of main lines was introduced together with residential streets, industrial areas, drainage systems and the geographic expansion of the cities prepared. With time, the old and new urban zones were including in zoning plans which assigned to each district a different function and were assigned to certain rules of construction. Even before the end of the 19<sup>th</sup> century, the urban growth of the small and large cities forced the state authorities to coordinate the plans of the central urban nuclei with those of the neighboring municipalities. Thus, at the beginning of the 20<sup>th</sup> century, in the region of Frankfurt, and also around Berlin, regional planning arose, from which the interest in introducing the whole country to a detailed program of local and regional urban plans that would be developed years later.<sup>11</sup>

In the United States, due to a relative decentralized political system, modern urban planning had a relatively chaotic appearance. At the turn of the century, because of the fast growth of the most important cities during the preceding decades, the gravity of the urban problems acquired grave and varied dimensions so that it became the center of national attention. The exigency of some type of public intervention in favor of the reformation of the urban planning and several speeches and movements that struggled for an urban reform materialized, by the end of the second decade of the 20<sup>th</sup> century, in the creation of a new profession: urban planning. Although this was concentrated mainly in the physical planning of cities, the discourses around urban topics preceding its creation were rich in contents that emphasized great social preoccupations. These speeches did not only advocate social reforms but the application of aesthetic, egalitarian and engineering schemes for the development of the cities. Nevertheless, the triumph of the practical aspect over the aesthetic (of the reformed policy

<sup>10</sup> . An historical framework of the urban planning can be seen in Arnold Whittick (ed), *Encyclopedia of Urban Planning*, McGraw Hill, 1974.

<sup>11</sup> . Anthony Sutcliffe, *The History of Urban and Regional Planning*, Facts on File, Inc., New York, 1981, p. 5-6

over the egalitarian) can be mainly attributed to the fact that the American urban civilization was, and continues being, essentially a capitalist enterprise.<sup>12</sup>

After World War I, as much in Europe as in the United States the idea and convenience of the urban planning had already matured sufficiently and the states were beginning to apply modern legislation on urbanization following the rules of the science and art of planning. Nevertheless, much of the terminology, ideology and techniques of urban planning had arisen before 1914. According to Anthony Sutcliffe, expressions like 'town planning', 'City planning', 'Städteplanung', 'urbanisme', 'urbanistica', 'stadsplanering', 'stedebouw', and 'gradostroitel'stvo', had become general use between 1890 and 1914, at the same time that had emerged an integral plan of development for a whole city, mainly in Germany. Additionally, the State that had discovered the increasing threat of urban problems was increasingly interested in urban subjects.<sup>13</sup>

Under this international context urban planning was introduced to Mexico by a group of engineers and architects, who, from diverse tribunes during the second and third decade of the 20<sup>th</sup> century impelled the idea to plan the urban growth of the Federal District and the country, and obtained that the Mexican State create a new legislation and new national and local institutions of urban planning.

Carlos Contreras and Jose Luis Cuevas Pietrasanta were the main impellers of the planning movement in Mexico in the decades of 1920 and 1930. Cuevas Pietrasanta had been in England in 1920 to study the development of the cities garden of Raymond Unwin and participated in one of the first meetings of the International Congresses of Modern Architecture. At his return to Mexico, among other city-planning projects that carried out, he adapted the postulates of the city garden to the development of the residential settlement Chapultepec Heights (1922), located to the west of the city of Mexico, where lived the elites of the post revolutionary Mexico.<sup>14</sup>

But the most outstanding of the impellers of the urban planning in Mexico was Carlos Contreras who, in 1918, initiated his studies in the University of Columbia, New York where

<sup>14</sup> . Vid. Gerardo G. Sánchez Ruiz, *Planificación y urbanismo de la Revolución Mexicana. Los sustentos de una nueva modernidad en la ciudad de México, 1917-1940*, México, UAM-A/Asamblea Legislativa del D.F., 2002. Alfonso Valenzuela raises that the transformations of the urban space of the city of Mexico in the first decades of century XX were inspired by European models like the one of the city garden of Ebenezer Howard and the system of parks of Claude Forestier. Vid. "The Place of Nature in the City in Twentieth-Century Europe and North America", in GHI Bulletin, no. 38 (Spring 2006)

he was professor after he had obtained his title of architect in 1925. At his return to Mexico he devoted an enormous activity to organize the planning of the cities but mainly the capital city. The same year he published a project for “The Planning of the Mexicana Republic”. The following year, he impelled the foundation of the *National Association for the Planning of the Mexican Republic* (ANPPRM). In 1927, he occupied the chair of Planning of Cities and Art Civic in the National School of Beautiful Arts of the National University, whose directors proposed, without luck, to create the Faculty of Planning. As Head of the Commission of Program of the Secretariat of Communications and Public Works (1929-1932), he wrote up, along with the engineer Enrique Schulz the *Law on General Planning of the Mexican Republic* (1930), and, in 1931, the *Law of the National Commission of Planning*. In 1933 he proposed the application of the *Regulating Plane of the Federal District*, the first plan in the city’s history, and, under the regency of Aaron Saénz (1933-1935), redacted the *Law of Planificación and Zonificación of the Federal District and Territories of the Baja California* (1933), and elaborated a plan of working house for the city of Mexico. Together with the impulse given to the planning of the Federal District, Contreras proposed regulating planes for other Mexican cities like Matamoros, Monterrey, Guadalajara, Veracruz, Acapulco, Mexicali and Aguascalientes. Also, he developed a publishing work for the planning through the magazines *Planning*, and the newspapers *Excelsior* and *The Universal*. In 1938, he organized the XVI International Congress of Planning and Housing celebrated in Mexico city, and from the following year until 1965, he held the position of Vice-president of the International Federation for Planning and Housing. He also represented Mexico and the Society of Mexican Architects in the International Congresses of Planning celebrated in New York, Paris, London, Israel, and San Juan of Puerto Rico. Finally, he was member of diverse organizations of Planners like the American Institute, American Institute of Architects, Royal Institute of British Architects and Colegio Nacional de Arquitectos of Uruguay.<sup>15</sup>

The studies of modern urban planning developed during what we could name the foundational stage of urban planning in the history in Mexico, usually exalted the visionary projects of their protagonists, as well as to demarcate from its influences as justification of their originality. Thus, for example, Sanchez Ruiz, emphasizes that far from following the city-

---

<sup>15</sup> . Vid. Francis Violich, *Cities of Latin America. Housing and Planning to the South*, Reinhold Publishing Corporation, New York, 1944, pp. 162-163. Biographical data and a summarized, although little critical study, of the ideas and the works of the Mexican city planners can be seen in Gerardo G. Sánchez Ruiz, *Planificación y urbanismo de la Revolución Mexicana. Los sustentos de una nueva modernidad en la ciudad de México, 1917-1940*, México, UAM-A/Asamblea Legislativa del D.F., 2002; and Gerardo G. Sánchez Ruiz (coord.), *Planificación y urbanismo visionarios de Carlos Contreras. Escritos de 1925 a 1938*, México, UNAM/UAM-A/UASLP, 2003

planning ideas of Le Corbusier (1924) and the dictations of the *Letter of Athens* of 1933, until end of the decade of 1930 the Mexican city planners, led by Contreras and Cuevas Pietrasanta, folded to some of the postulates of the modern planning of the cities such as the zones division of the city from a district of businesses, circulations with radial, concentric streets and in checkerboard, low densities in houses, the care of environment, the beauty of the cities, the community participation and the respect to the urban-architectonic tradition, from which they generated projects and they introduced modifications for some of the Mexican cities.<sup>16</sup>

Thus, under the impulse behind the speech of urban planning during the decade of 1920, the city and its problems, as well as the management of their government, was subject to the scientific glance of city planners and architects whose opinions were spilled in the press of the time. Its diagnosis was demolishing. Maybe the most serious problem of the urbanization of the District identified by the planners, besides its serious lack of planning, was the obsolescence of the administration and urban policies of the municipal government, which had turned into a deficient organization. One of them diffused this idea in *The Universal*: **“We must confess modestly that in view of our languid civic preparation, we do not deserve by suddenly more than the severe control of the Government of the District in the capital. It would have the advantage of which under its direction one would be saved the unit of the city of Mexico and the effectiveness of the services public, in exchange for the famous Free Municipality. After all we will not lose a so great treasure if it is deprived to us of the enjoyment of a democratic spectacle, that until like maneuvers, is more and more improbable and boring”**.<sup>17</sup>

Convinced of the urban and municipal disaster of the capital, in September of 1927, in the context of the political conflict produced by the aspirations of Alvaro Obregón to be re-elected President of Mexico, the architects grouped in *Society of Mexican Architects*, founded in the same year, to denounce “the failure of the free municipality” and summoned to that an Municipal Advice dependent directly of the Executive “was in charge of organize, understand and solve the transcendental problems that the operation of a modern city constitutes and that finishes once for always the chaos of our present urbanism”.

Basic component of the political reform that proposed to modernize the capital was the paper assigned to the architects and city planners. Given to the importance of a city like Mexico, a political, commercial and financial national center, and potential industrial center, “its

---

<sup>16</sup> . Vid. Sánchez Ruiz, *Planificación...*

<sup>17</sup> . Editorial. *El Universal*, 13 de enero de 1928

development, its urbanism, the extension of its avenues, the zoning, the creation of new colonies, the organization of the present ones, the multiple problems of traffic, the monumental embellishment in agreement with the exigencies of the time, the complete regulation of the construction, the resolution of problems of the present time according to the special nature of the subsoil, etc., etc.," all these problems had " to be solved with the scientific and artistic cooperation of the Mexican architects, of whom it is known are most competent, of those who have irrefutable tests of their value and personal integrity ".<sup>18</sup>

Thus, with its proposals on the solution that required the problems of the urbanization of the District, the community of city planners supported the administrative political reform of the District that, in the heat of campaign for its re-election, would present in April of 1928 the ex president Alvaro Obregón to the House of Representatives. Although they pointed to some of the problems who derived from the technical and administrative incapacity of the city councils, as well as of their corruption, they did not reason, as Obregón did not do either, on the institutional contradictions that surrounded the urban management of the city councils – mainly their inadequate legal frame, its shortage funds and its potential political explosive at times encouraged, and at others, repressed by the federal government, and therefore on the possible reforms to the municipal administration to solve the problems of the urbanization. In that sense the mexican city planners trusted that the powers and benefits of science of the city and the planning actions would be equal to which it would be possible to hope of the political and administrative centralization.

In fact, judging by the experience about the city planning in other Latin American countries, like Brazil and Argentina, an ideological component in which it was sustained that the modern speech of its city planners was the idea that the representative institutions, chosen by the route of the vote, were opposite to all possible planned conduction of the urbanization of the cities, because it took to that the positions public were held by incompetent individuals. For that reason the critic to the municipal authorities was translated in a negation of the representative government and in the exigency of a strong government, authoritarian and centralized.

In both Latin American nations, Outtes notes that the application of the plans and the institutionalization of urbanism like independent discipline, took place under interventionist and anti-liberal political regimes, like the years of Vargas in Brazil (1930-1945), especially the dictatorship of *State Nuovo* that invited city planners to become mayors of the Brazilian cities (1937-1945), and Argentina under the military governments of general Jose F. Uriburu

<sup>18</sup> . "La supresión del municipio libre", in *Excelsior*, 25 de septiembre de 1927. Sección de Arquitectura.

(1930-1932) and presidents Agustín P. Just (1932-1938), Robert M. Ortiz (1938-1940) and Ramon S. Castle (1940-1942).<sup>19</sup>

In Mexico, after the triumph of the Revolution initiated in 1910, arose a new State that centralized in its hands the power under the form of a presidencialista and authoritarian regime sanctioned in the own Constitution of 1917,<sup>20</sup> and was this power who forged and consolidated the centralization of the government of the District that, since we have seen, from the perspective of the Mexican city planners was most propitious for the rational and ordered conduction of the capital city.

### **The centralization of the government of the District**

In its initiative of law -directed to the Permanent Commission of the Congress of the Union with date of 18 of April of 1928 and read in the session of the House of Representatives of 14 of May- to completely suppress of the Federal District the city councils, the ex-president Alvaro Obregón diagnosed that the causes of the problems of the District and the incapacity of the municipal governments to solve them were reduced to “the conflicts of political and administrative character that constantly have arisen by the coexistence of authorities whose faculties are excluded sometimes and at times are confused”. Reason why, “to be in agreement with the logic and the reality”, the solution that prevailed was to reorganize the administration of the Federal District for establish the control and the “efficiency in all orders of the public service”.<sup>21</sup>

In support of its proposal he adduced a series of arguments that took care of the legal, historical and politics aspects of the problematic of the District. He pointed that “in all time the General Congress and the Federal Executive have been controlling the municipal administration of the District” and that the Revolution had hoisted the restoration of the free municipality as a demand to legitimize in all the country, because the city councils had been subordinated to the power of caciques and political intermediaries thus annulling their public functions. Nevertheless, the makers of Constitution of 1917 had extended this conquest to the Federal District “without considering the historical precedents that demonstrated the impossibility of the independent municipality in the District, neither the series of conflicts that

<sup>20</sup> . Arnaldo Córdova, “La legitimación del presidencialismo en la Revolución Mexicana”, in A. Córdova, *La Revolución y el Estado en México*, México, Era, 1989, p. 113

<sup>21</sup> . The initiative presented by Alvaro Obregón for the political reform of Federal District can be seen in: *Diario de los debates de la Cámara de Diputados*, año de 1928, XXXII Legislatura. Sesión del 14 de mayo.

always had been between this power and the Federal Executive, nor the difficulties of economic order, nor other many considerations of transcendental importance [...]”.<sup>22</sup>

For that reason the main lines of their proposal to reach the best efficiency in the services public of the District were the suppression of the city councils and the creation of an Financial Advice and an Executive Advice of Administration of the District, independents to each other, who would take care of the fiscal collection and the administration of the public services, respectively, without no political function.

Obregón had the idea that the reorganization and control of the cost and public administration was forced by the solution of the problems of the District. Nevertheless, in its single diagnosis he described the reality of the institutional difficulties by which it crossed the municipal government of the District, and omitted to analyze and to explain the causes of the same ones, subject of which we have taken care already in another work.<sup>23</sup>

What matters to analyze now are the arguments of the idea defended by Obregón in the Congress wherein “after of the mature examination that the experience [was] to him forced to do on the terrible operation of the City councils in the District and on the conflicts that its existence has created, [prevailed] the necessity of the legal reform for the best efficiency of the urban services”.<sup>24</sup>

As it can be observed, the solution that prevailed in the District, from the perspective of Obregón, was a political and administrative reform. Although Obregón had chosen to suppress the city councils for exerting its second presidential period. Whit out his political enemies encrusted in the city councils, he could not ignore the social, economic, urban and institutional problems that the District lived, of which, as a route to conceal its political interests, blamed the municipal administrations. Was in this point where he made use of the diagnosis of the city planners in order to back up his political reform:

“ [...] the questions on traffic, police, roads, instruction, justice, hygiene and salubrity, on charity, is not circumscribed to each locality, but that is really common to all the District. [...] the service of traffic is impossible to regulate it properly, if they have to be the dispositions that prevail until the edge between Mexico and Tacubaya and others of there in ahead. The service of roads and highways would be equally impossible to practice if the regulations of the Secretariat of Communications and Public Works struggled with those of the foreign City councils. [...] the proximity of the populations that belong to the municipalities of the Federal

District, with the capital of the Republic, does that their conflicts of authorities, their difficulties in their services, their necessities, always are fixed with aid of the Powers of the Center. And as if all the saying was not enough to support the reform that we propose, is left even the very powerful reason of the great economy that would obtain if in time of two treasuries, the one of the government of the District and policeman, single one public were in charge of the collection of the funds, if the great payments that the support of all the two hundred counselors of the District demands, etcetera, etcetera took off. In addition, the services public of each municipality already are bound to each other, of such way, that its general attention is indispensable, and thus the service of water and drainage requires to previously extend it to all the populations of the District, extending it in the extension of its necessities, being urgent not only to take care of the established thing, but to extend it, bringing sufficient water of other places, by means of works that require not only high costs, but possibility of guaranteeing them and of executing them properly. The same considerations must become respect to ways, services of police, traffic, etcetera. Surely a most important number could be destined, without resorting to easy means of creation of new taxes, to these services; and easy it will be to calculate the transformation which it could operate in the Federal District, in few years in which their populations can enjoy the investments that in services can't be postponed public will be able to become, of the economies, reductions and suppression of an endless number of offices with similar services in each municipality, in addition to great number of expenses that could be suppressed as a result of the new organization who can occur to the District”.<sup>25</sup>

Seen the previous thing it was clear that the improvement of the services public depended, from the perspective of Obregón, to eliminate the superposition of authorities, to establish a unified and metropolitan administration, to reduce the costs of the administration inverted in the payment of an excessive municipal bureaucracy, and to elevate and to guarantee the investment in the attention, extension and planning of the services by means of the saving that would produce the suppression of municipal offices.

Nevertheless, in opinion of Obregón's opponents in the House of Representatives, represented by the deputy Vicente Lombardo Toledano, the initiative was wrong because all the problems weren't see integrally. For Lombardo Toledano, who had attended years back representing the city council of Mexico's City at the International Housing and Town Planning Congress, celebrated in 1925 in New York City, the problems of the District

---

<sup>25</sup> . *Ibidem*, p. 10.

demanded a technical and nonpolitical solution that contravened the constitutional democratic principle of the free municipality.

This difference of opinions is explained partly by the fact that the militants of the Mexican Labor Party, would see lost their political power if was approved the suppression of the city councils, some of them under their control. But, leaving to a side their political interest, the arguments that exposed in the legislative tribune Lombardo Toledano, let see obviously that the problems of the Federal District had acquired such magnitude and complexity who prevailed the reform of his administration, but not necessarily in the direction of suppressing their municipal government.

Assuming that the problem of the reform of the Federal District was “fundamentally a technical problem and not a political problem”, Lombardo Toledano sent in his critic to the solutions that had been applied in some countries of the world, specially in some European capitals, to resolve the problems of the urban growth of the modern cities and that had given rise to the accomplishment of studies, meetings and publications of specialists.

According to the opinion of the specialists, for Lombardo, it was necessary solve jointly the problems of salubrity, economy, moral, architecture, physical growth, etc., of the great cities, which had to integrate legally to their surrounding cities, but agreement did not exist on the government system who agreed to establish in these great population centers.<sup>26</sup> “ Only reasons of political order, reasons of moral order, historical, own reasons of economic order, reasons perhaps until of the places in where the problems must be solved, will indicate which is the government system who is suitable to the great municipal areas ”.<sup>27</sup>

Taking care of this recommendation of the specialists of the foreigner, Lombardo suggested analyze the reform of Mexico considering the antecedents of social, economic and moral character related with their problems of growth and administrative reorganization of that moment. In the absence of historical and sociological studies on the subject, he referred to the conclusions that could be extracted of the examination of the planes and maps of the city and Valley of Mexico that dated from the colonial times until beginnings of century XX. From this point of view him recognized the primacy that had come exerting historically the city of

<sup>26</sup> . Some of the works that mentions Lombardo in their opposition to the initiative of Obregón in the House of Representatives are: “Circulations and transports”, of Augusto Bruggeman and Jacques Gréber, professors of the Institute of Urbanism of the University of Paris; “Methods of decentralization”, of the doctor Raymond Unwin, architect head of the British Ministry of Public Salubrity; “Cities satellites and local government” of G. Montagu Harris, lawyer of the Ministry of Briton of Salubrity, and Van Poelje, of the Department of Education in the Hague; “How to provide to the cities of spaces open and covered by the vegetation”, of J. Stubben (Westfalia); and “The City average garden as to avoid the threat of the great cities”, of Lawrence Veiller.

<sup>27</sup> . *Diario de los debates de la Cámara de Diputados*, año de 1928, XXXII Legislatura. Sesión del 16 de mayo, p. 16

Mexico in the set of the populations of the Valley until the point to annex these to its physical body and to exceed the physical borders that separated to them, constituting therefore a new economic, social and urban reality that no longer corresponded with the administrative limits imposed by the municipal organization. Therefore, prevailed a reform that left from the recognition of this historical reality and not from political objectives.

Moreover, politically, according to Lombardo, was wrong to argue on the failure of the free municipality in the Federal District because in general in all the Mexican Republic the state governments and legislatures, having as they had the faculty to control the municipal elections, had always favored the integration of docile city councils or subordinates to their interests and not to those of their respective localities. To solve this problem was a pending task of the Revolution, that if it were solved in the DF eliminating its city councils, doing to depend “this great administrative organization on the Federal Executive”, not only would take place “a civic dissociation in the most important population of the Republic” that it would take to that to anybody concerned the destiny of the city of Mexico, but that would set standard so that the governments of the States did the own thing with the capitals of the federal organizations. It was necessary to maintain the elect local government effective, and to obtain the consensus of “a so heterogeneous population, so opposite, as difficult as it is the population of the city of Mexico and the bordering populations ”, Lombardo suggested to resort to a system of proportional representation that included the capitalist sector, to the craftsmen, the small retailers, the wage-earners, the proprietors, the middle-class and the government.<sup>28</sup>

As we know, the arguments of Lombardo and their comrades of party were disregarded in the Camera. For Obregón and his adept legislators the city councils were corrupts and incompetents and always had been an onerous appendix of the resources of the federation. Moreover, for them the problems of the city required of practical solutions and not of great library theories, nor to the experience of other countries. So, under these assumptions, the deputies approved the initiative to suppress the city councils of the District, giving continuity thus to the constitutional proceeding so that the state legislatures and in the end the Congress of the Union confirmed this decision definitively.

Views therefore the two positions whereupon diagnosed the problems of the Federal District, cannot be said that a conscience did not exist, in the scope of the political class of post revolutionary Mexico, on the necessity of an integral reform of the District, one that when

---

<sup>28</sup> . *Ibidem*, pp.19-22

taking into account all the factors that influenced in their urbanization established the bases to be solving their immediate problems and at the same time seated the foundations of their future growth. Nevertheless, the final solution that was adopted was influenced by the political conjuncture. Obregón did not invent the problem of the inefficiency of the municipalities and the one of the disaster of the services public in the District to conceal its true political intentions, that were, as already we said, to undo of the political pressure of their enemies in the city councils. Both problems were real, had decades being perpetuated and the society inhabitant of the capital hoped that the Revolution's government gave solution them. Obregón, nevertheless, gave a political interpretation to these problems, it was used them to fulfill his political aspirations, and in it the practical and ideological work unfolded by the Mexican city planners was of extreme importance, because it gave technical arguments to legitimize the political reform him of the District. This took to him to ignore the necessity to fortify the municipal institution by means of the legal reforms that established clearly their tasks and responsibilities, their political and administrative autonomy and, most important, the provision of the economic resources that it required to fulfill his functions, thing that and beside the point then required the capital and the set of the municipalities of the country. Instead of this, Obregón, and who approved their initiative, bet to the centralization of the government of the D.F. and with it smoothed the way so that the specialists in urban planning conducted battle.

The city planners grouped in the National Association for the Planning of the Mexican Republic (ANPPRM), founded it the same year on which the municipalities of the District were suppressed (1928), and they began to try to induce the urban growth of the country through plans and projects. Thus, in their report of profits of the period of 1929-1932 the ANPPRM emphasized that their members occurred to the almost exclusive task to disclose the principles and benefits of the urban planning between the authorities and institutions of the country, without not to have obtained some concrete results like the one of the official approval of the projects for the planning of the port of Veracruz and Acapulco, the creation of the Commission of Program of the Secretariat of Communications and Transports, the celebration of the First National Congress of Planning (1930), the promulgation of the Law on General Planning of the Mexican Republic (1930), the creation of the commissions of planning of Mazatlán, Chilpancingo, Guanajuato, Aguascalientes, D.F. and Territories of the Baja California and Cuernavaca, the promulgation of the laws of Planning of Guerrero, Guanajuato, Aguascalientes, of the Federal District and Territories of the Baja California and Cuernavaca, in addition to have directed to more than 400 city councils of the Republic, each

one with more than 10 thousand inhabitants with the intention of making see the importance them that their respective organizations counted on a program of ordered development. Thus, then, throughout the decade of 1930, the Mexican State adopted the proposals of the modern urban planning and it was giving an institutional sustenance them, without it meant necessarily its effective application. The interventionist and authoritarian character of the State, that in the city of Mexico was absolute produced by the suppression of its municipal government, caused, since we have seen, a political instrumentation of the planning and with it the cancellation of its real possibilities to affect the conduction of a ordered, planned and equitable urban growth as it postulated the modern urban planning.<sup>29</sup>

# URBAN FORMS: historical references regarding Le Corbusier's project for Rio de Janeiro and others Brazilian architects

## Introduction

Urban morphology uses urbanistic and architectural analysis viewing the city as an architectural fact, in other words, that urban space construction goes necessarily through architecture. The idea of urban form corresponds to the physical means built as architecture, constituted by a set of architectural objects interlinked by spatial relations.

*Architecture will be, therefore, the key to the correct and global interpretation of the city as a spatial structure.* (Lamas, 1992, 41)

Through this concept we try to understand how the urban form of the *crescents* in Bath – *Royal Crescent*, 1769, and the *Lansdowne Crescent*, 1794 – build, by means of architecture, a reference urban space, which may have been the base or reference for Le Corbusier's project for Rio de Janeiro, in 1929. Also how the latter became the reference for two other projects built in Rio de Janeiro such as the residential condos Pedregulho and Marquês de São Vicente, by Affonso Eduardo Reidy, and Parque Guinle, by Lúcio Costa.

Sigfrido Giedion (1958, 161) states that, in the Argel project, "Le Corbusier is based upon buildings that prevail in the organic line of the *Crescents* in Bath." The *crescents* in Bath aim to merge the buildings with the surrounding natural environment, where nature is not at service of architecture, but where both – nature and architecture – have the same importance. *Royal Crescent* results in a visual softness of the broad elliptical curtain that uses the slope in landscape as a scenic component of the whole. *Lansdowne Crescent* overlooks the heights of Bath with its long and serial serpentine.

In the Obus Plan, for Argel, 1931, Le Corbusier applies the same philosophy, where nature and architecture complete and respect each other. The curves projected in Argel, as in Bath, are adapted to the natural landscape, even if the level variations are exaggerated in relation to those existent in an English city.

However, previous to Argel, the first project by Le Corbusier in Rio de Janeiro, presented in 1929, also portrays the proposal of a building-viaduct that, with the sea in front and the Atlantic Forest behind, is supported on the level curves and grows parallel to Guanabara Bay. Le Corbusier's proposal is a highway, located 100m above the ground, that crosses the city, skipping obstacles, surrounding barriers or breaking blockings. In this proposal not only transportation problems are solved but also housing problems, creating buildings where residences are projected up to 30m above the ground, under the highway.

Since, for Argel, Obus Plan is a re-elaboration of the project presented for Rio de Janeiro, we assume the project's formal reference for the Carioca building-viaduct, which follows the sinuous line of the mountains and supports itself on the topography, can be found in Bath, especially in *Lansdowne Crescent*. We also wonder if this same formal reference is present in the residential condos of Pedregulho, Marquês de São Vicente, and Catacumbas by Affonso Eduardo Reidy, as

well as Parque Guinle by Lúcio Costa.

### 1. Renaissance and Baroque urban form

Edmund Bacon (1995, 182) states that, in modernism, the interrelation between buildings did not evolve beyond the renaissance principles, and actually, failed to employ those principles. Except for Kenzo Tange and Tokyo's olympic stadium project, the author finds it difficult to find two or more modern structures related to something other than the Renaissance design principles, therefore recommending that the projects should be reviewed according to the renaissance structure.

We find significant changes in the city's design after the perspective and rationalism of the Renaissance period, which overwhelms the intuitive sensorial reactions of previous planners. Since the 15<sup>th</sup> century, architecture, esthetical theories and urbanistic principles follow similar ideas: the wish for order and geometric discipline. In lectures, treaties, schemes, projects and executions, the city's form is subordinated to unit and rationality.

Integration between architecture and urbanism can be found since the beginning of Renaissance until the 19<sup>th</sup> century. Architecture, however, is the first to absorb new ideas in accomplishments, while urbanism evolves based only on theoretical terms, from the conception of the ideal city to the architecture treaties and city planning. (Lamas, 1992, 168)

Points in common can be found between the urban design that developed during Renaissance and during the Baroque period: the principles of architecture and spatial design that constitute them are closely related; and the proportion rules generally used in plants, three-dimensional elements, and in the detailed drawings of façades, are extended to the organization of urban space. Architecture and urbanism are based on discipline and order, while asymmetric informality is restricted.

In Baroque, a focal point can be transformed into a powerful planning force bringing order to chaos. The plant is geometric by nature, and if to alter this type of plant and introduce new elements is to impair its symmetry, even superficial esthetical elements can only remain by the means of rigid management rules.

The main elements of Baroque urbanism are symmetry in relation to one or more axis, the conclusion in perspectives and isolated buildings integrated as being one, generating a coherent architectonic scenario. Its application is done in three ways: main straight street, neighborhoods with reticular formation and open spaces.

The street, or its drawing, is an extremely important element. The street has a regular trajectory granting access to the buildings, however, for the first time it is a perspective axis, union and valorization line between urban elements. The street quits being solely a functional route – as in Middle Age –, to become a visual, ornamental, pageant trajectory, adequate for carriages to pass, and an organizer of scenic and esthetical effects.

The construction of open spaces can't be justified exclusively by the political purpose of working as a frame for the king's statues, as in *places royales* in France. It is also linked to economic reasons, and to a higher demand level of urban efficiency: the construction of open spaces enables a localized intervention and a functional adequation, defining commercial centers, housing areas, and the city's administration. The spaces can be occupied by religious and civil buildings;

residential constructions in line; and by market and commercial buildings.

However, still under Baroque dominion, there are wonderful designs that are free from the formal demand of axial symmetry, as in the city of Bath, in England. Maintaining the above mentioned principles, but setting aside the closed geometric forms, the *crescents* in Bath are open to nature, innovating the urban form and breaking the rigid Baroque formalism.

Bath started to be much visited by the aristocracy, during the 18<sup>th</sup> century, who went there for its waters bringing about a series of small scale improvements and causing the landowners in the neighborhood to elaborate bold plans for the residential surroundings. In some spinal extensions, such as *Gay street*, the *Circus* and the *Royal Crescent*, along with *Queen Square*, we have a new urbanization order, in its best and most appealing form. (fig. 1)

The excellence of Bath demonstrates the advantage of a strict discipline, when it is sufficiently flexible to adapt to geographic and historical challenging realities. (Mumford, 1982, fig. 37)

Fig. 1: Airview of the Circus, Brock's Street, and Royal Crescent

Projects that mark the history of urban design in Bath are: *Queen Square*, by John Wood (father) 1729, who builds following the logic of a speculative operation, where Wood is able to create an ordered architectonic composition following several demands by his tenants; *King's Circus*, by John Wood (father) and John Wood (son) 1754, 96m diameter and 33 houses originating three façades in a circumference arch, with 3 floors, attic and basement, and an even height of 13m; *Royal Crescent*, by John Wood (son) built from 1767 to 1774, a perfect integration between built form and natural landscape, with 30 houses with rigidly controlled façades which close different plants; and the *Lansdowne Crescent*, by the architect John Palmer.

*Royal Crescent's* semi-elliptic pattern with its biggest axis of 155m opening to a sloping meadow, is not only the application of a geometric figure, but constitutes, with its location, an elevation that overlooks the entire valley, protected by the park below, besides the gardens in the back, all which can be seen through the iron gates. John Wood (son) leaves the previously used compact characteristic behind, projecting the *Royal Crescent* where the form used is in harmony with a softly sloping meadow. Nature does not serve architecture anymore, both now are endowed with the same importance.

*Lansdowne Crescent*, by the architect John Palmer, is an example where, besides the horizontal sinuosity of the set, the structure moves vertically climbing up a hill, descending to the valley, and continuing with another elevation, which Bacon compares to the spatial form of the "*sailing city*" by Paul Klee (Bacon, 1995, 183). It is a regional scale project, with no radical nor poorly known architectonic detail or even tricks; nevertheless the project is free of Baroque axial planing, representing a powerful declaration of a new and unexpected urban form. The urban design stands out due to the creation of ingenious spatial situations exploring topographic conditions in the territory, and using them to attain highly meaningful shapes. (fig. 2)

fig. 2. Airview of Lansdowne Crescent

The *crescents* in Bath have the buildings, the meadow and the green area as composition elements. A road, on the edge of the meadow, functions as a façade, while another one, behind, ensures service access.

We could locate here the beginning of the 'disappearance' of the blocks weren't it for the persistence of the relations between building/façade/urban space, and weren't it for the lack of continuity and evolution of these models. (Lamas, 1992, 198)

Mumford (1982, 430-1) considers that the squares, circles and *crescents* in Bath reached the peak in terms of residential squares, taking London and Paris as an example, partly due to an actual imponent use of new hilly and regular sites in the city. What we can see from *Royal Crescent* helps us understand that the projected form is not at all by chance, being a harmonious composition with the amplitude of the landscape and a view of distant hills that enthrall our souls. The panorama we contemplate explains the esthetical result, besides the wholesomeness of that open planning. (fig. 3)

Fig. 3: View of Royal Crescent façades and its meadow

This new order and unit are the result of a new attitude, a sole ownership of the land, and a unified control between the architect and the constructor. The result would not be the same if the land were previously divided and each landowner defined his own construction style. Despite the fact that, usually, open spaces are projected with closed geometric forms, the *crescents* in Bath and their new urban form, are recreated in some other English towns, such as the *College Crescent* projected and partially built by James Craig in Edimburgo (1786), and the *Park Crescent* built by John Nash in London (1812).

## 2. *The modernist urban form*

The modernist city originated from experiences and theoretical formulations that, in the first half of the 20<sup>th</sup> century, reject the traditional city and substitute it for a new model. These ideas come to substitute the residues of formal urbanism. Between the two wars, modern architects worked hard opposing formal urbanism and organizing the structure and morphology of the new city. Both architecture and modern urbanism aim to counter the traditional ways of building houses and cities. This anti-historical attitude, refusing shapes committed to the old city is also reflected on the rejection and destruction of historical centers.

During this phase, experiences were attempted to destroy and abandoned the block, street and even the square; the proposals are typologies of towers, condos and blocks; and the city is no longer structured based on a functional mixture to be zoned, breaking the reciprocal integration of the various morphological elements that constitute the urban structure. The new organization models of urban space reject the forms and the morphologic configuration of the traditional city.

After World War I, the need to build cheap standardized housings becomes apparent. It's the new spirit, proclaimed by Le Corbusier in 1920 – build serial houses, live in serial houses, and conceive serial houses.

Throughout Europe, legislative instruments related to city and territorial administrations are being reviewed; fact that enables the conception of ordenation plans for big and middle size cities.

Differently from the traditional city, the buildings are conceived alone, with the composition made as a wax model, where parts can be moved and repositioned.

Thus, the urban form is due to housing considerations disregarding the composition of urban spaces. The new housing typologies, which spread throughout the land according to needs such as hygiene, insulation, ventilation and accesses, cause the buildings to quit being part of the superior block structure to gain autonomy. The streets belong no more to the physical-spatial relations of the city being reduced to transports and services lines. The positions of the buildings are due to better living conditions and not to the position in the block.

The modern city is, therefore, different from the traditional city, where housing and residential constructions were determined by the lot, generated by the position and implantation previously determined by the urban form. Contrarily, in the modern city, the construction determines the urban form. The space between constructions becomes merely a residual space, left over space no more object of urban design.

However, the architectonic quality of the different isolated or contiguous buildings can't, by itself, confer shape to the urban environment. Even a quality condo, if not integrated into a context, emerges disarticulated and devoid of real meaning. The architectonic discourse assumes an interrelation between the buildings and the urban space which must be framed into a structure.

By means of *tabula rasa*, the modern metropolis project rationalizes the building's typologies, separates residential blocks from the road network, emphasizes the hygiene of linear residential blocks organizing them on unused land, and overall, separates the roads for cars from those for people, and business areas from residential areas. According to Gravagnuolo (1998, 336), it is the "steel frame" of an anticity abstract ideogram. Searching for the new, architects declare the death of the street, negating the traditional city.

In Le Corbusier's projects for ideal metropolis, the past and the traditional city have their rejection declared. Yet, after a more detailed analysis, wouldn't we find formal urban elements identified with the ideal Renaissance cities, Baroque open spaces, or even influences from architecture and urbanism from the first years of the 20<sup>th</sup> century?

### 3. *Le Corbusier's urban form and the project for Rio de Janeiro*

Le Corbusier, who can be considered as one of the great representatives of the Modern Movement, has a great influence over architects and urbanists; however his urban projects, all his ideas about cities, remained on the paper as a theoretical exercise, except for Chandigarh. Le Corbusier's urban philosophy evolves in a scenic mark of publicity projects and conferences, suggesting his solutions to the world in a narrative form and converting every project into literary fiction.

In his first urbanism project, *Ville Contemporaine pour trois millions d'habitants*, 1922, transports and speed are highlighted. His central point is to view the city as a circulating machine, which has now the new role as machine to live and machine to supply services. In this project, Le Corbusier develops the urban meaning of his architecture.

The concern regarding the integration of architecture and nature becomes apparent in 1925, at the

Pavilion of the New Spirit at Paris Exhibit, where a construction surrounded a tree, and where branches emerged through the roof. Nature, understood as irrational, demands to be once again accepted in architecture.

In 1925 Le Corbusier starts to criticize the garden cities more and more intensively, considering them as a model linked to excessive individualism. From then he dedicates most of the next two decades to research an individual housing that would not oppose the city, but would favor great density as well as an intense relation with the collective equipment.

Hence, he states that the urbanist revolution will be the only one to establish the conditions for a revolution in the art of housing, where the houses must abandon the streets (and the concept of road alignment disappear), rejecting the playground, and gathering, in height and extension, a useful number of housings, so the concentration in one place will free a considerable amount of land. He also suggests a separation between roads for cars and those for people. The roads for people must be free, not being hampered by real estate for they will be supported on a system of columns. The city will become a park, the ground free to be used by the people.

In regard to the buildings, Le Corbusier suggests that the business buildings must be located in a "vertical" center with enormous towers, such as the tower cities of Auguste Perret, 1922. The housings would obey the principle of "overlapped houses", however horizontal in their main extension. The big blocks of the *immeubles-villas* are interconnected by passageways forming a continuous network of "streets in the air", allowing the dwellers to go from one building to the next without landing. We can find the same idea in the buildings *à redents*, even more related to the organization of the constructions.

At a conference in Buenos Aires, 1929, Le Corbusier addresses the idea of a continuous building *à redents*, closely connected to a transportation axis freely extendable. From the moment he accepts such unlimited extension for buildings *à redents*, Le Corbusier opens the possibility of a more open planning. (Weber, 1998, 66)

The way in which Le Corbusier connects his projects to the geography of the location is not always that clear and, many times, a superficial analysis of his urbanist projects, assumes little or no relation with the elements existing in the place. We can attribute this interpretation to the contrast between the networks of the traditional city and that which Le Corbusier proposes, which, generally speaking, comes determined by the disappearance of the combination street-house.

We find an example of this relation, geography-city, in how to solve the problem of building on a highly irregular ground. Traditionally, the street goes surrounding obstacles and the houses follow its alignment, generating chaos and an arbitrary orientation. In a modern design, the buildings are located on the slope and a hillside street connects them. (Le Corbusier, 1980, 93)

Geography and city merge the most in the projects for Rio de Janeiro and Argel. Visits to the slums allow Le Corbusier to appreciate the view which establishes an intense relation between modest houses located on the hillsides and the bay's landscape. Le Corbusier certainly considers the possibility of rescuing the major advantage from the slums – the beautiful view of Rio – for housings located on the building-viaduct; but all latter reference to this subject appears, overall, at the service of an essentially theoretical proposal.

The ordination project for Rio, created by Le Corbusier on a few sketches in 1929, is based upon four fundamental principles: reduce traffic in the city's center; the increase of population density; expansion of means of transport; and expansion of park areas. His project is a building-viaduct, crossing the urban network over the existent buildings having the hill slopes as its garden and Guanabara Bay as its panorama.

In 1929, Le Corbusier traveled to South America and created a study for old urban centers in Buenos Aires, Montevidéo, São Paulo, and Rio de Janeiro. Among Le Corbusier's urbanist ideas, the manner how he retakes the utopist speech stands out along with high valorization of space and its therapeutic importance. He fundamentals his interventions evidencing the negative side of the modern city, does *tabula rasa* and substitutes it for an ordenated city.

For Rio, Le Corbusier considers an urban project which would not interfere with the existent city, where past and present overlap like layers of history. He elaborates the total of three ideas: the first one, in 1929, after flying over the city; the second one, already in Paris, in 1930, as an evolution of the first one; and the third one, in 1936, during his second visit to Rio.

From the airplane, I projected for Rio de Janeiro, an immense highway embracing the rocky headland open over the sea, so the city could be quickly reached from the wholesome plateaus, using this same highway. (Le Corbusier, 1979, 266)

Seen from the airplane, Rio makes an impression on Le Corbusier as a natural linear city, drawn as a narrow strip by the coast, having the ocean on one side and the high rocks on the other, which seam to have naturally suggested the idea of the city-viaduct. Hence, Le Corbusier draws an extension of Rio in the shape of a costal highway, with a longitude of approximately 6km and located 100m above the ground, comprehending 15 floors of artificial ground for residential use, below the road. The mega structure would stay above the roofs of the existing city.

Le Corbusier works hard to structure the strong and penetrating landscape and to understand its essential aspects. As a plastic artist, he was charmed by the unprecedented shapes; as an urbanist, he understood the impossibility of applying his theoretical rules and project challenging only the existent city.

The proposal – which crosses the uneven site from one point to the other – is altogether city, building and highway. Utopia incorporates lyrics: the highway continues, type of urban promenade, unfolding a delightful view; the sinuous 'strip', uniformly level, highlights the uneven topography; suspended in the air, the building open as belvederes to the extraordinary panorama. (Conde, 1998, 6)

The highway represents the base in all three projects, crossing the city, skipping obstacles, surrounding barriers, or breaking blockings. The big highway connects the main parts of the city; North Zone to the South Zone; Center and Niterói, on the other side of the bay. All three projects aim to solve transportation and housing problems.

Fig. 4: Sketch of Le Corbusier's project for Rio de Janeiro, 1929

Le Corbusier projects the city in its totality, having the car as a means of urban regulation. He denies the idea of periphery as a geographic and social notion, while his building-viaduct floats above the existent city. He projects the highway like a park-city which enjoys the landscape, the bay and mountains, as well as the old city.

In the first project (fig. 4), the big building-viaduct evolves parallel to the bay, with a bifurcation to the Sugar Loaf and another one to the business center, this one constituted by buildings which are perpendicular to the highway. The same structure is maintained in the second project, but without the bifurcation to the Sugar Loaf. The third proposal is entirely different from the others, since, in this project, the highway circuit goes towards the University City. The present residential units are substituted by “Y” shaped blocks.

Fig. 5: Elevation of Le Corbusier's project for Rio de Janeiro seen from the ocean, 1929

Without interfering in the city already built, Le Corbusier intends to create a contrast between the peaks of the mountains and the horizontal construction wall. The result is the contrast between man's work and nature's work. (fig. 5)

This project introduces one sole system: big axis that, as in *Ville Contemporaine*, effect regional connections between the city and its territory. It extends the level of arrival of this axis at the coast through a big viaduct over the existent city, being equipped in some strategic locations with big car elevators, which avoid a complicated system of ramps. It replaces the public "roof-gardens", with a highway, and grants liberty in walking areas below on the natural ground. The parking lots will be located on the highest floors and not on the ground.

There is the influence from the cinema, airview and theories, as *Park-movement* theses, where Le Corbusier integrates the built space, the landscape of Guanabara Bay, and the mountain's green slopes as a natural garden.

...for Le Corbusier it is not from the existent city [...] that guidelines and laws appear to generate the project. For Le Corbusier, the existent city is seen first of all as a poetic fact – plastic – in the way it relates to its site, its geography. (Pereira, 1996, 372)

The insight Le Corbusier had in his project was to establish a rational and economic urbanization system, where urbanize is to make money, and that the economy of the project comes from the implantation of a highway inserted in a territorial, urban and ambivalent logic, on one hand opening a connection between Rio and São Paulo and, on the other, dominating the agitated topography interconnecting neighborhoods, directing development and creating artificial areas, securing areas where there is no more space to build.

The beauty of the innovating form, the innovating form itself could never be noticed if they were not present in the corbusiana speech as part of a system. The example of housing as an 'extension of public services', the example of leisure linked to work time and to the liberation of the ground, hence, the issue of landownership and authority which must 'be present'... All constitute a system that validates the system of columns, the 'highway' supported by the buildings, the viaduct following the landscape. (Tsiomis, 1998, 39)

Bearing in mind that leisure is part of the modern city; Le Corbusier considers how his highway allows the user to enjoy the city's landscape, pride of the carioca, collective patrimony, while he drives his car to the beach or through the “window-frame” of his home under the highway.

#### 4. Other projects for Rio de Janeiro

The Popular Housing Department granted to Affonso Eduardo Reidy the opportunity to perform, as the City Hall's architect, two major works in his carrier – the condos of Pedregulho and Gávea,

where he could associate plastic richness with social content. Pedregulho condo was built in 1946 on 50 thousand square meters located on the west slope of Pedregulho hill, which has an irregular conformation and uneven topography, with a difference in level of approximately 50 meters. The project comprises four residential blocks; being that block A has an extension of 260 meters, located on the highest part of the slope and following the sinuous shape of the hillside. There two bridges lead you to a partially free pavement where it is possible to enjoy the most beautiful panoramic view.

Taking advantage of the uneven land, the outstanding size of Pedregulho Condo is balanced by the flexibility of its design, using the undulating forms of the local relief. The curves of the main building respect the curves of the hillside, according to a formal dialectic, greatly enhancing its lines. (Carmen Portinho, 1999, apud Bonduki, 1999, 91)

Fig. 6: Airview of Pedregulho Condo Block A

Fig. 7: View of Pedregulho Condo Block A

In the case of Marquês de São Vicente Condo, in Gávea, 1952, half of the area follows the hillside until it reaches the highest part of the hill which has a difference in level of approximately 60 meters. Likewise, Pedregulho, the main building, follows the hillside integrating itself to the hilly landscape of Rio de Janeiro.

Fig. 8: Wax model of the main block of Marquês de São Vicente Condo, in Gávea

Another project by Reidy with the same shape conception, however not executed, it's Catacumbas Condo, at Rodrigo de Freitas Lake, 1951.

Fig. 9: Perspective of the Catacumbas Condo in front of Rodrigo de Freitas Lake

In the case of Guinle Park, in the project by Lúcio Costa, 1943, a difference can be noticed in relation to Reidy's projects and Le Corbusier's building-viaduct. While in these the form was define by only one block that followed the local topography winding its way by the mountain, adapting to level curves, and granting plasticity to the whole, Guinle Park's buildings are five separate blocks which follow the topography trying to maintain the park's integrity and respect its implantation in an amphitheater shape.

Fig. 10: Perspective of the whole with the six buildings proposed

##### *5. Formal references of the projects for Rio de Janeiro*

The highway of Rio's project, 100m above the ground, inspired on the suspended test road of Turim's factory, 40m above the ground over workshops, grant an outstanding position for the project in Le Corbusier's urbanist repertory, and consolidate the organic trend of his work. However a more accurate analysis reveals that, besides creating an inspired landscape, Le Corbusier develops a reasonably logic urban and architectonic format, adequate to the pragmatic character of the environment and not specifically organic.

Le Corbusier develops a urbanization devise which stands out more explicitly in the project for Rio de Janeiro, and that he then enhances in his plans for Argel: the building-viaduct, strong image, for which Le Corbusier searches for references both in past as in modern architecture. (Ziegler, 1998, 110)

It is possible to reconstruct three axis that connect the first project for Rio both to the proposals that precede it as to those that come after it: the relation between transportation spaces and constructions; the immense buildings; and the independent structure.

The repetition of urban forms is not a novelty: they repeat themselves throughout the history of urban design. For instance, the grid is not a North-American invention, but can be found in Greece, in Millet, and in the colonial American cities, it can represent a cosmic law for the Etruscan priest, or the maximum possibilities for real estate speculation for New York planners, in 1811. We can say the same about other urban forms such as the diagram, mandala, etc.

The sinuous line of the *crescents* in Bath, in the 18<sup>th</sup> century, disregard the closed geometric shape, used until then in the open Baroque spaces. The square is no more closed with buildings and opens itself to the infinite, encompassing the green areas surrounding it and changing the relation between architecture and nature. The beauty of both meadows and hills in Bath are a scenario for the *crescents'* inhabitants.

In Rio, Le Corbusier, charmed by the splendor of Guanabara Bay, its magnificent rocky headlands, and the Atlantic Forest, suggests the same integration between nature and architecture. Thus, when he positions his building-viaduct by the coast, he distributes the city's beauties democratically, since they can be contemplated throughout the highway and from the windows, being, therefore, used to complement his project.

The connection element between the units is the street and the new means of transportation. In Bath, with the introduction of carriages, wider and more regular streets became necessary. At the *crescents*, the presence of constructions on only one side of the road, allows the means of transportation to flow more freely, besides being a perspective axis, union and valorization line between urban elements. In Rio, cars demand free roads where they can speed without obstacles from the pre-existing city. The highway of Le Corbusier's building-viaduct also fulfills its role of perspective and union line of both the city's units and elements. The access to residential units in the condos also takes the pedestrians into consideration when it locates a free pavement half way downhill, facilitating access to the upper and lower apartments. In Guinle Park, the street is projected in front of the buildings, facilitating their access without interfering with the park located in front.

The *crescents* in Bath break with the way of thinking and projecting cities in the Baroque by not interfering with the site, supporting the buildings on the level curves, and using them to create a scenic effect. In Rio, Le Corbusier breaks with the modernist city way of thinking, which proposes itself as ideal with no regard for the site's condition nor for the conditions of the pre-existing city. Projects by Reidy and Lúcio Costa also break with modernist premises and use the implantation site as a fundamental element to structure the project, while using nature and the existent city as an integrating part, and the uneven topography in Rio as a strong definition element for the urban form. Laranjeiras Palace is a focal point at Guinle Park, which, as an acropolis, stands out, being this a Baroque city strategy.

Nature is an essential element in all projects analyzed; whether it is the panoramic view of Guanabara Bay from Pedregulho, Rodrigo de Freitas Lake from Catacumbas, the Corcovado hill from Marquês de São Vicente, or the amphitheater shaped park projected by the French landscapist Cochet, in 1916, from Guinle Park.

The goal of projects from such distinctive periods is the same: residential and urban expansion. In Bath, the projects target the British aristocracy which endeavored the cities thermal waters, while in Rio Le Corbusier's proposal is for popular housings with the declared intention to substitute the slums, the same aim of Reidy's condos. Guinle Park targets a wealthier population; nonetheless it is also a residential project. The strategies adopted whether at the end of the 18<sup>th</sup> century or during the 20<sup>th</sup> century, preserve the built environment and the pre-existing city placing layers of history side by side or overlapped.

Considering the proper proportions, the *crescents* in Bath and the building-viaduct in Rio de Janeiro by Le Corbusier present similar conception elements, creating, in their periods, a new urban form while breaking established rules and limits, thus becoming a formal reference for the generations to come. However, despite the similarity of shape and conception, a deeper study would be necessary for us to establish that the *crescents* in Bath are the formal base of Le Corbusier's project for Rio de Janeiro.

In the case of formal references in regard to Le Corbusier's project in Pedregulho, Marquês de São Vicente and Catacumbas, and Guinle Park condo projects, this conclusion is more immediate when we relate Le Corbusier's<sup>1</sup> influence among the architects authors of the projects mentioned: Affonso Eduardo Reidy and Lúcio Costa.

All had two fundamental references: Brazil and **Le Corbusier**. Utopias in regard to Brazil were those of a Brazil with strong Brazilian characteristics, of a fairer Brazil, where the national characteristic references were observed and consulted. Le Corbusier is above all the result of his trip through here in 1929, when he proffered conferences at the *Escola Nacional de Belas Artes* – just imaging the impact on those 20 year old “kiddoes” (Britto, 2002, 15) (highlights from the author)

The projects analyzed follow the same project adopted by Le Corbusier where architecture, nature and geography combine to the sinuous urban form that uses level curves as the bases for design and nature as landscape.

Within this context, we limit ourselves to the formal analysis of the projects. However, we could extend our analysis to an architectonic conception where, as states Bruand (1981, 229-30) Pedregulho building presents architectural details reminiscent of the strong Le Corbusier style that can also be found in the buildings of Guinle Park. That is, however, another analysis.

---

<sup>1</sup> As Bruand states (1981, 225) the contact with Le Corbusier, especially in 1936, was a revelation. Both architects, Affonso Reidy and Lúcio Costa, were part of the Project team of the Ministry of Education and Health of which Le Corbusier was the consultant.

## URBAN FORMS: historical references regarding Le Corbusier's project for Rio de Janeiro and others brazilian architects

Eloísa Petti Pinheiro

### *Introduction*

Urban morphology uses urbanistic and architectural analysis viewing the city as an architectural fact, in other words, that urban space construction goes necessarily through architecture. The idea of urban form corresponds to the physical means built as architecture, constituted by a set of architetonic objects interlinked by spacial relations.

*Architecture will be, therefore, the key to the correct and global interpretation of the city as a spacial structure. (Lamas, 1992, 41)*

Through this concept we try to understand how the urban form of the *creascent*s in Bath – *Royal Crescent*, 1769, and the *Lansdowne Crescent*, 1794 – build, by means of architecture, a reference urban space, which may have been the base or reference for Le Corbusier's project for Rio de Janeiro, in 1929. Also how the latter became the reference for two other projects built in Rio de Janeiro such as the residential condos Pedregulho and Marquês de São Vicente, by Affonso Eduardo Reidy, and Parque Guinle, by Lúcio Costa.

Sigfrido Giedion (1958, 161) states that, in the Argel project, "Le Corbusier is based upon buildings that prevail in the organic line of the *Creascent*s in Bath." The *creascent*s in Bath aim to merge the buildings with the surrounding natural environment, where nature is not at service of architecture, but where both – nature and architecture – have the same importance. *Royal Crescent* results in a visual softness of the broad elliptical curtain that uses the slope in landscape as a scenic component of the whole. *Lansdowne Crescent* overlooks the heights of Bath with its long and serial serpentine.

In the Obus Plan, for Argel, 1931, Le Corbusier applies the same philosophy, where nature and architecture complete and respect each other. The curves projected in Argel, as in Bath, are adapted to the natural landscape, even if the level variations are exaggerated in relation to those existant in an English city.

However, previous to Argel, the first project by Le Corbusier in Rio de Janeiro, presented in 1929, also portrays the proposal of a building-viaduct that, with the sea in front and the Atlantic Forest behind, is supported on the level curves and grows parallel to Guanabara Bay. Le Corbusier's proposal is a highway, located 100m above the ground, that crosses the

city, skipping obstacles, surrounding barriers or breaking blockings. In this proposal not only transportation problems are solved but also housing problems, creating buildings where residences are projected up to 30m above the ground, under the highway.

Since, for Angel, Obus Plan is a re-elaboration of the project presented for Rio de Janeiro, we assume the project's formal reference for the Carioca building-viaduct, which follows the sinuous line of the mountains and supports itself on the topography, can be found in Bath, especially in *Lansdowne Crescent*. We also wonder if this same formal reference is present in the residential condos of Pedregulho, Marquês de São Vicente, and Catacumbas by Affonso Eduardo Reidy, as well as Parque Guinle by Lúcio Costa.

### *1. Renaissance and Baroque urban form*

Edmund Bacon (1995, 182) states that, in modernism, the interrelation between buildings did not evolve beyond the renaissance principles, and actually, failed to employ those principles. Except for Kenzo Tange and Tokyo's olympic stadium project, the author finds it difficult to find two or more modern structures related to something other than the Renaissance design principles, therefore recommending that the projects should be reviewed according to the renaissance structure.

We find significant changes in the city's design after the perspective and rationalism of the Renaissant period, which overwhelms the intuitive sensorial reactions of previous planners. Since the 15<sup>th</sup> century, architecture, esthetical theories and urbanistic principles follow similar ideas: the wish for order and geometric discipline. In lectures, treaties, schemes, projects and executions, the city's form is subordinated to unit and rationality.

Integration between architecture and urbanism can be found since the beginning of Renaissance until the 19<sup>th</sup> century. Architecture, however, is the first to absorb new ideas in accomplishments, while urbanism evolves based only on theoretical terms, from the conception of the ideal city to the architecture treaties and city planning. (Lamas, 1992, 168)

Points in common can be found between the urban design that developed during Renaissance and during the Baroque period: the principles of architecture and spatial design that constitute them are closely related; and the proportion rules generally used in plants, three-dimensional elements, and in the detailed drawings of façades, are extended to the organization of urban space. Architecture and urbanism are based on discipline and order, while asymmetric informality is restricted.

In Baroque, a focal point can be transformed into a powerful planning force bringing order to chaos. The plant is geometric by nature, and if to alter this type of plant and introduce new elements is to impair its symmetry, even superficial esthetical elements can only remain by the means of rigid management rules.

The main elements of Baroque urbanism are symmetry in relation to one or more axis, the conclusion in perspectives and isolated buildings integrated as being one, generating a coherent architectonic scenario. Its application is done in three ways: main strait street,

neighborhoods with reticular formation and open spaces.

The street, or its drawing, is an extremely important element. The street has a regular trajectory granting access to the buildings, however, for the first time it is a perspective axis, union and valorization line between urban elements. The street quits being solely a functional route – as in Middle Age –, to become a visual, ornamental, pageant trajectory, adequate for carriages to pass, and an organizer of scenic and esthetical effects.

The construction of open spaces can't be justified exclusively by the political purpose of working as a frame for the king's statues, as in *places royales* in France. It is also linked to economic reasons, and to a higher demand level of urban efficiency: the construction of open spaces enables a localized intervention and a functional adequation, defining commercial centers, housing areas, and the city's administration. The spaces can be occupied by religious and civil buildings; residencial constructions in line; and by market and commercial buildings.

However, still under Baroque dominion, there are wonderful designs that are free from the formal demand of axial symmetry, as in the city of Bath, in England. Maintaining the above mentioned principles, but setting aside the closed geometric forms, the *crescents* in Bath are open to nature, innovating the urban form and breaking the rigid Baroque formalism.

Bath started to be much visited by the aristocracy, during the 18<sup>th</sup> century, who went there for its waters bringing about a series of small scale improvements and causing the landowners in the neighborhood to elaborate bold plans for the residential surroundings. In some spinal extensions, such as *Gay street*, the *Circus* and the *Royal Crescent*, along with *Queen Square*, we have a new urbanization order, in its best and most appealing form. (fig. 1)

The excellence of Bath demonstrates the advantage of a strict discipline, when it is sufficiently flexible to adapt to geographic and historical challenging realities. (Mumford, 1982, fig. 37)

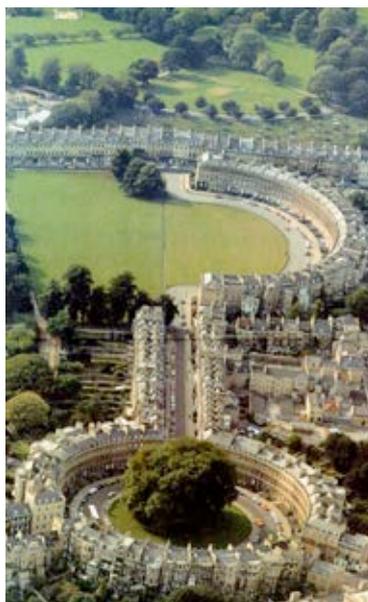

Fig. 1: Airview of the Circus, Brock's Street, and Royal Crescent

Projects that mark the history of urban design in Bath are: *Queen Square*, by John Wood (father) 1729, who builds following the logic of a speculative operation, where Wood is able to create an ordered architectural composition following several demands by his tenants; *King's Circus*, by John Wood (father) and John Wood (son) 1754, 96m diameter and 33 houses originating three façades in a circumference arch, with 3 floors, attic and basement, and an even height of 13m; *Royal Crescent*, by John Wood (son) built from 1767 to 1774, a perfect integration between built form and natural landscape, with 30 houses with rigidly controlled façades which close different plants; and the *Lansdowne Crescent*, by the architect John Palmer.

*Royal Crescent's* semi-elliptic pattern with its biggest axis of 155m opening to a sloping meadow, is not only the application of a geometric figure, but constitutes, with its location, an elevation that overlooks the entire valley, protected by the park below, besides the gardens in the back, all which can be seen through the iron gates. John Wood (son) leaves the previously used compact characteristic behind, projecting the *Royal Crescent* where the form used is in harmony with a softly sloping meadow. Nature does not serve architecture anymore, both now are endowed with the same importance.

*Lansdowne Crescent*, by the architect John Palmer, is an example where, besides the horizontal sinuosity of the set, the structure moves vertically climbing up a hill, descending to the valley, and continuing with another elevation, which Bacon compares to the spatial form of the "sailing city" by Paul Klee (Bacon, 1995, 183). It is a regional scale project, with no radical nor poorly known architectural detail or even tricks; nevertheless the project is free of Baroque axial planing, representing a powerful declaration of a new and unexpected urban form. The urban design stands out due to the creation of ingenious spatial situations exploring topographic conditions in the territory, and using them to attain highly meaningful shapes. (fig. 2)

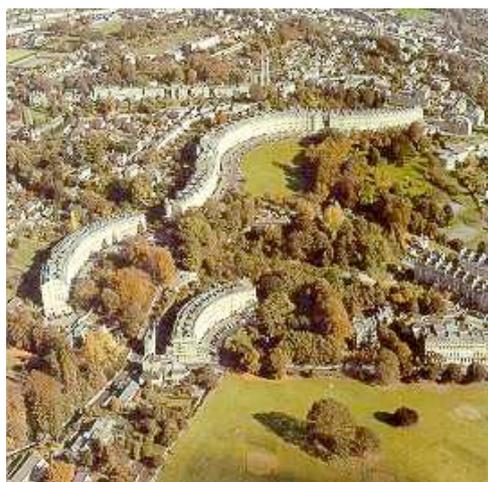

fig. 2. Airview of Lansdowne Crescent

The *crescents* in Bath have the buildings, the meadow and the green area as composition elements. A road, on the edge of the meadow, functions as a façade, while another one,

behind, ensures service access.

We could locate here the beginning of the 'disappearance' of the blocks weren't it for the persistence of the relations between building/façade/urban space, and weren't it for the lack of continuity and evolution of these models. (Lamas, 1992, 198)

Mumford (1982, 430-1) considers that the squares, circles and *crescents* in Bath reached the peak in terms of residential squares, taking London and Paris as an example, partly due to an actual imponent use of new hilly and regular sites in the city. What we can see from *Royal Crescent* helps us understand that the projected form is not at all by chance, being a harmonious composition with the amplitude of the landscape and a view of distant hills that enthrall our souls. The panorama we contemplate explains the esthetical result, besides the wholesomeness of that open planning. (fig. 3)

Fig. 3: View of Royal Crescent façades and its meadow

This new order and unit are the result of a new attitude, a sole ownership of the land, and a unified control between the architect and the constructor. The result would not be the same if the land were previously divided and each landowner defined his own construction style. Despite the fact that, usually, open spaces are projected with closed geometric forms, the *crescents* in Bath and their new urban form, are recreated in some other English towns, such as the *College Crescent* projected and partially built by James Craig in Edimburgo (1786), and the *Park Crescent* built by John Nash in London (1812).

## 2. The modernist urban form

The modernist city originated from experiences and theoretical formulations that, in the first half of the 20<sup>th</sup> century, reject the traditional city and substitute it for a new model. These ideas come to substitute the residues of formal urbanism. Between the two wars, modern architects worked hard opposing formal urbanism and organizing the structure and morphology of the new city. Both architecture and modern urbanism aim to counter the

traditional ways of building houses and cities. This anti-historical attitude, refusing shapes committed to the old city is also reflected on the rejection and destruction of historical centers.

During this phase, experiences were attempted to destroy and abandoned the block, street and even the square; the proposals are typologies of towers, condos and blocks; and the city is no longer structured based on a functional mixture to be zoned, breaking the reciprocal integration of the various morphological elements that constitute the urban structure. The new organization models of urban space reject the forms and the morphologic configuration of the traditional city.

After World War I, the need to build cheap standardized housings becomes apparent. It's the new spirit, proclaimed by Le Corbusier in 1920 – build serial houses, live in serial houses, and conceive serial houses.

Throughout Europe, legislative instruments related to city and territorial administrations are being reviewed; fact that enables the conception of ordination plans for big and middle size cities. Differently from the traditional city, the buildings are conceived alone, with the composition made as a wax model, where parts can be moved and repositioned.

Thus, the urban form is due to housing considerations disregarding the composition of urban spaces. The new housing typologies, which spread throughout the land according to needs such as hygiene, insulation, ventilation and accesses, cause the buildings to quit being part of the superior block structure to gain autonomy. The streets belong no more to the physical-spatial relations of the city being reduced to transports and services lines. The positions of the buildings are due to better living conditions and not to the position in the block.

The modern city is, therefore, different from the traditional city, where housing and residential constructions were determined by the lot, generated by the position and implantation previously determined by the urban form. Contrarily, in the modern city, the construction determines the urban form. The space between constructions becomes merely a residual space, left over space no more object of urban design.

However, the architectonic quality of the different isolated or contiguous buildings can't, by itself, confer shape to the urban environment. Even a quality condo, if not integrated into a context, emerges disarticulated and devoid of real meaning. The architectonic discourse assumes an interrelation between the buildings and the urban space which must be framed into a structure.

By means of *tabula rasa*, the modern metropolis project rationalizes the building's typologies, separates residential blocks from the road network, emphasizes the hygiene of linear residential blocks organizing them on unused land, and overall, separates the roads for cars from those for people, and business areas from residential areas. According to Gravagnuolo (1998, 336), it is the "steel frame" of an anticity abstract ideogram. Searching for the new, architects declare the death of the street, negating the traditional city.

In Le Corbusier's projects for ideal metropolis, the past and the traditional city have their rejection declared. Yet, after a more detailed analysis, wouldn't we find formal urban elements identified with the ideal Renaissance cities, Baroque open spaces, or even influences from architecture and urbanism from the first years of the 20<sup>th</sup> century?

### 3. *Le Corbusier's urban form and the project for Rio de Janeiro*

Le Corbusier, who can be considered as one of the great representatives of the Modern Movement, has a great influence over architects and urbanists; however his urban projects, all his ideas about cities, remained on the paper as a theoretical exercise, except for Chandigarh. Le Corbusier's urban philosophy evolves in a scenic mark of publicity projects and conferences, suggesting his solutions to the world in a narrative form and converting every project into literary fiction.

In his first urbanism project, *Ville Contemporaine pour trois millions d'habitants*, 1922, transports and speed are highlighted. His central point is to view the city as a circulating machine, which has now the new role as machine to live and machine to supply services. In this project, Le Corbusier develops the urban meaning of his architecture.

The concern regarding the integration of architecture and nature becomes apparent in 1925, at the Pavilion of the New Spirit at Paris Exhibit, where a construction surrounded a tree, and where branches emerged through the roof. Nature, understood as irrational, demands to be once again accepted in architecture.

In 1925 Le Corbusier starts to criticize the garden cities more and more intensively, considering them as a model linked to excessive individualism. From then he dedicates most of the next two decades to research an individual housing that would not oppose the city, but would favor great density as well as an intense relation with the collective equipment.

Hence, he states that the urbanist revolution will be the only one to establish the conditions for a revolution in the art of housing, where the houses must abandon the streets (and the concept of road alignment disappear), rejecting the playground, and gathering, in height and extension, a useful number of housings, so the concentration in one place will free a considerable amount of land. He also suggests a separation between roads for cars and those for people. The roads for people must be free, not being hampered by real estate for they will be supported on a system of columns. The city will become a park, the ground free to be used by the people.

In regard to the buildings, Le Corbusier suggests that the business buildings must be located in a "vertical" center with enormous towers, such as the tower cities of Auguste Perret, 1922. The housings would obey the principle of "overlapped houses", however horizontal in their main extension. The big blocks of the *immeubles-villas* are interconnected by passageways forming a continuous network of "streets in the air", allowing the dwellers to go from one building to the next without landing. We can find the same idea in the buildings *à redents*,

even more related to the organization of the constructions.

At a conference in Buenos Aires, 1929, Le Corbusier addresses the idea of a continuous building *à redents*, closely connected to a transportation axis freely extendable. From the moment he accepts such unlimited extension for buildings *à redents*, Le Corbusier opens the possibility of a more open planning. (Weber, 1998, 66)

The way in which Le Corbusier connects his projects to the geography of the location is not always that clear and, many times, a superficial analysis of his urbanist projects, assumes little or no relation with the elements existing in the place. We can attribute this interpretation to the contrast between the networks of the traditional city and that which Le Corbusier proposes, which, generally speaking, comes determined by the disappearance of the combination street-house.

We find an example of this relation, geography-city, in how to solve the problem of building on a highly irregular ground. Traditionally, the street goes surrounding obstacles and the houses follow its alignment, generating chaos and an arbitrary orientation. In a modern design, the buildings are located on the slope and a hillside street connects them. (Le Corbusier, 1980, 93)

Geography and city merge the most in the projects for Rio de Janeiro and Argel. Visits to the slums allow Le Corbusier to appreciate the view which establishes an intense relation between modest houses located on the hillsides and the bay's landscape. Le Corbusier certainly considers the possibility of rescuing the major advantage from the slums – the beautiful view of Rio – for housings located on the building-viaduct; but all latter reference to this subject appears, overall, at the service of an essentially theoretical proposal.

The ordenation project for Rio, created by Le Corbusier on a few sketches in 1929, is based upon four fundamental principles: reduce traffic in the city's center; the increase of population density; expansion of means of transport; and expansion of park areas. His project is a building-viaduct, crossing the urban network over the existent buildings having the hill slopes as its garden and Guanabara Bay as its panorama.

In 1929, Le Corbusier traveled to South America and created a study for old urban centers in Buenos Aires, Montevidéo, São Paulo, and Rio de Janeiro. Among Le Corbusier's urbanist ideas, the manner how he retakes the utopist speech stands out along with high valorization of space and its therapeutic importance. He fundamentals his interventions evidencing the negative side of the modern city, does *tabula rasa* and substitutes it for an ordenated city.

For Rio, Le Corbusier considers an urban project which would not interfere with the existent city, where past and present overlap like layers of history. He elaborates the total of three ideas: the first one, in 1929, after flying over the city; the second one, already in Paris, in 1930, as an evolution of the first one; and the third one, in 1936, during his second visit to Rio.

From the airplane, I projected for Rio de Janeiro, an immense highway embracing the rocky headland open over the sea, so the city could be quickly

reached from the wholesome plateaus, using this same highway. (Le Corbusier, 1979, 266)

Seen from the airplane, Rio makes an impression on Le Corbusier as a natural linear city, drawn as a narrow strip by the coast, having the ocean on one side and the high rocks on the other, which seem to have naturally suggested the idea of the city-viaduct. Hence, Le Corbusier draws an extension of Rio in the shape of a costal highway, with a longitude of approximately 6km and located 100m above the ground, comprehending 15 floors of artificial ground for residential use, below the road. The mega structure would stay above the roofs of the existing city.

Le Corbusier works hard to structure the strong and penetrating landscape and to understand its essential aspects. As a plastic artist, he was charmed by the unprecedented shapes; as an urbanist, he understood the impossibility of applying his theoretical rules and project challenging only the existent city.

The proposal – which crosses the uneven site from one point to the other – is altogether city, building and highway. Utopia incorporates lyrics: the highway continues, type of urban promenade, unfolding a delightful view; the sinuous 'strip', uniformly level, highlights the uneven topography; suspended in the air, the building open as belvederes to the extraordinary panorama. (Conde, 1998, 6)

The highway represents the base in all three projects, crossing the city, skipping obstacles, surrounding barriers, or breaking blockings. The big highway connects the main parts of the city; North Zone to the South Zone; Center and Niterói, on the other side of the bay. All three projects aim to solve transportation and housing problems.

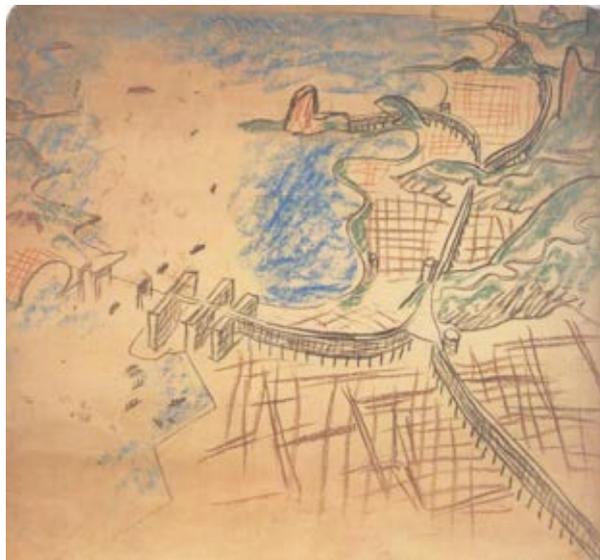

Fig. 4: Sketch of Le Corbusier's project for Rio de Janeiro, 1929

Le Corbusier projects the city in its totality, having the car as a means of urban regulation. He denies the idea of periphery as a geographic and social notion, while his building-viaduct floats above the existent city. He projects the highway like a park-city which enjoys the landscape, the bay and mountains, as well as the old city.

In the first project (fig. 4), the big building-viaduct evolves parallel to the bay, with a

bifurcation to the Sugar Loaf and another one to the business center, this one constituted by buildings which are perpendicular to the highway. The same structure is maintained in the second project, but without the bifurcation to the Sugar Loaf. The third proposal is entirely different from the others, since, in this project, the highway circuit goes towards the University City. The present residential units are substituted by “Y” shaped blocks.

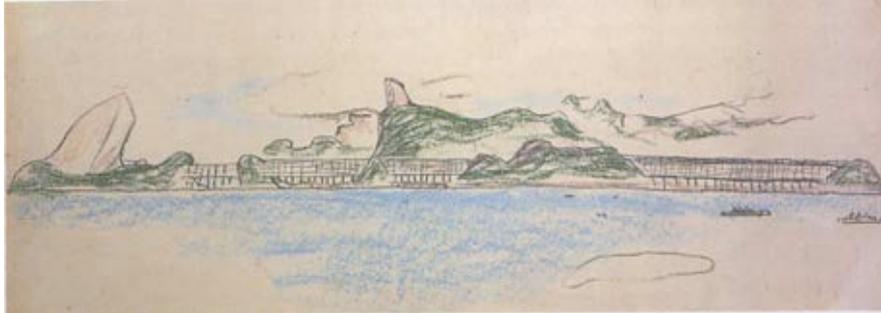

Fig. 5: Elevation of Le Corbusier's project for Rio de Janeiro seen from the ocean, 1929

Without interfering in the city already built, Le Corbusier intends to create a contrast between the peaks of the mountains and the horizontal construction wall. The result is the contrast between man's work and nature's work. (fig. 5)

This project introduces one sole system: big axis that, as in *Ville Contemporaine*, effect regional connections between the city and its territory. It extends the level of arrival of this axis at the coast through a big viaduct over the existent city, being equipped in some strategic locations with big car elevators, which avoid a complicated system of ramps. It replaces the public "roof-gardens", with a highway, and grants liberty in walking areas below on the natural ground. The parking lots will be located on the highest floors and not on the ground.

There is the influence from the cinema, airview and theories, as *Park-movement* theses, where Le Corbusier integrates the built space, the landscape of Guanabara Bay, and the mountain's green slopes as a natural garden.

...for Le Corbusier it is not from the existent city [...] that guidelines and laws appear to generate the project. For Le Corbusier, the existent city is seen first of all as a poetic fact – plastic – in the way it relates to its site, its geography. (Pereira, 1996, 372)

The insight Le Corbusier had in his project was to establish a rational and economic urbanization system, where urbanize is to make money, and that the economy of the project comes from the implantation of a highway inserted in a territorial, urban and ambivalent logic, on one hand opening a connection between Rio and São Paulo and, on the other, dominating the agitated topography interconnecting neighborhoods, directing development and creating artificial areas, securing areas where there is no more space to build.

The beauty of the innovating form, the innovating form itself could never be noticed if they were not present in the corbusiana speech as part of a system. The example of housing as an 'extension of public services', the example of leisure linked to work time and to the liberation of the ground, hence, the issue of landownership and authority which must 'be present'... All constitute a system that validates the system of columns, the 'highway' supported by the

buildings, the viaduct following the landscape. (Tsiomis, 1998, 39)

Bearing in mind that leisure is part of the modern city; Le Corbusier considers how his highway allows the user to enjoy the city's landscape, pride of the carioca, collective patrimony, while he drives his car to the beach or through the "window-frame" of his home under the highway.

#### 4. Other projects for Rio de Janeiro

The Popular Housing Department granted to Affonso Eduardo Reidy the opportunity to perform, as the City Hall's architect, two major works in his carrier – the condos of Pedregulho and Gávea, where he could associate plastic richness with social content. Pedregulho condo was built in 1946 on 50 thousand square meters located on the west slope of Pedregulho hill, which has an irregular conformation and uneven topography, with a difference in level of approximately 50 meters. The project comprises four residential blocks; being that block A has an extension of 260 meters, located on the highest part of the slope and following the sinuous shape of the hillside. There two bridges lead you to a partially free pavement where it is possible to enjoy the most beautiful panoramic view.

Taking advantage of the uneven land, the outstanding size of Pedregulho Condo is balanced by the flexibility of its design, using the undulating forms of the local relief. The curves of the main building respect the curves of the hillside, according to a formal dialectic, greatly enhancing its lines. (Carmen Portinho, 1999, apud Bonduki, 1999, 91)

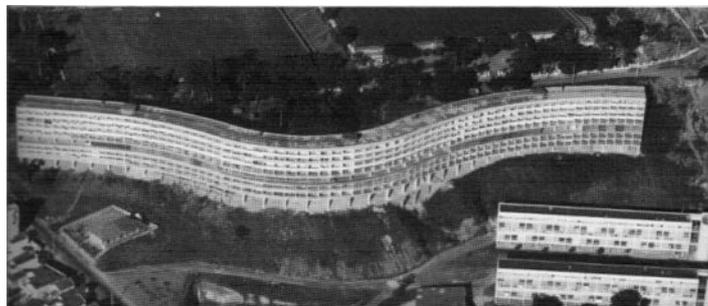

Fig. 6: Airview of Pedregulho Condo Block A

Fig. 7: View of Pedregulho Condo Block A

In the case of Marquês de São Vicente Condo, in Gávea, 1952, half of the area follows the hillside until it reaches the highest part of the hill which has a difference in level of approximately 60 meters. Likewise, Pedregulho, the main building, follows the hillside

integrating itself to the hilly landscape of Rio de Janeiro.

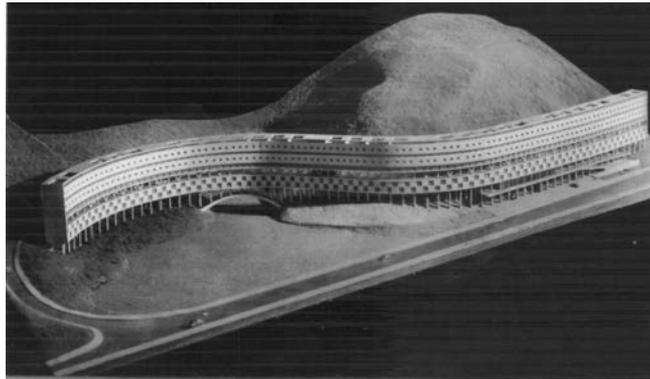

Fig. 8: Wax model of the main block of Marquês de São Vicente Condo, in Gávea

Another project by Reidy with the same shape conception, however not executed, it's Catacumbas Condo, at Rodrigo de Freitas Lake, 1951.

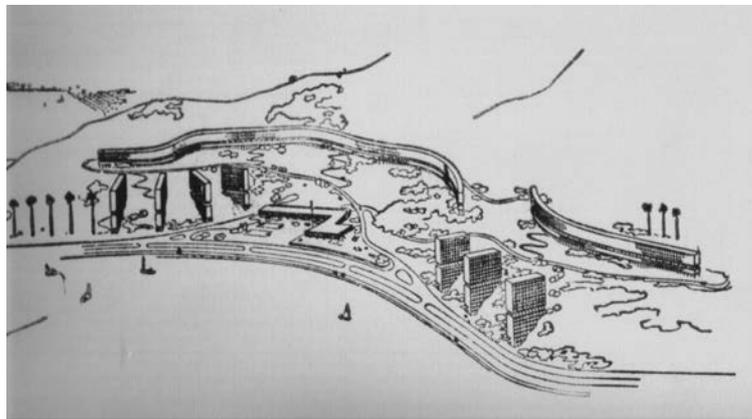

Fig. 9: Perspective of the Catacumbas Condo in front of Rodrigo de Freitas Lake

In the case of Guinle Park, in the project by Lúcio Costa, 1943, a difference can be noticed in relation to Reidy's projects and Le Corbusier's building-viaduct. While in these the form was define by only one block that followed the local topography winding its way by the mountain, adapting to level curves, and granting plasticity to the whole, Guinle Park's buildings are five separate blocks which follow the topography trying to maintain the park's integrity and respect its implantation in an amphitheater shape.

Fig. 10: Perspective of the whole with the six buildings proposed

## 5. Formal references of the projects for Rio de Janeiro

The highway of Rio's project, 100m above the ground, inspired on the suspended test road of Turim's factory, 40m above the ground over workshops, grant an outstanding position for the project in Le Corbusier's urbanist repertory, and consolidate the organic trend of his work. However a more accurate analysis reveals that, besides creating an inspired landscape, Le Corbusier develops a reasonably logic urban and architectonic format, adequate to the pragmatic character of the environment and not specifically organic.

Le Corbusier develops a urbanization devise which stands out more explicitly in the project for Rio de Janeiro, and that he then enhances in his plans for Argel: the building-viaduct, strong image, for which Le Corbusier searches for references both in past as in modern architecture. (Ziegler, 1998, 110)

It is possible to reconstruct three axis that connect the first project for Rio both to the proposals that precede it as to those that come after it: the relation between transportation spaces and constructions; the immense buildings; and the independent structure.

The repetition of urban forms is not a novelty: they repeat themselves throughout the history of urban design. For instance, the grid is not a North-American invention, but can be found in Greece, in Millet, and in the colonial American cities, it can represent a cosmic law for the Etruscan priest, or the maximum possibilities for real estate speculation for New York planners, in 1811. We can say the same about other urban forms such as the diagram, mandala, etc.

The sinuous line of the *crescents* in Bath, in the 18<sup>th</sup> century, disregard the closed geometric shape, used until then in the open Baroque spaces. The square is no more closed with buildings and opens itself to the infinite, encompassing the green areas surrounding it and changing the relation between architecture and nature. The beauty of both meadows and hills in Bath are a scenario for the *crescents'* inhabitants.

In Rio, Le Corbusier, charmed by the splendor of Guanabara Bay, its magnificent rocky headlands, and the Atlantic Forest, suggests the same integration between nature and architecture. Thus, when he positions his building-viaduct by the coast, he distributes the city's beauties democratically, since they can be contemplated throughout the highway and from the windows, being, therefore, used to complement his project.

The connection element between the units is the street and the new means of transportation. In Bath, with the introduction of carriages, wider and more regular streets became necessary. At the *crescents*, the presence of constructions on only one side of the road, allows the means of transportation to flow more freely, besides being a perspective axis, union and valorization line between urban elements. In Rio, cars demand free roads where they can speed without obstacles from the pre-existing city. The highway of Le Corbusier's building-viaduct also fulfills its role of perspective and union line of both the city's units and elements. The access to residential units in the condos also takes the pedestrians into consideration when it locates a free pavement half way downhill, facilitating access to the upper and lower apartments. In Guinle Park, the street is projected in front of the buildings, facilitating their

access without interfering with the park located in front.

The *crescents* in Bath break with the way of thinking and projecting cities in the Baroque by not interfering with the site, supporting the buildings on the level curves, and using them to create a scenic effect. In Rio, Le Corbusier breaks with the modernist city way of thinking, which proposes itself as ideal with no regard for the site's condition nor for the conditions of the pre-existing city. Projects by Reidy and Lúcio Costa also break with modernist premises and use the implantation site as a fundamental element to structure the project, while using nature and the existent city as an integrating part, and the uneven topography in Rio as a strong definition element for the urban form. Laranjeiras Palace is a focal point at Guinle Park, which, as an acropolis, stands out, being this a Baroque city strategy.

Nature is an essential element in all projects analyzed; whether it is the panoramic view of Guanabara Bay from Pedregulho, Rodrigo de Freitas Lake from Catacumbas, the Corcovado hill from Marquês de São Vicente, or the amphitheater shaped park projected by the French landscapist Cochet, in 1916, from Guinle Park.

The goal of projects from such distinctive periods is the same: residential and urban expansion. In Bath, the projects target the British aristocracy which endeavored the cities thermal waters, while in Rio Le Corbusier's proposal is for popular housings with the declared intention to substitute the slums, the same aim of Reidy's condos. Guinle Park targets a wealthier population; nonetheless it is also a residential project. The strategies adopted whether at the end of the 18<sup>th</sup> century or during the 20<sup>th</sup> century, preserve the built environment and the pre-existing city placing layers of history side by side or overlapped.

Considering the proper proportions, the *crescents* in Bath and the building-viaduct in Rio de Janeiro by Le Corbusier present similar conception elements, creating, in their periods, a new urban form while breaking established rules and limits, thus becoming a formal reference for the generations to come. However, despite the similarity of shape and conception, a deeper study would be necessary for us to establish that the *crescents* in Bath are the formal base of Le Corbusier's project for Rio de Janeiro.

In the case of formal references in regard to Le Corbusier's project in Pedregulho, Marquês de São Vicente and Catacumbas, and Guinle Park condo projects, this conclusion is more immediate when we relate Le Corbusier's<sup>1</sup> influence among the architects authors of the projects mentioned: Affonso Eduardo Reidy and Lúcio Costa.

All had two fundamental references: Brazil and **Le Corbusier**. Utopias in regard to Brazil were those of a Brazil with strong Brazilian characteristics, of a fairer Brazil, where the national characteristic references were observed and consulted. Le Corbusier is above all the result of his trip through here in 1929, when he proffered conferences at the *Escola Nacional de Belas Artes* – just imaging the impact on those 20 year old “kiddoes” (Britto, 2002, 15) (highlights from the author)

---

<sup>1</sup> As Bruand states (1981, 225) the contact with Le Corbusier, especially in 1936, was a revelation. Both architects, Affonso Reidy and Lúcio Costa, were part of the Project team of the Ministry of Education and Health of which Le Corbusier was the consultant.

The projects analyzed follow the same project adopted by Le Corbusier where architecture, nature and geography combine to the sinuous urban form that uses level curves as the bases for design and nature as landscape.

Within this context, we limit ourselves to the formal analysis of the projects. However, we could extend our analysis to an architectonic conception where, as states Bruand (1981, 229-30) Pedregulho building presents architectural details reminiscent of the strong Le Corbusier style that can also be found in the buildings of Guinle Park. That is, however, another analysis.

## **ABSTRACT:**

Brasília, born of the urban plan by Lúcio Costa and of the unexpected concrete structural forms designed by Oscar Niemeyer, knew how to adapt to the new forms that came from the country's religious syncretism.

This article aims to compare, through religious symbolism, structural forms and architectural spaces, two sacred monuments: The cathedral of Brasília, designed by Oscar Niemeyer in 1960, and the recently-dedicated Stūpa of the Tibetan Buddhist Center.

Even in a new capital, the millenary construction form of the Stūpa, one of the primordial sacred structures for all Buddhism traditions, the sacred symbol of enlightenment, must obey some construction rules according to its lineage's Buddhist tradition. In this way, the Stūpa is the opposite of a strong and fearless structural form embodied in the cathedral, with its 16 revolution hyperboloid concrete pillars and its subterranean entrance.

Although both structures must relate to a religious function, they are unusual forms of architecture, with specific religious and architectural significance. The spatial conception and the sculptural form are also distinct, as they respond to the religious symbolism of their own traditions.

**Keywords:** religious architecture, structural form, cathedral, stūpa.

## **1. INTRODUCTION**

Forty-six years stand between the sculptural monument of the Brasília Cathedral and the Stūpa of the Brasília Tibetan Buddhist Center. In the city planned by Lúcio Costa and inaugurated on April 21<sup>st</sup>, 1960, to be Brazil's new capital, Architect Oscar Niemeyer's signature genius makes itself present in several administrative, cultural and religious buildings, especially in the Our Lady of Aparecida Metropolitan Cathedral.

The 2000 census showed that in Brazil, a mostly Catholic country, there is a rise in religious diversity, and among Eastern religions, Buddhism stands out. There are over 200,000

practitioners in Brazil, Centers with resident Lamas and local meeting temples throughout the nation's territory. The largest number of Buddhists is concentrated in São Paulo, due to the many people of Japanese descent in that state. Other Buddhist schools, however, such as the Tibetan, are beginning to gain strength in many regions. In Brasilia, the Tibetan Buddhist Center Kagyü Pende Gyamtso ("An Ocean of Benefits"), founded on the 14<sup>th</sup> of May, 1987, through the initiative of some Brazilian adepts and in the oral transmission lineage of Shangpa Kagyü,<sup>1</sup> has the goal of studying and propagating Buddhism, and particularly the Vajrayāna,<sup>2</sup> in its religious, philosophic, artistic and cultural aspects.

This article intends to show that these two sacred monuments, the Cathedral and the Stūpa built in the Tibetan Buddhist Center Kagyü Pende Gyamtso (CBTKPG), go beyond the fulfillment of their spiritual functions, and enrich the architecture of Brasilia, with their surprising forms, full of symbolism. On the one hand, the free forms of the Cathedral, expresses its strength through an innovative structure, and on the other, the sacred symbol of Enlightenment, built according to rules established in the Buddhist tradition, perpetuates the ages-old building type.

Brasilia, a futuristic and modern city, is open to this new building just as the nation is to a religious syncretism. The detailed study of the structural conception in the Cathedral and in the Stūpa will provide invaluable elements to foster an understanding of these architectural forms, so different from each other, yet responding in a similar way to the necessity of a place for the faithful to withdraw into and demonstrate their faith.

## 2. BRASILIA CATHEDRAL

The daring structures in religious monuments built throughout history have always reflected the technical and constructive progress of each age. When thinking about the Brasilia Cathedral, Oscar Niemeyer wanted his design to embody every possibility offered by reinforced concrete and, by means of its lightness, to showcase contemporary technique. The "slender columns, extremely slender, prove how technique controls reinforced concrete and how the latter adapts mildly to all our fantasies". (Niemeyer, 1977, p. 309, my translation).

The Brasilia Cathedral was intended to hold 4,000 attendees, but its architectural ensemble includes other elements, such as the reflecting pool, the baptistery, and the campanile. This

---

<sup>1</sup> A Tibetan Buddhist lineage which had an important role in the transmission of the Tantric teachings. Although it is close to the Dakpo Kagyü school, the two should not be confused. It was founded by Khyoungpo Neldjor (978-1079), who traveled to India in order to receive the teachings of Niguma, Naropa's sister. The Shangpa Kagyü school had among its spiritual leaders Kalu Rinpoche (1905-1989), who founded several centers in the West, including the Tibetan Buddhist Kagyü Pende Gyamtso, in Brasilia. Bokar Rinpoche, Kalu Rinpoche's successor, assumed the spiritual continuity of this school until 2004, when he passed away. The new incarnation of Kalu Rinpoche was born in 1989, and is currently engaged in the three-year, three-month and three-day retreat, which will end in 2008, at the Bokar Rinpoche monastery, in Mirik, Northern India.

<sup>2</sup> Or Tantrayāna (Skt.). Also known as the "Diamond Vehicle," Vajrayāna is the name of the third vehicle of Buddhism, in the Indo-Tibetan tradition, after the Hinayāna and the Mahāyāna. It is a natural follow-up of the Mahāyāna, when this vehicle adopts the methods and means adequate do develop rapidly the supreme knowledge and attain the Enlightenment in few life-cycles, if not in a single one. In this tradition, it is taught that the Buddha-nature is identical to the essential nature of mind, having the qualities of emptiness-clarity and non-obstruction. There we also conduct the Paramita practice with the techniques corresponding to the phases of creation and wholeness, drawing out the resources of body, word, and mind.

article will emphasize only the Cathedral building, analyzing it under the perspective of its structure.

## 2.1. Siting

The urban plan for Brasilia, conceived by Lúcio Costa, is in the shape of an abstracted airplane: two imaginary axes, called “highway axis” and “monumental axis.” The huge monumental axis is slashed perpendicularly by a long spine, arched following the topography (the residential-highway axis), along which the superblocks unfold. Along the monumental axis were placed the government buildings, administrations, palaces, ministries, the theater, the broadcast tower, the Cathedral, among others. The Cathedral sits on its own plaza, on the lower stretch of this axis; together with the ministries and agencies, it forms a large esplanade terminating at the Plaza of the Three Powers.

Figure 1: “Pilot Plan” of Brasilia: the Cathedral is on the Monumental Axis. In the picture, it is indicated by the small dot to the left of the central axis, behind the Ministries (photo: João Facó)

## 2.2. Building Phases

Construction of the Cathedral, following Oscar Niemeyer’s design, began on the 12<sup>th</sup> of August, 1958, amid the building campaign of the new capital. In 1959, before the inauguration of Brasilia (1960), its structural form (reinforced concrete piers, shaped as a ruled revolution hyperboloid) was already finished. The lateral sheathing between the piers was undertaken only in 1967, shortly before its dedication, on October 12<sup>th</sup> of the same year. On this occasion the Cathedral received the image of Our Lady of Aparecida. From 1969 to 1970, the precinct was completed with the construction of the reflecting pool around the Cathedral, the baptistery and the campanile. Inaugurated on the 31<sup>st</sup> of May, 1971, it was repaired in 1987, on a design by Niemeyer, when its structure was painted white and the colored stained glass panes, by Marianne Peretti, were added beneath the mullions of the nave. Although it stood for eight years (1959-1967) under the elements, the structure of the nave has not received significant interventions so far. Both repair campaigns (1987 and 2000) targeted only aesthetic aspects, with no direct intervention in the structure of the Cathedral’s nave. From a structural point of view, only the second campaign (2000) involved the structure of the reflecting pool, renewing the waterproofing of its joints, and the baptistery slab, with the restoration of corrosion points in the slab’s reinforcement.

Figure 2: Brasilia Cathedral, with the structure just poured, before the inauguration of Brasilia  
(unknown photographer)

(photo: Alexander Fils)

## 2.2. Form and Symbolism

Aware of the fact that a cathedral requires broad spaces, Niemeyer creates a volume generated by its structural elements, by means of which he reaches a unity of form, structure and religious symbolism. As he ventured saying himself: “when the structure is ready, the building is finished”.

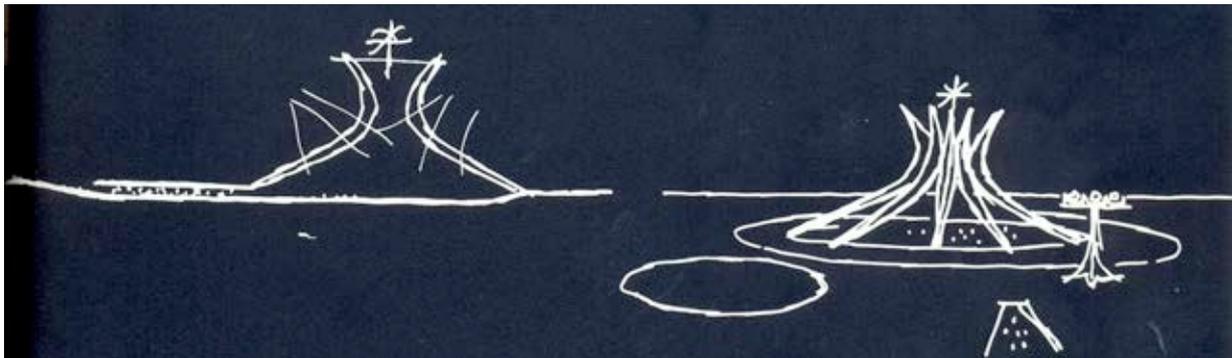

Figure 4: Diagram by Oscar Niemeyer showing the importance of daylighting in the temple's interior and the sculptural shape of the Cathedral, with the campanile and baptistery (“Cathédrale de Brasília”, 1974, p. 45)

Even though structural form may define a building, in the Brasilia Cathedral Niemeyer also demonstrates his genius for architectural composition. Structure and volumes interact to create spaces with so strong a religious connotation that the images of the cross and of saints may be eliminated. The curved columns pointing to the infinite may be seen as a gesture of supplication and communication with God. The regularity of the façade obtained with the circular form recalls the idea of purity.

Niemeyer lowers the nave 3 m below the esplanade floor and makes it accessible through a down ramp, followed by an underground gallery. Alfredo Ceschiatti's Apostle statues, lining the ramp, protect the devotees entering this dimly lit space so that, after the redemption, they may reach the wholeness of the nave's interior, bathed in daylight and colors. This magistral

play of light and darkness, nave and gallery, affords the faithful a space of withdrawal, hope, and peace.

Around the nave, and likewise sunken, are the sacristy, ancillary rooms for religious service and offices, linked to the main building through an underground corridor. This solution is also employed to connect the baptistery, placed outside the temple. Externally, however, the baptistery can also be accessed from a spiral stair as well as from a passage located in the tunnel leading to the church space.

Figures 5, 6 and 7: Brasilia Cathedral, present state. View towards the outer access ramp, interior devotional space bathed in daylight, and detail of the compression ring, roof slab and glazed curtain walls among the piers

(my photos)

### 2.3. Structure of the Cathedral

The structural form of the Brasilia Cathedral stems from the technical capabilities of reinforced concrete and from the genius of Engineer Joaquim Cardozo, who made the calculations for the structure at the time of its construction. The 21 40-meter tall hyperboloids, as had been intended originally by Niemeyer, were reduced, for aesthetic reasons, to 16 30-meter tall piers. Likewise, the concrete ring forming the base on the ground and serving as a footing, initially planned to be 70 meters in diameter, was altered for reasons of stability. It was reduced to 60 meters, and the top ring, a support to ensure the tying together of the piers and the rigidity of the structure, was lowered 10 meters from the top of the structure, enhancing the latter's light weight and transparency.

Among all possible geometric surfaces, Niemeyer chose, for the structural form of the Cathedral, the ruled revolution hyperboloid, a surface generated by a slanting line moving along two circles, the meridian of this surface being a hyperbola. This surface is also

considered a rotation surface, since its face is the result of the rotation of a planar curve (the meridian) around a line situated on its plane, and with the meridian convex in relation to the axis of rotation.

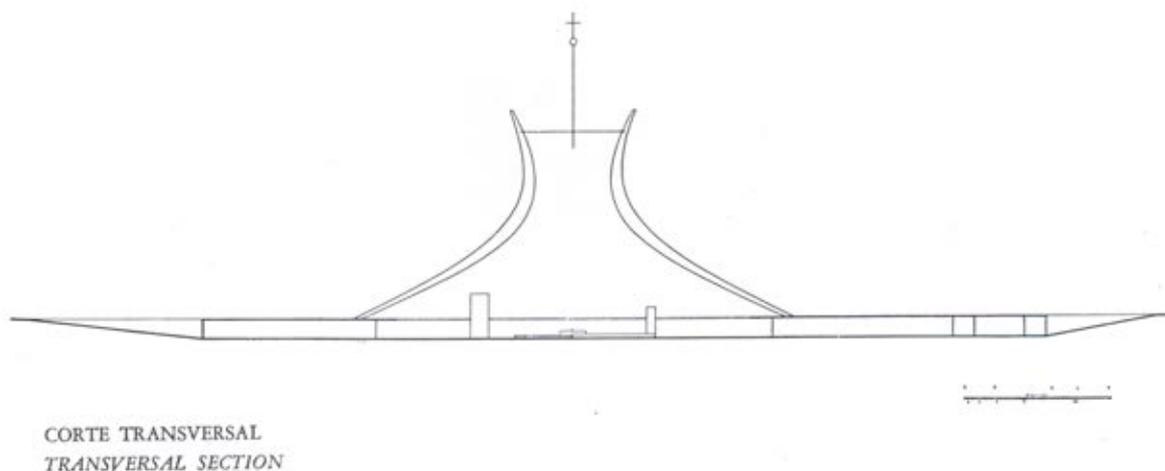

Figure 8: Diagrammatic section through the Cathedral, showing the hyperbolic arcs, the top slab as a base for the cross; also shown are the sunken spaces of the entrance, nave and sacristy (Niemeyer, 1958, p. 14)

The sixteen curved piers, revolution hyperboloids, represented a challenge to then-current structural concepts, as they find stability in the circular traction ring on which they stand, and also in the compression ring, placed not atop the piers, but 10 meters below their top. The upper ring is not visible, as it runs through the piers; the lower ring, at floor level, absorbs the traction stresses, thereby functioning as a tie-beam, reduces the load on the foundations, which then resist only vertical stresses. The roof slab has only a sheathing function, allowing for natural ventilation through its central opening.

The structural system of the Brasilia Cathedral is detailed below:

The structure is made of only 16 curved piers, with a near-triangular, hollow cross-section. The cross-section of the base is solid, shaped as a quadrilateral consisting of two triangles linked through their common, 65-centimeter-wide base, one being 20 centimeters tall, the other 50. From a statics point of view, this section was considered an articulation, the 76 x 1"-gauge (probably of 50-Megapascal steel), making up 16% of the cross-section area, notwithstanding. Along the first 7.4 meters the axis is straight and solid. From this point onwards, the section is hollow and wedge-shaped, leaving the side walls with a thickness of 15 centimeters. The maximum plan diameter at the base is 60 meters (on axis). At a height of 20.4 meters from the floor the least diameter is to be found, and the piers touch each other. An embedded beam with a section of 22 by 90 centimeters, not seen from the outside, ties the piers together, giving rigidity to the assembly. At this point the cross-section of the piers is largest, 2.05 meters tall and 2.58 meters wide. The diameter at the point of contact is reduced to a minimum of 26.28 meters. From there up, the piers spread out from the axis, reaching a height of 30.6 meters, with an outer diameter of 22.6 meters. At a height of  $20.4 + 4.85 = 25.25$  meters there is a roof slab, 20 centimeters thick. A central oculus, with a diameter of 3.1 meters, is covered with a 4-centimeter-thick spherical slab, having an inside radius of 6.15 meters. The remaining 4.1 meters are solid and have a straight axis. The 16 piers stand on a circular beam of 200 x 5 centimeters, reinforced top and bottom with 40 x 1"-gauge bars. This slab functions as a large tie, and runs to the center of the church, with a grid-like structure shaped as a circular crown on a module of 100 x 100 centimeters. The distance between the piers at their bases is 11.8 meters, affording wide panes of glazing. The solution for the sheathing of these panes represented a big construction problem, since there was no way to fabricate curved glass leaves of this size, and Niemeyer would not accept their subdivision with mullions, which would have debased his conception of lighting. (Vasconcelos; Carrieri Júnior, 2005, p. 145, my translation)

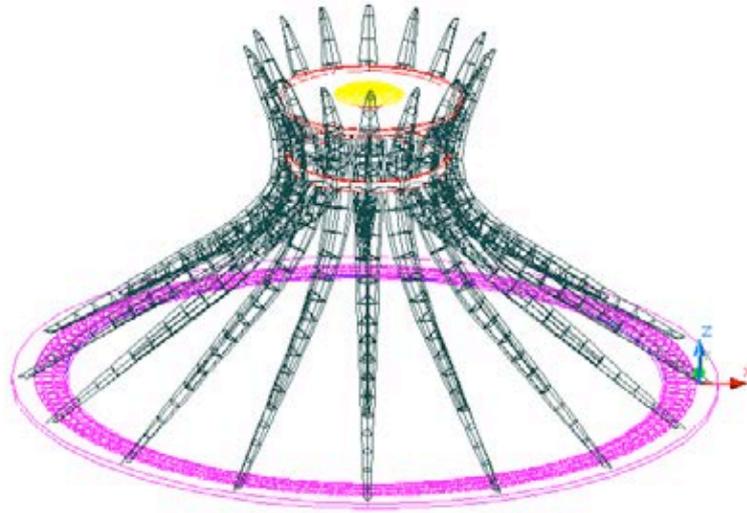

Figure 9: Structural system of the Cathedral; tracion ring, gridlike structure, piers, compression ring, and roof slab (Pessoa, 2002, p. 11)

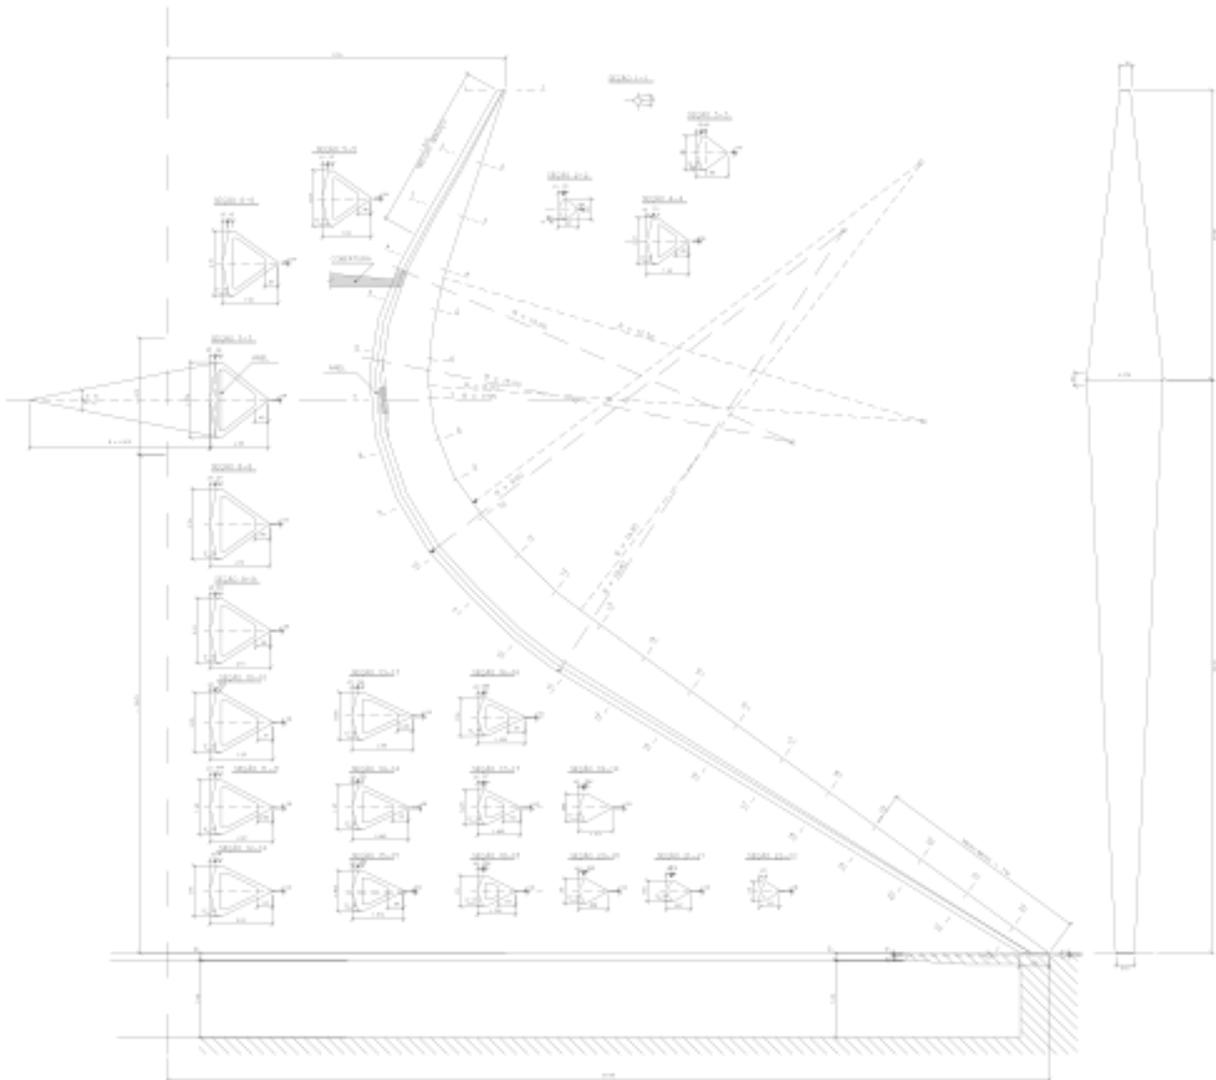

Figure 10: Cross-sections of the pier — copy of original work (Michelle Franz, *apud* Pessoa, *op. cit.*, p. 165)

Architect Carlos Magalhães, in charge of construction, describes the foundations and structure of the Cathedral, as follows:

On the foundation blocks stand 16 piers, one on each block, which support the ring from where spring the 16 columns marking the structure of the Brasilia Cathedral. The traction ring is separated from the infrastructure piers with sheets of neoprene (50 cm x 50 cm x 2.5 cm). The function of this traction ring is to absorb horizontal stresses transferred from the 16 columns. The neoprene prevents any horizontal movement of the traction ring to be transferred to the infrastructure piers. The columns rise from the traction ring, solid and slender, reinforced with seventy 1"-gauge, 50-Megapascal bars. From there their dimensions increase, and the structural calculations provided for lost caissons, which avoid an excessive increase in the weight of the member, preserving the size determined by the architect as well as the stability of the building. The 16 columns, even as they rise in height, draw near each other, and, after touching, keep rising, moving away from each other, solid again. On the spot where they touch, the columns rest on a ring which works in compression and prevents them from closing in. (Magalhães *apud* Pessoa, *op. cit.*, p. 15-16, my translation)

The 16 piers are tied together with glazing panes, and their initial loads, as anticipated by Cardozo, would have been limited to the wind loads and to the light weight of plastic mullions. Afterwards, the solution proposed by Niemeyer, with a spatial frame, has allowed, besides directing the heavier loads to the ground, the mounting of two layers of glazing on the hexagonal structure of the lower and upper webs of the truss.

#### **2.4. Structure of the sheathing of the Cathedral's nave**

Between the piers, a space frame (a three-dimensional truss) in steel, covered with glass panes, closes the structure. Although this space frame is tied to the concrete structure by means of steel bars fastened along the piers, it is not supported on the piers, but directly on the ground.

The Cathedral's lateral infill, executed in 1967, in between the 16 curved, slender piers in exposed concrete, constitutes the first idea of using a space frame in the architecture designs for Brasilia. However, this is not the case of a "spatial node": the bars, made in ¾"-gauge steel, are welded. The lower and upper web are made of elongated hexagons, horizontally sectioned, forming two wedges linked with diagonal braces. The proposed solution, a spatial frame, permitted, besides directing the heavier loads directly to the ground, also the fixation of both layers of glass, in the upper and lower hexagonal web structures.

The Cathedral was designed to have a glass skin on both upper and lower webs of the spatial frame. At the time of its inauguration, however, only the glazing on the upper web of the structure comprised its sheathing. This tempered glass was mounted in neoprene mullions, placed on the metallic structure, allowing the glazing to displace independently of the latter. The glass for the upper sheathing was made especially for the cathedral, and the dimensions of each pane are rigorously identical. In 1987, during the repair work, the lower web was filled with Marianne Peretti's stained glass (glass fiber colored blue, green and white). These glass panes were pre-cut and pre-stained. Perhaps because of this, their lengths are different, which caused some of them to rupture because of differential movement, since this time they were fastened to the steel bars. The suction of hot air is made through the purpose-designed central opening of the Cathedral.

The three-dimensional structure was delivered to the site in pre-welded stretches, and these were attached together on-site, forming 16 parts of 140 sq. m each, shaped like a triangle with a 10-meter base and 30-meter height. The pronounced slope of the spatial frame and the fact that the metallic structure is not welded to the piers caused almost all of the load from this roofing to be absorbed by the ground on which it stands. The piers therefore receive only the

wind loads, as previously estimated by Cardozo, and a small part of the load from the glazing panes, which touch the pier's lower stretches.

Figure 11: The spatial frame between the piers allows the fastening of two layers of glazing on the upper and lower hexagonal webs of the truss (my photo).

Figure 12: Detail of the fastening of the glass on the spatial truss (my photo).

### 3. STŪPA OF THE TIBETAN CENTER KAGYŪ PENDE GYAMTSO

Before analyzing the object, the Stūpa of the Tibetan Buddhist Center Kagyū Pende Gyamtso, it is necessary to address the origin, types, symbology, proportions and dimensions of this building.

#### 3.1. Definition

A form unique to Buddhist sacred architecture, the Stūpa (Sanskrit; Tibetan *chörten*) is the highest symbol of Enlightenment, the representation of Buddha's mind, the primeval sacred structure of every Buddhist tradition. Built according to universal principles and made canonical through the blessings of the uninterrupted lineages of transmission of the teachings, the stūpa converts offerings into merits which open the spiritual path and give birth to the aspiration for Enlightenment.

#### 3.2. Origin

The origin of stūpas goes back to pre-Buddhist times, and its hemispherical or conical shape over a round base conceivably descends from the *tumulus*, the earthen mound which every culture, since prehistory, has built on the spot of a grave. With the development of civilizations, this mound became a building erected with durable materials, such as the dome sculpted over a square base, mad in brick or stone, with a more or less researched ornamentation bestows it with an architectural character. In the center of the square base (that is, on the central axis of the building) is a reliquary intended to preserve the relics of saints or sacred texts.

Emperor Aśoka, who reigned in northern India in the 3<sup>rd</sup> century BCE, is held to be the great propagator of this kind of structure. Tradition credits him with building 84,000 such stūpas, but this number is probably more of a symbolic expression than a realistic assessment.

### 3.3. Functions of the Stūpa

The stūpa can have four functions: funerary monument, reliquary, commemorative monument, and votive monument. The first two are very close: the stūpas are real tombs when they hold complete remains, and they are considered reliquaries when they contain fragments of human remains or of other sacred objects. Several stūpas do not contain any kind of relic, and were built for commemoration and worship functions only, signaling and hollowing the sacred spots of the life of the Buddha (Lumbini, Sarnath, Bodhgaya and Kuśinagara). Finally, the stūpa bears, in the eyes of Buddhists, an intrinsic religious value, whence it is also considered a votive element.

Thus, according to the nature of their function, stūpas can be arranged in four categories: the *dhātu-śaitya*, which hold relics, the *paribhoga-śaitya*, which contain objects previously owned by the Buddha, the *dharma-śaitya*, which expound Buddhist doctrine, and the *uddeśika-śaitya*, which commemorate the *parinirvāna* (passing) of the Buddha, *śaitya* being a Sanskrit word for shrine.

For the purpose of the current study, the stūpa will be considered as a reliquary monument typical of Buddhism, originally built in stone by the lay congregation, on a suggestion from the Buddha Śākyamuni,<sup>3</sup> to hold his relics. It later became a building intended for the relics of other beings who achieved great spiritual achievements, as well as for texts and statutes. These buildings are erected in memory of a Bodhisattva or to protect from evil spirits places traditionally considered dangerous, such as crossings, bridges and mountain slopes. Just like statues, the stūpas which represent the mind of the Buddha are consecrated and contain, within their structure, the tree of life (Tibetan *srogshing*)—a tree trunk with relief inscriptions of religious formulas, relics, mantras<sup>4</sup>, sculptures, sacred books and spices.

### 3.4. Placement within the Monastery Compound

In the time of the Buddha Śākyamuni, wandering monks, members of the Sangha (monastic community) did not have a fixed dwelling place. They remained in open air, in the forests, beneath trees, in mountain caves, cemeteries, etc. During the three months of Monsoon, however, when it was not possible to wander, they had to seek temporary refuge in caves or sanctuaries. These buildings were, initially, bamboo huts or simple wooden buildings, but they soon became monasteries. The monastic precinct comprised several private and common spaces. Besides serving their originally-intended purposes (a place for meditation and

---

<sup>3</sup> Name given, in the Mahāyāna tradition, to the historical Buddha, Siddhārta Gautama (566-486 BCE), the son of a sovereign of the Śākya kingdom. Both for the Hīnayāna and Mahāyāna schools, the historical Buddha was not the first, and will not be the last, to manifest himself on this Earth. He is the seventh on the Hīnayāna list and the fourth according to the Mahāyāna, and will be followed by the Maitreya Buddha in the future.

<sup>4</sup> Sacred formula, verbal and mystical chant, invoking the deity. Mantras (Tibetan *ngak*) are Sanskrit syllables or words used to call on the power of the word or energy of one particular deity. The devotee need not know the meaning of the words, since the very sound of the mantra helps transform his own energy, hence his own awareness. The mantras are the oral form of waking reality, the ultimate divine sound. In this way, the mantra bears a particular blessing, a beneficial force which is inherent to it. Chanting, listening to, watching or touching a mantra allows one to enter the current of this force.

religious ceremonies), monasteries, especially the most important ones, became during the first centuries of the Common Era prestigious educational institutions, academic centers for Buddhist learning.

The earliest monasteries were made of decaying materials, such as wood or bamboo, and almost every one of them was destroyed or rebuilt several times, which makes it difficult to identify their original core. Fortunately, the rock-cut caves created since the 3<sup>rd</sup> century BCE provide elements regarding the evolution of monastic architecture. Although the monasteries (or temples) within caves are not buildings, and therefore not architecture, in the strict sense, they establish the original layout in the disposition of cells, isolated or grouped together.

It is necessary, therefore, to study a few of these buildings (particularly the Ajanta and Ellora caves, in India) in order to understand the evolution of architectural spaces in the built-up monasteries and the relationship among them (entrance piece, piers, colonnade, courtyard, porch, cells, nave, stūpa, and Buddha image).

Due to a long tradition, the Buddha image initially occupied a secondary position and was placed within the stūpa built inside the monastery. As the popularity of the image grew, this replaced the role of the stūpa in the shrine, and the latter was moved outside the precinct.

In the same way as for the temple, understanding the stūpa involves knowing its architectural evolution in Asia. Although our study is restricted to the essential elements of the Tibetan stūpa, the study of the evolution of the forms and plan of the stūpa, originating from the alterations introduced by each culture, tell of the migration of Buddhism. Without delving into detail, it should suffice to say that during the first centuries of its existence, Buddhism expanded to the Himalayan regions, in Northwest India. Afterwards, it spread to the Northeast, and from there the Indian emperor Aśoka introduced it to Nepal. Only after several centuries it reached Tibet. In the beginning of the Common Era it reached China, from where it spread to Korea, then in the 6<sup>th</sup> century to Japan.

### **3.5. Temple, prayer banners and stūpas: elements of the monastic compound**

Buddhism, having a vast view of the Universe, conceives of innumerable extra-temporal worlds, that is, worlds which are above the plane of enlightened manifestation, called “pure lands,” over which reign emanations of Buddhas as deities. The palace of the deity is called “mandala”. The Tibetan temple is a reflection, for human eyes, of the heavenly mandalas perceived only by the dwellers of the pure lands. The name used by the Tibetans to refer to a temple, *lhakhang*, embodies what it represents, as it means “Dwelling (Khang) of the Gods (Lha)”.

For the Tibetans, the temples remain what they always had been: the house of godly reality or enlightened reality, before which they come to prostrate, make offerings and say prayers. With the destruction of nearly all the temples in Tibet, during the Cultural Revolution of China, many Tibetan Lamas in exile, using determination and courage, rebuilt these structures in India, Europe, and America.

Although the temple is a heavenly reflection, its earthly building requires great care as well. The shrine, in order to emanate all its power, needs a special environment. While Christian, Jewish and Islamic sanctuaries are typically built in the middle of cities, the Buddhist temple, as it is in the first place part of a monastery, is traditionally found apart from settlements, preferably in a wild and isolated place.

The reason for this goes beyond the mere intention of integrating architecture and landscape, and of providing a feeling of strength and power. It is necessary to add a certain knowledge of

telluric forces (which were also taken into account in the construction of churches during the Middle Ages), with the respect for an invisible population made of different categories of spirits living in mountains, valleys and waters.

Around the temples, prayer banners and stūpas enhance and support its splendor. From afar, when we draw near a temple or monastery, the first thing we see are the multicolored prayer banners waving in the wind. These banners, originally in bright colors which became duller with the action of the elements, are covered from top to bottom in sacred writings. The stūpas, due to the symbolic complexity of their construction, will be analyzed in more detail below.

### 3.6. Types of Tibetan Stūpas

There are different kinds of stūpas, ranging from a few centimeters in height to several meters. Their forms vary just as much, and we can count, among the Tibetans, eight kinds of stūpa. According to tradition, after the cremation of the Buddha, his relics were split in eight parts and distributed to the eight kings who had come to pay homage to him: Ajātaśatru, King of Magadha, Licchavi of Vaiśālī, the Śākya of Kapilavastu, the Buli of Allakappa, the Koliya of Rāmagrāma, the Brāhmana of Vatthadvīpa, the Malla of Pāvā and the Malla of Kuśinagara.

These were the relics which ended up being enshrined in the first eight stūpas, built according to the episodes of the life of the Buddha: his birth, awakening or enlightenment, the first sermon or teaching, the descent of a celestial kingdom, the performing of miracles and prodigies, the reconciliation of a schism in the Sangha, the voluntary prolongation of life, and his death.

1. **The Stūpa of the Flowering Lotus (of Birth)**, in the Lumbini garden of Kapilavastu, Nepal, where the Buddha was born in 566;
2. **The Stūpa of Enlightenment**, in Bodhgaya, Northern India, where the Buddha attained Enlightenment under the Bodhi Tree, at age 35;
3. **The Stūpa of the Turning the Wheel of Dharma**, near Benares (Vārānasī), India, where the Buddha taught for the first time;
4. **The Stūpa of the Descent from Heaven**, in Sankāśya, India, where the Buddha came down from the realm of gods, where he had ascended to teach his mother, who was reborn there;
5. **The Stūpa of the Great Miracle**, in Srāvastī, India, where Buddha, at age 50, realized extraordinary miracles and where he also held 30 summer meditation retreats;
6. **The Stūpa of the Reconciliation of the Sangha**, in Rājagrha, India, where the Buddha reconciled a schism in the Sangha which had been divided by work of Devadatta;
7. **The Victory Stūpa**, in Vaiśālī, India, where the Buddha announced he would be leaving this world for the Nirvāna. One of his fervent lay disciples begged him to remain longer, and the Buddha lengthened his own life by three months;
8. **The Parinirvāna Stūpa**, in Kuśinagara, India, where the Buddha passed away at age 80.

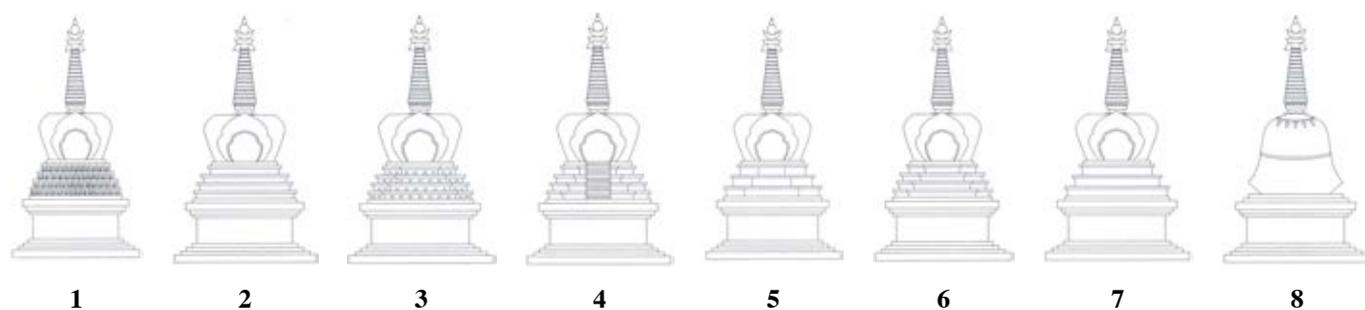

Figure 11: The eight types of Tibetan stūpas (Cornu, 2001, p. 551)

### 3.7. General Symbolism of the Stūpas

It is very common to find one or more stūpas around temples. These monuments are considered, by Westerners, as the emblem of religious architecture in Tibet. Under its apparent simplicity, the stūpa is a building that relates to a complex symbolism, difficult to explain in few words. We can say that it corresponds to the different aspects of progression towards Enlightenment, which can be attained by every being.

To showcase this symbolic richness, represented in the different architectural elements of the stūpa, we can say that the **plinth** (1), which supports the building, represents the ethics of the “ten virtues” upon which every spiritual practice depends, the **three staircases** (2) of the base stand for the Three Jewels, under the protection of which Buddhists place themselves—the Buddha, the Dharma (teachings), and the Sangha (community of believers), the **vase** (3) represents the “seven branches of awakening”, the **thirteen wheels** (4) designate the “ten stages” and the “three perfect applications”, the **moon** (5) represents the elimination of all suffering, the **sun** (6) symbolizes the unfolding of a thousand lamps of compassion, and the **jewel** at the top (7) stands for the realization of all wishes (Figure 12).

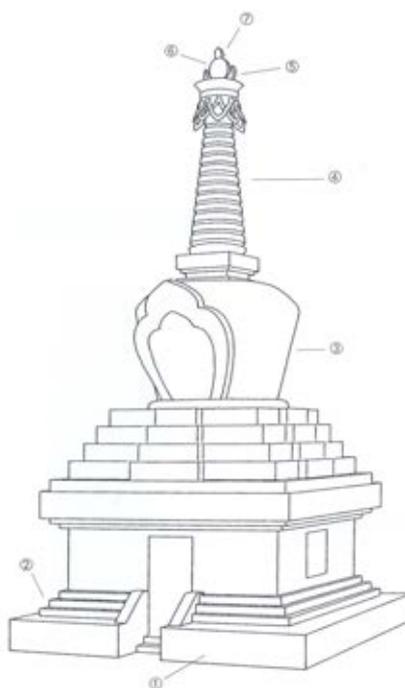

Figure 12: General symbolism of the stūpas (Sènguè, 1998, p.17)

The symbolism of this architectural image functions simultaneously at different levels. If the square base represents dominion over desire; the vase, dominion over form; the piled umbrellas, domain over no-form; and the central axis, Mount Meru, represented by the Tree of Life—a sandalwood or juniper trunk, ritually cut, which passes vertically through the center of the stūpa—other symbolisms can also be read. At the level of archetypes, a stūpa embodies five different geometric shapes referring to the five elements of which the Universe and all its atoms are made. The square or rectangular base is the Earth and the Buddha Ratnasambhava; the hemispherical dome symbolizes water and Akshobhya; the conical or pyramidal spire symbolizes fire and Amithāba; the canopy of the upper part is air and Amoghasiddhi; the Sun and the Moon are the female and male essences; and the volute at the top (*nāda*), the space and Buddha Vairocana.

In another symbolic interpretation of its form, the dome would represent nirvāna, the square base is the discipline, and the superimposed umbrellas at the top are a royal emblem, a symbol which might remind of the Buddha's princely origins. Besides, the overall shape of the stūpa is reminiscent of the sitting Buddha. It is held that, when we see such harmoniously balanced forms, we receive subtle benefits, experienced as a sensation of peace, well-being and wholeness. The several levels and steps of a stūpa also correspond to the different levels of the spiritual path which eventually reaches the ultimate Enlightenment.

In addition to its apparent structure, the stūpa is equally important for what it contains we do not see: several consecrated objects and relics. From there stem its force and power and what bestows it with a function, that of transmitting the Buddhas' blessings to all who see it, touch it, or think of it. It is said that the stūpa is the support for the mind of the Buddha, in the same way as the sacred texts are the support of his word, and the statues the support of his body. Two stūpas can be linked by a wall of prayers (*mani*), where there will probably be inscribed the mantra of Avalokiteśvara<sup>5</sup> (Om Mani Peme Hung).

The monks and laypeople walk around a stūpa clockwise, following the course of the Sun. This is what is called a circumambulation. Through this action, typically accompanied by the chanting of a mantra, respect is paid to the stūpa while filling oneself with its blessing. Thereby, one accumulates merits (positive karmic tendencies), even if the action is done involuntarily. The stūpa is also a place for offering lights. The pilgrims, during the circumambulation, light candles or butter lamps while chanting prayers. This practice helps keep the image of Enlightenment and all it represents at the center of our attention and is, therefore, very beneficial both as a conscious action and for the subconscious. Although a Cartesian mind could see in several Tibetan Buddhist aspects the expression of a superstition, a Buddhist mind will see in the same action the interaction of mind and matter, the two being not-separate.

---

<sup>5</sup> Avalokiteśvara (Sanskrit) or Chenrezi (Tibetan): The lord or Bodhisattva of Great Compassion, the Lord-who-looks-down-from-above, also called Lord of the World. It is the great Bodhisattva who personifies the compassion, the most popular Bodhisattva in the Mahāyāna tradition, also known as protector of the world or He-who-holds-a-lotus in his hand. The Dalai Lamas of Tibet are considered bodies of emanation of Avalokiteśvara, as well as the Gyalwa Karmapas, of the Karma Kagyü lineage.

### 3.8. Stūpa of Enlightenment

Architecture has been an effective means of expressing religion. In Tibetan Buddhism, any virtuous action with respect to the Three Jewels—Buddha, Dharma and Sangha—be it great or small, contains within it incommensurable merits. Among them, the construction of stūpas is considered one of the most virtuous and meritorious.

In Tibet and in all regions influenced by Tibetan Buddhism, the symbolism of the stūpa becomes Mahāyāna<sup>6</sup> and Tantric. We have seen that each of the eight Tibetan stūpas holds a specific symbolic meaning, but the current study will address the Stūpa of Enlightenment, built according to the strict construction norms of Tibetan Buddhism, on the site belonging to the Buddhist Tibetan Center Kagyü Pende Gyamtso, located in Sobradinho II, one of 19 metropolitan areas of the Federal District (Fig. 13).

For the construction of the stūpa one needs, besides the knowledge of its essential constituent parts, such as the dome or the funerary chamber, the reliquaries, foundations, circling terraces, the base used as a shrine, the stūpa's own superstructure, also an understanding of dimensions, materials, of how to stucco or finish a surface, of interior spaces, of decoration, and of the site where it will be located.

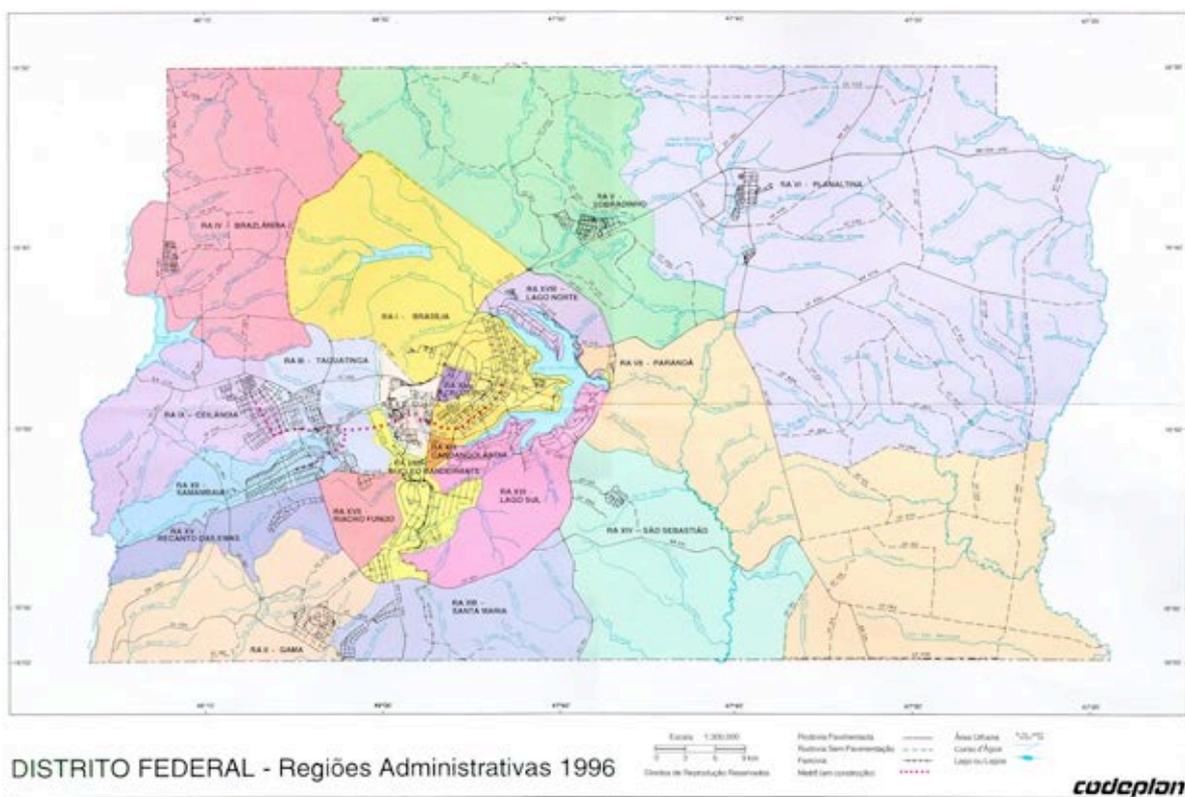

Figure 13: Administrative regions of the Federal District, including the location of Sobradinho, where the CBTKPG is located (Codeplan)

<sup>6</sup> Buddhist current which encompasses several schools of the Great Vehicle, having as a principle the ideal of the Bodhisattva. The Mahāyāna or Great Vehicle is based on the realization of emptiness and compassion. That who follows it, the Bodhisattva, seeks to attain the perfect state of Buddhahood in order to free all beings from suffering and establish them in happiness.

The main component of the stūpa is its hemispherical dome, covering the urn which contains human ashes and relics. The second part comprises the foundation on which the dome sits, and the third is the niche where the pole with umbrellas is inserted, indicating symbolically its honorific value.

Stūpas come in all sizes, but Fig. 14 shows the proportions to be used when building the Enlightenment Stūpa. We can see that the three parts mentioned above have the same height in proportion, and that this proportion is maintained at the base of the dome and in the great lotus.

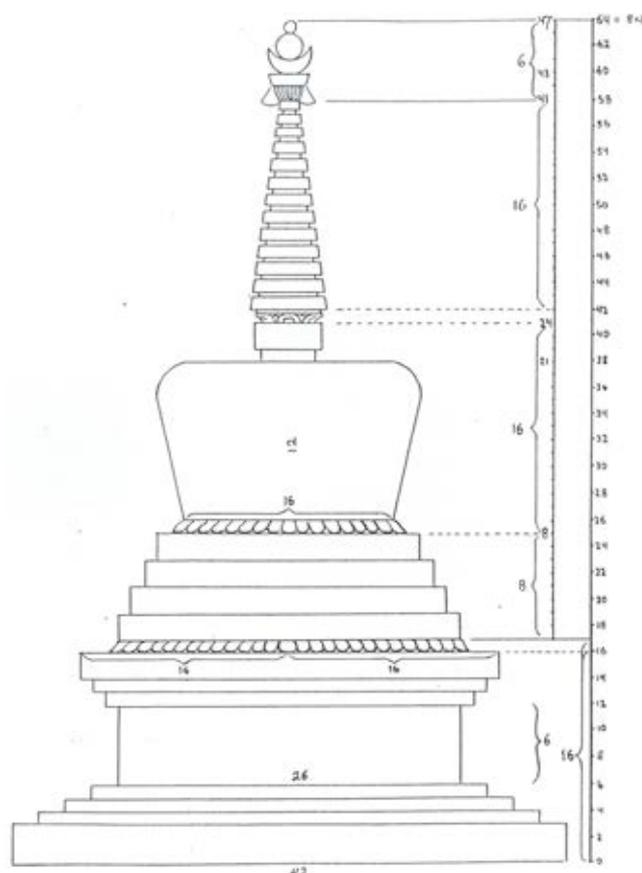

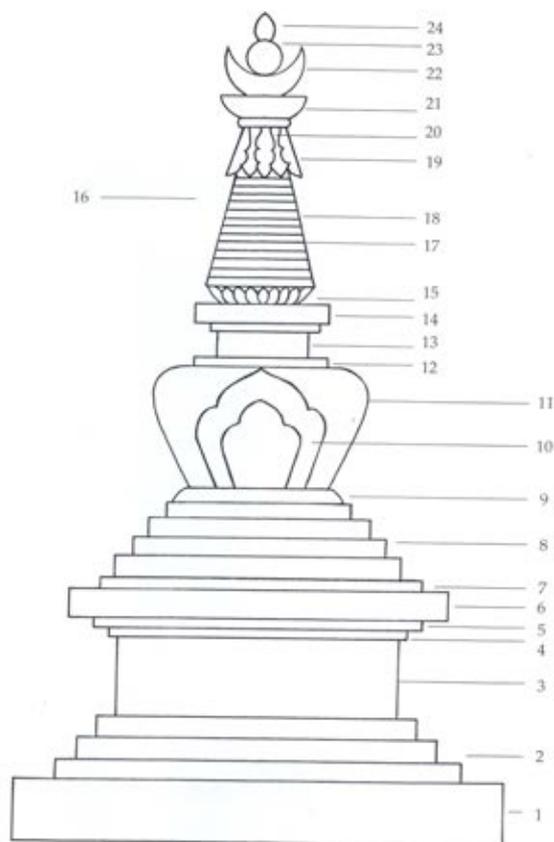

Figure 14: Proportions of the Stūpa of Enlightenment (Govinda, 1976, p. 23)

The Stūpa of Enlightenment, as shown in Fig. 15, is made of 24 parts, each one of them rich in symbolism. The analysis of several texts shows some degree of variation, but the purpose remains the same: the stūpa shows the way to liberation. Before building the stūpa, the site must be consecrated by means of the Treasure Vase, buried in the earth under the stūpa, representing the eight precious substances (the mirror, the crimson pigment, the white shell, the medicine taken from the elephant's brain, the *durva* grass, the *bilva* fruit, yogurt, and white mustard seeds).

Figure 15: The Stūpa of Enlightenment (*The Stūpa – Sacred Symbol of Enlightenment*, 1997, p. 235)

The foundation or plinth (1) symbolizes the ten virtues: three of the body (protect life, practice generosity and have an immaculate sexual conduct), four of the word (tell the truth, reconcile, speak calmly and sweetly, and have a sensible talk) and three of mind (benevolence, altruism and to have faith in the right views).

The three steps (2) symbolize the three refuges we take (in the Buddha, the Dharma, and the Sangha). The face or square base (3) is called Lion Throne and symbolizes the superiority over the entire Universe, its four sides being the four boundless (unlimited) thoughts (boundless love, boundless compassion, boundless happiness and boundless equanimity). Within it are placed the relics and sacred texts.

The edging (4) and the small lotuses (5) symbolize the six transcendent virtues (generosity, ethics, patience, energy, meditation, and wisdom). The large lotuses or four sides of the base throne (6) symbolize the four boundless ones, “the Four Unlimited”. Above the base throne

<sup>7</sup> Harmikā is the kiosk or pavilion topping the upper terrace of a raised dwelling.

there are five steps forming a truncated pyramid, symbolizing the five paths (of realization of the four noble truths, of the elimination of ignorance, of clear vision, of meditation, and the path where there is nothing more to learn—passage from the tenth land into Enlightenment) towards Enlightenment, each step being, sometimes, broken up into two, thus symbolizing the ten Bodhisattva levels (*bhumi*) (joy supreme, immaculate, radiant, luminous, difficult to conquer, revealed, far-reaching, immovable, excellent intelligence, cloud of Dharma).

The step (7) is the base of the ten virtues (refrain from destroying life, from having an improper sexual conduct, from telling falsehoods, from using abusive language, from slandering, from indulging in irrelevant talk, from covetousness, from malice, from holding destructive views), and the four subsequent steps (8) symbolize, respectively, the fundamental four attentions - first step (impermanence of the body, of sensations, non-substantiality of thoughts, condition of existence - Dharmas); the four perfect efforts – second step—Sammāpadhāna (to strive to preserve existing favorable conditions, to bring about such conditions as do not yet exist, to give up existing unfavorable conditions, and not to allow such conditions to come about again); the four bases of supernormal powers – third step—Riddhipāda (meditative experience based on prayer, on thought, on perseverance and on action); and the five spiritual faculties- fourth step—Indriya (the faculties of faith, energy, attention, concentration, and knowledge).

Standing on its base (9) is the dome (11), which became a cylinder dubbed ‘vase’ (Tibetan *bumpa*), widening towards the top, with a rounded upper part, typically decorated with a door (10) containing a statue of the Buddha within it, and millions of mantras, symbols of the mind of the Buddhas. The immovable base supporting the vase (9) symbolizes the five spiritual forces—*Bala* (faith, energy, attention, concentration, and knowledge). The vase represents the seven branches of Enlightenment—*Bodhyanga* (the full memory of past lives, the perfect knowledge of all Dharmas, diligence, ecstasy, the perfect mastery of all disciplines, concentration, and equanimity).

Above it, standing over a foundation (12) and a support (13), there is a small square balustrade (14, Sanskrit *harmikā*), frequently marked with the eyes of the Buddha. This ensemble symbolizes the Noble Eightfold Path (perfect view, understanding, speech, action, living, effort, attention and concentration).

From the balustrade rises a spire pointing to the sky, with a base shaped like a lotus garland (15), thirteen piled concentric circles (16) and a crowning marked with a canopy (19), a cup-like structure (21), a crescent Moon (22) and a solar disk (23) capped with a volute, a spiral shell called *nāda* (24). The thirteen piled concentric circles (formerly parasols or umbrellas) represent the thirteen stages for reaching Buddhahood, and symbolize the ten powers and three applications of mindfulness (the power of mind, superior mind, memory, concentration, mindfulness, authority, security, desire, love and compassion, and the power of the blessing of all Buddhas; the mindfulness which makes the Buddha not feel satisfaction when the disciples listen with respect, that which makes the Buddha not feel angry when the disciples do not listen with respect, and that which makes the Buddha remain equanimous when some disciples listen with respect and others do not). Each of these rings is called father *cakra* (18) and the space between them (17), mother *cakra*.

On the central axis of the *stūpa* is the Tree of Life, standing on the balcony, the large lotuses (6), and reaching into the thirteen wheels. It symbolizes the ten knowledges (of phenomena, of mind, of Interdependent links, of illusion, of suffering, of the origin of suffering, of the cessation of suffering, of the path leading to the cessation of suffering, of destruction, and, merged into one, of the non-appearance and of the ten transcendental knowledges).

The canopy (19), the lotus petals which give its form (20), symbols of compassion, and the rain cover (21) symbolize the Victorious Stage—the non-appearance and the ten transcendental knowledges. Each lotus petal (*zaraizak*) symbolizes the ornaments of all the Supreme Qualities. The Moon (22) symbolizes the elimination of all sufferings, the Sun (23) is the radiating of the thousand lights of compassion, and the top jewel (24) symbolizes the fulfilment of every wish.

### 3.9. The Stūpa of the Tibetan Buddhist Center Kagyü Pende Gyamtso of Brasilia

The idea of building this stūpa came from one of the resident Lamas at the center, Lama Sönam Sherpa, coming from the monastery of the Highly Venerable Kalu Rinpoche, in Sonada, Northern India. Venerable Lama Sherab Dorje, abbot of the French monastery of Kagyü Ling, in 2003, consecrated the terrain and starts the establishment of the fundamentals of construction work for a stūpa to commemorate the Enlightenment of the Buddha, which was dedicated on the 23<sup>rd</sup> of April, 2006 (Figs. 16 and 17).

The development of the architectural design and of preliminary work, such as the production of *tsha-tshas* (small statues and stūpa miniatures, made by the thousands to fill the inside of the stūpa), the choice of the central Tree of Life trunk, and the collection of relics and sacred substances engaged the entire Tibetan Buddhist community and took two years. The construction process itself, another year. This stūpa, although modest in architecture, remains soaked in the same religious symbolism that is typical of these buildings.

Figure 16: Dedication of the stūpa at the CTKPG  
(photo: Zuleika)

Figure 17: The Stūpa of Enlightenment at the CTKPG  
(my photo)

Stūpas under two meters can be built in a variety of materials, but beyond this size the stūpa is a building proper, and requires a foundation and structural elements according to the chosen material. Here, the material was reinforced concrete, and its structural system is shown in section (Fig. 20). Figures 18 and 19 show the front view and dimensions of the stūpa.

It stands on a concrete base 85 centimeters tall, on the lateral projection (40 cm) of which are placed the offerings and candles. The overall height of the stūpa, including its base, is 6.51 meters (base: 0.85 m, trunk: 1.52 m, the four incommensurable (steps): 0.64 m, the vase (bumpa): 1.12 m, harmikā: 0.56 m, 13 wheels: 1.06 m, ensemble of the canopy, compassion symbol and rain cover: 0.22 m, and ensemble with Moon, Sun and Jewel: 0.54 m). The concrete structure ends at a height of 4.69 m, and is continued with a metal part 1.82 m tall. Around the base, a hardscape surface 1.20 m wide serves as a circumambulation path.

Three bumpas (vases) came for the purpose from the Kalu Rinpoche monastery in Sonada, India, for the construction of the stūpa, and two others were given by Lama Trinlé Drubpa, a disciple of Kalu Rinpoche. The latter, *sabum* (offering bumpa for the Earth deities) and *lübum* (bumpa containing offerings for the deities living in water, that is, for the nāgas, marine serpents), were buried in the ground beneath the stūpa. The other three, called *yangbum* (a vase of good fortune, auspicious, containing relics inside it), together with mantras, prayers, sacred texts, spices, incenses, precious gems, relics and approximately 6,500 *tshas-tshas* fill the inside of the stūpa up to the four steps (8), before the dome (11).

The dome, a funerary shrine, occupies the center of the monument and does not typically have outside access. At the stūpa of the Tibetan Buddhist Center of Brasilia, however, it covers a cavity, within which lies the Buddha Śākyamuni, accessible through a “door” having a richly decorated frame in dark red and golden colors. Above this, in the harmikā, are the eyes of the Buddha, representing his omniscience. A pine trunk is used as the Tree of Life. A rock crystal, symbolizing the wish-fulfilling jewel, terminates the stūpa. Like all stūpas, it is painted white. Prayer banners are hung from the canopy, spreading the stūpa’s blessings to the four directions.

#### 4. CONCLUSION

The Cathedral is Brazilian Catholicism’s major symbol, “...an ecclesiastic monument all the more impressive because it retains the sacred meaning within the unity provided by the volumetric purity” (Müller, 2003, p. 31, my translation). The stūpa is the symbol of the mind of the Buddha, an architectural expression of the spirit of Enlightenment and symbol of the different qualities of Buddhahood. Two architecturally different forms, which emanate force and attract the faithful, who come in a pilgrimage of offerings and prayers.

Granted the differences between religions, we see that both monuments have things in common, beyond the white color of their façades. There is a real integration between form and structure, volume and religious symbolism. The circular form, used in the nave of the Cathedral, is also present in the vase, the main part of the stūpa. When dedicated, a stūpa is seen not as a structure, but as a living and waking presence bestowing blessings. Likewise, in a Cathedral, the congregation seeks Christ’s blessing, the remission of their sins in order to reach eternal life.

Although the beauty of the Cathedral is in the plastic form of its structure, three angels by Ceschiatti hang from the ceiling, and, together with Marianne Peretti’s stained glass and the wall panels by Athos Bulcão in the baptistery, complete the decoration. The stūpa, on the other hand, is lit by the eyes of the Buddha, painted on the harmikā, and by the frame of the bumpa, which shelters his image.

Another particularity is that, although both buildings have religious functions, they are not widespread forms in architecture. While the stūpa forcefully recalls a centuries-old Buddhist tradition, the Cathedral stems from the expressive and creative freedom of Niemeyer. So expressive it is, that the Buddhists could see in it the unfolding of a lotus flower.

**The City and the Bottom Line:  
Urban Megaprojects and the Privatization of Planning in Southeast Asia**

Paper to be published in *Environment and Planning A*

## Abstract

Prevailing perspectives on the impacts of globalization on urban form in large, globalizing cities in Asia holds that these cities are experiencing an inexorable process of 'Westernization' or 'Americanization'. Yet this focus on convergence distracts us from the task of analyzing urban change and its causes, leading to analytical muddiness and awkward planning and policy implications. This paper presents an alternative framework that focuses on actor-centered analysis and the importance of understanding historical context. It then employs this framework in a case study of recent trends in urban development in Metro Manila based on interviews, government, private sector, and non-profit sector documents, and newspapers. The paper concludes that, in Metro Manila, a defining characteristic of contemporary urban development is the unprecedented privatization of urban and regional planning. Large developers have conceived of urban development plans on a metro-wide scale, and begun to implement these with the assistance of government. This phenomenon has its roots in the historical development of social groups in the Philippines and their shifting interests with the globalization of the Philippine economy. The paper concludes that the privatization of planning raises distinct issues for urban planning theory and practice.

Of the 19 cities identified by the United Nations as having populations of greater than 10 million, 15 are located outside of the advanced economies of the United States, Europe and Japan (UN Habitat 2005). The proliferation of such massive urban regions in developing countries has captured the imaginations of urban scholars, and the question of how their integration into global networks of trade, communications, and migration shapes their form is one of particularly intense investigation. Many of these cities have been shaped by what Scott et al (2001) have called 'global city-region' development, as firms seeking low-cost sites for production have fed massive urbanization of their peripheries, while the centralization of corporate functions that coordinate production for global markets has simultaneously fed rapid central-city redevelopment (Scott et al 2001). In addition, the explosion of residential development in urban peripheries has led some to question whether these cities will follow the experience of the United States, with urban regions becoming polarized between vast and sprawling suburbs of rampant consumerism and blighted inner cities (Marcuse and Van Kempen Eds. 2000; Fishman 2003; Leichencko and Solecki 2005). Studies have examined the rise of

‘gated communities’, the ‘sprawling’ of cities, the development of ‘edge cities’, and the emergence of mall culture in a variety of contexts (Dick and Rimmer 1998; Pirez 2002; Graizborg et al 2003; Firman 2004; Salcedo and Torres 2004; Wu and Webber 2004; Erkip 2005). The predominant perspective perceives a convergence of urban form around an American model, and decries the potentially devastating social, cultural, and environmental issues that are likely to blight the futures of these societies as a result.

This paper shares concerns about present patterns of urbanization, but argues that a focus on convergence is indicative of a central contradiction in urban theory in the era of globalization—the fact that this theory has “come to rest on the (usually unstated) experiences of a small group of (mostly western) cities” (Robinson 2002). A ‘tyranny of terminology’ has taken hold in the literature on cities and globalization, as the labeling of diverse urban phenomena using terms developed and theorized with reference to Western cities (edge cities, sprawl, Disnefication, gated communities) increasingly obfuscates our understanding of urban transformations, thus impairing our ability to understand change and its causes, and to derive implications for planning and policy.

The paper further argues that two recent trends in urban theory can help to restore analytical clarity. The first is a growing emphasis on actor-centered approaches that focus on how actors both internal and external to localities shape urban space in response to forces of change operating across different scales (Yeoh 1999; Olds 2001; Markusen 2004). The second is to focus on the historical development of a city, which shapes the context in which local actors act (Abu-Lughod 1999). Examining Southeast Asian cities through these analytical lenses reveals critical differences in urban development processes that are shielded from our view if we employ ‘Westernization’ or ‘convergence’ as our analytical frame.

The paper focuses on Metro Manila, a city of 10 million located within a rapidly expanding urban region of more than 16 million. In Metro Manila, I argue that one defining characteristic of contemporary urban development is the unprecedented *privatization of urban and regional planning*. A handful of large property developers have assumed new planning powers and developed visions for metro-scale development in the wake of the retreat of government from city-building and consequent deterioration of the urban environment. They have developed geographically ‘diversified’ portfolios of integrated urban megaprojects, and play a growing role in mass transit and other infrastructures that connect these developments to the city and region. This form of urban development reflects the imperative of the private sector to seek opportunities for profit by cutting through the congested and decaying spaces of the ‘public city’ to allow for the freer flow of people and capital, and to implant spaces for new forms of production and consumption onto the urban fabric. I therefore term it ‘bypass-implant urbanism’. This form of urban development is not merely a consequence of the blind adoption of “Western” planning models. Rather, it reflects the incentives, constraints and opportunities posed by the globalization of the Philippine economy, which has fostered a state of perpetual fiscal and political crisis in government while also creating new economic opportunity in Metro Manila. This shift in focus to the actors and interests underlying urban change unveils a range of issues that remain concealed by a focus on convergence. These include regressive government subsidies for profit-driven private sector development, the abandonment of the very concept of public purpose by planning agencies, and the promotion of governance models that idealize the private sector by international organizations.

The paper draws on a number of sources, including a review of documents and newspapers, and interviews. Thirty-one interviews were conducted in Metro Manila, including

ten with people working in the real estate development industry, eight with current and former officials of local and national government, eight with academics and researchers who work on urban development and planning issues, and the remainder with informants were representatives of non-governmental and community-based organizations (NGOs and CBOs) that work on urban issues, the World Bank, and prominent international planning and architecture firms. The interviews were open ended—the interviewer established a general set of questions and allowed interviewees to direct the conversation to their own areas of interest and insight. Each took between 45 minutes and two and a half hours.

The paper will first discuss and critique perspectives on globalization and urban form. Next, it will focus on the privatization of planning in Metro Manila. It will then discuss the history behind this process of privatization, employing an actor oriented and historically informed perspective. It will finish with a discussion of the implications of the privatization of planning for urban planning and policy.

### ***Globalization and Urban Convergence: A Critique***

The question of whether urban development in the global era is characterized by convergence, or is conversely shaped in fundamental ways by place-specific forces, has been fundamental to recent debates in urban studies. In the Asian context, a seminal contribution was McGee's (1991) concept of *desakota* urbanization. McGee argued that Asian cities experience a distinct form of development in the current era of growing international trade and investment due to the particularities of their geography. Of specific importance are their location in densely populated rice-growing regions, the existence of 'transactive environments' in the urban periphery characterized by a high degree of mobility of people and commodities, and the

‘cultural preparedness’ of rural workers for the types of labor that are required in a burgeoning industrial economy. The resulting form of urbanization in the periphery is characterized by a dense intermingling of urban and rural land uses (the term *desakota* is derived from the Indonesian terms for countryside and city), and industrial and agricultural economies that enjoy a certain symbiotic relationship.

With increasing focus on broadly comparative global frameworks in urban studies, however, two strands of thinking have argued for a global convergence of urban form. The ‘global cities’ literature posits that certain cities are shaped by their function as ‘command and control’ centers for global capital—as centers for multinational corporate headquarters and producer service firms (Beaverstock et al 1999; Sassen 2001). In this view, the polarization of employment between professional jobs and low-skilled service sector jobs in such cities leads to spatial polarization between (often racialized) low-income areas and centers of business, upper-income residence, and consumption (Marcuse and Van Kempen Eds 2000; Smith 2002). The Los Angeles school argues for a more conscious adoption of American urban form. In this view Los Angeles offers a model of urbanism centered on automobility, intense commodification of housing and community, a ‘Disnefication’ of difference, and a celebration of consumerism that has been embraced by consumer classes in many parts of the world who share a desire to isolate themselves from cities that they perceive as increasingly dangerous and chaotic (Cowherd and Heikkila 2002; Erkip 2005). The elements of this model include the development of ‘edge cities’ and gated communities, the ‘theme park’ quality to urban development, and the enclavization of upper-income groups (Dear and Flusty 1998). The idea of convergence has led to a wave of studies that have examined sociospatial polarization and the diffusion of urban forms associated with the United States, and more specifically Los Angeles, in a wide variety of settings (see, for

example, Graizbord et al 2003; Chiu and Lui 2004; Wu and Webber 2004; Erkip 2005; Leichencko and Solecki 2005)

One of the most insightful arguments for urban convergence in Southeast Asia is a study by Dick and Rimmer (1998) that sets out explicitly to refute McGee's thesis of Asian exceptionalism. They argue that the "driving force behind the new urban geography of Southeast Asia is the avoidance of social discomfort" which has arisen with the economic and social polarization inherent in the globalization of these urban economies (1998: 2317). The response by large developers has been to 'rebundle' urban elements by creating large new city developments that allow the growing consumer class, and particularly ethnic Chinese, to isolate themselves from the surrounding city in enclaves that explicitly copy a model derived from the suburbs of the United States. They argue that developers have sought to replicate this model based on their perception of shared socioeconomic conditions with those of American cities, and that this urban form that can best be compared to 'edge city' and gated community developments in that context.

While not denying the importance of global actors, influences, and processes to urban development, this paper follows McGee in placing emphasis on the ways that these forces are reshaped in their interaction with local actors, influences and processes. Specifically, I argue that the excessive focus on convergence is problematic for two reasons. First, in starting with the assumption that Western urban form presents a universal mould and then attempting to determine whether urban form in other parts of the world 'fits', theories of convergence inherently privilege similarity over difference and prematurely abort an analysis of spatial change. In fact, a cursory examination of private sector-built megaprojects in Asia reveals several distinct features. The sheer scale of many of these projects sets them apart from most

‘edge city’ developments in the US—for example, Muang Thong Thani in Thailand and Lippo Karawaci in Indonesia have projected populations when completed of 750,000 and 1 million respectively (Dick and Rimmer 1998; Marshall 2003). Many are transit rather than auto-oriented and quite dense. And they are scattered throughout urban regions rather than necessarily being on the ‘edge’. Hence trends in urbanization in Southeast Asia do not resemble the rejection of urbanity itself and consequent exodus of the middle class from the center to the periphery characteristic of the American model—rather, it is characterized by movements from public to private space, which may occur from center to periphery, periphery to periphery, center to center, or periphery to center. More will be said about the distinct nature of Metro Manila’s spatial change later. Suffice to say here that, while Western influences are certainly apparent, the emerging urban form is also powerfully shaped by place-specific urban geographies, cultural preferences, and social structures.

The second issue with much of the literature on convergence is that it denies the ability of actors at the local level to be reflective about these processes or shape them to their own desired ends. The possibility that megaprojects have been actively promoted by planners, policy-makers, developers, and other powerful actors in order to further their own interests is largely disregarded, and instead a blind adoption of American planning models is blamed for a range of social and environmental ills. This denial of local agency leads to a lack of analytical clarity and to awkward policy and planning conclusions, as is apparent in the following quote:

In Jabotabek (Indonesia), the Southern California development models...serve to promote both a greater social segregation and an acceleration of environmentally destructive practices... The experience of Jabotabek’s new towns demonstrates the power and malleability of the images being broadcast from Southern California...and the dangers of uncritical adoption driven by the lure of commercial imagery. (Cowherd and Heikkela 2002: 196)

Here, and elsewhere in the convergence literature, consumers and developers are characterized as being duped by movies, television, and slick advertising into believing they share the interests of

middle-class American suburbanites, rather than as reflective individuals reacting to their own lived experience. And government is oddly absent from the scene, leaving developers and consumers as the main culprits/dupes in this story of self-marginalization. With little discussion of the role of government in shaping urban form, the reader is also left to presume that developers are the only potential custodians of a more socially and culturally appropriate form of urbanization (depicted by several analysts as that of European cities). The central policy and planning implication one derives, therefore, is a need to enlighten developers and consumers, and to convince them to act against what they perceive to be their interests by adopting the prescribed models of urbanization.

The challenge is to restore local agency to the analysis and develop sharper tools for analyzing urban change and prescribing alternatives. This paper follows Markusen (2004) in arguing for an actor-centered approach that more meaningfully probes the ideologies and interests underlying urban change. This perspective sees this process of change not as one way but as negotiated, and views local actors as active participants both responding to pressures in their external environment and trying to shape them to their own ends. This is therefore a view in which “(s)tructure and agency are not contrasted, but complexified and integrated” (Nasr and Volait 2003b), and in which outcomes are inherently hybrid. It is also one that stresses a need for deep historical analysis as a basis for understanding social groups and their interests.

In Southeast Asia, globalization has created a context of both opportunity and threat for local actors. Economic change has led to the growth of new markets for ‘world class’ urban space among foreign investors and a growing wealthy professional and merchant class (Berry and McGreal eds 1999). At the same time, local and national governments face pressures to adopt growth-oriented policies, and international aid and lending organizations seek to shape

frameworks for governance and economic management in an agenda largely designed to ensure that country's repay their foreign debt. The result has been an agenda of decentralization and privatization in development planning that has influenced governance in most countries, although the degree of its influence has varied significantly based on local institutional dynamics and beliefs about role of government that are rooted in culture and history (Hill 2004). These external influences have interacted with urban political economies that are themselves formed through local histories of economic and cultural change, and social group formation. While a deeper discussion of Metro Manila's political economy will be undertaken later, several categories of actors can be identified as key agents in city building in many parts of Southeast Asia:

- *Local and national government* play key roles in providing the legal, policy and regulatory framework in which development occurs. In the global era, however, they increasingly experience incentives and pressures to liberalize their economies, to focus modest state investment on infrastructure to support export-oriented production, and to engage the private sector in achieving goals for economic growth. In some contexts the public sector's capacity to plan has been fundamentally compromised due to pressures for fiscal austerity, and governments have embraced the view that urban development is best left to the private sector.
- *Private developers* have consequently come to be seen as the agents of 'cutting edge' innovations in urban development. Throughout the region these developers tend to be from ethnic Chinese business families, and are able to tap into the vast liquid assets that are controlled by international networks of overseas Chinese, as well as new sources of international finance (Olds 2001). They have also built relationships with government actors in recognition of their strong role in consolidating land and regulating development.
- These developers are lured into the property sector by the profits to be realized from an emerging *consumer class* of 'winners' in the globalization of these urban economies, and from multinational and local corporate investors. The desires of the consumer class are shaped both by culture-specific preferences and by their exposure to landscapes of consumption that they have witnessed elsewhere through international travel and the media (Pinches 1999b).
- Private developers look quite naturally to *foreign planners and architects* for models of urbanism that are attractive, efficient, consumer-oriented, and therefore profitable. Yet, while their designs are influenced by planning models from the United States and Europe,

their central purpose is to distinguish urban megaprojects from the rest of the city in the quality and aesthetic character of the spaces created in order to attract the consumer class and maximize profit. Hence their impact is less to ‘Westernize’ urban form than it is to commodify the urban experience.

What we are observing, therefore, is not a simple drive to emulate the global cities of the West or ‘Americanize’ urban landscapes. Rather, influential local actors, notably large developers and their government partners, have sought to selectively adapt certain international models of urban planning and design to the distinct context of Southeast Asian urbanization. What is driving this, I argue, is the marginalization of the ‘public city’ and the privatization of planning, which has occurred as new models of urban governance have been embraced by political actors in response to opportunities and constraints fostered by the emerging influence of global actors in urban political economies. I define the privatization of planning as the transfer of power over and responsibility for the visioning of urban futures and the exercise of social action for urban change from public to private sector actors.

In Metro Manila, planning has become privatized to a particularly marked extent, resulting in the emergence of what I call ‘bypass-implant urbanism’. The Philippine political economy has been described as a system of ‘booty capitalism’, in which the state is essentially captured by elites who use policy to advance personal interests (Hutchcroft 1998). In this context of unusually inert and deferential government, private developers have been granted considerable power to reengineer cities to create new spaces for production and consumption, and to facilitate the flow of people and capital between these spaces, by ‘bypassing’ the congested arteries of the ‘public city’ and ‘implanting’ new spaces for capital accumulation that are designed for consumerism and export-oriented production.

Specifically, a handful of the largest developers have responded to the lack of a compelling public sector vision for Metro Manila by conceiving of their own visions for urban

redevelopment. These visions center on urban integrated ‘mega-projects’ that are developed in strategic locations and are intended both to capitalize on trends in the city-region’s development and to shape this development to the advantage of the developer. Developers are also increasingly involved in building supporting infrastructure, including community infrastructure and large scale transportation systems such as light rail, regional rail, and toll roads, to link these developments to the larger city and region (World Bank 2004). Hence private sector firms do not just develop real estate but conceptualize and implement entire urban systems that are overlaid onto the existing urban form. The form of ‘public-private partnership’ that emerges from this scenario is distinguished by the domination of private developers in the entire planning processes, from the visioning of urban futures to the management of the urban environments that they create. This contrasts with theories of urban growth regimes originating in the United States, which argue that elected leaders must “develop policies in concert with those who have access to capital,” by mobilizing private actors around a coordinated vision of urban development, in order to realize policy and political goals (Fainstein 1995: 35). In many cases these roles are switched in Metro Manila—large developers conceive of corporate visions, then convene public sector entities (a hodgepodge of local governments, national agencies, and special purpose agencies) to pursue their own objectives of urban transformation for corporate profit.

These characteristics are arguably unique to Metro Manila, where the privatization of planning has been particularly pronounced. However, aspects of bypass-implant urbanism can be found in many cities in Southeast Asia, and in other parts of the world. It may represent the future of planning in parts of the world where government is breaking down under the strains of foreign debt and crises of legitimacy.

## **Bypass-Implant Urbanism in Metro Manila**

The growth of export-oriented industry in the Metro Manila region has led to dramatic spatial expansion with the industrialization and urbanization of the urban periphery. The five provinces surrounding Metro Manila, referred to collectively as CALABARZON (Cavite, Laguna, Batangas, Rizal and Quezon) have been a focus of foreign direct investment (FDI) and government planning. With about 20 percent of the nation's population, Metro Manila and CALABARZON combined represent more than one-half the country's GDP, and their share of manufacturing value added has remained steady at around two-thirds during the past two decades despite predictions by many that it would face competitions from other regions of the Philippines (NCSB 2003). This industrialization, and the more recent growth in business process outsourcing, has given rise to growth in the market for prime office space to house corporate headquarters and producer service firms. The city has also seen gradual movement of its middle-class population from the city center to the fringe, although the market for high-end real estate is not necessarily dominated by a managerial and professional elite as predicted in the global cities literature. According to many of the developers interviewed for this project, much if not most of the demand for new housing and consumer spaces comes from overseas Filipinos workers, a diverse group that includes maids in Hong Kong, engineers in the Middle East, nurses in North America, and others. Labor is the country's largest export, and the Philippine government estimates that overseas workers remitted \$8 billion annually by 2002 (Bagasao 2005; Ratha 2005).

The nature of bypass-implant urbanism as it has emerged in Metro Manila can perhaps best be illustrated with reference to an example. In 2004, a consortium of investors submitted an unsolicited bid to the Philippine government for a \$1.2 billion project involving the development

of a 22 kilometer ‘LRT-7’ light rail line connecting a major intersection along the northern portion of the city’s inner-ring road, Epinafio de los Santos Avenue (EDSA), to the rapidly growing city of San Jose del Monte in the neighboring province of Bulacan (Manila Bulletin 6/2/2005). This was not, as one might expect, the 7<sup>th</sup> phase of the city’s existing LRT system—indeed only three phases have been built, and government plans called for six lines. The proposal was instead an ‘unsolicited bid’, conceived outside of the Philippine government’s infrastructure plans. The consortium included the country’s largest mall developer, a construction company affiliated with one of the country’s largest conglomerates, a former secretary of finance in the national government, and several foreign partners. The primary motivation for the investors was not the profits to be made from the light rail itself, but rather the right to develop a commercial and residential megaproject on between 194 and 497 hectares of land adjacent to the line in rapidly urbanizing southern Bulacan province. The plan met with enthusiasm from some sectors, but many expressed concerns about overlap with government plans for the development of MRT-4, the fourth phase of light rail development in the city (Manila Bulletin 3/18/05). In addition, projections that the project would result in new sources of government revenue were questioned in light of the heavy subsidies required when previous light rail lines had not met their projected ridership and revenue.

Several aspects of this project mark it as part of a sea change that is occurring in urban development in the Metro Manila city-region. The fact that this project is an unsolicited bid is indicative of the greatly expanded role of the private sector in all phases of the planning process. This consortium proposes to develop an entire urban system, including a large-scale real estate venture and supporting mass transit and other infrastructure linking it to the region. Indeed the proposed new city development will be equivalent in size to some smaller Metro Manila

municipalities. Private sector influence has predominated at all stages of the planning process, from plan formulation to implementation to many aspects of post-project maintenance.

Government agencies have played a rather modest role in facilitating the achievement of the consortium's objectives. The entire endeavor is premised on the belief that, given the poor performance of government in the areas of transportation and land development in the past and the restrictions on its power and capacity at present, there is a close alignment between public and corporate interests.

Tables 1 details some of the most notable urban development projects undertaken in Metro Manila in recent years, and Figure 1 shows their locations along with recent transportation infrastructure projects. The real estate projects contain certain common features. First, they are integrated, containing residential, commercial, office and industrial space in what is at least theoretically a self-contained development. Each was planned according to what its developers viewed as 'international' standards and best practices, and indeed many were planned by major multinational architectural and planning firms. Each also employs a system of development controls (such as floor-area ratios, minimum setbacks, and building codes) and traffic management to prevent the 'informalization' of the built environment and maintain a distinctive planned character. The intent is to differentiate these spaces from those of the 'public' city in their aesthetic appeal, in the types of clientele that they attract, in their levels of security, and in the quality of the connecting transportation infrastructure. While these projects do borrow design and planning elements from cities in the United States, Europe, and elsewhere in Asia, they often do so in an eclectic manner that does not adhere to any one specific model. This is demonstrated in the three photos in Figure 2 of adjacent portions of Eastwood City that evoke

alternately the forms of Singaporean high rise housing, a Southern California shopping center, and a New York style glass and steel canyon.

These developments reflect changes in competition and opportunity in the real estate sector. In the 1980s developers began to realize that great opportunity lay in building integrated megaprojects, as such projects “enjoy enhanced profitability because each facility fed the other, by attracting and circulating custom” (Dick and Rimmer 1998). The result was competition to increase the scale and scope of these developments in order to provide the highest quality of amenities. In order to realize such projects some developers have moved into banking and construction, thus internalizing financial capacity and managing costs (Sajor 2003). They have also tapped into sources of capital from international ethnic Chinese networks and large development companies in other countries in the region. The largest have also endeavored to ‘diversify’ their holdings by following trends in urban development, and in some cases shaping them to their own benefit. In particular, expansion to the rapidly growing provinces of Laguna and Cavite to the south of Metro Manila, and to a lesser extent the area around the emerging export processing zones in the former Subic and Clark military bases to the north, have come to be seen as key to future profitability. For this reason they have also been strong proponents of, and sometimes investors in, transportation infrastructure aimed at opening up these regions for investment. Real estate interests have in some cases played a more direct role in connecting mass transit and toll road projects in recognition of the importance of these developments for their property holdings. For example, the MRT-3 light rail transit line, completed in 2000, was

developed by a consortium that included four property developers, the most prominent being Ayala Land (World Bank 2004).

The experience of Ayala Land illustrates how developers have attempted to shape the metro region to the ends of corporate profit. One of the oldest family owned companies in the country, Ayala Land began to establish its identity as a property developer with the development of the first integrated megaproject in the country, the Makati CBD, in the post-World War Two period (Zobel de Ayala 1983). The company was also one of the first to recognize the importance of the region's southern expansion, and developed a second megaproject, Ayala Alabang, in southern Metro Manila. This was developed on a large lot purchased from a prominent local landowner (Ayala Land Incorporated 2004). More recently, as the Makati CBD's status has begun to face challenges from newer developments with lower rents, the company has sought to maintain its lead in this segment of the market by purchased a controlling stake in the Fort Bonifacio Global City development after the financial crisis of 1997 led to the collapse of the original consortium of developers. The company has continued its southern expansion with the purchase of development rights to large tracts of land in Laguna, where it plans to build Ayala Westgrove Heights. It has also become a major player in the development of industrial estates—its Laguna Technopark is the country's premier industrial park.

Ayala Land has moved into infrastructure development as it has perceived that the availability of high-quality network infrastructure is critical to future profitability, and has increasingly viewed the poor quality of government provision as a bottleneck to corporate growth. One prominent Ayala employee revealed in an interview that:
