Corridor of change: a case study in metropolitan open space planning

Catherine Evans
University of New South Wales, Australia

In 2004 and 2005 the Western Sydney Parkland and the Westlink M7 motorway opened in metropolitan Sydney's west. Opening back-to-back, located side-by-side approximately 40 km west of the Sydney CBD, the park and motorway form a corridor approximately 45 km long and up to 1 km wide. The parkland is the largest in the southern hemisphere; the motorway the longest and last link in Sydney's orbital highway system. A hybrid of grey and green infrastructure, the corridor was over thirty years in planning and land acquisition. While this corridor is notable for its size, for the commitment of time and money invested in its creation, most notable of all today is that few people in Sydney are aware of the corridor, particularly the parklands.[1]

How did such a large public works project come to have such a low public profile? The WSP/M7 corridor has its origins as a designated special use corridor in the 1968 metropolitan planning strategy for Sydney, known as the Sydney Region Outline Plan (SROP). Forty years and three metropolitan strategies later, the principles, strategies and framework of this plan continue to inform the planning policy and urban form of the Sydney region. The SROP is recognized for establishing the corridor principle as Sydney's planning agenda; less well understood is that the SROP also set the course for the development of several large open spaces in the metropolitan region. While the longevity and influence of the SROP warrants an investigation of its legacy generally, this paper focuses on illuminating the history of the corridor principle of the SROP with specific regard to its application to open space planning and the genesis of the WSP/M7 corridor in particular. This paper explores how and why the role of this special use and open space corridor in defining and servicing metropolitan Sydney has changed over the last forty years, and along the way highlight issues that have contributed to its weak profile.

 The paper briefly outlines the significance of the corridor in the context of open space in Sydney. It then discusses the findings of a survey of statutory metropolitan strategies and selected relevant planning instruments; the survey focused on definitions and allocations of open space to map changes in the meaning and values associated with open space generally and the WSP/M7 corridor in particular. The paper concludes by considering how these changes have impacted the form and role of this corridor. What was lost and gained between 1968 and 2008?

The research represented in this paper is a first step toward developing a history of regional open space planning in Sydney. Studies of open space planning in Australia are limited: there are numerous reports for and by local and state governments; others are embedded in studies of history of urban and suburban communities; there are also few monographs on Australia's major urban parks. In the absence of a geographically specific historical framework for metropolitan open space planning, the paper also aims

to shed light on broader trends and issues related to the production of open space in Sydney.

Significance of the Corridor

Sydney's dramatic and varied topography and landform has blessed the region with numerous and varied types of public open space.The opportunity to recreate in or on water has long dominated the allocation of open space; since the late 19th century the foreshores of the region's many harbours, bays, beaches, and waterways have been dedicated in increasing amounts for public recreation. The sandstone plateaus surrounding Sydney have thin and infertile soils at their higher elevations, and steep incised ravines and gullies at their edges. They are both less accessible and amenable for development than shale based soils found at lower elevations, and as a result, beginning in 1886 with the establishment of Royal National Park on the Woronora Plateau just south of Sydney, national parks have expanded across much of these elevated sandstone plateaus. At lower elevations, some of Sydney's largest and best known parks, for example Centennial Park in 1888 and Sydney Olympic Park (since 1986), have been created out of low lying land, swamp and wetland, formerly perceived and treated as waste. Beginning in the late 19th century, areas of steep land, gullies and estuaries, were reserved and/or reclaimed for conservation and recreational uses; many of these also have become National Parks. Finally, and in parallel with global trends in the USA and Europe, the 1970s post-industrial economic shifts led to the release of many post-industrial and defence sites in the inner city area and generated several new parks.

Against this schematic outline of a typology of open space in the region, the WSP/M7 Corridor stands out as a new purpose-built corridor; in effect it is a new type of open space for the Sydney metropolitan area. In terms of urban form, the parkland component of the corridor provides a visual and physical break in Sydney's westward expansion, while the motorway works as a conduit and catalyst for this growth. Oriented north/south the M7 and its corridor form in effect a ring-road; since the Westlink M7 opened in 2005 it has generated a significant shift in the way western Sydney moves and works. Overall the corridor (WSP/M7) is defined by the external spine of the Westlink M7 motorway, and internally by an ecological core, a linear area of 760 hectares of regenerated indigenous ecological communities. The corridor links two urban growth areas, known generically as the North West and South West Growth sectors. With regard to open space in the metropolitan Sydney region, the corridor is distinguished by its inland greenfield location, by the lack of water based recreation opportunities, by the subtle drama of its topography, and the vast amount of infrastructure within its boundaries, notably the Westlink M7.

The infrastructure within the corridor is diverse and dispersed. The parkland contains some 5500 hectares of open space. The diverse recreational activities within it include a raceway, 3 separate Olympic facilities, 3 parks and nature reserves. Clusters of emerging industrial and new residential development are creating new hubs of activities within and adjacent to the corridor. Three major roads, a railway and another motorway,

the M4 transect it. Urban infrastructure includes a high pressure gas lines, water supply pipes, a water canal, electricity transmission tower, and a reservoir.

An abbreviated planning history of the Corridor

The first regional scale plan for Sydney was prepared by the County of Cumberland Council in 1948, ahead of the establishment of the state's first planning agency the State Planning Authority in 1963. The council represented local governments of the county, but was not a regional agency, *per se*. The resultant plan, the County of Cumberland Scheme, was based on the Greenbelt and Satellite City concepts then current in Europe and the United States. In effect, the Scheme was a regional scale zoning plan aimed at containing the growth of the city and protecting the economic and scenic values of the rural and non-urban areas.

With regard to open space, the CCPS focused on the provision of recreational opportunities: scenic delight; health benefits, and tourism attractions. The Scheme identified many types of open space, including recreational facilities and sports centres as well as institutional grounds, highways, and productive lands. Finally, it put forward three proposals for open space: a Green Belt wrapping around the urban area and separating the city from rural areas; a 'green web' system of linked bushland and recreational spaces within the inner urban district, and a series of special reserves for areas of significant scenic or recreational value. As a group these proposals reflect an agenda of utilizing undevelopable land to connect and define communities and thereby control growth; to improve the distribution of and access to recreation and scenic features, and to highlight and protect regional identity. Today, these CCPS proposals are notable for their application of concepts of connectivity—webs and belts—as a framework for open space planning.

The WSP/M7 Corridor is situated just west of the proposed Green Belt, on land designated rural in the CCPS and is approximately one quarter its area in size. The Green Belt was planned to cover 125 square miles (approximately 19,700 ha); as a corridor it was to connect the two National parks to the north and south of the city, and as a belt it would contain urban growth and provided land for large institutions and highways in park-like setting.[2] As Robert Freestone has noted, the Greenbelt was a highly contested concept, mainly because it was considered restrictive to growth.[3] The Cumberland County Council defended it in the face of pressure to release the land for housing, claiming that the Belt was "not a curb but a means towards a rational pattern of expansion."[4] However, its administration by several local councils rather than a single regional agency, along with intense population growth, led to 66% percent of the Green Belt being released for development by 1967.[5]

From the late 1950s through the 1960s, population growth, along with increasing access to automobiles and leisure time placed enormous pressure on urban areas across Australia. In Sydney, these pressures led to the defeat of the Greenbelt concept and the County of Cumberland Scheme 1959 and 1967 respectively.[6] Both were considered restrictive to growth and inflexible. Beginning in Adelaide and Canberra, the

corridor principle, derived from American planning examples, was adopted by state governments for their capital cities across Australia in the 1960s and 1970s.[7] The State Planning Authority of New South Wales published the Sydney Region Outline Plan (SROP) in 1968; its aims were to dilute the centralising force of the CBD by using established transport corridors to channel movement and growth between existing and new planned cities. Embedded in this vision was an acceptance of medium and low density housing and the automobile as means of transport. The SROP also mandated a significant expansion of the metropolitan region: the geographic limits of the County of Cumberland, mainly the Hawkesbury Nepean River, were superseded as the metropolitan region was extended west across river to include the Blue Mountains; north to Newcastle and south to Wollongong. Thus, in Sydney, the corridor principle was one of two key strategies for establishing a bigger city for more people.

These shifts in thinking about the urban reach and form of Sydney had significant implications for open space planning in the metropolitan region. The Hawkesbury Nepean River and the Blue Mountains Plateau replaced the green belt as the limits to growth; this in turn deflected growth across the agricultural and rural expanse between the former greenbelt and the Hawkesbury Nepean River. The SROP maps of this area, known as the Cumberland Plain, are, in today's terminology, a suitability analysis: the maps identify the 'rough land' of the plateaus; the flood prone lands along the many creeks which trace the Plain, radial transport routes, resource rich areas of sand/gravel, and large areas with development potential.

The SROP described open space as an active agent in urban form, and in essence reworked rather than altered the CCPS aims for open space. Open space was considered

- to shape the region,
- to provide visual definition and buffers; and
- to allow for movement of people, products and utilities. [8]

Like the CCPS these strategies highlight connectivity, but they go further to emphasize the need to plan for housing, transport, utilities and recreation as integrated urban functions. In applying the corridor principle to open space the SROP proposed four new systems. All four traced water courses and/or ridges; and would visually highlight the distinctions between urban areas. Though ambitious in scope, these proposals were not articulated as systems as we understand the term today: they included the extent of Hawkesbury-Nepean River; the west banks of the Georges River, the Chipping Norton Lakes remediation scheme, also on the Georges River, and a linear area, approximately 30 km long, tracing a north-south ridge and an existing water supply canal.

The special use corridor was a new land use category introduced by the SROP. The aim of these corridors, also referred to as service corridors, as distinct from open space, was to accommodate the future and unknown utilitarian needs and functions of the city, particularly the transmission of a variety of modes of energy. Embedded in this aim is an image of the city as a machine, with a clearly demarcated system of movement

essential to its long term viability. The SROP emphasized the importance of reserving land for these corridors as a means of ensuring the future coherency of the urban system, and reducing land costs and social disruption. In addition to these economic justifications, the corridors were considered to provide important visual breaks, and had the potential to provide 'parkway' settings for future highways.[9]

The 1968 plan identified three special use corridors at South Creek, Ropes Creek and Eastern Creek; all were associated with floodplains, but took in a limited extent of these creeks. [10]   Instead, the north and south boundaries of these special use corridors were in close proximity to the existing road corridors of the Great Western Highway and Richmond Road. This created a grid of special use corridors; and aligned with a growing commitment to transform Sydney's highways from a radial layout to grid configuration.   First signalled in the SROP, the grid concept was confirmed in 1974 when the National Highway Act was approved by the Federal government. The Act called out the need for a highway west of the Sydney CBD to strengthen the interstate links between all major cities across the country. The concept was explored at the regional level in a 1974 study by the NSW Department of Main Roads '*A Transport Plan for Sydney -2000.*[11] Though not approved, this study did show location of this Sydney portion of the national highway well west of the CBD, along Wallgrove Road, the western edge of the Eastern Creek Special Use and Open Space Corridor, and the current alignment of the Westlink M7, and the western edge of the Western Sydney Parklands.[12]

It is no coincidence that the special use corridors, initially presented as distinct from open space, became linked to it. By 1974, as concepts for the regional highways took shape, the state had extended the Eastern Creek Special Use corridor by appending the proposed 30 km long ridgeline open space system to its south. At the same time, this whole corridor was renamed 'Special Use and Open Space Corridor', and divided into 4 parts: Eastern Creek; Prospect; Horlsey Park and Hoxton Park. A 5th corridor was added, which connected the Hoxton Park segment to the proposed open space system along the Georges River. The end result was that along with the South Creek and Ropes' Creek Corridors, there were 7 Special Use and Open Space Corridors designated by 1974. Today the WSP/M7 corridor comprises four of these: the former Eastern Creek; Prospect; Horlsey Park and Hoxton Park Special Use and Open Space Corridors.

The state designation of this land as special use presented several administrative challenges, with acquisition being the most difficult. This land was no blank slate: most of it was in private ownership or long term leases, and used in a wide variety of ways. Much of it was productive, some of it was under cultivation, some used for grazing; there were also private trot tracks, brick quarries and tips sprinkled throughout the area. Two public reviews of the corridor proposals addressed the process of land valuation and acquisition, and assessed the location of corridor boundaries. The second review revealed concerns around setting a long term and large scale land acquisition process with no specific use designated. The same review also suggested several boundaries changes; these aimed to reduce costs and disruption to existing uses, and to establish

more economic uses for the land in question.[13] Environmental impacts of the proposal were assessed primarily on the basis of visual criteria; to amplify the importance of this approach, overseas examples were cited as examples of how to minimize the visual intrusion of utilities. Finally, Hawaii in particular was cited as a precedent for state based management of such corridors; in other words it was considered imperative that the state take control of land and planning process for the future benefit of all.[14]

State acquisition of this land began immediately following the inquiries; by 1980 approximately $20 million (Australian) had been spent and 77% of the land acquired.[15] At the same time, during the late 1970s, the focus on the provision of open space shifted to the inner city. There were two reasons for this: a research study published in 1975 demonstrated poor distribution of ample space; the other was the gradual closure of inner city industrial sites.[16] The NSW Planning and Environment Commission, later renamed the Department of Environment and Planning (DEP) initiated several significant reclamation open space projects, including Sydney Park, a 44 ha park in a former brick pit in St Peters, just south of the CBD; Bicentennial Park at Homebush, on a former tip (and now incorporated into Sydney Olympic Park) as well as the Penrith Lakes and Chipping Norton Lakes Schemes, both of which involved the rehabilitation of sand and gravel mining sites to recreational areas.

These investments partially explain why in spite of the substantial state level investment and acquisition of land for the special use and open space corridors, the state did not designate these spaces for recreational uses. In fact, several reports suggest a resistance to doing so. For example, a 1980 Review of the SROP by notes, "the recreational use of the corridors has not been actively promoted, but in late 1978 the DEC began to consider the need to adopt principles and policies for recreation and other uses of corridors." [17] This hedging was also noted in a 1985 Research Report on Open Space which noted: "In western Sydney large amounts of land have been set aside for future use as utility and transport corridors. While these can never be regarded as providing a permanent open space resource, the relevant councils are working with the Department in the preparation of management plans which will identify the most effective use of the corridors while they are not required for service purposes. Much of this corridor land may have an open space use."[18] And finally, in a series of Management Plans produced in the mid 1980s for these corridors, there is an emphasis on the potential, but undetermined, utilitarian use of corridors: "until they are fully needed, parts of these valuable areas of land…can be used for other purposes on an interim basis. . . . may be used temporarily for farming, and through the local councils, for parks and landscaped open space."[19]

Against this backdrop of the state funded long-term acquisition of the special use and open space corridors and no designated special or recreation use, the development of discrete recreational facilities began to occur within the WSP/M7 Corridor. This occurred mostly under the auspices of local councils who were given management responsibility for parcels of land following state acquisition. This included the transfer of a community farm to Fairfield Council in 1984; the establishment in 1988 of Nurrangingy Reserve by Blacktown City Council, and in 1989 the establishment of the Western

Sydney Recreation Area. This last was executed at the state level and dealt largely with the approval of the location of the Eastern Creek Raceway, a recreational use with potential to generate a huge amount of conflict. In spite of this slow and fragmented increase of recreational facilities within the Corridor, by 1988, when the third metropolitan strategy, *Sydney into its Third Century* was published, the Corridor was identified as a constraint on development, and not called out as an opportunity for open space or recreation.[20]

In its 1988 strategy, the NSW Department of Planning adopted a policy of urban consolidation within the continued context of linear or corridor based growth. Much of the policy was influenced by two issues: increasing evidence of environmental degradation, and the associated need to reduce the impact of population growth on the environment; the second was the need to encourage emerging new economic sectors, particularly recreation and tourism. Here, another reflection of the reluctance commit to a specific use for the special use and open space corridors, open space does not appear as a separate chapter or category as it did in the previous two strategies; instead regional open space is folded in as a subcategory of recreation and tourism. [21]

This emphasis on recreation and tourism in the late 1980s was a reflection of real and global economic shifts. The Australian Bicentennial celebrations of 1988 were another contributing factor. In terms of open space planning, the link between economic gain and open space management substantiated the ongoing planning focus on the remediation of the Homebush Bay area as an international sporting facility (now Sydney Olympic Park) and the continued protection of beaches and foreshores. At the same time, throughout the 1980s, the NSW Department of Environment and Planning initiated a series of programs aimed at improving the management of open space across the region, initiatives less tightly tied to the economic benefit of tourism and more focused on regional issues. These included Metropolitan Greenspace Program (1983) which directs state funds to local councils to aid improvements to open space, mainly in the form of strengthening linkages; the release of a Metropolitan Open Space Strategy (1991) which summarised the existing framework for the open space planning and management, but did not set out a new direction.[22] During this time, the WSP/M7 Corridor is referred to as a metropolitan recreation area; this reflects the westward shift of Sydney demographics, and more importantly an effort to direct planning energies to the metropolitan regional level, albeit through the state agency.

Planning strategies in the 1990s are characterized by the language of sustainability: catchments, biodiversity, social justice and equitable access guide both policies. The planning framework for the metropolitan region had also expanded from a single city to *cities*. With regard to open space, the strong westward shift in population from the CBD to Parramatta was reducing equitable access to jobs and open space. The 1998 strategy thus focused on the need for new facilities in new areas, and flagged the potential pressure to develop a management plan and vision for the special use and open space corridors.[23]

Another strong influence on open space planning in the 1990s was the mounting scientific evidence of the severely depleted biodiversity in the Sydney region. The enactment in 1995 of the NSW Threatened Species Conservation Act mandated a role for the NSW National Park Service in the conservation threatened species and endangered ecological communities across the state; their maps of ecological remnants on the Cumberland Plain, completed in 2000 have driven ecological restoration projects across Western Sydney. Particularly active has been a not-for- profit group, Greening Western Sydney (GWS) which undertook a series of ecological regeneration projects in the corridors beginning in the late 1980s; by the late 1990s, their work had expanded to establish significant links between community based ecological regeneration projects and improved social cohesion.[24]

In 1994, twenty years after the idea for a national highway system was proposed, the Wallgrove Road corridor, the western edge of the Eastern Creek Corridor was approved as the location of the Western Sydney Orbital (WSO) by the Federal government. This confirmed the role of a second state agency, the Road and Traffic Authority, in the planning and management of the corridor.   In the years between 1974 and 2001 when the Environment Impact Statement for the WSO was approved, the function of the motorway focused increasingly on regional, rather than national, issues. In addition to the work of Greening Western Australia and the NSW National Park Service, this had much to do with the numerous other state projects underway during the 1990s. These included the proposed location of a Second Sydney Airport just west of Hoxton Park, state plans for the release of greenfields known as the northwest and southwest growth sectors, and the growing concerns for social equity in Western Sydney and ecological fragmentation of the Cumberland Plain. The funding structure was also influential; borne out of an idea for a national highway system, the WSO became one of the segments of the system which the Federal government has not fully funded; thus the state of NSW entered into a private/public partnership to design and construct the WSO.

In its focus on regional issues, the planning and design of the WSO/ M7 explored many challenges above and beyond safety and engineering: how do roads lead to orderly, healthy, equitable and efficient development? Can they heal fragmented ecosystems? Can driving on high speed roads provide a memorable experience of place?   The M7 was designed to give as much as, if not more than it takes from the communities it traverses. In other words, this is infrastructure as an agent of positive—or at least neutral—change. [25]

Connectivity enhancing strategies for the Westlink M7 range from the structural –there are numerous pedestrian underpasses and overpasses and a bike lane runs the entire length of the road; to the visual—ten types of noise walls are tailored to their surrounding communities, and some are clear to allow views; the ecological—the planting scheme aims to contribute to the regeneration work underway; and finally, the sculptural – a simple and robust noise wall along the boundary of the Sydney International Equestrian Centre is engraved boldly with the acronym SIEC, making it is difficult *not* to know where you are; a pyramid of soil marking the junction of the M5 and the M7 signals the end of the major road corridor.

The motorway is limited in the success of these efforts. Ecological connectivity was stunted primarily through 2007 by drought, by development which has encroached around the road corridor since the 1970s, and the transition from planning and design team (involving ecologists and landscape architects) to the post-construction management of the motorway by the Westlink consortium. Achieving social connectivity is a long term project, but for now it is clear that the sculptural and place-making efforts lack coherence. These are largely focused on discrete experiences within the parklands; these are very difficult to register and comprehend on a limited access, high speed motorway. Indeed, the M7 is all movement: get on, drive, get off, with no place for pause and look out, and the experience from the road provides few cues to parkland. It is no surprise then that the image-ability of the Parklands is weak.[26] Perhaps this is understandable in the northern section where the M7 cuts through built up areas limiting these moments of prospect, but it does not explain the experience of the southern and more open section of the motorway.   An opportunity was missed to pursue the concept of parkway-- as suggested in 1968 SROP and the CCPS—in a distinctly agricultural Australian setting. The reality for the M7 –with its relatively narrow corridor and highly developed edges, may well be that connectivity is limited, if not elusive.

Around the same time that the WSO was approved, the NSW Department of Planning began working towards an environmental planning instrument for the rest of the corridor, which was then referred to as the Metropolitan Recreation Area. The resultant Sydney Regional Environmental Plan for the Regional Parklands (SREP 31), gazetted in 2001, set out a framework for unifying the planning and management processes. Key to this effort was establishing the role of NSW National Park and Wildlife Service in managing portions of the park. More importantly, for the first time in the history of this corridor, SREP 31 articulated the aims of this corridor as a regional open space. Broadly these were to create place of focus for conservation and recreation, much like the state's national parks. In addition, the aims articulated in SREP 31 return to the SROP definitions of what open space *can do* in an urban context: the parklands would provide visual quality, recreation diversity and a break in urban development; in addition SREP 31 asserted conservation of threatened species and ecological communities and ensuring water quality as two key roles of the parkland.[27] These last two aims indicate a significant shift from original intentions of these corridors, the influence of the NSW NPWS and GWS, and ultimately, the complexity of planning and managing large open spaces in the 21st century.

Although SREP 31 returned to many of 1960s concepts for the special use and open space corridor it downplayed many others, especially the concept of special use itself, perhaps because the location of the motorway within the corridor boundaries was considered to fulfil this obligation. In addition, by this time, although the corridor retained much of its vernacular uses, for example paddocks and market gardens, the parkland also contained many specialised facilities and uses within its boundaries: Olympic Equestrian, Baseball and Shooting facilities; the Eastern Creek Waste Facility; the Eastern Creek Raceway; Boral Brick Works; communication towers, water tanks and Sydney Water supply canals, a high pressure gas main; high voltage transmission lines.

When the parkland was officially opened by the NSW government in 2004, these diverse uses and facilities were re-presented in the first concept plan prepared for the parkland as nine distinct precincts; future planning and design work was directed toward strengthening the precincts as distinct destinations and establishing an overall link through the provision of a variety of pedestrian paths along the entire length of the parks.[28]

The Sydney Region Outline Plan is remarkable for setting out a long term vision and process of open space planning and provision. The broad, diagrammatic corridor principle has proved an effective strategy for committing the state government to the acquisition and management of the special use and open space corridors over a long period of time, and more importantly, through several changes of government. Overall, in terms of open space planning the major shift since 1968 has been from accommodating and providing for population growth to ecological sustainability; indeed reference to 'special use' was dropped in 2001, in spite of the fact that infrastructure, especially the M7, visually dominate the landscape. As a result, open space has an active and highly diversified role in this corridor and today is dominated by opportunities to maintain and restore ecological and social health. The importance of sustainability is also evident also in the discourse around the M7: beginning with a concern for establish a grid to encourage equitable access to jobs in the 1970s, the agenda for the road system has expanded to included principles very similar those used to plan and design the park: connect communities and provide visual identity.

The understanding of the corridor as a contributor to urban form has also shifted over time; notions of the special use corridor establishing breaks between urban areas have been supplanted by the designation of this corridor as a link—both its grey and green components-between the two emerging urban growth areas. At the same time, with planning efforts directly focused on the corridor, it is also emerging, albeit slowly, as a region in & of itself.

As uses were designated for the corridor, management was dispersed across new and powerful state agencies, and across state and local levels of government. This dispersal of interest and power is controlled through planning instruments, but it does nonetheless leave a gap at the regional level planning. In spite of attempts to develop regional plans during the 1980s, and more recent formation of the Sydney Western Region of Councils, a cohesive regional level planning body or agency has not existed since the dismissal of the County of Cumberland Council in the 1960s.

A major weakness of the corridor principle has been its open-ended nature. The term corridor implies movement and unity and uniformity; this was elusive from the start. Indeed, a careful analysis of the area in 1960s would have suggested insurmountable challenges—in the form of roads, commitments to brick works and other industry- to unity from the start. Put these inherent issues of fragmentation aside, and it becomes clear that the lack of a designated use is a double edge sword for this corridor. On one hand this has allowed for the grass-roots energy and efforts of Greening Western Sydney to realize the opportunity for a large scale ecological recovery; this in turn has

contributed to social cohesion. On the other hand, the corridor was vulnerable to state and local pressure to provide a range of facilities—thus the mix of Olympic facilities and parks inserted into the corridor during the 1980s and 1990s. The facilities in and of themselves are less problematical than the process: prior to 2004, in the absence of an overall plan, providing a sense of coherence, hierarchy and accessibility, the facilities have detracted from rather than contributed to an image for corridor as a land of parks—or parkland.

The outcome for now is a grey-green hybrid of open space where contests between large recreational facilities and nature reserves will be played out; where provocative and important questions, such as can social and ecological communities in a parkland alongside a motorway flourish, *because* of the motorway (or more simply, can motorways can be more than roads?) will take years to answer.

The provision of public amenities in private subdivisions 1900-1930

David Nichols
University of Melbourne, Australia

In the late 19th century two British factory villages – Port Sunlight and Bournville – typified what Anthony Sutcliffe described a century later as the 'perfection… of a cheap, low-density mode of design for residential neighbourhoods'.[1] These sculpted settlements were, essentially, a clarification of a host of ideals and assumptions that had been percolating through much of that century, in (as Sutcliffe says) both middle-class suburban and rural, village-styled forms; they were to serve – directly or otherwise – as templates for numerous suburban, peri-urban and rural areas into the following century. One important element of both places, expressed in the open space recreation areas and 'social and cultural facilities', was an assumption of the importance of community facilities in demarcating a community consciousness amongst residents. To appear as a valid, self-contained neighbourhood unit, planned subdivisions of the early 20th century necessarily embraced a palette of such amenities.

The issue of what, if anything, to provide in respect of public buildings within any privately-sponsored subdivisional estate was undoubtedly problematic for the subdivider. The primary concern was surely the extent to which such provision would cost the vendor over time in ongoing upkeep and supervision, particularly in a scenario in which land may have sold more slowly than expected, leaving a publicly-oriented (but probably still privately-owned) white elephant. Better, perhaps, to concentrate on the erection of model homes which could later be sold, and function as enticing conversation points in the interim, to lure prospective buyers. Yet the interwar subdivider was wary, sensibly, of being seen as a snake-oil salesman and perhaps genuinely cognisant of or beholden to new ideas of the value of community. Such new communities often comprised individuals from geographically diverse backgrounds;[2] anything that fostered community quickly was therefore advisable, and investment in implanted community facilities such as community halls, a library, schools, kindergartens or club buildings within an estate could prove the magic ingredient for sales success.

Frederick Olmsted, Jr.'s 1911 proclamation, in *The Builder,* that speculative realtors' business was 'simply to market their land, and, so far as their limited control extends, to provide sufficient means of access to it to attract purchasers',[3] was contentious and provocative. Olmsted Jr. would make a point of distinction between an arbitrary, hypothetical speculator and the conscientious and in some (though too few) respects socially progressive vendors of Forest Hills Gardens for whom he was working that time. Indeed, the vendors and the planner-surveyors who created new estates for them were increasingly cognisant of the desirability – if for no other reason, for commercial benefit – of providing elements within a design to foster community, or to at least provide the impression that a pattern was being set which would allow community to thrive. This applied to both rich and poor; it was the decade during which salubrious

Palos Verdes, in which Olmsted Jr. was also keenly involved, was to be the recipient of what Robert Fogelson calls 'a magnificent clubhouse'.[4]

Concepts of community, amenity and the responsibilities of government, vendor and designer towards the homeowner/resident within a new subdivision were, naturally, both fluid and open to redefinition: many have commented upon 'the lack of mutually understood and accepted terms.'[5] This paper, which draws on examples from Europe, North America and Australia, necessarily touches on different social expectations and assumptions, particularly in regard to governmental responsibility. However, in the early 20th century, a time at which technology and intellectual thought underwent enormous change impacting strongly on the development of new sub/urban environments, and in a burgeoning modernist era in which expectations of a perfect solution to urban issues were prominent, there are more similarities than differences. Some of these are necessarily socio-political and reformist; others served to reinforce and reproduce the (or create a new) status quo.

The paper begins by discussing some of the innovations and aspirations of the private-planning industry around the western world to create liveable environments with strong community facilities in scenarios in which, it is generally to be assumed, profit was the ultimate goal (of the organisation in question and its shareholders, if not necessarily in the mind and/or pronouncements of its leading lights) and social benefaction an agreeable by-product. It then moves to discuss notions of community, the issues of governance, ownership and maintenance of buildings. It does so primarily using hitherto unexplored (in Australia and elsewhere) examples from the Australian scene.

The use of Australian examples in an international context is justified as Australian planning practice at this time was, in perception at least, a synthesis of American and British processes.[6] As an expanding and urbanising capitalist nation in the early 20th century, Australia was self-consciously a social laboratory and its leaders at all tiers of government were keen, where possible, to locate, define and draw upon world's best practice in its continued development. The rhetoric of Australian planning in private practice at this time thereby contributes a valuable and important contemporary commentary on western processes. The inclusion of public buildings and the discussion of the importance of these buildings was a key element of particular interwar planned developments in rural, urban and peri-urban contexts. The Australian examples herein concentrate particularly on projects undertaken by the surveyor-planner Saxil Tuxen (1885-1975) and his sometime associate, the entrepreneur Clement John De Garis (1884-1926); both men lived and worked for much of their lives in the state of Victoria and its capital, Melbourne, in the 1920s.

The appeal of the community facility

Touching on (or, in some cases, thoroughly besotted by) the typification by William Morris and his followers of a slightly amended mediaeval community society as an ideal, many developers of early 20th century planned towns and suburbs pursued an ancient appearance for their creations. This was true of Ohio developments such as Columbus'

Mariemont[7] and Cleveland's Shaker Heights, where the faux antiquity tacitly reinforced the vendors' proclamation – reinforced through covenants – that the area was 'secure… protected for all time'.[8] Olmsted, Jr. and Atterbury's Forest Hills Gardens took a similar visual style and while Atterbury may have been criticised for a lack of interest in experimentation with communal facilities,[9] residents by the time of the First World War are reputed to have embraced community activities with gusto, having 'plunged into amateur ornithology' as well as organized sports such as tennis.[10] Similarly, if more paternalistically, the 'promoters and designers of housing estates [in the UK]… placed a high value on the concepts of community and equality, to be achieved through the medium of public ownership… supporting the sense of community which had supposedly been lost during a century or more of exposure to the industrial town.'[11] It is plain from examples of early 20th century planning for both wealthy and lower-waged that the essence of community was considered to have been lost, but was yet revivable through the provision of appropriate central meeting-places and village-like arrangements.

Stephen V. Ward and John R. Gold's 1994 edited collection, *Place Promotion,* focuses much more on the rhetoric of sales and on advertising imagery than it does on the potential impact inherent for prospective buyers in a site visit to a burgeoning new community. Yet some of the imagery Ward and Gold reproduce is redolent with this appeal. Advertising pamphlets for Richmond, Virginia from 1907 and 1927 are focused on grand public buildings: Richmond's City Hall and the Virginia capitol buildings specifically.[12] Writ smaller, such concentration on a built infrastructure celebrating government and democracy might also serve small developers well. In addition, the skilful inclusion of central community facilities might reinforce, in the consumer's mind, the professional abilities of the developer – and thereby a greater sense of trust. Certainly the grandeur of Saxil Tuxen's 1919 plan for realtor T. M. Burke at Merrilands, in Melbourne's north, was based on a range of best-practice inclusions, notable particularly in the arrangement of proposed (unrealised) public building sites and precincts for education, business and so on. Through such arrangements, as Carolyn S. Loeb has said, 'realtors asserted an ideal of their activities that emphasized large-scale and multidimensional planning and organizational skills':

> They presented themselves as assuming responsibility for the shape that the physical growth of suburban residential areas would take, in terms of tree-lined enclaves of predominantly single-family houses… residential areas that provided safe play areas for children, access to shops, schools, community facilities and churches… such commitments demonstrated that realtors were not interested merely in short-term gain through the buying and selling of a commodity.' [13]

Many of the issues surrounding the provision of community buildings and other amenities appear straightforward and, in the majority of cases, probably were. The building of special-purpose community structures within an estate – in circumstances wherein they may be some of the first erected – was a strong and valuable statement of viability within such an estate. Those expected to be 'pioneers' within a new suburban

area were taking a particular risk, perhaps the most important financial decision in their lives. Their estate may flourish, and their investment soar in value, or wither to its and owner-occupiers' ruin. This need not have been the product of recklessness: the Depression of the 1930s and World War II meant many owner-occupiers would not see the realisation of the dream they had invested in for decades, if indeed it happened within their lifetimes.

From the realtor's viewpoint in Australia and elsewhere, the primary goal in almost all cases was to sell off all lots as quickly as possible via the use of the most attractive planned community design. Fogelson tells us that, in the USA in the early 20th century, it was a general opinion that a vendor needed to sell between two-thirds and three-quarters of a subdivision to begin making profit.[14] The proper placement and creation of community facilities was invaluable for this purpose. Yet if a sale was to stall, for whatever reason, the costs associated with maintenance of particular buildings and facilities could prove ruinous. Local government and/or local community might valuably be persuaded to take control of these facilities as quickly as possible and, once this was achieved, the benefits were double: the vendor was no longer fiscally liable, and the involvement of government and/or community provided a vote of confidence in the subdivisional estate.

Aspiring to community

Raymond Unwin's *Town Planning in Practice,* published in 1909, features numerous examples of civic and/or community buildings – labeled simply 'institute'[15] or as part of a group of facilities serving as a 'subsidiary centre'.[16] Civic buildings and halls serve as visual interest in hypothetical illustrations of street scenes substituting, perhaps, for such church 'endpoints' as had been celebrated by Camillo Sitte. Unwin assisted in the preparation of the 1918 Tudor Walters report which defined provision of facilities as including shops, clubs, churches, 'institutions' and open spaces. [17] In the same era the developer John Laing was praised as a pro-family, anti-intellectual builder of homes and communities,[18]'attempting' (as Ian Bentley writes) 'to express and reinforce the concept of community' in estate design.[19] In developments such as Mariemont, Millard Rogers tells us, Charles Livingood pursued a harmonious relationship – in John Nolen's ground plan - between church, school and recreation hall.[20] Few designers were as reckless as Bertram Goodhue in his plan-with-the-lot for the ill-fated Tyrone, New Mexico including worker's club, baseball club and a plaza with concrete dancefloor amongst a host of other facilities including a theatre, department store and hotel.[21] More typical perhaps was the approach of Harry S. Kissell, President of the Kissell Company, the developers of Ridgewood, Ohio. Kissell's 1925 paper, 'Community Features for Subdivisions', reflected J. C. Nichols' 'broad meaning'[22] of the phrase: a program of symbolic, community-focused rituals and celebrations alongside low- (or, from the vendors' point of view, no-) cost establishment of facilities; such as a private school funded by local businessmen.[23] Kissell noted that baseball, quoits, tennis courts and ice skating were all popular and, though he was covert about saying so, cheap.[24] John Nolen, who no doubt had as much to gain professionally as Kissell from the promotion of such

amenities, noted that 'Without reservations for parks, playgrounds, and recreation centers… the more influential and independent citizens' would eschew a development.[25]

Middle- and upper-class designs: country clubs as community centres

Residential communities for wealthier homeowners created a template for new suburbanisation practice.[26] The Country Club ideal sees the embodiment in the landscape of an aspiration to upper-class living within suburban settlements. Country Club estates have often been considered important in the development of new suburban estates from the late 19th century when, as Kenneth T. Jackson says, 'growing acceptance of physical activity and of sports was closely associated with the expansion of upper-class railroad suburbs in the late nineteenth century.'[27] An early example of locals creating a club is the Onwentsia Club of Lake Forest, Illinois, where residents purchased an estate in the late 1890s;[28] most examples following would see the Club attract residents. This idea 'came to be the focus of suburban social life and a spur to residential movement towards the periphery.'[29] Clubs such as that at Tuxedo Park took on a regulatory, social and governmental role in the development of a new neighbourhood community.[30] Kissell's Ridgefield subdivision offered vacant land adjoining the local country club for polo games, primarily for the value of association and publicity.[31] In Britain, similar community creation processes were in place. Paul Oliver has written of 'the Club' in new suburbs:

> frequently, social life was focused on the tennis club, with dances and other fundraising activities, cementing relationships as well as financially supporting the unit. Cricket clubs, with fixtures arranged with other suburbs, were as popular… In Rayners Lane, the Rayners Lane Cricket Club was second to the Rayners Lane Camera Club, whose premises in the cellar of a new shopping parade were given a modern treatment by a local architect, who designed the projection room and screen, installed incidental lighting and obtained second-hand tip-up seats… In many suburbs amateur dramatics provided an important focus for social life…' [32]

J C Nichols' Country Club District has its genesis in a combination of Nichols' own interest in garden suburb design; the creation of the Kansas City, Missouri Country Club in 1895;[33] and a societal shift in suburban aspirations. As William S. Worley has put it, the Country Club District was less an innovation, more 'a synergistic enterprise: a bringing together of the best thinking available at the time toward the creation of a living environment second to none in the United States – for those who could afford it.' [34]

Nichols was overt about his wish to foster community spirit, and the ways in which his company achieved this are revelatory. In Nichols' conception, they mixed the transitory with the concrete: examples of the first included community field days, hikes and carol nights.[35] The second involved facilities as diverse as a riding academy (built by Nichols and leased to a private operator) and golf clubs (seeded by the company with a view to eventual independence).[36] Unlike many of his cohort,[37] Nichols actively encouraged

shopping centres within his developments, and in some instances established community facilities within them. Shopping centres 'were the heart of the success of his planned residential communities,'[38] and his schemes often combined community facilities with retail. His company paid for the creation of the Brookside Community Hall in the upstairs section of a shopping centre; dance classes, a kindergarten, and flower shows were held there.[39] In a number of instances (such as 1924 'Miss Houston's Kindergarten' operated in a space formerly occupied by coffee shop in Brookside shops)[40] it appears that Nichols used community non-profit space to fill, perhaps temporarily, that which could not be filled by renters. Additionally, the distinction between retail and community facility was fudged, as in the case of the Country Club Plaza's Robinson's Shoes outlet which included a 'Kiddies' Play Room' in 1924.[41] Perhaps the most telling harbinger for 20th century American life within Nichols' design is his version of the 'parish pump': the stylishly presented gas filling station.[42]

The fostering of community 'spirit' was Nichols' business, and when it ran smoothly it allowed his suburban developments to self-maintain. As Worsley puts it, simply, Nichols' 'goal was to attract as many people as possible to his subdivisions and keep them there.'[43] An important additional aspect however was that those who moved on would sell to someone appropriate for the community: the right kind of replacement.[44]

In Australia the country club was a concept embraced only in a vestigial form. However, those few established in the early 20th century are valuable examples of this style of community planning. The Melbourne surveyor/planner Saxil Tuxen's work at Park Orchards (Figure 1) has left one of the most unusual planned suburbs in Australia, which also, like many of its international and national contemporaries, has become one of the most affluent pockets of the city. North of Ringwood, in Melbourne's east, the region had (as per its name) functioned as an orchard for many years. Its elevated aspect no doubt indicated to its vendors that it could serve as a kind of alpine resort, though Melbourne's mild climate meant it would never see snow. Park Orchards was launched as 'a community settlement of country homes situated in delightful and beautiful hill country' in which 'the facilities for enjoyment, which will belong absolutely to the owners of those homes, will be much more extensive than the wealthiest in the land out of any single purse would care to attempt.'[45] It came on the market shortly after Tuxen's 1926 fact-finding trip to the USA but was presumably designed immediately prior to his departure. Park Orchards nonetheless touched on much of the rhetoric of the American elite planned estate in its connection to the 'country club' ethos. A specially-produced advertising brochure announced:

> Ample space has been reserved for the purpose of the Club to provide a small Golf Course, Lawn Tennis Courts (grass and asphalt), Cricket Ground, Croquet Greens, Bowling Greens, Swimming Pool, Children's Playground, Parks and Gardens, and a Club-house, where a Ball-room, Billiard-room, Card-room and library may be installed.' [46]

The vendors, Taylor and Sharp, did not promise unequivocally to undertake construction 'of any of these facilities', but suggested that 'Club members may, in their

uncontrolled discretion, desire themselves to design and carry out the details of the necessary work'; the vendors did, however, reserve the right to build anything they felt was 'immediately necessary to the general interests' using money from a compulsory trust fund derived from club membership fees. That is to say, the vendors intended the club to operate like a private-ownership local council; Park Orchards' initial conception was to serve as a transitory position between the traditional country club and local government, though it is difficult to glean to what extent Taylor and Sharp anticipated involvement in the development over succeeding years: an earlier estate had involved a club with jurisdiction over roads, open space and facilities. The last major act of the original vendors, at the end of the 1920s, was the creation of two major features: an extensive golf course and a centrally-located club building in Spanish mission style, the Chalet (Figure 2).

Though it was not an immediate commercial success – presumably because of poor timing – Park Orchards' plan is a distillation of the various important elements of the Country Club community. The club was to be the controlling influence, a type of village-style democratic unit. The focus of the club was to be on sporting facilities of an athletic or social (or both) variety. Though the estate would not be gated in the sense that obtains today, Tuxen designed its roads to limit access to all but those in the know. It was, in essence, a planned community centred on its facility buildings which were to embody its status as an exclusive, but within those perimeters democratic, settlement. By the 1960s, Park Orchards had risen to the challenges inherent in its design. It had become a discrete, recognized outer-urban community eagerly lobbying local and state governments for further amenities and rights. Though the Club was long gone as a concept, its legacy remained in the Chalet as a community centre and the focus of a group of newer buildings such as the tennis club and kindergarten.

De Garis: three new community scenarios

Clement John De Garis, an entrepreneur operating in Australia in the 19-teens and 20s, was a controversial figure in his day and can best be described as a charismatic, yet overreaching figure whose excessive (and, arguably obsessive) business behaviour proved disastrous for those who invested funds and, particularly, their faith and livelihoods, in his schemes. A number of these involved the creation of new towns and suburbs; though De Garis was not a planner, he was able to harness much of the rhetoric and in some instances the form of best-practice town planning of his era. Married to this was De Garis' cognisance of the premium value of community, an awareness which sat well with his own eagerness to lead and his desire for social activity. While his community-building activities, so often involving built environment and planned elements, were not often immediately successful, their record reflects the thinking of his international peers and serve as a measure of contemporary interest in such matters.

Australia in the early 20th century was in the throes of a long conversation about the best models to follow, and outcomes to pursue, in many social directions and projects large and small. Actors would utilise international ideas and ideals as artillery in debates

– a reason why their dialogue is so revelatory on international practice. De Garis, unusually for his time, was particularly patriotic and eager to promote Australian culture and innovation. Rather than note his verve and drive and thereby model him as an 'Americanised' Australian it might better be said that he, like many others, saw the USA as the source of the most progressive and modern ideas in marketing, technology and media. While he was plainly very interested in new settlements and communities in the USA – he visited Atascadero, California[47] in 1922, for instance, presumably drawn by its blend of utopian thought, modern design principles and agricultural technology – he also, it would seem, subscribed to the common belief of the early 20th century Australian that the new century would see their nation advance beyond the USA building on its achievements.

While De Garis was, undoubtedly, an inspired and individual thinker, it is difficult to imagine that his vision for new town construction and community building was not coloured in some part by a very different Californian model to such as Atascadero, as imparted to Australia by the North American Chaffey Brothers, who constructed the irrigation settlement of Mildura under colonial government sponsorship at the end of the 19th century.[48] De Garis' father had been one of a group of prominent Victorians who had lobbied premier Deakin to investigate the Chaffeys' American projects, and the De Garises had been amongst the first families to move to Mildura. De Garis' first two forays into the creation or nurturing of irrigation fruit-growing settlements he (and others at the time) called 'colonies' were on the Chaffey planned model. This was particularly true insofar as the extensive use of new technology and infrastructure and, in the case of the second settlement, Kendenup, classical grid-plan street design, were concerned.

De Garis' first foray into community creation was at Pyap, South Australia, approximately 100 miles (and five hours' drive) from his Mildura base.[49] Having been established in 1894 as one of seven government-sponsored 'communistic' settlements on the River Murray, it had failed as a project within a few years and passed through a number of private hands before being purchased by a De Garis company.[50] Here, in 1914 – opining a desire to 'take a wilderness and turn it into a garden'[51] – he quickly installed the latest in irrigation technology and erected a public hall (Figure 3) near the entrance to the settlement; he was able to attract a small number of Mildura residents to purchase land in, and relocate to, the region. The hall later took on the additional role of a school building as the settlement prospered.

It was, however, De Garis' next foray – at Kendenup, in 1921 – that saw him recognise and embrace the value of community spirit as a unifying force. In this remote inland region on the railway line to the regional port of Albany, De Garis engaged one F. Coote to plan out a grid-based town with designated park spaces and grand avenues. Public buildings and shops were to line one side of the road facing the station, thus placing the civic and retail buldings of the settlement in a perfect viewing position for those on the rail line. A large sign, 'My town Kendenup – where everybody smiles' was erected.[52] 'The Scheme', advertising of the time announced, 'is propelled by DeGARIS Force! DeGARIS Punch! and DeGARIS Enterprise!'[53] The town was to a 'closer-settlement' pattern, with each resident's landholding walking distance from the central grid.

De Garis' ideals of community were quickly adopted. 'What impressed me most during a recent visit to Kendenup,' wrote one anonymous visitor, 'was the rapidity with which the community spirit has grown. I do not think there is a settlement in Australia where what might be called community organisation has been born so quickly.' [54] An 'American Lady' visitor imagined 'the present bush [fading] away like a shadow' as 'young people in white flannels are already playing on the velvet turf of tennis courts, while across the way, the Administration Building rears its handsome façade above the trees of Central Park.' [55] The floor of the newly-erected dehydrator was declared 'an ideal dancing surface… larger than most suburban halls in the metropolitan area,'[56] and it was suggested that this building could serve as a temporary hall with the addition of a stage. [57] Settlers held a social and dance in October of 1921 'in aid of the Progress Association funds'.[58]

The monthly *Kendenup Index* functioned as both newsletter for the residents and publicist for the settlement in other quarters. Its dedication to community ideals, through the initiative of the tenacious public-spirited residents, was heralded. Perhaps the most notable and important of its pronouncements on this matter comes in an extended news report in which discusses a recent development in the town of Glendive, Montana, in which a large swimming pool was 'being built by volunteer labor and contributions of material and money. Everybody is wielding a shovel, running a tractor, directing a fresno, or doing his share to rush the work along.[59] Here the importance of public facilities were emphasised in the creation of a community, and the value of community work towards such facilities also highlighted. This was further iterated when Violet Austin announced in mid-1922 that she had 'cheerfully taken the responsibility of raising £1000 to erect –

1. A Settler's Hall (brick with tiled roof), £800
2. Establish central Sports Reserve, £200[60]

The creation of a permanent hall was plainly of high importance, but this was either highly disingenuous on Austin's part, or a sign of far more trusting times: she was an employee of De Garis Kendenup. Whether for this reason or another, Austin's rally for funds came to little; the town's dedicated community facility, Lawson (now Kendenup) Hall (Figure 4) was constructed soon after, funded by (and named for) an established local landowning family. It was 'booked ahead for twelve months'[61] on the day of opening. A theatrical troupe, the dubiously though apparently uncontroversially named 'K. K. K.' (Kendenup Koncert Kompany) was formed, as 'yet another addition to the many social features which are making for the development of the right community spirit at Kendenup.'[62] Kendenup was heralded as a vital model by De Garis himself, who claimed that 'in the interests of immigration, in the interests of nation-building' closer settlement establishments like this one were 'no job for a single capitalist or a group of prominent men.' [63]

Overstretching himself financially and essentially unable to focus on solitary projects for long enough to bring them to fruition, De Garis' Kendenup plans fell in a heap in 1923, and the company went into liquidation. Desperate to shore up his finances, he returned

to the eastern states, gathering a group of well-wishers to establish the Melbourne Subdivisions Company. The largest and best-publicised of the Company's projects was Corio Garden Suburb, in the north of the regional city of Geelong, an early development in the strategy to make the city a manufacturing hub. Announced on 24 November 1923,[64] it was promoted as 'a great advance on anything yet attempted in this country… on ordered and artistic lines.'[65] 'Shopping areas and recreation reserves at frequent intervals are provided at well-thought-out lines…'[66] The plan for the suburb (Figure 5) was centred on a crossroads of two major and one minor thoroughfares, featuring a 'civic centre' and including major (unlabelled on designer I. G. Anderson's plan) buildings, including the railway station to the south, at endpoints. During a promotional afternoon tea for prospective buyers at (the pre-existing) Corio Hall Anderson claimed the new suburb 'would be a self-contained community', with 15 acres of its 800 dedicated to 'shops and public buildings'.[67] Once again, however, De Garis had overextended himself and the Melbourne Subdivisions Company underwent a 'restructure' that ultimately entailed a name-change and then, a winding-up of its affairs, by which time De Garis was no longer associated. The Corio Garden Suburb plan was only sketchily followed in the final development of the region, which came to centre around the Ford Motor Company which, attracted by De Garis' machinations, had located its first Australian plant there. What is perhaps more extraordinary is the ultimate success of the Kendenup scheme which, though it did not grow to the extent of De Garis' original ambitions, re-established itself to become a flourishing fruit-growing settlement after his suicide in 1927.

As examples of the success of community infrastructure in nurturing a successful new subdivision, these De Garis examples are an ambivalent variety; certainly none of the three made their developer wealthy in the long term. What they do show, however, is the impact and importance on the ideal of the community centre and amenity provision to early 20th century land subdivision practice. De Garis was plainly aware of these ideas and sought to promote their application in all his developments, Kendenup being the most realised of these and Corio the closest to contemporary 'town planned' style. In both these cases the focus on community building (and even 'true community building', as examined by Richard Harris[68] – the original Kendenup Hall rally and the advocacy of a Glendive-styled approach being a case in point) and buildings to promote community were premium.

The post-war era

The immediate post-war years saw a radical consolidation in many western countries as reconstruction – be it social, as in Australian and USA conurbations barely physically damaged by war, or physical as in Europe – took hold. Much of this was driven by government. Progressive and modern thinkers of this era were seized by an earnest hope that the citizenry could be persuaded to continue their self-sacrificing effort and maintain a new society tinged with a community-based, if not communal per se, outlook. This would be embodied and reinforced by community centres – or, in some conceptions, schools-cum-community centres – at the heart of nodal developments. One piece of propaganda announced:

In every suburb, township, and village common needs exist: a common need for playing fields, swimming pool, baby health centre, kindergarten, lecture room, little theatre, library and so on. The fulfilling of these common needs for the great majority of the people is essential if the communities concerned are to have any claim to being civilised.[69]

This ideal brought forth multiple examples and models of new centralised public buildings and precincts. Just as De Garis had suggested that community creation was the duty of government and people, rather than 'a single capitalist or a group of prominent men', Australian children were told unequivocally in 1941 that

Many things which were once done by "private enterprise" and many things which were not done by anyone are now done for the good of the community by officers appointed, indirectly, by the citizens themselves.[70]

This is not to say that the private developer had no role in community promotion in the era of postwar reconstruction, or that s/he was an innovator in this area whose key ideas were adopted by governmentally-sponsored neighbourhood and/or subdivisional planners. However, it does show the infectiousness of the notion of a new inclusive community that would do more than look inwards for its 'spirit' and drive. For diverse reasons there was, in the second half of the 20th century, less reliance in either media promotion or the built environment itself, on the self-contained community and attempts to foster impulses of sociability; there was also far less likely to be resort, amongst developers, to images of charismatic leadership amongst vendors.

What remains in many of the privately-sold subdivisions of the early 20th century, therefore, is a mélange of ideals in which a frisson of utopianism would be tempered with the pragmatic desire of vendors for self-sufficient and self-regenerating suburbs, towns and settlements. The provision of public buildings in which, ostensibly, community ideals would be quickly founded and strengthened, played a key role in the expectations of families and other residents of new developments in the postwar era, even when governments provided these. While the impact of the specific developments of Park Orchards, Pyap, Kendenup and similar estates on the wider service provision 'landscape' was minimal, these places remain as testament to the style of thinking of the era in which they were built: a time when great faith was placed in the ability for public meeting places and communal spaces to quickly create new and in some cases idyllic towns, suburbs and 'colonies'.

Exposición Internacional 1910. Buenos Aires. Didactic leisure and international recognition

Agustina Martire
University of Buenos Aires, Argentina

Introduction

The city of Buenos Aires went through a period of peace and unprecedented overall development throughout the last years of the nineteenth century and the first decade of the twentieth. The increase of immigration brought demographic explosion. The steady growth in production and foreign investment in the country and the expansion of trade, transformed the city and in its population. The accumulation of local capital was a consequence of all these factors and produced economical, social and political change. This process could be called a process of modernisation of the state, which obviously brought a steady growth and transformation to the city of Buenos Aires. These factors also led way to problems such as housing deficit. Therefore, the administration of the city was also transformed and organised in a more efficient way. The idea of progress and evolution took over the political spheres as well as the everyday life of the common citizen. There was a strong expectation that this burst of success in the international markets and the local development in every sense would never cease.

In this period of political stability and the configuration of the political scene, the city saw the development of new political parties: The *Union Cívica Radical*, which would be in charge of the city and the country in the following decades; the anarchist and left wing parties that would sponsor labour and social reform; and the Socialist Party, which would - moderately - make sure that these reforms took place. The French Republican model, which had been present in Buenos Aires before the turn of the century, was replaced by European positivism[1], where Argentine political elite embraced the ideal of *scientific politics*.

The urban condition in the rest of the world was changing, and so it was in Buenos Aires. The City Beautiful movement in the United States, inspired by the work of Daniel H. Burnham(1846-1912) was changing the concept of park design and planning in the US and Europe. Architecture was increasingly appearing in public space. A good example of this transformation was the South Park of Chicago, earlier projected by Frederick Law Olmsted and Calvert Vaux. This park, which originally followed ideas of the *Park Movement* and *Rational Recreation,* was transformed in 1893 into the World Columbian Exposition. The park turned into a space of representation where international ideas and products were being shown in the context of a new kind of city, formally inspired in neo-classical style.

As observed by Pregill:

> "The Columbian Exposition demonstrated that Beaux Arts principles formerly limited to glorification of architecture were in fact equally or more suited to the creation of structured outdoor spaces."[2]

The City Beautiful movement focused on civic art, design, reform and improvement and, to what regarded open spaces, it treated them as critical urban needs emphasising active rather than passive recreation. The hierarchy of spaces and the location of important buildings as nodes or focuses in the city were also central to the configuring of urban space. Despite the social reform intentions of this movement, this aim was difficult to realise, for the need of civic space led to the demolition of slums and legislation was not suited for relocating the dwellers, so this caused even more social unrest.

Contemporarily, in the European Continent, another new tendency of public space design was being developed, the parks as a tool for social recreation, to afford relief of the workers, and this was considered a direct effect of the working conditions in already very industrialised and overcrowded cities. Examples of these kinds of projects were those of Fritz Schumacher and Leberecht Migge in Germany. These projects, opposed to the American examples did not have a symmetrical or geometrical configuration, but they still differed strongly in program from the landscape architecture of Olmsted or Vaux. On the other hand, the German school of Camillo Sitte[3] was very influential on characters such as Burnham in the US and Raymond Unwin in the UK.

International exhibitions in general throughout Europe and the US were being used as spaces of representation that conditioned the way urban and public space was used and experienced. The use of public space for the packaged demonstration of certain cultures and places was being generalised worldwide, and Buenos Aires was not an exception in this international campaign for the didactic development of national identity.

International conferences on urban planning, such as the RIBA in 1910 and the 1910 and 1911 conferences in Berlin, were generalised throughout the world and were providing a set of tools for urban development. The roles of Herman Joseph Stübben and Werner Hegemann were crucial in these meetings, for they provided new ways of analysing cities and gave a set of rules and regulations as well as concepts of use of the city that were unprecedented. Among these was the very relevant role of parks, as *lungs of the city* for the health and recreation of citizens.

The exhibition – relevant facts, intentions and urban landscape principles

In Buenos Aires the Centennial was a moment of consecration for the city and of established culture. With the anniversary of the May Revolution the commemoration of the past became the celebration of modernity, progress and future of the nation, symbolised in its capital city.[4]

The need of international recognition and the insisted comparison of Buenos Aires with European metropolis produced a strong influence in the ways of thinking and living the city. The exhibition, as a didactic tool, worked as a precedent for conceiving leisure spaces in the future.

By 1910 Argentina would abandon its quality of exclusive provider of meat and grains to become a focus of multiple interests. As many commentators state, the year 1910 was not only one of local celebration:

> "1910 is much more than the Centennial of the May Revolution; it is the key year of the Argentina that extends between 1852 and 1916; it is – to say it in someone else's phrasing - the most glorious hour of the project of the 80s"[5]

International influence and attraction

The beginning of the twentieth century was internationally a period of faith in progress and capital, and Buenos Aires sought to be part of these ideas and proposed the International Exhibition as a way of demonstrating its position to the rest of the world. At the same time, the transformation and transplant of international influences were building this particular image.

The role of the image of Spain was transformed from the 1880s onwards. Towards 1880 there was still a Hispanophobic feeling. Juan Bautista Alberdi and Domingo F. Sarmiento represented this tendency, criticising Spain for the historical years of domain over Argentina. The following thirty years changed this perspective. One of the main reasons for it was the rise in proportion of Spanish population in the country, which was mainly concentrated in the cities. In 1865 there was a 1.8% of Spanish born citizens in the country; by 1914 these were already 10.5% of the population. Later, during the first decade of the twentieth century a construction of the Hispanic imaginary took place. The aims were the construction of an identity, the process of *Argentinisation*, the revalorization of modern Spain, and the legitimisation of the Spanish collective.

The confraternity between Spain and Argentina begins to take shape in 1900:

> "The generosity of our motherland is rescued. She gave the gigantic birth and then donated the land to us, and a section of the European race, establishing an indissoluble community by the racial ascendance and a language as forces of harmony in a nation constantly renovated by the immigration masses."[6]

Other Nations were also valued as good influence in the building of the local image. There was a will to try to copy the North American model, for the United States kept good relations with Great Britain and this gave great results.

> "(US and Britain) have formed a moral alliance in whose virtue they do not obstruct each other but they co-operate because they have managed to transpose the honour of the Nation to a vaster field of the race"[7]

Important characters visited the city during 1910. The Infanta Isabel de Borbón was received with parades and celebrations. Regarding the international representation and

the idea of the simulacra, the presence of certain foreign visitors is very relevant. The main celebration held on May 25th started with thousands of school children singing the anthem to the flag. At night, buildings in the central area were decorated with electric lights. Visitors such as Jules Huret (1863-1915)[8] or Georges Clemenceau (1841-1929)[9] had nothing but praise for the city, for the hygiene in the streets, the parks and promenades, squares and gardens, Palermo and the zoological and botanical gardens.

> There was an evident will to show the best face of the city:
> "As it becomes obvious, the visitors – except for the jurist Adolfo Posada, of socialist militancy, and the writer Santiago Rusiñol, who even spent some days in jail, detained along with anarchist sympathisers – saw almost exclusively what was shown of the city."[10]

Social conflicts around the Centennial

The whole environment of the Centennial was not only that of euphoria and praise. It was also a moment of strong social conflict and this could be seen in the Centennial celebrations. A rise of nationalist thought took place. Apart from the real search of roots it was the irruption of fear of the *different* given by the high immigration rates in those years that produced this nationalist feeling. Immigrants populated the leftist parties and formed a resistance to the establishment. The law of residence 1902 had allowed the government to expel *undesirable foreigners* from the country. The implementation of this law led to a strike organised by workers organisations to demand the suppression of the law. The headquarters of leftist newspapers and the socialist party were burned and even the Jewish neighbourhood had some shops burned.

Authors such as Posada saw this other face of the city and wrote:

> "The area of the port and the other neighbourhoods have to be visited, and penetrate the dwellings called conventillos and the centres of promiscuity of tight space and filth to get an idea of the grey note that gives a shadow on the greatness of the capital of el Plata. There, you will find steps of life that touch depth in the lowest layers of society, that cry for a ray of light, of clarity, of a more intensive social policy, more, more, much more of this than of a hard intervention of the police."[11]

As it had been seen in other cities such as Barcelona, anarchist groups chose spaces of leisure of the higher social classes to protest for the social inequalities of the country. A bomb in Teatro Colón, the main theatre of the city, exacerbated xenophobia and made the law of residency more extreme.

1910 was also a year of some extent of social reform. The first two congresses of women took place then: The *Congreso Patriótico* and *Congreso del Centenario*. Neither was very innovative and they did not claim vote for women, but they set a precedent for the following reforms in the next decades. On the other hand the *Primer Congreso Femenino Internacional* counted with the participation of some of the first female professionals of the country. Subjects addressed were mainly the teaching of history, secular and mixed education and social influence of the mother, the battle of the sexes,

problems of the working woman, prostitution, civic and political female rights, divorce and alcoholism.

The urban transformations that accompanied the celebrations of the centennial were not isolated in Buenos Aires. Other capitals such as Mexico, Santiago de Chile, La Habana and Bogotá used the celebration of centennial of independence as a pretext to show a new image of the country and city as much as to develop new urban ideas in the cities.

The image of the city and the invention of an identity

Approaching the time of the Centennial of Independence the state had never made such a systematic effort for giving identity and tradition to its citizens, of which a great proportion were immigrants. This identity was therefore more created than discovered. The mixture of urban European cultures created a specific environment that was in need of its own identity.

As stated by Tulio Halperin Donghi:

> "A city in construction is a city searching for its form; and the Centennial seems to almost impose a term for the final transfiguration of Buenos Aires. The action of the governing elite, who has directed the urban transformation since 1880, has been oriented towards this transfiguration"[12]

The Centennial of Independence brought the need of searching for a new image for a city that was beginning and pushing for recognition. This is what has been called by some authors the *imaginario urbano*[13]. One of the premises for this idea was that the image of Argentina was different to that of Buenos Aires, its capital. Buenos Aires was to be a place that produced *delight and emotion*[14].

In the particular case of Buenos Aires of 1910, as Reese accurately states, the Celebrations of the Centennial played a fundamental role in the identification of Argentina and Buenos Aires. This took place through the commemoration and construction of the memory of a city made by immigrants that had few concrete memories and few or no nostalgia for the historical moment of the origin of the Argentine Nation.

The image of the city by 1910 was represented textually and visually. Textual images were: travel tales, travel guides, almanacs, political memoirs, autobiographies, poetry and novel, facsimiles and anthologies, essays, history and textbooks, official reports, literary awards were, as in the rest of the world, the images shown. On the other hand the visual were maps, models, panoramic views, architectural and urban drawings, drawing notebooks, paintings of the city, photographs of the city, transparencies and cinema. All these constructions served, as in many other World Exhibitions, to show an image of what was supposed to be a city in development, progress and aiming to modernity (image 01).

Relevant and famous international characters wrote about the city of Buenos Aires

during the Celebrations of the Centennial: Enrico Ferri, Italian criminalist; Vicente Blasco Ibañez, Valencian novelist; George Clemenceau, French politician and Adolfo Posada, Spanish jurist. All of them gave their image of the city. Ruben Dario, Nicaraguan poet was full of praise for Buenos Aires.

In various books published, the euphoria about the city was described until some start to recognise the negative side. Local authors such as Ricardo Rojas found it necessary to wake Argentina up off its unconsciousness, break the celebration of its cosmopolitan mercantilism and force the people to review the old ideas of Sarmiento and Alberdi.

The architect Christophersen considered that within the Centennial of Independence the best celebration to be made would be the transformation of the city, as monument and legacy, in an unquestionable equation in the period for the official view, that of Capital city and image of Nation.

The book[15] that was officially published for the Celebrations of the Centennial is very clear in its intentions of enhancing the image of Buenos Aires. The role of Paris as a source of inspiration for the developments of the new city is insisted upon, especially in the literature of the time.

> "Paris, sovereign of the cities of the earth's sphere, your yet very young sister, until today hidden will present itself to the world in May 1910! You can be proud! Humanity, while contemplating it, engrossed upon its superb beauty, will see that it belongs to your same ancestry. It is like you in everything. Only age makes you different. When you were little, remember? They called you Lutecia, you were not so beautiful; but afterwards splendid mother, your name Paris, has filled and will fill the world. As it will be filled by your sister, Buenos Aires, which as young maiden, conserving still fresh the orange blossom, admires and enchants with its young and radiant beauty"[16]

This book focuses extremely on the foreign, mainly European influences on the city and praises it for such influences. Buenos Aires was built by Argentine and foreign architects, sculptors, engineers and decorators: Italian, French, Spanish, Swiss, Belgian, German, English, Danish, Austrian and Russian.

The author does have a different view toward the United States. The difference between European and North American cities was mainly that uses, customs, law and recreation were different. Cities in North America, compared to Buenos Aires were similar in luxury, richness and splendour. But the attention is set on the similarities to Paris more than to New York, for in both of them there is the Latin spirit.

The comments also concentrate on the level of development of Buenos Aires compared to Europe, giving an idea of the extent of realisation of projects in this new city, which could not be achieved in already established European cities.

> "The widening, transformations, and modernisation of big cities in Europe are very far from giving an idea of the proportions that edification has in Argentina and especially in Buenos Aires. The average of building permits, settled by the municipal offices of the great capital, is over fifteen hundred a month which is 18.000 a year."[17]

The first decades of the twentieth century were those of urban reform, the idea was to modernise the traditional city[18]. There was a need for monumental compounds that responded to a rationalist logic. The urban debate and the need of representation of the government led to the participation of foreign professionals in the formulation of landscape and urban plans for Buenos Aires. Two professionals that were instrumental in the urban and landscape transformation, who also worked in the design and layout of the International Exhibition were Joseph Antoine Bouvard and Charles Thays.

Joseph Bouvard – biographical facts and urban landscape principles

After a long and fruitful career in public architecture and exhibition design, Joseph Antoine Bouvard (1840-1920) (image 02) was hired by Mayor Carlos de Alvear to formulate an urban plan for the city of Buenos Aires.

Bouvard was born in Paris; he began his work as an architect supervising the public works of the Parisian neighbourhood of Belleville. Bouvard followed his work with Alphand, who was at the time the municipal architect of the French capital. Bouvard was later named *Architecte de l'Administration Centrale des Beaux Arts* and with this role he worked on the building of dozens of schools and the museum of Carnavalet.

One of his most outstanding roles was that of Exhibition design. He participated as the designer of the French pavilion in the World Exhibitions of Paris of 1878 and 1889. Later, in 1900 he took over the important role of *Directeur des Parcs et Jardins* in the Paris Exhibition. He also worked on other World Exhibitions as the one of Brussels (1897), Amsterdam (1913), Chicago (1893), Anvers (1894) St. Louis (1904) and Melbourne.

In 1892 Bouvard replaced Alphand in the position of *Comisaire Generale des Fêtes Officieles*. Five years later he was named *Directeur et Administrateur du Service d'Architecture des Promenades et Rues de Paris*.

Bouvards principles of park design show a clear contrast to those of previous designers in Buenos Aires and also throughout America and Europe. The use of public space as a space of representation replaces the ideas of public space as a place of passive and active recreation.

For Bouvard the public square is a:

> "...meeting point, a pleasant place, where feasts and ceremonies are held, a centre
> of profit of fresh air, an appropriate location for monuments and a reference point
> in the labyrinth of streets. It is a place of rest, of regulating movement. They will
> have to be created profusely throughout all areas of the city"[19]

Bouvard was not a leading professional. He lacked written works and his municipal career was minimal compared to other contemporary figures like Henri Prost, León Jaussely, or Eugène Hénard, who had studied at the École des Beaux-Arts, and were

all highly successful in international competitions. Bouvard's main merits were owed to his activities at the Paris Municipality and his participation in exhibitions[20].

Bouvard's activities in Buenos Aires have been studied thoroughly[21], so it is not the intention here to deeply analyse his work but to give an overview of his ideas and his role as a planner in Buenos Aires.

Two major events were the consequence of political, economical and social influences in Buenos Aires: the urban plan of 1909 and the Celebration of the Centennial of Independence of 1910. Both enterprises were justified by ideas of representation, circulation and hygiene.

Between 1905 and 1906, the different urban proposals were analysed by the Congress and the Municipality Council, placing within the scope of the debate the significance of expropriations and public interest, as well as ways of financing public works. Upon the difficulties in selecting the projects and the urgency required to start the constructions for the celebration of the centennial, the city mayor, Carlos de Alvear, employed Bouvard as an external consultant. Both Argentina and France endorsed Bouvard's contract, having it acquire the status of a diplomatic agreement contemplating bilateral interests.

The Alvear family, as many other families of the elite, had a tight bond with France and especially with Paris. This was tightened by the fact that some members of the family were ambassadors in the French capital. The Alvears consulted thoroughly the urban archives of Paris with the aim of investigating aesthetics and administrative tools for their use in Buenos Aires.

Briefly in 1907, Bouvard travelled to Buenos Aires and drew several projects, namely the urban plan for Buenos Aires (image 03) and the International Exhibition's layout.

The *New Plan[22]* limited itself to fixing limits of streets and plazas, according to the canons of the emerging *art urbain. From then on, the location of railway stations, infrastructures and housing for workers were beyond the scope of action and were debated in other spheres. He passed on his experience in producing the descriptive report, his knowledge in the use of bibliographical references, and in general decision making, which enabled him to present urban proposals in a new way.*

The new plan

Bouvard's plan consisted in a series of diagonals that would break the regular grid of the city and a series of civic centres in some of their junctions. Parks and squares were important parts of the plan. The plan proposed three particular projects for the waterfront, a series of parks in the northern coast of the city; a northern waterfront avenue and a project to open the Plaza de Mayo[23] to the river.

The waterfront avenue project within the urban plan of Bouvard was almost directly taken from the project of Morales of 1895, but it included ideas more literally inspired in French urbanism. Already, ideas of Jean Claude Nicolas Forestier, French park designer, were included in the design of all avenues. Still, the main idea of the whole plan was not to provide a series of isolated projects, but a whole system of parks and avenues that would change the use of the city.

Bouvard focused on one of his main ideas for Buenos Aires: the need to open the city towards the Rio de la Plata.

> "The decisions taken so far, particularly in relation to the more dense parts of the city, have set aside the beautiful features of the incomparable river surrounding it."[24]

This idea surpassed the effects of a previous project proposing a ring avenue, and aimed at alleviating the effects on the coast of the construction of the port facilities. This proposal was inspired by Bouvard's own Parisian project to liberate the banks of the Seine after the Exhibition of 1900. The innovation consisted in establishing a new relationship between the city and the river, an idea that was to be repeated in future urban proposals like those of Benito Carrasco, J.C.N Forestier and Le Corbusier.

Nevertheless, when it comes to his project for the extension of Plaza de Mayo, the disregard for the local conditions was also clear. In the drawing we can see an axial composition, with a perspective that reaches the location of the Congress building, through Avenida de Mayo. However, the Government building that was *blocking* this perspective is eliminated and the whole system of buildings of the power structure of city and country are eliminated. The avenue and park are giving high priority to vehicle circulation and less to pedestrian. The use of green is relegated to a geometric enhancement of the axiality and the square does not provide any sense of nature or natural environment.

This plan in general, like the following ones, would mainly use new instruments rather than present new ways of urban transformation. With the exception of the opening towards the river, it is a sort of synthesis of a process along which many different projects for the city had been drawn. Upon the drawing of the plan, these other projects formed part of a systematised scheme of the changes taking place in the city. In this sense, the New Plan, with the assistance of Bouvard's know-how, condensed the proposals of modernisation of Buenos Aires at the turn of the century.

If we focus on the drawing of the project for the extension of Plaza de Mayo up to the river there is a lot to read through it. If we compare it with the projects of the previous period it is already evident that the concept of public space has changed. There is no regard for a green picturesque landscape to be cut out from the city, for the experience of nature in contrast to the urban conditions. Instead, the open space becomes an integrated part of the city. The civic centre includes architecture, preferably in the lines of a neo classical style. Trees and lawns of grass are minimal and almost inexistent compared to the area given to traffic and the already reduced space for the circulation of pedestrians. This is inevitably related to the City Beautiful movement and the concept

of urban landscape as an art that can have a serious influence in the behaviour of city dwellers.

As in the words of Charles Mulford Robinson[25]:

> "Social problems are to a large degree problems of the environment... with municipal art the utilitarian advantages and social benefits become so paramount that they are not forgotten... This art, which serves so many social ends, is municipal, in the sense of communal... It is not a fad. It is not merely a bit of aestheticism... Altruism is its impulse"[26]

Once again the use of urban landscape as a tool for the manipulation of behaviour of urban society is explicit, but the morphology used for this purpose had changed internationally as well as in Buenos Aires.

The role of Bouvard in Buenos Aires

Bouvard's proposals were criticised in the local specialised press, which pointed out his ignorance of local reality and the lack of an adequate amount of time for preliminary studies. This opposition, mainly embodied by local architects, was aimed at recovering their own role as decision-makers, and set against the mayor and his possible personal interests. The critics exposed the official attitude of ignoring the contributions of a technical body of solid background in spite of belonging to a "new country". On his first assignment, Bouvard acted as a project technician, resolving "from scratch" all the projects, and not as an expert. In spite of this, and under pressure from the city mayor Carlos de Alvear, who was in office only for a year, the general plans were sanctioned by the City Council.

While Bouvard was working in Buenos Aires, a company for public works was being formed with headquarters in Paris. The Company's objectives were "to attract French capital towards highly profitable businesses offered in Argentina to our economic activities: Railways, Tramways, and mining, banking, and public works enterprises"[27]. This company was a consulting firm who aimed at joining together European and Latin-American shareholders of influence in possession of information concerning potential business. The role of these urban technicians was to secure investments in unstable markets such as Argentina.

There are diverging opinions about the role of Bouvard in the development of the city of Buenos Aires. Berjman is rather critical about the work of Bouvard and its implications for the city. She states, and we agree, that having only spent six weeks in Buenos Aires it was extremely difficult to formulate an accurate diagnosis of the problems of the city, and this was obviously the case. Another weak issue in the hiring of the French architect was the political mechanisms followed for this purpose. Having completely capable local professionals for the developing of the plan, the government decided to summon a French architect, whom they paid accordingly. However, his hiring had more to do with a will for international recognition of prestige than for an actual improvement of the conditions of living in the city of Buenos Aires. The morphology of Buenos Aires

and its history are highly disregarded. When Bouvard writes about the labyrinth of the city in his report on Buenos Aires, he is oblivious of the fact that this is not a French or European city with a history of a medieval town with intricate streets and a labyrinthine layout. Buenos Aires' morphology was that of the gridiron layout set up by the Spanish with some slight changes of direction and modifications.

In Bouvard we find an obvious follower of the new concepts of urbanism in which public space and its aesthetics become more important than the already partly achieved aims of hygiene and infrastructure of the city (image 04). Even though his few texts do not refer to the City Beautiful movement, the fact that he was an active participant in World Exhibitions starting with the ones of Paris and following especially with the North American ones shows at least a sympathy for the City Beautiful movement. This was shown also in the search for a change in leisure attitudes, in which active leisure became more important than passive in the planning of open spaces.

Some of the elements of the project by Bouvard, such as some diagonal avenues, and a couple of parks and squares were effectively built, but those of the waterfront were not. However, the avenue project for the northern waterfront would still stay on the table of project leaders and decision-makers to finally be developed in the 1930s.

Jules Charles Thays – biographical facts and urban landscape principles

Jules Charles Thays (1849-1934) (image 05) was born in Paris and died in Buenos Aires after an extended career as park designer and park director of the city of Buenos Aires. He also did some work of park design in neighbouring countries Chile, Uruguay and Brazil.

In Paris he spent his childhood and youth where he was a student of Adolphe Alphand. Later he was also a student of Edouard André, and worked with him as an assistant in local as well as foreign projects in Austria, Holland, England and Switzerland.

While working with André in Paris he met Mister Paz, a *porteño*, who talked to him about Argentina. Later he received an offer to design a park in Córdoba, an Argentine city west of Buenos Aires. Alphand convinced Thays to move and work on the Argentine landscape, so he did. His stay in Argentina was planned to last just a couple of years, but his marriage to a local lady made him stay in Buenos Aires for the rest of his life.

From the beginning of his stay in Buenos Aires, Thays played a paramount role in the configuration of open spaces in the city. He soon became the first *Director de Parques y Paseos*, an institution that would from then on be in charge of the creation and maintenance of all green areas in the city, including street forestation.

Thays was a member of several institutions in the country and in 1913 he was Argentine delegate for the *Congrès Forestier Internationale* in Paris as well as for the International Exhibition in Gent. Thays was extremely respected in all social environments, from the highest classes of Buenos Aires and Paris to the workers and unions. As a writer he

was the first one to publish a book about green spaces in Argentina: *El Jardín Botanico de Buenos Aires*, appeared as homage to the Centennial of Independence in 1910. He also published the book Les Forêts Naturelles de la Republique Argentine, published in France after his visit to the *Congrès Forestier Internationale*. The local professionals appreciated his participation in the Conference and this is seen in the comments after his session:

> "I do not want to close this session without thanking M. Thays for the interesting and pleasant conference that he just presented. He has passed in front of our eyes a series of frames, as artistic as instructive, that us French can see as a great benefit. The Argentine government shows us the way that should be followed for the creation in France of the national parks and we can be usefully inspired by the examples that our friend republic offers us. If our flora and fauna do not permit us to compete with her we could at least imitate them."[28]

This quotation shows that influences in landscape design were not only unilateral and decisions made in a *peripheral* country such as Argentina could be considered even in the most established environments, such as Paris.

Thays is considered by Sonia Berjman as the synthesis of the *generación del 80*, but in contrast to most of the characters of this generation, who were praised as well as hardly criticised for their discourse and their doing, Thays was mostly praised. His work in the beginning of 1890s is regarded highly and shows an inflection compared to previous projects. His work for the city was extended until the 1920s, when he retired and left his son to take over.

Thays' period of work in the parks of Buenos Aires was one of democratisation. The process in which the oligarchy began to lose power to democratic political parties coincided with his park designs. This process made the parks that had begun as a privilege of the elite turn into parks available for the whole population of the city.

Having worked with Edouard André, and also having been close to Alphand was crucial for the formation of Thays as a park designer. He reached maturity in Paris, and for the time he came to Buenos Aires ha was already 40 years old. This made him follow the tradition of his mentors and follow their aesthetic, hygiene and recreation principles, considered for all social classes and for the improvement of the urban landscape.

According to Berjman the whole work of Thays was not an isolated system of open spaces for the service of the population. It was one more element in the configuration of the urban landscape in which *power structures* –government houses, tribunals, ministries – *services* – hospitals, cemeteries, libraries, schools, universities – and *infrastructure* – harbours, railways and water provision and sewage – were all being developed as a whole system.

This process of reconfiguration of the urban environment was a product of an oligarchy that was socially conscious and using models from abroad adapted them to the local situation to create a new system that was suitable for the new urban centres that were

developing. This process was not only a reflection of foreign ideas but an implementation that provided specialised multiple new spaces in the city.

The position as *Director de Parques y Paseos Públicos* was left open in 1891 and the decision was unanimous that Charles Thays would take over the responsibility of all park design and maintenance of the parks of the city. For the competition for the post as Director of parks, Thays presented a text that convinced the jury. He took this position since then until 1913 developing a brilliant career and having influence in every single park that existed in the city at the time.

In his texts, Thays reveals his relation to the ideas of Alphand and André by his description of the concept of garden. For him, the garden is an element created by man, and it is an art, that can influence the behaviour of people through the reproduction of elements of nature.

The second point of his text refers to the nature and hygiene. As Alphand before him, Thays refers to public parks as the *lungs* of the city, a concept that was beginning to be spread internationally, and he proposes the inclusion of new parks and squares in the dirtiest neighbourhoods, especially where there are wetlands and disease was widespread. He also provides information about the capacity of trees to absorb water; he was ahead of his time in this, for now it is well known that in lands that tend to flood it is very beneficial to have trees planted for their capacity of absorption.

Thays thought beauty had the capacity to influence the morals of citizens:

> "A man, especially the one who works, needs distraction. Is there then a healthier, nobler, truer, when able to appreciate it, distraction, than the contemplation of trees, of beautiful flowers, when tastefully laid out? The spirit then rests, sadness is forgotten for a moment at least, and the aspect of the beautiful, of the pure, produces an immediate effect on the heart."[29]

Here we are aware of the importance of passive leisure and the way the environment can be beneficial for the health and morals of citizens. This position is very clear and can be related to leisure practices common at the end of the nineteenth century.

Finally, the last point in his text referred to the criticism of the existing parks and promenades. The main flaws he observed on the local parks were: The bad tracing of the roads, the lack of correct treatment of terrain, the wrong location of the masses of trees, the absolute lack of water games or the wrong location of them, the need for continuing to work on floral decoration. Most importantly he criticised the lack of a park policy that would include all the parks, promenades and avenues of the city.

Thays' discourse was not limited to theory and throughout the 22 years in his position as *Director de Parques* he applied all these enunciates in park design of Buenos Aires and other neighbouring cities of the country and of neighbouring countries.

One of Thays aims was to provide Buenos Aires with at least as much park surface as Paris had. In his *memoria*[30] of the first report as *Director de Parques* he proposed a series of parks and squares that would be added to the existing ones. Paris at the time had 1,950 hectares of green for 2,425,000 inhabitants, corresponding to 7.83 m² of garden per inhabitant and 1 m² of green for each 2.45 m² of the total surface of the city that was 4.700 hectares. Buenos Aires would have, considering the parks projected by Thays: 779 hectares of green space for 550.000 inhabitants corresponding to 14.17 m² of garden per inhabitant and a relation of 1 m² of green for every 25.87 m² of surface of the city that extended through 18,632 hectares (4 times that of Paris).[31]

Thays' role in the exhibition for the Centennial was very important for he transformed his project of Parque Tres de Febrero of 1893 to be able to house the Industrial Exhibition (image 06).

International Exhibition – the project, design and layout

The first location chosen for the Exhibition was Parque Tres de Febrero, the greatest park in Buenos Aires and considered by Bouvard the most suitable place for the pavilions. Finally, the Exhibition took place on different locations mainly in the centre and north of the city. The Northern areas were focused on the parade circuits and the southern and most neglected areas of the city were the site of the protest circuits. The location of the exhibitions was a circuit that would start in the ceremonial centre of Plaza de Mayo and finish in Pacífico, where the Industrial exhibition was held.

The main ceremonial events were realised in the centre of the city, namely on Plaza de Mayo, where the square had been redesigned by Charles Thays in 1894, this layout was kept for the centennial celebrations. Thays' layout followed the principles of geometrical French design. This monumental square had already been turned into an oval by Buschiazzo some years earlier. Thays designed the square as a cross, with a focal point in which the most important monument was placed, the monument of the commemoration of the May Revolution. In 1904 electricity was added to the square and during the exhibition it would be illuminated for evening occasions.

The harbour was also used as a space of celebration, having ships from different parts of the world exhibited day and night. The old harbour of Madero was still in use and located behind the government building and it was considered, as in many other cities which held international exhibitions, as the gateway to the city.

The architectural styles displayed in the exhibition responded to the recent new currents of Art Nouveau, Jugendstil and Modernisme, and were tolerated and lightly criticised considering their temporary condition. However, their influence on the local permanent architecture was greater than expected.

The Art Exhibition had the largest international representation. It was located on the higher ground of Plaza San Martin, north of Plaza de Mayo and close to the wealthiest part of the city. This part of the exhibition had representatives of most European

countries, the United States and some South American countries. It was held on the Pavilion that was used for the World Exhibition of Paris of 1889, designed by French architect Albert Ballú, which measured 1,600 squared metres distributed in two floors. The building was made of iron and glass, which allowed its transportation and reassembly, for it was planned that it would become the fine arts museum of Buenos Aires. At its arrival to Buenos Aires, it was located in Plaza San Martin, close to the centre and to the main railway station and harbour. The Pavilion was restructured for the International Exhibition in 1910, but it kept all its main features. The art exhibition was influential in the development of the city of Buenos Aires not just because of the building it was placed in but also because of the images it showed. Basically these were images related to science, art and labour, which were not only depicting the contemporary image of these activities in Europe but also the local ones, which located labour and science in an important stage in the development of the city.

The international Rail and Transport Exhibition was located in the end of this circuit, closing it in a new monumental area of the city, Pacífico. The exhibition complex was formed by two groups of buildings and a series of gardens and lawns separating them. Between the two groups of buildings there ran the railway line with a station that connected the exhibition with the centre of the city. The main centre of the exhibition was the northern one; a group of buildings organised around a square provided with a garden. This area was considered a civic centre, embellished by the presence of the pavilions. Most of the buildings of this complex were made of iron and glass, and held exhibitions of all kinds of means of transportation. Specifically, the Italian pavilion was designed by Palanti and Moretti, Italian architects. This was a very light iron and glass structure; with a main entrance in the centre of the complex, a squared floor plan with two semi circular extensions on both sides. The building was ornamented with sculptures and had a metal dome in the centre. Other amenities of this part of the exhibition included a Ferris wheel and a cable car, which led from the ground of the British section to the top of one of the main buildings. The southern part of the exhibition, on the other side of the railway line, was just one building, of a more permanent character, with patios and corridors. The transport exhibition not only exposed but also influenced the technological advances in transportation that were to be soon installed in the city, such as new locomotives and motorcars.

The rest of the Exhibitions were located in Parque Tres de Febrero, closer to the river. The Industrial Exhibition, designed also by Thays, was placed in front of the Transport one, across Avenida Vertiz. This was a much more landscaped area than that of the transport exhibition. The main area was green and there was a lake that surrounded part of the pavilions. The area adjacent to the avenue was much more built, holding the pavilions of the workers galleries, raw materials, foodstuff, and other minor pavilions. These were of a more monumental character than those of the transport exhibition, stuccoed and painted white, such as the Spanish pavilion. Closer to the lake there were the pavilions of various provinces of Argentina, as Mendoza or Cordoba, which pavilion was an austere structure made of wood.

The Hygiene, National agriculture and Livestock expositions were also placed in the parks of Palermo. These areas did not have as much international representation as the Art or transport exhibition but were part of a circuit of strategic qualities that allowed the expected spaces of representation.

The Exhibition of Agriculture was a follow up to the annual exhibitions that had been held already since 1886, where products from the whole country were exhibited. The building is one of the few that still exist from the exhibition of 1910.

The Hygiene exhibition was crucial in showing especially the advances in health infrastructure such as the sewer network and new hospital facilities. The Interamerican Congress of Medicine and Hygiene was held parallel to the exhibition. In this exhibition not only products of medical need were exhibited but also products of personal care, such as perfumes and creams, which showed a new face of leisure activities in the city.

Final notes

World Exhibitions have been studied thoroughly, but the work of Pieter van Wesemael[32] is most relevant referring to the architectural and landscape issues of these. In his work he analyses the objectives and motives of these events. The main objectives of the International Exhibitions were the modernisation of Western Society in three main aspects: production, trade, consumption and socio cultural aspects. The motive for these events was based on the possibility of enhancing the country's international status abroad.

All of these issues were present in the Exposition of Buenos Aires.

> "By a means of a world exhibition a small elite of reformist organisers creates an ideological, didactic and spatial framework: a chance for their own programme but also a platform for a global selection of exhibitors who follow their own agendas. Supported by a coherent whole of attractive and entertainingly designed media, they attempt, in a multi sensory fashion, to convey the best and most recent products, achievements, skills, ideas, norms and values from every conceivable walk of life to the public at large. Visitors to the exhibition came due to a mixture of practical interest, inquisitiveness and desire for amusement"[33]

Motivation wise, the exhibition that can be most comparable to the one in Buenos Aires of 1910 was that of Paris of 1900. Scale wise they are incomparable, for the exhibition in Buenos Aires could absolutely not compete with the scale of that in Paris, in amount of exhibitors and public as well as in the quality of the exhibitions. However, the principles that moved them and the fact that Bouvard participated in the landscape and layout of both of them are relevant. According to van Wesemael the exhibition of Paris was influenced by those of Paris 1889 and Chicago 1893. The exhibition was aimed at creating playful, beautiful and spectacular didactics aimed to a larger public than the previous expositions.

The social target of the exhibition in Buenos Aires is not very clear, but even though it was organised by an elite there was a rather high turnout. In Buenos Aires the parades were a much more popular phenomenon than the exhibitions themselves.

Both the urban plan of 1909 and the International Exhibition of 1910 created and determined the limits between the centre and the north and south of Buenos Aires. This led way to new infrastructures and the development of these urban areas.

The issues not addressed in the implementation of the exhibition and in the materialisation of the urban plan were mainly based on this difference between north and south of the city. The northern side was the site of celebration and the bourgeoisie and the southern the space of the working class and protest.

Many issues were involved in the transformation of the city of Buenos Aires, official optimism, immigration and accumulation of capital which led to economical progress and population diversification were all influences in the process. However, the International Exhibition did help this process, being a catalyst of projects that were in the making. The exhibition also provided a set of images that would build the identity of the citizens of Buenos Aires and of Argentina.

The exhibition also contributed in the task of providing leisure spaces that would not only be spaces of passive recreation but also of didactic development. The exhibition introduced the idea of a place of display as a place to learn, so the subsequent development of the botanic gardens, the zoological gardens and the Japanese gardens had a boost of attendance after the exhibition. Monumental compounds as open spaces were also the product of the layout of the exhibition grounds.

The fact that there was an international exhibition also brought a display of social unrest and brought to the eyes of foreigners not only the positivist, capitalist and progressive image, but also the image of the real city, with its social differences and labour and housing problems. Some of these issues were indeed treated in the congresses of social issues and women issues during the centennial celebrations. This brought more awareness to local community about issues such as housing, health and education in Buenos Aires.

Foreign professionals had an important role in the shaping of this image and the urban conditions of the city, however, the conflict that this influence showed with local professionals demonstrated that most of the work done by these foreigners had had a precedent of local expertise. The positive image of Spain was recovered by the exhibition, but still French professionals were called for the tasks of urban planning, for even in Spain, especially Barcelona, it was French professionals such as Leon Jaussely and J.C.N. Forestier who were working especially on open space planning. The systems of parks and avenues that were introduced on the occasion of the exhibition set a standard on park and squares design that would prevail for decades in the city. Foreign professionals did not only work on the shaping of the urban environment but also on the shaping of the new architecture. Foreign architects introduced their styles in

a city that had been, since the 1880s and until then, reproducing the Parisian model of building and architecture.

The Exhibition worked then as a catalyst and tool for the implementation of urban transformations, it worked as a tool for international recognition of a city worth visiting and working with. It developed the northern areas of the city and it finally deepened the segregation problems of the city that are still present today.

Town planning in Recife and the circulation of knowledge: the study of the French Dominican priest Louis-Joseph Lebret

Virgínia Pontual
Federal University of Pernambuco, Brazil

To write about the Movement of the Economy and Humanism[1], the Dominican priest Louis-Joseph Lebret and the engineer Antônio Bezerra Baltar is always a challenge and a gratifying task. The reflections which emanate from the post-World War II period and stretch out to the mid 1960s have not been exhausted. Thus this article sets out to be not something which brings answers to the questions posed by history, but by raising facts to prompt further investigations. Its interest lies in presenting the ideas contained in the documents and public statements regarding the conceptual framework of the Movement of the Economy and Humanism, the relationships established by Lebret in Recife, especially with the engineer Antônio Bezerra Baltar and how various town planning ideas sat alongside each other in Recife in the 1960s.

The Dominican priest Louis-Joseph Lebret

Louis-Joseph Lebret was born in Brittany on 26 June 1897. As a young man, he voluntarily joined up in the army but later he entered the French Navy, where he reached the rank of a ship officer. He left his military career in 1923 in order to become a Dominican friar. Between 1923 and 1939, he set up the "Saint-Malo Movement", out of which were founded fishermen's committees. In 1941 he founded the Economy and Humanism Movement (E.H.). 1942 saw the Movement's launch of its magazine.

It was from 1946 that local the Economy and Humanism groups started to be organized in various regions of France, of Latin America, Africa, Asia and the Middle East. These groups acted as relay stations for the transmission of action for harmonious development. Lebret also founded, from 1957, IRAMM (Institut de Recherche et d'Action sur La Misere du Monde) with Father Pierre, ASCOFAM (Association Mondiale de Lutte Contre La Faim) with Josué de Castro, besides CINAM (Compagnie d'Études Industrielles et d'Aménagement du Territoire) and IRFED (Institut de Recherche et de Formation em Vue du Développement Harmonisé). From 1963 on, he dedicated himself mainly to Church works, by being its representative at several moments, including as an adviser to the II Vatican Council. Lebret died in Paris on 20 July 1966. Among Lebret's main books, special mention should be made of : "La Grande Angoisse de nos Familles Côtières" (1937); "La Méthode d'Enquête" (1944); "A la Découverte du Bien Commun" (1946) and "Suicide ou Survie de l'Occident" (1958).

According to Delprat and Queneau (1986, p. 11), Lebret's work expresses an outlook of action and dialogue, guided by the idea of the common good in which humankind is the centre of social and economic facts. This anthropocentric vision is anchored in a world context of economic and social crises both before and during the two world wars. Thus solutions which might remedy the ills should be founded on knowledge of the social complexes, by following two fundamental axes: the conception that economic

organization should be at the service of humankind and in the association between technical knowledge and political militancy.

Studies conducted on the Economy and Humanism Movement, Fr Lebret's thought and action and the activities of the Society for Graphical and Mechanographic Analysis Applied to Social Complexes (SAGMACS), make substantive contributions. Lamparelli (1994, 1994a and 2000), Leme (1999 and 2004), Lamparelli and Leme (2001), Ângelo (2007) and Josaphat (2007) deserve mention. Lamparelli and Leme provide evidence of not only the contribution which these activities made to the formation of thinking and practices for regional and town planning in Brazil, but they also stress that starting with Lebret's contact with Latin America the direction of their studies started to consider underdevelopment. These scholars further affirm the sociological matrix present in Fr Lebret's formulations out of which he developed his research method, and his permanent reference to the spiritual and religious dimension. Lamparelli (1998, p. 281) emphasizes that this influence is verified mainly in three aspects:

> "(...) first of all by the renewal of the lay militancy of the Catholic movements of young workers and students; parallel to this, by spreading the primacy of the politics of solidarity and the common good as action principles in Third World countries and, finally, by developing an empirical research method, as an instrument of scientific analysis to guide action, aiming at development by the so-called 'l'aménagement du territoire'" ("optimizing the economic division and use of territory – hereinafter referred to as "managing territory")".

This methodology was presented in a systematized way in 1955, in a book published in Paris, Guide Pratique de l'Enquête Sociale: l'enquête urbaine, written by Lebret and Bride, with collaboration from research staff of the Centre de Recherches Sociologiques et Économiques and Michel Quoist, in which the population is a central category.

Another important statement by Lamparelli (1994, p. 91) is that Lebret put forward the Economy and Humanism Movement as the fourth way to distinguish it from the ideologies of Marxism, capitalism and national-socialism, by laying down the primacy of the common good.

Whereas Leme (2004) clarifies the contribution of SAGMACS to training the professional cadres in Brazil:

> "The offices represented a new professional possibility, a qualitatively different experience from the point of the objectives and, also, from the results achieved. On the one hand, Lebret found fertile ground to train young Catholic militants in town planning. (...) On the other hand, Lebret's contact with Latin America bore the stamp of giving a new direction to the Movement's studies to the extent that it included the thematic concept of underdevelopment, a theme which, over the course of the 1950s, became dominant in the Dominican priest's studies."

Ângelo shows that the participation in town planning in Brazil had Lebretian thought as one of its reference points given the overlap between the sociological and religious matrices. Josaphat emphasizes that one of Lebret's most substantive contributions was

to show the confrontation between the socialist and capitalist systems and to propose a new system which might supersede these two and be creative, in order that a just political system and one of solidarity might be established.

Other contributions such as the special edition of the Revue Économie et Humanisme on Lebret, published in 1986, allow substantive in-depth studies to be made on the conceptual framework of this movement, matrices, mode of activity, method, practices, disciples and themed approaches.

The studies and work undertaken by Lebret and the SAGMACS on development and organization of the territory (aménagement du territoire), were what most distinguished Lebret's activities in Brazil. The method drawn up contains contributions and affiliations which come from the social sciences, especially from sociology and statistics which allowed the base of the research method on the organization of territory to be compiled. Lamparelli (1998, p. 284) quotes Le Play, and her followers such as Tourville, Demolinse, Pierre Du Marousseem and Urbain Guérin. As well as, other "(...) contributions received from different currents of progressive and critical thought. Mounier and Péguy,on the one hand, and Marxism, on the other (...)".

What makes these contributions important for understanding the Economy and Humanism Movement in Brazil is that they centre on the facts verified in São Paulo and leave Fr Lebret's move on to Recife to be narrated. However, one cannot speak of Lebret in Recife without referring to the town planner and engineer Antonio Bezerra Baltar, a member of the Economy and Humanism Movement, who participated in many of the studies undertaken by SAGMACS in Brazil. On the life and work of Baltar, studies have been published not only by the author of this article (1996, 1998, 2000 and 2001), but also by research fellows such as Macedo (2002), Carvalho (1992) and Moreira and Macedo (1998).

Lebret in Recife

It was in 1947 that Fr Lebret first came to Brazil to establish contact with professionals, clerics and governmental authorities besides for the purposes of propagating the philosophical and scientific principles of the Economy and Humanism Movement. He came to the city of Recife and made contact with Baltar[2]. According to Macedo (2002), Lebret's coming to Recife was to hold a conference on housing cooperatives. From then on, they worked on establishing strong professional links between themselves. At the same time, clarification needs to be given to the claim that the Economy and Humanism Movement in Recife benefited from the support of Fr Hélder Câmara. It is probable that this support has been verified in a general way for Brazil as a whole, for at that moment, Hélder Câmara was in Rio de Janeiro as an assistant Bishop and later as a bishop and it was only in 1954 that he was enthroned as Archbishop of Recife and Olinda.

Making explicit how they formed a professional and personal relationship allows an explanation of why one vision of Lebret complements the other contributions cited above.

Here are Baltar's words on Lebret, recorded in the preface to the study on setting up industries in Pernambuco, which were drafted and published in 1954:

> "As to natural gifts of perspicacity when observing economic and social facts, Fr Lebret's are, right now, extremely sharp on account of his tremendous experience as a research worker (...). His ability to apprehend rapidly the facts characteristic of an economic complex, to establish relationships between these facts and to interpret them correctly, as a whole, has once more been demonstrated in this study".

Antônio Bezerra Baltar had already spent 15 years working with other important professionals before becoming one of the main members of SAGMACS in Brazil. As a student, he had had a practical attachment to the architect Luiz Nunes. After graduating and as a member, for about 18 years, of the Committee for City Planning, he had interacted with the most prominent town planners in the City of Recife, besides those from the outside who spent some time in the city.

Baltar was a member of the SAGMACS[3] team, and had conducted studies, based in São Paulo. Therefore he states:

> "I was here in Pernambuco lecturing at the University and SAGMACS was there. When a job appeared, I took off for São Paulo, but I only went there when there was a job to be done and they needed me. Now I am one of the Directors (...)"

> "(...) because I worked in São Paulo, I was more linked to the São Paulo unit". (Baltar, 1989)

Baltar stresses that the Economy and Humanism Movement took shape as a reaction to the social doctrine of the Church, then in force. His words show an understanding of economics very unique to that moment, but which was then spread and guided the attitude of many professionals.

> "They were all Christians, Catholics, concerned about the total divergence between what they had learned for centuries in economics and sociology studies and the so-called social doctrine of the Church. If this was not entirely a divorce, what were shown to be insufficient were the economic analyses contained within the encyclicals. They were Catholics, Christians, they recognized that the economy, the economy, in the sense of economic activity, did not have deep thinking from the point of view of Catholic doctrine. Therefore, they decided to found a movement around a magazine: a movement that would seek economics at the service of humankind and would not allow people to continue to be at the beck and call of the economy. This distinction that they made is: the economy, which is a thing of subsistence, is a prisoner of the idea that it is a set of activities through which people satisfy their personal aspirations, and their collective and social needs; on the contrary, people instead of being served by the economy are being enslaved to the urgings and praxis of the economy". (Baltar, 1989)

According to Baltar, Lebret came several times to the Northeast, although how many, at what moments and for what purposes have not been made clear; nor is there any due reference to a SAGMACS office having been set up in Recife or if it were only a case of intellectuals sympathizing with the Economy and Humanism Movement.

But, on one of his trips, Lebret went to Baltar's home, and it is probable that this was in 1954 when Lebret came to conduct a study on the Pernambuco economy. In Baltar's report his admiration for Lebret can be perceived:

> "He came to my house, in Rua das Fronteiras, in Paissandu, (...) he asked for a map of Pernambuco, put it on the table, took a sheet of transparent paper, put the transparent paper on top of it, drew the main lines and then began to question me: into how many economic zones is this state divided ? (...) This took five hours (...). When he finished, he had an economic map of Pernambuco (...)".

For Lamparelli (2000), the presence of Prof. Baltar in a support role to Fr. Lebret and the full SAGMACS team in the ambit of town planning should be stressed.

> "For Fr Lebret, Prof. Baltar alongside some Dominican Friars, especially Friar Benevenuto, was always a competent assistant and an indefatigable promoter of E&H. (...) Prof. Baltar's contribution was especially important in Town Planning Research for, it was based on his theory of town planning indices (...) The objective of the theory and the method in the research was to determine the empirical".

If not all of Lebret's trips to Recife have as at today been identified, two have been duly recorded. One, in 1953, when he gave a lecture in the Grand Hall of the Faculty of Law of Recife, And, the other, in order to conduct a study on locating industries in Pernambuco.

The conference "Civilization's Problems" was mounted at the invitation of the Rector of the University of Recife[4], Prof. Joaquim Inácio de Almeida Amazonas. The key-note address was delivered by Lebret in French, recorded on magnetic tape by the students of the faculty, and later translated into Portuguese. Then, in 1954, it was published with the note, "responsibility for the translation and notes as well as for publication is assumed by the Economy and Humanism Group of Brazil".

However, according to Baltar in his lecture delivered in Recife, in 1989, it was he who translated Lebret´s address : "At the invitation of the Faculty of Law, Lebret delivered this key-note address and I did the translation, the translation errors are mine, the rest are Lebret's."

The conference was presided over by the Archbishop of Olinda and Recife, D. Antônio de Almeida Morais Jr.[5], who proffered words of praise on Lebret's work, and these were incorporated by way of the preface to the publication. It can be said that this moment was very significant, for it represented respect and acceptance being given to the ideas of the Economy and Humanism Movement by the leading intellectual, ecclesiastical and political lights, in a city with conservative traces dating back to its social formation which was linked to the barons of the sugar industry. It is probable that by this conference Lebret acquired professional recognition in the eyes of local leading political figures and thus was invited, in 1954, to conduct the study on the Pernambuco economy.

The extent of the Church´s agreement with Lebretian concepts can be measured through the Archbishop's words:

> "All those who study the social question, sincerely and with righteous intention, can observe the concern with which the Catholic Church has been studying it and seeking to find solutions. (...) Today Father Lebret continues along this fine track set by the Church, seeking, as ever, to awaken the economy to its profoundly human sense".

In 1989, on referring to this conference, Baltar shows with great objectivity the kernel of Lebret's words, especially when he clarifies notions dear to the doctrine. However, what is more interesting is to put forward as possible the influence of Saint Simon on Lebret's thought, perhaps not brought out as much by other interpreters:

> "Well now, in this publication you all see another idea developed by him (Lebret), which is the idea of civilization. He is a little saintsimonesque in this point. Culture within the theories of Economy and Humanism is the result of the accumulation of knowledge, of techniques, of ways of thinking which go on being made from generation to generation, in space and time; and give shape to a context which is understandable and coherent. While civilization is a system, a system of values which the community accepts by a process or by a commitment in a given situation. Thus he shows by means of this address that at the end of the day the problem of development is a problem of civilization. From this comes the spirit of this conference ".

It should be noted that in the period which followed the fall of the New State and lasted throughout the 1950s there was a great political bubbling up in Recife, shaped by the tone of popular culture alongside which Freyrian regionalism remained. The lively cultural atmosphere, swathed in democratic euphoria, saw the revival or the burgeoning of countless artistic groups. Concomitantly with the new cultural expressions, the 50s political scenario was marked by debates centred on the questions of regional disparities, of the under-development of the North-east region and of the social reforms; that is to say, intellectuals sought to propagate and spread ideas the effect of which would be to reverse statements on abject poverty and regional backwardness. Among the technical and political events held, special mention needs to be given to the Congress for Saving the Northeast, the 1st Encounter of the Bishops of the Northeast, the Encounter of Salgueiro and the Seminar for the Development of the Northeast. One of the main objectives of these technical events, the vehicles for ideas and concepts to modernize the region used by Northeast intellectuals and authorities in the Northeast and throughout Brazil was reached with the creation of SUDENE, by Law n.º 3.692, of 15/12/1959, under the directorship of the economist Celso Furtado.

In the early 1950s, the need was made public to create a body focused on planning studies for the local state economy in which the representatives of the executive and legislative powers met with those of the producer classes and the local banking network, with a view to guiding studies, research and programs for economic development, due to the advent of the Paulo Afonso hydroelectric power stations. The expectation surrounding this event and its repercussions on the economy of the region and, in particular, in that of the State of Pernambuco began to motivate intellectuals and the authorities to prepare for its coming into being and to forecast the future. Therefore,

Governor Agamenon Magalhães created the Commission for Economic Development in Pernambuco (Codepe in Port), according to Deceree Law n.º 180, of 11 August, 1952, as a consultative organ of the government and as one that would give assistance to the initiatives for economic development (Codepe, year I, n.º 1, feb./1954, p. 4). The main purpose of this commission was to produce suggestions and proposals to be adopted by the state government, from the perspective of modernizing the Pernambuco environment.

Through the Codepe Information Bulletin, theses, communications, reports and information was broadcast, reproducing the discussions on the then issues and needs. The general tone of these studies from this Commission was industrialization, which should be made a reality, especially, in the city of Recife. Among the issues on industrialization, the need was made public to decentralize industrial development in the sense of taking alternative economies to the interior so as to stem the rural exodus and contain the vertiginous growth in population observed for Recife.

Owing to the expectations and uncertainties of the industrialization which should take place in the State, Codepe decided to seek help from specialists, besides those already to hand in the region. Thus, when its work schedule for 1954 went forward for approval, at a meeting convened on 17 February of that year, the invitation to Lebret was earmarked. The request made to Lebret consisted of the study of the Pernambuco economy, including the presentation of suggestions as to where new industries might be localized in the State.

According to Baltar´s account in the preface of the study, published in 1954, the facts arose as follows:

> "The intervention of Father Louis Joseph Lebret O.P. (...) resulted in the invitation which was extended to him by the Government of the State at the suggestion of the General Secretary of that Commission (...) Fr Lebret got ready to come here to study the problem, so that he could stay here for about two or three weeks, and carry out a programme of intensive work which he himself would outline. About three months in advance, Fr Lebret sent the Secretariat of Codepe, a detailed list for the organization of a dossier which would bring together all the preliminary data for the study in question and in large part would be focused under a cartographical form (...) Thus, on his arrival in Recife, on 3 August 1954, Fr Lebret was immediately able to start studies in accordance with his original method of working (...).During the first days of his stay, Fr Lebret devoted himself to the study of this dossier, his advisors being the General Secretary of Codepe and the author of this preface, placed at his disposal by the University of Recife".

It is worth investigating if it can be stated that the invitation to Fr Lebret bore the feature of this study being under the aegis of SAGMACS, or if there was a distinction between the creator and the institution created.

In August 1954, Lebret spent fifteen days in the State. Moreover he held meetings with the members of the Commission, went on an aerial reconnaissance flight of the region,

and held collective meetings with different groups of specialists, and only then did he go on to interpret and systematize the data collected.

In order to transpose Lebret's ideas to Brazil and, in particular, to Pernambuco, Baltar (1995) states: "a great deal of what was done after his work here in terms of planning closely followed certain guidance he gave before leaving. They were not all cast by him, but there was what was most up-to-date in terms of planning and he was influenced by the great currents of town planning such as the English, German and French ones. And he left ideas which little by little were being absorbed and put into practice".

The result of all this work was consubstantiated in the document entitled "A Study on Developing and Setting up Industries, of Interest to Pernambuco and the Northeast". The central idea present in this document was the feasibility of development via industrialization in Pernambuco and, as a result, reducing its state of under-development.

According to Célestin (1988), the notion of humanized "mise-en-valeur" of regional spaces as a synonym for "aménagement du territoire" present in this study had already been underlined as an essential component of the Economy and Humanism since the Manifesto of 1942, although only in 1952, in the "Charte de l'Aménagement", had this notion been more precisely defined. This understanding subscribed to the outlook of "progressively setting up a human economy following a "pyramidal" model made up of integrating balanced territorial units into different scales, ranging from 'base communities' to a world level, upwards through country, region and nation (Célestin, 1986, p. 113).

Formulating hypotheses ongoing value to territory was founded on the following elements: i) space and the problems of location; ii) duration and the problem of the phases of "aménagement" ; iii) density and the problems of population.

Throughout the study, Lebret emphasized its incomplete character, he considered it as preliminary projections, susceptible to being consolidated. The diagnostics showed the unfavorable position of the Northeast in relation to the Centre-South and the privileged position of Pernambuco relative to the other Northeast States. He declared Recife as a regional metropolis because it has the greatest density of population in the Northeast, it had the only large port in the Northeast, it is well-positioned in relation to the means of highway and rail communications and to navigable routes, it was close to Paulo Afonso and has cultural tradition and is culturally equipped. This was a reading of the regional disparities according to a model of linking up pieces of information and elements of analysis from the Cepalin paradigm. However, they were not differentiated from each other in the final statements on the condition of the Northeast.

The hypotheses for solutions in Lebret's study consisted of organizing emigration and giving rational value to the Northeast. As part of organizing emigration, the need for land reform was put forward. However, such an issue was not relevant. On the contrary, it was indicated as a complex alternative, the structuring of which would demand a long time to mature. The hypothesis of giving value included planned and coordinated

industrialization but it was mainly underpinned by the emphatic demand for specialist knowledge.

The essence of the study was introduced into the long-term planning guidelines and, especially, those for the immediate plan. The first guidelines were general indications as to the types of industries to be set up and the necessary complementary features. In tackling the immediate plan, Lebret made them more concrete, and proposed a scheme for containing internal migrations in which new industries should be located and zoning for the city of Recife. The scheme to contain the population exodus to Recife consisted of two elements: the "crystallization points" and the "towns situated in a rosary". These elements were to be located beside the highways and railroads and were to be applied concomitantly, so as to form perimeter barriers for containing migration. As to locating such elements, those towns were identified which once were centers of production, relations and services and which should have a very prominent role in the economic development of the region.

In the second part of the report, guidelines were established for Recife, which met two priorities: the expansion of the port and the location of new industries. That is to say, on the one hand, the port function would be maintained, out of which the city had been formed, and, on the other hand, the industrial function would be designated as the new route by which to leverage economic growth. These intentions were translated into zoning Recife. Its most favorable areas for expansion were preponderantly set aside for industrial occupation; the hilly areas would serve for setting up a lower-income or blue-collar worker town. The proposal for zoning was based on four functional mechanisms: control of the densities, fluidity of the circulation, a reserve of green spaces and reducing commuting from home-work, by means of the following zones.

Recife as ordered by Lebret was to be an industrial and port city in which industries and the port would dominate the city landscape, and determine its vitality. It was to be, as a result, a blue-collar city, which hitherto had only been a city of the "sub-proletariat", but the chimera of industrialization of which would rescue it from the ills of under-development, and provide the population with better standards of living.

The framework of Ideas for the economy and Humanism Movement in Baltar´s studies

Although Baltar had maintained contact with Lebret since 1947, we consider that it was only in 1949, that he went on to style himself as a member of the Economy and Humanism Movement. Regarding his published works, in a lecture given as ´godfather' of the graduates from the School of Engineering of the University of Recife, he spoke on the doctrine of the Economy and Humanism Movement, as an alternative to passing on the problems of humanity. Entitled "For a Human Economy", the speech expatiated on the task of rehabilitating humanity, also reserved to engineering, i.e. the role of placing technical progress for the benefit of Man fell to the engineer, and he criticized economic liberalism and Marxism since they did not solve mankind's problems and contained contradictions inherent to their objectives and their practices. At the close of his speech,

the doctrine of the Economy and Humanism was introduced as a third alternative for tackling the problem of technical progress given the benefits it would bring to humanity.

In 1951, well before the GTDN (Working Group for Development of the Northeast) report and Lebret's study, Baltar presented his competitive entrance examination thesis for taking up the vacancy in the chair of town planning and landscape architecture. Therefore this did not amount to a SAGMACS study which is an error of understanding that some authors seem to fall into. The primacy of the notion of region over that of city brought as a consequence change in the proposed character of town planning which had been predominant in the practice of town planners in the 1930s.

The fundamental idea of the thesis was to show the city integrated into the region, with which it maintained an intense living relationship; to affirm regional planning and to refute the primitive ideas of town planning being targeted on making the city beautiful, solutions for problems of hygiene, housing, traffic, and town planning perspectives. The objective of the study was to present an expansion scheme for cities, in particular, for Recife.

Therefore, he proposed a detailed check-list for a city, in accordance with three categories of problems: appropriate occupation of the territory, number if inhabitants and their distribution and urban equipment. This scheme consisted of the component elements of the "aménagement du territoire", thus denoting the transposition of planning methods and techniques from the Economy and Humanism Movement, however highlighting references to modern British town planning. More recently, Baltar (1993) had this to say in the first chapter of his thesis:

> "This chapter places great emphasis on the fundamental role which the English have had in this formulation, which International Conferences on Modern Architecture have had,German Bauhaus has had, but, principally the practice of town planning in England, ending with the 1947 Law, drawn up soon after the end of World War II which is the most complete and most perfect document of legal town planning which has ever been made in the world, until today. The 1947 Law analyzes the urban structure, analyzes the economic, juridical, social and political determinations of the evolution of cities and proposes things which affect each on of these aspects of the growth of cities".

The urban model of a regional city, sketched out generically by Baltar, is made up of the following units: the urban nucleus of the regional city; the satellite cities, with their respective urban centers and residential units; residential units, with their respective local centers; the industrial units and the green zones – agricultural and forest areas; besides the road-rail system.

Baltar made the transposition of the principles of architecture and modern town planning broadcast by the CINAMs, but he transposed, especially, the experiences of post-war British town planning, above all the town planning legislation of 1947. The transposition of the garden-city model was preponderant, whether as a standard for re-modeling what already existed, or to guide the new occupations and city edifications. Nevertheless, the transposition of the framework of ideas of the Economy and Humanism Movement is

present in adopting the notion of region yet his work as a whole is focused more on modern town planning.

In the 1953 text "University, Economy and Humanism", Baltar tackled the problem of integrating the university into the modern world by putting on display the ideas and history of the Economy and Humanism Movement. In this text, he is emphasizing the concept of the common good, which was based on the doctrine of St Thomas Aquinus, and the contributions of René Moreux because he had undertaken studies on the transformations of the world centers of production; of Jean Marius Gatheron, because of his analysis of the chronic imbalance between agriculture and industry; of François Perroux on account of his analysis of the transformations underway in politico-economic institutions; of Loew, because he had studied "in loco" the conditions of the workers of the docks in Marseilles; and, also, of Thibon, Dubois, and Laulhère because of their studies on the agricultural and industrial structures of France.

Those who embraced the doctrine of the Economy and Humanism seem to have kept on broadcasting its principles for longer. Thus, the Seminar of Specialists and Staff in Town Planning, held in Bogotá, from 05 to 31 October 1958, resulting in the Andes Charter, demonstrated humanist ideas were present, by the fact of its thematic framework and the fact of those who participated. Baltar, the engineer Mário Laranjeiras de Mendonça (from Lebret´s team in São Paulo) and the architect from Bahaia Newton Oliveira formed the Brazilian delegation. Baltar's performance at the Seminar was remarkable, as he himself was present in all the debates, presided over one of the thematic committees, gave a keynote speech and granted two interviews.

> "A month was spent in Bogotá discussing six themes, each one of which had been developed by specialists of an international level, UNO, OAE and other international bodies which were present at the meeting and who discussed each theme with everyone present who numbered more or less around forty. Then they wrote the Andes Charter a good part of which was edited by me because they had had a great many arguments and I was regarded as the peace-keeper, I did the editing which everyone accepted."[6]

The framework of ideas of the Economy and Humanism Movement was, unquestionably, one of the most important such frameworks ever transposed to Brazil, and, it was Baltar, in the city of Recife, who best spread it. Currently, humanism continues to be an anchorage from which reality can be interpreted and economic and social proposals formulated. Therefore this continuity is emphasized.

The innovations introduce by the framework of ideas of the Economy and Humanism Movement did not amount to a rupture with the framework of ideas of the CINAMs and post-war British town planning. Defining guidelines regarding the location of economic and residential structures, locating street furniture and living quarters and population densities and dislocations did not contradict the precepts of modern architecture and town planning; these were rules regarding the different levels of ordering and control - in one of them, they were guidelines on procedures and modes of doing, in the other one, they were determinations of what to do, which found expression in relations and dimensions.

[1] The Movement of the Economy and Humanism was establishing in 1941, with the aim of state the bases of doctrine convergent with the Christianity faith and criticize the politics systems at the time actually. This Movement was the answer and one alternative the Christian democrat ideology then actually in Europe of post-World War II, one social mission of the Catholic Church. Yours promoters begin with the engagement in the workers communities, realizing studies that have supporting of the doctrine funded in the prime of common well and the human economy.

[2] Antônio Bezerra Baltar was born in Recife, on 16/08/1915. He graduated in civil engineering in 1938. As a student: he had a practical attachment to the Directorate of Architecture and Town Planning of the Secretariat for Highways and Works of the State headed by Luiz Nunes, and was a member of the Organizing Committee of the Institute for Social Security of the State of Pernambuco. As a politician: a member of the Democratic Left and of the Brazilian Socialist Party (PSB), he was a member of the municipal, state and national directorate; in Recife he was twice elected as a councillor for the PSB, first in 1955; he was elected as the under-study of Senator Barros de Carvalho on the slate of Cid Sampaio, in the election for the government of the State in 1958. As a professional: Head of the Engineering Department of IPSEP until 1943, engineer of the Brazilian Association of Portland Cement; District Head of DNER; Representative of the Engineering Club in the Planning Committee for the City from 1944; Superintendent Director of COPERBO, in the first Arraes Government; a member of Father Lebret's team, in Brazil, for 15 years. Founder of the Study Center for Urban Planning (CEPUR), in 1962. In exile, he worked on the Economic Committee for Latin América from 1965 to 1982. As a teacher: in the School of Fine Art, temporarily, in the chair of Town Planning (1941-42), having successively taught the courses on Perspective, Theory of Architecture and Small Compositions and, as a duly approved by public examination teacher of Town Planning (for 24 years). In the School of Engineering, in the chair of Economics and Finances (for 20 years). Stripped of his position by Institutional Act No.1, he was sent into exile from 1965 to1982, after return from which he taught for two years before taking retirement. Information taken from Montenegro, A. T., Siqueira, A. J. e Aguiar, A. C. M. de (orgs.) (1995) and from an interview held with Baltar in February 1995.

[3] According to Macedo (2002, p. 63), it was as from when Baltar took part in the study on the economy of Pernambuco, in 1954, that he became leader of the town planning research of the SAGMACS and remained so until 1965.

[4] In 1965, the University of Recife started to become an integral part of the new educational system in Braziland assumed the name of the Federal University of Pernambuco.

[5] D. Antônio de Almeida Morais Jr. was a teacher and performed various sacerdotal duties in São Paulo; he was Bishop of Montes Claros (MG); Archbishop of Olinda and Recife (1952-1960) and Archbishop of Niterói (RJ) until 1979. In the Northeast, he took part in discussion groups, comprising members of the Federal public administration of the Brazilian episcopate, which together put forward a solution for the problems of the Region. He published various books.

Redevelopment in Japan and replanning in the United Kingdom after the Second World War

Takashi Yasuda
J. Sano
K. Otani
Y. Yoshizum
Setsunan University, Japan

Introduction

Town planning systems vary depending on their historical and socio-economic backgrounds. Furthermore, they are influenced by various natural and geographical conditions. Therefore, there is a difference in the value, which has been made a goal of the system. For example, in Japan the security against disasters and fire is one of the first targets.

This paper focuses on the features of the Japanese war damage reconstruction plans and projects, which were similar to that of the English planning schemes or outline plans. It also refers to some weak points, which the Japanese reconstruction plans had, in comparison to the English reconstruction plans. One of the most important planning goals was to rebuild disaster prevention performance within urban infrastructures in Japan. It was difficult to include rebuildings in the reconstruction planning, for Japanese cities mainly consisted of wooden buildings prior to the Second World War.

This report examines the experiences of the Japanese pre-war planning and post-war reconstruction projects, mainly in Okayama and considers the position and significance of rebuilding plans in the Japanese planning system. Okayama is located about 600 km west of Tokyo.

The evolution of modern town planning in Japan and the Great Kanto Earthquake

The modern town planning started with the first plan for urban improvement in Tokyo in 1889. At that time, the form of main cities in Japan still remained early modern place and space system. Tokyo, Kyoto and Osaka had populations of several hundred thousand, main cities in local areas as Kanazawa, Hiroshima and etc. had populations under one hundred thousand. Many of them remained urban patterns of early modern castle towns. Okayama, one of traditional castle towns, had a population of just about thirty thousand.

As a modernizing country, the central government promoted regional and industrial development policies. The growth of main cities changed variously. In 1920, the first census survey was held; Tokyo and Osaka emerged to megalopolises with over one million population. Kyoto, Nagoya, Yokohama and Kobe became metropolises with populations over four hundred thousand. Kanazawa, Hiroshima, Sendai, Nagasaki, Kagoshima and Hakodate developed into regional centers with populations over one

hundred thousand, Wakayama, Fukuoka, Niigata and Okayama were also developing into regional towns with about one hundred thousand.

In those days, the 1919 Town Planning Act and Urban Building Act were promulgated, and modern town planning system was established in Japan. Until then, main cities such as Tokyo and Osaka were preparing to establish modern town planning system through urban improvement planning.

Four years later, the great Kanto Earthquake occurred around Tokyo and Yokohama. The 1919 Act had some articles on land readjustment method, but they had no large-scale applied example in Japan. So the central government enacted and applied the Special Town Planning Act in 1923 to restore and rebuild the damaged areas. The central government hurried to realize important urban facilities aimed in the 1919 Act. Those facilities were urban infrastructures to maintain public peace and order, and to improve civic well-being.

On the other hand, the central government as a modernizing country encouraged the promotion of industries and foreign trades. The policies of the government were reflected growing population in the cities mentioned above. Almost all main cities in Japan proposed constructions of industrial areas and port facilities as urban targets. After World War II, Japanese social system changed seriously, but these targets continued to exist. I would like to examine the fact through a study on the Okayama rebuilding planning and projects.

Town planning in Okayama before the Second World War

In several previous years of the 1919 Act, meetings of the city improvement survey committee started in Okayama city assembly. The record of the city assembly meeting dated June 4th 1913 shows statements on the establishment of the city improvement survey committee and three time meetings. They show also the names of eight members of the committee. The detail of activities of the committee is not clear. The record dated March 7th 1914 shows that the provisions of the city improvement survey committee consisted of six articles was presented as 27th Bill and decided.

The details of activities of the committee after that are not clear. According to the record dated March 8th 1923, eight members of the town planning survey committee were elected. The record dated September 18th same year shows that the abolition of the provision of the town planning survey committee was presented and decided as 70th Bill. A comment describes that Okayama was designated as a registered city on July 1st under the article 2 of the 1919 Act, and the provision of the committee which was announced as 3rd city notice in December 1922, was abolished by the order of the authorities.

According to some records of the city assembly meetings, town-planning areas were decided in 1924, and on August 6th 1925 six members of local town planning committee were appointed among the city councilors by the chairman of the city assembly.

By these records, we can recognize that the Okayama own urban improvement survey committee was abolished by the establishment of the local town planning committee under promulgation and enforcement of the 1919 Act. Thus the town planning in Okayama was situated under the advice and control of the central government through the local town planning committee of Okayama prefecture after the 1920s.

The records of the city assembly have no describes of the activities of the local town planning committee. The records show the promotion of industrial developments, constructions of the Okayama port and main roads as urban policies. Also many records show the promotion and advices of land readjustment projects for construction of important urban infrastructures.

A published document in 1938 showed a road plan, a transport facilities plan and land-use zoning plan. The document was published by the town planning division of Okayama city, but the plans were decided by the local planning committee.

The city administration area of Okayama was 5.77 square kilometers and its population was 47,564 in 1889, when the modern city administration system started. By 1935, the area became about 48 square kilometers, and the population increased to about 1.6 hundred thousand through the consolidations of neighboring smaller municipalities to form the greater Okayama. The population density decreased from 8,243 per square kilometer to 3,443, but the population density in inner built-up area was still high.

Development projects in Okayama and Japan before the Second World War

The national land planning after the 1930s stressed the importance on the restraints of metropolises, and the green space plan as a metropolitan area planning. In the 1940's, national and local land plans were supposed to push ahead for the decentralization of industries. This was decided in "the matter related to the dispersion of industries" issued by the Ministry of Commerce and Industry in 1939, and was carried out with "provisional measures on industry restricted areas and industry promoted areas "in June 1942.

On the one hand, the construction project of the Shinkansen, or a bullet train, between Tokyo and Shimonoseki was decided in the 75th Imperial Diet in 1940. Moreover, some committees involved, decided "the construction standards for the Shinkansen between Tokyo and Shimonoseki". The plans for construction works were approved from 1940 to 1942. 821 kilometers of the total route were decided, some construction sites were purchased, and the work eventually began. However, the situation in the Pacific War was getting worse, and construction of the Shinkansen halted in 1944.

In Okayama, the Town Planning of Okayama was officially announced in 1938, which was decided already in 1927-29. Meanwhile, Okayama prefecture made rules about the committee on attraction of industrial development according to a national policy. In effect, it invited some companies such as Kisha-Seizo Co. Ltd to set up in the southern areas of Okayama. It also made a start on the construction of the port of Okayama.

Therefore, the construction of transport facilities was required in this area called the Konan Industrial District. Delegates from companies located in the area had meetings since 1944. In May 1943 Seikichi Hashimoto, the Governor of Okayama Prefecture, applied to Yoshiaki Hatta, the Minister of Railway, for approval of railway construction survey and planning in the coastal industrial region. Later, the construction of the railway(Okayama Rinko Tetsudo) started at Oomoto station on the Uno Line after the war.

Rebuilding plans and redevelopment projects in Japan after the Second World War

Okayama, Wakayama, Himeji, Tokushima and Tsu were listed and developed as urban areas under the development policies of industrial cities in Japan. Consequently, these cities were seriously damaged during the war. The damage in each city covered an area of 1,000,000 to 2,000,000 *tsubo* (1*tsubo*=3.3 square meters) and included some 10,000 to 30,000 houses, and about 500 to 1,700 citizens were killed.

After the end of war, the national government issued an outline for building emergency housing in devastated cities, and the Cabinet decided on the basic policy for the reconstruction plan for war-damaged areas: The basic policy and direction became one of holding down on excessively large cities and promoting the development of small and medium-sized cities in localities.

On the other hand, pre-war local committees of town planning continued. In Tokushima the committee decided a reconstruction plan in March 1946,and in Okayama in June in the same year. These reconstruction plans mainly consisted of road plans.

The Cabinet also decided to promote implementation of land readjustment projects by some associations for war damage rehabilitation areas of Tokyo in May 1946. The War Damage Rehabilitation Board(WDRB) established criteria for design for rehabilitation land readjustment in July the same year. After that, the Special City Planning Act of September 1946 was necessary for their implementation.

Therefore, those cities mentioned above were included in the 115 cities, which were officially designated as war-damaged cities on October 9th 1946 under the Act. Each city was considered a full functioning urban area with public health, disaster prevention, and so on, under the basic policies of the previous year. They were also making reconstruction plans, the goal of which was to promote scenic areas, and to establish transportation, industries, and cultural events.

In Okayama City, Tomisaburo Hashimoto, the new post-war governor, made a proposal for a reconstruction plan including the construction plans of Rinko and bullet train railways. He was not only the governor of Okayama City at that time, but he was also the president of a local newspaper. He was known as a person who did not follow tradition, but a person representing the rising interests in developing industrial areas located in the southern region of Okayama Prefecture.

The outline of Hashimoto's proposal was presented at the Consultation Committee during the city assembly on January 21st 1946, consisted of a total of sixteen items. Nine of the sixteen items involved proposals on the width of main roads. The other seven involved the relocation of the city hall near Oomoto station, the decision on where to put the city market place, the relocation of the prison, the construction for a new bridge, the construction of the overhead Sanyo Line, and the designation of two green belts. It should be noted that two east-west roads with widths of 70 meters, and three north-south roads with widths of 36-50 meters were outlined in detail within the proposal. If one examined road maps from the outline, one might conclude that the prewar loop road plan had become secondary to the plan of widening main streets in the city center.

The reconstruction plan of Okayama city (No.43 notification of town planning decision by WDRB, June 13th 1946 before the promulgation of the Special City Planning Act, implementation order by Prime Minister Sept. 3rd 1946) was presented in front of the city assembly in November 1946. However, the plan was trimmed down due to financial difficulties, and the strong objection against burdens from the local landowners (30 percent area reduction or contribution system and relocation of over 10,000 houses), and was changed, according to the 184th Notification of Construction Bureau on May 15th 1948. Moreover, the plan was drastically cut down on project areas, according to the "Fundamental Policy for the Reconsideration of Reconstruction Planning" adopted by the Japanese Cabinet on June 24th 1949.

Consequently, the reconstruction plan of each city was a construction plan for urban infrastructures, which mainly consisted of green spaces, roads, and bridges under the leadership of the central government. The plan was expected to be materialised through land readjustment projects. The difference among each city's plan was road patterns influenced by hills and rivers, the reconstruction of symbolic castles, and the reuse of castle sites. It was one of the most important planning issues aimed at for the conservation, and the formation of the townscape, that in turn will be important into the future.

In Okayama, the route of the pre-war planned bullet train was explained in detail in the first war-damage reconstruction plan. The plan included Shin- Okayama station in the neighborhood of Oomoto station on the Uno Line. Eventually, the construction project of Shinkansen as envisaged in the inter-war period was abolished in 1956 and Shin-Okayama station was not built. New post-war Shinkansen construction work started in 1959.

In addition, it was written in the history of many cities, that reconstruction activities in local economic communities were established immediately after the end of the war. Reconstruction activities by local citizens were carried out as rebuilding shopping arcades and their own houses. Therefore, to the best of my knowledge, those documents of the reconstruction planning hardly remain as formal records today.

Replanning movement in the UK around the Second World War

In the UK, approximately 250 "reconstruction plans" have been traced for the period c.1940-1952 by Prof. Peter J. Larkham. Many planning authorities and joint committees were established in the first half of 20th century in England. Some of them were preparing outline plans or advisory plans.

After bomb damages of the second World War, they made up many interesting and significant reconstruction plans including no war-damage town and cities. The plans also were outline or advisory plans. The decade will be called a peak of planning movement around the second World War. The nature of rebuilding plans would be in the following concepts and procedures;

(1) Shaping of the town images
(2) Reconfirmation of the concepts of development and conservation for amenity
(3) Reformation and reorganization of urban structure
(4) Establishment of planning profession
(5) Beginning of area-based approach
(6) Formation of reconstruction planning within surrounding regional planning

Even if the rebuilding plans in England had the nature of place promotion and civic boosterism, they were plans which were prepared by the leadership of local authorities and committees. They will be said community reconstruction plans

Summary and conclusion

Immediately after the establishment of the 1919 town planning system in Japan, reconstruction planning and projects were needed for the damaged areas of the great Kanto Earthquake. To build urban infrastructures for facilitating disaster prevention performance, the central government was asked to take rapid measures and leadership.

Formerly, a system of local planning committees leaded by the central government was established to build urban infrastructures for promotions of industrial development and trades. The policies for these promotions were reinforced through the rebuilding projects and planning after the Second World War. The reconstruction planning was also speeded up for rapid rebuilding and the Special City Planning Act was enacted. Measures for the reconstructions were also land readjustment projects.

I described above on these central government-led and project-oriented town planning system through a study on the town planning of Okayama pre- and post-war period.

The main policies of the central government were promotion of industrial developments, trades and infrastructure building for industries. The plan of the bullet train was also a central government-led infrastructure-building project of national land planning.

In comparison with Japanese planning system, many reconstruction plans in the UK around the Second World War were rebuilding plans of communities. The new town plans to decentralize population and industries of metropolitan areas were also community-rebuilding plans. We had both a development- oriented planning system in Japan and a planning-oriented system in the UK in 20th century.

The patterns of *Machi-zukuri* in *Japan* and *Maul-mandulgi* in *Korea* on historic townscape conservation; focused on the resident organization

Ilji Cheong
Tokyo University, Japan

1. Introduction

1-1. Background of this Study

In *Korea*, until the 1990s, strong regulations for historic townscape conservation by the government failed to conserve the historic area, because there was no consensus of local residents. In other words, there was no participation of local residents. Rather, movements against the regulations by the residents often happened. But, since 2000s, because of a new initiative which is not only based on the support of the government but also the collaboration of the local people, the local government, and professionals, the situation has been changing. Lots of resident organizations on conservation have been created and have come to play an active role.

As can be seen in this case study, a consensus of local residents is one of the keys to the success of the town conservation planning and projects, especially in Asia. And on achieving a close consensus on the planning or the project itself, activities towards the sustainable development by resident organizations with support from the government become an important initiation.

On the other hand, in *Japan*, activities by the resident organizations also play an important role in arriving at a consensus of residents. But after achieving a consensus, it is usually the government and a representative of the local, for example, the *Machi-zukuri* Council, that lead the conservation planning and projects. Often, new issues such as house unoccupancy due to a dislike of traditional houses, negative impact from tourism activities, etc, begin to appear in the conservation areas. However, it is impossible for the government to cope with all the problems including landscape design guidelines, due to its limitations, especially manpower and financial limitations. In such circumstances, the resident organizations, for example, NPOs, should continually have more involvement on the conservation.

With the *Korea*'s and *Japan*'s case, we can say that the community style such as the system of the resident organizations or the relationship among the subjects on historic townscape conservation is one of the important parts to research.

1-2. Objectives

Therefore the aim of this research is to reveal the role and characteristics of the resident organizations for conservation, and the relationship among the local people, the

government and the resident organizations after the initiation of the project with the case studies of *Korea* and *Japan*. And in this research we will compare townscape conservation in *Korea* and *Japan* by looking at the characteristics of *Maul-mandulgi* in *Korea* and *Machi-zukuri* in *Japan*, which both can be simply defined as the residents' continual involvement in the regeneration of their environment (Note 1, Note 2), but which are different.

The ultimate target is to consider the ideal system of the resident organization and to get a more general suggestion to support the community design by looking at cases in other countries. In this research we used *Yanaka* area in *Tokyo, Japan* and *Bukchon* area in *Seoul, Korea* as the study areas that the townscape conservation project has been initiated and the resident organizations are actively involved in the conservation.

1-3. Definition of Terms in this study

(1) Resident organization
A resident organization is usually defined as the organization consisting of people who live in the same area and are involved in the politics, economy, customs, etc, of that area. In this study especially, we will focus on the 'theme community' which is a newly organized community by the local people to act on a specific part as opposed to the 'traditional community'.

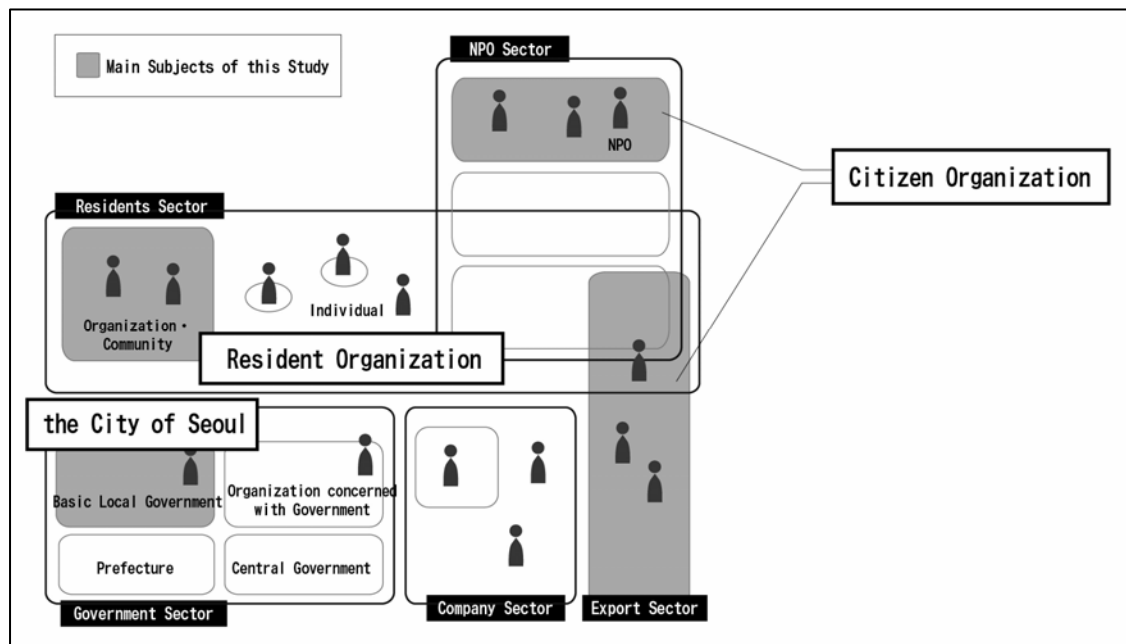
(2) Citizen Organization
In this study, a citizen organization can be defined as a NPO (non-profit organization) made up mainly of experts or the citizens, and supports urban regeneration activities on a wider regional scale.


Fig. 1 Main Subjects of this Study
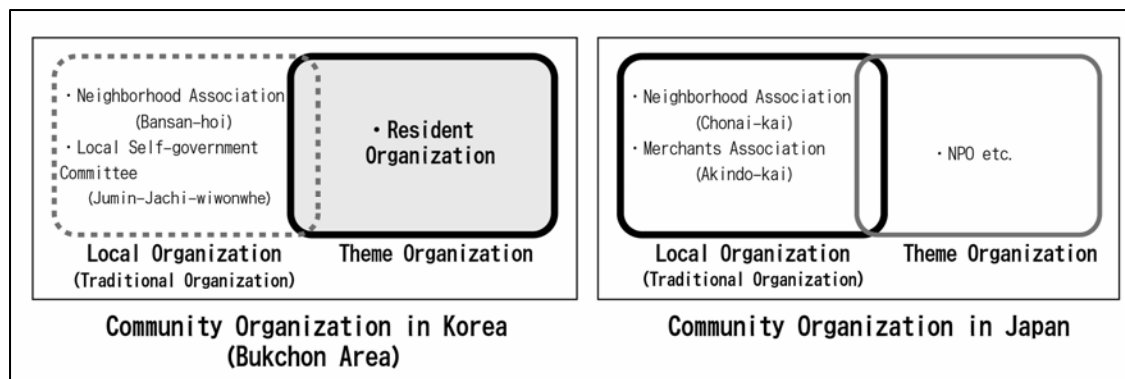

Fig. 2 Limit of Resident Organization on this Study

2. Placement of this study

2-1. Placement of this Study in *Japan*

In the case of *Japan*, movements by the local people on their welfare, environmental conservation and so on which can be called *Machi-zukuri* started to spread in the early 1970s. And in the late 1980s, community activities by various citizens on concepts like historical townscape design, disaster prevention etc. became common. Because of such movements, in the 1990s, collaboration among the local government, local people and the citizens like NPOs became to spread on a national scale. In addition, government policies such as the *Machi-zukuri* Ordinance became enacted. (Note 3)

2-2. Placement of this Study in *Korea*

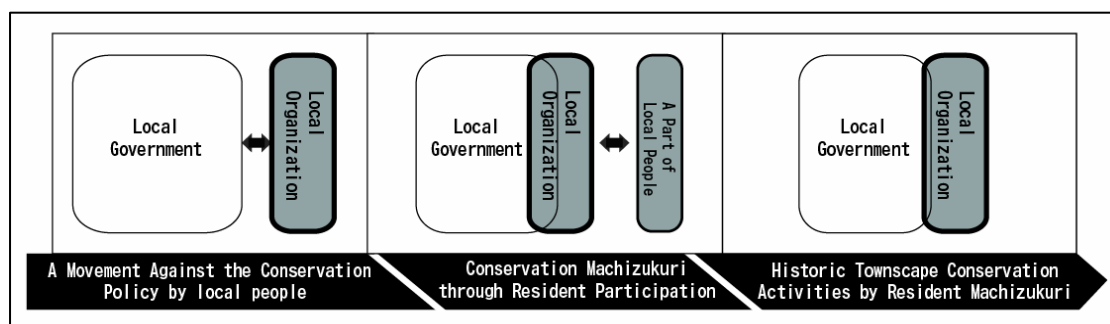
In the case of the regular areas in *Korea*, community activities which can be called *Maul-mandulgi* became to spread in the late 1980s. On the other hand, in the case of the historic townscape conservation areas, as we mentioned before, movements by the local people against the government's conservation policy often occurred. However, after the 2000s, because of the collaboration project of the government with the local people, the townscape of the area began to improve, starting with the repair and maintenance of the historic buildings, and the image by the local people towards local area also began to improve. As a result, activities by the local people towards conservation started to spread.


Fig. 3 Transition of Collaboration judging from the Relationship between Government and Local People in the Historic Townscape Conservation Area in *Korea*

2-3. Placement of this Study after the conservation project in *Japan* and *Korea*

In the case in the historic townscape conservation area in *Japan*, the activities by the resident organizations take an important role in the townscape conservation. But after the designation of a conservation district or a conservation project, design guide policy tends to be led by government and the local council. On the other hand, resident organizations and citizen organizations, etc. deal with the problems like house unoccupancy promptly and flexibly.

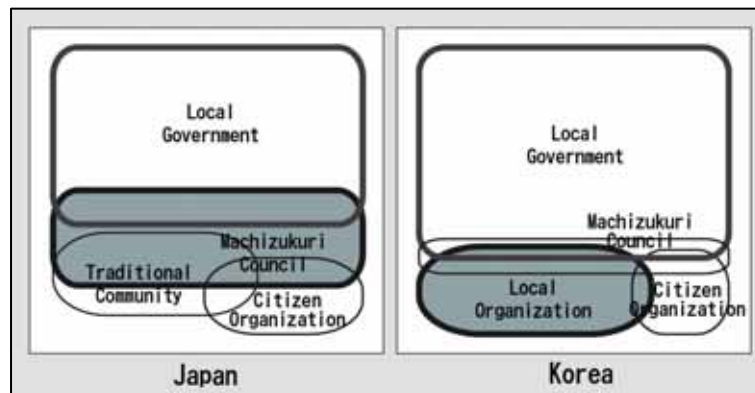
In the case of *Korea*, after the designation of a conservation district or the conservation project, the government led all the execution, even though it collected the opinion of the residents. But because of the limitation of the government and necessity for a more livable environment, local people started to carry out conservation activities and deal with the local problems by themselves.


Fig. 4 Comparison of Collaboration System on the Townscape Conservation between *Korea* and *Japan*

3. Conservation project and *Machi-zukuri* in *Yanaka* Area, *Japan*

3-1. Outline of *Yanaka* Area

Yanaka area, now attracting widespread of popularity as a "town of temples and slope" has historically been a temple town since the *Edo* period when the urban program at that time solicited many Buddhist temples to relocate there. However, beginning from the *Meiji* period and until the present, this area has experienced rapid construction of roads and new buildings. But regardless of these changes, historical sites such as temples, houses and old streets still remain in *Yanaka*.

Yanaka area is the 83 ha area bordering Taito ward, Bunkyo ward and has the scenery of lots of temples and houses. As the administrative division, *Yanaka* is located in Taito Ward. But, from the view point of landscape and community, there is a remarkable organic and flexible continuity with other neighboring wards. Even though Yanaka has faced disastrous times such as the *Ueno* War (1868), damage from the *Kanto*

Earthquake (1923) and the Second World War (~1945), we can still find a chronological order of historical continuity from the *Edo* period to the contemporary time. *Yanaka* area has had more temples than any other area. So it can be said to be a temple town. This was as a result of the *Edo* policy of trying to move the temples into this area because of *Mereki* Fire (1657), and so on. As the temples increased, visitors to the temples also increased gradually. Naturally the need for a commercial area led the established of a merchant town. More than 70 temples and *Machiya* from the *Edo* period exist until now. (Note 4, Note 5)

Yanaka area still retains the old style of narrow streets and many temples. However, the area is now on the process of various structural developments including development of huge apartment etc.(Note 6)

3-2. Actual Condition of Resident Organization in *Yanaka* Area

Since the early 1980s, there has been lots of resident organizations; *Yanaka* Community Committee, Young People Countermeasure Committee etc. In addition, because of the promotion efforts by local magazine [Yanesen] since 1984, the image of *Yanaka* has become to change from a negative one to a positive one. In 1989, *Machi-zukuri* group [*Yanaka* School] made up of architecture and urban planning students as well as representatives of local people was created and since then it has been active offering professional advice on the local level.

From the 1980s, because of the bubble economy and the deregulation of the architectural industry in 1986-89, construction of huge apartments has led to the destruction of historical buildings, temples and the streetscape in *Yanaka* area. An example of this was the announcement of a plan for a large-scale apartment containing 9 floors. Against this plan, activities like the examination of the building conditions and a signature campaign for the plan review was started by the neighborhood association, temple organizations and [*Yanaka* School] members aimed at the plan review. As a result of these activities, the plan was changed from 9 floors to 6 floors.

Because of this movement, the [*Yanaka*-Ueno Sakuragi district *Machi-zukuri* Charter] was established and the consensus for the building standards was undertaken. And as a *Machi-zukuri* council for the whole area, [*Yanaka* district *Machi-zukuri* Council] was established by the neighborhood association, the business association, Community Committee etc. These organizations have been examining and proposing projects for the Ward. In addition, Taito-Ward organized [*Yanaka* district *Machi-zukuri* Examination Committee], which has made various adjustments concerning the project plans.

But at the same time, the participation of the experts in planning, support for the condition examination and their offer of the plans that take into consideration values important to a particular region was necessary. So, the [NPO *Hito-Machi* CDC] was established by the members of [*Yanaka* School], as the supporter of *Machi-zukuri* Council. (Note 7)

3-3. *Machi-zukuri* on townscape conservation in *Japan*

It is important to gain the consensus of the local residents before initiating a project especially a large scale project such as townscape conservation project. So, establishing the *Machi-zukuri* Council composed of the local people and the local government is very common in *Japan.* This is the main concept of *Machi-zukuri* in *Japan. Machi-zukuri* Council starts to solve some problems over the whole area. And of course, the council is based on the [local community], for example, the neighborhood associations. As a result of this system, the participation of the local people, as well as the collaboration of the residents and the local government becomes possible.

However, the councils are limited by their jurisdictive boundaries. Therefore, even as they attempt to solve various problems, they often face difficulties and are often unable to offer prompt response. In addition, although the relationship between the members in the council is very strong, the relationship with other groups can easily result in conflict.

4. Conservation project in *Bukchon* Area

4-1. Outline of *Bukchon* Area (*Hanok* Village)

In *Korea*, there are 6,420,000 apartments, representing 52% of the total number of houses (June, 2004, Construction Traffic Department). On the other hand, until now, in *Bukchon* area, there has been a historic townscape with historic houses, streets, and so on. So it can be said that *Bukchon* has very special meaning in *Korea*. This area is in the center of *Seoul,* and it takes about 20 min on foot from downtown *Seoul.* The area is about 78.735 ha, which has been designated as the urban esthetic district since 1983. In *Chosen* period, noblemen lived there. Such large sites have been subdivided since 1900s because of a sudden increase in population and the resulting housing shortage, and standardized *Korean* Houses (*Hanok*) have come to be steadily built in the smaller sites.(Fig 5, Fig 6)

4-2. Genealogy of Conservation Policies ; 1980s-1990s

The conservation policies in *Bukchon* area started in 1983 with a regulation designating it as urban aesthetic district. However, as stricter regulations appeared, movements against the regulations by the local people intensified. For example, the [Association for the Cancellation of *Hanok* Preservation District] was formed in 1988. Consequently, the regulations in this area have come to decrease since the 1990's. As a result, the historic houses and townscape have become disturbed. This has resulted in the townscape of *Bukchon* changing rapidly.

Fig. 5 General Scenery of *Seoul*

Fig. 6 Scenery of *Bukchon* Area

4-3. *Bukchon-Gakugi* Project

From now, we will talk about [*Bukchon-Gakugi* Project] which means the project in *Bukchon* area for historic townscape conservation based on citizen participation. Because of the rapid changes of townscape such as streetscape changes or changes in living environment, in 1999, some of the local people began to demand conservation measures from the local government and in 2000, the *Seoul* Government established [*Seoul* Central Planning Bureau for Conservation of Historicity and Tradition] .
As a result of these developments, a project plan was initiated with discussions at the [*Bukchon-Gakugi* Task forces] in which the local people, local government and professionals participated, in addition to an informal discussion between planner and local people. The project started on Dec in 2001 with the establishment of [*Bukchon-Gakugi* Master Plan].

The project was comprised of 3 parts. Firstly, the [guide support] for *Hanok* was started. [*Hanok* Support Ordinance] was created in order to support the cost of repairing houses. At the same time, the *Seoul* Government purchased and leased lots of *Hanok* for cultural use such as use as guesthouses, museums, etc. And, [Prior Consultation System for Building] was formed to conserve the historical townscape. Secondly, the [support system] was improved. Before the change of the system, the services connected with [*Bukchon-Gakugi*] Project such like housing, tourism, urban planning were not integrated. So the residents faced inconveniences while trying to do anything concerning the project even inquiry. Because of this, a City Office was established in *Bukchon*. Thirdly, [environment improvement project] was formed. The *Seoul* Government paved the roads with traditional material while burying underground telegraph wires.

Because of this project, a lot of things changed. The rate of loss of the historical houses decreased, and their condition also improved. As a result, the streetscape of the area also improved. The street views also improved. As a result, the real estate value in this area rose. As a result, the images of *hanok* and *Bukchon* area have improved. As a matter of fact, the project also raised the confidence of the residents to the conservation project. (Note 8)

At the same time, some trouble arose between the residents and the local government due to their dissatisfaction with the Prior Consultation System, local commercialization and tourism, etc. In order for the locals to solve these problems by themselves, lots of resident organizations were established with the support of the citizen organizations. These organizations have played an active role in creating a more livable area. (Note 9)

Fig. 7 Guesthouse which the *Seoul* Government purchased and leased to local people
Fig. 8 Streetscape in *Bukchon* after [*Bukchon-Gakugi* Project]

5. Actual condition of Resident Organization in *Bukchon*

5-1. Outline of Resident Organization and Citizen Organization

Here is the list of the resident organizations and the citizen organizations that have been active in *Bukchon* and their characteristics as obtained through the interviews and documents.(Note 10) The activities of main organizations are like these:

● Resident Organizations
  • Organization by Local Residents

Z1 *Jogno-Bukchon* Preservation Association (After *Bukchon* Preservation Assoc.)

: [Association for the Cancellation of *Hanok* Preservation District] which had demanded the cancellation of severe building regulations in the conservation district was renamed as [*Jogno-Bukchon* Preservation Association] in 1998. It has changed its direction and started supporting conservation by the government. It is not representative of the *Bukchon* area. But it was the first movement for the conservation by the residents. And when problems arose among the residents or between the residents and government, it also interceded.

Tab. 1 Analysis of Resident & Citizen Organizations

Classification	Name	Org. No.	Start Year (or Start Activity in Bukchon)	Goal and Outline	Starter's Occupation	Core Members (Steering Committee)	Member Constitution	Number of the Members	Establishment Factor (or Start Activity in Bukchon)	Type	Operating Finance	Main Activities	Cooperation Situation	Cooperation with Seoul City
Resident Organization	Jogno-Bukchon Preservation Association	Z1	1991 (1988)	It was established with local people to build and succeed to the history culture tradition of Bukchon	politician	10	vice chairman at Korea Physical Education Society, Chairman at elderly people's club, honorary Mayor of ward, chairman at Ee-hwa Women's University Old Girls' Association	about 500	movement against building regulation Growing tendency to Participate in	corporation	fee and own expense	propose to local government, mediation between residents, monitor of townscape conservation	Z2 S2	
	Bukchon Service Association	Z2	2000	It was established to slove the local problmes by themselves and support for poor people	politician	?	various	about 147	Bukchon-Gakugi Project	voluntary	fee and contribution	propose to local government, mediation between residents, monitor of townscape	Z1 etc.	
	Hanok Lover Society	Z3	2000	It was organized by people who are living in Hanok, or who want to live in Hanok And they are trying to improve the bad point and to succeed to good point and the beauty of Hanok, as Hanok s Lover Group.	Guest House manager	18	traditional craftsmen, art designer, university professor, residents and citizens	about 100	Bukchon-Gakugi Project	voluntary	fee, financial support by the Seoul city, charitable work	opening a village party and, walking event aroud Bukchon	Z1 S2 S4	
	Hanok Guard Solidarity	Z4	2002	It was formed as residents in Gahoi-dong so that they can build community and to maintain the beauty of the Hanok Village.		14	Residents around No. 31 Gahoi-dong	65	Bukchon-Gakugi Project	voluntary	fee	Monitor fuction to Hanok repair, propose the system of townscape deliberation and Hanok removal	S2	
	Bukchon Neighborhood Society	Z5	2006	It was organized with about 10 people of the elementary school PTA, for the purpose of studying and developing about their village by themselves.	housewife	12	housewife	12	by the support of Hanok Lover Society and City Joint	voluntary	financial support by the Seoul city and the Ministry of Government Affairs and	Improvement of the wall in school district, propose the master plan of Bukchon	S4	
	Samchung-dong Prosperity Association	Z6	2006 (1980s)	It was organized as Samchung-dong Mall Prosperity Association , but it was rebeared as Samchung-dong Prosperity Association merging with Samchung-dong Resident Autonomy Committee	politician	30 Samchung-dong Resident Autonomy Committee	various	Samchuhng-dong Residents	movement against building regulation Growing tendency to Participate in Machizukuri	Resident Autonomy Committee	fee, financial support by the dong office, contribution	Samchung-dong Culture Festival, management of Resident Automy Center		
	Hanok Value Society	Z7	2000	It is consisted of members who are interested in Korean traditional culture, residence culture in particular, and preservation management of Hanok village and culture	Museum Director	?	housewife, art uni. Professor, enterpriser, designer	about 50	(voluntarily)	voluntary	fee	purchase of Hanok, repair	S2	
Citizen Organization	Arumjigi (Culture Keepers Foundation)	S1	2003 (2001)	It was organized so that they can put small power together to guard cultures of their own and to create it again to match modern living environment	activist		various	about 300	Bukchon-Gakugi Project	foundation	fee	preservation movement of districed culture heritage, propose about preservation policy Improvement		
	Bukchon Culture Forum	S2	2001	It was founded by professionals of culture art aiming at conservation of historic environment and improvement of living environment of Bukchon.	National Center Museum Director	about 20	architect, university professor, gallery representative, museum director, activist, occupation concerned with the religious world, occupation concerned with the	about 80	with activities for preserving scenery of the heritage and bukchon village	NPO	fee	research Bukchon's value and the problems, Monitor for the policy the system about the issue of Bukchon, discussion the practical suggestion for the problem	Z1 Z3 Z4 Z7 S3	
	Culture Joint	S3	2001	They are campaigning to preserve lots of culture heritages.	(collaboration)	15(24)	occupation concerned with culture art world	about 1700	preservation movement for the culture heritage in	NPO	fee	movement for townscape conservation and preservation of the culture heritage	S2 S4	
	Citizen Joint for Making a Walkable City	S4	2001	They support Machizukuri activities of the residents by themselves keeping the historic environment.	activist	4	various include local residents	about 350	with walking event around Bukchon	corporation	fee	movement for making poket park, support rearing enlightenment for the residents	Z1 Z3	

Z3 *Hanok* Lovers Society

: Some of the residents and citizens also sympathized with the necessity of *Hanok* conservation, and [*Hanok* Lovers Society] was establishing in 2000 as a group for organizing friendship parties. The group organized parties for the own community, such as a party commemorating the Bukchon Cultural Center . These parties became regular friendship parties for *Bukchon* residents. In addition, they organized a *Bukchon* tour for the foreigners, citizens and the residents. Through holding the events, the group

has helped increase *Bukchon*'s awareness. On the other hand, the group has also tried to solve confrontation problems between the residents.

Z4 *Hanok* Guard Solidarity

: This was established in 2002 by inhabitants of 65 households in No. 31 *Gahoi*-dong to preserve the *hanok* and the townscape of this area. They performed various activities and discussed how to maintain the scenery and also acted as monitors. They insisted especially on the conservation of townscape view. They also tried to solve the confrontation problems among the residents such as problems resulting from the right to view by acting as mediators.

● Citizen Organizations
  • Organization concerned with *Bukchon* Area

S2 *Bukchon* Culture Forum

: In 2001, a movement to save the cultural heritage of *Bukchon* by the experts of culture and art occurred. Taking this opportunity, the above organization was founded mainly by these experts (more than 60) who were interested in *Bukchon.* They have done research on the problem, monitoring of the administration, the policy and the system concerning *Bukchon.* They also discussed practical suggestions to that problem.

S4 Citizen Joint for Making a Walkable City (After City Joint)

: Since joining *Bukchon* area, this organization has organized [*Han-pyong* park] movements with the participation of residents, organized movements for promotion of walk regulation and the movement to rescue the small 12 shops in *Insadong*, etc. Since July 2001, the organization has also held *Bukchon* cultural tours for *Bukchon* residents and has continued to offer consistent support to the residents.

5-2. Analysis of Relationship between Organizations (include Citizen Organization & Professionals)

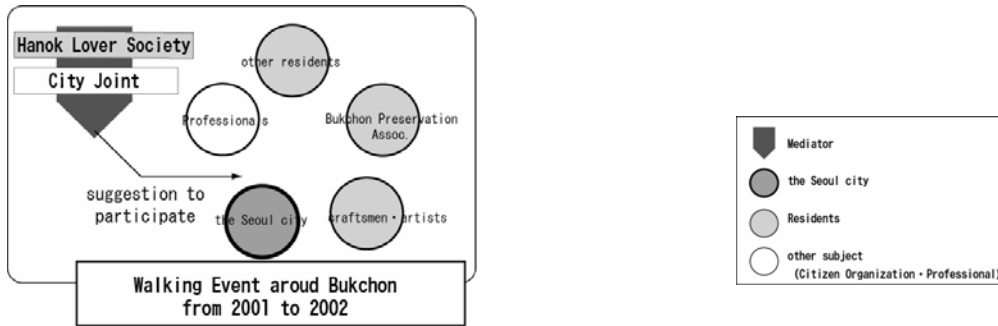
Because of the above collaborations, the relationship between the local government and the local people also has changed from bad to good. The organization of these events was made by lots of mediators, like resident organizations, local government and citizen organizations. For example, [Walking Event around *Bukchon*] was held mainly by [*Hanok* Lovers Society] and [City Joint]. Of course, a lot of other organizations also participated. The [*Bukchon* Regional Society Conference] was organized by [*Bukchon* Culture Forum] with the involvement of some of the resident organizations, citizen organizations, professionals, etc. Triggered by these events and movements, the [*Bukchon* Workshop] was held, too. As a result of these events and movements, we can say that the relationship between all the subjects involved has been strengthened. (Fig 9.)


Fig. 9-1 Mediator for the cooperation

Fig. 9-2 Mediator for the cooperation

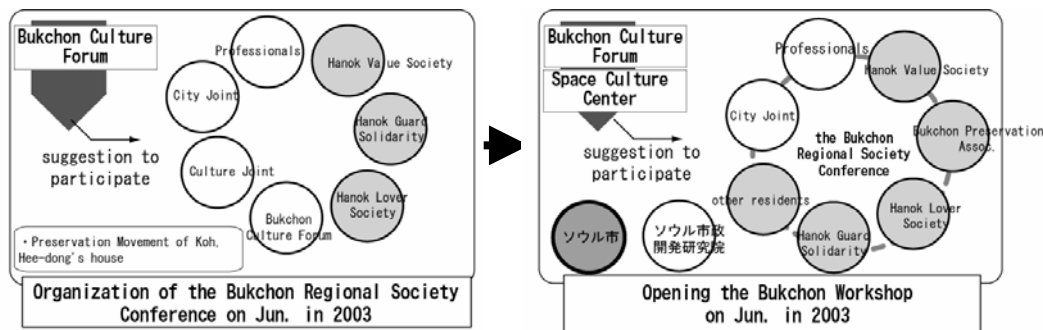
5-3. Transition Process on Relation of {Government-Local People>, <Resident Organization-Resident Organization}

In the transition process on relationship between the {government-local people}, {resident organization-resident organization}, there was a period of opposition between the {government-local people} which lasted until 1990s. On the other hand, in the first action period in 2000, lots of resident organizations started to cooperate with each other. Actually, the relationships were of a loose and equal category. There was also the opposition between the resident organizations from 2002 until 2005, a stagnation period where one organization was dismantled. On the other hand, a new group was formed by housewives in 2006, and we can say that there still will be other movements by the resident organizations from now on. In conclusion, we can say that, first, the bonds between the groups have been strengthened. Second, the relationships are loose and equal in terms of cooperation. (Fig 10.)

5-4. Activities of Resident Organizations

As can be seen from the above discussion, activities by the resident organizations can be summarized into the following 3 points. The first point is raising an appeal. From 1999, they demanded conservation measures from the *Seoul* Government, and suggested measures for problems relating to townscape views, etc. The second point is

conservation activity. Not only did they carry out conservation activities like a walk around the local area, hold residents party and purchase *Hanok*, they also carried out various improvements on their immediate environment. The third point is mediation. They got involved in the confrontation problems among the local people as well as between the local people and local government and tried to mediate on the conflicts. As a result of these activities, the resident organizations' recognition as well as trust from the local people began to rise. And this has enabled them to act as mediators for the local people.



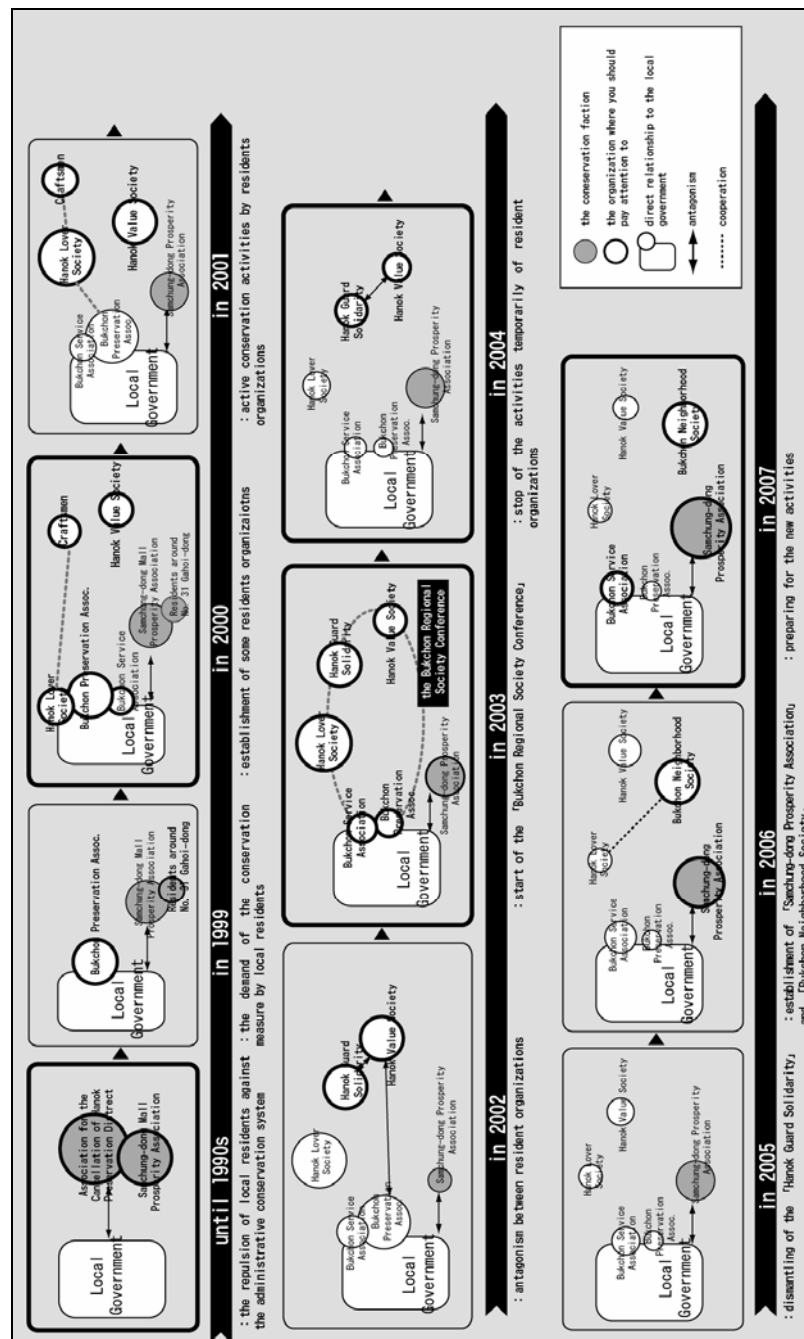


Fig. 10. Transition Process on Relation of {Government-Local People} & {Resident Organization-Resident Organization}

5-5. *Maul-mandulgi* on townscape conservation in *Korea*

As the conservation project goes on, lots of problems start to occur such as problems relating to Townscape Design Guidelines, one on right to a view, on conservation of modern architectural heritage, on local tourism etc.

In the case of *Korea*, the local government as the coordinator has of course been coping well on solving these confrontation problems. For example, to solve conflicts towards of townscape design guidelines, they did on-the-spot investigation, and consulted with the people involved. Secondly, for the confrontation problems on the operation of the guest house, they opened a meeting for the concerned parties to talk to each other. Thirdly, to solve conflicts involving the conservation of modern architectural heritage, they opted to try and purchase such heritage.

However, the local governments sometimes faced various limitations, including problems involved fairness, personal and financial limitations, etc. Because of this, therefore, in some cases, they could not ease or solve the opposition..

Resident organizations have coped with the confrontation problem well by trying to reach an agreement of views with the residents. For example, they opened a meeting for talks between the people involved, and showed to them the positive images of the future of a historic townscape. And they also talked and persuaded with people concerned. Moreover, they opened a campaign to collect signatures. They also independently carried out research on problems affecting the local area and requested measures from the government.
Fig. 11 Coordination Subject on Confrontation Problem

6. Conclusion

6-1. Significance of *Machi-zukuri* in *Japan*

In case of *Machi-zukuri* in *Japan*, due to economic limitations of the government, and also in order to spontaneously develop community activities, a *Machi-zukuri* Council was usually established. This council coped with various kinds of problems affecting the whole area.

However, at the same time, the councils were limited by their jurisdictive boundaries, and also the members were representatives of neighborhood associations. In addition, council members formed a vertical rather than an equal relationship. This made it difficult for the councils to respond quickly some problems. Because of this, new groups like NPOs had to take the roles where the *Machi-zukuri* council could not cope.

6-2. Significance of *Maul-mandulgi* in *Korea*

On *Maul-mandulgi* in *Korea*, the activities by the resident organizations can be said to be raising appeals, conservation activities, and coordination. Especially, the coordination role has been especially done by the resident organizations. The relationship of these organizations on matters dealing with cooperation was loose and horizontal in nature.

Of course, there were some limitations especially in the resident organizations. First, there was not so much maintenance for acting. The reasons could be said to be opposition between the resident organizations, discord in the groups, lacks of the leadership etc. Second, there was not representative organization of the area. In *Bukchon* case, [*Bukchon* Preservation Assoc.] came into action as a representation of local area, but it cannot be said as local representative, because it did not have any consensus in the whole area. So it is thinkable that a representative organization is organized and takes in opinions from the local residents temporarily only when necessary.

6-3. Conclusion

This study shows the placement of the community style in townscape conservation area.

In the case of *Japan*, most problems are led by the local government and the council. On the contrary, in the case of *Korea*, for the problems affecting the wider area, the local government and a representative organization of local area lead. But, for more local problems, various kinds of the resident organizations and the citizen groups cope with. The reason of the difference can be said to be due to a difference of the systems and also a difference of the people.

We cannot determine which system is better between *Machi-zukuri* and *Maul-mandulgi*. But we can pick up the good points from each. Our ultimate goal is to determine which system best suits a particular community design in one country by getting ideas from cases the other country.

Exploring the state of exception in urbanization: the case of urban villages in Zhuhai, China

Qing Li
University of Tongji, China

Introduction

Urban villages are a special phenomenon in China. Along with rapid economic growth brought about by the economic reform and opening since December 1978, the rate of urbanization in China increased from 14% at the end of the 1970s to 41.8% in 2005. In the course of such a rapid expansion of cities, many villages, originally located in the countryside, were wrapped completely in the newly constructed blocks or development zones of the city, without being adjusted and renovated. Thus appeared the so-called 'urban villages' (literally translated as 'villages-in-city'). By breaking down the former equilibrium in the countryside, the transition changed the social structure of the entire villages and brought about a series of social, economic and physical problems.

Given that farmlands formerly cultivated by villagers were compulsorily purchased by the government, and being short of adequate working skill in the city, villagers found their way of making a living by renting extra rooms to increasingly floating migrants. In order to accommodate the bulky demands for affordable housing, villagers often rebuilt their houses. Those that were previously one to two floors were converted to three to five floors, whilst the coverage rate of houses in urban villages increased from 40% or so to around 70%. This situation results in two severe issues. Firstly, urban villages become highly dense with narrow alleys, which are difficult for vehicles to pass through, especially in an emergency, such as a fire. The natural lighting and ventilation are also poor. Secondly, cheap accommodation for migrants and rare formal social control make villages the breeding grounds for some crimes such as theft, drug addiction and prostitution. In addition, there is no 'informal' concept in the local government's dictionary. Most of the new houses in urban villages are regarded as illegal because of the lack the government's endorsement of construction.

These issues and the illegal problems mentioned above annoy the government so much that the latter strives to carry on some aggressive actions. However, if all illegal houses were to be torn down according to prior customs and regulations, the villagers will resist and cost a considerable amount of money. How will this dilemma be treated? One way is adopting the conception of exception which means accepting some parts of informal urbanization beyond the order of formal urbanization. Here, exception is a special state with the power, granted by the juridical order, of proclaiming the exclusive rights of the planning apparatus over an area and people. Peter Ward (1999) elaborated the need for exceptions in the case of colonias in Texas. The colonias are informal subdivisions. Ward suggests a state of exception, to have a 5-year moratorium on codes while infrastructure is extended to the homes in the colonias, and at the same time to provide financing mechanisms for these settlements to upgrade them to code. Ananya Roy (2005, p. 153) suggests the regularity exceptions because "one important reason for

displacement is that formalization regularizes the irregularity of payments and transactions." Regularity exceptions have to be applied not only to land titling but also to service provisions. However, the state of exception is a very new idea for both urban policy makers and urban planners in China. Is it meaningful to use the concept of exception with respect to urban villages? In order to answer the question, we should articulate the following: why should we use the concept of the state of exception? What kinds of exceptions should we hold? And how does the state of exception contribute to the solution of the pressing issues in urban villages? By addressing these questions, the author attempts to seek an alternative for the future transformation of urban villages.

Methodology

Although a state of exception in urban planning is never formally mentioned in China, it is interesting that the state of exception has actually existed in urban villages for a long time. As their farmland was expropriated by the government, urban villages were laid out under the situation of self-help and self-control with scarce resources. That was essentially a state of exception. Ananya Roy (2005, p.153) states "there are two forms of exception: regulatory exception and regularity exception". She suggests that what Peter Ward (1999) recommended, the moratorium on codes, is the regulatory exception, while the regular exception of land titling and service provision are regularity exceptions. In terms of the role of the government, I argue that the regulatory exception can be further distinguished into two categories: passive exception and positive exception. In urban villages, the space development was overwhelmingly controlled by villagers and the government neglected or failed to superintend it. This situation could be regarded as the passive exception. Contrastingly, as the government takes a positive attitude in engaging in the space transformation of urban villages, while conceding the existing informal construction, this can be ascribed to the positive exception. In the process of villages' transformation, the state of exception played a vital role. The hypothesis of the study is that the state of the exception constitutes the institutional basis for urban villages' survival and development.

Using the case of Zhuhai, a new seashore city in the southern area of China, where there are typical urban villages, the article traces a route of how a state of exception in urban villages is generated, how it is evolving, and how it parallels the informal transformation of villages' space. Based on the analysis, the article finds a close relation between the space transformation of urban villages and the state of exception. It argues that a positive state of exception is valuable in the future transformation of urban villages.

Due to deficient data about urban villages in China, I applied the Anthropology approach. The three urban villages of Jida, Shanchang and Cuiwei, which are respectively located downtown, on the fringe of downtown, and on the city fringe of Zhuhai, are the main objects of the study. Adopting the half-structural form, I interviewed 30 or so informants in each village, including 20 village clerks and ordinary villagers, and 10 migrants, as well as local enforcement members and bureaucrats charged with urban planning. Village informants cover a range of people from yong to

elderly people. Most of the interviews were conducted in 2000-2005. Today, urban villages in Zhuhai are still in the same situation as before.

Origin of the state of exception in Zhuhai

In December 1978, faced with the dual difficulties of political uncertainty in the wake of Mao's death in 1967 and several years of economic stagnation, the Chinese leadership, under Den Xiaoping, announced a program of economic reform and opening to the outside world. In August 1980, the Chinese government designated four southeast coastal areas as "Special Economic Zones". Zhuhai, situated in the southern part of Guangdong province and adjcent to Macau and once a rarely known small town with a population of less than 20,000, was one of "Special Economic Zones". Invigorated by the favorable policies, a strong "engine" coming from the state, the area of the city of Zhuhai expanded from 6.81 square kilometers in 1980 to 121.0 square kilometers in 2002, and the population soared from 20,000 to 120 million at the same time. In the rapid urbanization, 25 villages, once in the countryside but now in the city of Zhuhai, step by step lost their farmland and became urban villages.

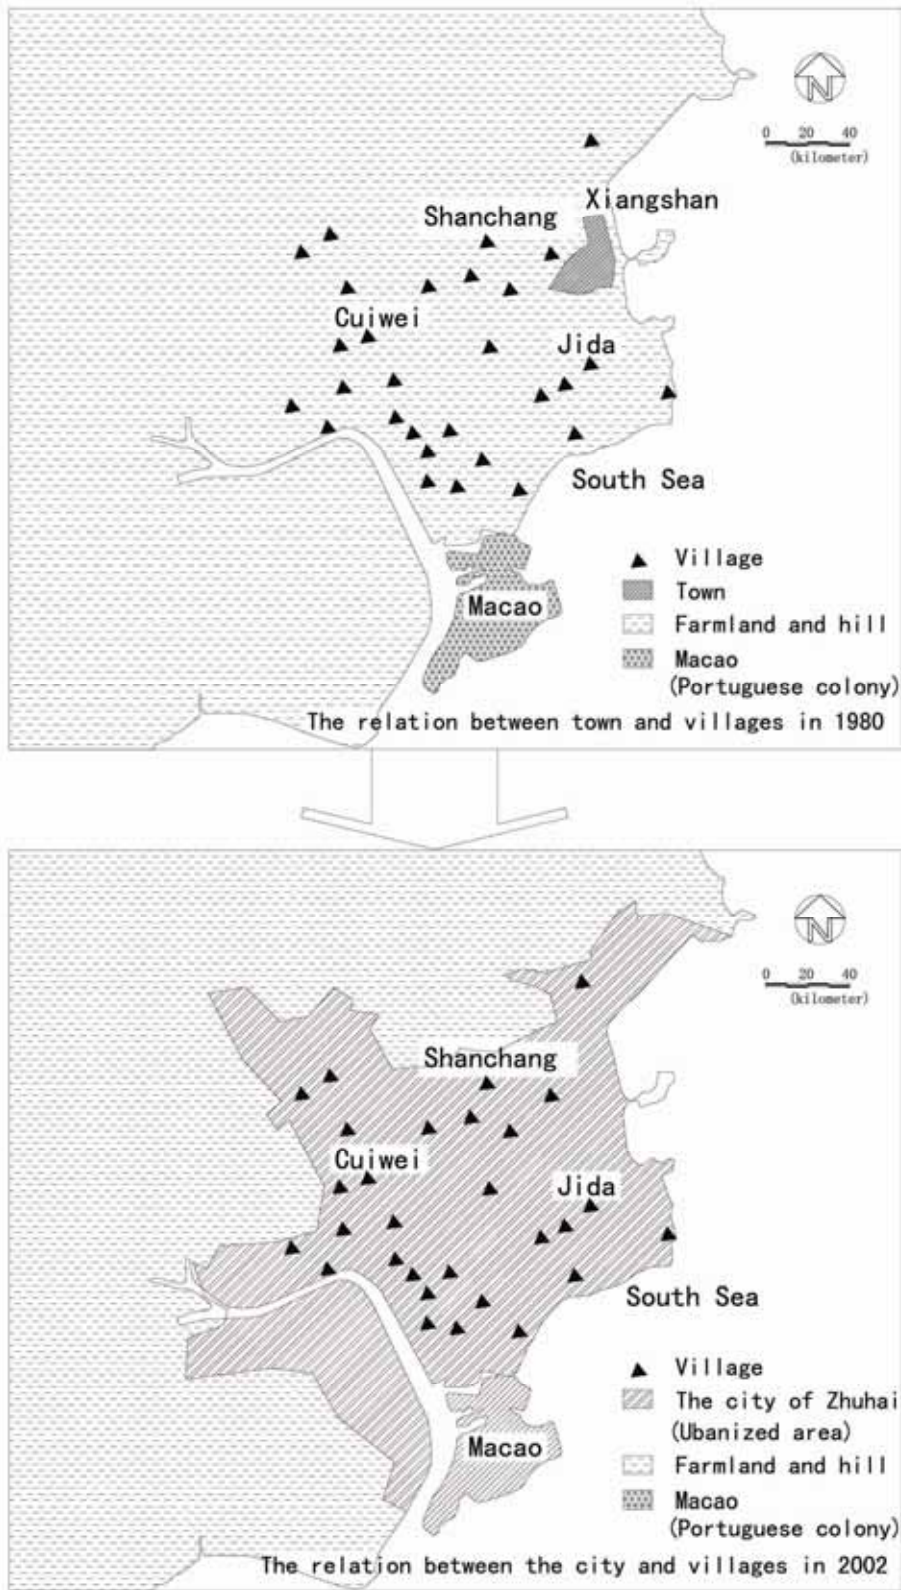
China has set up two kinds of land ownership systems since 1949. Land in the country belongs to the village collective, an organization responsible for common villager affairs. By this institutional arrangement, villagers reached their goal of owning farmland after a long period of revolution. On the contrary, land in the urbanized cities is owned by the state. Also villagers in the rural area and citizens in the city are assigned to distinct social, economic and physical operation systems. When the rural villages transitioned into urban villages, the government of Zhuhai changed villagers' household registration from peasant to citizen. However, the ownership of the villagers' residential settlement was still kept for village collectives due to high social and economic costs for the government, which was also struggling for resources in the initial stage of economic reform and opening to the outside world. If the land ownership of villagers' residential settlements were taken from village collectives and given to the state, the government had to purchase and compensate villagers for their lost dwellings and arrange jobs for the unskilled villagers in the city. In fact, villagers were regarded as "burdensome parcels" by the government. By keeping the residential land ownership with villagers, villagers still maintained their original identity as peasants even though they were in the city and without farmland. Therefore, two differing operational systems exist in the city to this day. The government administers common economic and social affairs in the city, while village committees manage the villagers' affairs under the condition of original rural regulations and laws. Actually, the status of urban villages is complicated. What is clear is that village committees are responsible for arranging jobs, providing welfare and bonuses, and paying for the infrastructure construction for villagers; whereas, the government is exempted from the expected obligation of providing public services for urban villagers. This gives rise to a passive state of exception in urban villages. Consequently, urban villages, dotting the city, become relatively "independent kingdoms."


Figure 1 The transition between the city and villages in 1980 and in 2002

Take the typical case of Shanchang, with a population of 2200 villagers. When its farmland of 260 hectares was expropriated in 1988, the compensation was just   19 million (about   2.4 million), in which a mere   3500 (440) was distributed for each villager, amounting to   7.7 million (about   1.0 million) for all villagers; whereas, the rest of the compensation was left to the village collective for future use, such as launching factories and trading businesses. The government also returned 11.4 hectares out of 260 hectares of land for the village's future industrial and residential development. From then on, by leaving the commitments of providing all the village's public affairs to the village committee, the government freed itself from having to expend more funds to the village. Therefore, Shanchang was actually laid aside to be in a state of exception in the city, resorting to self-help and self-administration. All costs, including social welfare, social security, and the infrastructure construction, would totally be covered by the village committee of Shanchang. The government also neglected the elevation of new urban roads around the village, which were designed higher than the ground of the village. These new roads brought about a flood to the village in the raining season, which never happened over the last 700 years, because part of the rain water in the lower location in the village could not flow away. Wu Fuqiang, an informant of mine and a former village clerk in Shanchang talked about details of those difficult situations that their villagers were faced with.

> There were more than 3000 Mu (200 hectares) of rice fields, 900 Mu (60 hectares) or so of hill land (belonging to Shanchang) as the city of Zhuhai was initially set up. Some of the farmland was expropriated to build new roads and infrastructure in 1984-1985. In 1988 all the land, including rice fields and hills, was expropriated by the government. 2200 Farmers have had no land to cultivate since then. At that time the compensation price of hill land was   450 (61) per Mu (0.066 hectare), whilst a 5-year rice product amount multiplied by the state-set rice price was equal to the amount for compensation of rice fields. With these two compensations, the whole village would be paid   1.9 million (260,000), plus 80 Mu (5.3 hectares) of land for villager's future housing construction and 105 Mu (7 hectares) of land for villager's industrial development. In all, a compensation of   3500 (480) was distributed to each villager. From then on, the government no longer paid attention to (our) village. Our village collected funds from ourselves to rebuild the infrastructure. Roads in the village were once covered by blanks, which were not convenient for cleaning the garbage, so villagers paid and replaced them with concrete. The state didn't spend a cent.

> Shanchang has a 700 year history. It never flooded in the past. After the surrounding farmland was expropriated, new urban roads were constructed at a higher elevation, which made the old village lower than the new urbanized development, and the village was flooded because rain could not drain away. The village was damaged severely, especially in 1997-1998.

A thorough state of exception

Although there are two administrative systems in the city, and urban villages are relatively "independent kingdoms," they are theoretically still under the supervision of civil authority. According to the laws, all construction in the city must be endorsed by the Urban Planning Bureau. Otherwise, the house will be claimed as illegal. Anyone who

transgresses it will be punished. Of course, construction in urban villages falls under this rule.

However, urban villages were trapped in troubles after they lost farmland. Though village collectives attempted to launch their new businesses in the returned industrial land, villagers are not congenital entrepreneurs. Most of the village enterprises, except rare ones, failed and villagers lost their jobs. What village committees finally did was rent the factory houses to outsiders. For common villagers, they found it very difficult to get a new job due to their lower education, lack of skills, and low-waged competitions coming from migrants. By the survey of the three villages of Jida, Shanchang and Cuiwei, 18% of 19-50 years old villagers hold elementary or below education, 32% of 19-50 years old villagers hold junior high school education, only 12% possessing college education or above. And among all 19-50 year old villagers, who are of the working age and not in college, 30% of them are unemployed, and another 12% are temporary casual laborers.

In the meantime, the markedly increased disparity between rural and urban incomes, in both Zhuhai and elsewhere in China, had a tremendous impact on urban villages. Urban incomes in China, that averaged just　80 a year in 1985, soared to over　1,000 in 2004, while rural incomes rose from around　50 to around　300 in the same period. Driven by the huge gap of incomes, rural migrants have continuously flooded into the

cities, especially in the coastal areas with faster economic growth and more chances for work. By the official count in 2004, China had 114 million migrant workers who had left rural areas, temporarily or for good, to work in cities. China is in the midst of the largest mass migration the world has ever seen. Zhuhai, as one of the attractive coastal cities, also amassed rural migrants. The number of "temporary migrants" living in Zhuhai at least half a year increased from 165,000 in 1988 to 510.000 in 2004, almost equal to the household registered population.

Figure 4 Poplulation change of temporary migrants and registered citizens
Data source: Zhuhai population census from 1980-2004.

Around 88% of the migrants came from rural areas, most of which are from inland impoverished rural areas. They were eager to look for the cheapest rental housing, which only urban villages would offer. While the renting price of a two bedroom common urban house was ￥1200-1500 (€200 or so) per month, the renting price of a one bedroom was less than ￥200 (around €27). Prices that are six to eight times higher push migrants to urban villages for affordable housing.

Allured by the "gold mine" in the market, almost every family that lived in a village acted quickly to condense their own living space from one house into one room, as to get more vacant rooms to rent. Also, in order to earn a higher profit, some villagers started to add additional three-five floor houses in the empty proximate area on their own plot, or to pull down their old one-two floor houses and rebuild them into three-five floor ones. However, these new houses surpassed the basic rule that houses can only be 2.5 floors high. Also, if the whole floor area of a house in a plot is over 240 square meters, it will be regarded as illegal according to relevant regulations. Therefore, most of the new houses are illegal and, of course, cannot get the endorsement from the Urban Planning Bureau.

However, low compensations for expropriating the farmland, rare income sources, and poor living conditions irritated villages and cause them publicly to defy the rules and regulations. Like Liu Zhiqiang, one law enforcement officer whom I interviewed, said, "Villagers do not care about whether it is legal or illegal to build. What they do care about is whether it is necessary." Even when law enforcement members attempted to interrupt the illegal construction, they met fierce resistance from the amassing numbers of villagers. Also, government inefficiency as well as corruption prevented villagers from seeking legal approaches. At last any intervention in the urban villages had to be given up by the law enforcement. Wu Zhongxian, an informant of mine and a native Shanchang villager, and Liu Zhiqiang both explained in detail why and how the informal construction happened.

Wu Zhongxian:

> There were institutions administrating the construction of urban villages before 1993. However, the fee for proceeding was too high, reaching   19 (around   2.6) per square meter. A number of procedures were neseccery in order to get the building permit. From the Village Committee to the Street Branch of the city government to the Urban Planning Bureau to the State Land Administration Bureau, every step needs to get its stamp. The clerks did not work efficiently. There was a lot of corruption. The construction of houses without endorsement would be checked, but the government could not enforce the administration (to stop building). If they received (black) money, they would not check any more. After 1993, most new buildings were illegal because the floor area of them was over 240 square meters per plot, which is the maximal limitation in terms of relevant regulations. These houses would not be endorsed.

Liu Zhiqiang:

> Villagers see the renting profit, 100-200 Yuan per room per month, which causes an increasing in illegal housing. With respect to the government, it can not spend much money for peasants. Due to impoverished living, villagers can not afford going to school, which in turn keeps them in poor social standing. They often go to the authority office to proclaim their outrage and frustration. The standard compensation (of expropriating farmland) is low so that villagers are very unsatisfied. Villagers do not care about whether it is legal or illegal to build. What they do care about is whether it is necessary. Middle-aged villagers of 40 years old or so are commonly refused by factories and can not attain work. Therefore they can only earn a living by renting rooms.
>
> According to the law of urban planning,village houses can only be built as high as 2.5 floors. But they are actually 3-5 floors. Most new houses are built without endorsement. It is difficult to control. When you check them in the daytime, they will continue to build at night. As our (enforcement) members go there and try to pull down the illegal houses, hundreds of villagers suddenly encompass us and fight against us so that our members are often wounded.

At the initial stage of Zhuhai development, the government shed the social, economic and physical liabilities for urban villages onto village committees, exempting the government's expected commitments of providing public services. It indicates that the government bestowed urban villages a state of exception. Under the sovereignty of

exception, urban villagers become strongly cohesive, especially as their interests are conflicting against those of the government. Pushed by the pressure of poverty and the attraction of the market, urban villages launched bulky informal housing construction and repelled the intervention of law enforcement through violent contesting. By driving out any government involvement in urban villages, this resulted in a thorough state of exception.

Massive informal housing construction

Under a thorough state of exception, massive informal housing, or illegal housing in the terms of the regulations, were built in urban villages. For example, in Shanchang there was a residential land area of 16.3 hectares and a floor area of 56,300 square meters in all of the houses in 1980. In 2002 the number surged to 21.6 hectares of residential land area and 362,000 square meters of floor area. While the residential land area increases only 1.3 times, the floor area soared 6.4 times at the same time. With respect to Jida village, located in the downtown area, the residential land area and the floor area increased 1.2 times and 6.8 times respectively at the same time. In another village, Cuiwei village located in the perimeter of the city, the residential land area and the floor area arose to 1.3 times and 4.2 times respectively. When villagers rebuilt their houses, they deliberately decreased the bedroom space from 12-16 square meters to 8-10 square meters as to get more bedrooms. Such a considerable increase in the amount of informal housing partly mitigated the thirst of migrants for affordable housing. In 2002 in Shanchang, there were around 16,400 migrants comparing to only 2,200 local villagers. The number of migrants was nearly 8 times the population of local villagers; in Jida, there were 860 local villagers and around 6,500 migrants, a disparity of more than 7 times; in Cuiwei, the number was 1,420 local villagers and around 14,300 migrants, a disparity of nearly 10 times.

Figure 5 Floor area comparison between 1980 and 2002

Figure 6 Population comparison between villagers and migrant tenants in urban villages
In 2002, 25 urban villages housed 200,000 people in 350 hectares area, consisting of 37,000 villagers, 150, 000 migrants and 8,000 other civic household registered inhabitants. The amount of migrants living in urban villages was close to one third of all migrants in Zhuhai. However, one thing that has to be mentioned is that in spite of high density, one-floor traditional monuments in urban villages are still persevered, such as kinship temples, Buddhist temples, old and delicate large housing, old wells and trees, as well as the open space around the monuments. Massive informal houses offer migrants the most basic living conditions and, in turn, offer villagers who are renting property more money because they can rent more rooms. The two populations have formed a co-existence. However, several issues emerge in urban villages.

With regard to the physical environment in urban villages, the building density is too high, some with near 60% coverage rate, "a stream of sky" and "hand-shaking" houses being often seen. Most streets and lanes are narrow and cramped, not accessible to fire trucks or ambulances. Environmental hygiene is in poor condition with litter almost everywhere. Infrastructures are in backward status, some parts of villages flooded during raining season, and informal housing is built against violation of rules and regulations of land use and construction. But, it needs to be noted that clear water, lighting and most sewer drainage are not available. In respect to social environment, urban villages become the breeding ground of crimes such as stealing, prostitution, gambling and drug abuse.

Such severe issues have a very bad impression on the government, media and citizens. People's Daily Huanan News, on its first page of November 7, 2001, published an article under the title of "Operate on the 'City Tumors' – a Record of Renovation of New Villages in Zhuhai", which held that the current status of old villages in the city produced a serious impact on the entire course of urbanization in Zhuhai, and that the most dirty old villages in the city constituted "scars" and "tumors". Thus, renovating these areas seems imperative.

Exploration of the positive state of exception

The state of exception in urban villages yields a coin with two sides. One side is attractive. The affordable housing produced under the state of exception benefits villagers, migrants, as well as the government which did not supply them. But the other side is a bit vicious due to severe issues. No doubt, the coin can be refurnished better. It is the government which needs to refill its anticipated places. Also, it indicates a thorough state of exception is not plausible.

The government should bring back its liabilities in public service provisions, including all social, economic and physical spheres, for urban villagers. However, it does not mean to pull down all informal housing and drive away migrants. Rather, the government should learn from the past to respect both villagers' and migrants' "rights to the city" (David, 2000).

Although there are serious problems in urban villages, villagers and migrants have their own viewpoints in judging villages' environmental quality. In a survey of three villages of Jida, Shanchang and Cuiwei, half of villagers believed that their own houses had better ventilation and better lighting conditions despite of high density in the villages. Though most of villagers agreed that public security and environmental hygiene were in bad conditions in the villages, over 80% of the villagers suggested the current situation was acceptable, over 70% of them believed that their villages just need improvement on a

small scale. Similarly, 65.7% of the immigrant tenants were basically satisfied with the living environment of the villages where they chose to stay.

Table 1 Survey of degree of satisfaction of villagers over the living conditions in villages

Table 3 Survey of attitudes of villagers about village renovation

Village / Evaluation	Jida village		Shanchang village		Cuiwei village		Sub-total	
	Qty	%	Qty	%	Qty	%	Qty	%
Very much satisfied, no renovation needed	0	0	5	31.25	0	0	5	10.2
Basically satisfied, only limited renovation needed	15	88.2	7	43.7	11	68.8	32	67.3
Neutral, any renovation approach	0	0	2	12.5	0	0	2	4.1
Not satisfied, large scale renovation needed	2	11.8	2	12.5	5	31.2	9	18.4
Total	17	100	16	100	16	100	49	100

Based on the survey of the satisfaction degree of both villagers and migrant tenants, the distinct objective can be targeted by the government in the transformation of urban villages. That is to solve main issues at a fair and feasible way while maintaining the delicate balance between villagers and migrant tenants. In physical environment, the government should renovate the infrastructures in urban villages, as well as upgrade

environmental facilities. Although the accessible to vehicles, especially fire truck, for main streets is important, the narrow street network, mostly 3-5 meter width in villages, cannot foolishly be destroyed. These streets and other traditional monuments were established in pre-industrial time and had been local collective memory. One alternative is making special small fire truck, similar to what villagers did in pre-industrial time. In all most of the informal houses will be regarded as an exception to be conserved, while upgrading fire safety, ventilation quality and even facade beauty if it is possible. In social environment, more law enforcement power should cooperate with village committees and be deployed in villages to prevent crimes. The government should also provide social welfare for villagers.

Not like an awkward state at the initial stage of the new city, Zhuhai has accumulated tremendous wealth in more than 20 years development. Now it should be able to earmark some funds for upgrading the bewildered villages. Through a policy of the positive state of exception, the government cannot only keep the balance between villagers and migrant tenants, but also renovate the physical and social environment in urban villages, and let it possible for villagers to share the benefits brought by the rapid economic and social development in Zhuhai.

Conclusion

The state of exception in urbanization is a vital yet less-discussed conception. Although it is closely associated with informality (for both of them are the opposite to the order of formal urbanization), it is important to distinguish between the two. The state of exception constitutes the precondition and basis of informal urbanization, while informality is often the outcome. Therefore, the exception acts as an underlying institutional actor in the process of informal urbanization. It becomes important for policy makers to consider why they should allow exceptions, what kinds of exceptions they should permit, and how long the state of exceptions should last as they cope with the informal urbanization.

In contrast to land titling issues in the informal settlements of other developing countries, urban villagers own their land title, while most of the housing structures are informal. Hence they also confront the issue of exceptions. However, the state of exception in urban villages was first bestowed by the government even though the words of the state of exception are never mentioned in relevantly formal documents in China. As villagers' farmlands were expropriated, urban villagers were arranged into a state of self-help. Village committees were put in charge of all duties for villagers including social administration, welfare supply, economic supports and infrastructure construction, which were anticipated to supply by the government and which the latter had avoided to do. That engendered a passive state of exception in urban villages. Subsequently, spurred by the drastic demands of affordable housing for migrants, urban villages held a thorough state of exception by contesting against the government's governance on village space, which brought about an unconstrained tide of informal housing construction. The amount of floor area in urban villages in 2002 was over 5 times that of 1985 and housed nearly one third of migrants in Zhuhai.

However, the passive state of exception is not desirable because severe issues, such as poor infrastructure and some crimes, bewilder urban villages. Therefore, "heroic entrepreneurship" (De Soto) stuck itself in the idea of informality, although the informal housing is the villagers' spontaneous and creative response to the city's incapacity to satisfy the basic needs of the impoverished masses. That means the thorough state of exception, the total sovereignty of planning apparatus, may lead to a failure. Like Peter Ward's (1999) policy recommendation to have a period of moratorium on codes, the government should take the policies of a positive exception. By delivering the social services and keeping the massive informal housing in urban villages, the social and physical environment can be greatly upgraded while the relationship among villagers, migrants and the government will remain in a sustained balance.

Shaping the city

Sofia Morgado
Technical University of Lisbon, Portugal

Introduction

The Tagus Estuary is a metropolitan central open space that is a catalyst for essential situations that impact on creating the city, morphologically, economically, culturally, and socially. A close examination of the urban formation of Lisbon, in an attempt to understand its open spaces as potential planning and project instruments, unveils the prominent position of its public spaces, not just from an aesthetic and social perspective, but also from the viewpoint of the infrastructure of the city itself and of its future development.

In the context of its own physiography, the urban growth of Lisbon was shaped from opportunities created by the Tagus Estuary, namely the deepest trenches, which determined a marked growth of the area around the harbour. In a stratified manner, the urban formation of the city can be understood as a superposition of complementary layers:

a)   Main axis forming a harbour and river waterfront, crossed by a spinal column expanding to the north;
b)   An external ring characterised by a rural mosaic in transformation, between the expansion of the sedimented city and its successive administrative borders.

A methodological approach

Given metropolitan Lisbon's current urbanistic scenario, a concept for the urban project whose main instrument in characterising identity and structuring growth is the unoccupied space is seen as relevant. This also acts as the agent that articulates the territorial and urban scales. As part of ongoing research (ETSAB-UPC, Barcelona/ FA-UTL, Lisbon), important premises have been defined: a. the potential of unoccupied spaces as instruments for urban control; b. case studies which reveal a certain degree of future impact or an emerging transformation. Specifically, natural and urban areas that are still unoccupied but which will house major infrastructures in the near future were selected: the New International Airport of Lisbon, the high speed train, and a new local skeleton network formed by a metropolitan tramway.

The present research stemmed from the need to systematise and further examine a vast number of overarching questions about the morphogenesis of metropolitan Lisbon, and about the forms of territorial intervention which have conditioned and determined its present state of development.

The first part of the research focused entirely on the morphogenic interpretation of metropolitan Lisbon (Morgado, 2005). It was organised in five consecutive periods

(1860, 1940, 1965, 1992 and 2001), through the morphological identification of non-occupied spaces in accordance with the same matrix – water, land and artificial creation – and with a thematic cartographic production (scales 1:100000 and 1:25000).

From the late 19th century to the mid-20th century, the spatial configuration created by the infrastructures – railways, national roads, docklands and harbours – inducted significant dynamics in the still incipient metropolitan area of Lisbon. The opportunities created by the development of a system of infrastructures promoted an intensive use of the territory and originated a pre-metropolitan configuration. As a result a productivist land use model and a new urban conceptualization, with metropolitan value, started to be developed.

The cartography of 1965 shows a radial structure converging into Lisbon and the Tagus Estuary, reinforcing its current status as metropolitan centre, national centre and European centrality. Regarding land use, large specialised areas emerged, namely industrial, dependent on a direct link to Lisbon and, especially, on the Port of Lisbon infrastructural ring around the Tagus Estuary.

In the 1990s, a consistent metropolitan structure gains shape combined with the renewing of land use opportunities. Democracy in 1974 and the entry of Portugal into the European Union in 1986 opened new political and economic perspectives. Changes in the productive system promoted the obsolescence of industrial and dock areas in central places, the emergence of new forms of centrality, correlated with a knowledge-based economy, integrated in a highway network.

In the Lisbon Metropolitan Area – a metropolitan association of municipalities institutionalised in 1991 – a polycentric system of alternative urban centre begins to develop, supported and integrated by an increasingly dense transport and road network system.

Thus, the radial structure developed into a network system of motorways, creating opportunities for new growth areas along the main axis built by the train in previous periods. As a result, functional complementarities start to develop, between urban centres and the metropolitan centre – Lisbon and the Tagus Estuary. As a consequence, new land uses and functions, previously located in the traditional urban centres, emerged in high connectivity areas and external rings, together with new dense and specialised uses, such as shopping centres and malls. Under high mobility patterns, dimmer urban tissues gained central functions, competing with Lisbon, and shaping a polycentric metropolitan network.

As the 20th century ends, European metropolises reach an advanced development stage, both in terms of achieving high levels of spatial and functional articulation between centres and promoting innovative uses in their territories. Therefore, from 2001 onwards, Lisbon metropolis gains and consolidates its shape, influence and role in the conurbation of Lisbon-Galicia, along the Atlantic coast. This new reality points towards even more complex transformations, to include several concatenated metropolitan

formations. This increasing and extensive urban growth, together with the integration into higher network systems, determines a drastic decrease of continually unoccupied space. At the same time, a landscape homogenisation gains shape contributing to undifferentiated territories with poor urban references.

Further research introduced new questions which, based on a morphogenetic reading of the pre-established metropolitan scale, led to various case studies on a scale which allowed the constitution of an urban morphology interpretation according to identical criteria, but now adapted to a more circumscribed scale.

In this context, the city of Lisbon, one of the case studies in progress, plays a key role, and a study of its urban formation has already been conducted using new sources (cartography, urbanism and planning).

Research is being conducted on specific areas of Lisbon, namely the Valley of Chelas, in the heart of Lisbon, which will be further examined so that its potential as an urban project can be evaluated[1].

Morphogenesis of the City

This interpretation of the urban formation of Lisbon aims to understand the way the city has been shaped. The work resorted to the formulation of its own interpretative guide, which identified morphologies as they progressed in time and space.

The present research allowed the identification of the following: 1. The processes of transformation of rustic structures into urban ones; 2. The nature of their own transformation; 3. The persistence of pre-existing structures and how they were assimilated by new ones; 4. Their importance in the formation of tissues; and finally, 5. It allowed us to identify distinct morphologies, stressing the morphogenesis of the city from the morphological characteristics of open spaces.

Open space and its different structures can provide a lot of the answers to our understanding of the urban formation of Lisbon, for which reason they lie at the root of our explanation for the formation of their morphology, taking into account the following key aspects:

a)   Topography and hydrography: by highlighting the relationship between watercourses and parallel lines and the development of the main infrastructured lines, the configuration of open spaces and of tissues (enclosed monastery areas, parks and gardens, rustic matrices), the importance of the morphology of the land (valleys, hills) and of water (the various coastal lines and the influence of the Tagus in the formation of the city);
b)   The transformation matrices: urban and rural plot division of land and different forms of parcels in accordance with the topography, forms of aggregation (namely, of the built space in its relationship with urban fabric and land uses, including – blocks of buildings and other urban units, disperse building); public space layouts

(including urban types such as plazas, street boulevards and gardens, as well as other types of open spaces and their correlation with major urban elements and outstanding buildings).

This interpretation goes hand in hand with a reflection on the relationship between the morphologies identified in each period in time (1903-37; 1937-49; 1949-71; 1971-87; 1987-2008, in progress), urban planning models and the city and architecture theoretical and cultural references, in their various movements, specifically:

a) Rustic pre-existing structures and the form in which they were integrated into the urbanisation process, particularly in the pre-industrial period.
b) Industrialisation and the expansion of the city in the 19th century – the formation of a green belt, circumscribed by two ring roads which set the administrative boundaries of Lisbon, in distinct periods of time, the last one dating from the end of the 19th century;
c) The shaping of the modern city – modernist disjunction, formation of zoning areas and of specialised areas located predominantly in this green belt and whose somehow disperse urbanization results in a landscape of rustic origins which are becoming obsolete, Post-modern period and obsolescence of industrial and rustic uses, abandonment and transformation of central spaces and the search for new programmes for the city;
d) Post-industrialisation and new approaches to collective space; urban projects through public space, the urban and environmental regeneration, miscegenation of uses and technological innovation.

Two axes and a ring

The Tagus Estuary was the major driver for the urban development of the Lisbon metropolitan area, with regard to the location of the various urban settings on its left and right banks and, particularly in the case of the latter, by fostering the creation of an urban formation which shaped the modern configuration of the city of Lisbon.

Therefore, in addition to the interpretative model for creating the metropolitan structure, this work proposes the study of specific situations arguing that the unoccupied space should be the basis for the articulation between metropolitan planning and the urban project.

The development of new forms of intervention in the city from the middle of the 19th century allowed for the possibility of planned innovation in the city of Lisbon, generally resorting to very interesting urban plans. The several varied urban plans for the city, particularly the plan for expansion to the north and improvements to the harbour (Ressano Garcia, up to 1903), which made clear references to Haussmann's interventions in Paris, allowed an initial qualification of the urban space by including new typologies for public spaces that complemented existing squares and plazas (development of an axis of great architectonic interest between Terreiro do Paço, which limits the city from the Tagus Estuary, through the Old Town – *Baixa Pombalina* -

reconstructed by the Marquis of Pombal up to the north, including the new boulevards in *Avenidas Novas* - New Avenues).

At the same time as it attempted to bestow the city with new, more cosmopolitan urban areas, appropriate to a European city, Ressano Garcia widened the area around the port, giving origin to new artificialised areas in the margins of the city which were vital to a major port city and which nowadays constitute privileged ground for urban intervention from the viewpoint of the qualification of public space and urban regeneration. Nowadays, the Tagus Estuary, which has a major harbour infrastructure appropriate to a city which was, in the past, the capital of an overseas empire, has been subjected to several changes with the purpose of readjusting its initial vocation to a more urban usage, including leisure purposes, benefiting not only Lisbon but equally other cities with waterfronts.

As a consequence, the qualification of the urban space through new proposals of public space has improved and shaped the Tagus Estuary, which has become an area that is both functional and highly qualified from a landscape perspective, with symbolic and strong identifying features that can characterize it as the *metropolitan plaza*.

A close examination of the urban formation of Lisbon, in an attempt to understand its open spaces as potential planning and project instruments, unveils the prominent position of its public spaces, not just from an aesthetic and social perspective, but also from the viewpoint of the infrastructure of the city itself and of its future development.

The consolidation of knowledge regarding the various forms of urban planning and design is a fundamental objective of the present work, as it aims to provide an understanding of how the different planning models of the city also conditioned, or gave origin to, both qualified open spaces and residual urban voids.

The option chosen for this analysis included essentially the observation and identification of morphologies which could, in a systematic form, highlight transformation processes of the city at specific periods of time. This analysis resorted basically to the production of a thematic cartography in which characteristic areas of a particular functional and formal coherence are identified, and contact points with the main plans for the city of Lisbon are established.

In a preliminary phase that is still currently in progress, several categories of urban forms have been identified, with a view to future conceptualization as part of Theory of Urbanism. In the systemization of the categories, several large scale city structuring elements were taken into consideration, as well as their desegregation into more specific and detailed morphologies.

In the context of its own physiography, the urban growth of Lisbon was shaped from opportunities created by the Tagus Estuary, namely the deepest trenches, which determined a marked growth of the area around the harbour. In a stratified manner, the

urban formation of the city can be understood as a superposition of complementary layers:

a) Main axis forming a harbour and river waterfront, crossed by a spinal column expanding to the north;
b) An external ring characterised by a rural mosaic in transformation, between the expansion of the sedimented city and its successive administrative borders.

The axes are characterised by:

c) Urban Fabrics – various forms of occupation in the context of the city, expressed through several approaches to urban space, as well as by growth areas that were planned and built.
d) Infrastructural lines – forms of linear development in which the role of infrastructuring is fundamental, such as the embankments on the harbour which were raised from the river Tagus, and the routes which have been shaping the growth of the urban tissue, such as transportation infrastructures and other public facilities.
e) Specific Uses – areas for specialised and frequently mono-functional land uses, indispensable to the city's structural functioning and with clear morphological characteristics, such as: public facilities areas; cemeteries, industrial and military zones.

The external green belt is formed by:

a) Specific open spaces: spaces with a precise identity that appear as part of an urban design project (such as public gardens), or as part of an idea of a city (such as Monsanto Park, which delineates a partial green belt), or as single elements in architectonic groups (erudite gardens in palaces).
b) Rural Matrix: distinct forms of rural plot division and of related land uses which register their progressive transformation and occupation by the urban space, as well as the features which will influence the formation of urban tissues.

In the urban formation of the city of Lisbon, mainly through the development of the road system and the intervention of Ressano Garcia in the 19th century, together with the successive external and internal ring roads, the compact nucleus of the city is surrounded by a transitional belt which began to be formed by farms and small towns in the outskirts of Lisbon with two types of fundamental landscapes (Atlantic and Mediterranean), which determines the different forms of land division and agriculture and, consequently, conditions urban development.

The intersection of these axes with the green belt, anchored on an older central part of Lisbon, contributed towards the definition of four sector identities with increasingly more specific characteristics regarding urban form and transformation, and which are regarded as the transition point to the urban areas of adjacent municipalities (Oeiras, Amadora, Odivelas and Loures, respectively):

a)   Belém/Monsanto sector;
b)   Benfica/Campo Grande sector;
c)   Lumiar/Airport sector
d)   Olivais/Chelas sector.

Following our interpretation of the urban formation of Lisbon and corresponding identification of the four sectors with their own specific characteristics, we have selected The Valley of Chelas as the object of more detailed study.

Bordering Territory

The Valley of Chelas, which lies both in the transitional green belt of the City of Lisbon and in the potential axis with Barreiro, is a border area of Lisbon and part of the rustic green belt characterised by the urban development of the first half of the 20th century, where the most relevant urban experiments took place.

This belt was included in several city plans, resorting to urbanism concepts related to the City Beautiful movement, and was reserved for infrastructures and Urban Parks and Woods, of which *Campo Grande* (included in Ressano Garcia's plan, but in a shorter version that the one originally planned) was the only park to see the light. Later, the Monsanto Forest, which was part of the De Gröer plan, was created in the late 1930s. In this context, key references, such as Abercrombie's Greater London Plan or Olmstead's innovations in various American cities, such as Chicago, played a fundamental role.

For several reasons, this green belt was never created. Quite the opposite: the differences between the various sectors deepened and widened even further the existing gap, given that the road system benefited mostly the centripedal radial structure of Lisbon, to the detriment of the strengthening of a transversal north/south type of road system, which anyway had been proposed in Meyer-Heine Master Plan for the City (1967-76). The transversal structure was set up in part with the new underground line to the Expo'98 (May 1998) Station and Interface, with the Chelas station and, more recently, it was included again in the Lisbon Municipal Master Plan. This fact was a major contribution to the recognition of this area as being equally part of the city, and it increased accessibility by public transport and by car. This had hitherto been an area of social housing whose residents, of low income and mixed social and ethnic origins, had restricted mobility, a factor which contributed to the strong segregation of this area in relation to the city of Lisbon. This area to the Western side of the city was characterised by social conflict and by the miscegenation of uses and urban forms, which had their origin in the contrasts between an industrial waterfront (Xabregas and Marvila), discontinued spaces between residential and industrial zoned occupations (Chelas) and, over the past 10 years, the latest measures for the re-conversion of industrial areas (Expo Park and Western Urban Rehabilitation Society/SRU - Lisboa Oriental).

In this particular case, research focused on how urban master plans for the city conditioned and gave origin to unoccupied space (vacant, derelict and brownfield areas), mostly comparing the various master plans for the city (Ressano Garcia, 1903;

De Gröer, 1948; GEU, 1954-59; Mayer-Heine, 1967-76; Lisbon Council/CML and the ongoing revision) with the Chelas and Olivais urban plans and the implementation of major infrastructures (railways and eventually high speed train).

The area under study is located precisely in this *green* belt – rustic space with specific characteristics and whose urbanisation process evolved in an atomised form and resorted to the introduction of new urban occupations which were perfectly delimitated and whose projects revealed specific characteristics (with exemplary references in the context of the history and theory of urbanism, such as the city-garden, modern architecture international congresses/ CIAM and TeamX), but which were equally autonomous in a city bordering territory organised from rustic structures bearing distinct characteristics (common farms as well as leisure farms, with gardens and palaces of high architectonic erudition).

Accordingly, this area stands out in the city of Lisbon due to its special discontinuities, which were basically caused by intermittent urban interventions in the 20th century, although, in themselves, they constitute good examples of the innovation and quality of the projects and of the architects who authored them, and started a certain type of territorial urbanisation which was different from the traditional approach, creating urban continuities of which the axis Baixa (Low Downtown) – Avenidas Novas (New Avenues)/Alvalade, and more recently the Alta de Lisboa (High Part of Lisbon, Airport Area) are models and equally relevant in the context of urban experimentation.

The Valley of Chelas has always been considered an infrastructural reserve of the City, as well as a privileged one for industrial type occupations (port and others). Presently, several interventions are planned which will certainly lead to major transformations in these discontinued spaces of a sectorial nature.

Nevertheless, the planned interventions, of different impact and characteristics, highly uncertain as to their future configuration or even accomplishment, are, for the most part, independent from each other, and the high structuring of open space, including their infrastructural and open space dimensions, may become the topic of an urban project with a high planning capacity in a fragile area.

Besides, the available spaces surrounding the areas of highest density, which between the 1960s and the 1990s were fully occupied by slums and thus affected by serious safety and social exclusion related problems (due to the rural exodus and the end of the Portuguese colonies in Africa) have been subject to landscape intervention, resulting in the creation of various urban parks with facilities and commerce, hosting important cultural events /such as Rock in Rio Lisbon, although they still lack a global articulation project. The most recent toponomy has recouped the references to the old Estates, as opposed to the more aseptic designations of the second half of the 20th century (such as Zones J, I, N).

Besides these collective spaces and transformations, the following interventions, which may eventually occur, were considered: high speed train, potential new crossings over

the Tagus river, like the Chelas-Barreiro bridge and other options, the location of major facilities, such as the Portuguese Cancer Institute (*Instituto Português de Oncologia*/IPO) and the All Saints Hospital (*Hospital de Todos os Santos*) and the potential relocation of the present Lisbon International Airport outside the city limits, probably in Benavente.

It is this uncertainty, together with the pre-existing rustic matrix, zoned interventions and infrastructured lines for specific purposes (which were unsuccessfully articulated superimpositions carried out sequentially in time), that originated the poor structuring and lack of urban coherence of the Valley of Chelas, both within itself and in relation to the context of the city.

The Valley of Chelas, which has always been an important reference in the context of architectonic and urban experimentation and innovation, inevitably finds its projects postponed, and the interventions that are actually made are always of a sectorial nature or, on the contrary, of an infrastructural character, in the form of motorways and railways. Above all, it is fragmented and disconnected, which increasingly poses more difficulties for any future truly coherent project, which is always in the pipeline but never actually put into practice. Although of a residual nature as an object of intervention, the Valley of Chelas is also central in terms of its potential in the context of metropolitan networks, where urban growth occurs by coalescence, stimulated by the development of the Vila-Franca de Xira industrial axis.

This creates a significant urban porosity and encourages a network of available spaces lacking coherence which, in themselves, constitute a major opportunity for urban connections and for continuities through new projects for public space, which, in this context, may be perceived as a major infrastructure of the city.

Conclusions

The present study has allowed us to consolidate the idea that the city of Lisbon has always been, for a variety of reasons (cultural, social, political and administrative), the object of more qualified studies and interventions in the context of national architecture and urbanism. However, from the 1990s onwards, while its metropolitan area underwent a consolidation process, from a functional, morphological and economic perspective, its study was systematically left behind in favour of projects which sometimes served different agendas. Focused interventions on a more metropolitan scale have been preferred, such as in the Lisbon metropolitan area, on other emerging municipalities, which in terms of centrality were alternative to Lisbon. The same applies to the options to study its urban tissues, which were more qualified from a project perspective, but were already consolidated and relatively old.

The evolution and nature of urban territories in European metropolises, mostly in Southern Europe, have contributed towards this situation, and, as a result of this evolution, so has the lack of adaptation of current urban intervention forms (urban design, urban and spatial planning) to areas whose characteristics are not always

clearly of an urban nature, in a context in which the city is not exclusively perceived as a result of the expansion over rural areas.

In fact, and with the exception of a few specific examples (such as Expo 98), over the past ten years Lisbon has not been subject to any structuring urban interventions based on the Idea of the City. In terms of innovation, architectonic and urban space quality, it does not show any specific particularities in recent years, although some examples of regeneration and qualification of interesting public space can be mentioned (the waterfront area, for example).

It has equally been noted that the study of the urban formation of Lisbon, besides focusing on the more compact areas, has left out the city's peripheral territory, which has a rustic basis and presents a mixture of occupation forms of high urban innovation. In reality, the major urban experiences of the 20th century have occurred in *green belt* and are often rooted in small villages, of which the following are easily identifiable: the social boroughs of the *Estado Novo* (1933-1974), which followed the city garden model; the new areas of the modern city, such as North and South Olivais; and, in the conceptual transition to more recent interventions, the Chelas and Telheiras Master/Urban Plans. More recently, atomised and discontinued proposals in the form of mega-structures of high metropolitan impact (large buildings and infrastructures or parks) are also examples of the above.

Interventions as part of a process of regeneration of decayed and obsolete areas give back to the city zones of privilege, through land use innovation and qualification of urban space. Fundamentally, at the external belt of Lisbon identical situations can be identified. Given their morphological characteristics, these areas could benefit the whole city had they not been systematically excluded from the city planning projects' main goals, except when considered as building zones.

At the level of intervention in the city, it is also observed that there is an urgent need for a new kind of town planning approach, of a spatial and design nature, capable of regenerating land use and restoring the landscape morphological coherence. In precise terms, in the context of urban space and planning, this should be achieved through the contraction of discontinuous and residual spaces which could become both anchors and control mechanisms for new projects of urban occupation.

Thus, and mostly from the beginning of the 20th century, the study of urbanistic formation in an urban context, alongside the concepts associated with its production, has demonstrated that architects and urban planners are intervening increasingly less, as they become more conciliatory in a territory whose circumstances extend well beyond the capacity for intervention in the city on a global scale.

Indeed, it was in the period up to the middle of the 20th century that we find the most meaningful and innovative references to the idea of city and which in fact led to new urban forms, whereas, at present, the intellectual effort has been focusing on the attempt to understand the urban phenomenon on a metropolis which goes beyond our

capacity for efficient intervention. Within this set of circumstances, innovation takes place mostly through resorting to processes which act at the level of economical, social and infra-structural dynamics, while relying less on the conception of new forms of urban space (for example, authors such as Patrick Geddes, Frank Lloyd Wright and Le Corbusier, who have proposed innovative models based on typological and technological innovation, and authors like Melwin Webber and, much more recently, Edward Soja, Joel Garreau, Indovina, Rem Koolhaas, who presented interpretations of urban phenomena on regional scales). In this context, public space does not always appear as the structuring element of the urban fabrics of conventional cities, or as a support (modernist dialectics figure/background) as in the modern model.

Basically, public space extends as an articulation element which "glues" together urban splinters, forming an extensive patchwork over which, in our opinion, new opportunities for a project and coherence of the contemporary city unfold.

These contrasting phenomena between macro and micro scales, which are generalized in European cities and more specifically in North American cities, can also be found in Lisbon.

Urban intervention, from what can be observed and read, balances between large-scale projects resorting to very abstract models which do not take into account the morphological coherence of the territory – urban, natural, rural (patterns, zoning and infrastructure) – and interventions of urban acupuncture in derelict and extremely central key areas (see emerging topics which include a combination of urban sprawl and urban shrinkage).

Nevertheless, it is also noted that the instruments that are now available (particularly GIS) enable us to intervene on a metropolitan city scale, and resort to a new urban language, using contemporary public space concepts and introducing new scales in the field of Urban Design.

A new idea of city would include innovative approaches in the field of intervention in collective spaces, as a means of improving and defining the articulation between spaces which are predominantly built and the ones remaining clearly open.

Enron on the Mississippi: the planning and failure of Cairo, Illinois, 1838-1840

Robert Douglass Russell, Jr.
College of Charleston, United States

Precis

If geography were destiny, then Cairo, Illinois would have been one of the great cities of the United States, if not the world. The title of 'inland metropolis' would have gone to it, rather than to Cincinnati, or Memphis, or, later, St. Louis. But geography is, unfortunately, linked to topography, and the topography of the confluence of two of the great inland waterways of the U.S. – the Ohio and the Mississippi – was not kind to city building.

This lesson was learned the hard way by many people in the early and mid-nineteenth century. Though beginning with the first attempt, in 1818, to establish a great city at the bottom end of the new state of Illinois, this paper primarily concentrates on the second attempt to found a city – Cairo – where the Ohio joined the Mississippi. This effort, linked at first to the establishment of the Illinois Central Railroad, was spearheaded by the New York capitalist, Darius B. Holbrook. Holbrook has been treated well in past literature on Cairo – too well, it seems, and the evidence presented here shows Holbrook to be a charming but unscrupulous con artist who well understood the powerful effects of greed on human actions, and knew how to use the ever-present temptation to get something for nothing to his benefit.

Holbrook was the sole link between the generally honorable Illinoisans involved in the dual enterprises of railroad and city building, and the investors, for the most part Englishmen. He provided what investors wanted, both in the form of prospectuses and, once he had employed William Strickland, noted American architect, engineer and graphic artist, compelling images of the (wholly imaginary) city of Cairo. Rumors of the direct financial involvement of Charles Dickens in the Cairo debacle, circulating since the early twentieth century, are laid to rest, while that writer's famously vicious description of the site of Cairo in his *American Notes* of 1842 is attributed to personal sympathy for those affected by Holbrook's swindle.

To anyone looking at a map of the inland United States near the beginning of the nineteenth century, one geographical point would have immediately leapt out, demanding attention: the spot where the great Ohio River, flowing southwestwards, joined with the sluggish, brown Mississippi, winding its way haphazardly south to the Gulf of Mexico (pl.1). There could be no doubt but that, if there was to be a "future metropolis of the Western world" anywhere, this was where it was going to be. In this case it looked like geography was destiny. [1]

It certainly was destiny to John G. Comegys, a native of Baltimore who had come west early in the new century and settled in St. Louis, where he became a merchant. Little is

known of his life there other than that his was a frequent name in court dockets, where he was often a plaintiff collecting debts. He was also a land speculator who paid close attention to politics. In July, 1817, Comegys bought 1800 acres comprising the very southern tip of the then-territory of Illinois. The land was still technically owned by the Kaskaskia Indians, since it was to be more than a year before their title was extinguished; a necessary preliminary to the offering of the land for public sale. Apparently this bothered neither Comegys nor the Register and Receiver of the territorial land office in Kaskaskia, across the Mississippi River from St. Louis, who concluded the sale.[2] So it was that when Illinois became the twenty-first state in the Union, on December 2, 1818, its southern tip was already privately owned by someone who had great plans.

Comegys did not just snatch up the Illinois land with the vague idea of doing something or other with it some day. Less than six months after his purchase, he and eight other men were the beneficiaries of an Act, passed by the territorial legislature, incorporating "the City and Bank of Cairo."[3] Comegys and his compatriots had clearly been looking at maps, and had decided, reasonably enough given that information, that the confluence of the two great rivers was the perfect spot for the future great American metropolis. Their choice of name for the future town was an interesting one, reflecting, no doubt, one or more of the speculators' familiarity with the then-current fascination with all things Egyptian. And given that fascination, what could be more natural than to assimilate the Nile to the great inland river of the U.S.?[4] They certainly had big dreams, and the plat of Cairo that Comegys had drawn up was remarkable for its expansiveness. It was for a gridded town, with seventeen east-west streets and thirty that ran north and south. They were all 80 feet wide. There were 290 blocks, four of which were set aside for markets. The longest streets ran for nearly two miles.[5]

Hope dies hard, and Comegys made payments on his land for the two years after he purchased it, but in 1820 he died and his business partners apparently lost hope. The land defaulted to the state of Illinois, with whom it remained for fifteen years. There were reasons for this failure. Major Stephen H. Long, of the U.S. Army Corps of Engineers, on his first exploratory journey west to the Rocky Mountains in 1819, commented on reaching the site of this stillborn city that 'the grandeur of the place fell short of what one would suppose or expect from the conjunction of two such mighty rivers.'[6] The topography did not match the geography.

In 1835 Comegys's lands were finally bought again. The purchasers of record were Judge Sidney Breese, Anthony Olney, Alexander M. Jenkins, Thomas Stanwick, Miles A. Gilbert, and David J. Baker. On January 16, 1836, the Illinois Central Railroad Company was incorporated. Two days later the Illinois Exporting Company was incorporated by the legislature. Its principals were James S. Lane, Thomas G. Hawley, Anthony Olney, John M. Crum and Darius B. Holbrook.[7] A new plan for the bottom of the state was taking shape.

This second attempt to create Cairo was closely linked to the desire to establish a railroad through the state. Judge Breese, mentioned above as one of the purchasers of

the Comegys lands, was an indefatigable supporter of this still new form of transportation. That he was intimately associated with land speculation closely connected with the proposed railway did not bother many people at the time. In the fall of 1835, about the time of his involvement with the purchase of the land at the confluence of the two great rivers, Judge Breese published a letter that called on the state to build a railroad from the proposed southern terminus of the Illinois and Michigan Canal, at Peru, to the future site of Cairo.[8] As has already been noted, the Illinois Central Railroad Company was incorporated shortly afterwards, in January, 1836.

On February 27, 1837, the Illinois legislature passed the infamous and ill-fated "Act to Establish a General System of Internal Improvements" within the state.[9] Five days later, on March 4, 1837, the Cairo City and Canal Company was incorporated. Its principals were Miles A. Gilbert, a judge, John S. Hacker, William M. Walker, Anthony Olney, Alexander M. Jenkins, who had until the year before been the Lieutenant Governor of Illinois, and Darius B. Holbrook, the President of the new company. It must be remembered that at this time there *was* no Cairo, nevertheless, the Internal Improvement Act specified that the main north-south railway line, to be built as part of the program, was to have its southern terminus "from the City of Cairo, at or near the confluence of the Ohio and Mississippi rivers."[10] $3.5 million, or a third of the total amount appropriated for the improvements, was to be expended on this line.

John Landsen, the historian of Cairo, interpreted this as a surprise and a shock to the incorporators of the Illinois Central Railroad Company and the Cairo City and Canal Company. "The news of its introduction [the Internal Improvement Act] into the legislature must have produced in the minds of those Cairo people a state of feeling little short of consternation."[11] This is a generous and protective response, and Lansden praises the men for their selfless releasing of the rights to the railroad. But it is difficult to believe that a group of men so intimately associated with early Illinois politics in all its rough-and-tumble frontier forms would have been taken unawares. It is much more likely that this was precisely the state of affairs desired by the incorporators, particularly of the Cairo City and Canal Company. The Internal Improvement Act provided an enormous amount of state money to build what otherwise they would have had to pay for themselves, and their relinquishing of their ownership rights was carefully conditioned so that, should the state default at any time, ownership would revert to the original incorporators. They were set to have their cake and eat it too.

With one exception, all the men involved in the incorporation of the Illinois Central Railroad and the Cairo City and Canal Company were permanent residents of Illinois. Most of them had come from elsewhere, but they were long settled in the area, and were generally well-connected with state politics. The one exception was Darius Blake Holbrook.

Holbrook was born in Dorchester, Massachusetts. The year of his birth is apparently not recorded. He had settled in New York by the 1830s. Holbrook was an enormously successful speculator in Western lands, and by the time of his death, in Mobile, Alabama in 1858, had amassed a huge fortune. In the early twentieth century he was

characterized, in a sympathetic magazine article, as "a man of daring, misguided perspicacity, an Alnaschar in kind."[12] Holbrook was clearly the man leading the efforts both to establish the Illinois Central Railroad and the new city of Cairo. He did not do this as a newly-relocated citizen of Illinois, but continued to influence events from afar – probably from New York, though, as we shall see, he was also in London at crucial stages of the working out of this story. For Holbrook, the topographical details of the site for the future town were not particularly important since there is no evidence he was committed to its success. The circumstantial evidence points to his involvement in the two-pronged scheme primarily as a way of pocketing funds intended for other uses. Holbrook no doubt would have been happy to see Cairo succeed as a town, and it is likely that the possibility of its success formed part of a back-up plan from which he would have reaped a more modest return, spread over a longer period of time. Holbrook's success as a swindler in this affair depended on the involvement of the other investors, who really did, for the most part, think they were committed to building a town and a railroad. Although it is impossible to know for certain, Holbrook must have bamboozled his fellow principals as thoroughly as he did the later investors in the schemes. Expansive projects like these – a town and a railroad to link the disparate parts of a state together – needed large amounts of capital. That capital was hard to come by on the frontier. It was even difficult to amass in the large cities of the eastern seaboard. Holbrook must have assured his frontier compatriots that he had wealthy and influential contacts not only in eastern cities, but in Europe as well. It is reported in a very general way that Holbrook made repeated trips to London in connection with the Illinois ventures. He almost surely made one of them in 1838, when he would have been in London at the same time as the Philadelphia architect and engineer, William Strickland.[13]

In 1838 Strickland was one of the most well-known and highly respected architects working in the United States. Since his first great design success with the Second Bank of the United States, built on Chestnut Street in Philadelphia in 1818-24, Strickland had gone on to create many of the most important Greek Revival structures in his hometown. In the overwrought sentiments of after-dinner toasts, Strickland was once compared to the Emperor Augustus, who had found Rome a city of brick and left it one of marble. The same claim was made (with some justification) about Strickland and Philadelphia. In late 1836, a group of architects meeting in New York City to establish a professional organization, the American Institution of Architects, elected Strickland their first president. In the months before that honor, he had been consulted by the state of North Carolina regarding the propriety of details suggested for their State Capitol, then abuilding in Raleigh.

The proposed professional organization of architects died a sudden death with the collapse of the American economy in the spring of 1837. Strickland himself had enough work to keep him busy until the end of the year, but in early 1838, with prospects dim for new building, he took his two daughters and sailed from Philadelphia to England, with plans to travel on to the continent, making a modified Grand Tour. This was the third time Strickland had gone to Britain, though he had never yet crossed the English Channel. In 1821, flush with the success of the Second Bank, and a few hundred dollars

ahead for the first time in his life, the impetuous young architect had taken himself off to England. In 1825 he returned to England, with visits to Scotland and Ireland, as the agent for the newly organized 'Society for the Promotion of Internal Improvement in the Commonwealth of Pennsylvania.' In that capacity he spent many months examining canals, railroads, breakwaters and other forms of technological improvements for which Britain was, at the time, justly famous as being in the forefront of innovation and development.

Strickland was the ideal man to serve as agent for such an undertaking. He was known and admired on both sides of the Atlantic for his architectural work. His early apprenticeship with the first professional architect in America, the Englishman Benjamin Henry Latrobe, had involved Strickland not only design, but trained him as a surveyor as well. It was not for nothing that he referred to himself consistently throughout his career as 'architect and engineer.' At the beginning of the nineteenth century it was still possible to blend those two professions together. Strickland's was the last generation where that was possible, however, and the 'architect and engineer' himself trained, through apprenticeship, as many of the next generation of professional engineers as he did architects.

Strickland and his daughters arrived in Liverpool, where they stayed with an old family friend. They are documented in London from February 6, 1838, and they stayed in the city until the beginning of March, when they departed for Paris.[14] They returned to London briefly in June, before taking ship again for Philadelphia. Although records of Darius Holbrook's visits to London remain elusive, the two men could have met one another either in February or June of 1838. That they did meet is highly likely, for soon after Strickland returned to the United States he left Philadelphia for the western frontier to carry out a survey preparatory to establishing the future great city of Cairo, Illinois.

Strickland and another man, the English surveyor and Geologist Richard C. Taylor, had been hired to survey the site by the London banking firm, Messers Wright and Co. Wright & Co. was an old and highly respected banking house that could trace its operations back to seventeenth-century goldsmiths, the predecessors of modern banks.[15] Holbrook had engaged the bank to offer bonds in England for his Cairo City and Canal Company, and Wright & Co. were doing almost a literal 'land-office business' selling them. The bonds were much in demand among English aristocrats and members of the nobility, as well as commoners who could afford them. They were apparently a very hot commodity on the London market in the late 1830s. Holbrook was a master at his business of promoting his investment schemes. He had published and circulated various pamphlets, both from the failed 1818 venture to create the city, as well as reassuringly official documents related to the current projects. It is likely that Holbrook reused the 1818 material – a 'Prospectus of the City' and a plat of the 'City of Cairo' -- for two reasons: to give the impression that this was such a good idea that it had been initiated two decades previously, and because he had no pictures to offer potential investors.[16]

Although Strickland referred to himself as 'Architect and Engineer' throughout his career when it suited the circumstances, he had long since dropped the 'Engineer' when working primarily as an architect. He had also given up the arduous life of a field surveyor, no doubt to his wife's satisfaction, if not at her urging. But with architectural work non-existent because of the dismal economic situation following the Panic of 1837, he had little choice, and soon after returning to Philadelphia in the summer of 1838, Strickland and Taylor set off for the western frontier.

From a strictly practical point of view, the Philadelphian and the Englishman were not needed in Illinois. James Thompson, a resident of the state, had been hired to survey the site of the town in 1837 and had already produced a perfectly acceptable plat of a part of the township that the city of Cairo was to be in. Strickland and Taylor were needed for another purpose: to provide an additional level of respectability and legitimacy to the enterprise, for Strickland, especially, was well-known on both sides of the Atlantic. Since it is likely Holbrook never intended actually to pay these men for their work, their services entailed little expense. [17]

After conducting their survey, Strickland and Taylor must have had some concerns; however, since their job was not to determine the suitability of the site, but rather to suggest the best way to render it practical to construct a city on, they did not spend any time in their report dwelling on the difficulties presented by an area inundated by almost annual flooding. They took the positive approach: the site would be ideal for a city provided adequate levees were constructed and the ground level raised several feet.[18] These were both very expensive propositions, and Strickland must have stressed to Holbrook their cost as well as their necessity. Venturing completely into the realm of supposition here, it is not hard to imagine Holbrook airily dismissing the concerns of his engineers over the cost of their recommendations, assuring them there was plenty of money available for needed improvements, and that whatever was necessary for the success of the enterprise would be done. Holbrook was nothing if not optimistic, and the optimism of men who control vast sums of capital is invariably infectious. He was also the only man in the whole intricate web of dealing and action who saw both sides. The capital was being raised in England while the surveyors were working on the muddy banks of the Ohio and Mississippi, thousands of miles away. Holbrook could say what he wanted to curious questioners at either end of his transatlantic span with no possibility of contradiction.[19]

But there was more that Strickland, particularly, could do for Holbrook. The architect could provide what was lacking in the mountain of publicity material the capitalist had assembled in his quest for cash: he could produce compelling images of what was to be. Prospectuses were all well and good, and compilations of statistics useful and reassuring to those with a bent for figures. But there is nothing quite as effective as a visual image at persuading the reluctant. Pictures are the basis of advertising.

Holbrook had Comegys' 1818 plat for the first proposed Cairo (pl.2), but it was pedestrian to a fault. John Reps rightly related it to William Penn's plan for Philadelphia of 1682. This 'new Philadelphia on the Mississippi' as Reps called it, was scarcely a

compelling design, even in 1818, let alone twenty years later.[20] But Strickland was on salary for the Cairo City and Canal Company, which meant that promises were all that was needed to keep him content. And Strickland was a highly talented draftsman, known since his youth for his ability with a pencil.[21] So it was that the middle-aged architect turned his hand to urban design for the first and only time in his career.

It should not be surprising that, after a lifetime spent in Philadelphia, his proposal displayed more than distant echoes of Penn's town (pl.3). A seventeen by eighteen-block grid at its largest extent, it displayed a consistent regularity except where it died into the levees intended to surround the town. But Strickland's plan eschewed the undifferentiated grid of Philadelphia, substituting for it a much more sophisticated series of primary and secondary axes, as well as nearly a half dozen regularly interposed but significantly more complex residential focal points. The most immediately noticeable feature of the plan, however, is what was apparently intended to be the civic center of town, at the southeast corner, fronting onto the Ohio River. It will become clear momentarily why this is identified as the civic center of town, but the plan itself makes it evident that this is a separate, and more important, part of the proposed city. The street grid continues, but there is a noticeable variance in the arrangement of the square. Most dramatically, there is a nearly complete reversal of color values on the plat to make the point that this is the most important part of town. Within this eight by six block rectangle there is another public square, but this one has been expanded in comparison to the other five complete squares of the plan, with four smaller squares surrounding it: one at each corner. At the southern end of the town plan, expanding beyond this civic center area, is a segmental curved area with an axial street intersected by two curved boulevards. Though this plan shows no monuments here, this has the appearance of a monumental zone, and there is some evidence that this is what Strickland was intending.

This plan was no doubt helpful to Holbrook in his marketing of the idea of Cairo, for it showed a much more elegant than normal potential American town. But a plan is still fundamentally an abstraction, something that does not mean much to people who are not trained to interpret it. Holbrook no doubt recognized this, and prevailed upon Strickland to create a more immediately accessible image of what was envisioned for the banks of the Ohio and Mississippi. Although the architect had not produced these topographical landscapes for a number of years, he had been, as a young man, quite adept at them. What he produced now, either on site in Illinois in the fall of 1838 or, more likely, back home in Philadelphia in the winter of 1839, was a masterpiece of the genre (pl.4). There is no doubt that this vision of Cairo (for such it must be described) was created in collaboration with Darius Holbrook, for the promoter was not interested in what the site looked like as much as he was desirous of projecting an image of what could be; as far as potential investors were concerned, what *would* be. Strickland was the delineator, but the content, for the most part, had to have come from Holbrook.

It was a brilliant vision, there is no doubt about that. It included virtually everything that the mid-nineteenth century had come to associate with a wealthy and productive town, especially seen with the eyes of an investor. The first notable feature is that the city is

set on the top of a high bluff. It is difficult to judge scale accurately, but the bluff is lined with riverboats, the stacks of which appear about even with the top of the bluff. This suggests the town was raised about 30 or 40 feet above the level of the Ohio (the view is from a vantage point on the Kentucky side of the river, looking roughly southwest). This is a subtle but reassuring start for minimizing the potential for flooding. At the bottom of the town, to the left, is a courthouse set against a backdrop of sturdy trees; the kind of trees that do not grow on land subject to periodic inundations.

Set back from the riverfront the width of a broad promenade (with groups of promenaders liberally sprinkled along it) are blocks and blocks of three-story factories. These march inward to the center of town with a monotonous but profitable regularity. They are divided into blocks by broad straight streets that debouch onto the riverfront. Over on the Mississippi side of town are a pair of chimneys belching smoke. However unpleasant these seem to 21st-century sensibilities, they meant one thing in 1838: productivity. And productivity meant profit. In between the factory stacks rises a twin towered castellated building, most likely a jail. To a Philadelphian in the 1830s such an arrangement of parts, presented in this style, would immediately bring to mind John Haviland's Eastern State Penitentiary, the most famous penal building of its day.

Rising next to it is the largest structure in the city. The imposing colonnaded drum, carrying a dome crowned by a lantern, stands atop an enormous structure, the triple gabled roofs of which can be discerned rising above the factories. Despite its overtones of governmental dignity – at the level of a state capital at least – it appears most likely to be a hotel. By the late 1830s hotels were another unmistakable sign of prosperity and cosmopolitanism in a city, especially cities associated with railroads, and it will be remembered that Cairo's establishment was intimately associated with the construction of the Illinois Central Railroad. Only a year or two before Strickland created this view of Cairo, James Gallier and Charles Dakin had designed the colossal St. Charles Hotel in New Orleans and crowned it with an enormous dome, very like the one depicted here (pl.5). Strickland who had not yet been to New Orleans, nevertheless was closely connected with architectural developments all over the country, and would no doubt have been familiar with this, the grandest of American hotels.

To the left of the dome of the hotel is a church steeple, suggesting the reassuring stability and respectability of Religion. Finally, farther to the left, down towards the point of the town, is a monument in the form of an enormous obelisk on a base. Its size (it appears to be about 150 feet high), while incongruous, draws attention to itself. We may understand this as a harmless conceit of the artist, who actually produced a design for a much more modest obelisk monument dedicated to the memory of Robert Fulton, which was to be erected in Cairo after the city was built. The two apparently ocean-going ships: a three-masted schooner and a side-wheel steamer, that can be seem anchored improbably in the river in front of the town will be explained later.

This, then, is the image of what every new American town of the nineteenth century aspired to be: prosperous, well-placed, respectable, beautiful. This Cairo was an image of justice, devotion, piety, hard work, wealth. It was, long before Italo Calvino, an

imaginary city. For Darius Holbrook, the picture Strickland drew was useful because it would persuade others of the inevitability of the success of this great new city, and increase the sales of its bonds, which were already going well. Strickland no doubt was proud of the work he thought he was doing for the Cairo City and Canal Company, though there is no evidence he was personally moved by it. Holbrook had offered him a job when he was unemployed, with no hope of architectural work anywhere in sight. Strickland was a grateful man, and happy to have the work, though he would have preferred to have stayed in Philadelphia, and was probably finding it increasingly difficult to get anything but promises out of Holbrook, who had engaged him as an engineer with his company at a salary of $3000 a year: not spectacularly good compared to what he had been receiving back in the 1820s, but nothing to turn down, especially with the country in a depression. The question of Strickland's complicity in Holbrook's schemes must, however, be addressed, for he did draw the picture of the imaginary Cairo.

William Strickland was not a complex man. His Philadelphia friend, the Judge John K. Kane, in writing his obituary in 1854, said: "The characteristics of Mr. Strickland's mind were directness and simplicity. There was nothing complicated or equivocal about him. A stranger could read him like a book…He had a warm heart, direct and gallant purposes, little aptitude of disguise, too little indeed, for promiscuous communion with the world."[22] There were few men in the 1830s more capable of 'promiscuous communion with the world' than Darius Holbrook, and the capitalist had no doubt read Strickland like a book. He saw a man who could do very well what Holbrook needed done, and who would not see through it. However innocent he might have been, Strickland was not stupid, and Holbrook had conceived of the image of Cairo as a sort of two-part invention. Strickland drew the picture, but Holbrook had someone else turn it into a lithograph. The name on the print is 'A. Heffy,' an otherwise unknown lithographer. And the highly misleading title attached to the print of the drawing: 'Prospective View of the City of Cairo, at the Junction of the Ohio with the Mississippi River, *Illinois'* is not something that can be ascribed to Strickland, who, as we shall see, was as taken in by Holbrook as everyone else involved with Cairo.[23]

Armed with Strickland's seductive plan and the newly printed view of Cairo, Holbrook took himself off to London again. It must be remembered that he was the only man who worked both sides of the street in this affair. Whatever he had said to Strickland in Philadelphia, or to the Illinoisans out on the frontier, was not necessarily what he told the eager and curious speculators in the English capital.

Wright & Co. had been aggressively marketing the new town. The bank issued and sold Cairo bonds worth £287,600: about a million and a half dollars in the 1840s and the equivalent of over twenty-five million dollars in today's money. This capital was supposed to be used to build the levees, raise the ground level and create the necessary infrastructure for the town that Strickland and Taylor had specified in their report. This never happened. In November, 1840, Wright & Co. failed, largely because of the Cairo speculation, leaving hundreds of creditors with worthless stock and empty accounts. It has, in the past, been asserted that Charles Dickens was among those who

gambled on Cairo. This is not true, but the failure of Wright & Co. was a monumental blow to the London financial world, and affected many investors, both small and great.[24]

In 1842 Charles Dickens visited America for the first time. His journey took him as far west as St. Louis. He decided to travel by river from Pittsburgh, which may have been largely a choice of convenience, though it did take him to Cairo. That this was completely accidental is unlikely, for Dickens seemed well prepared to detest the place, far beyond his general dislike of the United States and its inhabitants. When he published *American Notes* soon after returning to England, his comments betrayed an animus so pronounced that it is clear there was at least some level of personal revenge; if not for himself, then for friends. Dickens's attack on Cairo is still possibly the most venomous description of a town ever published. He wrote:

> "At length...we arrived at a spot so much more desolate than any we had yet beheld, that the forlornest places we had passed, were, in comparison with it, full of interest. At the junction of the two rivers, on ground so flat and low and marshy, that at certain seasons of the year it is inundated to the house-tops, lies a breeding-place of fever, ague, and death; vaunted in England as a mine of Golden Hope, and speculated in, on the faith of monstrous representations, to many people's ruin. A dismal swamp on which the half-built houses rot away: cleared here and there for the space of a few yards; and teeming, then, with rank unwholesome vegetation, in whose baleful shade the wretched wanderers who are tempted hither, droop, and die, and lay their bones; the hateful Mississippi circling and eddying before it, and turning off upon its southern course a slimy monster hideous to behold; a hotbed of disease, an ugly sepulchre, a grave uncheered by any gleam of promise; a place without one single quality, in earth or air or water, to commend it: such is this dismal Cairo." [25]

It is most likely that at least one aspect, if not in fact the most prominent, of the 'monstrous representations' he alludes to was the lithograph of Strickland's drawing that Holbrook had taken back to England.

Dickens was not done with Cairo even after he had savaged it in his *American Notes*. When he wrote *Martin Chuzzlewit* in 1843-4, he re-expressed his contempt for Cairo in the guise of dreary Eden, itself a sort of 'mine of Golden Hope' for the main character, who nearly dies there.

Even after the collapse of Wright & Co., Holbrook did not cease his promoting of Cairo, which consisted primarily of telling people things about the place that were not true. In the 1839 prospectus for the Cairo City and Canal Company, Holbrook had written that

> The company are proceeding in the execution of their plans as set forth in this prospectus, viz.: to make the levees, streets and embankments of the city; and to erect warehouses, stores and shops convenient for every branch of commercial business; dry docks; also buildings adapted for every useful mechanical and

manufacturing purpose, and dwelling houses of such cost and description as will suit the taste and means of every citizen."[26]

Two years later reports were circulating (most people had never actually seen Cairo) that miles of levees had been built, a hotel put up, lines of brick warehouses erected, docks, mills, iron foundries and workshops all put into service.[27] Essentially everything depicted on the 'Prospective View.' Perhaps most amazing, giving some sense of the unbounded imagination of Darius Holbrook, were 1841 reports published in the national press describing Cairo as a seaport:

> "A ship is now contracted for to be built at Cairo, the steamer designed for a regular trade between that city and Liverpool! Start not reader! This is most certainly true: and ten years will hardly pass before ships (twice the size?) will unload their cargoes at Cairo city which will then be a port of entry, and will take that rank among the cities of the west, to which her unrivalled position – unrivalled in any portion of the world – will entitle her.
>   We will add to this article the fact that the embankment, which will enclose 1303 acres, will be completed in June, after which an overflow of the city will no longer be apprehended."[28]

Even after the collapse of the speculative scheme in London, Holbrook was still pushing the 'Golden Hope' of Cairo.

For him in *was* a golden hope. When he had returned from England, bringing the first million and a half dollars of capital, everyone involved assumed the money would be put into work on the town. It was not. When James Silk Buckingham, the writer, journalist and Member of Parliament, traveled in America in the early 1840s he visited Cairo. In 1842 he wrote:

> "On looking around, however, for the "works already constructed," which are here [in London] said to be "considerable," nothing is seen but a few small dwellings of the humblest class of workmen…the infant settlement has already been completely submerged…and all its inhabitants were obliged to abandon it, to avoid being drowned!"[29]

Holbrook was indiscriminate in his using of people, relying largely on the credibility and greed of people presented with a sure thing. In the case of William Strickland, the creator of the new plan and the vision of Holbrook's Cairo, however, greed was not the primary motive. Strickland was out of work, and the employment offered by Holbrook was honorable. He worked for the Cairo City and Canal Company for a year and a half on the promise of a salary that never materialized. He was paid in company stock that became worthless after the failure of Wright & Co.[30] Holbrook walked away from the debacle, presumably with most of the $2 million (in 1840 dollars) that had been raised by the London bank, for it certainly had not been spent on Cairo.[31] His skill as a con artist – or as an entrepreneur of the most infectious optimism -- is most clearly seen in the fact that in 1846 Holbrook created a new company, the Cairo City Property Trust, to

which the assets of the old Cairo City and Canal Company were sold for $700,000. Half the shares went to Holbrook himself.[32] He essentially stepped from a sinking boat, just as it went under, to a new one, which he had purchased for pennies on the dollar.

Holbrook apparently invested his Cairo money in coal lands in Virginia, West Virginia, and Alabama, as well as maintaining ownership in Illinois property. After his successful exit from the Cairo business, his fertile imagination turned to communications, and in the early 1850s he was a partner in the first successful transatlantic telegraph cable. He died in Mobile, Alabama in 1858, 'one of the wealthiest men in the South,' according to the *New York Times*.[33]

The city of Cairo was essentially refounded in 1851 with the reincorporation of the Illinois Central Railroad early in that year. Holbrook's initial ICRR, which he had wisely abandoned early in the Cairo scheme, had collapsed in 1840 along with Illinois state finances. A town was necessary at the southern terminus of the railroad, and Cairo was it. The early vision of Sidney Breese and other Illinoisans of a railroad that linked the northern and southern ends of the state was finally realized. Holbrook's vision for Cairo evaporated like morning mist on the rivers that fronted it. He could hardly have been surprised.

[2] John M. Lansden, *A History of the City of Cairo Illinois*, Chicago: R.R. Donnelley, 1910 (republished, Carbondale, IL: Southern Illinois University Press, 1976), 31-2. Comegys bought "the South fractional halves of Sections Fourteen and Fifteen, fractional sections Twenty-Two, Twenty-Three and Twenty-Four, the North Fractional half of Section Twenty-Five, the North half of Section Twenty-Six, and the North East fractional Quarter of Section Twenty-Seven, all in Township Seventeen South, range One West, and all amounting to Eighteen Hundred acres, or thereabouts."

[3] The Act was passed January 9, 1818. The other incorporators were Shadrack Bond, Warren Brown, Michael Jones and Edward Humphreys of Kaskaskia, Illinois Territory, Charles W. Hunter of St. Louis, and Thomas H. Harris, Thomas F. Herbert and Charles Slade of Virginia. Shadrack Bond was the first Governor of the state of Illinois, which gives some indication of the level of connections the group of investors had. Lansden, 33-8. Although named after the medieval Egyptian city on the Nile, the local pronunciation of Cairo is American: KAY-Row.

[4] The naming of Cairo clearly had an influence on General James Winchester, who chose the only other city on the Egyptian Nile as the source for the new town he was involved with, about 150 miles south of Cairo: Memphis. That town, on the fourth Chickasaw Bluff in the southwestern corner of Tennessee, was founded in May, 1819, about a year and a half after Cairo was created on paper. E.J. Johnson and Robert Russell, *Memphis An Architectural Guide*, Knoxville: University of Tennessee Press, 1990, 2. Even though Cairo was never particularly successful as a town, its Egyptian name affected the whole lower end of Illinois, which came to be known as 'Little Egypt,' partly because of Cairo, and partly, probably, because that part of the state provided grain to the central and northern regions of Illinois after the hard winter and subsequent early fall frost of 1830-31 that resulted in widespread hardship. Empty wagons going south and returning laden with grain reminded Illinoisans of the Biblical story of the Israelites going down to Egypt to avoid famine. John W. Allen, *Legends and Lore of Southern Illinois*, Carbondale, IL: Southern Illinois University Press, 1963.

[16] The list of surviving documents related to the Cairo-Illinois Central schemes is fascinating. Individually, they are perfectly normal documents related to financial transactions, but looked at as a body they represent a remarkably thorough preparation of persuasive material aimed at investors. That, of course, is what they are, but the fact that the documents were found bound together in a volume with Holbrook's signature in it lends a certain credence to a more sinister interpretation of them. The volume included:

1. A Report of the President and Treasurer of the Illinois Exporting Co. (IEC).
2. Resolutions passed by the Board of Directors of the IEC.
3. A Deed of Trust from the Cairo City and Canal Co. to the New York Life Insurance and Trust Co.
4. A form of the Bonds issued in conformity with the Deed of Trust.
5. A form of Release Deed from the New York Life Insurance and Trust Co.
6. An opinion of Chancellor Kent concerning #3 above.
7. A prospectus for the Cairo City and Canal Co.
8. The Charter and By-Laws of the Cairo City and Canal Co.
9. A form of a Stock Certificate for the Cairo City and Canal Co.
10. A map of Township 17 [where Cairo was intended to be built] with the route of the proposed canal.
11. Articles of Agreement between the Illinois Central Railroad Co. and the Cairo City and Canal Co.
12. Articles of Agreement between the IEC and the Cairo City and Canal Co.
13. A survey map of Township 17, done by James Thompson.
14. A Survey Report and letter from Thompson
15, 16, 17 Letters from Wilson Abel, esq., George Cloud, esq. and The Hon. John S Hacker concerning the site proposed for Cairo and the health of the place.
18, A sketch of the town of Alton (IL), referred to in the Prospectus of the Cairo City and Canal Co.
19. A copy of the Illinois Internal Improvement Act of 1837.
20. A map showing the railroads and canals in Illinois.
21. The charter of the 1818 incorporation of the City and Bank of Cairo.
22. The 1818 prospectus of the city of Cairo.
23. A copy of the Charter of the Illinois Central Railroad Co.
24. The release of the Central Road Co. to the state of Illinois.
25. The 1818 plat of the 'City of Cairo.

James Thompson, a surveyor from Kaskaskia, was responsible for items #13 and 14 above. Thompson had been called on in 1830 to create the initial survey of Chicago. Chicago Historical Society, *Charter, Constitution, By-Laws, Membership List, Annual Report*, Chicago: CHS, 1908, 457-8.

[17] The Prospectus and Engineers' Report for the City of Cairo, published in St. Louis in 1839, listed both Strickland and Taylor as members of the Philadelphia committee, capable of providing information about the enterprise. Additionally, Strickland was listed first as a consulting engineer for the Company, a salaried position he held for a year and a half. Lansden, 47-9.

[18] John Reps , "Great Expectations and Hard Times: The Planning of Cairo, Illinois," *Journal of the Society of Architectural Historians*, XVI, 4, December, 1957, 16.

[19] Lansden, who never for a moment considered Holbrook to be other than a financial genius, possessed of the highest moral principles and capable of unflagging and Herculean effort, distills the relationship between Holbrook and Cairo to this: "I need not say more here…[than] that the Cairo City and Canal

Company was D.B. Holbrook, or D.B. Holbrook was the Cairo City and Canal Company." 52-3. By assuming this virtue however, Lansden is led again and again to metaphorically throw his hands into the air in incomprehension at actions taken or not taken in this period of the late 1830s.

[20] Reps, 14-15. For the amazing variations on the lowly grid that nineteenth-century American town planners were capable of, see Reps' *The Making of Urban America; the History of City Planning in the United States*, Princeton: Princeton University Press, 1965.

[21] His teacher, Latrobe, always thought Strickland the most talented of his pupils, even after they had a falling out. And at the beginning of his architectural career, in 1811, Strickland was asked by his old fellow apprentice, Robert Mills, to do a lithograph of Mills's Memorial Church in Richmond, Virginia, which Mills wanted to sell as a profitable commemoration of the disaster that resulted in Mills receiving the commission for the church. Mills asked Strickland to do the drawing since the latter was so much more proficient at rendering.

[22] J.K. Kane, Obituary notice of William Strickland, *Proceedings of the American Philosophical Society*, 1854-1858, VI, 31-2.

[23] A 'prospective view' is, of course, just what this image is, and if Holbrook were ever queried about it, he could, in all truth, declare it to be a vision of the future, rather than a factual recording of what it. But swindlers depend on the willing gullibility of their victims, and the fact that 'prospective view' is so close to 'perspective view' which also is what this lithograph is, was precisely what Holbrook intended. That this confusion still works is illustrated by the fact that when I contacted the owners of this print about using it for a publication, they wrote back about their "Perspective View of Cairo."

[24] The association of Charles Dickens with the failure of Wright & Co. and the Cairo scheme goes back to the early twentieth century when two articles, published within a few months of each other, made the claim that Dickens had speculated in Cairo stock. The first of these, "The Mississippi Eden," was written by Deshler Welch and published in *Harper's Monthly Magazine* (121:723 (Aug., 1910), 434-442). The second, a more scholarly undertaking, was John Francis Snyder's "Charles Dickens in Illinois," which appeared in the *Journal of the Illinois State Historical Society* (III (1910), 7-22). These claims were first refuted in 1951 by Gerald Grubb ("Dickens' Western Tour and the Cairo Legend,' *Studies in Philology*, XLVIII (1951), 87-97), though they continued to circulate. John Reps, in his seminal article about the planning of Cairo, was more circumspect, but still suggested that Dickens "may well have been an investor in the enterprise" (p.18).

Dickens scholars point out that in the late 1830s the writer was not yet very well known, and that while he was not living hand to mouth, he scarcely had the extra cash available for investing. On the other hand, there is evidence that Dickens knew people who suffered losses as a result of the bankruptcy of Wright & Co. In a letter to Charles Molloy, written November 28, 1840, just a few days after the bank failure, he wrote "I hope you have not been, or will not be, a great sufferer by Wright's failure. Remembering you banked there, I feared you might be a loser, when I heard they had stopped payment." *The Letters of Charles Dickens*, Madeline House and Graham Story, eds., Oxford: Oxford University Press, 1969, v. 2, 159-60.

Though the title of this article refers to the famous debacle of the Enron corporation in the early 2000s, a closer comparison could now be made to the collapse of the Wall Street banking house Bear Stearns, that occurred in early 2008 as a result of unwise speculation in the housing market.

[25] Charles Dickens, *American Notes and Pictures from Italy*, London: Oxford University Press, 1957, 171.

[26] Prospectus and Engineers' Report for the City of Cairo, St. Louis, 1839. Quoted in Lansden, 48.

[27] Reps, 17.

[28] *Niles's National Register*, v.59, Jan. 30, 1841, 342. A couple of months later – and nearly six months after Wright & Co. had gone bankrupt -- Niles's *Register* was still reporting that "Great efforts are now making by a company of capitalists, residing principally in England, to build up a city under the name of Cairo…They have purchased a tract of land, and expended a large sum in grading and embanking to keep out the waters. Quite a business settlement has already been located, and unless the whole town some day slips into and is lost in the rushing flood, money and enterprise will in time make Cairo, and important and flourishing city." April, 17, 1841; the report reprinted from the Cleveland *Herald*.

[29] James Silk Buckingham, *The Eastern and Western States of America*, London: Fisher, Son & Co., 1842, III, 81. Quoted in Reps, 17-18.

[30] In 1841, Congress passed the country's second bankruptcy act, in an attempt to bring relief to the many still suffering from the national depression brought on by the Panic of 1837. The consequent collapse of the building industry was what forced Strickland to accept Holbrook's offer of work, surveying the site of Cairo and his continued employment as an engineer with the Cairo City and Canal Company. The bankruptcy act was repealed in 1843 because of abuses, but in the short time it was in effect, Strickland took advantage of it and petitioned for bankruptcy. He filed his papers on December 27, 1842 and his petition was granted a month later. He was discharged as a bankrupt on May 26, 1843. The record of his petition proves he was swindled in the Cairo affair as much as anyone. His assets portray the sad case of a hopeful and honest man, taken in by fast-talking, unscrupulous con artists. Strickland listed $4500 as a year and a half's salary as an agent for the Cairo City and Canal Company, $10,000 in stock in the same company, $1200 as a claim on the 'Asphalte of Seyssel Company' and $2880 in stock from the company. The bankruptcy commissioners examined these and declared them "worthless." 'Capturing all the fish in the river': Public and private lessons from the making of Greater Brisbane

John Minnery
University of Queensland, Australia
Morgan Wilson
Humphreys Reynolds Perkins Town Planning Consultants, Australia

Introduction

"An effort to capture all suburban divisional boards and shires at once is sure to fail. It is like trying to capture all the fish in the river in one night…"[1]

On Monday, 25th May, 1925, the outgoing City Council of Brisbane, Australia, voted to produce "an historical sketch of the constitution and work of the Council...". The publication was to be "of a comprehensive character, and … form a suitable Souvenir and Record for presentation purposes"[2] Why the need for such a record?

In his Foreword, Mayor Maurice Barry provides the answer. He called himself "the last Mayor of the first dynasty"[3] because "in a few weeks' time the first phase of municipal history will be closed, and Brisbane, with the suburbs that have grown around it, will enter into a new and testing experience." The changes were to result from what Barry called "the creation of the largest City, geographically, in the English-speaking world, and the entrusting of its government to the inhabitants by a measure of civic autonomy thitherto, I think, unparalleled."[4]

The event to which Mayor Barry referred was the abolition of twenty cities and shires in South East Queensland – including the then much smaller Brisbane City Council – and the creation in their place of the 'greater' Brisbane City Council, implemented through the Queensland State government's *City of Brisbane Act 1924*. The souvenir publication was to be the swan song of the old Council. This paper explores the influence of four factors that influenced the successful implementation of 'Greater' Brisbane: the reforming zeal of the State government, the on-going concerns about coordination and efficiency of municipal administration, the interplay between business values and civic concerns, and the role of the nascent town planning profession. These factors illustrate the critical interplay between the public and the private in the successful implementation of this reform of metropolitan governance in Brisbane.

Greater Brisbane

Debates about the benefits or otherwise of the consolidation of metropolitan local government in Brisbane had raged since the late nineteenth century and paralleled many of the pro-consolidation and anti-consolidation debates elsewhere.[5] However, the Brisbane example is unusual in that, despite wide-spread support for the idea across most of Australia, Brisbane was the only State capital city where such consolidation actually occurred,[6] although there was wide agreement on the need for metropolitan-

wide administration to coordinate the various local government roles in other Australian capitals. Where a distinction is made amongst "amalgamation" (where neighbouring groups of local authorities join together to make fewer but larger local authorities), "joint authorities" (where nominees of constituent local authorities take responsibility for joint actions), "federalization" (where there is a separately elected additional authority overseeing and coordinating major activities) and "unification" (the abolition of the existing system and its replacement with a single omnicompetent metropolitan authority),[7] Brisbane's case was clearly one of unification. What happened in 'greater' Brisbane was only one form of possible metropolitan-wide consolidation and only one form of the use of 'greater' in the metropolitan local government context. The description of a 'greater' city was sometimes also used to refer to the whole metropolitan area, or 'city plus suburbs'. Bromley has pointed out that this was sometimes used in British writings referring to something like the U.S. Metropolitan Statistical Areas.[8] But in the case of the 'greaterized' Brisbane it was the abolition of the existing system of fractured local government administration across the whole metropolitan area and its replacement with a single metropolitan local government.

The changes in Brisbane occurred for a number of reasons that provide the focus for the paper. One of great importance was the reforming zeal of the State government of the time as part of a raft of changes implemented under Premiers T.J. Ryan (1915-1919) and E.G. Theodore (1919-1925).

As leader of the State's Australian Labor Party, T. J. Ryan, had made the amalgamation (or enlargement) of local governments in Queensland a part of his party's platform for the election in 1915. When Ryan's party took office after winning that election the policy was put into force and a number of Queensland regional and non-metropolitan local authorities[9] were enlarged. However, Brisbane, "with its larger population, its many local governing bodies, its diverse interests, presented a problem bristling with difficulties."[10] Bills to implement a Brisbane consolidation of some form were introduced into the Queensland Parliament in 1917 and 1923, but it was not until 30th October 1924 that success was achieved: The *City of Brisbane Act 1924* was passed by the Queensland State Parliament, the new Brisbane City Council was elected by its expanded electorate on 21st February, 1925 and took office on October 1st, 1925. The new unified Council administered an area of some 375 square miles. Soon afterwards it also took over the administration of many of the metropolitan infrastructure providers, such as tramways, the sewerage system, and cross-river bridges.[11]

Influences

What were the public and private influences that led to the suggestion and successful implementation of Greater Brisbane? This question is the focus of the remainder of this paper, although it should be noted that in many situations such as this both the distinction between public and private and the very nature of both the 'public' and the 'private' are problematic.

State government influence

Mayor Maurice Barry praises, in his 'swan song' for the old Council, the role of the Labor Party State government in creating Greater Brisbane. He saw it as a way of improving the efficiency of municipal administration along with the other changes the State administration was making, such as the extension of the adult franchise by removing the property qualification as well as changing the system of municipal elections (including making voting compulsory)[12]. Removal of the property qualification for both voting and eligibility to stand for election to the municipality were thought necessary by public commentators sympathetic to Labor Party views because "the absurd and archaic franchise" was seen as a direct cause of "this low ebb to which local politics has fallen."[13]

Consolidation to produce a Greater Brisbane was actually part of the platforms of both the conservative Premier (D. F. Denham) and Ryan's Labor Party Opposition for the elections of 1915. Denham, in fact, listed "town planning generally" as one of the functional areas that would be improved through consolidation.[14] At first sight it is difficult to see why a State government would support the formation of large and potentially competing administrations at the local government level. Reading between the lines of the kind of rhetoric already mentioned it seems likely that there was frustration with the quality of both the local politicians and local administrations across Queensland. The 'greaterization' proposals applied to many of the larger cities in the State and not just Brisbane. Small local governments were also unable to access loans funds at the lowest rates so there was a potential for the State government to have to provide some kind of financial crutch for, or even have to bail out, small councils.

The Labor Party won the election, and so consolidation became part of the State government agenda. A large and cumbersome *City of Brisbane Bill* was hastily prepared and presented to Parliament in 1917 but never progressed past the First Reading stage. A revised and shorter Bill was presented in 1923 then left on the table for public comment, eventually to be passed in 1924. The State government context is important here. The Labor Party government that ruled from 1915 had a strong reform agenda. Many of these reforms were thwarted by the conservative, appointed members of the Queensland Upper House, called the Legislative Council. In 1922 the government managed, by earlier appointing a 'suicide squad' of sympathizers, to abolish the Legislative Council.[15] This cleared the way for the Labor majority in the Lower House, the Legislative Assembly, to implement their reforms. Although both main parties contesting the 1915 election supported the 'greaterization' of Brisbane, for the Labor Party this move was associated with other social and political reforms.

The powers given to the new council by the State government were quite remarkable. The Council is charged with the "government" of the city. William Jolly, the first Mayor of the enlarged Council, described it as "'Home Rule' for Brisbane", although still subject to State government.[16] The Council was even given the power to resume (expropriate) land for public purposes, a power which other local councils did not have.

The State public influences also include pressures from bureaucrats such as the "most ardent and disinterested advocate of the ideal of greater city government", C. E. Chuter, Assistant Under-Secretary of the Queensland Home Office. Chuter assiduously amassed data to persuade decision-makers and prepared the ground for political action.[17] As there was on-going debate about final size of the new city (whether to have a five-mile or ten-mile limit from the city centre) and of the pace at which the expansion and unification should occur, "the officials of the Home Secretary's Department, who had given this matter much thought, strongly recommended the ten-mile radius, which was ultimately adopted."[18] Chuter was also responsible for the legislation giving to the new enlarged local authority a 'general competence' power, or general power to govern.[19] In fact the legislation was sometimes referred to as "Mr Chuter's Bill".[20]

Municipal consolidation

There had been discussions amongst the various Brisbane metropolitan local authorities about better coordination of their activities, including joint and *ad hoc* authorities, since the 1890s, including a submission by the Local Government Commission in 1896.[21] A meeting of metropolitan municipalities was organized by the Mayor of Brisbane in 1900 but further meetings were gradually more poorly attended until one proposed in 1902 was abandoned because of the poor numbers.[22] At the same time, Booroodabin, a small local council abutting Brisbane City agreed after a referendum of its rate-payers, to amalgamate with Brisbane. This was formalized by the State's *City of Brisbane Enlargement Act 1902*.[23] The new legislation made further expansions of Brisbane City through amalgamations possible, but the action exposed the major fault line amongst those supporting the larger municipal administration. The division was between those who supported the immediate expansion of Brisbane to a ten-mile limit from the city centre, usually also connected to related State government reforms proposed by the Labor Party (then in Opposition) such as amending the franchise, and those who supported amalgamations to increase municipal efficiencies but supported a cautious, steady expansion and generally saw this is something removed from other State government reforms. Two Brisbane newspapers of the time illustrated the two views. On the one hand, "There is no reason why a central council, endowed with such control, should not strike out immediately on bold lines and lift the city to the forefront in municipal equipment…"[24] But on the other hand, "If we are to have a greater Brisbane, we shall find that we can get that greater Brisbane only by moving slowly and surely … An effort to capture all suburban divisional boards and shires at once is sure to fail. It is like trying to capture all the fish in the river in one night…"[25]

A common feeling, though, was that the growing inefficiencies of the overlapping responsibilities of the many authorities in metropolitan Brisbane could be resolved through amalgamation with Brisbane City, thus leading to fewer Councillors, the potential for greater "fluidity" of money (enabling "finance to be conducted on wholesale rather than retail principles"), introducing "uniformity and simplicity in administration" and banishing "the curse of huckstering parochialism."[26] The features that made up this "curse" included the reluctance of existing Aldermen to negotiate themselves out of

office, the reluctance of the richer parts of the metropolitan area to share their revenues with more needy parts of the city and the unwillingness of suburban local authorities to bury their separate identities in a larger metropolitan authority.[27] In the 1924 Parliamentary debate over the legislation the successful examples of Greater Glasgow, Greater Birmingham and Greater London were cited as exemplars of greaterization to show both that it could be done and that it could be done successfully.[28]

Although it is conceptually possible to separate State and municipal approaches, in practice the two are interconnected. One commentator of the period noted that "the main reason which prevented the consummation of proposals to create Greater Cities of Sydney, Melbourne and Adelaide were political, caused by the fact that in each case the number of [State] electors in each Metropolitan area was much greater than the numbers in the rest of each of those States."[29]

Business Values

The debates about the changes to the local government franchise associated with the debates about amalgamation illustrate the polarization of views about the role of business values and business expertise in local government. The right to vote in municipal elections and the right to stand for council before 1915 were available only to those who owned property. The proposal to remove this qualification to achieve a universal franchise was criticized by some in the community: "to have secured property or money by thrift or honest industry is the one thing not to be rewarded" by such a change.[30] One local newspaper saw the problem as the separation of representation from taxation, giving the example of a lodger who has no private property in land but who would be given a voting power equal to that of the largest property owner.[31] Ownership of property was a sign of standing in the community and was connected with values of thrift and industry. And there was a strong feeling amongst many in the community that these values should be connected to the way that local authorities were run. The conservative argument was to question how those who had not thus far exhibited sufficient thrift or industry to gather personal wealth in property could be trusted to bring such necessary qualities to metropolitan administration.[32]

For some considerable time, however, there had been concern about the lack of enterprise of the smaller municipal councils and their lack of appreciation of the "vast possibility" of the city, a very civic boosterist view.[33] 'Greater' cities were seen as more efficient and economical, better coordinated, better resourced, better equipped to borrow money, better able to use expert advice, better able to deal with city-wide problems, and better able to attract more capable Aldermen.[34] In essence, these values were those of a well-run business. Some commentators saw the total overlap of administration and business; one claimed that "purely administrative functions – that is to say business functions –outweighed the political functions nine to one".[35] If the modern 'city efficient' was to be modelled along the lines of a "great business corporation"[36], then it would seem only natural that civic leaders be drawn from amongst the ranks of the businessmen who had experience in such matters.

The wider ideology of the 'city functional' or 'city efficient' was common at the time.[37] A major plank of the idea was that of the efficiency that comes with better coordination of activities. Public administration of the time was, in general, obsessed with these ideas of coordination, integration and efficiency. This emphasis existed in Queensland as elsewhere. These ideas were driven, in many cases, by business-based ideas developed by writers such as F. W. Taylor, although they were focused on the efficiency of provision of public services and the implementation of government policies rather than greater profits. In Queensland the ideas continued to influence public sector thinking throughout the 1920s and 1930s leading to the creation of offices such as the Queensland Co-ordinator General of Public Works in 1938.[38] Thus, it could be argued that there were elements of business ideals, such as good coordination of the internal workings of business institutions leading to greater efficiency, that paralleled concerns within the public sector about coordination leading to greater efficiency and better governance.

The town planning movement

The role of town planners and town planning in the greater Brisbane amalgamation is equivocal. The Town Planning Association of Queensland, initiated in 1914 after a lecture tour by C. C. Reade and W. R. Davidge of the U.K. Garden Cities and Town Planning Association but which had declined in influence and membership, was revived with the help of the pioneer planner R. A. McInnes in 1922 and this association was seen by some as "an important pressure group in agitating for a Greater Brisbane City Council".[39] McInnes was a land surveyor and urban planner who saw town planning as seeking the coordinated control of development so as to achieve the best life for the residents but who favoured down-to-earth schemes rather than grandiose designs. He was very concerned about the financial implications of planning programs, feeling that town planners killed off their schemes because they "ignored economic realities, allowing their aesthetic aspirations to lead them to absurdities that could never be financed by the community they planned for."[40] These sympathies meshed very well with the wider pragmatic, efficiency driven concerns for amalgamation of the diverse local governments and authorities in metropolitan Brisbane. The Town Planning Association of Queensland passed a motion approving the wider, ten-mile radius area fixed by the 1923 Bill for town planning purposes, although a number of local authority people in the Association opposed the resolution.[41]

It should be noted that C. E. Chuter, in 1922 made the Assistant Under Secretary of the Queensland Home Secretary's Department, was prominent in both the Town Planning Association, the two national Town Planning and Housing Conferences held in Adelaide in 1917 and Brisbane in 1918, and the lobbying for a greater Brisbane.[42] The fact that an influential senior State government bureaucrat was also part of the town planning movement that was lobbying for 'greaterization' may lead to a misinterpretation of the degree of influence of that movement. The Parliamentary Debate on the 1923 Bill drew attention to Chuter's considerable and continuing contribution to its creation, and some commentators go as far as suggesting that greater city movements in other capital cities of Australia came to nothing at least partially because "none of those cities had a

Charles Chuter available to cherish the ideal despite setbacks, and eventually, bring it into existence."[43]

But for some commentators on Queensland history, town planning was invisible in the political debates (and some even ignore the formation of Greater Brisbane itself).[44]

Many did make the connection between town planning and the governance of the metropolitan region. William Jolly, the first Mayor of the unified local authority, said that the creation of Greater Brisbane made possible "for the first time", the "application of scientific town planning principles, long recognized as indispensable to control and direct the development of the City of Brisbane along balanced and progressive lines"[45] He also lamented that in the previous chaotic conditions the science of town planning had received little attention so intelligent and far-sighted planning for the city's future was not realized.[46] It was also fortuitous for the nascent town planning movement that the interventionist possibilities of institutionalized town planning were well matched with the reforming nature of the Labor State government[47]. If town planning constitutes a form of public control over private interests[48], then the Ryan and Theodore Labor governments were politically amenable to the newly created Greater Brisbane Council exercising this control.

Greater Brisbane in its context

There were suggestions at the time that the kind of amalgamation suggested for Greater Brisbane – one that involved the dissolution of all the local governments involved, including the Council at the heart of the metropolitan area, and the creation of a new metropolitan authority – was too radical. Some of the proponents of a more modest and on-going consolidation were convinced this should rather be done "under one municipal authority of a suitable area centreing about the City of Brisbane."[49] This is suggesting the kind of expansion through annexation that was more common in the United States. [50] On the other hand, commentators noted that although Greater Brisbane was the first of its kind to be adopted in Australia, "Chicago and Glasgow stood as overseas precedents exemplifying the advantages proponents of Greater Brisbane envisaged for their city."[51] It is important to note that Brisbane has never occupied the commanding commercial position in Australia that, say, New York or Chicago have in the United States. There are critical differences as well between the role of local government in Queensland and that in other contexts. Hammack's detailed analysis of Greater New York at the turn of the twentieth century[52] clearly describes a different situation to that in Brisbane. For example, Australian local governments do not have the responsibility for police services or education; these are State government responsibilities. And the political context is different. Hammack describes a clear struggle between a well-established Republican Party machine and that of the Democratic Party in the political life of New York in the 1890s. In Brisbane a well-established but far from efficiently organised Australian Labor Party was opposed by a number of anti-Labor parties that were not combined into an effective Liberal Party until the 1940s. This is not to downplay the importance of the political context in Brisbane. The Ryan-Theodore Labor Party of 1915-25 was set on reforming the political

landscape of Queensland and Brisbane and it was opposed by the non-Labor forces. Many of these opposed Greater Brisbane, as they opposed a non-property franchise, but there were some conservative politicians who supported "greaterization" whilst they opposed the expansion of the franchise.

The new Greater Brisbane City Council of 1925 was quite different to the previous Brisbane, however, and not just in terms of size. Its authority was extended by State government through a range of both general and express powers.[53] "Greaterization" had been accompanied by an expansion of the definition of local government powers, most of which were also extended to all Queensland local governments with the consolidation of the *Local Government Act 1936* from several related pieces of legislation. Brisbane did retain some differences even after 1936, however; it still had its own *City of Brisbane Act,* it had powers (such as that of providing bus and ferry public transport) that other Queensland local governments have never enjoyed. In effect Brisbane has continued to enjoy a measure of 'Home Rule', although this has gradually been whittled away by successive State governments during the remainder of the twentieth and into the twenty-first centuries.

Conclusions

There are a number of lessons that can be learned from the example of the unification and 'greaterization' of Brisbane and the interplay of public and private forces in the way that unification was achieved. The debates were shaped through the interplay of similar public and private ideals relating to public service and public efficiency that shaped the debates in Britain and the United States at the time: support for the 'city efficient', the need for city administration to be more 'business-like', and the need to attract better qualified city councillors (where 'better' was to many commentators those with substantial business experience), the need to overcome parochial interests for the greater good of the wider metropolitan community, and the possibility of both acquiring greater resources and being able to spend them more effectively. But the events in Brisbane occurred in a different political and social context. In Brisbane the 'city efficient' ideology was hitched to political reformists' zeal to achieve a number of social goals, including expanding the electoral franchise. Town planning ideals formed a part of the mix of ideas leading to the change, although at the time it was a town planning movement made up of a range of professionals, public servants and laypeople. The forces that led to the unification in Brisbane also illustrate the way that achieving the greater public good and achieving the goals of business advocates and interests can coincide.

There is also a fascinating direct link to urban planning issues that face metropolitan governments today. In his review of the work of the unified Council in 1929, four years after its formation, the first Mayor, W.A. Jolly[54] noted that "the advent of the motor car in such large numbers has created a national problem … we are called upon to build good roads at the cost of many millions to meet the new form of transport". He further noted that "the responsibilities of local government bodies in Queensland have also been considerably increased during recent years". Jolly also showed that urban sprawl is

nothing new in noting that "Brisbane is spread out over a much wider area than other cities with the same population, each home having a fair-sized plot of land around it" which while making for "ideal living conditions … at the same time adds to the cost not only in the maintenance of extra mileage of streets but in the providing of the various services such as water, sewerage, electricity and transport."[55]

There are many lessons to learn from the creation of Greater Brisbane in 1924, not least of which is that we have still to work out how to deal with the problems of administering and managing growing metropolitan areas. These problems remain today. The creation of Greater Brisbane was justified on the public grounds of better governance and on the private grounds of business-like efficiency and business expertise, but neither has been sufficient to overcome the wider contextual problems facing Brisbane as they face other growing metropolitan areas.

[15] Queensland is still unicameral in 2008. The process was the appointment of a sympathetic Acting Lieutenant-Governor while the incumbent was on retirement leave in the UK in 1920 who then appointed a "suicide squad" of sufficient supporters to provide a majority in the Legislative Council. The Legislative Council then passed some of the Labor government's reforms, such as the direct election of Mayors. Then in 1922 the Legislative Council voted itself out of existence. [42] Tucker (1988). The links between town planning and 'greaterization' can also be seen in Sydney where the composer, journalist, barrister and politician J. D. Fitzgerald was active. Fitzgerald was a widely traveled 'progressivist' in the Australian Labor Party who, in addition to actively supporting the 'greaterization' of Sydney was a foundation member and Vice President of the Town Planning Association of New South Wales and was Chairman of the First and Second National Housing and Town Planning Conferences held in Adelaide in 1917 and Brisbane in 1918 (See Nairn, B. (1981) Fitzgerald, John Daniel (Jack) (1982-1922), *Australian Dictionary of Biography*, Vol. 8, University of Melbourne Press, Melbourne; Petrow, S. (2004) Progressivism in Australia: The case of John Daniel Fitzgerald 1900-1922, *Journal of the Royal Australian Historical Society*, Vol. 90, No. 1, pp. 53-74)

[43] Tucker (1988) p. 67

[44] For example, Ross Fitzgerald's biography of the life of the man who was Queensland Premier at the time of the consolidation does not even mention it. Indeed, neither 'Brisbane' nor 'Greater Brisbane' appears in the book's index. See Fitzgerald, R. (1994) *'Red Ted': The life of E. G. Theodore*, University of Queensland Press, Brisbane.

From city to region in planning Latin America's capital cities, 1920-1950

Arturo Almandoz
Universidad Simón Bolívar, Venezuela

Local and foreign experts

By the late 1920s, industrial growth, demographic mobility and urban sprawl evinced the necessity of Latin America's major capitals to adopt plans, which were undertaken by local governments relying on both foreign experts and new generations of native professionals. Confirming the specialization of the discourse and the discipline that had accompanied the emergence of urbanism in industrialized countries, the urban agenda had gained room in technical journals and magazines that were published during the first decades of the twentieth century.[1] Besides the Inter-American Conferences and Pan-American Congresses of Architects that took place since the 1920s, technical innovations in urbanism were exchanged at international events that, from the following decade, were focused on diverse components of the emerging field.[2]

Confirming the importance that administrative changes had for the consolidation of planning – as had happened in industrial countries before 1914 – Latin America's planning machinery did not take shape until the second half of the 1920s, when urban problems became issues of administrative regulation. Most of the national or municipal offices of urban planning in Santiago, Montevideo, Buenos Aires, Mexico City, Havana, Rio, São Paulo, Lima, Bogotá and Caracas were a joint effort among local and national governments, new professional associations, and urban research centres. Some of them acting at the same time as administrative heads, urban designers and promoters, an indigenous generation of de facto *urbanistas* would emerge from these offices in charge of elaborating the inaugural plans for the teeming metropolises. There were included Carlos Contreras in Mexico City, Mauricio Cravotto in Montevideo, Carlos della Paolera in Buenos Aires, Francisco Prestes Maia and Anhaia Mello in São Paulo, Pedro Martínez Inclán in Havana, and Leopoldo Martínez Olavarría and Carlos Raúl Villanueva in Caracas.

As a belated remnant of the inter-war colonialism in Latin America, that was still seduced by the Old World's cultural and academic prestige, the new offices of urbanism, though boasting teams that already were professionally mature, hired famous experts from Europe, either as advisers or coordinators of the plans to be produced. The new instruments seemed to reach the value of manifestoes or birth certificates of the emerging discipline, unlike European countries where the first planning laws had more epistemological significance. Having addressed in other texts the foreign experts' contributions from the 1900s (Almandoz, 2002; 2006; 2007), this paper aims at emphasizing the process of institutional and professional consolidation of some local milieus from the 1920s, while providing clues about the local and foreign experts' change in terms of conceptual approaches and spatial scope of their proposals up to the 1950s.

Institutional and professional consolidation between the wars

In the midst of the administrative and technical changes that accompanied the first offices and plans of urbanism, the institutional consolidation through university courses, professional associations and exchanges in events were mechanisms for broadening the theoretical and territorial scope of the discipline. Without pretending to thoroughly register the consolidation in each Latin American country – what would be impossible not only because of the extension limits of this paper but also due to a bibliography for case studies that is barely beginning to appear – let us just identify milestones that signaled the maturity of some national milieus from the 1920s onwards.

One of the first courses of *urbanismo* was introduced in 1928 at the School of Architecture of the University of Chile's Faculty of Economic Sciences and Mathematics, by Alberto Schade Pohlenz, author of a 1923 plan for Santiago; strongly influenced by Sitte's aesthetics, his syllabus inspired a similar program at the Catholic University in 1929 (Hofer, 2003: 74-75). With the foundation of the Institute of Urbanism and the issue of a *Ley General de Construcciones y Urbanizaciones* (General Law of Buildings and Urban Developments) in 1931, followed by the celebration of the first congress of Architecture and Urbanism in 1934, the country, convulsed by then with Arturo Alessandri's reforms, stood out, though, as one of the most articulate platforms of Latin America's urbanism. After the departure of Brunner, who developed urban plans, law proposals and university courses, his chair would be taken over until 1946 by his disciple, Rodulfo Armando Oyarzun Philippi, while other fronts of his activity were continued by junior members of the first generation of Chilean *urbanistas* (Pavez, 1992: 2-3).

Post-revolutionary Mexico was another milieu that matured early, boosted by the technocratic reforms launched during the presidencies of Álvaro Obregón (1920-24) and Plutarco E. Calles (1924-28). Promoted by the architect Manuel Ortiz Monasterio, the course "City Planning and Civic Art" was inaugurated in 1926 at the National School of Fine Arts. José Luis Cuevas Pietrasanta was in charge of it until 1929, when it was taken over by Carlos Contreras, founder of the *Planificación* journal, while Cuevas introduced a similar program at the Autonomous University. Led by the Asociación Nacional para la Planificación de la República Mexicana (ANPRM, National Association for the Planning of the Mexican Republic), the celebration of the first national conference on this subject in 1930, as well as the passing of a general law on planning in the same year, confirm Mexico's pioneering development of a professional and legal groundwork. Having promoted a regional plan for the capital as early as 1928, Contreras endeavored to create a faculty of planning that would certify students in three years; even though this initiative was not carried out, a graduate program on Urbanism and Planning was created in 1939 at the National Polytechnic Institute's High School of Engineering, probably the first in Latin America (Sánchez Ruiz, 2002).

Though some changes were undermined by political instability and the later consolidation of Getúlio Vargas's "Estado Novo" (New State, 1937-1945), whose authoritarian centralism did not seem to encourage local but national reforms, also Brazil showed advanced signs of administrative, professional and academic institutionalization of urbanism. After the creation of the short-lived National Association of Urbanism in 1927, another step towards its institutionalization as a national matter was marked by the 1932 Department of Municipal Administration, aimed at providing assistance to local governments. Confirming that the prefects of Brazilian cities have often been renown experts in addition to public servants, Luiz de Anhaia Mello – author of *Problemas de urbanismo* (1929) – organized in São Paulo a Congress of Housing, followed by a Week of Urbanism in Salvador de Bahia in 1935. The carioca academia witnessed Lúcio Costa's 1931 reform of the Escola Nacional de Belas Artes (ENBA, National School of Fine Arts), including courses of urbanism and landscape within a curricular framework intended to make the teaching of architecture independent from plastic arts. Later on, the prefect Pedro Ernesto would achieve the creation of the University of the Federal District (UDF), where a first graduate program on *urbanismo* was imparted until the university was closed by Vargas's regime in 1939 (Pereira, 2003: 79-80).

In the case of Argentina, after the creation of the Comisión de Estética Edilicia (CEE, Building Aesthetic Commission) in 1925, the architects' interest for urbanism was evinced in invitations to Le Corbusier and Werner Hegemann; the latter's proposals were promoted from the Office of the Plan created in 1932. The maturity of the professional milieu made possible the celebration of the first Congress of Urbanism in 1935 under the guidance of Carlos della Paolera, who had pioneered a course on *urbanismo* at Rosario's Universidad del Litoral in 1929, and took on a similar course at the University of Buenos Aires (UBA) in 1933 (Randle, 1977: 12). Developed between 1922 and 1928 as his doctoral thesis at the Institut d'Urbanisme, University of Paris, della Paolera's "Plan Regulador para la Aglomeración Boaerense" (Master Plan for the Buenos Aires Agglomeration) not only included the historic core but also the regional conurbation, according to the then resounding approach by Patrick Geddes. Also the city's historical and territorial relationship with the countryside, in the sense developed by Marcel Poëte in *L'évolution des villes,* was incorporated by della Paolera in his early regional plan, in which the identity of neighboring towns was subordinated to the Buenos Aires metropolis (Caride, 2002-2004: 215-216).

Among the foreign and local maestros of this generation, it was Brunner who not only consolidated the professional and institutional platforms of Chile and Colombia, but also managed to produce a textbook where clues about changing approaches of urban planning can be recognized. Published in Bogotá in two volumes, Brunner's *Manual de urbanismo* (1939-40) provided a review of the solutions that the emerging discipline gave to the functional problems of world metropolises, with many examples drawn from Latin America's fast-growing cities. Based on the author's 1924 course at Vienna's National Faculty of Architecture, recommended in turn as model at Heidelberg's 1928 Congress of Urbanism, the manual aimed at comprehending the "scientific system" of

the discipline, comprising political-sociological, technical and artistic components (Brunner, 1939, I: 19, 24).

Although Brunner's manual did not emphasize the region as a territorial ambit, it recognized "regional planning" as a new technique whose antecedents dated back to Schmidt's planning of the Ruhr basin and Geddes's civic studies for Edinburgh; but contemporary breakthroughs mainly referred to experiences of the Regional Planning Association of America (RPAA) in New York and California (Brunner, 1939-1940, II: 189-190). It was not the *urbanista* but the planner the professional that ought to be in charge of the economic goals of the regional technique, though part of its instruments, such as satellite towns and green belts, could be worked together with traditional urban planning (Brunner, 1939-1940, II: 138-177).

Modernism, *urbanismo* and *planificación*

While development remained elusive for the countries in economic and social terms, from the 1940s some of Latin America's metropolises strived to exhibit a modernist image that, in view of the imbalance between industrialization and urbanization, also resulted incomplete and distorted. But it must be recognized that architectural modernism was a showcase for displaying the rapid modernization pursued by economic developmentalism, whose nationalist ingredients colored vernacular and genuine *modernismos* in some of Latin America's developing countries (Almandoz, 2006: 95-96). The peculiarity of "alternative modernism" reached its peak where the "alliance between modernizing governments and modernist architects" took place, as in the cases of Mexico, Brazil and Venezuela, whose university cities, housing projects and administrative buildings were ranked among the world's best exponents of the modern movement (Fraser, 2000: 15-18).[3]

In the domain of urban planning, major foreign influences in post-war Latin America also shifted from academicism to functionalist modernism, which was put, like developmentalism and industrialization, at the service of the progressive goals of democracies and dictatorships alike. Before the eclipse of academic urbanism, Hannes Meyer's left-wing rationalism was introduced in Mexico during the 1939-49 stay of the former Bauhaus director, who came from another prolonged experience at Stalin's centralized USSR. The social housing and public institutions projects in which Meyer participated boosted a more vernacular and regionalist architecture favored during Lázaro Cardenas's tenure (1934-40), after the modernizing agenda initiated by Calles's *maximato*, which included sanitary and educational projects by Juan O´Gorman, Juan Legarreta and Villagrán García (Gorelik, 2005: 102-119).

Initially invited to the already-mentioned congress on Planning and Housing held at the Aztec capital in 1938, Meyer's arrival was aimed at backing the initiative of Cuevas and Enrique Yánez for creating a School of Urban Planning within the Instituto de Planificación Nacional (IPN, Institute of National Planning) launched a year before; Meyer's Soviet experience was supposed to help in bringing to Mexico's *urbanismo* the emerging categories of region and planning (Gorelik, 2005: 121-122). It was to some

extent a belated response to Contreras's advocacy for regional planning since the late 1920s, both in his professional practice and articles in the *Planificación* journal (Contreras, 2003).

The modern legacy in other Latin American capitals was enriched during the 1940s, especially through the visits of CIAM luminaries as advisers of the new planning institutions, some of which reached national jurisdiction. Le Corbusier learnt the lesson about the necessity of contextualizing and respecting the local milieu:[4] in his second proposal for Buenos Aires, prepared with Argentine architects Kurchan and Ferrari and published in 1947, the analysis of the "cardiac system" of the inner city, including the integration of traditional avenues and new "motorways", was complemented in the suburbs with the regional proposals of radiant cities, satellite towns and a green belt (Caride, 2002-204: 218). While Le Corbusier's other trips to Bogotá were to crystallize in a 1950 plan, CIAM's theoretical presence would be consolidated with the Spanish edition of the 1941 *Charte d'Athènes*, published in Argentina in 1954 and completed with its Cuban adaptation in Martínez Inclán's *Código de Urbanismo*, presented at Cuba's First National Conference of Architecture in 1948. A campaigner for the Patronato Pro-Urbanismo (Planning Trust) since 1942, Martínez Inclán led Cuba's shift from academicism to modernism, from his urban planning chair at Havana University. After visits to this capital of modernist maestros such as Richard Neutra (1945), Walter Gropius (1945) and Joseph Albers (1952), CIAM's leadership among new generations of Cuban architects was took on by José Luis Sert, adviser to the new Junta Nacional de Planificación (JNP, National Board of Planning) created in 1955 by Batista's second dictatorship (1952-59).

Having arrived from the late 1940s in Venezuela, but especially during Pérez Jiménez's dictatorship (1952-58), planning was advocated by Sert himself, Robert Moses, Francis Violich and Rotival again, all of them advisers of the Comisión Nacional de Urbanismo (CNU, National Commission of Planning) (Almandoz, 2006a: 341-350). Established by then at the United States, the French visitor left testimonies of the rise of the new planning technique in the post-war years. Hired for second time by the Venezuelan government,[5] Rotival did not wish to be considered any longer as *urbaniste*, but as representative of the more-comprehensive professional that the *planificateur* was supposed to be, according to a differentiation that he would theorize about some years later (Rotival, 1964). In the case of Violich, his *Cities of Latin America* (1944) had offered one of the first comparative perspectives of the Europeanized and academic backgrounds in several professional milieus he was in contact with throughout his journey. But it must be pointed out that in that early book the Californian planner had noticed that "younger practising architects and planners" started to "look towards the United States rather than to Europe" (Violich, 1944: 158, 169, 173). Violich later summarized, in relation to the Venezuelan experience, the disciplinary shift that had taken place in those decades, what can be generalized to most of the continent: "A latter-day Beaux Arts movement inspired the late 1930s, and a social orientation, the mid-1940s, only to give way in the early 1950s to a functional approach drawing on North American techniques" (Violich, 1975: 285).

In the case of Brazil, after the Russian Gregori Warchavchik's introduction of international modernism to São Paulo since 1923, the presence of CIAM representatives and Le Corbusier's proposals for Rio fuelled the functionalist momentum that would reach its peak in Costa's and Niemeyer's Brasilia. Undertaken by the progressive government of Juscelino Kubitschek (1956-61), the project for the new capital was carried out by a team of local experts and institutions, what proved that Brazil's *planejamento* was able to reach international resonance without the involvement of foreign experts. In the administrative level, following the boosting of local governments by the new 1946 constitution, the recently-created Brazilian Association of Municipalities celebrated its first congress in 1950 (Pereira, 2003: 81). The transition from *urbanismo* to *planejamento* was sped up by father Joseph Lebret's visits to São Paulo and other Brazilian cities, where he advocated the principles and variables of regional and economic planning as a new technique to deal with the sprawl of metropolitan areas (Lamparelli, 1995; Leme, 1999: 26). The awareness of new approaches to regional planning in the professional milieu was also evinced in the criticisms against the Brasilia plan, for not having incorporated more economists, ecologists, and planners, as it was spelt out by the historian Gilberto Freyre, a leading voice of Brazil's emerging social sciences. Costa's reply was not only clever but also indicative of a turning point of the discipline: the new capital city was not supposed to be "the outcome but the cause of a regional plan" (Fraser, 2000: 230).

Epilogue

It is not a coincidence that the use of the term *urbanismo* during the first decades of the twentieth century in Latin America was replaced after the Second World War by *planificación* or *planeamiento* in Spanish, and by *planejamento* in Portuguese. Since they often appear intermingled as mere synonyms, the seeming duplicity can be attributed to a vocabulary that, in this case, is richer in Spanish and Portuguese than in English. In the latter, urbanism did not use to have a disciplinary connotation alternative to British town planning or American urban planning - a situation that would only change in the post-modern era, especially with the resonance reached by the New Urbanism. But there actually are conceptual and historical nuances associated to each term: as it has been outlined for industrialized countries, unlike French *urbanisme*, Italian *urbanistica* and German *Städtebau*, Anglo-Saxon town planning stressed systemic, procedural and/or political values, relying for that purpose on social sciences and its technical apparatus instead of design, just to thus sum up the most widespread orientation that planning had by the mid-twentieth century (Piccinato, 1987; Taylor, 1998; Hebbert, 2004).

While involving some meanings of that construct, Latin America's transition from *urbanismo* into *planificación* coincided, as this paper has tried to show, with the takeover of the poles from which technical modernity was imported, as well as with the enlargement of the planning ambit from city to region. As it had happened in the domains of medicine and engineering, among others disciplines, the academic urbanism that had mainly arrived from Europe until the late 1930s, was to give way to a package of master plans, zoning ordinances and planning-related instruments and

institutions copied from the USA (Almandoz, 2002: 31-39). Mainly transferred to Latin America by the European maestros exiled in Harvard and MIT, Yale and Berkeley, but also supported by local experts, CIAM's functionalism became the mainstream where diverse methodological influences of planning were incorporated to. Ranging from economic and social variables to regional and systemic approaches, all of those ingredients were added in heterodox combinations to Latin America's national platforms of functionalist *planificación* and *planejamento*. If there had been some Taylorist functionalism as underlying rationality at the crystallization of *urbanismo* from the 1930s in countries like Argentina and Brazil (Outtes, 1997: 18), it was during the post-war search for development when a more procedural and technocratic functionalism fuelled the transition to regional planning and the definitive adoption of zoning, which spread throughout most the continent by the 1960s, in consonance with more technocratic orientation of the discipline.

[2] Chile held a national congress on architecture and urbanism in 1934, and the first international Congreso de Urbanismo (Congress of Urbanism) was held in Buenos Aires in 1935; later on, the first Congreso Interamericano de Municipalidades (Inter-American Congress of Municipalities) took place in Havana in 1938, and the second in Santiago in 1941. In relation to housing, the first Congreso Panamericano de Vivienda Popular (Pan-American Congress of Low-cost Housing) also took place in

Buenos Aires in 1939, and the Sixteenth International Congress on Planning and Housing was held in Mexico City in 1938. Celebrated in Washington the following year, the Fifteenth International Congress of Architects also represented a distinct opportunity for Latin American professionals to update and exchange their experiences.

[3] Foreign and especially US interest for reporting and explaining Latin America's modernism was early manifested. Regional maestros such as Mexico's Juan O´Gorman, Brazil's Lúcio Costa and Oscar Niemeyer, followed by Venezuela's Carlos Raúl Villanueva, were catalogued in the exhibitions "Brazil Builds" (Goodwin, 1943) and "Modern Architecture in Latin America since 1945", organized by New York's Metropolitan Museum of Modern Art, the latter with the famous critic Henry-Russel Hitchcock as curator (Hitchcock, 1955).

[4] Let us remember that Le Corbusier had been invited to visit Buenos Aires, Montevideo, São Paulo and Rio – a tour undertaken in 1929, while the second Congrès International d'Architecture Moderne (CIAM) took place in Frankfurt.

[5] Let us remember that Rotival's previous stay had been during the late 1930s, for the first plan of Caracas.

Public-private partnership in the central area of Belo Horizonte (Minas Gerais, Brazil): reflections upon the historic process of urban deliberations and interventions

Alice Viana de Araújo
Universidade Federal de Minas Gerais, Brazil
Celina Borges Lemos
Universidade Federal de Minas Gerais, Brazil

1 – The foundation of the capital, its consolidation and development

Belo Horizonte is the third biggest metropolis in Brazil, the heart of a metropolitan region formed by thirty-four cities, located in the southeast part of the country, next to Rio de Janeiro and São Paulo. It has 2.399.920 inhabitants living in a 331km² area[1]. The city was planned to become the new capital of Minas Gerais State in 1897, as the baroque urban tissue of Ouro Preto, the former capital, could no longer hold the growth of the newborn republican society.

The study of the urban center becomes interesting when we analyze the dynamics of the metropolitan area. Such developments are verifiable in Belo Horizonte but more effectively in advanced centers. Soja (1998:154) considers that these places *(…) are not, in these days, so decidedly monocentral, so determined by a model singularly polarized by centrifugal and centripetal forces, by a urban growth pattern that spins around the definitive city center. The new metropolis grows "decentralized" resembling more like a mosaic of an uneven geographic development, superposed to slow concentricities and sectorial wedges of the classical capitalist city".*

The conception of a city, inspired in the models of the pre-urbanism and in the industrialized European spaces, meant, to the diligent as to the ascendant bourgeoisie, that it was time for modernizing the nation. The planification of the capital corresponded to the attempt of reaching a model that could meet the expectations related to territory occupation, economic changes and politic and administrative management (SANTOS, 1988).

In search of a perfect design efficacy, with technical studies turned to the drawings and location of activities, the Constructing Commission planned a functional and aesthetic organization strategically distributed in the area. Following the order and the rationalism of the occupational conception, the engineer Aarão Reis, and later his successor, the engineer Francisco Bicalho, acted as territorial intervenors, as real social hygienists. Initially, the design proposed the creation of three zones hierarchically organized as Urban Zone, Suburban Zone and Agricultural Zone.

The first zone, which corresponds to the current Central Area, was the most detailed of the plan, being composed by an orthogonal grid, formed by the streets, and by a diagonal mesh, formed by avenues. Inserted in the models of the modern pre-urbanism, its classicism is defined mainly by the monumental axes hierarchized, but also by the

singular and regular scales of the proposed architecture. Historically, the classicism of the Aarão Reis's plan passes by three moments of the XVII, XVIII and XIX centuries, having, as references, the illuminists' conceptions, mainly the French ones. The L'Enfant's Washington plan and the Parisian reform proposed by Haussmann and Napoleon III, assemble characteristics found in the Belo Horizonte's urban design.

Since the specifications of the plan weren't immediately effective, a major demand for the Urban Area occurred, and, if on one side it presented better infrastructure conditions, on the other hand, due to the concentration of items and people, it attracted all social groups. Not everyone could "consume" this space orderly, which resulted in aleatory occupations. The existing "voids", next to the highly profitable land, propitiated temporary implantations and sublease of constructed spaces and backyards of lots. The McKenzie's studies (1974) on the decadence of the centers of some great American cities, verified between the end of the XIX century and the beginning of the XX, contribute to the analysis of the conduct of the local authorities. To the author, the 'invasions" of the areas furnished with greater public investments articulated with an expressive concentration of activities, were common in the metropolitanization process of some cities. Besides the attracting factors, the existence of available or irregularly occupied areas favored the peripheries-center migration (LEMOS, 2003).

In the fiftieth anniversary of Belo Horizonte, its commercial center was marked by a series of changes related to an industrial impulse, and to the following remodelation of its spaces, as well as by the diversification of the tertiary sector. The impulse based on the industry of consumer goods grows with the creation of the Industrial City in 1941, in the western vector of the Capital. This entire development propitiated a larger urban concentration, being the Center the primordial space of this new assemblage.

In the context of the capitalism dynamic, the cities needed a more dense and complex diversity of uses, since they sustain and support themselves, economically and socially (JACOBS, 1961). Various services and activities were distributed mainly in the Commercial Center and in the Urban Zone, specially those related to financial, educational, entertainment, housing and commercial areas. The activities were implemented in new buildings, specially built to receive them, meaning that the construction and the destruction of buildings occurred in a large number, simultaneously and in a concentrated area. In this same process, the public authorities begin to plan in a more rational way, aiming at the encouragement and control of the density in the Urban Zone, also known as Central Area. The municipality, testifying the great number of demolitions concentrated in the center, considered the occupation of this area as scattered and disconnected, creating a difficult paradox. It was then established a new zoning law, guaranteeing an altimetric control, expecting to plan and announce a high-rise city and the densification of the place (PLAMBEL, 1986).

These determinations, in addition to the differentiation of services and to the architecture renewal, reveal a new land valorization in the Center and adjacencies. The beginning of the increasing of activities concentration, marked by the private appropriation of the collective and individual consumption means, creates a real estate

submarket that brings us to a second picture of central space segregation. According to Lojkine (1981), the land value game plays a determinant role in the real estate value in the metropolis centers, granting an economical segregation, almost automatic, of functions and social classes that can be established there. The distinction between the land value in the center and in other areas and the "revenues according to localization" becomes preponderant, in central spaces as well as in their surrounding areas.

From the first half of the 20th century, the Center blocks and the adjacent areas can be conceived by a double value, that distinguish them from the blocks and areas in others zones. On one side, there is the land revenue value due to the ensemble of actors participating in its production. From this picture, and also due to this conjuncture, one aggregates the value of the order of spaces of representation elucidated according to the symbolic imagination. The possible experiences, the use and appropriation of spatialities in the Center extrapolate the simple functionality, reaching the sociability.

Furthermore, the symbolic value, associated with the monetary value, is inserted in the localization factor, which can materialize in the punctual or sectorial placing of establishments and activities. In this picture, one observes the convergence of the triad that characterizes space identification - experience, perception and imagination – very common in central passages (HARVEY, 1989). The more certain services establishments or spatialities are looked for or imagined, the more legitimated they become. Often, these spaces, when considered consecrated, present a preferential index so high that they are submitted to a constant process of renovation. The city develops itself in urban terms, and the consolidated Center also amplifies its agglomerative socioeconomic potential, pointing to its inaugural metropolitan condition (PLAMBEL, 1986). The territorial extensive urbanization and the conformation of microregional poles, non autosufficient, becomes evident, stipulating the socioeconomic practices of the industrial urban.

Although some problems may endure, like the fragile urban infrastructure and the lack of a consistent planning, the public service aims at, in a paradox, a requalification of the Commercial Center. The legislation, not yet fully detailed, gives the region new land use coefficient rates, Posture and Building Codes, besides a new plan for public transportation. As an immediate consequence, one verifies a planned stimulation to high-rise buildings and, naturally, a second renovation of local landscape.

In the beginning of the 1970s, the Metropolitan Region was consolidated as the leading dynamic core of the State, and the Center becomes a synonym for an articulator pole and attractor of sociocultural and economic practices. According to CASTELLS (1989), in the process of a complex territorial development, the report between centralization and decentralization is crucial. It is of most importance defining what is centralized and what is decentralized, and it is most relevant to determine the predominant characteristics of these spaces - and their interrelationships, the communication flow.

Having as reference the service sector, the author points out that the associations of the intra-organizational economic chain correspond to the association of the new spatial logic: "The flow space – situated between the organization units and the internal

organizational differences – represents the most significant space for the function, the performance and finally the existence of any given organization" (CASTELLS, 1989:169). The tendencies announced are the ones responsible for the production of the contemporary space.

The activities are located in space and their components depend on the space. This condition is added to a spaceless organizational logic which relies on the flow space characterizing the information chains. The processes of centralization and decentralization have as basic premise the existing tension between the spaces and flows. This tension could inspire in the gradual transformation of "power flows", within the "power of flows" (CASTELLS, 1989:170).

The phenomenon of diversity and generality in the service sector show the various degrees of organization, having as a parameter the rarity condition. The economical conquers of the Center are connected with the loss of its ludic and spontaneous condition. According to Lefèbvre (1974), the city builds, liberates and brings the essences of social relations. These are always deteriorated because of the distance that, in space and time, separates the institutions and groups. Soja (1999), defends that the city has a third space, whose complexity is linked to the extensivity of itself, being affiliated with the lefèbvrian condition that institutes the centrality as dependent on math and drama.

When the center lost significantly its singular symbolic condition, new and fragmented centralities began to multiply themselves in the urban tissue. At the same time, a polycentrism was predominant. To Carlos (1998:194), the Brazilian metropolis, whose analyses has common aspects with the most developed ones, is polinucleous, involving new areas and fragmented extensions, "since the access to urban land happens through the measured market."

Inserted in the Central Area, ancient Urban Zone of Aarão Reis' plan, the Funcionários neighborhood, so called Savassi, is constituted by a different centrality in the last decades of the 20th century. Boasted by the permissive legislation and by good location and accessibility conditions, the real estate investments have transformed the region in a short space-time.

Over the last decades of the 20th century, the diversity, modernization and opacity constitute the main characteristics of the Center as a place for services and consumption. The intense form indicates a dense and saturated place, a "expanded center". A big volume of people and things converge to its space, marked by the multifuncionality. The center unites the most various types and social categories due to the plurality of actors, an example of the heterogeneous services. Modulated by virtualities, the social types circulate by different places in different times, defining original forms of use and appropriation of the space (LEMOS, 2003).

Despite the loss in life quality and cultural patrimony, the Central Area presents the higher average revenues, as well as the best indexes in life quality among the regions of the agglomerate. Among the activities offered, the rare and semi rare services stand

out, such as financial centers, information activities, entertainment services, general commerce, higher quality commerce, malls, hotels, auditoriums, convention centers and museums. All these activities are in downtown, and when registered and grouped, they define the highest index in urban life quality of the city (PREFEITURA, 2000).

The productivity represents a key for understanding the role of services in the economy, where the demand for goods is defined as search for services. In the author's view, the production and expansion of this economy has spatial contradictory consequences (CASTELLS, 1989). The activities tend, at the same time, to centralization and decentralization, depending on the functioning logic of each organization and their respective positioning. The dependency in the hierarchical relation of inserted activities is verified in the context of different functions. This process is conditioned by new technologies, which affect location, diversification and innovation in service sector. The city of Belo Horizonte and its Metropolitan Region – the third socioeconomic region in Brazil – gather characteristics of the castellian analysis.

The presence of malls represents a dominant tendency in location of retail services and consumption in the capital. Initially, the consumption patterns reflect and economic and social composition of the regions and the city. They vary according to the wealth condition or the economic and cultural capital of the population and its forms of spatiality. The tenure revenue, the location factors, the urban infrastructure conditions, the socioeconomic profile and the symbolic representations participate in the urban service expansion logic (MARSHALL & WOOD, 1995).

A signal of the positive impacts of the regionalized localization of new consumer services is the change in the pattern of employs in the area and in the city. The localized creation of jobs redesign the picture of offer and demand of employment, occurring a predominance of specialized labour. The sub-regions contiguous of the consumer centers tend to receive new populations of middle and low revenues, which compose the employment infrastructure of these sectors, redefining the local life and demography, creating a picture of conurbation, gentrification and revision of local urban revenue. In general, the public power role doesn't surpass that of urban infrastructure provider. Forced to authorize these implantations, once resultant of the well known "urban negotiations", the transportation, routes and infrastructure investments are always insufficient to the final of implantation and work impacts. The attraction of the traditional shopping spaces tends to diminish, according to the verification that the outside centers offer a variety of commercial spots concentrated and endowed by good environmental conditions (PREFEITURA, 2000). One analyze the centralities and their fragments, found in the consumer culture seen in shopping malls, in the informal commerce and in the sophisticated commercial regions now emerging in Central Area.

The informal commerce, while also privileged space of exchange, redefined the central lifestyle, in the condition of excellency of public space, dialoguing with traditional consumer experiences. The informal sector, which occupied central streets since 1940, there remains until the beginning of the third millennium. This occupation, seasoned and full of mobility, could be categorized as archaic, residual and, in some cases, emergent.

In the hypercenter, or Ancient Center, the formal commerce, besides its decreasing process in the past years, could not be considered as in extinction. What really occurred was a significant loss of its centenary hegemony, being overcame by other urban segments potentially endowed to the development of retail. The main cause of this picture is associated to the *phenomenon* of Shopping Malls and to the inclusion of the department stores and supermarkets in these spaces, and in addition of the growth of urban violence in the past decades. Were also visible, in central areas, alarming deterioration conditions of cultural and urban patrimonies, and this fact was announcing the risk of loss in its primacy in the service sector. Finally, clearly present in the socioeconomic scenario of central areas, the informal commerce consolidated itself, revealing a vertiginous growth.

The improvement strategies proposed by the public sector praised the development of regional planning, the investment in professionalizing education, improvements in transportation planning, improvements in the pedestrian sidewalks and the removal of the street vendors, with their relocation to proper spaces. Innumerous impasses were detected in public and private politics in relation to the Central Area. The development of the Shopping Mall industry, the absence of conviviality spots, the deterioration of the cultural landscape and the growth of urban violence were the main agents of this conjuncture. It becomes vital to detail some aspects of the social and commercial practices of the sector that, despite informal, has inserted itself in a relevant way in the formal economy (LEMOS, 2003).

2 – The search for new management and urban intervention forms and their presence in Urban Negotiations

The great challenge being faced by the city is the recuperation of its downtown in a sustainable way, with traffic minimization, stimulating residential reoccupation and eradicating crime and urban violence. According to Desse (2001), the recuperation of the commercial activity in central places becomes urgent, and the last great instrument against the desertification of the ancient centers and against the extinction of the social universe that constitute our tertiary cities. Decentralization becomes not only desirable, but also vital to city survival. Only with a more sustainable development of the metropolitan area, with the creation of new centralities able to offer recreation, culture and consumption, we will see the rise of condign spaces for the whole population, central or peripheral.

In the 1990's, local government started to develop a serious work concerning downtown recuperation and decentralizing initiatives trough creation of new legislations, defining how the city should grow in the years to come. Within these laws some new ways of arrangements were created, making possible partnerships between public and private actors, a joint attempt for urban development. The Master Plan presented as one of its main goals the establishment of guidelines and policies to guarantee economical and social development in the city, in a greater public intervention in the urban structure.

As Rolnik analyses, on the São Paulo municipality case, the participative management guided by the Workers' Party (*Partido dos Trabalhadores – PT*) in the end of the 20th century propitiated a political rupture in the definition of priorities in investments and also in the way and methods for governing. This management "has opened space for political communication and negotiation in decision making processes, organizing councils and forums in which entities and individuals involved with a sector or territory shared their decisions with the government" (ROLNIK, 1997).

In the 90s, there were relevant initiatives linked with participative management in the municipal government of Belo Horizonte, also guided by the same party. Among the various initiatives, the elaboration of the Master Plan and a series of legislation such as zoning and parceling laws made evident the need for modernization in many aspects. In the *paulista* case, these initiatives flourished among other aspects "*the access to employment opportunities, consumption and real estate investments to the greater number possible, deconcentrating the city and its markets*" (ROLNIK, 1997:210). Conscious of the great urban expansion facilitated by the low value and by the availability of land in the periphery, the parameters created by the Master Plan had the objective of a fair distribution of development, capable of creating an equal offer of employment and revenue. The main strategy used was to guarantee the decentralization and dissemination of activities with a more liberal Use and Land Occupation Law, a review in the road system hierarchy, stimulating the competition between secondary centers (ARAÚJO, 2005).

In the name of a city less segregated and endowed with a real socioeconomical development, the local government sought, through regulations and negotiations, the implementation of partnerships between public and private capital. These strategies consider the urban transformations that guarantee the recovery and improvement of the quality of public spaces. Therefore, they could guarantee the enlargement of the responsibility of the citizen with the city management (ROLNIK, 1997).

Among the initiatives created in the new legislation to favour the recovery of central areas, the development of the Transference of Construction Rights and the legal acknowledgement of the public-private partnerships, the so-called Urban Operations (PREFEITURA, 1994). According to Compans (2005), the public-private partnerships were common practices in the United States before the end of the 60s being linked to great public projects for housing construction and social services. These initiatives were recovered in the end of the 70s and, like the Brazilian case, acquired intensity and visibility (COMPANS, 2005; HARVEY, 1996). In Europe, in a wider plan, the processes were closer to the former case and prioritized the productive restructuralization, financial penury of local governments and neoliberal hegemony. They collected the inaugural reasons for the implementation of this undertaking. One must add to these initiatives "*the administrative decentralization, the stronger interurban competition as well as a mentality change in the business sector related to its participation in public businesses, both decisive to boost the dissemination of partnerships verified during the 90s in the continent*" (COMPANS, 2005:114-115).

The big difference between the former initiatives and the most recent ones is based on the characteristics of purposes and motivations. They are no longer turned to meet the needs for collective equipments or improvements in housing conditions in certain regions. The partnerships seek the promotion of local development with the intention to reinforce the economical attraction (HEINZ, 1994). "*The expression "public-private partnership" has been used to designate coalitions between governmental institutions and companies in the consecution of common and specific objectives – such as the economical promotion in the city, big cultural or sports events, water management, etc. – involving a certain level of operational and/or financial engagement and a shared expectancy of benefit partition*" (COMPANS, 2005:115).

The Brazilian and the *belo-horizontino* cases correspond to these goals described above and were regulated by the Federal Law n. 11,079 in 2004, in the management of President Luiz Inácio Lula da Silva. It institutes norms for bidding and hiring public-private partnerships by public administration (FERREIRA, 2006). According to Bittencourt (2007:17) "*the scarcity of necessary resources for the efficient development of services to be offered to the community and the constant emergence of procedure and technology innovations made the State develop mechanisms to reduce its monopolist action, which determined a greater proximity with the private sector*".

Over the last years in Brazil, before a wide fiscal deficit, a fundamental transition to territory development was initiated. Through various ways of partnerships with private institutions, the State-businessmen became the State-regulator. The process appeared preliminarily with the approval of Federal Law n. 8.985 in 1995 denominated "General Law for Concession of Public Services", which establishes norms for grants and prorogation of concessions and permits of public services. This law was followed by delimitations of regulatory marks, when the Regulatory Agencies were necessary considering the privatization process developed widely in the country (BITTENCOURT, 2007). Therefore, in that time, the public authority adopted as a goal the reduction of its own dimensions. The rediscovery of the concessions occurred in Brazil in the 19th century was linked to the "financial and fiscal crisis". These contributed very little to the improvement of services and to the state reform when one considers the search for a restructuralization of the government making possible the creation of innovative institutional forms (COUTINHO, 2002). In this context, the definitive step to answer the necessities and interests of the Public Power was consolidated in the beginning of the new millennium, culminating under the juridical regimen of the Law n. 11,079/04. In summary, the public-private partnership, according to this legislation: "*is an administrative contract of concession having as a scope (a) the execution of a public service, preceded or not by public works, paid according to the tariff paid by the user and pecuniary installment of public partner or (b) the service that the Public Administration is direct or indirect user, with or without execution of works and implementation of goods against installment of public partner*" (DI PIETRO, 2006:161).

According to the legislation, the long-term contract is signed in risk sharing regimen and the remuneration starts when the offer or service developed by the private partner is concluded. The private partner is the one responsible for the investment, construction,

operation and maintenance of the facility or service rendered. The counterpart is assured by the public authority, along with the revenue guarantees and economical exploration (SUNDFELD, 2005).

The urban policy instruments, inserted in the Master Plan of the city, Law n. 7.165 of 1996, have as objectives the implementation of integrated policies that seek the arrangement of expansion and urban development in the city (PREFEITURA..., 1996). Besides, the goal of these instruments is the realization of concrete actions that prioritize collective interest and the dynamic of the city without forgetting the valorization of life quality and preservation of the environment. In this context, the instruments had the intention to innovate in institutional and administrative forms, considering the interests of public and private sectors. These were called "Urban Negotiations" and meant that the bureaucratic and legalist State aimed at alliances to promote urban dynamism through socioeconomic sustainability.

Among the juridical instruments, the one closer to the Public-Private Partnership is the Urban Operation. As it occurred in the *paulista* case, they can be formulated to the Executive power by any citizen or institution and it involves an integrated group of interventions with fixed time. They are coordinated by the government and processed with the participation of private management to make possible special urban projects in previously delimitated areas, inserted in a planning that aims at the urban dynamic (PREFEITURA..., 1996). The Urban Operation gathers initiatives, such as: urban treatment of public areas; opening of streets or improvements in the road system; implementation of social housing programs; implementation of public facilities; recovery of cultural patrimony; environmental protection; reurbanization; regularization of buildings located in areas not officially parceled (PREFEITURA..., 1996:32).

An example of these partnerships was the creation of *Shopping Oiapoque*, established in an abandoned historical building that sheltered the *Antártica Beerhouse*, an ancient beverage factory in downtown. In 2008, a local entrepreneur, Mr. Mário Valadares, bought this old building without a specific idea of what use it would serve. Aware of the historical value of the building, he turned to the City Hall and presented some proposals, one of them being the implementation of a popular mall. At that time, the city had been dealing with the conflict between formal and informal sectors of commerce, since the street vendors – *camelôs* – occupied the main streets in downtown due to the unemployment crises affecting an enormous contingent of population in the Metropolitan Region.   This commercial occupation, although highly dynamic and accepted by local society, caused many problems to the city because it made pedestrian and vehicle circulation difficult, it favored the dissemination of criminal activity and it blocked sight of local commercial windows, harming them when an uneven concurrence was established due to unfair prices offered by *camelôs*.

The new "Postures Code" instituted by Municipal Law n. 8,616 in 2003 determines a maximum deadline for removing the *camelôs* from the streets until the end of 2004, but the government had no idea of what to do with those vendors, and how to prevent them from coming back to the streets. Mr. Valadares, intending to destine the building to

commercial activities, proposed to make an useful and original mall to shelter the *camelôs* in a way to benefit the city, the vendors and the consumers that supported that kind of commerce. Since this activity only works with a constant flow of people passing by it, Mr. Valadares asked the City Hall for engaging a construction of a major bus station in front of the ancient factory (ARAÚJO, 2005).

The construction of such bus station on the street where the cultural patrimony was located was appropriate and operative to the city, since the local government had already the intention to deviate part of the bus stops to a farther region. However, the financial resources destined to the implementation of such facility could only be viable through the cooperation of the private initiative. It was then suggested to the entrepreneur that he use the instruments of the Urban Operation, meaning that he would pay for the installation of the station, guaranteeing a constant traffic of people in front of his establishment. The Municipality would manage the bus station, in exchange. Since he hadn't had the capital to do such building before the opening of the mall, the Municipality presented another option to finance the construction, adding another partner and undertaking to be soon implemented in the city.

The Savassi, suffering from a certain commercial decadence since the 90s, was about to receive the construction of a very sophisticated mall called *Pátio Savassi*, whose marketing campaign was entirely devoted to assure a commercial and cultural *renaissance* to the area, once inaugurated. Its architecture was configured as a *lifestyle center*, a kind of commercial space already well employed at other city centers in the United States of America and in some European countries over the last years. All internal space should receive natural illumination, plenty of green spaces and all kinds of masonry that could create a feeling of being in a city street rather than in a shopping center. However, the undertaking needed a greater construction potential then the one permitted by the new legislation and needed permission of the City Hall to find a solution to its case (ARAÚJO, 2005).

According to the new zoning law, the entrepreneur that bought the ancient *Antártica* factory had the right to raise more buildings in the same terrain, but the Municipality was very interested in preserving the historical building as the only one in that site, to maintain its original characteristics and to create an integrated space in an area so delicate as downtown. So, the City Hall proposed to Mr. Valadares selling his construction rights to Pátio Savassi, raising money to build the so longed bus station. The instrument of Transference of Construction Rights could provide the undertaking with the necessary area, generating simultaneously capital for the bus station and recovery of the building, according to the norms suggested by the Historical Patrimony Deparment (COMPUR, 2003).

Arrangements made, coordinated by the Muncipal Urban Policy Council (COMPUR), the building of the old *Antártica Beerhouse* and transformed into the *Shopping Popular Oiapoque.* It is, nowadays, a dynamic commercial success, and it has inspired the opening of other commercial spaces for the street vendors in the hypercentral and other regions of the capital, contributing to the eradication of the occupation of streets by

camelôs. Although it was destined to consumers with low purchasing power, it has been attracting all kind of consumer classes and it has already become a tourist point in town. The mall offers to merchants some advantages such as storage places, security and toilets.

For the city, this implementation was positive since it managed to stimulate in a few months the revitalization of the area, valuing the adjacent spaces and generating and enormous consumers flow daily. Although many critics comment on the illegality of the products sold and the impacts on the valorization of the space, which banned the first merchants installed there, the Shopping Oiapoque can still be considered a successful urban operation, which favored the capital as a whole.

The Pátio Savassi is also experiencing a commercial success, attracting the medium and upper classes, and stimulating a commercial renewal in the surrounding areas. Although it has received many favorable criticisms, the undertaking has also generated undesired consequences to the region, such as the increase in traffic, difficult access to pedestrians and banishment of ancient merchants due to valorization of the buildings. One must observe that, like in the international cases mentioned, in the contracts for interinstitutional cooperation, the contents are negotiated differently from privatization or concession of public service. They are "clearly defined roles and competencies for each participant, constituting the most common form of public-private partnership [...]" (COMPANS, 2005:117). These aspects come close to the juridical mechanisms of Urban Operation in Belo Horizonte which resulted in the PPP legislation in the current federal management. Besides, it represents the beginning of new initiatives of the Municipal Government turned to the implementation of specific projects of urbanization, urban recovery with the objective of amplifying the construction and management of infrastructure and collective facilities.

Another relevant aspect of the Urban Operation in the Central Area of Belo Horizonte is the introduction of the city marketing as a motivating element for partnerships. An integrated group of policies destined to guarantee and stimulate economical development considering the social environment in question (BORJA & FORN, 1996; COMPANS, 2005). This qualification of the partnership was unfolded in Belo Horizonte with the creation of bus and subway terminals. The partnerships established have a counterpart for the private institution: the creation of small malls located in the upper plan of the construction of the stations, distributed in various regions of the urban agglomerate.[2]

As a final analysis, we reach the conclusion that recent legislations have been already showing positive impacts in the urban tissue, but it is urgent to reconsider part of the impact of the public-private partnerships already made. Other pertinent considerations are related to the elaboration of complementary Master Plans, such as a Metropolitan Comprehensive Plan and Regional Master Plans that should help the decentralization process and definite recovery of central spaces, reaching the initial objective of developing the metropolis in a sustainable way, avoiding the same degradation signs from past decades.

[2] According to Municipal Law n. 7.928 from 1999, the bus integration stations of the Restructure Plan for the Collective Transportation System in Belo Horizonte – BHBUS can be built in partnerships with the private sector by means of Urban Operation. The objective of the Urban Operation is the implementation of integration stations, as well as the operation and management of them, guaranteeing to the entrepreneur in counterpart the right to design, build and explore the business structure, having freedom of decision, according to pertinent legislation (PREFEITURA..., 1999).

From public to private – the trajectory of Caraíba city, designed by Joaquim Guedes

Ana Carolina de Souza Bierrenbach
Universidade Federal da Bahia, Brazil

Introduction

The article seeks to examine the trajectory of Caraíba, a city located in the semi-arid 'sertão' region of the state of Bahia in Brazil. Caraíba was purpose-built by the Brazilian national government between 1976 and 1982 to support the extraction of copper ore. During this period other cities were constructed throughout the country with the same purpose of allowing the exploitation of existing energy and mineral resources. The article examines the characteristics of Caraíba's design, within a geographical, historical and cultural context . The objectives of the article are twofold: firstly, it seeks to analyse the city during two periods (the mid-60s and the present-day), looking for motives to explain how the project carried out by the architect, Joaquim Guedes and his team, was conserved and transformed Secondly, the article seeks to evaluate the impact of this project through its transition from public to private intervention.

Background

The project for the city of Caraíba (1) was closely connected to the political, economic and social situation in Brazil during the mid 60s and 70s. At that time, Brazil was experiencing a military dictatorship noted for centralizing power providing some measured economic growth but also for increasing social inequality. This was the background to the Brazilian government's exploration of the country's natural wealth and many facilities were put in place to extract mineral and hydroelectric resources. In the 1950s, the architect Oswaldo Bratke conceptualized Vila Amazonas and Vila Serra do Navio, in Amapá, to enable the extraction of manganese. In the 70s, the architect Joaquim Guedes conceptualized several mining towns. In the state of Pará, the towns of Carajás, New Marabá, and New Barcarena were designed and in the state of Bahia the same architect was assigned to design a project in Caraíba to facilitate the exploitation of copper.

It had been known for a long time that copper was available in the rural semi-arid region, the so-called "sertão"(2), but even though the first initiatives for its exploitation took place in the 50s, effective extraction only began during the 1970s. At that time the Brazilian government was represented by a public company called *Caraíba Metais* SA, which was located on a former farm of the same name in a very arid and unoccupied region. The government considered it appropriate to design a city that would give support to the community devoted to mining activities and to facilitate this *Caraíba Metais* hired the architect Joaquim Guedes and his team (3).

The Caraíba project was undertaken between 1976 and 1982. In 1978, when the copper mine began functioning, the city became populated by people from neighboring

areas and other parts of the state of Bahia. At the beginning of the exploitation period, the general understanding was that the mine would not last for long. In fact it was first predicted that the extraction of ore would only last until 1998. In that year, the opencast mine effectively exhausted its reserves but exploitation continued in the underground mine and this was not expected to become exhausted until 2007. However, even today the mine is still in existence and the next forecast for exhaustion is 2011.

It should be noted that the military dictatorship in Brazil came to an end in the mid-80s. After that the country moved toward a period of democracy in which its economy was liberalized and globalized, even though social inequalities persisted. As a result of these changes, the Caraíba mine was privatized in 1994 and this profoundly affected the characteristics of the city.

Design and implementation

Joaquim Guedes produced many documents in which he described and analysed his architectural design process. These deliberations enable us to understand the creative process of the architect associated with the Caraíba project (4). However, his words alone are not enough to fully comprehend the work which should be addressed on its own merits.

There is no straightforward procedure that drives the work of the architect/urbanist. In reality it is an exhaustive process, punctuated by thoughts and actions. But that does not mean that there is no method. The methodology consists of rationalization and systematization of existing thoughts and actions in the design process (5).

The consideration stage seeks to set up plans for the project and instigate general conditions. However, there are no pre-defined conditions, rather a plan that evolves through a dynamic process of contact with the specifics of each project. The plan presupposes an understanding of real circumstances.

For a plan to take place, it is necessary to establish its basic parameters. It is important to formulate a series of questions, the answers of which will vary depending on the situation of each project. In the case of Caraíba, the essential questions were: For who is the project intended? What are the historical and economic contexts? What other circumstances could interfere?

All this information has to be processed and organized to enable the project to happen. However, the processing of background information is not a linear process, rather a circular one, where action and reflection occur simultaneously.

Guedes expresses the need to design for real human beings, with their specific needs and desires. In this way his principles are similar to those disseminated by the Modern Movement in respect of social responsibility and architecture. However, if the principles are similar, the methods are different, as Guedes is opposed to the concept of a "generic modern man". Rather, it is the "specific man" that architecture and urbanism

should serve. Guedes calls attention to the profound lack of interest of most modern architects to the common man in his specific context and is sharply critical of Brazilian Modern Architecture which was created and supported by a dictatorship. He also decries the creation of Brasilia and its authoritarian architecture that benefits bureaucrats to the detriment of its anonymous citizens. However, it is worth noting that several projects designed by Guedes (including, Caraíba) were also completed under the auspices of a dictatorship that came into being with the military coup of 1964. (GUEDES, 1982: 86-91)

But what do all these procedures and circumstances have to do with the design of Caraíba?

Preliminary field assessments for the project were extensive. Guedes and his team considered that information provided by *Caraíba Metais* was insufficient to initiate the project design which should have included, from the outset, all its buildings including hospitals, schools, clubs, houses etc. All the company provided for the implementation of the urban centre was the following: a plan of the site, information on the points of extraction of the ore, the characteristics of the project and the total number of industrial jobs with their functional categories and salary. In order to build an action plan, Guedes considered it necessary to recognize the specifics of the place. To enable this, a multidisciplinary team conducted various assessments to examine the area's physical, human and cultural characteristics. These conditions affect not only the city's future but also its urban facility projects.

Guedes believed that the city and the constructions within it also effect the existential dynamics of its users and the context in which they exist."'Sertanejos' (inhabitants of the sertão) love "caatinga" (6), which is harmonious, luminous, majestic and beautiful. But the city, perhaps the city within the caatinga, imposes its own rules ... "(GUEDES, 1981: 114)

However, the establishment of such rules in that city in the caatinga would also be linked to the appropriation of the urban scheme by the owners and workers of the mine. Guedes challenges the traditional solutions applied to the urban design of other mining cities that end up separated into sectors intended for different categories of workers, causing social segregation. Although the architect considered that, in a mining town, social stratification is inevitable, he points out that it is possible to conceive of a proposal that would not intensify it. The city should not, therefore, be divided into sectors for the exclusive use of certain strata of workers within the mine, but should be accessible to everybody. A city dominated by a government company, situated in a remote region could readily adopt the concept of a 'closed city''', completely controlled. However Guedes and his team considered that, due to local conditions, it would be impossible to conceive of a city completely open, preferring to create a mixed city, controlled by the company, but with the ability to be adapted by its residents. This was seen to be the most appropriate solution, as the prediction was for the mine to soon be exhausted and the company to then abandon the city. Given this, the city should possess some physical structures both fixed and flexible, so that the residents would be

able to adapt more easily to this inevitable change. Guedes maintained that there should be an "invariable system", relating to roads and the general infrastructure, and a "variable system", relating to the architecture and the latter should be appropriated and transformed by the residents.

In respect of the 'invariable system', the architect conformed to an urban framework taking into account not only existing topographical, climatic and cultural conditions, but also his considerations of social relationships as they existed in the city. In this way he defined streets in straight and orthodox lines, running East-West and North-South, thus benefiting from the orientation of the sun and the winds. Various plazas were created throughout the city: six in the suburbs and six in the city centre. Guedes believed that such plazas, in addition to being urban fixtures that already exist in the region, are fundamental for the social interaction of the city's inhabitants. He also conceived of a central square, to become the principal point for social interaction.

Near the central square, there was an area reserved for trade, various services and for some residential housing, though the majority of houses were situated a long way from this central point. To locate them the architect created 36 rectangular blocks within 'lots' of variable dimensions leaving some empty lots to be occupied in the future.. The boundaries of these residential lots are not aligned with each other, but protract and recede in relation to the contours of the streets. In this way, the created sidewalks are of varying size providing a feeling of movement to those walking on them. This type of habitation does not adhere to a conventional structure. It appears to come not from a contextual point of reality, but rather a search for the composition of the urban framework.

The architect paid particular attention to the invariable or 'flexible' system. He believed that he should provide the city with areas that would promote public life, integrating its entire population. He believed that the health, education and recreation facilities would be important to assist with the adjustment of those arriving to work in the city. In one of his statements he stated that "we must see not only a generous design, but also a strategic vision superior to the interests of a modern company, that is not separate from the interests of its employees." (GUEDES, 1981B: 8) And so a hospital, schools, clubs and other facilities were built in the city. Guedes pointed out that the design of these buildings took into consideration the climate and the needs of the company and of the residents. Regarding the latter, it was essential to guarantee that the buildings could be modified in keeping with the needs of the users.

The households were also part of the 'flexible system' indicated by Guedes: "the inevitable impositions of organization and structure by the city challenge the freedom of the users. For this reason, we looked to protect the freedom and participation of each one in defining their internal and external spaces. In this way, houses originally designed to look identical were allowed extensions and individual decorative features. It was expected that users would extend, paint and complete their own houses, build gates, decorate them in any way they wanted - as was customary in the region." (GUEDES, 1981B: 7).

Let us consider the location of the homes of the mine's employees. The intention of the architect was not to separate the houses of semi-skilled and higher-skilled operators and technicians into different sectors in the city, but to integrate them with all sectors of the urban nucleus. Guedes proposed various types of residential homes (including houses and apartments) that were spread across practically the whole city. However, there was a clear priority to place smaller houses and lots (of a lower standard, for families on low income) in the city centre, close to most public services, whilst placing the bigger houses and lots (of a higher standard for higher-income families) in the suburbs.

In nearby towns many houses were semi-detached, but there were also buildings positioned in the centre of the lots. The architect opted to design semi-detached houses aiming to decrease the extent to which the buildings would be directly exposed to dry wind and sun, both of which are particularly intense in this region. For this reason semi-detached building designs were effectively adopted for the design of all residential housing.

The number of windows and doors of the house depended on its size and status. The houses of unskilled and semi-skilled workers would have a combination of one, two or four windows arranged in the main facades. The houses of the higher-skilled workers would not have windows at the front, just two access doors for residents and employees. The windows of those houses were to open to internal courtyards. Guedes justifies this isolating of the more expensive houses by saying that "the higher income minority require exclusivity even above the standards they enjoy in their cities of origin. They want separate homes with large gardens, distant from other workers and without any contact with the blue collar neighborhood" (GUEDES, 1981:135)

It was suggested that the appearance of the facades should also relate to local architectural conditions. Indeed, solutions proposed for low and medium income housing corresponded to certain features found in the region, such as the presence of small openings and borders that take the place of eaves in the roofs. (CAVALCANTI-BRENDLE; VIEIRA, 2004: 321-323) However, we should take note of the abstract nature of these facades: their surfaces seem to be separate from the bulk of the house due to the positioning of the black guttering that surrounds them. Another element that exemplifies this abstract characteristic nature is the presence of small door and window frames. With the higher-income housing, the facades differed from the local parameters by having smooth surfaces and enclosed prismatic volumes the whiteness of which accentuated their abstract nature. This was not entirely obvious because of the narrow elegant structure of the garage made in wood with a clay tile roof. In this way, defining the facades juxtaposed the complex relationship between an architectural language with local characteristics and another language with more "universal" characteristics, which serves to rehabilitate the abstract nature of modern architecture.

Another characteristic element of the facades was the use of colors. A limited amount of combinations of colors was to be used for the walls and windows, and these were to be applied to every house.

The city was expected to have a great number of cars but the architect decided to create parking spaces on the streets, so limiting the amount of parking places for each private residence. This criterion, however, applied only to households on low or medium incomes (with one exception), as the higher income homes were indeed projected to have garages.

The residential design project corresponded to the thoughts and actions implemented over the creative process. After an exhaustive review of data relating to the company requirements and taking into consideration the physical, human and cultural context, a figure of nine emerges as the number of types of architectural solutions for homes, of which 1294 were built. These nine types served a population whose specific duties, as well as wages, within the company varied greatly.

Use

Since its foundation the city has retained many of its original features and has modified others. Which are the features that remain and which are those that have been modified due to the transition from a public to a private domain? The comments below come from an examination of the current situation of the city, its facilities and houses, as well as from interviews with some of its residents (7).

It is important to point out that following Guedes' ideas the so called 'fixed structures' of the city are being preserved and the 'flexible' ones are being changed. The urban layout remains the same, as does the position of the plazas in the city. However, the central square looks quite different with new paving, some gateways and public facilities that provide it with a contemporary touch.

In respect of the lots there have been some important findings. For many years the city's lots retained their original characteristics. However, the present situation is a different story: the central lots, part commercial and part residential, are growing in size with unplanned and often illegal constructions, that take over public space and create a good deal of confusion. The suburban residential lots are also being expanded and modified, further changing the characteristics of the original project. Although the original solution stated that the boundaries of the lots were not to align with the contours of the streets, the trend has been for the front ends to align to match the size of the sidewalks. So, wherever they are able (physically or economically), users occupy the remaining sidewalks, and extend the area of their houses, building verandas or, more often, garages. Although there are residents who use the wide sidewalks for public use, many prefer to appropriate them for private use. To give this some context, this type of occupation by lots, as proposed by Guedes, is not commonplace in the "sertão", or even in Brazil as a whole. It was therefore to be expected that the inhabitants of Caraíba would not properly assimilate to a proposal which was alien to their life experience.

The various public facilities in the city have not changed in respect of the original project. As Guedes envisaged, these facilities effectively have changed and expanded

to meet new demands although the principal characteristics are still preserved. However, it should be stated that several buildings are currently extremely degraded and some just under-utilized, as is the case with the hospital which had been an important landmark in the region.

Another relevant factor is the utilization of these public facilities. Guedes' intention was to make them accessible to the whole population without discrimination but this did not transpire. At the time of the inauguration of the city the hospital and the schools were shared by all the city's inhabitants, although that was not the case for social clubs, for example. Ever since the city's inception two clubs have been used by different groups of mine employees. This situation of social segregation remains prevalent and has extended to the privatized schools which are now divided to receive students from different social backgrounds. The hospital is still public but it will undoubtedly be privatized soon.

It is possible to observe that houses go through an intense process of transformation. With the privatization of the mine in 1994, the houses that used to belong to the company were sold to those that inhabited them as well as for other people. This transition deeply affected their characteristics. Before 1994, local government used to monitor modifications which were progressively being carried out on the houses and there were virtually no significant changes. After 1994 the situation was reversed. Since there was no effective control to maintain the original characteristics of the houses the new owners felt free to modify their exterior façades and structures however they wanted.

There are a number of reasons for these modifications. One of the most controversial was the amount of openings (windows and doors) of the housings. Many residents made an immediate connection between the number of windows in each home and the social position of its occupants. It was therefore clear that those with one or two windows had a lower income, those with three had an average one and those with no windows at the front had a higher income. Consequently, in spite of the fact that houses of differing income levels were scattered throughout the city, theoretically mixing social classes, in actual fact social segregation manifested itself through the appearance of the house, specifically by the number of windows it possessed.

Recently, the residents of Caraíba are moving away from this kind of standardization. The renovated houses have more doors and windows opening onto the streets and incorporate verandas or garages at the front of the lots. The paradox is that today the economic level of a household depends mainly on whether it has gone through changes and especially whether the front of the house has been extended.

There have also been significant changes concerning the façades of the houses. The original houses were inspired by local architecture, enhanced by an abstract touch. The use of color was varied but in the original project they adhered to a standard that formed a coherent whole. This homogeneous characterization was indeed prevalent while the city was still controlled by the mining company, but since privatization it has been

modified. It is important to remember that the architect himself encouraged the residents to modify their houses and this is exactly what has happened. Each user has modified his residence as he thought fit, extending the property towards the front or the rear. So far the users have not altered the officially prescribed height of the buildings. It should be stated that there has been no consistency in these interventions which have been made without any control. This means that the city will gradually lose its original character and acquire other features with little or no "architectural quality". The question is whether the Guedes' encouragement of the principal of modification by residents allowed for such radical changes, which could ultimately lead to the complete adulteration of his work.

The materials with which the houses were made have also been modified. Those originally proposed for all the houses had quite an austere character and, although today many homes still preserve these original materials, others have adopted materials considered more "noble", both internally and externally.

Final considerations

The transition from public to private intervention has influenced the city of Caraíba in a complex way. Many of the city's characteristics have been greatly transformed while others have been conserved. Why is that?

The method adopted by Guedes for the design of Caraíba sought to rationalize and systematize the intrinsic characteristics of the region. He wanted to recognize the "other" from the perspective of the differences. He therefore established an active relationship between plan and project that attempted to capture the "otherness" and to make it manifest. However, although he tried hard to follow a rational and systematic approach, it seemed impossible to totally capture the "other" and completing this turned out not to be viable. The "other" proved to be extremely complex and dynamic, and the methodology that used was not capable of recognizing it completely.

This search for communicating with the "other", however, assumes that both parties are interested. It is therefore possible to see, in the design and in the construction of Caraíba, features relating to the local conditions, but also the presence of other, unrelated elements, closer to modern architectural language and which relate to the formal education of the architect. It is not uncommon for residents of Caraíba to be unaware of this "modern" language used by Guedes.

If the regional situation affected the project the same could be said of the national situation. It should be remembered that Caraíba was designed under the auspices of an "other" that was both absent and present and this "other" was installed in Brasília, heading a military dictatorship and promoting a capitalist economy. Guedes expressed his intention to reduce the interference of these circumstances in his project, but he was only partially successful. The architect stated that he aimed to minimize the differences in the social and economic classes in the mining company yet his performance was limited to two measures. The first relates to the proposed use of urban areas by the

entire population and the second concerns the distribution of houses of different standards throughout virtually the whole city. However, certain project decisions made by the architect are a manifestation of a hierarchy and social segregation that already existed in Caraíba. By defining the appearance of the houses the architect showed very clearly those who have power in the city, those who determine and control the social, political and economic situation of its inhabitants. This power was manifested as much in the size of the houses as in the differences in their façades, and also whether neighborhoods were integrated or separated.

It is likely that at the time of its completion the city and its architecture had largely assimilated with its residents. In the 70s, the "sertão" was still remote, and the points of reference for most residents of Caraíba were local ones. It could also be true that at that time people did not accurately understand (or were afraid to understand ...) the precise nature of social hierarchy and social segregation on an urban level. The people of Caraíba did not fully grasp the extent of public control on the urbanization process. However, these days such issues have other implications.

Several factors have influenced the current assimilation of the city by its users. The first one refers to the threat of extinction of Caraíba. For 30 years the people of the city have lived with this eventuality. They reacted by seeming unwilling to maintain and establish strong ties with the city, which could be taken from them at any time. In this way, despite the architecture seeking to establish a connection with the contextual reality, the users have not taken this on board, preferring to change its character.

The second factor that may explain the difficulties of the residents to assimilate and maintain the city and their houses is the influence of external circumstances. At the time of its conception, the city of Caraíba had a centralized public power (represented by the State or by the mining company), to determine the main characteristics of the project and establish ways to move it forward. In recent times, Caraíba has functioned under weaker governmental control and corrupt private interests that do not exercise control of the city, its urban facilities, its housing or its inhabitants. These "private powers", typical of the globalized era, have invaded the "sertão" and set up in Caraíba.

Under the impact of globalization the "sertão" has lost its unique features which have been replaced by features more characteristic of richer and more influential areas of the country and the world. "Globalization" can also be understood in the sense of the influence of the eponymous "Rede Globo" - the most influential television network in Brazil - which has contributed to the promotion of certain consumer values and a standard of living that pervades local communities, influencing and changing their cultural parameters.

And so the city of Caraíba, which was under public control, is now in private hands and as a result of this transition, the remote "sertão" is becoming increasingly globalized. The project envisaged by Guedes is at risk under these circumstances as it simultaneously seeks to understand, manifest and modify itself. At times the residents

of Caraíba assimilate the risks, but at other times transform them as if they no longer respect such risks or want to overcome them.

Today the remote city and the globalized city live together ... In the streets of Caraíba, people still walk between goats and sheep, they are still surrounded by cacti, but their houses now have satellite dishes ... (8).

Notes

1. Caraíba is now called "Núcleo do Pilar"; it is part of the district of Jaguarari in Bahia.
2. The "sertão" is a dry and harsh region located in the interior of the northeastern region in Brazil.
3. See: Mineração Caraíba S/A – uma empresa cidadã
4. To learn more about Caraíba: (GUEDES, 1981)
5. To learn more about the creative process of Guedes: (AMARAL Jr, 2003) and (CAMARGO, 2001)
6. The "caatinga" is a type of vegetation able to survive in the dry areas of the Brazilian northeastern region:
7. I would like to acknowledge the collaboration of Claudete, Eliete, Lucia, Cristina, Fátima and Valério, residents of Caraíba (Pilar). I also thank the attention of architects Joaquim Guedes and Marcos Acayaba.
8. This work was honored by the special participation of Neusa Lima, Ana Luiza Bierrenbach and also by the support of Edson Carvalho. The use of the images was authorized by the architect Joaquim Guedes.

'The Kaleidoscope of Town Planning': the Town and Country Planning Association and Planning Advocacy in Post-war South Australia

Christine Garnaut
University of South Australia, Australia
Kerrie Round
Independent Scholar, Australia

South Australia is well known as a planned nineteenth-century settlement and its capital city, Adelaide, is a highly regarded example of colonial city planning. The state's subsequent planning history reveals a modest but significant lineage of planned environments that emulate international ideas transposed and adapted to suit the local context. Given this history, it is perhaps not surprising that at various periods since its foundation in 1836 South Australia has spawned a variety of citizens' groups that have worked to promote, protect, reinforce and enhance not only the qualities and elements of the capital city's plan but also of the suburban and rural places that followed. This paper focuses on the evolution and contribution of one such organisation, the Town and Country Planning Association (T&CPA). The T&CPA formed in Adelaide in 1964 following more than a decade of post-war civilian and professional advocacy to revive popular interest in, and government action in relation to, town planning. It was one of several civilian-based environmental pressure groups nationally.

Before the T&CPA: antecedent advocates and activities

The T&CPA was not the state's first citizen-based planning advocacy group – a predecessor, the South Australian Town Planning and Housing Association (SATPHA), had formed in 1914 primarily to support the endeavours of South Australia's (and Australia's) inaugural Government Town Planner, New Zealand born journalist turned town planner Charles Reade, and the passage of town planning legislation. After a hard-fought battle, led by Reade, the Town Planning and Development Bill passed through Parliament in 1920. However, this fight, and continuing professional disparagement of their aims, exhausted SATPHA members and the organisation faded in 1924.

Persistent criticism of the town planning legislation won out and the Act was repealed in 1929. Its replacement, the Town Planning Act, negated most of the efforts of the preceding 15 years. It dealt only, and in an elementary way, with the control of subdivision of land. Thus, from the beginning of the 1930s, South Australia had neither effective legislation nor a vigilant group of involved citizens to monitor development.[1]

Individuals, though, and the Adelaide City Council (ACC), did remain concerned. William C.D. Veale, who was appointed assistant city engineer and surveyor with the ACC in 1923, had a deep interest in town planning,[2] and as Town Clerk for 19 years from 1947, he oversaw much of Adelaide's post-war development. In 1947 the Royal Australian Institute of Architects charged two local architects, Dean W. Berry and John (Jack) Cheesman, with the responsibility of forming a professional town planning body

eventually known as the Town Planning Institute of South Australia (TPISA).[3] Veale's credentials and interest in town planning made him the logical choice to assist them;[4] when the TPISA was inaugurated in April 1948 he was its first President.

In its first year the TPISA collaborated with the Commonwealth and State governments and the British Council in organising the visit of Sir Patrick Abercrombie, Professor of Town Planning at London University and principal author of a replanning scheme for London known as the County of London Plan (1943).[5] Abercrombie's itinerary was covered by the local press and his observations on mistakes that Adelaide had made in town planning were keenly reported. The exhibition, 'Re-planning Britain' which was held in conjunction with the Abercrombie tour, also focused Adelaideans' attention on town planning matters.

Two years later, in 1950, members of the TPISA persuaded the daily newspaper, the *Advertiser*, to bring to Adelaide Professor Denis Winston, Professor of Town and Country Planning at the University of Sydney. Winston's public lectures did much to reinforce Abercrombie's comments and to publicise the need for effective town planning measures locally. As F.W. Symons, Town Clerk of St Peters and a part-time lecturer in town planning at the School of Mines, explained:

> Unless the work of local governing authorities and Government and State bodies responsible for housing, transport and essential services is properly co-ordinated and related to a master plan, the haphazard development of Adelaide will continue as it has in Sydney and Melbourne.[6]

The TPISA's main focus was the implementation of effective town planning legislation but its efforts through 1948 were unsuccessful.[7] Spurred on by the positive response to Winston's lectures, it tried again and in August 1950 organised a deputation to Premier Tom Playford to put its case for the implementation of effective legislation. Members sought the establishment of an honorary committee to investigate and report on a new Town Planning Act and on the development and co-ordinated planning of new areas.[8] The parsimonious Playford agreed to the suggestion, which was subsequently approved by Cabinet. The 10-member committee included Veale and Harold Chalkan Day, draughtsman in the state's first Town Planning Department and Government Town Planner since 1929. Before long this committee recommended the establishment of a planning body and a qualified planner to lead it.[9]

Meanwhile other concerned individuals were promoting and educating the public about town planning. During 1948, Andrew Benko, an architect, and Rex Lloyd, an engineer, presented 24 lectures on the history of, and contemporary issues in, town planning at the University of Adelaide. These were subsequently compiled and published as a widely available monograph.[10] Throughout the first half of the 1950s there were frequent calls in the city's newspapers for a master plan for Adelaide to provide a vision for future development and to avoid the perils of urban sprawl and traffic congestion.[11] Local commentators considered that Adelaide had rested too long on its laurels as a planned capital, as did visiting British town planner Clough Williams-Ellis who found it 'the "most

moribund" of all the Australian capitals', and accused South Australians of 'living on Light's vision for more than a century without doing anything to extend it.'[12]

Perhaps the persistence and nature of media comment as well as the honorary committee's efforts had an influence on Playford, who had long opposed a town plan. He held that 'Adelaide had been planned as a city many years ago and all that could be done now was street widening and other alterations, except with recreation reserves and other safeguards to ensure that the city's growth was not haphazard.'[13] Although he told the 1954 Town Planning Institute Congress in Adelaide that he would not consider town planning until his program for industrialisation was complete,[14] he later changed his mind and spoke in support of a master plan. Significantly, he introduced a bill to amend the Town Planning Act.[15]

After much acrimony and 'heated scenes in parliament', the bill passed in November 1955.[16] '[U]nique for its brevity and simplicity',[17] it was completely inadequate. Like the 1929 Act, it dealt primarily with the control of land subdivision, and did not regulate land use or control growth.[18] It focused only on the metropolitan area, ignoring country regions completely. Despite its shortcomings, one positive was the provision for a Town Planning Committee to prepare a plan to develop the Adelaide metropolitan area. Day was the inaugural Committee chair but he was replaced in 1957 by new Government Town Planner, Stuart Hart. Hart, a qualified planner and engineer and a member of the Royal Town Planning Institute, was recruited from Scotland.[19]

The Town Planning Committee's comprehensive 'Report on the Metropolitan Area of Adelaide' was tabled in Parliament on 24 October 1962. For almost a year its proposals were neither implemented nor safeguarded: 'It may be months or years before the administration of town planning is properly organised and functioning', lamented a 1963 *Advertiser* editorial.[20]

A formal citizens' organisation emerges

During this period of advocacy and action towards raising the profile of town planning there had been a 'quiet revolution' and a 'gradual conversion' of a large number of South Australia's community leaders to town planning's ideals. From 1962 the Australian Planning Institute (API), the National Fitness Council, Junior Chambers of Commerce (groups of local businessmen who aimed to protect and advance the professional, manufacturing and commercial interests of their district), National Council of Women,[21] and many other voluntary groups debated the subject in countless meetings and discussion groups.[22] The time was ripe for the formation of an organisation of concerned individuals who would promote the development of a legislatively backed master plan for Adelaide's metropolitan and rural areas, as well as the reservation of open spaces throughout the state.

Prompted by the release of the Town Planning Committee's Report, talks by Albert Simpson, Director of the National Fitness Association, and a subsequent town planning study on the provision of a children's playground in its area, the Henley and Grange

chamber of the South Australian Junior Chambers of Commerce began to agitate for solutions to the lack of provision for reserves in it district.[23] Don P. March, its President and the coordinator of its Open Spaces Project, led the charge and headed a deputation to the Premier asking that the State Government acquire more open space.[24] He then chaired the steering committee that, after months of research, developed the framework for what became the Town and Country Planning Association (T&CPA). The Association's name reflected the committee's admiration for its well-established British counterpart.[25]

In addition 'to bring[ing] together the sociologist, planner, architect and layman to assist the education of the public in matters of planning', the Association had civic improvement in mind since it aimed to 'help in the sensible development of our communities in order that the future habitations will be congenial to overall living.'[26] It also intended to be a vehicle for citizens to have their say on town planning matters,[27] and to 'help those who plan the development of our community to avoid follies which may be thoughtlessly committed in honest pursuit of progress'.[28]

The T&CPA was inaugurated on 26 August 1964, a date chosen to coincide with the API National Congress in Adelaide. The Association attracted 200 members in its first year. They were a broad church that embraced architects, engineers, sociologists, lawyers, clerics, economists, laymen and planners.

The formal objectives of the Association were as broad as its membership:

- To promote civic planning and design.
- To secure adequate open spaces to meet present and future needs.
- To conserve areas and features of unique beauty and interest.
- To use planning as a means towards creating the most desirable living conditions for all.
- To secure legislation that will facilitate sound and progressive development.
- To work in association with groups of similar interest.[29]

Inaugural business

The T&CPA's initial achievement was an abridged version of the Town Planning Committee's 1962 Report. The 3000 copies were donated to libraries, local government officers and key citizens and sold to the public.[30]

During an extremely busy first year the Association held public meetings on planning issues; arranged guest speakers; organized a members' discussion group; led a deputation to the newly elected Attorney-General Don Dunstan to learn his views on town planning procedures; attended joint meetings with the Architectural Research Group at the University of Adelaide; and approached the Adult Education section of the South Australian Education Department and the Workers' Education Association (WEA) requesting them to arrange courses on town planning and Adelaide's Town Plan.[31]

However not all of the Association's early ventures were successful. Out of 2000 invitees to a three-session symposium on 'Maintaining Human Values in a Motorised Community', with guest speaker Paul Ritter, Perth City Planner, a mere 100 attended and the venture lost money. Lunch-hour meetings for members were discontinued in 1965 because of poor attendance.[32]

The Association took on the role of public advocacy in a major way. Even before its official inauguration, Don March wrote a letter objecting to the *Advertiser*'s assertion that the inadequacies in planning legislation were 'due to the apathy of the people and their so-called disinterest in the aesthetics of their environment', and promising that the T&CPA was prepared to help 'those people with a sense of responsibility towards Adelaide's future and assist them to take a deep and active interest.'[33] Other letters supported the proposed town planning legislation put forward by Attorney-General Dunstan.[34]

The T&CPA made one of the very few submissions on the 1962 Plan and its accompanying Report.[35] Association members protested against or commented upon such matters as the construction of steel pylons to carry electricity wires in the Little Para River valley to Adelaide's north,[36] the siting of Adelaide's proposed Festival Theatre, the incorporation of the Adelaide City Council area into the control of the Town Planning Act, city parking stations, removal of coastal sand dunes, and housing development and quarrying on the Adelaide Hills' face, the capital's scenic backdrop.[37]

But the Association's foremost concern was the passage of planning and development legislation to replace the existing Act and to establish a State Planning Authority. When the Town Planning and Development Bill was eventually introduced in early 1966 the T&CPA described it as potentially 'the beginning of a new era for the state' and the moment when 'the kaleidoscope of town planning ... [was] well and truly shaken.'[38]

The T&CPA stressed the need for a State Planning Authority particularly to regulate agencies like the Highways Department and the Electricity Trust as well as legislation such as the Building Act.[39] Not surprisingly then, it objected strongly to proposed Legislative Council amendments to include on the Authority representatives of various groups such as the Real Estate Institute, which it deemed would hinder the Authority's work.[40] Demonstrating the strength of its concern, with the University of Adelaide's Department of Adult Education and the WEA, the T&CPA organised a public meeting to highlight and debate the Legislative Council amendments.[41] Success followed when the Planning and Development Bill was passed on 13 April 1967 – despite 'opposition, misrepresentation, exaggeration and chicanery, the ability to guide the future development of South Australia, to remedy the errors of the past and to ameliorate the shortcomings of the present'[42] was incorporated into legislation. As a consequence, the South Australian State Planning Authority was born. The T&CPA had lent significant support to the achievement of this long-sought legislation.

Other activities

The T&CPA organised guest speakers from a variety of backgrounds to address its meetings through the 1960s. Politicians, architects, planners and civil servants lectured on a broad spectrum of topics, from the proposed planning legislation to planning overseas and recreation and leisure spaces. Soon after the passage of the new planning Act, the Association helped the Jaycees in Whyalla, a regional town on Spencer Gulf in country South Australia, to organise the seminar, 'Planning South Australia under the new Planning & Development Act'.[43] Also in 1967 it participated in the symposium 'Outrage', organised by the South Australian Chapter of the Royal Australian Institute of Architects (RAIA) and held in conjunction with a photographic exhibition entitled 'Australian Outrage' that documented the results of 'unchecked despoliation of Australian cities'. A direct outcome of the symposium was moves towards the formation of the Civic Trust of South Australia (established 1969),[44] a process assisted by several T&CPA members.

In recognition of its educative role, the Association was allotted space in the exhibition 'Towards a Better Environment', associated with the Jubilee Conference of the Australian Planning Institute held in Adelaide in 1967.[45] The other principal organisations involved in introducing or furthering town planning principles – the Municipal and Local Government Organisation, Jaycees of SA (Junior Chambers of Commerce), Mount Lofty Ranges Association, the National Trust, the National Fitness Council and the Australian Conservation Council – also participated.

A new agenda takes hold

In parallel with organising talks, symposia and exhibitions, members maintained their advocacy and lobbying roles, writing to newspapers about, or meeting with the appropriate Ministers in relation to, matters including Hills' face quarrying, sand dune mining, natural scrub conservation, nature reserves and land subdivision.[46] These topics are indicative of the T&CPA's gradual shift in focus from the built to the natural environment. Such a trend reflected the wider societal emphasis in the late 1960s and 1970s on nature conservation when those 'who were increasingly concerned about the loss of habitat ... and the loss of spaciousness and solitude' joined 'the plan using public.'[47]

The Association's main motivation at its inauguration had been to secure effective town planning legislation and an overarching body to control indiscriminate development. But it had also shown concern for the natural environment. In fact in its second newsletter it held that 'Natural scenery is a heritage which must be preserved as a tranquiliser against our garish 20th Century environment.'[48]

After the passage of the 1967 Act, the TCPA formed an 'active and enthusiastic' Natural Environment Subcommittee. Constituted in 1968 it took on an increasingly dominant role.[49] Its secretary, D.G. Strahle, distributed the first South Australian Conservation Newsletter to conservation-oriented societies throughout the State. This covered

various reserves and parks, protection of flora, water catchment in the Mount Lofty Ranges, and conservation strategy. With the Department of Adult Education and the Mount Lofty Ranges Association, the T&CPA organised a seminar on the Adelaide Hills.[50] In 1969 the Subcommittee opened a Conservation Fighting Fund and in 1970 strengthened its support for the preservation of the Hills' face.[51]

Talks at the 1970s meetings became more concerned with the natural environment. For example, Labor member of Federal Parliament Chris Hurford, a former T&CPA President, spoke on 'The Scope for Federal Action in Environmental Planning'.[52] The Association promoted the work of local conservation organisations which included the Nature Conservation Society of South Australia (established 1963) and the Australian Conservation Foundation.[53] In August 1970 a local Member of Parliament, Geoff Virgo, spoke on 'Planning and Conservation'.[54] The T&CPA was among the 13 'arbitrarily-selected nucleus of conservation bodies' that launched the Conservation Council of South Australia in February 1971.[55]

Population growth was a particular focus for a time. The July 1970 meeting listened to a taped lecture by Dr Paul Ehrlich, Professor of Biology, Stanford University, on 'The Population Crisis – Where we Stand'.[56] The guest speaker at the 1971 AGM was the vice president of Zero Population Growth (ZPG) who spoke on 'Famine, Pestilence, War or What'. The T&CPA held a joint meeting with ZPG in 1972 in which two parliamentarians conducted 'A Debate on Important Conservation Issues', and in 1973 the Association made a submission to the National Population Inquiry.[57]

But despite sharpening its conservation focus the T&CPA's original objectives were not abandoned. From 1968 it focused on the Metropolitan Adelaide Transportation Study (MATS) plan, unsuccessfully applying to give evidence to the Metropolitan Transportation Committee on the plan's inadequacies to cope with noise and air pollution and to suggest alternative land-use patterns: it was refused permission to appear before the Committee because none of its concerns was considered relevant. It did, though, submit a lengthy critique, one of 966 received.[58] It criticised the timidity of modifications to the Planning and Development Act because they did not go far enough.[59] In 1972 it organised a seminar, 'The Future of the City of Adelaide', and participated in another on the inner suburbs.[60]

The focus of the monthly newsletter, *Plan SA*, (later *Planning S.A.*,) definitely altered in the late 1960s as articles on subjects such as the Normanville sand dunes and mining in the Flinders Ranges came to dominate. The change intensified from June 1970 when Ron Caldicott became editor. Caldicott, a scientist and active Association member, was appointed T&CPA Director of Research in mid-1970, and was the first full-time paid employee in any conservation group in Australia.[61] The position was funded by a benefactor's donation. [62]

Caldicott's first editorial coincided with the T&CPA newsletter absorbing the South Australian Conservation Bulletin. He focused on the problems of industrial waste pollution at Lake Bonney, in the state's south-east, and on national parks and wildlife.

The issue promoted a forum organised by the South Australian Mountain Activities Federation on 'South Australia, Chaos or Conservation?'. T&CPA member D.G. Strahle was one of the speakers. Under Caldicott the newsletter adopted a more strident and activist tone, with editorials such as 'The Great God GNP' decrying the effects of 'cancerous economic growth. Its greedy suckers have fastened onto the fabric of our society drawing the life-blood from our communities, creating crime, poverty, anonymity and destroying our precious natural environment.'[63]

Prior to assuming his paid role with the T&CPA, Caldicott, and President David Higbed and Natural Environment Subcommittee Chair Strahle, had written a number of provocative – in title and content – letters to the editor in the local press. Some of their shots were directed at the work and composition of the State Planning Authority.[64] These were silenced when Caldicott accepted an appointment to the Authority from 1 July 1971 (until 1979). He was categorised as a member with 'knowledge of conservation or aesthetics'[65] and was active on a number of its Advisory Committees.

While retaining some content relating to traditional town planning concerns such as the Adelaide parklands, planning within the City of Adelaide, local government boundaries, the evolution of recent planning legislation, through the 1970s the newsletter devoted more and more space to environmental matters. The perceived threat of overpopulation, alternative means of transport and, increasingly, the perils of nuclear energy were regular topics. Finally, one member had had enough.

> The reason why I joined this association was that I was interested in town planning; yet, when I have a query or problem in this field I do not seem to be able to enlist the aid of the T&CPA. It seems to me that the T&CPA has become just another conservation organization. If this is the case, it should amalgamate with some other established conservation body. If not, please could this magazine be more orientated to practical planning matters?[66]

The editor, now Higbed, responded and in a nutshell encapsulated the history of the T&CPA's focus and the rationale for its new course:

> … when the Town and Country Planning Association was first formed, the issues confronting us were, if not uncomplicated, at least plainly seen. They related solely to the urban environment, the planning of the metropolitan area, and the building of a legislative base that would eventually, enable the principles of enlightened planning to be applied to the whole of the State. But today the 'bricks and bitumen' part, important though it still is, is merely a fraction of the task that faces the concerned and thinking person. Beyond this are vastly greater issues that affect not the comfort, convenience and appearance of our immediate surroundings, but the whole social and economic fabric of our life ... .[67]

For a while the Association's newsletter did make some effort to focus on traditional town planning matters while not eschewing its environmental leanings. But by the beginning of 1980 the editor could be reached at the Conservation Centre and John

Sibly, Vice-President of the Nature Conservation Society, President of the Conservation Council and Caldicott's replacement on the State Planning Authority, was guest writer for an entire issue devoted to environmental matters.[68]

In the last numbers of *Planning S.A.* the T&CPA's founding focus regained prominence, perhaps because Albert Simpson, one of the Association's instigators and still Director of the National Fitness Council, became president. The Association proposed a permanent exhibition on town planning to be set up as a South Australian Jubilee 150 project and organised a public meeting on 'Planning in the 80's – a new perspective'.[69] In 1984, it divided its attention between town planning and conservation, organising seminars on 'The Control of Vegetation Clearance' (with the Environmental Law Association), 'Recreation and Planning in the '80s' and 'Parklands under Siege?' (with the WEA).[70]

But members' interest was clearly waning. Because of a lack of volunteer assistance, *Planning S.A.* was in abeyance for several months. Its final issue was November 1985, when it included details of the T&CPA's AGM and called for volunteers to stand for the committee.[71] The absence of any indication that volunteers were forthcoming or indeed of any further records of the Association's activities suggests to us that this was its last gasp.

T&CPA achievements: reflections and observations

The 1960s in South Australia have been described as a decade 'when citizens found a voice ... more than usual wrote to papers, while others looked for ways of joining forces with like-minded people by forming committees and societies. There was no end to new movements [which included] nature conservation, residents' and planning associations.'[72] The T&CPA fits squarely into this story. But what did it contribute and why did it fade?

Early success and constraints

The Association was most active and perhaps most focused in its first years when it collaborated closely with Attorney-General Dunstan to ensure passage of the Planning and Development Bill through both Houses of Parliament. The legislation was 'handicapped by its strong representation of vested interests'[73] from both the private and the public sector. Consequently the T&CPA maintained a watching brief, criticising inadequacies of the Town Planning Act and perceived shortcomings in the State Planning Authority. Some of its initial fire was dimmed when its first President, the energetic Don March, resigned from the committee in mid-1967. Then its outspoken approach in the early 1970s diminished once it had a voice on the State Planning Authority.

As March knew from personal experience, from the start, the T&CPA was plagued with the not unusual problems of citizen action groups – too few members and a lack of support from those who did join. He found it 'impossible to delegate' his workload, 'due to most members of Council not taking an interest in subcommittee work.'[74]

Other options and opportunities

A subsequent deterrent to T&CPA participation was the rise of groups with overlapping or competing interests. Many of the architects who had been involved with the T&CPA redirected their effort to the Civic Trust which formed in 1969. The Trust's objects were 'to encourage the creation of buildings, precincts, comprehensive developments and landscapes which our descendants could be proud of.'[75] It hoped to attract 'designers, planners, non-specialists, and institutional members like local councils which administer planning laws and regulations',[76] the very same groups that had joined the T&CPA. Jim Warburton, Head of the Department of Continuing Education (previously Adult Education) of the University of Adelaide, was also a committed Civic Trust member. Consequently Warburton's Department, a frequent co-convenor with the T&CPA, now arranged seminars on the built environment with the Trust, although it continued to cooperate with the T&CPA on the natural environment. Town planning topics coordinated by the Department and the Trust included residential design standards, the planning of tourist resorts, housing in South Australia, the built environment, street trees, protection of the parklands, and outdoor advertising,[77] all original concerns of the T&CPA.

At the same time, other actual and potential T&CPA members, including those who perhaps shared the view of the newsletter correspondent who expressed frustration at the Association's conservation focus, began to see more advantage in forming or belonging to organisations that were concerned directly with their own residential areas. Such residents' associations had been suggested by Professor Winston during his 1950 visit to Adelaide so that the city could 'protect its special character'.[78] Residents were slow to act on his suggestion, but in 1968, in response to the poor quality of local roads and problems with sewage, the Morialta Residents' Association formed.[79] A spate of such groups then emerged for broadly similar reasons: zoning,[80] general concern about planning,[81] and the MATS Plan that proposed freeways through some Adelaide suburbs.[82]

Changes in planning administration and legislation

The T&CPA emerged at a time when South Australia was on the cusp of new planning legislation and a new administrative approach to planning. The Association survived the lifetime of each and responded to the opportunities and challenges extended by both. Planning administration changes afoot federally and locally from 1976 affected and ultimately spelt the end of the State Planning Authority. As a consequence 'the planning system as expressed by the *Planning and Development Act*[83] had to be rebuilt. Hart, who had stepped aside as State Planner in 1977, drafted new legislation that came into being in 1982 as the Planning Act. There was considerable stability in the state's planning administration for about eight years after the 1967 Act was introduced but thereafter the climate was one of change and uncertainty. Given this milieu and likely loss of incentive it is not surprising that the T&CPA's focus and members strayed.

Conclusion

While all seemed in order in its early years when the T&CPA was being publicly commended and the Association itself expressed 'satisfaction at having achieved much',[84] its later contributions are less easy to define. It was certainly a mouthpiece for a seemingly small cohort and it assisted in bringing built and natural environment issues of contemporary relevance into the public eye. But in the upshot, apart from its objectives to secure town planning legislation and to cooperate with similarly aligned groups, its broader goals appear to have been adopted and achieved, at least in part, by others. The history of the South Australian Town and Country Planning Association can be viewed, like 'the kaleidoscope of town planning', as a pattern of rapidly shifting foci and varied, sometimes complex, interests that occasionally settled but were invariably shaken by external forces and so took up new forms.

Planning and transforming: Benjamin Vicuña Mackenna and the City of Santiago 1872-75.

Fernando Pérez Oyarzun
Universidad Católica de Chile, Chile

Histories of planning usually underline the significant transformations that cities like Paris or Vienna suffered during the XIX century, as a starting point of modern planning. Thus, in its modern version, planning seems to be attached to a certain conscience about the real possibilities of changing the physical environment of a given city. Those real possibilities frequently mean cultural, political and economical conditions. In the already mentioned cases of Paris and Vienna, urban changes seem to depend on the action of strong political power. Thus urbanism, both as a discipline and as a technique - as Manuel Solá Morales has once stated - was in its beginnings often dependent on the power and resources of the state. The immense amount of economical resources needed to put forward significant urban plans, meant that only a few cities were able to develop them. However, those ideas expanded towards many places around the world. They not always represented as a real possibility but frequently a social aspiration.

The concentration of power and resources which made possible big plans during the XIX century contrasts in many aspects with the complexities of present day situation, in which they has to respond to conditions and demands coming from many and different actors. Sometimes planners, and even urban historians, turn secretly nostalgic about the old conditions in which the combination of central power and public wealth gave birth to powerful urban schemes.

However, and for various reasons, the evolution of planning offers us alternative examples, even during the XIX century, involving other ways to confront urban planning. In this context it is more than interesting to look, in certain detail, at the urban transformation happened in Latin America in the second half of the XIX century. Although roughly inspired by the transformations of some European capital cities, they hay to deal with relatively modest economic conditions and the complexities of the rather young national states.

That is the case of the transformation promoted by Benjamín Vicuña Mackenna in Santiago de Chile between 1872 and 1875. Both the ideas and the methods he put in place illuminate a very complex process of modernization in which motifs of the most various kinds are interwoven. The idea of *transformation*, the driving force in Vicuña Mackenna's proposals, doesn't exactly correspond to the idea of plan which began to be used during the mid XXth. century. Describing and analyzing those processes will allow a better understanding of the cultural and physical changes happened in Latin American cities during the XIX century, and could be useful to illuminate some of the present day discussion about planning processes.

1 Vicuña Mackenna politician and intellectual

The importance of Benjamín Vicuña Mackenna as an urban reformer has surpassed the Chilean frontiers to reach the Latin American environment. He has been recognized as one of the brightest intellectual and politicians of his time. His role as *intentedente* of Santiago between 1872 and 1875 is mentioned by almost every significant historian – from Encina and Castedo to Armando de Ramón- as a key actor in the development of the city and a major figure in the local history of planning. According to Collier and Sater, no other individual had such and influence upon the capital's urban development.[1]

Born in 1831, Vicuña Mackenna pursued basic and High School education in Santiago. After that he studied law at Universidad de Chile. As a young intellectual he embraced the liberal ideas which had significant influence in the country at that moment and had to leave the country due to his participation in political rebellions.
.
As an exiled he traveled extensively through America and Europe absorbing some of the prevailing ideas in politics and urban planning. His first travel was particularly long and due to his youth –he was 21 years old when he left Valparaíso in 1852- significantly influential in the definition of his convictions[2]. Different from what has been frequently thought, Vicuña Mackenna didn't go directly to Europe. His first experience abroad was an American one.

Arrived to San Francisco, California in January 1853, he had the opportunity to visit Mexico including cities as Cuernavaca, Acapulco and Mexico City. After that, he would able to visit the east coast in the United States and even Canada. Between April and June 1853 he would visit New York City, Washington DC, Montreal and Quebec. In October of the same year he left for Liverpool and then moved to Paris where he stayed for several months in a city which began to be transformed by Napoleon III following Baron de Haussmann plans. Vicuña Mackenna saw transformations in many European cities and collect various impressions of them, but the scale of the Parisian transformation remained undoubtedly attached to his memories.

In July 1854 he traveled to Great Britain and Ireland visiting London, Glasgow, Belfast and Berlin. He would remain there for long, attending to the Royal Agricultural College de Cirencester. In the beginnings of 1855 he travels to Italy via Paris, Marseille and Avignon. In Italy he would have the opportunity of visiting Genoa, Turin, Milan, Rome and Venice among many others. From Venice he would depart for Berlin in June 1855 visiting other cities like Dresden, Freiberg, Leipzig and Potsdam. After that, he would continue to northern Germany (Hamburg) and the Netherlands. In July, the same year he had the opportunity to visit the International exhibition in Paris, just before beginning his travel back to Chile.

It was in Southampton on July 8th 1855 that he embarked towards Buenos Aires via Lisbon, Pernambuco, Rio de Janeiro and Montevideo. As was usual at the time, he returned to Santiago from Buenos Aires via Mendoza crossing the Andes.

Arrived to Santiago where his political problems had been solved, Vicuña Mackenna was in a privileged position to judge the urban conditions of his rather modest home city against the background of many cities in the world. Even though significant plans like those of Burnham for Chicago or Olmstead for New York hadn't happened when he visited those cities in his first travel, he perceived everywhere attempt to undertake urban renovations. More that references to planners the notes of his diary refer to very concrete aspects of the cities visited by him: pavements, trees and greenery, public spaces. The reason for that was probably that more than as technician Vicuña Mackenna thought of himself as an intellectual and a politician.

During his travels Santiago had been always in his mind. Continuous comparisons with other cities are registered in his diary. He is aware that some of them could be considered exaggerated. Among them, the links between Santigo and particular aspects of Florence and Rome can be mentioned. Nevertheless they express his passion for his home city and an amazing condition to project it from a more than modest condition to a more developed state.

His activities as a journalist allowed him to disseminate some of his ideas on cities even being away from his homeland. Once in the country he managed to combine his exceptional talents as an intellectual and a politician. His contributions to Chilean historiography have been recognized as one of the most important of his century. He was part of the parliament for several periods, named "intendente" - that is representative of the president in a certain region - and became a candidate to the presidency of the Republic, position to which he finally resigned.

His plans to transform the city of Santiago during his period as *intendente,* produced some of the most significant urban pieces of the late XIX century, being the Santa Lucía hill park the most well known among them. Besides those accomplishments, his many unfinished projects were able set the urban agenda for the following decades.

The importance of Vicuña Mackenna within the process of embellishment and introduction of hygienic criteria of the XIX century Latin American city has been frequently underlined. However, little attention has been paid to the novelty of some of his ideas in the field of planning process and the premonitory strategies that he put forward to promote them.

2 Vicuña Mackenna as intendente of Santiago

Vicuña Mackenna assumed as "intendente" of Santiago on April 20, 1872. He was nominated by President Federico Errázuriz Zañartu, who began his period as a president this same year. His nomination was done at the same time that the one of Francisco Echaurren in Valparaíso, who did an outstanding work to improve the urban conditions of the port. Vicuña was by then 41 years old and had returned six months before from a long raid through Europe. He had published by then around ten books on Chilean and Latin American history, including urban histories of Santiago and

Valparaíso[3]. He was publicly known as a passionate politician, journalist and intellectual.

Is a common place in Chilean historiography to maintain that nominating Vicuña Mackenna aimed at distracting him from other political affairs, neutralizing him as a lieder who could provoke political problems to the government[4]. Demonstrating an amazing capacity for the political action, Vicuña Mackenna was able to present, after three months, a plan to transform the city both to the parliament and to the Municipality.

The idea of Vicuña Mackenna was to promote a complete renewal of the city, following the world wave of urban renovations he had had the opportunity to experience. Being completely aware of the difficulties of his task and the shortness of the available time, he tried to do it in the most expedite way.

The ambition of his plan is evident in its content. It includes 20 "works" ("obras") of the most various kinds, going from the canalization of the Mapocho River, the construction of a ring road and the creation of new plazas to the implementation of a new jail or the exotic proposal of 4 houses for "popular entertaining"[5]. In general terms, Vicuña Mackenna's plan involved restructuring the city through the presence of the ring road, which was expected to be able to distinguish what he named as proper city from its surroundings. In addition to that, significant infrastructure, such as the canalization of the river would be provided. Connected to them, the creation of new public spaces was a significant element of the plan. The rest of the proposals consisted mainly in providing various facilities which would allow a better functioning as well as a more hygienic condition to the city.

The project for a new park located in Santa Lucía hill, a rocky promontory which had been partially fortified during colonial times is perhaps the most well known of Vicuña Mackenna's accomplished works. He began to build and plant it just after he presented his plan and was able to finish it, no without enormous efforts, due to economical adverse circumstances, during his period as "intendente".

The oscillating economic and political conditions of the country as well as the ambition of the plan, made it very difficult to complete it during Vicuña Mackenna's three years as "intendente". Nevertheless its long term vision enabled it to set the urban agenda for the following 25 years. To mention only a couple of examples: the canalization of the Mapocho river, the first proposal in Vicuña Mackenna's plan was accomplished more than 10 years later in 1886, while the completion of the urban actions which were meant to accompany it, including a park and an urbanization (today Parque Forestal) happened during the first years of the XXth century.

In all his public life Vicuña Mackenna demonstrated an amazing ability to understand the role of communication both as part of politics and urbanism. That explains the publication, in the form of books, of many plans and reports related to his political performance. The massive use of photography, then a truly innovative technique, in some of those books, speaks us about his modern attitudes and convictions. Among

most well known of those books, there are two referred to Santa Lucía hill[6]. *La transformación de Santiago* must also be considered among one those key efforts both to communicate and to register his political actions.

3 La transformacion de Santiago

Santiago de Chile had been founded by the Spanish conquistador Pedro de Valdivia in 1541. During the Spanish domination it was the capital of the Capitanía General de Chile, a province of the Spanish empire and part of the Peru Viceroyalty. In the early 1870s the city had a population of around 120.000 inhabitants. It was therefore a small city which could be hardly compared with European or North American capitals. The city fabric was mainly composed of adobe constructions. Only a few religious or public buildings were built in stone or brick masonry. Among them the cathedral, the old Casa de Moneda (Coinage House), already used as presidential palace, and the municipal theater[7], can be mentioned. Some private residences had also surpassed the elemental forms and construction methods used during the colonial era. They had been possible mainly thanks to the fortunes produced by the mining business. Some of them became to be popularly designed as palaces[8]. Certainly, squatters and informal settlements could be found in the city. In Spanish they were called "ranchos". According to Vicuña Mackenna's horrified description, their living and hygienic conditions were horribly poor, being mainly located in the southern urban area and in the margins of the Mapocho River.

The absence of a drawing authored by Vicuña Mackenna, makes that the contemporary plan traced by the French engineer Ernest Ansart, the best alternative to understand the state of development of the city at the end of his period as intendente[9]. Ansart taught at Universidad de Chile and provided technical support to some of Vicuña Mackenna's proposals[10]. His very well known plan, is a mixture of technical drawing and a selected of vistas of the city, representing both the actual urban situation and some of the propositions which were promoted in those years.

In what had to do with public spaces, the city showed a serious shortage of them. Except for the Plaza de Armas, during the first three quarters of the XIX century the city had little more than the Paseo de la Alameda, planted according to Bernardo O'Higgins design in 1820, to offer its population. During Vicuña Mackenna's period as intendente, in addition to his own major achievement, the transformation of Santa Lucía hill in a public promenade, the Cousiño Park, replaced an old military camp and was delivered to the city for public use. The park had been planted by Luis Cousiño an extremely wealthy citizen connected to the coal mining business.

Concerning city planning initiatives, a series of efforts towards an urban enhancement of Santiago have been done during the mid XIX. All this happened in spite of many political difficulties after independence and the several wars the country had to face during the century. All of those efforts pointed roughly to the same objectives: development of public services, improvement of public spaces and provision of better hygienic conditions. Of particular importance seems to have been the contribution of

José Miguel de la Barra Intendente of Santiago province during the 1840s. However, none of those efforts had the kind of global vision and synthetic power of Vicuña Mackenna's one. One possible reason is that he was able to articulate a cultural vision with political and technical tools and combine his love for the country and its local conditions with a wider and international idea about the possibilities in the development of cities. Among his writings concerning the topic, perhaps none of them expressed his vision and his way of acting in a better way than *La Transformación de Santiago*.

The origins of *La Transformación de Santiago* can be found in the presentation that the *intendente* had to do both in front of the municipal council and of the parliament to promote and defend his urban proposals. As in similar cases, the publication of *La Transformación* …gave Vicuña Mackenna both the opportunity to promote and register his ideas. The book was published by Imprenta de la Librería del Mercurio de Orestes L. Tornero, who published many others of his books in 1872.

After the acknowledgments (to the parliament, the government, the municipality), an introduction details the meaning of the publication and lists the different works comprised in the transformation plan. The core of the book is the explanation in detail of the 20 projects which the proposal consists of. Each one of them is justified and described. Attached to this general description Vicuña Mackenna introduced letters, regulations, budget calculations and diverse documents concerning the proposed project. The presence of these heterogeneous materials gives the book, and each one of its descriptions, a great vitality, turning it into a very valuable historical source.

After exposing in detail each one of the proposed projects the book includes a recapitulation which makes reference to the need of financial resources for the plan. After that, a series of "memorias" (reports) referring to some of the most significant projects, in particular to the ring road, is included. The book concludes with a series of appendices referring to a proposal for the municipal management system, comprising a budget project for the year 1873.

In the introduction the "intendente" attempts to make dramatically clear the urgent need to implement his plan: "not only to embellish Santiago but to save it"[11]. Alluding to the planning process, he highlights the way -at the same time speedy and conscious- in which the studies have been undertaken. Of particular interest is the innovative way in which different actors have taken part in the design of the plan: "I can assure that the content of the indications contained in this modest notebook, is the fruit of the generous work and luminous dedications of more than 300 citizens…"[12]

Thus and according to what has been previously said, *La Transformación* stands not only as one historical testimony of a significant moment in the urban evolution of Santiago but also as a valuable source about Vicuña Mackenna's ideas about planning.

4 Vicuña Mackenna's idea of planning

An attentive look at the form and content of *La Transformación de Santiago* enables us to a better understanding of Vicuña Mackenna's idea of planning. Frequently this has been judged only from the point of view of a formalistic or purely aesthetic idea of urban embellishment, without paying attention to a much more complex and sophisticated way of understanding urban planning.

Vicuña Mackenna is fully aware about the fact that any planning idea is inseparable from its implementation. Thus, after enouncing a certain proposal, the *intendente* pays immediate attention to the conditions able to makes it feasible. He seems not interested in developing planning ideas up to its formal details before being sure that the idea can be implemented. This implies very often referring to economical resources, in connection to which Vicuña Mackenna doesn't hesitate in including detailed calculations about the possible origin of those resources. This is clearly visible in the plans for building schools or even parks. It was obvious for Vicuña Mackenna that implementing new school buildings or planting a park along the Mapocho river would improve the material, social and aesthetic conditions of the city. However he tries to demonstrate that they will be, at the same time a good business for the city. It the case of the schools he argues that the buildings under used lack the minimal condition to decently serve its purposes, but also that renting buildings is not convenient for the city and the public funds. In the case of the park, which Vicuña Mackenna failed to implement during his period he links it to the canalization of the river. Thus canalizing the river will allow to get rid of the existing "ranchos" and got new urban land for the city. Thus he proposes to dedicate this new land in part to some urban development and in part to a new park. The first would provide the many to invest in the second. Being aware about the scarcity of economic resources, and different to what is frequently said, he almost never recurs to aesthetic reasons in his discourse. He is convinced that the only rhetoric able to convince both politicians and the public is the one which speaks of hygiene and other pragmatic goals.

In addition to that Vicuña Mackenna is perfectly aware that any urban project needs to be supported by public and private actors. This conviction led him not only to present his plan to the various political powers as those represented by the parliament and the municipality. As it has been previously said, he manages to make many of the involved actors participate in the generation of the plan itself. As a result of that, those plans not only would become more precise and concrete, but would gain, from the beginning, public support. Thus, in the case of Vicuña Mackenna, the plan is not conceived purely as a technical instrument but also as a political one. Under such conditions, the plan is both conceived and presented as a collective product.

Last but not least, *La transformación…* makes evident the way in which Vicuña Mackenna conceived his plan as an instrument referring to the most varied scales and problems, comprising both large scale transformations and detailed implementations. Going to a couple of examples, the ring road ("camino de cintura") is obviously perceived as a massive and difficult urban transformation, involving expropriations of

private properties and tracing of new roads. Despite the project is divided in different sections for practical reasons, compared to it others like the repair of slaughter houses and even more the provision of new clothes to the security police seem of a completely different nature. Nevertheless, one can find that behind such apparent heterogeneity the intuition that the kind of transformation proposed for the city ask for that kind of complex and eclectic set of moves.

5 Planning and transforming

La Transformación de Santiago both in its form and contents, illustrates very well some of the ways in which urban action was conceived in Latin American cities during the late XIX century. The idea of urban transformation manifests in itself a new conscience about having both the power and the tools to modify the city to an extent which hadn't been known before. Throughout the book the *intendente* seems definitely determined to convince Santiago's citizens about the effective possibility of changing their urban conditions. That kind of operation, involving a series of improvements and innovations is consistently designated by the word transformation.

The term transformation enjoyed a good health and a certain prestige during the following decades. At least in the Chilean environment, it went on being used in the documents referring to urban reforms during the first third of the XXth century. That is the case of a brief book published by Ismael Valdés Valdés in 1918 named exactly the same that Vicuña Mackenna's one[13] . Still the Austrian planner Karl Brunner, who arrived to the country in 1929 and had a significant influence upon the city during the early thirties, continues making use of it. Brunner's urban ideas for Santiago were published in a book entitled Santiago, its present state and future transformation[14].

The use of the term plan, in its modern meaning, seems to have emerged in Latin America in the decade of 1940. In his PhD dissertation about La Serena plan[15], Horacio Torrent has highlighted the way in which the new idea of plan, manifests a certain connection with a North American way of approaching the planning process and involves the disputing of a disciplinary territory between architects and engineers. In addition to its connection with the regional scale, this new conception shows a more coherent and cohesive view about planning components and is strongly grounded in economic views.

Contrasting to that notion, the idea of transformation behind Vicuña Mackenna's proposal manifests very specific features: on one side, the plan is understood as a complex instrument compound of rather independent pieces or projects. Thus, it exhibits certain flexibility and its implementation has not to rely on its total completion. Partial accomplishments, so frequent in urban planning, are naturally admitted within this scheme.   On the other side, the plan is conceived neither as a purely technical and formal set of instructions, neither as a certain will coming from the authority power. The way in which Vicuña Mackenna promotes the inclusion of social actors, through committees attached to the specific projects, can be seen as an early attempt to promote participation in the realm of urban planning. Similar thing can be said about the

way in which Vicuña Mackenna takes in consideration the problem of economic resources and opportunities related to the plan.

The balance between ideas and implementation, internal flexibility and the involvement of social actors in the planning process, make the idea of urban transformation, as conceived by Vicuña Mackenna, not only a prove of his amazing talent as an acting intellectual, but also an inspiring model for contemporary planning. In this model, the mixture of pragmatism, strategic vision and urban poetics reaches on of its peaks in the history of Latin American planning.

Public planning vs. public and private intervention in Latin-American border cities. Explorations on theory and practice in the binational agglomeration San Cristóbal (Venezuela) – Cúcuta (Colombia)

Ligia Esther Mogollon
Universidad Nacional Experimental del Táchira, Venezuela

Introduction

The intention of this work was to investigate about the results of urban and regional planning and interventions of private sector in the area shaped by the urban subsystems of San Cristóbal (Venezuela) and Cúcuta (Colombia). The analysis was based on a historical exploration from the performances along the 20th century and their real effects on the process of urban development.

From the methodological point of view, there were three periods identified which, in general, allowed to distinguish three phases of the socio-economic process on the area. The first period, from 1900 to 1930, identified with the agro-exporting Venezuelan and Colombian economy stage. The second one, from 1930 until the middle 80s, identified with the consolidation of the Venezuelan oil economy. And the third one, from the middle 80s up to the present time, coincidental with strong socio-cultural and economic changes in the border area which are supposed to be associated with the economic and cultural changes that globalization carries out.

The study area

Within the extensive Colombian-Venezuelan border line of more than 2200 km, in the territorial area formed by Táchira State (Venezuela) and Norte de Santander Department (Colombia), the Binational conformation San Cristóbal - Cúcuta is located. It is formed by two urban subsystems integrated alongside The Border Highway (that goes from San Cristóbal, passes through Capacho and San Antonio and across Villa del Rosario reaches Cúcuta) /1 and separated by the Táchira River, physical limit between both countries.

San Cristóbal is the capital of Táchira State in Venezuela. It is located in the western part of the country, approximately 820 kilometers to the southwest of Caracas and 45 Km to the east of the border with Colombia. The San Cristóbal's urban subsystem to which we will refer is formed by the territory of what is officially known as San Cristóbal Metropolitan Area (AMSC) /2 with 489.126 inhabitants; with the towns of Rubio (68.869 inhabitants) and Santa Ana (26.475 inhabitants) and by the two Venezuelan towns located in the border limit, San Antonio (48.171 inhabitants) and Ureña (37.392 inhabitants). So, it would be an urban subsystem Venezuelan side of approximately 670.000 inhabitants. /3

Cúcuta is the capital of Norte de Santander Department in Colombia, it is located in the oriental part of the country and in 2003 had approximate 680.000 inhabitants. The Cúcuta's Metropolitan Area, decreed in 1992, is formed by Cúcuta and the towns of Villa del Rosario and Los Patios with a population of 862.000 inhabitants /4. The Venezuelan towns of San Antonio and Ureña are integrated to Cúcuta's Metropolitan Area: the first one linked to Villa del Rosario across the Simón Bolívar International Bridge,   and Ureña, linked to Cúcuta   across the Francisco de Paula Santander International Bridge. Both urban subsystems shelter more than 1.500.000 inhabitants, which represents the South America's biggest binational agglomeration and the third one of the American continent. /5

This metropolitan binational system is characterized for being bi - polar since San Cristóbal and Cúcuta behave as important centers that monopolize the functioning of the regional binational conformation. Both capitals fulfill national and binational activities. /6 In relation to the national ones, every city accomplish its own functions of government and of provision of services directed to the local population. In regarding to the binational activities, they can be transnational and cross-borders. In the first ones, the frontier area acts as a communication bridge between both countries, for what the direct impact in the border cities is small: it is circumscribed to custom processes and their collateral activities. In this level the economic activities are placed derived from the commercial exchange of the Comunidad Andina de Naciones (CAN)/7 and all those exchanges of exports-imports between countries, governments or individuals. The other activities, the cross-borders ones, are those produced in the local scale and imply all the processes, daily or not, that develop between the frontier area and which constituted the most relevant on the socio-economic and spatial functioning of the area.

According to Alberto Urdaneta, in the border area intense flows of people, goods and services are produced, which mean a binational labor market shaped by several thousands of persons, thousands of vehicles and thousands of tons of goods that cross every day the political territorial limit./8 According to written regional news, by the customs of San Antonio and Ureña more than 20.000 vehicles are mobilize every day and among 25.000 to 30.000 persons from the Colombian side pass to work to the Venezuelan border line industries. /9

Analysis of three periods

Period 1900 – 1930

From the last three decades of the 19th century and up to the third of the past century, during the Venezuelan and Colombian agro-exporting phase, the frontier zone was characterized by a vigorous economy, basically coffee farming, which allowed it a preponderant position on the economic context of its respective countries. This circumstance derived that San Cristóbal and Cúcuta had a dynamic and prosperous economic base and that shared a sense of identity because of the intense social, family and economic relations of exchange between them and from them with the world consumption centers (The United States and Europe), through Maracaibo's port of

exportation. The towns' geographical location (distant from the principal urban centers from their own countries) and their precarious road interconnection meant that they had more contacts between them and with the outside world than with the rest of the territories of their own countries. /10

In this period, the interventions propitiated by individuals and by commercial foreign companies defined the economic and social development of the frontier area.   In a first stage, the socio-economic formation was characterized by small and medium coffee farms that from the territorial point of view were articulated to the existing cities, which acted as services and coffee gather centers. The peak of the coffee grow was of a such magnitude that managed to support the urban network in gestation, spite of the 1875 earthquake that practically destroyed the totality of Cucuta's buildings and caused severe damages in San Cristóbal and its near by towns. After the earthquake a rapid reconstruction begins, to the point that up to 1883 scarcely the landscape sequels of the earthquake were noticed. / 11 The good dividends that offered the strengthening and expansion of the coffee production stimulated German companies to take part in the business by means of the growing and the exportation of coffee to Europe and The United States. So, it structured a social class that vigorously participates on the border area's territorial and urban development.   As Muñoz indicates: "… The rich owners of the big farms and the foreign merchants who dominated the import of goods and the exportation of coffee, formed an economic and social elite" ./12   By means of the openings of banks, shops and warehouses and the construction of dwellings for the new businessmen class, the central areas of San Cristóbal and Cúcuta acquired status. Important shops were established with a great variety of imported articles. According to Muñoz: " … a single commercial establishment could offer diversity of imported products, from machetes and shovels up to fine silverwork; ordinary work clothes for the farm workers and at the same time the last of the fashion in Paris and London … Also one can find lamps, frames and bronze beds, typewriters from the United States and a great variety of canned food. The most surprising of all was the variety of alcoholic imported drinks, including Bordeaux's wines, Bavaria's beer and the Brandy Hennessy./13   Later, in a second stage, and in order to make prompter the coffee exportation process, several Colombian and Venezuelan businessmen thought on improving the precarious existing roads to facilitate the transport of coffee to Maracaibo. In 1888 the Colombians from Cúcuta took the initiative and constituted a private company that gave life to Cúcuta's Railroad. Later, in 1896, the construction of the "Great Railroad of Táchira" began, important technical, managerial and civilizing taken forward by visionary *zuliano-tachirenses* businessmen, holders of the engineering knowledge.   In spite of the difficulties that imposed the Andean geography and of the huge economic investments for financing the rail construction, the entrepreneur men overcame all the obstacles and took forward this important work. As Arellano indicates: " It was ... from 1914 when the, already mature, civilizing company did for the region (from the territory up to the towns and their buildings) its domain, imposing on their forms, pace and movements …. It was in this stage where the whole illustrated project materialized which is incubated until 1914, on which the territorial and urban infrastructures … were considered the transformation instruments of the society". /14

Second period: From 1930 to the middle eighties

The coffee crises at the end of the twenties, signed by the product's violent drop in the international market and the development of the Venezuelan oil industry, were facts that affected notably San Cristóbal and Cúcuta's economy. At first, public and private actions began to be outlined directed to transform the economic base of both cities and to adjust them to the productive oil structure that was been established in Venezuela.

The spreading of the increasing fiscal incomes generated by the oil activity allows the modernization of Venezuelan cities, among them San Cristóbal, that is incorporated to the new dynamic in which the public sector assumes a new role on national life. Cúcuta accomplished the re-adjustment to the new economical situation through its transformation as commercial service center for the Venezuelan people, especially the frontier one, for whom it was very profitable to acquire the products for the familiar basic basket, clothes and footwear in the hundreds of tents that for such purposes were established in its traditional downtown. As a technical report indicates: " The Venezuelan oil prosperity and the Cúcuta's strategic frontier location, favored the advance of tertiary activities, specially commercial, transport, finance and tourism types, rising what is qualified as 'economy of border', in detriment to the development of other economic activities". /15

On the forties and fifties the Venezuelan central government initiates an industrialization process. Some Venezuelan cities were favored but San Cristóbal was not. As Negrón point out, there were positive changes seen in certain cities by means of growing national territory integration, both, political and economical. It happened in those cities holder of an "industrial relevant function" such as Valencia, Maracay, Guyana and others that could implant agricultural modern activities like Acarigua-Araure, Barinas, Guanare and Calabozo. /16. Táchira State and San Cristóbal was not incorporated to this process …"first because it was isolated from the principal markets and then, when this no longer was a bounding factor, because it is incorporated as market of the country's industrial activity centers rather than as a new producing zone of manufactured goods". /17 In Cúcuta the situation was similar to San Cristóbal. Its geographical emplacement, distant from the cities that had initiated their industrialization as Medellín and Bogotá and their deficient road connections, were factors that prevented their incorporation to the Colombian industrial dynamic. /18

By the end of the fifties (concretely in 1958) both countries created their central planning offices (Cordiplan in Venezuela and Conpes in Colombia) and they instituted the national plans as carrying instruments of social, economic and spatial public policies. One of their main objectives was to develop the decayed and peripheral areas. So, extensive plans and projects were elaborated for developing San Cristóbal and Cucuta´s territories. Even though, in the case of the first one, were not implemented. And it seems that neither in Cúcuta. A technical Colombian report, referring to the lack of concretion of national plans, synthesizes it in this way: "None were accompanied by force of law, they were not either discussed in wide circles". /19   then, public planning stayed practically on the paper. Very little was done. This insufficiency could be

explain, in a general way, by the traditional dichotomy and distancing between plan and concretion that characterizes planning in Latin-American countries, and concretely, in the study area, for its geographical emplacement, far away from the main industrial dynamic centers.

From the point of view of binational planning, in 1964 the Inter-American Bank of Development (BID) elaborates the report *Possibilities of integration of the Colombo-Venezuelan Frontier Zones,* in which, seen the existing dynamics, recommended an agenda of cross-border and binational development. Nevertheless, the proposals were not beyond good wishes. Before the lack of concretion of public sector policies, the productive private sector, the formal and the informal one, have motorized the economic and social life of the border area.

San Cristóbal and Cúcuta, given their condition of capital cities though their abandonment of the dynamic centers of their respective countries, were turning into regional services centers, which motivated local and regional powers to plan their future growth. Urban and regional plans were formulated, which to the end were not concreted either. Nevertheless, some public punctual interventions were made which modernized and structured both cities. Such was the case occurred in 1961 in San Cristóbal with the works carried out by the national government on occasion of its fourth centennial. Among them, the remodeling of the Cathedral and the Archiepiscopal Palace, the remodeling of Bolivar Square, the construction of the first viaduct which would join the south with the north part of the city and some important local streets. Later, in 1976 the first Urban Plan was formalized in San Cristobal, which in theory had a metropolitan vision but in the practice turned out to be a normative plan to a municipal scale. /20 In 1975 an Urbanism Code was approved for Cúcuta, /21 which as the same as the San Cristóbal's Urban Plan, defined the future urban city development (land uses, road plan, urban and suburban perimeters). The government's plan and construction of some important local roads stimulated private investors to act in the real-estate branch of residential and commercial developments. So by the end of the seventies both cities managed to have a functional road system articulated to wide commercial and residential sectors and to new public buildings, which changed their provincial physiognomy. In the mean time, the economic and social dynamics of the border area was demanding new employees and residential zones for workers since in both cities began to skimp and raise the price of the central land area. In San Cristóbal, the speculative dynamic that simultaneously arose, prevented from making effective the land purchase of areas that the Venezuelan State had previously located as zones for urban expansion in order to channel the population growth of the economically needier classes. Therefore, the State loses the capacity to control the urban growth of San Cristóbal and its territory. From the ends of the seventies and the beginning of the eighties, a process of invasions and unstable and not suitable occupation areas for urban development began, which consolidates little by little the growth of marginal dispersed areas that had appeared shyly since the end of the fifties. A similar situation happened in the neighboring Cúcuta, which becomes obvious, a condition of marginalization of wide urban sectors on the border area. This circumstance was physically evidenced in a metropolitan sprawl that already could not be controlled by the

governments, which begins an intensive process of fragmentation in the cross-border society that will be deepened into the two following decades.

The third period: from the middle eighties to our days

From the middle eighties in the urban binational spatial agglomeration it began to be observed big and deep urban development changes, both urban and socio-spatial, that lead to think that besides the transformations originated by endogenous factors (as it could be the 1983's Venezuelan devaluation currency) /22, , the processes of structuring of the economy, societies, institutions and cultures, which characterize the phenomenon of globalization and which according to several authors is happening in the majority of Latin American cities, also form a part of those changes./23

In this period two aspects are relevant. The first one is the great contrast between the efforts done by both nations to implement the border area shared planning and their lack of concretion. The second one, the intense activities exercised by the private sector, the formal and the informal, which have determined the border area's great economical and social dynamism.

From the sixties both countries' regional development corporations have jointly elaborated several studies and projects /24   which reiteratively have tried to harmonize and to foresee the economic and social development of the frontier area. In 1989, with the *Declaration of Ureña (*a political document of integration and binational development signed by the presidents of both countries) it was proposed a spatial concretion by means of a *binational metropolis* shaped by Cúcuta's Metropolitan Area and the urban Venezuelan axis San Antonio-Ureña. This delimiting originated disconformities on the Venezuelan side, probably because San Cristóbal and its Metropolitan Area as part of the metropolitan binational system were not included, given the degree of attraction and importance that for this system both cities would have: Cúcuta and San Cristóbal. Nevertheless, the Venezuelan technical Commission suggested changing the agglomeration name from *binational metropolis* to   *binational conurbation,* but this semantic proposal did not solve the conceptual problem. Probably the most negative aspect derived from this situation was the loss of interest for shared planning, to the point that in 1992, in a unilateral way, Cúcuta decreed its Metropolitan Area, action that in 1984 San Cristóbal had already taken in advance.

Later, in 2005, the same regional corporations reconsidered the idea of political, economic, territorial, social and cultural integration conformation zone which from two decades ago the Comunidad Andina de Naciones (CAN) had outlined. The idea was presented in the document: *Project of definition and delimiting of the Zone of Frontier Integration (ZIF): Area Norte de Santander (Colombia)-Táchira (Venezuela. /*25 It calls to the attention one more time, that spite they include San Cristóbal as part of tachirenses municipalities, which would form a part of the ZIF, they left out other municipalities that conform the San Cristóbal's Metropolitan Area /26   We consider this circumstance to be a conceptual mistake since the importance the binational system would represent, to have a suitable and balanced system of cities. From a theoretical

point of view, Castells and Borja already warned on it when made recommendations about the new territorial realities. They believe that competitiveness between territories does not already depend on natural or energetic resources, or on industrial traditional base, or on geographical position, but it depends to a great extent, on a suitable functioning of the urban-regional system. With this they were alluding especially to mobility and to basic services, to the definition of a city or region project, and territory governance based on social cohesion and civic participation. /27

San Cristóbal and Cúcuta continued growing according to the private interests of economic and cultural sectors, and surely, in agreement with the processes of reconfiguration that globalization imposes, determining a dual urban agglomeration, both in physical and social terms /28 This meant that some areas grew well structured and articulated whereas others accommodated in marginal zones with huge physical and infrastructural shortages. These areas are determining different ways of life and different ways of using the urban space. In Cúcuta it has meant that the nearby populations of Los Patios and Villa del Rosario are rapidly growing with low income families. Villa del Rosario has passed from being a Cúcuta's medium and high income zone settlers to one of the lowest socio-economic stratum.   In San Cristóbal it is evident the growth of peripheral areas given the need of spaces to lodge the population that works, in their majority, as construction workers and domestic employees. Great part of them are Colombians and constitute an originally floating population, which through time have established in Venezuela by means of the birth of their Venezuelan children. Furthermore, they seek to enjoy the rights and public service's supply that the Venezuelan State should guarantee to its citizens. Such it is the case of San Josecito, a peripheral planned development that at the end of the seventies was supposed to shelter 2500 people of medium and low incomes and through time has developed into a citadel close to 50.000 inhabitants /29, located to scarce 11 km from San Cristóbal.

From the point of view of the cross-border mobility, it has been conformed "a kind of commuting in the borders cities that depends to a great extent on the exchange value of their currency"/ 30. It calls the attention that spite of the constant devaluations and fluctuations of the cross-border economy and both countries' political disagreements, during the last ten years several big commercial establishments (malls and hypermarkets) have been opened in one and another side of the border, which not only are modifying the cities's functionality and morphology, /31 but also the citizen consumption's behaviors. /32

But the cross-border social-commercial dynamic not only is represented on the exchanges of the formal trade. The activities of the informal economy and the persons dedicated to it have grown considerably. The Colombians flows that pass to Venezuela and come to San Cristóbal to act as street sellers and return the same day to its place of origin, has been increased; they represent a floating and very significant population for its social-spatial effects.

In 2006 the unexpected exit of Venezuela from the *Comunidad Andina de Naciones* (CAN) occur, which stopped all the public actions that from several decades ago both

countries were willing to develop. However, the frontier area dynamics has not bunged. We can say that instead, it is continuously increasing.

Some preliminary conclusions

In the first decades of the 20th century, in the Venezuelan and Colombian agro-exporting economy stage, the study area was characterized by the importance of San Cristóbal and Cúcuta as autonomous cities, with deep links originated by the similarity on their economies (coffee agro-exporting to Europe and the Unites States).

This period is characterized by the strong weight of private sector participation, local and foreign economic groups, which had direct incidence on the area's territorial and urban development. In an early stage the private intervention consisted in the formation of coffee farms, which from small units developed on medium and big *haciendas,* all of them articulated to the existing towns. An import-export trade interchange system which contributed to the modernization of the physical and cultural cities contexts was also developed. In a second stage, huge entrepreneurial risks were undertaken, consisted on the construction of two railway networks through the unexplored and woodsy lands: Cúcuta and Táchira´s ones, which facilitated the coffee transportation to Maracaibo, the exportation port.

At the beginning of 1930-1980 periods, and after the world's coffee economic crisis, San Cristóbal and Cúcuta had to re-accommodate their economic base to adapt to the new conditionings of the oil Venezuelan economy. Public and private actions began to be outlined directed to transform the economic base on both cities. San Cristóbal modernizes through the investments of central government on the construction of infrastructure works and public buildings which initiate to modify the city's traditional and limited functional capacity. Cúcuta re-accommodated through the private sector intervention in order to convert it into a dynamic center for commercial services for Venezuelans citizens.

From the fifties onwards, both countries began to plan the developing of their peripheral areas and consequently they start to be taken into account in order to reverse their backward condition. This occurred even in the binational planning sphere. Many plans and projects were elaborated. However they were not effective. The policies and official plans constituted only rhetorical exercises transformed in dozens of documents that rested into the drawers of the public offices which were not able to contribute with the conformation of a functional and social aimed regional agglomeration.   In spite of this situation, both cities were constituted in active regional poles due to the action of private actors, most of them with mercantilists' aims, whom promoted the border socio-economic and urban development dynamic areas.

From the eighties, it was evident the increasing disability of both countries to guide, administer and finance the border area's urbanization intensive processes and socio–spatial changes which derived in a dual agglomeration, in economic and social terms. On the urban development two aspects that are changing the morphology and the

landscape of the frontier area are warned: the great diffusion of the non-controlled urbanization (sprawl) that is expanding over the metropolitan spaces and the construction of big architectural artifacts that are modifying the metropolitan functionality and the citizen's consumptions ways. Surely these forms consubstantially part of the frontier dynamics and of the world effects of the economic and cultural globalization. Finally, the increasing mobility of persons, good and services and the landscape transforming that are evidencing on the border area give into account of the new forms of social performance which need to be taken very much into account on analyzing their urban development dynamics. The strong private, social and economic, interchanges existing on the border area prevail over the recent acute political problems of both countries (originated on March of this year by the military assault of Colombians troops on Ecuadorian land and which unexplained originated distress on Venezuelan government to the point of sending troops to defend its border against the Colombian's one and give a clear account of the irreversibility of the border area vitality.

Notes

1. This route was originally constructed in 1913. It has been improved and extended but in essence it continues being a mountain road without many possibilities of modernization.
2. Originally the AMSC, defined in 1984 by the Plan Rector, included the urban areas of San Cristóbal, Táriba, Palmira and Cordero. Later, with the Plan de Ordenamiento Territorial del Estado Táchira of 2004 the urban areas of Capacho (Libertad and Independencia) and San Josecito were annexed.

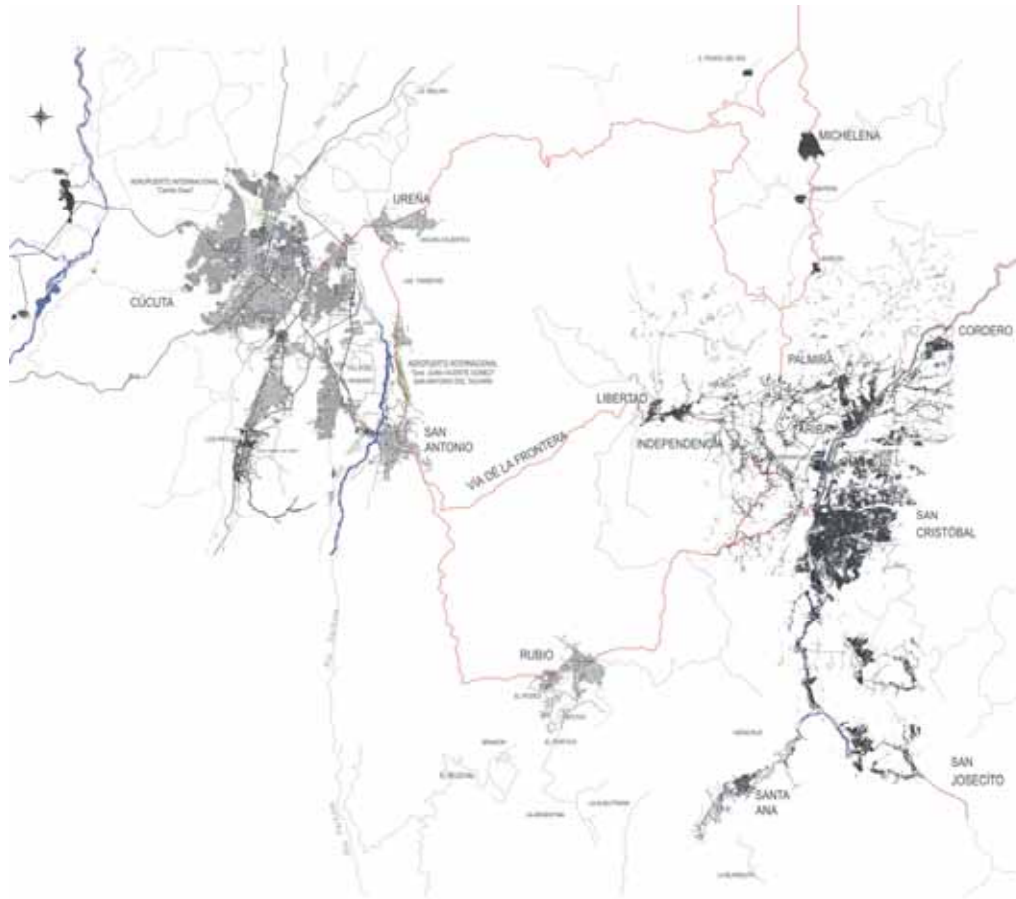
32. García Canclini, Néstor. *Consumidores y Ciudadanos. Conflictos multiculturales de la globalización*. (Editorial Grijalbo. Mexico.1995). p.29. The author suggests that many of the citizen's questions can be better answer on the good's private consumption and through the mass media channels than on the abstracts rules of democracy or on the collective participation in public spaces.

Appendix


SISTEMA URBANO BINACIONAL SAN CRISTÓBAI - CÚCUTA

Ferrucio Vitale, landscape architect and planner of Chicago's *A Century of Progress Exposition*: the emergence of Modernism in physical planning

Terry Schnadelbach
University of Florida, United States

Conceived in the best of times, executed in the worst of times, Chicago's Century of Progress Exposition, 1933-1934, was highly criticized, but none-the-less a phenomenal success. First proposed in 1928 to celebrate Chicago's centennial, the new exposition was meant to return Chicago to fair fame after a succession of dull Beaux Arts expositions in San Francisco, St. Louis, and Philadelphia. (The Philadelphia Sesquicentennial International Exposition was particularly financially disastrous.) The 1933 Chicago exposition was to be financed by the continuation of the 20's boom years of industry and stock market gains, but the national economic crash of 1929 stopped all but the most optimistic contributors in their tracks. That such an event could happen, the fact that even the idea could survive, let alone be planned, financed and built during the Great Depression, countered every national trend.

A part of the fair's success was due to in no small way to the creative physical planning and site design of one of America's forgotten landscape architect, Ferruccio Vitale of New York. This paper continues my research on the man and his oeuvre and follows the publication of my monograph *Ferruccio Vitale, Landscape Architect of the Country Place Era*.[1]

"Modern", "Dazzling" and "Outrageous" were the ways newspapers described the Exposition on its opening day. Conceived from the beginning as a rejection of the Beaux-Arts based City Beautiful Movement - embodied in the memory of the 1893 Chicago World Columbian Exposition and the visionary 1901 plan of Chicago-cum-Paris, the Chicago Century of Progress Exposition was to showcase new theory in physical planning and urban design. "It would be incongruous to house exhibits showing man's progress in the past century in a Greek temple of the age of Pericles, or a Roman villa of the time of Hadrian,"[2] As originally posited by the Board, the fair's architecture was intended to express the most advanced architectural theory of its day, which was at that time the Modernist design idiom.[3] The fair would reject the planning, architecture and site development of the "Great White City" of the 1893 World Columbian Exposition nor would it reflect any particular American architectural lineage such as that of the noted Shingle Style or Prairie School of Chicago architects Louis Sullivan and Frank Lloyd Wright respectively. Rather it called for a new architecture born out of modern technologies, materials and construction methods. It was to respond to the new lifestyles of the jazzy '20s, while still recovering from a Depression economy. And because of the Depression, there would be little or no state or national participation which drove all past expositions. It would have to be designed to be "lean and mean" due to exigent circumstances.

The planning and design for the exposition did not progress smoothly. The Exposition Board's president Charles G. Dawes, a former U.S. senator and vice president of the United States, chose the architect Daniel H. Burnham, Jr. to direct the 1933 project. Following in his father's footprints as planner of the 1893 fair, Burnham, Jr. chose the Art Deco style as the fair's artistic style. A few years earlier, he had visited the 1925 Paris Exposition International des Arts Decoratifs et Industrial Modernes. There, he had met then director general of the French administration of the Beaux Arts, Paul Leon, and his design team of landscape architects, headed by J.C.N.Forestier who planned the entire exposition. The Paris exposition's regulations stressed the need for the inspiration of the 'Modern'. All forms of past historical styles or eclectic elements were outlawed. Accordingly, the Paris exposition designers promoted the emerging new art movements of the day - Modern, Cubism, and Art Deco. The French essayist on art, Waldemar George wrote "All that clearly distinguished the older ways of life was rigorously excluded from the exposition of 1925,"[4] Nevertheless, whether the exhibits were Classical Moderne, Modernized Traditional or 'Modernistic' in character, they helped establish the themes and formal repertoire of the Art Deco. Burnham, Jr, having visited the 1925 Paris Fair, and newly commissioned to plan the next Chicago fair, returned to see and experience the 1929 Paris International Exposition designed by the noted French landscape architect, Jacque Grebert. The second Art Deco Paris exhibition had an immediate and worldwide impact on the design community. For Chicago, the choice was easy; Burnham chose the Art Deco style as its new international expression, born out of Modernism's technologies employing new materials, manufacturing and construction methods.

For Burnham, art deco architecture meant physical compositions and buildings that were:

- Simple, bold and clean shapes and forms - planarity, symmetry and unvaried repetition of elements
- Emphasized vertical elements through a buildup of repetitive forms
- Decorated with applied ornamentation and surface art
- Patterned in
  - Jazz motifs and jazz-age items
  - Tropical motifs, foliage, animals, sunbursts
  - Primitive art / African-inspired textiles
- Portrayed stylized human figures
- Rendered in the full color spectrum of
  - Bold non-primary hues
  - Contrasting and complex colorations
  - Tonal values
- Utilized fountains and water channels
- Used machine age products and expensive materials
  - Primary use or mixed use of aluminum, chrome, lacquer, inlays, clay/ceramics, exotic woods, glass and fabrics, ferroconcrete and metals
- Introduced neon and new forms of lighting

Initially, Burnham chose as the fair's architects the brightest young architects of the day: from New York the chairman of the architectural team, Harvey Wiley Corbert, with fellow New York architects Raymond Hood and Ralph T. Walker, Paul Phillippe Cret of Philadelphia, Arthur Page Brown, Jr. of San Francisco and Chicago architects, John Augustus Holabird, Edwin H. Bennett and his brother, D. Hurbert Burnham, who acted as chief of construction.

The site, chosen earlier in the process by Burnham, was 424 acres of recent fill stretched in a narrow, three and one-half mile band along Chicago's southern waterfront, Lake Erie. The site was separated from adjacent urban areas by railroad tracks, posing difficulties of access. The partially completed exposition grounds included part of the 1901 Beaux-arts formal downtown shoreline and parts of an offshore parallel island, and the lagoon between them. In the lake-front development at that time, a few elements of the grand 1901 Chicago Plan had been completed and had to be incorporated - they were the centerpiece and central plaza with its Burnham fountain, Soldiers Field football stadium with its classical façade, and jetting out into the Lake, the Chicago Planetarium.

The initial physical planning process of 1929 nearly killed any prospect for a successful fair design. Initial plans called for all major fair structures to line the three and a half mile shoreline landfill leaving the outer island as passive green parkland. The team of seven architects clashed over each one's ego-driven concept of a grand master plan, each with its own monumental structures. To these architects, the Burnham idea of Art Deco/Modernism translated into the American skyscraper; each architect proposed massive buildings with stunted central towers and strung-out low wings - forms totally inappropriate to prototype exhibition buildings. In any case, the 1929 crash killed all appeal to grandiosity and the fair itself practically closed down.

In the midst of the fray, Burnham drew inspiration from Paris again. He followed the Paris design team model and added two new members to the exposition's physical design team to oversee and coordinate a uniform design - a landscape architect to be the master urban designer and planner, and allied artists, typical support to the French design team. For an urban designer/landscape architect, Burnham commissioned to the architectural board the services of Ferruccio Vitale, a New York professional with roots in the Chicago suburban Community of Lake Forest. As his allied artist, Burnham chose the multifaceted architect, the colorist, mise-en-scene/stage designer, dramaturge, and plastician, Joseph Urban. Both Vitale and Urban were immigrants - Vitale from Italy and Urban from Vienna. The two were to collaborate on the fair's final plans, develop the site's public spaces and coordinate the fair's construction. Their work and collaboration profoundly changed the course of the fair's physical planning and design,

The choice of the New Yorker Vitale harbored political considerations – Vitale was virtually unknown nationally. The first and obvious choice would have been Frederick Law "Rick" Olmsted Jr., the principle partner of the nation's leading firm, Olmsted Brothers of Brookline, Massachusetts. But Olmsted was connected with the 1901 Beaux Arts Chicago master plan, and was steeped in both the picturesque landscapes and the

formal Beaux-Arts plans of the past. Choosing Olmsted, Jr. who rejected modern trends in planning and design, would not advance the new Modernist agenda. To the contrary, Vitale was already experimenting with Modernist space and form in his recent gardens.

Landscape Architect Ferruccio Vitale has been America's forgotten immigrant son. Born into a prominent Italian Florentine family, he finished military school there, before coming to America as the military attaché to the Italian Embassy. Through a chance meeting with George F. Pentecost, Jr., the commissioned landscape architect for the Capital Grounds, Vitale decided in 1904 to immigrate to the United States and enter the profession of landscape architecture. After apprenticing in Pentecost's office he established his own office in New York City. Vitale's work was quite contrasted to the dominant romantic landscapes of his day. His landscapes were Jeffersonian-like abstract spaces, some of which contained America's first Modern landscape elements. Borrowing liberally from Montecello, a typical Vitale landscape composition featured a large central green space enclosed by dense green side gardens which were connected at the end to form a loop.

The tall, lanky and affable Vitale began his career with estate commissions of the Country Place Era. Commissioned by the East Coast elite, his work stretched from Massachusetts to Virginia. Mid-career, he became known to the wealthy Chicagoans and gained commissions in the Chicago suburb of Lake Forest, Illinois. His early designs began with a mixture of the French / Italian Beaux-Arts styles, and progressed over the next twenty years to classical Modern, and then to abstract Modernism, and finally to Modernism and Art Deco. He was one of America's few landscape architects to make such a progression in his design theorem and to work within the Art Deco theory. His firm, Vitale and Geiffert, became the second largest professional office in the United States following that of the Olmsted Brothers. Vitale, as lead partner, was known to architects as a strong and knowledgeable collaborator.

Although noted for his private sector estate work, Vitale also received public sector planning and landscape architecture commissions. As a result of his service on the National Fine Arts Commission in Washington D. C., his design and execution of the National Mall remains unchanged. Vitale's work in the nation's capital alone qualified him for further recognition and study. His other commissions there include Meridian Hill Park, the completion a L'Enfant park on axis, north of the White House. Other large scale plans include the master plan for Scarsdale, New York, and the campus of the University of Illinois, Champaign-Urbana. The planning and landscape architecture of Chicago's Century of Progress Exhibition though was his largest and his most difficult commission up to that time.

Joseph Urban, Vitale's co-planner, was the "composite conceptor;" typically a member of a French architectural design team. The typical French team would be composed of any of the allied arts - architectural philosopher, a plastician (sculptor), a colorist, a mise-en-scene (stage set designer) and a dramaturge (stage director). Urban was well known for all these skills. He was set designer for operas and plays, an exuberant colorist, and a master at lighting and special effects. Through these skills, Urban had

directed numerous musical and theatrical events, including productions for the Ziegfeld Follies. This led to architectural commissions for theaters and related buildings. His most famous work, The New School in Manhattan was a minimalist expression of the Art Deco style.

Once engaged, Vitale immediately moved to change the concept of the fair's plan. He successfully argued for a new direction:

- *The formation of a central space*:   Vitale argued that the site was non-spatial and that visitors would not walk the entire length of the shoreline only to return the same way. Instead he proposed reshaping the shoreline and the outer island to form a central lagoon, the new centerpiece for the fair. Vitale shaped the lagoon into two sections, violin-like in form. The lagoon provided a viewing space to look back to all buildings of the fair. It functioned as a performance space in its own right. It contained space for the fair's famous night spectacles, the futuristic fountain and the light shows of the Urban and Vitale collaboration.

- *A clear pedestrian structure linking Island and Mainland:*   Street-promenades organized both island and shoreline, cross walks and a central bridge provided access to both sides of the central lagoon and also organized the entrances to the fair from the adjacent urban areas. The streets linking the expositions' sections, between entrances and bridge crossings, were wide promenades that structured the placement of all buildings. Long massive buildings of the major exhibitors were placed on the back outside edge of the walkways. Their mass concealed the noise and unsightliness of the adjacent railroad yards. On the opposite side of the street promenades, the section between the promenades and the lagoon, were separated by landscape garden or park-like spaces, smaller exhibition buildings dotting the lagoon edge. This organization afforded views of the lagoon and the composition of the opposite shoreline.

- *The thematic identification of promenades:*   Each street segment had its unique character. The exposition's most memorable street was the Avenue of Flags, a flag-draped wide promenade that was rapidly constructed at a relatively low cost. An Urban and Vitale collaboration, the street was lined by monumental flagpoles - Art Deco column of triangular plates with internal lighting, - connected by a low wall of linear benches lining the street. From cantilevered arms projecting high atop the metal pylons, the designers hung huge flags that rustled in Chicago's trademark winds. The pylons were chrome piping with black bracing triangular insets, while the flags were maroon in color, edged in electric chrome yellow ribbons. The effect was stunning and closely resembled the modern day sculptor Christo's saffron-colored flag draped Gates in Central Park, New York, executed in 2005. The lighting for the avenue was another Art Deco achievement. The pole mounted fixtures were "maza" lamped, a frosted linear florescent-like tubular bulb, golden in color and concealed within the column's structure. The maza lights gave a soft glow to the animated flags changing their maroon coloration from orange, when illuminated, to dark russet when in shadow. "Indelibly impressed upon the memory of all who attended the Fair is the Avenue of the Flags. Banners, as

high as a five-story building, lined both sides… for nearly a third of a mile. The forty-seven flag poles tilted at an angle of sixty-degrees and supported by a latticed steel columns rose eighty-five feet on the air forming a canopy over the seventy-foot drive. Breathtaking in their beauty, filling the eye, their streaming furls took a commanding place in the decorative features of the Fair," wrote the noted Chicago architectural historian Arthur Miller.[5]

• *The creative division of the site*: Vitale divided the site into three areas based on the lagoon as the fair's centerpiece – the two lagoons sections and the south continuation of the shoreline. He then further divided these sections into six sections, giving each of the six architects their section to plan and build. Within each sector the architect designed the major pavilion(s) and supervised the architecture and placement of the smaller pavilions.

• *Pavilions of major private exhibitors:* The stock market crash of 1929 nearly killed the planned event. In late 1929 and throughout 1930 and 1931, the design team was asked to stop work as there were no available committed governmental funds such as those that had powered previous fairs. But two decisions by the Board saved the event. The first was the pre-selling of fair passes to the public. To the surprise of all, a huge number subscribed. The second was corporate involvement. Burnham, Jr. remembered the 1925 Paris exposition where major French manufacturers of luxury items built and managed their own pavilions. Representative companies were Goeblins, Ruhlmann, Lalique, Erte and Cartier, to name but a few. Burnham reasoned American corporations would be eager to do the same. He would include as exhibitors major corporate exhibitions halls which American corporations would build at their own expense to exhibit their products. Further, each corporation would contribute to the development of the fair's infrastructure. Corporate sponsors included Sears and Roebuck, Ford, Chrysler, A & P, Miller High Life, Firestone, Walgreens, and General Electric, to name but a few. These major pavilions elevated corporate identity. Designed by the fair's leading architects, they represented both good corporate advertisements and good public relations.

In 1932, at President F. D. Roosevelt's direction, the United States built a major pavilion at the fair; the State of Illinois followed suit. These final two pavilions insured the financial success that was required for the planning to resume, this time at panic level speed. Vitale placed major exhibitions at the corners of all entrances, street intersections, and lagoon crossings. These were not only visual focuses but magnets, drawing the visitor through the site. They were massive in foot print and impressive in volume. In all cases these exhibition halls were designed and color coordinated by the Vitale/Urban team.

• *Collaboration on a new architecture:* The new Art Deco architecture of the exposition was a radical departure from all previous fair architecture. As buildings were considered temporary structures, the materials utilized were steel frames with walls or partitions finished in stucco over wire mesh. These structures were designed as windowless shells so as not to interrupt or limit the continuous flow of internal

exhibitions, which were predominately limited to the ground floor. Buildings were articulated boxes, featuring only entrances and exhibits, the rest of the structure comprised of blank walls that required a fresh approach to the building's exterior design. Art Deco decorative pylons, towers, spires and domes were useless features added only to give the pavilions individual identity. The typical building was in the Classical Modern mode; symmetrical and blocky. A few pavilions attempted new, and considered radical, non-symmetrical compositions of widely divergent massing. Those attempts utilized the tower as a vertical anchor to a sprawling building arrangement, somewhat similar to the role played by the campanile in Piazza San Marco, Venice.

Vitale had to rely on the impact of strong architecture that expressed only entrances and exits. The remaining volumes were blank canvases for Urban to paint. In anticipation of the crowds, the Vitale landscape provided large plazas directly adjacent to the street providing entrances and exits to the building. They were the settings for assemblies, visitor services, information booths, toilets, and bus stops for the fair's internal transit system. Vitale encouraged many fair architects to design their pavilions –States, Electric, and the Hall of Science, to name a few – with internal central-focusing spaces. In most cases Vitale designed plazas as Modernist spaces, Chrysler Motors was one of the few that provided an entry space in Art Deco design, with gardens, fountains and pools of that style.

- *Unifying Exposition elements*:   To such architectural innovation, Urban and Vitale took an equally radical approach. From his years of designing theatrical sets, Urban brought his love of full chromatic expression, and proposed its application to all expositions structures. The 1893 exhibition in Chicago had adopted the architectural theme of the "White City," in which the 14 major exhibit halls conformed to a uniformly white appearance. Under the direction of Joseph Urban, the 1933 exhibition contrasted the earlier fair with its "Rainbow City" scheme, suggested by the vibrant colors used to illustrate the fair. Urban employed space defining color theories in the specific selections of colors applied first to each of the fair's six sections, and, secondarily, to the choice of related colors applied to each building composition therein. In his presentations to the fair directors, Urban outlined his criteria:[6]

  - o   "Color to be used in an entirely architectural way
  - o   "Color used to co-ordinate and bring together all these vastly different buildings
  - o   "Color to unify sectors and give vitality
  - o   "Color to give brightness and life to material not beautiful in itself
  - o   "Color to give the spirit of carnival and gaiety, to supply all atmosphere lacking in our daily life
  - o   "Color that should transport you from your everyday life when you enter the fair grounds."   Joseph Urban

Urban created a palette of twenty–four colors, all of the "brightest intensity": one green, two blue–greens, six blues, two yellows, three reds, four oranges, and two each of grays, white, black, silver, and gold. The plan was for approximately twenty percent of

all surfaces to be white, twenty percent blue, twenty percent orange, fifteen percent black, and the remaining twenty-five percent to be spread among the yellows, grays, greens, and silver.[45].

Vitale matched this concept in Modernist streetscape and site development design, for the first time as public open space composed uniformly throughout the exposition grounds. For the site's general landscapes, Vitale placed young tree plantings, individually unimpressive, into massive groupings, spotting the vast area fronting the lagoon. The clusters were achieved in small rectangular clumps, usually of the Lombardy poplar, the then popular vertical tree of the Art Deco expression. They were fast growing, and when seen from a distance, complemented the towers and spires of the Art Deco architecture. Throughout the site, Vitale planted flower beds in the pallet employed by Joseph Urban, planning for a succession of color. Seventy-five thousand square feet of flowering beds were scattered throughout the site. Generally placed in large beds adjacent to building entrances and plazas, each bed was mono-cultured and monochromatic. The typical bed would phase between summer displays of creams and yellows, followed by midsummer's purples and plum which in turn was followed by late-summer's oranges and reds. Night lighting intensified their hues. To achieve the landscape site development, Vitale had to import all plant material from Long Island growers and ship by train directly to the site.

- *Color and light show: the fair's central feature*:   Of all the chromatic impact brought to the Century of Progress Exposition in its architecture, urban space, and landscape architecture, the most dazzling effect was to be found in the night displays created by the Urban and Vitale design team. Throughout the site, but primarily located in the area of the central lagoon, and with central Chicago's skyline as a glittering backdrop, the Century of Progress fountain consumed the entire main section of the lagoon. Rather than one composition of water jets, the fountain, whose performance was called "A Rhapsody in Color," was designed as a series of asymmetric fountains progressing down the length of the lagoon. The water display began with lines of arching water forty-feet high, continuing through a compositions of disk shaped water cones, and terminating in a huge water dome and fog area, two hundred-feet in diameter. Copied from the Trocadero fountains in Paris, huge water cannons shot volumes of water over-arching all the other waterworks. The enormity of it was matched by Urban in the biggest incandescent searchlight ever installed. It produced a silver fan over the lake and fountains.[7] All water jets were illuminated by color "submarine' lights of every hue of the rainbow. Most striking was the Urban favorite of jade green and deep blue-purple; most combinations were in the cold color range of the spectrum. Added to the central water displays, dazzling lighting effects were employed throughout the grounds. Night effects of light beams were integral to almost every building, expanding the startling night illuminations effects beyond the central lagoon area. The fair was a chromatic space throughout, both day and night.

Together Vitale and Urban brought color and light to the nighttime expo experience. The concept was daring as color was amassed as never before. Color was not just applied; it was, in fact, form giving and space defining. Color was the element that revealed the

identity and separation of each corporation's abstract architectural volumes. A strange note in history; All the fair's photographs were taken not in color, but in black and white. As a colorist, Urban was known for his watercolors, and we can be certain that the two know illustrations are accurate portrayals of his compositions. Official guides were illustrated in color, most with a crude hand, but there may be a few Urban illustration in the mix.

The 1933 fair is the only American fair to be designed under Modernist theory. Gone are the organizing central axis and the architecture monument terminus. Gone too are architecture's classical order, symmetrical buildings and decorative vegetation. Instead Vitale created the central lagoon as an inward-looking, non-symmetrical central space of major importance. It unified the individually different expressions of architecture while giving importance to America's corporations. Vitale shaped the architecture's footprint and envelope to form courts and plazas giving form to their entry and exist, their assembly and special events. In collaboration, Vitale and Urban orchestrated and unified the entire site through color and light, redefining the paradigm of expositions from a "White City" to that of "Rainbow City". Vitale died months before the fair opened; Urban, a month after. For Vitale and his survivor firm, Alfred Geiffert, the Chicago exposition led to another major Art Deco development: Rockefeller Center, New York. The esplanade gardens and the central plaza, with its surrounding flags, the new rooftop gardens and connecting footbridges are all Vitale signature pieces and Chicago Century of Progress-inspired.

The 1933 exposition was a huge success and was to continue for another year into 1934. For the first time in American history, an international fair had paid for itself. Its resultant planning and design theorem have all but been forgotten. It is one thing to create such a bright and vibrant color scheme for a world's fair, quite another to transform those ideas into a functioning city. The Fair's Board found "Rainbow City" too radical an idea and while "freshening-up" the buildings in 1934, painted them all white – a return to Exposition tradition. As a further loss - and since all structures were built as temporary- nothing of this great fair remains today.

> "A little while ago this site was placid lake. Now, shimmering beside the water, a dream city is risen. It lights the sky with splendor, yet soon will disappear and be merely memory."[8]

Penedo: a Finnish utopian colony in the Tropics

Sergio Moraes Rego Fagerlande

Introduction

Penedo was created on an ancient coffee plantation, at Rio de Janeiro State, in 1929, as a utopian colony by a young Finnish vegetarian group organized by Toivo Uuskallio[1]. This Finnish garden architect had a "call" to create a new society in the tropics, where people would live in a community close to the nature. Those ideas were the result of some existing movements in Finland, of natural treatments for health, vegetarianism and some Pentecostal religious thoughts, and also Uuskallio's own ideals[2].

Finland was a country of emigrants and there was a traditional migration movement especially to the United States and Canada and another that Peltoniemi[3] called the foundation of Finnish Utopian Colonies. Those experiments begun at the 18th century and during the beginning of 20th century there were some examples, as Sointula in Canada, founded at 1900, Colonia Finlandesa in Argentina, created at 1906 and Penedo in Brazil, founded in 1929[4].

Penedo privileged a communal vegetarian option, with equal work division, building a new society, having a natural life together with religious principles. Respect for nature and freedom were the commandments of the project, which would regulate the colony's life for a while. The installation of the settlement followed Uuskallio's Housing Project[5]. It was the basis for a communal life, organizing space and people's lives. The construction of houses and opening of roads were part of the project. It also regulated the part of the farm that would be occupied, and the forest that should be maintained, and a deep concern with the river and its pollution.

After the initial subsistence horticultural activities, the settlement functioned during the period between 1929-1942 as a utopian colony, when finally it suffered economical difficulties and problems to implant a harmonious community[6].

At the beginning it was a private project, with no state interference, supported by popular campaigns in Finland. It was a private project that after some years was transformed into a public place, being no more a Finnish closed community, but a small village, with people from different places. A project that began as a private communitarian society acquired another status, when its uses became definitively public.

Some points can be questioned, as how a utopian project can be considered private or collective, and how it can be considered public, after its end as a utopian colony. It can be questioned if it is possible to maintain a utopian place, with no State participation, with the community being self-controlled, or it has to depend on an external government to be a well organized place to live. Those points can be discussed, observing the example of Penedo and its history.

The study of the urban formation of the colony was done upon vast iconographic material, and also the personal history of first inhabitants. Studies of authors as Fagerlande and Melkas about the Finnish Colony history were especially important, as Toivo Uuskallio's Housing Project was fundamental to understand how Penedo was impressed by its utopian ideals, possible to be seen in its urban structure nowadays.

Penedo was a rare experience in Brazilian urban history. Differently from United States, Brazil has had a small number of utopian experiments. To study Finnish migration to Penedo, it was important to understand how Finland was at that moment, and its migration history. Some Finnish authors wrote about that subject. After reading Teuvo Peltoniemi's[7] book Kohti parempaa maailmaa (Towards a better world), and his texts about Finnish migration towards Canada and United States of America[8], it was possible to understand that Penedo was not alone as a utopian experiment among Finnish migration. There were some other important colonies based on utopian ideals, and the most important were Sointula, in Canada, founded in 1900 and Colonia Finlandesa, in Argentina, founded in 1906.

Finnish migration to Americas was also studied by Olavi Koivukangas[9], Reino Kero[10], Olavi Lähtenmäki[11] and Eevaleena Melkas[12], and included Penedo, as a part of Finnish rediscovery of its history.

Although Finns preferred North America as a migration place, Koivukangas[13] says that Finnish experiences in Latin America had been special

> The peculiar background of each colonial enterprise makes the Finnish emigration to Latin America unique and interesting. Every enterprise had its own uniting idealistic goals, which placed these colonies apart from the general and spontaneous mass emigration to North America.

Harvey[14] points the importance of discussing the utopian experiments' history, where the dialectic question of authoritarianism and freedom of thinking, present in those real utopias materialized can be clearly seen. Lefébvre[15] says that a u-topia is everywhere, and nowhere, and it is important because represents an element that cannot be forgotten in urbanism.

To study Penedo, beyond those authors concerned about Finnish migration, it was important to understand the concept of urban utopia, as it appears in Choay's[16], thesis about More's concept[17]. Studying the utopian socialists' ideas was also useful to understand those influences on Penedo and its founders. Some utopians, as Owen and Fourier were especially important, and their ideals possibly have influenced Penedo's creators in Finland[18].

Another way to understand Penedo was the study of American utopian colonies, and how they had been implanted. Reps[19] tells how many North American cities were planned with those ideals, seeking some kind of utopia. Places founded by religious groups, based on religious concepts of heaven on earth, and other more rational, with

non religious ideals. Sorkin[20] tells about the importance of those utopian experiments for the development of urbanism, talking about some American examples and its influence to "develop the atmosphere of renovation and changing, with consequences over urbanism".

Some pioneers in Penedo wrote their memories, books and diaries[21], and other Finnish descendants, as Alva Fagerlande[22], had works about its history, but generally about local families' history. As this study is about Penedo's urban history, its Housing Project was the best way to understand the place. Even without a physical map or any kind of designed plan, it was a text with 20 items describing what should be used in the urban structure of the colony, and many ways to develop it. It was important to study those items, showing what became real and also how it intended to be in its formal intentions. That helped to analyze the relation between public and private spaces, during the colony's first years.

Penedo's development was studied not as a simple project that was applied to one place, but how people used the created space, their personal history, and how that new space changed their lives, during those years. Studying a place and its inhabitant's history and memory is a way to rebuild their existence, and how we see them from our actual knowledge[23].

Finnish utopian colonies and the ideological grounds for the creation of Penedo

During the 18th century many Finnish went to the United States among Swedish emigrants, as Finland was part of the Swedish Kingdom[24]. This process continued during Russian domination, in the 19th century. At that moment Finland was a poor country, with hard climatic conditions, not much productive land for agriculture and no mineral resources. That encouraged part of its population to go to other places[25]. There was economical motivation for that process, and the United States and Canada were always receptive. There were many job opportunities, as mining activities, factories, railroad construction and land for agriculture[26].

Only after 1923 the United States began to restrict Finnish emigration, and Canada continued to admit immigrants[27]. Although there was a preference on North American countries, other places had their experiences, as Australia, Cuba, Paraguay, Dominican Republic, Argentina and Brazil.

Finnish migration movement had some particularities. Many of those experiences were created by people that wanted to transform the world, and founded what Peltoniemi called Finnish Utopian Colonies[28].

Those utopian experiences began in the 18th century, in Africa, and then continued in Russia and many American countries. The most important experiments were those of Sointula, in Canada and Colonia Finlandesa, in Argentina, and after that, the Brazilian utopian colony of Penedo[29].

Sointula was founded near Vancouver, Canada, in 1900. Martti Kurikka, the founder, was a socialist journalist, and he wanted the colony to be an experience with influence from socialism and anarchism. He was also a defender of feminism and equality of sexes. The colony wasn't successful, and after some years many of those ideals were abandoned[30].

Another important experience was Colonia Finlandesa, in Argentina. It was created in 1906, as a result of some political problems that occurred in Finland. Russia began a movement called russification in Finland, in the first years of the 19th century, reducing its autonomy. Arthur Thesleff guided many Finnish to Argentina, founding the colony near Brazilian boundary, in Misiones. Although it had a successful beginning, with many immigrants living there, after some years the experience ended[31].

After those experiments, there was during the 1920´s another flow of utopian colonies, called by Peltoniemi as a "tropical fever" in Finland. It was related to a search for tropical places and the application of vegetarian and naturalistic ideals[32]. Penedo in Brazil, Villa Alborado founded in Paraguay in 1920 and Viljavakka, created in Dominican Republic in 1929 were some examples[33].

America had nearly always been the place of European utopian dreams. Probably More's Utopia was related to the discovery of a new world, an open space for new experiments. During the first years of the 20th century there were in Europe many thoughts about the decline of the occidental society, especially caused by the war. Oswald Spengler influenced those ideas in Finland, where pessimism was disseminated after the World War I and 1917-1918 Finnish Civil War. These were a great motivation to abandon Europe and search a new world to live[34].

The ideas for the foundation of Penedo were the result of an existing movement in Finland, based on natural health treatments, vegetarianism, some Pentecostal religious movements and Toivo Uuskallio's own ideals[35]. There was a group interested in naturalistic ideals, grounded on some sanatoriums where those methods were applied, and newspapers and reviews publicizing those ideas. That group was also part of the Christian Socialist movement in Finland, from where Uuskallio departed to Brazil, in 1927, trying to make his ideas come true. The naturalist movement was connected to the Finnish Vegetarian Society (Suomen Vegetarien Yhdistys), with great influence from the German movement, and intended to establish a sanatorium in Penedo, using its methods of natural health, sauna and a radical vegetarian alimentation[36]. Uuskallio also had contact with friends of Matti Kurikka, founder of Sointula, and he also knew about the Argentinean experience of Colonia Finlandesa.

The idea of creation of Penedo was closer to American utopian experiments, described by Reps, than to Howard's Garden City movement. Although a vegetarian community seemed like a garden city, in its formal situation, the original ground is different. Uuskallio and his followers were radically against any cultural situation, and wanted to transform society, returning to a natural world.

Uuskallio thought God had created men to live in warmer places, not in cold places like Finland, and the tropics were the best choice to build a new society, far from wars, with an appropriate alimentation, where men and God would be together, and closer to nature, and Brazil was a good place for this new society.

How they came to Brazil and chose Fazenda Penedo

Brazil was the destination chosen by Uuskallio, and during 1927 the initial pioneer group of five Finns arrived in Rio de Janeiro. Their aim was to find a farm where they could develop their project. They finally found Fazenda Penedo, an ancient coffee plantation, ruined at that moment, near the Itatiaia Mountains, and not so far from Rio de Janeiro. There were some German and Italian colonies on the region, what seemed to have helped the choice. But the presence of mountains, with forests and rivers, and the view of the mountain chain behind the farm was very impressive. The natural conditions and the possibility of access, with a close railway station were the main cause for Uuskallio's choice.

Uuskallio's arrival to Brazil was described in his book, "Matkalla kohti tropiikin taikaa" [37] whose title showed his ideas. The purchase of the farm was done with contribution from a movement called "Friends of Penedo" that organized all proceedings in Finland to help the project. Pastor H.D.Pennanen was the representative of the group, and after coming to visit Penedo, he wrote a book "Suomalainen maanviljestelystila Brasiliassa"[38] as part of advertising campaign to divulge the enterprise. That included a formulary, to be filled by people interested on the community project. Analyzing this document can be seen how people were chosen to go to Brazil, know their financial, spiritual, educational, familiar and ideological situation. That was important because the major support to the project was the group of "Friends of Penedo", with small help from Finnish or Brazilian governments[39].

The development of the colony

The communal experience began when the first group arrived to live together, in the ancient farm main house, the only construction with conditions to house all those people. At the first year, 1929, at least 100 people came to Penedo and many of them soon returned to Finland. The residence was the center of the community, a place where they could sleep, eat together in a big room, and cook in a communal kitchen[40]. Equalitarianism was very important in Penedo, and all decisions were collective, according to the ideals proposed in the Project. There should be no social differences, and everything was equally discussed, work being divided the same way. Nobody could be obliged to do anything, but should work for the community welfare. Side by side with many Finnish traditions, the utopian ideals were part of Penedo daily life.

Everything had to be done in Fazenda Penedo. Opening roads, beginning the agricultural activities and building new houses were the main activities at the first year, to establish the new society in the tropics. Initially agriculture was destined to subsistence, but later orange trees were the main product in Penedo. It was what

supported the colony until war years, when a process of end of production was a great problem for the local economy[41].

Uuskallio's housing project

The planning of the colony was directly linked to Uuskallio's ideals, especially to what was in his Housing Project, written in 1929[42]. This project would be followed as an initial regulation, even if there was no map or physical plan for it, with any kind of designed lots. Reading its items is possible to understand how the colony should be developed, and the urban occupation intentions.

The project proposed the division of the farm in 250 lots, each one with 14 hectares, being 2 hectares of flat land and 12 staying covered by forest, with indicated roads and infrastructure to be built and collectively maintained[43]. Uuskallio thought that was the ideal size for each lot, because by his calculus, this piece of land could produce sufficient food to feed one family[44].

Nature was a major priority to Uuskallio, according not only to his vegetarian aims, but also to his worry about the pollution of the rivers and the preservation of the forest. Another important item related to the urban process was his intention to construct a straight road directly from the old house of the farm, its most important center, towards the Railway Station, close to Paraíba River, the main access to the property. There was an ancient small non paved road, used by carriages and oxcarts during the colonial ages, and very difficult for cars to use, because it was crossing many hills. That new straight road was a mark in Penedo's life, even without being completed and still is the main road of the town, the Avenida das Mangueiras.

The first houses

During the communal period, from 1929 till 1942, there were constructed four houses[45]. They were built also as an image of the colony itself, showing how Penedo was intended to be in the future, according to Uuskallio's plans.

Those houses were planned to be similar one to each other. They seemed to be model houses, a way to show how men in the new society would be equal one to another. Even the occupation of the houses was completely unusual. Many times their first owners traveled, and other people were allowed to live in the new building. This is different from traditional occupation, where one property is individual, and in this case, it was quite collective. In an urban way, the houses weren't close to each other. As a vegetarian community, the original project was to live and work in the same lot, so houses should necessarily be far from each other[46].

The new houses, abandoning the initial model

Building four residences was not enough to house all the people that still lived in the communitarian residence. Everyone wanted a new house, and some people decided to

build their own houses. There was no money to have brick houses for everybody, as it was Uuskallios's plans, so many houses were built in a simpler method, using materials like wood or bamboo, according to some ancient local traditions. That was how Penedo grew, following an informal disposition of many pioneers, and no longer obeying Uuskallio project[47]. This moment showed how the tied plans were obliged to change, as people's needs' forced it. In certain way, the original plan, thought by one person, had to change in favor of all community's needs. Utopia should follow men's lives, and not the opposite. As there was no external government except their own, people had to decide how to live, how to occupy land and how to build their houses. Uuskallio's opinion was very important, but people could find how to occupy the farm, even out of Uuskallios' "official" project. Utopia could restrain occupation, but real life was a major force towards the formation of a real village.

Social and cultural activities: Public and collective spaces

The center of the colony was the old main house. There happened all kind of social meetings, it was where the colony choir rehearsed, there took place many religious happenings and in the eating room people had their meals.

The patio in front of the old house was the place where many other communal events took place. Many photographs show people in wedding parties, departure parties, gymnastics, and there was the first dancing balls, with traditional Finnish music, that was later transferred to the inner room. On that place, used as a communal square, many photos were taken to show how life was in Penedo[48].

The end of the utopian dream: selling the farm

Uuskallio bought the farm and did not divide the lots, legally. He said his intention was to pay fewer taxes, but in a certain way his idea was that land was not to be a property of a man, but God's gift, and men should use it properly.

In 1935, many investors were not satisfied with the colony situation. Some got money from Uuskallio to buy properties near Penedo, and others went to Rio and São Paulo. A group called Kaleva obtained their lots with the interference of the Finnish Legation in Rio de Janeiro, and that was the beginning of the utopian experiment's end. As land was divided, there was possible to sell it, and the collective farm's idea finished soon. Even though, many activities continued to be collective, as the group of chicken producers that was later the origin of the local association, Clube Finlândia, founded in 1943[49].

The colony's economical situation was difficult, and Uuskallio had to sell the property. Finally, in 1942, a Swiss group, Plamed, bought part of the farm, to produce medicinal plants, employing a group of Finnish workers. Some pioneers had to leave their land and houses, but they could get money to rebuild their houses on other lots. Many residences were like small inns, and touristical reception activity could be increased, giving birth to Penedo's new main activity, tourism. That old utopian colony was then an attraction, with Finnish dances in Clube Finlândia, offering their traditional food, handicraft, and nature, especially the mountains and rivers[50].

Although Penedo's housing project was part of a movement organized in Finland, it was almost a man's ideals project, Toivo Uuskallio. Even being a place for communal life, it was directly under his command, even when questions were decided collectively, his influence was evident, and his ideas were generally followed.

Penedo's urban planning cannot be considered public, as there was no governmental interference, but the idea of being private seems something more commercial than collective, and it was not the point. Community had all means to decide how to live and to organize spaces, even if, in practical case, quite everything was decided by Uuskallio. It was a private enterprise, but it was not a commercial one. This position, being at the same time private and collective, without being commercial, was the most important thing in Penedo, and also what caused its major problems. This position, of being at the same time participative and communitarian, was very important for the community. Urban regulation was based on its ideological proposition, as a vegetarian and equalitarian community. The only accepted urban laws were the internal ones. Where to build a house or to open a road, everything was decided internally, by the group, following generally Uuskallios ideas, at first, and later were following their real needs.

At 1942, when the utopian colony ended, part of the farm became a private property, owned by an industry, and others lots were divided for many Finnish families. On this period Penedo was transformed into a traditional village, with public streets and private lots, and lost definitely its main characteristics as a utopian place, becoming part of the common world, ruled by municipal laws, as a common village.

Conclusion

Penedo was the result of a project formulated in a moment of great changes in urbanism, when new models were developed, but this Finnish Colony seemed to go in a different direction, being a space that privileged not industry or cars, but simplicity and natural life.

Although it could be compared to Howard's Garden-City, and its return to nature, Penedo is much more similar to those American utopian experiments, where freedom was apparently the most important point. That was the main concern in Penedo, but freedom not only of religion, but also in their common and daily lives. Being a vegetarian community reflected not only ideals of changing, from an Old Europe to a New World in tropics, but also a millenarian trial to go back to human origins, reaching God trough natural life,

There was in Uuskallio's Project an intention to maintain the natural environment, preserving the rivers, forests and those activities so-called naturalistic, as the health treatments. Uuskallio was also worried about urban density, against big cities and everything related to "civilized" places. For him, men should live and work in its small part of land, not destroying nature and trying to solve his problems together with other

people, in communitarian societies. That seemed to be freedom as it was idealized by Uuskallio and people who followed him to Brazil.

At the beginning, the settlement followed Uuskallio and his project, very detailed concerning social life and how people's behavior should be. It was a private plan, followed by all the community, without any governmental interference. Penedo's urban planning, based on its straight road, a direct line from the ancient residence and the railway station, was an emblematic form to ordeal all the community, and show a direction. Uuskallio probably tried to organize the urban site, following one of the most traditional organizing forms, to form a community where people were equal and organized. Although that, nature was stronger and in some places the river could not be transposed, and the straight line had to turn into a curve, especially where there was a valley, and the road should follow the river.

The Housing Project had the residences within its most important plans. How and where they should be built, following a predetermined model, is another testimony of how people should be treated equally in the colony. As a vegetarian enterprise, people would not have cattle or other animals, so there should not be fences between houses and plantations. That was another symbolic idea to reinforce the sense of communion, without fences dividing people and their lives.

Another influence on the landscape of the vegetarian choice was the growth of many trees, especially fruit trees, which transformed the farm, from a desert land to a green area, full of trees, with the return of birds and other animals. That was fundamental to transform the old colony into a new touristic area, where people could stay on small inns, hosted by Finnish old pioneers, and having many attractions as Finnish balls to go and handicraft to buy.

Penedo should be a private community, without any governmental help, aided only by idealistic vegetarian friends, and also its own production and work. Everything inside the community should be organized and decided by them, including the building of houses or roads. That was important for the community, showing how freedom could be lived, and how they could live without any State interference. Anyway, as economical situation couldn't support the colony's life, it ended, and that collective urban and social experience finished in 1942. Then it was transformed into a part of a traditional town, and nowadays is part of Itatiaia, and is ruled by all urban laws of a traditional village.

For many years the self regulation and government of the colony was successful, to maintain many of its characteristics, especially concerning ecological positions. As it was transformed into a traditional village, all ideological points were abandoned, and commercial interests began to rule the place.

Utopia main idea was to be no place and also the best place, and Penedo was another example of how Utopia should stay on our minds, when thinking about urbanism. Authors as Harvey, Reps and Sorkin wrote that those utopian ideals should be an

alternative way for cities; in a world where people don't care anymore about each other's welfare.

[1] Uuskallio's occupation in Finnish is called puutarha arkitekti, many times translated as gardener. That occurs in Melkas's book (Melkas, Eevaleena. Kaikkoavat paratiisit: Suomalaisten siirtokuntien aatteellinen tausta ja perustamisvaiheet Brasiliassa ja Dominikaanisessa tasavallassa n. 1925 – 1932. Turku, Finland: Sirtolaisuusinstitutti, 1999; in Lähteenmäki's (Lähteenmäki, Olavi, 1979), and was used by Fagerlande and Valtonen. Apparently it is not the best translation, though Uuskallio was not a simple gardener, but someone occupied in the agricultural planning. Should be garden architect, but not in an aesthetic way, but directly close to agricultural production.

"Reurbanizacion de el Silencio" and "Urbanization Altamira": public and private planning, building the city of Caracas"

Rafael Enrique Martínez Bellorín
Universidad Simón Bolívar, Venezuela

> *"… given a clear vision of a "design idea," the multiplicity of wills that constitutes our contemporary democratic process can coalesce into positive, unified action on a scale large enough to change the character of a city."*
> *Edmund N. Bacon (1967)*

In the city of Caracas, there are several iconic examples of Urban Planning developed by the public and private sectors. Among them, two of the most successful are LA REURBANIZACION DE EL SILENCIO and LA URBANIZACION ALTAMIRA. Both are example of completely different urban models, but eventually evolved into areas of large urban vitality, their spatiality and urban image are paradigm of good contemporary city. A product of clear vision of a "design idea" referred by Bacon.

La reurbanizacion de el silencio:

LA REURBANIZACION DE EL SILENCIO or THE REDEVELOPMENT OF EL SILENCIO is a project of urban renewal developed in 1944 by the Banco Obrero[1]. It is located just south of the foundational grid of Caracas[2], eastern of the hill of El Calvario.

The City of Caracas

Caracas was founded in 1567[3] by a group of 136 Spaniards under the command of Diego de Losada. The city was formed by a group of 24 squared blocks[4], grouped around a Plaza Mayor (Main Square), as it can be seen in the "Plan of Caracas" drawn in 1578 by Governor and Captain General of the province of Venezuela, Juan de Pimentel. It was located in the far west of a long and narrow valley, near the route to the Caribbean Sea, as explained by González[5].

Streets forming a squared grid, having all the streets the same width and hierarchy, characterized the urban structure of the foundational site and its surroundings. In terms of building typology, the buildings where generally organized around a courtyard, most of them were only one story tall.

Caracas' urban growth was very slow until the first three decades of the 20th Century, caused mostly by a poor economy, epidemics, earthquakes and war. By 1920 the population was about 100.000 inhabitants as explained by Morales et al[6], and city limits were just blocks around, from the foundational grid.

Rotival's Monumental Plan

LA REURBANIZACION DE EL SILENCIO was the result of a relatively complex

planning process that began in 1938 when the Government of the Federal District of Caracas, created the *Dirección de Urbanismo* (DU, Direction of Town Planning), its mission was to produce with the help of foreign advisors the *Plan Maestro* (Master Plan) for the city. Caracas' Governor Elbano Mibelli, hired Maurice Rotival[7] as one of the advisor for the plan. After several months of work, collaborating with the local counterparts, the so-called Plan Monumental (Monumental Plan) was presented to the Municipal Council in 1939 and approved in 1940. As affirmed by Almandoz[8], the Monumental Plan would not only change the image of the city, and create monumental public spaces, but address fundamental urban problems[9], giving it the potential to play a principal role among the tropical cities. The Plan described this in grandiose terms[10]:

> The great City, with its lovely boulevards, parks, theatres, clubs, etc. The outskirts with the beautiful garden-cities and theirs sports clubs linked to the city through comfortable and beautiful arteries for rapid circulation.

In terms of urban design, the plan had a very detailed proposal focused on giving the city a "monumentality" that was not present in the original colonial and republican city grid, as stated by María Fernanda Jaua[11].

The central "spine" of the spatial proposal was the Monumental Avenue or Central Avenue[12], flanked by two parallel avenues. This avenue begins beside the hill of El Calvario[13] in the Plaza Monumental (Monumental Square)[14] space that serves as an articulator with the Avenida Sucre, which runs to the northwest, and with the Avenida San Martín that runs to the southwest.

The Plan proposed to place in the hill of El Calvario Simon Bolívar's cenotaph[15] , across the square would be the location for the new National Capitol. The Central Avenue extends to the east, three blocks away appears a space named Plaza Comercial (Commercial Square), it is presided by a church. This space articulates with a pedestrian system that runs in the middle of two blocks, heading north to the Plaza Bolívar[16]. The Central or Monumental Avenue continues to the east, defined by low rise "L' or "U" shaped buildings for government use. The avenue would end in the Plaza Elíptica (Elliptical Square), placed diagonally to the "Nuevo Circo" (bullfight venue). From this space in the same fashion as in French "rond-points" diverted two diagonal avenues that were meant to distribute vehicular traffic. The Plan proposed to continue the Monumental Avenue to the East, ending in the Parque Los Caobos[17], located in the border of the city.

Roche's plan

It is very important to state that Rotival's proposal was not an entirely original idea. Various authors refer that in 1936 Luis Roche[18] unveiled a "Plan for the improvement and embellishment of Caracas". As Ciro Caraballo[19] remarks, that plan argumented: *" Caracas is and will be a big town until at least one of its streets is widened, this will let it be called a city."* Roche's plan proposed to create a 26 meters wide[20] and 3750 meters long avenue running from west to east. The plan not only took in consideration solving

the traffic problem and improving the city's image, but addressed the sanitary problems and established the legal procedures for its implementation. Regarding this Plan, Gonzalez[21] says that the 36 meter avenue was inspired by those of the Champs Elysées, and that it would continue on toward the suburbs along the Carretera del Este (East Road), inspired by Broadway. Almandoz[22] refers that Roche's avenue would be named Avenida Simón Bolívar[23] and that it would finish in the west end with a monument dedicated to Bolívar[24].

The competition

In 1939 President Isaías Medina Angarita considered that the economical[25] and political conditions reigning at that time were not adequate for developing a project like the Monumental Square, Bolívar's Cenotaph and the Capitol, and it would be considered unnecessary or sumptuous.

Later en 1942, he considered instead, that would be better to develop in that place a public housing project aimed for the working class. As referred by Ricardo de Sola[26] Medina gave instructions to the Directors of the Banco Obrero to open an architectural competition between the architects Carlos Guinand Sandoz[27] and Carlos Raúl Villanueva[28].

Villanueva, whose proposal took into consideration most of the points included in the program, won the architectural competition for the REURBANIZACION DEL SILENCIO.

By the time the competition took place, the sector called EL SILENCIO (THE SILENCE) was a very poor and unhealthful slum, plagued with bars and brothels. Its origin dates to 1658, and its name was due to an epidemic that hit the city of Caracas, and this sector was one of the most affected. Ricardo[29] quotes the Municipal Council's records: "In the slum located west of the Caroata stream, where the epidemic started, it can only be heard the silence, a deep silence".

Villanueva's winning proposal consisted in seven mixed use (residence and commercial) closed blocks multifamily buildings, using a neo - vernacular style[30], that recovered the taste for local tradition after years of French inspired copies, as its recalled by Almandoz[31]. The ornamentation was in the form of moldings, elaborated frontispieces[32], balconies and columns. The buildings are four stories tall except the "Bloque 1[33]" that has seven stories. The perimeter of the buildings in the ground level is surrounded by a colonnade that protects the commercial shops located inside. In the center of each building block, there is a courtyard (semi-private space) for recreational and ventilation-illumination purposes.

In the middle of the composition formed by the seven blocks is located the Plaza O'Leary (formerly Plaza Urdaneta)[34], emblematic space from the city center[35], home of the political demonstrations of the sixties and seventies. This space serves as a culmination for the Avenida Bolivar[36] and articulates it with the Avenida Sucre and Avenida San Martín.

In the center of the square, there are two symmetrical fountains[37] by the famous sculptor Francisco Narváez[38], named "Las Toninas". Each fountain has an sculptural group formed by four female naked figures. The composition is very fluid and poetic, sensations enhanced by the rhythmic play of the falling water.

From the date of it inauguration on July 5[Th] 1944, LA REURBANIZACION DE EL SILENCIO has received mixed critics and comments. Very particular were Rotival's opinions: In one accasion he praised the proportions, order, and scale of the square. Later in a 1977's interview he said: "unfortunately during war, my friend Villanueva did not wait for me and built the square where the buildings are, I did not agree with that square", both referred by Juan José Martín[39]. Rotival later suggested that the scale of the buildings that would be located in front of EL SILENCIO could be increased, implying that the new buildings would "cover" or "hide" those of EL SILENCIO, in the perspective of the Avenida Bolívar.

Uslar Pietri[40] cited by Ricardo[41] said:

> "…Since the REURBANIZACION DEL SILENCIO there has been a restoration of the forgotten concepts of what architecture should be. Its dues to the people, the climate and the good taste. Villanueva's building blocks relates to the present in what is necessary and alive from the past".

Almandoz[42] refers that EL SILENCIO is not only an important success in Medina's administration, but a milestone towards a new structure and dynamic in metropolitan Caracas, setting an example to other Latin-American cities.

Gasparini and Posani[43] say that EL SILENCIO produces the first important change in the city in terms of urban design, since Guzman Blanco's public works program; and plays a premium role in the city's "drama". They outline also the relevance of the solution: the inner courtyards and their sense of security, the peripheral commercial gallery with its collonade and its hectic dynamics, the fluid motor traffic.

Silvia Hernández de Lasala[44] affirms that EL SILENCIO among other urban interventions executed over the Avenida Bolívar, violates concepts, principles and ideas included in Rotival's Monumental Plan: the scale of the Monumental Square and the buildings around it, the change in the building's program (from government related to residential), the use of a neo-vernacular style. The aspect she criticized most and was labeled as an irreparable lost, was the fact that the building named "Bloque 1" denied the access and visuals to the EL CALVARIO hill, one of the most important landmarks of the city.

EL SILENCIO has been very successful among its dwellers and all Caracas' inhabitants that have had the opportunity to walk through its spaces. It has assumed with integrity all the changes in the urban dynamics of its surroundings. Over the time it has become one of the most important landmarks of the city and place with an urban image and identity praised by everyone. Both the square, and the building blocks around it, had not

suffered major changes over time, keeping its original scale and character, that have developed a very strong sense of place.

Some of the reasons of the success and values of LA REURBANIZACION EL SILENCIO may be a debt to Rotival's Monumental Plan: the understanding of the geographical scale, the spatial layout, the road plan that integrates the city, etc. Undoubtedly the main reason is the mastery in which Villanueva envisioned the complex, using the guidelines established in 1939's plan, the volumetrical, typological and spatial solutions, the rational design of the apartments, the use of an architectural style that relates with Caracas' Spanish heritage.

La urbanizacion Altamira:

The URBANIZACIÓN ALTAMIRA (ALTAMIRA SUBDIVISION) is a private land development, built-up in 1943 by private investors led by Luis Roche, in Eastern Caracas on properties that until that moment were used for agriculture[45].

The urbanization process:

Since the 1910's the presence of the car allowed Caracas' middle and upper class families to have a getaway in a "casa de campo"[46] (country house) located in the nearby eastern towns, while they kept their "town houses" in the city.

Later in the 1920's Venezuela was in one of the most important turning points from its history, shifting from an agriculture based rural society into an oil and industrial based, urban modern society. The growing economy caused the migration from the country to the cities, were oil profits were being invested in the form of hospitals, schools, housing and roads. This phenomenon did not happen in Caracas, since it was not the setting for the political power at that time, because it was moved to Maracay by president Juan Vicente Gómez[47]. Caracas' urban growth continued being slow. In this decade a decree that permitted the urbanization in the lands along the Carretera del Este (Eastern Road) was emitted. This encouraged private developers such as Luis Roche, Santiago Al fonzo Rivas and Juan Bernardo Arismendi to develop "Urbanizaciones" like Maripérez, La Florida, La Campiña, El Recreo, El Country Club, Campo Alegre, Los Palos Grandes, among others.

In the 1930's after Gómez death[48], political power returned to Caracas, and the centralization and the concentration of activities in the capital continued[49]. Urban growth in agricultural lands located East exploded during this years, and by 1936[50] Caracas' eastern valley was a sort of "patchwork" formed by urban developments[51] of different sizes and form[52], and sugarcane or coffee plantations. Here was no connection other than the "Carretera del Este" between these urban developments; there was no commitment to structure the city. This rapid growth made evident the necessity of an urban plan for the modern city that was later developed by Rotival and others.

Inserted in this process, in 1944 La Urbanización Altamira was developed by Luis

Roche in the lands that were before the Hacienda El Paraíso (Paradise Plantation).

Land developing, envisioning the city:

In 1943 Luis Roche bought the lands of Hacienda El Paraíso from Ana Cecilia Branger and Teresa Zaragoza as it is referred by Alvarez[53]. Hacienda El Paraíso had an extension of approximately 110 hectares, and was crossed by four streams that descended from the Cerro El Avila (Avila Mountain) towards El Río Guaire (Guaire River) : Pajaritos, Lambedero, Quebrada Seca y Quintero. Later in 1944 Roche creates a land developing company called "Altamira C.A." This same year he introduces the documents in the municipality in order to get the approval to develop "Urbanización Altamira".

The urban structure proposed was conformed mainly by a central square called Plaza Altamira[54] located over the "Carretera del Este"[55], this was a monumental entrance to the new development. From this elongated square, diverted two straight lined main avenues[56] that connected it with the "Cerro El Avila"[57], the rest of the avenues and streets were curved[58]. Building typology consisted in multi-family housing[59], located around the square and over Avenida Francisco de Miranda and part of the two main avenues; the rest were single-family houses[60]. The infrastructure and urban spaces were built by Roche's land developing company, the buildings were developed later, by various private developers and builders.

The "Plaza Altamira"[61] is undoubtedly in iconic terms the most important element from the development. From its beginnings, it was well decorated and illuminated, with a colorful landscaping dominated by red and yellow flowered "Capachos" [62]. In its center, reinforcing the perpendicular axis to "Carretera del Este" there is a reflecting pool with color changing lights and a superb obelisk[63] that evidences the formal articulation of the square and the two diverging avenues. The square's landscape has the magnificent view of "Cerro El Avila" as a backdrop. The square was used as a mean to promote the selling of the lots, in that direction, the space was used as the scene where musicians and other artists performed[64].

One important aspect related to "Urbanización Altamira" planning, was the idea that Roche unveiled in 1948 along with Antonio Rangel Báez, Alfredo Brandt, Alejandro Horn and Armando Sosa. The proposal was to link his new real estate development with the sea through a tunnel that would cross the El Avila mountain[65]. Preliminary studies were made, specifying technical solutions and costs. The project would be financed by the selling of bonds by Roche's company, and by the future operation of tolls.

Changes in time:

Both "Plaza Altamira" and its surroundings have suffered large changes over time, evolving from an almost suburban settlement into a vigorous urban centrality.

The first major change suffered by "Urbanización Altamira" was due to the construction

of the "Avenida Francisco de Miranda"[66] over the route of the "Carretera del Este". The buildings over this avenue had an absolutely commercial character.

Then important changes occurred over the two main avenues when in the late sixties the "Avenida Cota Mil" or "Avenida Boyaca" was built, running along the city over "Cerro Avila's" base. As these avenues connected metropolitan ways like "Cota Mil" and "Avenida Francisco de Miranda" their suburban character changed, with building typologies changing from single family houses to multi-family buildings.

In the early 1980's a massive transportation system arrived to Altamira's heart "Plaza Altamira", now "Plaza Francia", Caracas' Metro built one station under the square. This changed the sector's urban dynamic completely, giving it a definitely metropolitan character. Later in the decade, a new local administration gave "Altamira" and other sectors in Chacao[67] a new urban image: cleanliness, safe, well maintained, making "Plaza Altamira" one of the most successful urban spaces of contemporary Caracas.

Conclusion:

Both cases analyzed had their origins in very different processes, one of inserted in a complex process of urban planning, the other in an real state development operation.

Although "El Silencio" and "Altamira", have been executed almost simultaneously, they represent totally different urban models, the first a more traditional city model: closed block with courtyard. The second more representative of modernity, inspired by the "Garden City ".

Both examples derived from the understanding of city's region, geography and urban dynamics and urbanization process. Consequently the proposals envisioned Caracas' metropolitan scale and character.

"El Silencio" remained through time almost unchanged and "Altamira" have suffered large variations over time, evolving from an almost suburban settlement into a vigorous urban centrality, but its main structure remained unchanged[68].

Both examples are within their differences and similarities, important elements in the shaping of rich and diverse contemporary Caracas. They embody what Bacon referred to when he said: …*given a clear vision of a "design idea…"*

Comparative planning history of Japan, Taiwan and Korea: challenges from 'Machizukuri' or community building

Shun-ichi J. Watanabe
Tokyo University of Science, Japan

1. Introduction

A kind of social technology that can be named 'urban planning' has probably existed in many parts of the world since recorded history. Yet the urban planning that we are now involved in is a planning system of an extremely special style. It is 'modern western urban planning,' which emerged from the late 19th century to the early 20th century in Western Europe and North America, following Industrial Revolution. It is a social technology that created and protected a good physical environment in the suburbia of large industrial cities and was mainly developed and supported by the emerging middle class who settled there.

The concept of the Garden City had a big influence on the development of modern western urban planning. The Garden City was proposed as an answer to the problem of growing large cities by an English citizen named Ebenezer Howard. He presented his idea in his famous book published in 1898, *Tomorrow: A Peaceful Path to Real Reform*. Thus Howard became a powerful source of an intellectual tradition to discuss how the city should be. He also started a tradition of practice that 'a citizen makes the city.' In fact, he established an organization roughly corresponding to the present-day non-profit organization (hereafter, 'NPO'), which actually built the first Garden City of Letchworth in London suburbs in 1903. There, a Garden City that was full of greenery with a small scale, low density and unmixed land use development enchanted people and professionals, presenting an powerful urban image of modern western urban planning.

In the early 20th century, the practice of modern planning gradually moved from citizens' hands to that of the government which had far greater authority, capital, and expertise. Urban planning was legally institutionalized as an important element of public services that the government provides. Then, it became spread all over the world beyond Western Europe and North America. In this process, Japan was probably the first country in East Asia that accepted modern urban planning in full scale. Therefore, historical development of modern urban planning of East Asia starts first from the story of Japan.

The late 19th and early 20th centuries were an age of imperialism of powers. Within that time frame, the Japanese Empire began the invasion to surrounding countries by the Sino-Japanese War (1894-5) and Russo-Japanese War (1904-5). In around 1943, the colonies and occupied territories of the Empire at its heyday covered such wide regions as: part of the Aleutian Islands (U.S.A.) to the east; South Sakhalin, 'Manchuria', Kwantung Leased Territory, Korea and part of China to the north and northwest; Thailand and Burma to the west; and Taiwan, Dutch East Indies (present Indonesia) and many islands in the west Pacific to the south. In 1945, the Japanese Empire

collapsed as the result of the war defeat. The colonies and occupied areas were liberated, and became eventually independent.

In the prewar Taiwan and Korea, the Government-General was respectively set up, which introduced the Japanese planning system to its colonial territory. After the war, newly independent governments there succeeded the former colonial planning system. In the prewar days, the Japanese planning system was also planted in 'Manchuria' and some other areas under the Japanese control but, in the postwar days, the respective governments replaced it with their own planning system. So it may be said that only Taiwan and Korea have experienced the historical evolution of modern planning from the original Japanese colonial system to their own present system.

In the following, I will discuss the historical spread of modern urban planning in East Asia from the standpoint of comparative planning research. There I will see it in terms of the spread from Europe and America to Japan, and then the spread from Japan to Taiwan and Korea. What actually was the total process? How did the character of planning systems change in the process? How can we understand the present problem of each planning system in this historical context? What can we learn as for future perspectives? These are the questions to be answered in this paper.

2. Tokyo Urban Improvement Act of 1888

The first Japanese planning law was the Tokyo Urban Improvement Act, which was enacted in 1888 in order to remodel the premodern castle town of Edo into the modern capital Tokyo just like the Haussmann's Paris. The planning style of Urban Improvement was, in fact, an older one than modern planning as it aimed mainly at building such urban infrastructures as streets and parks in the already urbanized area, not aiming at planning and controlling the urbanizing area as a whole.

The act was applicable only to Tokyo, the capital of the rising Japanese Empire, where the Urban Improvement Program lasted for the following 30 years or so. The result was a considerable change in the physical appearance of the capital's core area. Narrow streets were paved and widened straight; sidewalks were provided with trees. People, with surprise and pleasure, welcomed devices of civilization such as gas lamps and horse cars of the street. Tokyo became a brilliant window to the Western civilization, for which Urban Improvement works provided physical and even psychological infrastructures.

If we look back from now, however, we can say that Urban Improvement was rather urban 'engineering' works, which built urban infrastructure after the area is already built up, than urban 'planning,' which tries to plan, build and maintain the urban area as a whole before it is actually built up. In a word, Urban Improvement was almost street construction works. The decision for individual works was made mostly by the Home Ministry bureaucrats on the project by project basis. There was not a long-term comprehensive vision or policy, which can be expressed in the form of the master plan

although there was a map that showed the kind and location of all the designated Urban Improvement projects.

In short, it should be noted that Urban Improvement has embedded three clear characters into the Japanese planning system of the following years. First is the main function of urban planning as the infrastructure construction rather than the provision of good living environment. Second is the main method of planning as the making of individual decisions based on the piecemeal basis rather than based upon the master plan. Third is the basic system of planning as a centralized and bureaucrat-leading style of planning rather than a decentralized and people-participating style. All these characters, with some later changes, dominated the later Japanese planning system for nearly a century and, as we see in the following chapters, are the points against which 'Machizukuri' or community building movements are challenging in recent years.

3. City Planning Act of 1919

After the World War I, the development of industry and urbanization caused the population concentration to Tokyo and other large cities which suffered from serious social and urban problems. Then, the government, learning from the technique of modern western urban planning, enacted the nation's first City Planning Act of 1919 (hereafter, 'the 1919 Act'). This law was to be applied first to the six largest cities and then to smaller cities all over the country.

The 1919 Act inherited the basic philosophy and structure from the Tokyo Urban Improvement Act. It was the Home Ministry bureaucrats who took charge of this new administrative field of urban planning. Urban planning was basically assumed as the job of the central government, not that of the municipality; the former was to decide almost all planning matters and the latter was simply to enforce them. This was typically a highly centralized bureaucratic planning system and there was no legal provision for people's participation.

The 1919 Act was a real modern planning system in that it aimed at the control of the whole urbanizing area with a variety of planning tools. As for the construction program, the act institutionalized the Land Readjustment Program of the German origin mainly for suburban development in addition to the infrastructure construction of the existing Urban Improvement program. As for the land use control tool, the act institutionalized the Zoning system of the American origin for the first time in Japan.

The implementation of the 1919 Act revealed, however, that the planning system did not work as was designed. Land use controls were weakened by politically strong landowners, who wanted to use their own land at their own desire, not under strong public control. The construction programs did not progress much due to the insufficient fiscal resources of the government. In short, the planning practice in the prewar Japan was characterized as 'weak planning powers.'

It became the 'planner's dream' to plan in advance and to build the urban area fully equipped with infrastructures, which needed 'strong planning powers.' This dream did not come true in the Japanese homeland for long but did come true in her colonies abroad in the later years, which will be discussed below.

4. City Planning Act of 1968

The 1919 Act, which lasted for nearly half a century until the postwar days, was drastically amended to the City Planning Act of 1968 (hereafter, 'the 1968 Act'). This act, after going through numerous amendments since then, is the current legislation for urban planning in Japan.

In the 1960s, the nation's rapid economic growth started, which brought about a rich fiscal situation to the government. Now, a huge amount of public money poured into the construction of such regional infrastructure as expressways and Shinkansen (Bullet Train), and of such urban infrastructure as street and sewage systems. Various agencies of the central government supplied generous subsidies to local governments but there was little coordination among national agencies and within local governments themselves. Local governments were too busy to carry out big construction projects one after another; they hardly had enough time and energy to discuss what is the desirable future image for their own community.

As the result, the more an individual infrastructure was built, the more the entire urban area became physically confused. In other ward, 'strong construction programs' went on under 'weak planning controls.' However, this system with the concentration of resources and powers in the hand of central government bureaucrats, functioned very efficiently in building expressways, industrial estates, and so on and contributed to the rapid economic growth of that time.

As we have seen above, infrastructure provision has occupied the central place of the planning function and the planner's concern whole through the history of Japanese modern planning. This may be compared with the American case, where 'city planning' started as a kind of 'physical planning' but then gradually evolved into an important tool for controlling the space, finance and character of the local community mainly through comprehensive planning and land use controls. So 'planning' now occupies the central place in the administration and politics of the American community as the social technology of policy making for the people and community as a whole.

The Japanese planning system has had a rather different path of evolution. Once, the 1919 Act planning system was one of the most advanced ones in the world at that time. Since then, however, it has never evolved into a wider function of public services. It was concerned about the 'physical' condition of the city but it remained basically as urban 'engineering' works rather than even physical 'planning.' It is probably because the planning administration of the central government was mainly dominated by civil engineering bureaucrats who controlled abundant budget for subsidies for construction works especially in the postwar years.

The urban planning system never evolved into a 'non-physical' tool for the people's community life. In a word, the 1919 Act planning system has 'fossilized' for long, which was embedded even in the 1968 Act system, widening the gap between what people ask for urban planning and what it provides for them. Unless we understand this historical fact, we may not be able to understand the real nature of the challenges of Machizukuri to the current planning system.

Then, how did this sort of Japanese planning system spread to the colonies of Taiwan and Korea in the prewar days? And how it developed there in the postwar days? Now we will see these as follows.

5. Prewar urban planning systems in Taiwan

The colonization of Taiwan started in 1895. In Taipei, the Japanese government established the Taiwan Government-General, which introduced into Taiwan the Urban Improvement Program that had started only several years ago in the homeland. The urban planning administration was carried out mostly by Japanese bureaucrat planners who came from the Home Ministry and related agencies. Local Taiwanese bureaucrats were hardly able to take part in the decision making of the core planning matters.

At that time, Taipei was a small walled settlement that had been built by the Qing dynasty bureaucrats. The city was with a population of about 50,000 and was suffering from epidemics, flooding and unsanitary conditions. The urban strategy of the Government-General was to provide the modern network of wide and straight streets with open ditches for drainage, and later sewer systems, which was to prevent flooding, to remove unsanitary houses and, above all, to demonstrate the modern urban image and dignity of the colonial government.

In 1899, the Government-General issued the first planning legislation in the form of the Order that was to regulate the land and buildings in the designated area for the Urban Improvement project. This is the starting point of the history of modern urban planning in Taiwan.

In 1905, the colonial government made a plan to completely remove the walls surrounding the city and to replace them with modern streets. They were popularly called 'three-ways streets' because these 40- to 70-meter wide streets were divided by wooded belts into two generous pedestrian walks on both sides and into wide vehicle lanes in the center. The network of these streets was later to be extended into the surrounding undeveloped areas. The result was a grandiose open space of streets stretching into all the directions in and out of the city, which looked like a miracle or dream to the planners and engineers in the homeland.

In Taiwan, the Urban Improvement Program was applied to many other cities than Taipei in contrast to the homeland, where it was applied only to the capital Tokyo. In 1900s, five cities (Taichung, Taipei, Hsinchu, Changhua, and Chia-i in this sequence)

made plans. A total of 51 Urban Improvement Plans were created in the entire Taiwan between 1895 and 1937 (Huang 2000: 154).

In 1932, the Government-General announced an urban Plan, which was to cover more than 9 times of the then urbanized area of Taipei. The planned population in 1955, or 23 years later, was 600,000 against the 260,000 existing population at that time. The street network was planned to cover the entire Taipei basin, which is the central urban area of the present-day Taipei. The 1932 Plan can be seen as an application of modern planning principle in that it aimed at controlling the whole urbanizing area, exceeding the old planning frame of merely providing infrastructures of the Urban Improvement style.

In 1936, the Government-General promulgated the Taiwan City Planning Order, which was roughly a combination of the homeland's 1919 Act, Urban Building Act and Land Readjustment Program. The main purpose of this order was to facilitate the colonial government to secure a vast amount of land needed for Taiwan as the logistics base for the Empire's expansion to the southern Pacific region. (The needs were more urgent in Korea, where the similar legislation took place two years earlier, as is discussed later.) The planning system under this order was maintained and extended to 72 cities until the end of the war in 1945 (Chang 43). Most of the planned future street lines were legally kept and became the basis of infrastructure provision even after the war.

It seems that the colonial planners knew the strategic nature of infrastructure planning. They could lay out and build streets, and could control the buildings along major streets as they wished. Once the government opened streets in the undeveloped areas, private people began to build their houses there under the government control, followed by schools and shops. In short, the street network planning only had a power to control the total urban area to a considerable degree. It should be also pointed that this was only possible under the colonial powers and the fact that Taipei was a far smaller city than Tokyo, whose population exceeded 6 million in the late 1930s.

6. Prewar urban planning systems in Korea

In 1910, or 15 years later than the case of Taiwan, the Japanese Empire made Korea her second colony. The Korea Government-General was established in Seoul and started the urban planning administration as part of colonial control. In 1912, the colonial government introduced the Urban Improvement program from the homeland. The first Plan designated the improvement of 31 streets by broadening, straightening and paving the former narrow streets in the midst of the historical Lee dynasty's capital of 500 years old. This plan was eventually amended five times and the number of the planned streets increased from 31 to 47. During the following 17 years (1913 to 1929), the actual construction works were carried out in Seoul, building about 21 kilometers of streets in total. By 1927, 21 out of 47 streets were completed (Sohn 71). Here again started the planning practice and tradition of street construction as the main function of urban planning.

In the early 1920s, as a result of the enactment of the homeland's 1919 Act and the start of the Capital Reconstruction Program after the Kanto Earthquake of 1923, the Korean authority got interested in introducing the City Planning system of the 1919 Act style. In Cities of Seoul, Wonsan and Taegu, there were actual movements for it. The new image of planning function was to expand it beyond mere street works, and to build, in the name of City Planning, many public facilities as railway stations and schools that are badly needed in the modernizing city especially for the Japanese immigrants. This idea, however, failed mainly because of the financial shortage of the colonial government (Sohn 82-138). So the City Planning fever faded away but the Urban Improvement style remained, which was the only urban planning activity of the colonial government until the 1930s.

In 1930s, the Japanese Empire started the militaristic invasion to the continent at full scale, and Korea became a very important logistics base for it. The colonial government now needed a system to secure a huge amount of urban space for industrial, military and residential uses. In this context, the Korea Urban Area Planning Order of 1934 was promulgated by combining the homeland's 1919 Act, Urban Building Act and Land Readjustment Program. The order gave great powers to the colonial government for the compulsory purchase of land and for the large-scale Land Readjustment. As the name suggests, the order did not aim at improving the existing 'city' but did aim mainly at developing the new 'urban area' outside the city. In fact, the Order was hurriedly made in order to secure the land for building the new harbor city of Najin on the Sea of Japan, which was to provide direct transport connection between 'Manchuria' and the Japan proper. Thus, this Order was applied to a total of 43 Urban Areas before the end of war in 1945.

It was time when the 'regional planning' concept was ardently discussed among planners in the homeland with little concrete results. In Korea, however, regional planning became a reality as the Government-General announced the designation of four Regional Plans from 1939 on. The largest of them was the Seoul-Inchon Regional Plan, where 11,636 hectare land was designated for compulsory purchase for industrial and residential uses, and 275 hectare land for Land Readjustment program (Sohn 202).

It may be summed up that the main planning function in the prewar Korea started with street construction of Urban Improvement, and changed into the large-scale new development by the combination of compulsory purchase and Land Readjustment program of the Korea Urban Area Planning Order. In both cases, the basic characteristics of urban planning was the infrastructure provision.

In Taiwan and Korea, the actual planning practice was centered on such construction works as street building and Land Readjustment. Land use controls were only carried out in areas resided predominantly by Japanese immigrants. In short, colonial urban planning was heavily oriented toward government's construction works. In doing so, each Government-General sought and, in fact, realized the 'ideal image' of the projects which was never possible in the homeland under a 'week planning system.' It must be

stressed that this was only possible because of the strong military power of the colonial government.

7. Postwar urban planning systems of Taiwan and Korea

In 1945, the war ended and subsequently the Government-General was replaced by each national government. Japanese planning bureaucrats returned home. The colonial planning system was left over but was not replaced immediately by the planning system of the new government. In Taiwan, the government of the Republic of China came in from the continent and brought its own City Planning Act that had been promulgated in 1939. Its planning system, however, was found hardly workable because the prescriptions were too simple to operate and too much different from the current situation in Taiwan (Chang 43). In South Korea, where the former colony was divided into two nations that were involved in the war between them, there was no time to create a planning system anew. So the colonial system remained valid, and 24 additional cities were designated for urban planning under the old system (Sohn 335).

In both countries, the new government utilized the power mechanism of the colonial planning Order by literally translating 'Governor-General' to 'President.' There, the planning system with concentration of powers for development and construction later functioned as an efficient tool for rapid economic development in the 1970s and 1980s. The urban structure of Seoul and Taipei, as we see today, which is fully equipped with urban infrastructure, is a combined product of the colonial and postwar governments both with strong planning powers. It may be seen by the former colonial planners as their 'dream come true' or an unexpected inheritance of the Government-General.

If we understand the above point as the 'continuity' from the colonial planning system, it would be also necessary to point out its 'discontinuity.' After the Japanese planners returned home, there was a huge lack in planning expertise in Taiwan and Korea. This technical vacuum was eventually filled by nationals who came back home after studying in the United States and other western countries. They have brought in planning philosophy, techniques and legislation which are completely different from the former Japanese planning system. The biggest difference was the introduction of professionalism into planning as contrasted to bureaucracy embodied by the Japan's Home Ministry, whose body order is still discernible in the contemporary Japanese planning system.

During 1960s, when the social, political and military disorders of the postwar days were over, Korea and Taiwan started to amend the old planning system they inherited from the colonial government in order to have their own systems. The first City Planning Acts were enacted in Korea in 1962 and in Taiwan in 1964. They had the second revision respectively in 1971 and in 1973, having had many more revisions until now. In this process, both planning systems became almost completely different from the original Japanese system. This can be seen as the 'complete independence' from the colonial planning system.

8. Birth of 'Machizukuri' in Japan

One of the biggest challenges that the Japanese planning system received from the postwar society was 'Machizukuri' or community building. In 1952, a group of citizens stood up who wanted to maintain their good living environment in the Tokyo's suburban Town of Kunitachi, where Hitotsubashi University is located. Their activity eventually became a big citizen movement to petition for zoning designation of Education District, where land uses are strictly controlled by prohibiting some undesirable uses. In this broad historical context, the term 'Machizukuri' was created by Professor Shiro Masuda of Hitotsubashi University who was a resident in Kunitachi at that time. He published an article in which he used a new word 'Machizukuri' with a meaning near to 'municipal reform' more or less as a slogan (Masuda 1952).

In 1960s, citizens and residents all over the country started various kinds of social movements in order to mitigate and protest against the negative impact of the rapid economic growth of the time. They include urban redevelopment proposals (Nagoya's Sakae-Higashi district), progressive municipal administration (Tokyo and Yokohama), opposition against industrial and residential developments (Mishima and Tsujidô), and neighborhood resident movements (Kobe's Maruyama and Mano districts). This nature of movements was often 'opposition' to the existing system or policy of the government. People engaged in the movements called their activities 'Machizukuri.'

As we have seen before, the 1968 Act was enacted in order to respond to the situation of rapid economic growth of the 1960s. The same was true with the full scale Machizukuri activities that took place all over Japan in the 1960s. So we can say that the 1968 Act and Machizukuri were twin brothers of 'The 1960s Family.' Yet the Act was born on the red carpet within the national Diet building by elite politicians and bureaucrats whereas Machizukuri was born as homeless on the bare streets of all over the country by citizens and residents.

In 1970s, however, the government began to develop various programs to respond to the people's needs that are expressed in Machizukuri activities. These programs include the Model Community Program [1], the Living Environment Improvement Program [2] and so on. At the same time, people also began to learn that their collaboration with government would bring about better fruits. As a result, the relationship between the people and government gradually shifted from 'opposition' to 'collaboration.'

In 1980, the amendment of the 1968 Act introduced the District Planning system, which aims at detailed and strict land use controls at the neighborhood level with intensive community participation. This planning system can be seen as one of the government's positive responses to the growing needs of Machizukuri activities. The next year, Kobe City was the first in the nation to enact the Machizukuri Ordinance, which aims at coordinating and incorporating Machizukuri activities into the District Planning system at the local level. The next year, Tokyo's Setagaya Ward followed the example of Kobe City. Since 1990, advanced municipalities all over the country have tried to enact

Machizukuri ordinances in order to supplement the City planning Act and to facilitate Machizukuri.

In 1992, the 1968 Act was amended to institutionalize the Municipal Master Plan system for the first time in Japan.[3] This system legally required citizen participation in the process of preparing the Master Plan. It had a great impact toward a wide and intensive practice of participation by both people and municipalities.

In this context, unique civic activities took place. Some citizen groups made the 'Master Plan' by their own hands and presented it to the local citizens and municipality. There was no legal basis or fiscal support provided by the government to this kind of a 'private' plan. Citizens simply got together and made a plan that would clearly reflect their own dreams and needs. It was named the 'Citizen-Made Master Plan' in order to 'relativize' the ordinary Master Plan as the 'Municipality-Made Master Plan.' It should be noted that this may be one of the ultimate styles of participation of the Machizukuri activities and that some citizens have now demonstrated they are no longer helpless amateur but have expertise even to prepare a plan for themselves (Watanabe 1998).

In 1998, the Non-Profit Organization (NPO) Act was enacted, which legally authorizes citizen's activity groups and give them corporate status. The act has promoted various kinds of people's voluntary activities in welfare, education, culture, international affairs and environment, including Machizukuri. This development has given us a good chance to look at Machizukuri in a wider theoretical context, especially in relationship to statutory urban planning.

9. Challenges of 'Machizukuri' in Japan

Generally speaking, there are three social sectors or mechanisms that produce, distribute and provide goods and services at the social scale. They are: (1) the government sector, (2) the market sector and (3) the civil society (or voluntary) sector. Each of them behaves respectively according to distinctly different principles. This three-sector diagram is also applicable to Machizukuri. The urban facilities and services can be also provided by (1) central or local governments, (2) enterprises and (3) people or NPOs.

The real essence of Machizukuri seems to be the activities of people and NPOs that provide urban facilities and services based upon the principle of civil society. So it is necessary to look at Machizukuri as one field of the whole spectrum of NPO activities.

Machizukuri is clearly different from statutory urban planning, which is basically the government activity for public goods and interests based upon the principle of government. It should be noted that public services are now provided not only by the government sector but also by the civil society sector as well. The government is no more the only provider of public services, although the kind and probably magnitude of public services provided by both sectors, may be often quite different.

Machizukuri was born out of the historical background of postwar democracy and the emerging civil society. Machizukuri as such can be understand as a challenge to the traditional statutory urban planning, which did and still often does monopolize the public decision and action for the urban space and life of people. What is now questioned is the nature of 'public' in urban planning, which is changing dramatically in recent years. More specifically, the point is: How can we redefine, in terms of planning system and its main actors, the 'traditional public' which has mainly meant the central government bureaucrats into the 'new public' which would mean the combination of local governments and people/NPOs?

In this context, important keywords are 'participation' and 'decentralization.' First, the participation of people and NPOs in the process of making public policies and plans has become crucially important. Further, the need for participation is now extended to the implementation and even evaluation of policies and plans that people themselves participated in making. People are no longer the mere consumers of public services and urban planning in particular, but are participants and often positive actors in the production and distribution of them.

Second, in order to guarantee such participation, it is necessary to decentralize the planning function of the central government to the local government. So far the national government still keeps the centralized planning system and tries to give planning powers little by little to the local government. This is a process of 'decentralized' planning powers within the 'centralized' planning system. The ultimate planning style that Machizukuri challenges ask for, may be the drastic decentralization of the current City Planning Act itself. It may be a combination of the basic planning act of the national government and of the planning ordinance of the local government, just like the American system of the combination of the State enabling act and the local government's ordinance. This would be a through decentralization, that is, the 'decentralized' planning powers within the 'decentralized' planning system.

In short, Machizukuri challenges the traditional urban planning and seeks for a new set of planning paradigm. They may be summarized as: planning function from the construction of infrastructure to the improvement of the living environment; planning method from piecemeal decisions to comprehensive decisions; and planning system from the centralized and bureaucrat-leading style to the decentralized and people-participating style. This will require that the traditional urban planning which is basically a hard engineering technology should evolve into a hard/soft social and policy-making technology which would enrich the quality of people's urban life as a whole.

10. Community building in Taiwan and Korea

In comparative planning research, we pay a special attention to the 'similarity' and 'difference' of each planning system. In terms of 'similarity,' the starting point of our entire discussion is the historical fact that the same Japanese planning system was imposed to both Taiwan and Korea in the prewar days. In terms of 'difference,' each planning system departed from the Japanese system and evolved into its own style in

the postwar years (the 1960s and 1970s). Recently, however, the 'same' side has surfaced again. In the late 1980s, people's activities that are very similar to the Japanese Machizukuri have risen as 'Shequ-Yingzao' in Taiwan and as 'Maeul-Mandeulgi' in Korea.

The social and political circumstances in the postwar history of South Korea and Taiwan are very similar to each other. In the cold war days after World War II, they both had a long period of the military regime, or 'development dictatorship' that promoted economic development with the sacrifice of political freedom. The government carried out large-scale construction works of the important regional infrastructures such as expressways and attained high economic growth in the 1970s and 1980s.

In the late 1980s, the oppressive regime went out and suddenly the society as a whole became democratized. In Korea, President-Elect Roh Tae-woo, who had been directly elected in 1987 after a 16 year interval, announced '6.29 Democratization Declaration.' The same year, the martial law, which had been kept for 38 years, was released in Taiwan. Now, citizen movements of various kinds including community building activities started on full scale. Some academics studied and introduced the philosophy and technique of the Japanese Machizukuri to their own localities, and also tried to make a new word that would express these new activities.[4] Thus, the words like 'Shequ-Yingzao' (Taiwan) and 'Maeul-Mandeulgi' (Korea) were made more or less as a direct translation of the Japanese 'Machi-zukuri.'[5]

In Taiwan, a citizen group named OURs[6] was organized in 1992 and started a movement to propose and act for wide range of urban policies. This is basically a citizen movement strongly led by academics, many of whom are planners but do not limit the field of their activities to the traditional urban planning. In 1994, the central government, under the leadership of President Lee Teng-hui, started a social campaign named 'Shequ-Zongti-Yingzao' or literally 'comprehensive community building.' The campaign emphasized the importance of creating community spirit and of promoting people's participation. The campaign seems to aim at establishing the self-identity of the Taiwanese, not necessarily Chinese, culture and tradition. The central government provided various subsidy programs for the local government for hard and soft projects. In 1995, Taipei City, under the leadership of Mayor Chen Shui-pien, also started a unique program to promote community activities through the project proposal system, the 'community planner' system and the 'community planning service center' program.

In South Korea, a citizen group named 'Urban Solidarity' was created in 1996 and began the activity like OURs of Taiwan. Around the turn of the century, Seoul City saw a public and private movement to preserve the traditional Korean style houses in the Pukchon neighborhood near the former Royal Palace. Kwangju City, under the academic guidance of Professor Lee Myeong-gyoo, started the government-citizen partnership program to improve the physical environment of neighborhoods. In 2006, the central government, under the leadership of President Roh Moo-hyeon, started a policy of 'Livable City' with financial subsidies and technical supports to the community building activities of all over Korea.

In both Taiwan and Korea, community building activities developed in accordance with the democratization of the political system, and the government plays a big role in promoting these activities. There, as many government subsidy programs in the name of 'community building' suggest, the government is more or less on the 'people side' as the general political mood is still 'democratization.' [7] The government, far more sympathetic to community building than in Japan, is eager to help and foster citizen activities in a 'effective' way. Yet in the current situation, where the NPOs are still weak, too much initiation of the government may fail in growing the NPO sector as a whole. It is important to remember that community building is a grassroots activity of a 'bottom-up style' rather than a 'top-down style.'

It may be fair to say that the practice of community building is still at a very young stage in Taiwan and Korea. Unlike in Japan, there is hardly a serious conflict between community building and urban planning. Yet as we have seen in the case of Japan, the basic logical structure of their relationship is rather similar though not exactly same. In short, community building activities will eventually challenge the traditional urban planning. They will ask urban planning for a shift from the large-scale development project for urban infrastructure to the small-scale improvement project for living environment, and also a shift from the centralized planning style of bureaucratic initiative to decentralized planning style of people's initiative and creativity.

Finally, it should be noted that recently the international exchange of community building is increasing. After the Taiwan's Jiji Earthquake in 1999, the exchange of experiences and expertise of the Machizukuri-style reconstruction started between the people of Taiwan and of Kobe City, which had suffered an earthquake and had started a subsequent reconstruction program 4 years before. Another exchange program is being developed by young academics of Japan, Korea and Taiwan, who have recently organized themselves into an international network, named ASCOM for the comparative and theoretical research of Machizukuri. There are many other trials to establish similar international networks of collaboration and exchange among the citizens, professionals and/or government officials so that they can learn from each other. In order to have a really productive international collaboration, it is important to have a convincing theoretical framework about community building and its practical future perspectives.

11. Conclusion

So far, I have briefly depicted the planning history of Japan, Taiwan and Korea as a basic diagram of 'traditional urban planning vs Machizukuri that challenges it.' I believe that this historical experience of ours may serve as a kind of model of wider applicability to the modernization process of other areas in East Asia, especially of our big brother China.

The traditional planning system has been a engineering technology by which elite bureaucrats efficiently build regional and urban infrastructures. It can be considered as a 'centralization model' for efficient development for a society where various resources are still scarce and so have to be centralized. As the result of economic development,

however, a mass of middle class people emerge, who ask for the better quality of life and for political freedom and participation. What they probably need is a 'decentralization model' for gradual improvement for a society whose future is decided by its residents themselves. This is exactly what Machizukuri activities envisage. Yet, our experience also shows that, when the centralization model is so successfully realized, the social system based upon it often becomes too huge and too rigid to flexibly respond to the new demands of the society of the next era.

How can we find a path of soft landing from the centralization model to the decentralization model? Again Machizukuri seems to be one of the answers. It is the painstaking efforts of the people who work hard creatively to shift from the traditional style to a new style. I believe that Machizukuri is what Ebenezer Howard expressed more than a century ago. That is: 'The peaceful path to real reform.'

Notes:

1. The Model Community Program was administered by the Ministry of Home Affairs, which designated 83 Model Neighborhoods all over Japan and promoted community organization approach from 1971 to 1973. The main strategy of the campaign was creating community center buildings. In this context, Kôchi City developed 'Community Kalte (Analysis)' and 'Community Facility Plan.'
2. The Living Environment Improvement Model Program was started by the Housing Bureau, Ministry of Construction in 1978, which aims at improving the physical condition of neighborhood through the rehabilitation rather than clearance and redevelopment methods.
3. Before the 1992 Amendment, there was no requirement for the Master Plan in the City Planning Act. How can planning matters be decided without the Master Plan would be one of the most interesting questions of the Japanese planning system.
4. For example, the late Professor Kahng Byong-ki in Korea and Professor Chen Liang-chuan in Taiwan
5. The Japanese word 'Machi-zukuri' is a combination of 'Machi' as (urban) community or neighborhood and 'Zukuri' as 'making (which is not limited to 'creating' but practically includes 'maintaining' or 'improving' as well)'. The Chinese, or more precisely, the Taiwanese word 'Shequ-Yingzao' is a combination of 'Shequ' as community and 'Yingzao' as making/maintaining of hardware (ying) and software (zao). The Korean word 'Maeul-Mandeulgi' is a combination of 'Maeul' as (often rural) community and 'Mandeulgi' as 'making.'
6. OURs is literally 'Organization of Urban Re's,' where 'Re's' may mean Reform, Revitalization, Reconstruction, etc. The Chinese direct translation is 'Urban Reform Organization by Professionals.
7. In the recent Presidential election, Taiwan elected Ma Ying-chiu and Korea Lee Myung-bak, who are both more conservative than their predecessors. This may result in the more passive government attitude, and/or the more realistic policies, toward community building matters.

Landscape law, built-environment education and citizen participation: a case study of Japanese experiences and experiments

Yuji Jinnouchi
Utsunomiya University, Japan

1. Introduction

As a place of vitality, it is important that it be a place where residents and visitors would appreciate its beauty and find it to be a comfortable space to live and work. In Japan, the "Keikan-ho" (The Landscape Act) was enacted by the Diet on June 18th, 2005. Its purposes are to facilitate landscape formation and to create/conserve a beautiful landscape. The main aim of this paper is to analyze the possibilities and issues of built-environment education and citizen participation related to the law. Built-environment education enables us to consider how we choose to shape the rural landscape and the urban townscape, which would result in creating sustainable environment. It includes consideration of different types of environmental design, including the built heritage, architecture, planning, landscape architecture, and so on. In this paper, several programs for built-environment education are evaluated.

To consider the relationship between citizen participation and the Landscape Law, a few examples of entangled high-rise apartment projects will be analyzed. In order to analyze the historical aspect of the Law, interviews were executed with authorities.

2. Transitions in Japanese landscape and urban policy

Landscape is at times blemished by human activity, but also rises again to its former beauty. In the past, Japan was home of beautiful landscapes. Records left by foreign visitors at the end of the Edo period (from 1603 to 1867) and the beginning of the Meiji period (from 1868 to 1912) made unanimous testaments to Japan's natural beauty. This beauty was not limited to nature but could be also seen in the distinct downtown streetscape which made use of wood, earth and bamboo as its main ingredients, achieving a natural balance that gives rise to an overall feeling of uniformity.

Two turning points in Japan's history have witnessed the deterioration of such beautiful natural and urban landscapes. The first turning point was the introduction of unfamiliar Western culture at the start of the Meiji period, and the second was the age of the post World War II. Many problems existed in postwar Japan. Postwar restoration in Japan focused on low-cost and minimum urban development with a disregard for cultural values.

Although Japan was fortunate to achieve rapid economic growth in the postwar years, urban investment in individual buildings, roads and railways was undertaken without the establishment of a central governing philosophy. There was no real conscious effort to look at the whole urban picture[1].

As recent apartment building conflicts show, it has become clear that there is an ever-present gap between reality and a system (building standard law, city-planning law etc.) designed on the presumption that citizens would move to protect their own residential environment.

3. Elicit domestic issues: high-rise apartment construction in urban areas

Transition in Japan's landscape and urban development is as stated above. Now, however, I would like to introduce two examples of high-rise apartment construction in urban areas, an issue which is especially controversial at the moment.

1) The case of Kunitachi City

Kunitachi City is an academic city with a population of approximately 72,000 people positioned on the outskirts of Tokyo. Concerted action by residential groups such as "Sakura-mori (protect the cherry-blossoms)" and "Treasure Kunitachi Citizens' Gathering" has helped to nurture and maintain the urban landscape which is represented by the lush greenery of Daigaku Street. Landscape regulations were established in 1998 as a direct result of such groups. Amidst all this, a plan was brought forth in 1999 to construct an 18 storey (53m tall) apartment building along Daigaku Street, the city's symbol. Residents collected 50,000 signatures in response to this and petitioned that the plan be reviewed. Residents also presented a district plan that limited buildings to a height of 20m (maidenhair trees lining the street set as the standard), filed a provisional deposition to stop construction and took various measures to oppose the plan, but all to no avail as the apartment building was eventually built. However, an unusual decision at the subsequent civil lawsuit in 2002 ordered that parties involved partially dismantle the building. (However, the ruling was overturned 2 years later.)

Photo 1.   An eighteen-storey apartment along Daigaku Street

This was a landmark decision, because it was the first time that citizens' "landscape profit" had been acknowledged by a court of law. It is also important to note that the court stated that the parties involved should not forget their responsibilities and it does not suffice to merely fulfill the city-planning law and other related legislation. It is not sufficient nowadays for an enterprise to seek profit simply based on strict conformation with regulations, but rather it can be said that there is an ever-increasing need for consideration of the living (landscape) profit of local residents.

2) The case of Utsunomiya City

Utsunomiya City, placed 100km north of Tokyo, is the prefectural capital of Tochigi

and home to 450,000 people. Although the city has flourished since the Middle Ages as the gate town for Futaarasan Shrine and as a castle town and post station in modern times, almost all historic buildings were burnt down in the two wars during recent times. It is at the gates of the historically rare Futaarasan Shrine that there are now plans to construct a 24-story high-rise apartment building. Local

Conceptual view of the development of Futaarasan Shrine

authorities had been looking to utilize the site since ever since the locally-owned department store previously placed there had gone bankrupt, leaving the lot vacant. However, there are of course calls to stop a 24-story building that would look down upon the shrine, with the opposition placed to take civil action if necessary. Although not directly related to this, local groups are also actively working to bring people to discuss urban development and landscape regardless of their stance, their activities published daily in local newspapers. Many residents are still indifferent despite such movements, with a considerable number completely unaware that there is even a problem in the first place. Utsunomiya City differs greatly to the before mentioned Kunitachi City on this point. Although these cases both involve apartment buildings, they differ in accumulative experience with regards to civil movement, making comparison a difficult affair. But why is there such a difference? There are two possible reasons. The first is Utsunomiya City's favorable geographic situation, with active induction of post-war production bases leading to urban development based on economic priorities. The second being an increasing drop in the awareness of citizens who have been overwhelmed by the economically prioritized ill-sorted town landscape, eventually leading to a complete indifference to town landscaping.

It was in 2004 that the Landscape Law was established and "landscape" was finally brought to light in terms of urban development. As a result, local bodies are expected to expand as they now have legal backup for their landscape & urban development activities.

4. The Landscape Law and Citizen Participation

According to research by the National Highway & Transport Bureau, there were 494 regulations established in 450 communities (14% of the total number) as of September 2003. The Landscape Law was brought into full use in June 2005 to reinforce landscape regulation along with the landscape administration of autonomous bodies[2].

The Landscape Law consists of: (1) the section which sets down basic regulations; basic philosophy surrounding landscape, residents, business sector, local authorities, and governmental responsibility; (2) the section about land use regulations surrounding landscape planning, landscape zones etc.; (3) the section dealing with the constituent factors of landscape such as derogation of public facilities; protection of landmarks such as important architectural landscape and important tree landscape; (4) the section

which sets down the support system; landscape agreement, landscape conference, landscape maintenance machinery, etc[3].

Moreover, the law clearly states citizens' responsibilities, the creation of a system that involves citizens being one of its main characteristics. An outline of this legal aspect is given below.

1) Joining the Landscape Planning Process

The main planning body of landscape planning is the landscape administration body（local authorities that take on the responsibility of administering the Landscape Law on a whole）. Such events as public hearings are held during the planning process to reflect the opinion of residents as a condition of the law (term 9).

2) Landscape Conference

Landscape Law term 15 is mainly concerned with the governing of landscape administration bodies, landscape maintenance machinery, and important landscape public facilities, setting out the organization of landscape conferences to deliberate on suitable landscaping for the proposed landscape planning zone. It is possible to join landscaping and the promotional activities of residents as a constituent member as necessary. In other words, citizens have the right to give their opinion and deliberate on issues that include maintenance and administration of public facilities.

3) Landscape Agreement

The Landscape Law allows for an agreement to achieve suitable landscaping within the proposed landscape planning zone through agreement between the landlord and leaseholders, in other words the signing of a "landscape agreement" is permitted[4]. However, in order to fully implement Landscape Law policy, regional consensus and maintenance of a support system becomes indispensable. It is thought that efforts centered on accumulative citizen participation geared to the region based on self-motivated citizens and the unique policies of self-governing bodies make landscaping a reality.

For this reason, the next chapter will look at built environment education and citizen participation, necessary to foster awareness as a citizen.

5. Interview Surveys

In January 2008, we conducted interviews with an official of Utsunomiya City who was responsible for landscape policy and an architect who had many architectural works in Utusnomiya.

Through the interview with an official we found that the most difficult task was to improve citizen's consciousness toward landscape. To create or preserve preferable

landscape, design, volume, shape and height of a building are often controlled by by-laws. However, it sometimes means invasion of private rights. So that, it is often very difficult to get consensus among citizens regarding creation and preservation of landscape.

It is also pointed out that local governments with less experience in landscape policy, like Utsunomiya City, will need much effort to motivate citizens.

The architect who cooperated with our interview told us that citizens, city officials and private corporations of Utsunomiya should at first find out landscapes that must be preserved. Then, together they should consider the ways to preserve those landscapes. Doing so, consensus about preferable landscapes will be established. However, it takes time.

6   Built-Environment Education and Landscape

1) Urban Development

This section looks at urban development. While there are various definitions of urban development, it can be clearly stated that the aim is "lifestyle development." <u>Machizukuri Textbook Vol. 1; Machizukuri Methods (2004</u> raises the following ten areas for basic urban development:

(1) Revitalization of the "town center" where local activities are focused
(2) A sustainable local society where all can feel safe living
(3) Urban development which allows one to get around on foot during everyday life
(4) Maintenance of landscape/landscape along with creation/revitalization of historical, cultural and artistic places of interest
(5) Local society where a diverse range of lifestyles and culture coexist
(6) Compact town planning that doesn't allow waste of resources
(7) Revitalization of town planning that coexists with the natural environment and eco-system
(8) Urban development that warmly welcomes all and allows for diverse exchange
(9) Recycling-oriented local economy based on community business etc.
(10) Construction of a local society system based on local authorities[5].

Fig 2.   Image of Landscape Law's Designated Areas   Source   *Journal of Architecture and Building Science*, January 2005, p.24

An emphasis should be made that "(4) Maintenance of landscape/landscape along with creation/revitalization of historically, cultural and artistic places of interest" is included among the ten areas.

Urban development deals with the everyday topic of lifestyle development, landscape, history, and culture eventually forming into unique local symbols as a direct result of such daily efforts. In other words, landscape is a reflection of lifestyle development and urban development. Particularly, it is in essence an expression of the values and esthetic feeling of the people who live there. It goes without saying that such aspects can become a substantial local asset.

2) About Landscape

Built-up areas generally consist of natural environment and artificial environment. Natural environment points to greenery, rivers, sky etc., while artificial environment is broken down further into public and private property. Civil structures and public facilities

such as roads constitute public property, with private property consisting of commercial establishments, housing etc. Individuals can only be directly involved in private property.

Accordingly, landscape is seen as having a "public nature" in Western countries, with many architectural restrictions in place even for privately owned land. However, there are few instances where the surrounding environment is taken into consideration when constructing privately in Japan, as private land is still viewed as a personal asset. As before mentioned, individual awareness is directly expressed with regards to private property, the values of the people who live there reflected by the natural environment and public property of the region. It is not so difficult to imagine that, for example, the overall landscape of a town with a large number of residents that want to "preserve nature and history" would differ slightly from that of a town with residents wanting to "entice factories and develop industry." As mentioned at the top of this paper, most post-war cities in Japan took the later, regional identity lost along with the landscape as a result of pushing urban development with priority on economic activity during the years of fast economic growth. The appearance of "swing back" phenomenon has become common in attempts to balance the scales that have been up to now heavily tipped by economic activities, built environment education being placed as one of the important tools in this process.

3) The Possibilities of Built Environment Education

Built Environment Education is a place for citizenship education, taking interest in one's residential environment, awareness and skills to find and actively solve issues through self-intuitive. In other words, fostering the ability to actively participate in the sustained maintenance and creation of a comfortable residential environment can be seen as built environment education. It is said that built environment education originated in England. In 1969 in England, it was proposed in the Skeffington Report that citizenship education be included in compulsory education in order to nurture urban planning qualities[6].

One of the key persons in built environment education in England is Lady Eileen Adams. She has been involved for many years in attempts to integrate built environment education into environment education methods. As a specialist in arts, Lady Adams claims that it is possible to increase receptiveness to the environment through environment education focused on design. This method can also be referred to as environment design education, where "realization" evoked by activities such as workshops develops into "understanding" and "expression". To be more precise, efforts are focused on fostering the children's observational skills. For example, the children are asked to sketch the shape and color of buildings, benches, the school yard and other

Fig 3   Teaching Manual for Built Environment Education by Lady Adams (Source   K. Teramoto   Machizukuri through Comprehensive Learning. p.45

landscape, or make a landscape collage through combination of various photos[7].

Such efforts by Lady Adams should be noted from a "landscape and sensitivity" perspective with a special eye on "increasing environmental receptiveness" and "fostering children's landscape observation skills."

Everyone possesses the ability to be aware of and evaluate landscape. Lady Adams' built environment education is an extremely informative method for developing such abilities, whilst also hinting at the possibilities of built environment education.

There is a need to develop the potential of each and ever one in order to be aware of good landscape. It is therefore necessary to firmly convey to children what is good landscape, and what is not.

 On the other hand, there are various domestic efforts taking place with regards to built environment education. Examples are introduced below.

Table 1 Classroom based Landscape Study for Junior High Students

Technique	Elective social studies lesson
Implementation Period	2003 , 17 hours
Implementer	Miyazaki City, teacher in charge at the school
Subject	13 3rd grade junior high students in 2001, 33 in 2002, 21 1st grade and 27 2nd grade students across 2 schools in 2004
Content	"Implementation of Landscape Education" "Studying Urban Development" "Landscape Observations and Census Research" "Making Landscape Models" "Looking back at Classroom based Landscape Study"
Reaction of Participants	Now notice the surrounding buildings. Now think about good Landscape and bad Landscape. Now concerned with the color of buildings, signs, etc.
Effect	Developed an eye for evaluating the Landscape where one lives

Source: Naomi Tani, "Classroom based Landscape Study for Junior High Students", *City Planning*, No. 253, (Tokyo: The City Planning Institute of Japan, 2005), pp.34-35.

4) Built Environment Education Issues

As stated above, there are various domestic efforts with regards to built environment education at schools and on a regional level. A steady stream of results can be seen with efforts all around the country that include such activities as utilization of supplementary reading material, interviews of regional members, dioramas about one's town, and participation by experts. However, on the other hand, it cannot be said that study to improve "receptiveness" to the environment, as mentioned above with relation

to Lady Eileen, is not exactly at a satisfactory level. For example, when looking at Landscape it is necessary to pay attention to the aesthetic beauty of individual buildings (design, color, shape) as well as taking into consideration how they will all come together (balance, proportion). This is not something that can be attained merely as a skill.

Without training to properly make use of thisreceptiveness, the built environment education that lies ahead eventually runs the risk of becoming a shallow affair. It can be said "sensitivity education" is important in order to raise "receptiveness" at this stage, especially as Landscape is a theme within built environment education that is closely related to one's "sensitivity."

Photo 4. Built Environment Education at Elementary School in Tochigi City

As fore mentioned, built environment education involves taking interest in one's residential environment, fostering awareness and skills to find and actively solve issues through self-intuitive. For this reason, it can be said there is a necessity to undertake sensitivity education to nurture receptiveness to things of beauty along with acquiring urban development skills through the use of the "supplementary reading material" mentioned above.

It would probably also be wise to consider integration of built environment education and environment education in this case. Sajima (1995) raises the following 4 points as "environmental ethics" to nurture in terms of school education: (1) concern for the environment; (2) posture toward the environment; (3) understand the environments pain and empathize; (4) strive to preserve the environment. Moreover, Sajima points out, "The most important thing of all in regards to the environment is being able to sense that what is beautiful is beautiful, and what is dirty is dirty.[8]" Can it not be said that integrating the best points of environment education and built environment education gives rise to the possibility of a new direction in education aimed at nurturing sensitivity to landscape.

7. Conclusion

It may be said that Japan is sick due to various problems from within. For example, housing policy continues to produce residential areas that sap individualism. And production/distribution system of mass-production/mass-marketing has destroyed neighborhood shops and businesses [9]. Kouyama expresses the comprehensive and root-deep internal sickness this country faces in the fashion above. Appropriately, he comments that this sickness cannot be cured simply with superficial design policy. As previously stated, Landscape is a reflection of daily lifestyle development and urban

development. Particularly, it is in essence an expression of the values and esthetic feeling of the people who live there.

Therefore, there can be no real cure for the "root-deep sickness" pointed out by Kouyama without nurturing our values and aesthetic feeling. There are high expectations for built environment education that fosters children's receptiveness to landscape and the environment, along with the possibility of opening up new horizons through integration with environment education.

Effects of public and private partnership in urban renewal - a case study of Hong Kong's district Sai Ying Pun

Hendrik Tieben
Woo Pui-leng
Yuet Tsang-Chi
The Chinese University of Hong Kong, China

Introduction

Hong Kong Urban Renewal Authority (URA) is currently working on two hundred projects to revitalize the city.[1] The first realized buildings after the establishment of the URA in 2001 have raised strong concerns among community groups, heritage activists, and academics. Determined by the goal of comprehensive redevelopment, the projects have displaced existing residents, increased development potentials of sites, and erased entire blocks of existing urban fabric. Since the formation of the Land Development Corporation (LDC) in 1988- the predecessor of the URA- redevelopment in the name of self-financing has ended up in maximizing profits for private developers.

This case study of Sai Ying Pun, one of the city's oldest districts, traces the collaboration between public agency and private developers in compromising stated public goals for revitalization. The study focuses on changes in the urban tissue: building types, open spaces, street life, and urban experience against the historical background and renewal strategies of the city. Through planning documents, building plans, aerial photographs, and site studies, this paper presents critical issues in Hong Kong's urban transformation.

The study is divided into five phases: 1) Formation of Sai Ying Pun 1850-1870; 2) Period of Transition 1945-1961; 3) A New Beginning 1962-1971; 4) Disintegration and Dilapidation 1972-1988; and 5) Urban Renewal 1988-2007. The transformation process is traced at three scales: the city, a district, and a street block with its individual houses. The focus is one block that contains Yu Lok Lane. Described by historian Carl Smith, the lane is one of the rare places where local life of the district has survived.[2] The current urban renewal project plans to demolish almost all the buildings in the lane, replace them with a high-rise tower and a new open space.[3]

The 'perfect' square: formation of Sai Ying Pun 1850-60

In studying a map of Hong Kong Island, one is undoubtedly struck by the unusual form of Sai Ying Pun's street layout. Among all urban districts in Hong Kong, Sai Ying Pun stands out as a 'perfect' square. Bounded by Des Voeux Road West, High Street, Eastern and Western Streets, it measures almost equally (900x960 feet) on its sides. The streets were laid out in the four cardinal directions. Centre Street bisects the square from north to south.

Fig. 1 Map of Sai Ying Pun

Fig. 2 Aeril view of Sai Ying Pum, 1964

Sai Ying Pun (　　　) means the Western Encampment in Chinese, the first military camp formed a year after British landing on Possession Point in 1842. The area was subdivided into orthogonal urban blocks with 50x100 feet lots for sale between 1855 and 1861.[4] Military influence has been suggested as a reason for this regimented layout. The simple numbering of interior streets, First, Second, and Third Streets, seems to support this view. However, Centre, Eastern, and Western Streets imply geographical boundaries and axis of a district, and evoke imperial models of Chinese and Roman walled cities. Several other aspects contribute to Sai Ying Pun's distinctive character apart from its square frame.

First, there are two planned areas in Sai Ying Pun, one on the waterfront (Praya West), and one uphill. Waterfront streets were laid out perpendicular to the terrain and harbor. This area has flourished as a trading port of dried seafood despite the construction of reclaimed land and highway at the waterfront. Uphill streets were laid out parallel to the terrain. The area is primarily a residential district with local shops and businesses. The two areas divided by the city's thoroughfare, Queens Road, are linked in the other direction by three uphill streets: Eastern, Centre, and Western Streets. These straight streets ascend rapidly from the harbor to a steep 20% incline, and give unobstructed views to the water.

Fig. 3 Eastern Street

Fig. Centre Street

Fig. 5 Western Street

Secondly, there are different types and sizes of blocks. Waterfront block measures 100x250 feet. Uphill block below Second Street measures 100x450 feet. Uphill block above Second Street measures 145x450 feet. The typical block consists of two rows of T-shape tenements with a back-lane between them. The blocks above Second Street, too deep for the standard tenements, have developed differently from adding a row of small houses in Yu Lok Lane to several dumb-bell shape tenements on High Street.

Thirdly, there are different types of pedestrian paths. Apart from the main streets, labyrinths of lanes, slopes, steps and lately escalators have been constructed. They climb the hill, access blocks' interior, and provide inter-block connections. Some are village-like streets called *fongs* (malls) or *lis* (lanes) connecting houses, temples, and open spaces. Beyond its external order, Sai Ying Pun is the opposite of the perfect square. It is a medieval town where building and space adjust and shift in relation to each other, and where community and privacy overlap in unexpected ways.
Fig. 6 Lot lines, 1889   Fig. 7 Pedestrian paths, 2007   Fig. 8 Survey plan. 2007

The architecture of Sai Ying Pun has changed significantly since the district was first laid out. 5-6 storey shops/flats built in the 1960s have replaced most of the original 3-4 storey tenements. Many have been redeveloped into 30-40 storey high-rise towers. Underlying the district's jagged appearance is a historical tissue within which the voids as opposed to the solids have been the vessels of urban life. The following sections will reveal the formation and disintegration of this urban tissue through a study of the interplay of public planning and private interests.

The period of transition 1945-61[5]

The Second World War ended in 1945 with extensive damage of properties throughout Hong Kong. The population dropped significantly from 1.63 million to 600,000 during the war and rose to 1.8 million by 1947.[6] War damage in Sai Ying Pun was concentrated on the western and southern ends. Many tenements located near public structures like the Kau Yan Church and the public dispensary became targets. The government established several policies to address postwar problems of dilapidation, overcrowding, and poor living condition. Severely damaged properties were demolished. Rent control act was enacted to curb escalation. Strata title of properties was introduced to encourage home ownership.[6] The result was the restoration of existing buildings, and the construction of new ones.

Fig. 10 Centre Street, 1946-47

Fig. 10 Centre Street,1946-47

The reconstruction of Sai Ying Pun was in a state of flux between hope and despair. Among buildings were many ruined and empty sites. Streets bustled with marketing activities were devoid of people at times. Squatter settlements proliferated on empty lots and rooftops. In the block of Yu Lok Lane, nineteen buildings were rebuilt between 1945 and 1955. Sixteen of them were located in the lane; three on High Street. They were built under an earlier 1935 Buildings Ordinance, which controlled the height of building by the width of street and to a maximum height of five stories.[7] On High Street, the buildings followed existing urban pattern with shops on the ground, and living units above. The buildings on Yu Lok Lane were essentially village houses with simple living units on two or three floors.

Fig. 11 Plan of Yu Lok Lane Block, 2007

Fig. 12 Elevation of house number 7-19 Yu Lok Lane, 2007

Housing problem in Hong Kong was at its worse in the 1950s given internal shortages and an influx of immigrants from China in 1949. Two types of housing policies were introduced. The first was to construct public housing. The Housing Society was set up in 1951 to build middle-income housing; the Housing Authority in 1954 for low-income housing. The second was to promote private home ownership[8]. The Buildings Ordinance was revised in 1955 to intensify land use. Building height was increased to two, three or four times the width of streets in different areas; floor height was reduced from 10'-6" to 9'-6"; buildings up to nine stories were permitted without a lift.[9] This led to a sharp growth in real estate investments from 95 to 250 million between1954 and 1957. The boom peaked in 1958 as most of the population could not afford private housing.[10] Sai Ying Pun was unaffected by this momentous growth of the city. It was not at a prime location. There was a shortage of available land. Developers had difficulties in assembling multiple lots. The streets were too narrow to capitalize from the zoning incentive. Some shops/flats were constructed, but the district had remained unchanged since its post-war reconstruction.

A new beginning 1962-71[11]

The decade of 1960 was one of outstanding growth in the history of Hong Kong. The territory's population reached 3 million in 1960. The introduction of industries in the 1950s brought influx of overseas investments and businesses.[12] Work opportunities flourished, and the livelihood of people improved significantly. But housing conditions deteriorated further. Illegal structures mushroomed everywhere and formed urban villages or "slums" in the city. The construction of factories, warehouses, offices, and private housing placed further strains on the city's infrastructure, utilities, open spaces, and public facilities.

The Buildings Ordinance was revised in 1962 to curb growth but to take effect in 1966. It aimed to reduce development by twenty percent. It set more stringent requirements for light and ventilation. Instead of curbing growth, this revision caused a sharp rise in development during the intervening period.[13] Coupled with high land costs, demolition and redevelopment of old buildings were prevalent. Hong Kong transformed from a low brick and tiled-roofs city into a high-rise city of concrete and flat-roofs. The government also put forward plans to build more public housing in new towns. In the span of ten years, the city underwent major transformation. Fifty percent of Hong Kong's population was living in high-rise public housing by 1971.[14]

Sai Ying Pun at the beginning of this exuberant decade looked its best from the air. War-damaged properties were filled; restored buildings had traditional tiled roofs; new buildings remained low in height. With the consolidation of the urban fabric, the district appeared homogenous and vibrant. Itinerant hawkers filled the streets. The Centre Street Market was rebuilt in 1953. The site of the Sai Ying Pun Market became an area for hawkers with a small playground. There was little vehicular traffic in the district apart

from Queens Road West. Centre Street, true to its name, had remained the focus of the community.

Fig. 13 Aerial photo of Sai Ying Pun, 1963

Fig. 14 Eastern Street, 1970s

This pristine view was quite different on the ground. Overcrowding was severe; living conditions poor. Deteriorating buildings posed danger of collapse; illegal structures permeated the district. A government appointed working group on slum clearance identified Sai Ying Pun in a 1964 Pilot Scheme for urban renewal although nothing was actually executed.[15] Small developers who dominated the real estate market then began developing prewar tenements into 5-6 storey shops/flats. The city was transforming incrementally with one building by one developer at a time. The 1965 banking critics, and the 1967 political unrest, and over building eventually altered this form of development. The end of 1960s saw the emergence of larger developers, and with them a different urban pattern.[16] Many institutions including churches had become developers. The block of Yu Lok Lane saw the redevelopment of the church-associated Kau Yan School and housing (site of Lechler Court) into a large six-storied project. Six other buildings were reconstructed into the 5-6 storey shops/flats in the block of Yu Lok Lane. All were built before the 1966 deadline- a confirmation of the strong public control and private interests in shaping the city.

Disintegration and dilapidation 1972-88

In order to cope with the continuing rapid rate of population growth (from 3 to 4 million between 1960 and 1971) and to ease pressure on the older districts of the city, Hong Kong's Government focussed in the 1970s on the development of the New Towns.[17] Plans to improve living conditions in the older districts such as the 1964 Pilot Scheme were discontinued. By the beginning of the 1970s, the Government was already working on the assumption that these areas would undergo change by private investors.[18]

In Sai Ying Pun, the Praya area was the first to change. All along Des Voeux Road West, old tenement buildings were replaced with 10-12 storey buildings, which expanded over areas equivalent to up to seven land parcels. On the corner of Queen's Road West and Eastern Street, the first tower constructions were underway. In the upper

part of the district, the changes were smaller in scale. Here, new shop/flat houses of up to 7 storeys built over 2-3 original land parcels replaced various tenement houses.

Toward the end of the 1970s, major political and economic events were to have an accelerating influence on the urban transformation process: e.g. Deng Xiaoping's "Open Door Policy" (1978), the creation of the Special Economic Zone Shenzhen (1979), the translocation of industrial production across the northern border and the rise of Hong Kong as a global centre of international finance services. In parallel, the population saw further rapid growth, reaching 5 million inhabitants by 1980.

Fig. 15 Aeril view of Sai Ying Pun, 1980
Fig. 16 Podium tower at Third Street, 56-72, 1981

In the 1970s, towers of up to 28 storeys begun to appear in the upper part of Sai Ying Pun along Eastern Street, Third Street and High Street (Fig. 15-16) close to the more attractive Mid-levels. These towers were built on top of podiums of between 1 and 3 storeys (their proportion was determined by the building regulations) which expanded horizontally over up to 10 land parcels. Often, they were developed at street corners or as transverse blocks as these sites allowed higher plot ratios. Despite their building height, these early podium towers did not change the relationship between street, shop and workshop. Indeed, the size and proportion of the shops remained still the same, facilitating the continuity of local businesses.

The building type began to change in the 1980s. The Government had been concentrating its work in improving Sai Ying Pun's hygienic conditions, which were precarious since the 19th century. To achieve this aim, the public market square in the centre of the district (Fig. 9) was replaced by a second enclosed market building. Next to it, public washrooms were added. As a further change, almost an entire street block was cleared away for a new private development adjacent to the new market building.

Fig. 17 Aerial view of Sai Ying Pun, 1989

Fig. 18 Second Street after redevelopment in the 1980s (photo 2007)

By the end of the decade, many towers that began construction in early 1980s were completed (Fig. 17); among them were two cruciform towers of the "Western Garden", a private development built on the cleared site next to the new market building. This development differed from the other projects in the district in that it was bigger and designed to integrate with the market building. Between one of the towers and the market building, an open space was created with similar dimensions as the original market square. This new open space was placed on a podium and equipped with benches, trees and plants. However, being separated from the surrounding buildings, it does not have the same meaning to the residents as the earlier public space. A second open space enclosed by fences was also introduced between the two towers. Today, these open spaces and a part of the new market are often devoid of people.

The attempt of the government to improve the hygienic conditions of the district and to create a design in coordination with a private developer resulted in negative side effects. With the design of the new podium, traditional shop-fronts were replaced by a wall of glazed tiles (Fig. 18) for easy cleaning and interrupted only by service entrances. Street life was further reduced by the banning hawker activities from the district after a road accident in 1984. The space gained from their disappearance was immediately occupied by increasing vehicle traffic.

The introduction of urban renewal 1988-2007

The creation of the Land Development Corporation (LDC) in 1988 represented a new chapter in the urban transformation process of Hong Kong and Sai Ying Pun. With this organisation the Government turned its attention back to older districts on Hong Kong Island. The LDC concentrated on them as the CBD was expanding rapidly. The renewal strategies of the LDC were first published in a study in 1990.[19] The wording of this study revealed intentions such as the careful improvement of streetscapes and respect for heritage and for traditional businesses.
Fig. 19 LDC Proposal for Sai Ying Pun
and Centre Street, 1990.

Fig. 20 Street life on Centre Street as
Represented in the LDC Study of 1990

Provided by the Government only with a minimal budget, the LDC decided to work in close partnership with four of Hong Kong's biggest developers. Its first priority was to develop highly profitable commercial projects in the vicinity of the CBD and to create a solid financial basis for later projects in less desirable areas. This strategy was welcomed to the Government as it could create land of high value with LDC 's intervention. According to a study by scholars Adams and Hastings (2000), the LDC used in the years from 1988 to 1996 only HK $31 million of its initial low interest loan of HK $100 million provided by the Government. In the same period, it paid the Government additionally to the interest for this loan an amount of HK$55.83 million on taxes for its revenue of over HK $2 billion. Moreover, the land premium for the two LDC flagship sites, Wing Lok Street and Jubilee Street, brought the Government Treasury total revenue of HK$2.9 billion.[20]

Fig. 21 LDC project Ko
Chun Court, 1994

Fig, 22 "Open space", Ko Chun
Court (photo 2007)

The study also revealed that the LDC had chosen Sai Ying Pun as one of the main redevelopment areas in 1990. It identified two blocks between Des Voeux Road West and Queens Road West and two blocks between Queen's Road West and Second Street as "Action Areas".[21] Based on their dilapidated conditions, it was first intended to

give these areas priority in the renewal process. Despite earlier stated aim of preserving traditional businesses, the LDC proposal would have erased many houses of the long established dry seafood traders (Fig. 19). However, like the Pilot Scheme of 1964, this project was never realised. Due to the multiple ownerships prevailing in the area, the site acquisition consumed too much time so the LDC decided to work on an alternative plan.

By the mid of the 1990s, the LDC completed two towers outside of the "Action Areas". These were the *Ko Nga Court* (Fig. 21)*,* a 33-storey apartment tower on Eastern Street and the *Ko Chun Court,* an adjacent 13-storey tower on High Street. Both towers profited from their attractive location near the King George V. Memorial Park. The apartments of the *Ko Nga Court* initially intended for the re-housing of residents from the "Action Areas" were immediately sold on the open market upon completion.[22]

The stated aims of the LDC study also included the creation of more community facilities and open spaces. While *Ko Nga Court* did in fact integrate 1,150 square metres of community space, e.g. a Central and Western District Association for Culture and Arts and a Third Street Refuse Collection Point; the newly created open space was separated by walls and gates from the neighbourhood (Fig. 22). In terms of their design, the two towers did not differ substantially from the private developments in Sai Ying Pun.

The new apartments offered comfortable living spaces for their new owners. However, the LDC did not improve the living conditions for people in the district. On the contrary, the *Ko Nga Court* exceeded the general building height and significantly increased the density; and its gated ground level excluded neighbourhood residents from using the new created open space. Even more problematic was the announcement of the comprehensive redevelopment of the "Action Areas" to replace most of the older buildings, causing great anxieties for existing residents about their future. This situation was maintained for over 15 years and nothing was done to encourage maintenance or improvement works to the existing buildings.

Fig. 23 URA project on First Street/Second Street as Present to the local residents until March 2008

Fig. 24 Updated rendering of the currently constructed URA project

In the first years after the Change of Sovereignty from Britain to the PRC (1997), the district did not see significant changes given the Asian financial crisis. The establishment

of the Urban Renewal Authority (URA) in 2001 to succeed the Land Development Corporation (LDC) brought changes. The URA inherited from the LDC its redevelopment plans but was given by the new HKSAR Government a greater power for assembling sites. Soon, the URA focused on the previously defined "Action Areas". Given the dilapidated condition of the First Street/Second Street block, which since 1990 has been waiting for the announced actions of the LDC, the general engagement of the URA could be seen as a positive step. In parallel, the URA also developed a second project in Yu Lok Lane.

The URA faced the same problem as the LDC in that it has to make redevelopment pay. Consequently, it chose to work similarly in partnership with private developers. For the development of the project on First Street/Second Street the firm Kerry Properties was selected through a tendering process. In community meetings, the URA presented a project with a wide open space and low buildings (Fig. 23). None of the traditional looking buildings were in fact part of the existing site; also the open space was shown in exaggerated dimensions and the intended towers were not shown.

Fig. 25 First Street/ Second Street (photo 2007)

After residents had moved out and the entire block was demolished (Fig. 25), the developer presented via its own website a rendering that showed two towers without any information as to how the buildings would meet the ground. The press release by the developer described a 425,000 square foot project comprising commercial spaces, 100 car parking spaces and "600 luxury residential units".[23] All of this was to be placed on a site of 38,000 square feet. The expressed goal of the developer is to reshape "the site into an 'Elite Neighbourhood' of the West". This meets the future economic potential of the site following a planned extension of the MTR Island Line linking it directly to the financial centre.[24]

After critique of its public information policy, the URA eventually updated its website in March 2008 showing a rendering of the project currently under construction (Fig. 24). The podium of this project will further destroy the existing network of alleyways and open spaces; and its wall-like double towers will reduce light and air. With the large building volumes and the proposed 100 new parking spaces it is unlikely that the project will reduce the most pressing problems of the district: traffic congestion and air pollution.

The second URA project in Sai Ying Pun of Yu Lok Lane is announced as another improvement of open space. As before, the planned tower was not shown in the rendering of the project. Only two houses of the early post-war period (Fig. 12) will be conserved to make way for a new open space. [25] One of them would be altered beyond recognition. One house in the lane will be retained "to recall the history of this place and the early days of the district". In looking at the desolate open spaces created in the district since the 1980s, one would argue for a new space to be integrated with the existing buildings and to preserve the atmosphere as described by historian Carl Smith "But not all of the past is gone. In Yu Lok Lane I found an old-style gabled Chinese roof, a relaxed, unhurried, quiet atmosphere, an old lady dozing in the sun, a young student doing home work, two people busy at cottage work on a table in the open air, four women playing a card game, washing strung on lines." [26]

Conclusion

Sai Ying Pun has transformed from an area of tenements to one with a mixture of old and new, low and tall residential buildings. It also retains a rich urban fabric on the ground because of its early development into urban blocks with multiple lots. Sai Ying Pun reflects the physical improvements as well as the historical imprints of Hong Kong in the past one hundred and fifty years. During this period, people's need has changed from basic housing provision to better living environment. Driven by wealth generation through real estate and belated urban renewal policies, the city has enabled the demolition of entire urban blocks, and the construction of large development projects since the 1980s. With these projects, the area is facing increased spatial segregation between the dwelling and the city, and rapid disintegration of its rich urban tissue.

One of the key reasons justifying urban renewal is to improve open spaces in the city. Contrary to established rhetoric, there are many open spaces in Sai Ying Pun. King George V Memorial Park on Eastern Street is located next to the current urban renewal project on the First and Second Streets. Buildings in Yu Lok Lane are to be demolished to make way for a proposed open space. Yu Lok Lane with several Chinese Banyan trees is already an urban enclave. Unique to the area are many urban voids of internal courts, pocket parks, widened paths, and old trees on retaining walls. Many such spaces have been made derelict, fenced in, and demolished by the city, while many purpose-designed open spaces are desolate-looking places.

Centre Street where residents, pedestrians, and storeowners gather and barter, has always been the focus of street life in Sai Ying Pun. With the introduction of vehicular traffic, the banning of hawkers and the building of two large indoor markets, much of

Centre Street's vitality has been reduced. People now clamber along on narrow pavement and behind protect railings. Street life is tenuous, regulatory control can help or destroy it. The study of history reveals the streets of Sai Ying Pun as places of gathering as opposed to channels of traffic.

Many traces of the land have disappeared in Sai Ying Pun. The building of uncoordinated structures on the waterfront has blocked important view axes to the harbor. Large leveled building sites replace small multiple terraces of the past; labyrinthine paths and pocket spaces become meaningless voids; and stonewalls and shady old trees are turned into rubbles of construction. With the building of large podium development, Sai Ying Pun is fast losing one of its unique qualities: experiencing of the land.

The transformation of Sai Ying Pun has been one of small-scale incremental change in which people of different means could find a place among diverse building types. With comprehensive urban renewal strategies introduced by the government in the 1980s and executed as public-private partnership with focus on real estate developments, the area is undergoing physical transformation and population change. The life and death of Sai Ying Pun are played out again in the familiar terms of large-scale development, gentrification, segregation, and homogenization.

The road of development for community planning based on public planning: study on the community planning of Yuzhang Street in Nanchang

Shan Huang
Zhejiang University, China

1 Introduction

The development of community in China started and promoted gradually under the special social background of transforming from planned economy to market economy, and its organizing form, work content, progress motivation etc. have been deeply influenced by rapid transformation and constant restructuring of structure. However, the communities of western developed countries are mostly developed under relatively steady social surroundings. They were established in the social system whose market economy had been relatively mature. And after long term evolvement, they have shaped a comparatively self-contained community development system. Although the urban community planning and construction of our mainland have learned from the experience and concept of those of overseas, their content and forms are greatly different from the latter because of different social backgrounds and constraint conditions of system. Meanwhile, the establishment and growth of the Chinese community are still in an exploring stage of economic and social transformation, and community form and function are far from stabilized condition. The public awareness of community essence is relatively dim, and the operating way of community still has a strong sense of administrative tendency.

The development of community directly impacts the living standard and quality of urban residents, as well as the sustainability and health of the development of a city. Therefore, exploring community planning and implementation manners suited Chinese national condition is of great practical importance. Accordingly, we take the community planning of Yuzhang Street of Nanchang, Jiangxi province as an opportunity, and public regulatory plan[i] as platform, carrying out a comprehensive and systematic research, from the perspectives of social background, characters of present conditions, impact of problems, analysis of strategy, planning measures and organizing forms etc., to provide some enlightenment for the relative studies of community planning in the future.

2 The present situation of Yuzhang Street

Divided by Yangming Road, Yuzhang Street is to the north of the old city zone of Nanchang, which is a historic ancient city. It has an excellent location:

standing on the southern bank of Ganjiang River, it faces Ganjiang Bridge Railway on its east, and the new Bayi Bridge on its west, and adjacent to urban center. After nearly fifty years' construction and development since 1949, where Yuzhang Street located has gradually evolved into an important part of the urban center of Nanchang. As Jiangxi Provincial Party Committee and Provincial Military Command stationed in this area, it even took on the appearance of a political center. (Fig 1) (Fig 2)

However, as the adjustment of urban character and functional distribution takes place, the internal and external surroundings of the street have been deeply changed, and its structure has also begun to decline and aging. Compared with other districts of the city, it shows more and more anility day after day. Based on the field investigation and relative interview, we can find out Yuzhang Street area has the following problems:

2.1 Lack of function orientation

There are lots of state-owned enterprises, construction sites and synergic supporting facilities in the street block, which mixed with living facilities and interrupt one another. As the society grows rapidly, the living pattern of planned economy seems to lag behind the development of the times further and further. Its status in the whole city is descending continuously, and its competitive power cannot be compared with the previous. The large state-owned enterprises in this area have now faced with embarrassment of shutout and change of production line and function. A great number of employees have to find their own ways out, and the improvement of their living conditions is far from being realized. Lots of plots like that are existed in the street block. Yuzhang Street, which is in the narrow crevice of history and reality, shoulders heavy responsibilities when it exploring the solutions to the series of problems such as what kind of developing way it should take, how to carry out function replacement, how to activate its growth potential, and how to offer developing opportunities for those who lost social guarantee because of the ruin of enterprises etc.

2.2 Mixture of land use

There are many fourth-class buildings among current residences with high building density and small intervals, which influence sunlight and ventilation; because of high building density and large extraneous floating population, random building and rebuilding are frequent, thus the whole surroundings are in disorder. The infrastructures have aged and cannot meet the living needs; building density is comparatively high; decent public facilities are in short; virescence is relatively poor; and the community is lack of attraction. The internal road network density is relatively low, and roads are narrow. Some

roads have not formed complete traffic network because of the dividing of *the Compound*, therefore result in certain inconvenience in trip, and difficulty in dealing with sudden events. Due to the lagging traffic planning, transportation service facilities are seriously in short, social parking lots and bus stops are comparatively sparse. The shortage in public transportation reachability also brings difficulty for the improvement of vitality of this block.

2.3 The precipitation of role transformation

China's community was developed from nearly vacuum: it was born from administration system of Mao Era. Under the trend of invalidation of omnipotent government and the disassembly of Danwei system, the government needed a new organizing and managing system to replace the former structure to keep the stability of political society, therefore, the existing resource of residential committees it could control naturally took the responsibility of transforming to community organization. Some scholars describe them as *political communities*, which is very appropriate. In reality, these communities still bear political colors – they are just simple alteration of residential committees, and their organizing structure and managing means have little difference from the previous. Whether the change is valid or not is to be examined by practice. Additionally, the re-dividing of communities is mostly operated by civil administration department, lacking overall consideration of city natural status and facility distribution etc. However, the various supporting facilities are allocated by planning departments, according to the planning requirements of residential areas and quarters. There are inevitably deviations between them, resulting in insufficiency of facilities in some community, and lack of cohesion and sense of belonging. Under such social background, the same precipitated problem comes to the twelve communities of Yuzhang Street in their role transformation.

2.4 The difficulty in the Compound's integration

As known to all, Aug. 1 Uprising is the unique resource of Nanchang. The entering of Jiangxi Provincial Party Committee and Provincial Military Command greatly improved Yuzhang's political status, and its political influence could speak for itself. To meet the requirements of governmental and military management and secrecy, the establishment of the Compound was natural. However, when the social surroundings change, the balanced self-development is broken. The government and military command are still in *the Compound*, and their self-managements do not allow external interruption; while the external society becomes activated due to the influence of market mechanism, and it begins to seek improvement of overall interest, or expects some factors in the Compound can be consistent with the external. Thus the conflict comes. Combining with the problems the street meets, the Compound

covers several relatively big blocks, and has comparatively complete transportation system inside. But the dividing of the Compound results in incapability in connecting some roads in the area, and then incapability in forming a complete network. What's more, quite a lot architectures in the Compound are among the few historic villa buildings in Nanchang city, which have important historic and cultural value. Due to lack of guidance of relative architecture protection planning, the repair by the army is so random that the phenomenon of altering the appearance and structure of the architecture at will is everywhere. The subsequent results of damaging of features and descending of cultural level are worrying.

3 The combination of public planning and private planning

3.1 The dilemma of public planning

Government-leading public planning is a planning from top to bottom, in which official urban planners are in charge of design and study, and then the relevant government departments or developers take the responsibility of implementation. In this process, the government plays the role of *parent*, while the public act as the *bystander*, at most receive some relevant investigation and interview at the beginning of the planning. Generally speaking, the main body making public planning is government, so it is governmental behavior. It holds the developing direction of a city or district from macroscopic perspective, makes overall arrangement for the various parts of a city, and offers guidance for its further implementation. It has overall and coordinated characters, and irreplaceable strategic significance for overall development of a city. But as the transformation of China economy and large-scale urban development, the pyramid type highly power-centralized development exposes more and more weaknesses of public planning. First, public planning is short of content of community planning, and without furthering into community, thus more and more planning cannot be carried out after reaching community. Under such circumstance, government has to make another plan, and thus national resources are wasted. Second, the public planning style from top to bottom loses the hold of conditions of grassroots society, various social conflicts, consequently, become more distinct. Danwei system management under long-term planned economy and the ignorance of mass participation bring about the discordance of contradiction at present stage, and, therefore, difficulty in carrying out the planning. Last, the cycle of large-scale operated public planning, from planning to practical implementation, is very short, too short to take deep and careful investigation and analysis. It is no longer suitable for the current economic system and construction development. Furthermore, it no longer accords with the world trend of sustainable development.

The public planning covering Yuzhang Street of *Regulatory planning of Binjiang Avenue (Bayi Bridge – Ganjiang Great Bridge)* has encountered dilemma of impracticability. The original purpose in making this plan is to comb road structure, solve the enterprise problems of *replacing the secondary industry with the tertiary-industry* and *replacing function.* However, due to condition limitation, the planning lacks further analysis of the development orientation of this district, and fails in predicting the functional replacement trend because of its nearness of the urban center. Therefore, during the implementation process, serious conflicts come out between the practical orientation of planned roads and community interest. The run-through of some roads needs the current community unit to be divided, or piles of buildings to be removed because of road alignment or fixation of width, etc. So when the main body is impracticable, the implementation of other relevant planning is far from being carried out.

3.2 Folk will and community planning

These years, China academia is advocating the concept of *public participation*, and different public planning also propose to actively encourage public participation and extensiveness, so that the planning can truly achieve a public participated win-win situation. But in general, the discuss and implementation of public participation in public planning still stay on the surface, the practical implementation strategy is still in short, and the practice of policy guarantee, technical support, mutual coordination etc. needed in public participation is insufficient. The shortage of content sets off the difficulty in practice. The deficiency of public participation in government-support public planning cannot be remedied in one day.

As market economy developing constantly, the social relations will be increasingly complicated in urban planning and construction, and the main behavior body of urban planning and construction will be increasing diversified and of non-governmental. The value choice and interest orientation of these main bodies are different, even conflict with each other. Take the community planning this time as an example: some residents hope to increase facilities of living service, cultural entertainment, public activities etc. in their living or working areas, while some other residents hope to decrease some of the above facilities, thinking the setting of those facilities would impact their living in the future. Meanwhile, the social demands of different communities will be somewhat diverse. Some communities have good conditions, comparatively complete functional facilities, so their demand of planning is not so urgent, enthusiasm of participating is not so high. But some other communities with bad conditions of facilities and environments are in high demand of improvement by government, so they are highly enthusiastic in participating planning, and will propose some acute problems out of the scale of planning

and investigation, expecting to take the opportunity of community planning to express their own interest.

So the main body of community planning of Yuzhang Street is individuals. We have to obey the principle of interest diversification, try to reflect their respective interests harmonically, to achieve a result that can satisfy any party. Rome is not built in a day, and public participation should be accumulated and advanced step by step. Only by doing so can the planning and design be practiced more smoothly.

3.3 How to combine public planning and private planning

Governmental planning encounters difficulty in practical implementation, while private planning based on popular will is hard to be approved by government, and short of legal basis and guarantee. Urban development is led by planning, community development is the same. The implementation and completion of planning cannot go without community planning. The problem for every one of us to think about is how to fill the vacancy at present rather than simply transplant and copy western community planning. Additionally, the current communities have the characteristics of the times: it is more than mere congregation of people in the same area living together for a long time, besides, reasonable measures should be executed for community residents' different unfixed conditions such as rebuilding of old community, construction of new community and alternation of old and new communities etc. Therefore, theory combined with practice, we conclude that the plan making at present demands a platform of governmental planning. Plan and study the community development under the framework of governmental planning can precipitate the smooth practice of governmental planning, and guarantee the interest and developing demands of community residents, even orient block developing for the developer, so every party can get the fruit it wants. (Fig 3)

Community planning relates to the various interests in community residents' everyday life. It pursues the harmony of the whole environment. It contains block rejuvenation, social construction, economic development, community involvement and community management etc., so the planning is bound to make practical arrangement and design for construction. When it comes to public planning that government authorized, examined and approved, it is on the technical layer of particular planning. When it comes to city subarea planning or city overall planning, their scales are too large, and much more considerations from macroscopic rather than microscopic will reduce the operability of community planning. The planning land of Yuzhang Street covers 4.05 square km, whose size is comparatively corresponding with that of public regulatory plan. Therefore, when making community plan, we can study community development based on this public planning platform. So that

after the completion of the plan, it can offer gist for the adjustment of government's previous public planning, and provide practical guidance for the planning and implementation of different communities as well, and finally reach a win-win end.

4 The cultivating of the spirit and atmosphere of public participation

In the process of the combination of public planning and private planning, multi-participation is a very important part, and the most basic working method. In popular words, a community demands planning, as well as the mass's opinions. But according to the present situation, there are shortages in participation spirit and atmosphere. They are mainly as the following:

4.1 The environment of public participation has not been set up yet

Since the middle of 1950s, our country has executed a set of *pyramid style* highly power-centralized managing system for a long time. Under this mode, government controls layer by layer from top to bottom, and everyone is in its relevant position. Planning, as one of government's work, is in semi-secrecy, that ordinary people have rare chance to get in touch with plan making, let alone bringing into the concept of public participation. The theory and practice exploration of *Public Participation in Urban Planning* has not walked gradually into the public vision until 1990s. But in general, this exploration still exists in form. The majority of ordinary people can only express their opinions to the planning at the final examine and approval stage or after the completion of exhibiting, which is useless for the planning. So government has been used to the mode of *big government, small society* for long. The public has been awarded some rights to know, but relatively very few rights to participate. In addition, government worries that if brings public participation totally, social contradictions can be triggered or inspired. Therefore, the environment of public participation has not been set up yet.

4.2 The social awareness of the public is to be strengthened

Community development has the characteristic of highly power-centralized, and when people are used to such style, they form an ingrained concept that city is in the work content of the government and does not relate with their own lives. They will appeal only when their lives are in inconvenience so as to get relative departments' attention and resolution. Thus the situation appears of more participation in the affairs relating to their own interest, but less participation in the affairs relating with public interest. Furthermore, the history of China's urbanization is short, while its developing velocity is quick. After the changing of identity and role, people have not switched their social concept accordingly yet, and their cultural qualities are not high, thus their initiative in

seeking social voice is not strong. Just because of the insufficient atmosphere of public participation and induction, people have limited awareness of public participation, and would be keen on their own demands if they participate. In the investigation of participation in Yuzhang community of Nanchang, what the residents care from the most to the least is respectively housing type – residential district internal facilities – residential district external facilities – community *planning*. We can conclude from this that at present stage when people's living standard is to be improved, the gap between the aim of public participation and the reality is to be minimized, and people's social awareness is to be strengthened.

4.3 The participation of developers and NPO

In the past, developers only obtained the development rights of land from government through economic way in the process of old city reconstruction and development, and began housing construction and house selling after house removing by government. There are few indigenous people among the new inhabitants, so this developing mode of overall-changing induced much castigation. Now developers have gradually started to realize the shortage of this developing mode which is lack of public participation. They spontaneously organize some similar participating activities, and achieve certain results. In this community planning, some developers actively took part in the investigation and collection of site information and the whole process of public participation. Community residents also initiatively organized some NPO in their participation. Of course, these organizations, compared with those of western countries, are just at germination stage. Under this developing background, actively cultivating NPO and creating a public participation atmosphere appear to be very urgent. It seems to be even more important in the process of community planning relating closely with the living and working of ordinary people.

5 Thinking and prospect

Under the current system and specification of present China's urban planning, only the community planning, which mostly originally initiated by non-governmental background bodies of businessmen, individuals and non-governmental organization, coordinated with the existing system and specification, can it promote community planning, realize the implementation corresponding with the national conditions, and exert the function of the existing mechanism. To meet the trend of development, community planning should progress step by step rather than achieve overnight. It needs long time to accumulate in every stage, as well as participation of various kinds in every process. At the same time, public planning's function as a platform should be brought into full play. The two kinds of planning should be promoted as each

other's supplement and optimization. And attention should be paid to the reasonable expression of community residents' pluralism in their will. What's more, a win-win development mechanism is to be established, to gain the support from multiparty interests of community in reality, which is becoming more and more complicated. China's communities are still developing under the high-speed economic development and violent social reform. Their planning is to adjust and develop accordingly constantly, and our exploration and research will go on as well.

Brazilian city planners and American city planning principles and practices: a starting point of view from Rio de Janeiro's urbanism, from 1930 to 1945

Vera F. Rezende
Fluminense Federal University, Brazil

Introduction

This article analyzes the connection between the ideas and principles of American city planning, mainly as of 1920, with those that have been proposed by Brazilian city planners years afterwards. Some of these proposals were adopted by the local administration of the City of Rio de Janeiro, then the capital of Brazil, especially during the "Estado Novo" [The New State] period (1937-1945).

That period in Brazil was characterized by great centralization of political power and decision making in the hands of the president and the state and local governments. In several Brazilian cities, such as Rio de Janeiro, restructuring projects were undertaken and new forms of urban administration and municipal organization were adopted.

During the same period, access for Brazilian professionals to technical and academic production from other countries was fostered. And, from 1927 to 1930, architect Donat Alfred Agache also contributed decisively to the circulation of ideas, bringing proposals and examples from other countries, such as those expressed in his Plan for the City of Rio de Janeiro.

There is already a recognized connection between Brazil and France regarding urbanism theory, but, in this article, we explore another theoretical connection for city planning ideas, namely, that with the United States. Among the principles and procedures in circulation, we emphasize the requirements of city plans, city planning commissions and finance for urban activities, such as "excess condemnation" (lateral disppropriation) and "special assessment" (urban improvement levy).

With this intention, we analyze articles and books written by four Brazilian engineers, Luiz Ignácio de Anhaia Mello, Washington Azevedo, Armando de Godoy and José Octacílio Saboya Ribeiro, and the proposals offered by the American City Planning Institute, registered in the proceedings of the National Conference on City Planning and in the periodical, 'City Planning', as well as books by affiliated authors, especially those cited by the aforementioned professionals as references. Many of the latter authors had been faculty members at the School of City Planning at Harvard University, which had played a remarkable role in this process due to its capacity to disseminate ideas and train professionals dedicated to the theme.

The post-1930 period and the "Estado Novo"

An understanding of the transformations in Brazilian cities in the period, 1930-1945[1], which included the "Estado Novo" (1937-1945), raises particular aspects of the economic and institutional scenario of the time: a new phase characterized by the industrialization process in the country, and the administrative reform that occurred in the institutions the State.

In political and ideological terms, the 1930 Movement[2] that brought Getúlio Vargas to power, is configured as the opposition to liberalism, to the State dominated by regional oligarchies and to the unconditional protection of the agrarian export model. It brought profound changes to the country with centralization of the political and administrative power necessary for an interventionist policy for changes regarding the industrialization process. (Moraes, 2000)

In the period, 1930-1945, political centralization mechanisms were progressively implemented extended and broadened in the Estado Novo[3], the dictatorial period, in which the Federal Government administered with totalitarian powers. The Estado Novo emerged as the consequence of a situation of hegemonic crisis in which different sectors of the dominant class proved to be incapable of controlling the political machine, thereby creating conditions favorable to the formation of a strong state. (Diniz, 1997)

With regard to the importance of the cities, this was in large part due to the industrialization process, which was driven by institutional conditions created after the 1930 Movement. In practical terms, the oligarchical federalism was replaced by politico-administrative centralization and conceded to the national state to be built, the means for an interventionist and industrialization policy. (Saes, 1984) This industrialization policy, which was part of a nation-building project, competed for the project of an urbanized Brazil.

Especially in the Estado Novo, as of 1937, the intention to build a nation was oriented towards policies for education, culture, protection of natural resources, worker organization and organization of public administration, including at municipal level. In this scenario were found municipalist ideals as elements of Brazilian nation-building.[4] If, however, we could perceive the State after 1930, and, mainly the Estado Novo as of 1937, intensely centralizing in political, administrative and financial terms, we could notice the paradoxical character of the municipalist ideals embedded in this model of State.

The explanation for this paradox is provided by Melo (1993), who, in this conception, highlights the municipality as a pre-political instance protected from the representative instances, without mediation of territorial or party-political instances. The articulation between the two levels would be ensured by centralization, which brings closer and unites the two poles.

Municipalism as a program has accompanied the discussion about cities throughout various decades. Politicians align themselves in ideological terms to this current, which preaches not only the strengthening of municipalities, but rational management and increased resources transferred to them. Juarez Távora, a participant in the 1930 Movement and Minister of Agriculture in the Getúlio Vargas Government from 1932 to 1934, was one of the advocates of the strengthening of municipalities and influenced, in ideological terms, Saboya Ribeiro, one of the professionals focused in this article.

The political and administrative centralization at federal level began soon after the 1930 Revolution, inspired in part by the procedures adopted in the USA as of the beginning of the XX century[5], aimed at greater efficiency in public service. The reform was accompanied by a series of measures, such as the creation of the institutions, like organs for formulation and control of policy, state intervention as a means of weakening or controlling the power of regionally dominant groups, councils and commissions, such as consultative organs[6].

The urbanism in Rio de Janeiro, capital of the Republic, after 1930

For an understanding of the transformations related to urban management in Rio de Janeiro after the 1930 Revolution, it is necessary to recognize the eminently political characteristic of the city, the nation's center of power, administered by mayors appointed by means of accords and permeated by discussions, such as that regarding the political autonomy of the Federal District.[7] The 1930-1937 period was characterized by great political instability and by three mayors, the penultimate of whom, Pedro Ernesto, did not conclude his mandate, as he was deposed and imprisoned. The discontinuity of the action in the urbanistic field was, as a consequence, also a characteristic of the period.

The first mayor, Adolfo Bergamini (1930-1931) remained in power for less than a year, and in the wake of the federal administrative reform measures, attempted to organize the administration[8], creating, among other measures, the "Comissão do Plano da Cidade" [City Plan Commission]. The decree, however, was revoked by his successor, mayor Pedro Ernesto (1931-1936) and re-established the former organization.

In terms of city planning, the contracting of Donat Alfred Agache, in the late 1920s, for preparation of the "Plano de Remodelação e Embelezamento da Cidade" [City's Remodeling and Embellishment Plan], had contributed to discussion about the problems of the time. But the conclusion of the Plan coincided with the 1930 Revolution and with the reaction contrary to everything that had been produced in the "Republica Velha" [Old Republic], including the Plan.[9]

Mayor Henrique Dodsworth (1937-1945), assumed office before the issue of the Estado Novo decree amid support from professionals in the technical sector, in a situation where to administer also meant take initiatives for physical urban reform. The form of action adopted was the execution of a large volume of works favored by the centralization of power in the Estado Novo era.

Outstanding in this context was the Comissão do Plano da Cidade, recreated in 1937[10], on similar lines to those utilized by administrations in the USA. Its justification was the need to devise an improvement program, contemplating pressing works. It was also an attempt by H. Dodsworth (1937-1945) to reply to criticisms of the absence of a plan for Rio de Janeiro, and mainly for not implementing "Plano Agache".

The Commission defined the Plano de Extensão e Transformação da Cidade [City Extension and Transformation Plan], a combined package of highway and urbanization projects resulting from the removal of hills and landfills in the central area. It constitutes the preponderance of urbanism understood as a set of works over the urbanism such as that proposed by D. A. Agache, based on surveys.

With this Commission, however, the bases were constructed for the institutionalization of urbanism as an activity in the ambit of the Rio de Janeiro City Hall, and in 1945[11] it was transformed into the Department of Urbanism, part of the official structure of the local administration.

In the XIª Feira Internacional de Amostras da City do Rio de Janeiro [11th International Fair of Urban Projects for Rio de Janeiro City] in 1938, the City Hall presented its projects. The exhibition was visited by President Getúlio Vargas, who was committed to opening the thoroughfare, Avenida do Mangue, later renamed Av. President Vargas. [12]

In order to viabilize this project, the "Obrigações Urbanísticas" [Urbanistic Obligations] were approved by the President of the Republic[13], an instrument similar to that of "excess condemnation", linked to the surrounding land resulting from urbanization projects. In the Brazilian version, it entails expropriation of an area larger than necessary to carry out the works, utilizing the deeds for the lots created by the new urbanization as collateral for bank finance, rendering the works financially self-sufficient.

Bearing in mind that the consciousness of the increased value of the real estate resulting from public interventions already existed, though previous governments had not tried to exploit this, the Estado Novo period, based on its authoritarian and centralizing approach, was the ideal moment for application of this new instrument: "This system of finance, which also had the merit of allowing the reallotment of the lateral land along the new avenue, deserves to be attentively accompanied by the scholars of municipal finance, and so this seems to be Brazil's first large scale attempt in this terrain". (Dodsworth, 1955, p.40)

City planning in the United States

In the USA, as of the 1920s, an atmosphere of intense discussion was consolidated by theories and experience regarding city planning propitiated by the existence of professional organizations, in particular, the American City Planning Institute, the American Society of Civil Engineers[14], the latter being more linked to works in cities, and the creation of the American Society of Planning Officials[15]. National seminars were held annually, with publications related to its proceedings and technical journals, such

as 'The American City' and 'City Planning'[16], a channel for divulgation of the American City Planning Institute. At the same time, the administrations of the states and cities were professionalized in the urbanistic field, and the Universities introduced graduate courses within the theme.

In 1917, as a result of the 19th National Conference on City Planning, the American City Planning Institute (ACPI) was founded, the first organization for city planners in America, characterized for having among its members the most active and best qualified professionals. This Institute was primarily concerned with public policy and legislation in city planning, and the nature of the profession; in its own words: "to study the art and advance of City Planning". (19th Conference 1927, p.12).[17]

The National Conference on City Planning was held in a different state each year, its proceedings being published under the title, 'Planning problems of city, region, state and nation after 1925'. The first conference occurred in 1909, in Washington, focusing on concerns regarding population congestion and housing conditions in American cities, and oriented towards discussion of the scope of city planning abroad and in the United States.

In the conference themes, it is perceived that, throughout time, the emphasis has lain on particular concerns, even though the necessary city plan, the establishment of zoning and attempts to delimit the field of the city planning have always been present. The affirmation of W. A. Hubbard, then Director of the Harvard School of City Planning, in the 1934 Conference, clarified the scope of the city planning thus:

"We are still concerned with getting straight in our own minds, …, what city planning really is, but I am afraid that we have been more successful in determining what it is not. In the first place, it is not the planning of cities alone. If the idea of planning is good it certainly applies just as much on the one hand to towns and villages and open country, and on the other to counties and states, and in some respects to the whole nation." (1934, p.1)

Other concerns, however, complement those already mentioned, such as the creation and functioning of the city plan commission, and financial management and urbanization of cities. Consulting the conferences proceedings from 1911 to 1934, we can observe that some issues are intensively focused: the discussion of the effectiveness or the progress of city planning (1912, 1913, 1914, 1916,1920, 1924, 1927, 1928, 1931, 1934); the financial gains and the economic value of city planning, the acquisition of land for public improvements and the discussion of procedures as "excess condemnation" and "special assessment" (1911,1912,1914, 1917, 1924, 1927, 1928, 1929, 1930, 1931,1932, 1934), and city planning administration and the functions of a city plan commission (1912, 1913, 1915,1917,1924,1929, 1930).

The denomination of the conference also provides evidence of the concerns focused. In 1910, it was entitled the 'Second National Conference on City Planning and Congestion of Population'. In 1933, the first after the Crisis of 1929, held jointly with the American

Civic Association,[18] was denominated 'Planning and National Recovery' and discussed city and regional planning in depression and the federal administration of emergency public works. In 1935, the first as the initiative of the American Society of Planning Officials, successor to the American City Planning Institute, was denominated 'Planning for the future of American Cities' and discussed, among other themes, the decadence of the American cities and the efficacy of the city plans.

Regarding the works of the authors cited by the Brazilian professionals, we can observe that some professionals, such as E. Bassett, J. Nichols, J. Nolen, A. Bettman and F.B. Williams were not exclusively oriented to a specific issue and discussed different matters related to the general theme of city planning.

On the other hand, R. E. Cushman and A. E. Buck were particularly devoted to the study of "excess condemnation" and "special assessment". T. Adams was oriented to the study of the history of city planning and its scope. N. P. Lewis with his book, "Planning the Modern City", influenced all other professionals on the issue of financial gains, city planning administration and city planning commissions, after its first edition in 1912, as well as W.B. Munro and his books on government and municipal administration.

Regarding city planning courses[19], there are strong connections among professional associations, especially the American City Planning Institute with the foundation at Harvard University, the nation's first Academic Department of City Planning, established in 1929. Many of its members are also lecturers or professors at Harvard: H. Hubbard[20], T. Adams, G. B. Ford, F. B. Williams, A. C. Comey , A. Bettman and E. Bassett.

Brazilian professionals and their relation with urbanism in the USA in the 1920s and 1930s

In the 1920s and 30s, Brazilian professionals defended the need for master plans, citing, in their articles and books, forms of management and instruments applied by American urbanism. Among them, the outstanding are the publications by Luiz Ignácio de Anhaia Mello, Washington Azevedo, Armando de Godoy and José Octacílio Saboya Ribeiro, the latter two authors having been significantly involved with the technical corps of the Federal District, Rio de Janeiro.

Engineer Anhaia Mello[21], through his book published in 1929,"Problemas de urbanismo, bases para a resolução do problema técnico" [Problems of urbanism, bases for solution of the technical problem] produced a treatise on municipal administration focused on urbanism, comparing the experiences of France, Germany and England, and covering the USA's proposals in greater depth.

In this book, which compiles lectures given throughout 1928 and 1929, he stressed the American initiatives in the field of urbanism. The importance of the author and this book, and their impact on other professionals is undeniable, cited by Washington Azevedo (1932) and innumerable times by Saboya Ribeiro (1936) in their publications.

Azevedo in his article in 1932 about architecture in cities, in reality an article about urbanism, states: "The true urbanism was born in Germany. The War and the financial difficulties paralyzed the German efforts, but the USA came to expand this initiative to the point of turning it into a great science. Some months ago, Dr. Anhaia Mello, ex-mayor of São Paulo and engineer, that possesses great understanding and culture with regard to urban problems, said to me, that the sole source for urbanism studies were the American books. (1932, p.151)

Although no evidence exists of Mello's trips abroad, consultation of his personal collection shows evidence of a professional oriented towards new ideas in the urbanistic field in countries like England, France and the United States, the latter being especially contemplated: "In matters of Urbanism, the Americans are in the vanguard of the world; they are Wagnerians of this science and art, while we are still rehearsing the «La donna é mobile» of fragmented projects. There, with city problems overcome, solutions are already being sought for the large districts or metropolitans regions, like New York, Chicago, Philadelphia, Boston, San Francisco, Pittsburgh, Washington and others." (Mello, 1929, p. 31)

Among the books he possessed by American authors, we can highlight the sources of some of his proposals concerning our theme: "The planning of the modern city" by Nelson P. Lewis (1922), which presents principles and proposals for legislation of urbanism and finance for the city plan; "The law of city planning and zoning" by Frank B. Williams (1922), in which are discussed the excess and zone condemnation and reallotment in the USA and Europe, plus the finance of the planning and administration in the USA, Canada, France and England; 'A standard city planning enabling act' by Herbert Hoover (1928), an act that deals with municipal planning and planning commissions and "Model laws for planning cities, counties and states" by Edward Basset, Frank B. Williams, Alfred Bettman and Robert Whitten, published by Harvard University (1935), in which planning laws, zoning and planning commissions are discussed.

Anhaia Mello analyzes the main ideas and urbanism professionals in the USA. In particular, he cites H. Bartholomew, J. Nolen, "who, after Bartholomew, is the urban planner who has most produced in the USA", T. Adams, "director of the Regional Plan for New York and environs, the greatest work of urbanism ever conducted and financed by the Russell Sage Foundation", Bettman, Bassett and Williams, "the men to whom the American cities owe the admirable progress to their urbanistic legislation, far superior to that of the old European cities" and W. B. Munro. (1929 , p.36)

On the other hand, Washington Azevedo[22] had direct contact with the principles of "city planning" practiced in the USA, where he did a postgraduate course at Harvard University in 1932. He opened a technical consulting office in Rio de Janeiro, and the title urbanist-engineer was encountered in his articles (1932, 1934). Upon consultation of his study records at Harvard University, we verified that prior to his postgraduation in "City Planning", he had already undergone another at Institut d'Urbanisme in Sorbonne, France, concluded in 1927.

The usual behavior among the postgraduate students at the Harvard School of City Planning was the sending of news to the director of the institution, keeping him abreast of their professional development. There is, however, an exchange of correspondence between H. V. Hubard, director of the "School of City Planning" and W. Azevedo, in which is expressed the importance of the ideas divulgated in the courses for his work. The exchange took place between October 1933 and October 1936, and began in response to a request from Hubbard about an assessment of the training received.

Azevedo presented the conclusion of two reports[23]. The first, about the organization of a commission for control of municipal activities in Minas Gerais State, gave rise to the book, 'A Organização Técnica dos Municipios'(1935) [The Technical Organization of the Municipalities], and the second, about the city plan for Recife, resulted in the publication, 'Urbanismo no Brasil' (1934) [Urbanism in Brazil], dealing mainly with the city plan commission.

Azevedo, in reply to a request for an assessment of the training, highlighted the courses run by A. Comey, and the technical literature that contributed to his professional qualification. Thus, he commended "The planning of the modern city" by N. P. Lewis, the 'Regional Plan of New York and its environs" - according to him, a sort of encyclopaedia, "Recent advances in town planning" by T. Adams, main author of the Plan of New York, and, among others, "The law of city planning and zoning" by F. B. Williams. In the area of municipal administration and finance, Azevedo further highlights the books written by W. B. Munro, Lent D. Upson, A. E. Buck and J. Wright. His book, 'A Organização Técnica dos Municipios' reproduces the main concepts divulgated in the School of City Planning, by which he influenced others, especially J. O. Saboya Ribeiro. Azevedo dedicated this book to Thomas Adams and William Bennett Munro, professors of City Planning and Municipal Government and Administration at Harvard University, "to whom I owe much and to whom Urbanism and Municipal Administration owe a lot (1935, p.v)"

In Brazil, the relationship of W. Azevedo with public administration and the divulgation of his ideas in the federal ambit, which compete for the acceptance and adaptation of his proposals, seemed to take place after his work for the Minas Gerais State Government, the origin of his book "A Organização Técnica dos Municipios":

"With the advent of the 1930 Revolution, the Mayors began to be nominated by the interventors. The municipal administration was centralized. .... Dr. Gustavo Capanema, then Secretary of the Interior, Minas Gerais State, understanding the need for exclusively administrative control, and, therefore, of a technical nature, submitted the problem to our opinion, in May 1932. In January of the next year, this opinion was presented." (1935, p.vii)

Gustavo Capanema, then Secretary of the Interior, Minas Gerais State, later, as of 1934 [24] became Minister of Education and Health under President Getúlio Vargas, with extension of his power over the forms of urban administration, including that of the Federal District, the capital of the Republic.

Another two engineers, José Octacílio Saboya Ribeiro and Armando de Godoy, were reponsible for divulgating the principles of American urbanism with greater proximity to the technical sphere of the City of Rio de Janeiro.

Armando de Godoy[25], as of 1923, acted in defense of a plan for Rio de Janeiro. It was he, among other professionals, who exerted pressure on the administration prior to the 1930 Revolution, which resulted in the contracting of D. A. Agache to prepare a master plan (1926-1930). After 1930, the Agache Plan was not implemented, despite having been evaluated by a commission[26] in which he was a member. Godoy disagreed publicly with abandoning the instrument, (1931,1936), having been one of the voices, along with Saboya Ribeiro, who had insisted on the importance of city planning.

His production[27], in general, is oriented towards planning as a necessity and the reproduction of examples from the USA. After his visit that country, he situated himself in this line, as in the article, "O Urbanismo nos Estados Unidos"(1935) [Urbanism in the USA], which, besides presenting a picture of American urbanism and the example of cities he had visited, defends the city plan commissions and the Nova York regional plan as an example of planning: "the most gigantic and complex plan devised until today" (1935, p.211-212). In another article in 1935, 'As conseqüências sociais e econômicas dos princípios do urbanismo' [The social and economic consequences of the principles of urbanism], cites Hoover, who, "as Minister of Commerce and later as President of the United States, contributed much to the principles of urbanism." (p.712).

Godoy was one of the voices that reproduced the guidelines of American urbanism in Brazil via his articles. On the other hand, we find J. O. Saboya Ribeiro[28], a young engineer, acting not only through articles, but also as a consultant of the Federal District Government. The structuring of the Federal District Government (PDF) as of 1937 coincides with the period in which Saboya Ribeiro was linked to the City Plan Commission, as the author of various projects. His articles and books reflect the initiatives of European countries, but dwells, just like Anhaia Mello, on American urbanism. It was only in the 1950s that he left Brazilian shores, the occasion being an international congress[29].

In a work in 1936, 'A cidade e o Estado' [The city and the State] he cited, as references for his proposals, the books by W. Azevedo, "O urbanismo no Brasil" (1934) [Urbanism in Brazil], Anhaia Mello and his book, 'Problemas de Urbanismo" (1928) [Problems of Urbanism], and N. P. Lewis, 'Planning the modern city'(1922), on themes related to the city plan commissions, the administration of the City, the figure of the city-manager and the need for the municipalist technician, cognizant of the problems of the cities. He did not, however, focus on issues of revaluation of the land for the purpose of urbanization works.

Saboya Ribeiro's statements reflected the desire for a strong, organized, anti-liberal state that solves the major national issues as expressed in the cities. Such ideals justified his affinity[30], and, as a consequence, the opportunities in advising the City Plan Commission throughout the Estado Novo period.

Principles and ideas divulgated by the Brazilian professionals

In the articles and books by Brazilian professionals we focus, the recurrent theme is the relevance of city planning and the preparation of a master plan. Besides this, Brazilian authors highlight the city plan commissions and the figure of the city manager or municipalist technician. The need to restore property values subsequent to public works and the respective are also current issues, with emphasis on the discussion regarding the advantages of the application of each one of the instruments: "excess condemnation" or "special assessment". Among the model documents mentioned, the outstanding are the 'Regional Plan of New York and its environs' (1930) and the 'Standard City Planning Enabling Act' (1928), published as guidelines for American states and cities.

With regard to the city plan commission, Anhaia Mello (1929) stated: "Another administrative device of the modern, progressive American cities (adopted by 529 of the major cities in 44 states) is the City Plan Commission. Either we adopt an identical device or we will never do complete, durable work in the field of urbanism"(p.70)

And he cited A. Bettman in the National Urbanism Conference in Dallas: "The need of this organ arises from the very nature of the problem of urbanization. Each municipal government organ is in charge of a specialized type of physical development or administrative activity. For this reason it is inevitably partial in its particular type. The adjustment of these parts can only be made by an organ interested (but disinterested...) in the problem in its entirety." (p.71)

In this regard, Armando de Godoy, (1936) in an article in which he evaluated the administrations of the City of Rio de Janeiro, issues the following warning:

> "The history of innumerable North American cities shows us the enormous services that the City Commissions may render to the population centers, when they are well constituted and dominated by high social purposes: and aesthetics. The urbanism commissions function as an intermediate organ, of great utility, between the government and public opinion, enormously facilitating the tasks of the municipal authorities." (1936, p.309)

Saboya Ribeiro, in 1936, defended the institution of management of the cities by commissions, citing the City Plan Commission with the purpose of "overseeing the growth of cities and their improvement; apolitical commission and outside the administrative sphere of the municipalities and has rendered great services to cities like New York." (1936, p.92)

His administrative model for cities was via councils or independent commissions of elected representatives, utilized by the local administration in the U.S.A, which commenced around 1900 and radiated out to various states, reaching 400 cities by around 1915. Some contemplating the figure of "manager", a technician without a political link who managed various municipal departments. (1936, p. 89)

For Azevedo, the commission should also include cities and regions. For this reason, according to him, the most comprehensive was: "that in which I include as consultants the technicians of greater universal reputation, the 'Regional Plan of New York and its environs', which covers an area of 14,200 sq. km, including 400 cities and part of 3 states. In 1915, Arthur C. Comey, was already arguing in favor of cooperation among the studies regarding state and municipal public services."(p.180)

The proposals found in the books by Azevedo (1934, 1935) are mainly related to the administrative organization of the states and municipalities. Among the measures "to rationalize and 'industrialize' the municipal administration" (1935, p.7), in his words, reaffirms the importance of the city manager, a specialized technician to be maintained in the administrations and independent of political groups, in accordance with a proposal presented by, among others, N. P. Lewis.

However, Azevedo did not mention "excess condemnation" as a means of financing urbanization, but "special assessment", as evidence of the divergence of opinions on the best instrument: "The widening of streets must be financed, as already mentioned, by taxes in general and special ones created for this purpose, that is, what the Americans call "special assessments". After a certain time lapse, the onus of these taxes is borne by the parties benefited by the improvements. In Brazil, these are termed improvement taxes. Various methods were created to determine what would be a fair distribution of such tax and it can be presumed that the scheme presented by Nelson P. Lewis is the most satisfactory." (p. 121)]

The discussion about the advantages arising from the utilization of "excess condemnation" or "special assessment" took place in Brazil, in the same period and in the same way as in the USA, and intensified in subsequent decades. Mayor H. Dodsworth (1937-1945) in his book published in 1955 about the opening of Avenida Presidente Vargas, stated: "An attitude of prudent reserve regarding the results is what is most suitable in the face of the plans of 'excess condemnation'. Even admitting, however, that the success of the plan (Av. Presidente Vargas) from the financial aspect was complete, we will have to consider that the expropriation by zone constitutes an exceptional financing process, which, only in rare cases, can be effectively applied, and that, from the fiscal point of view, is unjust and unequal." (1955, p.41)

He stated, citing, among others, R. E. Cushman that the instrument presented great risks of financial failure, constitutional difficulties and disadvantages in relation to "special assessment", regarding the revaluation of the land.

Final considerations

In underlining the importance of the American participation in the formation of urbanistic thinking in Brazil, in particular, in Rio de Janeiro, the Federal District, we cannot isolate it from other branches, whose models reach us sometimes via the hands of the foreign professionals mentioned in this article. Authors that are featured in the Brazilian technical literature through their articles and books, in particular, T. Adams (an English

urbanist), W. B. Munro, F. L. Olmsted, F. B. Williams, reproduce the English, German and French experiences as an introduction to the theme of planning or as a counterpart to that practiced in the USA, which shows us the importance of these initiatives as constituents of the knowledge field of urbanism.

It is also befitting to recall the importance of French urbanism brought by D. Alfred Agache[31] invited, in 1926, to devise the plan for the City of Rio de Janeiro. The contribution of this plan to the discussion about the problems of the city in that period is undeniable, and it should also be stressed that among his proposals there are instruments that we are discussing[32]: the city plan commissions and the procedures for recovery of land value arising from urbanization projects.

On the other hand, we must not forget that other Brazilian authors also dedicate themselves to the study of experiences in France, including those linked to modernist urbanism and other urbanistic experiences in England or Germany in the period covered by our research.

The point presented here, therefore, does not consist of attributing supremacy to a particular school in the formation of ideas, but shedding light on a less discussed current, perhaps by its presence in the sphere of Brazilian professionals, more due to issues related to municipal administration than the general principles of urbanism. Even so, we must highlight that other themes, contemplating examples of American experiences also reached us, such as those related to parks, free areas and the highway and transport system as of the 1930s.

Finally, the links between the urbanistic thinking of Brazilian professionals and the technical literary production from the United States lead us to recognize the divulgation capacity of this current that reaches us and influences government practice. The explanation for its power seems to lie in the circulation of the innumerable books and articles produced by American professionals, propitiated mainly by the annual holding of the National Conference on City Planning and by the publications resulting from it, such as the Proceedings and the magazine, 'City Planning'. Besides this, as we have mentioned, this is due to the recognition of postgraduate city planning courses in that country, that began to have as early as 1929.

As regards Brazil, what appears to be clear is that, in the period following the 1930 Revolution until the end of Estado Novo, there was a political and ideological conjuncture that included the municipalist ideals, and this was transformed into measures for rationalization of administrative organization. This setting was favorable to receiving proposals from American city planning and were adopted, in the case of the City of Rio de Janeiro, into the City Plan Commission and the institution of the "Obrigações Urbanísticas" [urbanistic obligations], based on "excess condemnation", procedures and options in matters of city planning, adjusted to the country's reality at that moment.

Notes

[1] On this subject, see Décio Saes, (1984), Eli Diniz, (1997) and M. Célia M. de Moraes (2000).

[2] After November 1930, Getúlio Vargas, head of the Provisional Government, suspended the 1891 Constitution, dissolved the National Congress and the State Assemblies, and replaced the governors by appointed interventors.

[3] The Estado Novo was characterized by a major concentration of the political power and means of communication in the hands of the President of the Republic, publication of the 1937 Constitution and the dissolution of the parties, besides the closure of the National Congress, State Assemblies and Municipal Chambers. The municipal mayors were designated by the interventors appointed by the President.

[4] An example highlighted by Melo (1993, p.4) is the proposal, in the 1934 Constituinte [Constitutional Convention], from ex-lieutenant and Minister Juarez Tavora for reorganization of the country into a municipalist federation. In it, the states would perform the role of intermediary between the sovereign union and the autonomous municipalities.

[5] In the USA, procedures adopted in the "Progressive Era" and others by H. Hoover, responsible for measures in the management of cities, constituted models for other countries. Favorable attitude toward urban-industrial society, belief in ability of experts and in the efficacy of government intervention formed part of the principles of the "Progressive Era."

[6] Decree no. 20.348 of 20th August 1931, issued by the Provisional Government, instituted consultative councils in the states, in the Federal District and in the municipalities, limited independent financial activity at these government levels, dictated rules for public service, and, moreover, suppressed municipalities via small annual budgets.

[7] The autonomist banner used to identify Rio de Janeiro as the "land for everyone, except its own" or "an attractive head that does not think". Getúlio Vargas allows the autonomist proposal, but yearned to construct a solid axis among the political forces and only then allow it. (Sarmento, Carlos Eduardo, lecture on 3rd September 2007).

[8] Decree no. 3.622 of 14th September 1931.

[9] Denomination given to the republican period prior to the 1930 Revolution.

[10] Decree-Law no. 6.092 of 8th November 1937, approved by President Getúlio Vargas. It constituted a recreation given that another had already existed in 1931.

[11] Decree-Law no. 8.304 of 1945.

[12] The avenue, inaugurated in 1944, with a width of 80 m, resulted in the demolition of 525 buildings.

[13] The Obrigações Urbanísticas [urbanistic obligations] were approved by Decree-Law no. 2.722 of 30th October 1940, federal decree, and regulated by the City/Town Hall by Decree no. 6.896 of 28th December 1940.

[14] The American Society of Civil Engineers (ASCE), the oldest national engineering society in the United States was founded in 1852.

[15] The American Society of Planning Officials was founded in 1934, an organization for planners, planning commissioners, and planning-related public officials.

[16] In 1925, City Planning no. 1 was published.

[17] The institute changed its name to the American Institute of Planners (AIP) in 1939 and later joined with the American Society of Planning Officials (ASPO) in 1978 to form the American Planning Association (APA). (Hopper, Mary, 2000)

[18] The National League for Civic Improvement was established in 1900, and merged with the American Park and Outdoor Association in 1904 to form the American Civic Association. In 1935, this organization merged with the National Conference on City Planning to form the American Planning and Civic Association. (Cornell University Archives, 2008)

[19] Education in city planning was first provided in the School of Landscape Architecture in 1909. In 1923, an optional curriculum was established leading to a master's degree in Landscape Architecture in the field of City Planning, and, in 1929, a separate School of City Planning was founded.(School of City Planning, 1930, p.9) The second course was founded in the Massachusetts Institute of Technology – MIT in 1932.

[20] H. Hubbard , director of the School of City Planning in Harvard was editor of the magazine, 'City Planning' for 10 years.

[21] He was born in 1891 in São Paulo and concluded his graduation as architect-engineer in 1913. He was professor of city planning and Mayor of the City of São Paulo for two periods during 1930 and 1931.

[22] He was born in 1904 in São Paulo. He concluded his graduation in Mackenzie University in 1923. His office in Rio de Janeiro was situated in the Edifício Castelo Avenida Nilo Peçanha 151, 803/804. Although not stated in his educational school record, we deduce from the information in later correspondence that, in 1932, he was attending the course on City Planning at Harvard University. (Harvard Archives, consultation in October 2008)

[23] Letter sent to Hubbard on 27th November 1933.

[24] In 1935, once again, we found Azevedo as a technician in the confidence of Minister Capanema, commissioned to advise him on the choice of project for the university campus in response to the reactions of Brazilian professionals against the invitation made by the Minister to the Italian architect, Marcello Piacentini, who designed Rome University campus, executed under the fascist regime.

[25] He was born in 1876, in Minas Gerais State, and died in 1944. He graduated as an engineer in 1903 and was the editor of 'Revista Municipal de Engenharia' from its foundation (1932) till 1943.

[26] The Plan was examined in 1931 by a commission, which included Armando de Godoy (president), Henrique Novaes, Lúcio Costa, Arquimedes Memória, Ângelo Bruhns, Raul Pederneiras and José Mariano Filho, who decided to approve it with modifications.

[27] Godoy was the reporter of the commission that prepared the first Code of Urban Works for Rio de Janeiro (Decree 2021/1924, Decree 2087/1925). He stated that to draft it "he was greatly inspired by the celebrated work of Lawrence Veiller, 'The Model Housing Law'". (1943, p. 320).

[28] He was born in Ceará in 1903 and died in 1969. He graduated in engineering at Escola Politécnica do Rio de Janeiro. His professional activity was mainly in the City of Rio de Janeiro.

[29] In the 1950s, the engineer participated in an International Congress in Puerto Rico. This information was provided by his son, J. O. Saboya Ribeiro Filho, on 22nd February 2008.

[30] After the decline of the Estado Novo, his texts contained críticism of the excessive centralization of the central government, in detriment to other forms of management by commissions. Saboya Ribeiro, J.O. 'Urbanização do Rio de Janeiro e o Problema do Tráfego', Conference at Clube de Engenharia, Revista do Clube de Engenharia (Rio de Janeiro, BR: November 1948), p. 329 and 'Por uma política de descentralização urbana', Revista do Clube de Engenharia (Rio de Janeiro, BR: November 1953), p. 57.

[31] In Anhaia Mello's collection there are books by D. A. Agache: Comment reconstruire nos cites détruites (Paris, FR: Librarie Armand Colin, 1916), La remodelation d'une capitale, aménagement, extension, embelissement (Paris, FR: Société Coopérative d''Architectes, 1932).

[32] The circulation of ideas between the USA and France resulted in Agache's article, 'City planning in the United States' published in the magazine, 'City Planning', the official organ of the American City Planning Institute, vol. VI, October 1930, p.264-269, in which he analyzes different trends in American city planning.

A study on 'flexibility' and 'mobility' of mega-structures design shown after 1960's architecture – urban theory

Jee Hyun Nam
The University of Tokyo, Japan

1. Introduction

1-1. Purpose and background

Banham addressed the realization a few years earlier, in his melancholy epilogue to Megastructure: Urban Futures of the Recent Past(1976). Megastructures and other experimental practices of the 1960's embraced the period's liberation sentiments and the "belief in the permissive and the open-ended, in a future with 'alternative scenarios".[1]This was quite different trial from the modernist dreams of a totalizing environmental control which urge to impose a simple and architectonic order on the layout of human society and its equipment. Rapid economic development and concentration of population and industries in urban areas have aggravated space problems in urban areas. As the space available for development is limited, rational and multi-dimensional development of the land got to be needed.

Questioning of modernism was of course nothing new; from New Monumentality, Neo-liberty, and the multifaceted work of Team 10 to practices that embraced system theory, cybernetics, and the behavioral and social sciences after modern architecture had been repeatedly challenged throughout the decades following the Second World War. Yet after experimentation with new technologies and new social subjectivities in the 1960s, the '70s marked a watershed and a distinctly post-utopian turn.[2]

This paper begins with the investigation of the background of Avant-garde architecture's theory covering the theory of ideal cities in 19C~20C. The reason why we focus on the period of 1960~70s experimental movement after CIAM is that it seems to be reasonable to see this period as turning point of the urban theories' paradigm in 20th century. Since 19th century, we try to see the Ideal cities which expedite the birth of modern urban theory and radical creative suggestions of the early 20th century in the terms of 'historical avant garde'. The work of number of British and European architects and urbanists(often called the radical avant-garde) will be discussed within the greater intellectual and cultural milieu of bodily and psychological freedom, liberation, and permissiveness that exploded during the 1960s and early 1970s. Themes of liberation and freedom were commonplace by the mid-1960s: the civil right, feminist, and free speech movements were only a few of the numerous peaceful coalition that formed under the banner of freedom.

The purpose of this study is to clarify the meaning of 'Flexibility' and 'Mobility' of mega-structure design shown in the experimental architecture movements and theories after CIAM (Confress Internationaux d`Architecture Moderne) which was finished with 10th conference in 1956. Throughout this trial, the concept and features of sustainable urban

growth of experimental and radical architecture-urban theories can be found and understood as the possibility to be able to adapt to the contemporary cities.

2. Ideal cities and new urbanism theories

2.1 19C ideal cities theory

An underlying assumption of was the rationalism, functionalism, and mode of production espoused by the modern movement was analyzed and critiqued by this third generation of architects who ultimately found the "modern project" to be unfinished, alienating, and repressive. It was the modern ideal of architecture as rational and functional , and its utopian desire to engender a better world through

the symbolic representation of the mode of production, that this generation of architects who grew up during the war both celebrated and critiqued.

European modernists like Charles-Edouard "Le Corbusier" Jeanneret and Ludwig Hilberseimer were revolutionaries, fascinated with large-scale schemes that would wipe away the old order and comprehensively reorganize cities for personal mobility via the automobile. The selling points

were speed, efficiency, cleanliness and progress, a message that played especially well in America.

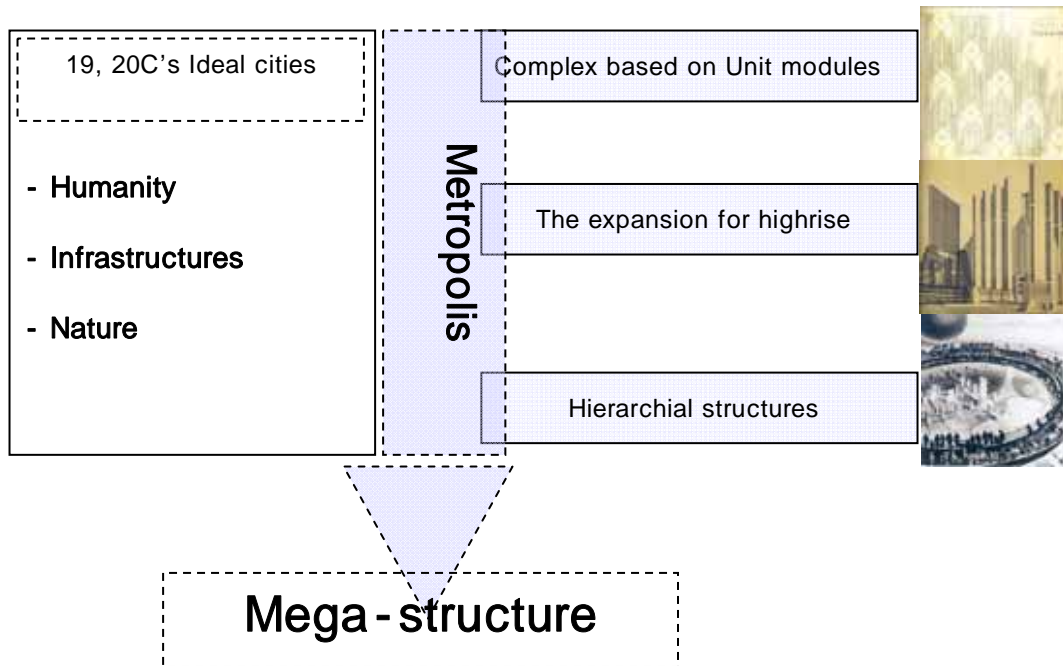
There was nothing new about proposals for a vertical, industrial metropolis. By the 1920s, various visions had been floating around for over a generation. Possibly the earliest was King Champ Gillette's "Metropolis," which he outlined in his book *The Human Drift* (1894). Gillette proposed a city of high rise towers to be located in the region of Buffalo, NY and powered by Niagara Falls. Everyone would live in 25-story apartments arranged around domed atria.

Gillette proposed a well-connected street network made of hexagonal blocks and triangular, glass-roofed islands. Below the surface were three levels for electric transport, deliveries, maintenance and infrastructure. Gillette's blocks were 900 feet across, which was large for a pedestrian-oriented plan but on par with Manhattan's 800-foot blocks.
Visions of the vertical metropolis continued to catch the public's fancy. William Robinson Leigh, a painter of wilderness landscapes and Indians, painted his atypical "Visionary City" in 1908. Leigh portrayed the urban superstructure of the future as a vertiginous massif illuminated by a ruddy sunset. But even this mega-structural vision had a well-connected thoroughfare network, with bridge crossings spaced at regular city block intervals.

"King's Dream of New York" appeared in the 1908 annual souvenir book of New York architecture published by the Moses King Corporation. A more bustling version than Leigh's future, this was the Manhattan of 1908 compounded vertically, yet retaining its fundamental pedestrian orientation at ground level.

In Chicago, planner Daniel Burnham was commissioned to create a plan for the Chicago region. Burnham was the most famous planner in the nation, having designed and built the epochal 1893 Chicago World's Fair and having planned the National Mall in Washington. Burnham's 1909 Chicago plan proposed multilevel thoroughfares snaking through downtown with towers rising above. The upper level was to be a grand boulevard for pedestrians and vehicles, while the lower level would serve as an intermodal freight distribution network. This was actually built (albeit for automobiles only) as Wacker Drive in 1924-26. The vertical metropolis was in the Zeitgeist of the day — but always with a pedestrian and mass transit orientation.

2.2 The critique about the modern movement

Le Corbusier made the most dramatic leap yet towards the auto-oriented city. He demanded that existing cities be razed and built anew from the ground up. He proposed a thoroughfare network composed of multi-level freeways, forming a grid of superblocks 1,300 feet on a side. All citizens would live in 60-story towers and slabs, creating densities of 400 people/acre while also freeing most of the surface as open space for sports and decorative landscaping.


In Le Corbusier's concept, the street was abolished. He opposed the placement of residences next to streets with a fundamentalist's fervor: Because freeway ramps would connect directly to the towers' garages, there was scarcely any need for people to walk anywhere. But in case they did have the desire, there would be underground tunnels allowing pedestrians to access neighboring superblocks and streetcar stops.
The repetition of the blocks resulted in too much uniformity. Every natural thing was excluded: no tree or grassy area broke the monotony. The result was more a necropolis than a metropolis, a sterile landscape of asphalt and cement, inhuman in every aspect.[3] Another mega-structures' theorist, Ludwig Hilberseimer said like this from 'Grossstadtarchitektur' which was published in 1927.

> "The megastructures basically depend on the two factors: the room as the basic unit and urban structure as total system. Basic housing cell, the total urban system and the single unit as the gradient establish the residential complex block and decide the housing type."[4]

This explains that each cell unit is main important factor to decide the urban design. In short, the metropolis shown in modern ideal cities is the mega-structure as the complex based on the basic cell unit.

In the late 1920s, Hilberseimer began to theorize more dispersed settlement patterns with more green space. He proposed a strict separation of uses into dedicated districts: industrial, commerce and administration, and residential. He developed "branching" or hierarchical thoroughfare patterns to eliminate automobile conflicts and danger to pedestrians.

However, the complex of Cell of Hilberseimer got rid of the possibility of diversity or flexibility which can be different from the individual residence and provided the massive productivity. There is the limitation that the networks of cells appear as the uniformed features in any environment. Here, we can suggest that another possibility for the future urban needs was the autonomy which were disregarded in modern urban theory and could be important alternatives as the new demands for future system in order to be able to response individually and spontaneously according to the residential environment

Mega- structure

3. "Mobility" and "flexibility" of avant-garde movement after 1960s

3.1 The birth of experimental movement of 1960s

As Europe recovered from the ravages of World War 2, many of the youth of Britain, France and Italy turned away from the brute reality of their broken cities and shattered lifestyle and began to seek a new life through education.

The next generation of young European and British architects who went to school during 1950s and began to practice and teach during the late 1950s and early 1960s were less convinced by Modernism's social and formal aims, but were attracted to the architectural potential of advances in technology that were the handmaiden of progress. Instead of looking to the more formalized work of Le Corbusier and Mies van der Rohe, They championed designers such as Buckminster Fuller and group like archigram, Haus-Rucker, and Superstudio and architects such as Hans Hollein among many others embraced the ideology of liberation, freedom, and pleasure that permeated Europe and the United States during the 1960s.[5]

3. 2 The meaning of 'Flexibility' and 'Mobility' of Megastructures

The various architecture group of 1960's tried to make various meanings in the aspects of "Flexibility" and "Mobility" to the transition history of architecture. "Self-control" make it possible for resident to intervene positively in circumstances by application of a demand for residence's environment. "Flexibility" enabled to examine several experiments as alternative proposal about complicated technology at the side of

facilities. It became the factors to be able to recognize the limitation of modernization and arouse the experimental and practical architectural movement and groups such as TeamX, GEAM(Group d'Etude d'Architecture Mobil), Archigram, Metabolism, Superstudio and Archizoom.

This main issues of ideal cities were Human Circumstances, Infrastructures, and High density of residence. Those issues became the basic idea for expanding modern design of metropolitan After the Second World War II. The rapid economical growth resulted in the excessive belief about the mechanical response and caused the problem of lost identity and isolated settlement. This brought some changes, such as mega-structures through network, free-developing structures based on infra, and high density residence of new form. Additionally, "Self-control city as a foundation of mental state" and the "Flexibility including potential movement" are two factors. It came to be critical focus that can figure out features of avant-garde architecture after CIAM.

Modern architecture		Avant'garde Urban Architecture	
Restricted space		Network space	Mobility
Fuctional Space	Avant'garde Urban Architecture Theory in 1960's	Interchagne space	
Introduce the meaning of Time		'Mobility' thorough physical network of Infrastructures	
- Human Environment	Humanism	No- directional Free growth structure	Flexibility
- non limited Growth cities based on the Infrastructure	Infrastructures	Organic Growh of densed low rise	
- High rises on the green	density	Multi layered groth of 'Flexibility'	

1960 is the most critical period to understand the change of paradigm which show the transformation of the architectural movement from the CIAM which was the fortress to aim the rationalization and standardization of modernism to the TeamX which suggested mobility, change and growth, cluster and Urbanism as part of habitat.

4. The features of mega-structures

The hypothetical environments proposed by the so-called mega-structuralist drawing of groups like the international situationists, the Metabolist, and the Italian Futurists as well as the evolving extraterrestrial architectures of space stations and satellites is not the

only fantasy and experimental world anymore. Offshore oil exploration was only a nascent industry in the 1960s when megastructuralist images began to emerge in European architectural circles. Works like Yona friedman's spatial city series and archigram's Plug-in city proposed a utopian vision of a truly three-dimensional and infinitely expandable urban environment, bearing an uncanny likeness to the technology. Ralph Wilcoxon defined the megastructure in 1968 as:

> Not only a structure of great size, but… also a structure which is frequently: 1 constructed of modular units; 2. capable of great or even 'unlimited extension; 3. a structural framework into which smaller structural units(for examples, rooms, houses, or small buildings of other sorts) can b built- or even 'plugged-in' or 'clipped-on' after having been prefabricated elsewhere; 4. a structural framework expected to have a useful life much longer that of the smaller units which it might support.(Wilcoxon, 1968, p.2)

The emerging utopian vision was a metropolis as a machine: an autonomous, adaptable urban environment.

4.1 "Flexibility"

		TeamX	GEAM	Archigram
Flexibility	Unit and total	Addictive Unit	Independent unit	Changeable Unit
	Exchange and Reponse	Human and Human	Human and Architecture	Human and System
	Conservation and expansion	Existing city and flexible system	Existing city and upper layer	Selective choice of existing cities

4.1.1 Unlimited expansion of unit order

- Metabolism's Capsule idea

I intended my capsule spaces to be a declaration of war in support of restoration of the oriental individualism, which has been lost in the process of restoration of the oriental individualism, which has been lost in the process of modernization (Capsule Declaration , 1969)

The capsule space, which is a representation of the oriental individualism, is not a part of the piece of architecture to which it is attached. The capsule and the building exist in contradiction yet mutually include each other. Such Architecture and cities would exist in contradiction but would mutually include another. The same kind of relation should exist between architecture and nature and between human beings and technology. The philosophy of in-between spaces and en-spaces should help make possible a change of direction towards attaining such relations.[6]

4.1.2 The changes of situation and event

Urbanity and Architecture can be conceived as a flow between permanent and transient polemic by developing a conceptual system in which the physical arrangement of event-facility spaces is disassembled. "Even spaces' become the

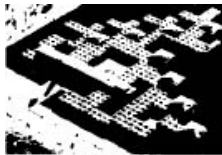
- Situationist(SI)

The Situation: this concept, central to the SI, was defined in the first issue of their journal as "A moment of life concretely and deliberately constructed by the collective organization of a unitary ambiance and a game of events." As the SI embraced dialectical Marxism, the situation came to refer less to a specific avant-garde practice than to the dialectical unification of art and life more generally. Beyond this theoretical definition, the situation as a practical manifestation thus slipped between a series of proposals. The SI thus were first led to distinguish the situation from the mere artistic practice of the beat happening, and later identified it in historical events such as the Paris Commune or the Watts riots}, and eventually not with partial insurrections, but with total revolution itself.

4.1.3 frame structure for sustainable growth

Constant Nieuwenhuis' New Babylon Project

The technological and visual similarities between the elaborate structures of the new Babylon and the blustered grouping of oil rigs common today are striking- the raised platforms, the vibrant colors, and flexible space-frame systems composed of an infinitely expandable plastiche of parts rather than an architecturally organized whole. Morever,

the rig as an autonomous floating city seems to exceed even the most far-fetched futurist ideas of utopian urbanism.[7]


4.1.4 permeable boundaries(public-private)

Georg Simmel emphasizes the struggle between the private and the public in his description of the urban experience.

> 'Since contemporary urban culture, with its commercial, professional and social intercourse, forces us to be physically close to an enormous number of people, sensitive and nervous people would sink into despair if the objectification of social relationships did not bring with it an inner boundary and reserve.(Simmel, 1997)'

4.2 "Mobility"

> 'The future environment will be where you may find it. If there is an upsurge in designing for mobility of society and mobility of facilities, so that the previous limitations of location and institution are overridden, we shall reach a point where the whole of territory is part of a responsive environment.(Cook, 1970)'

		Team X	GEAM	Archigram
Mobility	Infra structure	Recongnized infrastructures	Insulting system	Moving Infrastructures
	Inbetween Flexible structures	Continuous Pedestrian network	Indetermination Space	Intermediate space for circulation

4.2.1 Organic structure of pedestrian network

The development of pedestrian network that covers diverse human activities creates diverse space organization methods, viewing the train station area from the pedestrian network perspective links underground and above ground spaces more closely.

- Alison and Peter Smithson's Golden lane

This study was concerned with the problem of identity in a mobile society. In the old tradition, the street ouside the house is the first point of contract where children learn for the first time of the world outside. Urban structuring diagram in which Golden Lane-type housing weaves between existing buildings interlaced with main roads. The street mesh slots into the vertical circulation of such integrated deck and complexes. Using this concept, the word 'cluster' was introduced at CIAM 10 at Dubrovnik in 1956. Intention of these studies was to show in terms of actual built network forms that a new approach to urbanism was possible.

There are two interrelated systems of movement and two interrelated geometries: the upper level platform net for pedestrian and the lower-level street net for vehicles.[8] Pedestrian upper level platform net crosses the vehicular street net between every street intersection. At these points, the two systems are connected by continuously running public escalators.

4.2.2 Potable structures

- Fuller's DDU project(1941-44)

The dymaxion Deployment Unit(DDU) marked a significant turning point in Richard Buckminster Fuller's research agenda on the industrialized house since the hiatus to his 4D-Dyamaxion House project in the mid-thirties. In the larer context of Fuller's humanitarian proect of a 'house for every one', the military patronage that enables the DDU to pose outstanding questions with respect to the issue of oppprtunism, necessity and complicity. DDU is the type of DUchamp 'ready made.' The whole concept of what is modern has been changing. This invention meant that the new need for future is uprising as a machin for living, with the accent on the mechanical equipment, the possibility of mass production, the notions of portability and self-sufficiency.[9] In an attempt to redirect the destiny of the DDU, Fuller tried to ascertain the viability of his structural adaptation to the construction of air base facilities. The limited qualities of DDu recall yet another of Fuller's earlier artifactual productions, the DTU(the Tree wheeled Dymaxion Transport Unit) of the thirties-a personal omni-medium transporter capable of traversing land and sea. By mid-1956, with the success of the geodesic structure as a radome-deployment along the DEW-line(Distant Early Warning) halfway around the north pole, fuller's 1928 projection for a portable trans-continental portable environment system appeared to be partially fulfilled. Like this, He made a strategic choice to fucus on the enclosure-structure technology functioning as the portable facility to support the nomadic life.

- Peter cook's Blow-out village

Peter cook's blow out village presented a transportable environment that could be used in disaster areas or for less serious and more playful events. "Mobile villages could be used everywhere to rehouse people hit by disaster, for workmaen in remote areas, and

as fun resorts sited permanently or seasonally at the seaside and near festivals. When not in use the village was quarter size.". Archigram 7(and the work done between 1966 and 1967)codified the group's interest in soft and mobile solutions for the critique of dwelling and permanence.

- Mike Webb's Cushicle(1966-7)

The cushicle, designed by Mike Webb in 1966-7, was to be a fully serviced, semi-autonomous nomadic unit(Cook, 1999). It comprised two main components- a chassis, or spinal system, to provide the structural support to carry the required appliances, and an inflatable exclosure to provide shelter, along with a series of viewing screens. Mike Webb also proposed the suitaloon, conceptually an extension of the cushicle, in1968(Cook, 1999). In this design the suit became the base unit that provided movement, a large envelope and power. The possibility of community development was enhanced by the inclusion of a key on each suit, which allowed envelopes to be grouped together if desired.

4.2.3 Spontaneous infrastructures

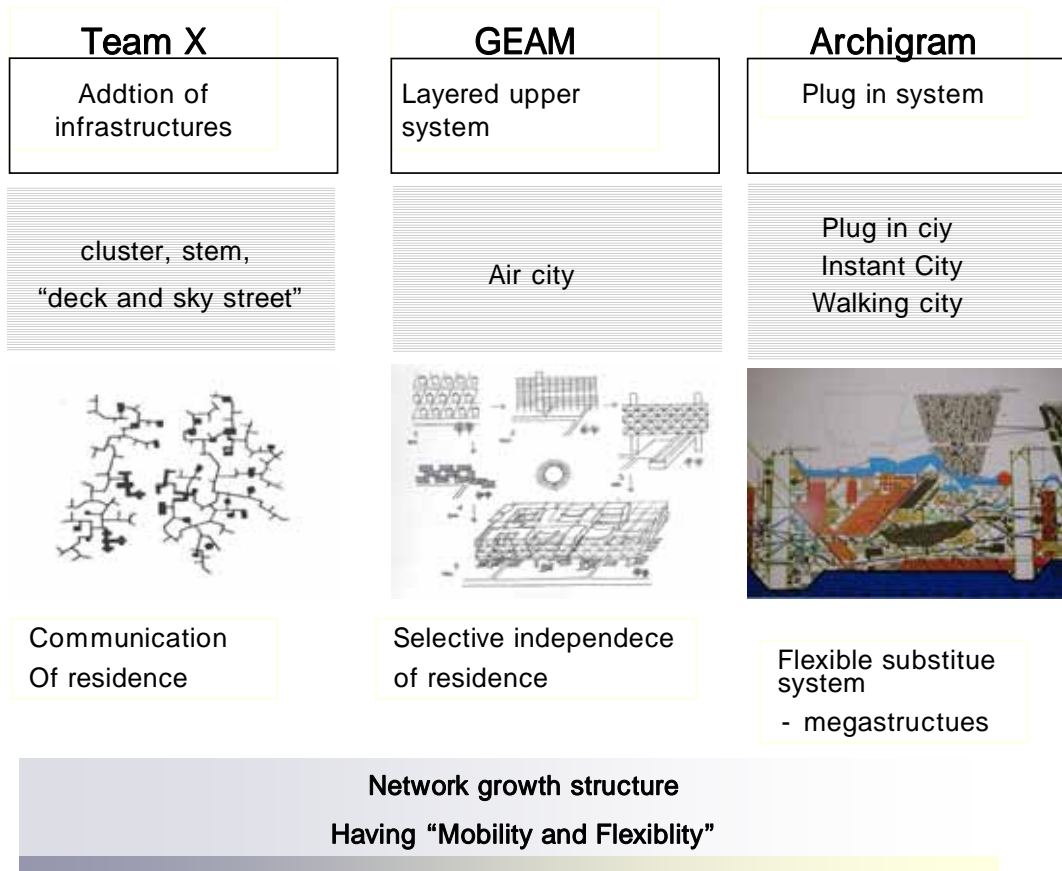
- Achizoom Associati, Non stop city

For Archizoom Associati, to pretend that functions had particular shapes was a false qualification of Modernism that would be eliminated. The factory and the supermarket become the specimen models of the future city.: optimal urban structures potentially limiltless, where human fuctions were arraged spontaneously in a free field, and made uniform by a system of micro acclimatization and optimal circulation of information. Achizoom's non stop city was to be made up of a totally artificial and homogenous infrastructure of residential districts. These free and equipped spatial systems were called "residential parking" lots that would allow inhabitants to appropriate for their individual and spontaneous uses.

Team X	GEAM	Archigram
Addtion of infrastructures	Layered upper system	Plug in system
cluster, stem, "deck and sky street"	Air city	Plug in ciy Instant City Walking city

Communication Of residence	Selective independece of residence	Flexible substitue system - megastructues

Network growth structure

Having "Mobility and Flexiblity"


Team X showed external developing structures by adding infra system from the existing core. And GEAM show internal developing structures which is a organically layered combination of upper and lower parts extend personal characters into the inside through space frame structures. In the case of Archigram, They propose automatic network system which acquired free control system (plug in system).

They all have common features from the point of taking sustainable network systems which obtained "Mobility" and "Flexibility" .

5. from the mega-structures (flexibility+mobility) to mega-city for transit oriented development

The strategy for the mega-structures of modern times is more symbolic, integrated and multi-dimensional solution for quality of human life unlike the other suggestions of direct and physical solution in 1960's avant-garde architecture-urban theory.

They tried to suggest the unlimited growth of high density, open structures for undetermined situations, flexible frame based on mobility, Nomadic residence based on infrastructures, etc.

Currently, the train station area share the cores of urban transportation and play a

pivotal role in the area development. But disconnection of urban blocks, high density use of land and other problems exist and they haven't fulfilled their functions. In each cases, they had a important role in modern TOD area as a starting point to discuss about the relationship between architecture and urban design fields having the issues of urban circulation and multi-dimensional pedestrian network. The existing urban planning of the train station area is based on spot development that emphasizes commercial and economic efficiency. But the underground development in recent years requires flexible and diverse designs that are closely related to the community and that can handle large floating population. When we consider the fact that the train station area is used by the public, systematic planning technique that emphasizes total urban network is more appropriate than special purpose unit planning. Therefore, the development of underground pedestrian network is important because it incorporates urban network by utilizing underground and above ground spaces rather than using existing individual building or block development method.

We have two important standpoint about the multi-dimensional space of Transit Oriented Development.

" the effective and flexible utilization of urban space(MXD) "
" public-open-space giving multi-dimensional pedestrian network "

5. Conclusions

In conclusion, the radical movement after 1960s such as Team, GEAM and Archigram produced several types of urban solution, such as Infra Architecture, Flexible residence of high density, and Systematic mega-structure. Also they promoted the Sustainable Network through the open possibility of undetermination and variety by residents, not by intention of developer. They have the several similarities and differences in the way to support their Growth Concept from the point of the "Self-control" and the "Flexibility". Therefore, this study shows that they produced the mega-structures which can be the possibility of the sustainable-open-structures and contribution for making network system above existing urban fabric. In each case, the 1960's experimental architecture group's theory had a important role as a starting point to discuss about the relationship between architecture and urban design fields into practical viewpoint with "Self control" and "Flexibility.

In details, Their "Flexibility" and 'Mobility" concept came to make a mega-structures which is different from metropolis of modern architecture.

In short, Ideal cities and Avant garde 1960's experimental suggestions shown in architecture and urban theory produced several types of urban solution, such as Infrastructure's circulation, Flexible structures of high density, and Systematic multi functional mega-structure. Also they promoted the Sustainable Network through the open possibility of undetermination and variety by residents, not by intention of developer. They have the several similarities and differences in the way to support their Growth Concept from the point of the "flexibility" and the "Mobility". In each cases, they

had a important role in modern TOD area as a starting point to discuss about the relationship between architecture and urban design fields having the issues of urban circulation and multi-dimensional pedestrian network..

Carl Friedrich Joseph Rath in the 19th century São Paulo: conflict and complementarity in private and public planning

Ivone Salgado
Pontifícia Universidade Católica de Campinas, Brazil

In the 1830s and 1840s, demographic density and industrialization were key factors for the resurgence of epidemic outbreaks in European cities. These decisive historical events increased public awareness on the sanitary problems and led governments to intervene in the cities.[1]

From the 1840s onward, after the first impacts caused by such epidemics had passed, the first public research on the sanitary conditions of the population was conducted in England.[2]

Written in 1842 under Edwin Chadwick's coordination, the *Report on the Sanitary Condition of the Labouring Population of Great Britain* revealed that London workers lived in precarious districts with awful healthiness conditions.[3]

For the first time in the history of cities, both their physiology and pathology became important objects of study in Europe. New methodological tools made available by science, among which topographic and hydrographic surveys of cities, became extremely important to obtain scientific knowledge on the environment and find technical solutions to fight epidemics.[4]

Particularly noteworthy in this context are the works of Rudolf Virchow, in Berlin, especially his topographic survey, which included soil conditions and waterways, and was intended to help plan the urban development after a cholera epidemic. These were fundamental works for the birth of epidemiology in Germany.

Considered the father of both this new science and the modern conception of public health, Virchow wrote *Collected Essays on Public Health and Epidemiology*, in 1879, to strengthen his theories following various studies and his active participation in the City Council of Berlin in the 1840s, 1850s and 1860s.

In 1854, the Government of the *Província* (State) of São Paulo communicated to the City Council of São Paulo that "*cholera morbus*" might arrive to Brazil. It requested that action be taken to remove any infection source from that city. City Council inspectors were then charged to monitor hygienic conditions systematically.

From 1834 onward, the fear that epidemics could reach Brazil mobilized Rio de Janeiro's Society of Medicine, which sent to all the City Councils of the different *Províncias* (States) a report containing the necessary measures recommended by Dr. Broussais in order to avoid *Cholera-Morbus*.[5]

Since this report stressed the topographic conditions of Rio de Janeiro, the doctors consulted on that matter by the City Council of São Paulo disregarded part of the recommendations it contained. In fact, differently from Rio de Janeiro, São Paulo's urban core did not have, at the time, areas liable to flooding because it had been built on a hill.[6]

Nevertheless, these fears led the City Council of São Paulo to create inspection commissions and begin supervising the city health conditions by visiting different places considered insalubrious, as slaughterhouses, butchers and the Council's pen in addition to squares, streets, *casinhas* (shops that sold food), Churches and the *Cemitério dos Aflitos* (Cemetery of the Afflicted).

The concern with the epidemic outbreaks that hit European cities stimulated the government of the Empire to restructure the health services by creating, on September 14th, 1850, the Board of Public Hygiene in Rio de Janeiro. Nevertheless, cholera and smallpox outbreaks raged through many Brazilian cities, in 1854 and 1858, respectively.

Because of this conjuncture, the sanitary decisions contained in the 1828 Imperial Law were incorporated into the City Councils' legislation in a more incisive way and the authorities increased their actions to inspect the sanitary conditions of the cities during epidemic outbreaks. From the mid-19th century onward, through Regulations and *Posturas* (local laws), the City Councils began intervening further in the administration process of the city space, to guarantee public interest, and their actions were inspired by scientific knowledge. [7]

Later cholera outbreaks in Brazilian cities explain why the city of São Paulo, which called on German Engineers for help, began to build more urban works related to healthiness and water supply.

Since the links between these German engineers and the birth of epidemiology in Germany have not yet been investigated in the field of urbanistic studies, we decided to undertake a research focusing on Carl Friedrich Joseph Rath, the most renowned German professional who worked in São Paulo at that time.

A naturalized Brazilian citizen in 1845, Rath was born in Stuttgart in 1802. Graduated from a European academy of natural sciences, he was a civil engineer, a geologist, a geographer and a doctor and he played a leading role in the main discussions on healthiness in the city of São Paulo in the 1850s and 1860s. The City Council of São Paulo hired his engineering services to design projects aligning streets and squares and promoting their improvement and embellishment, to manage the water and sewer piping services, to install fountains, to participate in commissions on the city healthiness and to be responsible for garbage collection, among others.

His works were designed with the help of the graphic and hydraulic survey of the city he had made in 1855, which located rivers, springs, brooks and areas liable to flooding. Both this map and the debates held at the City Council show how well informed he was

about the works carried out in Berlin and the ongoing development of epidemiology by Virchow. Since he spread this new scientific knowledge, the new science of urban planning that would develop in Europe in the second half of the 19th century was not unknown in São Paulo.

Rath also wrote a thesis on the situation of the water network in the city. Nevertheless, he considered that the Council had never given his studies and proposals the deserved attention or appraisal. Among others, he stressed how noxious it was to build countless water tanks or reservoirs kept open and thus exposed to insects and animal visits.

Based on a unitary vision of the complexity of the urban world, Rath was a professional engineer with specialized knowledge of hydraulics, which he tried to apply to the works built in the city of São Paulo.

In the 1850s and 1860s, the public administration of the city of São Paulo started to construct a series of public works considered essential to preserve urban hygiene. The role of Rath in the discussion on the localization of healthy and unhealthy buildings in the city is still being investigated, but he may have been the precursor of a scientific conception of technical control on the city territory. Rath's services were crucial for various public works in the city of São Paulo at that time, as the Consolação public cemetery, built between 1855 and 1858 after one of his projects

The first open air cemetery in the city of São Paulo had been constructed in the late 18th century on a land that belonged to the diocese. Since the Chapel of Our Lady of the Afflicted, inaugurated on June 27th 1779, stood in its center, it became known simply as Cemetery of the Afflicted. Used to bury indigents, slaves and victims of torture, it was closed after the Consolação Cemetery was inaugurated and inhumations in other places were forbidden.

Although the City Council strived to enforce the 1828 law that determined the creation of public cemeteries in the city and prohibited church burials, it failed to find a consensus with the ecclesiastic authorities. In 1845, a cemetery abutting the convent of the Luz was built. The religious and their chaplains, who were responsible for its administration, would also be buried there. In 1851, half of it was ceded to make a cemetery for catholic foreigners, which was called the Germans' Cemetery. Part of the latter, which was reserved for non-catholic foreigners, became known as the Protestants' Cemetery.

That same year, a special commission was appointed to tackle the creation of a public, general cemetery and, in 1855, engineer Rath, who administrated the Protestants' Cemetery in the district of Luz, suggested the heights of Consolação would be the most appropriate location for it.

In the debate on the need to build a municipal cemetery, the idea of building two, one in the western part and one in the eastern part of the city, was initially put forward. In 1854, the *Presidente da Província* (Governor) even approved a project to construct these two public cemeteries in the city of São Paulo, one for the inhabitants of the

northern and western districts and one for the population of the southern and eastern parts. The first one would be called "*Campo Redondo*" (Round Field) and would receive the dead from the Freguesia de Santa Efigênia, in the western part of the city, and from the Distrito do Norte, in the Freguesia da Sé. The other one would be intended for the dead from the Distrito do Sul, also in the Freguesia da Sé, and from Braz.[8]

The "Campo Redondo" cemetery should be built after a project by engineer José Jacques da Costa Ourique, in a region later inhabited by São Paulo's coffee elite. The other would be located exactly where the then Cemetery of the Afflicted was located, in a less noble part of the city. Although this polemic on the construction of two public cemeteries had arisen, it was finally decided to build only one, the public Consolação cemetery.[9]

On October 15th, 1855, physician Ernesto Benedito Ottoni sent to the councilors a report on the epidemics that hit the State of Pará. He asserted that "burials within temples should be ended once and for all" and proposed to adopt "a temporary cemetery out of the city".[10]

Faced with the population's pressures, on September 13th, 1855, São Paulo's councilors eventually decided the best place to construct the new cemetery based on a report by Rath, who had provided a map together with his arguments. The new Cemetery should then be built on the heights of Consolação and its construction should begin by the walls and the Chapel. The Council appointed Rath to design personally the Cemetery and temporary Chapel "plans".[11]

Still in 1855, the Council approved a *postura* (local law) that prohibited any "burial in Churches, Chapels, Sacristies, Corridors or any other place in their premises"[12] and the Government of the *Província* (State) ordered the Regulation for the public cemetery be executed. It was approved in 1856 and, although it established thorough procedures, it did not help prevent the practice of church burials to occur in the city of São Paulo. When a smallpox epidemic broke out, in 1858, corpses were still buried in churches. On July 07th, 1858, the *Presidente da Província* (Governor) ordered that the City Council of São Paulo prohibit the practice of burials in temples. The Consolação cemetery would receive the first corpses of the victims of the epidemic before its works were concluded. Thus, on August 15th, 1858, when the first inhumation occurred in the cemetery, the first public cemetery of São Paulo, the Consolação cemetery, was considered open.

Rath's works on São Paulo reveal how scientific knowledge circulated in the 19th century, a knowledge that, in the field of the urban planning, was marked by hygienist conceptions. When he designed his works, Rath knew the hygienic premises that guided the 1862 urban planning project of J. F. L. Hobrecht for Berlin, which included solutions for the water supply and sewerage systems to avoid such serious problems as the 1841 and 1846 cholera epidemics. Among the proposals actually adopted in the beginning of the 1880s, Berlin chose a sewerage system (*Schwemmkanalisation)* with a process to eliminate the black waters through radial drainpipes. This was firmly advocated by Rudolf Virchow who had also participated in the commissions created to

investigate the causes of and solutions to the problems that the epidemics brought to Berlin in the 1840s. [13]

Private interests, public virtues: *Parana Plantations Ltd* and the foundation of new towns in Brazil

Renato Leao Rego
Birkbeck College, Brazil
Universidade Estadual de Maringá, Brazil

Introduction: a British colonization enterprise – private interests, public virtues

British colonial enterprises have had profound consequences for urban development and local life in worldwide dependent territories.[1] The case of northern Paraná's late colonization process was not different. As part of imperialist initiatives, the British company Parana Plantations Limited invested in Brazil during the second quarter of the twentieth century. Thus, three million acres of unexplored area in the north region of Paraná State were acquired from State government. Then, a colonization scheme was set up and the settlement of immigrants was carried out. Nowadays, six decades after the British company's liquidation, Parana Plantations' former property holds dozens of towns and cities, and a population of nearly two million inhabitants.

Although Parana Plantations' colonization scheme has been positively evaluated, particularly from economic, technical, and social point of view[2], less attention has been drawn to its urban features. As a land speculation syndicate, the British company's main purpose resided in selling small rural plots for coffee growing. However, the success of the financial investment thoroughly depended on the facilities the company could offer to settlers. As a result, the colonization scheme carried out in northern Paraná comprised the countryside as well as new town areas. As a fundamental part of the land development project, a railway line was built and a road network was established. Also, a cluster of nine new towns was originally founded. Additionally, basic public services and facilities were provided. Moreover, the British company was responsible for stimulating local urban life. Thus, in contrast with other company and railway towns, Parana Plantations' public built environment seems to have been favored.

Hence, this paper will reflect upon the regional planning features of that British colonial private enterprise. Based on town and country planning history, on studies of colonialism/imperialism, on a few remaining original documents and maps, and on personal observations, it will seek to explore the boundaries between private interests and public virtues within that colonization scheme.

Imperialism, colonialism, urbanism

Plantations, colonial properties and farms were one of the pillars of British Empire economy.[3] For decades colonies and dominions fed back the dynamic of British capitalism. Since the eighteenth century, money has been poured in a continuous stream into the English countryside by those who have sought their fortunes in distant parts of the globe. Thus, Parana Plantations' founder, Lord Lovat, just followed a

tradition, in investing 'so heavily' in Brazil in 1925.[4] However, there was more than investment and income involved in metropolitan businesses with dependent territories.

On the one hand, imperialist initiatives were usually taken as an obligation which, in turn, was also rewarded with moral satisfaction. According to Said, transactions within colonial context were encouraged beyond the profits by the certainty of being promoting the development of undeveloped regions.[11] Thus, as an example of that attitude, Lord Lovat, in referring to a certain African colonial development scheme which he also took part in, declared that the scheme was not only 'materially advantageous to Great Britain and the cotton industry' but it was also 'adding very largely to the welfare of the natives'.[12] Similarly, Parana Plantations board of directors expressed satisfaction with the 'plantation' mostly because the company was also taking 'prosperity to numerous Brazilians'.[13]

On the other hand, transactions within colonial context involved the movement of people, commodities, capital, and ideas as well. Likewise, physical planning notions were also exported. As a result, planning goals and techniques were applied to the colonial world, notably systematic colonization and settlement; ordered development; physically healthy environments; good traffic flow; planned residential areas; low densities; and zoning.[5] Actually, physical planning notions became part of the overall economic and political context of colonialism.[6] Thus, metropolitan planning ideas, particularly corollaries of the Garden City proposal, were transferred to dependent territories and colonies as well as to the north region of Paraná.[7]

The development period of town planning's theory, ideology, legislation, and professional skills coincided with the British colonization of northern Paraná. Lord Lovat, in taking part in Parliamentary debates on Town and Country Acts, was probably acquainted to those issues. Besides, by that time, a massive campaign for Garden City idea was noticed in London.[8] In fact, it had already been suggested that the social cities' scheme was 'well enough adapted to a new country'.[9] Moreover, Letchworth and Welwyn Garden Cities 'were undertaken as home colonization schemes' and, according to Purdom's book, first published in 1925,

> 'they ought to be considered as providing models for the organization of the planned transfer of communities to Australia, New Zealand, Canada, and the African colonies… If emigration were to take the form of the establishment of new industrial towns, not villages but real towns, each with its agricultural belt, we should have the basis of a new population policy for the British Commonwealth…The two garden cites show how it could be done'.[10]

Now, the implementation of town and country planning ideas in northern Paraná was the basis of substantial improvements afforded by the British colonization scheme. The success of the enterprise relied upon it, as it is about to be presented. Moreover, British town and country planning ideas were to a great extent responsible for the prosperity the colonizer claimed to have been taking to that developing region.

Town & country planning in northern Paraná

The interpretation of maps usually implies a search for geographical features. However, maps are seldom read as a manipulated form of knowledge that has helped to fashion those features. Actually, they are not inert records of morphological landscapes.[14] Maps are 'thick' texts: discourses of a culturally-constructed form of knowledge. Thus, they can also convey much about the context which they were produced on.

Figure 1. Parana Plantations' partial map: rural land parceling and planned new towns. From left to right, three towns are shown: Rolândia (1932), Cambé (1932) and Londrina (1932). Small rural plots and road network are also presented. Source: Universidade Estadual de Londrina-CDPH, 1934.

Parana Plantations' development map (Fig. 1) can reveal the effect of metropolitan ideas and previous British colonial experiences on northern Paraná colonization scheme. To put it another way, it suggests what Said has pointed out as a 'set of cultural forms and structures of feelings'.[15] Indeed, in the core of British culture preparations were made for colonial enterprises. As a result, British town and country planning notions can be observed on that map.

To begin with, a systematic colonization can be learnt. The British company was interested not simply in selling the land but in developing the entire region, and realized that the development project had to rest upon large number of small farmers, urban centers, and ready accessibility.[16] Besides, systematic colonization had long been recommended for British colonies' development.[17] Thus, the whole estate was previously surveyed and thoroughly planned. Northern Paraná planning is conveyed in

what King has called a comprehensive environmental decision-making.[18] Transport system, rural parceling, and urban areas resulted in a landscape of integrated settlement with colonization and regional planning coordinated.

Once the company's target was small holders, the territory was parceled off into small rural plots, apparently responding to a Garden City movement's recommendation.[19] The parceling obeyed a simple rule: roads were opened up along the inter-streams; since each rural property was expected to have easy access to transport system and to water supply, plots took a rectangular shape, from ridges to streams. The sale of rural plots was conditioned to the planned expansion and the progressive foundation of new towns; so, incipient towns and roads preceded the sale of rural plots, evoking the British colonial settlement policy pointed out by Home.[20]

Then, a policy of deliberated urbanization can also be noticed. Towns were laid out in advance of occupation, according to a prepared plan. The railway line positioned on the main ridges was the backbone of the urbanization scheme, even though towns were built before the arrival of the train tracks. Thus, town sites were chosen along the projected railway line at small regular intervals (Fig. 2). Fifteen kilometers separated the most distant towns. Moreover, the British company was eager to 'animate not one but many towns'.[21] Thus, a cluster of towns was established, acting as 'social cities'.[22] The dispersion of settlements was avoided as well as the difficulties of collecting the rural production. Additionally, the dweller in a town of small population could easily reach and communicate with the neighborly group of towns.

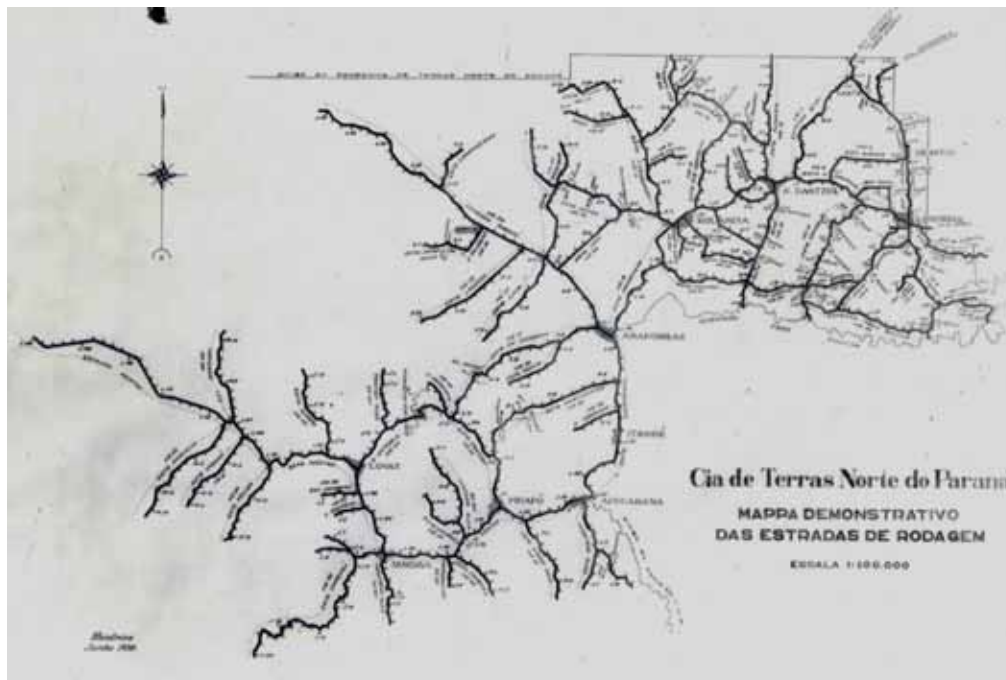

Figure 2. The cluster of nine towns founded by the British company in northern Paraná State. Attention should be drawn to the railway line connecting the urban settlements at small regular intervals. Source: Universidade Estadual de Londrina-Museu Histórico, 1938.

As one might expect, short regular intervals between train stops obviously favor water and coal supplying to trains; however, those regular intervals occurred only within the company's territory, and not along the entire extension of Parana Plantations' railway line. Therefore, traffic issues and settlements were closely combined in that regional planning.[23]

Furthermore, town and country were thought to be complementary. The short distance between urban settlements benefited the inter-relationship between town and country. Urban settlements formed a series of nodes that brought town and country together. The railway link assured not only transport for agricultural produce but also interaction among the population and exchange of services. Thus, the country area between towns acted as green belts.[24]

Garden City's green belt scheme intended not only to maintain but also to attract people to the countryside.[25] In fact, that scheme was perfectly adapted for a colonization project. Such a scheme would have

> 'the effect of reviving the agricultural industry in the district in which it is established, by bringing a market to the door of the farmers, providing security of tenure, establishing small holdings, promoting co-operation, and giving the laborer accessibility to the social attraction of the town'.[26]

Regarding physical forms, Parana Plantations' towns were carefully planned. Generally true, company towns have a practical, simple, grid-like urban tissue. In fact, an artistic aspect appears to be inappropriate for colonial towns entirely destined to be sold. From a commercial point of view the beauty of an automatic, regular, orthogonal, pattern seems to be evident.[27] Additionally, regular patterns and orthogonal systems seem to have been the prompt response to the task of planning and creating new towns: they readily serve the interests of property speculation and land distribution.[28] Moreover, railway towns normally existed for the interest of the railway enterprise and, therefore, urban land planning basically served the operating necessities of the railway company.[29] Nevertheless, this was not the case of Parana Plantations' planted towns (Fig. 3 and 4).

Firstly, Parana Plantations ran the land company and the railway company as well. The two subsidiaries coordinated their activities and were responsible for an integrated land-use plan. Land speculation as well as the whole colonization enterprise depended very much on the railway line which, in turn, was reliant on passengers and agricultural produce. As a consequence, a symbiotic relationship between towns' position, town layout, country parceling, road system, and railway line was strategically achieved. Then, Parana Plantations' towns did not present the strict functional regularity usually noticed in company towns' layout.[30] Parana Plantations town's layout was adapted the site. Thus, ridges, trains stations, the railway line as well as the topographic features conditioned the conformation of different urban forms, which nowadays would be considered as eco-friendly.

Straight streets, orthogonal grids, symmetrical conformations, well-defined town centers, and a symmetrical layout of institutional buildings were predominant in Parana Plantations towns' layout, like in the British colonial town model[31]; additionally, as in many British colonial towns, the street system was fitted to a one-square-mile urban area. However, some artistic intention can be noticed in Parana Plantations' urban forms. Formal motifs were eventually applied to streets layout and train stations' squares usually presented an artistically elaborated parterres' layout.

Source: the author, 2008.

Finally, apart from their regional role, towns were designed to foster a sense of urban concentration. The town center was clearly established by an open public space in the central urban area. Institutional buildings were preferably displayed around it, while the Catholic Church was usually positioned in the main square. Cemeteries, sport courts and trains stations were located at the town boundaries. Thus, public buildings were strategically positioned in order to structure the urban space and act as spatial references.

Actually, train stations became the town entrance, usually placed at the north part of the town center, opposite the cemetery, which was located at the extreme south edge of the town. They were connected to the town center by a straight avenue. According to Garden City corollaries,

> 'long distance passengers' stations should be situated just outside the commercial area, as they need a more considerable area of land. They should, however, be closely related to the urban transport system, for ready communication with all parts of the town. It is desirable that a number of main streets should radiate from the plaza in front of a station in such a central position that it can form a unit of the Civic Centre, but it is often possible to bring it into architectural relation with the civic group by means of a straight avenue linking station and Civic Centre'.[32]

Now, following this clear, simple spatial organization, avenues and streets were hierarchically defined; streets layout responded to the cardinal points, as well as the urban lots. Bigger urban lots destined to industrial activities were reserved besides the train station, along the railway line, as a principle of zoning.

To sum up, it has to be added that private businesses were allowed within the limits of the company's property. Citizens were or could be the owners of the town lots. In addition, towns had their own public administration. However, the company was responsible for water and energy supply, for street pavement, and for the construction of public squares, leisure facilities, and certain public buildings. Besides, as Parana Plantations launched a campaign responsible for foreign immigration to the north of Paraná State, notably among Germans, the British company provided financial assistance for just-arrived settlers. Thus, the company stimulated urban life, which would end up improving their land business. To this extent, the company can be taken as a combination of private entrepreneur and welfare state.

As a result, that self-financed colonization scheme instituted a middle class rural society. It also proved to be an effective means of occupying the territory.[33] The consequent economic and urban regional development benefited not only the settlers but also the private entrepreneur itself and the State as well.

Conclusion

Parana Plantations Limited carried out a comprehensive land development project, despite being a land speculation private company whose main object was basically to sell rural plots to small holders. As a private investor, the British company constantly assumed that role usually reserved for public power, namely, the State. For State support seems to have been restricted to a minimum, whenever it occurred. Thus, within its territory, Parana Plantations became the agent capable of and responsible for providing public facilities and services. Towns, railway line, train stations, roads, parks, water and energy supply were provided. As a result, land price progressively increased, due to the implementation of public services and facilities. In fact, land price within Parana Plantations' territory was really higher than outside its limits.[34]

The private colonization company aimed deliberated urbanization and regional planning, as a step to their financial success. Thus, commercial, technical, social, and environmental aspects were equally regarded. Although towns were being progressively founded and each new town presented a different urban form, both the existence of a single town pattern and the maintenance of small regular intervals between towns confirm systematic colonization scheme as well as deliberated urbanization process.

Therefore, Parana Plantations transferred metropolitan, up-to-date, planning notions to their territory, similar to other British private colonization companies[35]. In general, physical planning notions were part of the overall economic and political context of colonialism. However, in that particular case, they cannot but represent a sort of public virtue.

Garden city proposal's corollaries were applied. As a result, a cluster of towns was created and town and country were brought together. This is a significant case of early transfer of Garden City ideas to Latin America and so it should be considered.[36] Also, town layouts drew attention to geographic conditions.[37] Context did matter, once particularities of the site were taken into account. Consequently, individuality[38] and identity[39] were achieved. Thus, difference became a positive spatial quality. Although orthogonal, practical, unsophisticated, Parana Plantations' town layouts were sensible; zoning and spatial organization can be noticed; public squares and leisure facilities were provided. Moreover, Parana Plantations' development project promoted a singular regional landscape in northern Paraná State. These historic cultural attributes of the landscape should always be taken into account when a new planning is thought.

Even though town and country planning have played a fundamental role in the regional development, the British development project for northern Paraná has been overlooked. The original rural landscape disappeared over the years. The railway line is not the main transport system anymore. Howard's idea of social cities and green belts seems to have been forgotten. Conurbation has already been noticed. Nevertheless, the remaining principle of a cluster of towns could be the real basis for a sustainable corridor of regional development. It is always a matter of mindful planning.

Intra-urban social-occupational structure and unequal housing conditions in the Fortaleza Metropolitan Region

L. Renato B. Pequeno
Federal University of Ceara, Brazil

Introduction

This article tries to appoint the results of a research in which the objectives were to identify the framed picture of the inequality of the inhabitations conditions associated to the intra-urban structure of the Fortaleza Metropolitan Region – FMR – defined according to its social-occupational characteristics. In the first part, we intend to present the FMR within the national context, as much as emphasize some aspects associated to its recent process of urban growth. Next, following a methodology commonly adopted within the research network, we propose the social- spatial structure, formed with seven different typologies, describing them in their social-occupational context associated to the urban elements which structure the FMR, as we have as main variable the density of the different social-occupational categories residing in each of the areas that compound the types. For last, we try to analyze the picture of the inequality among the referred typologies, regarding to the inhabition conditions, as well as the differences inherent to them, considering the parts of which it is formed, focusing on the spaces occupied by squatter settlements, opposite the presence of formal real estate enterprises and social interest inhabitational programs.

1. Elements of intra-urban infrastructure of the Fortaleza

Created in 1973, Fortaleza distinguishes itself in the set of the other Brazilian metropolitan regions because of its high degrees of disparity and for the intense rhythm of the demographic growth. Its long distance from the other national metropolis as well as the environmental conditions of its vast enclosed region lead to a process of urban macrocephaly, turning this urban conglomeration a convergence point for populational flows, in search for jobs, as much as for the urban services, as precarious as they are.

Recent scientific researches indicate that in the national scenario, Fortaleza presents the worse social indicators among the most populous metropolitan regions, which are: inhabitational lack index, rates of the population in poverty situation, percentiles of youngsters in extreme social vulnerability situation, marginalization risk, and relative inhabitational deficit, among others.

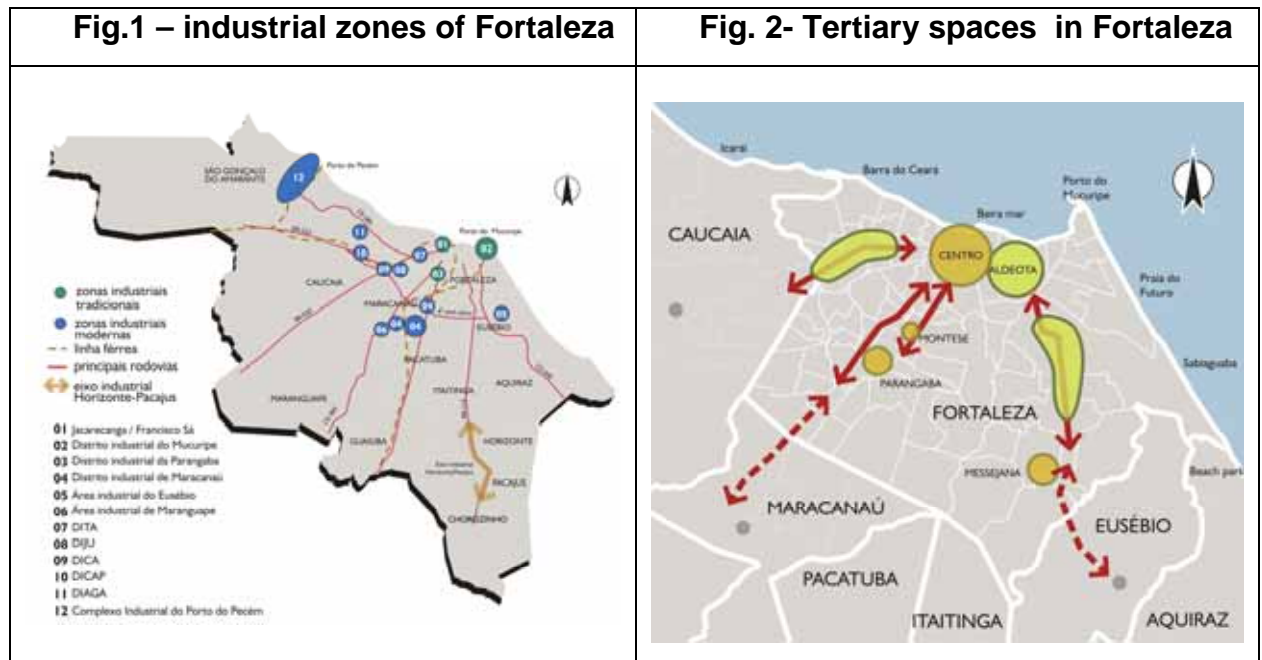
Data from the last populational count realized in 2007 indicate that the FMR already has more than 3,5 million inhabitants (Brazilian Institute of Geography and Statistics – IBGE, 2007). Compound of 13 cities, among which there is Fortaleza, nowadays the fourth city in Brazil in terms of population with 2,41 million individuals, more than 70% of the total population of the metropolis. Anyhow, this rapid population increment has not been accompanied with investments on infrastructure and social equipments, the same happening with the job opportunities which hasn't been sufficient to attend the growing

demands. With this the scene of informality increases, whether in inhabitation, urban services or in the work relations.

Since its creation, the FMR had its political-administrative composition transformed as with the fragmentation of its original municipalities, through the emancipation of districts to municipalities, as through the insertion of new ones. From this we have a scene of conflicts regarding the integration of these cities, associated to the indefinition of their boundaries; remaining unsolved some questions regarding the metropolis as: the circulation of merchandises and of handiwork, the water supply and environmental sanitation, the provision of social housing, among others. In the absence of instruments for metropolitan planning and space management, as much as the inexistence of institutions in the political administrative level, we can verify the expansion of different kinds of problems which generates a series of incompatibilities among different patterns of land use and of the occupation of the territory, characterizing a model of the social production of the space extremely predatory and environmentally misbalanced. (Pequeno, 2002)

In the last decades, the FMR has seen a process of economical reestructuring, ruled by the spatial redistribution of its industrial areas, which is directly bound to the necessary infrastructures needed to the production flowage. Besides, we can verify the reorganization of its centralities, which gain new forms, assuming differentiated patterns that adjust to the social-economical disparities presenting the metropolitan scenario. The contribution to this picture of this disorderly increment comes from the presence of a real estate market that has been acting avidly over the metropolis, notably when it confronts the frailty of the instruments for planning and management in the cities level.

Once concentrated in Fortaleza, along sides with the road-railway axels to the West and in the Center-South, as well as surrounding the port sector, the secondary sector passed through reorganization in the last decades, migrating to the peripheral spaces of the metropolis, interfering directly in its social-spatial structure. These transformations could be decomposed into three periods: first, with the induced creation of industrial district in the 1970's; second, since the 1990's by means of the expansion of the sector in axel and districts alongside the federal and state highways, bound to the state policy to attract more industries; third, the creation of a port industrial complex in the West part of the FMR resulting from government projects still being implanted, revisiting the logic of the exogenous development, unbound from the regional vocations.

Fig.1 – industrial zones of Fortaleza	Fig. 2- Tertiary spaces in Fortaleza


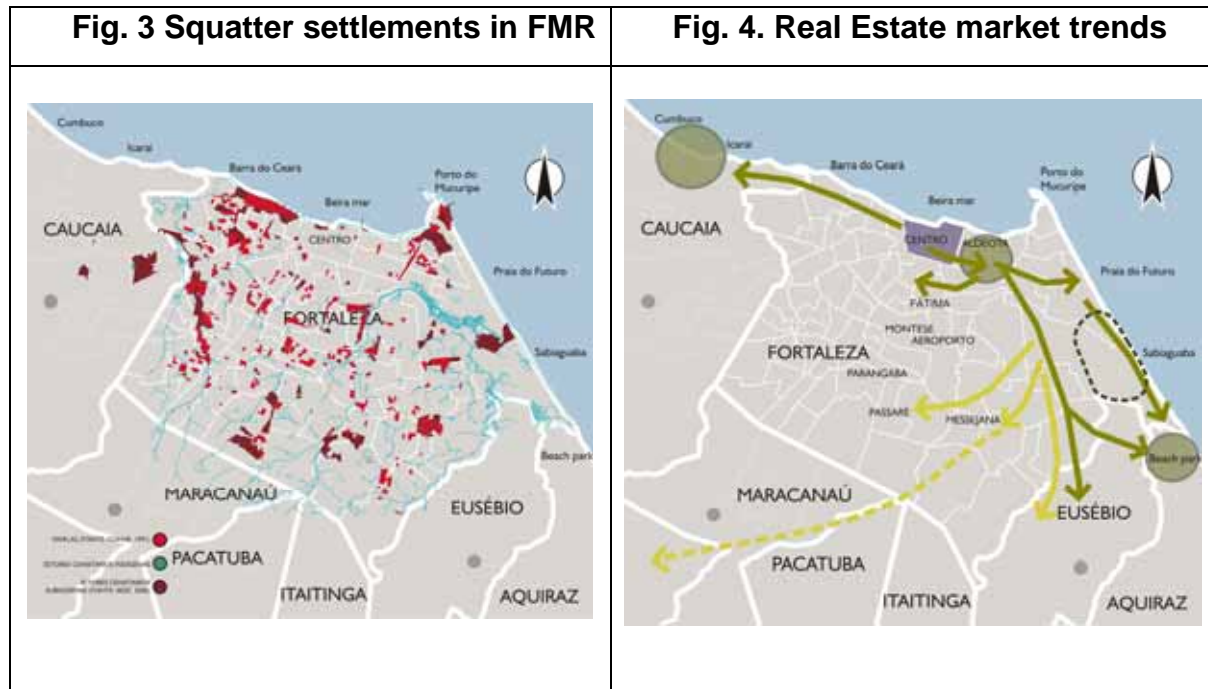
Source. Elaborated by the author

What refers to the tertiary spaces, we can observe its expansion in corridors, as well as its fragmentation in sub centralities which come to emerge in areas with greater urban growth. (Villaça, 1998) Collaborating with the axial configuration of commerce and services, we have the rising of the shopping malls, alongside the downtown avenues going to the East (see fig. 1). Strongly entailed to the real estate market, these areas come to redefine the distribution of the social groups with the higher purchasing power in the FMR. On its side, remaining in a state of disorderly growth, we have the traditional downtown, attending especially to the demands of the West part of the metropolis, under a strong impact of the informal economy. Unable to attend the whole demographic share of this part of the FMR, the downtown suffer with the dispersion of its tertiary activities through the ways with a greater flow, going West and Southwest. Besides, we can observe the intensification of the commerce in the center of the cities, assuming the function of sub centralities in the metropolis. (figure 2)

During this explosive demographic growth, the housing conditions were heavily transformed, fitting here its use as an indicator of changes of life conditions in the FMR, as a result of the presence of different players, holders of distinct roles and interests (Maricatto, 2001). We must observe the role of the public authority in the definition of policies for social housing, locating residential settlements in the peripheral space to the West and Southwest, shaping a process of redistribution of the population especially concentrated in the 1970's and the 1980's, running to a strong conurbation process.

Since its incapacity of attending the demands, there has been a proliferation of occupied areas as an answer from the excluded population to the decrease of the inhabitation offer. Assuming the condition of corridors of social-environmental degradation, the urban rivers and streams came to direct the squatting process (figure 3), more and more seen as signs of the absence of the urban and environmental

control. Reaching beyond the boundaries of the city of Fortaleza, since the 1990's, this process came to be an inductor of a new way of conurbation, contributing with the overflow of poverty and social exclusion to the surrounding cities. This way, are generated new patterns of inter cities integration, which came to indicate the need of implantation of metropolitan managing programs that emphasize the inter city cooperation.

Fig. 3 Squatter settlements in FMR	Fig. 4. Real Estate market trends


Source. Elaborated by the author

On its side, the actions of the real estate market also indicate changes in its social housing offers. Concentrated in few neighborhoods, the real estate sector shows itself tied together to the social groups that have in the residential segregation, a strategy of appropriation of the areas that are better attended by the infrastructure and urban services networks. In an intense and concentrated rhythm, we observed the substitution of the medium and large range residences for vertical condominiums, since the late 1980's, in the areas next to the East coast of Fortaleza. At the same time, occurred the expansion of the city in the Southeast way, where new neighborhoods were created, turning to the dissemination of the horizontal condominiums, establishing new patterns of social-spatial segregation in the metropolis. (figure 4)

Contributes to the understanding of the restructuring process of the metropolitan space, the spacialization of the touristic activities and its forms, which are directly associated to the real estate sector, interfering strongly in the land market of the FMR and contributing with the processes of social-spatial segregation, segmentation and social exclusion. We can observe that with the interventions in the road system at the regional and intra-urban levels, as well as the restructuring of great equipments, the progressive

appropriation of areas with greater landscaping value in this sector occurs, exacerbating the social exclusion in the FMR.

In short, we verify that in an integrated way, the different productive activities and the distinctive ways of producing dwellings, whether by the public authority, whether by the real estate market, whether by the excluded social groups; turn the metropolis into a diversified space in its social-spatial configuration, which is especially associated to the infrastructure and road system implantation.

2. Social-occupational structure in the FMR

To understand the disparities scenario present in a determined spatial frame, it is necessary to recognize the parts that form the whole, attributing criteria and establishing the variables that will allow us to distinguish between the compartments that will be considered as social typologies.

In the sense of limiting these social-spatial types, and therefore, formulating a social-spatial structure of the FMR, we used a methodology performed by the Rede de Pesquisa Observatório das Metrópoles[1], which uses as spatial unity of analysis, the areas of pondering of the samples of the demographic census (AED), from where are obtained the information related to the working population. As main variable, is used the main job of each individual, grouped in social-occupational categories (CATs) defined according to some differentiations such as: city or rural work, specialized or non-specialized, secondary or tertiary, modern or traditional technology, regarding superior or medium formation level, employee or manager.

Subdivided in 98 areas (AEDs), we obtained as main result the social-spatial structure compounded with seven different typologies, verifying the consistency graduation between the results obtained by the use of geostatistics software and the social-spatial processes of the metropolis. Following the qualitative and quantitative analysis procedures, we adopted in a first stage for further identification of social-spatial types: the density of each social-occupational category, aiming to confront and differentiate the several typologies and the percentile of the different categories in each typology, analyzing the composition of each type. As a qualitative analysis, we observe the relation of contiguity among the different areas that compound each typology, as well as the compartmentation of each one of them.

Furthermore, the social-spatial typologies were related to the urban development process in its transformations and tendencies presented to the FMR, specially related to the restructuring of the productive sectors and to the interventions in the structure of the dislocation of handiwork and the distribution of the supplies and of the production.

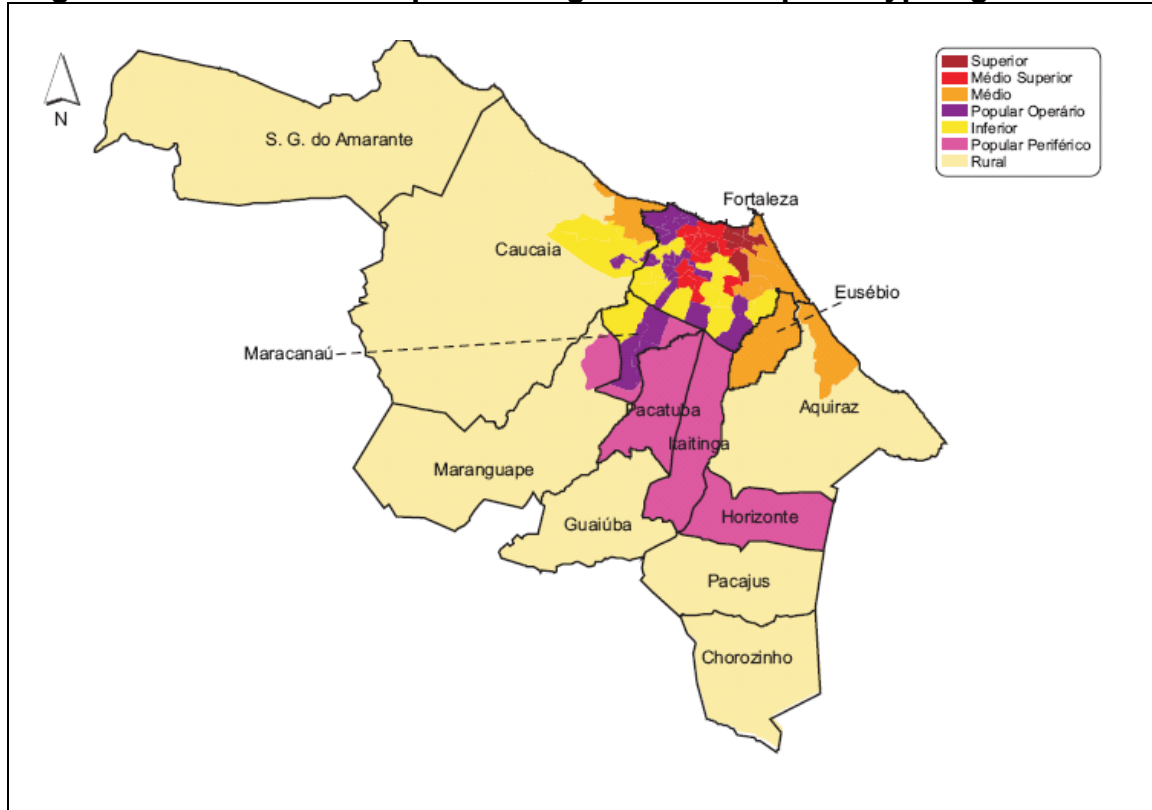
With all this, it is viable to identify the parts that compound the totality, which allow us to understand that the social space of the metropolis encircles differences, which interpolate among the extremities, granting a better comprehension of the social-spatial

dynamics, such as; the segmentation, the segregation, the exclusion, in the ways of how the groups aggregate, break apart, disband through the metropolitan social fabric.

In the FMR case, we identified seven social-spatial typologies denominated in a hierarchic way as: Superior, Medium-superior, Medium, Popular-proletarian, Inferior, Popular-peripheral e Rural. Using a factorial analysis, we obtained the social position of the different categories in the metropolitan space, observing the relations between the complementarities, juxtaposition and the opposition among the different occupational groups of the metropolis. Based in the extreme situations we observed that on one side, the category of the agricultural workers indicated the diametrical opposition between the rural spaces and the other parts of the metropolis. On the other hand, the occupations associated to the management, intellectuals and small employers indicated areas with larger concentration of groups with greater income, better education, such as with the best opportunities in the city (see figure 5). On the axial crossing where the intermediate position are predominant, we verify the grouping of areas characterized by the predominance of some social-occupational categories though juxtaposed and sometimes superposed indicating the social-occupational diversity and denying the plain dichotomy that generally subdivides the social metropolitan space between the rich and the poor.

Figure 5 – Final dispersion with all the individuals identified by typology
Source. Elaborated by the author

When compounding a set of social-spatial typologies, some aspects of the metropolis are clarified, such as: the populational concentration in the main city opposite to the rarefied occupation. The size of each typology also clarifies the recent courses and the segregation tendencies, differentiation, segmentation and social exclusion as we will attempt to present in a brief way. (fig. 6)

Figure 6 - Fortaleza Metropolitan Region – socio-spatial typologies


Source. Elaborated by the author

With the data shown in the tables 1 and 2, we intend to present a brief characterization of the typologies we identified, linked to the urban development process and to the tendencies that are present in the metropolis growth. We have to say that the values regard to the relative density of each social-occupational category by social-spatial typology related to the total in the metropolis.

Table 1 – Density of the CATs in the different social-spatial typologies – 2000

Social-occupational categories (CATs)	Social-spatial typologies (densities)						
	Superior	Medium superior	Medium	Popular-proletarian	Inferior	Popular-Peripheral	Rural

Source: elaborated by the author / IBGE, 2000

Superior Typology: This typology comprehends areas with greater homogeneity in its landscape, gathering the intensely verticalized spaces of the FMR. Concentrated in the coastal part East of downtown, and in the surrounding neighborhoods, this typology has in its form the juxtaposition of residential areas with better standards, articulated by roads that concentrate better services and commerce in the FMR. Holder of the best conditions of mobility and accessibility to services and the urban infrastructure network, this typology is the greatest target of the real estate market whether turned to the residential use of the dominant groups, as for enterprises in the touristic sector.

The social-occupational continents of the superior typology are marked by the greater density of the managers, intellectuals and small employers regarding to the other typologies. Extremely concentrated, these occupations represent more than a third of the total amount of working people in the typology in percentiles. Observing the social-occupational data for this typology, we can perceive the association between better opportunities of work and access to college to the social groups formed by the categories mentioned above, becoming evident their exaggerated spatial concentration, as well as the tendency to maintain and perpetuate this segregation. It is remarkable that the house workers also emerge in this typology for their bigger density, being as well the one with greater percentile related to the other categories, coming to more than 15% of the working population. The concentration of this category in this typology indicates, in one hand, the search to diminish the need of dislocation of the house workers, and on the other, the increment of the daily working hours, characterizing the continuance of the precarious forms of the labor relations. However, since there are new offers from the real estate market to the superior typology, we can conclude the tendency of dispersion of this category in the peripheral neighborhoods and in irregular

occupation next to the working place, including mass inhabitations, forming real tenements inserted in the slums. We can say that few occupations last long in these typologies, which were removed in the last decades due to management programs.

Medium-superior Typology: Includes areas located along side the road axels from the traditional downtown in Fortaleza, going to the West, Southwest and South of the FMR. Besides the residential use, it is clear to us the increment of the tertiary linked to the demographic condensation West of the FMR. Like the superior typology, we have here strong evidence that the accessibility to the urban services and transport also makes this type a preferential target of the real estate market. Among the transformations in process, we can notice: the increment of the offers to groups with purchasing power relatively superior substituting the late owners; the attending to a differentiated demand recently incorporated to the market, increasing in consequence the social segregation of those in the superior typology. The densities of managers and intellectuals, when compared to the other types, indicate that this correspond to a first alternative related to the residence location. However, differently from the superior typology, we can notice a greater occupational diversity, once the medium occupations and the workers of the tertiary sector specialized, present greater representativeness in the typology, grouping more than 50% of the working people. The proximity to the working place, as well as to the urban benefits concentrated in the superior typology contributes to the differentiated conditions of this type in its localization in the intra-urban of the FMR.

Medium Typology: Though it gathers few areas, we do not verify homogeneity in its composition, turning into a diversified landscape. The presence of vacant urban spaces, liable to the expansion of the real estate market, such as the occurrence of slums juxtaposed to condominiums and lots with beach houses contribute to this situation. In the case of the coastal areas of the East part, located in Fortaleza next to the superior typology, we can observe that the recent increment of slums opposes to the recent public investments made as circulation systems leading to that sector of the city. In other areas to the Southeast we have the presence of real estate investments as small condominiums attending to the emerging demands. Furthermore, in the areas located in the surrounding cities, where occurs an expansion of condominiums and hotels, we can verify a differentiation between the areas located to the East and to the West. Verifying the tendency of occupation of the eastern areas by managers, intellectuals and small employers, though in the other, we can see a disorganized process of occupation, such as the occupation of the former beach apartments as definitive residence.

The density of house workers and construction workers state the strong expansion of the incorporation market. Equally, the density of managers, intellectuals and small employers, when compared to the others, indicate this type to be one of the preferred in these categories, attesting the dispersion of these groups in the East outskirts of the FMR, where the condominiums represent the dominant way leading to the a conurbation of Fortaleza with the surrounding cities. The presence of medium and specialized tertiary occupations alongside the tertiary axels to the East and to the Southeast portrays the social-inhabitational diversity of this typology. The presence of inhabitational sets and lots from the 1970's, as well as irregular occupations in the

interstices of this typology attest this ascertainment. However, the implantation of the infrastructure and the diffusion of specialized services tend to drive these categories to more distant areas, as the popular spaces. We can also say that the proximity with the Port and its industrial sector, as well as the climate conditions lead the East coast areas to stagnation; having there been the expansion of the slums, predominantly occupied by people with non specialized activities. Associated to this, there is the seasonality of the tourism, once the greater attractions and leisure areas are in this type, turning the commerce and the informal services a surviving alternative to great part of the population.

Popular-proletarian Typology: it has as main characteristics the presence of huge social housing groups and illegal settlements associated to the greater industrial concentration, as for its proximity, as well as for the location alongside the great road axels between downtown and the outskirts where the secondary sector is settled. The best living conditions of these sets, compared to other popular areas, as well as the facilitated mobility to central areas and working places, is associated to the high percentiles of workers of modern and traditional industries, of the medium occupations and of the specialized tertiary, who are the greater part of people of this type.

When compared to the other typologies, we verify the greater densities for occupations of modern industry and of the specialized commerce in the FMR. Anyhow, we can observe that the traditional industry prevails over the modern one, regarding to the percentile of these categories in the typology, there being 12% of the working people in the traditional industries and about 4,6% in the modern ones. Once great part of the areas is located in Fortaleza, it is possible to appoint the preference of the modern industries for the peripheral cities of the FMR, which offer taxes advantages to the entrepreneurs of the sector. On the other hand, the traditional industries that remain without adopting any technological innovation in its production still have a good number of jobs, although with lower salaries. Besides the social-occupational diversity of the medium, tertiary and secondary categories, the social segregation scenario is evident, calling the attention to the little representativeness of the social-occupational categories of managers, intellectuals and small employers that together are a little more than 5% of the total of the working population.

Inferior Typology: This typology intertwines the central spaces of the metropolis to the outskirts, having the urban rivers as its structuring elements. Interpolating to the corridors of the popular-proletarian typology that link the production areas to the central spaces, this typology is subdivided into compartments with fragments of high density next to the center, opposite to others less dense in the outskirts of the FMR. Picture of the absence of policies for the urban environmental control for the margins of the rivers in the FMR, this typology indicates the interconnection between the precarious housing conditions and territorial exclusion. On the side of concentrating shanty towns at risk situation, presents the greatest densities of workers of survival, once some of these areas are known as the origin and the destination of routes of garbage-pickers, who symbolize the extreme situation of the inferior *circle of the metropolis' economy* (SANTOS, 1979). The occurrence of more than 10% of the working people in the

traditional industry and of 11% in the construction sector, both considered to be low income areas, characterizes this typology, which is characterized by the gathering of poorer groups, associated to the infrastructure needs and difficulty of dislocation. We can also detach the specialized tertiary and the house workers showing themselves in percentiles that are representative in the total of the occupations in the inferior typology.

Popular-peripheral Typology: This social-spatial type formed by areas outside the main city of the FMR presents in its composition wide areas that correspond to the total of the area in some cities. Strongly associated to the process of productive restructuring of the secondary sector, these areas lodge the periferization of the industry and the proliferation of the popular allotments occurred since the late 1990's. The foreseen road conveniences, as much as the low cost handiwork offer and the availability of low cost land, lead to the spatial redistribution of the population, forming a demographic growth vector in this direction. The presence of more than 30% of the workers in industries, associated to the greater densities of traditional industry and auxiliary services could be associated to the abandonment of the traditional industry corridors of the popular-proletarian type in Fortaleza.

Rural Typology: Because of its extended dimensions and its patterns for territorial occupation turned to the agricultural production, the rural typology appears as the less dense of the FMR. The percentile superior to 28% of the working population in agricultural activities justifies its denomination, which aggregates the field workers, as well as the fishermen on the beach. However, since its physical-natural aspects, we have a sub-division of it into two groups: coastal areas, target of lots for a second residence, which social-environmental reality of its traditional communities has been transformed by the predatory practices of the real estate market; extended rural zones subdivided into dry areas used by agriculture of subsistence and small farms in the mountain parts. Comes to the attention the presence of building workers, who are associated to the public works of infrastructure realized in these areas, as much as the expansion of the real estate sector linked to tourism. In the same way, we have that 10% of the working people are house workers, distributed among jobs in beach houses and in farms.

3. Social-spatial disparity and the housing subject in the FMR

Several are the possibilities to establish the inter-relations among the social-spatial typologies and the life conditions of the population, in the sense of characterizing better the social intra-urban structure in the FMR. Opting for secondary variables leads us to perceive other differences among the social types, as well as disparities among the fragments that from them. In this sense, we will adopt the housing condition as the variable that shows the inequality of the urban spaces, especially regarding to the following aspects: the inhabitational deficit; inadequacies of the residence; lacking of urban infrastructure; access to the urban land and the precariousness of the land market in the metropolis. Taking the data from IBGE/2000, we start with the questions: what is the regularity existent between the proposed social-spatial structure and the estimated inhabitational deficit? Is there an interconnection between the social division

of the space and the inequality of the distribution of basic sanitation services? How does the distribution of the areas considered to be subnormal happen, as well as the distribution of the inhabitation in precarious land situation throughout the social-spatial hierarchy? As a methodological resource to this phase we adopt as procedure: reading the data given by the tables that indicate the percentile for social-spatial type; the analysis of the thematic maps characterizing the FMR from the classification of the areas for the data ponderation as to the respective percentiles to each indicator we used.

3.1 Housing deficit

The Fortaleza Metropolitan Region presents a inhabitational deficit of 85.570 domiciles, mainly concentrated in the capital (75,8%) and in the most populous cities: Caucaia (6.5%) e Maracanaú (5,7%), which present processes of conurbations that area more consolidated with Fortaleza.

As characteristics that attest the deficit situation, we used: co-inhabitation, the improvised domicile made out of rustic materials and the residence in rooms that were lent or rented. According to table 3, the greater representatives of the deficit correspond to families that live together, with more than 92,5% of the total of domiciles. It is possible to assume that the inhabitational deficit presents lower intensity in the superior typology compound by areas in which we observe the greater density of working people as managers, intellectuals and small employers, where the real estate market is more consolidated. However, the inhabitational deficit is also diminished in the typologies formed by areas that are more distant from downtown: inferior, popular-peripheral and rural, with greater percentiles of working people in the traditional secondary sector, in construction, in auxiliary services, in agriculture, especially in those activities with lower incomes, leading to a lower presence in the formal real estate market.

Table 3 – Housing deficit indicators – 2000

Typology	Total of houses	Housing Deficit		Families living together		Improvised domiciles		Lent or rented precarious rooms	
		total	%	total	%	total	%	total	%
Superior	47680	4238	8,89	3598	84,90	272	6,42	368	8,68
Mediium-superior	112696	13888	12,32	12842	92,46	424	3,05	622	4,48

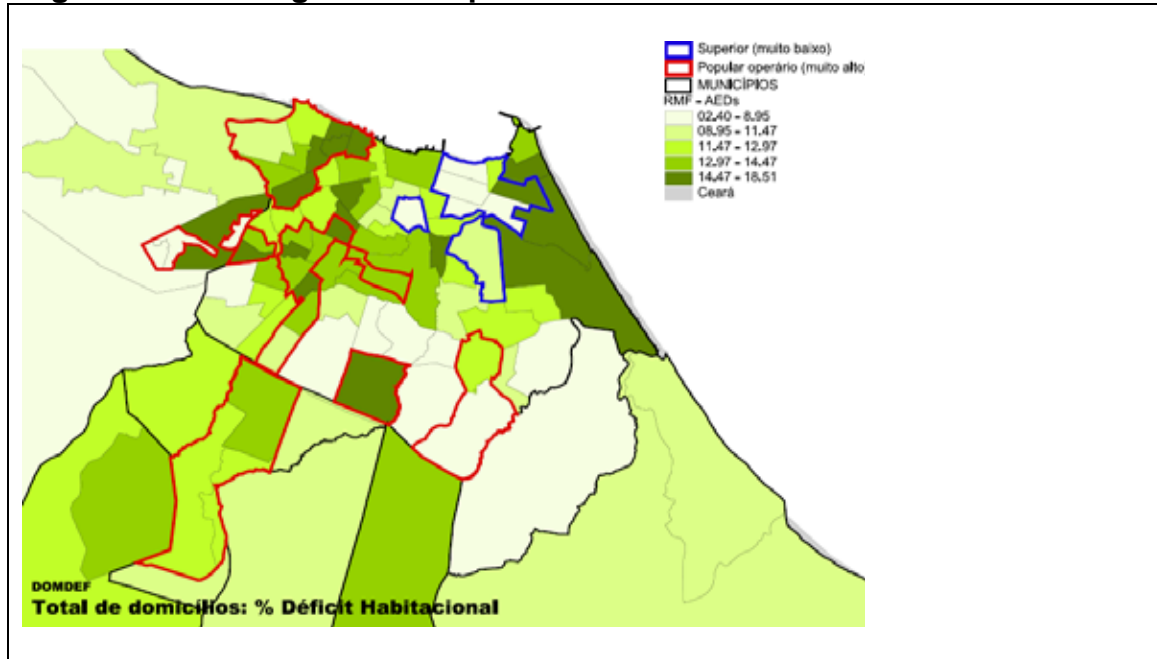
Total	723197	85570	11,83	79174	92,53	2760	3,23	3636	4,25

Source: elaborated by the author / IBGE, 2000

We observe that the medium-superior, medium and popular-peripheral typologies, which present the greater densities of medium and specialized tertiary activities, indicate the greater inhabitational deficit in percentiles, surpassing the average in the FMR. Turning in its majority from the condition of families living together, we point to aspects that deserve a better investigation: - the low offer of houses for rent; - the attempt of saving for a future investment in a better house; - the inability of paying the rent in the areas of the superior typology where there is a greater offer of residences.

Figure 7 – Housing deficit map in FMR


Source: elaborated by the author / IBGE, 2000

We have to say that these typologies regarding to the inhabitational provision, could be classified in two categories: - the medium-superior and medium typologies where the real estate market is expanding in a more promising way, whether substituting the rent, or attending to the demand for areas of expansion of the condominiums for the spatial segregation; - the popular-proletarian typology, where the public policies of social housing were more intense in the 1970's and the 1980's, as the infrastructure and the plot dimensions allow the expansion of the house, turning co-inhabitation a typical process in areas with medium, secondary and tertiary occupations.

Figure 7 presents the predominance of areas with a lower inhabitational deficit in the superior typology, where the real estate market has been even more present. On the other hand, we observe that in the case of the popular-proletarian typology, the concentration of areas with greater percentiles, especially in the areas next to downtown, with com predominance of the social housing sets, for this reason denser and with better urban infrastructure than the others.

Source: elaborated by the author / IBGE, 2000

Table 4 has in its contents data that attests the domiciles inadequacies of the inferior, popular-peripheral and rural typologies, though they do not have significant inhabitational deficit. From this comes up the question if the ways of inhabitation used by the poorer people of the metropolis, though inadequate, could come to be disregarded of the demands, or even, if the inhabitational policies turn to have a better focus on the urbanization of these precarious lots, granting better housing conditions with the legalization of the land possession, the implantation of infrastructure and improvements in the residences. In this sense, the following topics try to discuss the condition of the urban infrastructure and of the land irregularity associated to the proposed social hierarchy.

3.2 Intra urban structure and the urban infrastructure inadequacy

When it comes to accessibility to the infrastructure networks, the analysis of the social-occupational structure of the FMR considers as main hypothesis the direct relation between the precariousness of the basic sanitation and the areas denominated popular or inferior, where the managing elite, the intellectuals and the small employers would not be concentrated. The same way, we try to find evidences of the possible expansion of the benefits of the urban services to the surrounding areas, verifying if there occurs or not a better condition for the access to the infrastructure network to the popular areas next to the superior and medium-superior typologies, comparing to the others, located in the outskirts of the FMR.

## Table 5 – Indicators of the inadequacy of the urban infrastructure, 2000

Typology	total of houses	Urban domiciles		Inadequate water supply		Inadequate sewerage system		Inadequate garbage collecting		Inadequate energy supply	
		total	%	total	%	total	%	total	%	total	%
Superior	47680	47680	100,00	3766	7,90	3134	6,57	829	1,74	827	0,08

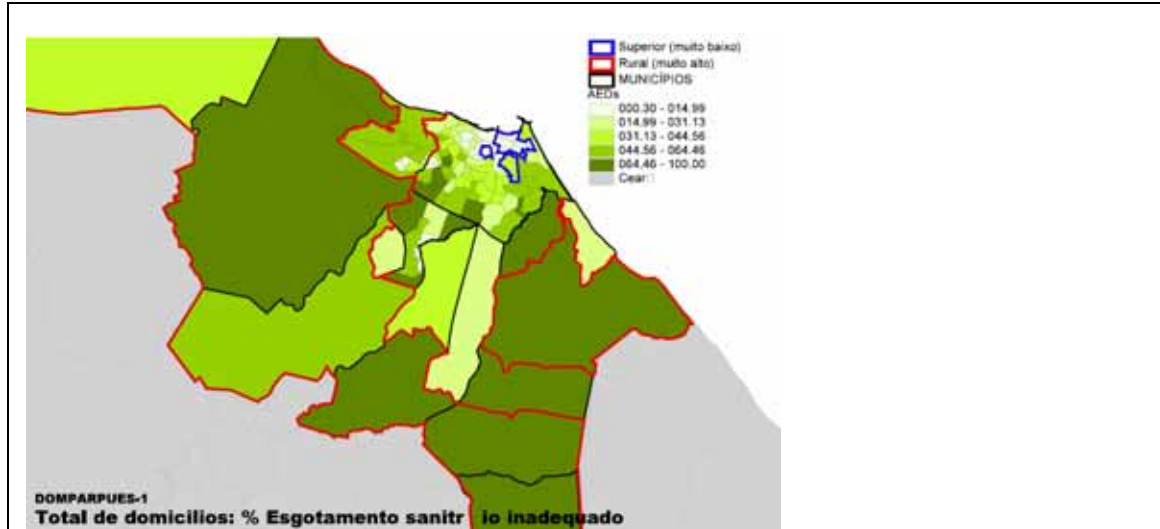
Source: elaborated by the author / IBGE, 2000

The analysis of the chart of the social-occupational typologies as to the access to the infrastructure network of the Fortaleza Metropolitan Region, present in table 5, leads us to the understanding of a strong correlation between the inadequate conditions of sanitation and the popular-peripheral, inferior and rural typologies where we can verify the concentration of social-occupational non specialized categories of the industrial, commercial and services sectors, besides the agricultural occupations.

In the same way, we confirm that the adequate attending conditions to the superior and medium-superior typologies, bringing privilege to the managing and intellectual social-spatial categories which are concentrated there, such as the medium occupations. We have to make clear the strong interaction between the real estate market and the social-spatial hierarchy, differentiating the types as to the accessibility to the infrastructure network, the location of the FMR and the availability of areas for its expansion. The superior typology, though privileged, when concentrating the verticalization indicates the necessity of supplementary capacity of the urban infrastructure network, in the detriment of the areas that are worst attended to in the other typologies, favoring the land owners and the real estate speculation. We can certify that the real estate market in free expansion, comes to reach the areas of the medium-superior typology, where the infrastructure is already installed, enlarging its enclosure over the metropolitan territory, including new areas located to West of the traditional downtown with easy access by roads.

Figure 8 – Map of inadequate sewage system in Fortaleza


Source: elaborated by the author / IBGE, 2000

The popular-proletarian typology, though it has a predominance of the medium, secondary and specialized tertiary occupations, indicates very satisfactory values, surpassing the average of the metropolis. Some of its areas come even to surpass the rates of superior typology in the social hierarchy, especially the ones that had their origin in great social housing sets of the 1970's and 1980's, indicating the heterogeneity present in this social-spatial type. Even in the case of the medium typology, where we can verify the housing precariousness and the inadequacies of its infrastructure, it is clear that there is already a new pattern of attending, with decentralized sewerage treatment unities, in the dimension of the condominiums and hotels that are yet to be implanted, besides the benefits gained regarding to roads structure, increasing the land value and favoring social groups where determinate categories are not dominant.

Comparatively, we can perceive that the sanitation has its worse situation in quantitative terms, especially in the most peripheral typologies and with the gravest environmental situation. The farther from the central areas, and consequently from the social-spatial superior and medium-superior typologies, the worst will be the conditions of inadequacies of these urban services. The situation is even more critical in the case of the inferior typology, which has as predominant characteristics: excessive density, land precariousness, small domiciles and the lack of sanitary; is a more inadequate situation for the infrastructure network (see table 5). Considering the exponential growth of the areas at risk in the margin of the urban rivers, we can attest that the inferior typology needs greater attention in posterior studies.

It is possible to say that the areas of a typology have influence over the others, in an adjoining situation, as to the better adequateness of the infrastructure network. In the case of areas next to the ones best provided with the services, we can verify the extension of the attending to the surrounding areas, diminishing gradually the effect of

proximity as we get farther from the central areas. Anyhow, we can say that in the peripheral areas where the social interest inhabitational programs developed by the National Bank of Housing (BNH) and State Companies of Housing (COHABs) in the 1970's and 1980's, endowed with every infrastructure, exercise a positive impact over the adjacent areas, incorporating them to the demands attended by the networks and the decentralized treatment stations implanted in the past.

According to the figure 8, the sewage systems brought many benefits to the families of the superior typology, place of greater density of managers and intellectuals, as in the surrounding areas, where the same categories predominate. Besides that, we can verify a gradual decrease of the adequateness of the sewerage as we go in direction of the periphery, exception made to the social housing settlements that in the past contributed with the induction of the urban growth in that direction.

3.3 The social-occupational intra urban structure and the favelas in the FMR

Considering the social production process of the intra urban space in the FMR, the implantation of *favelas*, Brazilian name for squatter settlements, as one of its main phenomena, notably in the cities conurbed with Fortaleza. The impoverishment of the population, unable to pay the rent, as much as the permanent flow country-city has lead to an acceleration of this process in the last years, turning the risk areas the greater challenge of the institutions working on the housing issues.

When we analyze the location of the subnormal conglomerates identified by the Brazilian Institute for Geography and Statistics (IBGE), it is possible to verify a scenario of degradation of the natural resources and the migration to the peripheries of lower purchasing power people, who seek in the irregular occupation of the land the solution to their dwelling problem. To analyze the process of the beginning of the favelas in the FMR, will be used as indicators the percentile of families living in abnormal conglomerates and the percentage of domiciles that declared the ownership of the house without the ownership of the terrain. [2]

In terms of percentiles, we can observe that the medium typology presents the greater rates of subnormal conglomerates and of houses without the possession of the land, being in fact more than double of the total of the FMR. Considering that the composition of this social-spatial typology gathers the coastal areas and the Southeast areas in Fortaleza and in the surrounding cities, where the real estate market of condominiums and the touristic enterprises are expanding with great intensity, we can predict a conflicting scenario in the future. We believe that investments of urban developers directed to the categories of the managers and intellectuals will come to displace most of the larger and most occupied squatter areas, whose inhabitants have in the proximity with the working place an enormous benefit.(table 6)

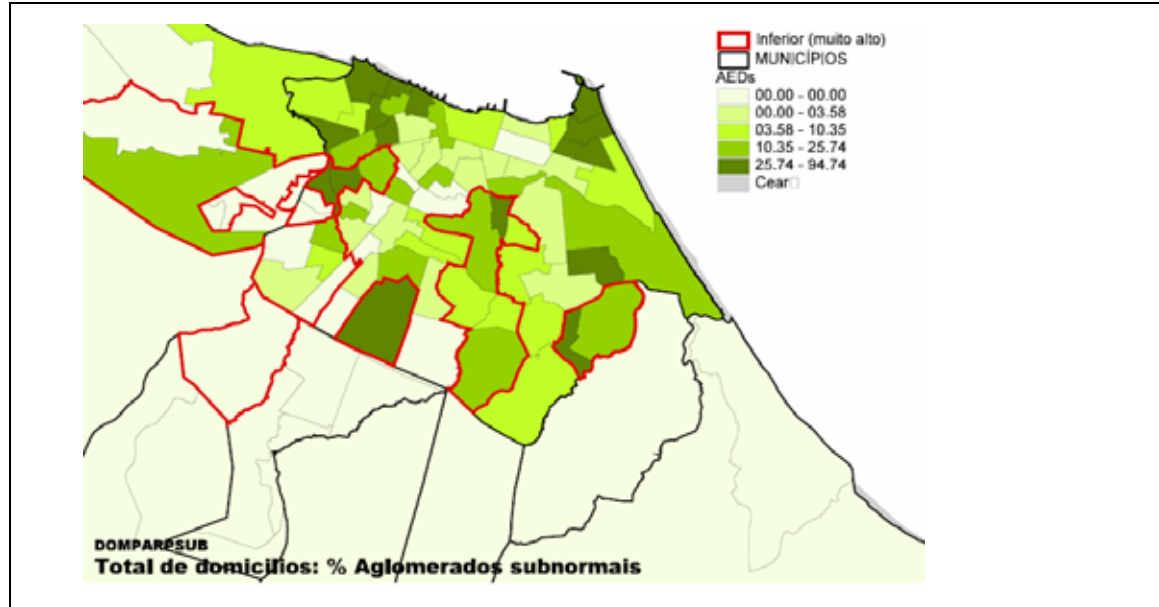
Table 6 – Indicators of the land ownership precariousness

	Total of domiciles	subnormal conglomerates		Ownership house without possession of the land	
Typology		total	%	total	%
Superior	47680	3623,7	7,6	2874	6,03
Medium-superior	112696	8226,8	7,3	8234	7,31
Medium	52790	12142	23	13184	30,92
Popular- proletarian	222961	29431	13,2	23250	10,43
Inferior	184830	25691	13,9	30210	16,34
Popular-Peripheral	45959	0	0	4820	10,49
Rural	56280	0	0	5197	9,23
total	723197	79552	11	87767	12,14

Source: elaborated by the author / IBGE, 2000

The popular-proletarian and inferior typologies also present significant percentiles of subnormal conglomerates, surpassing the average rates in the FMR, indicating the presence of shanty towns in these social-spatial typologies, though in a different situation when it comes to the social-spatial hierarchy. From this we can ascertain the presence of favelas with better location and better opportunities in the metropolis than others, since the popular-proletarian typology has among other characteristics: proximity to working places; the best attending in terms of the infrastructure and urban mobility. The inferior typology, on the contrary, gather the most precarious squatter settlements, mainly those in a situation of environmental risk, that run along the margin of rivers and lagoons, finding themselves in precarious conditions of accessibility to the basic sanitation.

In the case of the superior e medium-superior typologies, we can verify values lower than the average rates of the metropolis, once they are preferential areas to the real estate market have been during decades the main target of urban control policies and of programs for the dislocation of favelas supported by the city and state governments and almost always associated to interventions in the road system. Even though, we can verify that some areas remain, though under the pressure of the real estate entrepreneurs furnished with public private partnerships.

Figure 9 – Map of sub-normal áreas – FMR


The discrepancy between the numbers associated to the subnormal conglomerates related to those inhabitants that do not own the plot of land, in the case of the popular-peripheral and rural indicate that the squatting process is already present in the other cities of the metropolis. This happens under the form of lines of shacks in the entrance of the cities, which associate with the migratory flows from the country to the city, as to the transposition of poverty originated in the main city.

As shown in the figure 9 above, we have in the inferior typology the greatest percentile of families in subnormal conglomerates. However, it is possible to observe the presence of areas with high rates of land precariousness in two blocks of areas out of the inferior type: - in the coastal sectors to the East, which belong to the medium typology, recovering the dunes next to the industrial port sector; to the West of the central area of Fortaleza, next to the areas with intense industrial activities, portraying a real corridor of social-environmental degradation alongside the coast. Both have in common the possibility of going through deep transformations due to the opening of landscape roads by the governments, as by the changes of the use forecast in the laws of use and occupation of the soil, substituting the industries with new enterprises.

A situation as grave as this can be ascertained related to the areas that are crossed by the urban rivers in Fortaleza, where lots of shanty towns are at risk of landslides and floods. Though it is partial, the presence of these communities in permanent preservation areas hinders its regularization, as its urbanization. While there is no alternative for a tenable occupation of the surrounding urban empty spaces, to be included in policies of social interest inhabitations and of urban development, we can

verify the greater proliferation of this kind of precarious settlements, which give shelter to more than 20.000 families.

Final considerations

In the scenario of the social-spatial disparities present in the Brazilian metropolis, the housing subject associated to the squatter settlements has been a special way to the comprehension of the problems associated to the historic unequal development. Fortaleza represents one more case, differentiated by the acceleration and intensity of the implantation of this process in its intra urban space. The proposition of a social-spatial structure to the FMR brings along some innovating elements regarding to the understanding of the dynamics of growth and development of the FMR, through the spatialization of the concentration of determinate social-occupational categories associated to the productive use of the territory and to the housing forms.

From the differences exacerbated among extreme social-spatial typologies, to the heterogeneities of the intermediary types, we can verify a strong link of the remaining types to the location of the productive activities in the metropolitan intra urban space, as the power of the real estate market associated to the tertiary activities and to the tourism. We dismantle this way the comprehension of the dichotomist division of the metropolitan space in only two parts, undoing the myth of the torn city: one very dense and poor to the West; and other less dense and rich to the East.

On the contrary, when we visualize the dispersion of determinate social-occupational categories in the metropolitan territory, we make clear the identification of new compartments, which justify the intra urban flows and the preferences for determinate location in the city, showing new spaces of social-spatial segregation and projecting areas of greater territorial exclusion. In the same way, from the density of the social-occupational categories, it is possible to recognize the representativeness and the importance of the productive activities that are predominant in the FMR, as well as the complementarities among them, through the recognition of heterogeneities present in the different social-spatial types.

The realization of the crossing between the proposed structure and some elements that characterize the housing issues in the FMR, as a way of investigation of the spatial disparities in the social hierarchy of the metropolis, lead us to verify a critical scenario regarding to the estimative of the housing deficit, to the accessibility of the infrastructure networks and to the state of illegality of land ownership.

The concentration of the dwelling deficit in the medium-superior and popular-proletarian types, areas with greater demographic density, could be associated to the lower purchasing power of its social-occupational predominant categories, in this case the medium, of the tertiary and of the secondary. On its turn, the predominance of these same categories at more peripheral areas, where the inhabitational policies were more positive, indicate the tendency of the appropriation of the lots by these social groups, substituting the original beneficiaries. With this, we can shape the hypothesis that has

been more and more propagated of the occurrence of pressure of the intermediary classes in these areas, resolving its incapacity of access to the formal market, using the appropriation of lots of inhabitations, as well as the evidences of the presence of informal market in these lots. New alternatives formulated by the National Inhabitation Policies, as well as the residential lease programs and the downtown rehabilitation programs for housing, tend to furnish in part these demands.

The emphasis given to the superior and medium-superior typologies in the provision of urban infrastructure confirms the supposition of a privileged attending to, most importantly regarding to the basic sanitation. The concentration of investments in construction in the superior social-spatial type, as well as the signs of new enterprises in the medium-superior typology, attests the combination between areas with the adequate infrastructure and the proposed social hierarchy. On its side, in the medium typology, facing the expansion of the touristic real estate sector, since the dispersion of its occupation, spreading the use of decentralized unities for sewerage treatment and water supply from artesian wells, and the costs are poured out to the customers.

In the peripheral spaces, exception made to the areas formed predominantly by social housing settlements inserted in the popular-proletarian typology, we can observe a picture which associates the lack of infrastructure and precariousness of the land. From this we can ascertain the importance of the formulation of policies for land regularization and sustainability, where the land ownership comes accompanied with the implantation of the urban infrastructure and services, as a way to diminish the social-economic disparity existent between the socio-spatial typologies of the FMR.

As to the popular-peripheral and rural types, composed only by areas of the municipalities of the FMR adjoining Fortaleza, we have a picture of occupation that is spread in the agricultural sectors, there being a greater demographic density in the centers and localities. We can say that the inadequate conditions of the urban infrastructures proves not only the differences of the occupation patterns of the land, but also, the low integration levels of these areas with the remaining areas of the metropolis. On its side, the recent industrialization of these cities, which are not well provided with infrastructure, indicate a preoccupying scenario due to the migratory flows, mainly with the certainty of the precariousness of the land situation presented here.

In short, face the reading of the social structure of the FMR; we can ascertain that its recent economical re-structuring associated to great public works, points to the urgency in the formulation of processes for regional planning, from where would be pointed development policies that would help to hinder the propagation of the problems that exist today in the peri-urban areas. As this being a question of a study in the metropolitan scale, we verify the importance that mechanisms of cooperation between the cities come to be established, in the sense of trying to diminish its impacts and to increase the institutional integration levels between the cities of the FMR.

[1] The Rede de Pesquisa Observatório das Metrópoles gathers 12 different research settlements, which has been developing, since 1997, studies associated to the state of the inequalities and the management and govern problems in the Brazilian Metropolitan Regions.

[2] At once it is necessary to make an exception related to these indicators, since the IBGE considers only the settlements with more than 50 residences, and that not all the people interviewed admit the illegality regarding to the land possession, omitting the information. For a better notion of the discrepancy among this data, in the last slum census realized in Fortaleza in 1991, the results were the presence of 314 occupied areas, while the IBGE appoints a total of 154 in the last census.

The roles that government, private sectors & public play in the leisure space development in Hangzhou waterfront areas, China

Ying Jun Liang
Zhejiang University, China

Preface

The word "leisure" in China holds connotations of urban residents' leisure, lie fallow, recreation and tourism. Leisure in China is now acting as a new city function to boost economy, to improve living quality and to promote city culture.

Ann Breen and Dick Rigby classified waterfront districts exploitation in the US into six kinds according to their functional uses: commercial, recreational, cultural & educational, history, residential and transportation port（Ann Breen, Dick Rigby,1996）. According to this classification, the first four functions all go to the leisure category. Spreading our insight on the waterfront area development in China, the mainstream is concentrating on the function of leisure. More and more people realized the importance of transferring waterfront area into urban public space. Based on these backgrounds, recreation space is becoming the majority part of substantial waterfront district development.

Four water territories in the city enable Hangzhou multiform waterfront leisure space

Hangzhou is a city with a gift of tourism: Qiantang River standing at east, the West Lake enchasing in the middle of the city, to the west there is Xixi wetland, and to the north is Beijing-Hangzhou Grand Canal. These waterfront spaces around Hangzhou with abundant deposition of historic culture provide a profound culture background to the developers. "Surrounding of four-waterfront territories" composes leisure space framework of Hangzhou water systam (Embodied Location in Fig. 1). 2006, World Leisure Expo was held in Hangzhou, and Hangzhou was elected to be one of three "Excellent Chinese Tourism City". In the same year, the entire investment appropriated to protect and renovate Grand Canal in integration is up to 28.4 billion(1st phase 6.5 billion, 2nd phase 21.9billion), which is conducting for applying World Cultural Heritage; Xixi National Wetland Park is the first national wetland park locating in the city; the new city CBD and citizen center are pullulated by the side of Qiantang River; the West Lake is taking the drive towards west for engendering "the new West Lake" etc. The Hangzhou government is striving to establish "International

Leisure Tourism City" and "Oriental Capital of Leisure". From the prediction, waterfront leisure spaces will become more exuberance till the completion of Grand Canal Protection and Innovation Project in 2010.

The interacted collaboration between government, private sectors (e.g. business individuals, planning institutions) and public is indispensable for the development of Hangzhou waterfront leisure space. During the whole procedure of development, various benefit and objective of both government and private sectors exert different effects and influences. Since the waterfront area has been the significant place where leisure activities occur in Hangzhou, where the city is embraced by four big water bodies, the development patterns of leisure space in the waterfront area of Hangzhou will be primarily focused on in this research. In addition, in order to unveil the roles the government, private sectors and public play in the leisure space exploitation, four waterfront territory leisure space developing background will be hackled and their characteristics will be concluded.

Hangzhou waterfront leisure space developing patterns based on diverse growing background

In order to conduct this research, we collected various information of the four waterfront area through relative websites, master planning and detailed planning etc. simultaneously we consulted Hangzhou Almanac to sort out the histories and analyze the developing process of the waterfront leisure areas. Afterwards the developing patterns of Hangzhou waterfront leisure space will be classified according to its background, prime origin and internal motivation (Background, attractor and cases in Tab. 1, the detail distribution in Fig. 1, photos in Fig. 2). The development process will also be described briefly (Tab. 2).

Tab. 1 Classification of developing patterns of Hangzhou waterfront leisure space: (case followed with "*" is under construction)

DEVELOPING PATTERN	BACKGROUND & INCENTIVE	ATTRACTORS	CASES
. Regeneration of Industrial Architectural Heritage	During the procedure of economy growing and the industries upgrading, the waterfront former function such as factory warehouse will be expected to be renewed and re-used.	By reforming the former industrial building, the structure continues to in function. Creative industry workshop, exhibition, catering, recreation and other new function will be endowed. The combination completed industrial heritage with history, culture and modernist life quality is popular.	Grand Canal Tiandi（LOFT Culture Park）[1] *
. Conservation & Exploitation of Historic Sites/ Blocks with Feature	The functional requirement of the city to conserve historic Sites in waterfront area; meanwhile, parts of waterfront area with characteristic of prominent location should be rebuilt and revitalized for usage.	Base on the attraction of culture and unique architecture of the historic legacy/historic district, leisure area is catalyzed by distributing museums and show rooms, assisted by surrounding features characterizing in unity with tourism, catering, recreation, shopping etc.	Gongchen Bridge Region [2];Xiaohe Street Historic Block; Qiaoxi Historic Block*; Fuyi Granary Historic Site Park*
		Located closely to famous tourism spot, Some blocks with feature will be rebuilt and afterwards branded with characterized architecture pattern and high quality life style. In virtue of abundant population addicted by fabulous tourism spot, these blocks often become recreation, shopping, catering and tourism functional RBD.	Hubin International Boutique Compound [3]; Xihu Tiandi; Xinyifang Commercial Street [4]

	The master plan accelerates the new CBD establishment and some new public facilities construction to provide space to host big events, promoting city modern image in order to attract social investment and collaboration.	The new public space would be dominant by distinctive city museums, exhibition halls, theater, international convention center, public square and other leisure equipments.	Qianjiang CBD [5*]、Xihu Culture Square
. New Town Center Construction			
. Eco-corridor/ Eco-park & Theme Park	Local authorities concentrate on ecological environment protection. With this incentive, waterfront space would be renovated and reformed by enhancing waterfront landscape and purifying the water bodies, which would also ascend resident life quality.	Excellent wetland and waterfront park, lake-side pleasant promenades and piazza, consist with proper catering, shopping and entertainment facilities.	Xixi National Wetland Park [6]; 21km landscape promenade and public parks along Grand Canal(Genshan Park, Qingsha Park, Beixing Park); public parks along West Lake (Hangzhou Flower Nursery, No.1-6 Park etc.), the "New West Lake"
	Furthermore, under the premise of environment protection, exotic investment would be captured to ensure waterfront vigor，diversity of tourism product and promotion of tourism economy.	Recreation space embodies theme parks, amusement park, resorts, sanatoriums and hotels.	Hangzhou Zhijiang National Tourist Holiday Resort (include Song Dynasty Town, Future World Amusement Park, West Lake International Golf & Country Club and other resort units)[7]

Tab. 2 Procedures of four kinds of developing pattern of Hangzhou waterfront leisure space:

DEVELOPING PATTERN	PROCEDURE
. **Regeneration of industrial architectural heritage**	Government organized factories relocation——Institute subordinates to government Planed and Design——Government invested to renew the factory buildings and environmental renovation——Company chosen by government——Company operates
. **Conservation & exploitation of historic sites/historic district/blocks with feature**	Government makes the historic sites and historic district conservation strategic plan——Planning institute is committed by government to implement detail planning——Government investment—Collegiums leagued by government——Collegiums operate relative district
	Government makes the distinctive blocks general developing orientation and strategic plan——Private business company invests and constructs——Operation company committed by private business company operate and manage the district
. **New town center construction**	Government makes general strategic plan and the planning conditions——Collegiums leagued by government——Professional planning institutes will be committed to manipulate detail planning by invitation of collegiums——Collegiums attract investment and collaboration, and carry out plan implementation
. **Eco-corridor/eco-park and Theme park**	Landscape Planning institute is committed by government to implement planning——Government investment—Collegiums leagued by government——Collegiums operate relative greenbelt/eco-park
	Private business company got the land use right——Private business company invests and constructs——Operation company committed by private business company operate and manage the project

Hangzhou waterfront leisure space exploitation: government predominates & private sectors supplement

From decades, waterfront leisure space is developed and exploited by both government and private investors to accelerate local economy rather than just meet the demands of public for amenities. In this process, different interest groups including government, investor, management committee/operation company and public play different roles and also interact on others. Regarding to Hangzhou, its domain of leisure space development manipulated by government planning is obviously sophisticated at functional position, while the private sectors as the minor role.

1. Incentives of Government in Hangzhou Waterfront Leisure Space Development & Social Impacts

After specific research on the leisure space of the-four waterfront territory in Hangzhou: West Lake, Grand Canal, Qiantang River and Xixi National Wetland Park, the incentives and their impacts on the city of the government's predominating in waterfront leisure space exploitation is embodied on five aspects:

(1) Preservation of history and culture and city image promotion

The-four waterfront territory in Hangzhou possesses of exuberant historic heritage, more than 60 historic legacies just for the amount around the West Lake, and mass of heritage also alongside the Grand Canal.   The policy of heritage preservation and collaborated with recreation and tourism industry development, is the pace step forward to be promine of historic characteristic and city image. In this way, some RBD (Recreational Business District) will engender. So far as it goes, compare with the other three waterfront territory, West Lake waterfront area, owing to its prime location in the city and long-time valued by the local authority, is the most advanced in taking full advantage of historic heritage, by protecting legacy and propagating culture, simultaneously developing leisure equipments and business. During the 7-day Chinese Spring Festival holiday, 2.3 million visitors have traveled along the West Lake (totally 3.09 million visitors in Hangzhou).

(2) City economy development

2007 Hangzhou has been issued "China's best tourist city" by UN World Tourism Organization, for definitely the government must support and spares no effect in establishing substantial tourism economy. The ascendancy of Hangzhou is spectacular waterfront landscape and historic heritage, the vital foundation and guarantee for that is to develop leisure and tourism industry. In the whole 2006,

Hangzhou had received 38.64 million visitors and achieved the gross income from tourism of 54.37 billion RMB, approximately 7.66 billion US dollar (Hangzhou Almanac2007). Simultaneously, In order to leverage the reputation of "UN World Habitat Prize cities", the relevant government authorities are striving to follow context of creating landscape-comfort city, intending to convey waterfront districts as places with blooming public activities, benign environment, and potential price-raise estate, and become catalyst for native economy to revitalize waterfront district potential development, then draw public attention, collaboration and private investment.

(3) Urban functional transformation and industries upgrading

Hangzhou is accomplished by water from ancient, envisage parts of waterfront districts subordinate to inner city with poverty, low life quality and demoded function of land-use is inevitable. Furthermore, by the impact of technological innovation of transportation, port town like Hangzhou, especially Grand Canal alongside, its transportation function is descending, while requirement of being multiplicity with high-grade integrated function is ascending. In addition, urban sprawl and industrial structure readjustment in land-use lead to manufactories external migration. The industrial architectural heritages like former factories, warehouses and docks are eager to be revitalized and re-used as the functional combination of office use and leisure activities. This revitalization pattern is at prevailing and has abundant successful foreign and domestic precedents, thus, the Hangzhou government intends to imitate and apply in the Grand Canal. Incidentally, the Grand Canal Tiandi（LOFT Culture Park）, under construction, is a maiden attempt for Hangzhou government, which certainly will set the pace for the remaining in the near future.

(4) Authority political achievement pursuit

Every session of governments desired to achievement through waterfront area development, which could improve city image and "window of the city", and normally being focused by public so as to win appreciation and to gain attraction from citizens and estate developer. Meanwhile, great amount of public facilities were equipped for promoting city impression, therefore "political achievement" would be kind of obvious. Moreover, for decision makers would alternate along with each session of government, the focus area of urban construction and development would adjust with concentration of decision makers. In consequence, the leisure space developing pace presents Hangzhou with continued transformation in spatial layout.

(5) Ecological environment protection and landscape restoration

The leadership of government embodies to the improvement, protection and surveillance of frail wetland, riverbank and others vital landscape, and the melioration

of urban ecological environment with daily leisure space enhancing. Moreover, the ascendancy of government execution is effective to monitor and prevent the myopic behaviors which private sectors might benefit from sacrificing environment. The research due to first phase of Grand Canal Improvement and Protection Project from 500 units household and 500 tourists indicates that, the approval to the environment improvement and open space construction in the first phase of the project is 99.9%, with 49.6% increased (Hangzhou Almanac2007).

2. Efforts by private sectors in Hangzhou waterfront leisure space & roles they play

Despite neither the dominant exploiter nor the main part users of leisure space which apparently serving society and public is private sectors, we could still observe during the whole planning and development procedure the objective and efforts of private sectors. Underlying roles act on numbers of waterfront development projects, private sectors would be classified as following:

(1) Planning design institute and Consultant Company

Recently, referring to specified waterfront area, Hangzhou city authority normally applies public bidding, invited commission and consultation for strategy planning and urban design. Besides native design units, foreign units would also take parts in this game, such as   OBERMEYER PLANEN + BERATEN GmbH which was invited for consultation for the master planning of the central district in Qianjiang CBD; the West Lake well-know waterfront area，Hubin region, was made urban design by SWA group. Analogy of design units conduct the waterfront leisure space planning with advanced design principle and planning conception, better regarding of user's psychology , which will be significant supplement to government. However, as the case stands, these design units are more influenced by the will of government. In other words, waterfront leisure space planning in Hangzhou seems even more like government planning.

(2) Private business investor

It is overwhelming that a direct investment from government to manipulate leisure space projects involved large public facilities, waterfront parks, green corridor and legacy conservation, however, few establishment of public leisure space would be bidden with estate , and the construction and maintenance on site also undertaken by private investor as premise for bidding. There are three reasons for private investors' eagerness to taking part in leisure space projects exploitation: first, waterfront environment and public service is improved by the real estate business investor enough to gain potential increasing profit from land value and house price ascending; second, investment in specified area in the city like Zhijiang National Tourist Holiday

Resort is apt to gain preferential financial policies from government, so as to reduce expenditure; third, exploiting some kind of leisure space projects with high quality to promote social image and reputation of private company. Incidentally, such as Song Dynasty Town, Future World Amusement Park and other theme parks, which fetch in abundant new recreational products, increasing selectivity for residents and visitors, are invested by private business companies. Moreover, the flexibility of private investors is remarkable to meet financial balance once government lack of capital.

(2) Private operation companies

In Hangzhou, private operation companies of some recreation projects are usually found and strategically controlled by private business investors. They take charge of project investment attraction and collaboration. With modern management mode and market-oriented, private operation companies are more efficient, flexible and independent. However, compare with the private operation company, another kind of operation organization, collegiums, are found by government normally, responsible for execution of leisure space planning, attracting investment. More importantly, it ensures the unity of project going direction and integrated urban planning with expertise consultancy. It become government substitute to supervise waterfront leisure space project processing and is another expression of government planning.

The baffle & suggestion to the interaction between government, private sectors & public

Analyzing the responsibilities undertaken by government and private sectors respectively in numerous projects of Hang Zhou waterfront leisure space development would be expedient to understand distinctive developing patterns of waterfront leisure space, and unveil the inner problem. Presently, to the waterfront leisure space development situation which regarding of government leadership and consisted with private sectors, suggestions are as following to the baffle of this phenomenon:

(1) Government Desire Transcends Market Requirement

Because of "political achievement" motivation and lack of marketing research, the leadership of government in leisure space exploitation might induce idealism planning, meaning government desire transcends market requirement. Once this circumstance actualized, parts of leisure space might be devoid of usage, and will be difficult to meet public appraisal. Such as Hubin International Boutique Compound, there are conflicts between district original plan and consuming requirement, consuming ability and consuming objective. The construction on best location did not achieve public consensus, in contrast, just became the image promotion by government desire.

(2) Myopic Behavior for Benefit in Some Private Business Developer

Parts of private business developer with myopic behavior for benefit, is short of long-term development schedule in integration, especially lack of realization of characteristic brand-building. The Xinyifang Commercial Street, by the side of Grand Canal, is the precedent which the developer overslaughed commerce admittance mechanism in the beginning, leaded to absence of nurturing district characteristics, attraction to local dwellers and travelers. Consequently, the operation of the commercial street became gloomy, the owner of the shop continued shifting or even closing for painstaking business.

(3) Seldom Private Business Developer Participates in the Industrial Heritage Vitalization Projects

Hangzhou government is the only planner, investor and builder in the industry heritage vitalization projects at present. However, our consideration for the projects of industry heritage vitalization would tend to be methods of cooperation, which means private developer would implement the project by planning, architectural design, investment and management with government surveillance and preferential policy. There are abundant practical experiences in china or abroad, private sectors could better estimate market trend, then the architecture design and commercial promotion might protrude characteristics of the industry heritage with more ample usage. Hangzhou government could take reference of the Bridge eight project in Luwan district in Shanghai, government accreditation and creation of private sectors transferred a 50-year-old car manufacturer building into life style center and gained the reputation of national paradigm of industrial tourism.

(4) The Extent of Public Participating in Urban Planning is Insufficient & Limited

As we know, China is under a rapidly constructing and developing background, because of which most of the public projects including leisure space projects would be likely to be implemented immediately after making the plan without publishing the plan to the public or enough consultancies.　This phenomenon always happens in lots of small leisure space projects relating to citizen's daily life, and only some large-scale projects will be published and public's opinion collected by the Urban Planning Bureau. In order to save time and expenditure, government-leaded leisure space construction does not give public the chance to join in planning, which will lead to less attraction and illusive reflection of the public demand.

(5) Suggestion of Establishing NPO (Non-Profit Organization)

In Hangzhou, as long as other cities in China, there aren't any real Non-Profit Organizations which could stand among government, private companies and public without any related-interest is existed. The introducing of NPO among the three benefit groups in the Hangzhou waterfront leisure space development will improve the public participation which is in a low level at present, increase the utilization of the recreation facilities and promote project operation efficiency (Illustration of NPO refers to Fig.3).

1.   Grand Canal Tiandi (Loft Culture Park) is under second phase of Grand Canal Integrated Protective and Renovation Project. The construction began in 2006, comprising renewal of former industrial buildings and the erection of leisure park. Within 13 hectare area around canal bank, Lankongque Chemical Fiber Factory, Dahe Dockyard, Changzheng Chemical Plant and Hangzhou the 1st Cotton Textile Mill, approximately 30,000m^2 building area, protection and renovation to their warehouses and manufactory buildings would be conducted in progress. Meanwhile underlying on

architectural style to orientate industrial building into loft style office, catering leisure space, commercial space, serviced apartment. Incidentally, outskirt of the loft coenobiums, there is 6.8 hectare Canal Park open to public.

2.   Gongchen Bridge began to be built in 1631; it is renowned bridge on southern part of Grand Canal. Gongchen Bridge region as hinge of canal tourism and tourist service center is involved in the first phase of Grand Canal Integrated Protective and Renovation Project. Along with bridge remedy and riverside renovation, this project also facilitated water bus pier, canal museum, library, convention halls and adjacent 5.2 hectares multi-functional underground shopping mall included shopping, catering, entertament.

3.   In 2002, Hangzhou Hubin International Boutique Compound, which was upheld by Hangzhou government, was erected as focal project of international tourism city. After it's completion in 2003, it has won the prize of "Future Project" form MIPIM, France, and "Excellent Prize" from ULI, USA. It is located at prominent segment of The West Lake waterfront tourism area, which transits to city commercial area. Oct 2005, it opened to public; there is an assemblage of top 30 international brand stores, and has all the functions including catering, entertaining and recreation, orientating Hangzhou fashion center.

4.   Xinyifang Commercial Street locates in traditional economy and culture center alongside the Canal branch. Total building area is 30,000 ㎡, 11 low-rise commercial buildings with Chinese traditional style and commercial street is installed by the side of the branch, connected by bridges, protracting about 500m to review the scene of ancient market. Xinyifang Commercial Street was orientated to be integrated leisure recreational place, taking the principle of 'small but sophisticated, numerous then versatile' to satisfy multi-function required by urbanite. However, the shops in Xinyifang Commercial Street sequentially liquidated by years since it opened to public.
5.   For the protection of historic old city, Hang Zhou government proposed the urban area layout strategic policy of 'urban area migrates to the east, tourism moves to the west, develop by the riverside and across Qiantang river'. The government also decided to establish a new Hangzhou city center, Qianjiang CBD, at the center of northern part of Qiantang River. This will consequently transfer the long existing 'radiated space with the core of West Lake' into scattered space with axis of Qiantang River, and 'the West Lake era' will become 'Qiantang River era'. According to Qianjiang CBD master plan, the area of its core district is 4km^2. Some important urban public facilities will be built in the core district, such as Hangzhou Theater, International Convention Center, Citizen Center, Central Park etc. What's more, the biggest shopping mall in Hangzhou with the building area of 550,000 ㎡ and an investment of 4 billion RMB(approximately 560 million USD) and a great amount of business hotels will appear in a few years time.

6.   During the late 90s last century, for the reasons of urban sprawling and estate development, and lake reclamation for cultivation and poultry breeding by local peasants, Xixi wetland descended from 60km^2 to 10.08 km^2, along with the environment deterioration. Since 2002, Hangzhou government invested 4 billion for the protection and recovery of wetland by classifying 3 conservation area: ecology protection area, ecology recovery area, historic heritage conservation area; establishing ecological science showroom while protecting local custom. Xixi National Wetland Park was the first national wetland park which integrates protection with utilization in the city.

7.   Hangzhou Zhijiang National Tourist Holiday Resort was established as one of 12 national resort development district in 1992, with 50.68km^2 planning area, which involves three major projects of Song Dynasty Town, Future World Amusement Park and West Lake International Golf & Country Club. Other resorts, holiday hotels, rose garden leisure center are also being developed. Currently, flower expo, tennis court, ocean parks and others recreation units are still introducing to furnish Zhijiang National Tourist Holiday Resort.

Change and continuity in the creation of new gated communities in post-reform Beijing: a typo-morphological analysis

Qiang Dou
University College London, United Kingdom

1. Introduction

Since early 1990s, China has undergone a dramatic socio-economy restructuring from a socialist planned economy to a socialist market economy, which has changed the way of urban development and management through the 'privatization of the city' legitimated through the public and private partnership. As the results, the use right of previous state-owned urban land was transferred into the land market; developers and property management companies have taken over the main responsibility for providing neighborhood facility, infrastructure and service previously under the charge of the local government and the "work-units" or state enterprises; and since 1992 the market reform of the housing sector from a socialist welfare system into a market-provision system has stimulated the boom of real estate industry and produced massive commodity housing developments.

Commonly, these new commodity housing developments were produced with guarded gates, fences and certain facilities, and are often advertised as 'communities' in market rhetoric which response to the ethos of 'community building' initiated by government. Therefore they can be seen as the Chinese version of 'gated communities' which are originated in the USA as a form of private neighbourhood and now a global phenomenon.[1] In a political economy sense, a gated community can be seen as a kind of residential "proprietary community" which defines a "club realm" that "give[s] legal protection to the economic rights over shared neighborhood attributes". [2]

In Beijing, unlike the separated archipelagos of fortified enclaves in the US, gated commodity housing developments are the basic components or units of the newly master planned residential districts. The agglomeration of these gated residential developments is shaping Beijing into a 'gated city of tomorrow' proposed by Webster [3], which is "made up entirely of privately supplied communal space and local infrastructure – a patchwork of spatial club realms to match the patchwork of non-spatial club realms that have always characterized cities".

The rise of gated communities is often seen as a controversial alternative to conventional patterns of urban development, and has been received extensive debate from different perspectives. However, the current debate has mainly concentrated on the abstract social discourses with few on the overall morphology and design at the micro neighbourhood level and its links with the historical development and the broad social process. In considering this deficiency, the specific setting of Beijing, and the important role of planning and design in shaping the new cityscape and the patterns of everyday life, this paper aims to contribute to an understanding of the origin and nature of the creation of gated communities in post-reform Beijing through a careful

morphological investigation of the designs of a set of new gated community cases (hereafter GC cases) against the designs of a set of non-gated public produced neighbourhood cases of early socialist period (1949-1992) as baseline or benchmark cases. The specific question is: how and in what way is the morphology of the new private gated communities similar to or different from the morphology of the old public produced neighborhoods?

The locations and general plans of all the cases are given in Figures 1 and 2. For the nine GC cases, they are all located along the green belt of the inner suburb, and they were created by nine different developers and nine different design teams after 1998 (the end year of the old welfare housing system) and sold on the market in or since 2003 for the upper-middle and middle income families. In a general sense, these cases represent a new type of gated living at the urban edge for the rising 'middle class' in post-housing reform Beijing. Furthermore, the cases selected are all piecemeal developments within one leased tract or 'urban cell', which has a site area at least above 9 hectares.

In respect of the set of old public produced non-gated neighbourhood cases, they are usually called "*Xiao Qu*" or "small districts" (hereafter SDs) in literal translation, which has an origin in the Soviet idea: 'micro-rayon' or 'micro district', which in essence similar to the idea of 'neighborhood unit'.[4] According to the major urban building cycle and socio-economy changes, these SD cases can be further divided into two sub-sets. One sub-set represents the early small district planning experiments in Maoist period (1949-1978) of a socialist planned economy which emphasizes on production and constrains consumption, and a communist ideology which values an equalitarian society and communal living. These pre-1978 SD developments were usually built together with workplaces and were developed by several work-units for their own needs. The second sub-set represents the further experiments after economic reform in 1978 and before the start of the housing reform in 1992. During this period, modernisation became the priority of the socio-economic and cultural development. Meanwhile, with the government intervention, the project-specific planning of pre-1978 SD developments was replaced by comprehensive development carried out though more powerful city authority.

In the following five sections, the findings of the comparative morphological analyses based on the careful visual inspection of the figure-ground cartographic representations and the basic qualitative and quantitative examinations will be presented in respect of the major analytic elements or components of neighbourhood form, i.e. size, density, boundary, residential buildings, facilities, street system and open space. Meanwhile, the ideas and logics behind the changes and continuities in design demonstrated by the findings will be accounted. In the final section, the origins of the new gated community designs and the links between the morphological changes and the broad social process will be discussed.

2. Size and density

According to the *Code of Urban Residential Areas Planning and Design in China*, which was first proposed in 1993 based on the earlier experience of SD planning and design, there are three levels of residential developments which were defined based on facility-catchment population. The first level is called 'residential district', which accommodates a population between 30,000 and 50,000 which is similar to the population of a Howard's garden city; the second level is called 'small district', which accommodates a school catchment-population between 7000 and 15,000 which is similar to the population of a neighbourhood unit suggested by Perry; the third level is called 'cluster' which accommodates a population between 1000 and 3000 corresponding to the population-catchment of a residential committee.

With respect to this planning guidance, the majority of the SD cases can accommodate a population at the small district level; while for GC cases, the majority of them cannot accommodate a population at the small district level, and in one case it can only accommodate a population at the cluster level. In another sense, GC cases tend to not accommodate a school catchment population.

The drop in population size is linked to population density (i.e. persons per hectare or PPH). The comparison of average values shows a trend of an increase in population density from pre-1978 SD (498 PPH) to post-1978 SD cases (733 PPH), followed by a trend of a sharp drop in GC cases (324 PPH), which is similar to the value of an apartment unit proposed by Perry (326 PPH) and below the value of a typical London urban district (400 PPH).

Next in respect of another kind of density – Floor Area Ratio (FAR), it is a gross one which counts the floor areas of both residential buildings and non-residential buildings. The average value comparison shows a continuing increase of FAR from pre-1978 SD cases (0.71) to GC cases (1.57) through the leap in post-1978 SD (1.443). Further it is worth considering the slight continuing increase in FAR from post-1978 SD cases to GC cases with respect to the parallel trend of a sharp drop in population density. Two physical factors which contribute to this countermove between these two kinds of densities can be suggested: 1) the increasing living area for each dwelling unit coupled with shrinking household size; 2) the increasing floor areas for commercial facilities. Moreover, besides these physical factors, there exists an incentive of real estate developers to pursuit more profit by increasing FAR.

3. Boundaries

Commonly, the boundaries of all the GC cases and SD cases are defined by a hierarchical city thoroughfare network, which is like a deformed tartan grid. Therefore, the neighbourhood unit principle of boundary definition by arterial roads was implemented in both SD cases and GC cases. However, the surrounding arterial roads in GC cases tend to be designed with more sufficient width on all sides. Meanwhile, in half of the SD cases, the boundaries were partially defined by the combination of boundary arterial roads and municipal green areas. While municipal green areas are

also provided in three out of nine GC cases, it seems that there is a tendency to decrease the provision.

Having examined the boundary delimitation, the following will look at how the boundary frontage as the physical interface between the city and the neighbourhood was shaped. First, in two pre-1978 SD cases which were designed under the Soviet influence in early 1950s (i.e. S1, S2), their boundary frontages were mainly shaped by outward facing residential building frontages (Fig. 3a) in combination with a small proportion of institutional office building frontages. However, this kind of frontage was not survived in the following post-Soviet influence SD cases. In pre-1978 case S3 which was designed as a people's commune, its boundary frontage was transformed into an inactive one (Fig. 3b), which was formed by brick walls, the back and side of residential buildings, neighbourhood entry demarcation and gates of institutional office and industry building compounds. In the following post-1978 SD cases, residential building back and side were still the major form of their boundary frontages, and the similar neighbourhood entry demarcation continued to exist (Fig. 3c); while brick walls were transformed into simple wrought iron fences (Fig. 3d), and the gates of non-residential building compounds cannot be found in any case. Meanwhile, accompanied by the economic reform, active commercial frontage recurred in all post-1978 cases after its absence in all pre-1978 cases (Fig. 3e).

For GC cases, the most obvious change is the transformation of the neighbourhood entry demarcations into the guarded gates. Commonly, there is a guarded main entry gate formed by a gate house and other symbolic constructions (Fig. 3f), while the rest of the neighbourhood entries are usually smaller in size as secondary entries, which, in some cases, are more like checkpoints controlled by simple vehicle barriers and gate-posts (Fig. 3g). In fact, the distinction between main and secondary neighbourhood entry in terms of their sizes is also present in all post-Soviet influence SD cases.

In respect of the residential building back and side, they are not appeared in any GC case. Instead, residential buildings stand behind the wrought iron fence which are more varied in form and style and even installed with CCTV or infrared boundary detectors (Fig. 3h). Meanwhile, it is noteworthy that, in some cases, few residential buildings along the boundary are outward facing (Fig. 3i).

In respect of the commercial frontage, although it is present in the majority of the GC cases (Fig. 3j), it could be absent in certain cases which therefore have the similar inactive frontage of a people's commune. Finally, it is worth noting a new element of boundary frontage presented in two GC cases: an underground parking entrance which is open directly onto the surrounding boundary roads.

4. Residential buildings

In SD cases, in addition to the major private family housing, a small amount of social rental housing were provided at the periphery in the cases of the Soviet influence as 'bachelor halls' which were provided for single young people who worked in adjacent

workplaces and in post-1978 SD case as 'youth apartment buildings' which were provided for the special housing need of young people. In GC cases, the old social rental housing forms have been replaced by a private rental housing form: 'condominiums', which are provided with more complete facilities and services, and their market target is not only on young people, but also on wider social spectrum, such as city migrants and commercial travellers.

In considering the architectural style of family housing, in SD cases, the traces of modern industrial design are obvious (Fig. 4a); while by imposing the Chinese traditional architectural elements, they become less obvious especially in the Soviet influence cases (Fig. 4b). For GC cases, the traces of both the monotonous modern industrial design and the decorative Chinese traditional elements can not be identified any more. Instead, their styles become much more varied even exotic, such as the European contemporary architectural style directly transplanted by European architects (Fig. 4c), the faked European classical architectural style (Fig. 4d), North American contemporary design and Mediterranean traditional style transplanted by North American architects (Fig. 4e&f), and the styles which can be identified in the housing design in Hong Kong, Taiwan or Singapore (Fig. 4g). Moreover, not just the overall variation, two different styles can coexist in the same development, such as Mediterranean tradition versus North American contemporary. To some extent, the creation of style differentiation can be seen as a means of increasing the marketability of the new phases of their developments or the whole development by creating distinctive images.

Further, looking at the built form of family housing, multi-family apartment buildings with varied heights and shapes are the dominant form in both GC cases and SD cases. Meanwhile, a small proportion of single-family houses were built in one SD case of the Soviet influence in the form of row houses (Fig. 4h), and in one GC case in the form of row houses and detached houses (Fig. 4i) and a quasi single-family housing form in two GC cases (Fig. 4j), which basically is a four storey building structure with one two-storey maisonette over another one on the ground, which has its own accesses from outside. However, in SD case, single family houses were built as high standard welfare-housing for cadres who had high official positions within the work units; while in the GC case, they were built as high quality residence for who can afford them.

On closer examination of the built form of the multi-family apartment buildings, pre-1978 SD cases all take a mono-form: only low-rise apartment buildings (3 storeys) in the cases of Soviet influence, and only multi-storey apartment buildings (4-6 storeys) in the case of people's commune. For post-1978 SD cases, despite the continuing presence of the mono-form of multi-storey apartment buildings, the overall form tends to be diversified by mixing low-rise, middle-rise (8-16 storeys) and high-rise apartment buildings (18 storeys and over) with multi-storey ones.

In considering GC cases, first, the low-rise forms are not adopted. Second, the mono-form of multi-storey apartment buildings remains only in one case; while, there exists a new mono-form of middle-rise apartment buildings. Third, in the cases of a mixture of

different types, the proportion of the mid-rise type tends to become the highest one not the lowest one, while the proportion of multi-storey type tends to become the lowest one not the highest one. Overall, in GC cases, the middle-rise form tends to become more favoured than both high-rise and multi-storey forms.

Furthermore, in respect of the quality of the multi-family apartment buildings, some architectural means were used to raise the standard of apartment buildings in GC cases. The first one is to provide ground floor entry hall for each apartment unit; the second one is to equip the multi-storey apartment buildings with lifts; the third one is to reduce the number of dwelling units connected to lifts in middle-rise and high-rise apartment buildings; and the fourth one is to provide larger dwelling units or loft living.

On the whole, by using the distinction between single-family houses and multi-family apartment buildings, and the specific architectural means, a quality differentiation of family housing can be produced in the same development; and commonly the family housing of a higher quality are deployed in a central landscaped low density zone. The logic behind this commonality can be suggested as follows: 1) quality differentiation can broaden the scope of customers; 2) by bring customers of higher socio-economic status, the reputation of the developments can be raised and therefore the added value can be generated in the long run; 3) by building relatively higher quality housing close to the central natural amenities, there values will be further increased; 4) by concentrating the housing of different quality in a separated zone, the stage development and the provision of management or service at different level will be feasible.

Finally, looking at the layout form of residential buildings, an outward courtyard-type or street-block type arrangement is clearly present in SD cases of the Soviet influence. In the following case of people's commune, an overall linear row-type arrangement was generated due to the modernist functional considerations, such as light and ventilation. The linear row-type arrangement and the courtyard-type arrangement are continually present in post-1978 SD cases; however an new loose scatter form of arrangement was generated in respect of the idea of 'towers in a park' [5], and the outward courtyard-type arrangement was transformed into inward looking courtyard-type arrangement or 'clusters within clusters' in respect of the principle of 'defensible space' [6]. In GC cases, the inward looking courtyard-type arrangement, the linear row-type arrangement, and the loose scatter type of arrangement are all present to a similar degree. However, the courtyard-type arrangement tends to take simpler forms, and in the cases of a loose scatter type of arrangement, the idea of the 'towers in a park' can be transformed into the idea of the 'houses in a park'.

5. Facilities

Alongside residential buildings, five major facilities can be identified in both SD cases and GC cases: 1) community centre; 2) commercial facility; 3) neighbourhood shop; 4) kindergarten 5) and primary school.

First, a community centre is usually called "club house" in GC cases and is the most present facility in comparison with other facilities (eight out of nine cases). Functionally, it provides spaces for meeting and recreation, such as meeting rooms, a gym and an indoor swimming pool. For the pre-1978 SD cases of the Soviet influence, the equivalence is called "dining hall", which provides a space for welfare catering service and a large indoor multifunctional space for other social activities. For the Post-Soviet influence SD cases, the equivalence is called "youth activity station", which provides indoor recreation facilities especially for young people. In SD cases, the equivalent community centres belong to the semi-public realm; while in GC cases, the community centres were all initially designed as a club realm facility behind the gates and fences. However, in reality, a clubhouse could be converted into the public realm since the exclusive use might not be economically viable. In respect of the position of the community centres, besides the middle position (between the periphery and the geometric centres of the sites) without direct visual link from boundary roads in all pre-1978 SD cases, the near periphery position without direct visual link from boundary roads and the near centre position with direct visual link from boundary roads in post-1978 SD cases, a new periphery position is present in half of the GC cases. More exactly, their clubhouses are commonly adjacent to neighbourhood entries and visible from the boundary roads through the fences.

Second, in considering the commercial facility of the public realm, it was not provided in all pre-1978 SD cases due to the communist ideology and policy which valued production and constrained consumption; while it was provided in all post-1978 cases. In GC cases, although it was provided in seven out of nine cases, it may not be necessarily provided. Due to the periphery position of commercial facilities, in both post-1978 SD cases and GC cases, the boundary roads with the commercial frontages were shaped like shopping streets. In respect of the built form of commercial facilities, in post-1978 cases, the residential building annex is the most present form, the ground floor shop is the second one, and the separated commercial building is the least; while in GC cases, the ground floor shop becomes the least presented form, the residential building annexes and the separated commercial buildings, which have much larger scale and more mixed functions, tend to become the equally most presented forms.

Third, in respect of neighbourhood shops, they were provided in most SD cases as semi-public realm facilities; while in GC cases, they were provided in two third of the cases as club-realm facilities. In considering the forms and positions, the similar ground floor form and near entry position adopted in post-1978 SD cases were continually adopted in most GC cases; however the self-standing buildings situated near the centre in pre-1978 cases, which is not consistent with the neighbourhood unit principle, and building annex form presented in both pre-1978 and post-1978 SD cases can not survive in GC cases.

Fourth, a kindergarten as a semi-public realm facility was provided in all SD cases, however it may not be provided in two GC cases, or not built in the real site in one case. Meanwhile, although in most GC cases a kindergarten is a club realm facility behind the gates, it could be transformed into a public realm facility with its compound entry

opening directly onto the surrounding arterial roads. In respect of the forms and positions, the pre-1978 SD cases of the Soviet influence are common in having more than one kindergarten deployed separately near periphery in accordance with the sub-blocks divided by the neighbourhood through roads. In post-Soviet influence SD cases, usually one kindergarten compound was provided near the centre with a direct visual link from the boundary road. In all the GC cases, one kindergarten compound was provided. In three out of seven cases, the compounds are also located in a near centre position but with a deeper and less direct visual link from the boundary road; while in another three GC cases, their kindergarten compounds are located exactly at the periphery.

Fifth, a primary school as semi-public facility was provided in all SD cases, while it was only provided in five out nine GC cases. In respect of their positions, only in the first case of the Soviet influence is the primary school located near the centre of its site, which is consistent with the neighbourhood unit principle; for the rest of the SD cases and all the GC cases, primary school compounds were commonly located at the periphery. However, in respect of the sphere of service, the primary schools in SD cases are semi-public facilities which are accessed through the internal neighbourhood roads; while for GC cases, their primary schools are treated as either club realm facilities set behind the gates or public realm facilities with direct accesses from the surrounding arterial roads. In general, in GC cases, a primary school tends to be not provided, and tends to be treated more as a public realm facility. One reason behind this trend is the insufficient population size for supporting a primary school; the other one is that, accompanying the increasing choice and mobility, today a primary school with a good reputation seems to be more important than that a school can be reached by walking safely; and one more explanation is that provision of a primary school is not profitable and is difficult in its operation.

Finally, in addition to the five major facilities examined above, it is worth noting that in all pre-1978 SD cases, institutional office buildings were provided within the sites, while they cannot be found in post-1978 SD cases, which indicates the separation between living and work after the launch of economic reform in 1978. However, in third of the GC cases, office space has been provided within the mid-rise or high-rise commercial complexes as the leased workplaces for commercial organisations.

6. Street system and open space

In respect of the overall pattern of the street system (Fig. 5), GC cases are characterised by a miniaturisation of the local grid, and are more complex and contain less order in comparison with SD cases which have much coarser patterns. Meanwhile, a clear road hierarchy of the internal street system commonly identified in SD cases seems to be disrupted by the mosaic-like enlarged pedestrian areas and the curving pedestrian paths. Yet, another marked change in GC cases is the unanimous provision of parking spaces either uncovered surface parking or underground parking spaces. Looking more carefully, in three GC cases, the dominant form of parking is underground parking, while a few temporary surface parking spaces were provided for visitors or

guests. For the rest of the GC cases, it is a combination of underground and surface parking, and the surface parking spaces are usually deployed along the internal vehicular roads or in the form of concentrated parking plazas. In general, the dramatic increase in providing parking spaces is a response to the rising numbers of private car ownership, which can be indicated by the average parking coefficient at 1.021, which means each household is supposed to have at least one car.

In respect of the arrangement of vehicle access, a new logic of the vehicle access at the periphery is adopted in GC cases in addition to the internal vehicle access predominantly adopted in all SD cases. The result of this new logic is the creation of the periphery vehicle circulation or collector road along the boundary just behind the fences and the pedestrianized zones or blocks by separating the traffic from pedestrians. To some extent, this new logic is kin to the logic of the 'super-blocks' of the prototypical American suburban new town Radburn designed in 1920s, [7] which are characterized with cul-de-sac vehicle accesses from the surrounding arterial roads and with parks in the central area connected with the houses by a pedestrian network.

In addition to the means of the periphery vehicle access, there are two other ways to constrain vehicle access in GC cases. The first one which has been implemented in post-1978 SD cases is simply to reduce the number of neighbourhood vehicle access points. In most GC cases, one side of the boundary is usually punctuated only by one vehicle entry in the middle, although it could be two, and in two third of the cases, they all have at least one side of their boundaries without any vehicle access points. In contrast, in pre-1978 SD cases, one side the boundaries can be even punctuated by four or more vehicle access points. The second way to constrain vehicle access is traffic diversion achieved by using non-cross intersections (i.e. T, L or Y intersection) and curving or diagonal roads. These techniques can be identified in all GC cases and SD cases as well. However, it is notable that the first turns of the neighbourhood access roads in SD cases generally happen at a deeper position (probably near the geometric centre) than in GC cases.

Besides the functional ideas underpinning the arrangement of the street system, it is worth noting the formal design or Baroque elements imposed on plans – 'visual axes'. In six GC cases, there exists a long visual axis, which cannot be found in any SD cases, cutting through the site and linking two opposite neighbourhood entries. Another kind of visual axis is the visual penetration started from a neighbourhood entry and terminated somewhere inside. This kind of visual axis can be identified in both GC cases and SD cases. However, in GC cases, it is usually terminated softly into the landscaped areas (such as central park or artificial lake) not at communal buildings as in SD cases.

Having examined the street system as a network of continuous linear open spaces, what follows will further look at the other two types of open spaces: paved plazas and open green spaces. So far as the plazas are concerned, in pre-1978 SD cases, a few small plazas in front of the communal buildings can be identified; while in post-1978 SD cases, due to the provision of commercial facilities, the elongated shopping plazas along the arterial roads were provided. In GC cases, a similar kind of elongated

shopping plaza can also be found, however there exist a new form of corner shopping plaza. In addition to shopping plazas, two new kinds of plazas are present in GC cases: 1) neighbourhood entry plaza, which are provided behind the gates; 2) 'community plazas', which are mostly situated near the centre of the sites in connection with their clubhouses.

Finally, in respect of the open green spaces, they can be generally classified into two kinds: parks and small open greens, which were provided in both SD cases and GC cases. However, the parks in GC cases tend to be large, linear in form, extensive in covering, and tend to be dissociated from buildings as separate islands defined by pedestrian routes, and not necessarily deployed in a central position. In considering small open green spaces, they tend to be more sufficiently provided in GC cases, and the popularity of courtyard-like small open green spaces tends to be increased in GC cases.

7. Discussion

As demonstrated by the morphological analyses in previous sections, new GC planning and design is not revolutionary. In other words, the imprints of the old SD planning and design are identifiable. However, at the same time, new trends or features of change are also evident to different degrees. In general, it is a mixed picture of change and continuity.

In respect of the origins of the new GC planning and design, first, an important legacy of the Soviet design influence is the implementation of the principles of the planning paradigm 'neighborhood unit' originated in the US, while the outward facing street-block arrangement and the provision of multiple children's caring facilities were not survived in both post-Soviet influence SD cases and GC cases. In comparison, the neighborhood unit principles of the size of a school catchment population and the central position of institutional buildings were much less rigidly implemented in GC cases; while the principles of the boundary definition, the provision of open recreation spaces, the position of shopping facilities and the arrangement of the internal street layout were more rigidly implemented in GC cases. Overall, the imprints of neighborhood unit principles in GC cases tend to be even more evident.

Second, GC planning and design has its origin in modernist architectural paradigm, which is especially evident in post-Soviet influence SD cases. However, the implementation of modernist's design principles of "enclosure, hierarchy, and repetition" tends to be attenuated in GC cases. This is shown in the tendency to create a simpler form of courtyard-type residential building arrangement and to disrupt internal road hierarchy. Meanwhile, the 'towers in a park' model implemented in post-1978 SD case tends to be less favored in GC cases.

Third, new GC planning and design also has origins in design ideas which are new to SD planning and design. One is the idea of Radburn super block; the other one is the New Urbanism originated in the US.[8] The imprints of the principles of the New Urbanism

at the neighborhood level are evident in the creation of more pedestrianized and interconnected street system, imposing visual axes and the mix of different housing types. However, at the meantime, with an odd combination with gating, new GC planning and design tends to also against some principles of the New Urbanism, such as the promotion of the mixed-use and mixed-income neighborhood, and the open accessible street-block system with public transit stop at the centre.

While the morphological changes can be seen as the results of the change in planning and design ideas, they can also be linked to the broad process of the societal transition. In respect of economic globalization as one challenge to new Chinese cities, its impact at the micro-level of the creation of GCs in post-reform Beijing is via the foreign design cooperation and the wider western urban cultural influence, which has brought some new design vocabulary. More exactly, the impact is manifested in the direct architectural style transplantation by foreign architects, a marked increase of pedestrian areas, and the increasing provision of plazas of varied forms.

In parallel with globalization, 'marketization' as another challenge to new Chinese cities has profound social, cultural, economic impacts. In respect of the increasing social plurality and socio-economic stratification, they are reflected in the quality differentiation of family housing produced within the same development and across cases; while cultural diversity is manifested in more varied even exotic architectural styles. Meanwhile, the current economic prosperity has caused the increased wealth and consumption. Therefore, the increased residential space consumption combined with the shrinking household structure led to the trend of a decrease in population density in new gated developments. Yet as responses to the increasing private car consumption and use, the neighborhood unit principle of boundary definition by arterial roads tends to be fully followed in GC cases; there was a dramatic increase in providing parking spaces, specially the underground parking spaces; and the Radburn idea was adopted.

In respect of the impacts of the changes in the mechanism of urban development and management, first, the privatization of land use right provides the market the freedom to operate within leased tracts, therefore a perfect condition for the application of the Radburn idea, which however was not widely adopted in the US due to the constraints of the individual land ownership of a private lot. Meanwhile, it creates the condition for the tendency to create large freely formed and deployed community parks.

Second, the provision of urban service by private property management companies induces the intention to reduce the number of neighborhood access points and to detach residential buildings from boundary frontage in order to easy the management and to reduce the cost of maintenance. Meanwhile, the consideration of the feasibility of the stage development and the provision of differentiated management or service contribute to the tendency of deploying the family housing of higher qualities in a separate central landscaped low density zone.

Third, due to the private provision of mass commodity housing in a leased tract, the market logic in general and the developer's logic in specific have clear effects on

housing design. Therefore the profit-maximization logic of the developers has resulted in the trend of an increased FAR despite the parallel trend of a decreasing population density. In turn, like a kind 'market selection', middle rise apartment building form tends to become more favored than both high-rise and multi-storey forms due to its capacity to generate high FAR and to provide lifts which could be more efficiently used with lower cost. Furthermore, in order to increase the marketability of the different stages of the developments, there is a trend to create style and quality differentiation within the same development; and to increase the marketability of the whole developments, single-family houses and apartment houses as up-market products are produced in mix with other multi-family housing to yield mutual benefits, and to raise the neighborhood reputation and sales prices.

Fourth, the impact of the private provision of facilities is also via the logic of market or developers. Therefore, in order to produce economic exclusivity, the major facilities were mostly converted into the club realms; however they (such as primary school and kindergarten) could also be converted into public realms and may not be necessarily provided due to the concern of their economic viability in specific local conditions. Consequently, there is a rediscovery of the non-active boundary frontage of people's commune; the periphery position of facilities tends to become equally favored with near centre position. Moreover, in respond to the market demand for large scale commercial facilities and driven by the principle of the economy of scale, separated large scale commercial building complexes with linear or corner shopping plazas are created as a new form of the commercial frontage, meanwhile there is a rediscovery of office spaces as workplace for commercial organizations.

Finally, in respect of the impact of the private provision of environmental infrastructure, the most obvious manifestation is the creation of large scale artificial landscapes, specially the artificial waterscape due to the financial capability, the concern of marketability, and the specialization in landscape design. Also in order to increase marketability, interior street vistas in varied forms of promenades or avenues were created to explore the views.

Besides the impacts of the privatization, there are also the influences from the new demands of the consumer or consumer preferences which have a wider connection with the rising consumerism and changing lifestyle. Therefore, the need for security provides a further rationalization for gating and the installation of all kinds of security devices at the boundaries. Meanwhile, the desire for distinction was realized in the distinctive architectural styles and specially provided natural amenities in combination with marketing rhetoric; while the desire for prestige was realized in boundary demarcation and the provision of more luxury housing in the developments. Yet the demand for a better residential environment, which is associated with the image of the American dream, was realized in the decrease in population density, raised standard of multi-family apartment buildings by some architectural means, and the increasing provision of small open green spaces. Furthermore, the increasing mobility and choice combined with the concern of reputation makes it rational to not provide a community centre, a kindergarten or a primary school in a gated development.

Who wrote the plans? A traditional and revisionist view of post-war reconstruction in the UK

Peter J Larkham
Birmingham City University, United Kingdom

During and immediately after the Second World War, about 200 'advisory' or 'outline' reconstruction plans were formulated for a wide variety of British towns and cities. Some had been badly bomb-damaged, others were little-damaged or even undamaged. In terms of British planning, this was a crucial period in the development of concepts and processes. Reconstruction spurred central government action (even, briefly, a dedicated Ministry) [1], and the 1947 Town and Country Planning Act specified the content of Development Plans, changing the character of published plans considerably by the early 1950s. Many of the plans were 'technocentric'.

There are several significant issues relating to 'traditional' planning history embedded in these plans and their processes of production and consumption. Principally, who developed the plans – and, in the case of outside consultants, how much did they know of the character of the places they were replanning? There can be little doubt that the activities of plan-making and implementation in this crucial but short period have had long-lasting implications for British towns and cities throughout the post-war period. Yet researching the personalities behind the decision-making is problematic. Little biographical work exists on British planners of the time, in contrast to contemporary architects. Gordon Cherry attempted to raise the profile of individual town planners, editing a volume of biographical contributions and producing a biography of Lord Holford (joint-author of the reconstruction plan for the City of London) [2]. Even the most prominent and prolific plan-authors of the period, Thomas Sharp and Professor Sir Patrick Abercrombie, have until recently merited little more than chapters in Cherry's book and entries in the *Dictionary of National Biography*. The municipal employees who compiled many plans, and who co-ordinated the actual post-war rebuilding, have gone largely unrecorded; although Dagenais *et al*. have encouraged further consideration of the roles of urban services and agents in urban transformation and the 'municipal experience' [3].

It is hardly surprising, given the variety of places and the ambitions of their local politicians and administrators, that a wide range of approaches were taken to the production of plans. These include the employment of consultants, the use of in-house municipal staff, the formation of specific committees of elected representatives, the involvement of the local press, and the contribution of third parties, whether local organisations [4] or private individuals. It has been a surprising finding, given the focus of traditional planning histories, that the authorship of known plans is weighted more to local authority officers than consultants; plans by other types of author – ranging from private individuals to local societies – do exist, but are rare (Table 1). In most cases, the final 'plan' was a composite, showing influences of the nature of the commission, the professional approach or personal idiosyncrasies of the author(s), and even the interpretations of illustrators, photographers and model-makers. Most published commentaries have focused on the individual named

author, and particularly on the 'great plans' of the 'great planners'. This traditional planning history does obscure many stages and actors in the actual process.

Table 1: Plan numbers and types of author [5]

Type of author	Number of plans	Percentage
Consultant	98	37%
Local Authority	120	45%
Unofficial	48	18%
	266	100%

The selection of consultant authors

At the time, it should be remembered that the profession of town planning was young. There were relatively few professionally-qualified town planners; much planning was undertaken by architects or architect-planners.

> This raises the important question of the number of experienced town planners available for the work which will be so vital to our well-being after the war. There are not many of them, for although the professor himself [Abercrombie] must have had quite a number of able students under his tuition and guidance, few of them can have had much practical experience. Our best men are likely to be overworked [6]

This is borne out by examination of the credited authors of plans. A very small number of consultants were very active. Although most (Abercrombie, Davidge) were well-established professionals, several having served as President of various professional organisations, others were relatively junior and made their name through their plans (Sharp, Lock). Table 2 demonstrates this concentration of planning activity (although it does not consider those consultants who worked upon only one plan). It reveals some surprising names, including the great Edwardian architect Sir Edwin Lutyens who, with Abercrombie, took the commission for Hull in the final years of his life, when he was dying of lung cancer; Geoffrey Jellicoe, more famous as a landscape architect; and Clough Williams-Ellis, historian of the Royal Tank Regiment and owner-architect of Portmeirion. It also demonstrates some enduring professional partnerships, including Minoprio and Spencely, who were together at Harrow, Oxford and Liverpool and went into partnership in 1928; Richard Nickson, in architectural practice in the Wirral, who went into partnership with Abercrombie in mid-1945 with offices in London; and Hening and Chitty. Hening was educated as an architect but 'did not bother with exams', going instead into partnership with Chitty, formerly with Tecton, in 1937.

Table 2: Numbers of known plans by named consultant authors

Consultant	Number of plans
Sharp, Thomas *CBE MA DLitt MTPI FRIBA PPILA; TPI President 1945-6*	12
Abercrombie, Sir Patrick *MA DLitt FRIBA FILA; TPI President 1925-6*	10 (3 with Nickson)
Davidge, William R. *MTPI AMInstCE FRIBA FSI; TPI President 1926-7*	7
Chapman, W. Dobson *MA MTPI LRIBA FILA; TPI President 1943-4*	6
Lloyd, T. Alwyn *OBE Hon LLD FRIBA FILA FSA; TPI President 1933-4*	6 (3 with Jackson)
Chitty, Anthony M. *MA FRIBA AMTPI*	5 (3 with Hening)
Holden, Charles *LittD FRIBA MTPI*	5 (2 with Enderby, 2 with Holford)
Lock, Max *ARIBA MTPI*	4
Adshead, Stanley D. *MA MArch FRIBA; TPI President 1918-19*	4 (2 with Needham)
Jellicoe, [later Sir] Geoffrey *CBE RA PPILA FRIBA MTPI*	4
Edwards, A. Trystan *FRIBA*	3
Jackson, Herbert	3 (all with Lloyd)
Needham, Charles William Cashmore *FRIBA*	3 (2 with Adshead)
Nickson, Richard *MA FRIBA (Abercrombie's business partner from 1946)*	3 (with Abercrombie)
Thompson, F. Longstreth *BSc FSI AssocMInstCE PPTPI*	3
Williams-Ellis, [later Sir] Clough *MC CBE FRIBA MTPI PPILA Hon LLD*	3

Pierce, S. Rowland *FRIBA*	2 (with James)
Spencely, H.G.C. *BArch FRIBA AMTPI*	2 (with Minoprio)

Nevertheless, despite the shortage of planners, this was the 'golden age' of British planning [7]: a period when, although planning as a profession was young, there was a 'belief in planning as an overall principle for ordering human affairs' [8]. As with other professionals, planners were seen as the informed experts: 'the planner, serenely sure of his technical capacities, was left to get on with his job' [9]. And, indeed, very few were female. Moreover, there was apparently a view of 'the planner as omniscient ruler, who should create new settlement form, and perhaps also destroy the old, without interference or question' [10]. While the new profession and new mechanisms, including a new Ministry, were fast developing, there was also a broad general consensus in favour of the activity of planning [11]. Turning to an 'expert' seemed natural, for towns as diverse as London, Macclesfield, Brierley Hill and Accrington.

Some of the established local authority officers, especially engineers and surveyors, made some strenuous efforts to resist 'outsiders'. A 1944 Ministry memo on the replanning of the Tyneside area noted that 'it is evident that Parr [of Newcastle] and Lewis of Sunderland, and probably Minders of Darlington as well, are determined to prevent an outside planner from trespassing on what they consider is their own domain' [12].

In a few cases it is clear that consultants – planners or architects – were selected because of their prior connection with a place and thus, inevitably, their development of good working relationships with either the local politicians or senior municipal officers (perhaps both). Abercrombie was approached to prepare a plan for Bath, damaged in one of the 1942 'Baedeker raids', by the Bath and District Joint Planning Committee. He had been employed as a consultant by the Bristol and Bath Regional Planning Committee since about 1928, and as consultant town planning officer by the Bath and District Joint Planning Committee since March 1935, and so was well known to at least one of his co-authors, H.A. Mealand [13]. The three became 'something like a secret society who had been working since July 1943 on a plan for the future of Bath' [14]. Likewise the architects C.H. James and S. Rowland Pierce were engaged to produce a plan for Norwich, which had also suffered a 'Baedeker raid'. They had designed its City Hall (in 1930; built 1938) and were commissioned to extend it in January 1945. Some were simply 'on the spot': W. Dobson Chapman's practice was based in Macclesfield and, in the inevitable downturn of work in wartime, but at a point when he was elected as the youngest President of the Town Planning Institute, he acted as Honorary Consultant to produce the short but graphically striking Macclesfield plan, which was 'the result of two years' work at odd hours' [15].

In some cases where no direct personal relationship existed, local authorities seem to have worked on a word-of-mouth basis. There is one very striking example of this in the West Midlands (although, sadly, detailed records are virtually non-existent). The Cardiff-based architect-planner T. Alwyn Lloyd, a senior professional who had been President of the Town Planning Institute in 1933-4, produced several reconstruction plans in a very sharply-defined geographical cluster during a very short period. These included Brierley Hill (1943), Bromsgrove (1943), Bilston (1944), Dudley (1944) and Stourbridge (1945), some in conjunction with the Birmingham-based Herbert Jackson. This cluster seems to originate in his being invited to report 'as to the practicability of engaging upon a

comprehensive planning scheme' for an area of Bilston in early 1944, two and a half months before the press report of his Bromsgrove commission. By October 1943 he had been invited to design two major housing estates in Bilston, and by June 1944 to prepare a Borough-wide plan in which his estates were integrated [16]. However, his Bilston plans were not implemented: the then Town Clerk noted 'I wrote to Lloyd yesterday and did my best to make our change of heart appear not too unkindly. I like Lloyd. This business of planning however is quite ruthless ...'[17].

In yet other cases, local authorities sought advice directly from the professional bodies: the Town Planning Institute or Royal Institute of British Architects. Although their letters were almost invariably addressed to the Presidents of these institutions, the responses came from various officers. A pre-war comment by Charles Reilly about Edward Carter, then RIBA Librarian and editor of the *RIBA Journal*, sheds an interesting light on the influence of these officers: 'I feel Carter is already a power behind the scenes who will do much to steer the Institute, largely without its realizing it, into the key position it must now take up. He knows all the young men and sympathizes with their work, and better still, helps them to get positions and influence' [18]. In unbombed Warwick, the Borough Surveyor was 'instructed to approach the Town Planning Institute to enquire whether it is possible to engage a Town Planning Expert for the Borough' [19]. A list of names was reported on 9 March (unfortunately this has not survived). Abercrombie appears to have been the first choice, for he had visited the borough with an assistant before early June, when he wrote stating that he would be 'willing to accept the position of Town Planning Consultant at the usual fees, namely about £500' [20].

There remain some traces of unsolicited approaches, usually by younger or less-successful consultants. For example, I. Massey LRIBA, describing himself as a Chartered Architect and Quantity Surveyor, wrote to Coventry shortly after its major raid: 'It may be that I could render you some assistance at some date in re-designing your City and Buildings' [21]. No such approach is known to have been successful.

However appointed, the working relationships between consultants, local officers and politicians were not always easy. Evidently there were problems between Sharp and Exeter for, discussing forthcoming work at Oxford, H.C. de Cronin of the Architectural Press wrote to Sharp, 'Ought we not to start taking photographs this summer, to avoid the Exeter trouble? ... what sons of bitches that Exeter council is composed of – don't let them get you down' [22]. (Sharp was an indiosyncratic character: an outspoken loner who never hesitated to speak (or write) his mind [23]). Some consultants had low opinions of local officers, typified by Charles Reilly's conflict with Bertie Robinson, Borough Engineer and Surveyor of Birkenhead. Reilly did not mince words on the ineptness of his 'typical' housing designs [24] although he seems to have made an exception for Manzoni [25]. Max Lock had similar problems with the Borough Engineer at Middlesbrough, despite the Housing Subcommittee's instructions that they should collaborate; he wrote to the Borough Engineer that 'I was very disappointed to hear from you ... that you could not consider discussing any amendments to either of the schemes in such a way that we can present a combined scheme to the Housing Committee' [26].

On the other hand, a successful and unusual arrangement was developed at the end of the reconstruction planning period for W.G. Holford and H. Myles Wright (later Professor Lord, and Professor, respectively) acting for Cambridge.

> A consultant of the first order [Holford] was appointed for Cambridge Borough under what I believe is a unique arrangement, namely, that he used the staff of the county planning department, and was represented locally by a partner [Myles Wright] who during the preparation of the report gave his whole time to the work and worked inside the department, not in an office fifty miles away. It is believed that in this way continuity will be preserved and the consultants' proposals will not become just another seven days' local planning wonder [27].

The contrast with other working practices (see below) is noteworthy. Another advantage of engaging a consultant is also explained: the relevant planning officer (the County Planning Officer, at this point) was not the plan author and could therefore act independently, especially if amendments were deemed necessary; however the experience of those who worked on the plan preparation was retained within the Department.

The use of in-house professionals

The work of the consultants, where these were engaged, would have been much more difficult without the co-operation of existing in-house staff. Bradshaw who? had advised Worcester that, although the Town Planning Institute operated a fixed scale of costs, 'much would depend ... on the amount of assistance which could be given by the authority's own department' [28]. Yet there were also significant cost implications of using in-house staff. In 1943 Manchester Corporation appointed 29 temporary planning assistants, at a cost of at least £7,000 per year, most of whom were employed on the City or the Regional Plans [29]. Suitably-qualified professionals were often as expensive per year as consultants: when F.H.C. Maunder ARIBA was appointed City Planning Officer and Reconstruction Architect for Portsmouth City Council in 1944, his annual salary was £1,250 [30].

Indeed, many consultants' reports were produced in such close so-operation that the relevant chief officer is cited as a co-author. Abercrombie's reports for Plymouth, Bath and Edinburgh are examples. In the case of the 1949 Edinburgh plan, the Town Planning Officer, Derek Plumstead, is credited as co-author. Plumstead had been appointed as a temporary town planning assistant at Plymouth, then became involved in the Hull plan after the death of Abercrombie's co-author Sir Edwin Lutyens – bring described by Abercrombie (in the Edinburgh plan) as 'resident planner' for the Hull plan – but it is unclear whether he was ever directly employed by Abercrombie.

Some reports bear only the names of the chief officer. Many of these are now virtually unknown, although a few were prominent in their professions, and their experience was such that no thought was given to bringing-in expensive consultants. Amongst these would be counted Herbert Manzoni, the long-serving City Surveyor and Engineer of Birmingham [see Note 25]. He was a very powerful figure within the municipal structure: 'it was through

him that the rebuilding programme was accomplished, and through him that it had the character and qualities that it did'. Even after the appointment of a City Architect in 1952, 'major decisions and the real power remained with Manzoni' [31]. Likewise J. Nelson Meredith FRIBA, Bristol's City Architect, was well-connected, and served as editor of the journal *Official Architect*. He was deeply involved with Bristol's replanning, writing several conference and journal papers about it [32]. Even officials of much smaller towns could be well-connected in professional organisations: M.E. Habershon OBE MEng MIM&CE, Borough Engineer and Surveyor of Walsall, spoke on the replanning of central areas (his diagrams were a very thinly-disguised Walsall) to the Institute of Municipal and County Engineers [33]. Neither Birmingham, Bristol nor Walsall employed consultants for their reconstruction planning [34].

However in these cases, even more than with the consultants, it is plain that the actual plans were the result of many hands. Percy Parr OBE BSc MTPI, City Engineer and Planning Officer of Newcastle upon Tyne, is named as the principal author of the city's plan, although the acknowledgements thank several staff, and a title page suggests that it is actually a Report of the Town Planning Sub-Committee [35]. The substantial number of new staff recruited by Manchester Corporation has already been mentioned. The prevailing bureaucratic tradition of all departmental work being credited to the senior officer was roundly criticised by Reilly, writing about pre-war architectural practices:

> When ... the real author of some municipal building, as so often happens, is an anonymous, unknown young architect in the Borough Surveyor's or Borough Engineer's office, with one of those officials signing his drawings and taking to himself the credit for his work, it is not to be wondered at if, after a while, he loses his enthusiasm and initiative ... This fraud as regards architecture ... on the part of the Borough Engineers and Borough Surveyors of the country, is a thing which needs hammering at and exposing [36].

Again, little information survives on how junior staff were recruited. The experience of Percy Johnson-Marshall at Coventry is instructive. He refers to Donald Gibson's appointment as the first City Architect in 1938, and the impact on young radical professionals. Johnson-Marshall himself was left-wing, indeed a card-carrying member of the Communist Party certainly in the 1940s (when working at the Ministry and the London County Council: his membership cards survive) [37].

> Donald had to accept some handovers from the City Engineer's empire, but also advertised for his new men. It was the moment for which we had been waiting, and I applied immediately I saw the advertisement. I was fortunate to be appointed out of a shortlist of over 500. It was a big moment, and I shook the dust of London off my feet without any qualms ... a group of us went from London to Coventry ... We thought a small city might present an opportunity as a test case [38].

The young radical staff almost immediately set about replanning the city centre, and exhibited their proposals even before the major air raid of 1940. Thereafter, Johnson-Marshall became the Senior Architect responsible for the city-centre reconstruction.

Some problematic personalities

The local level

There are some examples of tension between consultants and local officers, and indeed between officers themselves. In Dover, where Abercrombie was appointed as consultant by 18 May 1945 [39], it is probable that most work was carried out by his new partner, Richard Nickson. Yet the final report, accepted by the full Council on 29 January 1946, carried the sole name of P.V. Marchant, the Borough Engineer and Surveyor. It was noted simply in the press that 'Frequent consultations have taken place between Professor Abercrombie and Mr Marchant' [40]. The Norwich plan more directly betrays an uneasy relationships between the consultants and the locals. This is even seen in the Foreword, where the Chairman of the Town Planning Committee begins 'Town Planning in England is a new science', while the second paragraph of the main text begins 'Planning is no new activity'. The tone of the main text seems to be that of the consultants and, although H.C. Rowley, the City Engineer, is credited on the title page, his only clear contribution is in the form of a forthright Appendix, 'Reservations on report by City Engineer' [41]. This has recently been described as a 'crude plan' which 'was, of course, much more destructive' than the consultants' 'sane and conservative approach' [42].

At Southampton there was a complex relationship between consultant, officials and politicians [43]. The city had a Town Planning Assistant, H.T. Cook. He was regarded by the deputy leader of the local Labour group, experienced in planning issues, as 'a first class man' but

> handicapped by his subordination to the Borough Engineer and by the prevailing attitude of Council members to any drastic planning proposals. That is why the appointment of an eminent Town Planning consultant is essential. But in addition to this the Town Planning work of the Council should be constituted either as a separate Department, or Mr Cook, as Town Planning Officer, be given special status [44].

An eminent consultant was called in, apparently on the recommendation of the then Minister, Lord Reith [45]. This was Professor Stanley Adshead who, although then at the end of his career, had been the country's first Professor of Town Planning at the University of Liverpool and then the University of London. Cook was promoted to head a new Town Planning and Development Department. A city-wide plan was speedily produced [46]. Following its consideration by councillors, Cook was then asked to prepare a revised plan with H. Bennett, appointed as Borough Architect in 1943 (Adshead's contract was not renewed), and a new Reconstruction Committee was set up. But Cook found difficulties in working with Bennett, writing that 'you prefer to work out your own scheme independently' [47]. A newly-appointed Borough Engineer, F.L. Wooldridge, sided with Bennett; although his own proposals were criticized by the Ministry of Town and Country Planning. Nevertheless, the Council accepted Wooldridge's proposals as the way forward in January 1946, and Councillor Matthews noted that 'Where experts differ the layman has to make a decision ... and having made it the officers must loyally accept it and get to work on the

details so that the reconstruction of the central area can proceed rapidly' [48]. Cook did not 'loyally accept' the decision and resigned, instead joining a local business association which fought the Council's plans as far as the Public Local Inquiry in September 1946. Shortly after he left, and probably caused to a large extent by the breakdown of personal and professional relations, the city's Town Planning and Development Department was disbanded.

National-local relationships

Not only were relationships within individual authorities sometimes problematic, but those between authorities and central government were often poor. The Ministry in its various guises, and indeed the various Ministers themselves, could be autocratic. The first Minister with responsibility for reconstruction was Lord Reith, who forcefully encouraged towns to 'plan boldly', causing some confusion [49]. W.S. Morrison, the first Minister of the new Ministry of Town and Country Planning formed in 1943, was equally forceful in pushing the City of London Corporation to abandon the plan produced by its own staff, and engage consultants. His senior staff felt that 'an entirely new plan prepared by a competent planner was required' [50]. In the early years of reconstruction, of course, building material was rationed, and controlled by the Ministry; so the aspirations of individual authorities were frequently dashed. All reconstruction plans had to be approved by the Ministry and the processes of consultation and approval were often extremely lengthy, as Coventry in particular found, having drafted its master-plan in February 1941 but received no formal comment until 1947: the Regional Planning Officer noted that 'the officials were disturbed to receive our comments on their scheme so long after its preparation and submission' [51]. Furthermore, all plans concerning housing design or layout had to be approved by the Ministry of Health. Such approvals were largely to release grants or loans. The impact of such refusal on purely financial terms is shown by Bilston's problems with housebuilding and its consultant Reilly's dramatic personal intervention with the Minister [52].

Communications from the Ministry could also be terse and dismissive. Max Lock, Middlesbrough's planning consultant, wrote in April 1944 seeking the Ministry's advice over the Borough Surveyor's continued submission of plans despite Lock's appointment. He received from George Pepler a two-line response: 'To a Ministry a local authority is supposed to speak with one voice' [53]. In belatedly commenting on Coventry's plan, the Ministry's report noted that 'the plan of the proposed redevelopment is badly presented and indefinite ... the statement in support of the application is little more than a description of the redevelopment plan', bemoaning the fact that the proposal would have been far better if Coventry had complied with the forthcoming guidance notes (as this was essentially a 1941 plan, this criticism seems unreasonable, especially as the guidance was not finally made available until 1947!) [54].

Ministry officials were also not averse to writing equally dismissive internal reports and memoranda, such as the Note by H. Gatliff, Assistant Secretary at the Ministry, that 'Generally, it seems to me a tragedy both for Hull, Sir Patrick Abercrombie and planning generally that he ever went near the place, and the sooner Hull gets away from his

wilder ideas and faces up to the practical job of replanning ... in a sound, decent, ordinary way the better' [55]. Sometimes these comments were very personal, such as Wells's comment of 14/3/44 that 'the City Surveyor [of Exeter], Mr Dymond, is not very imaginative but confesses to his own limitations' [56], and Hughes's comment of 16/8/49 that H.T. Hough, City Engineer of Liverpool, 'is rather a weak character' [57]. Indeed, the Ministry seems to have held low opinions of most local borough engineers and surveyors: the Surveyor of Welshpool, for example, presented 'the usual rather amateur attempt at a planning scheme [which] serves no useful purpose' [58]. The comments from THS (the Permanent Secretary) to the Minister about Great Yarmouth are not only personal but patronising: 'They are not a good Council and their professional officers are weak. The Town Clerk is quite a good young man in his way but is not, I suspect, really interested in town planning' [59]. There are equally dismissive comments about Yarmouth's Planning Officer, K.K. Parker; ironically, he joined the staff of the Ministry in August 1945. Gatliff also wrote acerbically of the West Sussex County Clerk in the case of Sharp's plan for Chichester: 'one cannot write chatty human letters to a mummy which is about what the County Clerk seems to be, though he is an exceedingly courteous one'; and this memo has a manuscript PS, 'or should we say an embodied rubber stamp' [60]. Ironically, the architect S.E. Dykes Bower, then working for the Ministry, wrote in a report on Carlisle that 'it is important, in reports of this kind, to avoid any appearance of being critical and still more of trying to dictate how a local authority should plan' [61].

Although Cullingworth's official history exhaustively reviews the development of policy prior to the 1947 Act, and Cherry and Penny discuss Holford's contribution within the Ministry, there is no clear rationale for this extremely critical perspective from the centre – 'Headquarters', as the Ministry's London office referred to itself – of the individual local authorities, their officers and consultants [62]. No-one, however experienced, seemed exempt. Perhaps the senior Ministry staff were more imbued with a civil service mentality? Although the Regional Planning Officers were all members of the Town Planning Institute or Royal Institute of British Architects by 1947, the Regional Controllers certainly were not [63].

Conclusions

This, fundamentally traditional, exploration of plan authorship sheds new light on a period of unparalleled activity in British planning. More towns and cities were replanned in a shorter period than ever before, and this involved the widespread introduction of radical new concepts of architectural and urban form, and a technocentric, scientific approach to planning. The view of the planner as independent scientific expert was nurtured in this process. But the traditional view has tended to prioritise the expert consultant planner at the expense of other 'authors'.

The wide range of plans produced through the 1940s and into the early 1950s suggests that the actual process of reshaping urban form was very different. Who did the planning – principally local official or consultant – depended more on local politics and spheres of influence than objective assessment of plan-making abilities or experience. Advertising for

consultants, competitive tendering or searching interviews – in short, an open and transparent selection process – played only a minor role and in only a few cases. People were selected because of who they knew (or who knew them), or because of press coverage of their work. Owing to the small pool of suitably-qualified people, 'who knew them' was often determined by their place of education. The University of London and, most particularly, the School of Architecture and Department of Civic Design at the University of Liverpool generated high numbers of reconstruction planners, with Professors Abercrombie and Reilly active in promoting their former students or, indeed, employing them directly.

However, the plan production process was often shaped by personal, political or professional tensions. These operated at a local scale, with Reilly's experiences at Birkenhead being perhaps the most overt political clash, and the problems in Southampton between Cook, Bennett and Wooldridge, and also in Coventry between Ford and Gibson, being both professional and, the written evidence suggests, personal conflicts. Both Donald Gibson and A.G. Sheppard Fidler (Birmingham's City Architect) resigned in 1955 and 1964 respectively, in what might be termed demarcation disputes over the implementation of reconstruction schemes. Similar tensions also existed between local authorities and the Ministry's civil servants at both regional and 'headquarters' level, with the Ministry files and correspondence in the National Archives being littered with disparaging comments such as that about Abercrombie's involvement in Hull. Even the most experienced consultant, commissioned repeatedly by the same Ministry for some of the largest-scale regional reconstruction plans, was not immune from vitriolic criticism, of which he was presumably unaware. Although some recent histories have revealed such conflicts, they are usually minimised or absent in many histories, particularly at the local level [64].

Professional publicity and self-promotion, traditional planning histories and standard bibliographic conventions have tended to represent many plans as being the sole product of just one or two people – especially consultants and, with perhaps only one or two exceptions, male. This is a far from accurate view of the range of activity and contributors to these plans, and planning histories need to take the broader range of contributions to the plan-making process into account. For example, the pioneering sociological contributions of Ruth Glass to the plans of the Max Lock Group, fully acknowledged in the printed versions, seems too often forgotten. The plans were truly the products of many minds. Planning solutions emerged from a labour-intensive Geddesian process of survey and analysis, often undertaken largely by junior staff [65]. They were filtered through consultation with the local politicians, local officers and, surprisingly often, displayed for comment and "criticism" to the wider public [66]. They were often further interpreted for communication purposes by artists, photographers and modelmakers [67].

In short, the numerous British reconstruction plans of the immediate post-war period have proved a fertile source for the consideration of plan authorship; reassessing the processes of plan production and consumption, and challenging the myth of the post-war planner as wholly objective scientist. New perspectives on this period, these planners, and these plans, are also beginning to dig deeper into the relationships between people and the

process of production, and the conception of plans [68]. This period of radical urban reshaping owes far more to the influence of human behaviour, including politics and personality, than is commonly credited. Those who replanned our cities were all too human and suffered all of the foibles of humanity.

Notes

Urban transformations in Bom Retiro (São Paulo): building new territories, social networks and identities

Maria Ruth Amaral de Sampaio

Stamatia Koulioumba
University of São Paulo, Brazil

1. Introduction: social networks

Bom Retiro neighborhood can be analyzed as a special case study in Sao Paulo (Brazil), due to its migration process, considering that, in different times, many national and international migrants have established themselves in this city's neighborhood. In the following research, we intend to understand the immigrant's contribution to the construction of urbanity, as well as the social and economic relationship established there. Several ethnical groups, such as the Italians, Jewish, Arabians, Turkish, Greeks, Hungarians, and since the eighties, the Koreans and the Bolivians, that lived or are still living there, playing an important role to sociability, integrating those residents with a communication network that has not only connected this place to others in the city, but also gave some visibility and form to the culture of popular urban classes.

Although our main study aims at analyzing three different periods, as listed below: from the end of the nineteenth century towards the thirties, from the post-war to the seventies, and, from the eighties up to nowadays, the present communication will emphasize the last one, focusing on the Koreans and the Bolivians, that have changed, since the 80's, this neighborhood's face. Our approach will report to the first network studies such as those developed by the German sociologist Georg Simmel, in the end of the nineteen century, followed by the French anthropologist Marcel Mauss, among others.

The science that analyzes the networks has its origins in the idea that the main sociologist's task is related to the understanding of social structure, or better saying, the distinct patterns that connects some human members to a group. They try to describe these patterns and use their descriptions to learn how networks structures constrain social behavior and social change. The descriptions are based on the social network concept of ties linking nodes in a social system: ties that connect persons, groups, organizations or clusters, as well as persons. This emphasis on studying the structural properties of networks informs different ways in which analysts pose questions, organize data collection and develop analytic methods[1]. .

Wellman summarizes his network methodology as following: "I view network analysis as a broad intellectual approach and not as a narrow set of methods". Networks analysts search for deep structures, this means, regular network patterns beneath the often complex surfaces of social systems. Also, Mark Granovetter studies' are extremely important since he considers that "the analysis of process in interpersonal networks provides the most fruitful micro-macro bridges". In one way or another, it is through

these networks that small-scale interaction becomes translated into large-scale patterns, and these, in turn, feed back into small groups. In his paper, "The Strength of Weak Ties", Granovetter[2] (1973) analyzes rather limited aspects of small scale interaction - the strength of interpersonal ties - and intends to show how the use of network analysis can relate this aspect to such varied macro phenomena such as diffusion, social mobility, political organization, and social cohesion in general. This analysis is essentially qualitative.

Following his procedure, we will discuss the internal links from the Korean and the Bolivian communities, plus their respective connections. According to Granovetter, the strength of a tie can be defined as "(…) a combination of the amount of time, the emotional intensity, the intimacy (mutual confiding) and the reciprocal services which characterize the tie". Each of these is somehow independent of the other, though the set is obviously highly intra-correlated. For the current purpose, it is enough, on a rough intuitive basis, whether a given tie is strong, weak or absent. Included "absent" are both the lack of any relationship and ties without substantial significance, such as nodding relationship between people living on the same street or the "tie" to the vendor from whom one can normally buy a morning newspaper.

The hypothesis is made plausible also by empirical evidence that the stronger the ties connecting two individuals, the more similar they are in various ways (Berscheid and Walster, 1969; Bramel, 1969; Brown, 1965; Laumann, 1968). On the other extreme, the weak ties would be those where local bridges create more and shorter paths. "This means that whatever is to be diffused can reach a larger number of people, and traverse social distance (i.e., path length) pass through weak ties rather than strong. This means that more people can be reached through weak ties".

Granovetter (1973) says that "strong ties form a dense network and weak ties a less dense one". In a weak sector, not only will ego's contacts not be tied to one another, but they will be tied to individuals. Indirect contacts are thus typically reached through ties in the sector. Such ties are then of importance, not only in ego's manipulation of networks, but also because they are the channels through which ideas, influences or information socially distant from ego may reach him. The fewer indirect contacts one has the more encapsulated he will be in terms of knowledge of the world beyond his own friendship circle. Thus, bridging weak ties (and the consequent indirect contacts) are important in both ways. "Those to whom we are weakly tied are more likely to move in circles different from our own and will thus access to information different from that which we receive".

From the individual's viewpoint, then, weak ties are an important resource in making possible mobility opportunity. Therefore, weak ties play a role in effecting social cohesion. Under the point of view of community organization, as Granovetter (1973) remind us, it is desirable to deal with a unit of analysis larger than a single individual, as adopted by our research. This author describes several experiences based on the dissemination of information in some specific communities, like the Italians in Boston, for example.

He shows that if there is "a strong relationship between two individuals, the network tends to be more limited, as well as the flood of information, ideas, influences, that becomes concentrated inside this relationship. On the other hand, weak ties expose individuals to an indirect contact, with more and more people, from different circles than their own ones". He also lists the importance of weak ties in mobilizing some communities towards common objectives, whereas others are unable to obtain resources even in difficult times or for a clear purpose.

He concludes his explanation, by indicating that individuals with very few weak ties are definitely excluded from getting information from other groups. They are, then, restricted to their closely relationship information and opinions'. As they get involved only with their own partners, they do not envisage other opportunities further than those presented to the group. He also points out that strong network ties seem to be related to economic uncertainty plus a lack of social services, both aspects identified in Bom Retiro's Bolivian community, as it will be examined along this paper.

In another article, entitled *"The strength of weak ties: a network theory revisited",* Granovetter[3] (1983) reviews his theory, mentioning some studies about poor communities networks'. He shows the importance of strong ties for surviving strategies, as well as intense interchange and reciprocity among neighbors, hypothesis verified in Brazilian poor communities. This author insists, nevertheless, that considerable investment should be done in such communities to avoid the perpetuation of poverty. Weak ties, on the other hand, allow indirect contacts among a larger number of people that belong to different and varied groups. This fact contributes to a more diverse and diffused set of information. This is exactly what happens to Bom Retiro' Korean community, that even though keep some strong ties, also have an unlimited weak ties, responsible for the creation of new opportunities and perspectives.

Working networks are expressed in Bom Retiro, nowadays, through two main nationalities; the Koreans and the Bolivians. Cheap labor is done by the Bolivians for the Koreans, most of them shop owners from the Garment Industry, the main commercial activity of this neighborhood. This type of work can either occur at home or at sewing practices', both in unhealthy working environments. They are based on old working practices that dates back to the beginning of industrialization, according to the *'putting-out'* process, where the worker produces as many pieces as he is able to. All of these is directly associated to a type of production based on the flexibility of capital. It is also important to observe that the Koreans have been responsible for an intensive urban renewal that has produced new buildings in Bom Retiro. Moreover, Bolivians have introduced new cultural habits, such as celebrations and open air markets that have completely changed this neighborhood face.

Therefore, our research is concerned about obtaining information related to social relations of these two groups and their network structures'. Our main interest is, hence, connected to multiple cultural expressions, the complex working relationships and the building diversity.

2. Historical and current aspects of Bom Retiro

Bom Retiro is a traditional neighborhood of Sao Paulo in terms of cultural and architectonical heritage. It concentrates many institutional buildings of Sao Paulo, such as: Pinacoteca do Estado de Sao Paulo, Sacred Art Museum of Sao Paulo, Portuguese Language Museum (established in Luz Station), Estação Pinacoteca (another fine art museum) and the old building of Sao Paulo Polytechnic University. Also, Julio Prestes Station is another important reference, considering that it holds the famous Symphonic Orchestra of the State of Sao Paulo (OSESP). However, in spite of all these public equipments and its favorable location (close to two underground stations), nowadays this district presents many low income inhabitants, some of them living in slums.[4] According to a national research, the total estimated population of this neighborhood was around 26.596 inhabitants, with monthly income average of R$1.358,39. This is the second largest oriental neighborhood, due to the Koreans' presence, followed by Liberdade, where many Japanese descendents live.

According to Sao Paulo Major's site, "nowadays Bom Retiro is practically a Korean neighborhood. They represent nearly 70% of the 1.200 business, as documented by the Câmara dos Dirigentes Lojistas (Bom Retiro Shop Owners' League). The Koreans have modified the physiognomy and the spirit of this region, but not its soul[5]". Its entrepreneurship in economic activities is reflected through some rough numbers. Currently, Bom Retiro holds 4.000 approximately business places, distributed as listed below: 1.663 in industry, 1.325 in commerce and 949 in services. This corresponds to 16.021 working places in the industrial sector, 6.520 in commerce and 9.909 in services, based on IBGE data (1996-2000). However, Bom Retiro is losing its population in the last decades, like other Sao Paulo's central districts. Nevertheless, this central neighborhood was not always oriental (Korean) from its origins. It was the place for several migrants and immigrants along the centuries.

Located in a flooding area near Tietê River, close to the city center, Bom Retiro[6] began as a recreational and leisure place of Sao Paulo. This neighborhood was originally composed by some country houses, one of them that gave its name. Another one, belonged to an English family called Dulley. Some significant parts of land where property of another immigrant, named Manfred Meyer. Due to an increase in immigration during the coffee economic cycle, it is observed that this land was divided in small parts in order to supply housing demand. Similar process was noticed in other neighborhoods, such as Barra Funda, Bras, Bexiga, Pari and Mooca. Several factors have collaborated for the establishment of immigrants in this area, mainly Italians, after 1890. Among them, we can consider the opening of Luz Station (1867), as well as the introduction of many cultural and institutional types of equipment nearby[7]. Immigrants' presence is noted from the very beginning through the names of some streets, like Immigrant Street (nowadays, Jose Paulino Street) and Italians Street[8].

Some statistics point out that at least one third of the immigrants that arrived in Sao Paulo, between 1890 and 1920, stayed in the city, introducing new socioeconomic and

cultural aspects[9]. This *'Italianization'* process has been largely discussed by literature through its architectonical and constructive aspects[10]. Few studies have tried, nonetheless, to analyze Bom Retiro since its origins. A first approach shows, however, that the Italians' participation to civil construction was very important[11]. The Italians also changed long term established social and economic relationships, by introducing new habits, previously inexistent. It is commonly verified that some economic activities, like services and commerce, are straightly linked to housing, something that will appear very often in Bom Retiro. From another point of view, some indicators show that the Italians created particular mechanisms to expand their own culture, i.e. schools, newspapers and others. Nevertheless, not everything was Italian[12].

In the twenties, many European Jewish have found in Brazil the right place to live. Some of them came with their own financial resources. Others have the support of private international organizations (Hias, Ica, Emigdirect)[13]. In Sao Paulo, they have established themselves in popular neighborhoods, like Bom Retiro. In the very beginning, housing conditions were not desirable, obliging many of them to live, either in slums, or in a rented place from an Italian owner[14]. During this period, it was very common to observe an intense experience interchange between the two groups. Italians mainly worked in services and formal commerce, whereas Jewish people introduced a new type of deal: door to door informal commerce[15]. Some worked in industry, on the other hand[16]. Social integration was not very easy, particularly because of language, but slowly, due to capital injection[17], some urban transformations are identified. The Jewish bought the old Italian made houses and tried to improve housing conditions. They have introduced as well some new products in the market, such as plastic made ones and others.

In parallel to the verticalization process[18] that took place in Sao Paulo, since the thirties, some specific urban transformations were observed in Bom Retiro. The first high building made of concrete, with more than three floors, named Palacete da Luz, appeared there. The Jewish contribution is inserted in the transition of a brick made town to a concrete made one[19]. These immigrants, therefore, constructed new buildings using contemporary techniques. They became the new properties' owners, considering that a gradual ethnical substitution occurred in this period. Most enriched Italians moved out to more prominent places[20], close to Paulista Avenue. Stimulated by this rapid change, the old Immigrant Street definitely assumed its commercial vein, partially because of the installation of prostitution zone in the area. New buildings emerged in order to attend Jewish traditions. Synagogues and schools appeared after the Second World War, a period characterized by the arrival of new immigrants.

Capital accumulation, which begun since the Jewish arrival, and an immediate demand for housing helped to improve this neighborhood urban structure. New high residential buildings became visible, most of them made by Jewish constructors, like Carlos Kusminsky, Max Stuhlberger, Jonas Gordon, Eurico Soicher e Samuel Belk. Most of these buildings were made in a Modern Architecture language that took place between the sixties and seventies in Sao Paulo City, introduced by other notable immigrants, such as Jacques Pillon, Lina Bo Bardi, Franz Heep, among others[21]. Also, Tietê River

canalization encouraged new urban configurations for the neighborhood's lower areas, opening place for one floor housing. Since the fifties, Bom Retiro became also a place for other ethnical groups. Like Greeks, Arabians, Turkish, Hungarians and others. Literature commonly tends to consider the substitution of one culture from another[22], which is not always true. A clear example are the Greeks, that will share commerce activities with Jewish. Those two groups will have more common points that are still due to be analyzed.

Since the eighties, many changes have been taken place in Bom Retiro. This period coincides with the Asians arrival, specially the Koreans ones'. It is also correct to say that they have been in Sao Paulo before that time, in other neighborhoods such as Bras and Pari, but it is during the eighties that they will establish themselves in Bom Retiro, changing for good, economic, housing and cultural aspects of this place. Koreans also contributed to urban renewal. There is a huge coincidence in this time, because most Jewish were leaving the neighborhood, as well as their commerce activities. They went to better residential areas, like Santa Cecilia, Higienópolis, Jardins, Perdizes and Pinheiros, in parts because most of their descendents do not want to continue in this type of business. The building stock was, therefore, completely renewed and adapted to global capitalism needs through the Koreans initiative. This included physical innovations of many shops, located at Jose Paulino Street (former Immigrant Street), Aimorés, César Lombroso, Italians and Ribeiro de Lima Streets. These transformations are also reflected in a new type of production (just in time) that characterizes the nineties[23]. Cheap labor working force and imported garment industry resources was the tonic of that period. The new demands for textile and garment industry claim for new production modes based on flexible production in world scale. Informality became more evident, in order to avoid the strict working class laws[24]. In Brazilian terms, this is presented through Bolivians and other Latin arrivals'.

It is been observed, in Developing Countries, that millions of people look forward a better life in richer countries. Statistics are quite inexistent, because of many factors, particularly illegality. These immigrants suffer a lot, they earn less than what they should, travel illegally, which increases the risks for bad treatment. According to World Bank, there are 74 millions of immigrants from 'south to south', expression normally used to describe people that move from one developing country to another. The same bank estimates that they send back home quantities between US$18 to US$55 millions per year. These immigrants notice that moving from one poor country to another is the best they can achieve. Because of severe migration policies in the Developed World, it is more likely that migration tend to increase inside the Developing Countries. Patricia Wiess Fagen, University of Georgetown researcher, points out that are those poor people that send money to even more poor people, covering rural areas where money cannot reach. In general, these immigrants work hard in change for low salaries, and they have their private rights frequently violated. Sometimes they are discriminated because of their skin color and they are afraid of the police[25].

In Sao Paulo (Brazil), since the fifties, the first Bolivians students started to arrive, stimulated by interchange programs between Brazil and Bolivia. After the end of their

studies, many of them remained in the city. In a second moment, during the eighties, Sao Paulo offered better working opportunities in garment industry, a sector that did not need previous qualifications. This segment was very attractive due to the salaries, especially for the young ones that hoped for a better life. Informal sector is another one that employs Bolivians, mostly irregularly. Some authors[26] consider that the first moment of the migratory cycle is characterized by the salary marginality. These authors emphasize that this entrance through work is established in their country of origin, before arriving Sao Paulo, by their own *'brothers'*. Consequently, the most serious question related to these immigrants is connected to their illegal documentation.

During the intensive Bolivian migration period, the Foreign Migration Policies, dating from 1980, only allowed the entrance of either specialized working force, or entrepreneurs. There were only two paths to overcome these laws. The first one was by getting married to a Brazilian. The second one was by having a baby born in Brazil. Only recently, in 2005, Brazil and Bolivia signed an agreement related to this, especially after the fact that the media has noticed that approximately 60.000 were in an irregular situation[27]. However, in order to become a regular citizen it is necessary to pay several taxes and fees, sometimes corresponding to 100 illegal lived days in the country. This regulatory process also does not guarantee that the worker will have its rights secured.

Firstly established in neighborhoods such as Bom Retiro, Pari and Brás, the Bolivians will be responsible for producing most of the pieces in the garment industry[28]. Mercosul integration will also stimulate migration for some Latin-Americans in search for a better life. Statistics are not very clear about the number of immigrants that live in Sao Paulo[29]. It is very common to observe that this group is highly discriminated due to its skin color. They occupy, therefore, the lowest ethnical point from a large spectrum. Nevertheless, some of them are moving out from central areas due to some income increase. Since the 2000, it has been noticed that Bolivians are living in other neighborhoods, like Vila Nova Cachoeirinha, Limao and other municipalities, like Guarulhos. In those places it is possible to buy a place for living and working as well. In this sense, Bolivians are a quite an isolated group, compared to others. Their culture is occasionally shown in some events[30]. Their illegal situation plus some internal social difficulties restrict somehow social relationships, with a strong value to strong ties, this means, ties limited to their own group.

In this global context, Bom Retiro is still a very interesting case study, where several social links are established. Survival and/ or the substitution of cultural and ethnical traditions are, consequently, the last challenge that reflects the new contemporary urban areas demands[31].

3. The eighties: social and working

3.1 Koreans and Bolivians

The first Korean immigrants arrived in Brazil between 1963 and 1974[32], although many of them came in the nineties[33]. Nearly 90 per cent of the Korean community is

concentrated in Sao Paulo. From these, a substantial amount lives in Bom Retiro[34]. Since the eighties, Koreans have contributed to change commerce and garment industry. By working in a familiar basis, they have substituted most of the Arabians, Greeks and Jewish that used to work in this sector[35]. Differently from other immigrants, Koreans had a former education from their country of origin, which allowed them to grow up socially. Part of this economic raise was due to the low-cost working force, mainly Latins or others. Hence to informal sector practices, they could achieve good prices for their products in a 'just in time' based mode.

The Koreans have a similar model of financial credit as the Jewish in previous times, named Kye, that has a very important role in helping new immigrants to establish themselves in a foreign country. Thanks to this community network, some of them have been able to improve themselves economically, as well as to move to better neighborhoods. In social terms, the Koreans show themselves as a more reserved community, not so open minded to occidental traditions and behaviors[36]. Other ethnical groups that live in Bom Retiro understand that this procedure blocks somehow the communication among them. Cultural and language difficulties are also some of the problems that do not allow a proper interchange between Koreans and other communities groups'.

When we talk about the Bolivians, statistics may vary enormously. According to Bolivian Consulate, it is estimated that nearly 34.000 Bolivians are living legally in the country. At least the double number is composed by illegal immigrants. Some people suggest from 60 to 80 thousand immigrants in total, according to numbers from Pastoral do Imigrante. More than 40 per cent are illegal[37]. They come to Brazil in search for better opportunities[38]. Most of them live and work in Sao Paulo, mainly in the garment industry, almost always in exchange for food and bed. Bom Retiro is one of the neighborhoods that they have chosen to live and work[39].

In addition to the exploitation that is established between Koreans garment shop owners and Bolivians, it has been observed another type of exploitation. Some Bolivians, in general the owners of small sewing establishments exploit their own people by asking for a heavy labor week journey[40]. Informal work has, as well as bad working and living conditions have allowed the occurrence of serious diseases, such as tuberculosis[41]. This happens because most of them work and live in the same place. They also work between 14 to 16 hours in inadequate and unhealthy environment[42]. Parallel to this fact, they do not have a proper food diet.

In the few free moments, Bolivians like to eat typical food such as *empanadas* and *salteñas* or try a haircut in an open air hairdresser. The main entertainment point occurs in Kantuta Square, in Pari, a nearby neighborhood that attracts approximately 2.000 people every Sunday. Also in Anhaia Street, in Bom Retiro, several Bolivians meet on Saturday evenings to have some fun, to exchange information about work or even to date. Bolivians concentrate four irregular radio stations[43]. This communication system is a very important link for the community because it helps immigrants to search either for

a new home or a job. Furthermore, it is a way to keep in touch with their own country and traditions.

4. Urban Renewal, Architecture and Public Space

This Sao Paulo central neighborhood reflects the city urban evolution by itself. In the end of the nineteenth century, huge land portions gave place to a working class housing. Many Italian immigrants have settled down there, contributing to improve architectural building stock. Very few buildings remain from this time, with the exception of some industrial plants and social housing. In the first decades of the twentieth century, with the European Jewish migration Bom Retiro faced another urban transformation. Some two or three floor buildings started to appear. During the fifties and sixties, following the same tendency that took place in Sao Paulo, Bom Retiro began to verticalize. Modern architecture was in vogue and spread out all over the city. Many of these buildings are still not completely identified, but they evidence, however, a plastic intention similar to the one developed by the International Modern Movement. Some other buildings represent a singular and unique architectural heritage, including from cultural associations to synagogues[44].

Currently, Bom Retiro is seen as 'Women's Disneyland'. This happens because six of its most important streets concentrate 2.700 shops that attract women for shopping. Price is quite reasonable. Nevertheless it is not the only reason for catching their attention. Since the eighties, the neighborhood is facing an intensive urban renewal, especially in its commercial segment in order to improve its image. Part of it is due to the Koreans intervention. Old businesses have been completely renewed and can be compared to sophisticated shops situated in New York, Paris or London. Some wholesale shops, located in Professor César Lombroso and Aimorés Streets accelerated the process by introducing a clean and innovative layout. Slowly, this change has touched Jose Paulino Street, the main commercial street of this neighborhood. "The special care with the product and the establishment has reached high luxurious levels in some examples". Some of them include the participation of renowned architects, such as Isay Weinfeld, that developed a project for two Koreans in Jose Paulino Street, 400. The discourse of a worker translates the importance of Koreans in urban renewal: "If it was not for the Koreans, most of the shops would have been like in the past: with simple furniture and layout. They have changed Bom Retiro completely".

In this sense, Bom Retiro can be seen as an 'open air Shopping Mall'. The change in its architecture also shows a trend to sell fashion instead of clothes. Therefore, it is very common, more recently, to send people abroad, particularly stylist designers (to Paris, London or New York) in order to improve fashion design. All these visual changes have reflected to an increase in rental prices[45]. It has been suggested that the rent of a 750 square meter shop could cost around 27 million reais for a 4 year contract. However, some additional money is asked (around US$ 300.000). In other places, such as in Lombroso Fashion Mall, prices can be extremely high. Some of the best valued streets include Jose Paulino, Aimores, Cesar Lombroso, Ribeiro de Lima, among others. "(...)

the koreans have change this place, affording for architectural projects compared to the best world shopping places. Nowadays, nearly 2000 commercial places are very disputed. The square meter can cost 25.000 reais. More than 70% are occupied by Koreans".

But it is not only the fashion segment that things are changing in Bom Retiro. Thanks to the Koreans, churches, schools and cultural associations are been developed. One example is Polilogos School, located in Solon Street[46]. Developed by the well-known Biselli e Katchaborian Architects, this school is administrated by Brazilian Association of Korean Education. It dates back to 1997. The concrete made building is an example of Contemporary Brazilian Architecture and reflects the continuity of Sao Paulo's Modern Movement. Another prominent recent building is the Catholic Korean Church, in Matarazzo Street. Its white architecture is an enormous contrast for the industrial plants that surrounds it. In old times, there were many synagogues spread out in Bom Retiro[47]. Nowadays, they divide space with protestant churches as well as hotels and flats developed by Koreans. Some of them also include golf training place among their facilities.

According to Bastenier and Dassetto (1993) migration cycle concept, it is possible to argue that Koreans are in a third level, where they are definitely stabilized. It is not only related to their social rights but also to their relationship in the society where they live. It is not only a demographic acknowledgement, as classified by the authors, but the future impact of the immigrants. In this stage, it is important to notice that this population becomes a permanent part of the public space, what they call social and political co-inclusion.

Latin-American communities that live in Bom Retiro have not collaborated to rebuild urban place, mainly because they do not have economic power for doing so. Nevertheless, it has been observed that private initiative is starting to get some interest in this area. Some new stock building is being developed thanks to public transportation proximity and other facilities. Therefore, in order to think about Bom Retiro architectures' and its urban renewal through centuries, it is necessary to understand continuity and interruption reflected by the buildings there localized. In this sense, these processes show, for example, a strong link between Luz Train Station, that used to bring immigrants, and social housing, between shops and streets, between garment industry and housing, between restaurants and religious places. Bom Retiro building's are a testimony of its past. They are also current actors, where one can attribute new values and significances.

Public space is used in different ways by all these communities as verified in multicultural Bom Retiro. Because of this, this neighborhood is considered to be a very important legacy due to its diversity and cultural expressions. Streets are the most important place for sociability. It is very common to observe interaction among long established communities, such as Greeks and Jewish. On traditional Shabbat Saturdays, Orthodox Jewish walk next to Greeks and Italians, mainly Catholics. Also

Koreans have a very specific mode of using the public space. They are very often seen next to their Korean shops and groceries that sell typical products from Korea.

Streets remain an important place for recreational and leisure activities. Soccer has its origins directly associated to this area, when English immigrants brought the first ball. Nowadays, this sport is played by Bolivians and others[48]. Nonetheless, some problems and conflicts are quite evident among some Bom Retiro communities'. Considered by others as the '*poor brothers'*, Bolivians do not mix with other people, mostly due to illegality and irregular working conditions. Although their language (Spanish) is very similar to Portuguese, it is noticed that they only interact among themselves. Somehow Koreans do face the same language and communication difficulties. However, in this case, it is being observed that new generations are becoming more occidental than before. The dialogue between Koreans and others is changing gradually, particularly imposed by commercial and educational needs.

However, it is been a long time since Europeans, such as Jewish, Greeks, Italians and also, Arabians and Armenians, used to share street corners' to discuss about politics and their respective cultures. Bom Retiro that was shown in a famous movie, nominated for Oscar 2008, entitled *'The year that my parents left for vacation" is* not really the same as now. At that time, not only there was cooperation among different ethnical groups, but also there was more intensive public space utilization. In global times, what is seen is that social discrimination is more intensified than ever, as well as a spatial segregation. Consequently, Koreans and Bolivians live in the same neighborhood, but they do not interact as they should. Economical distance, cultural and language barriers, plus working exploitation, in parallel to urban violence have practically excluded minimum possibilities of interaction among immigrants in Bom Retiro.

5. Conclusion

In the beginning of this year, it has been noticed by the media[49] a campaign to reduce informal work as well as Bolivians exploitation. This meeting took place in Superintendência Regional do Trabalho, where Bolivians, Brazilians and Koreans, plus members of more than 15 entities met, for the first time, in order to discuss about possible solutions for immigrants exploitation in garment industry. Three different commissions were created: the first one, related to bureaucracy in legalization process; the second one, related to informal work and businesses responsibilities to this, and the last one, about the lack of orientation for foreigners. Bolbra President, Cultural Bolivia-Brazil association that represents Bolivians suggested that entrepreneurs do not employ irregular employees. He also asked them that employees' salaries were paid in cash, and not in 'food and bed'. Korean Consulate asked for the distribution of manuals for the foreign entrepreneurs containing Brazilian laws as well.

This initiative congregated on the one side Koreans and, on the other, Bolivians. Nevertheless, it was not a mutual decision. Mainly Brazilian authorities, plus Bolivian diplomatic entities started this process. Information, firstly presented by media (television, newspapers, magazines) and others (academic researches, human rights

organizations, and foreign office, detected the subhuman living condition that Bolivians were submitted to. Therefore, Brazilian Government has to undertake some measures. It is interesting to observe that Korean Consulate asked for the printing of Brazilian working laws manual, as if they did not know anything about this type of exploitation. Bolivians, alone, linked by strong ties, would not be able to give the first step in order to break this exploitative chain, reinforcing Granovetter (1983) theory that there is a need to invest in poor communities, as a strategy to avoid the perpetuation of poverty. However, this measure alone does not guarantee that this situation will end soon. But there is not doubt that a first step was done.

In the collective imaginary, exile and exclusion walk side by side. This exile is, though, voluntary. However, what happens in Bom Retiro, with Bolivians, is that in spite of social exclusion, there is also exploitation that deeply affects these people's dignity. We strongly believe that this process, mobilized by public and media initiative will help to increase the reaction against irregular working forms. Regarding Koreans, as similar as what happens to other nationalities that inhabited the neighborhood and obtained some success, it is being observed that they are moving to other places, such as Aclimação, Higienópolis, and others. However, they are still linked to their social, economic and political contacts placed in Bom Retiro. This means that they somehow continue to develop their productive and leisure activities there, and also some irregular ones, as noticed recently by newspapers[50].

Along the centuries, Bom Retiro reflects its origins as an immigrant neighborhood, made by different foreign groups, plus Brazilians. It is the place for many small industries, commerce and housing, especially social interest one. As it was presented in this paper, it also places several cultural equipments with some particular characteristics. That is the reason why National Historical and Artistic Cultural Heritage Institute (IPHAN) is revaluating Bom Retiro's importance due to its multicultural aspects as well as its historical buildings. Luckily, up to now, Bom Retiro is still not a full target for gentrification, as it has happened to other Sao Paulo's neighborhood. Its gentrification process has only reached its commercial area, in spite of the land value increase and the proximity to the city center.

They integrated a prostitution network and were illegally in the country. All of them did not speak Portuguese and were sent back to Korea. This place was visited by South Korean men that live in Brazil.

Public space or private planning? Trends and tensions

Manoel Rodrigues Alves
Universidade de São Paulo, Brazil

1. Introduction

Contemporary urban territorialities bring about new questions to urban environment. Challenging the tensions between domains, legalities and practical uses they promote new interpretations in the relations between urban morphologies, social fabrics, conceptual behaviors and constructions - beyond the models and concepts instituted in Architecture, Urbanism and Social Sciences.

Due to its public condition, diverse and hybrid morphology, any investigation of the contemporary city must be carried out under a particular theoretical framework, observing emerging urban tissues and its referential universes culturally implemented. Although contemporary urban tissues and territorialities are (still) mainly culturally determined, the contemporary thought confronts itself with the totalizing tendency of the capital upon the culture. In a global scenario where the contemporary culture is related to consumption, 'new' urban planning rules, aesthetic theoretical constructions and practices of a contemporary urban model produce strategies of the tertiary in an aesthetic city of gentrification processes that, once associated to the private capital of great financial and industrial conglomerates, lead to "new" urban structures of social segregation fostering a profound cultural and spatial reorganization (for instance, the territorialization and de-territorialization phenomena in relation to its spaces, sceneries and urban actors).

New urbanization processes produce "new" urban spatialities determined by the association of global economy and information technology that broaden (or confront) the classical conception of public space. Therefore, investigations about the spatiality of the contemporary urban space must observe that the public scope has to deal with a global capital market and a new socio-technical reality of a mediatic society.

"New" spatial patterns of 'new' urban tissues are determined by a cultural and economic context that promotes the logic of social and spatial segregation of private spaces in a fragmentary urban city. "New" morphological patterns representative of cultural, functional and economical specialization of urban processes that, based on the understanding of urban space as a ´commodity´, produce segregated urban environments and thematic urban landscapes.

2. Contemporary city: a private product

Although contemporary urban spatiality presents emerging ways of urbanity the contemporary city finds in the aesthetization and spectacularization phenomena a powerful mechanism of symbolic control of production of the urban landscape and occupation of its spatiality. Cities are composed by urban structures determined by

conflicts of different natures, objects and actors. However, these constitutive elements have been transformed in the last few decades in its socio-cultural dimensions, social and public aspects, its transformation processes and its permanencies. Despite the conflictive possibilities of urban concrete spatial situations related to multiple dimensions of its context and product, consensus have been articulated in a kind of artificial form, more or less fabricated, but not less efficient, that frame and base urban conceptions, images, interventions and proposals in multiple scales.

In the superabundance of the 'post-city' we can notice the transformation of the urban landscape into a product, an object of consumption, legitimizing a new sense of urbanity. Urbanity that not only promotes the deflation of public urban sphere, but also answers mainly to sectors of the market, formalisms in vogue, aesthetical experimentations and media codes instead of to the complex articulation of the daily uses of the urban life. Urbanity related to the transformation of the private/public relation, the continuous erosion of the public realm and the promotion of a particular spatiality of social segregation in a fragmentary privatized space.

The idea of city as a universal public asset, a public good, conformed by a public / private relationship, place of an heterogeneous conviviality is nowadays being questioned by another idea. One that do not take into consideration that consensus and conflict are two basic configurations of constitution or destitution dimensions, of elaborations of the public and private dimensions that constitute the classic grammar of the urban life. In this process, the urban space loses its social meaning allowing for a de-territorialized urban form: cities not as cultural artifacts to be experienced, but, as a result of consumerism and commercialization, a fake object of space-consumption of an aesthetic empty form.

It is a shuffled grammar based on a strategy of social control and reproduction of an established order where the history sense has been reduced in an appearance game (imitation/simulation). A grammar that leads to an experience of a different sense of urbanity that, passing from the modern form and function to a post-modern fiction spectacle, transfers civic activities to private spaces and promotes new spatialities of global pre-determined imagery in so called 'new public spaces'– to a certain extent, an example of Sorkin´s 'ageographical cities'.[1]

On one hand, the contemporary thought confronts itself with the totalizing tendency of the capital upon the culture and with an ever growing aesthetization process of the life circles. On the other, it (the contemporary thought) claims the acknowledgment of a plurality of social practices. Similarly, on one hand, contemporary culture encompasses both a unifying global meaning and the appreciation for meaning differences, on the other it is associated to consumption, and its practices to a mediation of the capital circulation rather than to the social context.

In the urban contemporary spectacle, the production of culture, attached to the system of production and consumption of goods, is related to the production of a space-landscape of saturated images; in it, the goods, in seductive image forms, become the constitutive principle not only of the organization but also of the relations of social

practice; in it, the existential dimensions are strongly reduced to the production of exclusive and fragmentary spaces of controlled access. Spaces where the public life occurs according to daily previously defined rules.

In this scenery, the production of the contemporary urban space answers primarily to the necessity to keep alive the circuit of production, circulation and consumption of goods in a mercantile world. These transformations, with its proper codes of ethics and functional behavior, not only weaken the urban identity and make secondary the dialectic urban fabric/ social fabric but also determine an ample series of activities that integrate the urban fabric of the contemporary collective life in the city drawing (or designing) of dissociated urban fragments: a city where the cultural capital has an important role in the definition of its physical and social transformations. However, a transformed city of an spectacle based on cultural goods.

The city as a spectacle is the place and the way of reception a new urbanity based on the aesthetical social relationships of contemporary culture. An urbanity reduced to a particular process of production / reproduction of a globalized and homogeneous imagery. What we are more and more observing is not anymore processes of urban space transformations based on the notion of commodity, but the continuous interchange between brand and commodity, commodity and space. In this context, the experience of the visual consolidates itself as a mediator element between the landscape and the geography, between the city and the territory, between the individual and the space, becoming the reproduction environment. An environment that reduces the sense of the context and the relations of the everyday life to the appearance-immateriality condition

Contemporary urban tissues may still be mainly culturally determined, but it is necessary to understand properly under what conditions they are so. In the global age scenario, one which 'place-specifics' urban landscapes offer life-style choices and amenities based on local symbolic culture, one which knowledge and identity are submitted to an homogeneous cultural and economic context, we experience an urban space that promotes new ambiguities and social territorialities representative of the so-called innovative landscapes.

Creativity (whatever it may means) has become a decisive factor on the agenda of city managers, development agents, urban planners, and architects, as they search for new urban forms that may promote the link between a range of new technologies and the development of new urban structures. Due to a strategy of control and reproduction of an established new economical order (public-private partnerships), the so-called innovative landscapes of a creative class economy do not necessarily articulate with each other. In globalized scenarios of an ever increasingly privatized urban space, these so-called vanguard urban landscapes promote the logic of social and spatial segregation of private spaces in a fragmentary urban tissue, social and spatial segregated thematic cities within the real city.

The making of the contemporary city materializes in a polarized city that loses identity and meaning, becoming more and more difficult to be noticed as a public object - even

in historical cities based on local symbolic culture that should be representative of historical values. Cities where urban structures are not conceived as a public realm that results from the overlap of social, cultural, economical processes and historical times; cities where the identitary disputes and appropriations of the past are not anymore the counterpoint between the constructed and/or official memory and other versions of the social memory. On the contrary, breaking up specificities, the so called 'place-specifics' urban landscapes that offer life-style choices and amenities of private interests.

Cities not as cultural artifacts to be experienced, but a fake object of space-consumption of an aesthetic empty form – in fact, a-topic non-places of human alienation. In a time of estrangement before the world, of an alienation based on the individual experience of dislocation and detachment, that becomes the common pattern of an architecture that easily transforms the city into an empty form, the urban space loses its social meaning allowing for a de-territorialized urban form.

3. Contemporary urban spatialities

Nowadays we observe a city, that operating in a differentiated social-cultural context, is permeated by unknown urban fabrics. It questions interpretations, ways of use and appropriations of urban landscape (in its materiality and in its practices) and, in this way, the possibilities of configuration of the urban space.

In the contemporary urban space different realities, products of different times, and people of different origins live together. In the urban space, heterogeneity, which is intrinsic and necessary, is at the same time fostered and crushed by the overlapping of coexistence. As a consequence from a collage of social assemblages and urban forms, only possible in a society of mass production and communication, where a kind of 'inflation' of products and information reigns. the contemporary society creates new proximities and explicitates distinct material, political, economic and ethnic landscapes - they promote new ambiguities of the urban space that, strictly speaking, articulate and exclude themselves. In the contemporary city we observe transformations related not only to the materiality of space, but also to its permanency, ephemerality and de-territorialization (temporal substractum).

In many ways the current city represents the maximum point of the process of disenchantment of the modern world. As a critical process of knowledge, Modernity is deteriorated, being characterized more by the certainty and arrogance of one 'ism' than to the interrogation and self-understanding critics. However, despite of the criticism to the rationalism and the reduction of the modern movement, the contemporary city, although new forms of cultural expression and social communication open unexplored fields of investigation of urban and spatial structures, is translated more and more in a beautified and simulated urban landscape.

In the society of super-modernity (Augé)[2] an emergent city is evidenced in distinct (different) ways, either mapping out and questioning the emergency and transformation of new conflictive processes around the classic and contemporary axis of structuration and appropriation of the urban space – urban housing, urban services, forms of

resistance and contraposition to the intervention forms -, or in contemporary urban forms that can or cannot dislocate old demands, substituting and/or overlapping them. However, it is questionable to what extent, the contemporary city, submitted to significant processes of social and technological transformations, and conditioned by a privative speech and the standardized message of the media, explores these possibilities.

Muñoz (appud Solà-Morales 2005)[3] points out that the logic of the 'containers' (understood as elements of capital accumulation and economical, cultural, touristic and social reproduction) is already present at the contemporary urban space: traditional typological elements as streets, squares, public and institutional spaces has been transformed in containers-objects, thematically reduced to a set of urban functions of a controlled space. A space of idleness and consumption characterized for models and similar standards of intervention in the production of an urban environment to be visited intensively in partial time. A space that produces a-territorial landscapes characterized by the economic and functional specialization of the territory - in every places landscapes of nowhere. As such, the urban tissue is not anymore a result of the processes of elaboration and/or reception of conceptions and urban intervention forms that are constructed around consensus that are spread in a transversal way in the global political specter.

The investigation of the contemporary city, requires the revision of concepts and action plans regarding its spatiality, particularly about the processes of transformation of its territory and its urban landscape (as physical as social). It is true that we must deal with a new socio-technical scenario of a heterotopic, multi-referential and mediatic society, but, as already mentioned, we must also question to what extent the so-called innovative landscapes of a creative class economy of the global age appropriately respond to new forms of enunciation of the spatiality of the contemporary urban space; or, to what extent the spatiality of new urban tissues are not submitted to a homogeneous cultural and economic context that promotes the logic of social and spatial segregation of private spaces in a fragmentary urban city.

It becomes necessary that we search for alternatives for the distinct enunciations that allow theoretical constructions relative to the contemporary urban environment. The contemporary city, to be representative of new contiguous and ambiguous symbolic interpretations in relation to its landscape, demands investigation of the spatiality of the public scope of the urban space.

On other question to be considered, in attention to the indicators that evidence the semantic displacement between culture and urbanistic productions, it is necessary to observe the relation architecture/city being not only in the paradigm text/context, but also in the textualities of the multiple dimensions of today's city. These questionings require knowledge and action reinterpretation, particularly in relation to the project /projectuality aspects of the contemporary city and social appropriation. It is all about crossing the own course of the events, where the spatialities of the public and the private, the appropriations of the places, the formal references of identities, practices and the urban habits can be inquired and be interpreted as a phenomenology of the

diversity - a diversity that recognizing influences reveals differences. The study of the spatiality of the contemporary city requires a different approach to the (re)meaning of the notion of public space and the investigation of processes and procedures related to the conformation and configuration of its urban structures.

4. Final observations

The model of the city as a spectacle in thematic urban landscapes has been constantly present in recent urban renewal proposals. In these proposals, the role of architecture moves from a vehicle of modern urban reform utopias to the production of urban spectacles – ones that simulates images of urban landscapes in a fragmentary city. In fact, we can say that these fragments, once reduced to urban appearances of isolated pictures, are cenographical spaces of visual consumerism, urban interventions representative of gentrification processes, which not only generate social expelling and exclusion but also reduce the complexity and heterogeneity of the urban environment to an aseptic vernacular landscape of security and civility.

As a result, a city built by simulacra of urban spaces that disregards the importance of the place. Vectors of the creation of privatized fortresses ruled by isolation and claustrophobia – as in recent projects of New Urbanism, like Celebration - they set aside the urban space and create a fictional city ruled by the interiorization of functions of the 'old city'. In this 'ageographic' city of huge containers, of historical uniform gentrifications, of homogeneous urban renewal proposals of the private capital, we observe urban spaces of temporary occupation and anonymous confluence, flexible space-time contexts without identity, designed for the client, not for the citizen

If we intend to conceive a view of the contemporary city, we must understand that it is necessary to develop intervention strategies consistent with an attempt to generate a place - one which is representative of the present urban phenomenological environment. The intersection between past/present time-cultural flows should go far beyond the (re)production of a new global paradigm of thematic urban configurations.

According to Boyer[4], the urban representational model of the contemporary city envisages the city as a spectacle that corresponds to the global capital in constant flux. The image of the city of the spectacle, without territorials and physical specificities, represents an urbanity and urbanization processes more and more privatized. Representative of an increasingly stronger relationship between culture and capital, a contemporary urban model (related to a global economy and the electronic communication world web) do not create representations of a social world. On the contrary, this urban model simulates and promotes urban environments that disregard any physical or social references.

The contemporary built environment is representative of a new universal paradigm: an 'everywhere-nowhere' architecture based on a model of production of the contemporary urban space completely based on the capital, local or not. A model that, as a result of a pre-established imagery, looks for legitimacy arguing for the superimposition of a "global

and modern matrix" over the archaic and uneven city. A model that does not understand that the loss of reality in urban life is the other side of the coin of a city that is unable to show anything but an image (void of stimulus and knowledge), and vice-versa, in the conformation of the urban environment and its collective spaces of public domains.

Any attempt to understand the urban experience as a multifaceted reality calls for a redefinition of the conception and perception of architecture, in case we are willing to overcome what has been questioned by a global hyper-mediatic society of the pos-industrial era. In the complexes pathways of contemporary culture, it is necessary to rethink the topology of the construction of the place, in the instituted space or the emergent one, in the city of discursive stratifications or in the city of another genealogical ´topos´ (where concepts, forms and spaces mark events) considering the manipulation of heterogeneous and complex elements, unique ones or not. Since this perspective, the urban typologies, the standards of social behavior, the normative and norms of planning, as well as the traditional distinction between public and private are not enough to answer, adequately, to the events of a city whose paradigms have been unstabled by undetermined and diffuse territorialities.

The distinction between public and private has always been one of the main investigation aspects of the western urbanistic thought. The notion of public space appears in the utopist belief of a capitalist society of the XIX century, when the concept of private property and the institutional definition of collective rights (transformation into public rights) appeared. However, this classic distinction between public and private became obsolete[5]. Today, the distinction between public and private is anachronistic and restrictive, and does not respond anymore to the demands of the contemporary social plurality, for it limits the legitimate universe of contestation and promotes the appearance of pseudo public spaces of surveillance, control, and consumption. Such obsolescence results from extremely limited definitions of the concepts of space and public, which derive from insisting on the unity, the desire of fixed categories of space and time, or for having notions of public and private rigidly pre-conceived.

New reading keys to understand contemporary urban space transformations are necessary in a scenario of a heterotopic society where: urban centralities are determined by great physical structures and/or by gentrificatory proposals of urban renewal; we observe a dislocation from the bipolar notion of center/periphery of the model of industrial city to diffuse and undetermined territorialities where the monocentrality of the city opens the way to territorial pluricentrality; the phenomena of demographic explosion and customs implosion entail new patterns of urban morphology and force us to (re)think the city in today's multifaceted reality (associated to a new semantic of terms such as flows, dispersion, decentralization, and networks); there is not only the chronological or linear sequencing, once replacing the synchronic space-time of the mnemonic landscape we observe an asynchronic time, not serial, of "pass-see-pass" that mirrors the images of sporadic appearances and form a landscape of "pass-time" images.

Far from assuming the failure of the public space, its degradation in a diversity of intermediate situations, we argue for the change, multiplicity and contestation that form

its real nature: an understanding that is based not on loss, but on the possibility of constantly reinventing the urban place. If it is true that any investigation about the spatiality of the contemporary city must come to terms with new aspects of its configuration (to a certain extent result of new social and technical realities of a strongly mediatic society), it is also true that public spaces must be representative of public and social aspects - the urban locus of a new neo-existential approach. Places that do not only reflect a cultural order based on current social relations, but also enable its continuous (re)valorization, making way to aleatory space – space of indetermination, contestation - and not spatial forms of appropriation of public space, prepensely neutral. It is crucial that collective spaces be participatory, representing urban life and collective memory, and that they become elements of a multiform urban web: transfunctional spaces[6], hybrid and multiple.

In our understanding it is more meaningful to search for new ways of producing urban structures - which recognize the nature of collective urban space as a space for experimenting, even if it proves wrong - than lead us through to nostalgia and the brooding over conditions that no longer exist. Any investigation of contemporary spatiality must observe, among its hypotheses to be developed, that:

- once the present city shows itself as a complex diagram, which articulates plural connections between the historical matrix and the multiplicity of matters and fluxes, a better understanding of the transformations operated on it requires transdisciplinary investigation of its multiple dimensions.

- the analysis of the configuration of the public/private relationship in possible new spatialities demand an answer through narratives of multiple natures based on the notion of domain – spaces of transversal differences of the urban, physical and social fabric.

- new territorialities of public domains substantiated on collective memory of a multi-referential social plurality, in opposition to the obscurity and devaluation of collective memory[7] of frozen fragments of a valued and official history – as we more and more can see in an urban of pre-defined imagery - can enable "urban places" and their distinct representations.

The search for solutions that respond to the current spatial demands of urban and territorial reelaboration of the city requires an approach without any 'a priori', based on the diversity and singularity of a particular understanding of collective spaces structured on the notion of domain. A urban strategy that observe where and how to act. It is a matter of weaving places, conexions and interstices; revealing and highlighting contrasts, contradictions, and complexities of urban confrontation. Therefore, this heterogeneity opens the way for the richness of the city and its urban voids. It is necessary a notion of collective spaces, public or private that may promote a better understanding of the osmotic and conflicting overlapping of domains, of territory demarcation and collectivization of the private space.

We understand that in architecture there are not 'semi' or 'almost' spaces. Spaces are and exist; they are concrete and ambiguous, not dubious. Therefore, we do not recognize any classification that uses the roots 'semi' or 'almost' - as, for example, semipublic or semiprivate - since this use leads to intentionally dubious concepts. We also understand that what is relevant is not an analysis of the functional specificity of collective spaces - since they are transfunctional - but an analysis of its modes of use. This analysis should underscore the notions of domain and plurality, leaving aspects of hierarchy and dominance as secondary, and consider the notion of equipment inadequate (once dictated by a semantic fad that reflects something functionally determined).

	PROPERTY	DOMAIN	MODE OF USE	ACCESSIBILITY	SPATIAL CONTINUITY	HIERARCHY
COLLECTIVE SPACE	Private	Privatist	Individual	Nonexistent	Nonexistent	Determined
		Particular	Collectivized	Determined	Undetermined	Determined
		Publicized	Collectivized	Controlled	Variable	Variable
	Public	Particular	Privatist	Determined	Undesired	Variable
		Privatized	Collectivized	Controlled	Variable	Variable
		Public	Collective	Free	Existent	Undetermined

It is necessary to search for other types of urban collective spaces different from the ones representative financial dogmas. Ambiguous spaces of (re)invention of the urban locus, the public and social one, producers of knowledge of new spatialities that can offer new connections within the city and today's culture. On one hand, considering economical issues and the impact of information technology on urban spatialization, on the other, avoiding the development of a techno-aesthetic urban views (urban spatialities) of alienation from the social context. Only this way will it be possible to long for something else than a private urban architecture; one that is transformed into a technocrat, technicist and economicist product of a supposedly global technological vanguard, which believes in itself as a pretense innovative means - in fact, innovation as mere commercial (re) production.

This search, in a world that is not alone and which does not present only one truth, must aim at   dissolving the non-contaminated magic of the obsolete and substituting it with the reality of urban life, and not the realism of an empty efficiency. Instead of rationalizing over reality, it values time and space experimentation, the rediscovery of sensitivity and poetic characteristics when redefining urban space.

New territorialities of public domain built up on collective memory of a multi-referential and heterotopic society are still to be developed. Urban landscapes must be representative of social urban tissues. Therefore, must be based on the contemporary social plurality, glocal and not global ones. Public urban landscapes, and not private thematic ones, that observe: that permanencies are strongly associated to cities' historical construction and its collective memory; local identity, social cohesion and dynamic urbanity; 'spacing' in terms of acting to place people and establishes activities

(places, not spaces, matters to local culture), instead of global 'urbanilization'[8] processes of functional and economical spatialization.

In order to avoid building cities through simulacra of reality - globalized fac-similes of empty and aseptic forms -, it is mandatory to approach the construction of urban environment, on the basis of today's society, by means of creating social and political urban spaces. Collective transfunctional spaces based on the notion of domain, which can promote the exercise of citizenship in its full potential - not as one more label of a product – and allow for citizens practicing their civil and political rights.

[5] Arguing for the obsolescence of this distinction does not mean, absolutely, that it is necessary to agree with theoretical propositions about the death of the public space, but the need to reinterpret it.

[6] Transfunctional space: polifunctional space where the physical structures, due to a certain degree of indetermination, allow for encounter and collective action. Once they are indetermined, they can deal with plurallism and diversity, transferring consensus, coherence and universality to multifunctional space. Polifuncional spaces, spaces that allow for a certain overlapping of known functions – as such, to a limited degree of indetermination. Multifuncional space: made of certain physical structures, that eventually present a certain level of overlapping and inter-relation, within a set of known functions, therefore leaving no room for indetermination.

[7] Collective memory necessary to form urban places; memory (that is built from places full of meanings) and not history (which becomes concrete through events) - memory as a tool for conception of the present and history as a tool for understanding the past.

1. The emergence of a late but strong municipal market hall system

Markets had always been especially sensitive factors in the relation between the public and the private so it is not surprising that the emergence of the contemporary market systems was closely associated with the formation of a new political thought which had been developing from the mid-18th century and became consolidated with the liquidation of the Ancien Régime. In Spain the changes were late in arriving and initially timid. Moreover, in 1834 trade was deregulated there and permission was granted to deal in "all the objects for eating, drinking or burning", except bread. In 1836, the disentailment of the ecclesiastical property allowed a set of interventions aimed to adapt the inherited city to the liberal notion of the "service city". The first two markets were then designed and built in Barcelona in *ad hoc* spaces. One was in the shape of a monumental porticoed square and the other, which drew its inspiration from the Saint-Germain market in Paris, was in the shape of a porticoed rectangular building surrounding an extensive free space. For decades, however, three of Barcelona's five markets continued to be held on squares and streets. The municipal commissions themselves were extremely critical of the grave unhealthiness, scant functionality and great congestion of their markets in a city with a steadily growing population. Nevertheless, the budgetary difficulties of the municipality prevented any advance.

In Barcelona, just as in Madrid, the decisive phase was ushered in by another political change: the revolution of 1868. A new disentailment allowed the undertaking of an enlargement of the main market, that of Sant Josep (or La Boqueria), and the proposal of a new market on the site of the Monastery of Jonqueres. Likewise, in July 1870 a specific commission was formed that was devoted to the improvement of the market squares. It issued a report that proposed the planning of the set of the city's markets. As from that date, the documents on record show a constant concern and activity in this sphere.

As in other Spanish cities, the period between 1874 and 1900 was that of the effective construction of the first examples of modern wrought-iron market halls. Within the municipality of Barcelona, there had been built before 1888 the markets of El Born (1876), Sant Antoni (1882), Barceloneta (1884), Hostafrancs (1888) and Concepció (1888). To these facilities should be added the markets built in the various municipalities of the plain of Barcelona: Llibertat (1888), Clot (1889), Unió (1889), and Abaceria Central de Gràcia (1892), which would be integrated into the market halls system of Barcelona with the amalgamation of their respective towns in 1897.

Accordingly, compared to the cities of Great Britain, France or the United States in terms of the renewal of the market system, Barcelona was a latecomer. This was also the case of the city of Berlin, where "in the mid-sixties there were several projects of new iron market halls" and "the pace of activity quickened in 1880...". [1] In Berlin, however, which was the capital of a great political and economic power, it was the "government machinery" which drove a late but highly ambitious system of markets. For this reason, if one considers the limitations of the municipal power of Barcelona in those years due to its scant budgets and the weakness of the expropriation mechanisms which characterized Spanish law, it is even more surprising to observe the strength of the municipal market system which was forged there. When the City Council decided to promote a system of municipal markets, such an option was not completely evident from the European cities' various experiences. If in France, for example, the municipal option seemed predominant, in Great Britain, on the other hand, municipal and private initiative were almost on a par. Even in the case of France, which could appear to be a prototype of public initiative, the examples of markets promoted by private initiative were not rare. [2]

The absence of interior reforms in Barcelona and Madrid until the 20th century is clear proof of these weaknesses in relation to other European cities. In the case of Barcelona, although the interior reform project was not carried out, it conditioned notably the market policy. The two biggest markets, those of Sant Josep and Santa Caterina, were affected by the so-called Gran Via C. This circumstance froze their renewal and the municipal finances were unable to replace them through the acquisition of new plots. [3] This contributed to the production of a paradox: the first, biggest and most monumental wrought-iron market halls never came to be the most active and never succeeded in attracting the activity from the old markets threatened by the interior reform, and it was soon found that they had been over-dimensioned.

The acquisition of public land for the markets was one of the constant concerns of the municipal representatives. It is not surprising that the foremost interventions were carried out on land disentailed from the religious orders (Sant Josep, Santa Caterina, Jerusalem), on plots freed by the Ministry of War (El Born market, Sant Antoni market), or on the same squares where outdoor markets had been held previously. Even in these cases, however, numerous problems arose and in many instances the plots proved quite costly (Jerusalem, Sant Antoni). The difficulty in obtaining land may explain, in part, the few private initiatives in the process of building and managing new markets. Although there existed, from a very early time, proposals of private groups who took as a model some French or Italian markets, these proposals did not prosper and when they succeeded in obtaining the municipal support, as occurred with the auction markets, they did not obtain the expected results and finally came to close down. [4]

In this confrontation between public and private initiative, the most significant episode was doubtless the one that took place in the municipality of Gràcia, which was the most populous town on the plain of Barcelona. There were two markets in Gràcia: the wrought-iron Llibertat market, which opened in 1888, and the Revolució market, which

was held on the square of the same name. In 1892, about one hundred meters away, a private group built and started up a market called the Abacería, in open conflict with the Town Council of Gràcia.[5] In 1897 Gràcia was amalgamated with the municipal district of Barcelona, together with the other towns of the plain which were affected by the Eixample (expansion district) plan approved in 1859, and Barcelona City Council inherited the lawsuit. Its efforts to acquire the Abaceria proving unsuccessful, in 1903 the City Council began the construction of a new wrought-iron building aimed to cover the market held at the square Plaça de la Revolució.[6] This building had been in operation for several years when the City Council finally succeeded in purchasing the Abaceria Central in 1911. The new Revolució market was then dismantled and part of its materials were re-used in the construction of the market of Sant Gervasi.[7] This sole serious attempt to establish a private market ended up by strengthening the market system's completely municipal character, which it has maintained to the present.

A comparison with other European and American cities makes the case of Barcelona even more singular and it is especially surprising when experts highlight the decisive period between 1868 and 1901 as "the peak moment of *laissez-faire*, the moment of maximum confidence of the system in the capacity of the private sector and the corresponding regression of the public administration in economic areas".[8] It is probable that the selfsame budgetary limitations of the municipality caused it to channel its efforts towards a service which provided considerable income as a result of the leases paid by the vendors. In this way it was possible to carry out a by no means insignificant renewal of many spheres of urban life.

2. The markets and the public space: El Born and Els Encants

One of the objectives of the market buildings was to free the public space from unwanted, congestive, unhealthy and anti-aesthetic activities. Indeed, during these years this desire was made patent in documents and actions. The resistances which arose are also quite visible, however.

The opening of the new wrought-iron market of El Born in 1876 allowed improvements to be undertaken at the old square where the market had been held since the Middle Ages. Nevertheless, the local inhabitants were hardly in agreement and lodged a complaint in which they expounded on the harm that they would suffer as a result of the distancing of the new market. In the complaint they affirmed that "adjacent to the markets is established a very large number of industries with products analogous or similar to the articles which are dispatched at the markets themselves and proof of this is what happens at the Rambla de San Josep, since on the ground floor of the houses nearest the market are found shops of all types of groceries, and above all of articles for clothing, salted fish, dried fruit and nuts and other products which are not what one could call fresh articles appropriate for dispatch at the markets. Your Excellency also knows that, adjacent to the markets, shops of kitchen utensils and other similar products likewise establish themselves, as is also shown by the shops of glazed ware, pottery and porcelain which are open at the aforementioned Rambla de San Josep. And, moreover, Your Excellency knows that, owing to the large crowds which are drawn by

the markets, numerous shops of ordinary clothing establish themselves, as is also shown by the shops found adjacent to the market of San Josep and on the side-streets Hospital, Petxina, Jerusalén and others. Now, therefore, this same circumstance had occurred, as is only natural, at the old Plaça del Born, where there were establishments of long tradition with large clienteles created by dint of years of serving them well, doubtless with great sacrifice of capitals over an extended period of time; and this circumstance has caused the value of the urban property in that area to rise, due to the animation which a market, with its affluence of products, always produces. If the market is removed to some other place, such conditions disappear and it is impossible for the shops of the aforesaid articles to find themselves visited by all the old customers, who are naturally drawn to make their purchases with economy...". Lastly, they requested permission for "the proprietors of the shops to continue to occupy, as up to now, an extension of four palms of the sidewalk, even if they may be set certain conditions of embellishment in the placement of the objects which they display to the public for their sale...". [9] The petition was rejected. This episode evidences the inertias in the commercial structure and shows the point to which the traditional markets were an uncomfortable exception in the city's public space. Any mercantile occupation of the street which would impede the circulation of persons and goods was to be forbidden. Its ideal place was the protected transparency of the new market building, which was safe for the circulation of buyers devoted to the orderly observation of the goods. The new wrought-iron and glass architectures of the markets, similar to those of the passages, exhibition halls and railway stations, were architectures of "transitoriness", as stated by Benjamin, of safe orderly circulation for mobile, nomadic persons. [10]

The problem of Els Encants (the second-hand market in Barcelona) was considered with the same focus of eliminating commercial activity from the public space. A city councillor affirmed: "neither Els Encants nor the vending stalls on the public way have any reason for being (...)".[11] So when the inhabitants of El Born proposed that this type of sale should be allowed around the Plaça del Born in order to activate the neighbourhood, this same councillor stated that "...it does not correspond to what is demanded by the modern advances and the spirit of the times... since, instead of seconding what has been resolved by the City Council, eliminating the market of Els Encants, it is sought, to the contrary, to establish another new one... the spirit of all the city councils has been against the continuation of Els Encants, whereby the petition of the local inhabitants means nothing, since it is impossible to issue an order that will please all... and what has to lend positive animation to such neighbourhoods is the construction of buildings and the complete development of all that is planned in the Park...". Even so, one of the members of the commission defended the complaint, arguing that there also existed "fairs and similar markets in leading capitals, including Madrid and Paris...". [12]

In 1888, with a view to the imminent holding of the Universal Exposition, "the Most Excellent City Council, on the supposed pretext that Els Encants, in the form in which it was established at Carrer Consolat and Plaça de San Sebastià, would vilify Barcelona... decreed at a stroke of the pen, the transfer of the vilifying Encants to the area around the market of Sant Antoni (...). Consequently, the old Encants, with all its defects and

with its 245 vendors, was installed (despite the protests of those who considered themselves harmed)" in the environs of the market of Sant Antoni.

As in other cities, the attempt to move beyond the traditional markets was often associated with the control of forms of urbanity and the moralization of customs.[13] The markets had theretofore been considered hardly recommendable places. For example, in petition from 1859 in relation to the transfer of the market of Hostafrancs, it was argued that: "... in the first place, the aforementioned school, remaining as it does in the midst of the stretch of sidewalk which serves as a square in such a way that it may be said that the whole front of the building forms a square, the boys and girls, who in a number of two hundred attend the said school, must hear and witness every day and at all hours the blasphemies, obscene and indecent words, brawls and disputes and all the rest which, as everyone knows, occurs at the market squares and which can only serve and does indeed serve as the poorest example of education of childhood and of the formation of good habits and customs".[14] Similar arguments were used in 1895 in a conference published against the market of Els Encants: "... And with respect to the uplifting spectacles which the vendors offer us on their market days, what can we say? There is no doubt that they place the culture of Barcelona on a level which 'honors it exceedingly'. The infernal clamor... formed for the most part by vulgar and obscene words and coarse insults, to which they treat each other, accompanied often by gestures and actions which are in no way edifying and other analogous niceties, produces an ill-assorted set of scenes which clash openly with the morality and decency appropriate to cities such as ours...". [15] In the regulations approved in 1898, this would be the object of Section 30: "Vendors have the duty of showing good manners and courteous behavior in their dealings among each other, the same as with the public and with the municipal employees of the market...".[16]

3. Towards a change of scale. Wholesalers, free market and public intervention

When the process of amalgamation of the municipalities of the plain of Barcelona came to an end in 1897, six markets had been built in Barcelona and the various towns of the plain had carried out their own initiatives.[17] Although the management had been fragmentary, they had taken part in a common experience. The Llibertat market in Gràcia, which had been built by the company La Maquinista Terrestre i Marítima, was similar to those of Barcelona. The markets of Clot and Unió (1889), designed by the municipal architect of Barcelona, Pere Falquès, in the town of Sant Martí de Provençals, were based on the experiences in Barcelona. These markets adopted a more economical construction and replaced the cast-iron pillars with brick masonry. In any case, the amalgamation of the towns imposed necessarily a new scale of administration, that is, a joint management of all these markets, with respect to both personnel (the director of markets, tax-collectors, inspectors, labourers and watchmen, forming a workforce of over 150 people at that time), and the regulation of their operation as provided in the Regulations of 1898.[18]

A file from 1900 presents a brief preliminary balance.[19] Soon after, the *Anuarios Estadísticos* (statistical yearbooks) published as from 1902 help to assess the situation

and offer a very useful overview. The first thing to be pointed out is the distribution of the revenues of the city's various markets (see figure 1). The market of Sant Josep (or La Boqueria) represents 40% of the total revenue of the city's 16 markets.[20]

Nevertheless, it was almost the only leading market which remained without a definite architecture, unfinished and basically unroofed. Also surprising is the description of the second market, that of Santa Caterina, which represented 12% of the tax revenues: "for the most part, this building is in a ruinous state and some reforms are being carried out at present". In short, the two most centrally-located and important markets were those which were in the worst condition, doubtless owing to the threat of the Gran Vía C of the Interior Reform. In the case of the market of Sant Josep (La Boqueria), in addition to this threat there was the indecision with respect to the future of the plot of the ex-convent of the Jerusalén nuns, a plot which a court ruling had returned its former owners. These were two causes of the precariousness which prevented the architectural planning of the markets but not the growth of their activity.

In June 1896 the City Council proposed the start-up of the process of expropriation of the Jerusalén plot in order to provide a final solution to the problem.[21] The main argument for such a costly acquisition was the installation of a central market aimed to accommodate the growing presence of wholesalers. The expropriation process, however, was interrupted almost immediately as one more example of the high degree of indecision which characterized the municipal policy on markets.

As in other cities, one may observe in Barcelona in the final decades of the 19th century many signs of the growing importance of wholesaling. In the series of initiatives aimed to put order into wholesaling, mention should be made of those which were concentrated in 1891. In that year it was proposed to use the Machine Gallery of the Universal Exhibition of 1888 as a wholesale fish market and another large building of the city as a facility for the accommodation, inspection and contracting of livestock.[22] At the same time, another expert opinion proposed the construction of a "market-depot and lazaretto" for hens at the market of Santa Caterina as an instrument for the health control of the growing number of imports.[23] According to the *Anuario Estadístico* of 1902, Barcelona was the city with the world's largest consumption of hens, which came mainly from Russia, Turkey, France, Italy and Portugal...[24]

In 1897 the same Machine Gallery was proposed as the Wholesale Poultry, Fruit and Fish Market, and the works began the following year. The Central Poultry Market alone went into operation, however.[25] The vendors' resistance is probably what prevented the completion of the project since in 1899 it was resolved to install the wholesale of fruits and vegetables at the market of El Born, in the space that was then occupied by the wholesale of fish, which was to be transferred to the Machine Gallery, as mentioned. Although this proposal was carried out, it did not last for long.[26]

Three sets of regulations were under preparation in these same years: the General Regulations on Markets and the Special Regulations on the Central Fish Market and on the Central Wholesale Fruit and Vegetable Market.[27] In any case, despite these and

other initiatives, the wholesale of fruits and vegetables was left distributed among the leading markets until 1921, at which time this function was being performed on 3,500 sq. m. at the market of Sant Josep, on 1,750 sq. m. at the market of Santa Caterina, on a little under 1,000 sq. m. at that of Sant Antoni, on almost 300 sq. m. at that of Sants, on 230 sq. m. at the Llibertat market in Gràcia and on 124 sq. m. at the market of El Clot.[28] Likewise, the constant increase of this function led to successive changes in the regulations.[29]

One of the most active advocates of the need for a wholesale fruit and vegetable market was the Catalan Agricultural Institute of San Isidre. Some paragraphs from its journal of 20 December 1913 give as good description of the malfunctioning of the market of Sant Josep (La Boqueria), which was a genuine central market of the city. "It is truly a pity to see the current process of entry and inspection of the fruits and vegetables which are to be sold to the public. Few people are unacquainted with the location and layout of today's market of San Josep. If they were to be told that in that narrow rear alley there are crowded daily some three hundred carts piled high with fruits and vegetables, they would surely consider such an affirmation impossible. Nevertheless it is true, quite true indeed. Such an incomplete and rudimentary system is another factor that causes depreciation in prices for the sellers, that is to say, the farmers, without benefiting the consumer. The reason is obvious. The carts of the plain of the river Llobregat must wait, it is to be assumed, from twelve at night when they reach the market to join the queue, until the sometimes late hour when, having sold their goods, they can turn homewards. Since there is little room available, agglomerated there are baskets and more baskets, there rise up great heaps of fruit which has been very hastily unloaded, almost dumped because of the crowding, because of the absolute lack of conditions, without time to arrange it or room to position it. This is the fault-ridden path which is followed up to the time of their sale by delicate products which, for these and other reasons, must be surrendered by the farmers at genuinely ruinous prices..."[30]

Within the context of the crisis of subsistence prompted by First World War, in February 1916, the article insisted: "One of the joint causes producing the so-called conflict of subsistence is, in regard to Barcelona, the prevailing disorganization of the city's markets, with the aggravating circumstance that, at the same time as the consumer is harmed, harm is likewise inflicted on the producers, that is to say, the farmers of the neighboring areas and even of the most distant ones… This is the sorry situation in which we find ourselves… a crisis involving a scarcity of supply in the city and abundance in the country. How can this conflict be solved? By establishing a free central market where contracting is carried out publicly and all necessary publicity is given to the price quotations, which would bring to an end the present disorder and prevailing situation of privileges."[31] Some of the city councillors, and quite especially the Catalan Agricultural Institute of San Isidre, denounced the interested resistances of highly influential groups. Indeed, despite the openly stated urgency of this initiative, it took three years for it to be imposed.

The arrival of General Martínez Anido, an especially authoritarian Civil Governor, in a context of intense social conflict, helped to unblock the situation. The new central fruit

and vegetable market became one of the foremost scenes of his image policy, with its decidedly interventionist seal, in relation to the subsistence problem. The concentration of the wholesalers in a single market was expected to increase competition and the correct formation of prices. The main concern of the Civil Government and of the City Council, however - and this can only be considered contradictory -, was the control of the regulated prices which governed the sale of the most critical products.

4. Public markets and their impact on their neighborhoods: markets and retailing structure

The relation between the markets and their neighborhoods is another aspect to be considered in the relation between public action and private initiative. In this respect, it could be useful to analyse the consequences of the planning of wholesale as well as the impact of the retail markets on their surroundings.

There is little debate about the reasons for having chosen the market of El Born as the wholesalers' market, perhaps because the choice was obvious in view of the municipality's financial limitations. As previously mentioned, it was definitely over-dimensioned and had been unable to generate the usual commercial fabric around itself, as may be seen from the records of the Industrial Register. Moreover, from the logistical standpoint this market's location could hardly be improved upon, situated as it was between the railway stations Estació de França and Estació del Nord, near the port and with easy connection to the Morrot station. Additionally, it was surrounded by broad thoroughfares which simplified access for carts and automobiles. This privileged situation explains the traditional localization of wholesalers of chemical products, colonial goods, and grain and rice around the old Plaça del Born, as may be seen in the records of the Industrial Register from the 19th and 20th centuries (see Figs. 2 and 3: Wholesale goods 1914, 1932)[32]. The centralization of the fruit and vegetable wholesalers marked the definitive transfer of the wholesale of fish from the market of El Born to the Machine Gallery of the Universal Exposition of 1888, on the other side of Ciudadela Park. Even so, the market proved insufficient so the ordinance did not limit wholesaling to the interior of the building and defined a broad area around it for this function. These changes contributed decisively to the activation of the neighborhood.

As pointed out by Andrew Lohmeier, it is difficult "to quantify the proportion of food retailing that took place in public markets as opposed to privately-owned retail shops".[33] If one makes a preliminary comparison in the central districts of Barcelona, the grocery shops (which also sold fruits and vegetables) represented about 40%, as opposed to the 60% represented by fruit and vegetable stalls at the markets. [34] The proportion drops to about 26% outside the market in the case of fish retailers, and to about 21 % in that of meat retailers. In addition to this concentration inside the markets, around the markets there was also polarized a significant part of the shops selling these foods, especially in the case of meat (with somewhat less in the case of fish and still less in the case of grocery shops). This is particularly visible in the markets of Sant Josep, Santa Caterina, Barceloneta, Sant Antoni and Hostafrancs, and to a lesser extent at Concepció market (see Fig. 4).

Nevertheless, a reading of the map also highlights that the largest concentrations of small neighborhood shops outside the influence of the markets may be observed in the most popular districts and that they show a density correlative to that of the population of these areas. On the other hand, it is quite visible that there is a void of this type of shops in the residential areas of higher status (see Fig. 4). This correlation between small grocery shops and popular neighborhoods has been observed in other cities, for example in the studies on Manchester conducted by Scola and, from a more general perspective, by John Benson and Gareth Shaw. These authors remark that if "market traders retained a role as suppliers of fresh food to the urban working class", (…) "small shopkeepers underwent a substantial increase in numbers, becoming linked inextricably with the satisfaction of working-class demand". [35]

5. A strong system of public markets born from historical weaknesses and lags

Between the years 1930 and 1970, when a progressive erosion of the markets was being observed in the more dynamic countries, an active policy was unfolding in this area in Spain. In the 1930s, it was of a fundamentally theoretical character and was led by the corps of municipal architects and their journal CAME. In the so-called Autarchy period, between 1939 and 1959, which was the most depressive and interventionist phase of the dictatorship, a decided impetus was lent to the building of markets. The gradual liberalization of the economy and the "developmentism" of the 1960s did not halt the expansion of the market system, which grew significantly in both Barcelona and Madrid to serve the districts which had arisen with immigration. In contrast to the post-war Europe, which incorporated more advanced commercial formulas in unequal competition with the markets, in Spain the selfsame weaknesses of the economy allowed a surprising expansion and consolidation of the public market system which, in the case of Barcelona, has been preserved wholly and has even increased in recent years. The late penetration of hypermarkets in the 1980s was accompanied by measures aimed to protect neighborhood shops and to avoid the effects which had been observed in other European countries.

The 1986 Special Plan for Food Retailing Facilities of the City of Barcelona approached precisely the markets as essential polarities and proposed the systematic renewal of the markets as a way of activating neighborhood retailing. The Municipal Institute of Markets, which was created in 1991, has been responsible for this renewal process, which is still under way and which has even entailed the building of new market halls[36].

[3] In effect, Àngel Josep Baixeras's Interior Reform project of 1 March 1888 affected the markets of Sant Josep and Santa Caterina and newly proposed a market at Jonqueres and, in the Raval district, another market on the plot of the Casa de la Misericòrdia and one adjacent to the Drassanes. All were to be on the new roads B and C.

[4] For example, the file promoted by Julio Moricé, a native of Bordeaux, "as he and individuals of his family have built the celebrated markets of Bordeaux, the ones with what are perhaps the best features known anywhere (...) as there is no one who is not aware that the present conditions of the markets of Barcelona are not recommendable from either the economic standpoint or in relation to hygiene, and the public is not served as should be expected, and moreover the development which the public is undergoing make it clear that these disadvantages will increase progressively (...)" (AMAB, 24 August 1864, Commission for Public Works and Development /Section 3, File 3050. Ibid, File 3502, "Proposal of Mr Carlos Souton, 14 July 1871 (…) The establishment of markets which shall present all due conditions of hygiene, duration, solidity, economy, elegance, etc. etc, and since the applicant has built several markets abroad, including that of Naples, situated at the market square of that city, which have provided excellent results... he presents to you a proposal for the construction in this city of the markets which Your Excellency may consider appropriate and in the places which you were to designate... Either of two methods may be used for the construction of the markets: either by contracting the construction for a lump sum payable by months, quarters or years..., or else by means of the grant of a concession and operation of such markets for a period of ninety-nine years (...), Barcelona 13 February 1871. Years later, a proposal by Jaime Osmin Lacombre Dubousquet ("In the leading capitals of Europe such as London, Paris, Brussels and other important population centres such as Genoa and especially, in our neighbour France, such as Bordeaux, Lyon, Marseille, Toulouse, etc., there exist certain markets devoted to the daily and continuous auctioning of all types of food products...") sought to provide the free and direct supply and demand between the producer and the consumer, which would reduce prices. Finance Commission / Section 2, File 6539 "On the Establishment of Auction Markets for the Sale of Food Products", May 1877.

[5] The newspaper *Diario de Barcelona* of 13 December 1892 announced that a private group has erected "a large market or Abacería Central, built with all known advances". On 21 December the same newspaper announced that the facility had opened to the public. *Gaceta Municipal*, no. 29, 17 July 1950, pp. 741 to 746: "L'Abaceria Central".

[10] Teyssot, Georges, Habits/Habitus/Habitat (1996), http://urban.cccb.org (urban library): "In *Paris the Capital of the Nineteenth Century*, Walter Benjamin notes how iron and glass were avoided in dwellings while such materials came to be used in passages, covered markets, pavilions for expositions and train

stations: 'buildings which served transitory purposes'. Two contrasting modes of subjectivity began to insinuate themselves into the world of things: on the one hand, the 'transitoriness' that determines a sort of man, mobile and nomadic; and on the other, the old individualism of the inhabitant par excellence who defends his traditional 'permanence' or 'allocation'... It is certainly true that recent studies, for example, on the Victorian country house in Great Britain, or on the apartment building during the Haussmann era, tend to qualify Benjamin's assertion that 'iron, then, combines itself immediately with functional moments of economic life'".

[17] The limitation of the municipal district was decisive in the unending matter of the slaughterhouse. The process had become eternalized from the time of the proposal included by Fontserè in his project for the Park area in 1872. This project was quickly rejected for reasons of hygiene. The start of the acquisition of some land for its construction in the municipal district of Sant Martí de Provençals proved to be useless owing to the difficulties posed by this municipality. The subsequent attempts to install it in the municipal district of Sants did not prosper either, and it was not until 1886 that its construction was granted on the land of La Vinyeta, between the streets Aragó, Tarragona, Diputació and Vilamarí, within the municipal district of Barcelona. The amalgamation entailed that the new City Council inherited the various facilities of the different municipalities and it had to plan them. This was quite clear in the case of the slaughterhouses. Those of Sants, Les Corts, Sant Gervasi and Sant Andreu were eliminated, while those of Gràcia and Sant Martí de Provençals were provisionally maintained in operation. The various municipalities of the plain had maintained their own policies with respect to markets, which had to be integrated as from that time into a much broader and homogeneous system, following criteria which were already clear and explicit from the time of the discussions on the Eixample project and from the time of Cerdà's proposal. A fair number of years would still be required to achieve this, but the amalgamation was unquestionably a decisive step in this direction.

Pioneers in Spanish town planning: César Cort Botí

Maria Cristina Garcia Gonzalez
University of Alicante, Spain

The aim of this paper is to describe the work of the first lecturer in town planning in Spain, the architect and engineer César Cort Botí (Alcoy[1], 1893- Alicante, 1978), and to give an outline of the scientific and urban context in which he developed his work on town planning. This study will include the period up until the Spanish Civil War.

The principal cities in Spain underwent considerable growth during the second half of the 19th century, due to the Industrial Revolution, and this growth was both informal and unplanned. The pre-industrial city and the new towns suffered from over-crowding, dirt and disease because of this growth. Various problems arose, not only involving public health and epidemics, but also economic segregation caused by immigration, difficulties encountered in integrating new methods of transport, and the precarious nature of over-extended infrastructures and services. In the decade of the 1840s, many studies were carried out into causes of death among the working classes, and many of these studies concluded that the high death rate was due to the physical and public health conditions of the crowded cities in which these people lived, where public health services were absent. These conclusions could not be ignored by the authorities.

Compared with American or European industrial development and the resulting urban spread, Spanish development came later and was on a smaller scale, but the underlying tendency was the same. In 1857 in Spain, only Madrid, Barcelona, Valencia and Seville had more than 100,000 inhabitants, but by 1900 their populations had grown to 539,000, 533,000, 230,000 and 149,000 inhabitants respectively. By the same year, the populations of Málaga, Murcia and Zaragoza reached 100,000, although later on, major population growth was mainly centred on Madrid and Barcelona. In 1930, the population in Madrid and in Barcelona become to the million of inhabitants. This rapid increase in the urban population continued, so that by 1940, demographics had changed the structure of the country. Although the resulting problems mainly affected the urban environment, rural life was also influenced: in fact, the majority of the population was still rural, with only 14.9% of the population living in towns by 1930, compared with 46.4% in the most urbanised country, Great Britain[2].

This new situation created the need for a new approach to both concepts procedures of cities[3]. A major effort was made to implement new styles of city intervention and management as a new kind of society emerged, with a middle class based on capitalism and a Marxist working class. Up until the 1930s, the three dominant approaches to town planning and design were expansion of the existing city, renovation of parts of the pre-industrial city for the benefit of the emerging middle class, in search of quality space, and the creation of new towns, which attempted to offer a new way of living based on philanthropic principles, and a new kind of urban landscape.

In Spain, as in other Western European countries in the second half of the 19th century, urban expansion was based on an ordered, geometrical design built around the existing cities, and the city was conceived of as a space for regimented and ordered middle class intervention. This idea was implemented in many cities, the most important example being the expansion of Barcelona designed by the engineer Ildefonso Cerdá, who wrote the first manual on town planning, *The general theory of Urbanisation*, in 1987, and whose work had an important influence on later urban theories. One of the first to acclaim his ideas was the architect and engineer, César Cort Botí, who disseminated Cerdá's proposals for urban improvement in many of his texts.

At this time in Spain, new and specific legislation existed which governed this kind of geometric expansion, comprising specific regulations and laws. However, application of this legislation was difficult, and usually impoverished the original project. The laws in force at the beginning of the 19th century, were the Regular City Extension Law of 1876, the Regular Extension Law of 1892, specific to Madrid and Barcelona, the Town Sanitation and Internal Reform Law of 1895, and the Compulsory Purchase Law of 1879. These laws, governing town planning mainly based on the urban schemes, continued to be in force until 1924, when the Municipal Statute was passed in response to the need for new town planning legislation.

In Spain, the City Beautiful movement was not only seen in terms of improving infrastructure and sanitation, but was also considered a means of dignifying the urban environment, and Baroque and Neoclassical techniques such as perspective were used. However, middle class geometric expansion did not provide for the working class's need for housing, leading to irresolvable problems of uncontrolled periphery growth. At the same time, city centre intervention at the end of the 19th century and first half of the 20th century in Spain led to the creation of the "grandes vías", like the Italian "sventramentos". In 1908, the Vía Layetana was built in Barcelona, connecting the old city and the new area of expansion. The resulting revalorisation of the land on either side of the boulevard led to the construction of grand buildings along its length. In Madrid, construction of the Gran Vía began in 1910, although the original proposal had been put forward some years before. The idea was to cut through the existing city, financed by a revalorisation of the land on either side of the new boulevard. The "gran vía" formed a characteristic feature of inner city reform projects for Bilbao, in 1923, Zaragoza, in 1925, Valencia, in 1928 and Murcia, this latter project being carried out by César Cort in 1926.

Besides the geometrical expansion and inner city renovation projects, the third principal city planning innovation was the creation of new cities. In 1882, Arturo Soria put forward the original idea of a garden city, anticipating Howard's creation and popularisation of the same. Arturo Soria's lineal garden city constituted an integrated territorial vision, where the new urban garden city was based on the concept of mobility: his city was not just a city but also the relationship between the land on which it was developed and existing cities. However, his ideas were only put into practice once, by the *Madrid Urbanisation Company*. He also published the *Lineal garden city, sanitation, agricultural, engineering and urbanization review* journal, which first appeared in 1897.

After Arturo Soria, Hilarión González del Castillo was also a proponent of the lineal garden city, but he had more success abroad than in his own country.

In Spain, Howard's garden city philosophy was promoted through his attendance at the international conferences organised by the International Federation of Garden Cities, and the publication of interviews and articles about Raymond Unwin and Howard in several journals. This was of great importance at the time, given the lack of access to Spanish translations, and the lack of education in foreign languages among architects. For example, *Der Städtebau nach Künstlerichen Grundsätzen* by Camillo Sitte was only translated into Spanish for the first time in 1927, by Emilio Canosa. The main proponent of garden cities in Spain was Ciprià de Montoliu, in Barcelona, who founded the *Civitas* journal, published by Barcelona's Social Museum. César Cort, who joined the Garden Society of Madrid in 1919, was also very interested, adopting the more salient points of Howard's philosophy, as well as the ideas of Unwin and Barry, embodied in their design of Letchworth.

As a result of Spanish neutrality in the First World War, Spain witnessed significant economic growth between 1914 and 1918. The associated acceleration of the industrialisation process brought concerns about urban development to the fore, with architects, civil engineers and the administration all feeling that a new science was needed. In 1914, the new Architecture Study Plan was proposed, which incorporated a new subject called Project Design and Sanitary Infrastructures, for cities. There had never been a similar subject before; previous urban studies had concentrated solely on sanitary infrastructures and public health. At that time in Spain, the only Schools of Architecture in existence were in Madrid and Barcelona. In 1918, César Cort was appointed Professor at the Madrid School of Architecture, and became the first to teach the new subject, which he proposed calling "Urbanology". As in the Barcelona school, the predominant influence in Madrid was the German school, represented mainly by Camillo Sitte, Joseph Stübben and Karl Henrici, and most Spanish architects or students of architecture went to Germany if they wished to study abroad, and in the case of urban studies, to Berlin and the Charlottemburg Seminar. Following the contacts he made at the international conference, Cort also introduced Anglo-Saxon urban theories into the Madrid School.

As representative of the Spanish Society of Architecture, César Cort attended the Paris Inter-allied Congress in 1919, the 1920 Conference organised by the London City Council, and several International Federation of Garden City conferences (later called Housing and Town Planning Conferences). Again, as representative of the Spanish Society of Architecture, and also of several other institutions such as the Ministry for Art, he attended the Gotteborg Conference in 1923. Representatives of the Social Reform Institute, such as Amós Salvador, López Valencia and Ricardo Bastida, attended the London Congress in 1920, returning to Spain with the idea of applying the policy developments on social housing and renting put forward at the Congress. These ideas were strongly criticised by Cort, who felt that it was pointless to copy policies when both the contexts and conditions of Great Britain and Spain were so different. His own ideas were highly influenced by contact with Henry R. Aldridge, John Nolen, Alfred Agache,

Eugéne Hénard and Howard, and he was also an admirer of George Burdett Ford, the theoretician who transformed the "city beautiful" into the "city scientific" and in the post war period, he worked in France in the *Renaissance des cities*. Later Cort put forward this idea as a proposal to the post Spanish Civil War government, but it aroused no interest among the authorities.

In the 1920s, *Architecture* [4], the Spanish Society of Architects' journal, published articles dealing with the town planning projects being developed at the Madrid School of Architecture. One of these articles, about a small town in the north of central Spain, Ciudad Rodrigo (Salamanca Province), was widely disseminated. César Cort presented the student's work at the Spanish Architecture and Urban Congress of Madrid in 1926, and it was also published as part of the *Schemes of cities*, a posthumous publication of work by Gustavo Fernández Balbuena, edited by Otto Czekelius in 1932. The same article is precedent of the book, *Murcia, a simple example of urban design* [5], published in 1932 with a prologue by Joseph Stübben.

In documentation relating to the 1924-25 Urbanology course, continuous reference is made to Joseph Stübben's handbook, *Stadtebau*, and to Camillo Sitte's *Construction of cities*. Ildefonso Cerdá is introduced, and *Vers une Arquitecture* by Le Corbusier is mentioned. Part of Henry R. Aldridge's book, *The case for town planning* [6], is analysed, as is *The civic Art* by T. H. Mawson, together with some of George Burdett Ford and Nelson P. Lewis's proposals. The articles published in the early years of the journal *Sociological Review,* on Patrick Geddes's *Survey of cities,* were also recommended.

It was at this time that urban design began to be considered not just as a means of organising a horizontal space to be filled with buildings, but as an integrated overview of the future life of the city, as a completely new way to create a city. Spatial, social and economic factors needed to be integrated and considered as a complex whole, something which had never happened before. In 1923, the Ministry of Works, prompted by the Social Reform Institute, organised the National Construction Conference, in an attempt to find an answer to the different problems faced by housing construction: materials, the economic situation and social housing, and all parties involved in the process were invited. Acting as the representative for the Spanish Society of Architects, César Cort participated in the section on co-ordination of the different activities involved in the construction process. The conclusions of the Conference were to form the basis of town planning law in 1923, but a change in the political situation and the coming to power of Primo de Rivera meant that this was never developed. However, the conclusions were a precedent to the Municipal Statute.

In 1924, the Municipal Statute [7] was approved. It introduced a new approach to intervention, proposing expansion plans for municipalities with a population of 10,000 inhabitants, and a growth of 20%. In this respect, the Statute was more a conceptual, methodological and instrumental formulation than a general experience. The type of expansion proposed was much more controlled than the geometric expansion which had to be approved by Central Government; new expansion was to be approved by the Town Councils. The Municipal Statute meant the necessity for technical professionals

in town planning and urban design, and these were not available; there was no relation between the needs and the existing professionals. César Cort denounced the situation and asked for the educational system to be adapted to the new needs and for the professionalisation of town planning and urban design science. That year the Spanish Architects' Congress decided to focus their next Congress on the urban issue alone, seeking consolidation of the discipline. In order to achieve this, it would be necessary to give systematic and theoretical support to the new science.

On the other hand, Town Council concerns about urban intervention in their towns were very specific. Orense, a town in the north of Spain where César Cort worked in 1925, would be an example of this. The objectives here of urban intervention were to resolve public health problems, such as the general water supply and sanitation services infrastructure, and to decide on the best sites for the indoor market, the slaughterhouse and the open-air market. This latter point was of great importance: it entailed developing an accurate map of the city in order to define the plots and control future expansion or inner city renovation. The projects were financed with a loan from the Spanish Local Credit Bank, created in 1925 in order to give economic support to the Municipalities, as laid down in the Municipal Statute. However, as town planning legislation, the Municipal Statute was insufficient, and the need for a national town planning law was recognised. The issue was raised in 1925, at the first Municipal Spanish Congress, by César Cort among others, and arguments were made in favour of a National Town Planning Law and a National Institute for Construction. Nevertheless, such a law would not be introduced until 1956.

In 1926, the XI Congress of Architecture (also the first on Town Planning) was held in Madrid, and this is an important landmark in the development of town planning as a scientific discipline in Spain. César Cort was the speaker on teaching town planning, and other leading lights such as Gustavo Fernández Balbuena (Congress Secretary) Fernando García Mercadal, Modesto López Otero, Secundino Zuazo, Manuel Sanchez Arcas, Teodoro Anasagasti, Amadeo Llopart and Nicolás Rubió Tudurí also attended and participated in the Congress. In his paper, César Cort presented the course programme and gave his ideas on the new science of Urbanology, which differed from the German Stadtebau and English Town Planning. He saw Urbanology much more as a dynamic process than the concept of Urbanisation introduced by Ildefonso Cerdá, proposing that the central concern of Urbanology should be the overall functioning of the city.

Although some, mainly César Cort, felt that Congress should be the reserve of architects, many others felt that the complexity of Urbanology called for an inter-disciplinary approach, involving civil engineers, lawyers and other technical experts. Among them was the civil engineer José Paz Maroto, who was closely involved in town planning because of his work with Madrid City Council, and who had worked with César Cort in some competitions. He wrote several articles about town planning, and in the Civil Engineer's Review, calling for the participation of civil engineers in the development of the new discipline. Meanwhile, César Cort demanded that city development be directed by an Urbanologist, and that this Urbanologist be an architect

because of issues relating to civic art, feeling that an aesthetic appreciation was necessary in order to direct developments in Urbanology. All other technical experts involved were to be limited to their own fields of expertise, reserving the global vision for the architect.

Professionalising and disseminating the new science was a necessity[8], and César Cort in particular strove to consolidate the idea of disseminating Urbanology, using the work of Ortega y Gasset as a philosophical base. In the first three decades of the 20th century in Spain, the entire cultural movement was suffused with Ortega's philosophy, an elite minority position holding the idea that the State must put government before citizens. Dissemination was achieved through conferences, publication of articles and attending national and international congresses. César Cort was believed to be an accomplished speaker, and was also an unflagging traveller, both in Spain and abroad. His texts are neither a systematic presentation of his beliefs, nor a technical guide, but rather a compendium of thoughts and ideas combined with moral judgements and personal information, containing, nevertheless, interesting reflections on Urbanology.

But in the 30s, changes began to be seen in town planning. Clear evidence of this is that planning began to be seen as separate from the architectural culture of construction and engineering, and city intervention was considered more in its social and economic aspect than solely in a spatial dimension. At first, this change was brought about by increasing knowledge on some of the factors which defined the situation and possibilities for development. The survey introduced by Patrick Geddes became part of the professional procedure, and stimulated the development of quantifiable methods. In 1929, the Madrid City Council held an international town planning contest based on plans for the city's expansion. The City Council's technical services drew up a report on the city[9], describing and presenting the over-ambitious aims of the competition for the use of participants. César Cort participated, with Joseph Stübben as partner, and they were classified among the top six finalist teams. There was no outright winner, and the first classified team was formed by Secundino Zuazo and Hermann Jansen. The Cort-Stübbens proposal was based on the creation of satellite towns, a radial road system and the prolongation of the Lineal City[10].

César Cort propounded the predominantly municipal character of Urbanology in many articles. He demanded social commitment from architects, and he was very critical of their ethical behaviour. In accordance with his principles, he stood for, and was elected councillor of Madrid City Council from 1931 to 1936, consequently reducing his teaching commitments. He was a monarchist and a liberal in a republican, socialist City Council. He maintained his controversial stand when defending the City Council's responsibility for town planning in the face of a Central Government proposal to create access to the capital city, and again when he criticized land management and called for the acquisition of land in order to benefit from rising land values generated by developments in transportation such as the railway.

In 1932, a new architecture study plan for the final year of the architecture degree came into force, introducing a subject which was a continuation of the previous year's subject,

Sanitation and Public Health in buildings and towns. César Cort continued to teach, but because of political problems, was no longer legally responsible for Urbanology.

His book, *Murcia, an example of a simple urban scheme*, was published that year, and César Cort used the town plan he had developed, commissioned by the mayor of Murcia in 1925, to illustrate his approach to Urbanology. The book represented a kind of guide to Urbanology, with strong British influences. The main themes dealt with in the book are the importance of systemising the information process, his theories on city morphology, the *nucleology theory* and territorial perspective, and his criticisms of the zoning concepts which were then starting to appear with greater frequency. His approach was not that of a conservative but of an economic liberal[11]. This was one of the first town planning books to be published in a luxury format, something which then was not very common in town planning publications, although the map reproductions were not very clear. The development project which formed the basis of the book outlined the conditions to be established for the future city, but the plan was soon modified, and only partially put into practice. The plan demonstrated a new way of thinking, but traditional planning approaches and conceptual principles continued to hold sway in town planning in the big cities.   In fact, town planning in Madrid was more advanced than, for example, German and Italian town planning, and went beyond simple expansion plans. The principle strands of Cort's ideas are gathered in this book, and can be presented schematically:

Information about the city:

He considered detailed knowledge of the city and its conditioning factors, such as location and climate, developmental processes, legal factors, typology and continuity, to be fundamental when considering intervention in a city. Systematic surveying processes were also presented, using new technological advances.

Nucleology as a regional structure:

In 1920, with the initial success of the garden city of Letchworth, the Garden Town Planning Association defined the garden city thus: "A garden city is a city defined by life and healthy industries; on a scale which permits a satisfactory social life, but no bigger; situated on a rural belt; with property which is public or held by the community[12]".

A schematic figure gave a graphic representation of *nucleology* configuration for cities of the future. Taking the original size of the city, it proposed that whilst there may be spiritual and economic growth, this would be directed to suburban and new satellite towns, whose size and population would be restricted, and which should always have good transport connections whilst at the same time retaining connections with the surrounding rural area [13]. The plan looked not only at the municipal limits, but also at the areas on the edge of the territory. A satellite town would be structured around a civic centre, where spiritual needs (church and education), material needs (markets), leisure needs (theatres and cinema), administration needs and housing would be integrated. It was not necessary to have all the facilities in each satellite town, but the

different facilities would have to be co-ordinated and accessible. The rural belt functioned as a support for agricultural, industrial and transportation systems.

César Cort voiced concerns about the rural world which were answered with the establishment of the Urbanology Seminar, which had as its first director his disciple, José Fonseca. The Seminar began work in 1932, although it was not inaugurated until 1935, and was operative until the beginning of the Civil War[14]. The original idea was to create a multi-disciplinary institution similar to the Parisian "Institut des hauts études d'Urbanisme". It looked mainly at colonisation processes taking place in the rural world, similar to those in the Italian Agro pontino. The approval of the Spanish Hydraulic Act in 1932, one of the first approaches to integrated territorial development, had a great impact, and the contest held to develop plans for the new villages in the Guadalmellato and Guadalquivir river irrigation areas, in 1933, had an enthusiastic response, with both César Cort and José Fonseca participating in the Guadalquivir [15] contest, although on different teams.

Greening:

The weight given to green spaces in César Cort's approach was due to its significance for public health, in terms of providing access to sun and air. He said, "Big cities need a system of parks connected by wide roads in order to purify the air and make movement easier; expansion must be carried out avoiding agglomerations of buildings, and forming a series of towns connected by park systems[16]." With this in mind, he quantified and compared ratios of open space per inhabitant and established the need for a hierarchy ranging from green belts to private gardens.

He was concerned for the protection of trees and urban vegetation, and whilst a councillor, denounced the felling of trees in Madrid and in San Fernando Royal Academy of Fine Arts reports insisted on the replacement of every tree which had been cut down in order to make way for the construction of the city[17]. He felt that the selection of plants for a project should take into account the geographical conditions, and was interested in gardening, as is evidenced by the garden "Los Molinos", in Madrid, now surrounded by urban development but then a retirement home projected by him as a Secesionist palace which he designed for himself with a typical Mediterranean garden reminiscent of the Alicante landscape

Communications:

Transport is of prime importance in regional planning, and not only roads, railways and trams but also air flight paths had to be considered in town planning. Cort's great admiration for Cerdá was to a large extent based on his ideas about transport, and he expressed this admiration in interest in crossroads, and in the use of different levels for different kinds of traffic, as proposed by Hennard, but his ideas were not put into practice. Exhaustive analyses of isochrones, such as those presented by Schumaher in his plan for Hamburg, and maps showing traffic density, were translated into a series of crossroads and pedestrian separated level. In his different plans, he clearly defined

ring-road systems linked to green belt areas, and, just as he had done for green spaces, he established a hierarchy for roads, from parkways to street housing access.

Aesthetic as perception:

César Cort valued both how the city looked from within, and in its territorial context. Inside the city, views and perspectives were to be created using points of reference and perspective, enabling each part of the city to have a distinctive character distinguishing it from other parts. Externally, topographical features and the skyline created by existing, historical buildings needed to be considered and incorporated into any urban intervention proposal.

Zoning:

César Cort criticised previous approaches to zoning[18], and felt that zoning should not be aimed merely at grouping different activities in separate locations within the city but rather at facilitating favourable conditions for specific activities in different sectors of the city. He argued that simply separating activities and locating them together at different sites had been based mainly on public health issues, such as the existence of heavy industry. Just zoning created problems of mobility and traffic, reducing quality of life in the city.

Housing:

The economic management of land was one of Cort's prime concerns: he considered land to be merchandise, which had to be dealt with as merchandise. He believed that the City Council should acquire land in order to facilitate effective land management, thus enabling the community to benefit from development in the city. In his opinion, the authorities had a duty to promote property development and draw up appropriate renting policies in order to encourage private sector interest through possibilities for job and wealth creation. Evidently, this idea was in complete contrast to the position of the Institute of Social Reform, which promoted the idea of public economic support for social housing. Nevertheless, the theoretical and practical issues surrounding plot production and the concept of land as merchandise was at the heart of Cort's teaching[19]. He applied his ideas in his own life, participating in land speculation to considerable economic advantage.

Although new ideas about town planning were being developed, and the CIAM (International Congress of Modern Architecture) was active in Spain, holding a meeting prior to the Congress which had been planned for Barcelona but was never held, the outbreak of the Civil War in 1936 brought these developments to a halt. Once the Civil War was over, a new cultural and economic regime was established by the dictatorship, and due to his strong character and political ideas, Cort was marginalized by the authorities. In Madrid, the chief architect, Pedro Muguruza, and Pedro Bidagot, author of Madrid's post war town plan and later head of town planning, were not sympathetic to Cort's ideas. Cort drew up the plan for Valladolid in 1939, and later for La Coruña in

1945[20], but like all his projects these began well only to later end badly[21]. In 1939, he founded the National Town Planning and Housing Federation, which organised conferences between 1940 and 1954. The first conference was a success, with significant official and professional participation, but this was not to be repeated. During the Civil War, Cort had lived in the Norwegian Embassy as a refugee, and it was while he was there that he wrote his book '*The urbanisation of the country and the ruralisation of towns*'[22], which was later published by the National Town Planning and Housing Federation he had founded. It was planned as an historical overview, using both national and international examples, and dealing with general concepts – as did his other works – and an explanation of public health services in a city context.

His professional interests were wide ranging, and included the foundation of the publishing company Plus Ultra Editions. From 1943 onwards, this editorial house published a series of collections, such as *Ars Hispaniae*: authored by Fernando Chueca Goitia or Leopoldo Torres Balbás among others, these books were considered to be the best works available on Spanish art. Following his election to member of the Royal Academy of Fine Arts in Madrid in 1940, formerly the School of Architecture, he dedicated much of his time to his symbolic responsibilities there. Replying to his inauguration speech, the architect Modesto López Otero said, "If we look again at town planning issues in various areas of Spanish life, we can see that great contributions are being made today by young people from *Urbanology*, still bearing the hallmarks of our new Academy Member"[23], words which summarise Cort's significant contribution to the development of town planning in Spain.

Spatial and Social Transformation from "Public Streets" to "Private / Invented Streets"

Hatice Ayataç
Istanbul Technical University, Turkey

Conceptual definitions

Privatization of Public Life and Spaces

Banerjee (2001), in his work that debates the future of the definition of public space, questions the major changes that are being experienced within the conditions of the century in which we are living. His work has also affected the understanding and definition of public benefit, as well as the great change in urban space. The changing process of politics, economics and technology are components that also affect this transformation. These basic factors also closely affect social life and its requirements as well as social behavior.

In the literature (Lofland, 1998; Carr and et all, 1992) public benefit is generally meant to include such entities as parks and recreation grounds or to other public spaces. However, every public space may not serve the public benefit. Public benefit space must be accessible and free. Many years ago K. Lynch questioned this by stating, *"how open are public spaces?"* At this point the argument about public space and private space comes to mind. According to Yırtıcı (2003), the meanings of the words public and private have fundamentally changed as they have been linked to the process of modernization. In the 18th century public space became defined as the space in which life was conducted apart from family and close friends. Within public spaces varied and complex social groups gathered together. In the 1960's the logic of public space changed along with the appearance of the postmodern state.

Today many observers (Banerjee, 2001; Goldberger, 1996; Mehta, 2007) have claimed that public life and spaces have became privatized. This condition includes definitions of plazas, shopping centers and the increasing popularity of public life. Of course, it cannot be said that these privatized spaces and managed spaces are actually open for the benefit of the people and public benefit. Most of these spaces are being watched by cameras and protected by security firms. Mike Davis (1990) defines these spaces as fortress environments (Banerjee, 2001).

Along with the changes in the communal structure, public spaces have been moved into buildings. Within this context, for more than 50 years now shopping centers have been accepted as "new residential areas" (Rybczynski, 1993) and have become visited more than the main avenues, especially in the United States (Kowinski, 1985). They have become defined as spaces in which the shopping center management manages many public activities and in which everyone shares equal rights. Within this space various activities take place and these may act to serve the shopping center utilization (Beddington, 1987). Even though these spaces seem to be public in nature, in actuality

those utilizing this space are called upon to pay a price. General usage spaces can be seen as public spaces because they are open to the use of the whole public. However, especially in the case of shopping centers, general usage spaces should be defined as private spaces open to the public. Even though they are the property of either a firm or a person, the main point is for it to be used by the public.

Private spaces open to the public (Perincek, 2003) are spaces that are owned privately and are spaces and buildings that are supervised but that are open to the public. These spaces are public interior spaces that have arisen from the changes in public traditions. Generally, these privately owned, public spaces are based on very dense commercial purposes. These spaces usually encompass such services and activities as work, life, food, sales, entertainment and visitation.

Invented Streets: A Public Life of Third Places

In 1989 Oldenburg termed the spaces where this kind of public life takes place as "Third Space". Different in kind from the home or the workplace, these "third spaces" include such places as bars, taverns, beauty parlors and cafes etc. The spaces that this public life requires are becoming more and more widespread in our day. Starbucks cafes, bookstores and health clubs are examples of Third Spaces that are becoming more common in our cities today.

Users of these spaces engage in a daily activity based on looking and watching. This has prompted many writers to work on studies aimed at trying to define the relationship between the observer and the environment. "Flaneur" was the name given to the "the activity of strolling and observing" taking place along the boulevards that Haussmann had designed in the 19th century in Paris (Banerjee, 2001). Arcades were among the earliest forms of privatized public spaces and in our day they are defined as shopping centers and invented streets. New shopping spaces are now designed to support these activities.

Simulation spaces versus public spaces

A fantasy world is created when shopping centers are designed today (Vural, 2005). When Gruen (1973) first designed a shopping center he visualized it as a simulation of urban space. However, what Gruen had imagined was shopping centers serving as a city center or an urban gathering space. In our day shopping centers are small cities onto themselves.

Shopping spaces, which were usually constructed in a closed manner, became an object or argument among designers starting in the 1980's. Researchers who study the closed shopping spaces in Northern America usually deal with the practical problems that arise during the construction phase and they tend to ignore the subject of what the city should be like in the future. The most important subject in the research that is being carried out currently is how the closed space shopping centers destroy the shopping activity on the streets and how then streets are abandoned solely to vehicle use. On the

other hand a space being provided that shelters people from climate changes is accepted as the most important advantage that these spaces provide. (Maitland, 1992)

White (1988) states that as a result of changing the traditional shopping that takes place on the street to shopping in closed spaces, the feeling of the urban space is lost and that it becomes very difficult to get a clue of what city one is in while in these controlled closed spaces. For this reason alone, in some cities street level pedestrian spaces are being embraced (Maitland, 1992) (Turkoglu, 1998).

These shopping centers allow people to observe, by looking at and touching, their desire for a luxurious life without having to pay any monetary fee and without their actual financial situation being a factor. There is an emulation of life here. In this context the studied urban simulation include those shopping centers that are constructed. Here the real emphasis is the use of shopping street and urban center elements (Beddington, 1987; Baştuğ, 2005; Saltan 2007) . The fountains and artificial greenery emphasize the parts that are designed as city centers and squares. Food courts are placed in these parts to increase the interest. Additionally clocks, street lamps and street signs are used in order to strengthen the urban feeling. Another element is the use of daylight inside the shopping center. In this way the feeling that one is strolling outside is created.

Local case; Istiklal Avenue and Istinye Park and methodology

This process that is changing the utilization of public usage and public space worldwide is also appearing in Turkey. In Istanbul, a cultural capital with a vast history, the identity of open, public thoroughfares is now taking a backseat to shopping centers. These spaces, that are constantly increasing in number and that are being designed as invented spaces, now compete with the streets and avenues of the city that are open to urban use. Istiklal Avenue, with its historical and cultural value and with the roles that it has played up till today, is a very important public usage space. During every period its use and its usage purpose has been clearly defined. It has continuously been a part of the urban political life as well as its social and cultural life. It is a true public usage space.

On the other hand Istinye Park is the latest in a line of developed shopping and living center concepts. The space in which it is located was designed as an enclosed environment within Istanbul. This paper compares the example of Istiklal Avenue's urban public space, which is very important in the history of city planning, to the privatized public spaces of Istinye Park, which has been designed as an example of the latest urban living center concept. The facts alluded to in the literature will be compared at a social and special dimension.

In this comparison the method will be to not only take the data from previous studies that have done evaluations about Istiklal Avenue or on examples of shopping centers, but also studies actualized on location.

Istiklal Avenue

Istanbul is a city that has long historical and cultural values and one that is currently undergoing a global transformation process. Today Istanbul ranks as Turkey's most populated city. Despite its population and outward sprawl the city still has various historical pedestrian streets that retain importance within the urban fabric. Probably the most important and one of the oldest of these is İstiklal Street. Istiklal Street is a pedestrian street formerly known as the Grand Rue de Pera. It is today the heart of the city's cultural life and is lined with various cafés, restaurants, shops, and cinemas. The district of Pera was traditionally known as the part of the city in which the majority of foreign nationals used to reside. There are many consular buildings in Pera, among them the Russian, Swedish, Dutch, French, American and British Consulate Genera buildings and a host of other smaller consulates. Most of the buildings on Istiklal Street date from the mid- to the late 19th century and carry a French influence. French Baroque and neo-classical styles were two leading styles in these buildings (Dökmeci and Çıracı, 1990).

During the last quarter of the twentieth century, Istanbul like many other large cities of the world, experienced multi-centre development causing the decline of its old CBD. Decentralisation in housing, jobs and commercial activities (including shopping centers and hyper-markets) occurred as these moved from the core to more peripheral areas of the city. This resulted in an increasing loss of accessibility to the city center due to expansion of the city and traffic congestion. By the mid-1980's new retail innovations had begun to transform the traditional retail environment. At the same time, an increase in the number of cars and enhancement of mobility and increase in income boosted consumers' spatial demand for flexibility. This resulted in a considerably reduced demand in central city stores; retail business became more independent in the choice of their locations. Thus, commercial development in the suburban neighborhoods and mega-malls widely overshadowed commercial life in Beyoglu, just as they have done in city centers of developed countries (Bromley & Thomas, 1993).

BEYOĞLU

In the middle of the 16th century, the district of Beyoğlu developed as an extension of Galata, which was an international trade center (Dokmeci and Çiraci, 1990). The embassies established in Beyoğlu in the 16th and 17th centuries played an important role in giving the district a European identity. In the 18th century, the European influence gradually increased and it became a district with luxurious shops where European luxury goods were easily disposed. This, along with its artisans and its social life, gave Beyoğlu the flavor of a European city in the Ottoman land (Dokmeci and Çiraci, 1990).

It was in the 19th century that Beyoğlu saw its most major development. Spurred on by developments in Ottoman foreign trade in the 19th century, Beyoğlu grew into an international trade center and the area saw developments of the transportation system and integration of the country with the world capitalist system. These in turns propelled the area to mainly

Beyoğlu / İstiklal Street (Public)
İstinye Park / Sarıyer (Private)

Istinye Park

Istinye Park is one of the latest examples of spaces that was designed with this changing idea of shopping and living spaces. This shopping center concept, which is situated outside of the city center per se, was developed with a park theme and includes invented spaces that reflect Ortakoy's square, Istiklal Avenue's 'balik pazari' (fish market), etc. Here all of these spaces are realized in the same environment. But, no matter how much it seems to be a public space, in reality it is a controlled private space.

Following is a view trying to define Istinye Park (Icon, 2008). "*This space of consumption has been designed to look like a "public" space. While Kanyon and Meydan have established a balance between shopping and public utilization, in Istinye Park all of the features that belong to the public are in almost a commercial labyrinth of a dizzying collection of stores and wide spaces rather than a park. Istinye Park is an example by the Development Design group of how a middle-class American large chain architecture has been imported into and become widespread in developing countries such as Turkey. It is the only shopping and entertainment center to the north of the Bosphorus. Even though it serves to lessen the commute to the city center and the traffic, it does not integrate with its environment*".

Evaluation

The functional and physical space of Beyoglu - Istiklal Avenue and Istinye Park's avenue execution have been questioned. The following criteria have been looked at in comparing the use of the avenue.

Comparison criteria

1. Access…The relationship to urban transportation means, garage capacity,
2. Use of space….Pedestrian space, store space, elemental stores and functions…
    a. Public use,
    b. Distribution of functions,
    c. Urban furnishings and usage,
    d. Floor covering, Lighting, Time of usage,

The identified criteria will be supported by similar studies and the appraisals of the concerned spaces that have been performed.

Access

The results of other similar studies (İlze, 1996; Önalan, 2004) that have been performed in Istanbul have determined that: private vehicles are preferred in shopping center access (40%) but 40% are pedestrians in reaching avenues. Private vehicles rank in third place for avenue access. Garage access and the length of the avenue are constraints on access.
In findings related to purpose of visit to shopping centers the results were: 35% for shopping, 27% for strolling/window shopping and 17% for film-entertainment. The type of stores and whether or not they are brands affect the intention of shopping. When it comes to avenues it is 42% for shopping, 32% for strolling/window shopping and 11% are passing transit (Karabay, 1993; Ilze, 1996).

Use Of Space

The preferred activity of those who come to the shopping centers is looking at stores. They also state a preference for eating and drinking. The markets in the shopping centers are also preferred choices. Things are different on the avenues. Cultural activities, passing through and strolling are the widespread usage (Ilze, 1996).

A total of 48% of shopping center visitors spend 1-2 hours at the center but only 20% of avenue shoppers spend this amount of time. Brand preference is at the forefront in shopping centers and window-shop displays add to the appeal.

Accessories / design criteria

While defining such problems as lack of accessories, noise, ventilation and problems finding directions visitors mostly complained about the lack of accessories on avenues, vehicle noise, air pollution and the quality of pedestrian space.
On the avenue's long pedestrian space there are too few or no places to sit or rest along the way. The greenery is changed from time to time. Sun and climate problems cannot be solved. Shopping centers have solved these problems with climatic control systems.

Time of Use

While shopping centers can be visited during defined and limited hours, the avenues of a city can be used in a more active manner.

In this context,

When compared with its public space requirements, Istiklal Avenue has very valuable factors in watching the city, participating in city life and in understanding the urban environment. In the city, individuals from every social class can be in the same place at the same time, even if for different reasons. Still transit passage is the most common reason for walking down the avenue. On the avenue there are very few public places to

rest or stop for the public. Lighting and floor covering is not adequate to study. The greenery elements are changed constantly, being added and taken away. The cultural life aspect is the most important contribution of the avenue. It is also a popular and preferred space and it is thought in pair with Taksim Square.

Istinye Park, with its brand new concept, has places for people to sit and watch and allows for perceptions of different dimensions. Gyms and other accessories have been included so that people can spend more time there.

On Istiklal Avenue, one can see an increase in the food and beverage component as a function of increasing pedestrian usage. The avenue that in its first phase had housed the most important stores in the city, now has the food and beverage spaces at the forefront. Large concept stores have taken the place of smaller stores and especially brand name stores. This shows the change of the city center to the shopping center theme.

According to the various studies on Istiklal Avenue (Karabay, 1993; Altunbas, 2005) the functional usage of Istiklal Avenue has changed from its widespread pedestrian use before. After the avenue, with Istanbul's most famous stores and pastry shops, was opened to traffic, it then became used solely for transit passing. After it was closed to traffic in 1991, the cultural and artistic activities increased along with the food and beverage spaces. The number of open air cafes and franchise cafes like Starbucks is increasing on the avenue that is preferred in our day as a public space. These locations, with just a simple visual barrier that provides a half open use of the avenue, allows for interaction with the public space itself. Similar spaces are also seen in closed shopping centers such as Istinye Park. This pattern, within the real urban space, is also designed for Istinye Park in an invented manner.

In comparing the functions and the food and beverage possibilities and the provision of privatized public spaces we see that in both locations cafes and bookstores, where for a price one can partake, are being developed. Even in the city, individuals prefer to meet in privatized spaces. In a study done in 1993 street and avenues closed to traffic were seen as the spaces in which people could learn the city and the behaviors of the city and where they could come together to watch each other (Karabay, 1993). This must continue.

In shopping centers, time has been organized according to space organization. The aim is to keep the user inside as long as possible. Shopping streets are the basis and the user is made to travel through all of them. Urbanized spaces and individualized spaces are created. Daylight is a constant element with the use of specific roof covering. Different types of stores are brought together and stairs and ramps are utilized for connections. Cameras and equipment provide control.

Conclusion

In this study that looks at the spatial and social transformation from public streets to invented avenues, the literature has keyed in on a subject that has currently been

important. As it questions the contrast between public and private, it has also looked at the changing social values and life, and the special confirmation. It has questioned how public these shared public spaces within these consumer product shopping centers, which are the results of globalization around the world, really are.

The spaces that were chosen for comparison in our country as examples were Beyoglu Istiklal Avenue, which has played an important role in the history of city planning, and the shopping center example of Istinye Park, which was designed with the modern design concept based on the urban avenue. Istiklal Avenue was used alternately for pedestrians and traffic till it was closed to the traffic for the last time in 1991. Studies were done in different time periods regarding the use of this avenue and the common opinion of all of them was that by closing the avenue to traffic and pedestrianizing it, it would add positive contributions to the city and public life. However, we can still see that the spaces where people perform their fundamental public usage needs of sitting, watching and resting are at spaces that are privately run. This is a constraint on the design of Istiklal Avenue and its use of space but also at the same time is an incentive for the commercial use of the avenue.

No matter how much Istinye Park seems to be open to the public with its privatized public spaces it is still--as Banerjee has ascertained--no different than privatized space. Most importantly no matter how much these invented public spaces allow for public use it still does not provide a feeling of participation in the city and of living in your space. Additionally because it brings together so many urban spaces within a limited environment, it causes a confusion of perception of space.

Within light of these statements, and taking into effect Banerjee's proposals, we still need parks, playgrounds and urban open public spaces within our privatized spaces and our public lives, which are constantly advancing on the technical front. For these reasons the important role that our urban streets play in our lives should not be forgotten. Public avenues and streets are the only places that can teach city dwellers about the city and city life. Public benefit needs to be a design criterion that is indispensable.

Appendix
The city of Istanbul, with its historical and cultural value, is part of a global transformation. At the same time Istanbul is the most populated city in Turkey. Within the fabric of the city there are pedestrianized avenues, which are historically important. The oldest and most important one is Istiklal Avenue. The avenue known as Grand Du Pera, with its various spaces such as coffeehouses, restaurants, stores and movie theatres, has traditionally been an important cultural center of the city. Historically the name "Pera" was used for the areas that were predominantly used by foreigners. This is the reason why the Russian, Swedish, Dutch, French, American and the British consulate buildings were situated in this area. Most of the buildings on Istiklal Avenue were designed under the influence of French Baroque in the mid and late 19th century. French Baroque and neo-classical are the styles that define the buildings.

In our day, especially for Istanbul, the advanced technology in means of access – automobiles and light rail system – have changed the activities in the urban spaces, and have become the defining factor for the physical space itself. In many studies it is also emphasized that a reason for the shift from urban streets to shopping centers are the security of the public. For this reason, investors, especially when it comes to the design of new shopping spaces in Istanbul, are choosing centers that have invented spaces fashioned after for example Istiklal Avenue and Ortakoy square. In these spaces the aim is to have the consumer spend more than two hours by the use of these famous and historic models of stores, cinemas and cafes.

This study was developed to question the comparison of public space with private space and compared examples for both located in Istanbul; Istinye Park which is one of the latest examples of shopping center design and the public spaces in Kanyon with the public spaces in historic Istiklal Avenue. The contribution to urban social life is another subject of study.

Squatter settlements as a kind of perverse outcome. History of popular housing policies in São Paulo

Suzana Pasternak
Universidade de Sao Paulo, Brazil

1. Introduction

The prevalent forms of housing among low-income groups in Brazil vary according to the city and period considered. In each place and time, a specific form of housing was prevalent and shaped the urban design. Within this context, three basic historic types of housing stand out: slums, squatter settlements (*favelas*) and peripheral land developments, with home ownership and self-construction.

Interventions for the provision of low-cost housing have changed throughout history. During the slavery period, up until 1888, slave quarters were the housing solution. During the first phase of the industrialization process, the slums (*cortiços*) - a spontaneous solution, and factory villages, a solution implemented through government-backed private initiative emerged. Rent was by far the primary means of having a roof. From the 1930s onwards, sharp industrial growth and industrial expansion above 5% gave rise to increasing migration from rural into urban areas, and to the growth of large cities, especially in the Southeast region. Interventions in the relationship between lessor and lessee discouraged the construction of rental housing units. The urban settlement pattern had three pillars: low-cost land developments, home ownership and self-construction. The urbanized area expanded horizontally, thus increasing the so called periphery.

During the Vargas period (1930-1945), government concerns over housing issues became clear and prompted intervention in the rental housing market, along with the creation of construction programs sponsored by Retirement and Pension Institutes. During the "populist period[1]" (1945-1964), the "Entrepreneur State" created the Fundação da Casa Popular/Popular Housing Foundation (for low-cost housing), which became the seed of the military government's housing policy. After the military coup in 1964, the federal government set up an ambitious system to raise funds, finance, and build mass housing. The choice of the housing policy as the central axis of the government's social policy was determined by the military government's need to legitimize itself with the low-income population. According to one of the creators of the system, Minister Roberto Campos, "*the solution to the problem of home ownership has the specific allure of encouraging savings that would otherwise not exist, and contributes a lot more to creating social stability than rental property. Home owners think twice before getting into trouble or vandalizing the property of others and become allies in order maintenance*" (Banco Nacional da Habitação/BNH/National Housing Bank, 1966, v 2, p. 20-21).

In the beginning of 1985, when the so-called New Republic came about, the National Housing Bank was going through a deep institutional crisis which eventually brought it

to bankruptcy and closure in 1986. The following year, CEF (Caixa Econômica Federal, a federally-owned savings bank), a commercial bank, incorporated the activities of the National Housing Bank. The federal government's policy was primarily based on alternative programs, within an ideological framework of compensatory policies. During the Sarney administration, federal housing programs focused on the National Program for Collective Home Building (Programa Nacional de Mutirões Habitacionais).

The Collor administration, which followed the Sarney administration, innovated very little in its two and a half year term. The State and Municipal governments, however, made interventions in the low-cost housing market, adopting their own criteria. This was possible because of the decentralization provided for in the Constitution of 1988. With the inauguration of President Itamar Franco (1992), decentralization increased further.

The Cardoso administration started in 1995 and sought to implement a new financial system, the S.F.I. (Sistema Financeiro Imobiliário/Real Estate Financial System). It also designed new capital funding systems, mortgage securitization, and prioritized the granting of credit directly to the buyer (and not to a real estate developer or construction company, as was the case with SFH/Sistema Financeiro da Habitação/Housing Financing System). During the Lula administration (2002) the SFI has yet to be fully implemented and decentralized policies still prevail.

The problem of home financing remains unsolved to date. There are efforts in place to create a specific system for the medium and high-income population based on the SFI, that is, on mortgage refinancing, and another system for the low-income population, with heavy subsidies. But social housing is still in very short supply.

In short, there are macrostructural limitations that make squatter settlements a possible housing solution for the low-income population.

The problem of squatter settlements (*favelas)* has gained unprecedented importance in Brazil from a historic standpoint. The 2005 PNAD Survey (National Household Sample Survey) points to the existence of almost two million households in squatter settlements in Brazil, with over 6.5 million dwellers. In some cities, such as Rio de Janeiro and São Paulo, there are approximately one million people living in the *favelas*, and in others such as Belém, households in the *favelas* account for 35% of the total housing units. "How and why have squatter settlements become a problem of the magnitude stated previously?" (Cardoso, 2007, p. 4)

Up until the 1980s, the growth of squatter settlements was thought to be related to the high rates of migration from rural into urban areas. Squatters were thought to be primarily those recently arrived in town, especially from backward rural areas. This interpretation was challenged in the late 1970s and early 1980s by research showing that a significant part of the squatter population was not formed by recent migrants in social ascent, but rather included impoverished segments in the process of social descent (Pasternak Taschner, 1978).

"*The Brazilian model of development led to the formation of a social pattern that associates a reasonable degree of economic growth (especially from the 1940s to the 1970s) to a high degree of inequality and a significant portion of the population living below the poverty line. Poverty and inequality, structural characteristics that have marked Brazilian development, have been associated with increasingly deteriorated and informal employment relations in the last 25 years. This is why a significant portion of the population has insufficient or insecure income, which greatly limits their possibilities of contracting debt and thus of having access to the formal housing market.*" (Cardoso, 2007, p. 4).

Additionally, Brazilian economic development was marked by the focus of public authorities on investment to support the industrialization process to the detriment of investment in services designed to reproduce labor power. Public authorities were therefore unable to invest in infrastructure, or to increase their ability to regulate the land and housing markets. As a result, cities grew in a poorly planned manner, and there was rampant land speculation. The land market was, up until the 1960s, one of the few alternatives for capital investment. Since the 1970s, the financial market has been organized and consolidated as an alternative for investment. Land speculation generated a huge disparity between the price of land in the formal market, and the credit worthiness of the majority of the population, thus prompting informal takeovers, a possible alternative for the huge mass of urban workers. Ineffective housing policies for the low-income population were also associated with these facts.

In short, there are a large number of squatter settlements which will be around for a long time.

2. Squatter population in Brazil, in Metropolitan regions and in the Municipality of São Paulo

Squatter settlements are present in all Brazilian regions, and are unevenly distributed. In 1991, there were 3,187 squatter settlements according to the Demographic Census. According to the Population Count of 1996, the number of such settlements had risen to 3,348 to reach 3,906 in 2000.

Just as the number of settlements has been increasing since 1980 at higher rates than the total population, so has the number of households and of squatters. From 1980 to 1991, the total households in the country grew by 3.08% yearly, whereas the number of households in squatter settlements grew by 8.18% yearly. In the following period – from 1991 to 2000 – total households grew by 0.88% yearly whereas households in settlements grew by 4.18%. Estimates for 2005 point to a 3.45% yearly growth rate for total households, with the number of households in settlements increasing at a similar rate, i.e. 3.46% yearly for the period. The squatter population in 1980 was 2,25 million people; in 1991, more than 5 million; in 2000, approximately 7,2 million; and in 2005, it was estimated at more than 8,5 million, for a total of 1,956,331 households in subnormal settlements.

Squatter settlements in Brazil are a predominantly metropolitan phenomenon: in 1980, 79.16% of the households in squatter settlements were located in the nine federal metropolitan regions. In 1991, 2,391 squatter settlements (74%) and 817,000 households (78%) were located in these metropolitan regions.

In 2000, the percentage of households in metropolitan squatter settlements as compared to the total number of households in squatter settlements increased to 87.15%. In that same year, squatter settlements were described as a clearly metropolitan phenomenon, and their percentage continued to rise as of 1980. In 2005, the percentage of metropolitan households in squatter settlements dropped to 75.15% of the total households in squatter settlements, thus indicating a certain reversal in the trend. Although squatter settlements are mostly an urban phenomenon, they are spreading rapidly in other cities: squatter settlements can also be considered a problem in medium-sized cities: 26% of the squatter population was found, in 2000, in cities with a population between 100,000 and 500,000 inhabitants.

Throughout the 20th century, squatter settlements have clearly become the major alternative for the urban poor population. In some state capitals, such as Belém, the percentage of people living in such settlements has reached 35% of the local population. In metropolitan centers such as Rio de Janeiro, the absolute number is in excess of one million people, almost 20% of the households.

The São Paulo Metropolitan Region has the largest concentration of squatter settlements in Brazil. The cities of São Paulo, Guarulhos, Osasco and Diadema alone had, in 2000, 938 squatter settlements – approximately one quarter of the country's squatter settlements according to the Demographic Census. The percentage of households in squatter settlements in São Paulo has been increasing since 1991. This percentage was 5.72% in 1991, then rose to 8.14% in 2000 and to 9.29% in 2005 relative to the total households. The housing scenario in the metropolis has clearly deteriorated.

This growth was not consistent throughout the urban fabric of Greater São Paulo. The 2005 data cannot be broken down, but the census information of 1991 and 2000 shows that the growth rate of households in squatter settlements in peripheral municipalities was almost twice that of the capital city, a sign that squatter settlements are spreading throughout the metropolitan region (the so-called process of "*favelization*"). Not only is the population living on the periphery of the metropolis growing more than the population of the capital city, but squatter settlements in peripheral municipalities are also growing faster than those located in the capital. Even when absolute numbers are considered, the number of households in squatter settlements in peripheral municipalities has increased faster than in the capital city: 94,248, that is, growth of more than 100%, whereas in the capital the number of households in squatter settlements increased by 78,242, that is, slightly above 53%.

This fact may reflect a trend toward the expansion of poverty into the periphery, which is represented here by the territorial expansion of poor housing. In addition to poor

housing conditions, distances to work also increase, thus rendering the life of the poor living in metropolitan regions even more difficult.

The number of squatter settlements, households and squatters in the São Paulo municipality varies according to the source of data used. The numbers form the Demographic Census show 933 thousand squatter dwellers in 2000, 9% of the population of the city, and the estimate from CEM (Centro de Estudos da Metrópole, Centre of Metropolitan Studies, an NGO academic organization) gave, for the same date, 1,160 thousand *favelados,* 11% of the city population. But all the sources agree in the following points:

- The squatter population in the São Paulo Municipality has increased at a higher rate than the population of the municipality;
- The squatter settlement area grew substantially in the 1990s;
- In addition to the increase in the area used by squatter settlements, there is strong evidence of an increase in their average density. Squatter settlements are now denser, with their empty spaces being occupied, and squatter settlements are undergoing a process of verticalization;
- Difficulties in accessing land put up for sale, in addition to the impoverishment of the dwellers have made squatter settlements a possible housing alternative for them. To these factors, we should add the lack of housing units for the low-income population and the relative improvement in housing conditions in squatter settlements in the city of São Paulo, so that living in squatter settlement is not as hard as it used to be decades ago;
- The policy of upgrading and maintaining squatter settlements within the urban fabric – although legitimate – has encouraged land takeovers.

3. Low- costing housing policy in the Metropolitan Region of São Paulo. Interventions on popular housing

3.1 Introduction

Policies regarding low-cost housing in Brazil, and specially those regarding squatter settlements and slums were, up until 1984, highly centralized at the federal level. There have always been interventions at a local level, but until the closure of BNH (Banco Nacional da Habitação/Brazilian Housing Bank, in November 1986, they were not as relevant as they came to be in the 1990's. A detailed analysis of the policies at the federal level can be found in Pasternak Taschner, 1997.

The first squatter settlement upgrading experiences in Brazil were carried out in the late 1960s, and were strongly inspired by the ideas of John Turner. However, it was only as of the 1980s that this form of intervention was consolidated, under the auspices of the municipal and/or state governments.

In this item, we will discuss the interventions at the municipal, regional and state levels in the municipalities which are part of the São Paulo metropolitan region. This is no

easy task because, first of all, the information on these interventions has not been organized in a competent bibliography. Secondly, the prominence of the São Paulo municipality, in terms of its territory and political influence in the metropolitan region, overshadows the initiatives and programs implemented by the other municipalities. In addition, we should emphasize that having municipal programs or policies is not enough. Regional policies would be necessary to guide the investments in housing and the activities of the different government levels. At the metropolitan level, we should highlight the efforts made by ABC's Intermunicipal Consortium to conduct a diagnostic survey of the housing problem in the municipalities which are part of this sub-region. In the last 30 years, the interventions have been organized into eight chronological periods. For each period, the type of analysis conducted for the problem, the solutions found, and the problems and the reactions the interventions created are discussed, according to an analysis plan already used by me (Pasternak Taschner, 1995 & 1997), which was further enriched by Patton (1988).

By analysis we mean the prevailing ideas, concepts and hegemonic theories of each period. Solutions include the actions effectively carried out to address the problems and theories. Reactions refer to the new problems detected, which redefine new theories and actions.

Until the 1980s, there was no housing policy for the municipalities of the São Paulo Metropolitan Region (SPMR), with the exception of the municipality of São Paulo. There are some exceptions in the region of the Greater ABC.

The Greater ABC sub-region, made up of the municipalities of Santo André, São Bernardo do Campo, São Caetano do Sul, Diadema, Mauá, Rio Grande da Serra and Ribeirão Pires, stands out due to its industrial profile. "*In the late 1970s, the social movements organized by the CEBs (Grassroots Ecclesial Communities) and the trade union movement of the region sprung to the regional and national scenario,*" putting forth alternative proposals to the lack of local and national social policies (Baltrusis & Mourad, 1999, p. 44).

3.2 The 1960s

Regarding squatter settlement clearance policies, these only emerged in this decade in the municipality of the capital. In the other municipalities of the metropolitan region, squatter settlements were not considered a huge problem.

The first intervention in squatter settlements in the São Paulo municipality was the removal and the reinstallation of the settlement somewhere else. The guiding principle of this type of intervention had to do with the idea that squatter settlements were dumps where disease, crime, social disorganization and criminality bred. This pathology would end with the eradication of the settlement and the removal of the squatters to appropriate units. We mustn't forget that the squatter population of São Paulo was small, approximately 100,000 people, which enabled their removal. In São Paulo, the removal never reached the brutality employed by Carlos Lacerda in Rio de Janeiro. The

results of this policy, both in Rio and in São Paulo, were not very promising. The housing centers to which the squatters were removed were usually located in remote areas in the outskirts. As a consequence, the cost of transportation increased for the squatter families, thus affecting their budget. The greater distance between service centers and homes also prevented women from contributing to the family income. Purchasing power dropped, making the payment of mortgage or rent difficult, thus driving the families back to squatter settlements.

3.3 The 1970s

In the 1970s, it was clear that the removal was only justified in emergency situations or in risk areas. As a modal form for squatter settlement intervention, a more efficient and less traumatic policy was needed. Therefore, instead of taking the squatters to a permanent unit, an attempt was made to place them in the so-called VHP (Vilas de Habitação Provisória/Provisional Housing Centers), which already existed in Rio de Janeiro since the mid 1940s, under the name of Proletarian Parks (Pasternak Taschner, 1995 & 1997). VHPs were non-permanent shelters built on the same land where the squatter settlements were. Intense social service was provided toward offering professional training, literacy classes, and documentation to the population, to enable them to integrate into the city life and into the real-estate market. Even the physical design of the shelter reflected its provisional character: it was built with non-permanent building material used. The VHPs were made of wood, with no brickwork and the bathrooms were shared. It was expected that after one year the family would be able to integrate into the housing and labor markets.

The theoretical assumptions that mediated this form of intervention were inspired by the ideas of social integration championed by functionalist sociology, a school of thought. They emphasized the idea that squatter settlements were the first housing alternative for rural migrants, a "springboard" to the city, a necessary stage for their integration into urban life. At VHPs, the primary concern was that of shortening the "necessary time" that the migrant would stay in squatter settlements by supplying some basic infrastructure, professional guidance and formal education.

There is countless criticism to this project. In addition to the notion of implicit social integration, which did not prove true, empirical data, derived from the Squatter Settlement Registry, whose systematic collection began in the mid 1970s, showed that the squatters weren't recent migrants at all, nor were the squatter settlements their first homes. Squatter settlements were growing less because of direct migration than because of impoverishment. "*The dwellers of squatter settlements did not settle, at first, in the shacks where they lived. They were displaced in urban space, in a "descending filtration" course, due to the appreciation of urban land and the impoverishment of the working class. They were displaced from the central areas towards the outskirts, from the brick houses to the cardboard shacks of the squatter settlements*" (Pasternak Taschner, 1997, p. 54).

In the late 1970s, the notion that squatter settlements were here to stay and that squatters were workers, most of whom registered workers in São Paulo's industries, made it necessary to search for new solutions. Temporary shelters became permanent. The assumption of social integration into a society such as the Brazilian one has serious limitations: the capacity of São Paulo's economy to incorporate work force into dynamic economic segments is restricted, and there are pre-requirements regarding professional competence and educational background to be met.

3.4 The 1980-1985 period

The awareness arose that squatter settlements do not represent a dysfunction of the system but are rather the physical expression of its contradictions. This led to an operational dilemma: How can the problem of intervention be put forward? How can a methodology of action be developed that would not disrupt the system?

Some technical segments believed that large-scale construction, prefabrication, industrialization and the rationalization of construction could promote the falling of house prices, thus making them accessible to everyone. Therefore, housing projects such as the Itaquera project were built, where some cost-lowering models were introduced (light prefabrication systems with outnord-type metallic structures, structural brickwork, etc.) as part of the efforts of COHAB-SP (Companhia Metropolitana de Habitação de São Paulo/São Paulo Metropolitan Housing Company) to build approximately 80,000 housing units from 1980 to 1985.

Cooperation, self-help and mutual help were commended as tools that would contribute to the overcoming of the problems of squatter settlements. The Brazilian middle class tried to convey a specific notion of society to squatters, so that the latter would think that their daily lives could be improved by means of their own efforts and community assistance. Squatter settlement upgrading is established as a basic policy.

In 1979, the PRÓ – ÁGUA (Pro-Water) program was initiated in the municipality of São Paulo. The program was designed to extend the drinking water network to squatter settlements, with a connection to households whenever possible. PRÓ-LUZ (Pro-Light), a program to electrify squatter settlement units, was also initiated in 1979, and by 1987 had already installed electricity in almost all the squatter settlement households. These programs were included in the so-called compensatory policies and charged its users a minimum rate. In 1981, a more ambitious program was also used – the PROFAVELA (Pro- Squatter Settlement) program, which determines not only the installation of infrastructure, but also the provision of educational and health services and heavily subsidized funding for betterment services and/or the construction of housing units. The cost was very high and the project was dropped in 1984. At the federal level, another project, PROMORAR [Pro-living], also proposed the eradication of squatter settlements with the replacement of the cardboard shacks by embryo-units in the same area, with the regularization of land tenure.

The critics of squatter settlement upgrading programs argue that the certainty of permanence encourages new land takeovers and the densification of old settlements, and brings a crude imitation of the real estate market to the invaded land. Anyway, even in a conservative administration like Reinaldo de Barros', in 1979, the mass of squatters (over 400,000 people, approximately 5% of the municipal population) was such that made removal-type solutions unfeasible.

In the São Paulo Metropolitan Region, more precisely in the municipality of Santo André, this new alternative – upgrading – responded to the proposals of the dwellers of the Palmares squatter settlement. In the late 1970s, the dwellers, led by father Rubens, organized the first squatter settlement upgrading initiative of the region, and gave rise to a spin off, the Movement to Defend Squatters, created in the 1st National Meeting on Squatter Settlements, held on May 2nd and 3rd, 1980, in Santo André. Among the main demands was the regularization of land tenure.

In the municipality of Diadema, the concept of squatter settlements upgrading, with physical interventions and land regularization actions, was put into practice. As of 1983, the local administration has started to intervene in the city's squatter settlements.
In São Bernardo do Campo, Associação de Construção Comunitária (Community Building Association], created from a Strike Fund, set up new housing programs through a pilot project financed by CDHU, the São Paulo State Housing and Urban Development Company. According to Bonduki (1992, p. 39), the work of the Community Association "*became an important hub of self-organization for the workers to face their concrete problems.*" Still, according to this author, the Community Building Association began to work with low-cost housing "*as of 1983, (when) a group of 50 families bought a piece of land, with the help of the church, and developed, with independent technical assistance, a self-managed project to build houses. After negotiating with the state government, they obtained, from the Housing Development Company, funding to build the houses. This was an unprecedented situation (…) as the funds were directly transferred to the association, which can manage it with total autonomy.*"

3.5 The 1986 to 1988 period

In Diadema, the process of squatter settlement upgrading continued. During this period, both in São Paulo and in the other municipalities, a process of taking over the vacant terrains was initiated on the part of the housing movements.

In January 1986, in the municipality of São Paulo, a new municipal administration, the first one directly elected by the people since 1964, took office. "*Supported by conservative forces and comprehensive segments of the middle class, that were fearful of the growing urban violence and attributed it partially to the "concessions" made to the low-income classes, this administration once again started talking about the removal of squatter settlements, particularly the ones located in areas near the richest neighborhoods*"   (Pasternak Taschner, 1997, p. 61).

The prevailing logic saw squatters as the poor to be segregated, and the squatter settlements which were established in prime locations within the urban network were regarded as pieces of land to be made available and recovered for the middle class to live in. In 1986, due to the effect of the Cruzado Plan (which froze prices), there was a real estate boom.

The housing plan of the 1986-88 administration was the object of more talk than action. Two squatter settlements were removed from upscale areas. The most interesting contribution of the period was the partnership with the private initiative for squatter settlement clearance. By offering advantages about the prevailing building code in exchange for the building of houses for squatters, interconnected transactions were made which allowed developers to build a larger area than was permitted by virtue of the zoning law in exchange for the donation of residential units for squatters.

3.6 The 1989 to 1992 period

In 1989, the municipalities of São Paulo, Santo André and São Bernardo started to be administered by left-wing parties, engaged with popular movements and union fights. Their line of thought showed this commitment. The description of the city made by their technicians brought forth the existence of a huge illegal city which sheltered the low-income classes. It was estimated that in the municipality of São Paulo, 350,000 households, most of which smaller than 125 square meters did not meet the provisions of the zoning law and the construction code. If squatter settlement households, slums and irregular plots of land were added to this, approximately 65% of the city was irregular. In Diadema, one third of the population lives in squatter settlements that occupy 4% of the territory. The proposals were to integrate and reduce the socio-spatial segregation. Thus, the streamlining of the plan approval process, both regarding units and plots of land, became essential.

Urban segregation appears as an item to be avoided. All have right to the city. This position enabled initiatives toward maintaining the slum population in the inner city area. The squatter settlement upgrading projects returned, this time with the participation of the population. Popular movements demanded the removal of middlemen and the end user's participation in the decision making process to build and plan homes. Projects which included self-construction and self-management were encouraged. Regarding the criticism of the old-left-wing, which considered community-built housing initiatives as the overexploitation of labor power, the "new left" answered that the self-managed community-built housing initiatives helped reduce costs, and fostered political awareness and citizenship, for the "*organization to build homes becomes a self-managed school where self-management and collective organization are learned*" (Bonduki, 1992, p. 164).

The municipality of Santo André created EMHAP (Empresa Municipal de Habitação Popular/Municipal Company for Low-Cost Housing) that built units with alternative material, initiated a squatter settlement upgrading program, and in 1991 created the Special Areas of Social Interest – local acronym AEIS, to regulate squatter settlements.

São Bernardo do Campo also started a squatter settlement upgrading program. Diadema continues its upgrading and land regularization program: from 1983 to 1988, 51 areas were regularized by means of the Concession of Rights of Use. In 1991, the first vertical self-managed community-built housing initiative of the country was started: the Buraco do Gazuza, through the PROHAP Comunidade (Programa de Habitação Popular/Low-Cost Housing Program.)

The Buraco do Gazuza project was the response of the federal government, but it was not carried out for the takeovers that took place in the late 1980s and early 1990s. The Caixa Econômica Federal savings bank was committed to financing three pilot projects, each with 50 units, with direct transfers to the community associations. These three pilot projects were to be located in the ABC region and in the east zone of São Paulo. The east zone movement waived the financing, and thus 100 units were built in Diadema and 50 in the Industrial Village of São Bernardo do Campo, with the assistance of independent technical advisory teams directly hired by the associations.

In the case of the upgrading of São Paulo squatter settlements, as of 1990 "*26,000 families in 50 squatter settlements were provided with infrastructure improvements: pavement, land re-parceling, water, sewerage system, drainage, and opening of access points. At the same time 3,500 families in 70 squatter settlements benefited from small improvements, also as a collective effort*" (São Paulo, 1992, p.12.) The concept of environmental risk was introduced in squatter settlement upgrading initiatives to prioritize interventions. It assesses the geomorphological risk for the residents: collapse, flooding or sapping. Regarding the supply of housing units outside the squatter settlements, approximately 33,000 units, part of which had been initiated in the previous administration, had their construction continued. In summary, the guidelines of the Luiza Erundina administration (1989-1992) regarding low-cost housing were:

- Elimination of redtape and simplification of building norms
- Organization of the population, thus choosing popular movements to take part in talks
- Household construction by self-managed community-built housing initiatives (local administration and dwellers)
- Squatter settlement upgrading, prioritizing the ones at environmental risk
- Intervention in slums
- Maintenance of partnership with the private sector (interconnected transactions)

The initiatives in the municipalities of São Paulo, Santo André, São Bernardo do Campo and Diadema started to influence other municipalities of the region that had conservative administrations. Some initiatives toward improvement emerged in squatter settlements in Guarulhos, Osasco, Mauá.

In Osasco, COPROMO (Cooperativa Pró Moradia de Osasco/Osasco Pro-housing Cooperative), occupied and negotiated a large area of the city and built a housing project with 2,000 units through a community-built housing initiative financed by the

state government, through CDHU, the São Paulo State Housing and Urban Development Company,

There was countless criticism to the policies in effect, mostly dealing with the sluggishness of the community-built housing process, the transformation of popular movements into political machines which generated new patronage relationships. Criticism was also directed at the continuous emergence of new squatter settlements and the densification of the existing ones, and to the increasing speculation in upgraded squatter settlements.

3.7 The 1993 to 2000 period

In 1992 elections, conservative governments for the municipalities of the region came to power. This scenario remained so until 1996 in São Paulo and changed in Santo André, Mauá, Ribeirão Pires. Santo André continued the 1989-2001 administration programs and started new housing construction projects in partnership with the state government. In 1994, the local administration of Diadema approved the new master plan, and created the Special Areas of Social Interest (AEIS) I and II. The AEIS II were used to demarcate all of the squatter settlements in the city. The AEIS I demarcated vacant properties and allocated them as spaces reserved for the construction of HIS (Habitação de Interesse Social/Social Interest Housing.) According to Mourad (2000), 90% of the areas demarcated were used for the construction of low-cost housing. In Guarulhos, as of 1998, when the mayor was removed from office, the deputy mayor, with ties to the green party, took office and adopted more participatory programs and policies.

Another noteworthy experience was the Guarapiranga Project, which upgraded squatter settlements in the water source region of São Paulo, Cotia, Embu and Taboão da Serra. In 1993, another elected administration, with a different political stand relative to the previous one, was inaugurated in the Municipality of São Paulo. In the same year, research coordinated by FIPE (Economic Research Institute Foundation), showed that the squatter population in the municipality had increased to reach almost 20% of the total population, amounting to 1.98 million people. In addition to the densification of the existing squatter settlements and the emergence of new ones, the FIPE research pointed to the growing percentage of brickwork units in squatter settlements, approximately 75%. Despite the possible exaggeration in the calculation of the FIPE data, the number of squatter settlements and squatters had definitely increased, and their profile was changing, both regarding constructive and economic characteristics. In this study, a relative increase in household income was noticed in squatter settlements. The municipal administration at the time did not have any commitment to popular movements, as had been the case during the Erundina administration. The notion that squatters were poor workers, who had rights relative to the city and the right to be integrated to urban life had already been consolidated. The housing policy of the municipality focused on PROVER (Projeto de Urbanização de Favelas com Verticalização/Project of Squatter Settlement Upgrading with Verticalization,) that became known as the Cingapura Project.

The Cingapura Project keeps the squatters in the same piece of land where the squatter settlement was, but in vertical units built by developers. Thus, it is different from the squatter settlement upgrading initiative of the previous administration, in that it does not make use of the urban fabric which had already been built by the squatters, and it provides non-expandable finished housing units. In the Paulo Maluf administration (1993-96), approximately 9,000 units were delivered. The administration which took over after Maluf's continued with the same policy regarding squatter settlements. The units of the Cingapura buildings, with 5 and 11 floors, are small – 42 square meters - and cannot be expanded. Their cost is high, approximately U$ 18,000. The architectural design is standardized, and the project is exclusively residential, in that commercial units are not included. The population does not participate, and this is, in a sense, the trade-off for speed. Another criticism which is seen in the press is that the Cingapura units have been preferably built in sites with great visibility, with the criteria used to choose the squatter settlements for intervention being not so much technical but rather related to propaganda.

3.8 The 2001-2004 period

In the new century, another political trend, once again the Workers' Party, took over the administration of São Paulo. The housing situation was deteriorated, with an increase in squatter settlements and homelessness. As a main proposal, until the beginning of the second semester of 2001, the revitalization of the center was put forward, emphasizing it as a housing space for the poor population. The participation of the population was encouraged as a way of building citizenship.

The discourse on the revitalization of the central area, highlighting its primary role as a housing space for the poor, was not actually put into action. Despite the actions of the PRI (Programa de Recuperação Integrada/Integrated Recovery Program), which defined areas for urban interventions in some deteriorated areas of the region, and the Municipal Master Plan, which included the demarcation of ZEIS (Zonas Especiais de Interesse Social/Special Zones of Social Interest), in the inner city, only very limited actions were carried out in this region. Part of the interventions were made by the state government through the PAC (Programa de Atendimento aos Cortiços/Service Program for Slums), undertaken by a state government agency, and part were affected by the federal government by means of a financing plan, PAR (Plano de Arrendamento Residencial/Home Lease Plan.)

At this time, the number of takeovers of vacant real estate in the inner city increased, thus stirring the housing conflicts in the central area even further.

The presence of homeless people throughout the urban fabric, especially in the central area of the city, forced the local administration to prioritize a program to remove the dwellers of the 44 viaducts of São Paulo. Until the middle of 2002, only 17 of these viaducts had been vacated, with the placement of rails around the empty spaces of some of them as a preemptive measure. However, this measure was not effective: many viaducts were once again occupied. The local administration estimates that there

are 10,000 homeless in São Paulo: approximately 1,200 living under bridges and viaducts, while another 8,800 are on the streets, that is, they sleep rough without shelter of any kind, with no access to any type of housing.

To serve them, the Acolher (Take in) Program invites them to go to shelters and community centers, where 3,382 vacancies were opened, and where the service is being computerized to make these vacancies more readily available. For people living under bridges and viaducts, the program of urban rehabilitation and attention to dwellers determines their removal and transfer to hotels or rented houses, until they are definitively transferred to housing projects.

This program has not been duly assessed. It should be pointed out that the Brazilian legislation does not allow the removal of the homeless by force. They are only directed to public shelters upon their consent.

The municipal administration at the time used the Bairro Legal (Cool Neighborhood) Program as a tool to implement its housing policy. This program can be defined as a set of integrated actions in continuous and demarcated territories, occupied predominantly by low-income population. It includes the upgrading and regularization of squatter settlements and irregular land developments and the classification of housing projects. The intervention projects must consider land regularization, the access to public services and equipment and to green and leisure areas (in addition to trying to include squatters in the municipality's regular social and job/income generation programs without opening any special line of activity in the settlement).

The intention was to implement the program in the 10 areas of greater social exclusion of the city. It differs from the programs of the previous administrations due to its demand of integrated action among different municipal agencies, thus also seeking the involvement of the other public spheres, of non-governmental organizations, and of the civil society.

In the project description, one item tells the history and describes the housing conditions of the city. For the total metropolitan area, the number of vacant real estate is estimated at 666,257, according to PNAD data of 2005, totaling 11.5% of the total stock of households. The information of PNAD 2005 shows that, among these 666,000 households, only slightly over 7,000 are totally deteriorated; 584,000 are fit for living, and 74,620 are under construction.

For the São Paulo Metropolitan Region, squatter settlements were estimated to have a total of 538,288 housing units in 2005. Obviously, an overly simplified reasoning would quickly compare the two figures: the number of squatter households could be replaced by the vacant households which are fit for living. This is reductionism, but it is always food for thought, especially since the 2000 Census points to the existence of 420,000 vacant households in the municipality of the capital, in that 26.8% are in the Sé district, in central areas, with infrastructure and public equipment. There is a clear imbalance between vacant units and unfit units.

In addition to housing in squatter settlements, the needy population meets their housing needs by building, on their own, on irregular land developments. In April 2002, there were approximately 2,866 of these developments. According to RESOLO (Department for the Regularization of Land Parceling), an agency of the local administration of the Municipality of São Paulo, the illegal and irregular land developments and condominiums occupy one fifth of the surface of São Paulo: a total of 338.8 million sq meters. This map of the irregularity does not include squatter settlements and slums. In the outskirts of the municipality, self-built housing units have been estimated at 35% of the total houses.

According to the official document, the interventions in squatter settlements, despite the different concepts implemented in the last decade, have not been able to significantly change the urban scenario. Both the upgrading experiences geared toward basic sanitation, and the resettlement into new units have proven to be little sustainable. The former was due to the difficulties in incorporating settlements with such different urban standards into the formal city. The latter for being partial interventions, implemented without the participation of the population, which disrupted consolidated relationships and ignored the investments of the dwellers, thus generating new debts.

So, a paradigm shift was proposed: policies geared toward both the production of new homes and sanitation should be replaced for comprehensive interventions, which consider, in an integrated manner, urban qualification, land regularization, access to public services and equipment and green areas, together with social programs.
The priority areas for intervention were chosen according to a social exclusion criterion (defined as a situation of collective deprivation, which includes poverty, discrimination, subservience, inequity, non-accessibility, lack of public representation). The Bairro Legal was implemented in the first phase in Capão Redondo, Brasilândia, Lajeado, Jardim Ângela and Grajaú, since they had a percentage of squatters of 15% or above. In the 2nd phase, it served the districts of Campo Limpo, Guaianazes, Iguatemi and Anhanguera.

The housing program of the Suplicy administration was divided into three parts:

- Incentive to produce housing units
- Articulation for financing
- Legalization and upgrading of plots and squatter settlements

In previous administrations, the main element of the low-cost housing policy was the construction of new units (for squatter settlements, vertical units in building projects, with or without elevators, on the space of the squatter settlement itself, by means of contracts). In the Suplicy administration, priority was given to squatter settlement and plot upgrading and to the regularization of the areas taken over.

The justification for such a procedure, according to the Housing Secretary, was that the cost-benefit ratio of this type of action is better, enabling the provision of services to a greater portion of the needy population. In addition, there were highly consolidated

squatter settlements and land developments where the idea of removal would be absurd. Thus, they should change and become neighborhoods. The local administration should act in two fronts: the legalization and the upgrading of the area.

In two decades there have been intervention programs in squatter settlements through legalization and upgrading. Among these programs, in the 1980s, we highlight those of Recife, Belo Horizonte and Diadema; in the 1990s, the Favela-Bairro, in Rio de Janeiro and the one in Santo André. The programs of Recife and Belo Horizonte focused on changes in land management, with the PreZeis (Programa de Regularização das Zonas Especiais de Interesse Social/Program to Regularize the Special Zones of Social Interest), and the legalization of the takeovers. Favela-Bairro changed the urban design, physically altering the squatter fabric. In Santo André, the attempt was to move beyond the traditional "qualified upgrading"; the municipality is promoting a "sectoral approach". In an attempt to overcome the limitations of the current projects, the municipal government launched the PIIS (Programa Integrado de Inclusão Social/Integrated Program for Social Inclusion) in 1997 that includes the UIF (Programa de Urbanização Integral de Favelas/Full Squatter Settlement Upgrading Program). It innovates in terms of squatter settlements, concentrating partial policies designed to leverage processes of social inclusion in a space and in an institution.

The PIIS involves the opening of a road system and provision of infrastructure, in addition to granting credit and fostering small businesses (by the Banco do Povo/People's Bank, constituted along the lines of the micro-credit system of Porto Alegre, credit is made available in small amounts, by means of simple procedures for formal and informal businesses, with flexible demands of guarantee). In addition to the residential plots of land, in the squatter settlements of Santo André business units are built so that economic activities can contribute to the social, economic and urbanistic integration of these settlements into the neighborhood. Just like Favela-Bairro in Rio de Janeiro, this integration is also related to the installation of services and trade demanded by the neighborhood, by the nucleus and by the city, thus creating a transition zone between them.

It is still early to assess the results of this program. However, it differs from the São Paulo one, in which job and income generation are not being considered. Bairro Legal focuses its activities on physical remodeling, by installing the road system and sanitation structure, and by legalizing the land.

The current local administration of the municipality focuses on the *Programa de Reabilitação do Centro,* a Program to rehabilitate the Central Area, where resources will be invested in low-cost housing and in the rehabilitation of vacant commercial real estate to re-populate the region, which is densely occupied during the day and empty at night.

3.9 The period starting in 2005

If in the Marta Suplicy administration the idea was to re-populate the central area through the Program of Rehabilitation of the Central Area, the Serra/Kassab administration considers that the program should not focus on the low-income population. What can be perceived are actions to restrict programs designed to foster the settlement of poor population in the central areas.

Regarding the homeless, attitudes are taken to make the occupation of public areas difficult by building anti-beggar barriers, for example, by changing the urban furniture of squares to prevent benches from being used as beds. Having no other options, since there are not enough city shelters, the homeless are displaced to less guarded areas. There has been continuity in the programs to regularize and grant deeds to irregular real estate, and also in re-upgrading interventions in some squatter settlements, such as Heliópolis (a big favela en the East zone of the city of São Paulo)

Other squatter settlements, such as the one near Berrini avenue, a place of upscale offices, and demarcated as ZEIS in the Master Plan, have been under pressure for removal.

4. Conclusions and issues to be debated

Cardoso (2007) summarizes the current interventions in precarious settlements into three basic models: upgrading, re-upgrading and removal. Upgrading involves interventions which do not change the structure of the settlement, working only on infrastructure and pavement. This has been the most commonly used, even though, in general, squatter settlements have an urban pattern which is completely out of norms. Re-upgrading consists of interventions where the structure of the settlement is totally changed, with the families resettled in the same area. This was the case of the paradigmatic upgrading of the Brás de Pina squatter settlement in Rio de Janeiro. Removal implies the total removal of dwellers and their resettlement in another area. In practice, many interventions make use of the three alternatives, re-parceling part of the settlement, working on infrastructure wherever possible and even removing a portion of the population, when the squatter settlement is very dense and it is necessary to do so to open roads and build infrastructure. Often times, this removal is carried out by means of the payment of indemnities.

Likewise, the interventions in squatter settlements can be ad hoc, when they are restricted to parts of the settlement, or total. Ad hoc interventions have taken place as a result of patronage practices or emergency needs, such as the reconstruction of areas hit by fire and/or floods. In Diadema, from 1993 to 1996 countless ad hoc interventions were carried out, but with the intention of later expanding them.

Examples of total interventions are the Favela-Bairro program in Rio de Janeiro, or *Programa Santo André Mais Igual*, a program in Santo André, in the Greater São Paulo. In these cases, there was an attempt to act in groups of smaller squatter settlements,

fully carrying out the improvement project within a 2-year period. In these cases, huge resources are necessary, making this type of project unfeasible for most of the local administrations since funding programs are very restricted. Both Rio de Janeiro and Santo André counted on foreign resources (European Community and the IDB, the Inter-American Development Bank).

A mixed model also emerged in Recife and in Belo Horizonte, that is, gradual planned interventions. These interventions, despite gradual, integrate plans for each settlement and, finally, integrate a global plan for the group of squatter settlements. Important examples of this type of action have been used in Recife, with the Plan to Regularize the Special Zones of Social Interest and in Belo Horizonte, with the Specific Global Plans for squatter settlement upgrading.

As management models, there can be participatory interventions (as in the PREZEIS in Recife) or authoritarian ones (such as Cingapura in São Paulo, or Favela-Bairro in Rio de Janeiro).

Regarding the minimum physical standards, Denaldi (2003) notices the existence of three levels to classify the physical-urbanistic interventions:

- Minimum Standard: includes the water, sewerage, and drainage systems, solutions for garbage collection, accessibility, treatment of the risk areas and land regularization.
- Intermediate Standard: in addition to the above mentioned elements, it includes urban equipment, adaptation of the road system and interventions in the surroundings.
- High Standard: in addition to the previous elements, it includes the adaptation of the density, re-parceling, reconstruction of housing units, adaptation of the road system with a minimum width for streets.

Costs vary greatly with the adoption of each standard. Simulations developed by the São Paulo State Technology Research Institute – IPT for squatter settlement upgrading projects located on the banks of the Guarapiranga dam estimated costs ranging from U$ 1,000.00 to U$ 13,000.00 per family, depending on the model of intervention to be used. After analyzing several projects also carried out in Guarapiranga, the São Paulo local administration came upon costs ranging from U$ 2,000.00 to U$ 5,000.00. Some examples can be taken from the programs mentioned as paradigmatic of total interventions: Favela-Bairro and the Santo André Mais Igual Program. In Favela-Bairro, minimum standards of density or housing conditions are not adopted, and the standards of accessibility are quite flexible. There are cases, such as in the Ladeira dos Funcionários, where the demographic density reaches 1,000 inhab/ha. The decrease in density is restricted to the minimum necessary to open roads and to offer equipment, and the improvement of individual households is left to the dwellers, who are motivated by the upgrading of the area. Accessibility is not guaranteed for all households: a passable road is built within a reasonable distance, and alleys and unfit housing units are not eliminated.

In Santo André, minimum standards are adopted for plots (40 sq meters) and for roads (4-meter width), and the upgrading program is associated with a financing program for the remodeling of housing units.

The arguments of the Favela Bairro emphasize the high density of the Rio de Janeiro squatter settlements, their consolidation level, their size, and the difficult geographical and geological conditions of the settlements in Rio, mostly located on hills. The high density, if a high standard were adopted, would imply in the removal of a great portion of the population. This argument puts forward a serious issue to the public authorities: on the one hand, the respect for the population's right to remain in their place of residence; on the other hand, the legalization of settlements which do not comply with the city's urban standards, thus creating two regulating principles for the conditions of urban life: one for the formal city, and a more flexible one, for squatter settlements. And a tragic dilemma arises: is it that just anything goes to maintain people in their place of residence? Should just anything, even dump-like structures be regularized? Should two standards of citizenship be approved?

Land regularization is also a challenge. The Special Zone of Social Interest has proven to be an efficient instrument to guarantee land tenure, thus avoiding removals. To the resident population, in general, this has proven to be enough. De Soto's argument, that real estate and land regularization with titles for squatters would integrate all this capital which is left outside the market, since it could be actually used in the mortgage market, has not been confirmed. In Lima, titles were granted, and squatter settlements have only increased. And no bank accepted that type of property as a mortgage guarantee. In São Paulo, many squatters don't want the deeds because that would involve the payment of land taxes.

Squatter settlement upgrading itself poses challenges. Many scholars refer to this procedure as "trying to dry ice". Doesn't upgrading also encourage takeovers? The short supply of new housing units with subsidies has turned squatter settlement-upgrading programs into the only alternative. However, as has been mentioned in the beginning of this paper, the growth rate of the squatter population has been historically higher than that of the population as a whole. Thus, housing conditions have been deteriorating. Additionally, even in the improved squatter settlements, the density increases again, thus deteriorating the living conditions in the settlements that have already been upgraded. The discussion of the two standards of city is also pressing. Squatter settlements, even when upgraded, will never become neighborhoods. This is an illusion of integration which hides the profound inequality of Brazilian society.

Summary of the current interventions in precarious settlements

From the 40s to the 60s	Emergence of favelas in the city Removal policy
70s	Growth of favelas Besides removal policy, policy of building temporary lodge
80s	Increase growth of favelas Upgrading policies by local, provincial and federal programs
From mid 80s to 1988	Removal policy Building of popular housing though private partnership (interconnected operation)
Beginning of the 90s	Upgrading of the favela by local government, though self management Emphasis on popular participation
Mid 90s	Construction of vertical building in the same place of the invasion, by building firms, without popular participation, sponsored by IDB
Beginning of the 2000	Continuation of the upgrading policy, trying to improve the integration of the excluded Upgrading the urban centre by popular housing Attempt to legalize invasions in private space
Mid 2000s	Recover the urban centre by economic enterprises Continuation of upgrading favelas with a different approach (maintenance of the structure)

Advertising suburbanization in Mexico City: Luis Barragan's El Pedregal television program (1953-1954) and Press Campaign (1948-1965)

Alfonso Perez-Mendez
University of Florida, USA

"Los jardines del Pedregal" –referred to generally as El Pedregal– is a vast housing subdivision in the southern part of Mexico City that began construction in 1947. El Pedregal had been ideated around 1944-1945 by architect/developer Luis Barragán in collaboration with developers Luis and José Alberto Bustamante.[1] They associated to purchase low-cost properties in El Pedregal de San Ángel, a volcanic desert that, although located 13 kilometers south of el Zócalo (the historical central plaza of Mexico City), was directly adjacent to the colonial town of San Ángel. In the 1940's San Ángel had been integrated into the contiguous Mexico City as the District X, and by 1945 it had already been engulfed by the continuous urban fabric of Mexico's capital, potentially making the adjacent El Pedregal a desirable location. This was especially true because while the explosive growth of Mexico City was already generating poverty spots as much in the north as in the east and west of the city, the mythical south had remained in the imagination of the middle and upper middle classes as solidly desirable. The south was also –due to the same reasons— the direction of the most important highway investments in the capital that the government was completing. The subdivision became a trendsetter for Mexican urban development practices of the post WWII years, a historical moment in Mexico of unbridled land speculation. These post WWII years were profoundly marked by the administration of President Miguel Alemán (1946-1952), a lawyer who made his pre-presidency fortune developing Mexico City real estate, and with whom the Bustamantes had also collaborated.[2] The presidency of Alemán was a moment where, in a sharp contrast with the situation in pre WWII, the influence of American socio-cultural models reached in Mexico an historical peak. This influence was particularly true among the social class that colonized El Pedregal, a fact that had a profound impact in the settlement models of the subdivision.[3]

Given the notoriety of some El Pedregal colonists in Mexican politics and society, it has been easy but partially misleading to identify the subdivision only with the upper middle class. While it is true that at the beginning this was the public that the developers had in mind, the realities of the market forced them to open the offer to the most comfortable sectors of the middle class. Most colonists of El Pedregal ended up coming from what in Mexico were known as "profesionistas", a charged-with-meaning word that identified professionals with a university education. The professionals of El Pedregal represented the growing group of Mexicans that benefited from the unequal expansion of economic opportunities of the liberal policies of President Alemán. These policies were very sympathetic to American business models and opportunities; a sympathy that its beneficiaries extended to American socio-cultural models.

Although the idea of El Pedregal was conceived by later Pritzker Prize architect Luis Barragán, its plan was technically designed and drawn by city planner Luis Contreras. Contreras, educated as an urban planner in New York City's Columbia University, was under the influence of the models of territorial development that since Olmsted's proposal for Riverside, were becoming increasingly predominant in the United States. As a simple comparison of the plans for both subdivisions clearly indicates, Contreras plan of El Pedregal draws direct inspiration from Riverside's romantic-picturesque approach to the American suburb, one that included an anti-urban stance manifested in a clear preference for living in natural settings. Barragán not only was on board with Contreras appropriation of Riverside ideas, but also was the originator of the overarching urban planning philosophy of the subdivision. Most of Barragán's architectural ideology and poetic approach emerged from an anti-urban stance based in the romanticization of his rural upbringing. One of the handful of essays he ever published titled "How Modern Cities Should Develop: Mexico City's Growth" and written in 1959, is a diatribe against vertical development and high densities and a defense on the picturesque values of the landscape of the Valley of Mexico for private developments such as El Pedregal.[4] Both Barragán and Contreras converged towards the American suburb of Olmsted as an ideal model for their intuitions. But by imagining El Pedregal with USA suburban models in mind, they proposed ways of living that, despite the post WWII peak of American socio-cultural influence in Mexico's bourgeoisie, were still considered foreign.

This paper analyzes the massive advertisement campaign for the subdivision and the strategies proposed to sell a new set of urban planning ideas for which the Mexican public was still not fully ready. We will discuss briefly the print media advertising campaign that El Pedregal maintained from its inception until the selling of the last lots in 1965, and in depth the series of television programs that the management of the subdivision sponsored in the emerging Mexican television of the fifties.

The press campaign started in 1949 with some ads published in architectural magazines and intended for the real state trade, but it went full force in 1951 including ads, frequently full page, in Mexico City's daily newspapers. The newspapers selected were the ones intended for the upper middle class and the "profesionistas" such as *Excelsior* and *Novedades*. Ads appeared in popular magazines as *La Revista de Revistas*, and also in cultural magazines such as *Artes de Mexico*. Finally, the subdivision was heavily publicized in all Mexican magazines specifically dedicated to architecture, such as *Arquitectura, Espacios*, *Kabah* and *Decoración.* In *Arquitectura*, for instance, it nearly monopolized its valuable back cover from 1948 until 1965. In the process of this research we have collected over 200 different pages of advertisement, many of which appeared repeatedly on print.

Both, television programs and printed advertisements exemplify the intelligent propaganda techniques with which the private economic forces behind processes of suburbanization attempted to influence urban planning for private profit.

In order to comprehend why a single development could afford such level of investment in advertisement campaigns, one must understand the considerable size and importance of El Pedregal within Mexico City. After a series of consecutive land purchases, the final extension of the subdivision settled into an irregular landscape-rectangle of approximately 3.2 km long by 1.8 Km wide totaling 520 Ha (1260 acres). It is worth mentioning that the total urban area colonized by Mexico City in 1941 was only 7,138 Ha; therefore this single subdivision was increasing the city's developed area by a significant 7%.[5] El Pedregal had a convoluted commercial history that included a progressive series of reductions in lot size that reflected the lowering of the economic status of the desired potential client that we have mentioned. But, in summary, after all of these market negotiations, the subdivision ended up selling around 1,500 parcels, all intended for isolated single family houses with widely diverse lot sizes averaging 0.4 Ha (one acre).[6] Since most were occupied by big families with domestic service, we estimate a population of around 9,000 people. Based in these estimates, the population density of El Pedregal was 17 per Ha (7 per acre).

When we compare the suburban density of El Pedregal with all contemporary densities in Mexico's capital city, the foreign nature of the land patterns proposed by the subdivision appear clear. In the census of 1951, the population density of all the districts of the contiguous Mexico City averaged at 245 per Ha (99 per acre), with a maximum in the District I, which includes the traditional center, of 508 persons per Ha (205 per acre).[7] But of more referential importance here are the densities of the areas of Mexico City preferred by the same sector of the population that El Pedregal pursued as settlers. Examples of favored settlements of upper middle class and "profesionistas" were the traditional satellite colonial towns of the Federal District: namely San Ángel with 174 per Ha (70 per Acre), and Coyoacán with 82 per Ha (33 per Acre). In summary, the 17 persons per Ha of El Pedregal show the profound difference of the settlement ideas that it proposed with the all the patterns preferred for city living by its potential clients.

Since El Pedregal was clearly and unambiguously conceived as a fulltime residential development for living in Mexico City, its low population density was for post WWII Mexico a innovation for such fulltime city living. Starting in the 1850's in Mexico City, and several decades later in other Mexican cities such as Guadalajara, there had been subdivisions built in the outskirts of the traditional centers. But virtually all of these new neighborhoods had adopted settlement patterns hybridized between American and Mexican models, with far higher population densities than El Pedregal. Known as "colonias" (colonies) –for instance the first one in Guadalajara was significantly named Colonia Americana (the American Colony) – their densities were much closer to the ones of existing Mexican satellite town models such as San Ángel or Coyoacán.[8]

And indeed, the central issue that dominated El Pedregal's advertising campaigns was educational propaganda on low density patterns for a population unaccustomed to them. It was not a question of openly-technical urban planning discussion, but one of convincing people that the new ways of living produced by the new urban patterns were desirable. I will mention here just two among the most obvious of the key problems that El Pedregal's low density generated for the daily city life of its inhabitants: transportation

and food supply. Since the turn of the century Mexico City had adopted a relatively efficient electrical streetcar system that facilitated the connection between the historical center, new neighborhoods such as Condesa, and satellite towns such as San Ángel, Coyoacán or Tlalpan. But, for the low density of El Pedregal, the streetcar model simple did not work and was never implemented. While the social class that El Pedregal pursued had without exception a car in the family, many did not have the multiple cars needed to solve all the logistical problems that the new patterns generated. Regarding food, all neighborhoods in the city had historically depended on a model of domestic food supply based in the daily access to local "mercados" (meat, fish and produce markets). The "mercado" was not a unit economically feasible for the low density of El Pedregal, and even though the subdivision always included a small supermarket, this alone was not enough to solve the needs of its inhabitants.

To circumvent the problem of transportation in the minds of the public, the advertising strategy was to idealize and romanticize the dependence on the private car. For the problem of daily food supply, and learning from American post WWII developments in electrodomestics, the strategy was to refer to the glamour of the new post war architectural developments on domestic life. The key issue was refrigeration, which allowed a model of weekly instead of daily supply, thus minimizing the problems of transportation for the service. Meaningfully, from 1945 a 1947, Mexico imported from the USA 45,900 refrigerators, a machine still not produced in the country, and one that was preparing the ground for the possibility of a fully suburban development.[9]

But at the outset of El Pedregal, these innovations were still not enough to change minds. When in 1947 Barragán and the Bustamantes started to gather investors that, prior to selling individual lots, would help in the infrastructure costs of the development, the lack of a solid initial response forced the realization that El Pedregal would need propaganda techniques if it was to be successful.[10]

Barragán and the Bustamantes hired the Mexican advertising agency "Publicidad General", a company with expertise in the printed press that was conveniently located in the same building in Paseo de Reforma as the offices of the subdivision. "Publicidad General's" campaign –with initial direct control by Barragán himself— began in 1949 with printed pages concentrated in architectural magazines, a pattern that lasted until 1951. Under the slogan "the ideal place to live", the campaign attempted to balanced commercial and cultural aspects.

Barragán had taken the lead for this first phase of the advertising, one that in accordance with his anti-urban stance was dominated by the idea of selling houses that while still being close to the city had all the advantages of living in the country. Thus, the first advertisement published in the back cover of magazine *Arquitectura* and repeated in several issues from July to October 1949, announced "Enjoy the pleasures of the countryside; build your house in El Pedregal". This same tone continued while Barragán was in charge of the publicity until late 1951. For instance, another advertisement in magazine *Arquitectura* published in September of 1951 –and also repeated several

times announced– "(in El Pedregal) you will find the comforts of the city, combined with the panoramic views and space amplitude of the country weekend house."

During this first phase, the publicity was frequently illustrated with the appealing "Demonstration Gardens" that Barragán designed for the volcanic landscape of El Pedregal, frequently by using the brilliant photographs of Armando Salas Portugal. These photographs, together with the mention in every ad of the garden-like quality of the lots, were intended to overcome a public negative preconception about volcanic land which in Mexico was generally referred to as "malpaís" (badlands). Even the name of the subdivision "The Gardens of El Pedregal" tried to overcome this same problem, one that certainly had been reflected in the bargain purchasing price that Barragán's and the Bustamantes' paid for the property.

The culture of architecture also took a strategic central stage in Barragán advertisements. On the one hand, the concentration of ads in architectural magazines was based on the hybrid nature of the architectural profession in Mexico, where most residential architects acted also as contractors and frequently as developers. It was a normal procedure for a client to approach the architect with the idea of building a house and relying on his or her judgment for site selection.[11] But on the other hand, as much Barragán as his partners tried to shore the innovative nature of their sociological proposals by recommending cultural architectural aspects. In promoting a subdivision that for Mexico was so out of the ordinary, they obligated the use of modern architecture thinking that the hopeful idea of the "modern" would give them a selling edge. For instance, in one of the most notable ads appearing in 1951, before having many images of actual constructions in the area, a perspective of Frank Lloyd Wright's famous Fallingwater was pasted into El Pedregal landscape suggesting it as sample of the architecture emerging in the subdivision.

But in mid 1952, after seven years of development work and five of sales, there were only 31 houses completed or under construction in an operation that by then expected to sell over a 1,000 lots.[12] In a transition that lasted for a full year, there was a conceptual and financial restructuring of the development that removed Barragán from the executive decisions of the subdivision.

Other important historical factors directly and dramatically influenced this transition. In December 1952, Adolfo Ruíz Cortines succeeded Alemán as president of the republic. Ruíz Cortines was determined to stop the widespread corruption and excesses of the administration leaving office, among which illegal practices in real estate development were very prominent. With that purpose in mind he named Ernesto Uruchurtu as "Regente" of Mexico City. Given the oversized importance of the capital in Mexico's economy, this post (equivalent to major) was among the most influential of the Mexican political firmament and also had the rank of a ministerial position in the president's cabinet.

In the years previous to these events, Barragán had taken charge of the essentially political task of arranging the permits for the subdivision. He had conducted his

negotiations with the leaving "Regente" Fernando Casas Alemán. As requested by Barragán, Casas Alemán agreed to grant the original permit for El Pedregal as a "rural development".[13] Although this reflected Barragán's poetic ideology and aspects of the initial publicity, the real reason for requesting a "rural" permit was another. By being considered rural, the subdivision was exempt from city taxes and sheltered from the hefty fees necessary for linking the subdivision to all city networks. Also and most importantly, rural developments allowed individual septic tanks, thus removing the need of linking every individual lot to the city sewage. With these individual systems being traditionally built by the purchaser of the lot, the subdivision was avoiding one of the fundamental economic problems of its low density, the need of blasting well over a hundred of kilometers of city sewage lines in the consistently rocky ground of El Pedregal. But foreseeing the sewage problems, the legal requirements of a rural consideration also included a minimum buildable lot of 10,000 m^2 (2.5 acres), low density intended to guarantee a sustainable recycling of dark water.

From the very beginning, however, many of the lots were in flagrant violation of this rule. Starting with the first house completed in the subdivision –built by architect Max Cetto for his own family– the minimum lot size had been illegally reduced. Barragán was without doubt aware of these practices since he himself sold the lot to Cetto, who was not only his friend but his direct collaborator in the design of the sample houses for the subdivision. [14]

In early 1953, at the arrival of Regente Urruchurtu, most of the new lots being sold were already a fraction of the legal lot size. As a consequence, the new Mexico City administration, as one of their first measures in power, decided to prosecute the illegalities of El Pedregal, by taking four direct measures against the subdivision First, the small lot-sizes were enough for removing the rural consideration and Urruchurtu required the incorporation of the subdivision into the city's urban land. Second, El Pedregal had been up to then a de facto gated community with guarded gates at its main entry in Avenida de las Fuentes, and the city required the removal of the gates and the continuation of several of its streets into the adjacent emerging street patterns. Third, in order to fund the infrastructure problems generated by the incorporation into the city systems, Urruchurtu also fined heavily the investors of El Pedregal. However, the combined problem of rocky ground and low density left these infrastructural problems economically unsolvable. Even today El Pedregal lots are not linked to the city sewage and the subdivision systematically floods in the rainy season; a problem only disguised by the widespread presence of flooding in the Federal District. And Fourth, since the original rural denomination excluded the general urban provision of allocating 15% of its surface to public gardens, the city also required property title for a number of the subdivision lots that they destined for public spaces, some of which were implemented in the coming years.[15]

Along 1953 and 1954, in negotiations with the city, the original set of promoters decided that they were not in the position of paying the heavy fine, and sold control of the subdivision to Banca SOMEX. SOMEX bought financial control but arrived to an agreement with the brothers Bustamante by which they retained control of the sales and

other commercial aspects of the subdivision, such as publicity.[16] From this moment on, the decision of adjusting the size of the lot to the growing demand for less-expensive properties, although already a de facto practice, was legally established. Coinciding with these adjustments, Barragán separated himself from the subdivision, moving his primary interests and investments to "Los jardines del bosque" (Forest Gardens), a subdivision that he designed between 1954 and 1955 for his native city of Guadalajara in the Mexican state of Jalisco.

In this transitional year of 1952, in response to the lackluster sales, the management of El Pedregal decided to heighten their advertising campaign. Coinciding with the progressive removal of Barragán from the subdivision, the supervision of publicity fell into the hands of Noé Carlos Botello, the administrative manager of El Pedregal. Botello, still in collaboration with "Publicidad General", started a new phase that instead of promoting the idea of a rural arcadia, focused in the proximity of the subdivision to the city and the glamorization of the dependence on the automobile. Significantly, all references to the country house that had been prevalent in Barragán's era immediately disappeared.

Coinciding in time with the developments above, Héctor Cervera, a young free-lance publicist approached "Publicidad General" with an innovative idea for the publicity of El Pedregal. Cervera, accompanied and supported by "Publicidad General's" manager Eduardo Godard proposed to Botello to partially move the publicity of the subdivision to the new media of television, which had recently debuted in Mexico. Even though the pioneer Channel 4 had started with two daily experimental hours in 1949, and Channels 2 and 5 completed the early television landscape soon afterwards, it was only with the fourth presidential report of president Alemán to congress at the end of 1950 when the new media was officially inaugurated. And they had to wait until 1952, sparkled by the construction of Televicentro studios, for the beginning of fully developed commercial broadcasts.[17]

The interest of El Pedregal television program for this paper is that, conceived in the transitional period of the subdivision, it forced the publicists and the management to settle into a precise new ideology for the propaganda. They adopted some of the ideas of Barragán, such as the cultural role of architecture, and the insistence on the value of gardens. They rejected others, such as the idea of country house. And they incorporated a new emphasis in the positive values of the dependence on the automobile. In doing so, the television program created the definitive set of ideas that would make the subdivision successful. Once established, this ideology was kept in all the press campaigns that followed the television program, from 1954 until the end of the commercialization of the subdivision around 1965.

The first campaign that Cervera conceived for El Pedregal was a three-month concentrated drive based in a weekly television program dedicated monographically to the subdivision. The program was directed to the sociological group of the upper middle class that the subdivision pursued as clients. At the end of 1952, the limited number of

TV sets –even though expanding rapidly—was still mainly concentrated in the most comfortable sectors of the public.

It is worth dwelling briefly here on the personality of Cervera, the creator of the program and soon to become one of the most important figures of Mexican television: director for 17 years of Channel 5 and creator of such influential programs as Telesecundaria. Cervera –in his words– had learned all what he knew about television from the Mexico branch of Walter Thompson, the American advertising company that pioneered television advertising in Mexico. He was also profoundly patriotic and proudly "mestizo" with a particular interest in Mexican culture that showed in the various segments of his program that we will describe later. But his early educational immersion in American corporate practices also marked him, making him a prime example of the cultural negotiations between American practices and Mexican models that characterized as much El Pedregal, as its inhabitants, as the business culture of the 1950's in Mexico.[18] Ever since he heard of the inception of the subdivision, his ambition was to settle in El Pedregal, which he did in 1954.

Cervera's idea for this first series of programs was a combination of direct publicity together with three segments of publicity-free cultural content intended to educate the public about the concepts behind the settlement's choices. The three educational components will take over 80% of the broadcast time, but at the beginning, end, and both intermissions of the program, direct publicity would set the tone.

In these direct advertising introductions and intermissions, camera footage and still photographs showed the new houses being built in El Pedregal and also images of all the subdivision's emerging services and facilities. The images were chosen to present a vision of progress, including numerous and strategic views of automobiles, and mentions of the great highways towards the south of the city that the government was completing. After all, as much the new roads as the acceptance of the philosophies relying in the indispensable use of the automobile, were the authentic catalyst behind the development of a new area such as El Pedregal so dependent on the car for the practicalities of daily life.

Cervera's strategically conceived the three cultural sections in order to help the public to overcome some of the factors that, since the inception of the subdivision, were still perceived as negative. Section One of the program described the history of El Pedregal, attempting to soften in the eyes of the public the idea of reoccupying a volcanic desert. Starting from its geological origins and moving through its long and rich indigenous past, along the three months of the campaign the program would arrive up to the apocalyptic climax of the eruption of the Xitle Volcano that created the current landscape. The underlying message was the association of the volcanoes with the Mexican identity, suggesting ideas as much of origin as of cultural renaissance. The historical connection of Mexico's national myths with the volcano, always present, had had an enormous popular growth in 1943, with the nearly instantaneous emergence of the Paricutín Volcano, in what up to that date had been flat cultivated land. Drawing from this association, the reoccupation of the badlands of the mythical explosion of the Xitle

Volcano –the last of the great geological phenomena that defined the geography around the capital— was painted with strong esthetic and patriotic overtones.

This was a reorganization of some of Barragán's ideas for the subdivision, ideas that he had learned from Diego Rivera and from the artist and volcanologist Dr. Atl, Paricutín's esthetic and cultural chronicler. Dr. Atl -famous character self-named as Doctor Water in the indigenous Nahuatl language– had mentored Barragán understanding of the cultural implications of El Pedregal as a landscape identifying with Mexican national aspirations. The skill of Barragán as architect, but even more as a businessman, consisted of – through his longs walks across El Pedregal accompanying Dr. Atl– seeing the potential transformation of the landscape into gardens that would soften its harshest aspects.

In attempting to lure the public to a difficult land, the program also used more tangible cultural data. El Pedregal de San Ángel was also, in a fortunate coincidence for the emerging subdivision, the place chosen by the UNAM (Universidad Nacional Autónoma de México) for their new University City. The new UNAM center was intended as the great cultural project of the Presidency of Miguel Alemán and was located in land directly adjacent to the subdivision. Cervera would look always for the opportunity to pair both projects in the program.

The other two sections of Cervera's program would be about modernism, the architectural language that the subdivision promoted as a selling strategy. Section Two, based in modern dance, was the attempt to connect with a source of national pride. Under the directorship of the artist Miguel Covarrubias the national ballet companies and by extension cultural ballet had become very popular in Mexico and ballet was a staple of early Mexican television.

Section Three –the last and most important— continued the line of earlier advertising by concentrate in a discussion of recent issues of architectural culture. In this segment, the expressed goal was to educate the public about the underlying logics behind the architectural modernity that, in a radical approach, El Pedregal was attempting to regulate as legally binding for the subdivision. Even though the modern movement was already a currency widely accepted in Mexico, it was so mainly in government sponsored buildings that would require only the acceptance of enlightened politicians or in private operations where the reduced cost of a naked decorative approach was a convincing factor. There were of course multitude of buildings that demonstrated the tendency towards using the language of modernity, but its coordinated use was something that differentiated the subdivision.

In the New Years day of 1953 –a Thursday– at the evening hour of 9:30 –the peak segment of daily audience– "El Pedregal, Your House, and Yourself" a program of half an hour of duration dedicated to "the esthetic and good taste in building" begun, broadcasting live in Channel 2 (XEW-TV) of Mexican television. For presenting the architectural segment, Cervera –in agreement with the managers of El Pedregal– selected Guillermo Rosell de la Lama, an emerging figure in the Mexican panorama of architectural polemics. Rosell was a very young architect, who three years before, in

collaboration with Lorenzo Carrasco had founded *Espacios. Espacios* —including figures such as Barragán in his editorial board—was one of the defenders of the Gardens of El Pedregal as a real estate operation rooted in cultural values. *Espacios* was also a magazine that enjoyed a significant publicity contract with the emerging subdivision.

Along the series of programs, Rossell brought to the TV screen a popularized version of the modernist ideologies that his magazine supported. He introduced the public to key figures such as Frank Lloyd Wright o Mies van der Rohe, and interviewed figures of the Mexican art and architecture worlds such as the painters Dr. Atl, David Alfaro Siqueiros and Diego Rivera, and the architects Alberto Arai, and Carlos Contreras among others. Arai, for instance, was not only one of the leading participants in the University City campus but also was a collaborator of *Espacios*, where he published his important text "Paths for a Mexican Architecture". Contreras was, as we have mentioned, the co-designer of El Pedregal.

In the interviews with Rivera and Siqueiros, the issue of discussion was "plastic integration", the general concept of collaboration between architecture and the arts where many of critics of the era –with Rosell figuring prominently in this particular polemic— did search for the incorporation of Mexican traits into modern architecture.

In two of the programs, Rossell ceded his anchor position to Clara Porset, a frequent collaborator of his magazine. Porset was a furniture designer that, although born and educated in Cuba, was by 1952 a leading figure in the fields of Mexican interiors and furniture design. In her work, Porset married international culture with local methods of artisan fabrication. The reason to invite Porset to the program was to cover the issue of the modern domestic furnishings, considered an indispensable component of the total environment that the TV program was proposing for the subdivision, and directly connected to the new housing arrangements that the subdivision was advertising.

Broadcasting from the studios of Channel 2, Rossell and Porset –filmed over a background with one of Armando Salas Portugal's famous photographs of El Pedregal– appeared always sitting behind one of the tables that Barragán's had designed for his own studio. Although as we have explained, Barragán was in the latter stages of a process of separation from the subdivision, at the end of 1952 he was still part of the picture and Cervera had been required by Botello to present his project also to him. Meeting with the architect in the studio adjacent to his house in Tacubaya, Cervera was only required to justify to the architect the adequacy of using TV to court the upper middle class that he still saw as the potential clients for his project. Responding to the distanced curiosity of the architect for the decoration of the TV setting, Cervera successfully proposed to refer to Barragán's studio environment by using one of its drawing tables as the place where the interviews would take place. Every Thursday for the following months, one of Barragán's tables would be meticulously borrowed and returned to its exact position in the architect's office after the live program.

After its debut, the first version of "El Pedregal… Your house… and Yourself…" did appear punctually at the same hour for the next thirteen Thursdays. The commercial effects, documented through the number of visitors to the subdivision on-site-sales office, were immediate. As a consequence of the success, the program's run was extended twice; continuing in modified versions for two full years until the end of 1954. The changes were multiple, in content and duration. Modern dance was already suppressed in the second run, and in the third, the duration was shorter and it was the publicity took over the cultural segments. All changes in the program responded to polling conducted amongst its viewers, a practice that Cervera had learned from Walter Thompson.

According to the data gathered in advertisements and among the original occupants the price of the lot nearly doubled with the television program run; from 32 pesos/m^2 at its beginning to 60 pesos/m^2 in the moment of closing the broadcast two years later. With the opening of University City, the establishment of its nearby public transportation, and the change of the perception of the area as closer to the capital center, prices jumped nearly overnight to 75 pesos/m^2.[19] At the end of 1954, with lot sales finally flourishing, the management of El Pedregal did not consider necessary to continue with the heavy cost implied in maintaining Cervera's television program in the air.

In many aspects, El Pedregal became the first non hybrid North American style suburb in Mexico City. Because of its remarkable architectural and landscape design, El Pedregal will be touted in later years as a main architectural achievement, and will start the chain of events that, in 1980, will make its author the second ever Pritzker Prize recipient. What remains mostly unquestioned, are all of the implications, positive or negative, concerning the contribution of El Pedregal to the suburbanization of Mexico City.

The rapid process by which many Latin American cities changed throughout the second part 20th century involves, nearly without exception, a progressive abandonment of the traditional gridded dense patterns codified in the Law of the Indies and evolved through three centuries of colonial and postcolonial practices. Massive poor immigrant informal settlements are no doubt a fundamental factor in this evolution. But at the other end of the spectrum, as it was clearly so in El Pedregal, the influence of the North American suburb in the growth of bourgeois quarters also influenced these changes, especially in countries in close physical and cultural proximity to the United States such as Mexico, Cuba or Puerto Rico. As we have discussed here, this was not an immediate or an easy assimilation, and needed important propaganda campaigns fueled exclusively by private developers searching for profits.

---

[1] Most of the many books on Pritzker Prize Luis Barragán briefly explain his involvement in the subdivision. There is an architectural monograph specifically dedicated to El Pedregal: Eggener, Keith, Luis Barragán Gardens of El Pedregal (New York, New York, Princeton Architectural Press) 2001. And I have co-authored the most recent and comprehensive book on the architectural aspects of the subdivision: Pérez-Méndez, Alfonso, and Aptilon, Alejandro, Las casas del Pedregal 1947-1968 (Mexico City, Mexico, Gustavo Gili, 2007). Please note that I use the plural in many instances of this essay in recognition of aspects of the research done in collaboration with my co-author in this book. The book,

however, deals with architectural aspects and not with the urban planning aspects that I develop in this paper. The research supporting both the book and this paper included over 50 interviews with original settlers of the subdivision, many of which still occupy their houses. Our estimate on the total population is based in these extensive interviews. Many data of this paper emerged from these interviews and the clients archives. We also interviewed and copied the archives of many among the subdivision's developers and architects. All interviews are referenced in our book.

[5] Espinosa López, Enrique, Ciudad de México, Compendio cronológico de su desarrollo urbano 1521-2000 (Mexico City, Mexico, Instituto Politécnico Nacional, 2003) p. 199. The figure of 7,138 Ha includes all adjacent urban areas of Mexico City proper, but does not include 2,790 Ha of satellite urban villages within the Federal District, which later the city engulfed.

[6] This number refers to the phase of first occupation of the subdivision completed around the mid 1960's. The plans of the subdivision published in the 1950's (see for instance plan published in the back cover of magazine *Espacios* # 18, February 1954) contain the 1,235 lots. But these plans do not include the further subdivision of big lots by intermediaries that purchased extended areas of the subdivision for independent commercialization. The figure of 1,500 is our estimate based in aerial photographs of the mid 1960's.

[14] According to interview of the authors with Bettina Cetto, daughter of the architect –contrary to the accepted belief in most accounts– Barragán did not give the lot where Cetto's House is located as payment for his services. Cetto actually bought a lot from the subdivision. Although he had to purchase one of the originally sized lots, he immediately arranged to divide the lot in two, building in half of the property, and selling the other half as a contribution to his then economic efforts to complete the house. A house was also built in the other half.

[19] The advertisement's and Cervera's figures of lot cost can only be indicative, since prices varied with the individual properties. Prices did change with location (some streets were more desirable and expensive than others), with the different promoters (there were already different investment characters that would commercialize lots), with the particular topographic characteristics (lots with picturesque rock formations were the most desired and valuable), and with the size (with smaller lots increasing the square meter price) .

Foreign experts and International public-works consulting agencies: some hypothesis about city building and governance

Alicia Novick
Institution Universidad de Buenos Aires, Argentina
Universidad Nacional de General Sarmiento, Argentina

In 1912, the Argentine Senate sanctioned the national laws that authorized the expropriations for the construction of a major transverse avenue and the North Diagonal avenue, which would communicate the *Casa Rosada*, Seat of the National Government, and the Courthouse Palace. A year afterwards, in July 1913, a civic procession led by the Vice-president of the Nation inaugurated the first part of the Diagonal. If the crowd had walked northwest, it would have quickly faced the distressing view of debris resulting from an improper operation of expropriations and demolitions. World War I had blocked the international funds necessary for the works were only concluded in the 1930s. However, beyond that troubled start, these works ended the debates on the projects to build avenues initiated in the prior century.

The avenues projects were interpreted by literature from different perspectives. On the one hand, the general atmosphere around the 100th Anniversary of Argentina (1910), the employment of a French technician for the design of the project and the kind of solution adopted favored a traditional interpretation –almost a common place- that visualized those works in Buenos Aires as an importation of the *spleen* of *Paris* (Berjman, 1997; Gutierrez, 1992; Hardoy, 1988). On the other hand, later research in the urban history field examined those works –and similar situations in Latin America- in the framework of cultural studies of social representations (Almandoz, 2002, Gorelik, 1998), or on the translation of international trends in urban planning models (Novick, 2003). However, these cultural researches did not investigate the financial circumstances or values at stake that are exposed when one analyzes decision-making processes. By contrast, local economic history studies, classical researches (Ortiz, 1972; Harnoux, 1977) and the most recent ones on infrastructure, corporations or banks (García Heras, 1994; Davis, 1988; Regalsky, 2006) have paid special attention to the networks of public and private interests underlying their concretion. Symmetrically, a renewed political history - following Sckopol's work, which brought the State "back in" (1987)- analyzed the behaviors and contradictions of those who had formed the Buenos Aires municipal institution (Walter, 1993). In this way, the projects analysis can be one way to approach the problem, because can contribute to build an articulation field between the perspectives of urban planning history - that analyzed the ideas, models and actors lying behind its formulation- and the economics, political or cultural issues, focused on the context circumstances and logics ruling its implementation -but does not contemplate the specificity of urban models.

During the *Ancien Régime* cycle, the years preceding the implementation of universal vote in Argentina in 1912 (de Privitello, 2003), investments in infrastructure and projects comprehended in the embellishment and extension plans played a significant part in the metropolitan transformations. Urban Design was an issue for national and foreign

specialists, who debated urban planning models. The interventions were also an administrative problem for the officers of a State that was undergoing its organization. For companies and businessmen, those works were investment opportunities. Finally, their implementation was addressed at the Congress, and their approval decided on the concretion of the expropriations and administration of the corresponding borrowings.

From that viewpoint, we suggest an analyze of the life cycle of diagonal avenues project, from the stages of its first designs until its implementation, paying special attention to the network of actors that appeared in the decision-making processes. In others words, the issue is to answer two questions: How was the transition from the project to the materialisation os the works?, What public and private, national and international actors and what values were at stake during the different stages of the decision-making processes?

These matters can be problematized through the concept of *governance*, according to which the conception and implementation of public policies take place at multiple levels which the State and no-governmental actors share spaces. It is interesting to wonder if it is possible to use a notion created in the context of recent global transformations in a historical research without being anachronistic. Marc Hufty provides us with an answer when he defines governance as "a social facts category, since it refers to collective processes, formal or informal, that determine, in a given society, the modalities according to which decisions are made and regulations are written in the public affairs arena. So defined, it is a concept generalizable to all societies –whether local, national or international- and to all times." (Hufty, 2007). It is then possible to identify a specific modality of governance for each society and each time, that is to say, modalities of the interaction between social actors and of resolution of specific conflicts.

In order to introduce the problem, the text is organized in two parts. In the first one, we will refer to the cycle that ended in 1910 and to the key roles that the Mayor, local and foreign experts and international consulting agencies played and which contributed to place the avenues' project in the government's agenda. In the second part, we will look into the 1909 and 1911 parliamentary debates on the financing, the role of the State and operative matters related to the implementation of the project.

This article's outcomes are the result of the articulation of two new lines of research. On one hand, it is the result of a series of studies on the role of the projects and plans in the construction of the modern city. On the other hand, it results from a series of studies on "Innovations in decision-making processes for sustainable urban projects" (NCCR, 2006-2009). The methodological notion of governance allows us to articulate these two lines of work, posing new questions on the public-private, local-global relations, even if the answers that we come up with are preliminary. As work material, among others, we resorted to historiography studies, to documents from the Archive of the French Ministry of Foreign Affairs, Argentine National General Archive and the City Council's and the Congress' records.

1. The avenues in the public agenda

The projects for new avenues and widening of existing ones began to be designed in Buenos Aires throughout the 19th century, but the concretion of these projects was initiated in the first decade of the century, during the euphoric atmosphere of the Centenary. In this section we aim to look into the first stage of the Avenues project, focusing on three moments signed by different actors and circumstances, which can be understood as an inclusion on the agenda.

The Centenary cycle, described in our bibliography as the "illusion of progress", was an expansionary period. (Bonaudo, 1999; Lobato, 2000) The increase of the population due to the immigration flow and the economic development led to the joint construction of the society, the National State and its Capital. In 1895, the Census of Buenos Aires counted over 600,000 inhabitants, trebling the 187,126 of 1867. In 1910 the population had increased to 1.5 million people. Uninterrupted growth ceased only in 1936, with almost 2.5 millions, when the suburban villages –counting 100,000 inhabitants in 1895- took the lead.

How was that expansion process analyzed by literature? Immigration, the construction of the port and railways were the engines of the expansion from "the centre to the suburbs", according to structural functionalism studies of the 70s (Scobie 1974; Bourde, 1974). In these hypotheses, the State was reduced to a transparent arena of conflicts between the different social groups. By contrast, alongside the renewed political, urban planning (Claude, 2006; Secchi, 2006) and cultural studies, many of the local studies – that we mentioned in the introduction because they didn't take the material conditions of the construction of the city into account- progressively focused on the role the State and the professionals had played in the construction of the urban space and society. These researches allowed overcoming and complexifying the classical interpretations that emphasized the key role of private developers who divided rural lands in plots for urban fabric as the driver of the urbanization. However, as we have said, the analysis of the projects themselves requires that we go back through the public-private, international-local intricate articulations. The first urban planning documents that helped include the avenues item on the agendas are illustrative.

The 1898, the *Plan de Mejoras* (Improvements Plan), adopted in 1904 as the "*Plano de alineamiento*" (Morales, 1898), which includes preliminary projects for the avenues, is a good example of the new role of the State. The explicit goals of the plan were to integrate the new neighborhoods, establishing limits between public and private domains, guiding public control and interventions vis-à-vis a city that was expanding. Actually, it set the rules of the game between the state and the market. Regarding its designers, the plan was traced by the city engineers' office. The capacities of the technical offices increased since Buenos Aires became the Capital (1880), in the framework of a municipality that was incorporating specialized competencies. In this way, those competencies were gaining position in a new University al the same time: the hygienists first (c. 1860), then the engineers (c. 1870) and finally the architects (c. 1890), are, in that order, the professionals with urban planning competencies that take

part in the recently created municipal offices. The new professionals graduated from university, concerned about the city, they became more and more organized, and they adopted postures facing the problems and its possible solutions. The construction of parks and squares, the sanitary regulations, the first building regulations –published in 1886 the property registers and topographical maps (published in 1887, 1892, 1895 and 1909) were some of the tools intending to control private constructions. This set of instruments was introduced in relation to administrative reorganization processes, which created spaces for social doctors, sanitary engineers and architects that were building their relative autonomy.

However, regarding the public-private relationship, in the context of that increasing institutionalization, the budgets and the capacity of public control were restricted. The administration imposed restrictions and, in other cases, accompanied and built the real estate market through its actions. As the classical studies of urban planning history show, we can observe the existing tension between the ideas that considered the development of the city as a stimulus of the capitalist development and those aiming to solve society's problems -within the framework of the obligations of the State with its citizens - education, health and public welfare programs. In other words, on the one hand interventions were made through works, and the control of the promoters was encouraged, but at the same time the territory was being conditioned, adding land to the market.

The 1898 Improvement Plan's proposals are illustrative of these dilemmas. This proposal regularized the space, extending the grid of the city to the whole area of the municipality. That urban shape was another of the management and administrative control tools that were implemented. That action constituted a rigorous control of owners and plot sellers by the technical bodies with control instruments. The extension of the roads network, the creation of parks and squares, the new infrastructure in services and transport encouraged the expansion to new neighborhoods, an opportunity for land and property valorization. Likewise, the downtown (as it was the window to the national progress and modernity) is transformed. As rough diagram – a cross of diagonals departing from the National Congress, the route of the North-South Avenue and the route of the waterfront avenue- ordered the ensemble. It is in that sphere of extraordinary interventions that required special budgetary approval that the possible involvement of private entrepreneurs was at stake. Years after the 1890 crisis, as an attractive market consolidated, entrepreneur proposals for interventions in the Old City increased. In that context, along with the developers of the suburban new plots, some interventions of extraordinary costs were proposed, also being an opportunity for large scale business operations. *Avenida de Mayo* (1886) was the flagship of those initiatives, since it mobilized transformations were tensions existed between the will of the public power and the interests of the owners, who obtained considerable benefits from expropriations in locations that increased their value exponentially. But even if agreements and differences between businessmen and municipal engineers were not few, the consolidation of technical offices at local and national level initiated a process that built both public officers and private entrepreneurs. Beyond these alternatives, the 1898 plan took the discussions on the avenue openings to public debate.

Years later, in 1905, as a result of the pressure made by city legislators ((VTCA, 20/03/1905, p. 251) an ambitious borrowing request destined to finance the works for the Centenary gave an opportunity to these projects. The diagonal and the north-south avenue project were included, and the request was taken to the Congress, being introduced in governmental agendas (CNACD, 16/9/1905). In those years, a projectual fever resulted in a wide range of alternative proposals that were the arena of technical experiments as well as political disputes. The broad range of avenues and diagonals proposed published in the press and in specialized magazines - between 1904 y 1914, the *Revista de Arquitectura*, magazine of the Central Society of Architects publisher over thirty articles- were an opportunity for artists and architects to become a part of the urban debate.

In 1907, within those discussions, the Mayor –Carlos de Alvear- called Paris' director of Public Works who designed, together with a group of local technicians, the New Plan (*Intendencia Municipal*, 1910). Jean-Joseph Bouvard was a disciple of the "academic" Constat Dufeux, but his 'artistic' career did not shine in contrast with other contemporary *l´École* figures, and his greatest accomplishments were all result of his position as an officer at the Paris City Government. He was the Managing Director of the Architecture, Boulevards and Plantations Services. In that capacity, he organized regulations, designed a public schools network, as well as the pavilions of Paris in international Exhibitions (Chicago, 1893; Anvers, 1894; Brussels, 1898; Saint Louis & Melbourne, 1904; London, 1908; among others). That experience allowed him to become an international advisor. He drew plans for Istanbul (1902), Brussels (1903), and after serving in Buenos Aires he also worked in Rosario, Sao Paulo and other Latin American cities. Most of the architects and artists rejected the presence of the Parisian officer because he didn't have an outstanding career –he was a bureaucrat rather than a talented artist- and also because he obstructed the possibility to call to a bid open to specialists. These groups of specialists and their associations spread new ideas and attempted to influence the decision-making processes of specific matters. Nevertheless, as we developed *in extenso* in previous works, as for Jean-Joseph Bouvard, the foreign expert, he was acting as a referee, mediating between the different technical positions. (Novick, 2003).

The proposal was presented over a grid extending to the whole city, enhanced by avenues and green spaces, drafted in collaboration with a team of officers that knew the territory very well. On the one hand, the erudite references to Eugène Hénard (relating the circulation), Buls (relating to urban aesthetics) and Jean-Claude Forestier (concerning park system) lent a theoretical basis to the entire proposal, with the intention of going beyond fragmented projects towards a system for the city as a whole. But, on the other a hand, the general directions of the proposals came from the city director of public works, one of the members of the Plan commission. At the 1909 Nuevo Plano (New Plan), a sort of translation exercise was carried out, a complex operation that accomplished the articulation of the built city with various referents – *haussmannian, city beautiful*, and urban art logics. It was a translation of the different urban models that were in circulation into a local reality marked by the regularity of Buenos Aires' street grid.

Specifically, we can see the change in meaning that identical forms take in different contexts. In Paris and in the European cities in general, around/over the fabric of the medieval city, intricate and irregular, diagonals played the role of rationalizing and modernizing the cities, adapting them to new functions. In the case of Buenos Aires, just like in the rest of the cities of the Americas, the *haussmannian* sense was inverted, since the grid-base –reinforced by the proposal of the Alignment Plan- was since its origin a rational matrix. Diagonals appeared, mainly, as aesthetic devices (composition, visual improvements, perspective of the spaces). Likewise, even if in the plans they were visualized as ways to organize growth, the parts that were built were only those reorganizing the downtown area. These matters are not exclusive to Buenos Aires, and are framed by the international dynamics of the circulation of ideas, as we read in some of the highlights of Bouvard's proposal. For instance, the parks and plazas system – revisiting Jean-Claude Forestier- was inspired in the American park system. Equally, the treatment of the monumental perspectives was recovered from the ideas of the city beautiful that had already processed an adaptation of the beaux arts system to the American grid.

But beyond those disjunctives, the New Plan had the merit of systematizing the broad range of projects in debate, as the new diagonal avenues were consensually established as priorities. Despite that collaboration and the position taken by the "specialists' network", the hiring of the French officer –that resulted in the inclusion of the project in a more comprehensive plan- was the result of the Mayor's political will and other underlying strategies.

In the first place, behind the presence of the foreign expert hid the struggle for the importance of an explicit policy of importing from the French, typical of the "Age of the Empires". (AMAE, 14/03/1908: folio 14) New countries were seen as opportunity lands where to make business and, in that spirit, experts and advisors operated as delegates to capture markets and business opportunities, in a dynamics that was examined by international bibliography on the exportation-importation of models (Nasr and Volait, 2003)

In the second place, hidden behind those "neocolonial" relations, the interests of local and international companies and businessmen were quite important. On one hand, the Mayor's decision was a result of arrangements made with local businessmen who since the end of the 19th century were trying to make urban business. On the other hand, international consulting companies were operating. The Parisian officer, after serving as an advisor in this part of the world, was named the director of the *Société Franco-Argentine de Travaux-Publics*, a branch of an international consulting group, the *Public Works Company, Society for Studies.* These consulting companies, formed by French shareholders and local government officers, bank directors and engineers, had the goal of identifying "profitable businesses"-as railways, trams, mines and big public works- and of promoting special societies for their carrying out. (AMAE, NS, 09/12/1909). Just like in other Latin-American contexts, such as Brazil, Chile or Venezuela, experts operated as guarantors for potential investments in public works. (Leme,1999; Martin Frechilla, 1992)

That dynamic changed with the political reform processes, as they put limits to these imperial ways of operating, when control and bid mechanisms were incorporated. Regarding international bids for the construction of ports, is it possible to read the critic comments made by the French diplomacy: "Once again we ratify that open bids launched by the Argentine Government have no other goal than acquiring, at no cost, seriously studied projects that their own engineers would be capable to design. Those same engineers choose from each project the best solutions provided by foreign science, put them together and call it an 'argentine' project. It is clear that, in effect, if the Department of Public Works had been able to prepare it, it would have been superfluous to invite foreign companies." (AMAE, N.S., 24/02/1911: folio 213)

Beyond the increasing public controls and the changing relation with the private arena, it is possible to observe a multiplicity of actors that were present in the initial stage of the inclusion of the avenues in the government's agenda. In those first moments, the project was progressively designed as part of a public program, through a process according to the described modalities. In 1898, preliminary projects of avenues were included in the Plan de Mejoras (Improvements plan), drawn by municipal officers, even if the local businessmen strategies' were behind it. In that document we can also see the rules of the game that the municipality made to establish the borders between private and public. In 1905, when one of these avenues was included as an item in a borrowing requested to finance the works for the centenary, the role of architects and city legislators was crucial. Later, in 1907, when it was integrated as a part of an urban plan (1907-09), the Mayor had a prominent role in contracting Bouvard, who was criticized by experts but supported by national and international companies.

Even if most of those logics were exclusive of the centenary period, they allow us to pose questions about the decision-making in other scenarios.

2. The *Ancien Régime* Networks

Years later, the avenues proposal was included in the congressional debates. Figueroa Alcorta, the President of the Nation, and the Secretary Montes de Oca – lawyer of one of the English companies interested in the enterprise- presented the avenues project to both houses. It was subject to intense debate in 1909 but the proposals were filed until 1911, when discussions were restarted. Throughout those congressional debates, different ideas about the role of the State and private investments were expressed, responding to different ways to conceive development and wealth production, deeply rooted in the previous century, but nevertheless increasingly filtered by the new reforming ideas about the city, the society, and its urban representations. Finally, it is in 1912 that the expropriations laws that allowed the openings were adopted.

The first debate in the National Congress took place in 1909. The four projects examined showed a general consensus about the convenience of building centric avenues but also dissidence regarding the amount of expropriations and the role the State should play as an agent in the market. The general agreement was on the need to transform the historic city center. The opening of new avenues was justified by the

logics of hygiene, aesthetics and circulation, but mainly by the project's capability to transform the downtown, the center of the political and economic life, a space symbolizing and representing the National State. It was an operation that was "convenient for the commerce and for the *decongestion* of the area". As Topalov's works showed, the "congestion" was at the same time the notion and metaphor that condensed the diagnostic of the city as a living –and ill- organism, and of its treatment. (Topalov, 1990). The problems were the danger of social violence, the fear of illnesses, obstacles for the circulation of the continuous flow of humans and goods that prevented an effective production and an efficient commerce. The "congestion" was visualized as an especially serious problem in the downtown, the most dynamic area of the city, where public buildings met workshops and crowded dorms -affecting its image-, but where property prices were rising rapidly. The avenues/widening projects were proposed as solutions that liberated plots that could home new building types.

The differences were about expropriations. The majority proposed to expropriate the surface necessary for the avenue plus a side strip –that through the resale of plots offered the city government the possibility of financing the works-, but the rest of the alternatives proposed to buy the necessary plots only. What was under discussion was the State's resale of unused expropriated plots, thus becoming another actor in the market. For some people this meant a dangerous advance of the State into the market: "Isn't this the beginning of the end of the healthiest rules of every well organized society on the *ipso jure* property rights?" (CNACD, Gonnet, 1909: 691). For others, even if they were not "defending a state socialism", wide expropriations were a resource to defend the "general interest". (CNACD, Oleachea Alcorta, 1909:719)

The debate took place in a start-up stage of the Project, when the necessary actions to transform the Project into a public policy were decided. In that moment, what was at stake was the 1866 expropriations law, that established a mechanism through which the state had authority to buy private real estate –previously, the Congress had to pass the property's "public utility"- paying market value and future valorization. Up to that moment the law had been applied in Buenos Aires in two opportunities with different consequences. It was first applied in the late 19th century for the trials for the expropriations to build *Avenida de Mayo*, when the Supreme Court adopted an extremely liberal doctrine and the owners' rights were placed at the forefront. The second time it was applied was in 1911, around the debates on the operations on *Plaza del Congreso*, with quite a different criterion, as the "public utility" was no longer under debate. By that time, the language and ideas of the social reformers was already current in the speeches of senators and representatives.

Pedro Luro and Meyer Pellegrini were the main voices in the 1911 discussion. Luro was a businessman, a partner of prestigious families that in those days were building big hotels –such as the Buenos Aires Plaza and the Bristol in Mar del Plata-, who promoted the construction of the port of Mar del Plata, in a time in which real estate investments –as economic history shows- were one of the main sources of profit.

They were both aligned in the heterogeneous ranks of the social reformers, who, according to different bibliographic interpretations, were liberals (Zimmerman, 1995) as well as conservatives (Suriano, 2000). Just like in other parts of the world, in the Argentina of the first decades of the century a noticeable network of reform institutions was organized alongside the debates on the moral, social and political reform that was being held in the public square regarding the Universal Vote Law (1912). With lawyers and social doctors playing a leading part, local reformers focused for the first part of the century in themes such as life and work conditions, hygiene, social security and housing for workers, acting as intermediaries between the State and the society, between capital and labor. But even if urban issues were addressed quite late in the century (around 1920), matters related to the role of the municipality, to the expropriations and, more broadly, to the mechanisms necessary to rationalize politics were in the reformers' agendas.

Pedro Luro was very eloquent in his speech to both congress chambers in defense of the avenue openings. In the first place, his erudite dissertation quotes Howe's texts, Gaston Géze's 'Political Economy' and Roosevelt's speeches – Roosevelt, who would deliver a few speeches in Buenos Aires in 1913, and form whom he rescues the need to place "human rights before property rights", pointing at the restrictions to property promoted from the liberalism in the United States of America. In this way, Luro explains, the engine of development is private, the private capital and in the performance of large companies within a dynamic of property valorization that must be understood as a synonym for progress. He proposed, in that context, the convergence between the 'Mayor's actions', 'the efforts of citizens' and 'the precious contest of construction companies' that should play defined roles. The municipality would play a comprehensive part, being able to value areas and create investment opportunities. More broadly, the Mayor hat to assume the leadership of the decisions and the state should act as a guarantor of the borrowings to ensure the financing. But it was the private capital that should play an active role in the development. Long term borrowings (20-30 years) were seen as a resource to contribute to the rapid transformation. (CNACD, Luro, 18/9/1911, p. 459-462)

Openings roads and expropriations were visualized as a possibility to liberate plots of new scales, whose intensive exploitation required of large investments that resulted in new real estate products. American *sky-scrapers* were rejected as a symbol of the "triumph of profit over idealism in constructions" (Luro at CNACD, 20/09/1911, p. 505). The big hotels and high buildings in academic style were the new real estate products which were Buenos Aires´ image of the modern city. But to build them, it was necessary to promote the development of larger construction companies. "We want to make palaces on ten square meters, and that's impossible. This is contradictory to all rules of proportion and monumentality. We shall have palaces once we try to build them on a minimum of twenty square meters, and when those can be extended, according to the owner's possibilities, to another plot of twenty or forty square meters". (CNACD, Luro, 18/09/1911, p. 474)

Somehow, during the 1911 debates, Pedro Luro acted as spokesman for large scale construction companies –and their construction businesses- as well as for banks and credit institutions interested in expropriations and borrowings. But, at the same time, the capacity of a State that was adding competencies was also present in broadened expropriations. From that perspective, more than a collision of public and private –of a private sector looking for businesses and a public sector defending the general interests-, what seemed to be at stake were the uncertainties of those years regarding the limits of those two sectors.

In 1912, two laws -called the 'Luro' laws- were sanctioned. These laws authorized the "public utility" for the north diagonal and the north-south Avenue. In the articles of these laws the terms of the projects, borrowings and financing were detailed. So written, they became a legal referent for the execution of the operations. However, a legal framework is not sufficient for the execution of the works. In that transition, the decision of the mayor Joaquín de Anchorena was crucial. He did not only mobilize efforts to start the works, but he also took a window of opportunity to initiate a second diagonal avenue.

At the beginning, his figure was introduced as that of a hero who won't be intimidated by difficulties. Immersed in the euphoria around the Centenary and imagining undefined progress, he wanted to crown his administration inaugurating monumental public works. As he justifies in his speeches, it was possible to assume that, given the increasing value of property, the works would finance themselves. That illusory image, common of that time, was shared by city legislators who supported his initiatives. "This is a new era of diagonal avenues and garden city neighborhoods". (VTCD, 7/6/1911: 204.). However, little by little, agreements with owners for the total or partial cession of their plots and audacious finance operations, such as short term credits and borrowings, led the administration to a dead end. Unsystematic procedures and the lack of an operation plan were discussed in the public square. Even if the transference of land to real estate developers had generated new business expectations, the Great War changed the rules of the game.

As an aggravating factor, the funds from one of the borrowings from the English Bahring Borthers and a group of German banks never made it to its destination. After its inauguration in July 1913, the works were interrupted because the municipality was almost bankrupt. In 1920 the debt was still being negotiated, in the context of a new political dynamics, with representatives from all the political parties in a city council with a socialist majority. The "*Ancien Régime* networks" were criticized by leftist lawmakers, who, from their new views on public and private, had strong arguments to second their criticism to previous administrations: "several properties have been sold, and all (the owners), almost no exception, have resorted to judges, who have been sufficiently flexible to satisfy their excessive demands" (VTCD, Dickman, 13/4/1920: 280). Finally, with the cooperation of pro and anti government legislators, there was a negotiation with the banks and in 1926 an extra money transfer was added to the local treasury. (VTCD, 7/5/1926: 277)

The passage from the plans and laws to the material city was a result of the mayor's will – who was at the time designated by the President of the Nation. Consulting groups, experts and companies were present but in the background. The city Council at the time supported or criticized some procedures, but it was not directly involved in the decisions. In other words, on the basis of established consensuses, it was the city's executive branch –related to the national government- that decided the beginning of the works. The first block of the north diagonal was inaugurated, but all the area affected by the avenues law was frozen since the trials and the expropriated properties exposed the chaotic procedure of those years, when everything seemed to be possible. The limits of a time when it all seemed possible resulted in a controversial legacy that determined the early transformation of the downtown.

Ten years later, when the political and social situation was recovering from the effects of World War I, the first 'leftovers' were auctioned. At the first auction, in February 1920, the buyers were the Bank of Boston, the insurance company 'La Continental' and the exports/imports company "La Patagonia". At the second auction, *Ferrocarril Central* (the National Central Railway, and English company) and insurance companies like 'La Sud América' and 'La Franco Argentina' bought their plots. In April 1929, the Bank of Boston and other companies were setting up, and the American Embassy bought its plots. A few months after the deep 1930 crisis, the North Diagonal reached Suipacha st. and articulated with Lavalle Square and the Courthouse Palace. The new plots resulting from its opening were acquired by banks, insurance companies and import/export agencies. The avenue, imagined in the likes of the *Hausmannian* interventions, and destined to organized the extension from the downtown to the suburbs, contributed to the early modernization of the down town..

Conclusions

How was the transition from the Project to the materialization of the works? What public and private actors and what values were at stake during the different stages of the decision-making process?

The avenues, conceived as modern spaces for circulation and for monumental celebration, that allowed to renew the central area and to add new activities, creating symbolic spaces and real estate opportunities, were included in the public works agenda after decades of debate through which coincidences on their priority developed little by little. In times of the Centenary a liberal model took shape –based on property rights- and in tension with the reforming ideas and a progressive increase of the State's competences.

The concept of governance allowed us to highlight the modalities in which different actors came into the play at different moments of the process. After being included in the city's urban planning programs, the request of a borrowing for the works for the Centenary was an opportunity. Once they were adopted as a governmental priority –in the framework of the *Nuevo Plano*-, the mechanisms necessary for its concretion were discussed at the Congress. Debates on the diagonals and the expropriations led to a

thorough discussion about the role of the State and the relation between private rights and public utility. In the standpoints expressed in those debates we confirm that interest networks always have political representatives that are also working on a side as advisors for the private companies involved in the public works. However, the initiation of the works, beyond their controversial consequences, found its conditions of possibility in the leadership assumed by the Mayor.

The analysis of the decision-making processes referred to urban projects, beyond the avenues shows that the nature of the projects varies according to different points of view. For the specialists it is an arena for experimentation and legitimization. When subject to public debate, they become weapons for political combat, which varies according to the more or less democratic context (depending on the transparency required in the decision-making). Urban Projects, as potential public works, mobilize networks of relations and economic interests around them; once the works are completed, they serve as a legitimacy icon for the administration of the government. In other words, the meaning it has for the experts is different to the one it has for the officers and the representatives.

Foreign experts, international consulting groups and companies were some of the actors that were directly or indirectly present behind the decisions. And, it is possible to suggest that many of the traces identified as characteristic of the *Ancien Régime* cycle seem to be present in other times and other periods. We refer to, for instance, the influence of consulting and business groups in the public arena; or to the power of the executive branch –local and national- in the allocation of the resources, its capacity to promote the implementation of some works over others and the significance assigned to the building –and mainly to inauguration ceremonies- of the public works. These issues, more than dilemmas regarding private and public, local and global, remind us of the multiplicity of agents and their interrelations to be pondered in order to understand the urban space transformation process.

Finally, what can the analysis of Buenos Aires' unique features tell us? As we said, the analysis of the projects allows us to articulate the urban planning histories –centered in ideas, technical agendas and biographical studies- with urban histories that, unlike political, social, economic and cultural histories, reveal the alternatives of the built urban space. These Diagonals could still be embedded within the broad framework of the 'Haussmannian model', in the wake of the formation of the knowledge and know-how of the urban city planning of the interwar era. That 'model' goes beyond Paris' morphology and refers more broadly to social representations and technical conceptions that started taking shape since the late 19th century. It also refers to the emergence of a constellation of economic agents and technical profiles –such as the urban advisors- that were added to the new State and managerial competencies that are typical to modernization processes. This process acquired different configurations according to the circumstances and temporalities of each country. In this way, projects and *modi operandii* established coincidences between Latin American cities. However, in Buenos Aires there was the context of the 100th anniversary added to a political will that allowed the concretion of the projects. As a matter of fact, the diagonals were the beginning of a

series of interventions that transformed the structure of the downtown area. The widenings enabled the construction of the new typologies –typical of banks and companies- that replaced the workshops and tenements houses. The city center, unlike the center of other Latin American cities, gained life and became the referent for administrative and recreational activities of the metropolis, after losing, in the early 20th century, its colonial look.

As we said at the beginning of this text, the works of the north diagonal extended for one block only and the landscape of "the day after tomorrow" remained distressing for many years since the Great War froze the works and investments until the beginnings of the *golden age* of the 20s. But, beyond the debris, avenues and diagonals arrived to the urban fabric, and in the early 30s, they were completed. These *Ancien Régime* works, seen through the lens of the avenues projects, raise some questions about the construction of the modern city.

"Our Cities" and "The City": incompatible classics?

Carl Abbott
Portland State University

Lewis Mumford was a man who knew his own mind . . . . and knew what was right and wrong about cities. In 1938 he penned a review of *Our Cities: Their Role in the National Economy*, the recent report issued by the Urbanism Committee of the National Resources Committee. Writing in the *American Journal of Sociology*, Mumford found much to praise. "No serious student will be anything but grateful for the immense amount of research that the authors have succinctly summarized," he wrote, pointing to the report's abundant comparative statistics and its reflection of "contemporary political and sociological thought in relation to the city." He found himself in "hearty agreement" with many of its recommendations about employment, public services, and government.

But Mumford also had serious reservations, finding that the report was too narrowly framed, lacking both an historical sense and an interest in cities a physical constructs. In effect, he argued, the report was a study in social science–perhaps not a problem for readers of the *American Journal of Sociology* but certainly one for Mumford and his compatriots in the Regional Planning Association of America. "There is no attempt to show either verbally or graphically the wide range of morphological variations in the structure of cities," he complained. "The 'city' dealt with, accordingly, is the administrator's city–a statistical abstraction–not the four dimensional reality in which the regional and historical backgrounds present important modifications of contemporary fact."[1]

Our Cities was widely reviewed and widely disseminated--a "best seller" according to its chief author–but it had less public impact–and less staying power–than another contemporaneous analysis of urban problems in which Mumford had a direct hand.[2] That "document," of course, was the film *The City*, made under the auspices of the American Institute of Planners and shown with great success at the New York World's Fair in 1939. Tracing the rise and crisis of American cities and ending with specific proposals for improvement, *The City* played to full audiences eight times a week for the eighteen months of the fair. It received a rave review in the New York Post, an article on the New York Times Magazine, and a two-page spread in the June 5, 1939 issue of LIFE.[3] Here it shared a fascinating issue on "America's Future" with articles on the new wonder material nylon, Boulder and Grand Coulee dams, aluminum cookware, the first televised sports event, John Steinbeck's new novel *The Grapes of Wrath*, the General Motors Futurama, an essay by Walter Lippman on "The American Destiny," and a letter from Buckminster Fuller. Since then the film has kept the company of generations of students in many a planning class.

The two texts–the densely packed report and the fast-moving film–emerged from the same historical milieu, but I will argue that they drew on diverging intellectual traditions and prefigured the fragmented nature of urban planning and policy in the second half of the twentieth century. In this interpretive essay, I briefly discuss the origins and contents

of the two texts and then set them side by side to consider similarities and differences in content and context and to comment on their differing receptions and careers within the intellectual traditions of city planning in the United States.

Making *The City*

Behind *The City* was the American Institute of Planners, newly reconstituted and looking for ways to define the scope of city planning in the rapidly evolving institutional landscape of the New Deal. Clarence Stein was the deal-maker who obtained a $50,000 grant from the Carnegie Foundation and organized Civic Films as the film-making arm of the AIP. With Stein, Frederick Ackerman, Robert Kohn, and Tracy Augur as board members, Civic Films drew heavily on the close-knit Regional Planning Association of America engaged the services of directors Willard Van Dyke and Ralph Steiner, two of the leading lights in documentary film. Pare Lorentz, now remembered as an even bigger name, worked with Henwar Rodakiewicz to develop the scenario and shooting script. As the project progressed in the course of 1938, Aaron Copland was brought in for the musical score and Lewis Mumford to write the narrative commentary, which was voiced by actor Morris Carnovsky. From start to finish, it was essentially a New York project that drew on that city's great pool often leftish artists and intellectuals.[4]

The resulting film has five sections that trace a trajectory of declension and renewal. It begins with the ideal small town of the previous century–literally a golden age in the bright sunshine. The village nestles among rolling hills. White picket fences punctuate the townscape. The village blacksmith, a la Henry Wadsworth Longfellow, wields his hammer in the town center. There follow a triptych of urban decline. The age of iron supplants the age of gold in the form of smoke-shrouded Pittsburgh. Manhattan turns human beings into frenzied denizens of an urban anthill, but there is no escape from New York on jammed highways that turn into weekend parking lots. Salvation comes at the end in the form of good planning, carefully explained and depicted in images of the new planned communities of Greenbelt and Radburn where the summer sun again shines.

The City is skilled film-making by leaders in the evolution of documentary cinema. Pare Lorentz very deliberately wove the trope of children's play through most of the scenes–a child happily running along the village street, urchins scrabbling in the polluted dirt on a barren Pittsburgh hillside, kids trapped in the backseat of an overheated car, the children of new suburbia happily biking on clean, safe streets.[5] Another trope is the metaphorical juxtaposition of sun and of cloud. Cinematic tricks anticipate future films. The accelerated clock and accelerated motion of the film's Manhattan workers would be imitated decades later in *Koyaanisqatsi* (1982). The highway scene is a precursor of the famous seven-minute panning shot of the stalled cars of urban refugees in Jean-Luc Godard's *Week End* (1968).

At the same time, *The City* is adamantly didactic. The supervising planners had a point to make, and they wanted it made in detail. Ralph Steiner remembered enduring a

barrage of books and lecture notes from AIP members before turning to Lorentz for a useable outline. The film professionals worked hard to insert humor and irony and cringed at some of the sometimes sententious prose that Mumford overlaid on their work. The foundation funders did not necessarily appreciate high-energy depiction of Manhattan workers nor the injection of humor into the bland garden village scenes at the end. The Civic Films Committee vetoed Rodakiewicz's proposal that the final sequence involve a debate in which a "slick realtor," a city tough, and a demagogue would be countered by the voice of planning reason. Instead, the final sequence (a whopping 17 minutes in a 43 minute film) hammered home the argument in favor of good planning–in the form of moderate-density suburban communities. Given that the board of Civic Films included Frederick Ackerman, Robert Kohn, Tracy Augur, and Clarence Stein, all of whom had been involved along with Lewis Mumford in the work of the Regional Planning Association of America, it is no surprise that the message embodied the garden city idea that the RPAA advocated.[6]

Writing *Our Cities*

If *The City* came out of a profession on the make, *Our Cities* emerged from the busy intellectual workshop of the New Deal and the National Resources Committee. The NRC was a small, independent federal agency that reported directly to President Franklin Roosevelt. It had already undergone two changes of name, created as a National Planning Board in 1933 to help coordinate the work of the Public Works Administration, evolving into the National Resources Board in 1934, and changing name to National Resources Committee in 1935. From 1939 to 1943 it would evolve into a National Resources Planning Board, still part of the Executive Office but now needing Congressional appropriations for survival. The key figures through the changes were Frederick Delano, the President's uncle and a director of the National Capital Park and Planning Commission, Charles Eliot as staff director, and Charles Merriam, a University of Chicago political science professor and the idea man behind the agency and its work. When the NRC set up a Research Committee on Urbanism in 1935, the umbrella organization was already deeply engaged with national issues of macro-regional differences and resource allocation.[7]

The second context for the report, and one that was also linked to the busy Professor Merriam, was the set of organizations co-located at 1313 E. 60th Street, across the wide boulevarded Midway from the UC campus. The glue was the Public Administration Clearinghouse directed by Louis Brownlow, one of the key figures in the emerging field of public administration. Brownlow worked and lobbied for the establishment of cognate groups: the National Association of Housing Officials in January 1934 and the American Society of Planning Officials later the same year. Under the leadership of Walter Blucher, ASPO's goal was to activate and serve planning commissioners, city managers, and other concerned with administering planning regulations. All of the 1313ers knew plenty about urban problems and about the urban research that had

3

distinguished the University of Chicago, but they came at the urban question from the viewpoint of the old bureaus of municipal research with their Progressive concern for efficient and effective provision of services–the name Public Administration Clearinghouse was well and carefully chosen.

In both of these contexts, the NRC's Urbanism Committee was connected to the main organizational interests but also a bit peripheral. The Urbanism Committee chair was Clarence Dykstra, well-respected from his years as city manager of Cincinnati. Other members were Charles Eliot, Louis Brownlow, Arthur Comey of the Harvard School of City Planning, Undersecretary of Agriculture M. L. Wilson, Harold D. Smith from the Michigan Municipal League, and Louis Wirth. from the University of Chicago. Planner Ladislas Segoe directed the research staff from a base in Cincinnati, while Wirth was the key figure who digested the research into just under a hundred pages of text. As the membership of city management specialists suggested, the work of the Urbanism Committee centered not on land use and infrastructure planning per se but rather on the economic conditions and "government tangles" that often frustrated physical planning. Charles Eliot put it this way: "Is it now time to look at the whole problem . . . to examine more closely, more intensively the social-economic limitations and government procedures and methods which limit and influence the kinds of plans that are both desirable and practicable." In examining the social and economic functions of cities and combating the problems of intensive urbanization, added Ladislas Segoe, the group hoped to find ways to help planners treat underlying problems rather than symptoms.[8]

The resulting document is very much a "Chicago" product with its attention to social dynamics and institutions. The body of the report has the careful rhetoric of social science research and government publications. The text is thickly argued, supported by statistical picture graphs and statistical and administrative maps. Its attention centers on issues of population growth, economic development, and governance.. Although one of its important background documents was a study of planned communities and company towns, it essentially viewed cities as arenas for improved political and economic organization. The focus is the particularities of demography, regional change, and administrative structure with an eye for economic viability and efficiency.

Our Cities has three main sections of data and analysis, bookended by a Foreword that summarizes problems and challenges and a concluding set of "Statements of General Policy and Recommendations." In between are "The Facts about Urban America," "The Process of Urbanization–Underlying Forces and Emerging Trends," and "The Problems of Urban America" (of which it lists and discusses thirty-six). The topical coverage is comprehensive, ranging from transportation to recreation, from economic specialization to public health, from poverty and unemployment to governmental disorganization and lack of municipal cooperation. The report placed the blame for many urban problems squarely on public neglect, pointing out that "although the United States has been a predominantly urban nation for more than two decades, this report . . . is the first inquiry of national, official, and comprehensive scale into the problems of the American urban

community."[9] It concludes with wide-ranging recommendations for federal studies, federal policies, and federal programs to address the needs of cities, many of which have been implemented in the nearly seventy years since its publication.[10]

Different visions . . . different solutions

Placed side by side, the film and the report reveal a consistent fault line that divided two distinct approaches to city planning and the improvement of urban life As Table 1 summarizes, the differences spanned both the details of plans and the processes by which these plans might be developed and implemented.

Table 1: The City and Our Cities: Points of Comparison

The City	Our Cities
Cities as physical artifacts	Cities as social and political systems
Cities as residential environments	Cities as centers of production
Decentralization as solution	Dispersal and fragmentation as problem
The products of planning	The process of planning
Planners as "outside" experts	Planners as governmental "insiders"

1) The scope of city planning

The City highlighted the physical functionality–and dysfunctionality–of the modern city. It diagnosed the problems of physical scale such as crowded housing, overburdened downtowns, lack of open space, and congested traffic, and it offered a solution based on physical design. In part, of course, this is a natural consequence of the medium, since films are designed to show physical things in motion. Cinema critics then and now have examined the ways in which the film used still and moving cameras to different effect, choices of physical perspective in different scenes, and the contrasts of scale– people are foregrounded in the "good" village and planned suburb but dwarfed by large, looming cityscapes in the "bad" industrial city and metropolis.

In addition, the focus on physical design matched the interests of Stein, Mumford, Frederick Ackerman, and others of the RPAA who provided the intellectual context in which the film makers worked. As is well known, the RPAA shared a vision of regional urbanization in which the key factors were the physical design of individual components (e.g., Radburn, NJ) and the spatial relationships among the components that assembled into the regional city. Their work, fundamentally, was about the ground plan of individual communities and the proactive mapping of activities and population on a regional scale.[11]

Presented in the context of the New York Fair, *The City* also invited comparisons with the General Motors Futurama exhibit. Both the film and the exhibit put cities in motion– the Futurama by physically moving visitors through the exhibit and the film by use of camera and actors. The New York sequences, comments William Alexander, were especially "clever, quickly paced, [and] composed of some of the best cutting and internal movement in 1930s documentary film."[12] Each *showed* what the future might be like rather than writing about it and, by so doing, inevitably emphasized the physical aspects of metropolitan areas.

The central concern of *Our Cities*, in contrast, is the problem of economic viability and efficiency: efficiency of production, economic rationality in land uses, affordability of housing, effectiveness of taxation systems. The underlying concern was the New Deal challenge of restoring long-term viability to the national economy. The writers of *Our Cities* thus understood cities in the context of regional resource development (the parent organization, after all, was the National Resources Committee) and worried most intensively about the economic costs of urban inefficiencies. Closely connected was a concern with labor force quality, with recommendations looking toward expanded social welfare, improved education, and crime prevention.

In other words, the report was a product of social science that lay in the tradition that stretched back to the Paul Kellogg's Pittsburgh Survey.[13] More recently, Charles Merriam had been one of the founders of Hoover's Social Science Research Council, whose compendious reports on *Recent Social Trends* had set the foundation for understanding the modernization of American society. As reviewers noted at the time, the authors made effective use of pictorial graphs and descriptive maps showing urban growth (and decline) over time, the role of railroads in metropolitan growth, and migration patterns.[14] *Our Cities* offered data where *The City* highlighted design.

2) Consumers and producers

The City implicitly rejects the world of work. The "bad" city is defined by the twin poles of the industrial economy–smoke-belching factories and downtown office buildings filled with paper and paper-pushers. In the short transitional fourth sequence, efforts to find weekend respite from the hard-working metropolis end in overheated radiators. In

contrast, the "good" city that is set in contrast to the metropolis is a place of leisure. Kids are home after school, dad is home after work, mom gets to stay at home with her up-to-date kitchen. Leisure is individual (bike riding children) and communal (picnicking in the park, joining or cheering a ball game). Encapsulated and foreshadowed in the film is the transition from a world of work to what historian Lizabeth Cohen calls the "consumer's republic" in which citizens are understood not as workers but as consumers, and citizenship as the opportunity and right to consume goods and services.[15]

The very title of the Urbanism Committee report–*Our Cities: Their Role in the National Economy* –set a different agenda. The opening list of fourteen emerging problems begins with "drastic inequalities of income and wealth" and the "lack of articulation among the various industries within our urban communities." leading to "seasonal and cyclical fluctuations in the total pay roll of the community . . . . migrant labor, increased unemployment load, lower wages, shrunken purchasing power, loss of business, high cost of relief, untenanted property, tax arrears, and curtailed municipal services" (see Table 2 for a summary of the entire list).[16] The entire middle section offers the classic economic explanation for the growth of large cities as increased agricultural production makes possible spatial specialization in industrial production and service. Maps trace urban growth and decline, rural-urban migration, transportation as a factor in population concentration, and industrial trends. The report distinguishes among individual cities as they "acquire a specialized role in the national economy."

> They become differentiated partly as a result of differences in access to suitable resources, transportation facilities, and labor supply. In addition to these natural and technological factors, cities in the course of time become distinguishable from one another also because of the initiative of entrepreneurs . .. . so that certain cities acquire a prestige and renown for the production of certain goods. Such factors wig;; in the course of time shape the industrial character of the community. Furthermore,. Certain industries can exist advantageously only where others upon which they depend are already established. Some cities, therefore, developed a highly specialized economic base, while others, offering more general locational advantages, attract a variety of industries and thus become more balanced economic entities.[17]

3) Decentralization v Regeneration

The City, of course, presents congestion as a basic urban problem and planned decentralization as the solution. Both the murky industrial city and the teeming metropolis are, fundamentally, places where too much activity is concentrated in too small a compass. The alternative is squarely within the mainstream of planning thought that stretched from Frederick Law Olmsted and Ebenezer Howard through social reformers like Harlan Paul Douglas and the design utopians of the RPAA.

Our Cities, in contrast, anticipates much of the urban policy discourse of the 1950s and 1960s by viewing decentralization as a triple challenge. Suburbanization fragments the governance of the metropolis and undermines administrative capacity. It often involves inefficient and fragmented land development with attendant costs for the provision of public services. Finally, the dispersal of population and activity undermine the downtown and core neighborhoods. On all of these analytical dimensions, the report highlighted the problems of central cities–increasing poverty, declining tax base, obsolete infrastructure, and substandard housing.

In response, the report's authors argued against wholesale decentralization and abandonment of core areas. As Christine Boyer has summarized, "the Urbanism Committee set about to redefine the structure of the urban center within the metropolitan whole."[18] They asserted that "wholesale decentralization, which is being advocated by some, does not seem to be compatible with the effective performance of the economic and cultural role of the urban community in the life of the Nation." The many defects of cities, "are but blemishes or infections which an otherwise healthy organism can check," in this case through "judicious reshaping of the urban community and region by systematic development and redevelopment in accordance with forward-looking and intelligent plans."[19] Their specific solutions included the rationalization of social welfare systems, slum clearance, a national housing program, the expansion of municipal authority, and something very like urban renewal:

> Better to control urban development, to combat land speculation, and to have land available for low-rent housing, recreational, educational, and other public facilities likely to be increasingly required in the future, the Committee advocates a more liberal policy of land acquisition by municipalities and accordingly recommends the liberalizing of the fundamental laws of the States in order to permit urban authorities to acquire, hold, and dispose of land with greater freedom and to allow a wider interpretation of the term "public use."

4) Planning as product or process

The City is about end states and desired results. The film committee explicitly rejected efforts to build in analysis of how cities found themselves in dire straits, opting to show the *content* of good planning rather than the planning process. In the context of the late 1930s, it is especially striking that the film avoided direct confrontation with the central contradictions of capitalism. Critic Richard Griffith noted the problem at the time. The film's conclusion, he commented, placed the choice of chaotic metropolis or summery suburb squarely on the viewer. Who could actually make the choice, he wondered. "The City proceeds as though everyone could, as though it had only to convince us of the *value* of the future town. But people do not live in slums by choice. They need to be shown not only what they ought to have but how they can get it. And this the film does not mention.[20]

Our Cities, in contrast, is about ways to rationalize the institutional location of decisions and improve the process of decision-making. Its authors wanted to tackle the metropolitan governance question by making administrative and legislative functions match up with social and economic realities. They worried about municipal taxing capacity, about the professionalization of public service, and about the legal authority of city and regional governments. The first of the hefty supplementary volumes was devoted entirely to urban government and administration, while the second volume devoted equal space to Arthur C. Comey and Max S. Wehrly's physically-oriented description of "Planned Communities" and Harold Buttenheim's discussion of "Urban Land Policies" with its attention to issues like tax foreclosures, land titling, subdivision controls, tax assessment, and property taxation.[21]

5) Outsiders or insiders.

The leadership of the American Institute of Planners offered a telling bit of self-analysis in the inaugural May-June 1935 issue of the *Planners' Journal*. They–AIP members–were "professional planners" in contrast to "administrative planning officials." The formulation packed several overlapping meanings. Planning as a field of practice had evolved in part from architecture and landscape design, both fields where individuals with specialized skills and knowledge worked project by project for a succession of clients. Out of this context, many AIP members had developed their careers in the 1910s and 1920s as freelance consultants who advised communities about zoning, transportation, and the location of public buildings. Others, like Lewis Mumford and many of the RPAA crew, were idea people who commented and advised about urban growth as critics and outsiders. There was an assumption of superiority in the *Planners' Journal* formulation: professionals were the experts who told the administrative planning officials what to do.

In contrast, *Our Cities* was written for policy-makers and officials, fitting squarely within Charles Merriam's agenda of making social science research an indispensable staff function for elected officials and bureaucrats. Both Merriam, as the research entrepreneur behind the National Resources Committee, and Louis Wirth, as the social scientist most closely engaged with the Urbanism Committee, moved easily between government advisory roles and the academy. *Our Cities* thus treated city planning as one element among many that made for effective, efficient, and progressive government. This is the same intellectual environment in which political scientist Robert Walker, a student of Merriam, argued that planning should acknowledge or even embrace its essentially political character and that it would function best as a staff function of central city administrations.[22]

If planning was best seen as a function internal to the city management process, then its purview was broad and its boundaries expansive. *Our Cities*, after all, covered questions of taxation, public employment, administrative reorganization, unemployment, and social welfare. A few years later, John Gaus, one of the pioneers of American public administration and political science, found himself a professor of city planning at

Harvard University. His summary of the subject matter ranged over "administrative planning" and "social research" as well as "city planning" and "regional planning," making figures as different as Woodrow Wilson and Robert Lynd into ancestors of the planning tradition.[23] Similarly, the Public Administration Service in 1943 published *Action for Cities: A Guide for Community Planning* (Chicago, 1943) with the sponsorship of the American Municipal Association, American Society of Planning Officials, and International City Managers' Association. The guide gave economic development strategies and social services equal attention and standing with "the ground plan of the community."

Concluding thoughts

The two texts originated in what we can call the contrast between the American Society of Planning Officials and the American Institute of Planners. As John Gaus commented in 1943, "the existence of these two organizations reflects the difference in emphasis between physical design in city planning . .. .and that on legal, administrative and social analysis and staff work generally. . ...I think that the American Institute of Planners might properly be viewed as the physical design section within the planning personnel of the country."[24] As an AIP (and RPAA) project, *The City* reveled in the physicality of the city, highlighting the impacts of the built environment on everyday life. As applied social research, *Our Cities* zeroed in on social statistics and administrative problems.

In the decades since, *The City* has remained an important text for planners while *Our Cities* has been assimilated more easily into the lineage of urban policy and urban studies. Eduard Lindeman's review in *The Annals of the American Academy of Political and Social Science* anticipated this direction but predicting that the report would be of special interest to social workers, educators, officials, and social theorists–but not mentioning planners.[25] *Our Cities* had little direct impact on federal policy in the short run, but it provided an intellectual foundation on which postwar policies might be built.[26] The differences then and since have reflected and reinforced the split between the public housing and social work wing of urban reform and those who centered their attention on urban form, land use, and architecture. In a sense, they anticipated the contemporary contrast between the sociologists and political scientists who populate the Urban Affairs Association and the designers and architects who have organized and promoted the Congress for the New Urbanism.

Table 2: Emerging Problems According to Our Cities
(as summarized in Walker, The Planning Function in Urban Government, p. 43)

1, Basic inequalities of income and wealth within the urban community.

2. Lack of articulation among various industries within the community

3. Rapid obsolescence of physical plan and plant.

4. Disruption of the national urban pattern brought about by competing forms of transportation.

5. Uncontrolled subdivision and real estate speculation.

6. Burdensome proportion of substandard housing.

7. Endangered public health, particularly in blighted areas and among low-income groups.

8. Disorganizing effects of ethnic, religious, and cultural heterogeneity.

9. Inadequacy of adult, vocational, and higher educational programs.

10. Prevalence of juvenile delinquency, organized crime, and commercial rackets.

11. Inadequacy and irrationality of existing systems of urban public finance.

12. Adjustment of the legal position and powers of the city.

13. Difficulties arising from the overlapping of independent governmental units.

14. Persistence in some cities of graft and corruption

1. Lewis Mumford, review of Our Cities in American Journal of Sociology, 44 (July 1938): 149

2. Louis Wirth quoted in Howard Odum, American Sociology: The Story of Sociology in the Untied States through 1950 (New York: Longmans, Green and Co, 1951), p. 231.

3. Movies: The City: Fine New Documentary Film Shows Evolution of U.S. Urban Living," LIFE, 6 (June 5, 1939): 64-65.

4. Insightful and detailed studies of The City that draw directly on archives and interviews with the film makers are Howard Gillette, Jr., "Film as Artifact: The City (1939)," American Studies, 18 (Fall 1977): 71-85 and William Alexander, Film on the Left: American Documentary Film from 1931 to 1942 (Princeton, NJ: Princeton University Press, 1981). The film also receives useful commentary in Robert Wojtowicz, Lewis Mumford and American Modernism: Eutopian Theories for Architecture and Urban Planning (New York: Cambridge University Press, 1990) but gets little mention in other studies of Mumford's life and thought by Casey Blake, Donald Miller, and Mark Luccarelli.

5. Gillette, "Film as Artifact."

6. Critics in 1939 noted that the ending sequence appeared "flat and lifeless" in comparison with the energy of the earlier sections. "A World's Fair Film," review of The City in Architectural Review, 86 (August 1939): 93-94, quoted in Wojtowicz, Lewis Mumford, p. 143. Also see Howard Gillette's characterization of the film as a "propaganda piece for the garden city idea" in "Film as Artifact," p. 73. A commonly distributed version of the film cut the ending substantially.

7. For the creation and evolution of the National Resources Committee in the context of national social research, see Barry D. Karl, Charles Merriam and the Study of Politics (Chicago: University of Chicago Press, 1974). Karl shows clearly how Merriam's intellectual entrepreneurship linked the privately funded Social Science Research Council, President Herbert Hoover's Research Committee on Social Trends (which produced two formidable volumes on Recent Social Trends in 1933), and the various manifestations of the National Resources Committee. The central interest of these organizations was national trends and patterns and the possibility of national-scale administrative reorganization, as in the NRC's report on Regional Factors in National Planning. Also see Harold Ickes, "City Planning Merges into National Planning," The American City, Nov. 1933, p. 65, cited in Alan Brinkley, "The National Resources Planning Board and the Reconstruction of Planning," in Robert Fishman, ed., The American Planning Tradition: Culture and Policy (Washington: Woodrow Wilson Center Press, 2000), pp. 173-92.

8. Charles W. Eliot, II, "New Approaches to City Planning," Planning for the Future of American Cities, 1935, p. 111 and Ladislas Segoe, "City Planning and the Urbanism Study," Planning for City, State, Region and Nation, 1936, p. 7, both quoted in Mel Scott, American City Planning since 1890 (Berkeley: University of California Press, 1971), 310-311

9. Our Cities: Their Role in the National Economy: Report of the Urbanism Committee to the National Resources Committee (Washington: Government Printing Office, 1937), p. iii.

10. In this reading, Our Cities lies squarely within the tradition of progressive reform that seeks government interventions to fix failures of open markets without challenging the basic distribution of economic power. For an alternative reading that sees the report as a call for radical restructuring see John D. Fairfield, The Mysteries of the Great City: The Politics of Urban Design, 1877-1937 (Columbus: Ohio State University Press, 1993).

11. In this view, The City was in synch with the Regional Plan of New York and Environs (1931), which was about the spatial arrangement of urban activities and population. Even though Lewis Mumford strongly disliked the New York plan for accepting the power of centralization, this was an argument among people who shared some of the same assumptions about the essential elements of planning. See Mark Luccarelli, Lewis Mumford and the Ecological Region: The Politics of Planning (New York: Guilford Press, 1995), pp. 167-80.

After urbanism: recent urban planning challenges in Lisbon

Catarina Teles Ferreira Camarinhas
Universidade Técnica de Lisboa, Portugal

1. Introduction

During the XXth century we have observed the creation of town planning as a scientific discipline, independent from engineering and architecture. What basically distinguishes and characterizes it from the preceding urban practices is the adoption of the social sciences scientific method (to observe, document, classify, index, compare). The growing disciplinary autonomy is a result of the institutionalization of urbanism[1], the creation of specific urban planning regulations[2], and also the creation, at the university level, of diplomas and specific training in the field[3].

The end of the XXth century brought the term of a cycle associated with scientific urbanism. As from the 1980's, the practices of democratic town planning processes gradually substituted the city-beautiful ideal, of author-endorsed formal planning.

The internationalization and globalization processes also had an impact in urban design. Recent urban development trends show, rather than the influence of national, regional or local[4] schools of town planning, the imposition of methods and techniques and urban models established at the international level, in particular in what concerns the vastly discussed issue of urban competitiveness, integration in international networks and rankings of regions and cities, territorial marketing and the consequent adoption of strategies and methodologies of the marketing type, from which planning and management are the most obvious. Planning marks its way by opposition to urbanism (in french *urbanisme*, in portuguese/spanish *urbanismo*). The use of the word planning (*planification* or *planeamento*) comes as a distinction from former scientific urbanism practice and ideology.

Planning and management, which today seem current terms when applied to the territory, are in fact concepts adopted from business administration. Its application to the urban realm has deeply changed the practices of the city-beautiful movement (or *Art urbain*) expressed in the *Beaux-Arts* style, in which the architects or the engineers had the main role (XIXth century and beginning of the XXth century) or of scientific town planning, where the town planner would be in charge and assume the responsibility for the plan and its implementation (XXth century).

In Portugal the new post-urbanism stage is mainly represented by Lisbon's Strategic Plan (Plano Estratégico, PE) of 1992 implemented through the Master Plan (Plano Director Municipal, PDM) of 1994 (both of municipal responsibility), and also through the so-called Priority Plans and Projects (PPP's), which planned pragmatic action through the adoption of projects designed by architects or teams, often external to the municipality. This principle unchained several urban actions currently still in progress, in

spite of the fact that a certain discontinuance in the urban policies which preceded them might be observed (PE and PDM, which is obsolete).

In this paper we will discuss the constitution of a new planning era associated to post-metropolitan transition, where cities have become the nucleus of multi-polarized regions of often metapolitan[5] expression. Looking at three local plans we will attempt to further define characteristics and current trends towards the constitution of a new post-industrial planning period.

2. Post-urbanism

After its golden years[6], urbanism has lost its formal authority to design univocal and hegemonic ideal futures. This new "after urbanism" cycle relates to a new moment and a new stage of the city, which Ascher called the metapolis[7]. Territorial fragmentation requires new planning answers: a greater investment in the regional scale (a process that is very clear in the case of Lisbon) to allow the definition of supra-urban policies aiming at the contention of territorial fragmentation and that offer a certain structure to the networks of places, and the construction of the new meta-heritage. The purpose is to retain the growth dispersal patterns and induce territorial recentralisation. These policies claim to obtain the desired sustainable development and to ensure the balance of the energetic gains and losses, in what concerns urban mobility, land use management, the conservation and restructuring of the territory natural systems and the forms of waste and residue treatment and recycling.

The recentralisation policy relates very directly to the town centres: indeed, the decentralization of the production and in particular the industrial relocalisation, the increasing family autonomy associated to the increase in automobile dependency[8], and the increasing tertiarisation of the society, are all factors that help explain the decline in town centre densities, with the undesirable processes of territorial and social fragmentation, characteristic of sprawled territories and other commonly known costs of sprawl, such as the destruction of farmland and open space, environmental concerns and global warming[9].

Furthermore, the already mentioned need to enhance urban attractiveness associated to town planning globalisation, has lead to a growing importance of rehabilitation, requalification and urban regeneration programs as the main scope for post-urbanism. Considering that the city is, already, basically built or at least, structured, main methods and action procedures are currently centred in the possibilities of intervention on this existing city. These forms of intervention have a very broad spectrum: as of the *tabula rasa* urban renewal processes, to the extreme opposite of the conservation and even of the reconstitution of the pre-existent memories (case of the rebuilding of the Chiado district, project of the architect Álvaro Siza, after the fire of 1992).

Analysis of the most important projects developed in Lisbon, in the last 20 years, allows for the identification of the following urban trends: the "iconification" (adoption of avant-garde symbolic projects designed within a framework of competitive post-urbanism,

Frank Gehry's project for the Parque Mayer being the most expressive example in Lisbon), decentralization (in particular industrial decentralization), strategic planning, sustainable planning (for example the constitution of greenways or the adoption of Lisbon's Green Plan), *Re* methodologies (rehabilitation, reuse, etc.), urban infill, brownfield redevelopment, management and action planning techniques. Processes of sustainable urban regeneration, focusing on the society and on the improvement of population life standards, differentiate from the operations of urban requalification, of major urban design projects aiming at the quality of public space and the improvement of urban image. We will present three cases of post-urbanism in Lisbon, where these trends are combined.

3. Three cases located in Lisbon

3.1 Praça de Espanha Plan
[image] 1 | Praça de Espanha plan, 1995.
 [image] 2 | Praça de Espanha plan, 1995**.**

In 1989, Mayor Nuno Krus Abecassis established the first agreements aiming at constructing the Orient Museum, the new building of the Teatro Aberto (theatre) and the Gôndola restaurant, all located in the Praça de Espanha area. The proposals were approved in City hall session and Municipal Assembly. Following these decisions, it was deliberated in 1990 to develop a detail Plan for the Praça de Espanha. Later, Mayor Jorge Sampaio decided to invite the architect Álvaro Siza "by his prestige, internationally recognised and confirmed by the special quality of the services to the municipality of Lisbon in the development of the Detail plan for the Chiado affected area"[10].

Architect Siza Vieira was already connected to the area due to his commitment to the project for the Foundation Cargaleiro[11] The Orient Foundation, on the other hand, had invited the architect Ioeh M. Pei to work on the project of the Orient Museum.

After the approval of the preliminary study, in 1990, doubts were raised regarding the interest in the preservation of the building of the Theatre of Comuna, whose demolition was envisaged in the context of the Master Plan of 1967 for the opening of a viaduct (Av. Malhoa). These studies were carried out in the context of the demolition of the building, which was later occupied by revolutionary artists in 1974, after the democratic revolution. The building has since gained a symbolic cultural meaning. A new context and a different view of cultural heritage, implied in a closer look at the area's constraints and the need to consider local values in the project outcome.

The program for the creation of a new urban centre would include two bank headquarters (Bank of Portugal and Montepio), the headquarters of an insurance company (Lusitânia), two museums (Oriente and Manuel Cargaleiro), two theatres, a bus terminal, connected to the subway, underground car parking, a commercial gallery and a hotel. The program was complex considering that each one of these buildings contained mixed uses including sport facilities, one school of ceramics, resource centres, etc. Siza's team maintained the idea of replacing the viaducts envisaged by tunnels, which introduced unexpected technical and financial problems. In 1991, a traffic report, showed a major reduction in the importance of Praça de Espanha as a traffic distributor, after the construction of a new highway (eixo Norte-Sul). The new axis came to diverge much of the traffic coming from the south bridge, in particular those of Campolide and University campuses. As a result from these studies, one of these tunnels would be abandoned.

The zone was declared of public utility, with authorization for administrative possession, to expropriate the buildings considered to be essential to implement the Plan of Praça de Espanha. The protocol of intervention was established in 1990 and 1991, signed by the municipality, the 2 foundations, the bank Montepio Geral and the insurance company.

The main project goals set by the municipality were related to road traffic and urban transport and also to the imposition of urban continuities through the effort of integration of various urban fabrics. Architect Siza Vieira proposed to keep of the character of the

Praça de Espanha as an open space defined only by isolated elements which have the symbolic capacity (from the institutional or cultural point of view) to act as references of physical limit (Gulbenkian foundation, Spanish Embassy, Institut of Oncology, Theatre of Comuna, Mosque).

Álvaro Siza refused to design a closed plazza, preferring to maintain the fragmentary character of the place: an open urban space "dominated by gardens, nonetheless controlled by a few isolated but yet solid and inter-related volumes" [12].

"The buildings to be built on municipal ground (such as the Bank of Portugal) will have the role of closing and consolidating the fragmented urban fabric (fabric made of blocks and continuous façades) and still, as independent volumes, to define readable relationships with the diffuse construction.

These relations can be established on the basis of intense 'traffic design', composing an overall dynamic unity of isolated volumes and continuous spaces, of stability and fluidity." [13]

The main square would be programmed like a symbolic place, of cultural relationship (the pre-existent foundation Calouste Gulbenkian, the Mosque, the Spanish Embassy, the Orient and Manuel Cargaleiro museum/foundations and two theatres), allowing the contact between various cultures associated to Portuguese history.

It was also decided to establish a greenway between the gardens of the pre-existent Gulbenkian foundation and the grounds to the south of the Columbano Bordalo Pinheiro Avenue (in connection with Lisbon's major park, Monsanto). Lisbon has been engaged in this project of greenways, a study of the landscape architect Gonçalo Ribeiro Telles, developed within the framework of Lisbon's Green Plan. Lisbon's Green Plan integrated the municipal 1994 Master Plan and aims at establishing the urban ecological structure [14].

The greenway is constituted as a free linear space accompanying natural corridors like waterfronts and coastal lines, which connect natural reserves, historic sites and cultural heritage sites and monuments (churches, firm, mills, aqueducts, etc). The concept is integrated in an international movement, which aims at giving answers to the modern requirements of compatibility between the negative effects of urban development and the safeguard of environmental quality.

Monsanto's greenway is another example, which also crosses the plan, as a limit to the south: beginning in the downtown Plaza of Restauradores, it is prolonged on Avenida da Liberdade, crosses the gardens of Alto do Parque through the University campus to the gardens of Campolide and ends in a pedestrian crossing which leads directly to the park of Monsanto. The traffic-free paths are designed to establish pedestrian connections and cycling routes and are animated by various bars, restaurants and activities.

Later, the municipality commissioned landscape architect Ribeiro Telles with the development of a study on the surface waters, which would consider the problems of floods and, at the same time, the requalification of several parts of the city. The study was undertaken in collaboration with Ambelis, Lisbon's development agency. The Valleys of Chelas, Ameixoeira and Alcântara were the three main poles of the program. Architect Ribeiro Telles developed a system of retaining ponds for the collection of surface water from the rains. The idea is to build small dams, avoiding the uncontrolled influx of water to the low areas of the city. This system would accompany the length of the green corridors, adjunct to the Central Avenue in Chelas and also in the Parks of Ameixoeira and Alcântara Valley.

Siza Vieira criticized the building of the Bank of Portugal because of the volumetric impact on the square (Praça de Espanha), confronted with close pre-existences such as the Spanish Embassy and the Gulbenkian Foundation. In 1992, Siza recommended the revision of the project of the bank, which envisaged a building with approximately 300 meters long and 50 meters high, and also that of the imposing private sector housing project (Twin Towers). In 1993, the Bank of Portugal gave up the project. The area that would be occupied by the bank was later proposed to be a housing unit.

Following the decision of the Bank of Portugal to abandon the project, together with the publication of the PDM, in 1994, it was decided to develop a new plan for the area. The new version of the plan was integrated in the PDM in the context of the Planning Unit 14 (UOP 14) as a priority plan, within the Priority Plans and Projects (PPP's) program.

The preliminary draft for the establishment of the Bank of Portugal envisaged the demolition of some apartment buildings. Instead, in the new project it was proposed to build new housing as urban infill. The municipality also gave up the intention of constructing an underground bus station. After the abandonment of the Bank of Portugal, Siza proposed the revision of the volumetry planned for the Bank Montepio Geral, which previously balanced the volumetry planned for the Bank of Portugal.

The abandonment of the bank's headquarter project implied that the municipality returned, with interests, the money which had already been advanced by the Bank of Portugal, which, in 1993, was translated into an amount of 12 million euros.

The market salesmen of Praça de Espanha complained about the planned new market location in another district (Alvalade). The relocation became controversial by the opposition of the inhabitants of Alvalade, who did not accept the new localization envisaged inside the neighbourhood Alternatives were studied. A new plan is in hand since 2004.

3.2 Chelas civic centre
[image] 3 | Chelas civic center development plan, 1999.

Located in the Chelas district, one of the last large housing neighbourhoods designed in Lisbon (1960-64), the Chelas civic centre plan was integrated in the PDM of 1994 (UOP 27) and was coordinated by Ambelis[15]. Such as the neighbourhood of Olivais, another large housing development also located in the eastern side of Lisbon, programmed in the sixties for a population of 34000 inhabitants, the civic centre was the last project to be implemented. Contrary to planning recommendations, financial constraints have led the central units (or civic centres), where the social activities should take place, to be the last areas to be executed, and the final program of these units was even contrary to the vision behind these plans.

Unlike other preceding social housing projects in Lisbon, where several types of promotion were integrated to avoid the risks of social exclusion, Chelas was mainly built during the revolutionary time and considered only the promotion of social housing. The district has many functional, aesthetic, and social problems and was criticized by its housing monofonctionality, the difficulties of accessibility to the downtown area, the absence of public space design and maintenance (including the built park), the delay in the construction of the programmed public buildings (including the civic centre), the constructive insufficiencies, and the delay in the construction which led to failure to implement the global program (replaced by a progressive operation)[16]. All these difficulties of programming and implementation resulted in a physical isolation from the close neighbourhoods and the built continuum.

Ambelis considered the improvement of the image and status of the area, developing a new urban project, coordinated by architect Nuno Portas, aiming at the design of the civic centre, programmed in the Chelas Plan. The new program for the civic centre proposed four private housing blocks of 16 stages, offices and a mall/multi-department store, built above Chelas Central Avenue involving the construction of ring road, and subway station: "a true fortified consumption wellbeing island encircled by miserable social neighbourhoods"[17]

The project also included the programming of several large public buildings (municipal services, such as Lisbon's historic archives and the hemerotheque), the new criminal courts, the hospital of Todos os Santos, the headquarters of the *Expresso* newspaper and an upper status condominium.

The main purpose would be the urban regeneration of the eastern side of the city. The urban models considered in the design of Chelas civic centre would be that of La Défense and several projects in Barcelona, which were intended as strategic poles to invert the image of the sensitive districts, establishing private/public investment partnerships.

The plan gave freedom and flexibility to the architects who designed the buildings, resulting in a fragmented urban design, centred exclusively on the perimeter of the new blocks, without establishing connections with neighbour buildings or continuities with pedestrian accessibility.

All the projects, including the municipal archives, were commissioned to private architecture teams. The lack of quality of the urban project and the obvious lack of continuities it allowed was possibly the main reason for the early abandonment of the overall idea. All the municipal services[18] gave up their intentions to build on the site and the only projects that were built in the civic centre were the housing complex (mall/multi-department store with the four housing tower blocks) and the housing condominium, totally disconnected from the existing fabric.

From the 27.5 million euros that the consortium responsible for the housing and mall complex paid by the land, the municipality received a little less than 1,5 million euros, the remainder being paid with the roadwork[19]. The first outcome of the project shows the enormous difficulties in the commercialization of the apartments (consortium complex and condominium) and also the negative impacts of a commercial bunker imposed on the small commercial units of the neighbourhood (often the only spaces of social interaction in sensitive districts such as Chelas). With the abandonment of the main investors in the public services such as the municipality and criminal courts, but also of important urban functions such as the newspaper headquarters, the programmed transformation lost its dynamic and ability to develop an enduring regeneration process actually capable of putting a new symbolic meaning to the process of urban change. Instead, the new "commercial bunker" stands isolated in the Chelas Valley, not contributing to its image and strategic social regeneration.

3.3 Alto do Lumiar

The Plan, coordinated by SGAL, a company responsible by the project's urban management, was established for an area classified by Lisbon's 1992 Strategic Plan as Innovation crown, a cluster of urban sectors to be transformed, which included the grounds of Expo'98. The zone had been object of a proposal of Urbanization Plan, developed in collaboration with the National Laboratory of Engineering (Laboratório Nacional de Engenharia Civil, LNEC), in 1988.

The project was object of a public-private partnership, established through the constitution of SGAL and which claimed to generate "the greatest real estate operation of today in Europe"[20].

The sector in study (adjacent to Lisbon's airport) was occupied by illegal and informal housing, derelict sites and outdated infrastructure, forming a decaying unit, socially, physically and functionally unstructured.

The plan was included in the 1994 PPP's and was developed incorporating the proposals established in the PDM (UOP 23).

[image] 4 | Alto do Lumiar plan, 1999. City structure and continuities in street design.

The program is that of a new district for 65.000 inhabitants, integrating new lodging for the population, which previously lived in the site under extremely precarious conditions. Programmed as an extension of the city centre, the plan envisages the prolongation of the historical axis, structuring the new urban development. According to the authors of the plan, the walk of Lisbon (Passeio de Lisboa), will be "the biggest and widest" avenue of the city, in continuity and according to the character of the *avenue-boulevards* of the beginning of the XXth century (Avenida da Liberdade and Avenida da República). Programmed housing is intended for various social classes, integrating several types of promotions. The program aims at a mixed-use neighbourhood: housing, commerce, services, hotel, offering the basic urban services, infrastructures, public transport (including subway station), parks, sporting and leisure facilities.

The approach is market oriented and functional. Aiming at the inversion of the declining image of the East side, the plan used a marketing strategy to gain a new status, for example by the choice of a new name: Alta de Lisboa (Uptown Lisbon, with a connotation of high standing). The strategy is that of offering low budget housing for the middle class, trying to reverse the speculation process in Lisbon.

[image] 5 | Alto do Lumiar plan, 1999 (zoning and urban design).

The program is designed as a compact city, in an approach directed towards street design, identified by the authors as the crucial public space. The grid plan was intended in continuity with the structure of the beginning of the XXth century Lisbon, with the housing organized in small blocks, often open and making use of the interiors as public spaces of creativity.

The intention was not to build ghettos, leading to a solution where the new social housing was built separated by private housing promotion for the middle class, a project designed to mix large-scale private-sector investment with low-income housing. However, the first constructions were the lodging for the populations that already lived on the grounds in precarious conditions. As a result, the first image of the new neighbourhood was disastrous: islands of social housing non-profit developments, dispersed on construction grounds in an overall de-structured chaotic unit. The image of neglected area led to difficulties in selling the new housing units with the consequent trouble in giving continuity to the program. The zone is full of discontinuities, misses equipment and exhibits high levels of insecurity associated with a majority of population relodged in small isolated blocks interrupted from other construction and vacant grounds.

The enormous quantity of recent apartments placed on sale by extremely low values, led to an increase in the loss of interest in the historic city centre, with difficulty of sale and decrease in market value of the built heritage, especially in sensitive neighbourhoods where this process was already on the way. This type of promotion, intended at the low and middle classes, does not have an influence on the value of the real estate located in central consolidated areas where the speculation process is

independent of slum upgrade promotions or brownfield redevelopment. The bigger impact tends to be in the already decaying middle class neighbourhoods, although the conclusions are premature since the process is still under development.

Difficulties in implementing the project, which is slowly transforming the area into a new Chelas, have led to the pressure for displacement of the Lisbon airport towards a new location on the urban fringe.

4. Conclusions

Desperate attempts at rebuilding downtown territories have been made since the mid XXth century[21]. These attempts are supported by pragmatic reasons, associated to the value of the central grounds and the need for speculation, and, in addition, by aesthetic reasons, mentioned especially by the architects. This aesthetic/urban renewal movement of social reform by special renovation, mainly represented by architect Le Corbusier and the CIAM, gradually became opposed to the culturalist model[22] associated to movements and schools of town planners like the Institut d'Urbanisme de Paris, which had an enormous influence in Lisbon. The relation between these two ideological groups could not be peaceful, since their visions are antagonistic and their desires for the future of the cities are opposite. The failure of the modern movement, with regard to its capacity of action in the urban fabrics, has led the architects to join the competitive movement and the attempt at the "iconification" of the city, through emblematic promotions which claim to improve, in a more or less radical way, the quality of life in the urban territories. We observe this type of promotion associated for example, with the waterfronts, the case of Expo' 98 or the maritime waterfront of Barcelone, etc.. These systems of urban action have been criticized by its rupture of the traditional model of urban production, entering sometimes in contradiction with the state/municipal projects, not respecting the wills of the local populations and dispersing the territory with fragmentary megalomaniac visions, often of great impact and density.

This type of action is often, in fact, associated to real estate private investments which can be an important urban economic asset but that should not prevail in the benefit of private profit, without regard for the true demands of the populations. It is, thus, recommended to associate private investment and public interest. It is important that these programs are developed in public offices, with respect to the principles of sustainable planning and, above all, obeying to programmed territorial thought. A first measure, taken by the Portuguese authorities has been to simplify planning procedures, namely regarding the respect for delays and planning approvals. Efforts are being made at simplifying the planning procedures throughout its entire process, not allowing for bureaucratic logics to gain terrain as an excuse for private programming. This need for simplifying has been noticed in cases such as the Expo'98 urban development and the Polis Program, which, using specific legal and financial resources, have allowed the execution of urban operations, crossing private and public interest and that would not have been possible had the traditional heavy processuel structure, to which local administration are subject, been used.

Table 1 | Comparative framework of three of post-urbanism projects

The three Lisbon case studies analysed here, exhibit the definition of a new planning phase, evolving from city science to urban politic. Given the fact that the city is basically already built, new trends are centred in its rehabilitation (architecture preservation and renewal), requalification (improvement of life style, namely through street and public place design), and the more profound urban regeneration processes. The development of two opposed tendencies may be observed: regional competition, using designers as image and identity makers and sustainable planning, evolving from culturalist town planning approaches to ecological design and democratic planning. Both make appeal to strategic management techniques, centred in the definition of a new after-city policy for a society in paradigmatic transition where urbanism no longer has a place. Urban governance, making use of sustainable planning, civic engagement and strategic management, comes up as a new disciplinary approach to the building of societal organization.

[8] A particularly emergent issue in the case of Portugal, where the network of motorways is mainly an invention of the end of the XXth century, after European funding. The study of the European environment agency - integrating, since 1994 the CORINE (Co-ordination of information on the environment) Land Cover of 1990 and 2000, using the Landsat satellite images - shows that Portugal is the second European country with the greatest urban growth during this time, following Ireland. Nevertheless, urban diffusion in the case of Lisbon must be put into scope since its urban surface of 3128 km2 (2000) not comparable to the American cases of Phoenix (46000 km2) or Los Angeles (sprawled metropolitan area: 86000 km2), which is approximately the size of Portugal (88900 km2).

Public and private values in planning architectural icons: in search of a rationale

Ekaterina Petetskaya
University of New South Wales, Australia

Introduction

Purpose-built architectural icons have appeared all over the world as components of "culture-led" regeneration programs in recent decades. In contrast to the profound tradition of great world icons, such as the Taj Mahal in India or the Pyramids in Egypt, these modern constructions were intended to become iconic and to thus become powerful and unique forms of attraction for cities. Planning history comes to see them as physical and spiritual embodiments of cultural capital in their respective urban environments. There is a belief that such buildings can bring about substantial economic benefits. It seems almost every city believes they need an icon or icons to appear culturally relevant and achieve what other regeneration winners have done. But given the scale of investment required, and the political and economic stakes, two questions need to be answered: what difference do they bring to a city and what rationales underpin the decision to build them? Important matters of public and private costs and benefits inform the discussion. Icon projects appear to be widely supported by public funds. Across this divide, issues arise around the distribution of benefits. The first two parts of the paper present a theoretical view on the difference that architectural icons bring to cities and the rationales behind the decision to build them. "Successful" examples of icons in Australia and Europe are discussed. The final part puts theoretical and practical considerations together and concludes with recommendations on what can be done to improve their performance.

1. Architectural icons and culture-led regeneration programs

Terms such as "architectural icon" and "iconic architecture" are readily found in urban planning literature but appear not to have been precisely defined. An interesting definition for an "urban icon" can be found in the Urban Icons Conference 2006 materials. Widely exploring the "urban iconicity" topic the combined conference materials provided the following definition:

> Urban icons, then, are signs born when symbols become images but are not thereafter limited to their incarnation as images. They originate in specific places – cities – and convey meanings that are not only urban but also national, global, religious, ideological, personal, political, commercial, emotional and in all ways historical, as mediated by the urban context. While as a subclass of symbols they are also (with signs in general) unstable carriers of multiple, perspectival, ideological and often contradictory meanings, they can also achieve some measure of universal, cross-cultural meaning[1].

It is notable that this definition includes reference to notions such as "urban environment" and "place representation"; urban icons must also possess a "circulation in the mass media" characteristic. The images of urban icons need to be media-friendly; their media image needs to be able to attract public attention in the long term.

I would like to argue that to define architectural icons additional features to the definition of an urban icon have to be found. First, they are buildings or collections of buildings and the spaces between them. Second, such constructions become icons when they transcend their original functional purpose. Third, the history of construction process of iconic buildings is usually remarkable and captivating.

Architectural icons function as distinct expressions of place in urban landscapes. They represent many things but most of all they represent the soul of a city, and sometimes a nation. Weston underlines the importance of possessing a "recognizable image" of an iconic world monument and to become "iconic", a construction needs to do no less than win the hearts of crowds, locally and globally. The degree, to which such constructions are leveraged worldwide as iconic structures linked to certain places, depends on the strength of their unique and intrinsic links to the place of their location[2].

Certain distinctive characteristics appear to be crucial for city planners and authorities charged with building iconic architecture. Engaging a world name architect appears to be an absolute necessity. The design itself must be innovative and of a large scale. Such ambitious projects are typically enormously expensive, and generally the majority of this expense comes from public funds. As Julier notes, location can be distinguished by a new building itself and by "civic patronage", meaning that the city has the money to carry on the project and has the taste to employ a famous architect[3].

There is, however, no guarantee - even in following these unofficial guidelines - that a city will become a proud possessor of another iconic building. There are buildings and structures all over the world that were built with an intention to become iconic, failed to do so and became forgotten. Some have failed to reach their visitors' number targets, or income generated estimates, for example: Santiago Calatrava's new wing at the Milwaukee Art Museum (USA); KIASMA Helsinki Museum of Contemporary Art[4]; the new buildings of the City Museum of Washington DC, the Royal Armouries museum in Leeds[5](Plaza, 2006). Some have even had to close soon after they were opened, such as the Earth Centre in South Yorkshire. Yet others become successful beyond expectations, examples being the Sydney Opera House or the Eden Project in Cornwall.

What determines the success of architectural icons is actually not so clear. More often the successes or otherwise of icons are written off as the result of fortune. But given the high cost of failure, typically hundreds of millions, should we not be looking into what makes an iconic building successful or not, and on whose terms, with some more accuracy?

There is also no clear evidence on the contribution of architectural icons to local economies. This may be because there is no "scientific proof" of what actually the contribution of culture-led regeneration is. The outcomes and value systems/judgments of regeneration have never been meaningfully established: "The rationale for measuring cultural impacts in relation to regeneration is not sufficiently understood or valued by stakeholders. Culture is not generally recognized in urban policy or environmental and quality of life indicators (such as health, education, employment, crime) and therefore is absent from regeneration measurement criteria"[6].

Many cities have been challenged by the relatively recent transition from industrial to post-industrial economies. As travel and technology bring people closer, cities are threatened with becoming "interchangeable". They have had to turn to unique "value-based" competitive advantages that are "non-price" competitive. This has brought a new focus in urban planning on creating competitive attractiveness.

In turn, cities have begun to develop their historic and cultural capital as a cornerstone of their "point of difference" in the competition between cities, in order to achieve sustainable competitive advantage. This focus on culture in urban development is now widely deployed by local, regional and national governments as a way to increase urban competitiveness, and this is where the specific construction of cultural centers began to take shape as a powerful city branding device.

"Culture-led" urban development began to appear as a concept in the urban planning literature from the late 1980s. "Culture-led" regeneration refers to a type of regeneration where culture can be employed as a driver for urban economic growth and "cultural activity is seen as the catalyst and engine of regeneration—epithets of change and movement"[7]. This type of regeneration brings along a number of distinct cultural projects, which claim for a uniqueness and aim to create place distinctiveness. Purpose-built architectural icons and other forms of flagship development projects form a big part of this type of regeneration.

The use of unique place values as a driver of city competitiveness was emphasized during the OECD International Symposium "Enhancing City Attractiveness for the Future" in Japan, 2005, where the role of culture was especially highlighted. Cities' attractiveness is a combination of environmental, cultural, social and economic elements. All components are equally important; however understanding that cities need to trade on unique values reveals new and important roles of culture - the ability to drive the distinctiveness of place. In recent years studies have been undertaken on cities' search for their distinctiveness. A well known work of this type is Markusen and Schrock who theorize urban homogenization and distinctiveness[8]. Montgomery's concept of cultural quarters as distinct and distinctive areas of cities that enhance city attractiveness is another contribution to the field[9]. Malecki outlined the ability local culture to add unique features to economies, underling the importance of creating and maintaining a distinctive local culture as an important tool for attracting investment[10].

The realization of the cultural sector's great potential for economic development brought architectural icons to the forefront of culture-led regeneration strategies developed by city planners. Put simply, the ambition that drives cities to undertake these projects all over the world is to build the world's great building and to become a "world city" because of it.

Architectural icons, therefore, are components of city growth strategy and are usually combined with place marketing strategies or/and enhanced amenities strategies in order to increase a city's attractiveness and competitiveness on a national or international level.

The overall role of flagship developments (including architectural icons) and regeneration programs is to benefit a local community by fighting social deprivation and bringing economic development. Yet economic development does not need to be narrowly defined to increase employment; the broader interpretation means achieving higher standards of living and increased quality of life.

The benefits of architectural icons are seen to be spread widely through public and private sectors. Icons contribute to economic development by enhancing the regional culture on offer, creating regional identity, increasing a region's attractiveness to people and businesses and generating a social and political climate open to innovation and change in regional governance[11].

It is commonplace for city authorities to argue that such cultural projects support surrounding businesses; increase business profitability; enhance property values in the area; attract well-educated work force and increase tax base for the region.
It is assumed that large cultural schemes such as architectural icons bring a positive impact for local communities through creating new jobs to the area and encouraging civic pride, and that they also have potential to contribute to creativity and innovation for the community, and (being common public spaces) can promote a feeling of equalization. These are frequent reasons cited as to why architectural icons should be supported by public funds.

Thus, to summarize the main findings, architectural icons are seen as a strategic component of culture-led regeneration programs that are brought in to revitalize an area, and stimulate economic development. The projects are usually developed and supported by public funds. The benefits appear, at least theoretically, to flow widely to public and private sector.

2. Three cases: Sydney, Salford and Bilbao

To demonstrate how this works in reality I would like to explore three "successful" examples of architectural icons: the Sydney Opera House, Sydney, Australia; the Guggenheim Museum Bilbao, Bilbao, Spain; and the Lowry at Salford Quays, Salford, UK. These cases have been chosen because of their wide recognition as successful

icons and flagship developments, and because all three cases are supported by extensive documentation.

Images of these three buildings are pervasive: we find their presence in advertising and tourism campaigns locally and internationally, representing their cities and nations. They stand as magnets for investors and visitors. Time has shown that all three were able to achieve their original purpose and are widely recognized as iconic architecture. Indeed their performances are used to demonstrate the possible success of an architectural icon, to the point where in 2007 the Sydney Opera House was invited to join UNESCO's World Heritage List as "a world-famous icon of architecture".

By exploring the real experiences of iconic architecture in Salford, Bilbao and Sydney in frameworks that were highlighted in the first part of the article I would like to challenge some of the theoretical propositions as to why architectural icons are made. I would like to look at how to answer the genuine questions that are raised such as: what difference does an architectural icon really bring to a city? What rationale is behind the decision to build them?

Architectural icon projects are usually undertaken as part of wider regeneration programs. Thus, Salford Quays were only part of the regeneration of inner city Salford. The Guggenheim Museum in Bilbao was part of the holistic Plan for Revitalization, which included improvements of several substantial areas in the Metropolitan Region. What is striking, from today's perspective, is that the Sydney Opera House project did not follow an official regeneration program. In the 1950s when the idea of new opera house for Sydney appeared, regeneration programs were not apparent in planning policy. I would argue that this iconic building became the first example of flagship development in the world, without having a formal aim to do so. It became a benchmark for the success of an architectural icon, and cities all over the world have since tried to emulate this effect.

An architectural icon aims to become a symbol of change. The success of an iconic building is measured by its ability to change perceptions (towards the place) for the better. In these terms, it is hard to argue anything other than that the Sydney Opera House was a resounding success: as Drew notes, the decision to build an opera house in Sydney and the choice of Utzon's unique architectural idea presaged a new epoch for Australia. It meant the transformation of an old British Australia to a diverse European multi-cultural Australia[12]. The Guggenheim Museum Bilbao also assisted to transform the city's image from a traditional steel and shipbuilding region with a reputation of violence from extremist Basque separatists into a thriving, contemporary cultural destination. Likewise, the Lowry was a symbol of new beginning for an industrial city after the Salford docks decline and their eventual closure. Subsequently, in practical terms, the notion of a symbolic "change" of a place, a region or a city through the effect of a culture-driven architectural masterpiece was successful in these examples, as all the theories had hoped it would be.

In each of the three cases, governments were the major initiator of enhancing urban attractiveness programs. Thus, Punter argues that it was the state that initiated the pursuit of global standards of design quality and urban amenity pointing out improvement projects of the Sydney Opera House and other improvement projects which "brought a new sophistication to architecture, public realm design and conservation respectively, and new and expanded cultural facilities to enhance the city's international appeal"[13]. It was the idea and initiative of the team established by local authorities to create the Lowry at Salford and it was not driven by national government or by business or by the demand of local residents[14]. The history of the Guggenheim Museum in Bilbao reveals that promotion of innovative architecture was brought by the regional and provincial administrations, the Basque Government and the Bizkaia Regional Council[15].

Investments required to construct these three buildings were also primarily publicly-sourced. The costs of the Sydney Opera House were almost entirely funded by a State lottery. The Guggenheim was paid for with public funds by the Basque Government without central government support. In the case of the Lowry it was a National lottery that covered 70 per cent of the total cost of the project; the other sources of funding included the European Regional Development Fund; public-private partnership of the government-sponsored regeneration agencies English Partnerships and the Northwest Regional Development Agency; the local authority Salford City Council; other sources and private sector. It is worth noting that initial investments in grand cultural projects typically take many years to recover. According to Plaza the fact that financial planning of the Guggenheim Museum made it possible to recover the initial investment in less then a decade can be considered to be a world record[16].

There is a significant continued need to subsidize running costs and reconstruction costs which are usually largely financed by additional public funds. The budgeting schemes of the Guggenheim Museum Bilbao, the Sydney Opera House and the Lowry can be defined as market-orientated and are claimed to be the most successful in bringing beneficial impact on their respective local economy[17]. Even though, 25 per cent of operating costs of first two are covered by local and state governments; whilst the Lowry is generating more than 85 per cent of its own funding, leaving public funding to cover remaining 15 per cent.

So government was and is the major stakeholder in undertaking these architectural icons. But what inspired governments to take the risk and responsibility to undertake these grand projects?

The Sydney Opera House was a product of local competition between Australia's major cities, Sydney and Melbourne. The year 1956 became an important stage for Australia: the Melbourne Olympics allowed Australia to attract world attention, to grow its place in the international community and to grow national self confidence. Unfortunately for Sydney, Melbourne won the Olympic bid to host the Games. Sydney's response was to construct a unique building – an opera house worthy of a great metropolitan city that could propel Sydney to ascendancy over Melbourne and others Australian cities[18].

Similarly, the Guggenheim was an attempt by Bilbao to find its place among the leading cultural centers of Europe. The Lowry at Salford Quays was an answer to the rivalry between Salford and its neighbor Manchester. It is also true that the Sydney Opera House was a political opportunity for a great gesture before the NSW State elections in March 1959[19]. The idea of the Guggenheim Museum in Bilbao and promotion of a museum's ability to increase quality of life for local population was a likewise an opportunity for the politically disfavored Basque Nationalist Party to regain Bilbao's favor and retain its voters in the region[20]. Given these factors, it is arguable that political reasons have more to do with the initiation of the concept for an architectural icon than many would care to acknowledge, especially when hounded by growing city competition on a national and international level.

As referred to above, the overall role of regeneration programs and consequently architectural icons is, at least theoretically, to benefit local communities. The governments of Australia and the United Kingdom have made wellbeing a national policy goal, and the aim of Bilbao was to increase the quality of life for its citizens. However, if one looks at promotional materials, design masterplans or feasibility studies of Sydney, Salford and Bilbao projects it is clear that the intention to raise the cultural profile of a place and place attractiveness was set in order to bring more businesses and more tourism into the area. The focus was on outsiders: visitors and investors. It assumes rapid economic growth; however it did not calibrate the degree to which this growth actually affected local people's wellbeing.

In Salford, for example, the city became able to attract major investment after years of decline. However many original residents were forced away and their houses were demolished. The development of Salford Quays and the Lowry has brought a new type of resident to the area. Henderson shows that "the Quays has not produces a cohesive residential community… a considerable proportion of the housing was being rented, in particular to a population of transient professionals, students and people living abroad"[21]. Promotional materials for the Salford Quays development operated with overstated numbers of new jobs that could have been created. Meanwhile, the 1999/ 2000 estimates revealed that only 20-35 per cent of the employees on Salford Quays were Salford residents[22].

The Guggenheim Museum certainly brought global recognition to Bilbao. However, its role was seen primarily as attracting tourists and not residents and workers[23]. The Guggenheim gives little support to local culture and artists and the international orientation of the Guggenheim explains why the promotion of Basque culture is not a goal of the museum and why regional artists are only marginally represented in the museum's collections[24]. Even though the Plan for Revitalization mentions the quality of life, there are no proposals in the plan for how this can be achieved[25].

The development of the plans for all three of these buildings was remarkably "top-down". In each case grand designs to promote the host city were mobilized by key elite groups manipulating the decision-making process. Government, whether regional, state or local, were the central stakeholders responsible for promotion, design, construction

and post-construction of the architectural icon project. Residents and local businesses had a very limited role in decision-making, a token gesture at best.

All three cases worked on the "standard iconic project scenario": world name architects were brought to the area by design competition organized by cities' authorities, whether, Frank Gehry for Bilbao or James Stirling and Michael Wilford for Lowry. It was an international jury specifically created for choosing the Jørn Utzon design of an opera house for Sydney.

In Sydney, a committee was specifically created to take decisions on how to build the Sydney Opera House[26]. By doing so decision-makers had the authority to direct revenue sources without voter's input. In Salford, despite the formal connections between local business and Salford City Council, businesses were not expected to meaningfully contribute with their views on the development[27]: "Rather it was used as a source of advice about the reactions of local business to the council's plans and as a means of persuading local business of the value of those plans"[28]. The architectural competition for the museum in Bilbao was "carefully designed so that its "international" character could not be defied and the Basques would be officially responsible for the architect's selection"[29]. There were concerns from the Bilbao community about the idea of building a brand new museum with international artwork, instead of promoting Basque art and culture. Community consultation did not take place in Salford either: "local people were not expected to play any part in developing the aims of the plan except through the (fairly limited) input of local councilors who in turn "sold" the plan to local constituents as bringing in job opportunities"[30].

Thus, to conclude the case study findings, architectural icons aim to transform perceptions towards its city for the better, and sometimes they certainly do. They are usually developed and implemented by a small group of key decision-makers, who often leave beside the main interest groups: business and residents. Government, whether regional, state or local, became central stakeholders responsible for the development and construction of architectural icon projects, in the most part using public funds. The elite groups that drive these projects do so in concert with a wider strategy of culture-led regeneration.

3. Discrepancies between theory and practice

Benefits to stakeholders Analysis of the distribution of benefits from architectural icons shows clear discrepancies between the planning theory of the beneficiaries and the real-life examples of such.

Iconic architecture is designed as a badge to "put city on a map". I have found no evidence of a flagship development which was not followed by an intensive city marketing campaign. As Julier comments, building architectural icons actually means creating "unique selling propositions" for a location[31]. But what outcomes does this policy bring to residents and businesses? The reality is that urban marketing strategies aim to provide fast growth to a local economy; this usually means a focus on short-term

incentives without a considered approach to long-term objectives. By providing jobs they also can exhaust physical and human capital. Further to this, radical growth does not always equal wealth or equate with a higher standard of living for most urban residents[32]. The sense of equalization is considered to be one of the most positive impacts that architectural icons bring to communities, but the contradiction lies in the questionable practices of whether these grand projects bring benefits that are "socially inclusive". Drawing businesses and people to an area may lead to negative outcomes to local communities; such as increasing pressure on existing infrastructure, environmental degradation, declining housing affordability and a growing welfare gap between those who reap the benefits of economic change and those who are "left out"[33].

Regeneration and flagship development projects proudly claim to benefit the people who live in the host city by improving communities without paying a high price for the influx of the new labor moving in. But the benefits of flagship developments appear to be quite narrowly spread. Often new businesses, new residents and some private interests leverage the benefits of an iconic building more then the original residents and tax payers.

Companies involved in tourism businesses appear to be the obvious beneficiaries of iconic buildings. However, other urban industries also stand to gain from flagship developments. Local aesthetics contribute considerably to the overall business climate of a city. The distinctiveness of a city, employed via cultural capital, creates a significant competitive advantage for businesses. Companies use cultural capital in marketing their products and services in any number of ways. Images of iconic buildings are widely employed by companies – in advertisements, websites or marketing campaigns that powerfully demonstrate in the blink of an eye their local networks and their global reach. International competitiveness of the firms located in a city contributes to that city's competitiveness[34], however the converse is also true: a city's competitiveness contributes to the value of the firms located in that city. Thus Turok justifies that "cities contain unique resources that makes firms in the knowledge economy are more internationally competitive"[35].

Business can therefore be considered a benefactor of city marketing and, thus, of architectural icons. But whether the construction of architectural icons is as beneficial for the residents as they claim to be remains a point of contention.

Rationale behind exclusion interest groups from decision-making The studies of Sydney, Salford and Bilbao indicate that major interest groups, residents and businesses were excluded from the planning processes, (despite being advised to the contrary in the proposal stages). Presumably, government does this to try and simplify the planning and implementation of these grand development projects. Unfortunately such a "top-down" approach brings serious negative outcomes.

By undertaking architectural icon projects, cities are attempting to enhance their regional identities in order to sharpen their competitive advantages. The sustainable competitive advantages of a city come down to its distinctive characteristics – i.e.: local

cultural capital. The success of architectural icons, it can be argued, is determined by how successfully culture is deployed in them. The distinctiveness that cities look for is located in places and in the cultural knowledge possessed by local people; they are gatekeepers of the local values.

Miles and Paddison point out the close relationship between culture-led regeneration to a sense of place. They claim that cultural development success depends on the engagement with local culture and community groups[36]. As mentioned, a building becomes iconic when it represents the soul of its city. Residents, local people, carry the culture and identity of the place inherently within.

Engaging world name architects and established regeneration specialists creates a danger of diluting the intrinsic sense of place. Truly distinctive characteristics come from deployment of cultural values that already exist in the place, not creative appendages brought from outside. As Julier claims "… any development of place-identity is one of nurturing pre-existing information resonates with the possibility that this is a process of appropriation and reappropriation rather than invention"[37]. Thus, in order to maximize the powerful potential effect of the proposed iconic architecture in a city, community consultation must be viewed as imperative in the planning process.

By excluding communities from planning and urban attractiveness strategies, cities may lose an opportunity to create truly iconic architecture, distinctive buildings which possess the local sense of place deep within them. In the three cases reviewed, local people were not able to have their voices heard before constructions began. Community consultations often had more of paper-work significance. Arguably there were opportunities lost by not fully deploying local cultural capital in their designs.

Even though there are benefits that businesses derive from the mere existence of an iconic building near their location, these benefits generally come to them for free. Businesses are normally excluded from the planning process, and even the prospective benefits to them, as such, are never communicated. Companies could be investing in landmark structures, but there is no necessity for them to contribute funds to such projects as government inevitably supports those using public funds. Thus, business enjoys the benefits of government-provided constructions, independent of whether they pay for them or not.

The idea of greater private sector involvement via contribution to construction funds of public assets is not new[38]. But there are obvious difficulties in bringing companies and private funds into culture-led regeneration programs. Entrepreneurial forms of city leadership and philanthropy have been widely criticized for diminishing public power and weakening state sovereignty. But in cautiously avoiding partnership with business, government decision-makers have birthed a new conundrum; the exclusion of companies from the decision-making process results in their apathy towards cultural projects, and yet they reap the benefits.

Government (local, state or regional) is the major stakeholder in these grand cultural projects - and practically the only one. This absolutely central involvement of

government in such a competitive process may not be desirable due to the distant relationship which government has with the market realm, and their incapability of making decisions isolated from politics. Governmental organizations are often blamed for not being efficient as business organizations and therefore steered to behave more business-like. According to Turok city authorities are distinct from firms because of their limited control over their assets and liabilities[39]. Cities are not profit-makers and the outcome of their input is often indirect and uncertain. Greene, Tracey and Cowling also agrees that city policy makers face their limits of what they can do to increase urban performance[40]. Often, a cities revenue from business rates goes to the national budget they may find no incentives to promote economic growth.

In 1980 the concern expressed by Peter Hall in his famous book "Planning Disasters" was about the inefficiency of the public sector, claiming that it was generally trying "to do too much". It seems those arguments still have currencies today.
Even though local, regional and state governments are in the best position to initiate architectural icons, the dominancy of government in planning and implementation of such cultural projects may not be efficient. Arguably, the efficiency of architectural icon projects can be improved via collaboration with stakeholders (which government in the best position to facilitate) and via receiving feedback from interest groups.

Ways to improve the situation Overall, not all cities need to have iconic buildings. Indeed, signature architecture does not guarantee urban development[41,42,43]. Architectural icon projects should not be replicated uncritically. The careful analysis of their contribution to economic development of a region is required; and their contribution in the wider economic framework of culture-led regeneration programs needs to be clearly understood and assessed.

Large sums of public money spent on architectural icons require development plans to be clearly explained and communicated to the public. Culture-led regeneration and architectural icon projects need to have clear and thoroughly researched long-term goals; promotional materials which just aim to sell an idea to the public often do not reflect the full reality.

The theoretical aim of culture-led regeneration is to benefit communities by increasing the quality of life; but this is not necessarily in line with the practical outcomes as reviewed in the case studies. Benefits often go to outsiders: tourists and visitors, at the expense of local residents. This could be avoided if genuine communication to interest groups (business and residents) becomes an absolute requirement during planning of an architectural icon. Communities deserve to know how public funding benefits them. The evidence which is open for public should be more transparent and methodology grounded.

The current research reveals that there is a lot of promotional material about the potential for cultural investments, but also, conversely, that there is limited published evidence of long-term regeneration outputs[44]. As Evans (2005) reasons, there are very few assessments to be found with actual evidence on regeneration effects, even less on cultural impacts within regeneration[45].

City planners and authorities need to recognize that such cultural projects require robust testing and greater assessment. Long-term evaluations and periodic reports are needed in this area in order to understand the contribution of cultural investment to local economies.

Evidence-based policy making and evaluation of culture-led regeneration programs and cultural projects would lower the danger of blindly following the "unofficial guidelines" potentially at great risk to the investors, and so ultimately to public funds.

More than this, it needs to be a transformation of such "guidelines" into an adequate methodology which would establish concrete planning mechanisms to determine the most effective deployment of cultural capital in designing architectural icons. Architectural icons do not need to be solely a product of fortune, and an informed analysis of their planning would reduce the risk.

Conclusion

In order to increase their competitive advantage, cities need to establish planning mechanisms that most effectively deploy cultural capital in place attractiveness. These planning mechanisms require the involvement of all stakeholders, of which government is probably in the best position to facilitate. Long-term evaluations and assessments of how architectural icons contribute to the economic development of their host cities are required. This will bring a deeper understanding of how the benefits are distributed among stakeholders and a more sophisticated awareness of the rationale of cultural investments. This requires access to such evidence from central stakeholders and collaboration with them on such a project. A methodology for such assessments needs to be developed. It could be used to examine existing architectural icons, and as a basis to appraise proposed new interventions. This could help policymakers to think more clearly and logically about the choices they face and could provide them with more relevant and improved information on which to base future decisions.

Artistic genius, civil servant or shrewd businessman? Town architects in Flanders

Evert Vandeweghe
Ghent University, Belgium

Introduction

This study will discuss town planning in small provincial towns as these often slip through the net of scientific studies. After a historical analysis of the ambiguous position of Belgian town architects, the main point will be on their role during the interwar reconstruction, starting from the drastic top down proposals by the central government up to the local private initiatives. With Dendermonde as illustrative case study, we'll focus on spatial (architectural) aspects of town planning and more specifically on the gable as transition between private and public.

Up till now remarkably little has been written on the role of architects in government service and especially on town architects. There are of course studies on famous modernist town architects who succeeded in implementing their vision like Ernst May in Frankfurt or Jacob Johannes P. Oud in Rotterdam. But even those studies often seem to ignore their municipal office or consider it as a negative factor for their work rather than an opportunity. Although some writers acknowledge that Oud realized his vision thanks to his municipal function, most of them stress that the economic, technical and bureaucratic aspects of this office caused the rift between him and De Stijl, the artistic avant-garde he was a member of. This already reveals that municipal and other public practices were kept dark for so long because of the individualist, artistic and idealistic claims of most architects. Oud himself for that matter was the first who minimized the role of his governmental function as to not jeopardize his meaning as an independent creative artist.[1]

Because of this artistic claim many architects did not want to become involved with town planning in the first place since this implied an integral vision that conflicted with their idea of the building as an artistic masterpiece.[2] One of the few architects who was and is always identified with his governmental office is the Dutchmen Willem Marinus Dudok, town architect of Hilversum from 1915 till 1954. But even in his case it is emphasized that his 'masterpiece' (the town hall) was realized in spite of the local government and thanks to the support from other architects. [3]

The Belgian case

Belgium is a small country with a young (°1830) but turbulent history, partially because of its central location in between Germany and France. It consists of two cultural regions (Flanders in the north and the Walloon provinces in the south) and a capital (Brussels) which can be considered a third region. Flanders (which will be dealt with here) is highly urbanized, yet only Antwerp evolved into a real city. Other Flemish towns can be labelled provincial.

Given its early industrialisation, urbanisation and bicultural character, Belgium was receptive to different foreign town planning theories (mainly from Great Britain and Germany) and a cradle of internationalism.[4] The destructions of the First World War offered immense opportunities to put these new town planning theories into practice. This went together with an increased governmental intervention, hitherto unknown in Belgium.[5] As a reaction some utopian architects radicalized and lost touch with the complex reality of urban society. Others accepted the increased governmental action and tried to blend in, partially because of idealism, partially because private patrons were harder to find in the aftermath of the war.[6]

In contrast to Germany where the prime of architecture and town planning between 1924 and 1932 is to a large extent attributed to national and especially municipal governmental initiatives, it is generally assumed that this politicisation had a negative effect in Belgium.[7] Especially for modernists, Belgium became more and more a land of missed opportunities, associated with a weak planning approach as opposed to its northern neighbour the Netherlands. One of the most famous pamphlets on town planning in Belgium is entitled: *Belgium, the ugliest country of the world*. Written by the modernist architect Renaat Braem in 1968 it blamed the architectural chaos and ugliness on the fact that architects had compromised themselves with capitalism and politics.[8]

This dichotomy between visionary architects and corrupt conservative politicians should however be nuanced. It can be noted for example that Charles Buls, one of the town planning pioneers in late 19th-century Belgium (whose preservation theories strongly resembled those of Camillo Sitte), was not an architect but a politician (mayor of Brussels). Furthermore one can wonder whether this influence of politics on architecture is always baleful. To answer these questions the practice of town architects is particularly illuminating as they constantly balance between public and private.

This is seen in the case of the Antwerp *Boerentoren*, the first skyscraper of the European mainland. Mostly Jan Van Hoenacker is considered as the architect and a private bank as the commissioner. Archival research has revealed however that town architect Emiel Van Averbeke was to a large extent responsible for the town planning concept with square and high rise and that he even made specific architectural plans. Afterwards the municipality sought a private commissioner and architect to develop and execute those existing plans for the 1930 World Exhibition.[9]

Governmental town planning: the long 19th century

As Anthony Sutcliffe has rightly pointed out industrialisation in the 19th century demanded not only an increased private initiative but also a growing governmental interference in public and private property due to urbanisation and related problems of traffic, sewage and workers housing.[10] Tensions between these conflicting tendencies occurred already in the first half of the century in Belgium given its intense and early industrialisation. During the French occupation (1795-1815) there had been attempts at institutionalizing and centralizing governmental control of architecture and town planning, partly by introducing the office of provincial architect.[11] After the independency of Belgium in 1830, this control was reduced. According to the optimistic liberalism of that period private initiative would solve all problems. Architectural and town planning control (let alone governmental initiatives on those domains) were considered totally contradictory to the principles of the Belgian state.

The remaining governmental control was decentralized by the 'Municipality Law' of 1836. The mayor and aldermen managed the municipal works and the municipal council appointed architects and other personnel for the management, construction and conservation of municipal buildings. The law also gave the local government authority over the arrangement of space through alignment plans, building regulations and – after 1844 – the construction of roads. However, in reality town 'planning' often remained subject to private ground and real estate speculation. The laws of 1858 and 1867, issued to enable government intervention in architecture and town planning for public health, fostered private initiatives as well.[12]

Since more and more towns disposed of their own architect to answer problems of industrialisation and urbanisation, tasks of the provincial architects were gradually taken

over by them, as was legally established in the Municipality Law (art. 84, n° 2). The central government tried to regain control in 1869 by a ministerial circular stating that when local authorities were asking for finance, the higher authorities were to choose the architect or at least approve the local authorities' choice. In reality however architectural control remained local well into the interwar period.[13] In 1913 the Minister of Interior still stated that local administrations in Belgium enjoyed an almost absolute autonomy.[14]

Town architects: public and private

How did town architects fit into this? In France there was an enormous diversity in the way town architects worked. Some can be considered real officials with fixed wages; others were appointed after a competition for one or more assignments. Most of them cumulated different functions, in one or more municipalities or on different levels (for example local and provincial).[15] The limited data on Belgian governmental architects seem to support this image. Whereas in the Netherlands the office of town architect was already strictly laid down in the late 18th century with an official ban to design or execute private plans in the town concerned, this was certainly not the case for Belgium.[16] Provincial architects in Antwerp had to abandon their private practice officially in 1849 but in practice it was winked at until 1929.[17] Only in 1939 a law protecting the profession of the architect forbade private practices to all governmental architects, including town architects.[18] As a result town architects in Belgium enjoyed a lot of freedom till the Second World War.

Initially the tasks of town architects were closely linked to the upcoming industrialisation but from the 1860's onwards equal attention was given to the representative value of architecture and town planning. Simultaneously the town architect began supervising more strictly on private builders, drawing up and enforcing building regulations, participating in local commissions on city aesthetics and teaching at the local academy. As such he had an important economic role given the increasing importance of heritage-based tourism, especially in the coastal area. In 'medieval' Bruges for example the catholic municipality historicized the municipal image by subsidizing 'artistic restorations'. Though these restorations remained private initiatives, most of them were led by the town architects.[19]

By emphasizing aesthetics town architects defended themselves against '*the ignorance of engineers with their straight lines*'.[20] The main advocates of town-engineers were however private architects, just because town-architects were monopolizing not only big prestigious projects but also their private assignments.[21] On the international town planning conference of Ghent in 1913 (with Raymond Unwin, Joseph Stübben and Patrick Abercrombie) some stated that town-officials with technical, aesthetical and sociological knowledge, sufficient independency and legal power could act as an intermediary between the private initiative and the common good. Others like Louis Van der Swaelmen - one of the pioneers of modern town planning in Belgium - were more sceptical and stressed that an aesthetical town planning could not be resolved by one local politician or town architect since this would only lead to misuse of authority, tyranny and monopoly.[22]

For many architects the reasons to become town official were undoubtedly very down to earth. Since the building industry depended heavily on the economy, the municipal office guaranteed a fixed - though rather modest - income in periods of unemployment. Given the weak legal framework, the appointment as town architect in Belgium was thus seldom a reason to abandon private practice but - on the opposite - a way to boost it. In the absence of an official recognition of the profession, the title of town architect proved competence, as did their prestigious buildings, commissioned by the municipality.

In larger Belgian cities there was already an increased regulation of the office in the middle of the 19th century. In Ghent the number of employees in the department of Public Works was drastically decreased in 1848 while the remaining personnel was obliged full time in service of the city instead of doing private commissions.[23] In the capital the role of the city architect was reduced in 1863 to supervising instead of designing.[24] Provincial municipalities however openly allowed a private practice which enabled a smaller official remuneration. That is also the reason why the function of town architect was often combined with other jobs like teacher in the local academy and head of the fire brigade. Sometimes the town architect even acted as a private real estate developer.[25]

Now and then reproaches concerning conflicts of interest were voiced but town architects became increasingly creative in avoiding those. August Waterschoot for example (town architect of Sint-Niklaas from 1896 till 1936) used to this end his two sons and their private architectural careers. Stylistic investigations have shown that many plans of his son Leander were in fact designed by August Waterschoot himself who by using the name of his son avoided difficult questions. On the other hand both sons clearly cooperated with their father on public assignments.[26]

Image 2. August Waterschoot and sons, Mgr. Stillemansstreet, Sint-Niklaas (1930's).

That municipalities of smaller towns compensated their badly paid town architects by granting them a private practice, was more and more criticised. Many asked fewer but well paid full time officials, independent from private builders. [27] To no avail; though there was specialization after the First World War, this did not lead to restrictions on

private practices, quite on the contrary. Instead of employing one town architect full time for the increasing work, the different tasks were given to different half time officials, each with their private practice. This undoubtedly was cheaper since the appointment as official in itself could be seen as a reward, boosting their private practice.[28]

Town architects: politics and architecture

A town architect always answered to the mayor and alderman for public works but this relation varied from town to town. Given the growing intervention of the government in matters of architecture and town planning the choice of a town architect was of course partly political.[29] In 1937 the modernist periodical *Bâtir* praised several town architects for their resistance against the chaos of the past and the inertia of municipal services.[30] This seems to imply that for certain town architects the municipal government was an obstacle rather than an ally in realizing their vision.

Architectural reality supports this. The homogeneous regionalist art deco-oeuvre of René Doom (town architect of Roeselare from 1919 onwards) shows that some could impose their vision on the municipality. In Dendermonde there are several indications that Ferdinand De Ruddere (town architect from 1922 till 1950) had to oppose the municipal authority. In his public buildings he occasionally convinced the municipal authorities to adapt a more modern approach (for example in the gymnasium which he designed in a style reminiscent of Dudok) but in general he had to conform to their traditionalist view.[31]

To realize their own vision, some architects ventured even further into politics. In Antwerp Gustave Royers started a successful political career after his resignation as city engineer.[32] Others combined their executive office with an administrative one. Only exceptionally the town architect became at the same time alderman for public works[33] but several private architects cumulated the office of alderman for public works during the interwar period. In Roeselare for example the alderman for public works Alfons Van Coillie designed dozens of houses as a private architect in a style similar to that of town architect René Doom.[34] It is clear that a lot of architects – amongst which the town architects – operated successfully in the twilight zone of politics and architecture.

Image 3. René Doom and Alfons Van Coillie, Marketplace 4-8, Roeselare (1920's).

Interwar reconstruction: the contribution of town architects

On the town planning congress in 1913 the town-engineer of Ghent Soenen stressed that focus had to be on extending existing cities. According to him (and many others) the development of totally new town plans was highly irrelevant in Europe.[35] It reminds us that (town) architects were totally unprepared for the impending massive destructions of the First World War only a few months later. Approximately 80.000 dwellings were rendered uninhabitable in Belgium, roughly the same proportion as in France though with a bigger impact on smaller towns.[36] Dendermonde was one of those adopted 'martyr towns'. Of the 2.239 buildings only 98 (mainly run-down working-class houses) were left intact during the war.[37] These destructions offered huge opportunities for rationalization and modernization but for modernists Dendermonde quickly became an example of bad taste and as such a symbol for the entire nation.

The destruction of neutral Belgium caused international indignation amongst architects and town planners, partially because many Belgian architects had fled abroad. Already in February 1915 an international conference was held in London concerning the reconstruction of Belgium by the International Garden Cities and Town Planning Association. There the idea of Belgium as one giant garden city emerged. The Belgian Minister of Public Works Georges Helleputte searched for a compromise between this English garden city idea and the German development plan.[38] Realising that private enterprise or local control alone could not provide the solution given the scale-up of the problems and the local conflicts of interest he tried to enhance the influence of the national government in town planning by a municipal directional town plan that had to be approved by the central government; as was already standard in many other European countries.[39]

After the war this idea of a drastic town plan quickly degenerated in an alignment plan. Reasons for this failed rationalisation and centralisation were that the central government was abroad during the war, the financial implications of such drastic town plans and the nature of the destructions (especially historic town centres) fostering a conservative view.[40] Already in 1919 the central government changed tactics, sponsoring local and private initiatives. Towns which were severely destroyed could get adopted by a Service of Devastated Regions and receive subsidies for reconstruction. In return they had to give account to the central government and present a layout plan which in most cases was nothing more than a slightly improved copy of the pre-war situation, made by the town architect.[41]

In Dendermonde the reconstruction was characterized by a persistent housing problem combined with a prestigious historicist reconstruction of the town centre and a conservative town planning. The layout plan by town architect Alexis Sterck (1921) containing the broadening of existing roads, the straightening of the river with construction of a new boulevard (the later Queen Astrid avenue) and the extension on the ramparts with a park and villa quarter was largely based on a pre-war plan by the famous Joseph Stübben, town architect of Cologne.[42] Stercks successor Ferdinand De Ruddere still recuperated those ideas in his town plan in the 1930's.

Town architects did get their hands on a lot of resources from the national Service of Devastated Regions.[43] Most of their subsidized projects were public but there were also private projects (for example the house of the mayor in Dendermonde). On the other hand this financial aid implied national interference. De Ruddere constantly had to adapt his designs leading to an open conflict with the regional head of the Service of Devastated Regions. He complained that De Ruddere had forgotten that he worked for his office and not as a private architect.[44]

Some tried to overcome this interference by joining the very organisations they confronted. The most flagrant example of this was Jules Coomans as town architect of Ypres, the most well-known martyr town. While the national and international opinion (among which Winston Churchill) demanded the preservation of the ruins, Coomans succeeded with support of the local government and population in implementing his own vision: reconstruction of the most important buildings in a historicist décor. When Minister Renkin appointed a comity to judge these reconstruction plans and to investigate accusations of monopolization by town architect Coomans and provincial architect Viérin, both became member of this comity! Even more remarkable is that Coomans spoke in this comity not as a party concerned but as an 'objective' representative of the Royal Commission of Monuments and Sites, another organisation of which he was a member. Because Coomans, Viérin and mayor Collaert crossed any proposition of modernisation or conservation of the ruins, the comity couldn't agree on a univocal verdict. Hence the Minister turned to the Royal Commission of Monuments and Sites. Again Jules Coomans himself pled and voted in favour of his own plans, with success.[45]

Image 4. René Doom and J. Vermeersch, garden city
 Batavia, Roeselare (1919).

For public housing outside the historic town centres, large scale initiatives by the central government initially bore more result. In the beginning of the 1920's the National Society of Cheap Housing built some experimental garden cities, the most famous being Batavia in Roeselare. Though these were national initiatives, they were often realized with the aid of local sections and town architects like René Doom in Roeselare. As a

result their radical character was tempered. Only a handful of radically modernist town gardens were realized (for example 'Little Russia' by Huib Hoste).

However, because of its socialist egalitarian associations, more and more (catholic) municipalities rejected garden cities and encouraged private initiatives in new neighbourhoods with a strict segregation of worker- and middle class-streets.[46] By 1924 the national government too chose to enhance the private initiative of the working class with an incentive system (to dam socialism and communism) rather than to provide large-scale housing.[47] This idea would culminate after the Second World War in the Law De Taeye, subsidizing a staggering 411.000 private family-houses between 1948 and 1973.[48]

In the 1930's there was a short revival of large-scale interventionist town plans as a way to counteract unemployment. In 1932 the municipality of Dendermonde was the first to organize a national town planning competition for the ramparts and the town in general. As such she wanted to gather ideas in anticipation of the transfer of those lands from the national government to the town. In organising this town architect De Ruddere was possibly inspired by the 1930 C.I.A.M.-congress in Brussels where the modernist plans of Ernst May (town architect of Frankfurt) were presented. Regardless of the appreciation of the functionalist C.I.A.M.-approach, there was a growing consensus amongst Belgian architects that town planning should be their domain.[49] The two published projects of the competition showed a highly rational town extension plan with attention for traffic and zoning; functionally as well as socially.[50]

Image 5. Gaston Brunfaut and Emile Henvaux, competition project
« Dendermonde 1935 » (La Cité, 1933, 12, p. 232).

It is often stated that such large-scale rational modernist efforts led to nothing because of local resistance. This has to be nuanced since in Dendermonde it was the municipality herself who organized the contest. It does seem true that town architect De Ruddere (who was a member of the jury but was also permitted to take part in the competition) prevented the execution of the competition plans; though not because he

disliked the ideas (since afterwards he recuperated a lot of them in his own town plan).[51] Raphael Verwilghen, a pioneer of modern town planning in Belgium who was also a member of the jury in Dendermonde, hinted at the real reason. He blamed the poor results of the competition on those municipal officials who were terrified that private architects were to come on the ground which they wrongfully thought to be their own.[52] A clear reference to town architect De Ruddere and his mix up of public and private assignments.

Town architects in Dendermonde, Roeselare, Ypres… did influence the reconstruction positively with their ideal plans, made by order of the municipality. These were not to be executed as such but functioned as inspirational guidelines for private builders on the most important places. Local leaders clearly understood that specific models could be more influential than vague legislation in convincing people to build a certain way.

The same can be said for certain municipal buildings. Apart from prestigious public buildings like schools, hospitals and monuments, the municipality sometimes took over the entitlement to compensation from private house owners to execute exemplary plans by the town architect. The houses by Sterck on the Grote Markt next to the medieval meat hall (1919) were one of those rare initiatives in Dendermonde which were positively received even by national organisations like the Royal Commission of Monuments and Sites.[53]

Image 6. Alexis Sterck, Marketplace, Dendermonde (1919).

Municipal building orders were however extremely difficult to realize given the dramatic finances of Dendermonde. The destructions, the presence of expensive facilities like the court house and the prison, and the impending acquisition of the ramparts from the state all lay a heavy burden on the small town. As a result the municipality of Dendermonde - more than in other martyr towns - had to rely on private initiative for reconstruction. Apart from the financial gain, private reconstruction of houses had the advantage of quick realisation. Disadvantages were the financial abuses, the neglecting of housing for the poor and the widespread competition between neighbours for the most decorated gable.[54]

The town architect was often depicted as a defence against these dangers of unbridled private initiative and as a promoter of professionalism.[55] One way in which he regulated private initiative was by parcelling out and selling municipal building lots. By doing this

the town earned money and at the same time could impose certain formal restrictions, connected to the sale. De Ruddere employed this tactic in Dendermonde for the Queen Astrid avenue (1935). The houses on this avenue had to have three storeys and be executed in Flemish gothic or renaissance to complete the picturesque townscape along the river. For the interiors the owners were completely free, resulting sometimes in a remarkable discontinuity between interior and exterior. The motive of these formal restrictions was aesthetical as well as financial. By imposing large, traditionalist and thus expensive houses, the municipality could raise the prize of the building grounds and use the money to lay the Queen Astrid avenue and the streets on the ramparts.[56]

Image 7. Ferdinand De Ruddere, Queen Astrid avenue, Dendermonde (1935-1940).

Since 1836 the municipality also had the authority to supervise and authorize private building plans on private ground but it is often stated that – certainly in Dendermonde – the municipality did not succeed in implementing her architectural ideas. An often repeated complaint in the immediate years after the First World War was that everybody in Dendermonde had reconstructed his house according to his personal taste, without any supervision or unity. [57] At first sight this seems true. Local building regulations contained few aesthetical elements and the actual building permits seldom show any commentary. The local advisory commission which was established after the war to look into the aesthetics of the private reconstruction didn't display a large activity either. Yet when walking through some of these streets today, they still radiate a remarkable homogeneity (which was also the reason for a large scale protection campaign in 2004).

Though it is true that in Dendermonde the reconstruction was largely the product of private initiative this does not mean that it was totally devoid of any coherence. Homogeneity was obtained not by official regulations but by more informal policies. When looking closer at the activity of the local aesthetical commission it becomes clear that the majority of those building permits which were approved without any comments, were in fact designed by the town architect and other members of that commission. The establishment of such a comity by the government therefore seems less intended to judge building applications as to promote and empower certain architects through their membership of that commission. People were officially free to choose their own architect but they undoubtedly knew that their building application would be more easily accepted if designed by one of the commission's architects and in particular by the town

architect. De Ruddere for example designed twenty two houses on the Queen Astrid avenue.

Moreover the municipal authority used these private commissions of the town architect as models for further private initiatives. Town architect Sterck in total built more than one hundred private houses in the centre of Dendermonde between 1919 and 1921, approximately one third of all the building applications in that period. De Ruddere built another hundred in the remaining 18 years of the interwar period; often the first and visual dominant houses of a street.

When analyzing De Rudderes 'oeuvre' it becomes clear that he designed traditionalist houses on important places like the Queen Astrid avenue, the main marketplace, the thoroughfares and the station square. In smaller streets and on the outskirts of town he used art deco. As such he set the tone and defined what was admissible and desirable in a given street. Though this policy was not written down, the streets themselves provide the evidence, as do those private clients who ordered several houses by De Ruddere, each totally different and adapted to the respective street scene.[58] That these projects appeared to the outside world as private undertakings was only to the benefit of the local government since private projects encountered much less political opposition than municipal ones.[59]

Provincial towns undamaged during the First World War showed a more modern architectural imagery but a similar interweaving of private and public commissions of the town architects leading to a homogeneous street image. In Sint-Niklaas August Waterschoot planned several quarters in which he and his sons designed hundreds of houses in a marked art deco design.[60] In Ronse town architect Albert Massez designed the first and most important private houses in different (publicly and privately) planned streets like the Jean-Baptiste Mouroitsquare (1935).[61] In discussing that square the modernist periodical *Bâtir* praised him for the opportunities he gave to young architects, for the houses he had built himself on that square and for the fact that he thereby provided certain limitations in materials and gables.[62]

Image 8. Albert Massez and others, Jean-Baptiste Mouroitsquare, Ronse (1935).

Afterwards: an evaluation

How do we have to evaluate such town planning projects? Undoubtedly De Ruddere designed the lion's share of houses in the Queen Astrid avenue himself to compensate for the economic crisis of the 1930's. Yet with his traditionalist architecture he also responded to a public need for lasting values and security in those years of crisis. A comparison between these traditionalist compromises and the rarely realized modernist projects shows that the first are still more appreciated and respected by their inhabitants because they reckon with their longings and the existing urban fabric. As such several town architects by a conglomerate of public and private commissions succeeded where most modernists failed: to enter - slowly but steadily - the idea of town planning in the mind of the public.

After the law of 1939 this mixture of public and private practices largely disappeared. As a result the office of town architect became less attractive and was mostly occupied by supervising technicians, clearing the way for mere profit seeking private companies. In Dendermonde, De Rudderes plan of a station street with Renaissance gables connecting the station square with the old town was still executed through regulations in the notarial deed of sale. The traditionalist villa quarter between the two remaining city gates was realized thanks to private commissions of De Ruddere and his successor Désiré Windey (though this was strictly speaking no longer allowed). However, when Windey tried to continue the policy of De Ruddere in the 1960's by extending the villa quarter on the ramparts, he failed. Private high rise blocks emerged behind the gates and the station street, damaging the small scale town.

Image 9. Station street, Dendermonde (1950's).

The last decade there has been a renewed interest for architects in governmental service. In 1998 one of the most renowned Belgian architects bOb Van Reeth was appointed as Flemish Building Master, advising the Flemish and local authorities on matters of architecture and town planning. As such the government is again more actively engaged in architecture and town planning. Following this, some towns have reinstalled and revalued the office of town architect. Antwerp disposes since a couple of years of a town building master who on his own initiative counsels the city on important public and private projects and is structurally embedded in the working of the municipality.[63] The town architect of Eeklo, a small provincial town, received the Flemish Culture Prize for Architecture in 2003. The main difference between these officials and their pre-war counterparts is that they merely supervise. Yet the enduring polemics

concerning possible conflicts of interest show that it remains difficult to balance between independency and loyalty, involvement and detachment, professionalism and politics, public and private interests, past, present and future. It is this compromise that makes town planning so interesting.

Changing roles of the public institutions in planning issues

Guler Koca
Anadolu University, Turkey

It is well-known that urban planning studies in Turkey gained significance during the republican period beginning from the second half of the 19th century. Urban planning studies which emerged towards the end of Ottoman Empire were not based on a certain system and also they had quite shallow implementations and they were mostly implemented by foreign planners. The new republican government, who speeded up the attempts to constitute new municipalities with the help of the various acts which were passed beginning from the declaration of the republic, took the first step to form the corporate body related to urban planning and the concept of municipality in the country.

The urban planning of Ankara, which was declared to be the capital of the country shortly before the declaration of the republic in Turkey, and the attempts to constitute the first local government which appeared as a consequence of the Ottomans' experience on the business of governing a city had a pioneer role and helped the republic to have an understanding related to municipality and city planning.

In those years, with the help of many acts passed one after the other, the municipalities were granted with significant responsibilities related to both city planning and economy. However, considering that it would be hard for local authorities to overcome the difficulties in the field of planning with the laws passed one by one, it was agreed to establish a central powerful organization which will be responsible for making the decisions related to city planning and also this organization was considered to be dependent to the government.

This above mentioned attitude played a significant role in the formation of corporate structure in urban planning beginning from 1930s and new regulations related to corporate and law were passed one right after the other beginning from that time. The first of this law was the one passed in 1930 and numbered 1580, Municipality Act. This law which was in force for 75 years was prepared being inspired by the French laws of that time and the laws granted equal rights to all municipalities and their corporate structures were shaped as one single type. Taking regular local services to middle-sized cities which appeared as a consequence of the policies which, at that time, aimed to make industry prevalent throughout the country, became mandatory with that law. Whereas this municipality act granted municipalities some flexibility related to their being modernized, in fact all municipalities were taken under strict control of the central government, which can also be named as "guardianship". Similar understanding of strict guardianship could also be encountered in Ottoman period. This approach regards municipalities as the natural extentions of the central governments. This centralist tendency roots back to the societies in Anatolia before the foundation of Ottoman Empire, but it still continues its existence although it loosened up partly. That meant for municipalities that they were dependent to the central government in most of the issues ranging from decision-making process to vesting authority and using sources. It was

made mandatory for all municipalities to have their urban planning prepared and their fields which they were responsible for were expanded with this municipality act. However, it did not handle the issue of source at all. Besides, another significant innovation that this act brought about was that all municipalities were supposed to constitute a budget considering the programme that they had prepared depending on their city planning implementation and then they had to submit it to the central government for its approval. The Buildings and Roads Act which was passed in 1933 was replaced with the Reconstruction Act and it aimed to contribute to the systematic progress of the urban planning and also helped cities experience a systematic development. This act made it compulsory for all municipalities to have their urban planning prepared for the following 50 years within 5 years. According to this act, municipalities were supposed to have their basic maps prepared primarily within the suggested period, and then they were supposed to prepare their city planning by themselves or have the units that they constitute for that specific purpose prepare it within 5 years. Thus, a new era started in Turkey in the field of urban planning and this lasted till 1956 when a new city planning act was released.

The fact that municipalities could not implement the authority for city planning which was granted to municipalities as a consequence of some financial and technical insufficiencies was noticed by the authorities in republican period very soon and a new foundation dependent to the central government and also named as "Municipality Urban Planning Committee" was granted with responsibility for planning so as to find an ultimate solution to the problem. This committee not only prevented municipalities from going into partnership and thus weakened them, but also strengthened the function of the central government related to this issue. The institution which was established under the name of Municipalities Bank, the function of which was to offer municipalities the financial back-up they needed in the field of urban planning was then rearranged as İller Bankası in the following years. It kept offering financial and technical supports to the municipalities throughout the country. Before 1950s, municipalities occasionally took the responsibility especially for the implementation of the plans, but the central government was found to be responsible especially for the preparation of the plans.

However, it is a well-known fact that these authorities were expanded against the local guardianship in time; moreover, as a consequence of the above mentioned changes, the responsibilities granted to the central and local government were confused with one another. This also made it hard for municipalities to play more active roles in city life and to undertake the services such as planning and implementing the plans, which were considered to be among their basic responsibilities. No municipalities could overcome their responsibilities without getting any support from the central government anymore. The rapid increase in the number of the people dwelling in cities caused the city related problems to come into prominence and the organizations constituted under the light of the available laws remained insufficient. Thus, the reconstruction act numbered 6785, which was considered to be the first real city planning act in republican period was passed in 1956. With this act, it was made voluntary for all municipalities to have urban planning prepared, but it was still compulsory to have urban planning for the cities the population of which exceeded 5000.With this act again, all municipalities were granted

with the authority to do urban planning and implement it within their borders. However, they were still supposed to send their urban plannings to the Ministry of Public Works and Settlement. The Ministry of Public Works and Settlement which was established after the reconstruction act was passed was founded as a central organization having full-control over all reconstruction works, and also it was granted with the authority to pass necessary regulations needed in the field. The reconstruction act, which generally assumed a centralist attitude, can be suggested to have a flexible understanding of reconstruction because the task to prepare urban planning was granted to municipalities completely. The ministry was only granted with controlling the plans. However, the changes carried out in the following years intended to limit the responsibilities of the municipalities. It is commonly accepted that 1961 constitution divided authority into two as local and central and that it granted municipalities with more power and autonomy.

As a consequence of that, it can be suggested here that municipalities in Turkey after 1960 were exposed partly less central guardianship. The fact that the majors of the municipalites were elected through elections also made them stronger and more effective. With the regulations in reconstruction act in 1972, the authorities granted to municipalities in the field of reconstruction were dispossessed and given to the Ministry of Public Works and Settlement. In this period, the effects of a heavy centralist attitude were visible. The reconstruction Act which was passed in 1956 and then modified in 1972 was found to be quite incapable of meeting the needs of city planners as a consequence of both its being too centralist and being not flexible. Therefore, after 30 years, it was discussed to pass a new reconstruction law and then the reconstruction act numbered 3194 was passed in 1985. With the help of this act, planning decisions in Turkey were systematized for the first time and directing development through planning was adapted in principle. Besides, another significant innovation that this act brought about was that the strict control of central government was weakened in planning; on the other hand, the authorities of local governments were strengthened. The authority for urban planning was granted to local governments and the ministry was granted no control over the local authorities, which were significant steps in making the local governments autonomous. The planning related authority that is granted to local governments which are considered to be the most basic mile stones of democracy brought the idea of constituting totally independent local governments in the foreground. However, an article of the law, which suggests a privilege to the ministry in urban planning and its approval can be considered to overshadow the autonomy of the local governments. Whereas some special cases were listed in the article, it is connoted here that the ministry could merge into planning process when it considered it necessary. Whereas it is an undeniable fact that the central government was granted with some significant responsibilities so as to furnish the coordination among the institutions throughout the country, the attempts to solve these problems through individual methods not only overshadow the positive attempts, but also lead some problems.

Although our country has experienced many phases since the declaration of the republic, it can be suggested here that urban planning has been basically considered as

local governments' business; however, the intervention of the central government has increased and loosened from time to time.

Today, things are very similar to the past; local governments are responsible for urban planning, however, many institutions of the central government still intervene the urban planning process of the local governments. Because no determined and consistent attitudes have been adopted in determining the political decision making processes which are supposed to direct the physical planning, and because different priorities have come into prominence in law making, a complete coordination among the institutions throughout the country has not been obtained and as a consequence of that, a chaos in planning and implementing of the plans have been encountered. The number of the institutions dependent to central government, which work in the field of urban planning as well as the local governments, has increased so dramatically that the chance for those institutions to work in coordination has become quite difficult. If we are to mention about these institutions in brief, we can mention about the Ministry of Public Works and Settlement, which works at local and central basis. The Ministry of Culture and Tourism which has the responsibility to watch over and to make tourism planning, The Ministry of Environment and Forest which has the responsibility for the planning process related to the coasts and forests, State planning Institution, Boğaziçi Reconstruction High Coordination Committee and some other similar institutions.

Besides, when we consider the local authorities responsible for urban planning, a complex urban planning organization structure appears.

Conclusion

It is observed here that all the laws related to urban planning passed beginning from the declaration of the republic seemed to be much in favor of the local governments; however, things have started to change dramatically, the laws passed in that field seemed to be strictly in favor of a centralist attitude. The discomfort that this strict state caused lasted in an increasing rate till 1985, and it resulted in a new reconstruction act which granted local governments with significant authorities related to urban planning.

However, an article in the new reconstruction act which still granted responsibilities to the central government to intervene, and the privileges granted to various central units in urban planning, all contributed to a chaos in the share of authority. The difficulties for the central government to take service to every corner of the country from a single center were learned through experience and as a consequence of that, the idea that planning is something based on governing locally was accepted as a general principle. Another thing is that granting full-authority to local governments in planning was not an ultimate solution and that new problems emerged. This experience helped the decision makers to understand that granting equal authorities to all cities, without considering their population density and some other characteristics was not a good decision. Granting authorities without considering the structural differences among municipalities with regards to demographic, social, cultural, topographic differences and etc., without any transition period resulted in many negative outcomes. Especially the municipalities

which were not capable of employing the authorities granted to them by the central government suggested that they needed a transition institution to get help. This case suggests that a regional governing institution, which can offer help to the municipalities with less population, without technical and financial capabilities in urban planning and which can function as the controller over them, and at the same time ensure the coordination between the central and local government has come to the light.

When we consider the things from the consistency of the plans prepared at the region and country scale and the plans prepared at urban scale, ensuring the coordination among the institutions, the absence of such administrative phases come to the foreground.

Building Mexico City: formal and informal planning of the urban environment since 1945

Harold L Platt
Loyola University, United States

On 2 October 1968, the city and nation of Mexico changed course. The pivotal event was the massacre of 300-350 university students by the government near their housing complex of Tlateloco. Like the aftershocks of an even more catastrophic event, the earthquake of 1985, the political repercussions of the ambush at the Plaza of the Three Cultures continue to reverberate throughout society until the present day. In the harsh repression following in its wake, radical activists hid among the people and laid the organizational foundations of the social movements that would emerge full-blown after the natural disaster. As Vivienne Bennett confirms, "two decades of popular organizing… changed the face of civil society in Mexico."[1]

My paper examines the processes of formal and informal planning that resulted from the new waves of political protests following the student massacre. I tell three interconnected stories of city-building, each with significant impacts on the environment and the quality of daily life. The first is about Ajusco, probably the best-documented *colonia popular*, or "irregular settlement". In part, the success of its inhabitants not only in securing title to their self-built homesteads during the 1970-80s but also in creating an ecologically productive zone stems from the organizational and technical support of student activists.

The second story is based on the post-earthquake rebuilding of the El Centro district between the Zócalo and Tlateloco. The mobilization of its residents into a united front forced the government to rebuild their neighborhoods, resulting in 48,000 new housing units within a year. The ability of these working class people to resist displacement led the big business leaders to plan a new commercial "downtown" on a garbage dump in an area called Santa Fe. Like a phoenix, an instant city of modernist skyscrapers arose as the headquarters of NAFTA corporations, which employ over 70,000 office workers. It has also become the location for a similar mushroom-like growth of upscale condominium towers as well as the site for the largest shopping mall in Latin America.[2]

In each case, interventions by foreign agencies influenced the construction of Mexico City. In Ajusco, international non-government organizations (NGOs) helped install ecologically productive technologies. In El Centro, the World Bank helped pay for new housing while outside labor and feminist activists helped garment workers form a new union. In Santa Fe, the NAFTA treaty helped encourage American corporations to relocate their Mexican headquarters there, ensuring its success.

Ajusco

Ajusco represents a case study of alternative or informal planning brick-by-brick and block-by-block. It is a part of a much larger pattern of irregular settlements in the

metropolitan area that cover sixty percent of its land and houses over half of its more than twenty million inhabitants. Located on the steep southern rim of the Valley of Mexico, the Ajusco area in 1970 was a rural forest of ejidal land with few residents. Over the course of the next decade, it would become home to 150,000 people. While their efforts to build houses and a community may be characterized as heroic, there was certainly nothing romantic about their struggle to survive.

The fact that they settled on the hillsides of a remote mountain with up to 45-degree slopes did not reflect conscious choice but desperation from a lack of better options. Without level places to build, the area lacked all of the basics necessities such as water, electricity, roads, and sewerage. Moving illegally onto land they did not own meant they would soon face repeated waves of private and government demolition squads - "*desalojo* (eviction) machines,"- that tore down their homes and scattered their meager possessions. With nowhere else to go, many would return after these devastating raids to put the pieces back together again.[3]

While the plight of the settlers or *colonos* of Ajusco was extreme, it was typical of the housing problems encountered by newcomers to the capital in the post-1945 period. Starting with World War II, the national plan of economic modernization through import substitution gained sustained momentum. Between 1950 and 1990, the push of rural poverty and the pull of factory jobs would quadruple the population of Mexico City. Developing the economy was carefully plotted by government experts, but equivalent blueprints for worker housing and urban expansion did not exist. "In Mexico," Peter J. Ward comments, "the key problem was that until the late 1970s urban planners occupied no political space whatsoever."[4]

In this sense, the official plan was to have no plan at all. The privileged industrial sector benefited from the government's blind eye to the illegal takeover of public and ejidal land in two ways. Employers could pay lower wages to workers who paid no rent as well as less in taxes to the local government, which did not have the expense of providing them with infrastructure improvements and public services. Rent control imposed during the war created additional disincentives for private investment in the housing market compared to manufacturing. For three decades following the war, the economic plans produced what was called a "miracle," but since then they can be renamed a mirage. In the mid-1970s, real wages began to decline and unemployment rates began to rise, making more of the working classes desperate to find cheap housing.[5]

In the two post-war decades, most of the irregular settlements were built within the boundaries of the Federal District. Migrants clustered as close to the center as possible to gain better access to jobs, friends, transportation, and other public services. But in the 1960s, the district's political boss, Ernest P. Uruchurtu, launched a campaign against further congestion. Earning dubious monikers as the "Bulldozer Mayor" and the "Iron Hand", he became ruthless in forcing the settlers out of the Federal District. In 1966, he was himself ousted by the national party leadership over his opposition to an underground transit system in preparation for the opening of the Olympic games two

years later. Nonetheless, the new settlement patterns persisted. In effect, Uruchurtu's campaign further exacerbated urban sprawl, pushing it into the adjoining states.[6]

The occupation of Ajusco was a part of this legacy. Not suitable for farming, this rocky area began to undergo urbanization during the 1950s, when the government expropriated ejidal land for a new international symbol of Modernism, the University City (National Autonomous University of Mexico (UNAM)). Additional expropriations followed for the grounds of another global icon, the Olympics. Both projects created thousands of construction jobs; the land grab was on. Corrupt ejidal leaders and local officials conspired together in the illegal subdivision and sale of lots -sometimes several times over- to would-be homeowners. Large-scale builders also moved into Ajusco, marketing expensive houses in planned developments on the basis of such environmental amenities as cleaner air, lower densities, and less congestion. By the early 1970s, the occupation of the more accessible land north of the barrier formed by the railroad tracks was essentially complete.[7]

A second wave of settlement south of the tracks became much more contentious because it did not have the sanction of the landowners and politicians. The illegal takeover of the colonia popular Lomas de Padierna illustrates the ways in which the ensuing battle against the authorities forged the social bonds of community needed to undertake the physical planning of a neighborhood. An identity of place among the colonos was engendered in a process of self-defense that they called "*necesidad*," or the struggle for survival.

In 1971, a single mother in her late thirties, "Ursula", would emerge as the leader after her jerry-built shanty was torn down. Angry and in despair, she recalled that "when my house was destroyed, [the] colonos united; they rebuild my house with stone." She got involved, joined the water supply committee, and got to work painting the inside of barrels to prevent rust. Other committees laid out homestead lots and streets, set up a system of collective defense against the demolition squads, and organized a democratic assembly of government. Over the next three years, as other leaders were arrested and forced to move, more and more of the colonos looked to Ursula.[8]

Student radicals were also important in the informal planning of Lomas de Padierna that transformed the environment and the people's sense of identity. In 1972, students from the UNAM moved in to help organize the settlers for self-government and to build an elementary school. Like many other post-massacre students, they were members of the *Frente Popular Independiente* (FPI), a group that adopted a Maoist ideology of grassroots activism. Getting the school up and running within a year for about 300 children earned the respect of the colonos as well as giving momentum to the process of community-building. The students also helped Ursula and other members of the assembly petition the government for an official school, drinking water, and other public services.[9]

During this period of the presidency of Luis Echeverria (1970-76), government policy on the urban environment began to change from denial to incorporation of the irregular

settlements. He was deeply implicated as the Minister of the Interior in the ambush and repression of the students, but he also was an economic reformer. Rejecting the classic approach of anthropologist Oscar Lewis that the colonias populares represented pathological breeding grounds for a "culture of poverty," Echeverria adopted more recent counter-theories that they were an essential part of the solution to low-income housing. In 1973, he established the Trust for Urban Development within the Federal Distrist (FIDEURBE) as a formal planning agency. It was charged with mediating land disputes, legalizing ownership, imposing property taxes, and providing an infrastructure of urban services. Three years later, the government enacted an even more sweeping measure, the Law of Human Settlements.[10]

For the colonos of Lomas de Padierna, the new policies led to victory in the battle for land tenure, but at the price of self-government. In April 1974, local officials ignored the law and mounted a last-ditch effort to evict the community. Now well organized, however, three thousand residents responded to the ringing of the alarm bell of defense. Their united stand rebuffed the bulldozers and riot police. According to Ursula, "with this action our movement began to gain respect [from the local authorities]." Conceding defeat, they agreed to negotiate with her as the political boss or *caudilla* of the people. During the next four years of hard bargaining, the colonos demanded the right to the planning of land use, the self-construction of homes, the government provision of public utilities and services, and the cessation of police repression. Officials insisted that FEDEURBE had to govern the incorporation process, set land prices, and cut lot sizes in half in order to resell the recovered property at market rates.[11]

In the end, Ursula was willing to trade away self-rule in order to secure title to the land. She won concessions to keep the original lot sizes at a price of only 40 percent of market value. The student activists felt betrayed by the cooptation of the popular movement by the ruling party, the Institutional Revolutionary Party (PRI). Yet, they had to admit that Ursula had acted pragmatically on behalf of the residents. The settlement also brought the construction of an official school and the installation of piped water. By the early 1980s, many colonos took advantage of rising land values to sell their properties, changing the nature of community into a more middle class neighborhood.[12]

In 1976, a third, eco-centric pattern of irregular settlements became evident during of the presidency of Jose Lopez Portillo (1976-1982).   "The attempt to plan urban development," Diaz-Barriga proposes, "marked a redefinition of state policy from incorporation to containment of urban expansion, poverty, and collective organizing...." In effect, he argues that the Portillo administration adopted a technocratic vision of the environment that attempts to impose a rational order on nature.[13]

About 50,000 people were already settled in the area by 1976, when the invasion began south of the railroad tracks into an area newly designated by the government as a protected, ecology conservation zone. Soon 20-25,000 people were living in shanty housing, mostly build with bituminized cardboard as roofs, and low-grade boards or bricks called *tabique* for walls. The new colonias populares were known as Bosques

del Pedregal, Cullotepec, Dos de Octubre, and Belvedere. They were situated on 200 hectares of mountainside, above the city limit of 2,350 feet above sea level to receive water. Instead, the colonos had to organize to get their water supplies trucked in to the highest points and distributed from barrels to homes downhill through garden hoses. Electricity was supplied on an irregular basis to settlers who "appropriated" it by illegal hook-ups on utility company wires.

But the new intrusions in the green zone brought retaliation from the demolition squads. In 1977, the authorities retaliated with the *desalojo* machine, attempting to remove the colonos. Three times the people stood and watched their homes be destroyed and three times some of them returned to rebuild. But when the authorities returned the fourth time, they confronted an organized community determined to stand its ground and defend its homes. Holding them to a 72-hour standoff, the settlers attracted outside support from college students and labor union based NGOs. As the deadline approached on June 6, 1977, the police met a much larger crowd which was now armed with sticks and rocks. Again, the civil authorities retreated.[14]

What ensued next was an extracted, eight years process of political negotiation leading to the issuance of official land certificates for about five thousand households. In between, both sides marshaled environmental reports in support of their opposing positions. On the one hand, the planners contended that human settlements on the hillsides of Ajusco were destroying a fragile environment, they were way too costly to supply with urban services, and they were violating the master plan of urban containment. On the other hand, the eco-populists enlisted a wide array of external support groups ranging from nearby university science departments to global NGOs to formulate a counter-plan of the *colonia ecological productive* (the ecologically productive settlement). For instance, the residents' cooperative would plant and harvest 20,000 fruit trees as opposed to commercial deforestation under the government's current program. The community also proposed to install an environmentally friendly sewage recycling plant that would produce fertilizer and grow mushrooms.

In contrast, their expert allies could point a green finger of blame at the planners for maintaining one of the city's most polluted places nearby in the protected greenbelt, a gigantic garbage landfill. Both sides made credible arguments on behalf of the environment, but the garbage dump undermined the city's credibility. In the end, an extremely twisted and corrupt politics of appeasing social unrest by the ruling party accounts most for the successful outcome in the battle of Ajusco for the settlers, who won property certificates.[15]

For the environment, however, this new urban area had negative impacts. By turning eco-populists into property owners, the powers-that-be achieved their immediate goal of sapping the political strength of the grassroots movement. With the dissipation of the community's cooperative spirit, the projects to reverse environmental consumption into production faltered. Instead, the land basically was paved over by public authorities and private homeowners alike. Ajusco as a rural, open space and as an urban greenbelt reserve was gone. Since the 1985 resolution of the battle of Ajusco, this story has been

repeated literally hundreds of times in the ecological preserves. The result has been more sprawl and environmental degradation, as the government seems locked into a failed plan of urban containment.[16]

El Centro

On 19 September 1985, the earthquake had its most devastating impact on the El Centro district, the historic heart of the city. Human-made changes in the natural hydrology of the Valley of Mexico had turned the old center's sub-soils into a jello-like consistency. The shock waves of the earthquake were amplified by the ground underneath to the point where the taller buildings were swaying so violently that they were banging into each other, hastening their collapse. With a force estimated to be the equivalent of over 1,100 atomic bombs of 20 kiloton strength, the tremors also shook apart large areas of working-class housing, called *vecindades*. These two and three story tenements had traditional elements of a communal internal courtyard for privies, for washing clothes and dishes, and sometimes for cooking. Out of the rubble and the government's inept response to the emergency arose urban popular movements among residents of the El Centro district. As the critic A. Lazcano stated, "the 1985 earthquake represents the most important collective questioning of the government, and its failing paternalist system, in the history of Mexico." [17]

Unlike the "survival" communities forming on the Ajusco foothills, these were ancient places with identities of place deeply rooted in the foundations of the city's popular culture.   Clustered around the national sacred space, the central plaza or Zócalo, were working-class neighborhoods known as Alameda, Morelos, Guerrero, Buenavista, Tabacalera/Reforma, and Doctores. "Many [residents] identify with the community," Susan Eckstein remarks, "[they] take pride in their community. They view their neighbourhood as authentic, representing the 'soul' of Mexico City." Elena Poniatowska adds, "[their] profound historical roots endowed the quake-damaged areas with a strong sense of place." Their place-based organizations would provide the leadership for the growth of a new generation of urban popular movements with agendas of environmental justice and equity.[18]

The residents of El Centro had not only solid identities of place, but also strong class-consciousness through occupations that tended to cluster around the city center. Long ago, the Zócalo became established as a distinct locational advantage for civil servants, street vendors and storefront businesses, bus-drivers, and women garment workers jammed in sweatshops near the big department stores. "If anything," Diane Davis observes, "the Zócalo and the monumental state buildings that graced the area served to reinforce the social divisions that had long characterized the city: a petit-bourgeois east end filled with petty traders, street vendors, and small-scale merchants, and a more bourgeois west end filled with luxurious departments stores, fancy restaurants, and medium- or large-sized (in employees and fixed capital) commercial establishments that appealed to the middle and upper classes of the city."[19]

Already well organized when the earthquake struck, the residents of El Centro were better prepared than most disaster-victims to meet the political challenges of reconstructing their neighborhoods. Their success in attracting international funding helped them overcome bureaucratic and party resistance to grassroots participation in formal urban planning. To construct almost 50,000 modern housing units in a year would require the government to set up a special agency to by-pass all of the red-tape the project could anticipate if it had to go through normal channels. But like Ajusco, the gain of home ownership would come at the cost of democratic self-government. Facing post-earthquake uprisings on many fronts, the PRI was anxious to cut deals to contain populist revolts and appease the best organized and most vocal groups of united neighbors and unionized workers.[20]

In the post-World War II period, an identity of place was fostered in a classic, not-in-my-backyard (NIMBY) defense of residential neighborhoods against the wrecking ball of the city's urban renewal plans. With rents frozen, the only hope for the landlords to get rid of their tenants living in the vecindades was demolition. In addition, the official plan called for their replacement with a complex of International Style office, shopping, and condo towers that would mean property values would soar. Many other influential economic interests, those identified by Davis as the "west-enders", endorsed the makeover of the historic core into a glass-and-steel central business district with upscale hotels, restaurants, and brand-name boutiques like other "First World" capitals.

But standing against this powerful phalanx of Modernism stood an unlikely local hero, Ernest P. Uruchurtu. He would build a political "machine" independent of the national PRI hierarchy of power precisely among two of the community's main occupational groups: the street vendors and the bus-drivers. For members of the "informal economy" selling in the streets around the Zócalo, its markets had long been known to attract the largest, metropolitan-wide base of customers. Known as the "The Regent of Iron" Uruchurtu was ruthless in forcing the vendors to join syndicate-like "associations" to gain access to the public space. At the same time, however, he gave them legitimacy, and hence power to their Godfather-like leaders to represent 50,00 dues-paying members. For the already unionized bus-drivers, stopping urban renewal had direct effects on their lives and livelihoods. Saving their central residential locations meant less commuting time to their jobs, and perhaps their jobs too. Visions of a high-rise downtown included an underground metro system to move the office-workers, giving planners an excuse to force the anarchistic micro- and mini-buses off the streets.[21]

From 1952 until his ouster from office fourteen years later in 1966, Uruchurtu held the forces of Modernist planning to a standstill. "In fact," Davis suggests, "one might go so far as to say that the more formalized and powerful planning as a profession became, the more neglected were downtown areas of the city, and the less likely were concerted efforts to nurture a lively, socially inclusive place in which public life, public interaction, and public debate could flower."[22] On the contrary, El Central may have remained rooted in traditional identities of place and class-consciousness, but it certainly passed the test of a lively urban space of people in the streets.

In the years between the student massacre of 1968 and the earthquake of 1985, these bonds of community were strengthened in two ways. With the loss of their "patron" Uruchurtu, the street vendors associations had to band closer together to negotiate from a position of strength with the newly appointed PRI representative, Mayor Alfonso Corona del Rosal. After portraying the "Regent of Iron" as an out-of-control monster, Corona hoped that he could rebuild loyalty to the ruling party by lightening up on enforcement of the rules governing vendors' use of the streets. For the bus-drivers, a payoff was already in the works for their betrayal of Uruchurtu. Their year-long strike helped bring him down in the national legislature. For the drivers, victory meant pay raises and stronger bonds of union solidarity. Privatizing the bus service also gave virtual free reign to the little companies already clogging downtown traffic. As environmental historian Priscilla Connolly bemoans, "it is now generally agreed that the political power of the minibus cartels represents a serious obstacle to rationally planning the public transport system."[23]

In a second way, the post-1968 student radicals who joined the underground in the El Centro district helped further sharpen the communities' organizing skills. The solid foundations of their identities of place were ready-made for the activists to build grassroots movements around environmental issues of quality of life in the home, neighborhood, and workplace. As Bennett points out, "lack of housing, inadequate services, and speculation with land prices and rents characterized Mexico's cities in 1968 and they characterized Mexico's cities in 1983." Political mobilizations and to some degree, a measure of democratic participation became more deeply embedded in the popular culture of the barrios of the city center. In July 1979, the Union de Colonias Populares (UCP) formed with representatives from nine colonias and with over a thousand members. A year later, a second umbrella organization was established in the metropolitan area, the Movimiento Popular de Pueblos y Colonias del Sur (MPPCS). Gaining momentum, the next step for the neighborhood groups was at the national level, creating in 1981, the National Coordinator of Urban Popular Movements.[24]

By the time of the earthquake, then, the residents of El Centro were empowered by a network of oppositional community and labor organizations. "Ironically," Eckstein observes, "the government's effort in the 1970s to bulldoze the area had -from its vantage- the unintended effect of strengthening the community base of resistance to the housing crisis of the 1980s." Within in a month of the natural disaster, twenty-four neighborhood groups formed the Coordinadora Unica de Damnificados (CUD). It presented the government with petitions signed by 30,000 people, who demanded inclusion in the process of planning the reconstruction of the central area. The PRI sought to appease the CUD by announcing the government expropriation of the land. While this policy closed the door on landlord abuses seeking to get rid of their vecindades tenants, it opened the way for central planners to bulldoze their clean-sweep fantasies into a reality of an International Style commercial district. The CUD counter-proposed rebuilding in the traditional, vecendades style with updated infrastructure but the same low-densities and the same residents inside. In March 1986, the tenants of 200 of these housing units marched to the Zócalo to demonstrate their determination to participate in the formal planning process. The organizers of this

sit-in movement threatened to move 50,000 homeless people from the El Centro to the Olympic Village if their voices were not heard.

In 1987, the CUD worked out a deal with the government that was highly advantageous to the tenants but at a price of political cooptation and containment by the PRI. The political activists started another grassroots organization, the Assembly of the Neighborhooods/Asamble de Barrios. It gathered a list of rental tenants made homeless by the earthquake, compiling 50,000 names within a year. The movement also generated its own media star, "Superbarrio," a self-made street-theater persona. This super-hero provided not only a rallying point but a point of political satire typical of the city's popular culture.

Against such an array of protest tactics, national officials listened to party leaders not city planners in reaching a resolution to the protest movement. To safeguard the project from entrenched bureaucrats, it was given protective shelter by Manuel Camacho Solis in the People's Reconstruction Housing/*Renovacion Habitacional Popular* (RHP**)** program within the Secretariat of Urban Development and Ecology/*Secretari de Desarrollo Urbano y Ecologia* (SEDUE). In order to construct 48,000 household units by April 1987 required general agreement of the one-hundred-plus vecindades groups on a very limited set of blueprints. The "Convenio de concertacion democratica para la reconstruccion de vivienda" retained the low-rise, courtyard design for 38,000 housing units, but now they included forty square meters of space, private bathrooms, and kitchens with indoor plumbing. Another 10,000 units would replace high-rise towers designed by Modernist architect Mario Pani that had fallen down in the sprawling Tlateloco housing complex. At the same time, the pact excluded the populist leadership and substituted party functionaries in the administration of the plan. As Susan Eckstein argues, "autocratic rule at the national level is consistent with, and strengthened by, administrative democratization at the local level." [25]

The former rental tenants could return triumphant as future homeowners. Prices were heavily discounted and payments spread out over eight years. The World Bank funded about 60 percent, or $15.25 billion of the housing project and government subsidies further reduced the price to about one-fourth of market value. This low cost offer attracted seven out of ten residents to come back to their neighborhoods, at least temporarily. With an immediate doubling of value at a minimum, many residents could not afford to forego a chance to reap an instant windfall. But many others moved into new homes in their old neighborhoods, reestablishing identities of place. [26]

Equally important, populist struggles against party and official authorities over post-earthquake reconstruction fostered new identities as well. The remarkable story of the rise of a women's garment workers' union out of the ashes illustrates the ways in which movement culture reshaped urban politics. As Bennett notices, women had long formed the backbone of the neighborhood groups. But a different group of 40,000 women, the piece-workers in the sweatshops, were especially vulnerable to a male-dominated "patron-client" relationship on the job. The earthquake hit hard at the rows of

old factory buildings housing the garment workers in the Doctores district.

From 200-400 of these sweatshops collapsed, killing at least 800 workers. While many women still lay buried alive in the rubble, factory owners returned to dig out their sewing machines in order to set up shop somewhere else. One of the emerging leaders, Evangilina Corona recalled, "the boss, the masculine figure, the paternal image, the one who gives a pat on the back, the one who can grant permission, the one who pays cash in a manila envelop to unwed mothers who go to work at age fourteen. The boss, the patron, is always the reference point. Hard to believe the bosses demanded the recovery of their machines before the bodies of the dead."[27]

Out of the ensuing outrage, rescue and recovery efforts, and protest movements came a new group, the Nineteenth of September Garment Workers Union. Given support by outside NGOs of union organizers and feminist advocates, the garment union was able to confront the factory owners for back-pay and relief funds. In the process, the rank-and-file took on new gender and community identities. Labor historian Teresa Carrillo concurs, "the combination of gender- and class-based demands and interests has worked to fashion the union's functions and goals to resemble a combination trade union/social movement/women's organization."[28]

In many respects, the transformation of the sweatshop workers reflects how the earthquake changed social and political identities more than the physical space. The neighborhood groups and unions of El Centro formed an organizational core of post-reconstruction protest movements, but they were nonetheless typical of the urban popular movements created in aftermath of the natural disaster. Judith Hellman cautions against assuming they represent a structural change in Mexican political culture towards more democratic practices. Yet with PRI support down to only one in four voters in the Federal District by the end of the 1980s, the new wave of social movements opened up the official electoral process to multi-party competition for the first time.[29]

Santa Fe

The failure of modernist plans of urban renewal in the city center before and after the 1985 catastrophe pushed the residential zones of the affluent classes first to preserves along the grand Paseo de la Refoma, and then further out "where the air is clear" in the southwest hills of Interlomas, Cuajimalpa, and Santa Fe. For some business leaders, the chance to rebuild corporate skyscrapers on demolition sites along the prestigious Reforma was irresistible. But others sought ground outside of the high-risk zones of sinking, jello-like subsoils.

In large part, urbanization came relatively late to the Pueblo de Santa Fe because its rugged terrain had long kept it isolated from the main routes of settlement. This part of the ascending slopes of the Valley of Mexico is characterized by small desert-like mesas separated by steep *barrancos* or canyons that are difficult to transverse. Until the late 1970s, Santa Fe remained a poor village undergoing a one-two punch of urban

environmental destruction. Garbage was being trucked in as landfill to expand the edges of the mesa and sand was being gouged-out of the surrounding hillsides to create flat space for more tower-block, building sites.[30]

In 1982, the transformation of Santa Fe into a fashionable center of international trade and life-styles began with the building of a new campus for the Universidad Iberoamericana. Two years earlier, an earthquake had destroyed its historic site. Led by Manuel Camacho Solis, the federal and local governments gave the Jesuit school twenty hectares of landfill to kick-start the project. Designed by Le Corbusier disciple Francisco Serrano Cacho, this tribute to Modernism set the style for the architecture of the commercial district.

Both the environmental limits of the barrancos and the conscious design of the planners made it into an isolated island. Access is by automobiles only that routinely must pass through security checkpoints. Along the main highway paralleling the spine of the mesa, the plan followed the "logic of capital" by packing one skyscraper as close as possible to the next. Taking up early residence were NAFTA corporations such as Philip Morris, Pepsicola, Fed Ed, and Banomex (a Citicorp subsidiary). Carved into the terraced surfaces below sits a three-level shopping mall that like a tapeworm keeps growing new segments. A Sak's Fifth Avenue and a Liverpool department stores are recent additions.[31]

Across the street from the row of office towers is arising another master planned, large-scale development, City Santa Fe. Primarily condominium skyscrapers, it is marketing itself by highlighting its internationally renowned "starchitects," urban designers, and interior decorators. The master plan of a secure zone for ten residential towers was the work of the Jerde Partnership of Los Angeles (L.A.), which created other theme parks such as Universal's "Citywalk" in L.A. and the Bellagio Hotel in Los Vegas. Santa Fe's make-believe Emerald City is lifted three stories into the air above a monolithic parking structure that doubles as a medieval wall. Commercial shops, restaurants, and service centers accessible to the public are embedded into the side facing the commercial row of skyscrapers. The "City's" residential towers are each brand-named by architects, including the Serrano family, Bernardo Gomez-Pimienta, and Michel Rojkind. Landscape architect Susana Garcia has laid out extensive green spaces, bike trails, and recreational grounds. Only the residents will be permitted access to the Emerald City by having special passes to get by the security guards far below at street-entry level. Prospective condo buyers are assured that all their possible needs can be met without having to leave the "City" ever again.[32]

The expected traffic jams from a lack of planning for public transportation may turn the choice of a self-contained life-style into a necessity of survival. In Santa Fe, the planners remained true to the principles of modernist design.   Urban space and the pedestrian are subordinated to the primary demands of technology: the automobile and the highway. Plans for subway or surface Metro lines to Santa Fe are conspicuous by their absence. Yet, the barrancos restrict access to the flat mesas' interior highways,

creating choke points for traffic trying to integrate with the larger metropolitan network of roads.

Additional bridges can span the canyons but hold little hope of alleviating the traffic problem. Expensive bridges recently constructed have already brought nearby land under speculative development. Hilltops are being lopped off to create level ground for more mega-sized housing and office complexes. Moreover, the master plan makes no provision for moving people around inside Santa Fe between shopping, work, and homes. Except for those occupying the highest floors, the air pollution resulting from auto congestion is already generating a micro-environment of a more-or-less permanent haze, belying any notion that the air is cleaner in the southwest hills. Air quality may be further at risk due to persistent concerns that adequate environmental technologies have not been installed to vent gases begin generated by the solid wastes decomposing below the ground.

The ubiquitous construction cranes prove the success of the formal plan of Santa Fe in solving the problem of providing office space for international trade, but at a cost of making urban sprawl and congestion significantly worse. Like most private development schemes no matter how large the scale, the plans of Santa Fe represent fragmented pieces of urban space that ignore larger environmental contexts. For example, the City Santa Fe will have all of its thousands of cars enter and leave on a single road, the "Avenue of the Architects/*Avenida dos Arquitectos.*" Bordering the edge of a canyon, it is simply a crescent-shaped loop that feeds back to the main road fronting the row of corporate towers and the City's own façade of shops. Its plan contributes to traffic jams within the district in similar ways that Santa Fe's master plan adds to the metropolitan problems of too many cars, and too much congestion and pollution. Both formal plans underscore the costs to public health and individual quality of life resulting from designing pieces of urban space in isolation of their larger ecological setting.[33] Yet, Santa Fe as a case study in the shortcomings of planning by the private sector begs a final question of whether or not the federal government laid out an adequate plan on a scale large enough for the protection of nature and the inhabitants of the Valley of Mexico.

Conclusions

In the half-century following 1945, Mexico City was constructed without an overall plan for its expansion from less than three million to more than fifteen million people. The different environmental and social setting of Ajusco, El Centro, and Santa Fe produced distinctive outcomes. In Ajusco, illegal land invasions on steep hillsides led eventually to urbanization house-by-house and terrace-by-terrace. Identities of place remain fluid as rising property values generate a turnover of residents and gentrification of the built environment. For the more rooted residents of El Centro, pre-earthquake organization of neighborhood and labor groups helped give them political leverage after the disaster in forcing their way into the formal processes of planning the reconstruction. Their skill in securing the backing of the World Bank further strengthened their power to pressure the ruling party, the PRI, to rebuild their neighborhoods just like they used to be, except

better. In Santa Fe, the city's business leaders chose a theme park designer to imagine a new downtown in the style of global Modernism. With NAFTA money pumping into the urban economy, up arose a glass-and-steel ribbon of skyscrapers on a rugged, albeit fragile environment. The spine of its narrow barrancos have been made bigger by filling in their valleys with garbage and by cutting away their higher areas with mining equipment. The (re-)construction of each district has contributed in its own way to a deterioration of environment conditions.

The efforts of the federal government to address the needs for environmental planning for the Federal District and larger metropolitan area may be conveniently divided into pre- and post-earthquake periods. As Peter Ward contends, the leaders of the PRI until the late 1970s portrayed planning experts as dangerous competitors threatening to undermine the party's political authority. The Lopez Portillo and Miguel de la Madrid administrations (1976-1988) began a process of creating regional plans and environmental agencies; at least on paper. But even the most rudimentary enforcement of the new laws remained non-existent until after the urban catastrophe of 1985 and the national recovery of the economy. Since the late 1980s, the administrations of Carlos Salinas and Ernesto Zedillo (1988-2000) have taken positive steps to institutionalize and professionalize the environmental monitoring services. Moreover, the replacement of smoke-belching factory chimneys with residential apartment towers, and the constant announcement of new rules governing vehicle traffic and driver behavior have become normal parts of everyday life.[34]

But a holistic vision of the urban environment does not seem to be an integral part of the still more important, national economic plan. Regional planning no longer resembles Le Corbusier-like finished blueprints. On the contrary, it now draws flexible guidelines of general goals such as growth/containment strategies, green-space preservation, drainage maps, and highway networks. This type of framework approach also attempts to balance the perspectives of planning experts and the participation of grassroots activism. On a regional scale, the computer models of the academics can help visualize the flows of auto traffic, air pollution, waste water, electrical power, and so on. However, their dynamic, three-dimensional representations of virtual reality have the same authoritarian tendencies of "seeing like a state" as Le Corbusier's still-framed but no less dazzling images of tomorrow's city in-motion.[35]

At the local level, the post-modern planning mantra of "mixed use" reflects the experts' greater appreciation of the link between the vibrancy of the community's identity of place and the conservation of neighborhood's physical tissue. Yet, the narrow geographical focus of most NIMBY movements need to be turned from their defensive looking inward to a broader context of the ecological setting of the whole city. Like the fragmented pieces of the private developers' subdivisions, the plans generated within each local district needs to be plugged-in to an overall framework for the environmental protection of region's nature and people.[36]

The costs to public health and individual quality of life of putting national economic goals ahead of urban environmental planning are not difficult to expose in Mexico City.

Despite some meager, symbolic efforts to gain control of the overload of vehicles on the city streets, for instance, the larger plan is to promote the sale of more automobiles. In 1986, there were 1.3 million cars in the city, which increased at a rate faster than the population to 2.4 million ten years later. The professional politicians deem it expedient to keep the price of the government-owned monopoly in gasoline (and gas for water heating and cooking) low as proof of their benevolence to the masses. Moreover, stimulating the domestic market for new cars has been a high priority for the national government since this industry began undergoing massive restructuring in a globalized economy. "As a result," Priscilla Connolly states, "individual transport in cars and taxis has been allowed to dominate Mexico City unchecked and, in many ways, [it has been] actively supported by government policy." These national goals have meant a virtual stonewalling of proven schemes to reduce the number of vehicles on city streets and to coordinate public transport with the overall movement of people and goods within the metropolitan area. Equally important, the promotion of a car culture had silenced public education on the alternatives. "Car-owning Mexicans," she surmises, "are not usually prepared to walk more than half a block to their final destination and they do not usually have to."[37]

Although the health costs of air pollution from auto congestion may be impossible to calculate with precision, there is no doubt that it is taking a serious toll. Even by official standards, the air is polluted on 320 days of the year. In addition, the air has too many suspended particles at least half of the time. And the government does not measure many toxic substances in the atmosphere, making health risks difficult to measure. Nonetheless, statisticians estimate that bad air causes almost 500,000 children and senior citizens to suffer from eye and nose irritations, while it makes another 333,000 city dwellers victims of lung disease. Extensive interviews by scholars reveal a general perception among the educated classes and the political authorities that air pollution is the city's single worst environmental problem. Yet, the piecemeal and puny response of public policy to it underscores the political subordination of safeguarding Mexico City's environment to national economic goals.[38]

The examples of the piecemeal planning of Ajusco and Santa Fe illustrate a more mixed picture that results from confounding the protection of the environment with the politics of urban development. They offer cautionary tales of the abuse of environmental tropes such as "sustainability". Both the self-built colonias populares of Ajusco and the more formally planned Santa Fe district has satisfied the needs of its primary occupants. In Ajusco, "*necesidad*", or the struggle for survival, engendered not only a sense of identity but also an informal plan of residential neighborhoods. The colonos of Bosques del Pedregal were joined by local activists and international NGOs in making claims to constructing a utopia of an ecologically productive settlement. But enthusiasm among the residents for such a communal project of visionary scope was not deep-rooted. In the end, it was sapped dry by the PRI-sponsored grants of individual land titles. The example of Santa Fe sheds light on the limits of formal planning outside of regional frameworks. The claims of its plan to offering environmental amenities such as clean air and less congestion are very things its success is destroying. While satisfying individual needs for modern office, residential, and shopping spaces in the most trendy

international styles, Santa Fe contributes to a communal poverty by degrading the environment and quality of daily life.

In contrast, the rebuilding of El Centro illuminates the ways in which international, national, and local groups can work together to produce successful planning outcomes. In this case, strong identities of place and class formed a solid social foundation to build a defense of a traditional building type, the vecindades, and its communal style of urban life. After the 1985 earthquake, the rapid mobilization of urban popular movements in this historic district helped them get external NGOs to steer global relief aid through their grassroots organizations. Their insistence on low-rise housing in the reconstruction plan has helped to lower population densities at the city center along private landlords, who are reluctant to erect apartment towers in this high-risk zone. The massive addition of so much new low-income housing in such a brief period apparently had the secondary effect of depressing market prices. At the end of the decade, renters-turned-capitalists could profit from their NGO and government subsidizes, while new groups of would-be homeowners temporarily had an opportunity to buy an up-to-date unit in a central location. The reconstruction of El Centro as working-class neighborhoods also contributed to a reduction of traffic congestion by allowing its legions of service workers to remain living near their jobs. Finally, the empowerment of the grassroots in this case helped preserve the entire historic core from the planners' wreaking ball of Modernism. Under the direction of private investors such as billionaire Carlos Slim, some of its tarnished gems of the colonial era are now being restored to their Baroque splendor. At many levels, then, the rebuilding of El Centro has made a positive impact on the urban environment.[39]

Erosion of local distinctiveness and place identity of Simla, a hill station in the Himalayas

Rajinder S. Jutla
Missouri State University, United States

Tourism in Himalayan cities is growing very fast. In the summer months, thousands of Indian and foreign tourists flock there to escape the hot Indian summer and in winter, to experience snowfall and winter sports. To meet the rising demand for tourist accommodation, a number of facilities has been constructed over a short period of time. Himalayan communities have also experienced tremendous growth due to their own population pressure.   This has led to a loss of townscape character which has also been accelerated by the fast change in technology, construction systems, and building styles.

This study focuses on the fast growing Himalayan community of Simla in terms of its residents' and tourists' perception of its rapidly changing townscape character and development practices. Simla which is known for its natural beauty is a town tucked away in mountains covered with tall majestic pine trees. It also projects the image of a typical English town .s. These characteristics make the city and the region an attractive place for tourists. The study examines the physical attributes of the townscape of Simla through interviews with residents and tourists. The physical attributes of a townscape are an important part of the extrinsic dimension and are relevant to this study. The study primarily examines the changes in townscape character and developmental practices of Simla in terms of its residents' and tourists' perception.

This study is important because in recent years, Simla has emerged as a major tourist destination. This increase stems partly from the political unrest and lack of safety for the last fifteen to twenty years in the Indian state of Kashmir which for decades had been a major tourist destination in Northern India. The city of Simla attracts not only Indian tourists from different states, but also foreign visitors to India. For foreign nationals, a visit to Simla is often the first stage of a trek through the Himalayas. There is also an increase in weekend tourists from neighboring areas. Consequently, Simla has become one of the most popular tourist destinations in Northern India.

The relationship between tourism and the physical environment has been recognized by tourism planners worldwide. Many world renowned cities, such as Salzburg in Germany, Innsbruck in Austria, and Banff in Canada are widely acclaimed and popular among tourists for their physical setting and townscape quality. In the words of Tringano (1984:20) 'tourism and environment are inseparable.' Thus, environment, which attracts tourists, needs to be protected. This study of townscape character dealt with the urban environment which consists of both the cultural and natural elements of the city. The cultural landscape includes landmarks, unique historic buildings, and public spaces, and form the backbone of the urban fabric. Lynch (1996) identified landmarks as important to cities because they provide them with visual identity; they are the urban signatures by which a city is remembered. The natural environment includes the topographic

character, wooded areas or water bodies. Natural settings provide a backdrop for the city and play an important role in lending character to well known cities. Krippendorf (1997) clearly articulated that landscape quality is the capital in tourism and so must be managed properly. Tourism planners need to realize that it is the quality of the urban environment which attracts tourists. The lack of planning and management of the urban landscape will result not only in loss of visual aesthetics but also environmental degradation which may cause natural disaster and safety concerns.

Although a number of researchers have examined the reactions of the host resident population to tourists, relatively few have focused on the reactions of residents and tourists to changes in the townscapes brought about by tourism development. Kavallins and Pizam (1994), Canedy and Zeiger (1991), Lawson et al. (1998), Jurowski et al. (1997), Ryan et al. (1998), and Allen et al. (1998) have also conducted studies in the areas of perception and attitudes of tourists and residents. These studies examined issues of tourism, recreational development, and tourist destinations in terms of social, economic, and environmental aspects. However these are focused on the well developed resorts and/or urban destinations in the developed world and relatively little attention has been paid to Himalayan destinations such as Simla.   Singh (1985, 1989a, 1989b, 1991) and Singh and Kaur (1985) have completed a number of studies in the context of the Himalayan region but these studies focus on the non urban environment aspects of environmental concerns and sustainable development of the ecologically sensitive region of the Himalayas. Both Page (1995) and Law (1996)   pinpoint that very little has been done to explore issues and problems related to the urban design aspects of tourism. Also, hardly any research has been done to explore residents and tourists response to examine visual character of Himalayan townscapes.

The paper has two objectives. The first is to examine the historical development of Simla. The second is to examine the townscape character and pattern of development of Simla in terms of resident and tourist perception. The paper attempts to address the development of Simla in terms of townscape characteristics, to investigate how new buildings relate to their immediate surroundings and landscape. It also identifies the most and least favored parts of the city. The first section of the paper provides Simla, the site and gives a brief historical account of the city.   The second section deals with the research methodology, analysis and a discussion of the residents' and tourists' responses to the townscape character and pattern of development. The last section provides the conclusions.

The site description

Simla is about 225 miles north of the Indian capital of Indiai. The city is connected by an air, rail, and a network of good roads to Delhi via Kalka, a town at the foot of the Himalayan mountain range. The scenery from Simla to Kalka is breathtaking and the road passes through intact cedar, pine and oak forests. The train goes through one hundred and three tunnels through the mountains, on a journey which provides picturesque views of step farming villages, wooden houses and sloping roofs.

Originally, Simla was planned for a population of 30,000 to 40,000 but the present permanent population, with the inclusion of peripheral villages has crossed 200,000. It is located in the Shivalik range of the Himalayas in Northern India and has become a very popular tourist destination in recent times. Simla was carved out of mountains enveloped with mature pine forests, at an elevation of approximately 7500 feet above sea level. The dense and mature pine forests of the hill station generate an enduring imagery. These majestic trees are the pride of the Himalayan region and they greatly contribute to its scenic quality (Singh 2000). Historically, the British colonials created Simla as their summer capital because of its unique setting and its climate which was similar to that of England. The hill station not only was a haven from the hot Indian summer but its winter snowfall allowed for recreational activities such as skiing and skating. To create a sense of familiarity, the British recreated an English townscape in Simla. The image of the city was projected to revive memories of England, which is reflected today in a number of its buildings, which include the municipal corporation, state tourism information bureau, Church of Christ, and the State Bank of India.

Historical Background:

Simla was discovered by British army officers in the early part of the nineteenth century. At that time, it was a small hamlet, known as the abode of the local Hindu goddess, *Shamala.* In 1827, Lord Amherst the Governor General of British India built his summer residence in Simla. After this it did not take very long for Simla to become the favorite destination of young British officers. Far away from the conservative environment of Victorian England, Simla was a place of fun, fancy dress balls, horse riding, and picnics. It was also known as the place where unmarried British women went to find a suitable match (Lohumi 1999).

The town really grew after 1864 when the Viceroy, Lord John Lawrence made Simla the official summer capital of British India. The city was developed over seven spurs around an irregular shaped Ridge. Many important buildings were built in the last part of the nineteenth century. The Cathedral of Saint Michael and Joseph was built in 1882 and Rippon Hospital was built in 1885. The Gaiety Theater which was modeled after the Royal Albert Hall of London was built in 1887. The most well known and architecturally significant building is the Viceregal Lodge, the summer residence of the Viceroy which was completed in 1888. This building is presently known as the Indian Institute of Advanced Studies (Lohumi 1999).

For the travel convenience of British government officials, Simla was connected to Delhi, the winter capital of India by railway, via the town of Kalka. The journey from Kalka to Simla is virtually an uphill one. The connection was made by a narrow-gauge rail line link. Small 'toy trains' ran on this link making a long mountainous journey through 103 tunnels, covering a distance of 56 miles to reach Simla. The introduction of the railway system attracted many more tourists into the city. In addition to this for the convenience of the Viceroy General and other important British officials, a rail car was introduced. This covered the distance between Kalka and Simla in about three hours, almost half of the time taken by the normal train journey. Another important factor

responsible for the expansion of Simla was the installation of the Chaba power station in 1912. This provided the required power supply to the city (Lohumi 1999).

The urban form of Simla was based on segregation. This was an essential element in preserving the existing social structure with the British rulers at the top and the Indian population on the lower tier (Kanwar 1997). Simla has two major shopping areas. The first, the Mall road, was created to serve the needs of the colonials while the second, the Lower Bazaar, catered to the Indians. These two commercial areas are located in close proximity in the heart of Simla, at two different levels. The Mall road is located at the upper level and the Lower Bazaar at the lower level. Both these areas have mixed land use which includes shopping, office, and residential spaces. English type shops, catering to the elite, were built on the Mall road. Also, a Swiss hotel chain opened the posh Cecil Hotel. Nowadays the Mall is mainly frequented by wealthy Indians and tourists while the Lower Bazaar continues to meet the needs of a large number of Simla residents.

In the early part of the twentieth century, a color bar was instituted to prohibit Indians from the Mall and the Ridge. This was lifted later on during the first World War when Indian men were recruited into the British armed forces. The wives of these Indian army officers started appearing on the Mall as well as at the Gaiety, a theatre frequented by the British residents. Elite schools for the children of the British and wealthy Indians were built at this time. Examples are Bishop Cotton and St. Edward's for boys and Loretto Convent and Auckland House for girls. These schools were run by missionaries from Great Britain. After the end of World War I, there was hardly any development in Simla and the city continued to be the summer capital of India up to its independence in August 1947 (Lohumi 1999).

At the time of India's independence, Lahore, the capital of the adjoining province of Punjab was transferred to Pakistan. As a result, Simla served as the temporary capital for the state of Punjab. In 1956, the capital of Punjab was transferred to Chandigarh, a modern city designed by the world renowned architect, Le Corbusier. At this time, many government offices moved to Chandigarh. Another turning point for Simla came in 1971 when the city became the state capital for   Himachal Pradesh. It continues today to serve in this capacity. Another change came about in the late 1980s when the spelling of Simla was changed to *Shimla*, in accordance with the pronunciation of the local residents*.*

Tourism in Simla

Before 1947 when India was a British colony about 50,000 British officers and rich Indians visited Simla annually. After India's independence from the late 1940s to the late 1980s, tourist arrival to Simla increased to approximately 250,000 annually; this period can be described as the stage of involvement. During this time the city started celebrating the Simla Summer Festival which was marketed through various regional newspapers. A number of Hindi movies were also shot in Simla making the city popular among Indians. The number of tourists continuously increased. In late 1980s, an

average of 350,000 tourists visited Simla annually. The period 1980 to 2000 marks the third and development stage. There were 50 hotels at the end of the 1970s and in the early 1980s, the number of hotels increased to 75. *The Tribune*, a major regional newspaper, reports tremendous growth in Simla's hotel industry, from 98 in 1990 to 210 in 1998 (Singh, 2000).

In the early 1990s the annual tourist arrival increased to 500,000 and by the late 1990s, this number almost doubled to 900,000 (Singh 2000). During this time, residents felt the impact of tourism on their quality of life. The property values and house rents increased and also there was a shortage of drinking water. As a result some tension developed between the host resident population and the tourists. Tourist influx to Simla is still increasing and this trend is expected to continue in the coming future.

Research methodology

To examine the current issues and problems of the townscape character and development practices of Simla in terms of the perception of tourists and residents, a questionnaire based survey was administered at the siteduring the summer months of June and July in 2005. Fifty residents and fifty tourists were interviewed face-to-face in the heart of the city, the Mall Road and the Ridge.

These areas were deliberately selected because they are major activity areas of the city Many offices, good restaurants, shops, and emporiums selling specialty items of the region are located in the Mall and on the Ridge. A good mix of residents and tourists from all over the city are represented dailyand since the survey was conducted during the peak of the tourist season,there were many families from the different parts of India. The sample included residents older than twenty years of age who have beenliving in Simla for at least then years. The ten year residential requirement was included to ensure respondents' familiarity with the town. To avoid gender bias, the sample was stratified to include fifty percent male and fifty percent female. Also only one person per household was eligible to participate in the survey. The tourist population was defined as all those who had visited Simla at least once before to ensure that they too had some familiarity with the place just as in the case of local residents.

The questionnaire was divided into three sections. The first section contained questions pertaining to demographic information such as age, place of residence, and profession, and was identical for both target groups. The second section of the questionnaire contained questions targeted to each group. Residents were asked about their length of residence in Simla and about their satisfaction with the city. Tourists were questioned about their reasons for visiting Simla, their accommodation, their place of residence, and vacation period. The third section was again identical for residents and tourists; it examined townscape character, the pattern of development, the most favorite and the least favorite area.

Analysis and discussion

Age was classified into three categories: the first, between 20 and 30; the second, between 40 and 50, and the third over 50 years old. Date compilation shows that residents interviewed for the study included 24% between 20 and 30, 36% between 40 to 50 years, and remaining 40% over 50 years of age (Table 1). This selected sample of residents represented a wide range of occupations which included military personnel, health occupations, educators, businessmen, civil servants and agriculturists (orchard owners).

Table 1: Age Structure of Residents and Tourists:

Age Categories	Residents	Tourists
20-30	24%	16%
30-40	36%	20%
50+	40%	64%

Eighty percent of the residents who were questioned were born in Simla and lived there all their lives. When residents were asked whether they liked living in Simla,ninety percent responded that they were satisfied with living in the city. They stated that it was quiet, safe, and pollution free as opposed to the hustle and bustle of big Indian cities. The remaining ten percent of the residents said that Simla was boring and unexciting and they would like to move to a bigger city in the future. When asked about the influx of tourists to Simla, fifty two percent of the residents had a strong positive attitude and felt that tourism should be further encouraged. Twenty percent were somewhat positive while the remaining twenty eight percent had a negative attitude and did not think tourism should be encouraged. To the question on the impact of tourism, forty percent of the residents   strongly believed that tourism is making a negative impact. Twenty percent somewhat agreed with this while the remaining forty percent did not believe thisl. Residents commented that the cost of living shoots up during the tourist season and the city cannot meet the increased demand for water and electricity.

Data analysis shows that tourists interviewed for the study included sixteen percent between 20 and 30 years old, twenty percent between 40 to 50 years, and remaining sixty four percent over 50 years of age (Table 1). It also shows that sixty percent of the tourists visited Simla on more than two occasions. In response to the question about the reasons for selecting Simla as their tourist destination, sixty percent of the tourists responded that they came to Simla because of its cool climate, fresh air, and to escape from the heat of the plains. Sixteen percent said that they selected Simla because of its location and proximity to their place of residence. The remaining twenty four percent chose Simla over other hill resorts because of its unique character, magnificent scenery, and cleanliness (Table 2).

Table 2: Tourists' Reasons for selecting Simla as a Tourist Destination

Criteria	Percentages
Cool climate	22%
Fresh Air	10%
Escape From heat	28%
Location and Proximity	16%
Unique Character	12%
Magnificent Scenery	10%
Cleanliness	2%

Eighty percent of the tourists surveyed said that they would definitely return to Simla. The other twenty percent responded that they would like to visit some other new destination. Eighty percent of the tourists stayed in hotels while the remaining twenty percent stayed with their relatives and friends. It was interesting to note that tourists who stayed in hotels spent one to a maximum of two weeks in Simla while those who stayed with relatives spent more than two weeks. Five percent of these tourists also visited Simla in the winter season to experience the snowfall and enjoy ice-skating.

Townscape character

The townscape character of Simla has eroded since India's independence from Britain. When questioned about the character of Simla, the majority of the residents and tourists noticed and were concerned about the changing character of the city. Residents and tourists were asked to rate the new development in terms of its appropriateness to the surroundings. They were assessing new development in terms of construction method, building material, textures, scale and style. They were shown photographs to explain these aspects. New development appears in almost all corners of the city, and it is difficult to ignore it. Tourists who were visiting Simla after a long period were very quick to observe the changes. They were asked to rate these questions on 1 to 7 scale where 1 represented inappropriate and 7 highly appropriate. Table 3 summarizes residents' and tourists' ratings of townscape character. The overall mean ratings of these questions represented the townscape character. The average rating for all residents was 2.2 and for tourists it was 2.9. These ratings reflect a deterioration of Simla's townscape.

Table 3 Assessment of Townscape Character: New Development

Townscape Criteria	Residents' sample mean	Tourists' sample mean
Appropriateness to the place.	2.1	2.4
Appropriateness of building style.	2.3	3.1
Appropriateness of construction system	1.8	2.9
Scale, color and texture of new building material	2.6	3.3
Overall Mean Ratings of Townscape Character	**2.2**	**2.9**

To study the significant difference between the perceptions of both groups, the mean ratings and overall mean ratings of both residents and tourists were run through the z test for two independent groups on Excel. The null hypothesis for each criterion which states that there was no significant difference between the mean ratings of residents (n =50) and tourists (n = 50) failed to be rejected at α = .05 significance level. This shows that there were no significant differences between the perception of both groups. There is no doubt that the mean rating for the residents were found to be lower than that of tourists. This shows that residents were more dissatisfied with the new buildings and land development schemes as compared to the tourists. However, both these resulting mean ratings were below the middle value of 4 on the measurement scale of perception on a seven point scale where 1 represented inappropriate and 7, highly appropriate. These ratings reflect that both the groups noticed a deterioration of Simla's townscape character.

Eighty five percent of the residents were concerned about the inappropriate pattern of recent development which was described as characterless and an eyesore. The residents were also very nostalgic for the old Simla, its colonial character and cleanliness, particularly those who were born and raised in the city. They referred to the 1960s and 1970s as the "good old days." Residents also reported about the changing face of the Mall road due to the construction of a number of concrete buildings which do not lend to the local character of the older existing buildings. New buildings are not architecturally sympathetic to the existing buildings. Many of the old colonial buildings have been consumed by fire and residents complained that the remaining ones are not properly maintained (Jutla 2000). Simla which has become very congested and overcrowded over the past twenty five to thirty years is turning into a 'concrete jungle,' far from its original natural environment. Only fifteen percent of the residents thought that the change was positive in terms of cable TV, cellular phones, increase in public transportation, and private auto ownership. Eighty percent of the tourists also thought that the change was negative. The tourists who visited Simla in 1970s and early 1980s

romanticized the old image of Simla. The remaining twenty percent did not notice any significant change or thought that the change was unnoticeable. Twenty percent of tourists stated that the change was positive in terms of better train travel facilities, quality of hotels and taxi service.

Pattern of current development

In response to the question about the current practices of physical development, eighty seven percent of residents and eighty percent of tourists responded negatively to the way Simla was developing. Both groups agreed that the new development is haphazard, and ugly, resulting in overcrowding, and congestion. Lohumi (1999) reports that a number of high-rise apartment buildings have been built and are mushrooming in different parts of the city. They have even been constructed on lawns and tennis courts of old buildings. The Tenancy and Land Reform Act, which debars non agriculturists from buying land in the rural area is responsible for the congestion and the concentration of construction activity in the city. The increased demand for housing has led to property owners constructing multi story buildings, occupying one floor, and selling the others to pay for the cost of the land and construction. These high rise apartments have become very popular especially with out of state buyers since land ownership in Simla is confined to residents. People from other states have been buying holiday homes in the city. Twenty to thirty years ago this was not a common trend. Sharma (2001) reports that in the past many people lived in single or double story houses, and they rented their additional accommodation.

In the last fifteen to twenty years, the population pressure has added more cars, more concrete buildings and ugly unplanned buildings in Simla . This is also caused by the recent economic prosperity of the region. Many buildings are constructed rapidly and in many cases, without ecological, aesthetics and safety concerns. The residents tend to think that they can build almost anything with concrete pillars but this has proved to be untrue since many of these high-rise structures collapse because of improper construction, soft soils and landslides.

There is therefore an immediate need to identify the unstable slopes and establish no construction zones in the area.. Government authorities are reportedly ignoring all these incidents because of political pressure. They need to address the issues of sinking roads and buildings by setting standards for the design and construction of concrete retaining walls based on engineering standards and principles of sound ecology.

Urban Artifacts

Forty percent of the resident sample have been living in Simla for more than twenty five years. They were also nostalgic for some of the interesting streetscape details from the colonial past. The same feeling was also expressed by twenty percent of the tourists, who had visited Simla on several occasions before 1980s.   For example, many residents talked about the elegant design of the old red post boxes, decorative wrought iron fences, manhole covers on roads and also unique lion-headed public water taps on

the roadsides. The people surveyed wondered why these details have disappeared and why similar details are not utilized at present. This question takes us to issues of the preservation of townscape character. The responses of both residents and tourists suggest that new development must sympathetically link with the colonial history as well as the future development of the city. There should be a sense of continuity in the townscape character.

Favorite Areas

Both residents and tourists were provided with a list of distinctive areas in Simla. They were asked to identify their most favorite and least favorite parts of the city. Both groups were asked to identify the criteria which attracted them to these places and select any number that was appropriate for them. Eighty percent of residents described the Mall Road and the Ridge as their most favorite part of Simla (Fig. 1). This was because of location, a traffic free pedestrian friendly atmosphere, and people watching activities (Table 4).

Table 4 Criteria for the most favorite area.

Criteria	Residents	Tourists
Central Location	90%	90%
Pedestrian Friendly	75%	85%
Restaurants	45%	80%
Movie Theaters	60%	65%
Views	60%	80%
Activities for Children	70%	90%
People Watching	70%	80%
Shopping Facilities	60%	80%

Ninety percent of the tourists also identify The Mall and The Ridge as their most favorite place. Tourists indicated that the Ridge is particularly important because it is the place where the summer festival is celebrated and it is where Simla's well known landmark, the Christ Church, is located . The groups surveyed further elaborated that they always associate Simla with the image of the church on the Ridge. Some tourists commented that Hindi movies shot in Simla always included shots of the church. This illustrates the extent to which city images are promoted by Bollywood movies. The popularity of this

spot is marked by horse riding activities for children. The Ridge is also connected to the Lakkar Bazaar which sells the specialty wooden items sought after by tourists.

Residents and tourists described the Mall Road and the Ridge as the hub of the town, as crowded, fun and pleasant places. They are the two important pedestrian oriented urban spaces of Simla. They are centers of activity interlinked by important pathways. They generate a rich social life by attracting a large number of people. Both groups stated that they went there to meet their friends, stroll, wear their fashionable clothes and jewelry, and watch other people (Jutla 2000). People watching in urban plazas have been identified as a popular activity (Whyte 1990).

Sixty five percent of the residents identified the interstate bus terminal as their least favorite part of Simla. Fifteen percent of the residents could not identify their least favorite part and there was no consensus among the remaining twenty percent. The interstate bus terminal was again cited by fifty percent of the tourists as their least favorite part of the city. This area was described as congested, polluted, unsafe and unattractive (Table 5). There was no consensus however among the other fifty percent.

Table 5 Criteria for the least favorite area.

Criteria	Residents	Tourists
Congested	84%	90%
Polluted	80%	84%
Unsafe	90%	92%
Unattractive	75%	80%

 Singh (2000) reports that during the summer tourist season over 5,000 tourists arrived daily in Simla. This resulted in an increase of over 1500 vehicles entering into the city daily creating traffic congestion. The number of vehicles owned by residents has also increased sharply over the past few years; about 450 new vehicles are registered every month.

Conclusion

Simla was built by British colonials as a hill station to escape the hot Indian summers. Nowadays ays it has become a popular tourist destination and is expected to grow in the near future. This study examined current development practices of Simla in terms of resident and tourist perception. It concluded that there is no significant difference between both groups; they gave equal importance to the quality of the environment. The quality of building design and setting was found to be very important for both groups. In response to the townscape character, the study concludes that there is a strong sense

of feeling among the majority of residents and tourists that the character of Simla is eroding and that there is a great need for the protection and conservation of both the natural and cultural landscape. A strong sense of nostalgia was revealed among residents as well as returning tourists in preserving and promoting the British heritage.

This research highlights the need to maintain and enhance the visual character of townscapes. The issues discussed here also exist in other Himalayan hill towns such as Kulu and Manali. The study recommends that cities which draw tourists should be developed in the context of their history, architectural heritage, and landscape character. Visually attractive cities not only bring civic pride to its residents but also attract tourists and increased economic activity. The study concludes that residents and tourists perceive that the city of Simla is in danger of losing its unique townscape character as a result of its increase in population, economic growth, and tourist influx. For Simla to continue as a viable, attractive, and promising tourist destination, planners must pay attention to the preservation and protection of its natural and cultural landscape. They must also ensure that new development is based on conservation and not consumption of the natural environment.

Clarence Stein's formative experiences and unbuilt projects – transforming classical training into modern design and planning sensibilities

Kristin Larsen
University of Florida, United States

As a community architect, Clarence Stein integrated social and economic considerations into his designs.   A balance and linkages between the built and natural environments informed his projects from individual buildings to garden apartments to the proposed garden city at Radburn and fueled his advocacy of policies and programs supportive of housing, town building, and regional planning. He applied his late Victorian architectural education and progressive reform sensibilities at a time of rapidly changing technologies, increased professionalization, specialization, and government intervention in shaping the built environment. This paper examines his architectural education and training and his early unbuilt projects as a means to better understand how Stein transformed his classical training into a practice that engaged with modern design and planning sensibilities.

Stein's classical, formal architecture education at the École des Beaux Arts in Paris from 1905 to 1911 equipped him with design skills and an appreciation and understanding of form. Following his return to New York City, he entered into the office of Bertram Goodhue where the architect refined his professional skills and collaborative work ethic and gained significant experience with large-scale community design. At Goodhue's side, Stein also began to deepen his understanding of site layout beyond the strict classical arrangements of the Beaux Arts and to engage historical precedents relevant to the region.

Following World War I, Stein embarked on a particularly crucial and productive period allowing theory to freely inform his maturing practice—theory that evolved through a network of leading thinkers in design, regionalism, and urban development—theory that he cannily promoted through his political connections and writing. With his mentor Robert Kohn, Stein formed a cooperative architectural practice. During the initial years of this partnership, Stein worked on several unbuilt projects that reflected his evolving interest and expertise in site planning and application of regional materials and design techniques. Through an examination of contemporary primary documents, assessments of the École, pertinent biographies and studies on design and modernity, a greater understanding of Stein is obtained. During these early years of training and practice, the architect engaged a collaborative work ethic, a practice-based theoretical approach, emerging modern site design sensibilities, a commitment to addressing affordability, and community building informed by a regional perspective.

Ethical culture – learning by doing

In 1890, when he was 8 years old, Clarence moved with his family from Rochester, NY to New York City and initially settled in the northern section of the Chelsea Street

district. Shortly after moving to the city, the Stein's enrolled Clarence and his older brother William as tuition-paying students of the Ethical Culture Society's Workingman's School; his three younger siblings would soon follow. Founded in 1876, Adler's Society for Ethical Culture "sought to erect ethical purpose as the vital principle of living without reference to any kind of theological doctrine."[1] Serving society was a primary concern. Two years later, Adler opened a kindergarten, and then in 1880, the Workingman's School in the Chelsea neighborhood. Felix Adler integrated work, play, and moral instruction so that the children would "become accustomed to mutual aid and support."[2]

In addition to Adler, John Lovejoy Elliott, who joined the school in 1894, became a significant mentor and teacher of Clarence's. Elliott practiced and taught the principles of mutual aid involving his students in the activities of the Hudson Guild Settlement House and instilling in them his concerns about moral corruption and the deterioration of the urban environment, especially the living conditions of the poor. Through his work with Elliott in the Hudson Guild Settlement House Boy's Club and the summer camp in Netcong, New Jersey, Clarence observed the affects of the tenements on young people and gained a deep interest in cities, urban reform politics, and neighborhood life.

Following his education at the Workingman's School, Stein worked for two years with his father and two brothers at the National Casket Company but became restless, realizing that though his father had paved the way, a career with the company was not for him. Shortly after a trip to Europe in the summer of 1903, where his growing interest in architecture was stimulated by visits to Venice, Naples, and Paris, Stein decided to begin studies in interior decoration and the design of furniture entering Columbia University in fall 1903. After one year at the university, Stein decided to study architecture at the École des Beaux Arts. Though several American universities had architecture programs, family friend and architect Robert Kohn's experience at the school ten years earlier, Clarence's recent travels in Europe, and the prestige of the institution probably all contributed to his decision.

École des Beaux Arts – classical training

Stein's life was transformed in Paris. He quickly became enamored with its broad boulevards, medieval quarters, crowded, vibrant neighborhoods, great and small parks, and rich urban life. And so, the city itself contributed to his development as an architect. Further, Paris became a launching ground for trips to other parts of Europe. Over the next six years, he augmented his preparation for and training at the École with travels in England, France, Italy, Austria, and Spain. These experiences contributed to his growing interest in urban spaces and the layout of cities. Meanwhile, his classical, formal architecture education at the École equipped him with design skills and an appreciation and understanding of form.

While Paris certainly had its distractions, among them the museums, numerous parks, street life, and cafes, Stein's primary goal was to begin his architectural studies. Stein attended the school when its reputation was at its peak. In the hierarchical studio system, the newer students of the École (nouveau) assisted and learned from the

advanced ones (anciens). This collaborative approach and strong identity with a particular atelier made choosing one that much more important. "The attraction of the ateliers was twofold: an experienced master offering guidance, and a company of students sharing their learning."[3] Stein called this approach "mutual assistance" because he considered it similar to the concept of mutual aid he had been exposed to through the Ethical Cultural Society. He would return to this concept throughout his life and integrate the idea in his architectural practice.[4]

Like most aspirants with his level of education and training, he did not pass the exam on his first try that December.[5] He did gain a more holistic understanding of the "essentials one needs for architectural design."[6] Though the modernist movement was certainly underway in Europe, the École continued in its long tradition of emphasizing the classical orders and grand design problems. Consistent with this mind-set, Clarence praised the "Municipal Art" movement occurring in the United States – "City after city is working out schemes for the beautifying of their public places."[7] Still he did not support simply the "rehashing of old work" noting that people "are going to require something different . . ."[8] To achieve that "something different," the architecture profession required those with the skills to apply the qualities of the old "with the purpose not of copying it" but making it distinctively their own.[9]

Stein and his friend Ely Jacques Kahn, who had recently graduated from the architecture program at Columbia, were the only aspirants in their circle of friends to pass the exam in December 1907. Of "four to five hundred competitors," only the 60 with the highest scores gained admission to the École, and of those only fifteen foreigners could enter.[10] Clarence placed fourteen among the fifteen foreigners who successfully completed the exam.[11] Following more than two years of preparation and disappointment, Stein was a "full-fledged eleve de École des Beaux Arts" with the right to officially begin his studies at the prestigious institution.[12]

By February 1908, Stein had decided to enter the atelier of Victor Laloux. Consistent with the culture of the École, Laloux focused on the plan – "Laloux concentrated on the organization of a plan, with an intuitive balancing and proportioning of each part so as to contribute to the whole. He let his students leave facades until the last minute; one remembered him saying, 'You can put forty good facades on a good plan, but without a good plan you cannot have a good façade.'"[13] Stein would remain in Laloux's atelier for the remainder of his years at the École.[14]

Clarence also continued his studies through his travel often accompanied by his roommate, Henry Klaber. One of the more significant trips was to Bournville, England in August 1908. The prospect of visiting the model town, just four miles from Birmingham, particularly excited Clarence who saw it as a fairly successful alternative to the overcrowded tenements.[15] Along the broad tree-lined streets stood the houses with small, attractive gardens in front. "Bournville is like a park," he exclaimed.[16] At the time of Clarence and Henry's visit, roughly 586 houses stood on 456 acres of land and accommodated a population of approximately 2,800 residents, half of whom were

Cadbury employees.[17] An inexpensive rail line transported workers from the village to the city of Birmingham.

The trust form of ownership, limited profit, park-like setting, and variation in design all appealed to Stein as an alternative to the late Victorian industrial cities. During this time, Ebenezer Howard wrote his groundbreaking book, *Tomorrow, A Peaceful Path to Real Reform* outlining his concept of the garden city. The meeting place for the British Garden Cities Association in 1901, Bournville exemplified the physical realization of the garden city, so much so that the solution it represented overwhelmed the radical socio-economic proposal at the heart of Howard's treatise. As such, it began to gain popularity in England.

While Clarence appreciated the physical design, he admired the ideals of the model town as well. In the design of the homes and the concept of living close to the land, Bournville reflected the influence of William Morris, the late nineteenth century leader of the Arts and Crafts movement. Upon reading Morris' *News from Nowhere* the year prior to his visit, Stein had expressed general admiration for Morris' views but critiqued his vision. "[A]s long as human nature remains, those of us who would better things can only hope to repair here and there and always under the old rules of the nature of man. I doubt if we will ever be able to pull down and rebuild society."[18] For a pragmatist like Stein, Bournville exemplified the ideals of Howard, and Morris before him, realized within the current system, and at a reasonable profit to the trustees.

In fall 1908, as his first formal year of study at the École was drawing to a close, Stein began to think ahead to how best to focus his course of study. No student was allowed to continue at the École after his thirtieth birthday.[19] As a result of this system, gaining architectural knowledge, not the diplome, became the focus, particularly for the American students who tended to start later and typically did not intend to practice in France. Family friend and mentor Robert Kohn, who had studied at the École and later worked with Stein in architectural practice, advised Clarence that in the limited time he had left, rather than preparing for the major exams needed to advance to the first class, he focus on his architecture studies. Stein took this advice, and in the summer of 1911, at the age of 29 and after four years of formal architecture education at the École, Clarence decided it was time to go home.

Bertram Goodhue's office – collaboration, large-scale site planning, and housing

Clarence had always intended to return to New York City, writing in an early letter to his younger sister Gertrude, "Paris is the place to draw inspiration, but when it comes to work, to giving what little you may have, then it's your business to go home. . . . [I]t is my strongest desire to try to help at least a little in making New York more what Paris is, but different, not a Parisian New York, but a finer, more beautiful New Yorkish New York."[20] That fall Stein gained a position at the prestigious firm of Goodhue, Cram, and Ferguson. While employed at the firm over the next six years, Clarence refined his professional skills and collaborative work ethic and gained significant experience with large-scale site planning, including community design.

Though the firm of Goodhue, Cram, and Ferguson still existed, the two founders had drifted apart architecturally and intellectually well before Stein joined the New York office. In 1891, Bertram Grosvenor Goodhue had begun work in Ralph Adam Cram's Boston office lending his already exceptional drafting skills to the firm's design work. The two architects shared an enduring interest in craftsmanship and Gothic architecture though Goodhue specifically advocated "the proper balance of machine-made and handcrafted elements."[21] The idea of a group of men each lending his skill to a project particularly appealed to him. The two architects began to drift apart in 1903 with the relocation of a branch office under Goodhue from the main office in Boston to New York City to oversee the commission for substantially expanding the complex at West Point.

In September 1911, Goodhue became responsible for the layout and architecture of the Panama-California Exposition in San Diego.[22] Shortly thereafter, Stein began to work for the architect. Considered by architectural critics as a master in combining traditional designs with a modern sensibility, Goodhue also preferred more regional influences, such as the Spanish of the American southwest and Mexico, particularly in his secular structures. Due to its strong association with what Goodhue considered the binding stylistic rules of classicism, the École did not impress the architect.[23] Apprenticed in James Renwick's office, Goodhue favored this approach to professional training.[24] Stein's detailed drawings of building ornament, structures, and urban spaces he produced one year earlier while traveling in Spain impressed Goodhue much more than the four years spent at the École and seemed directly applicable to the work already underway on the Exposition.

The strong-willed Goodhue encouraged a collaborative and cohesive office environment in some ways similar to what Stein had experienced at Laloux's atelier in Paris. Though he admitted to having no head draftsmen as a rule, he assigned architects increasing responsibility as their tenure with him lengthened, eventually putting them in charge when he was out of the office. Given Stein's understanding of Spanish design, evident in his sketches of Churrigueresque detailing that had caught Goodhue's attention during the interview, it is no surprise that in less than two years Stein was preparing drawings of the California Building, one of two permanent structures and the central building at the fair.[25]

At Goodhue's side, Stein also began to deepen his understanding of site layout beyond the strict classical arrangements of the Beaux Arts. The dramatic entrance to the fair over the Cabrillo Canyon with the California Building as the anchor certainly was consistent with classical sensibilities. Yet Goodhue also grouped the buildings in a more informal manner to take advantage of the site and to create a variety of intimate spaces off the main boulevard. He bound them together using the strong orthogonal central axis and creating a cohesive whole through the buildings' architectural unity.[26]

In *The Architecture and Gardens of the San Diego Exposition* issued to coincide with the fair's opening in 1915, Goodhue decried the classical tradition:

> From the first to the last of such expositions there has been apparent an almost constant progress in size and in magnificence . . . To house such enormous congeries of exhibits enormous groups of buildings have become necessary, and so all local, ethnic, and fitting character has been lost, and the architectural scheme and style, following the "easiest way," has taken on a rather colourless, classic character with rows of columns, triumphal arches, courts of honour, and the like—all very magnificent and often very beautiful indeed, but quite unrelated to anything inherent in the exhibits, or to the great event which the Exhibition has, as a rule, commemorated. . . .[27]

By engaging historical precedents relevant to the region, the fair initiated a revival of the Spanish colonial style in California. Goodhue also emphasized the relationship between buildings rather than an overwhelming grandeur noting, "We are beginning to find that the display of fewer things, well chosen and well related one to the other, is far more likely to arouse joyful appreciation. An artist, in creating a work of beauty, whatever it may be, chooses and eliminates his elements until he has formed a unified whole."[28]

Stein wrote the only other essay in the book, reflecting the esteem in which Goodhue held the architect's contributions to the project and his ideas on design and layout.[29] In fact, Stein took the opportunity to celebrate "the varied symmetry and underlying order of Latin cities" and to address the integration of this approach in American city planning practice:

> . . . for some time city planning has come to mean to us a great open place surrounded by colonnades.
>
> We have imitated the Piazzo San Marco in Venice, the squares of St. Peter's and the Capitol in Rome. But in so doing we have perhaps forgotten the charm of the approach to these big places. Their impression gains in force from the contrast with the narrow streets that give access to them, whose interest is due not to any symmetrical unity, but to the accidental variety of daily life. On the one hand, the great focal points and the main arteries of traffic speak of the dignity of government and the easy movement of commerce. But we need also the more intimate side of city planning, the by-ways with their little shops, the occasional drinking fountain at a street corner, the glimpse of some secluded garden through a half-open gate.[30]

His comments here parallel his appreciation of the urban fabric of Paris, with its broad boulevards and formal gardens and the more intimate spaces of the medieval quarters with their narrow, meandering streets. Although early in his career, Stein clearly was already considering the need to design spaces in accordance with their functions and

the methods to integrate grander and more intimate designs within a harmonious whole. The next major project, Tyrone, New Mexico, "introduced Stein to the complexities of town planning and the economies of housing design."[31]

Shortly after the Exposition opened, the executives of Phelps-Dodge Corporation (Phelps-Dodge) hired Goodhue to design a model mining town for them near one of their mines in the Burro Mountains of southwest New Mexico.[32] As in other company towns, company executives, including Dr. James Douglas (president 1909-16) and his son Walter Douglas (president 1917-30), believed that introducing certain amenities while retaining total control over the town would address labor unrest and increase worker efficiency. Owners of the largest copper mine in the country – the Copper Queen in Bisbee, Arizona – on the eve of World War I, Phelps-Dodge had decided to build their model mining town in New Mexico, away from the pro-labor legislation in the newly formed state of Arizona.[33] In addition, New Mexico had a ready, and cheap, labor pool of Mexicans coming across the border.[34]

Goodhue certainly felt that Hispanic influenced styles were appropriate for the project, but he had a much different image in mind than the ornate style of the California Building. "Mr. Goodhue seemed to be horrified at the ornate types of architecture and it appears is a strong exponent of extreme simplicity in design. He distinctly favors the Mexican type of architecture, provided it is pure and unadorned by modern so-called improvements."[35] Shortly after visiting the site, Goodhue wrote his office manager Mayers to "put a good man . . . at work on restudying the plaza plans" and simplifying the elevations of the cottages for the American employees. ". . . Of course I do not know which men are most available but would suggest Mr. Stein as the best if he is there."[36]

By the time he signed the contract with the company in late August 1915, Goodhue and his architects had "recast the earlier company-designed proposals for Tyrone designing a picturesque composition of space, form, and color integrated into a dramatic natural setting."[37] They proposed a formal treatment at the center of the town with the community's significant buildings surrounding the plaza. To create an interesting and picturesque townscape, they varied the massing of these structures with an arcade connecting them, unifying them, in a manner similar to that prescribed in the Spanish colonial towns. In addition to a formal axial walkway system within the plaza, the town's major boulevard, Mangus Street, ran parallel to the railroad and intersected the mid-point of the plaza's shorter sides, continuing to rond-points several hundred feet to the east and the west respectively of the plaza. These rond-points provided sites for other important buildings. As with the San Diego Exposition, Hegemann and Peets prominently featured Goodhue's work at Tyrone as an example of harmonious grouping of buildings and "the intelligent use, adaptation, and development of traditional forms."[38]

Phelps-Dodge's efforts to improve the quality of its workers' housing while insuring a certain profit provided Stein, who was already an aspiring housing reformer, opportunities to observe and deal with the hard realities of reducing construction costs and retaining decent conditions.[39] Housing costs were lowered by reducing room size,

increasing residential density, minimizing land costs, and using inexpensive local materials and building labor. Both the American and Mexican workers' housing were patterned on adobe design with no exterior ornament, though the residential areas certainly differed. Segregated from the American workers' housing and located in a minor canyon along a road running southeast of the plaza, the majority of Mexican workers' housing was grouped into six attached dwellings, each with two rooms. With its barrel tile construction and low wall along the front elevation identifying entryways into the individual units, the attached two-room Mexican units were a significant improvement over the tents and temporary shacks that constituted much of the worker housing in the mining camps.[40]   In single family and duplex configurations, the homes of the American workers were located along Hilltop Road that ran along a ridgeline and provided access to the community hospital southwest of the plaza. The architects achieved a pleasing effect in the American workers' housing through variations in massing, fenestration, porches, and color.[41] "These little houses show how the materials and, with proper simplifications, the architectural style used in the public buildings can be employed in the most modest private houses, thus producing a feeling of unity throughout the town."[42]

Within one year of beginning the project, Stein was working on several buildings, including the bank, shops, and warehouse, and was in direct contact with Walter Douglas.[43] During the second year, Stein visited the project in 1916 and early in 1917, making changes on the site and supervising construction.[44] Many of the major buildings were already under construction as was the plaza and housing. At the close of World War I, the price of copper steeply declined and the mines shut down. Still a significant part of the town as envisioned was realized.

Stein's understanding of architecture and planning also benefited from his ongoing activities in the Hudson Guild and the Chelsea neighborhood, which engaged his interest in working-class housing. Upon returning to New York City in 1911, Stein had again taken up civic reform work with John Elliott. He also became quite active in the City Club, acting as secretary of its City Planning Committee from 1915 to 1919.[45] In that capacity, he presented a series of papers discussing the essential role of planning to preserve residential neighborhoods, establish parks, assure housing reform, and mitigate traffic congestion. He consistently advocated the Garden City as "the ideal system" to address these issues, referring specifically to the new town of Letchworth. An essay on city planning outlined a simplified version of the neighborhood unit that would come to dominate his significant projects: "Think what an interesting group could be made of all these buildings, properly related and surrounded by trees in a small neighborhood park. Such a group would be a symbol of the best ideals of the neighborhood."[46] It was probably at one of these sessions that he first met Charles Whitaker, the progressive editor of the *Journal of the American Institute of Architects* (*JAIA*).[47] Whitaker would introduce Stein to some of his most significant colleagues and collaborators: Lewis Mumford, Frederick Ackerman, and Benton MacKaye. An organization established in part for political reform, the City Club also provided Stein a means to make important political connections with people such as future governor Alfred E. Smith.

Though his employment in Goodhue's office introduced him to large-scale community design, Stein's work in the Chelsea neighborhood allowed him to grapple with more complex issues associated with development that had accreted over time and reflected his efforts to integrate his architectural training and experience with his ideals concerning community architecture. In 1918, Stein and his long-time friend and colleague Henry Klaber worked on a neighborhood plan for the area to address whether housing could or should be retained given burgeoning commercial and industrial development and large-scale public projects that had significantly diminished the residential areas.[48] Undertaken for the City Planning Committee of the City Club, the survey examined housing needs and projected future land uses in the area. Stein's training had taught him to first observe and consider existing conditions before drawing conclusions or making recommendations. Though crude, the approach he employed was consistent with the ideas of survey before plan being promulgated by the growing number of architects undertaking city planning. Though the committee accepted the transition underway in Chelsea as inevitable, Stein maintained that housing should be retained if at all possible proximate to workplaces. The connection he had made with Whitaker allowed him to more fully explore this perspective for a national audience.

Stein had begun writing a series of articles for the *JAIA*, the first connecting his and Klaber's work in Chelsea with the emerging national crisis regarding inadequate labor near war industries.[49] The broader and more significant second article outlined his support for government participation in meeting housing needs, particularly given the housing crisis anticipated with veterans returning to a housing market that had come to a standstill during the war. Rather than a federal role, he argued that state-run government housing programs created a greater opportunity "to try out various methods of building, aiding and financing housing," a position he would maintain for many years.[50] In his submittal letter to Whitaker, he discussed the City Club's efforts to induce Smith, then running for governor, "to favor the appointment of a commission by the next legislature to investigate the whole question of housing in New York State and what has been done elsewhere to solve the problems of housing."[51] With his participation in this and subsequent committees, Stein would have the opportunity to formulate and refine his ideas regarding the types of activities the state government should undertake.

Early architectural practice and projects

Following his brief stint in the military during World War I, Stein decided not to return to Goodhue's office. With his training completed, he wanted to establish his own architectural practice, which would allow him to pursue his interests in large-scale community design, broaden his efforts in housing reform, and pursue associations with collaborators in related fields. Stein entered into partnership with Kohn and, through his political support, connections, and tenacity, became a member of the new governor's Reconstruction Commission. As he developed his ideas and new connections, Stein acquired the resources he needed to implement his goals as a community architect. Several of his early projects reflect his arts and crafts sensibilities notably the individual camp buildings and dining hall for the Ethical Culture Society's Hudson Guild Farm in

Netcong, New Jersey and three homes designed for upper-middle income families in the New York region. During the period, he also refined his site design skills, displaying a modern sensibility in proposals for several unbuilt grouped housing projects.

Not surprisingly, the Ethical Culture Society was among his first clients.[52] In 1921, Dr. Elliott decided to expand the facilities at Hudson Guild Farm, the Society's camp in Netcong, New Jersey for city youths. Using fieldstones, heavy timbered roofs, exposed beams, and deep eaves, Stein brought the countryside indoors through site design and use of materials. The buildings – the Dining Hall, Rose Walter Cottage, and a building at Camp Aladdin – reflected the Arts and Crafts precepts of incorporating local materials and natural textual qualities and clearly articulating a building's structure.[53] With work begun on Hudson Guild Farm, Stein secured a job on the William Pollack House in 1922, also located in Netcong. This home, actually a renovated barn, and the Paul Rie and Edwin Wasser Houses designed within the next two years, all incorporated similar Arts and Crafts concepts and use of local materials.[54] The Wasser House in particular, demonstrated Stein's skills in site design as he integrated the home into the rolling landscape.

But Stein's unbuilt projects especially reflect his evolving interest and expertise in site planning. During this period, he undertook several grouped housing proposals, including Sunnyside Park in Shelton, Connecticut begun with Kohn in 1920; Fort Sheridan Gardens with Ernest Gruensfeldt; and the up-scale Spuyten Duyvil Housing Development in the Bronx. At the first project, designed with his mentor, detached and attached houses are grouped around loop streets. The site plan for Fort Sheridan Gardens uses the grouped housing to free up open space, incorporating a school and community park as well as smaller interior block playgrounds.[55]

In 1923, Stein designed Spuyten Duyvil Housing Development, the most clearly articulated of the three, for the Dunnock Realty Company, skillfully integrating the site design, elevations, and floor plans.[56] The seven apartment buildings bound an open space on three sides. Consistent with his work on the Hudson Guild Farm and the three houses, Stein used fieldstone on the first two stories thematically joining the buildings. In fact, he also incorporated the fieldstone into low walls that connect the three apartment buildings at the busy corner of Spuyten Duyvil Parkway, creating a clearly articulated border for the interior park. Stein confidently designed the site with a formal terrace and reflecting pool opening up to a larger park with informal walkways, making use of the gentle downward slope into the more picturesque section of the interior park and dramatically siting his apartment houses on the highest elevation on the property.

Despite this luxury project, Stein's focus had increasingly turned to ongoing issues associated with the post-war housing crisis, a crisis he believed was more permanent than the general public and many policy-makers realized. Upon returning from his brief military duty, Stein again immersed himself in New York State politics strongly supporting independent Democrat Alfred Smith for governor while lending his voice to calls for government intervention to address an anticipated post-war housing crisis. In November 1918, Smith was elected governor. He promptly established a bipartisan

Reconstruction Commission to reform government and address critical needs of the state at the close of the war, including housing condition, availability, and affordability.

In 1919, Stein, who had served as vice-president of the Fusionist Committee and strongly supported Smith in his campaign, volunteered his services as secretary to the Housing Committee of the Reconstruction Commission. Smith accepted the proposition, recognizing Stein's political skills and his insightful ideas on housing issues. Felix Adler, Robert Kohn, Frederick Ackerman, Andrew Thomas, and Alexander Bing all served in an advisory capacity to the Committee, which certainly had significant issues to address. The great post-war shortage of housing drove rents so high that tens of thousands of tenants could not afford them and were evicted, requiring them to double up with friends and relatives or ultimately end up on the street. Even though Smith opposed rent controls in principle, he urged the legislature to continue wartime emergency rent controls in response to a series of rent strikes in New York City.

Early in their 1919-1920 studies of New York City's housing problems for Al Smith, Clarence Stein, Edith Elmer Wood, Andrew Thomas, and other reformers, concluded regulatory approaches including rent controls, building codes, and turn-of-the-century tenement house laws widely championed by Lawrence Veiller were not sufficient.[57] Despite their wide adoption to address housing issues, these approaches, Stein and his colleagues argued, could not increase housing production or sufficiently improve housing quality for working class New Yorkers.[58]

> The poor of New York – half the population – has always lived in unwholesome, dark, left over dwellings because it did not pay to build new homes. The only difference between the present and so-called normal times is that a large and more articulate part of the population is suffering. The provision of adequate housing in decent surroundings for all the people is a public service. Until this is generally recognized we can not set up the necessary machinery, either to meet the present menacing shortage – or the shortage of decent homes for working people that has existed at all times. This can not be attained without the use of every possible economy.[59]

This new breed of housers was convinced of the intractability of the housing problem, particularly affordability issues, without proactive government intervention. At the beginning of the twentieth century architects, engineers, and other professionals trained in the planning, design, or building fields joined the housing movement.[60] The most progressive of these housers argued that adequate policy formulation and program implementation would require technical expertise working in partnership with the government. These technocrats included progressive architects, who were using new tools, including cost analysis, standardization, and social surveys, to realize a more objective and informed approach to residential design.[61] Stein certainly subscribed to this characterization of the architect as technocrat. In a speech before the City Club regarding the "housing problem", he emphasized the significance of a scientific

approach "[S]cience is not afraid of being cast out. It does not progress through the emotions. It seeks the truth."[62]

In addition to studying housing issues and needs, the Reconstruction Commission also sponsored a competition to demonstrate how to rehabilitate and construct more appealing and cost-efficient projects. Both Thomas and Stein entered the competition with proposals for new construction. Thomas designed U-shaped five-story apartment buildings retaining a significant amount of open space without sacrificing affordability.[63] Stein created an appealingly diverse design, grouping alternating combinations of two-story semi-attached two-family houses and apartment buildings around a shared interior space.[64]

Thus, modern housing emerged within a context of continued poor housing conditions and crowding due to the postwar housing shortage, increased accessibility to relatively inexpensive land outside the city center, improved large-scale development strategies, and communitarian concepts of shared open space.[65] Further, a greater variety of financing and ownership options allowed larger-scale projects to be developed. With roots in the housing reform movement of late nineteenth century Great Britain, limited dividend housing represented one example of a viable, philanthropic approach to addressing housing needs prior to federal assistance.[66] Philanthropic and limited dividend corporations favored this "perimeter block" design in their model projects. Combining lots created greater flexibility in site design, resulting in super-blocks that accommodated reduced lot coverage at an adequate profit.[67]

Though the elements were in place for innovation, the members of the Housing Committee were not yet ready to advocate a significant role for the state in the housing delivery process. In March 1920, they issued a report to the Reconstruction Commission outlining their findings and recommendations.[68] The recommendations focused on encouraging the private sector, with some governmental incentives, such as low interest loans and tax exemptions, to build housing for workers. At a special late summer meeting called by the governor to push the initiatives through, the majority of legislators approved extension of emergency rent controls, some revisions to the war-time rent laws that had led to rapid evictions and other tenant hardships, and limited municipal real estate tax abatements to encourage "moderate-priced" housing construction.[69] Without the comprehensive adoption of all the initiatives, particularly the system of government oversight and controls, the tax exemptions fed a boom of poor quality, speculative home building in Queens, Brooklyn, and the Bronx, which did not sell or rent at prices that working class families could afford.[70]

In 1920, with Smith no longer in office, Stein continued promoting his housing ideas in articles, many for the *Journal of the American Institute of Architects (JAIA)* and speeches before groups such as the Greenwich Village settlement house. Although acknowledging the necessity of government involvement in affordable housing production, Stein emphasized the role of the private sector primarily through the participation of limited dividend corporations. He considered community development and design as key components of such a program and recommended state as opposed to federal involvement to ensure a more informed and responsive approach to meeting

housing needs. In a 1921 article published in the *Sunday World* he stated, "We must recognize that in the larger aspect housing is a public need and a public service."[71] Further, "State credit must not be used to increase congestion, to build new slums. It must be used toward building new centres of population – garden cities."[72] A speech for the City Club reinforced this perspective.

To mark his fortieth birthday in the summer of 1922, Stein decided to learn more about post-war housing policy and projects in Europe by visiting them. On the voyage home, Stein drafted a proposal for a city planning atelier that would harness the strengths of his widening inner-circle of colleagues to address these issues: to examine "man's physical environment as influenced by social, economic and aesthetic needs and the technical means of creating new environments serving those needs" and recommend solutions, chief among them rural, regional, and national planning and the establishment of garden cities.[73] Thus, by the early 1920s, Stein already had amassed the architecture and planning skills to understand and address community building and housing needs, employed a collaborative approach, and had a key network in place to explore and implement his ideas.

[22] Oliver, 1983.

[23] Goodhue did not necessarily oppose classicism itself, but its strict formulaic application. A 1922 article in *Pencil Points* described his disparaging opinion of the École. His comments at the time about a recent hire perhaps reflected the way he felt about Stein when he first entered the office, "Mr. ---- went to the Beaux-Arts. *I hate to admit it, but he did.* But he didn't *graduate.* I have always maintained that the truants and bad boys of the Beaux-Arts turn out to be the best product of that—so far as I am concerned—lamentable institution." (Goodhue quoted in "Twelfth Night in Mr. Goodhue's Office," in *Pencil Points* [January 1922]: 21-26, 22).

[24] In 1884, when he was 15 years old, Goodhue began his training in the office of Renwick, Aspinwall & Russell. At the time, James Renwick, Jr. still ran the firm. Renwick had a strong understanding of historical styles, artfully adapting and applying them in projects such as the Smithsonian Institution (1846-55) and more strictly adhering to a particular style such as his skillful use of the gothic in Grace Church (1843-46).

[25] *Sturgis' Illustrated Dictionary of Architecture and Building* of 1901-02 defines Churrigueresque Architecture as "characterized by a disregard of the canons of classic design and the combination of its features, or members, or fragments of them, in the most incongruous and grotesque assemblages conceivable. Stucco and gilding was lavishly used, and broken pediments, twisted shafts, and contorted scrolls abound. High altarpieces, fantastic doorways, and picturesque towers are also characteristic. The result is, like nearly all Spanish work, highly decorative, and not without a certain theatrical splendour, but lacks the essentials of propriety, refinement, and structural reasonableness" (p. 601). "Stein's initials are in the 'Drawn By' and 'Checked By' boxes of the detailed drawings for the sculptural ornament of both the entrance and the tower windows of the California Building of the San Diego Fair. Because Goodhue admitted to rarely listing those in his office responsible for various projects, it is difficult to determine the extent to which Stein worked on the site design of the fair.

[26] Oliver, 1983. The buildings were all designed in the Spanish-colonial style with a pearl gray stucco used consistently on the temporary structures.

[39] The Douglases expected to make a ten percent profit on the Mexican and American miners' houses and fifteen percent profit in rents of the non-company commercial buildings.

[40] A total of 16 homes in duplex or single family configurations, each with three rooms, were also built for the Mexican workers. Though the architects requested more funding to improve the design and enlarge the layout, the Burro Company felt that the design already reflected a significant improvement over housing typically available to Mexican workers and did not approve the greater expense.

[41] In the American workers' housing lived the "technical and office men and foremen." The homes had a variety of floor plans and consisted of three to five rooms. A variety of subtle pastels were used in the exterior stucco, and the homes had indoor plumbing and lighting unlike the housing for Mexicans.

[42] Hegemann and Peets, 1922, 1988, pg. 108.

[43] Letter from Walter Douglas to F. M. Sawyer, Superintendent, Burro Mountain Copper Company, 21 July 1916; Letter from Thomson, Assistant to the President to Sawyer, 13 July 1916 (PDR/TA). Oliver (1983) refers to Stein as Goodhue's chief assistant on the project (p. 154). A short, undated article, probably from a local paper, also names Stein the "architect in charge of the construction of the mining camp at Tyrone."

[44] He wrote regularly to Goodhue. A set of five reports about the details of materials, color, and construction written in November 1916 is probably typical of the kind of reports Stein prepared during his site visits (Box 1, Folder 3, CSP/CUA).

[45] The City Club had been formed in 1892 by a group of Ethical Culture Society members and like-minded progressive politicians. Stein had begun to educate himself on city planning shortly after returning to New York. Given his previous experience in and sensitivity to the Chelsea neighborhood and relatively extensive planning activities occurring in the city, which passed the first comprehensive zoning code in the country in 1916, it is no surprise that Stein chose to take a leading role in the City Planning Committee.

[46] "City Planning," unpublished essay, 13 May 1917 (Box 11, File 20, CSP/CUA).

[47] Whitaker served as editor of the journal from 1913 to 1927. During this time, he moved the journal away from a focus on architecture to broader issues of housing and neighborhood development.

[48] Stein, "A Survey of the Chelsea District," 20 September 1918 (Box 11, File 20, CSP/CUA). Two major projects, Pennsylvania Station and Chelsea Park had resulted in the demolition of many residences.

[49] "Transportation or Housing" published in July 1918 discussed the inadequacy of the city transit system in getting workers from Chelsea and other nearby areas to their jobs in the New Jersey shipping yards. Though Stein acknowledged that extensions of the lines into Chelsea and Greenwich would begin to address the issue, he noted that housing needs would also have to be met before the transit solution could work. Specifically, he pointed to the inadequate condition and scattered location of the existing tenements.

[50] Clarence Stein, "Housing and Reconstruction," in *Journal of the American Institute of Architects* 6 (October 1918), pg. 471.

[51] Letter to Charles Whitaker, 8 September 1918 (Box 30, CSP/CUA).

[52] Stein's first project after leaving Goodhue's employ was the simple, colonial-influenced White Plains Meeting House. Completed in 1921, it was designed for Quakers in White Plains, New York.

[53] Camp Aladdin was managed through the Hudson Guild Settlement House.

[54] In fact, an article in the February 1931 issue of *Architecture* compared the design of the camp buildings with that of the Pollack House showing photographs that demonstrated the similarity between the buildings' interiors.

[55] Although several drawings of Fort Sheridan Gardens exist, including a site plan and alternate street and plot plan, no specific date or location is associated with the proposed project.

[56] The two- and three-bedroom apartments have foyers opening up to sizable living and dining rooms. Some have bay windows, while others have porches. The basements include small apartments for servants.

[57] Edith Elmer Wood had just written the pioneering *The Housing of the Unskilled Wage Earner*, an extremely influential contribution to housing studies and policy-making that used a variety of data, including statistics, to document housing needs in this country and persuasively argue for government involvement in housing production. Andrew Thomas was an architect who designed several model housing projects in New York City.

[58] A primary concern of the group was the drop in production from a high of 54,884 dwellings in 1906 to 1,624 in 1919 (Richard Plunz, *A History of Housing in New York City: Dwelling Type and Social Change in the American Metropolis* (New York: Columbia University Press, 1990), pg. 126). Further, their March 1, 1919 survey identified a total 982,926 individual apartments in New York City, 587,851 in old law tenements, built prior to 1901.

Landscape quality as result of urban planning: the study case of Curitiba, Parana, Brazil

Leticia Peret Antunes Hardt
University Center Positivo, Brazil
Federal University of the Paraná, Brazil
Carlos Hardt
Pontifical Catholic University of Paraná, Brazil
International Institute of Urban Technical Management, Brazil

Introduction

Starting with the assumption that cities cause significant changes on landscapes, as well as relevant environmental pressure, and they fall into a built environment context that is structured by pervious and impervious spaces, especially green areas, this study is centred around the hypothesis that the number of such areas is related to the urban landscape's quality and this quality, in its turn, is related with the city's environment qualitative aspects and its citizen's life.

Quality of life ratings usually refer to social, economical and infrastructure indicators, among others, without the proper interpretation of the human beings' satisfaction with respect to the space in which they live.

Evaluate the quality of urban landscapes can be an important instrument to interpret the citizens' welfare level with respect to the cities' environments. However, among the several landscape quality evaluation methodologies, there are insufficient methods aimed specifically at urban areas.

Within this context, Curitiba is an interesting analysis object, not only because of the broad acknowledgement its planning experiences have, but also because of its configuration as the pole of one of the fastest growing metropolitan areas in Brazil, during the last decades.

Since its origins, by the end of the seventeenth century, until the 1940s, Curitiba experienced a spontaneous growth process. Then, the first urban plan was implemented: the Agache Plan. Its purpose was to reroute traffic so that it flowed from the city's center out. In the 1960s, new proposals – Urban Preliminary Plan – laid out guidelines to minimize urban sprawl, reduce traffic in the city's central area, protect the historic district, provide an accessible and affordable public transportation system and build linear traffic street systems to provide direct, high-speed routes in and out of town. Initially, this plan was implemented in the 1970s. The 1980s was a decade marked by the expansion of green areas. Throughout the 1990s, Curitiba continued to add to its green areas and cultural sites. In the beginning of the 21st century, the specific time of the present analysis, the city is being faced with an urban landscape that is the result of this historic planning process.

In this context, the general purpose of this study is to check the relationship between urban form, landscaping quality and green areas seen as a subsidy to methodological models for a landscape assessment process and environmental quality management.

Fundamentals

Considering quality of life as the basic premiss, this study is based upon conceptual (city and landscape), theoretical (urban and landscape ecology) and methodological (landscape and environment quality management) grounds.

Conceptual grounds

Interpreted as a social, economic and institutional phenomenon (Mumford, 1998), as well as a physical and territorial process of conformation of the built environment (Soja, 2000), cities can be generically understood as a set made up of two basic systems (Hardt, 2006): natural and cultural. Their components integrate the total environment to which the human experience is associated (Gaddis, 2002).

Among its several definitions, the city can be interpreted as a set of pervious and impervious areas. Given to impervious spaces, almost "irreversible", the physical connotation of something which fluids cannot pass, one can associate visual effects, because many times our vision cannot go through them. Qualified as "reversible", in the sense they can be occupied and made waterproof, pervious spaces can be physically interpreted as something that can be penetrated and also associated to visual effects because many times they can be penetrated by one's vision (Hardt & Hardt, 2007).

Considered as environmental quality factors that must be protected (Boudjenouia, Fleury & Tacherift, 2007), open spaces, unoccupied or construction free, do not necessarily constitute pervious areas. Among these, we can point out green areas, which are considered as free spaces (public or private) in the city, with predominantly natural characteristics, regardless of the vegetation's size or origin – native, introduced or exotic (Hardt, 2000).

In a broad concept, the landscape can be interpreted as a dynamic combination of interrelated and interdependent natural (physicochemical and biologic) and antropic elements, which in a certain time, space and social moment form a unique and non-dissociable set, whether balanced or not, in permanent evolution, and producing mental perceptions and aesthetic sensations as an "ecosystem that is seen" (Hardt & Hardt, 2007).

With respect to their naturalness level, landscapes can be classified as natural, worked, cultivated, suburban or urban (Forman & Godron, 1986; Hardt, 2000). The areas of interest for this study evolve essentially from the two last typologies and in this ambit one can attribute a higher proportion of impervious areas, when compared to the previous ones.

Theoretical grounds

Hardt (2000) defines the landscape's ecology as the multidisciplinary study of interrelations between the several factors that contribute to the formation of structuring homogeneous landscape units of a certain space (Forman & Godron, 1986). The integrated systemic ecological approach aimed at the total environment and at the human experience starts to have an analysis fundamental factor in man's perception.

The ecology of landscapes has as its study object the several landscape typologies (McIntyre & Wiens, 2000), applying concepts of the general ecology to natural landscapes, while to cities' landscapes, object of this study, the concepts inherent to the urban ecology are used.

Generically defined as the visualisation of urban ecosystems, cities' landscapes are basically formed by:

a)   visual space, especially made up by the total environment (principally by the natural and built environments and secondary by the socio-economic one, thus resulting in social and environmental conditions) (Hardt & Hardt, 2007);
b)   perceptual mechanisms that depend on the human experience – personal ambience and behaviour, and life conditions (Harvey, 2000).

Methodological grounds

The concept of management is strongly associated to that one of quality.
The quality of a landscape represents its visual characteristics' excellence level (Hardt, 2000), whose diversity makes it difficult to define the evaluation in absolute terms, thus being necessary to use the help of methods based on value judgements (Cougo & Ribeiro, 2006).

Based on the observing the landscape as a whole, users or specialists, locally or by means of substitutes (e.g.: photographs, diapositives, films, pictures, etc.), direct methods realise appraising by determining a landscape value judgement in its whole, regardless of defining this evaluation's determinant components.

Indirect methods, which have the possibility of subjectivity reduction as their chief characteristic, process the landscape's disaggregation into its main components and visual elements, which are analysed by determining a value judgement and according to criteria established by specialists.

Associating the advantages of the previous methods, the mixed ones use the evaluation of subjective answers and the interpretation of the landscape's components that determine this kind of answer.

Materials and methods

Curitiba, capital of the State of Paraná, is located in Brazil's Southern Region, under the average geographical coordinates of 25º25'50" latitude South and 49º16'15" longitude West of Greenwich, between UTM coordinates 682.000, 683.000, 7.196.000 and 7.162.000, and at an average altitude of 934.6 m (IPPUC, 1999a). With 43,241.80 ha, the study area is delimited by the urban perimeter, which coincides with the municipality's legal administrative boundaries and is the pole of the metropolitan region that has the same name (Hardt, 2004).

As study units, 27 zones or urbanistic sectors were considered, subdivided into 120 territorial compartments, defined by the soil's use and occupation zoning in force until 2000, which was used as the basic configuration for Curitiba's present urban landscape **(Figure 1).**

Figure 1. Curitiba's soil use and ocupation zoning map in force until 2000

IPPUC (1999b)

Study Phases

Contemplating the total environment's natural and cultural systems' several components, as well as the characteristics of the human experience, the study development was structured into two basic steps, considering:

a) visual space, applying the evaluation indirect method as from the landscape's components;
b) perception mechanisms, applying the visual preferences evaluation direct method and the mixed method, based on regression analysis. These mechanisms reveal the satisfaction level that citizens have with the environment in which they live, thus establishing an uncommon way of assessing the quality of life.

Corresponding to the total environment's landscape's quality evaluation, the indirect evaluation method as from the landscape's components, was based upon a landscape units mixed system, irregular, corresponding to the specific physical limits of the 27 zones and 120 urbanistic compartments considered (study units), as well as regular, structured in a 125 per 250 m (3.12 ha) square lattice, thus allowing the choice of 568 sample units of the sampling system.

Based on the interpretation of sample units, based upon panchromatic aerial photographs from 1990, scale 1:8.000, with 1997 update, we obtained, by means of manual planimetry, the measurement of the following selected landscape components:

a) impervious area: built (e.g.: buildings, furniture, infra-structure); paved (e.g.: streets, paved or not, yards, sidewalks); others (e.g.: liquid surfaces contained in waterproofed spaces);
b) pervious area: with arboreal covering (e.g.: trees, isolated or in groups); with non-arboreal vegetation (e.g.: bushes, coverings); exposed ground (e.g.: naked earth, sand, gravel, small stones); others (e.g.: non-channelled water bodies and courses).

During the measurement phase, data were checked on field, in each one of the sample units considered.

In order to structure the landscape's components appraising system, besides the support found in references of several authors, the work was based on similar works and specific inquiries to specialists trained in landscape quality evaluation and related to the several areas involved, and then, an appraising system was adopted, considering several attributes for each element in the landscape, among which we point out: diversity, compatibility, singularity, mutability, complexity and visual broadness, and also, non-visual elements, representing other landscape's perception factors.
The result per landscape unit corresponds to the set of values of each landscape component in each square. In order to get the information's spatial relations into maps,

the urban compartments were distributed according to four classes represented by quartiles.

Comprising part of the landscape's quality evaluation through human experience, the visual preferences evaluation direct method – which includes assessing the levels of human satisfaction and, therefore, the quality of life –was supported by the 27 sample units with a pervious average area (main variable) closer to the own zone's average. These landscape units were represented by substitutes, under the form of photographs that were produced under photographic reproduction and survey specific criteria and conditions.

The sampling survey of visual preferences through the classification of the photographs into five landscape quality classes was carried out with Curitiba's population (252 residents aged above 7), from a stratified sample defined according to the city's populational structure, by genre, age, education and income. This same stratification, but including origin, was also used for the non-resident population (110 people aged above 7).

The measurement of landscape components in the photographs was made by means of the superimposition of a dot lattice, with a distance of 1.25 x 1.25 mm (totalling 9,600 dots), thus allowing to establish these elements' proportionality in the photographs. For the landscape's quality final evaluation through human experience, adopting the mixed method allowed the formulation of regression models based on the Stepwise technique. More than 2,000 alternatives were tested, among general methods and by evaluators categories and their strata. In order top make results feasible it was necessary to detail, in the field, the measurement of landscape components in the 568 sample units.

Getting the spatial relations of information into maps was also carried out by distributing the compartments according to four classes represented by quartiles.
In order to picture Curitiba's urban landscape's general situation, considering the total environment and the human experience, we developed the landscape quality integrated evaluation method, by determining two procedures:

a)   for each zone we added its relative position in each evaluation, thus obtaining the final position. Then, we indicated its landscape conditions recuperation and/or preservation priorities with respect to the total environment or human experience, according to the zone's final position, above or below the total average in each evaluation **(Chart 1)**;
b)   for each compartment, its position's values sum in each evaluation resulted in a new ranking, with a value scale ranging from 2 to 8 **(Figure 2)**. This allowed us to establish priorities for recuperation and or preservation of the landscapes' conditions.

Chart 1

Criteria to establish priority recommendations for preservation and/or recuperation of specific landscape conditions for urban zones in Curitiba

Results

The results are presented according to the total environment and the human experience, as well as from its integrated evaluation.

Evaluation of the total environment's landscape's quality

Considering that both, environmental and social conditions, as well as the natural and cultural subsystems, for the total environment's landscape, evaluated as from their visual space, in an indirect form (technical method), the following features stand out:

a)   for the urbanistic zones, the environment's total visual quality class above the municipal average encompasses 84.50% of the city's total area (15 zones), where 70.73% of the population lives; the lots' occupation rate (52.72%) and the demographic density (29.33 inhabit./ha) are below the averages recorded for the city. These zones fall into a category above the corresponding municipal averages, in at least one if not in both types of green areas under consideration (with or without arboreal covering);

b)   for the urbanistic compartments **(Figure 3)**, the total environment's high quality visual class (upper quartile) occupies 55.68% of the municipality, housing 25.02% of the population. The lots' occupation rate (52.96%) and the demographic density (23.35 inhabit./ha) are below the municipal averages, configuring poorly consolidated urbanistic areas.

These results show that Curitiba's urban occupation historical process has reduced its landscape's quality, similarly to what Benevolo (2006) and Choay (2003) verified in several moments of the urbanization history.

Figure 3
Map classifying the quality of Curitiba's total environment's compartments urbanistic landscape

Evaluation of the landscape's quality through human experience

The direct evaluation of Curitiba's landscape's quality, allows an analysis of its population's visual preferences and the comparison with those of people not living in the city. Preferences analysed were both overall and by the considered categories:
For the urbanistic zones, Curitiba's population, as well as those who do not live in the city, evaluated as having visual quality above the municipal average, an area corresponding to 26.56% of the municipality, equivalent to 33.11% of the population, with a lots occupation rate (69.12%) and demographic density (56.89 inhabit./ha), higher than the municipal averages; for both populations, the same 14 zones **(Figure 4)** integrate this class, the five best coincide, with only one inversion of the third and fourth placed.

Figure 4
Chart classifying the landscape's quality through analysis of visual preferences of Curitiba's urbanistic zones

Source: Information organised by the authors. Obs.: The zones on the non-resident population chart are organised according to the position on the Curitiba population chart.

In the photograph typical of the first zone, preferred by all categories analysed, pervious areas predominate (56.67%) with a relative balance between non-arboreal and arboreal vegetation, respectively (29.60%) and (27.00%). However, for the set of photographs that constitute the higher visual quality class, the proportion of impervious areas is greater (52.17%), and one can notice a strong intention in the treatment of the spaces. According to the population, this is a fundamental aspect, as has been already verified in several periods in history, such as those related to the Renaissance and Baroque periods (Jellicoe & Jellicoe, 2000).

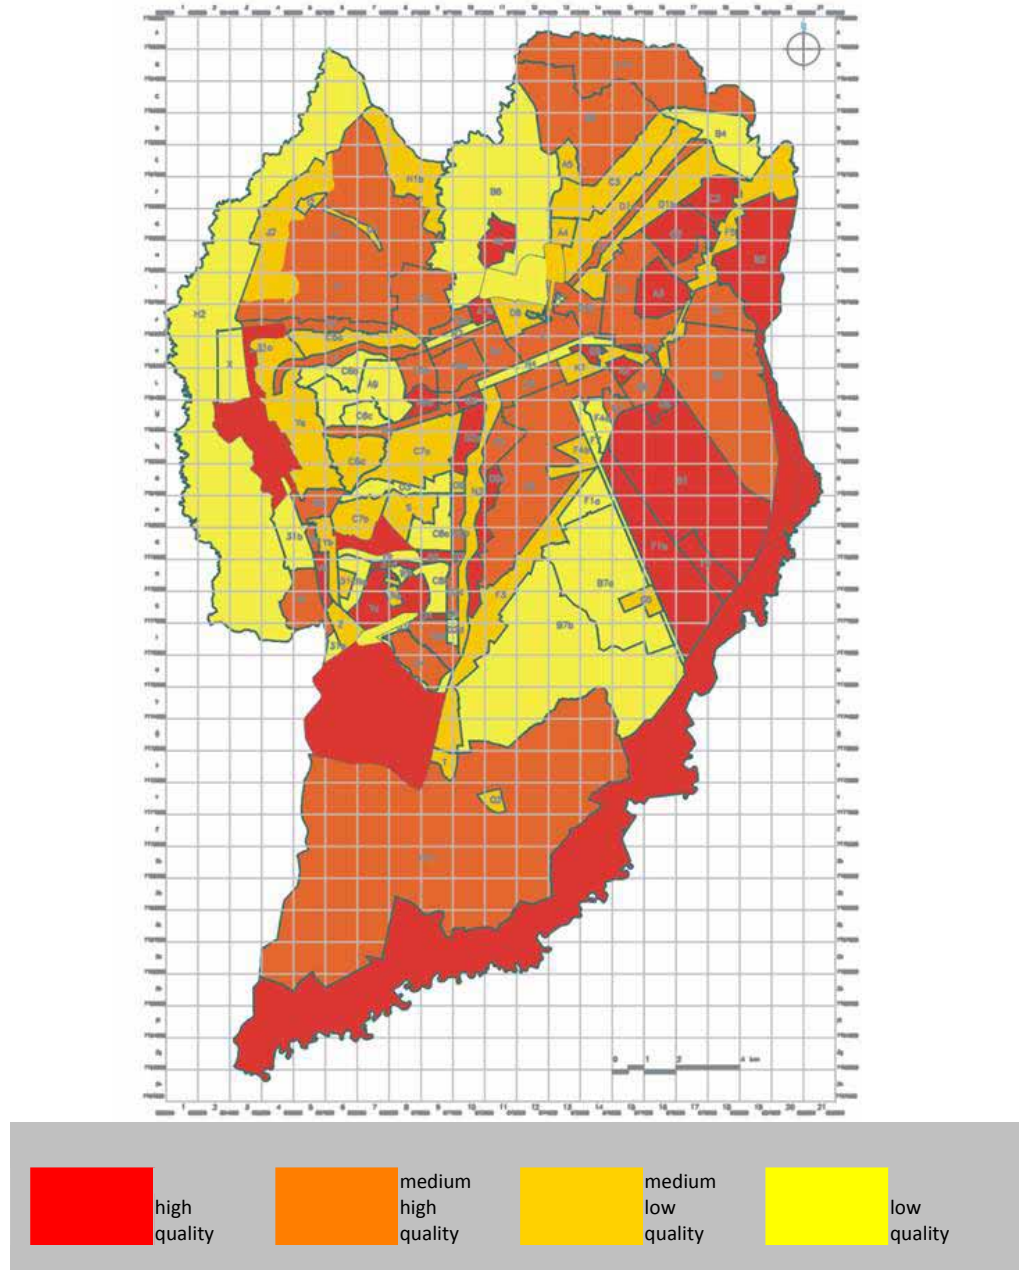
In the photograph typical of the last zone, the least preferred among all categories analysed, the predominance is of impervious areas (40.34%). However, the set of photos of the lower visual quality class shows a greater proportion of pervious areas (38.27%), with an expressive balance of trees (17.02%) and non-arboreal vegetation (17.72%). One can notice a marked lack of maintenance and care of these spaces in practically all of the photos typical of the zones that fall into this class, corroborating the previous affirmation.

The use of regression models resulting from the direct method (mixed method) allows the following analysis of the general human experience, as the average of Curitiba's and the non-resident populations:

a) for the urbanistic zones, the visual quality class above the municipal average as from the human experience (11 zones), is related to 34.51% of the municipality, containing 29.16% of the population, with a lots occupation rate (62.84%) and demographic density (48.72 inhabit./ha), above Curitiba's averages; contrary to what was found out in the evaluation of the total environment's landscape's quality (indirect method), the majority of the zones integrating this class, shows green area rates bellow the respective Curitiba averages;

b) for the urbanistic compartments **(Figure 5)**, the high visual quality class as from the human experience (upper quartile), encompasses 16.37% of the municipality, containing 17.78% of the population; the lots occupation rates (64.14%) and demographic density (48.78 inhabit./ha), are higher than the municipal averages, configuring urbanistically consolidated areas.

Therefore, the diagnosis is that the population's point of view is different in the various situations of the technical tradition. Historically, Curitiba's community had no stimuli to participate and this produced a relative passivity with respect to the decision processes related to the future of this intangible asset – the city (Choay, 2001).

Figure 5
Map classifying the landscape's quality of Curitiba's urbanistic compartments as from the human experience


Source:
Information organised by the authors.

Integrated evaluation of the landscape's quality

The integrated evaluation method is justified in view of the divergence in the results found between the total environment's visual space's natural and cultural subsystem components evaluation (indirect method), supported on strictly technical grounds, and the interpretation as from human experience and its perception of the landscape, be it from an analysis of Curitiba's resident and the non-resident population's visual preferences (direct method), be it by the examination of these preferences by regression analysis (mixed method).

The comparative analysis of the results obtained from the methods employed shows that only 29.6% of the urbanistic zones did not present a difference in position above or below around 10% of the posts (3 positions) in both evaluation typologies. However, more expressive situations have been diagnosed for 29.6% of the zones, which presented more than 50% of positioning alterations (13 posts).

These data indicate that the integration of methods and techniques consolidates results, in the sense that it adds positive attributes and reduces negative features of each methodology. As a result, one has:

a) for the urbanistic zones, the class of landscape quality, higher than the municipal average, corresponds to 58.20% of the municipality's total area, containing 32.03% of the population, with a lots occupation rate (58.93%) and demographic density (34.13 inhabit./ha) slightly lower than the averages registered for the city. Therefore, they constitute a region of relative urban consolidation; of the twelve zones situated in this class, with exception of only one, all the others fall above the respective municipal averages, in at least one, if not in both types of green areas (with or without arboreal coverage);

b) for the urbanistic compartments **(Figure 6)**, the classes of higher landscape quality (very high and high) cover 37.89% of the municipality's space, with a lots occupation (61.53%) slightly above the Curitiba average, with 23.64% of the population and demographic density (30.66 inhabit./ha) lower than the Curitiba average. All of the compartments fall at least into one of the higher quartiles of vegetable quantity, with or without arboreal coverage (46.6% falling into both of the green area types recorded).

Therefore, one can notice that the traditional technical procedures can – and should – include new paradigms related to a greater direct participation of the population when building the urban landscape, which is, after all, the result of the accumulation of several historical periods (Soja, 2000).

Conclusions

Due to the difference of results between the procedures of technical base, based on a landscape's evaluation, starting with the decomposition of the natural and cultural

subsystems of the city's landscape's visual space components (indirect method), and the study of the human perception, stemming from the observation of visual preferences (direct method), and of its interpretation by means of regression analysis, (mixed method), one can infer that the landscapes' quality evaluation methods are not mutually exclusive. Therefore, it is necessary to integrate the different landscape appraisal methodologies, thus allowing the intrinsic urban environmental values to be joined to the subjective conditions of landscape observers, which reveal the levels of human satisfaction and consequently, the quality of urban life.
From the results obtained, spaces with a significant presence of vegetation, arboreal or not, usually have better visual quality attributes, which confirms the hypothesis that pervious spaces having vegetable covering represent elements that foster the quality of the urban landscape's quality. Thus the importance of green areas in the context of organising a town's landscape, once they are considered priorities for landscape preservation and/or recovering measures, in order to assist the decision process of a city's management.

The model proposed (integrated evaluation) has advantages related to the monitoring of urban environmental conditions, through the analysis of the visual space (indirect method) and the establishment of the man's satisfaction level in relation to the urban space, by means of the interpretation of the human experience (direct and mixed methods), establishing a simplifying instrument to evaluate quality of life, with the possibility of comparing different urban centres, at different historical periods: past, present and future.

Without too many technological, technical, material and financial resources, this study permits its future applicability by any municipality minimally prepared for the urban management process. However, uniting more specialised techniques and procedures will allow the simplification and speed-up of processes.

Thus, a set of procedures was established to assess the prospects of the planning for the future, based on the experiences from the past.

The green belt concept in Caracas, Venezuela: transfer and uses

Douglas Llanos

Arturo Almandoz
Universidad Simón Bolívar, Venezuela

Introduction

The problem of the unlimited urban growth, real or virtual, as a mainstream subject of modern planning was anteceded in proposals like Ebenezer Howard´s agricultural belt and Sir Patrick Abercrombie´s green belt of London. Those proposals sought to establish a threshold between the rural and urban area, analogous to the pre-industrial image of cities enclosed by barrier or a wall.

Indeed, a green belt surrounding the city was one of the elements of Howard's scheme that was rapidly adopted by urban planners in Europe and America, in order to restrict the sprawl of cities. In Howard´s original model, the city was encircled by an agricultural or country belt of 5,000 acres that would work out as a cultivation area of permanent production of food for the community; as Howard described it, an "outer ring of the town are factories, warehouses, dairies, markets, coal yards, timber yards, etc, all fronting on the circle, which encompasses the whole town, and which has siding connecting it with a main line of railways which passes through the state" (Howard, 1973, p.55). The agricultural belt and the railway lines would serve as a double ring for controlling the city's expansion.

But it was Raymond Unwin (1863-1940) who advocated and used the term "green belt" (GB) as synonym of "country belt" for encompassing the open spaces with parks, sport activities and agricultural areas around the city. As technical advisor of the Greater London Regional Planning Committee (GLRPC), he proposed a GB around London, in order to both compensate the lack of open spaces within the city and control the urban sprawl.

With an initial area of 150 square km, the GB was eventually contemplated by the GLRPC in the *Green Belt Act (London and Home Counties)*, issued in 1938. The GB was also recognized in the Greater London Regional Plan (1943-44) masterminded by Abercrombie (1879-1957), who incorporated this area as a reservoir of green and rural areas as well as a provider of fresh food for the sprawling capital (Abercrombie, 1933, 98-99). After World War II, the New Towns policy resumed some of Howard's tenets, while the *Town and Country Planning Act* of 1947 confirmed Abercrombie's GB as a 11.2-mile-wide strip around the city, what would amount and 6,177,634 acres by 1959.

This conception of a green area around the city was rapidly adopted by regional planners of Europe and America that were trying to restrict the urban sprawl of their cities. That was the case of the Regional Planning Association of America (RPAA) – founded in March 1923 by Lewis Mumford (1885-1990) and Clarence Stein (1882-

1975), among others – which analyzed the models of public intervention in European countries, especially the British gardens cities that would inspire metropolitan GBs.[1] Letchworth and Welwyn served as models for Henry Wright projects in Sunnyside Gardens (1924-29) and Radburn (1929). In the latter were included parks that can be seen as internal equivalents of the green belt within the limits of the neighborhood unit.

The urban growth of Caracas

Fuelled by the beginning of the oil exploitation and the end of the dictatorship of Juan Vicente Gómez (1908-135), between 1920 and 1940, the urban area of Caracas passed from 9,810 to 81,295 acres (Table 1, Figure 1), what meant a rate of 238.5 acres/year (Table 2). Such a speedy growth evinced the need of an urban plan for what the Californian planner later labeled as Latin America's "instantaneous metropolis" (Violich, 1975, pp. 272-79).

Table 1: Urban growth of Caracas between 1889 and 1971

Year	1889	1906	1920	1940	1950	1971
Area (Acres)	6,000	6,231	9,810	81,295	84,507	773,412

Plan Monumental de Caracas (PMC)

In April 1938 was created the *Dirección de Urbanismo* (DU, Direction of Urban Planning) at the Government of Caracas Federal District (GDF). One of the DU's first tasks was to prepare the new plan for Venezuela's booming capital, whose main instrument of urban control was hitherto the 1930 ordinance of Civil Engineering. Elaborated with the advice of a group of French *urbanistes* led by Maurice Rotival, the so-called "Plan Monumental de Caracas" (PMC, Monumental Plan of Caracas) focused

on the renewal and extension of the urban centre (Figure 2), while establishing guidelines for the expansion of the capital within its region.[2]

The PMC partly responded to the concern by Eleazar López Contreras's government (1936-41) for sanitary and environmental deterioration of the Caracas center, which was evinced in severe problems of traffic, disordered installment of new services and infrastructure, uncontrolled densification of residence and other activities, and the engulfment of nearby green areas by the metropolitan sprawl.

In order to strengthen the relationship between the capital and its hinterland, the PMC incorporated the category of "Region of Caracas", which structured the communication of the urban core with surrounding sport clubs and garden-city-like suburbs through modern roads. Also within this region the PMC proposed to preserve the natural beauty of tropical countryside by banning the occupation and construction of grounds that not were suitable for urbanization, which became labeled as "Zones of Reforestation". In one of the PMC's graphic documents, these areas just represented a 200 m-wide border around the city; however, it can be considered the first attempt restrict the urban sprawl with a green ring. As the gem of that ring, at the north of the city, the El Avila hill was highlighted as the ideal place for rest and practice of mountaineering and other sports, with his vantage points, restaurants and hotels that did not seem to be in conflict with the idea of green area (GDF, 1939, p. 23).

Plano Regulador de Caracas (PRC)

As the first planning body of national scope, in 1946 was created the *Comisión Nacional de Urbanismo* (CNU, Nacional Comisión of Urban Planning), including a Technical Direction that grouped some of the DU's former members. The CNU's great contribution was the elaboration of the so-called *Plano Regulador de Caracas* (PRC, Caracas Master Plan), also issued for Venezuela's five major metropolises. Published in 1951, the PRC somehow completed the 1939 PMC, but now integrating proposals of the former DU with others elaborated in the early 1940s by the *Ministerio de Obras Públicas* (MOP, Ministry of Public Works). Including Rotival himself – who now came to Venezuela claiming to be a "planificateur" than a "urbaniste" (Rotival, 1964) – in the PRC participated some of the members and advisers of the former DU; but the PRC relied on a much modern groundwork than the Haussmannsque principles that had partly inspired the PMC (Almandoz, 2006). With Carlos R. Villanueva as a member and Robert Moses and José Luis Sert as advisers, the CNU featured architects and engineers that had been educated in Europe and the United States, but were now closer to the heritage of Bauhaus and the International Congresses of Modern Architecture (CIAM) (Martín Frechilla, 1996). Under the guidance of Francis Violich – a planner from Berkeley that was responsible for introducing the zoning ordinances to implement the PRC - the CNU staff was also in contact with Richard Neutra, Eric Mendelsohn and Marcel Breuer.[3]

In order to emphasize the location and organization of urban activities, the PRC divided the city's structure according to the concept of "communal units" – a hybrid resulting

from Le Corbusier's *unite d'habitation* and Stein's neighborhood unit, among other influences (Villoria and Almandoz, 2002). Such a concept was not only applied for numerous residential areas, but also for the distribution shopping centers, civic centers and recreational activities. The PRC's urbanization limits were initially fixed below the 905-1,000 meters above sea level throughout the hills and mountains that contour the Caracas valley, though the need of further and more detailed studies in order to establish definitive boundaries was recognized (Figure 3). Since most of these areas presented topographic and environmental peculiarities, they were classified by the PRC as "Reforestation Areas", so that the erosion of the mountain slopes could be prevented, as it was the case of the El Avila above the 1,000 meters (CNU, 1987). Considering that the population of the Caracas region only amounted 359,000 by then, these areas can be said to have been defined more on environmental than demographic grounds.

Plan Urbano General de Caracas: 1970 -1990 (PUGC)

Three years after the disappearance of the CNU in 1957 – prompted by the end of Marcos Pérez Jiménez's dictatorship (1952-58) – the new democratic government of Rómulo Betancourt (1959-63) created the *Oficina Municipal de Planeamiento Urbano* (OMPU, Municipal Office of Urban Planning) of the Caracas Federal District. In addition to dealing with the permits of urban growth and construction in the booming capital, one of the OMPU's main competences was to elaborate the Plan Urbano General de Caracas: 1970-1990 (PUGC), aimed at controlling the physical expansion of the population metropolis. As a body close to the conception of the English master plans (Almandoz, 1993), in the PUGC participated Rafael Valery, Omar Hernández and Alberto Morale Tucker,[4] who were familiar with the RPAA's theories of Open Space and England's New Towns program (Chacón and Almandoz, 1992 and Morales Tucker, 1991).

Inspired by the English experience, the PUGC proposed the urban development of the Tuy and Guarenas valleys of the Caracas region, where satellite towns of industrial and commercial nature were strengthened, in order to de-concentrate the capital and avoid its eventual conurbation with nearby centers. Within this regional background, the plan also contemplated to adopt the El Avila National Park as northern border of the capital's urbanized area, while establishing a *Zona Protectora de Caracas* (ZPC, Protective Zone of Caracas) that extended the urbanization limits in other directions (OMPU, 1972).[5]

Even though at the north of Caracas was launched, by the late 1960s, the Boyaca Avenue – also known as the *Cota Mil*, because it followed the northern curve 1,000-m above sea level – the PUGC restricted the construction of roads that could pave the way for urbanizing the ZPC. Though sport activities were permitted, the plan also lowered densities in areas close to the ZPC, so that there would be a transition the urbanized and semi-rural belts (Figure 4).

Plan de Caracas 1990 (PC1990)

By 1969, a presidential decree established the *Área Metropolitana de Caracas* (AMC, Metropolitan Area of Caracas) that comprised 5 municipalities and more than 11,000 hectares, which was enlarged in 1972, by another presidential decree, to more than 66,000 hectares.[6] Integrated by the same team of the former "municipal" office, the new "metropolitan" OMPU prepared the *Plan de Caracas 1990* (PC1990), which can be considered as the continuation of the PUGC. The PC1990 confirmed the ZPC and the El Avila National Park as great recreational reservoirs for the Venezuelan capital; however, it did not establish new limits for the area, but rather focused on the plan's operative aspects (OMPU, 1972).

1978: Plan de Caracas 2000 (PC2000)

By 1978 the OMPU designed the Plan de Caracas 2000 (PC2000), aimed at updating and reformulating some of the PUGC's goals and proposals. The PC2000's ambit was a 663-square km *Area Metropolitana Total* (AMT, Total Metropolitan Area) that was included between the ZPC and the southern border of the El Avila National Park, whose combined function as metropolitan green belt was thereby consolidated (Figure 5). Jointly with a so-called policy of "concentrated decentralization" – which encouraged the development of alternative metropolises such as Maracay, Valencia and Puerto Cabello – the green belt sought to correct the excessive growth of Caracas, in view of the severe constraints imposed by the physical environment (OMPU, 1978).

Among other recommendations concerning the ZPC, the PC2000 proposed a regime for introducing recreational activities in that area, so that it could be more accessible to the community. Such a policy also intended to raise the ratio of public spaces for recreation, which by the late 1970s had been estimated at 1.5 m2 per person – far below the 10 m2 established by local and international norms. ´

Past and present of the Caracas green belt

 As it has already been mentioned, the creation of the El Avila Park in 1958 and the launch of the Boyaca Avenue in the following decade were decisive barriers to fend the capital's expansion towards the north. By 1972, the 66,295-hectare ZPC consolidated the protective ring that was completed by the Macarao National Park.[7] Those measures lowered the city's annual rate of urban expansion from 1,035.62 acres during 1950-71 to 680.8 in 1971-94 (De Lisio, 2001, p. 212). As it was evinced by the OMPU plans along the 1970s, the main reasons for boosting the ZPC were to stop the exorbitant sprawl of the metropolitan outskirts, while trying to prevent the destruction and deterioration of green areas and other natural resources.

The creation of the ZPC implied a considerable decrease of the area originally reserved for urbanization, what unleashed an increase of densities in the valley of Caracas. The decree established that landowners of agricultural, industrial, commercial or residential properties could remain in the ZPC if they kept the same conditions existing at the

moment of the decree's passing. This meant that agricultural, recreational, scientific, military activities and public services were permissible within the ZPC, if the decree's conditions were met by landowners or developers. The ZPC's positive effects thus included the prudential and discretional control in the land use and the rational planning of the capital's region, while trying to maintain the valley's environmental quality.

Conclusions

Even though this paper is a partial result of an ongoing doctoral research, some conclusions can be outlined. After the strong influence of French academic urbanism in the 1939 PMC, modernist concepts such as the communal unit, as well as zoning ordinances and other instruments of urban control, were incorporated by CIAM representatives – presided by Sert - and regional planners – such as Rotival and Violich - to the PRC and later plans of Caracas. Although it was anticipated in the PMC and the PRC, the green belt was really shaped in the OMPU plans, as a component of regional policies that, inspired on the English New Towns, tried to avoid the conurbation of Caracas with nearby metropolises.

Comprising the ZPC (1972) and the National Parks of El Avila (1958) and Marcarao (1972), the Caracas green belt shows some features of Howard's proposal, though it is closer to Unwin's "country belt" and Abercrombie's "open space". The issue of the Plan de Ordenamiento y Reglamento de Uso de la Zona Protectora del Área Metropolitana de Caracas (1993, Management Plan and Land Use Regulation of the ZPC) allowed suburban residence as an activity, what finally altered the original idea of green belt around the Venezuelan capital.

Endnotes

[1] "Elements of their vision were reflected in the activism of the New Deal of the 1930s, the new towns proposals of the 1960s and 1970s… Despite these initiatives, RPAA's broader vision was ignored by most twentieth-century policy makers, and many of the concerns first raised in the 1920s remain largely unresolved: the impacts of suburban sprawl on cities and countryside; how to reconcile the automobile and highways with the design of communities and regions; and the need for high-quality affordable housing." (Seltzer,2000; http://www.lincolninst.edu/pubs/PubDetail.aspx?pubid=274)

[2] Arrived in Caracas with Jacques Lambert – also a member of the Paris-based office of Henri Prost - Rotival worked with Venezuelan architects and engineers, one of them was the later renowned Carlos Raul Villanueva. This episode is assumed as the birth of Venezuelan *urbanismo* (Almandoz, 2006).

[3] In order to recreate the professional climate of the CNU, we rely on an interview – especially made for this paper - to Professor Victor Fossi, a former assistant of the commission.

[4] The leading member of the team and later director of the OMPU – which he joined in 1968 – Morales was trained as Architect at the Central University of Venezuela (UCV), before getting a master degree in Urban Planning at Harvard University.

[5] In relation to the Avila hill, the PUGC recognizes its function as limit of the urban development towards the north of the city, with which it has forced her to spread towards other cardinal points, saving the obstacles that have been objected. This expansion, after occupying the relatively flat areas of the principal valley and of the secondary valleys, they started occupying intensively the zones of relief injured in the hills that border and define the city. For this motive, there appears the utilization of these zones for urban development purposes always and when its uses with principles of conservation, knowledge of the geological conditions, and respect to the topography and the environment (OMPU, 1972).

[6] The decrees were issued on June 11, 1969 and July 20, 1972.

[7] The Macarao National Park has its precedents in the Decree of 1926 of the government of General Juan Vicente Gómez which declared Macarao as National Forest, with the purpose of protecting water resources that the city would need in the future. In 1936, the government of the General Eleazar Lopez Contreras decreed the protection and reforestation of the zone. The Protective Zone of the AMC incorporated Macarao as part of the zone, contributing to the posterior creation as National Park in December 5, 1973 (Decree N ° 1529).

A new private planning ideal: the case study of a planned community in the south of Brazil

Marina Toneli Siqueira
University of São Paulo, Brazil

This study began with the aim to understand the origins and conflicts about *Jurerê Internacional*, a private planned neighborhood in *Florianópolis*, capital of the *Santa Catarina* state in Southern Brazil. A very audacious project, the first in this region, what began as a high class residential project turned into a reference of the city. The many controversies that surrounded the project remain since its approval in 1981. The impacts in the environment, the social exclusion process and the effects in the local historical heritage, including the constructed one, exemplify that. However, one concept was frequently used in the reference literature and also in the marketing of the entrepreneur: "planned community".

Planned community is a term frequently used by Brazilian real state promoters to designate a private planned residential area with luxurious services and commerce. It works actually as a small independent city disconnected of the structure and life of the city in which is located. With its own regulation and identity, as if it does not belong to urban reality, the planned communities have become a dream of Brazilian population: a safe place isolated from the chaos outside. Much more than a commercial product, the planned community utopia is highly connected with the recent changes in the Brazilian urban planning matrix and ideology and, consequently, this is the start point of the present paper.

Theoretical References: utopia, ideology, and urban planning

Many authors already had explored the relation between ideology and urban planning as a practice conditioned by political, economical and social interests. According to Choay, no theory of urbanism escapes a certain "landslide"[1]. The landslide mentioned by the author is the union of a speech of scientific intention with utopia traces. Choay completes that the scientific speech is operated by the settlement of a statement of facts in a value judgment[2]. The theory of urbanism also has a certain mystifying nature where later and independent versions may proliferate, once that it is formed by two kinds of speech: one from the architecture treatise written, that consist in the application of norms, and another one derived from utopia.

The same author characterizes utopia as the society reflected by an inverse mirror: the relation between the ideal imaginary society as an inversion of the real and criticized one. However, it is necessary to attempt for the fact that the utopian models not always are opposed to the existing reality; they can appear, in contrary, to strengthen it. In these molds utopia cannot exist isolated from ideology[3]. In fact, utopia finds its place when articulated with the processes of intervention of the Real, passing from speech to practical policy, or better, a Project to confer visibility so that utopia gains effectiveness

and objectivity. As for the Brazilian cities, the urban plans, that in most of the cases are not completely followed, become ideological speech and not practice.

> *"The urban planning in Brazil became identified with the intellectual activity to elaborate plans. A self-closed activity, disentailed of the public policy and of the concrete action of the state, even though, eventually, it looks for justifying them. In the majority of the cases, however, it intends, in the truth, to occult them"*[4].

The main agent of urbanism concern is the urban crisis phenomenon. This one is seen as irrational; therefore it needs to be coordinated, or better, rationalized. The opposition between urban crisis, real and unreal problems come to strengthen the question of ideology in the urban planning, therefore it hides the true conflicts in the social area. To solve the crisis, city planners try to explain the reality in an objective way, knowing and dominating it to try to say everything what the space is or should be. It is common, therefore, the presentation of diagnostics, where are listed problems of impossible solution, since they are originated in another sphere. These diagnostics are, in the majority of the cases, detached from urban reality, especially because they do not truly dialogue with all the diverse segments of population, emphasizing a process in which the dominant interests prevail. Governmental actions try to minimize the conflict by attenuating the disorder of urban crisis phenomenon and its consequences. To discipline the urban chaos and to try new forms of cities ordinance appear as the challenges of the urban planning, even if it is known that the city itself is not a result only of this process.

> *"It was popularized the dominant idea that the urban problems derive from the lack of planning of our cities. The idea of `urban chaos' became a common-place, and its cause was a urban planning lack (...) The urban plans start to have value by itself and not for its results (...) This autonomy of the plans, its displacement from reality are connected with the production of an enormous armory of ideas about the city and about urban planning that are stimulated from itself therefore it does not have any relation with the real city. It is the urban planning as ideology that will dominate – and still it dominates – the urban planning in Brazil"*[5].

Since 1960´s a new accumulation crisis of the capitalist system became present, being used as its landmark the oil crisis in 1973. The current phase of capitalism development, described as flexible accumulation, financial capitalism, post-fordism or post-industrial, corresponds to a new organizational structure based in technological advances and, consequently, in a new labor division; to an acceleration of capital concentration and to the aggravation of social inequalities; to an emphasis in a global level competition and consumerism, among others. Although many of the actions only seem to legitimize the supervenience of the system in a structural crisis since the beginning of last century[6], they bring changes in the speech about the urban situation and about the present social relations.

It is important to notice that the neoliberal proposals had started to disassemble the matrix of the modernist urban planning, effective for more than a century. With roots in the Illuminism, from which it receives its positivistic and holistic inheritance, the ascension and consolidation of this way of analyzing and proposing the urban planning were given during the capitalist expansion of the postwar era. In this period, as remembers Harvey[7], the government is the central figure of the accumulation system, guaranteeing, side by side to the great capital, a mass market. Welfare State combined the control of the production and the work with a massive investment in social policies. Therefore, the main agent is the intervening State, possessor of the rationality capable to stimulate economic development and to correct social dysfunctions. Modern urbanism, embedded in this source, has an enormous political and social enrollment, demonstrated during the several International Congress of Modern Architecture (CIAMs). And it is from this matrix that appears the plans of ideal cities, projects for a better society, such as *Ville Radieuse* of Le Corbusier[8]. Even thought changes occurred in the movement, tending more to formalism and to a commitment with the capitalist accumulation[9], modern urbanism obtained, at least in the countries of central economy, a true urban reform, with the mass construction of housing, subsidies by the government for the public services and magnifying of the urban infrastructure, among others. In Brazil, the modern planning had the utopia to take the country to development. Such utopia was emptied of its social content after 1964, year of the military coup and beginning of the dictatorial period, but that took it to its consolidation, established in national plans of development (PNDs), through the temporal coincidence with an authoritarian and centralized government[10].

Before its true collapse, the modern matrix was being attacked since the 1960´s by social movements in favor of the inclusion of ethnic, national and religious minorities in the urban debate and by the critics of the functionalist space segregation, the formal rigidity and the massing of the fordist period formulated by authors like Jacobs, Berman, Lefrebvre and Venturi. Therefore, being contested by the new accumulation model, which asked for more flexibility and less governmental intervention, among others, its base was not already solid. The requests were answered inside the urban planning also with more flexibility, territorial spalling and less state intervention, but at the same time, with public-private partnerships, a so called bigger participation of the civil society and by the adoption of strategies capable to dribble the economic crisis while generating competitive solutions.

According to Harvey[11] the compression of the space-time relation through the internationalization and the emphasis in the financial economy and through the technological advances, is one the most important aspects of this "Postmodern Condition", once this aspects, in special the neoliberal globalization, made possible the acceleration of the capital function time (production-exchange-consume) and, consequently, the acceleration of product style time. The author explains that this is another step of the annulations process of space by time, already initiated by modernity. However, this does not mean that the space loses its meaning. On the contrary, the economy becomes even more sensible to the location. The lack of economic regulation and the instable model of financial accumulation associated with the technological

developments allow the relocation of enterprises and changes in the spatial configuration (spatial fix) to be easier and faster. From it emerges the necessity of a pro-business environment in the cities in order to attract this capital each time more mobile. Such configuration promotes competition among cities to locate investments and resources, thought the location of enterprises, thought tourism or through the attraction of new users with capital to expend. Harvey[12] calls this time of urban governance of *urban entrepreneurialism*. In recent studies about the Brazilian contemporary urban planning, this model has been called *strategic planning*. Rose Compans summarizes well what it is consisted of:

> "*The strategic planning constitutes the main instrument of adaptation of the local institutional forms to the objectives of the competitive insertion, adjusting an agenda of physical interventions and of modifications in the legal and administrative structure to the observed marketing trends in the dynamics of global economy. Attributing strategic relevance to determined action and projects, it excludes the possibility of those others, not included in this agenda, to be accomplished or even demanded. On the other hand, the strategic planning favors the construction of political alliances with the enterprise segments and the public marketing, both conferring legitimacy to the established priorities and to the participation of the private sector in the management of the public affairs. By these terms, it became a privileged vehicle for the adoption of the competitive entrepreneurialism in the governance of cities*"[13].

The strategic planning appears as the unique solution for the urban problems in this postmodern condition, making cities competitive and efficient. Inspired in Barcelona´s preparation experience for the 1992 Olympics, the strategic planning is the one that aims to restructure a city both economically and spatially. Through the constant publicizing of this experience, the notion that the "Barcelona model" could be adopted in any other city, regardless of its characteristics, became popular, as the modernist model type of urban planning, so scrutinized. Catalan professionals founded consulting services for the elaboration of the plans world-wide, like TUBSA; universities and research institutes promote courses and studies programs within these ideals; public organizations and the civil society become defenders of the adoption of this models. International agencies, such as IMF and IADB, not only finance the projects, but also promote this model of planning rewarding the "good practices" of urban governance, as the quote of IADB demonstrates:

> "(…) an important part of the good urban governance involves the adoption of a commercial approach to many of the services and administrative functions of the cities (...) a commercial approach is also prerequisite for involvement of the private sector or eventual privatization of urban services"[14].

Among the most important authors of the strategic planning are Manuel Castells, Manuel de Forn and Jordi Borja, former mayor of Barcelona. The three have already published papers and books that are used as manuals of urban reform by their statement that if the cities are willing to obtain a role of promoters in social economic

development are necessary: a radical political change through a promoting governance based upon a popular leadership; urban valorization projects of public and private investment by quick and strong interventions; and, at last but not least, the identity and the image that the city has of itself and the one it projects to others.

This model of local intervention is based in two strong words for the postmodern condition: synergy and strategy. It is believed that a plan of local interventions localized in a fragmented pattern would stimulate actions of revitalization and renovation in and of the whole city. Among the advantages usually are cited the facility of getting resources through public-private partnerships (projects and negotiations case by case); least time for execution, adapting itself to localized interests and to the period of different governments; and, a greater visibility for the projects, allowing the local population engagement. A fragmented urban planning would also have more agility and flexibility to adapt to changes. Acselrad[15] says that it has been invented an urban planning *just in time*, in reference to de production model based in the demand. The analogy between the city and the enterprise or with the merchandise already shows the transference of entrepreneur techniques, as marketing and aggressive competitive strategies, to the urban governance.

Actually, it is possible to say that the strategic planning consists in a plan to adapt the cities to the new stage of capitalist expansion, through the spatial fix and the legal and political structure adjusted with an economy based in the advanced third sector and in the high technology industries and also through the promotion of a pro-business environment. It is possible to distinguish the emergence of two process of urban revitalization: a material one and a symbolic one. Among the direct interventions in spatial reality, like already said, the urban planning becomes fragmented with the main concern of certain areas of the city to attract investments. The interventions must prioritize the spatial organization and the construction of structure that attracts investors, by the improvement of the transportation system, by the creation of financial and entrepreneur's districts, by the installation of advanced communication services and by the local financial advantages, like the cut of taxes. Meanwhile, the city also has to make itself attractive to inhabitants and tourists, therefore the necessity of location of exclusive high class residential areas and the necessity of qualified services and goods with the investment in leisure and consume areas, such as shopping malls e cultural centers, and in qualified tourist structure[16]. By any terms, this is an unequal treatment of the city with the unequal provision of investments and the priority of areas designated for the capital of any means: the city is a luxurious merchandise[17].

The social consensus constructed in favor of the project is based upon the promise that the fragmented interventions would benefit the whole city through sustainability, through development and through the (post) modernization[18]. However, the main social justification is the job improvement. In the case studies in Brazil, the high costs of the actions, the low tax resource and the lack of investment in social protection show that is not the local population that gains with the project. Fernandes[19] also remembers that are the national economical politics which have the most influence in the aggregate level of jobs.

In the symbolic process of cities transformation, there is a reconstruction of urban subjectivities through strategies like city patriotism. The construction of symbols for the new city through the promotion of new spaces, cultural and sportive events; the urban governance by charismatic leaders; the improvement and the publicity of the local identity by the urban marketing transforms the city life through the more importance given to the image, to the representation than the one given to the real object, in the case, the city itself. Certainly, this image must be of a positive future for it, producing the consensus through the self-esteem and the pride of the inhabitants. Actually, the strategic plan must be extremely positive: the problems should be ignored so they cannot create a negative image of the city for future investments.

By these terms, beside the effects in the urban space, there is the act of symbolic violence against the city[20]. The process masks the real urban identity, eliminating contradictions and homogenizing the space through the refuse of any other image or representation of the city. This manipulation combined with the physical interventions promotes gentrification processes with the expulsion of population segments that do not interest the city-enterprise, confirming the social cohesion of the promoted simplified image. The de-politicization, since the city is no longer a truly democratic space, is another guarantee for the investments. This way is possible to understand the importance of ideology in strategic planning, letting the interventions be considered as of public interest. Thus, the strategic planning is a "speech plan"[21] that accomplishes its ideological goals by masking the real city.

It is important to remember that the model exposed by Borja and Castells seeks to adapt a hypothetical local socialism to the new inexorable trends of global capitalism. Contradictory goal, but that does give importance to the quality of life of the complete city, proposing the construction of housing and improvement of structure and public services for the poor. It is the way that the strategic plan has been adopted that only prioritizes the highest classes' interests. One example is the *Strategic Plan of the City of Rio de Janeiro*. According to Vainer[22], although the social participation is one of its requirements, it had not open space for public participation and discussion. In other terms, according to the author, it is another urban plan that legitimizes the economic interests, in special by treating the local social inequality as a landscape problem that constringes and inhibits the investments in the city. Rose Compans also analyses the plan methodology, realized through the Catalans consulting service, including Borja himself, and concludes that the result of it is according to the requirements of strategic planning since it should be "*in favor that the most dynamic and strongest sectors are the protagonists of the re-launching of the city*"[23]. Even most important is to understand what are the real consequences of being effectively adopted in Brazilian reality, since, as Arantes says,

> "*(...)it seems much less reasonable that in such context somebody minimum responsible – to say the least – can imagine a city government that is basically limited to promote businesses, that feels alright considering a competitive race*

where is very obvious that some will go well in the accurate measured where others will lose"[24].

The emergence and adoption of this model demonstrate a new conception of the urban space and a new ideology for urban planning. The promotion of cities competition leads to urban reconstruction for a global capital space, configuring agile and deep changes processes for the Third World cities. The changes are not only material, but also symbolic, interpreting the city only as part of the economic accumulation process[25]. The postmodern condition, in fact, seems to strength the role that cities play in the "spectacle society"[26], producing images of a new way "to make" the cities and a new way "to live" the cities. These images simplify urban identity, empting the social content and the diversity of the urban life, which are its proper conditions. Remembering what Lefebvre said in the beginning of these changes, this new image of the city: *"(…) incorporates and at the same time dissimulates social relations as also the way these relations are"*[27].

Florianópolis and Jurerê Internacional

Florianópolis, capital of the *Santa Catarina* state in Southern Brazil, has been receiving a lot of attention since the ending of last century. Located in a very dynamic area of the country and close to the neighbors of the *Mercosul* Argentina and Uruguay, most part of its territory is situated in an island of great beauty and a fragile ecosystem. The city is considered the state capital with better quality of life in Brazil, based on the UNDP/UN - 2000 and published in the major medias of the country and in that closest others. With the valorization of new ways of life in Brazil, such as a straighter relation with nature and security from urban violence, *Florianópolis* has become an island not only in its obvious geographic way, but also a dream city in the middle of a chaotic urban reality. But it wasn't always like this.

Florianópolis, at the colonial time *Desterro*, was a strategic area of the Portuguese colonization plan for the New World in South America. During the battles between the Portuguese and Spanish Crows in search of the metal richness of the continent, *Florianópolis* was considered the last safe port on the way to the Silver River (*Rio da Prata*), a connection to the new areas of exploration, and the middle point in this route from *Rio de Janeiro*. To ensure the control of the area, Portugal began a massive plan of occupation in which were planned some drastic measures for the island, such as the construction of a fortification's system and the immigration of families from the Islands of Azores, also controlled by the Portuguese Crown. This was a very important moment in *Florianópolis'* history that determined its form of occupation until the present, a central area that unites the administrative, military, religious and commercial functions and controls the interior of the island. In this last one, it was conformed a hierarchal net of small communities in which the *Freguesias* were the most important ones, since there existed branches of that functions. However, with the end of the territories' disputes and the new forms of economic exploitation of the conquered ones, *Florianópolis* became only a port with small proportions, reason why it was deactivated in the beginning of the 20th century, and the capital of the *Santa Catarina* Province, after a Brazilian state.

Actually, it is the administrative function that will dominate the city's economy until the 1970´s and that will make possible for the city to grow.

The city enters in the 20th century with a fragile economy and literally disconnected from the Brazilian reality. With most of its territory located in an island, the connection with the continent was the first obstacle to transpose. In 1926 was built a bridge, *Ponte Hercílio Luz*, imported with the English technology of steel construction that cost ten times the city budget. The bridge changed the physical aspect of *Florianópolis*, since it stimulated other improvements in the city, like new streets and new urban services. But it didn't change its economy.

Contradictorily in a conservatory way, Brazil was entering its industrializing period. Leaded mostly by *São Paulo*, others southern Brazilian state capitals were also going in this direction. It is from one of these, *Porto Alegre*, that a team was hired by the local political leaders to make the first urban planning of *Florianópolis*. Approved in 1956, this plan was inspired in the modernist movement, mostly in the progressive kind of Le Corbusier's theories, and projected a city based in the modern technologies. According to it, *Florianópolis'* economy should be stimulated by the industrialization and the construction of a modern port area. It also previewed the implantation of a research and college institution and the development of the tourism, secondary functions. From these propositions, these last ones were privileged by the local interests, even with the new urban plan of the 1970´s that had the same inspiration. *Florianópolis* became the polarizing city in the state area with the constructions of the road connections with other ones and, inside it, with other areas of the island. Although the development of the city was idealized in the Southeastern direction of the island, as in the diagnostics of the plans, these investments had been dislocated to the sectors north and east of the island, mainly by the pressure of the land proprietors in this axle, a mixture of public and private agents[28]. The fastness of its growth was based in the expansion of the occupation for the tourism, activity that will be its major economic base from this time on.

Florianópolis' main attractive points are the beauty of the environment and of the landscape; the form of dispersed occupation of the territory; its geographic position, in the center of an extremely dynamic area of the Brazilian territory and near of important countries of South America; the climate, more cold than other areas in Brazil, what also can bring strong climatic changes caused by the influence of polar masses; and the quality of life of the city.

The tourist activity in *Florianópolis*, less present until the decade of 1970, had two factors for its posterior vertiginous growth: the opening and the tarring of the BR-101, road that connects the city to the national highways, and the immigration of a great number of workers of the middle class when of the consolidation of the island as capital of the State, receiving headquarters of state agencies, and with the implantation of the Federal University of *Santa Catarina*. However, the most important factor was the integration of the interior of the island to the center of the city through the construction of the linking roads on top of the old colonial ways. In the 60´s, the SC-401 was

constructed, binding the central area to *Canasvieiras*, a coastal area, before a *Freguesia*, now a neighborhood designated for leisure and summer vacations mostly for tourists of the neighbor countries. At the same time, were constructed the highways SC's 402, 403, 404, also for the coastal areas *Jurerê*, *Ingleses* and *Lagoa da Conceição*, respectively, and expanding the areas of leisure and vacations. At a first moment, are the proper inhabitants of *Florianópolis* who construct residences for the summering, producing the expansion of the city occupation. This type of urbanization, extensive and of low density, still configures most of the beaches' occupation of the island.

The 1980s consolidated the tourist activity in the island, making of *Florianópolis* one of the points most visited by middle classes' tourism in Brazil. But, it is during the beginning of the decade of 1990 that a new standard of exploration of the island is adopted, combining the influence of the local elites with the interests of national and foreign economic groups and with sights to the attraction of a clientele of high income. If until then the tourist activity depended on local capitals or in the maximum regional ones, this situation changed with the intensive investment from external agents.

With the emergency of a competitive scenario between cities for attraction of investments, *Florianópolis* also turned itself in this direction. Although its natural characteristics always have attracted tourists and new inhabitants, who also searched a life "more calm", *Florianópolis* tried to adjust itself to the new world-wide parameters, with the construction of urban infrastructure and promotion of the city's lifestyle that joins the traditional culture and occupation to the modern installations. This union between the old and the new seems to be a new way to live in the city and, in propaganda for the municipal managements, a new way to make the city. The union between the exuberant nature of *Florianópolis* and the modern installations also can be faced in the same way. Thus, partnerships of public and private investments appear in prominence in the city for the attraction of high classes, new inhabitants and tourist. These great urban-tourist enterprises differ from the previous forms of growth of the coastal areas by the planning and execution in block of the land division and the infrastructure, previously gradual. The local airport was raised to the category of International, with flights to Montevideo and Buenos Aires that last less than an hour and a half. Ouriques[29] intents to the intense process of commercialization of the land, with a real state explosion in certain areas. The main road of connection with the coastal areas in the north of the island (SC-401) was enlarged. All the process seems to have culminated with the nomination in 2000 by the UNDP/UN of *Florianópolis* as the Brazilian state capital of better quality of life, as well as its metropolitan region. *Florianópolis* became published in the major mass medias. Exclusive hotels, condominiums and land divisions in the molds of luxurious tourist areas were constructed. The highlight among these is *Jurerê Internacional* that marks the entrance of the city in the logic of post-modernity[30].

Jurerê Internacional is the first private planned neighborhood in this region. A very audacious project, what began as a high class residential project turned into a reference of the city. The *international* last name appeared to differentiate the new enterprise of

the previous one, made by local entrepreneurs and politicians, called *Jurerê Nacional* or National Jurerê. The *Habitasul Group*, the entrepreneur group originated in another Brazilian state, considered that if beyond the infrastructure demanded for the municipal law it was installed others types of urban equipments and spaces of leisure, the enterprise could be equalized to the world-wide famous beaches, as the ones located in Miami (U.S.A.) or the Mediterranean (Europe). Therefore, this would be "an international" urbanization and this last name would serve, therefore, to differentiate the "lifestyle of the first world".

The architectural styles of the constructions can be classified in two types: a first model dates from the beginning of the enterprise and, the other, appears in the decade of 1990, with the valuation of *Florianópolis* and of the proper place. The first one follows a pattern directed to middle classes, with structure in concrete and bricks, many times apparent. However, constructions in this style exist in lesser number and are, literally, dimmed by the most recent. These last ones are connected to a turning point of the development when it was contracted the North American company Edward Durell Stone Architects (EDSA) for the elaboration of an urbanization plan and landscape for the area. This plan marks a strategy change: from a tourist coastal area to a high class tourist coastal area with services and infrastructure of an independent neighborhood. Therefore, the area beyond keeping the tourist character became a residential area of the city. It was constructed new habitations by the *Habitasul Group* imposing a new edification type and new infrastructures, as the sanitation system that had valued the enterprise still more. The new adopted style is clearly connected to the place of origin of the company idealizer of the plan, Fort Lauderdale in Florida/USA. But their inspiration is not restricted to Florida since an entire block of apartment buildings, named *Il Campanário*, is being erected around a small tower directly imported from Hitchcock's Spanish California: the convent tower from the top of which Kim Novak falls twice, in the unforgettable movie *Vertigo*[31]. And more, the adoption of this model is contradictory regarding the goals of the company to valuate the local culture and to the affirmation of Hélio Chevarria, associated director of the *Habitasul Group*, that the "*differential of a real estate enterprise today is the integration of it with the history and the environment of the place. Jurerê Internacional already was created with this vision*"[32].

The *Habitasul Group* has a strong presence. The architectural projects must be approved not only by city institute of urban planning but also by the entrepreneur. It is in charge of the investments, the urbanization, the property and use of the land, the commerce and services offered and the infrastructures, such as a security system with a great number of cameras that control the whole area. The Group says, in its website, that its mission is to create and to develop "*planned communities*" by "*the permanent management of the entrepreneur*". Also, the group looks for "*to announce and to institute in the community a calendar of activities, generating events that valuates the communitarian self-esteem and increases the values of the properties*"[33]. With activities managed constantly by the entrepreneur, it can keeps the idealized goals when of the projection of the community and monitor the changes of the same one.

According to survey carried through by the *Habitasul Group*, the motivators for the public interest in *Jurerê Internacional* are, in order, the tranquility, the beauty of the beach and the security. There are approximately 4,000 permanent inhabitants, number that, added at the summer tourists, in the high season reaches 9,000 people, without counting the daily visitors. In commercial terms, the enterprise also can be considered a success. The last stages had more than a 100% valuation in only one year. In *Jurerê Internacional*, the emergence of new models of quality of life with a narrower relation with the nature and the movement of the high classes in suburban residential condominiums were extremely important to this valuation. These new ways of lives create a new kind of daily movement: almost 7% of the inhabitants of *Jurerê Internacional* work in bigger centers located even in others states of Brazil having to be dislocated to these cities by plane every day.

The daily bases of *Jurerê Internacional* are defined by the changes of the seasons. As the climate in *Florianópolis* is configured by a period of higher temperatures and another one with a sufficiently rigorous cold, the beach cannot be frequented constantly. In a coastal area occupied mostly by second residences, this means that for the most part of the year the place is relatively empty. Thus, the direction of community of *Jurerê Internacional* restores much more in the common interests of proprietors and inhabitants than in bonds of proximity and solidarity. And, in this way, it also can be sufficiently fragile and temporary.

The many controversies that surrounded the project remain since its approval in 1981. The impacts in the environment, the social exclusion process of the traditional population and the effects in the local historical heritage, including the constructed one, exemplify that. Among these, one that detaches is the economic, in special because of the increase of the cost-of-living during the high season and the unemployment in the low one. The traditional community of the area sold its lands and changed its jobs from the old activities to combine it with the jobs in tourist activity. However, the jobs generated by the enterprise do not differ in such a way from the ones from other parts of the island: badly-remunerated, disqualified and temporary. Helton Ouriques[34], characterizes well this hand of workmanship: temporary, of great rotation, without working regulations and sub-wage-earners.

Still, the tourism of high standard forms true "enclaves" in the territory that privatizes the nature, segregates the space and debilitate the local culture and the local landscape, as *Jurerê Internacional* confirms. Ferreira[35] recognizes well that the objective is *"to take care of a demand of private consumption of high class, without significantly modifying the picture of lacks of the local communities and without valuing a more rational exploitation of the local resources"*. Ouriques[36] explains that almost 50% of its sampling, formed by inhabitants of *Florianópolis*, believes that there are areas of the island destined exclusively to the tourists and that they fell discriminated or even forbidden to frequent them. Most of the inhabitants of areas near *Jurerê Internacional* also expose the privatization of the area, the restriction of the use of the services, beyond the negative constraint and effects in the environment[37]. Therefore, the problems of the population nearby are related to the basic infrastructure, as the accessibility to the

garbage collection and the system of sewer, that are only leagued to the enterprise; the water lack during the high season, due to overload of the system; and the inefficient system of transports, after all, who lives in or frequents the enterprise has an individual automobile and does not depend on a collective system of transportation.

When approved, the impasse generated inside the local institute of urban planning (IPUF), richly detailed by CECCA[38], resulted in the biggest crisis that the public institution ever faced, with the resignation of diverse employees and also of its director, Etienne Silva, and even of its president, Fernando Ferreira de Mello. Currently, the enterprise is investigated by the Brazilian Federal Police for the suspicion of purchase of ambient licenses and other diverse irregularities of the project. According to representative of the *Habitasul Group*, Clóvis Calliari, "*the laws we do and undo*". It seems that it was what really happened in this case. After several appearances in criminal pages of national newspapers during 2007, *Jurerê Internacional* opened 2008 in their first page and on the cover of the more important national magazine (*Folha de São Paulo*, *O Estado de São Paulo*, both jan. 2, *Veja São Paulo*, jan. 9) as a 'must' meeting point for conspicuous consumers.

This demonstration of business and political power corroborates the statement that in post-modern times, fiction and show have a convincing force stronger than (or at least similar to) that of reality[39]. These facts also confirm the truth of what Harvey[40] points out about the role of mercantile culture for the increase of the monopoly power a city has on the attractions of her natural setting in its competition with others for spendthrift tourists.[41]

By any terms, *Jurerê Internacional* has become, through public and private interests, one of the city's new symbols. It represents the first total private planned neighborhood in this region. With a high cost funded by an external entrepreneur group, it marks also the emergence of external parameters of urban planning in *Florianópolis* and the entrance of the international post-modern architecture in the city. In an area that increases the land value exponentially, with the provision of luxurious commerce and services for the tourists of high income, a standard of occupation that is as close as possible to Miami, isolated and protected from the "invasion" of the other ones that "do not belong" to this dynamics, the enterprise became one of the postal cards of the city, configuring an image that represents the interests of the dominant classes – socials and economics ones – but does not reflects the reality of *Florianópolis* as a whole.

Final considerations

Although the objective of this inquiry is not to study the changes of the matrix of the urban planning, they are sufficiently connected with the types of utopian speeches in these terms: one of change of the reality and another one of affirmation of the same one. While the modern utopia, presented in the CIAMs, searched the social equality and a universal better quality of life, its exhaustion represented, in contrast of what its critics intended, the utopia of few: fragmentary, exculpatory and homogenizing. In this way also are the visions of future derived from these models: while the modern utopia

glimpsed a standardized future, without freedom of choice, currently, the future vision is a past and future mixture of highly segregated ghettos and the famous watched freedom, "the big brother". Therefore, the contemporary urban planning does not represent the end of utopia, as some authors affirm, but the end of the universalizing utopia.

Fiction has alerted what men, much less realistic, do not want to see or understand. As diverse authors already had certified, the space organization reflects the proper society. If the planned communities are the Brazilian contemporary utopia and if the speech and the practice of urban planning are in this direction, this is a decisive moment not only to think about the future of the cities, but also to think in what kind of society we are planning.

Another planning history. The Ten-year plan (1956-1965) for the port of Antwerp as an urbanization project

Michael Ryckewaert
Onderzoekseenheid Stedenbouw en Architectuur, Belgium
Katholieke Universiteit Leuven, Belgium

Introduction. A Belgian case study as 'another' history of modernist planning

For several years, adjusting the canonical view on the 'modernist project' of urban planning in the mid 20th century has been a key interest for planning and urban history.[1] The dominating view of this 'modernist project' as a largely government-led project based on rational principles of functionalist town planning, has been adjusted by pointing toward the diversity in modernization projects and to 'untold stories' or 'insurgent planning histories.'[2] These alternative histories point to the role of actors other than the usual 'heroes' –iconic planners or architects that usually appear in the canonical texts-, of agencies other than the established planning agencies, of minority groups, women, intermediary organizations, the civil society and private parties in shaping spatial transformation and planning projects.

An example of the difficulty of canonical planning history to deal with 'other' stories in Western European planning, is revealed in the absence of a case study on Belgium in Hall's comparison of British planning in the post war years with that of the six founding member states of the European Union.[3] Belgium did indeed lack a strong formalized planning tradition that would correspond to the accepted description of the typical 'modernist project'. Hall's comparison focuses on the role of the 'planning machinery' in the respective case studies, noting for example with regard to Italy that 'the planning machinery does not seem to have been equal to the problems it had to face.'

The very notion that planning should rely on a 'planning machinery' is indicative for the dominance of highly visible 'modernist projects' in planning history. It largely neglects planning histories in areas with a 'weak' planning tradition, where private parties and other branches of government played a greater role in shaping territorial transformation.

In Belgium in particular, the 'planning machinery' was particularly weak.[4] The present contribution on the Ten-Year Plan for the Port of Antwerp (1956-1965) as an urbanization project is a case study of such an alternative planning history that can serve as an iconic example of the Belgian approach in the post war years.[5] First of all, it addresses planning and urban history from the point of view of infrastructure and business activities, a generally neglected dimension in post war planning history that tends to privilege housing. In Belgium, infrastructure construction was the most important field of government-led spatial intervention shaping the project of modernization in the post war era.[6]

Second, the case study looks beyond the borders of the formal discipline of planning and urbanism to unravel the history of this post war urbanization project. Given the

limited scope of the 'planning machinery' in Belgium, it is necessary to look at the role of different actors and the socio-economic context to understand the urbanization process. In particular, this contribution focuses on untangling the complex patterns of urban governance between local and national government agencies, public works departments and port and city technical commissions. It briefly highlights the role of politicians, business circles, private enterprises, labor unions, and investigates the role of visionary architects as well as planners in public office in shaping a territorial project for an area that spanned a vast region to the north east of the city of Antwerp.

The project comprises ingredients that occurred throughout the modernist planning projects in Western Europe. Given the particular context however, this Antwerp case study illustrates a distinctive Belgian version of post war modernization that is much closer to the idea of a strategic project than to the accepted vision of comprehensive, government-led, functionalist planning.

Shaping the conditions for a central government intervention on behalf of the port of Antwerp

Reconstruction and modernization after World War II within a pre-war framework

In port history, the port of Antwerp is catalogued as one of the Hanseatic ports among such ports as Le Havre (France), Rotterdam (The Netherlands) and Hamburg (Germany).[7] These ports share a common history dating back to the era of the Hanseatic League and, more importantly, they are the main competitors for port traffic toward the northwestern European hinterland and share a similar institutional framework as ports that are administered by the municipal authorities of the cities to which their territory belongs.

The port of Antwerp was immediately challenged by the changing economic context of the post-war years and the emergence of new economic and industrial patterns. One important trend was the shift of industrial activities towards maritime locations. Since the late 1920's, the harbor authorities had encouraged industrial settlement as a means to link flows of goods more strongly to the harbor, thus protecting it from cyclical movements in the harbor economy.[8] In Antwerp, car assembly was the pioneering industry in this respect. It was the first 'modern' industry to settle in the port as opposed to 'traditional' harbor industries such as ship repairing.[9] Both Ford and General Motors used the opportunity offered by post-war reconstruction to enlarge and modernize their plants.

The second trend was the increasing importance of oil as an energy source. After car manufacturing, petroleum played an important role in the industrialization of the port. Traditionally, petroleum storage facilities had been located to the south of the city, but this area was saturated. Shortly before and immediately after the war, the city was faced with several demands from oil companies to settle in the northern port area. Initially, Antwerp was able to respond quickly to the requests of the car and petroleum companies. In 1927, a 'Convention for the North Grounds' had annexed three northern

municipalities for the city of Antwerp, with the aim of providing additional space for harbor activities.[10] The plan for these 'Northern Grounds' provided for the construction of 'new industrial' and 'new residential centers.'[11] A first string of new docks was built in the 'Northern Grounds' in the 1930s, but the economic crisis meant that few additional activities had settled around these new infrastructures.

Despite numerous proposals for the lay-out of 'industrial' docks, i.e. docks not destined primarily for transshipment and storage activities, but for industrial occupation, the northern and western portion of the area remained vacant throughout the 1930s and the wartime years. Shortly after the liberation, construction began on the so-called Marshall-dock for the petrochemical industry[12] and a new high rise housing estate.

Entering an era of 'unfulfilled wishes' [13]

This first post-war northern extension was a short-term economic success and upon completion in the early 1950s, it conveyed the image of successful reconstruction and modernization through its distinct architectural approach. From an economic and technical point of view however, it showed the failure of an urbanization process based on an outdated development model embedded in the 1927 plan. The resulting physical constraints were a first element leading up to the Ten-Year Plan. Demand by petrochemical and other industries for industrial grounds in the port very soon exceeded supply, and the harbor was faced with an acute shortage of industrial space. The remaining space in the harbor was reserved for shipping installations, and the harbor extension had reached its northern limit. The limited capacity of the existing pre-war infrastructure created conflicts between sea-going vessels and inland traffic.[14] Moreover, the increase in ship sizes required longer berths. Although the net mooring length for general cargo in the harbor remained fixed, the absolute number of ships that could be handled decreased. In order to solve these infrastructure problems, the municipal harbor authority drew up a plan for an additional general cargo dock, and a new link to the Albert Canal, the main hinterland waterway. The municipal board accepted the plan in 1951, but there was no funding to build it.[15]

These financial difficulties of the port provided the second element leading up to the Ten-Year Plan. The limited resources of the port authority were a direct result of the export-oriented economic policy pursued by the central government. To enhance trade and compete with Rotterdam,[16] the government imposed low transshipment tariffs. The revenue from these port dues did not cover port operation costs, which meant that the harbor authority accumulated losses on harbor exploitation. This put a heavy burden on the Antwerp municipal budget.

Both these conditions combined provided strong elements for the Antwerp municipal authorities and the association of entrepreneurs related to the port of Antwerp to lobby for a national government intervention for the port of Antwerp. These parties argued that the port of Antwerp was in fact subsidizing the Belgian economy that relied strongly on international trade, and filed monthly reports to the Ministry of Economic Affairs that included the requests of enterprises wanting to settle in the port that could not be

accommodated due to the lack of space.[17] Except for the limited amount of funding from the Marshall plan for the construction of the petroleum dock, the central government did not intervene to solve Antwerp's problems. The period between 1951 and 1956 was an era of 'unfulfilled wishes' in which the needs of the Antwerp port community were not addressed.[18]

The general economic slump of the early 1950s was the third element that shaped a favorable climate for a national government intervention on behalf of the port of Antwerp. The general economic situation prompted the socialist liberalist government that came into office in 1954 to engage in a powerful Keynesian policy of job creation by increasing demand through public infrastructure programs. The policy relied on three Acts, outlining a 15-year investment program for the construction of a highway network (1954), the Ten-Year-Plan for the expansion of the port of Antwerp (1956) and an act aimed at the modernization of the Belgian canal network (1957).

On a more detailed level, the economic slump and related unemployment affected the port of Antwerp directly. It led to social unrest, in particular among dockworkers. In 1950, 25% of Antwerp dockworkers were unemployed and the figure rose to 33% by 1953. Notably, for lack of action to counter these problems, socialist labor union officials feared a radicalization of their workers that would turn them to the communist party. In the emerging Cold War atmosphere of the early 1950s, this fear for radicalization was yet another element in favor of a central government intervention for the port. It allowed Antwerp mayor Lode Craeybeckx to enhance his lobbying campaign on behalf of the needs of the port of Antwerp. As a member of parliament, he could directly raise the issue on the national political level, and as such, he succeeded in including the needs of the Port of Antwerp in the national infrastructure program.[19]

The case of the infrastructure constraints in the Port of Antwerp demonstrates that the new infrastructure policy of the national government was not merely driven by macro-economic motives of job creation. Belgian infrastructure was indeed outdated and in great need of modernization, and because other European nations had used the reconstruction for a thorough modernization Belgium was clearly lagging behind in this respect.

Conceiving a plan for the port of Antwerp

The conceptual and institutional framework of the Ten-Year Plan.

The program for the Ten-Year Plan was based on negotiations between the central government and the city, and formalized in a 'Convention between the City and the State.'[20] The port authorities proposed an elongated scheme, adopting the trajectory of a future canal that would link the port of Antwerp with the Rhine and the port of Rotterdam (fig. 1.). A serious of so called 'Canal Docks' on the trajectory of this future canal was the extension plan's backbone. To the east of this backbone, a secondary canal was projected to meet with the Albert Canal and a set of industrial docks.

The cost of carrying out this plan was estimated at 7 billion Belgian francs, but the central government could only agree upon an amount of 4.2 billion.[21] It limited the program to the most essential and strategic elements, the construction of the Canal Docks B1 and B2. The eastern extension, the new hinterland canal and the lock connecting the new docks to the River Scheldt were cancelled from the national program, but continued to figure in the plans of the municipal authorities. In any case, the arrival of the Ten-Year Plan marked the end of Antwerp's era of 'unfulfilled wishes'. A commission of city officials for the 'expansion of city and port', known as the ACUSH,[22] was established to coordinate the execution of the Ten-Year Plan as an urbanization project. The technicians and engineers responsible for the execution of the Ten-Year Plan in strict sense of the word, were incorporated into the technical department of the Port Authority, functioning as a decentralized cell that formally belonged to the national Public Works department.

As such, the Antwerp municipality received a relative autonomy of action in implementing the Ten-Year Plan. On a number of crucial matters, however, it still had to rely on decisions from the central government. In addition to the decision to limit the scope of the Ten-Year Plan discussed above, two other strategic decisions taken by the national government played an important role in steering the urbanization process that would inevitably accompany the harbor extension.

First, during the parliamentary discussion of the Ten-Year Plan, it was decided to limit land annexation in neighboring municipalities as much as possible: expropriations of property could only proceed at the same pace as the actual harbor extension. The local communities from the remaining polder villages to the north of Antwerp strongly opposed the harbor extension, remembering the earlier experience of the first post-war harbor extension, where villagers were faced with 20 years of uncertainty between the formal expropriation of their homes in the 1930s and their ultimate eviction in 1950s.[23] Only Lillo, Berendrecht and Zandvliet were attached to the city by an Act of Parliament in 1958. As a result, the eastern parts of the harbor extension plan in Hoevenen and Stabroek remained outside the city's jurisdiction. This jurisdiction was further restricted by the route traced for the Antwerp–Rotterdam highway by the Road Administration of the Public Works department, as it effectively limited any further eastward extension. Antwerp city officials contested this route.[24] The central Roads Administration however maintained the route's trajectory and the dock was cut short.

Secondly, the city could not rely on the 'Convention between the City and the State' for the immediate expropriation of the annexed land. The Inspector General Leopold Hendrickx of the national Urban Planning Department requested that the procedure provided for in the Town Planning Act of 1946 should be followed.[25] This implied that a zoning plan for the entire area had to be authorized to be able to proceed with the expropriation. The combination of these measures would prove very effective in safeguarding the residential landscape of the polders as the harbor extension proceeded.

As such, in a strange reversal of the usual hierarchy of policy making, it was the national policy level that defended local interest of the polder communities, against the aspirations of the Antwerp authorities. Despite the lack of formal spatial planning at the level of the urban region, that would transcend inter-municipal conflicts, the urbanization process was effectively guided along clear lines in a clever constellation that balanced local and national powers.

Housing the work force of the port expansion. Renaat Braem's counter-project for the Satellite Town of Lillo

City and harbor officials were thus mainly interested in the harbor extension. The city extension, meanwhile, did not feature on their priority list, although it was strictly speaking part of the ACUSH's mission. In the General Plan for the Antwerp Agglomeration of 1960, the entire area of the territory annexed in 1958 was earmarked for industry, with the polder villages overrun by port and industrial installations (fig. 2.).[26] This created the impression that in planning the harbor extension the authorities had 'forgotten' to include the required extension of residential areas to house the work force, as Antwerp modernist architect and former Le Corbusier collaborator Renaat Braem noted.[27] Braem, the most important representative of the Modern Movement in Belgium and a prolific architect and critic, decided to design a string of satellite towns along the banks of the Scheldt River as a personal counter-project, a utopian design with a critical aim. These satellite towns were part of an industrial *Band City* that was laid out along the main industrial corridors to cover the whole of Belgium.[28]

The project was a further development of Braem's earlier ideas on linear cities, inspired by Miljutin's examples of the 1930s.[29] The linear city was a planning concept that had received a great deal of attention in Belgian planning circles since the early 20th century. Belgian variants of Sorio y Mata Ciudad Lineal were proposed, and near Ghent, a small neighborhood was built in the 1920s as an intended first step in the development of a linear industrial city along the Ghent sea canal.[30] Braem's post war proposal moved away from the interwar ideas and translates the inspiration of Le Corbusiers *Cité Linéaire Industrielle* of the 1940s.[31] Indeed, as opposed to the pre-war proposals of continuously built-up strips of working, housing and recreation areas, the *Cité Industrielle*, as well as Braem's *Industrial Band City*, adopted a 'beads-on-a-string' configuration of industrial areas (laid out along the principles of the Usine verte) and compact dwelling satellites set in green and/or agricultural surroundings.

In Antwerp Braem designed a detailed satellite town near the village of Lillo.[32] This project is one of five satellite towns of 2,000 dwellings (housing 8,000 persons) attached to the industrial backbone of the Antwerp harbor installations, first sketched out on a piece of tracing paper affixed over an official depiction of the Ten-Year Plan (fig. 3 & 4).[33]

The implementation of the Ten-Year Plan

The economic and infrastructure dimension of the Ten-Year Plan assessed. Available space as the main competitive advantage

In order to judge the importance of this infrastructure operation it is important to focus on the particular characteristics and hybrid nature of the 'Canal Dock' concept. As the name indicates, it was conceived to fulfill two roles at the same time, that of providing a means of transportation (the Canal dimension of the project) and that of providing a means of transshipment (the Dock dimension of the project). Upon construction of the Ten-Year Plan there was no certainty whether the Rhine link would ever be built, since its construction depended on difficult negotiations between the Netherlands and Belgium. Moreover, some people in the port community feared that the Rhine link would result in a loss of traffic to Rotterdam.[34] So the 'canal' aspect of the infrastructure was certainly problematic. Nonetheless it was decided to construct the Canal Docks with soft sloping banks rather than wharves suited to mooring ships, except for a small part of the B1 Dock. As a result the infrastructure was not immediately fit for transshipment or deepwater related industries, thereby compromising the 'dock' dimension of the infrastructure.

The Canal Docks represented nonetheless a strategic investment in terms of economic development, as Loyen has shown.[35] His comparison of traffic growth figures for the Port of Antwerp and the other North Sea ports shows that Antwerp grew less than its competitors between 1950 and 1970, losing part of its market share to other North Sea ports. This indicates that shipping activities were not the main beneficiary of the Ten-Year Plan. Blomme has pointed out that the ideal pattern for investments in port infrastructure is one where investments follow growth in port traffic and throughput.[36] The Ten-Year Plan resulted in a sharp increase in the net mooring length of the Port of Antwerp. Initially, this was followed by an increase in maritime traffic, but then by a regression during the 1970s. However, since the 1970s, a further increase in maritime traffic in Antwerp has occurred with only a limited increase in mooring length. This indicates that the infrastructure built under the Ten-Year Plan was sufficient to accommodate the increase in traffic for many years. Loyen furthermore notes that:

> The increase in welfare of the silver fifties and the golden sixties did not bring Antwerp the expansion (of port traffic) predicted in the context of the Ten-year plan – on the contrary. In this period Antwerp merely laid the basis for a sustained achievement after the (1973) oil crisis through the expansion of the petrochemical industry.[37]

The petrochemical complex in Antwerp does not rely critically on maritime transport. Since the closure of the Suez Canal in 1958, tankers grew bigger to offset the longer journey around Africa, but could not call at Antwerp because of the insufficient depth of the Wester Scheldt. To assure the supply of crude oil, the Rotterdam Antwerp Pipe Line was built in 1970. The deep water location of the petrochemical complex mainly

supported the inland shipping of semi-finished products produced by the chemical plants.

The construction of the Canal Dock was therefore primarily an industrialization project, that relied on the ability of offering vast areas of land to the space consuming petrochemical industry. An analysis by the Goey of the location decisions of the German BASF chemical company that choose Antwerp above Rotterdam demonstrates how the availability of vast areas at low cost provided Antwerp with the competitive advantage. Infrastructure construction appears then as a strategic investment opening up a large area of polder land to industrial activities. Its actual value as a transportation (Canal) and transshipment (Dock) infrastructure is of secondary importance.[38] Infrastructure construction thus serves as a strategic instrument of urbanization that changes existing patterns of land use. As such, the Ten-Year Plan can be interpreted primarily as a successful instance of urbanization within the working sector of the functional city. In its ulterior development, it becomes a fully fledged urbanization endeavor that structured and guided the transformation of the city of Antwerp into a city region, a modern metropolitan area exceeding the traditional boundaries of the pre-war agglomeration.

The harbor extension as the infrastructure and economic backbone of an urbanization project. The satellite town revisited

The transformation of the port of Antwerp into a petrochemical cluster –the second largest in the world after Houston, Texas- again reveals the strategic nature of the Ten-Year Plan. First, it answered directly to the needs of private parties that played a crucial role in the development of the port. Second, it introduced a functional zoning of urban activities, even though no formal zoning plan was established. Indeed, the choice to settle petrochemical activities in the stretch of land in between the Scheldt River and the Canal Docks prevented residential in this area as had been suggested by Braem in his proposal for Lillo. Although Braem's scheme occupied only a very small portion of land on the bank of the river, any residential development so close to the industrial area would jeopardize the siting of hazardous production activities such as petrochemicals.[39] As such, the principle of zoning as a means to isolate conflicting activities was at work in a very direct way, even without the intermediary of a formal spatial plan.

Nonetheless, the issue of residential expansion as raised by Braem could not be ignored. The 'residence question,' the development of Antwerp 'as a ribbon along the stream' and its impact on the mobility of workers was also raised by the municipality's housing and social services administration.[40] While calling for a comprehensive town planning approach to solve this question, the city official also covertly pleaded for additional annexation of municipalities such as Hoevenen and Stabroek under the city's territorial jurisdiction,[41] in order to plan the area as a whole. As noted earlier, the national authorities, by means of Insepcor General Hendrickx, prevented this annexation, thereby limiting the port territory to the part west of the route traced for the Rotterdam highway, while at the same time requesting a zoning plan to allow for further expropriations as the construction of new docks proceeded. As a result of this request the ACUSH presented a new plan that in fact translated Hendrickx' ideas on the expansion of the port and the city (fig. 5).[42]

In a publication on the development and planning of large agglomerations in Belgium, Hendrickx gave his vision on the development of the wider Antwerp agglomeration. He argued:

> Given the location of the port [i.e. the expansion to the north], it is not necessary to expand the existing agglomeration: new settlements can be built eastward of the port complex.[43]

Delivered at an international congress where Jean Francois Gravier spoke about limiting the growth of Paris[44] and Robert Shaw presented the British policy for New Towns,[45] this remark by Hendrickx has to be interpreted as identifying an opportunity to limit and guide the uncontrolled expansion of the agglomeration. Hendrickx advocated the decentralized growth of the agglomeration, a reference to the 'satellite town' concept. Satellite towns occupied a prominent place in Belgium's contemporary urban planning literature. In 1958, Groupe Alpha had put forward this concept when planning the Brussels agglomeration.[46] In Antwerp, Braem's proposal for Lillo was inspired by similar thinking. Hendrickx was probably well aware of Braem's project, as they had befriended each other in the 1930s while both studying architecture at the Academy of Fine Arts in Antwerp. [47]

The satellite town of Hoogvliet, designed and built in the wake of the Europoort plan near Rotterdam, was undoubtedly a further point of reference.[48] A comparison with Hoogvliet, a classical, textbook implementation of the satellite town and British and Scandinavian examples, illustrates how the Belgian approach differed from the canonical examples of modernist planning in the post war years.

The new plan for Antwerp –presented by the ACUSH and based on Hendrickx's views- was tailored to meet the realities of the local context, while at the same time deriving some of its inspiration from Braem's *Band City* model. Rather than self-sufficient new towns, the Antwerp 'satellite town'-proposal consisted of decentralized communities that are still dependent on the city of Antwerp. The plan attempted to create well-defined communities around the polder villages of Zandvliet, Berendrecht Stabroek and Hoevenen, bound and framed by a new intermediary road network. The spatial vocabulary of these new communities is similar to the 'neighborhood units' as they appeared in the British and Scandinavian examples of the time, be it that they lack the larger urban framework. They form separate units, each with their own civic center, and are integrated by means of a new traffic system. This mesh of circumferential roads served in the first place to avoid through traffic on the inadequate existing road network. Secondly, the ring roads were set in green buffers that served to contain the growth of the residential nuclei, buffer the units from each other and the adjacent port installations. Although the intermediary road network was never built, the residential expansion of the polder villages that took place during the 1960s and 70s effectively protected them from being incorporated into the harbor extension.

The northern harbor extension as a part of Band City Belgium

The accommodation of residential expansion in the wake of the Ten-Year Plan, reveals that the infrastructure project triggered a much wider ranging debate on the urban future of the Antwerp agglomeration. This debate translated a clear vision on the development of the Antwerp agglomeration, a vision that was capable of guiding the actual urbanization process, even if little comprehensive planning was applied to do so.

The project established a well-defined system of strips parallel to the river. The consecutive strips, each with their distinct nature and function, comprise the petrochemical complex, the Canal Dock system, the port area with transshipment and non-hazardous industrial activities, the Antwerp–Rotterdam highway, and the string of old polder villages turned into satellite communities (fig. 6). Finally, beyond the string of polder villages that act as a buffer of regional scale, is the *Voorkempen*, a formerly agrarian and recreational territory of woods and heath that became subject to a widespread suburbanization with mostly high-class, dispersed low-rise single family homes.[49] The combined intervention of local and central government planning and public works agencies engineered a very clear structure for the northeastern expansion of the agglomeration of Antwerp into a regional metropolis – that, in its basic spatial pattern, forms an implicit implementation of Renaat Braem's idea of the *Band City*.

Conclusion

Given Belgium's weak planning tradition and the absence of a highly visible 'modernist project' many critics have condemned post war urbanization in Belgium as merely the result of ad hoc-ism and *laissez faire*. Renaat Braem himself was one of the strongest voices in this respect, calling Belgium 'the ugliest country in the world.' For other critics the traditional close-knit urban agglomeration remained the point of reference:

> The city takes less and less advantage of the port; or rather, the port no longer benefits from the city. Port policy has not been integrated into a comprehensive town plan that deals with Antwerp as a total phenomenon.[50]

The fact was, however, that 'the Antwerp phenomenon' now encompassed the entire area to the northeast of the traditional agglomeration. As such, the image of the expansion of the port of Antwerp as an infrastructure project serving strictly economic needs has to be adjusted. Formally, the Ten-Year Plan was nothing more than an infrastructure program. However, the preceding analysis shows that the infrastructure project is in fact a strategic trigger that launched an industrialization project that in turn forms the economic core and physical backbone of an urbanization project shaping the Antwerp metropolitan area.

Even if many of the traditional ingredients of modernist planning such as zoning, the satellite town or linear industrial city models appear in this project, these spatial concepts are tailored to the needs of economic development and private enterprise, the aspirations of local communities, labor unions and city officials. In this project, port engineers and public works officers appear as the primary agents, with planners (and architects) limiting their intervention to crucial matters -as Hendrickx's actions on behalf of the polder villages- or Braem's critical stance.

Nonetheless, in this complex interplay of different actors and agencies, a relatively coherent spatial project emerges. In this respect, the infrastructure project serves as a strategic intervention that is capable of framing a wider ranging spatial project. Rather than on a blue print plan, the project relies on negotiation, coordination and allows for flexibility.

It reveals that planning approaches advocated in recent years that rely on 'strategic planning' or 'strategic projects,' that re-emphasize the role of private parties, look for innovative public private partnerships, and aim to increase the democratic dimension of the planning process, are not entirely new. They also result from the persistence of other planning traditions, next to the modern tradition of rationalist, comprehensive planning. For one thing, the prominence of infrastructure as the primary structuring element of the urbanization process is reminiscent of a type of urban planning that originated in Haussmann's transformation of Paris through the construction of boulevards.

This case study shows how an alternative lecture of planning history that looks beyond the traditional boundaries of the discipline reveals modernization projects that rely on a different rationality than the accepted paradigms of modernist planning. It shows that also in contexts with a weak 'planning machinery,' coherent spatial projects were developed. As such, these 'alternative' stories are crucial for a better understanding of the present day urban landscape and the plurality of planning practices and approaches that shaped it.

Ideas on paper – on the visionary urbanism in Eliel Saarinen's drawings and texts

Minna Chudoba
Tampere University of Technology, Finland

Introduction

Eliel Saarinen is best known in Finland for his urban visions of Helsinki and the national romanticist architecture he designed with his colleagues at the turn of the previous century. In the United States he is perhaps best remembered for his second prize winning entry for the Chicago Tribune Tower Competition in 1922. Possibly some would also remember Saarinen's ideas on decentralization, expressed in his book *The City*.

This paper takes a look at these rather well known examples of Saarinen's work. The plans for Helsinki, the skyscraper design and the book are different examples of an architect's and urban designer's work, but all of them have a common theme in being somehow linked to Chicago. They were designed or written in different decades and thus can be found to express the development of a designer's thought – some themes are consistently present, others more a sign of the times. Important themes included the urban whole and the design process based on an understanding of scales. In looking at the city of Saarinen, the structural elements of armature, enclave and heterotopia have been used as a basis of interpretation.[1] An interpretive-historical method has been used; importance has been given to defining the context in which the story unfolds. Richard Rorty's genres of the historiography of philosophy have offered a helpful guideline. Rational reconstruction allows a look to the past from a present viewpoint, but to prevent the dangers of anachronism historical reconstruction helps in placing the studied matters in their own context.

The material consists of texts written by Eliel Saarinen, especially those having to do with urban design themes. Selected design proposals have been used to illustrate the writings. To see these in the context of the period studied, background information has been collected from texts of other contemporary writers as well as articles in architectural magazines or newspapers.

Background: plans of Helsinki – influence of Chicago Plan

When a prominent Finnish businessman of the early 1900's had ideas about urban development of Helsinki, he got together with an architect who could make these ideas into captivating visions. The architect was Eliel Saarinen, who gave his name to a vision that inspired the planning of the Finnish capital for many decades. This was a typical case of private planning schemes of the period, although in Finland nothing of quite the same scope had been seen before.

Munkkiniemi-Haaga Plan was published in 1915 and Pro Helsingfors Plan in 1918. Both have a regional viewpoint on Helsinki's development, although the former plan's focus

was on the development of one specific housing area in the north-western part of Helsinki. Eliel Saarinen was not alone in designing the latter plan. One of his colleagues, Bertel Jung, had been appointed to the office of city planning architect ten years before [2]. Jung wrote the text for the plan, giving credit to Eliel Saarinen for finishing the plan and to Julius Tallberg for the original overall idea. When finished, the plan was handed over to the city of Helsinki. [3] The public and private in planning matters seem intertwined here; the businessman who commissioned the plan was even a member of the five-man Town Planning Commission, set up by the City Council in late 1907, with Bertel Jung as a secretary. [4]

This grand plan for Helsinki was a very urban vision. It received much attention, but was also criticised. Its visionary qualities were not really understood by the likes of one critic, who declared that one should never make plans that cannot be implemented within one generation [5]. The plan is perhaps most noted for its grand boulevard, The King's Avenue, and the suggestion to fill the Töölö Bay and move the just recently finished Main Railway Station to another location in the Northern part of town. These did not come about. As the reasons for this most sources will mention the war that had dispersed the partnership of the architects who originally worked on the plan. The businessman who had commissioned the plan died in 1921 and thus did not have much time to promote the plan he had provided ideas for [6]. Seeing how the plan's overall ideas of growth influenced the planning of Helsinki for decades, as well as giving the city a kind of an alternative future that inspired other plans, it seems a bit irrelevant that the well-publicized details never came to pass. Nevertheless, the lack of actual implementation has caused some to think that the Saarinen plan was a failure. [7]

When Pro Helsingfors came out, Saarinen had worked as an urban designer and planner already for almost a decade. He had travelled widely and had been influenced by many contemporary planning sources. This was apparent already in his previous Helsinki plan concerning Munkkiniemi-Haaga area. One of its possible planning influences was Daniel Burnham's Chicago Plan [8]. The Chicago Plan had been published in 1909, just before Saarinen started his work on the Munkkiniemi-Haaga area. There are many common elements in the two plans, but they could have come from other sources as well [9]. Town planning ideas were widely circulated as planners traveled around, and town planning exhibition catalogues gathered information for all to read. Where and when exactly Saarinen got his information about the Burnham plan is not known. In 1910 Saarinen traveled in Europe, but apparently only on the continent [10], and so did not attend the town planning conference in London where Burnham presented his Chicago Plan. However, Werner Hegemann published a summary of the plan that same year [11], and parts of the Burnham plan were also included in his two-volume exhibition catalogue of Berlin and Düsseldorf exhibitions, *Der Städtebau,* of 1911 and 1913. The title of the booklet *Chicago's World Wide Influence on City Planning*[12], published in 1914, is perhaps not so far from truth. Burnham's plan was certainly noticed in Europe. It was the first general plan of a metropolitan area, and especially remarkable because its conception, financing and marketing was achieved by the private sector.[13] The marketing of Saarinen's plan was not nearly as grand, but in Finland it nevertheless achieved a publicity that was rather rare for planning ideas.[14]

It is natural that two books on urban planning, published just six years apart, would employ many similar themes. Common planning heritage provided sources for both. Unity and the understanding of wholes were important in both plans, current themes of urban design were treated even in a similar kind of language. Both start with a historical overview and end with a lawyer's text on actual realization. Traffic was naturally an issue, its importance stressed with growth forecasts. Other similar themes include clear street hierarchy and criticism of speculative land-use. Both were also text books in addition to being plans of a certain city. The educational aspect was strong; the plans were a serious attempt to make planning questions understandable to the general public. [15]

There is no mention of Burnham or his plan in Saarinen's Munkkiniemi-Haaga plan text, although Chicago is mentioned for its park ring [16]. Perhaps it is unnecessary to speculate about just how much the Chicago plan may have influenced Saarinen's plan's content or outward appearance, but it is possible influence through its function is interesting. The Chicago Plan has been seen to have had two functions, technical and ideological[17]. The latter referred to the plan as a product on paper, packaged in such way that people could be persuaded to adopt it. Both functions could also be applied to the interpretation of the role of Saarinen's Munkkiniemi-Haaga plan. The plan was a possibility, not necessarily a model to be implemented as such. It aimed at "winning the public's interest and sympathy". If the plan was supposed to a ceremonial, inspiring vision, and it was intended to convince the people to support the order and idea of beauty it proposed, then the realization of details was a minor point. When the ideological function is stressed, the plan may be seen as a vision intended to open up possibilities. It could have a role in the future realization of the city, but it was not the future city. Its importance transcends the few fragments that were ever realized of it. It influenced the building of Helsinki for many decades, and still appears from time to time when there is talk about the planning of the Helsinki region [18]. Saarinen said later of one of his other plans: "I've not aimed to present that plan which should be executed but one that can be".[19]

Saarinen's vision of Helsinki relied on many familiar elements of the traditional city. The elements could be looked at through the division made by David Graham Shane in his book *Recombinant Urbanism*; Shane sees three basic elements in cities: the armature, the enclave and the heterotopia. Armature is, according to Shane, a sorting device that orders urban flows and sequences urban materials in memorable ways.[20] The simple armature of the street is used with various degrees of hierarchy in Saarinen's city. The grandest of his boulevards is axiality in a Haussmannian style, and from there the channels of movement wind down to smaller scale streets and eventually narrow back alleys. Enclave is used by Saarinen also, in various degrees of hierarchy. His squares were capable of monumentality, but the Sitte-inspired small enclosed courtyard can be found in his Helsinki plans as well.[21] The movement through the armatures and enclaves of his town can be found in the description of an imaginary automobile-ride through the Munkkiniemi-Haaga plan model, written by Otto-Iivari Meurman, who had worked with Saarinen on the plan. Meurman describes the street scenes, the busy hubs

of public transportation, the peace of the residential areas as well the focal points in the design. He covers the whole area, emphasizing the different views and variety as well as the harmony and order of the whole. [22] The latter idea is a continuing theme that would be later emphasized in Saarinen writings.

The armature and the enclave Saarinen combined into a unified whole in his bird's eye views of the Helsinki plans. This kind of continuing townscape has been aptly called "urban fabric by the bolt" by Marc Trieb[23]. He has also distinguished two elements of this urban fabric, the tower and the square, seeing them as basic to Saarinen's work as a planner [24]. These two elements he linked with the influence of Camillo Sitte and the long tradition in European towns of enclosed spaces marked by steeples of churches or towers of town halls. The two elements can be seen in many Saarinen's building designs as well. Trieb sees the Saarinen Chicago Tribune Tower entry as an elongated version of the town or station hall towers he had previously designed.

Saarinen and Chicago – the idea of the skyscraper

Saarinen's work was not linked to Chicago only through the possible influence of the Chicago plan of 1909. In 1923 the Chicago Tribune Tower Competition brought Eliel Saarinen to the United States. When Saarinen arrived in Chicago for the first time, he expressed surprise at not finding the Chicago of Burnham plan realized yet. [25] Saarinen said: "It is a splendid and grandiose project, and ought to be adopted in its entirety as a foundation for a rational recreation of Chicago." [26]

The Burnham plan was a basis for Saarinen's own ideas about the future of Chicago, expressed in his Chicago Lakefront Plan of 1923. Eliel Saarinen thought the Burnham plan excellent and criticized only one thing: the plan had not taken into account an essential new aspect of American cities: verticality.[27] This verticality had been a major factor when Saarinen was designing his Chicago Tribune Tower entry in 1922. Saarinen must have been aware of the European as well as American discussion of the problem of high buildings.[28] He tells of starting the Tribune Tower competition by taking a picture of the silhouette of New York, and beginning to sketch a vertical city over it [29]. After Saarinen won the second prize in the competition, the media would marvel at the skill of the Finnish architect in capturing the essence of this very American building type [30]. This was not so strange, however, as the development of American skyscraper design was well documented in American architectural magazines, which were also read in Europe. [31] The magazine articles described structural and aesthetic problems, and rather early on began the discussion on the building type's difficulty in fitting in the existing context [32]. As a building type, the skyscraper was in crisis by the time the Tribune Tower Competition was announced, and there was also a growing contradiction between the construction of single buildings and the need to control the milieu of the larger cityscape; individualism was clashing with the smooth functioning of the whole.[33]

The Chicago Tribune Tower competition emphasized the individual role of the building type and did not attempt to address the wider issues of its role in a larger context. Mostly the building were depicted against neutral backgrounds, one could have placed

them anywhere. Some of the European entries – including Saarinen's – could be seen trying to address this problem. These entries were continuing the discussion going on in Europe, where architects and urban designers had been critical towards the clusters of skyscrapers that were rising in the cities in the United States.[34] Saarinen had expressed similar doubts about the clustering of skyscrapers as early as 1912, in his accompanying text for the town planning competition of Canberra, Australia. [35]

Whatever doubts Saarinen may have had about skyscrapers, his design played a role in the development of the architectural articulation of this egocentric building type [36]. His competition entry was said to follow "the logic of living things" [37]; Vincent Scully later called it a moulded mountain, and went on to describe Hugh Ferriss's fantastic metropolis drawings, which, according to Scully, were inspired by the Saarinen design.[38] Saarinen gave American designers a model to follow that was an inspiration for several famous buildings.[39] Nevertheless, Saarinen had an ambiguous attitude towards this building type. From the suspicions of its suitability he would move on to the excited praise of the possibilities of vertical cities in the1920s, when he compared them to pine-tree forests [40]. At the same time, his critical statements against the egocentric skyscraper were published as well [41]. In his book *The City* the final verdict is both negative and positive: the skyscraper is basically seen as an architectural feature only – but this verdict is preceded by a very positive description of a boat ride around Manhattan. There he admits to admiring the lofty changing views, the color and the atmosphere. But, as a building in the organically decentralized city, the skyscraper needed to surrender to the context, to accept its role as a well controlled part of the whole. [42]

The skyscraper did not readily fit into the organic whole of Saarinen's decentralized city, not even when it was accepted and mellowed down into a "natural product of the plan" [43], functioning in accordance with the other functions of the city. Even when a "favourable grouping of them" was encouraged, there seems to be a slight lingering doubt in Saarinen's mind about its actual suitability. Or perhaps he suspected that the building type would not in reality conform to the degree of control he demanded of it.

The skyscraper belongs to the third category of city elements as defined by David Graham Shane, who calls it a "modernist heterotopia of deviance" [44]. The other two categories, armature and enclave, were elements familiar from the townscape of the traditional city. But the heterotopia of the skyscraper was something else, not quite so easy to fit into the form of the traditional city. It was an elusive concept, capable of transformations. It had possibilities for various mixed uses and had a capacity to sort and segregate along its vertical axis. Shane has noted that somehow mostly only the monofunctional office-building type has been noticed by modernist history, and the possibilities inherent in the skyscraper as a building type have received little attention. [45]

Saarinen never got to see his skyscraper built, but he saw it in various versions by others. It is hard to say how this heterotopia of deviance would have transformed in his actual design, had it been built. His texts on the subject do not shed much light on this matter either. The verticality is celebrated in his words about the Chicago Lake Front

Plan proposal. He tells of a tourist's arrival to the city: from the subway the traveller moves to the hotel and gets on the elevator, which carries him up. From the very top he is able to see the city. There are green stretches of parks, the growing metropolis, and far away the Chicago Tower, its "monumental pinnacle flashing in the sun high above the city's smoke and dust."[46]

Eliel Saarinen's Chicago Lake Front Plan has been described as a combination of the axial armature and central square, which is a common theme used in all stages of city structure models. [47] Manfredo Tafuri claims that Saarinen used this building type as an element that could control the urban whole by its form. It was not an image of commercial competition, but a single member of the city. Saarinen used his version of the skyscraper in both of the urban design proposals he designed shortly after his arrival to the US, the Chicago Lake Front and Detroit River Front proposals. Tafuri has called the Chicago Lake Front proposal skyscrapers "spectators of the urban scene". His design was not so much a part of the commercial city, but a place from which to view it. Contradiction may be seen – as Tafuri does – in the role of the skyscraper as a controlling formal element and its exceptional character, which in reality prevented it from ever becoming an element in an innovative planning proposal [48]. According to Tafuri, the Saarinen's skyscraper proposals did not really have precedents in the United States, unless one counts Sullivan's article illustration from 1891.[49] This illustration was at least an attempt to picture the skyscraper as a part of an urban whole. If Saarinen's version of the skyscraper indeed differed from the prevailing American attitude as Tafuri suggests, he at least had colleagues who had an urban design attitude to the question and a similar concern for wholes. Architect Edward H. Bennett, who had worked on the Chicago Plan of 1909, complained that when the winning entry of the Chicago Tribune Tower competition would be built, all possibilities for a harmonious plaza or street were lost. According to Bennett, high buildings should only be placed on edges of squares or intersections of roads, in the wrong place they were like exclamation marks in the middle of a sentence instead of at the end. Too much individualism was not good for the unity of the whole. [50] Saarinen would most likely have agreed. His own comments around the time of the competition also expressed concerns from an urban design point of view. He criticized the egoistic nature of the skyscraper as a building type, and the premises of the competition that tended to emphasize this individual role [51].

Saarinen's view of the city was based on concepts like harmony, correlation and unity. The"organic" city thus formed had a hard time accommodating such an individual member as a skyscraper. A truly vertical city formed with these members would likely have left the surrounding space to "vibrate in discordant distress"[52], to use Saarinen's own words. Although he was also ready to admit that the spatial tension created in this way could be intriguing as well, the organic whole of the city was the main focus of his planning ideas.

The nature of city planning - Saarinen view

The premises of Saarinen's urban design thinking can be seen in his Helsinki plans. A kind of hermeneutic oscillation between the whole and the parts was visible in the

design process. The whole appears as the big picture seen in the birds' eye views of urban fabric stretching for miles, or the more schematic plans drawn with concentric circles, the pre-models for later decentralization of Helsinki. The parts are visible in the meticulously detailed housing plans and elevations – drawn much more as advertising for a private architect's skill than as designs for an actual city district.[53] That all these scales should be present in the design and planning of cities is much emphasized in Saarinen's book *The City*. An architect involved in town planning should "conceive architecture in the broad scope, beginning from an organism of a single room and ending with the comprehensive labyrinth of a large city." [54] Saarinen's solution to dealing with the labyrinth was organic decentralization, which his book so eagerly wanted to promote [55]. In addition to its main theme, it contains design elements of more general nature: for example, process and scale. These are sketched in a general way, without focusing on details – the actual city structure with its defining elements is not described, as these would vary in each specific case.

The book has a roughly bipolar structure: part one talks of the past, and part two about the future – or the way towards the future, to be exact. The long historical overview (called simplified history by Kirmo Mikkola [56]) could be explained by the organic background of Saarinen's design thinking. To him, the city was a living organism, and as such subject to the laws of nature and the result of evolutionary processes. Contemporary urban development was seen as a part of historical continuity by linking it with descriptions of design principles of bygone cultures. These could then be compared with more recent examples. One may wonder if the danger of doxography is lurking here, but it is more likely that the descriptions were just meant to educate the lay reader. They provided a simple groundwork, on which the design principles were based. After that the story of the new city could begin.

Saarinen's urban story was not a utopia in the traditional sense. Saarinen was very careful with the concept of space in his texts, his version was more a description of a process than a model to be copied. [57] He was not so much criticizing the existing situation as providing a future-oriented alternative scenario. The text is connected with the time it was written, but the writer points out that the proposed solutions will take a long time. Although published in the middle of the Second World War, its viewpoint went beyond the housing questions of the post-war period. The book was characterized by a timeless generality, in spite of its place-bound examples and links to design thinking of its time. [58]

Decentralization, or the dispersion of the city into surrounding lands, was a fact. Saarinen declared that some sort of control was needed to prevent it from becoming too reckless (in the expressive word of a slightly later time, sprawl), and at the same time the core of the city should not be completely forgotten either. Saarinen's decentralization was a proposal to solve the problems of unplanned urban growth around the central core as well as the problems of the congested city core itself. The "organic" he attached to the already popular word decentralization was supposed to lead to "lastingly healthy results" – today's reader might be tempted to link such words as "sustainable development" and "ecologically feasible" to the images inspired by this

rhetoric. In the style of planning language of the time when the text was written, Saarinen's words were linked to the common aim of general good, never mind that the good was mainly determined by the planner himself. [59]

Decentralization was a process, not a model. This may sound paradoxical; the concept implied that it was the result of more or less natural, evolutionary processes, but at the same time it required visionary, future-oriented planning of large wholes. The latter were much inspired by Ebenezer Howard's social city diagram[60], but Saarinen's illustrations of his ideas were in a general scale. He did not want details to be derived from generalizations, as details were case-determined [61]. Saarinen started his description by a visual image: organic decentralization was explained by a water drop on a table. When sufficient pressure was suddenly placed on the drop, it would splash, forming groups of different sized drops around the original drop. These new drops Saarinen called individual units. He emphasized that in reality this process of rearranging the physical urban structure was slow as well as complicated, involving distribution and interrelation of activities and the forming of functional groupings.[62]

When Saarinen spoke of functional groupings, however, he did not mean functional separation. He moved swiftly from the large-scale vision of the water drop description to the individual – "the molecule of the functional substance of the city" – and started to think about the everyday life of the inhabitant. He divided the movements of the inhabitants into two categories: everyday activities and casual contacts. The former were to be concentrated together, the latter could be further apart. Everyday activities should be reached by walking, as Saarinen was vehemently against compulsory daily commuting. He believed in the possibilities of modern traffic facilities, but not in the separation of living and working, at least not for everyone. In fact, he claimed that when everyone was not on the streets so busily commuting, traffic would be much more efficient and faster. [63]

The above mentioned descriptions of decentralization, first as a simple water drop diagram, then as the movements of the molecules or human beings, brings to mind Michael de Certeau's dichotomic division of the city into a large scale view as well as the everyday practise. In Saarinen' case, research focus has mostly concentrated on the large scale aspects of his urban planning ideas. These are most clearly visible parts of his decentralization scheme, and could be explained by diagrams. However, the everyday practise is definitely there, although it is defined by the slightly paternalistic interpretation of the planner, not the life experience of the actual individual. Both scales are still present at the same time.

The large scale in Saarinen's decentralization could be called regional, for organic decentralization meant looking at the whole picture of a city's functional area. In this scale, the whole and the parts may be seen in a hierarchical order, each with its own place. This hierarchy was later criticized for its rigid tree-like structure [64]. It is difficult to say how rigid it in reality would have been, for Saarinen's diagrams were general enough to give plenty of room for the flexibility and changes that he required of his plans. Many of his students used the scheme in their urban design projects – always

applied to real situations. One of these so called illuminating examples was the decentralization scheme of Chicago [65]. In this part, Saarinen goes back to the Chicago plan by Burnham, and laments the lost possibilities in beautification of the city. If the plan had been followed, much would have been gained, he says. He is especially irked by the forest of skyscrapers breaking up the silhouette like a broken comb. Although, again, Saarinen admits that the sight can be imposing at night. Even so, surgery is needed, he declares. [66]

Saarinen seemed to be a very patient surgeon. According to him, actions should take the bigger picture into consideration, piecemeal improvements without on overall plan were not enough. After comprehensive studies of the whole region, the decentralization process could gradually be implemented. The result would be a regionally functional city, with a liveable business center, quiet communities for living and working and restless commuting minimized. Saarinen writes of the need for openness, space, air and light in these communities – and here the functionalist language of the times can be easily heard. [67]

Saarinen's book is not specific on details, even when it handles actual example cases. It is an explanation and a marketing speech for an idea that required an urban designer's view of the whole and the imagination to see several of the many possible paths to the future of this whole. The city cannot quit, he said – perhaps this echoed his thoughts on the process-nature of city development as well. [68]

Already in the Munkkiniemi-Haaga plan the concept of the whole was visible, the scale regional even when a single housing area was the design task. This whole was so strong, that an individually "deviant" element like the skyscraper should have been subordinate to it. And thus it never really seemed to fit. Saarinen's treatment of the skyscraper as a building type could be seen as a kind of visual analogy of the alternation of the individual and the collective in his writings. He wrote of taking the individual viewpoint into account when dealing with planning issues, but the collective good - as defined by the planner himself – was still the important determining factor. In this Saarinen was very much a writer and planner of his own time.

What was the "public" in Saarinen's writings? The faceless recipient of the designers plans, designed with the "general good" in mind? There was an amount of modernist rhetoric in Saarinen's writings. The different housing types of Munkkiniemi-Haaga were designed for various social groups, each likely knowing its place. The birds' eye views of the Helsinki plans were drawn from a viewpoint that required the skills of a creator of wholes. This creator would know the needs of the people better than they knew themselves – the general good was a design guideline mentioned in the Munkkiniemi-Haaga plan, for example. "Public" was also used to mean the actual realizers and developers of the ideas depicted in the plans. Education was needed to help these realizers understand and make use of what was given to them. There was a strong educational aspect in *The City*, and a belief in the abilities of man. In the way Saarinen stressed the role of the town people themselves in planning processes, one could see a parallel to today's efforts of participatory processes in public planning. Saarinen firmly

believed in the power of education, and sought in his own way to explain what was needed, so that others could continue the work. He was optimistic, ending his book with the same saying he started with: "Show me your city and I will tell you what are the cultural aims of its population". [69]

Saarinen's book does not go into the actual difficulties of participatory planning, he merely states a hopeful, optimistic wish. One wishes it were easier to read between the lines - Saarinen had seen many planning processes in operation in his lifetime and must have known the many difficulties of communication in planning processes. They are never easy, participation requires knowledge and skill. These problems were not the scope of Saarinen's book. He writes of application of the town design principles he has previously outlined in his book, but only in the most general terms, as guidelines of an attitude more than actual procedures. The speed of change in the city of 20th century is one of the determining conditions of the planning research Saarinen mentions. This "research" was future-oriented, the preliminary stage of the design process, that gave the material for alternative schemes of new possibilities. It meant the kind of visionary thinking that could see different paths of growth for the future – but not the concrete pictures of the "City of Tomorrow"-type, as Saarinen was quick to point out. He seemed to want to stay away from exactly the kind of visioning that had been criticized in connection with his Munkkiniemi-Haaga plan: the vision of a complete ready-made city. Instead he stressed flexible procedures, not the appearance of a "dream scheme" future. [70]

Every urban designer is familiar with, for example, the diagram made reality of Ebenezer Howard, the modernistic monumentality of Corbusier's city visions and the science fiction detailing hovering above Frank Lloyd Wright's sketches of Broadacre city. For Saarinen's vision of the future city we must be content with the water-drop derived disintegrating block diagram. The details are not there. The carefully detailed townscape of Munkkiniemi-Haaga has given way to plain words describing a flexible procedure in general terms. This leaves a great deal to the reader's interpretation, and fails to capture the imagination in the same way that the concrete visions – no matter how unrealistic – did and do. Organic decentralization was more an idea than a vision.

As an idea it was easy to apply to different situations, and it was even given new interpretations. In Finland Saarinen's pupil Otto-Iivari Meurman coined a new Finnish word for it, shifting the focus from badly concentrated cities (which Finland of 60 years ago did not really have) to the periphery. It was used to explain the need for new suburban housing neighborhoods, mostly built in the 1960s and 1970s according to prevailing modern concepts with rows of housing blocks. Flexible the idea certainly was, readily interpreted to fit new conditions and aspirations set by new times. [71]

Conclusion

As an urban designer Eliel Saarinen started his planning career with private commissions that eventually resulted in a visually spectacular plan that he finished alone. He went on to design a much applied model for the skyscraper, which never

really fit into his own city concept. In his book he ends up writing of planning as a joint effort of various professionals; he stressed the process-like nature of designing cities and gave planning advice that was mostly directed to the public sector. One may see interesting dichotomies or even contradictions when one compares Saarinen's early plans and later texts, but there are also similarities in the educational aspects. In all these cases the role of the planner is seen as someone who operates on an ideological level and relies on the convincing power of his ideas. In the book – in spite of its optimism - the reader can also sense something of the constant tensions of the planning profession: moving between visionary thinking and the strenuous processes of realization. In the time-consuming realization of city-building, the eventual results were bound to look different from the Saarinen images. This was the case with the detailed plans as well as the diagrams of organic decentralization. Saarinen was answering to the planning needs of his own time and times changed. The urban visions may have remained largely on paper, but the design premises stressed by Saarinen are hardly obsolete. Scale and process may still belong to an urban designer's vocabulary.

[8] As noted by Mikkola: Mikkola, Kirmo, "Eliel Saarinen ja kaupunkisuunnittelu" in Marika Hausen et al., Eliel Saarinen: Suomen aika (Keuruu: Suomen rakennustaiteen museo, 1990), p. 195. See also Mikkola 1984, 34.
Saarinen himself wrote years later, that as a town builder he was professionally familiar with the Burnham plan long before he ever thought of going to the United States. See Saarinen, Eliel, "Project for Lake Front Development of the City of Chicago" in American Architect 124, no. 2434, 1923, p. 487. See also Tafuri, Manfredo, "The Disenchanted Mountain: The Skyscraper and the City", p. 513, in Giorgio Ciucci et al., The American City. From the Civil War to the New Deal (London: Granada, 1980, originally published in 1973 as La città americana dalla guerra civile al New Deal). Saarinen had studied the plan in detail, and most likely was also familiar with the design and marketing processes of the plan – as these were the very essence of its significance.

[9] Kirmo Mikkola has illustrated his story on Saarinen as an urban designer with Burnham's general plan layout and a bird's eye view of the city center. According to Mikkola, links to Burnham's plan could be found in the axial streetscape of the boulevards and the apartment house blocks, but he notes that the same themes also appear in Otto Wagner's Vienna plans of 1893 and 1911. Mikkola notes also that both

the Chicago plan and the Helsinki plans were begun by the initiative of local businessmen. Saarinen also used organism-similes in a way that was similar to the Burnham plan text. Mikkola 1990,194, 205, 349.

[10] Mikkola 1990, 194; and Christ-Janer, Albert, Eliel Saarinen (Chicago and London: The University of Chicago Press, 1979, originally published in 1948), p. 136. Prodding officialdom into action: community involvement in planning in Hobart 1945-1962

Stefan Petrow
University of Tasmania at Hobart, Australia

Introduction

In Hobart, the capital of the Australian island state of Tasmania, the first phase of the modern town planning movement began in 1915 with the formation of the Southern Tasmanian Town Planning Association. This association developed close links with local government until it folded in 1926 due to lack of public support and opposition from vested interests. After 1945 urban planning in Australia took on a new lease of life as part of a broader aspiration for a better postwar society.[1] In Hobart planning was taken up with renewed fervour when citizens' groups, in alliance with the architectural profession, demanded a larger role in the planning process. Based on archival records left by citizens' groups, the Hobart City Council and the Town and Country Planning Commissioner, this paper will examine the nature of their role, the planning ideas those groups proposed and the extent to which they achieved their goals.

The 1940s and 1950s presented governments at the Federal and State level with many urban challenges.[2] Some of these challenges were of longstanding such as deteriorating housing and the unregulated expansion of industry. Other challenges, arising largely from postwar prosperity and accelerated population growth, were new and included the urban sprawl, ribbon development, the demand for more housing and associated infrastructure created by a baby boom and a mass migration programme and the preservation of open spaces in and around cities.[3] The decline in the price of cars meant that car ownership grew dramatically and was the most powerful force changing the face of Australian cities.[4] Planning enthusiasts argued that a more co-ordinated approach to metropolitan planning would solve these problems and 'created unrealistic expectations about the ability of planning to achieve radical change'.[5] Visits of outstanding British town planners such as Patrick Abercrombie in 1948 further heightened expectations of what large-scale metropolitan planning could achieve. Alexander has argued that generally the plans of the 1950s were 'top-down documents' with little scope for public participation, but he notes that 'people in the community made their voices heard on specific planning issues'.[6] His analysis underestimates the role played by progress associations in the immediate post-war period. Although prominent in the improvement and beautification of most Australian suburbs and rural communities from at least the early twentieth century, progress associations have received little systematic scholarly attention, as Mullins has pointed out.[7] Mullins argues that these staunchly middle-class associations made a significant contribution to the improvement of household and residential life and urban development in Australia, especially between 1945 and the 1960s.[8]

This paper reinforces Mullins' claim about the prominent role of progress associations in the post-war period. Although the smallest capital city, Hobart faced similar problems to

the other Australian capitals and members of progress associations were consequently active in urban affairs.[9] Citizens banded together because of 'visible shared interests' in ensuring their suburbs had the necessary infrastructure and facilities to forge better lives for their families.[10] The various suburban associations coalesced to form the Council of Hobart Progress Associations (CHPA) in 1944, hoping to place greater pressure on the City Council. In early 1948 the CHPA persuaded the town-planning conscious City Council to form a Citizen's Advisory Town Planning Committee (CATPC), which would have a representative on the City Councils' Town Planning Committee. The CATPC, a broadly-based community body, proved to be a vigilant watchdog and some of its members became powerful advocates of participatory and co-operative planning. Some CATPC members were even elected as aldermen, which strengthened its voice on the City Council.

The CATPC provided the City Council with ideas on town planning and was a catalyst for change when public interest in town planning seemed to be dying as post-war reform euphoria waned. It made various suggestions concerning road alignments that needed widening to avoid bottle-necks, the provision of off-street car parking, the development of the port, the improvement of recreation areas, and the urgent need for co-ordinated metropolitan planning. By 1958 many but certainly not all of the CATPC's proposals were taken up by the City Council and its push for co-ordinated planning bore fruit in the establishment of the Southern Tasmanian Master Planning Authority in 1957. Having fulfilled many of its objectives, the CATPC lost momentum and folded in 1958. Its role was taken over by the CHPA and the work of this body will also be discussed to 1962 when a master plan was drawn up for Hobart. Before examining the work of the CATPC, this paper begins by providing the background to the formation of the CATPC and the context in which it operated.

Background

In the early decades of the twentieth century the Hobart City Council showed little interest in town planning. In 1915 the Southern Tasmanian Town Planning Association (STTPA) was formed and was the key body in publicising town planning ideals and projects until 1926.[11] It attempted to secure town-planning legislation, better housing and roads, and more parks and playgrounds for children. The STTPA had greater success in beautifying Hobart's parks and reserves than in improving urban housing and town planning legislation was not passed. Aldermen were willing to beautify the city because it was not a heavy drain on limited funds, alienated few vested interests, and promised to increase revenue by attracting tourists. Altering the urban environment by slum clearance and removal of insanitary housing was less appealing because it required interference with the rights of landowners and would be a much heavier charge on municipal finances. Suburban progress associations, which had been officially registered at the Town Clerk's office from November 1924, continued to raise some town planning concerns for their local areas to 1939, but no city-wide pressure group was formed.

World War Two had a great impact on attitudes towards town planning in Tasmania. People became dissatisfied with old ways of doing things and demanded that government deal with the social problems caused by the disregard of housing and planning.[12] Major advances in town planning occurred after housing reformer, businessman and former STTPA member Alderman John Soundy became Lord Mayor of Hobart in 1938.[13] Soundy was aided in his endeavours by the newly-appointed Town Clerk HJR Cole, a keen supporter of town planning. Under Soundy, new powers were acquired to control subdivisions and widen streets. Perhaps Soundy's most important initiative occurred in February 1943 when he set up a Town Planning Committee, comprising one representative of each standing committee of the Council.

The primary function of the Town Planning Committee was to secure a plan of the city. In 1944 the City of Hobart had a population of 54, 215 and Soundy wanted a plan for a population of 100,000. He realised that 'in an old city like Hobart it would be a costly job to replan some of it'.[14] Hobart had numerous topographical 'problems to solve in providing a balanced plan'. Engineering difficulties arose from 'the hilly nature of the land and deep gullies, especially along the elevated sections of the city and Sandy Bay', a suburb to the south. The scarcity of flat land made provision of recreation areas difficult. As Hobart was mostly squeezed between the River Derwent and Mount Wellington, plans to attract industry competed with plans to provide housing for a growing population. The approaches to the city also needed careful consideration.

In 1943 the Town Planning Committee appointed Frederick Charles Cook, City Engineer for Port Melbourne in Victoria, to prepare a town planning scheme.[15] Cook's thorough plan concentrated on the zoning, traffic and recreational needs of the city, but avoided difficult issues such as the government of a Greater Hobart area embracing the surrounding Glenorchy and Kingborough Councils and any attempt to estimate the cost of his proposals. Remarkably, Cook ignored increasingly important issues such as the provision of car parks, community centres and facilities for the young and unwisely minimised the urgency of street widening. Perhaps influenced by his Port Melbourne experience, Cook sanctioned the building of industry on the foreshore, but this proposal was widely condemned as destroying the tourist industry. Despite its deficiencies, Cook's plan was timely as the State's first major planning legislation, the Town and Country Planning Act 1944, was gazetted to be operational in 1945. Based on the English Town and Country Planning Act 1932, the Tasmanian Act strengthened local government responsibility for planning. Councils were required to submit a proposed town planning scheme to the newly-appointed Town and Country Planning Commissioner, RA McInnis, and, once this scheme was provisionally approved, it remained open for public inspection and objection for three months.

The Hobart City Council intended to use Cook's plan as the basis for its statutory plan under the Act. First the standing committees of Council would study reactions to Cook's plan from 'all responsible citizens' and then steps would be taken to prepare the official town planning scheme for registration under the Act.[16] The Council supplied bound and illustrated copies of the plan to professional bodies of architects, surveyors and engineers and to progress associations. Although there were few written replies, those

who did respond were favourably disposed towards Cook's plan. But they also sent the clear message that a top down approach to planning was unacceptable and could no longer be tolerated. They urged that citizens be involved in future discussion and development of the plan to ensure that public needs were not sacrificed to the demands of vested interests as historically had been the case in Hobart and to ensure that the City Council put the plan into effect. The engineers and the CHPA, which had been formed in 1944, wanted a Town Planning Committee composed of technical experts and representatives of government departments, adjoining municipalities and citizen bodies.

Despite receiving generally approving if not enthusiastic comments on Cook's plan, the Hobart City Council seemed to lose impetus in preparing a town planning scheme.[17] The Council did not appoint interested and expert residents to its Town Planning Committee and kept its 'actions and attitudes' to planning secret. Work was slow mainly because the Council, claiming not to be able to afford a town planner, had designated the overworked but capable City Engineer JE Knott as Planning Officer. This was compounded by the Council's refusal officially to confer with McInnis or to seek his advice. As traffic and parking problems intensified, the public demand for action and representation, voiced through the CHPA and the Institute of Architects, grew louder.[18] As the need to draft a statutory plan became more urgent, the Council, with Cole taking a lead, relented and did invite McInnis, the most experienced town planner in the State, to attend meetings of the Town Planning Committee.

The CHPA pressed for a conference with Cole and senior municipal officers in July 1946 to discuss 'many subjects affecting municipal administration and the status of progress associations'.[19] CHPA Chairman, John Arthur Turnbull, hoped the conference would 'stimulate public interest in civic problems by a free exchange of views and ideas'.[20] Subjects discussed included providing the CHPA with 'a detailed and comprehensive schedule of works and expenditure' before a decision on the works was made, eliminating river pollution by installing a sewage treatment plant, promoting greater adherence to municipal by-laws by citizens, abolishing slums, compelling the installation of baths in old houses, and recognising the CHPA as 'a nucleus' of a citizens' Town Planning Committee.[21] The CHPA finally persuaded the Town Planning Committee of the need for such a body and in early 1948 Cole invited the CHPA to form a Citizens' Advisory Town Planning Committee (CATPC) and appoint a representative to the City Council's Town Planning Committee.[22] The Citizens' Committee contained representatives from the Royal Hobart Regatta Association, the Institute of Architects, the Tasmanian Council of School Parents Association, the National Fitness Council, the Better Homes for Australia Association, the Tasmanian Road Transport Association and suburban progress associations.

Community involvement in planning: the CATPC and the CHPA

Would the appointment of the CATPC be a turning point for community planning in Hobart? Certainly much was expected of it. As one town planning official noted, such 'lively, keen, and knowledgeable groups of citizens' were essential 'to lead, support and

sometimes to prod into action Officialdom'.[23] The CATPC hoped to obtain 'a better insight into the difficulties that beset the City Council in its planning' and to develop 'a pronounced feeling of co-operation in the task of completing a plan that will meet present difficulties' based on Cook's recommendations. Drawing on the wide cross section of views of its members, the CATPC hoped, 'as private citizens, to accept our full share of responsibility in the task of planning our City in the future'.[24] If the 'co-operative outlook' and 'essential team spirit' was maintained, the committee was confident it could surmount 'obstacles' in its way.   The CATPC was given free use of a room in the Town Hall and the Town Clerk and City Engineer attended meetings in 'an advisory capacity'. Other signs of co-operation included the CATPC agreeing in June 1948 to prepare a civic survey plan to show 'existing use and occupation of all land within the city'.[25] This would be 'an adjunct' to the City Council's final zoning plan.

The CATPC was initially represented on the City Council Town Planning Committee by its Chairman, John Arthur Turnbull, a clerk with a military background.[26] Turnbull believed that the CATPC had made 'civic history and had opened up unlimited opportunities of civic service'.[27] Turnbull tried to cultivate good relations with local newspapers to give maximum publicity to planning issues but the newspapers did not always publish press releases.[28] He was elected an alderman in 1950 and, resigning as chairman of the CATPC, tried but failed to have even greater influence on shaping planning policy inside the City Council until his defeat at the City Council elections in 1954.[29] He urged his CATPC colleagues to keep working with the City Council to achieve 'the vision splendid' and not be deflected by critics 'whose limited horizon does not permit their gaze to penetrate beyond their own little world of to-day'.

Turnbull was succeeded as chairman and CATPC representative on the City Council Town Planning Committee by KF Cowles. When pressure of business forced Cowles to step down from the City Council, he was replaced by Colin Philp, an architect, who was the most prominent individual to extol the benefits of community planning up to 1962.[30] In 1954 Philp went on a planning tour of North America and England and in 1955 wrote a pamphlet for citizens called *Planning for You.*[31] Planning did not mean regimentation or 'a set of immutable decrees or restrictions', but co-operation in 'a completely democratic manner to serve the best interests of all citizens'. He concluded that the 'right kind of planning will only result if informed and active citizens … arouse public opinion and assist the planners to make our communities better places for our families, our neighbours and ourselves to live in'.

Philp had a chance to transform the City Council when in 1956 he was elected an alderman, but at the insistence of the City Council remained as the CATPC representative on the City Council Town Planning Committee.[32] This disappointed and puzzled the CATPC, which wanted to replace Philp with its new chairman, another architect, IG Anderson, to retain 'the independence of approach to Town Planning problems not always possible when the member concerned had the wider responsibility of an elected civic leader'.[33] The City Council gave no satisfactory explanation for this change in policy, which indicated a more insular approach to planning. Alternatively, the decision may have had something to do with the attitude of aldermen to Anderson (an

alderman himself from 1950 to 1954) because in July 1958 when the CATPC nominated Turnbull as its nominee this was accepted.[34] While an alderman Anderson had 'continually' argued that planning had 'nothing whatever to do with economics or finance' and this produced negative attitudes to planning on the City Council.[35] But for some time the influence of the CATPC had been weakened by the lack of interest shown by some of its affiliated bodies and attendance at meetings was 'very poor' perhaps because, as we will see, of the new planning 'instrumentalities' that it had suggested be formed.[36] In July 1958 the CATPC realised that, as interest in it had dwindled, its functions 'had to a large extent been taken over' by the CHPA and by one vote decided to disband after ten years of active involvement in town planning 'problems and projects' in Hobart.[37] Turnbull remained the CHPA representative on the City Council Town Planning Committee, but became 'an observer' not a member.[38] He found his association with this committee 'always friendly and productive'.[39] We now move on to discuss some of the specific proposals of the CATPC and the CHPA relating to roads and cars, recreational areas and building standards and co-ordinated planning.

Roads and cars

After 1945 the CATPC gave particular attention to the issues arising from the dramatic rise in car ownership, especially after petrol rationing was lifted in 1949, and the need for better roads to assist traffic flow.[40] In 1949 the CATPC was concerned that the state government's plans to improve road alignments to Tasmanian cities were not ambitious enough 'to meet future traffic requirements' and would result in bottlenecks.[41] It was satisfied that at 150 feet wide the new northern approach to Hobart would be adequate, but in a deputation to the Minister for Lands and Works Eric Reece criticised the decision to destroy the Risdon Reserve by building the road through it.[42] The CATPC was reassured that the road would not 'intersect' the area but would, as it wanted, be raised to 'span it' and that additional land would be purchased so that 2 separate sports grounds would be built on 'either side of the proposed viaduct'. When the cost of the road grew dramatically and the Cosgrove government demanded that the City Council pay for the last part from Cleary's Gates to the city CDB, the CHPA supported the view that it was 'a State responsibility' and not a municipal one.[43] This prompted Premier Robert Cosgrove to call the CHPA 'stooges' of the City Council, an insult Turnbull vigorously denied. The government finally built the road to the railway roundabout near Liverpool Street and the Council built the final section to Davey Street after a large programme of land acquisition.

The CATPC also raised objections when the southern outlet road was mooted to be built by the Department of Public Works through the Fitzroy Gardens Reserve.[44] Although conceding that an alternative route raised 'technical difficulties', the CATPC thought these should be overcome to stop 'this beautiful park land being destroyed or impaired by an arterial thoroughfare'. The southern outlet road was ultimately built through part of the gardens but much of the area was saved. There is no evidence to indicate what the CATPC felt about Cook's idea of building a diagonal road through, and redeveloping, the old working-class enclave of Wapping on the Hobart waterfront. This road would have endangered the historic Theatre Royal, but the idea was finally

abandoned in 1957 when the City Council adopted a one-way street system to improve traffic flow in the city.[45]

The CATPC agitated to stop 'ribbon development' occurring along the main highways and to stop subdivision of land with frontages along the highways.[46] It wanted a green belt on both sides of the highway with a by-road inside the green belt. It had an ally in McInnis, who supported park strips ten feet wide on both sides of highways, barred subdivision along highways and required 'parallel roads' to the main highway to serve all subdivisions. This stopped car parking along the highway and facilitated future highway widening.

The CATPC was also interested in inner city street congestion. It suggested that Davey Street be widened by building a two level road through Franklin Square, the city's most central and oldest park, because congestion was intolerable in the area.[47] In 1953 CATPC also objected to the proposed diagonal road from the corner of Warwick and Elizabeth Streets to Molle and Macquarie Streets because it would create 'many awkward and dangerous intersections'.[48] The CATPC suggested that congestion in North Hobart would be more effectively relieved by extending Murray Street to join Elizabeth Street at the North Hobart Post Office. The City Council sensibly abandoned the diagonal road and decided against the extension of Murray Street on the grounds of expense.

One area of contention between the CATPC and the City Council was over the width of Montpelier Retreat, which was a major outlet from the Hobart waterfront. The CATPC criticised the Council's decision, supported by McInnis, to provide a 50 feet reservation and wanted this to be widened to 70 feet to allow two-way traffic to use it and to allow parking.[49] When two lorries were parked on either side of the street, Philp pointed out, it was 'very difficult' for traffic to pass through and a longer view of the provision of future needs should be taken'.[50] The demands of 'wise town planning for the future' persuaded the CHPA in 1957 to lobby the City Council for a tunnel to be built under Harrington Street at its intersection with Macquarie Street.[51] Although 'expensive', the improvement would 'eliminate' traffic congestion at this busy intersection.

The greater use of cars created a demand for more car parks and the CATPC took a keen interest in planning for future needs. It urged the City Council 'to prohibit the use of property in city areas as timber stacking and timber drying yards' and to buy up existing areas for car parking.[52] The CATPC thought car parking was the government's responsibility, but the government disagreed and the advisory committee lobbied the City Council. In 1955 the City Council installed over 200 parking meters, a first for an Australian city, in 1956 opened its first off-street car park in lower Macquarie Street, and in 1958 zoned four areas near the centre of the city for off-street parking.[53] New premises would also be required to supply parking spaces. The CATPC and CHPA both pushed for a central bus terminal at Lower Collins Street as one way of removing city congestion on Hobart's narrow streets and encouraging the use of public transport.[54]

We have already discussed the CATPC desire to improve traffic flow from the waterfront and Philp was appointed the CATPC representative on the Port of Hobart Foreshores Committee to comment on this and other port related issues.[55] The CATPC 'strongly' opposed the proposal to fill in Victoria and Constitution Docks for use as parking areas as Cook's plan had recommended and deemed the dock as an 'essential' port installation.[56] Opposition was equally strong in 1950 to the Marine Board's proposal to build a fruit inspection shed on the triangle next to Parliament Square. The building would obscure vision in an area where traffic was 'very heavy' and would only increase when Montpelier Retreat was widened.[57] In both cases the CATPC view won the argument, but Philp pointed out that the City Council had 'no control' over any building the Marine Board wanted to build on its land.[58] He thought that the Council should be given this control to stop the erection of buildings that 'did not conform to accepted standards'. Control was not likely, but the two bodies did confer on a zoning plan for the waterfront.[59] One zone was devoted to general port uses and the other for restricted port uses.

In 1958 the Marine Board proved that greater control was necessary when it proposed to reclaim about five acres of land at Castray Esplanade to build Numbers 4 and 5 Princes Wharf berths and large goods sheds.[60] A deputation of the CHPA and other associations to the Legislative Council pointed out that the Marine Board proposal would add to the already 'heavy traffic' in the area and would be 'short sighted'. To relieve congestion it was preferable to develop the other side of the port at Macquarie Point, where there was easy access to rail facilities and the new northern outlet road. The deputation also noted the impact on the residents of Battery Point from the noise and fumes, on 'the unique scenic and historical value' of Princes Park and Castray Esplanade, and on the crowds who watched yachting from the foreshore. To the dismay of many, Parliament sanctioned the reclamation, but subsequent lobbying by the CHPA persuaded the Marine Board to build 'a low shed with access to a promenade on top' instead of building the original sheds.[61]

When he became an alderman, Philp constantly drew attention to the problems caused by cars. In July 1956 he warned the City Council Town Planning Committee that 'we have to convince ourselves, as well as the public, that the motor vehicle poses the biggest problem for us in the future and right now. A problem we *must* solve if we are to keep Hobart a living, growing, healthy city' and to stop 'the inevitable slowing down and strangling of the business of the City'.[62] Towards the end of 1956 Philp thought good progress had been made in widening street alignments at Sandy Bay Road and Elizabeth Street, two very busy thoroughfares for shoppers.[63] In 1957, to make some progress with forward planning, Philp secured the appointment of a planning officer working under the City Engineer.[64] His duties included preparing plans for street alignments and for the development of new areas, including the layout of streets and services and the zoning of land, and maintaining the current draft town plan.

Recreational areas and building standards

The CATPC was ever vigilant to protect recreational areas for public use. In 1949 Philp's plan to reclaim about six acres of the Marieville Esplanade, Sandy Bay attracted

notice. The City Council adopted the CATPC proposal to restrict the foreshore to 'aquatic facilities' for the public and stop encroachment by 'sectional interests'.[65] The City Council was less willing to buy properties along the Sandy Bay foreshore to provide open spaces for the public, but did agree to buy 'vacant land where possible as "open windows" to the River'.[66] Other established recreational spots did not escape the attention of the CATPC. In 1949 Amy Rowntree, one of a handful of women to contribute to community planning before 1962, suggested a scheme to recondition the tracks and restore signposts on Mount Wellington 'as a greater attraction for tourists'.[67] This was taken up by the City Council, which began to show greater interest in the mountain as a recreational resource. Preserving 'the natural beauty' of areas such as Fern Tree, the suburb adjacent to the mountain, was another CATPC suggestion welcomed by the Council.[68] The City Council was also urged to acquire the Fort Nelson site on Mount Nelson for its 'scenic, historic, and recreational value' and to keep the CATPC informed about proposed improvements to the Domain, a large area of scenic bushland near the city centre.[69]

The CHPA also had to be alert for encroachments onto public recreational areas. In 1960 the City Council proposal to alienate about five acres of Mount Wellington for a hotel development threatened to disrupt its 'harmonious relationship' with the CHPA.[70] The proposal ran counter to 'the best interests' of Hobart and was soundly defeated in a poll of ratepayers in May, yet the City Council was ready to override that decision by leasing the land for 99 years and not selling it. This did not alter the CHPA's principled stand against the alienation of 'the people's park for profit' and their protest was successful. Turnbull philosophically declared that 'true progress in the city was built on constant striving' and that 'disagreements were part of the effort for progress', but he adhered to 'a policy of constructive thought and co-operative approach'.[71]

Across the Derwent River in the Clarence Municipality the CATPC agitated in 1950 to have the area between Bridge Road and Montagu Bay known as Smelting Works Point 'reserved for public use'.[72] The area had originally been zoned as a shopping area, but McInnis agreed with the CATPC that it was more suitable for a reserve.[73] The issue dragged on and Philp, frustrated at the delay, urged McInnis to stop the area being built over for housing by the Agricultural Bank.[74] This is one of the few instances of the CATPC contributing to the debate over how government departments ignored local government planning schemes when building housing estates. The CATPC showed little interest in the provision of public housing, one of the most important social issues after 1945, perhaps because its middle-class members did not experience housing and other social problems and the committee was more interested in infrastructure.[75] After a period of 'tremendous growth' in home building, the housing shortage had eased considerably by 1960, but propensity of the Housing Department to build where it liked and to override municipal planning schemes should have concerned community planning bodies more than it did.[76]

A desire to preserve iconic recreational areas was complemented by a desire to preserve iconic buildings. Noting how the city skyline and street architecture was changing, in 1953 the CATPC expressed 'alarm that some public buildings of distinction', such as the Town Hall and Davey Street Public Buildings, had been

'disfigured by cheap, makeshift additions contrary to the building regulations'.[77] The CATPC suggested that an advisory committee of architects 'should have some overall supervision of building control'.[78] They would advise on matters such as 'the appropriate siting of buildings', 'suitable heights' and 'good skylines', the most appropriate material for a locality, 'the modifications of conflicting designs for adjacent buildings', and point out where shop fascias and advertising elevations were unsuitable. All government and private buildings would be vetted by the advisory committee as 'they collectively constitute the city pattern and in consequence should be vital to the City's welfare'. The City Council Town Planning Committee considered the appointment of an advisory panel.

Co-ordinated planning

The purview of the CATPC was broader than the city of Hobart itself and it was behind the push for co-ordinated planning in Greater Hobart. This was a contentious issue and required support from the various local government authorities which had legislative responsibility for planning—the Hobart City Council, the Glenorchy Municipal Council to the north, the Kingborough Municipal Council to the south and the Clarence Municipal Council on the eastern shore of the River Derwent. Agreement was also required from McInnis as Town and Country Planning Commissioner and government departments and marine boards, which were not bound by planning legislation and ignored municipal planning schemes. Philp told McInnis that he was anxious to get 'planning done, instead of being forever swayed by conflicting interests and ribbon development going on all the while'.[79] In 1950 the CATPC approved of the Hobart City Council holding a conference with the municipalities of Clarence, Kingston and Glenorchy to discuss 'co-operative town planning' on arterial roads, sporting and recreational provision, industrial areas and water supply.[80] In addition to the four councils, nominees of the Hobart Marine Board and of the government became members of the Hobart Joint Planning Advisory Committee. This committee did not last long because the government and government instrumentalities were opposed to becoming legally bound by the Town and Country Planning Act and Glenorchy suspected Hobart of wanting to take it over.[81]

The CATPC also grew impatient at the City Council's approach to planning and urged Premier Cosgrove to appoint a planning board for Greater Hobart with power to bind all councils and the government.[82] McInnis thought the CATPC was 'closely in touch with the planning problems of the City, and their suggestions are worthy of consideration'. However, he saw political and other difficulties in creating a Greater Hobart Council and adhered to his view that 'planning must be done by those authorities who must carry it out'. He recommended that the government appoint a Greater Hobart Planning Advisory Committee, with himself as convener and chairman, one council and one technical representative each from the four councils, one representative from each of the Citizen Advisory Committees of those councils, one representative from the Department of Public Works, the Transport Commission, the Education Department and the Department of Public Health, and one representative from the professional bodies of engineers, architects and surveyors. Although not suggesting that the committee be given 'statutory authority', McInnis thought giving it 'official status' would enable the committee to approach government departments and councils and receive 'full

consideration of its requests'. Cabinet approved and the new Hobart Metropolitan Planning Committee (HMPC) was formed.

The HMPC held its first meeting on 11 September 1951. Its primary aim was to plan for the metropolitan area as a sub-region to achieve 'the best conditions of living, working and recreation' and to secure 'the implementation of the plan as a framework for statutory Town Planning Schemes'.[83] Although many useful reports were written on subjects like the location of industry, residential development and traffic and transport, the CATPC remained dissatisfied. In July 1952 it pressed Premier Cosgrove to appoint a statutory authority with 'complete control over any and all Town and Country Planning Development'.[84] This 'supreme Authority' must be under the direction of Parliament and be 'independent of local preferences when it comes to overall planning and planning policy'. The authority must control land use 'so as to retain natural soil resources to the best advantage' of the community; have power to stop further ribbon development in built-up areas; seek solutions to parking problems; encourage the construction of 'multi-family housing units in a controlled proportion to the total housing programme'; and make grants to councils to increase the number of trained personnel engaged in formulating and carrying out town planning investigations and surveys. McInnis again demurred, arguing that the CATPC should give the HMPC 'a fair trial'.[85]

However, Philp was critical of the long gap between meetings and in 1953 thought the HMPC record was 'unsatisfactory'.[86] The following year members of the HMPC concluded that their advisory powers were inadequate. In November 1954 Philp chaired a meeting of the general development and implementation sub-committees of the HMPC, which supported a statutory planning authority.[87] This authority should prepare a Master Plan 'for the development of all community needs for the whole Southern Region', including all planning of land use, zoning, and public utilities for a population of 250,000. It would be empowered to commission experts and employ staff or assist in the preparation of the Master Plan, but detailed planning and implementation of the plans would remain the responsibility of municipalities. The full HMPC endorsed the proposal, which in its final form gave equal representation on the authority to the Hobart, Brighton, Clarence, Glenorchy and Kingborough Councils.[88]

In July 1955 representatives of the councils and the implementation sub-committee began to draft a bill for presentation to the government, which acquiesced in the wishes of the councils. When finally passed in 1957, the legislation enabled any group of local authorities in a particular area to petition the government to set up a Master Planning Authority and to finance schemes by levying special rates.[89] A Master Planning Authority would be able to issue interim orders to restrict the development of land and to compel landowners to develop their land according to the plan, but they had the right to appeal to a magistrate. That the Crown and marine boards were not bound by the legislation was a significant weakness, but Philp hoped that more attention would finally be given to 'our greatest need for co-ordinated development'—'long range physical and financial planning', which was 'a vital necessity for the preservation of amenities, values and growth'.[90]

The Southern Metropolitan Master Planning Authority held its first meeting in September 1958. Despite losing key staff, experiencing delays in replacing them and having to deal with the time-consuming task of mapping and surveying the metropolitan area, the authority drafted and exhibited a Master Plan for public inspection in 1962. The plan contained flaws, such as the absence of a traffic and transportation scheme and simply incorporated 'as much as possible of the work already completed in a number of the local planning schemes, either in the course of preparation or finalisation', which the authority had helped develop.[91] The Hobart City Council was disappointed that the authority had produced not 'a strategic plan in broad outline, with a set of policies in broad scope', but a detailed plan that would be a straight-jacket for the Council and would override the Council's proposals.[92] The CHPA became disillusioned with the 'anomalies associated with master planning'.[93] Ultimately, the Master Plan was withdrawn and the authority struggled on, preparing numerous reports and sponsoring two transportation studies, before it was disbanded after the Hobart City Council withdrew in 1973.[94] The experiment fell far short of the CATPC's and CHPA's hopes for co-ordinated planning, but that it was attempted at all was largely due to their campaigning.

Conclusion

In the 1920s the agitation of the STTPA did much to improve the provision of parks and reserves in Hobart, but it failed to improve the standard of housing or to secure its major goal of town planning legislation mainly because it was unable to command wide public support. In the postwar period public support remained a crucial factor in achieving town planning goals. As the *Mercury* argued in 1954, planning problems can be solved 'only by intelligent interest and activity on the part of all the people'.[95] After 1945, as intimated earlier, the provision of housing was 'the absolute popular priority' and certainly attracted much government and community attention, but few outside the CATPC took an active interest in planning in Hobart.[96] Both the CATPC and the CHPA often bemoaned their failure to arouse wide public support for urban planning and civic issues more generally.[97]

While these public-spirited urban activists, like the STTPA, achieved some gains in areas such as recreational provision, roads building and improved car parking, they also failed to achieve their main goal. This was to secure the appointment of a Master Planning Authority with wide (and if necessary coercive) powers over councils, with representatives of citizens groups and with direct links to the economic and social policy makers in government. Planning in Hobart remained as it had been in the inter-war period—an under-resourced and narrowly-conceived local government function preoccupied with development control. The City Engineer conceded in 1962 that he lacked the planning staff to deal with the problems arising from the rapid growth of Hobart that community bodies regularly pointed out.[98]

One might be forgiven for concluding that the burst of community engagement after 1945 had not altered planning processes and thinking in fundamental ways. But that conclusion should not detract from what had been achieved by developing closer relations with the City Council. Bodies such as the CATPC and the CHPA forced local

and central government to take account of public needs and made some crucial interventions to remind government of its responsibilities to the community in building roads, providing recreational facilities, and planning for the future. Although its influence has waned since the height of its influence in the 1950s, the CHPA continues that vital role to the present day.

Building utopia, Italian style. Silvio Berlusconi and the new town of Milanotre

Deni Ruggeri
Cornell University, United States

I. Introduction: building utopia, Italian style.

The history of human civilization is populated with attempts to solve past problems through utopian visions of a perfect world (Mumford, 1962). In almost all cases, these utopias used new spatial organizations and architectural forms to establish new social orders and promote new lifestyles (ibid. 22). In almost all cases, their materialization required great efforts in terms of personal charisma, religious faith, political, or economic power accompanied by tensions between those in charge of maintaining the status quo and those wanting to alter it.

These characteristics are clearly visible in the Italian new town of Milanotre. Developed in the late 1970s by Silvio Berlusconi, Milanotre was an innovative, private-sector response to the degraded urban conditions of post WWII cities, plagued by speculative developments in the historical core and large scale public housing projects at the city's edge. Neither the private sector piecemeal solutions—infill projects in areas already saturated in terms of infrastructure—nor the large public housing projects built on agricultural land at the periphery were intended to be comprehensive solutions to the housing dilemma. Furthermore, neither type of developments offered the well-designed and maintained public the residents needed to call these places home.

Berlusconi's new town offered an alternative to the status quo of Italian cities by providing a mix of housing, retail, and commercial uses in close proximity to nature. The link between housing and landscape visible in the plans for the new tow was reminiscent of Ebenezer Howard's garden city a planning model that public governments would not entertain for ideological and political reasons. Over the following pages I give readers an overview of the history of residential development in Italy from the country's unification to the early 1970s. These should uncover some of the reasons that led to the rejection of these urban development approaches.

2. Background: from garden cities to new towns

a) The early 1900s

Upon its unification in 1861, Italy was an agricultural nation of small urban centers. During the first few decades as a nation, governmental efforts were directed at the establishment of a strong industrial sector. This resulted in the transfer of many public functions to larger metropolitan areas and in an unprecedented wave of urbanization, with the subsequent demand for housing. Italy's central government responded to this pressure with a laissez-faire approach, limiting its role to that of controller of the urbanization (Fubini; Ruggeri).

Alternatives to the uncontrolled urban growth that generated from this housing policy were limited. In the early 1900s—thanks to the work of philanthropists, union leaders and the Socialist Party—a limited number of garden city-inspired neighborhoods were built thanks to a new law, which offered low-interest mortgages to private housing developers in exchange for higher sanitary standards (Giordani, 145).

One such development was the 12,000 people garden village of Milanino by philanthropist Luigi Buffoli and modeled after the new towns of Letchworth and Hampstead. Unlike its British counterparts, Milanino was a mostly white-collar community based on a balanced figure-ground relationship. This relationship was maintained through deed restrictions that prevented owners from altering their homes, which resulted in the intact physical conditions visible today (Boriani-Bortolotto, 33). Compared to the rest of the city, the new garden city was based on a very fine balance between housing and open space, its center becoming a long linear park

Figure 1 General Plan of the Garden City of Milanino, Italy, (1923).

Figure 2 View of typical residential block in Milanino, circa 1923.

Figure 3 Today's Milanino shows a great deal of changes to the original integrity of the neighborhood (Source: Boriani and Bortolotto)

b) Planning during the Fascist regime

During the early to mid 1900s slow industrial growth coupled with the Fascist regime's negative attitude towards cities, urban growth proceeded very slowly. Mussolini saw urbanization as a source of "moral insanity" and promoted efforts to de-urbanize cities and expand development in rural areas (Sica, 1978, p.325). Instrumental to the policies of the fascist government was the collaboration with private entities, according to a political model called "corporativism" by which the public and private sectors would collaborate. This collaboration was accepted so long as private interest would coincide with public goals. This system explains the expansion of the Italian middle class during the fascist period and its support to the regime (Blinkhorn, 2006).

In Fascist Italy, the garden city model became an alternative to the chaotic urban development feared by the middle class. The low-density family oriented qualities of Italian garden cities fit their need for order and control. However, adherence to the garden city principles was somewhat superficial and limited mainly to formal aspects, by setting small houses in a garden setting. In the new towns of the *Agro Pontino*— situated on marshland reclaimed by the Fascists for sanitation-- the belief of the superiority of agrarian life led to the absence of industrial uses, in sharp contrast with one of Ebenezer Howard's key planning principles (Ghirardo, 1981, p.81).

c) Planning in post WWII Italy

Throughout Europe, post-war reconstruction was preceded by a debate on the need for new urban development paradigms. Great Britain and France passed comprehensive legislation to guide urban reconstruction (New Towns Act, Town and Country Planning Act). Fearing that comprehensive plans and architectural innovation would limit a speedy recovery, central and local governments preferred a piecemeal approach to a more comprehensive and thought out housing policy.

While the reconstruction of the downtown areas of Milan and Rome after WWII became a mainly private effort, the Italian government invested in the construction of public housing in the periphery to create new employment. The governmental INA Casa Agency was created in the early 1950s to manage the construction of 1.5 million new units. Through low mortgage rates and discounts, the agency was able to provide homes for a minority of Italian families and act to jumpstart the construction industry.

c) The 1960s and 70s economic boom

During the 1960s and 70's, metropolitan areas started to expand due to a booming manufacturing sector and to millions of immigrants from southern to northern Italy (Fubini, 1979). While private developers were building large amounts of low-quality houses, the IACP Institute (Autonomous Institute for Public Housing) engaged in an aggressive campaign to build large public housing complexes.

Italian families were encouraged to purchase homes in these suburban enclaves with high densities, limited services, and few green spaces (Campos Venuti, 1996, p.23). Just like their private counterparts, IACP's developments paid limited attention to the quality of life of their residents. Given the limited budgets and scarcity of land, IACP's residential neighborhoods often featured high-rise, modernist residential towers located at the outskirts of major cities. Being located on the outskirts of the city, they contributed to the degradation of the *periferia* (Doglio, 1983, 110).[1]

Unlike British and French new town experiments, driven by the vision of decentralized and improved urban areas, Italian public housing efforts were often responding to emergency situations. The choice of suburban sites meant cheaper land, but resulted in large infrastructural investments in roads, water and sewer lines and in limited budgets for Landscape Architectural and Urban Design improvements. Finally, many of

these developments lacked areas for retail and commercial uses, which eventually turned them into nothing more than bedroom communities.

Exceptions to this rule were the plans developed as competition entries by eminent architects such as Carlo Aymonino and Aldo Rossi. Praised by the critics as a masterpiece, Rossi's *Gallaratese* housing complex (1967-1976) used monumental architecture to celebrate the role of the public and celebrated Italy's urban tradition through high densities, limited green spaces, and urban plazas (Conforti, 1981).

During the years of the economic "miracle" Milan had positioned itself as Italy's fastest growing city, with a growing service sector and declining industries (Foot, 2003). As many other cities in Italy, years of unregulated residential development had taken a toll on the quality of Milan's urban and suburban environment. In response to the problem the government approved new legislation[2] introducing new minimum open space, infrastructure and public services zoning requirements (Campos Venuti). Due to a caveat in the law, the results went in the opposite direction than the one its promoters had expected; cities were inundated with low quality infill housing, which in returned contributed to push the middle classes out of the city. It was against this background that the town of Milanotre was conceived.

3. Milanotre, Italy's first new town

Berlusconi's first take at a utopian dream

The history of Italy's first new town is deeply intertwined with the life of its developer, Silvio Berlusconi. Born of a middle class Milanese family, the self-made entrepreneur began his career in real estate at the age of 25, when he built and sold his first home. He was only 34 when he began planning a new residential development, which he called Milanodue. The development was an early, partial attempt at the realization of a utopian dream of a futuristic community built according to the needs of the emerging Milanese middle class (Foot, 118). Despite its limited size, this pilot experiment would be used to test many of the principles later applied in Milanotre.

Milanodue was designed as a place where families could live, work, and play safely amidst modernist buildings, beautifully maintained parks and extensive public facilities. Understanding the need for a critical infrastructure (Bourdieu) to support and promote his utopian dream, Berlusconi also created TeleMilano, a cable channel broadcasting American movies and soap operas (Foot, 119-120).

Berlusconi's televisions made him into the most popular and powerful entrepreneur, offering him the financial and ideological tools to complete his dream of creating a new town. While his fame and political connections were instrumental in his city-building ventures, they also gained him the preconceived opposition of the Italian intelligentsia (Foot, 121). Rather than evaluating his ideas for their innovative aspects, academics, and planners rejected his private utopia. In the eyes of many academics, only the government was legitimated to plan for more housing. This explains why projects like

Alvar Aalto's plan for a new residential development in the cit of Pavia found a very similar fate and were abandoned at the onset (Ruggeri, 2001).[3]

are needed to see this picture.

Figure 4 A recent picture of Berlusconi showing his eclectic personality (Source: http://www.theage.com.au)

Figure 5 Aerial view of Milanotre's town center (Source: Mondadori)

Milanotre: an alternative to uncontrolled sprawl

Milanodue was the first attempt to deliver Berlusconi's dream of a new town. Due the site's physical constraints, the design team had been unable to fully implement the full range of innovative architectural and planning solutions needed for a new town. This led the developer and his staff to the building of a second, more complete new town, which

would begin in 1974. Unlike Milanodue, Milanotre would be equipped with all the buildings, infrastructure, and services that a new town of 12,500 people demanded.

For its development, the design team—160 architects, planners and sociologists—chose a 39 acres site in the municipality of Basiglio just south of the city of Milan. In April of 1979, after the official approval by the regional government, Berlusconi began construction of a dozen apartment towers. A few years later in 1981 the new town was completed. The plan was organized as a series of self-contained neighborhoods connected by a fully separated circulation system. It featured a range of public facilities—convention center, church, and shopping mall—extensive infrastructural investments and 22 acres of open space.

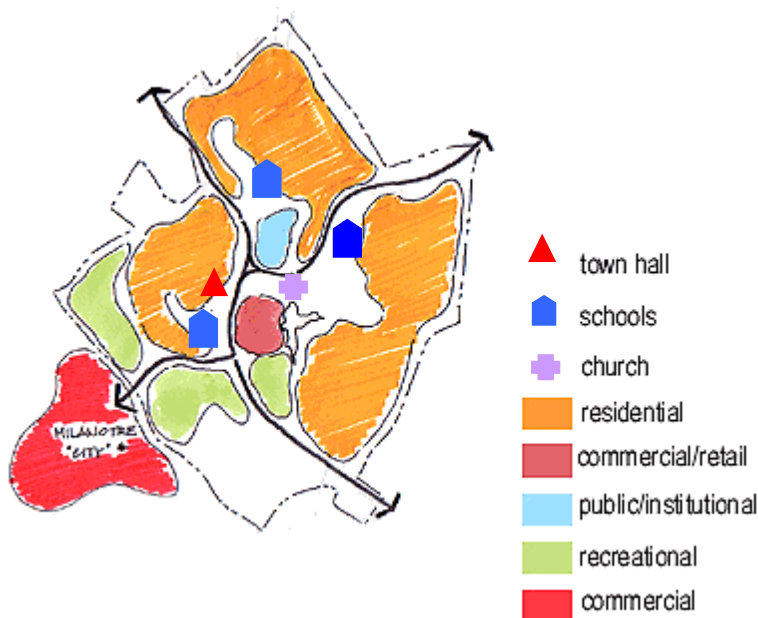
Milanotre was the most complete realization of Berlusconi's utopia. Its plan achieved goals that even the most sophisticated public housing projects had been unable to reach. The planners' selection of a site in a small town outside the boundaries of the city of Milan gave them flexibility and freedom necessary to break away from traditional schemes and from the rigidity of Milan's planning ordinances.


Figure 6 Milanotre's land use diagram shows residential zones separate from retail, commercial and institutional uses, all of which are located at the center of the new town. Notice the tertiary appendix (Milanotre-City) to the south. (Illustration by author).

4. Designing a new town

In the previous pages I discussed the vicissitudes that led to the planning of Milanotre and hinted at some of its innovative aspects. In this section I will investigate in depth some of these solutions and explain how they differed from traditional schemes for residential neighbourhoods.

a) Land use

The plan of Milanotre rejected the high density, land use conflicts, lack of open space, and infrastructural inadequacy that characterized traditional urban forms. Its land use diagram was dominated by residential uses with retail and commercial uses grouped in a town center located within walking distance of one's home. The functional separation of uses generated an environment quite different from the vital, interwoven pattern of activities that characterized the fabric of historic European cities (Gehl, 1980, p. 27).

By concentrating housing in tall apartment tower, the planners of Milanotre stated their adherence to the principles of modernism and created an urban setting similar to Le Corbusier's *Ville Radieuse (Le Corbusier, 1986).* Moreover the decision to cluster development in U and L shaped resident led to the preservation of vast amounts of open space. This resulted in a city that felt cleaner, safer and "greener" than any other Italian urban centers (Edilnord Progettazioni, 1976, p.11).

An important difference between Milanotre and other contemporary new towns was its lack of industrial areas. While in England and France new industrial plants were a pre-requisite success of the new towns, Milanotre became known as a primarily residential community. Years after its completion, its planners attempted to change this situation by introducing office and commercial spaces through the creation of a commercial appendix on the southern edge of site. Because of its location away from all residential and civic uses, Milanotre City promoted automobile use and reinforced a sense of separation between uses.[4]

b) Block structure

In urban design, the block is a key defining element of urban form." In order to understand its *forma urbis* it is necessary to look at the relationship between solids and voids that constitute city (Krier, 1976; Trancik, 1980). A figure-ground analysis of Milanotre reveals the dominance of voids over solids, as well as a block structure made of apartment towers organized in "U" or "L" shaped sub-units. In the eyes of the designers, these layouts would create pocket parks and playgrounds, which in return would create a sense of community. Despite this agreeable goal, the block structure appears "cookie-cutter" and monotonous. The monotony is accentuated by the choice of a standard architectural type, the low-rise apartment tower, which blends into the skyline of the new town. Such uniformity is broken only by the introduction of a few single-family and semi-detached housing units at the outer edges of the development, in isolation from the rest of the community.

Figure 7 Milanotre's figure-ground diagram showing its block structure and the U and L shaped building arrangements. (Illustration by the author)

Architecture

Like Clarence Stein and Henry Wright did in their plans for Radburn, NJ and Sunnyside, NY, Milanotre's designers emphasized the need to blend residential buildings into the existing landscape (Ruggeri, 2004, 165). In addition to the use of stucco and wood in their buildings, they oriented the towers so that kitchens and living rooms would face the playgrounds and neighborhood parks. This allowed families to observe their children as they played and to foster an increased sense of safety.

Milanotre's residential architecture was clearly inspired by modernism. Le Corbusier's inspiration was visible in their acceptance of the "tower in the park" model and the rejection of contemporary experiments with architectural "megastructures" like those of the French and British new towns. Berlusconi's team rejected the idea of an iconic architecture deciding instead to focus on environmental and landscape architectural features. Moreover, the uniform heights and discrete forms of the public and private buildings contrasted with the stylistic diversity seen in many traditional Italian cities.

The uniformity and blandness of the exteriors contrasted with the carefully planned interiors, designed to meet the needs of the residents and adjust to each family's specific needs (Edilnord Progettazioni). The idea of flexible, "custom-designed" layouts was innovative, particularly if compared to the standardized housing solutions offered by IACP public housing. As interior designer Isa Vercelloni wrote, Milanotre represented an attempt to "create a new kind of living, flexible, articulated, balanced" and centered on the needs of individuals and families (Edilnord Progettazioni, 63). It is in this tension between public and private, between individual needs and common good that lays the ideological rejection of Berlusconi's projects.
Figure 8 Diagram of the relationship between architecture and open space in Milanotre (Source: Edilnord Progettazioni)

Streets and circulation

Milanotre's streetscape can be divided into three categories: primary (arterials), secondary (connectors) and cul-de-sacs/streets (neighborhood). A system of primary arterial roads constitutes the backbone of the development, while secondary roads looping around the development provide access to the cul-de-sacs and neighborhood streets are with single-family and town homes. The cul-de-sacs penetrate the innermost areas of the new town and provide vehicular access to the garages at the back of each residential building.[5]

In Milanotre roads occupy only 5% of the total developable area, a significant improvement over traditional planning standards. This was the result of the use of super blocks to limit vehicular access. Roads were replaced by an extensive, grade-separated trail system promoting walkability as a primary means of connecting neighborhoods. While justified by concerns for children safety and pedestrian accessibility, the separation of cars from pedestrians had some drawbacks. The decision to take traditional activities like stores, cafes, and newsstands away from streets led to a dull urban experience. It also undermined the street's potential as a linkage between parts of the urban fabric (Trancik) and ultimately poorer overall imageability (Lynch, 1960).

Berlusconi's marketing efforts stressed the need for children's safety and their ability to "reach every area of the new town by bike or on foot "…without ever crossing a street or an intersection" (Edilnord Progettazioni, 45). [6] Increased safety was achieved through an extensive system of paths and pedestrian bridges providing easy and *car-free* access to every corner of the new town. Recent studies support Berlusconi's goals for more walkable residential neighborhoods. They show that walkability is best achieved when distances between destinations do not exceed 5 minute/quarter mile and by locating mixed-use and retail areas within a walkable range of housing (Southworth, 2003). A quick review of Milanotre's plan shows that most residents live farther than the comfortable ¼ mile radius from the town center and commercial areas of Milanotre City. This has resulted in an increased automobile use, as witnessed by the congestion of many parking lots.

Figure 9 Milanotre's pedestrian bridges allow residents to walk safely throughout the new town. Bus stops are visible at street level (Source: Milanotre Sales Office Promotional Material).

Open spaces and parks

Milanotre's planners believed that a livable environment would require the mixing of areas for recreation, work and dwelling. In the old urban centers these activities were placed far away from each other, forcing citizens to commute long hours to school or to work (Ruggeri, 164). By incorporating these activities within a comprehensive master plan, Milanotre's designers wanted to free up resident's time and encourage recreation and use of public areas.

Milanotre residents could count on an average of 430 sq. ft. of open space for active and passive recreation vs. the 16 square feet of Milan's residents. The new towns' open space system changes as one moves farther away from home, with playgrounds located next to residences, followed by neighborhood parks and ending in a picturesque central park with meadows and lakes. The park serves the multiple purposes, turning it into the equivalent of the traditional *piazza*.[7]. Acting as a backbone of the entire development, it houses public facilities like schools and churches while also separating neighborhoods into discrete units. Most of all, it is promotes Berlusconi's utopia and a new *bourgeois* lifestyle (Edilnord Progettazioni, 101).

5. Discussion: successes and failures of Berlusconi's new town

This paper attempted to fill a gap in the history of Italian city planning.
By shedding light on the convoluted process that led to the building of Silvio
Berlusconi's utopia. I attempted to do so by summarizing the history of landscape-driven
urban development in Italy and the forces that determined its rejection as an urban
development strategy in the Italian context. The following is a discussion of the five
main reasons for the failure of this utopian effort:

a. Public vs. private

The history of Italian city planning from its unification to these days is characterized by a
conflictual, almost schizophrenic relationship between national and local governments
and private enterprises involved in planning residential neighborhoods. On one hand,
the public played the role of the controller, passing restrictive zoning ordinances and
pieces of legislations whose intent was to limit abuses and speculative attempts. On
the other hand, with very few exceptions, the public relied heavily on the private sector
to provide housing to facilitate the massive internal migration fluxes required by the ups
and downs of the industrial sector. The result was that while large, comprehensive
developments were halted or found harsh opposition, while infill and piecemeal
developments were able to slip through the cracks of a poorly organized public
administration.

The skepticism of public administrators and academics toward private sector solutions
to the housing problem had deep historical roots in Italy's rejection of the partnership

between private and public, which reminded them of the *corporativism* of the fascist regime and the corruption it had generated (Blinkhorn).

b. The landscape as a social symbol

Richard Schein (1997) has recently written about the discursive nature of landscape architecture as a way to enhance the social identity of a place. Just like the American suburb, the landscape of Milanotre was the "bourgeois utopia" of the growing Italian middle classes (Fishman), a landscape that promoted a new lifestyle of success through a renewed relationship of the individual with nature (Foot).

There is no doubt that Berlusconi's agenda went far beyond the creation of a unique community. Through the new town, he wanted to offer an alternative model for society based on the needs and values of the Italian middle class. In the eyes of its planners, the landscape-based approach employed in the planning of Milanotre, borrowed from British and American precedents, spoke of he needs for a renewed personal connection between the individual and nature (Ruggeri, 2001).

c. The park as piazza

The story of Berlusconi's utopias highlights the intricate relationship between private and public interests in Italian urban planning decision. During the 1970s Milanese planners worked hard to reinforce the city's centrality and promote its viability as a world financial center. Meanwhile urban growth occurred at the city's edge, in working class enclaves built either by land speculators or by the public housing authority (Campos Venuti, 1996). While the public ignored the needs—both practical and ideological--of the middle classes, Berlusconi and his design team understood their demands for an alternative urban form and lifestyle, which he translated into form in his New Towns.

Contemporary public housing projects like Aldo Rossi's *Gallaratese* (1967-1976) embodied a theoretical interest in re-interpreting Italian traditional urban forms (Rossi, 1982; Conforti, 1981). On the contrary, Berlusconi's new town was designed with the goal to provide a superlative user experience. Its plan emphasized urban design, open space and walkability concerns over architectural form. The result was a pastoral landscape where the architecture almost disappeared (Ruggeri, 2001).

The focus on open space as a key component of a new town's public realm and the focus on needs and values of its users contrasted with the "socialist" agenda visible in Italian public housing, whose goal was to celebrate the public interest over individuality, community over family values. Berlusconi's call for a garden city in close contact with nature reminded many Academics of Mussolini's anti-urban attitude and thus could not be tolerated. It is no surprise that Berlusconi's utopias were never studied or replicated (Campos Venuti, 1986)

d. Urban design innovation: a missed opportunity

The new town of Milanotre could have offered Italian architects, planners, academics and students the opportunity to critically evaluate and learn from some of the innovative planning strategies employed by Berlusconi's design team. It would have also contributed to the beginning of a discussion on alternative urbanization patterns that may have been able to solve some of the most urgent issues of the time and the needs of the emerging middle class.

Instead, planners and politicians preferred to engage in a holy war against private developers and urban forms that did not fit the tradition they were familiar with. These included garden cities, Fascist planning precedents as well as Berlusconi's city-building experiments (Ruggeri, 2001). This may have contributed to the absence of a Landscape Architectural discourse within Academia and the practice, one of Italy's anomalies.

[1] The word "periferia" indicates both the location at the edge of existing urban centers and the qualities of that periphery, such as high densities, lack of well-maintained open space, and overall social decline.

[2] A key piece of legislation was the "Legge Ponte," Law 765/67, establishing parameters with regard to open space and limits to growth. However, it also introduced a mechanism by which local municipalities that did not incorporate these new standards into their plans would by default be prevented from denying anyone with a building permit. This resulted in a flood of questionable housing projects on areas otherwise protected from development (Campos Venuti).

[3] The contemporary plan for a residential neighborhood named "Quartiere Patrizia," conceived by prominent Finnish Architect Alvar Aalto, the development also found a harsh opposition in local union leaders and politicians (Ruggeri, 152).

[4] A recent survey sponsored by the municipality of Basiglio among children 5 to 13 years old showed that Milanotre City is considered by them as one of the "scariest" places in the whole new town, due to the absence of activities, particularly at night and week-ends (Source: Survey Ex Lege 285, Comune di Basiglio, 1999).

[5] Clarence Stein and Henry Wright were the first to use cul-de-sacs and community-garages in their residential developments. In Radburn, NJ cul-de-sacs acted as small parks, with lawns and trees. In Milanotre the cul-de-sacs are mainly used as visitor parking and access to the inner blocks and is devoid of any activities.

[6] The idea of separating different modes of transportation for pedestrian safety has been used by Frederick Law Olmsted in New York City's central park and by Clarence Stein and Henry Wright in the garden cities of Radburn and Sunnyside. The planners of Milanotre were drew their inspiration for a separation of circulation means came from Leonardo da Vinci's "Codice Atlantico," where the Renaissance artist had sketched a diagram of a city working at different levels, where roads did not cross one another thanks to the use of bridges. Leonardo had envisioned a pedestrian friendly city, where people would safely walk and pedestrian bridges would cross over vehicular streets, avoiding any dangerous intersections.

[7] The strong open space presence resonates in the resident's place identity. According to a recent survey, 50% of the children ages 5 to 13 consider parks and playgrounds as their favorite areas (Ruggeri, 2001).

"'In spite of the river' ought to be a Pittsburgh town slogan"

Edward K. Muller
University of Pittsburgh, United States

Today, Pittsburgh like many cities around the world has discovered the scenic, recreational, tourist, and even residential values of its miles of rivers and riverfronts. For more than a century, these lands were the scene of intense of industrial development and environmental defilement. Only the massive deindustrialization of the 1980s and its aftermath could inspire civic leaders to overturn the long held perception of the rivers and riverfronts as first and foremost integral parts of the region's urban industrial infrastructure. During the past fifteen years environmentalists, river advocates, a few planners, and eventually both developers and civic leaders have proposed various ideas and projects that reflect the reconceptualization and redevelopment of the riverfront lands. In recreational activity, scenic enjoyment, and ecological restoration, these projects emphasize physical and visual access to the rivers such that the rivers have become a significant aspect of the city's revitalization.

This recent discovery of the aesthetic and recreational qualities of the rivers is really a rediscovery. At various times during the twentieth century, an array of national and local planners and architects advanced plans for the central riverfronts, especially for the historic Point where the three rivers converge, which ran counter to the prevailing conception and use of these lands as primarily essential to the city's industrial economy. Both businessmen and public officials shared and retained this utilitarian view, even when more community-oriented visions emanated from civic organizations dominated by private leaders. Fiercely pro-business, pragmatic, and conservative, these leaders and their public sector allies set the parameters within which planners and architects had to operate and seek out small spaces of latitude. Despite Pittsburgh's adoption of public planning, the utilitarian perception of the rivers and riverfronts remained in tact. There was no real tension between public and private use, and thus Frank Lloyd Wright felt amply justified in 1935 in rendering his judgment that "'In spite of the river' ought to be a Pittsburgh town-slogan."

The path-breaking creation (at least for Pittsburgh) of Point State Park in the post-World War II era through the efforts of a powerful public-private partnership might have suggested a new outlook for the rivers, especially since commercial and industrial activities were already closing or leaving the central riverfronts---downtown, and on the South Side, the North Side, and the Strip District. The park explicitly took advantage of the site's scenic potential. But as late as the 1970s, when cities such as Boston, Baltimore, and Portland, Oregon were famously redefining their waterfronts, most Pittsburgh leaders had not yet grasped the great potential of the rivers for improving the city's quality of life and thus contributing to economic development.   As revealed by their ignoring the rivers in erecting two signature public projects, both public and private planning interests still perceived Pittsburgh's waterfronts as components of the region's industrial complex. The shift in the relationship between public and private leaders had not significantly altered this consensus.

* * * * *

Given the region's complex and challenging topography, development during the nineteenth century logically sought the flat, accessible floodplains of the three major rivers and their tributary streams. Despite the nuisance of annual high water events and periodic devastating floods, industry and adjacent residences lined the riverfronts by the beginning of the twentieth century. Little concerned with flooding, the U.S. Army Corps of Engineers was erecting locks and dams in order to enhance commercial navigation. By 1929 the three rivers, indeed the entire Ohio River to Cairo, Illinois had become a series of slackwater pools between the dams. Enormous tows of coal barges plied Pittsburgh's central pool and tied up along river banks. Shippers and manufacturers had hardened the river edges with bulkheads, erected giant circular mooring terminals, and extended the banks in places with fill. Both industry and local municipalities depended on the rivers for water supplies and the disposal of wastes. Engineered and intensely developed, the three rivers and their floodplains had become part of the urban industrial infrastructure.[1]

Pittsburgh's notoriously dismal landscape at the turn of the century---smoke-laden skies, soot-covered buildings, polluted rivers, and deforested and billboard-covered hillsides---spurred progressive reformers, design professionals, and civic leaders to advocate counter measures for beautification. Public works director Edward M. Bigelow, for example, initiated a park system in1890. Andrew Carnegie erected his cultural complex adjacent to the park in 1895, and his business partner and boyhood friend Henry Phipps donated a botanical conservatory there as well. By 1905 a civic center, inspired by the legacy of Chicago's World's Columbian Exposition and the then fashionable City Beautiful movement, was taking shape in the Oakland section of the city. Daniel Burnham was busy in town designing an office tower for Henry Clay Frick (1901), a grand terminal for the Pennsylvania Railroad (1902), and fourteen other buildings.[2] Indeed, during the months that Burnham was finalizing his plan for Chicago, sponsored by the private Commercial Club, Pittsburgh reform mayor George Guthrie, a prominent lawyer, and other civic leaders were moving inexorably towards creating a plan for Pittsburgh.

In this milieu, the Pittsburgh Architectural Club pressed for municipal improvements focused on downtown and Oakland. Beginning around 1900, the Club held competitions and exhibits with particular attention to the design of a downtown civic center of municipal buildings adjacent to H. H. Richardson's Allegheny County Courthouse. Reporting on its first competition, the Club also emphasized the necessity of improving the central waterfronts and the Point. The Point was already a run-down area of railroad tracks, warehouses, and old deteriorating residences. The adjacent Monongahela Wharf, once the heart of Pittsburgh's commercial life, had been decling for years as a result of the railroad's ascendancy in the 1850s. Although not the first lamentation of the unkempt character of the riverfronts, this competition inaugurated a century-long discussion and planning of these important central spaces.[3]

In June 1909, one month before the publication of Burnham's *Plan of Chicago*, the Pittsburgh Civic Commission [PCC], invited Frederick Law Olmsted, Jr., to consider preparing a plan for the city's main streets and downtown. Departing reform mayor George Guthrie appointed the PCC, a group of 18 leading private citizens, to address a number of social, political, and environmental problems highlighted by the embarrassing investigation of the Pittsburgh Survey. The PCC's decision to hire Olmsted culminated intense discussions about the value of planning led by the Civic Club of Allegheny County and the Chamber of Commerce.[4] After a year of intense research and consultation with both PCC members and public officials, the Brookline landscape architect produced his plan for Pittsburgh in 1911. Olmsted observed that Pittsburgh, like many American river ports, had neglected its main wharf, leaving it a "primitive," unpaved, sloping mud bank. Presciently comprehending the central problem in planning the city's riverfronts for most of the twentieth century, Olmsted deplored "the false impression spread abroad that economical and useful things were normally ugly; and … the vicious idea which followed, that beauty and the higher pleasures of civilized life were to be sought only in things otherwise useless. Thus, the pursuit of beauty was confounded with extravagance." He asserted that Pittsburghers, "familiar with the present neglected aspect" and "not familiar with the finer European quays," simply accepted the unsightliness of the riverfronts as the norm and could not conceive of the benefits of aesthetic improvements.[5]

Olmsted identified three uses for the riverfronts, which with proper planning could exist simultaneously. All improvements, he averred, would have to be coordinated with the recommendations of the Flood Commission that had yet to issue its report. However, he did not consder a flood wall, a likely and eventual recommendation of the Commission, as a problem for his proposals. Based on precedents in European cities such as Paris, Lyons, and Berlin, Olmsted envisioned modernizing the quays of both rivers in order to attract new packet boat trade, which he believed to be the riverfront's primary use. He wished to provide ramps down from street level to a wide, flat floating quay outfitted with cranes. A flood wall at the landward edge of the quay would protect the downtown and create a base for a wide street along its top. This street, the second use of the riverfronts, would be part of a traffic circuit around the edges of downtown, what he defined as "a wide marginal thoroughfare for the relief of traffic congestion… [by] diverting some of the main streams of heavy teaming from the older interior streets."[6] The idea of a circuit or loop around downtown along the riverfronts would become a persistent theme in the city's planning, and eventually a reality.

With an improved quay and wide thoroughfares, the city could concurrently develop the waterfront for its "value for recreation and as an element of civic comeliness and self-respect." For this third function, Olmsted proposed a tree-lined promenade along the circuit streets with benches and overlooks from which to "enjoy…the natural beauty of the river valley and the always interesting activities of which it is a stage." Although Mt. Washington across from the Monongahela Wharf was scarred and eroded, this leader of the nascent planning movement pictured its reforestation such that in combination with the rivers and their incessant hum of activity, the city's "spacious and impressive

landscape" would be restored. He urged the city to treat the landscape "with the respect which it deserves."[7]

Having presented his plans for riverfronts, Olmsted turned to the Point. He reviewed the geographical and historical meanings of this space and concluded: "Poetically, this spot, at the meeting of the rivers, stands for Pittsburgh." Although offering only a vague vision of its redevelopment, he implored civic leaders to consider the Point as a whole and in conjunction with bridges and traffic that converged there. But, whatever would be decided in the future for the Point, a plan must be, he advised, monumental, dignified and designed with the "best artistic skill."[8]

As a creature of the city's privately sponsored reform movement, the Pittsburgh Civic Commission soon became embroiled in a political squabble with the newly elected, Republican machine mayor, William A. Magee. Objecting that Magee had cherry-picked proposed projects rather than selecting them as part of a comprehensive plan, the PCC strenuously fought the mayor's large bond issue put to the voters as a referendum. However, the mayor did support planning and engineered enabling legislation for a planning commission through the state legislature in 1911. But, he also became embattled with his political rival, the public works director, whom he soon fired. Unfortunately, the director succeeded Magee as mayor and among other things eviscerated the new Department of Planning. In short, politics scuttled the harmony among civic leaders necessary for obtaining political consensus and public support for implementing Olmsted's proposals, including those for the riverfronts. Inaction resulted from political fractures, not conflict over priorities for use of the riverfronts.[9]

Over the years, planners wrestled with many of the issues for which Olmsted offered recommendations. While some of his suggestions became part of the landscape, the flood wall, circuit thoroughfares, and especially the Point remained central to planning over the next several decades.   Fortuitously, his plans for an elaborate reconstruction of the quays failed to move forward since river packet traffic never revived along the Ohio River. The Flood Commission's recommendations generally became entangled in federal politics and did not materialize until after the Great Depression.[10]   In the wake of the Department of Planning's diminished status, the new municipal Arts Commission and the Civic Club kept the idea of planning alive, particularly for the Point, until another private organization could revive it. Indeed, in 1913 the Commission engaged Edward H. Bennett, former partner of Daniel Burnham to prepare a plan for the Point, which like others was never implemented.[11]

* * * * *

At the end World War I, a group of business leaders formed the Citizens Committee on the City Plan [CCCP] at the instigation of local planner Frederick Bigger. The men undertook a six part plan as a means to reinvigorate the planning process and bring some order to this rapidly growing city. The six reports, together called *The Pittsburgh Plan*, targeted specific aspects of the city: playgrounds, parks, the major street plan, railroads, transit, and waterways. This second effort at comprehensive planning only a decade after the publication of Olmsted's plan revealed that his vision of the central

riverfronts as potentially having recreational and scenic qualities had largely faded from view. The renewed advocacy of a traffic circuit around downtown in the *Major Street* report again saw the streets paralleling the riverfronts as logical places to build the highways to relieve congestion, but this time without Olmsted's promenade and overlooks. The *Waterways* volume of the plan, published in 1923, emphatically stated that the riverfronts themselves were to remain primarily commercial infrastructure.[12]

Men from shipping and other corporate interests comprised the committee charged with preparing the *Waterways* report. An engineer from the office of St. Louis planner Harland Bartholomew, the consultant to the CCCP's planning effort, provided the technical expertise. Not surprisingly the committee defined the principle underlying all recommendations for the riverfronts as the necessity of nurturing extant industries and attracting new ones. To that end, the committee determined "it to be undisputed, that navigation interests have a prior right to the use of those portions of the City's waterfront which can be advantageously used for water transportation."[13] It predicted that the anticipated completion of the U.S. Army Corps of Engineers' improvements to the Ohio River would generate large increases in both barge and packet freight traffic. Consequently, the report recommended the retention of city-owned riverfront lands for freight handling and services. When public properties were used in another way for the community's interest, the report emphasized, they must not prevent the tying up of commercial craft or the erection of hoisting equipment. While the committee wanted the Monongahela Wharf left open for packet freight traffic, it proposed the construction of several rail-to-river freight terminals elsewhere along the central riverfronts, including the conversion of the deteriorating and infrequently used Exposition buildings on the Allegheny River side of the Point to such a terminal. As if foreclosing opportunities for public access to the rivers, these prominent business leaders supported the erection, wherever feasible, of substantial flood walls along the central riverfronts.

Instead of the predicted growth of packet commerce, the city experienced an enormous increase in motor vehicle traffic, especially coming into and through downtown. Traffic congestion in the compact downtown, which had always been a bad problem, became nightmarish in the 1920s. Between 1920 and 1927, the number of automobiles and trucks entering downtown daily increased by 71 percent to more than 90,000. Streetcars, buses, and horse-drawn vehicles pushed the total number of vehicles to above 100,000.[14] As it had a decade earlier, the rejuvenated Department of Planning ignored recommendations for commercial improvements on the wharves and focused on designing the circuit loop for automobiles, which would use the paths of least resistance and expense---the underused riverfronts of the Golden Triangle. During the 1920s and 1930s, several proposals by both the city and county planning departments and private groups advocated turning Water Street along the Monongahela and Duquesne Way along the Allegheny into high volume, high speed by-pass routes. They variously put forward schemes for six lane boulevards, elevated highways, and double-decked roads. All envisioned parking on the wharves. Some included streetcar rights-of-way and one even subways. Infrastructure, not aesthetics, remained the top priority for the riverfronts.[15]

Although civic leaders generally agreed on the necessity of these by-pass boulevards, agency conflicts, the complexity of converging traffic at the Point, and existing private uses on the wharves inhibited reaching a consensus on the details of a traffic plan well into the 1930s. The proposals struggled with the confounding presence of the old Baltimore & Ohio Railroad station on the Monongahela wharf, Pennsylvania Railroad tracks on the Allegheny riverfront, and the underused deteriorating Exposition Hall farther along that bank near the Point. Bigger supported an elaborate traffic circle to coordinate the converging traffic at the two bridges of the Point, but the Western Pennsylvania Exposition Society's vigorous efforts in the 1930s to revive its membership with a new multi-purpose civic center threatened his plans. The river business interests held out for commercial wharf improvements, while the Lower Downtown Businessmen's Association advanced an additional bridge entrance from the South Hills into downtown, which would potentially complicate traffic patterns along the Monongahela waterfront. Finally, the planning departments of the city and county acrimoniously disagreed on the designs for the loop around downtown.

Most of the proposals for riverfront boulevards incorporated flood walls and embraced minimal riverfront improvements in terms of landscaped river edges, tree- lined esplanades, or small parklets. The Department of Planning's "Report on River Front Development" in 1932, for example, displayed tree-lined boulevards skirting the edges of downtown, reminiscent of Olmsted's 1911 proposals. But, the city's chief planner Frederick Bigger, who generally shared Olmsted's views of city planning and was a founding member of the visionary Regional Planning Association of America at the time of preparing *The Pittsburgh Plan*, still granted priority to commercial and transportation uses along the riverfronts. As author of the CCCP's 1923 report on *Parks*, the fourth volume of the comprehensive plan, Bigger propounded the wisdom of some park development on the public waterfront for the recreational use of downtown workers and "the substitution of an embellishment in lieu of unimaginative neglect and ugliness." However, he proposed only small "rest parks" adjacent to bridge ramps, simply landscaped and furnished with benches. This minor concession to recreational and contemplative use was to come only after the "utilitarian" needs of streets, terminals, and transportation identified elsewhere in the city plan had been addressed. Although Bigger argued that human needs outweighed automobile storage on the waterfront, his plans did not reflect the principle, and parking occupied the Monongahela Wharf within a few years.[16]

In a 1935 interview for the *Pittsburgh Sun-Telegraph*, Frank Lloyd Wright denounced the condition of the city's river lands. In the previous fall, department store magnate Edgar J. Kaufmann invited the architect to the city with the prospect of several commissions, including a possible Civil Works Administration, multi-million dollar package of projects that involved wharf improvements and a flood wall.[17] The commissions never materialized; but after coming to the city, Wright glimpsed the reality and potential of the riverfronts. In developing Pittsburgh, he observed, the principle must have been "to hell with nature, and we'll get what we want in spite of her…." He described the city as huddled uncomfortably on both sides of the rivers, vainly trying to hold "together with bridges, more bridges and again bridges…'In spite of the river' ought

to be a Pittsburgh town-slogan." Although he suggested how the river valleys might have been sculpted for beauty, he issued his notorious, caustic remark:

> In all probability, it [Pittsburgh] will have to be abandoned some day, a rusty ruin to tumble into the river, keeping the river waters still stained with oxide of iron for another half century, meanwhile serving, at least, to mark the spot where one great phase of human endeavor, centralization, ended,…[18]

Despite Wright's remarks and years of inaction, civic leaders and planners were not yet ready to give up. The revival of the private, voluntary planning body in 1936 after a depression-induced hiatus marked a watershed in both planning and ultimately the implementation of plans into construction projects. Frustrating stalemates on several longstanding projects would be overcome in the ensuing years as the private planning body assumed an activist role in both planning and implementation. In 1936, Howard Heinz re-opened the offices of the Municipal Planning Association (formerly the CCCP), renamed it the Pittsburgh Regional Planning Association, retained long time Pittsburgh city planner Frederick Bigger as a consultant, and hired as executive director Wallace Richards, fresh from working on the Greenbelt project in Washington with Bigger. After courting the impresario of New York's parks and parkway development for several months, Heinz finally secured Robert Moses' consent in 1939 to prepare a report on solving the longstanding problems of traffic in downtown.[19]

When Moses' team came to the city in 1939, it encountered renewed energy for, but little progress in, redeveloping the Point into an historical park. In 1930 local advocates had lobbied Congress without success for authorization and funding. In 1938, several civic leaders approached the National Park Service with similarly unsatisfactory results.[20] But, the vague vision of a large complex involving some combination of monument, museum, restored forts, and parking, while simultaneously accommodating traffic, had been kept alive. Moreover, as a result of Heinz and Richards' insistent pressure to forge a consensus among planners and officials, construction of the Water Street improvement parallel to the Monongahela Wharf, one leg in the loop around downtown, had actually begun in 1939. The opportunity to obtain Public Works Administration funds, along with Washington's concern to upgrade Pittsburgh's infrastructure for defense reasons, had driven Heinz to push the unusual sunken, two-level Water Street design. Other components of the typical roster of downtown improvements, including Duquesne Way and the Point, still languished.[21]

Moses' plan, a slim report issued in November 1939, did not break new ground, as even he forewarned. The New York power broker reiterated the overriding priority of mitigating traffic congestion; all plans for the Point and the waterfront boulevards among other proposals had to bend to this concern. In considering the Point, he declared that "traffic rather than history must be the decisive factor in the reconstruction of the apex of the Pittsburgh Triangle and in the establishment of Point Park." Despite this arterial emphasis, Moses did recommend landscaping the slivers of land sandwiched between the highways and the rivers at the Point and proposed a large park nestled between the

highway ramps to the bridges. The ramps as they rose to the bridges would have, however, blocked views of the rivers from the park. He also urged removal of both the railroads and automobile parking from the waterfronts; and once the by-pass boulevards with flood walls were in place, he envisioned attractively landscaping the river edges and putting an esplanade on the top of the wall along Duquesne Way. In keeping with the traffic priority, he proposed bringing the much-discussed Pitt Parkway into downtown from the nearly completed Pennsylvania Turnpike along the Monongahela north shore to the new Water Street. As part of the parkway design, Moses advanced a small parklet with handball courts and a boat landing next to the Brady Street Bridge about one mile upstream from the Monongahela Wharf.[22]

In short, Moses' plan did not appreciably threaten the prevailing view of the importance of the riverfronts for infrastructure. Nor did it essentially alter the modest, longstanding aesthetic and recreational proposals for these lands. The large park at the Point and the softening of the river edges were to come only after the flood and traffic problems had been addressed. His report did alter, however, the planning process. Heinz and the PRPA were delighted, even surprised, at the favorable publicity attending its publication, and they resolved to take the lead, rather than remaining sideline advisors, in moving plans from the drawing boards to the contractors in the field.[23]

* * * *

The business community's determination to revitalize Pittsburgh resulted in the twenty five year-long, post-World War II redevelopment program, known as Renaissance.[24] It was initiated before federal funds became the catalyst for redevelopment among most other cities; orchestrated by a new nonprofit organization dominated by the city's major corporations, the Allegheny Conference on Community Development (or simply the Allegheny Conference); and led by the unlikely partnership of the Republican scion of the Mellon financial interests, R.K. Mellon, and the head of the Democratic political machine, David L. Lawrence. Renaissance reflected a changed relationship between private interests and planning. Through the Allegheny Conference, private leaders determined the agenda, used the nonprofit Pittsburgh Regional Planning Association for much of the planning, and exercised considerable influence at all governmental levels to implement projects.

Renaissance was a multi-prong, economic development strategy to retain locally-based corporations and attract new ones by improving infrastructure, the environment, and downtown. Not surprisingly, the economic development goals of the Allegheny Conference, echoing the 1923 *Waterways* report, registered little interest in the potential aesthetic and recreational qualities of the rivers, riverfronts, and surrounding hillsides. Civic leaders still could not envision them as assets in view of the industries still lining the riverfronts, the fleets of coal tows plying the rivers, and the visibly degraded environment. Although the new Allegheny County Sanitation Authority began treating sewage in 1959 for the first time in the city's history with marked improvement in the rivers' water quality, Renaissance leaders saw to the completion of the long-discussed circuit highways along the rivers, flood walls, and parking on the Monongahela Wharf.

Consequently, neither downtown waterfront was accessible to the public; nor were the industrial or abandoned river lands across from the Golden Triangle made more inviting under Renaissance projects.[25]

However, there was an important exception to business as usual. The pre-war conception of a large park at the Point gained momentum as Pittsburgh leaders pursued the redevelopment of downtown. They convinced the governor of Pennsylvania in 1945 to create a park at the Point. Park plans became coupled with an adjacent blighted area proposed for revitalization into a modernistic office complex, which emerged as Gateway Center in the 1950s. Complicated financial, political, and infrastructural issues delayed the final plans for a park.[26] A design controversy simmered between those desiring an historical emphasis and others like the chair of the Allegheny Conference's Architectural and Design Subcommittee Edgar J. Kaufmann who promulgated a bold, innovative statement symbolizing human progress. For the latter idea, Kaufmann again drew on Frank Lloyd Wright, who sketched a futuristic scheme in 1946. Wright's enormous three story, beehive-like structure set at the Point accommodated entering and exiting traffic at different levels with spiral ramps to circulate this traffic and incorporated a melange of entertainment, business, and government uses. The Allegheny Conference's delegation to Wright's studio at Taliesan West to inspect the architect's plan blanched at the radical and, in their opinion, impractical vision. By spring 1948 even Kaufmann had given up on his architect's design.[27]

The following year the Point Park Committee of the Allegheny Conference hired the New York landscape architecture firm of Clarke, Rapuano, and Holleran (experienced in working with Robert Moses) along with the local firm of Ralph Griswold and Associates to devise a traffic interchange at the Point as an alternative to the scheme favored by the state highway department. Traffic had always been the limiting factor in designing a park suitable for this historically and geographically significant site. Three years earlier Pennsylvania Governor Edward Martin had boldly approved the Pittsburgh Regional Planning Association's proposal to remove the existing Point bridges and erect two new ones a little farther upstream in order to provide more land for a park. This unprecedented decision meant that park considerations prevailed over traffic priorities. Once having solved the interchange problem, the same team turned to the park itself and by the early 1950s completed a design that for the first time since Frederick Law Olmsted's 1911 plan viewed the rivers and riverfronts, at least the portions near the Point, as aesthetic and recreational assets. With the highway interchange moved eastward away from the Point itself, Griswold and Rapuano emphasized an open westward view to the Ohio River for the park, punctuated by a symbolic fountain. Further, their plan provided pedestrian access to the rivers' edges. Making alterations as construction progressed, they extended the river banks by 50 feet and hardened them, embedded boat mooring rings in the new river walls, built a strolling trail around the Point, and placed a stepped seating space along the Allegheny for spectator viewing of river programming. Although critics doubted the efficacy of recreational use of a downtown park, subsequent activities in years to come justified the architects' intentions.[28]

As Point State Park was taking shape in the 1950s, the city engaged the Griswold firm to develop a concept plan for the riverfronts and hillsides. Pittsburgh Parks and Recreation director, Robert J. Templeton, believed that for all its emerging accomplishments and acclaim, Renaissance had ignored the potential recreational use and beauty of the city's dramatic topographical features. However, in view of the new park arising at the Point and the city's desire to be "modern," he detected an "awakening to the recreational and aesthetic value of its rivers and riverfronts." The purpose of the plan was to redress the longstanding neglect of the city's natural setting by creating "a unified program of adequate recreation and conservation." The planners noted that public purchase of some waterfront properties would stop their depreciation, enhance the value of adjacent private properties, and offer opportunities for public access. They predicted increased recreational boating and public demand for leisure facilities due to the growing free time of local workers. In his riverfront *A Master Plan for the Development of Riverfronts and Hillsides*, Griswold recommended that 20 percent of the city's riverfronts be devoted to walks and drives, marinas and launching ramps, picnic landings for boaters, river bank landscaping, and even an elaborate double-deck structure with docks, restaurants, swimming pool, terraces, and a roof top garden. In what surely must have seemed like incredible flights of the imagination, Griswold and his colleagues painted pictures of a great park on industrialized Herr's Island (two miles above downtown in the Allegheny River) like Skansen in Stockholm or Tivoli in Copenhagen. They proposed a walk and drive along the north shore of the Ohio River like those along the Charles River in Boston and the Potomac in Washington. Even modest suggestions for riverfront walks on the north shore of the Monongahela near an enormous slag dump and on the South Side riverfront near the Jones & Laughlin Steel Corporation's mill must have struck readers as far-fetched in the industrial atmosphere of 1959, though considering recent developments Griswold was remarkably prescient.[29]

At first glance, Point State Park and Griswold's *Master Plan* might have signaled a major change in the city's perception of its rivers and riverfronts. The new park at the Point did represent a departure in its recognition of the rivers as scenic assets, the expensive adjustment of traffic infrastructure to meet the needs of the park, and its being the outcome of a public-private partnership. The 1959 riverfront *Master Plan* embraced many of these same attributes, though it was a public initiative that would need private collaboration for implementation. Together, the park and the modest riverfront plan did constitute a growing recreational and scenic interest in the rivers and riverfronts. Sewage treatment had begun to improve water quality, though the rivers remained polluted by most measures. The dramatic clearing of the region's infamously smoky skies contributed to an increasingly upbeat, environmental attitude. Indeed, recreational boating showed signs of growth during the Renaissance years.

Despite the enthusiasm surrounding the emerging Point park, a new day for the rivers and riverfronts had not yet arrived. The park and its new accessibility to the river edges represented only a small portion of the still largely inaccessible central waterfronts, where automobile infrastructure precluded pedestrian use, except for a few hardy runners out for lunch time exercise. The 1959 master plan itself began by reiterating that most flat riverfront property must remain the province of industry, which supported

the region. Its objective was to find a "balance among the diverse interests" and, accordingly, it proposed making about 20 percent of the shore within the city, not just the central riverfronts, available for scenic and recreational uses.[30] Without the Allegheny Conference's enthusiastic adoption, nothing was accomplished. Instead, the planning and eventual construction of two major public projects embraced by the Renaissance partnership reflected the continued limited appreciation of the city's natural assets. Opening in 1970 to considerable fanfare, Three Rivers Stadium, despite its name and location on the Allegheny River across from Point State Park, had little direct contact with the rivers. The small, narrow, and hard-edged Roberto Clemente Park along the river provided some connection between the ballpark and the water, but the circular stadium enclosed spectators in a high-walled arena separating them from the facility's namesakes. Only the stadium's name and location, not its design, proclaimed its riverine attachment. Completed a few years later, the city's new convention center faced the interior of downtown, turning its backside of loading platforms and infrastructure to the Allegheny River. A quarter of a century later, the city redressed these two errors by orienting new stadiums and a massively redesigned convention center open to the riverscape.

<p style="text-align:center">* * * * *</p>

In the 1980s, Pittsburgh's "golden" era of industrial power and prosperity came to an abrupt end. Over the more than 100 years of industrialization and concomitant urbanization, civic leaders turned the rivers and riverfront lands into essential components of the region's industrial infrastructure. In so doing, Pittsburghers generally lost access to and contact with these primary geographical features. Polluted, crowded with enormous coal tows, enshrouded in smoke, and accessible to the public only by trespassing on industrial property, crossing dangerous railroad tracks, and negotiating muddy banks, the rivers did not seem either natural or scenic for most people.[31]

Civic leaders before World War I, during the interwar years, and after World War II wished to modernize their city in order to improve its image and conditions for business. At each stage, they feared the consequences for economic growth of not improving traffic circulation and upgrading the utility of the waterfronts. During three quarters of the twentieth century, proposals to caste at least part of the riverfronts in a different light by architects and planners from the nationally prominent Olmsted, Moses, Rapuano, and even the mercurial Wright to locally important professionals like Bigger and Griswold failed to overturn prevailing utilitarian conceptions. Indeed, most of these voices for providing some accessibility to the rivers accepted the primacy, even inevitability, of commercial and industrial uses, and tried to work within that constraint. But prior to the World War II neither private leaders nor public officials showed the strong commitment to work on behalf of such modest proposals in the manner that Charles Wacker and Walter Moody had for Burnham's Chicago plan.[32] Only after the war did private leaders, alarmed by dire predictions of dismal economic prospects, assume active roles in bringing about substantial change on the waterfronts. Even then, infrastructure concerns took priority with the exception of Point State Park.

Despite improving water quality, growing recreational boating, and the visible success of Point State Park after World War II, Pittsburghers would not relinquish their self-defined industrial identity until deindustrialization left it in tatters. The process of rediscovering the region's riverine character since the 1980s has been complicated, multifaceted, contentious, and exciting.[33] While Olmsted, Moses, and the others could not have envisioned the commercial and residential development now taking place along the rivers, they did foresee in broad terms the linear trails, parklets, boating facilities, and ecological regeneration transforming the rivers and riverfronts. But even here, they would be amazed at the extent of the transformation, for in their day the industrial imperative was just too dominant.

Private interest or civic duty? Early projects for the enlargement of Vienna, 1817-1857

Francesca Torello
Carnegie Mellon University, United States

A number of early projects for the enlargement of the city of Vienna preceded the famous competition for a master plan, officially announced in 1857, for the area that would then become the *Ringstrasse*.

Ludwig Förster, later one of the protagonists of the competition, presented one of these proposals at the first gatherings of the association of German architects and engineers (Leipzig 1842, Bamberg 1843). He even exposed a model at the public exhibition accompanying the third congress in Prag, in 1844, and in the same year published a three page description of his project on the *Allgemeine Bauzeitung,* the technical journal he had founded in 1836.[1]

The characteristics of this city enlargement proposal have been discussed before[2], in the effort of documenting comprehensively those phases of the debate about the *Stadterweiterung*, that anticipate the official announcement and the competition. These documents have been framed, together with the observations of literates and travelers, and with a number of *Verschönerungspläne* of more limited scope, as proof that the need for city enlargement was deeply felt by all levels of the population, long before 1857[3].

What has been revealed only marginally are the reasons sustaining the engagement of the technicians who prepared the plans, but even more the motivations of the patrons who were financing the work - and, we can imagine, choosing their architect also for his ability to reach a broader public and put the proposal in the spotlight.

The aim of this work is to shed light on the economic interests behind the proposals, especially, as was the case for Forster's, the ones overtly financed by groups of private investors. These in fact go far beyond the pattern of traditional aristocratic patronage and propose a far-reaching vision of the opportunities of intervention in the city, which suggests a new approach and a whole new set of motivations and objectives.
Why did these economic subjects feel involved in the debate on the future of Vienna, and why precisely at this moment in time? What was their purpose in financing a proposal, in having it submitted to the State administration, but also published and discussed by the public opinion?

A number of shifts occurred in the balance of private economic goals and public recognition of the necessities of the investors, first in the context of the political struggles and economic crisis of the Forties, then again in the time of exceptional growth called *Grunderzeit*, between the Fifties and the Seventies of the Nineteenth century.

The roles of investors and real estate entrepreneurs became more and more significant in the civil society, their goals obtained official recognition, and they even managed to direct public policies and decisions towards the *Stadterweiterung*.

Eventually, the Government was able to advocate direct control on the complex of the operations, to manage how this was organized, making it financially highly beneficial for the State itself, and at the same time was able to allow private investors to play a significant part in it, gaining their part through their investments and also through a system of tax reductions. The effects of the *Ringstrasse* operation on the market dynamics in the *Altstadt*, where such a policy of direct control was not applied, will show how the market forces obliged smaller private owners to transform and adapt their houses, thus allowing the Municipality, in this case responsible for the transformation of the area, to implement a policy of *Regulierung* without intervening directly.

The need for the city of Vienna to expand outside the internal circle of walls had been expressed at least since the late XVII century, together with the idea that reconnecting the city core with the densely built urban fabric of the outer areas would allow not only growth, but also the creation of a more stately image for the capital city of the Empire.

In the *Altstadt*, the old city, still enclosed by Sixteenth century defensive walls, great demographic increase had been grafted on an urban center of very limited dimensions, while a number of activities had been located in proximity to the Court, together with the urban residences of the aristocratic families[4].

The prohibition to build in the strip of land under military control called *Glacis*, which was partially bordered to the West by the river *Wien*, dated back to the XVII century[5]. In 1770, under Joseph II, the *Glacis* area had been leveled completely reorganized and both military roads and promenades had been traced, connecting the urban doors to the *Vorstädte*.

These "suburbs" had acquired a consistently urban character and hosted some of the most important buildings in the city, from religious ones, like churches and monasteries, to the secondary residences of aristocratic and bourgeois families, from hospitals, schools and military structures, to markets and even a river docking area. The constant increase of population in these zones and the related exuberant building activity had been triggered by tax relief measures and incentives to private enterprise, promoted by Emperor Leopold I in the XVII century.

Other suburbs, called *Vororte*, were instead situated in the outskirts of the city, externally to a second defensive structure, the *Linienwall*. Outside this line, which had never been completed and functioned less as military structure than as tariff border, had been situated as well the main railway stations of the city, the *Ostbanhof* (o *Staatsbanhof*) and the *Sudbanhof*, both built at the beginning of the Forties of the Nineteenth century.

The presence of the *Glacis* worked as an interruption to urban continuum. This had as a result functional difficulties, for example in the flow of people and merchandise. The physical disjunction in the city fabric caused as well the separation of some institutional activities, a scattered localization of offices, while at the same time exacerbating the hygienic and crowd-control problems due to high density, in the walled area of the *Altstadt*.

At the same time, it also meant a huge limitation to economic growth and investment, especially in the sector of real estate. While the city in the first half of the Nineteenth century was not yet invested by the phenomenon of industrialization that had taken momentum in other areas of Europe - and the shops and factories where still limited in dimension and mainly situated outside the *Linienwall* - the dramatic shortage of available land to build upon was having a huge impact on the possibilities of investing in real estate activities. Especially in the most attractive zones of the city, which were situated near the state administration buildings around the Court, it was difficult to provide plots of land of sufficient dimensions to capture real estate investments. Generally speaking, the capital city of the Empire, before 1857, provided very limited opportunities for this kind of business, especially if compared with the other main cities of Europe. In fact the Austrian upper classes, while supporting an official residency near the *Hofburg*, were investing in "suburban" upscale areas or built their castles and estates in the countryside, leaving the city to middle class state officials and bourgeois families, which could not reside too far away from their businesses and offices.

The intervention of private actors in the debate about the city enlargement happens as early as the beginning of the XIX century, but around the Forties, still under the rule of Emperor Ferdinand, a new pattern appears, as the proposals are sponsored by groups of investors. A project by Cerrini is dated 1839; the one by the so-called *Proponenten-Comité* is presented in 1840; the already mentioned plan by Förster is published in 1844.

These projects were designed by famous participants in the early debate about the future of the city. Cerrini was a military, and he had already presented a proposal for the expansion of the city in 1817, while Förster was a professional architect and professor at the Academie, as well as the founder of the journal *Allgemeine Bauzeitung*, and the author of some eight proposals of city expansion before becoming one of the winners of the official competition in 1858.

The most interesting feature of these proposals is that they were paid for by associations of private citizens: the proposal by Cerrini was commissioned by a number of famous commercial companies of the city, which represented as well some of the richest families: Rothschild, Sina, Geymüller, Arnstein, Esceles, Coith e Pereira; the 1844 project by Förster was commissioned by an association of banks.

The interest in this context for the proposal of the *Proponenten-Comité*, a group of technicians of the municipal administration, comes from the observation that in the same year, Karl von Bruck associated with them to propose the construction in Vienna

of a theater on the model of "La Fenice" in Venice, which had been realized by an association of private investors just before the end of the Serenissima. The presence of von Bruck on the scene is another interesting signal that the question of the expansion of the capital city was becoming an issue of interest for commercial enterprises: in fact, von Bruck was an influential trader from Triest, later commercial consul in Portugal, founder of the Triest Stock-exchange and of the Österreichischen Lloyd. He will end up being Minister of Commerce between 1848 and 1851 and Minister of the Finances between 1855 and 1860.

The text that Förster wrote and published on the *Allgemeine Bauzeitung* in 1844, refers that "some of the principal banks of Vienna" had commissioned him this plan, based on precise measurements and accompanied by concrete indications for realization, considering that it would be in the interest of the Administration of the State to entrust the realization of the city expansion to an association between capitalists, following the recent examples of many European and American cities where entire areas had been realized thanks to private investment". In fact, it is underlined how the involvement of private capitals would lighten the load undertaken by the State Treasury for an operation as wide ranging as the enlargement of the city, while it tends to present the operation as a civic duty both for the architect and for his patrons. The proposal includes the design for three different areas of the city, situated to the North of the city core, where the circle of walls was rejoining the Danube canal, the plan for each of them structured on a perpendicular grid. While a number of public buildings are included in the project and seem to get all the attention, the three expansion areas also provide a large amount of residential spaces, just broadly sketched as quadrangular blocks.

At this point of the story, it seems necessary to consider why these proposals were all produced in the Forties, and to reflect on the motivations for their rejection. At the same time, it is possible to consider the effect the thrust from these lobbies of investors had in subsequent years, especially after 1848.

The accession to power of Emperor Franz Joseph marks the return, after the Liberal Revolution of 1848, to a conservative, neo-absolutistic political line. After the Constitution granted during the Revolution had been revoked, the State was once again under the direct and centralized control of army and police forces.

At the same time, the line of the Crown after 1848 is characterized as well by the cautious conservation of some of the political concessions of the revolutionary times.[6] In fact the political aims of the Habsburg, intent at recreating their legitimacy as well as maintaining the cohesion of the Empire, required the support of the middle classes, in Vienna formed by a mixture of "service aristocracy" (*Dienstadel*) and middle and high bourgeoisie, which as a matter of fact was the holder of real economic power. The support of these groups, weakened at the time of the direct involvement of the Habsburg Court in the repression of the liberal revolts, needed to be won back. These same classes were also the most deeply rooted in the urban cosmopolitan environment of the Capital city.

Moreover, the 1848 revolution had "convinced the government officials of the need to consider the multinational character of the Habsburg Empire" and brought some of them to recognize that it was possible to prove the legitimacy of the Empire[7], if the many nationalities that were part of it could be brought to acknowledge its common history.

The city of Vienna, "capital of the Empire and seat of its administration", being in itself the symbol of the reorganization and centralization of the state under Franz Joseph, was also the place where the cultural policies of dynastic reaffirmation and cohesion of *Großösterreich*, the "Great Austria", were realized in concrete terms.

It is not by chance that the report by Cerrini, accompanying his project, emphasizes how the city extension would offer the interesting political opportunity to create, in proximity to the city core, a residential area to be destined to the rich and the aristocrats coming from all the various provinces. This would encourage the closeness and even the mix of the different ethnical groups, re-introducing at the same time a cluster of high level population near the decaying city center, and thus also re-equilibrating the proportions of social provenance of its inhabitants.

One of the most important results of the 1848 Revolution, regarding the Capital city, was in fact the integration into the urban area the wide crown of external areas called *Vorstädte*.

The objective was mainly economic, as this integration would allow for a more rapid passage of people and merchandise. A first proposal in this sense is contained in the document *Entwurf einer neuen Gemeindeordnung der Stadt Wien*, elaborated by a commission of experts in May 1848. In October of the same year, for the first time were held elections for a *Gemeinderat*. Even if the voters, compared to a Viennese population exceeding the 300.000 people, was barely of 8000, and even if the *Gemeinderat* was eventually dissolved just one month later, this first official act contributed to a first identification of the *Gemeinde* as the smallest unit of the civil administration. In 1849, the new Interior Minister, Count Franz Stadion, produced a *Skizze zu einem Entwurfe einer künftigen Gemeindeordnung für die K.K. Haupt- und Residenzstadt Wien*[8]. The urban limit had to be extended outside the *Linienwall*, including in the municipal area both the suburbs of the first crown, or *Vorstädte* and the most external ones, or *Vororte*.

The Viennese élite resisted the project, concerned with the huge expense that would be required to equip with urban infrastructures the more peripheral areas, which could not be evened out through the limited revenue these areas could possibly generate. For this reason, in the urban limit was at the time included only the area comprised inside the perimeter of the *Linienwall*.

The *Provisorische Gemeindeordnung* was then signed by the Emperor during the next year, realizing the administrative (and thus electoral) annexation of 34 *Vorstädte*, as seven new *Gemeinde*. The inclusion of the *Vorstädte* to the capital city was then

realized from the administrative point of view well before it was concretely carried out in the physical reality, with the construction of the *Ringstrasse* area, after 1857.

Only from 1856, though, it is possible to reconstruct a decisive shift in the position of the Emperor, in favor of the needs expressed by the civil society against the opposition of the Military. In fact, a project of reorganization of the internal fortifications, prepared by the Military Chancellery, was not even taken into consideration, as "no obstacles should be put in the way of the expansion of city and suburbs".

In the sitting of April 17th, 1857, the Emperor finally expressed the desire, that "the long postponed and each day more urgent question of the enlargement of the internal part of the city of Vienna could finally find a definitive solution"[9] and ordered the creation of a Commission to draw up a plan. The internal fortifications of the city would be abandoned and on the *Glacis* area would be placed the necessary public buildings, wide squares and open areas.

This change might surely be connected, as many have suggested, with the drifting away of the memories of the popular risings of 1848, which for a long time had supported the claims of the Military, that the walls were needed for the protection of the Emperor from the crowds. This had put the Military in a situation of political centrality and high influence on the Court.

The fundamental motivations of this change, though, have to be found in the difficulties of the Habsburg Empire at the international level, and especially in the economic sector. These factors were creating for the Emperor and the Court a number of preoccupations that had higher priority than the military ones: the financial struggles of the State and the difficulties of the lower strata of the population could create conditions that were far more destabilizing and in the long term and also more dangerous than the risings the Military were constantly fearing.

In the final phase of the debate for the *Stadterweiterung*, the military hierarchies were apparently and constantly losing ground and in some occasions even losing control of the facts happening under their noses[10], while it appears clearly that the decisions publicly attributed to the Emperor have been carefully prepared in advance by the Government.

It seems evident that the upper classes, especially those which were directly involved in business and financial activities, were lobbying and pressuring the members of the Government to reach a decision that since at least twenty years they were envisaging as a solution to many problems of the city, with a welcome series of advantages for private money. The higher classes and especially the richer bourgeois families that were interested in finding ways of producing richness, apart from production and commerce of luxury goods for the Court, were highly interested in the opportunity that the *Glacis* offered of unoccupied land, where investments in real estate could be made at a larger scale, and in areas of very high value, next to the *Hofburg* and the old city but not

compromised by nearby presence of lower classes settlements, hygienic problems, high density or existing low quality buildings.

The implementation of the *Ringstrasse* intervention, in the times between the 1858 competition and 1873 (the huge crack of the *Börse*), demonstrates that their calculations were going in the right direction. A huge number of new building enterprises were created and the building sector in the Capital was growing steadily, making the fortunes of many.

The initiative regarding the enlargement of the capital city had in fact been assumed by the Minister of the Interiors, Alexander von Bach, who had defined a precise political vision of the *Stadterweiterung* and a precise strategy to obtain its realization.

In fact, early in 1857 the Minister had been engaged in deftly influencing public opinion. I the spring of 1857 the newspaper *Die Presse* published three articles under the title "The architectural future of Vienna"[11]. Vienna is described as inadequate for the needs of life in the "industrial century"; the defensive walls will have to be demolished *because the city needs space for new buildings*; and "the weight of a great state is measured by the greater or lesser splendor of its Capital city"[12].

Meanwhile, a long time before the official announcement of the *Stadterweiterung* was made, the administration of the Interior Ministry was at work to prepare its realization.

The role of the Minister von Bach regarding the city expansion will have to be considered as decisive: he was able to influence the opinions of the Emperor, to manage the consensus of the public opinion, to create lobbies even by way of secret agreements, revealing a search for effectiveness and great clarity of intents.

At the same time, as could be argued from the disappearance of a reference to expropriation rights from an earlier draft to the definitive version of the official bill announcing the *Stadterweiterung*, the Minister could enjoy in his endeavors a strong support from the same entrepreneurial upper classes, which were going to benefit financially from the enlargement of the city.

At this point, it becomes necessary to take a look at how the complex administrative machine managing practically and financially the *Stadterweiterung* was organized and which actors in the end were able to gain from it.

The first phases of planning regarding the city extension see the struggle between the Government and the local powers, especially the *Gemeinde*, or municipal power. The latter claimed its right to be involved in the transformation of such an important part of the territory under its jurisdiction. This strife was mainly caused by financial motivations: the tax reductions, which were granted to support the intervention of private capitals in the plan, and to promote the rapid conclusion of building activities, were making a dent not only in state and provincial earnings, but also in the contributions received by the city, for a time extending in some cases to 30 years.

With the approval of the new *Bauordnung* for the city of Vienna, in 1859, the power is definitively and indisputably put in the hands of the Ministry of the Interiors, through the creation in its ranks of a new *Baucommission*, which had preeminence both on the military commissions and on other city magistrates in charge of private building activities. The *Stadtmagistrat* in fact maintained only competences on public hygiene and fire control in the city, while it was the new commission to be in charge of deciding the number of floors (*Niveau*) and the profile (*Baulinie*) of the new buildings. At the same time, at the Ministry of the Interiors was also created a specific *Stadterweiterungscommission*, in charge of the management and control of all the activity connected with the extension plan, including activities ranging from the management of the demolition of the walls to the construction of the new public buildings supported financially by the State.

The almost complete area of the *Glacis* and of the fortifications was military property. When the dismantling of the walls was decided, in 1857, all the terrains originally under military control were automatically put under jurisdiction of the civil administration, with the motivation that their original military purpose had ceased to exist.

From this property change were excluded only the areas that kept their military purpose, like those already singled out for the construction of barracks, or still in use for military activity, like the *Paradeplatz*[13] and the areas pertaining to the Court, like the terrains adjoining the *Hofburg*, and the vast open area facing the Palace towards the baroque horse stables, where in the next years the construction of the so-called *Kaisersforum* was discussed.

In 1859 an Imperial act stated that these terrains would directly be put under the jurisdiction of a new fund, the *Stadterweiterungs-Baufonds*, which had been created at the Ministry of the Interiors at the same time as the city expansion commission.

There are a number of interesting aspects to this machination: first of all, the Military were stripped of their most interesting - and valuable - real estate properties, having received in compensation outer city areas, like for example the one where the Arsenal was built, but no payment.

Then, the change of ownership happened directly, and did not include a preliminary stance under the Ministry of Finance, as was normally the case, in a procedure that was used in other similar situations in other European cities.

The new *Baufonds*, as the commission of the same name, was put under direct control of the Ministry of the Interiors. It was even legally protected, from the very beginning, from the risk of aversion of its funds from their original purpose, being by decree put out of reach of the ordinary State budget. The proceeds of the sale of the *Glacis* terrains to the private investors, which was one of the activities of the *Baufonds*, could not be employed for anything different from the realization of the city extension, nor could they be averted to sustain the deficit of the State. The *Baufonds* would sell to the privates certain areas of the available land, using all the profits to finance the realization of the

city extension, from the construction of public buildings to the necessary urbanization works.

The creation of the *Stadterweiterungsfonds* and they way it was organized were the real winning stroke at the end of all discussions: the *Fonds* was a strong instrument in the practical and financial management of the entire extension operation, and it guaranteed its substantial economic independence, considering both contingent economic factors and a potential political instability.

Another important aspect of the financial management of the plan though was the support to an ordered and rapid growth of the new areas through important tax relief measures, in favor of those who were investing and building in the frame of the new lot areas.

Tax exemptions on real estate properties were a very important policy instrument in this age, when the fiscal pressure on real estate could be as high as the 37% of the gross income. The tax reductions could reduce of half or one third the owed sum, for a time span that could be as long as twenty years for building refurbishments and even to thirty years in the case of the new buildings along the *Ringstrasse* (which also received a ten years reduction on municipal taxes).

While the area of the Ringstrasse was built, with the great support of the administrative and financial stuctures we have considered, a process of transformation was going on as well in the *Altstadt*, the old city originally surrounded by walls. Only in the time span between 1859 and 1869, more than 1500 new houses were built, while more than 2800 were completely restructured[14].

This process, known as *Regulierung*, was as well imposed from above, through a series of smaller plans (*Parzellierungspläne*) based on the reorganization of the street network. In this case the responsibility was left to the *Gemeinde*, reducing the means employed (and the real control on what was being built). The *Altstadt* in fact was less interesting for the investors, because it was not offering enough free land space for investments and new construction.

The rapid realization of the planned interventions was also in this case supported mainly through tax relief measures, but the most effective stimuli came in reality from the market itself. In fact, one of the effects that the availability of new plots and the appearance on the market of the new residential areas of the *Ringstrasse* had had on the housing market, was that the owners of the *Innenstadt* were directly interested in revamping their properties as quickly as possible, to be able to compete with all the new offerings.

The centralized system, both from the point of view of decision making and economic management of the city extension, was one of the elements of success of the Vienna *Stadterweiterung*. It would also be possible to quote as another element, explaining the good outcome of the enterprise, the fact that the small structure of the Viennese élites had as a result the presence, at the various levels of the State administration, in the

banks, in the Stock-exchange, and in the real estate companies, always of the same actors, all more or less connected between them by familiar or social ties. As a result, personal relations were supporting deals and decisions, information was exchanged with great rapidity and the management of power was in reality not as strictly hierarchical and complex as the structure of the State would have suggested.

The real difference, though, accounting for the great success of the *Stadterweiterung* in Vienna, especially if compared, for example, with the struggles of the Baron Haussmann in Paris, is the public property of the land, which eliminated all the political and financial difficulties connected with that dangerous instrument called *expropriation for public utility*[15].

"In the name of development, do not make us refugees in our own homeland." Contestations around public interest and development planning in Sikkim India

Vibha Arora
Indian Institute of Technology, India

> "As I walked round the site I thought that these days the biggest temple and mosque and gurudwara is the place where man works for the good of mankind. Which place can be better than this, this Bhakra Nangal…" (J.L. Nehru, *Temples of the New Age*, speech given by him while dedicating the dam in 1954).

Dams have become "political symbols of conquest of nature, representative of progress, and the development of a modern state."[1] They attained iconic status as temples of modern democratic India and national achievement during the Nehruvian period. Following such a model, Himalayan Sikkim identified hydropower generation as the critical variable and cornerstone of its development planning after joining the Indian union in 1975. Meanwhile, the top-down spectacular liberal development model of dams and hydropower projects imposed arbitrarily without public consultations became questionable and unacceptable to tribal and other rural constituencies who were uprooted, displaced, impoverished, and made destitute in the name of public and national interest. Hence, the eighties saw questions of equity and justice taking centre stage with mega dams and multipurpose hydropower projects no longer being considered symbols of national progress, sacred or above public criticism.[2] Simultaneously, modern technocratic top-down development planning and its practice by experts have been critiqued by the anthropology of development.[3]

Impervious to widespread critique of development and hydraulic gigantism, the development planners in Sikkim have identified cascade development of the perennial river waters of Rangit and Teesta rivers[4] as the panacea for modernizing Sikkim's economy, generating employment for its youth,[5] earning revenue to offset fiscal deficit and servicing its debt, financing human development, and meeting domestic and national energy requirements. Speeches by political representatives in legislatures and administration in press and public reports continually circulate a performative rhetoric of people-centred development in Sikkim.[6] The government maintains that they have obtained the necessary environmental clearances for hydropower projects and followed a participatory approach to implement them in public interest.

Institutions, state, and social groups enter into contingent interactions in complex situations to express power and exercise control over resources. Highly amorphous, the idea of public interest has become a manipulative symbol. This rhetoric interrelating dams and public interest is not going unchallenged within Sikkim. Three Lepcha youth affiliated to the Affected Citizens of the Teesta (ACT) and the Concerned Lepchas of Sikkim (CLOS) with the support of the Sangha of Dzongu began an indefinite relay hunger strike on 20th June 2007 at Gangtok[7] to pressurize the government into revoking

the power projects on river Teesta. The Lepcha activists banner proclaiming, "In the name of development, do not make us refugees in our own homeland [Sikkim]" and another asserting, "Dzongu is the holy land of the Lepchas. Lepchas have the responsibility to protect it," challenge definitions of what constitutes public interest in Sikkim.

Lepcha legislators including Sonam Gyatso Lepcha (the MLA of Dzongu) assert that the development prospects offered by hydel projects are being welcomed by the Lepchas of Dzongu wherein the majority of the residents have accepted them. The state government maintains that if there are some protesting voices, pleading voices of *some* Lepcha youth sitting on indefinite hunger strike, then they are marginal, anti-national and simplistically by any interpretation profusely anti-Sikkimese. This is precisely how the Chief Minister of Sikkim, Sh. Pawan Chamling framed the Affected Citizen's of the Teesta and their leaders during his public speech on the occasion of the Indian Independence day celebrations on 15th August 2007 at Gangtok in Sikkim.

Emergence of public protests by Lepchas in alliance with other civil society organizations signal the deep-seated contradictions and contested meanings of public interest and rejection of nationalist projects that could culminate in a loss of culture and identity for the indigenous ethnic minorities. For these agitating Lepchas, rivers are not merely watercourses and natural assets but the central loci of socio-cultural heritage, and their religious beliefs and practices. In this paper, I analyse the contested formulations and perceptions of public interest and development in Sikkim in order to reiterate the need of not ignoring but integrating culture in any project planning. The first section of this paper discusses the privileging of hydropower model of development in Sikkim. Following cultural ecology, the second section explains the emergence of recent protests demanding closure of hydropower projects in Dzongu and the trajectory of their non-violent oppositional politics. In the final section, I argue that development in Sikkim has become both a contested discourse and a site of identity politics. Tracing the continuities of the Teesta hydropower protests with the Rathongchu movement, I emphasize the need of participatory planning and decolonising development by integrating culture in development.

1.1 Development through hydropower

The recognition of Shri Pawan Chamling, the Chief Minister of Sikkim as the greenest Chief Minister in the country in the year 1999 epitomizes the policy, administrative, and legal initiatives and efforts articulated by this Government over the years in the field of environment and sustainable development. Over the years, he has spearheaded a relentless movement towards inculcating a better environmental ethics in the people, benchmarked development to ensure ecological security, forbade projects and programmes contrary to sustainable development, legislated stringent measures for better conservation and protection of the flora and fauna of this beautiful State (Towards Greener Sikkim, http://www.sikenvis.nic.in).

Located in Northeast India, Himalayan Sikkim measuring 7096 sq km is inhabited by about half a million persons (540, 493) people[8] belonging to 22 ethnic groups. These diverse ethnic groups are classified into three broad categories: the Lepchas, the Bhutias and the Nepalis.[9] In 1975, the underdeveloped erstwhile Buddhist kingdom of Sikkim joined the Indian Union. A democratically elected "super-active government"[10] was given the responsibility of economically developing and modernizing the 22nd Indian state of Sikkim. The population of Sikkim is predominantly Hindu (68 per cent), and the Buddhists comprise a large majority (27 per cent), while the Christians comprise a small component of the population (3 per cent).[11] About 20.6 per cent are Scheduled Tribes[12] while the Scheduled Castes (exclusively of Nepali origin) comprise about 5 percent of the total population. Official discourse continually highlights government's development intervention, the maintenance of social harmony among an ethnically plural society and political stability as a defining feature of this model state of democratic India.[13]

As a special category state (SCS), economically Sikkim is largely dependent on preferential funding from the Central government.[14] SCS receive substantial financial and non-financial support from the national government in the form of 90 per cent as grants and 10 per cent as loans. This ratio is 30 per cent grants and 70 per cent loans for non-special category states.[15] After joining the North-East Council in December 2002, Sikkim has access to additional funding for developing infrastructure, roads and transport, communications, and alleviating health, education and poverty.[16] It is maintained that post-1975, nearly three-quarters of the state budget is spent on development activities,[17] although expenditure on salaries and interest-payments nearly pre-empt most of this.[18] Despite protracted government interventions in the last 30 years, Sikkim ranks fifth among all Indian states in terms of poverty.[19] More than 40 per cent of its population is living below the poverty line.[20] Industrial development has been a low priority although the tertiary sector has been expanding steadily with the growth of tourism. Therefore, structural shift has been much slower that other parts of India with agriculture continuing to contribute nearly 49 per cent of state domestic product.[21] The sectoral distribution in 1995-6 was about 52.03 per cent in the Primary sector, 13.65 in the Secondary sector and 34.31 in the Tertiary sector.[22] Further details about development planning and state of human development are available in two official publications namely *Sikkim Human Development Report* (2001) and *Sikkim: The People's Vision* (2001). Consequently I will not be dwelling on them at length.

Sikkim's biodiversity rich landscape and waterscapes possesses immense ecological and developmental value. The innumerable streams, gushing waterfalls, abundant rain, perennial river waters of Teesta and Rangit flag off the immense potential of developing hydroelectric projects here. Sikkim is defined as the landmass constituting the river basin of the turbulent Teesta. The river originates in the Himalayan glaciers at 8598m rapidly flows downstream cutting deep gorges to drop at 213 m in Melli within an aerial distance of 100km.[23] Various tributaries join the main river to demarcate a natural divide between North and South Sikkim.

Hydel projects are not new but can be historically traced to the 50 KW Ranikhola micro-hydel project commissioned as far back as 1927 to cater to the needs of the royal family

and residents of Gangtok, Sikkim.[24] Most existing hydel projects are stated to be run-off-the-river scheme.[25] Historically until end1979, Sikkim had a total power generation capacity of only 3MW with only a few towns being electrified.[26] The shelving of the Rathongchu Hydel project on eco-social and environmental grounds in 1997 has had a profound impact on meeting the energy demand-supply gap in Sikkim and crystallizing nativist sentiments among the indigenous people.[27]

It is very much possible for Sikkim to achieve self-sufficiency in power generation by designing mini-micro hydropower projects,[28] which will neither displace nor disrupt people's livelihood and cultural practices. Nonetheless, its gigantism and mega projects with their tremendous capacity to alter social and natural worlds that are favoured by the modernist state. Hence in 1998, the Sikkim Power Development Corporation Limited was founded to provide cheap pollution-free electricity by following a project recourse financing approach to exploit its vast hydroelectric potential.[29] The Sikkim government has pinned high hopes on cascade development of the river Teesta in six-stages through 26 hydropower projects to generate an estimated capacity of 3635 MW. Various private developers of national and international (dis)repute are involved in implementing these. Table 1 below summarizes the cascade development of Teesta. Companies maintain that the efficient facilitative environment being provided by the state government and expected future profits are magnetically attracting them to Sikkim. As Y.N. Apparao Managing Director of Teesta Urja Ltd that is setting up the controversial 1200 MW Teesta III shared, "we took up the project because the Sikkim government is proactive and quick in decision-making…Land acquisition, along with forest and environmental clearance, took less than two years."[30]

Table 1: Teesta Hydroelectric Power Projects[31]

HEP Stage	Area/location	Installed capacity	Remarks
Teesta I	Zemu Lake	320MW	Under study
Teesta II	Lachen-Lachung	750MW	Under survey
Teesta III	Chungthang	1200	Environmental Clearance has been given to Teesta Urja Limited
Teesta IV	Singhik	495MW	EIA under study by NHPC
Teesta V	Dikchu	510MW	Completed by NHPC
Teesta VI	Shirwani/Rangpo	500MW	Environment Clearance was given to LANCO

The explicit purpose of Environmental Impact Assessment (EIA) is to assist in scientific decision-making process based on environmental and socio-economic studies to ensure projects are economically cost-effective, environmentally sustainable and do not

flout norms of social justice. EIA studies identify the interventions necessary for mitigating the adverse impact on the ecology and preparing an Environment Monitoring Plan (EMP), the Catchment Area Treatment (CAT) plan, Disaster Management Plan (DMP) and formulate a Relief and Resettlement (R&R) policy. These studies are a prerequisite for obtaining any clearances form the Ministry of Environment and Forests, Government of India and obtaining a No-Objection certificate form the State Pollution Board. Environmentalists such as Ashish Kothari and Shekhar Singh point towards utter disregard of norms laid out for conducting EIA and the lack of accountability and transparency in implementing projects.[32] "In almost all such cases "NGOs and affected people have protested, pointed to violations and destructive implications, and often even offered alternatives, yet all this has been systematically ignored." [33] Clearance of projects without proper studies and the inadequateness and the faulty methodology used by existing environmental impact studies are widely criticized.[34]

The Teesta cascade projects are advertised as environmentally benign and largely run-of-the-river projects located in low-density population areas therefore would not displace people at a large scale.[35] Even the EIA studies of these projects and the Carrying Capacity Studies of the Teesta Basin do note that many of the hydropower projects are located in geologically fragile ecologically sensitive biodiversity rich areas.[36] Eight of these proposed hydropower projects are located in North Sikkim in and around the Kanchendzonga Biosphere reserve. Under Sikkim Government Gazette Notification No.95, 26 August 1977 and Khangchendzonga Biosphere vide notification no. J-2201/76/91-BR dated 27th February 2000, Ministry of Environment and Forests, an area of 2619.92 was demarcated as a Biosphere reserve which is to be left undisturbed. However in clear violation of these notifications, five hydel projects namely Lingza HEP, Rangyong HEP, Ruckel HEP, Ringpi and to some extent Panang are situated in and around this biologically significant ecologically rich geologically fragile area.

Rules have been flouted time and again in order to give speedy clearance to projects at both the state and national level.[37] Clearances have been issued without requisite studies being done and consulting the affected people. The track record of NHPC, which is constructing the larger of these projects is deplorable.[38] In 1998, the Ministry of Environment and Forests had recommended that a carrying capacity study of the Teesta basin be done while deliberating on giving an environmental clearance to the Teesta V project. However, in 1999 while giving clearance to Teesta V, the ministry had stated that it would not clear any other hydropower projects until the carrying-capacity study was completed.[39] In this regard, the Centre for Interdisciplinary Studies of Mountain and Hill Environment (CISMHE) based at Delhi University was assigned the responsibility of undertaking this research. After six years of research they submitted a 10 Volume report in December 2007.[40] Meanwhile in clear violation of its own rulings, the Ministry of Environment and Forests (MOEF) has given clearances to several new projects.[41] In many instances, the concerned people were not aware of scheduled public hearings as they had not been publicised. Activists accuse the government of not sharing project information and explaining the purpose and impact of these projects on the affected people, these violations and criticisms are not unique to the Teesta projects in Sikkim either.[42] There have several instances when they were forced to file a RTI in order to access the necessary documents.

The larger of these projects do entail construction of large dams and diversion of the river waters through longhead race or underground tunnels (HRTs) where they pass through a powerhouse before being dropped back into the river at a downstream location.[43] Teesta III in Chungthang envisages the construction of a 60m high concrete dam and a reservoir of gross capacity of 5.08m^3 and Panan in Dzongu involves the construction of a 56m high concrete gravity dam. Teesta V stage under NHPC has already constructed a 95m high reservoir and 17 km long underground tunnel. At a rough estimate, Stage III and IV of the Teesta Project are expected to submerge 156.41 hectares and 359.89 hectares of forest.[44] On the one hand, the government claims that the number of families who will be displaced by these hydropower projects is not very large. For instance the Panan project located in Dzongu that requires 56.835 hectares of land including 23.629 hectares of forest area would displace about 116 families while rendering only nine families landless.[45] On the other hand, it is estimated that Teesta would add 50 million environmental refugees.[46]

More recently, Professor M K Pandit, the Director of the Centre for Interdisciplinary Studies of Mountain and Hill Environment (CISMHE) under whose supervision a carrying capacity study of the Teesta basin was conducted over nearly six years has admitted that Stage I-III of the Teesta project are neither environmentally advisable nor feasible. They recommend that it's not possible to have dams above the height of 80m in North Sikkim [47] The researchers acknowledge that many people were not opposed to infrastructural development but not be done at the cost of losing their culture and identity.[48] Geographer Maitreyee Choundhury, who researched and wrote the section on the socio-cultural aspects for the carrying capacity study, has acknowledged existence and expression of substantial local opposition to projects located in the Dzongu due to fear of influx and settlement of outsiders which would dilute Lepcha culture and simultaneously bring crime and disease in a restricted-access area. Her report documents the high level of awareness among the Lepchas about their rights as the indigenous people including right to self-determination, protection from cultural ethnocide and right to control, use, and oppose the alienation of their natural resources. She recommends that Teesta projects should not be implemented by ignoring either the local sentiments or vocal opposition by the indigenous severely affected by them.[49] Many bureaucrats within the power and forestry departments (on being assured of anonymity) were critical of these Teesta projects as they admit that they would cause immense destruction of existing flora and fauna, degrade forests, disrupt the hydrological cycle, while blasting activities will trigger numerous landslides.

Emergence and organization of opposition to Teesta Projects

Lots of water flowed down river Teesta and Rungit, but we never understood its importance, now we will generate huge revenue through this flowing water (Sh Pawan Chamling, 15th August 2007, Independence Day speech given at Gangtok, Sikkim).

Hills after hills are bombed by dynamite, tunnels after tunnels dug inside our sacred hills, our most beautiful rivers, damned beyond recognition and along with it

our dying trees, fishes, animals and ecology…(weepingsikkim.blogspot.com, 23rd February 2008).

Development project often do generate unplanned outcomes unanticipated responses amongst the people whose very interest they profess to promote. People are neither a blank slate nor can their life be reductively defined in utilitarian cost and benefit statements. Bureaucratic appropriation of river waters for national development and its transformation into an economic resource disregards local cultural traditions and livelihood integrated with the riverscape. Regimes of hegemonic representation that legitimise resource extraction have not gone unchallenged by cultural politics. Identities and interests are crystallized as part of the cultural politics over landscape. Who are the people declaring that government and project developers in Sikkim are all set to dam(n) their future? Are these voices a minority representing sectional interests? Why are these voices unheard and ignored by leaders democratically elected by the people of Sikkim?

Indigenous Lepchas youth affiliated with the Affected Citizens of Teesta (ACT), Concerned Lepchas of Sikkim (CLOS) and the Sangha of Dzongu (Buddhist lamas of Dzongu) who are protesting against 26 hydropower projects planned or under construction on river Teesta in Sikkim declare: "We are not against development, but will fight against development that will extinguish our culture." ACT is the rechristened name of Joint Action Committee, an organization formed by the people living in the basin of River Teesta in Northern district of Sikkim in 2005. They define themselves in following terms, 'we are a group of people affected by dams on the Teesta and its tributaries in the Lepcha reserve of Dzongu in Sikkim. Organizations of Lepchas based at Kalimpong and Darjeeling in the North Bengal district have also organized hunger strikes and joined rallies in support.[50]

The Tibeto-Burman Lepchas term themselves *Rong* (a Lepcha word meaning ravine-folk or the dwellers of the valley) and they define themselves by their association with the sacred mountain Kanchenjunga that is regarded the source of their knowledge, culture, religion, wealth, resources, and place of their origin. The Lepchas trace their social origins and the birth of their lineage ancestors to specific (sacred) sites such as the five peaks of Kanchenjunga, the other sacred mountains, lakes, caves, and sites in Sikkim and the Darjeeling Hills. Over the past century with their numbers dwindling to about 90,000 persons who are physically dispersed in Sikkim and Darjeeling Hills of West Bengal, they have become an indigenous minority in the region. Deemed a "vanishing tribe"[51] the Lepchas are said to be loosing their cultural moorings after the settlement of migrants in their homeland.

Culture, politics, and ecology are inseparable in Lepcha cosmology. Given the strong place-based identities of the Lepchas, any severance of their connection with sacred sites strikes at the heart of their culture and civilization. River Teesta is assigned religious significance in their folklore and cannot be dismissed as an environmental and economic resource. Many of their sacred sites are located on the banks of this river or near the originating source of its tributaries. River Teesta constitutes the lifeline of their livelihood, society, and culture. According to a famous myth, a furious Teesta once

deluged the entire landscape and nearly led to extinction of all flora and fauna excepting those who got sanctuary on the peak of Mt. Tendong in South Sikkim. Every year, Lepcha shamans offer prayers to placate the protective deities and ensure harmony and environmental balance in the region. For these protesting Lepchas the rape of Teesta has officially begun and the river is weeping out and reduced to becoming a dry stream, stripped of its glory and weeping at its untimely death.[52]

Similarly, Dzongu is not merely a piece of real estate available for commercial exploitation. Located in North Sikkim, it is historically recognized as a tribal reserve area exclusively inhabited by the Lepchas belonging to this reserve, such that even other Lepchas are prohibited from residing here permanently and purchasing land. Under the provisions of Article 371F of the Indian Constitution, the government is mandated to protect the unique cultural heritage and interests of the indigenous Lepchas and Bhutias who were rendered a political minority with the incorporation of Sikkim into India. Hence, the sanctity of this ecologically fragile and culturally rich Dzongu can neither in principle nor in practice be undermined by either migration and settlement of outsiders or the implementation of environmentally destructive development projects. The Sikkim government time and again has maintained the rhetoric of its commitment to protect the rights of the indigenous Lepchas who were also recognized as the Most Primitive Tribe in 2005.

Political ecology is embedded in a wider network of cultural politics in the form of cultural ecology. "Natural resources have a value within a larger economy of signification which crucially shapes their modes of appropriation."[53] Struggles over resources are simultaneously struggles over meanings and futures. To the Lepchas, Dzongu represents the last bastion of their cultural heritage and the only place in the region where they feel free to follow their distinctive cultural and religious traditions. Its alienation is unacceptable to them. Dzongu contains a number of important sacred sites such as caves where Guru Rinpoche meditated, the Keshong lake, the Kongsa hot springs, the Tholung temple revered not merely by the Lepchas but by all Buddhists of Sikkim. The Panan Hydel project harnesses the waters of the Tholung river. The sanctity of this area is well documented in historical and religious texts including the pilgrimage guide to Sikkim. This explains the activists' uncompromising posture, "we will accept nothing less than a complete scrapping of hydel projects in Dzongu."

Vociferously protesting at the desecration and alienation of their ancestral roots, the activists assert,"[I]n the name of development, do not make us refugees in our own homeland." These concerns are strongly been raised since 2001. The activists have filed legal petitions in the National Appellate Authority at Delhi to question the grant of necessary environmental clearances,[54] repeatedly sent delegations to convince the state government to commission a review of the ecological impact of these projects, generated debate during hearings and public-meetings, and demanded a better relief and compensation package for the affected and displaced families. After being personally assured by the Chief Minister that he would review the projects located in North Sikkim, the activists decided to call-off their scheduled rally for 12th December 2006. Meanwhile, the Panan Project received environmental clearance in January 2007

and developers started to acquire land in Dzongu.[55] With government assurances belied repeatedly, concerned activists were left with no option but to mobilize public opinion, oppose and launch protests.

Since 20th June 2007, Lepcha youth are participating in a relay hunger-strike at Gangtok, organizing sit-in's, and rallying against hydel projects at Gangtok, Kalimpong, Darjeeling and even coming to protest at Delhi to galvanize public sympathy and express solidarity with other groups opposing arbitrary imposition of development projects. Dawa Lepcha (34 years) and Tenzing Lepcha's (20 years) *satyagraha* that began on 20th June lasted for 63 days.[56] Their satyagraha was hailed exemplary none other than Medha Patkar of the Narmada Bachao Andolan.[57] As Dawa and Tenzing declare, "we may die in our efforts but we will not see our land being plundered by capitalists." Adopting Gandhian methods of non-violence and resistance, sitting under an inspiring framed picture of Mahatma Gandhi, the activist base is largely composed of young men and women including Buddhist priests/lamas. In a press release the activists shared that "these fast symbolically recalls the sacrifice made by the freedom fighters, particularly Mahatma Gandhi to achieve democracy and self-rule for ordinary Indians."[58] Religious prayers by lamas to the protective deities of Sikkim in *gnas-bsol* offerings and shamanic rituals provide spiritual support to these satyagrahi.

Pressurized by these activists the government constituted a review committee in September 2007 but its composition has been unacceptable. Athup Lepcha who was the sole activist nominated for inclusion in it, has declined to participate in it. Determined to agitate against the arbitrariness of the government, these activists have sent numerous delegations to Delhi to appraise ministers in the central government. A thirty-member delegation successfully staged a *dharna* on 5-6th December 2007 at Jantar Mantar in Delhi in collaboration with other human rights activists. "Dams over Dzongu will be built over our dead bodies," proclaimed the banner marking the 200th day on 6th January 2008 of this historic satyagraha. Faced with a stalemate situation, the relay fast continued at Bhutia-Lepcha House while activists continued to campaign in a low-key manner in Dzongu during the winter months. On 5th February 2008 during a visit to Dzongu, members of Review Committee were greeted by peaceful show of protest and banners opposing the projects. Petitions demanding a fair review and shelving of projects were submitted by Lepchas and lamas belonging to twenty Buddhist temples of Dzongu. On 10th March about three hundred Lepchas of Dzongu staged a rally at Gangtok carrying placards and banners demanding the closure of all hydel projects in North Sikkim. Preceding this rally, the activists offered prayers at the sacred stones at Kabi on 7th March to galvanize moral support. Dawa Lepcha and Tenzing Lepcha commenced a second round of an indefinite fast on 10th March 2008 along with Gyabu Lepcha (19 years) of Dzongu. As Dawa shared, their intention is not to challenge or confront authority, but merely to make a sincere appeal to the concerned authorities.[59] Largely non-political, the protests are increasingly acquiring political overtones with politicians belonging to Sikkim Himali Parishad, Sikkim Bhutia Lepcha Apex committee, Sikkim United, Communist Party of India extending their support and occasionally participating briefly in the relay satyagraha.

The emergence of protests against Teesta III and Teesta Low Dam projects located in North Bengal with an ethnically diverse population, Teesta II project in Lachen and Lachung in North Sikkim that are inhabited mainly by Sikkimese Bhutias does substantiate the activists' claims that they are generally concerned about Sikkim and not merely Lepchas. They have been extremely critical of the reservoir constructed and massive tunnelling undertaken by NHPC in the Teesta V phase in South Sikkim. ACT has gallantly exposed the corruption and the paltry compensation given to the people displaced in Teesta V by using the RTI Act.[60] They have strategically gathered the support of numerous civil society organizations such as Kalpavriksh, which is an influential environmental action and research group of India. Neeraj Vagholikar, a Kalpavriksh activist has campaigned and participated in workshops at Gangtok and also written several articles in national newspapers to mobilize public opinion in their support.[61] Other important partners include the South Asian Network for Dams, Rivers and People (SANDRP), North East Society for Protection of Nature (NESPON), Delhi Forum, Intercultural Resources, River Basin Friends, Legal Initiative for Forests and Environment (LIFE), Centre for Organisation, Research and Education (CORE) Manipur. Networking with these have strengthened public outreach and helped them overcome any feelings of isolation and powerlessness.

After a prolonged period of stalemate, the Chief Minister succumbing to public pressure "officially" declared in the Sikkim Legislative Assembly in early March that excepting the 280 MW Panan Project over river Talung for which the Memorandum of Understanding had already been signed with NHPC and land acquired, all the other six hydropower projects located in Dzongu would be shelved.[62] Explaining his decision Chief Minister stated that a MOU on Panan project had already been signed and it would additionally provide sustainable alternative livelihood[63] to the Lepchas of Dzongu. At the time of submitting this paper to IPHS for review, the peaceful relay hunger strike that had begun on 20th June 2007 by Lepcha youth had clocked more than 275 days. The indomitably courageous satyagrahi duo Dawa and Tenzing were in hospital at the time of submitting this paper to the IPHS 2008. In an interview given from his hospital bed at STNM hospital in Gangtok, Dawa admitted despite their body getting weaker their thoughts and beliefs in their cause had become stronger. They want all projects to be shelved including Panan project, which is located in the heart of Dzongu. As they explain, Panan strikes at the roots of their cultural heritage and indigenous identity.[64]

1.2   Participatory Planning and Culturing Development

Development has largely been a top-down ethnographic technocratic approach, which has treated people and culture as abstract concepts and statistical figures that could be moved around on charts of progress.[65] It is not surprising to find discourses of culture and development standing in oppositional camps within Sikkim even though the culture of development practice entails participatory development planning and implementation in public interest. One needs to carefully distinguish between development as a discourse and as a process, although both are interconnected. Development itself has become a site of struggle and resistance, with people and social movements questioning a national development model which deprives them of their livelihood, identity, and dignity. The tendency to regard development as an all-powerful monolithic

enterprise and something beyond influence is quite pervasive and emerged as a pervasive myth of development.[66] As a discourse, there are several co-existent discourses of development, of which Hobart identifies three: the discourse of developers, the discourse of local people, and that of the national government and its local officials. These are not merely different but sometimes incommensurable.[67] To an extent Hobart's (1993) postulate is evident here in the discussion on the Teesta hydropower projects of Sikkim. The project developers have defined development in utilitarian terms of cost-benefit and profit while the government underscored its need to extract and distribute scarce resources in the name of development while posturing to safeguard the indigenous. Project reports have documented dissent to these projects while underscoring the necessity to gathering public support for these projects and ensuring local culture is not eroded. Differing conceptions of what and how development should be done are available and in circulation among Lepchas and the other ethnic constituencies residing in Sikkim. In a context where who is local and who is a migrant or an outsider are difficult political questions,[68] it is virtually impossible to craft discourses of the local.

Extending the argument given by Hobart and Escobar,[69] I have shown the necessity of ethnographically documenting multiple voices while crafting the local discourse of development and shattering the myth of development. Within this restricted access remote locality of Dzongu of North Sikkim, where I have been conducting fieldwork since 2001, there persist differing conceptions of what is development with the simultaneous awareness that these projects will profoundly shape their future. For some Lepchas the project implies ready cash for land that is not merely now unproductive, but for land that they are not permitted to sell to outsiders. Hence the government and project developer's promise of more schools, more hospitals, more roads and transportation, and greater employment opportunities looks attractive. Some Lepchas who have received modern education are very concerned about the negative impact on the environment and culture of Dzongu. Their cultural politics has questioned 'the development gaze'[70] that treats them as passive objects. Questions of indigeneity, cultural identity, and political power are foregrounded here. For the vocal section opposing development, these hydropower projects also signal their powerlessness against wider forces including the state and greedy capital. Yet, the strengthening power of Lepchas non-violent resistance and widening of public support beyond Dzongu in national and international arenas such as the rights of the indigenous people, testify that any attempts to deny them a future will be resisted.

At this juncture, I will emphasize that neither such articulations nor such protests are unique or novel in Sikkim. As a matter of fact, they can be traced to the discourses advanced by the indigenous Lepchas and Bhutias, and the Buddhist Sangha during 1993-97, when they opposed the Rathongchu hydroelectric project.[71] At the height of the Rathongchu agitations the lamas had questioned the moral legitimacy of the state and threatened:

> We, the monks of Sikkim, hereby demand that the Rathongchu hydroelectric project located at Yoksum be stopped immediately…the *gnas bsol* text is to the Sikkimese Buddhists what the Ramayana is to the Hindus, the Koran to the Muslims, and the

Bible to the Christians. If the Rathongchu Hydroelectric project is not stopped and abandoned, we, the lamas of Sikkim are ready to burn our *gnas bsol* text, as its meaning and purpose will be lost (Extract from a memorandum submitted by the Buddhist monastic order to the Chief Minister of Sikkim on 29 July 1995).

Rather than conferring legitimacy to government and development planning, hydel projects have required to be legitimised by the modern state. Klingesmith's assertion that "a challenge to a dam can be a challenge to much more than just a dam," is quite apparent in the Sikkimese context where the legitimacy of governments has been undermined by public opposition.[72] In August 1997, the Chief Minister of Sikkim Sh. Pawan Kumar Chamling was forced to shelve this ecologically viable and economically profitable Rathongchu hydroelectric project to avert an ethnic imbroglio. The main reasons cited by the Sikkim government for its closure were escalating ethnic tensions, preserving Yoksum as a sacred landscape and respecting the religious sentiments of the Buddhists, checking environmental destruction caused in the area by frequent landslides, the escalating costs of construction, and gaining favourable public opinion before the general elections scheduled for 1998. It is this decision along with some other policies that won Pawan Kumar Chamling the award of being the Greenest Chief Minister from the Centre for Science and Environment's in 1999.

Conclusively, development planning and the government have already forgotten the lessons that they should have been imbibed from the Rathongchu case. The situation was simpler in the Rathongchu situation as it was a state government project and a political decision resolved the ethnic imbroglio. However, most hydropower projects on river Teesta are joint ventures involving public and private companies, hence the situation is complicated for the state government which has signed memorandums of understanding with private capital that equally needs to recover cost and make profits from these projects. Activists are demanding the public sharing of information about these projects in order to generate consensus about "development." Not many among the Lepcha community are educated enough to understand or comprehend these project reports, nonetheless communication gaps and the lack of consultation has fermented discontent against the government in general. There is an urgent necessity to take informed decisions, as these projects will profoundly impact the future of the land and the indigenous people. I will emphasize that community participation in decision-making can effectively prevent large and avoidable costs of the mid-way [73]withdrawal of projects while better planning, sharing of project details, and consultative implementation can resolve conflicting definitions of public interest. Alternative development paradigms advance the necessity of inculcating a culture of development rooted in decentralized planning and routed by a decolonised mind.

A memorial, intervention, parsimony, and civic design

Ian Morley
University of Hong Kong, Hong Kong

Introduction

The death of Queen Victoria on January 22nd 1901 signalled the conclusion of an historic epoch for Britain and her Empire, one which had overseen major social, cultural, and environmental transformations. Immediately after the Queen's passing the Queen Victoria Memorial Committee (QVMC) was created for the purpose of producing a national memorial dedicated to her honour, an opportunity many argued to implicate a great architectural and scenic change in London. The occasion of the Queen's death it seemed gave no excuse for not initiating a commemorative project on a monumental scale. Prime Minister Arthur Balfour concurred with such a sentiment, and remarked that any memorial to Queen Victoria would be "of kind of which other nations have shown examples, which we may imitate, and can easily surpass."

In order to be conscious of events as they unfolded from January 1901 in London a few generic comments are necessary. To begin with it should be noted that the later decades of Queen Victoria's reign witnessed a growth in the awareness of Britain's role as the centre of a globally dispersed realm, and an eruption of imperial fervour. Assisting this process were a number of factors that forged the imperial canon: the publication of literature such as J.R. Seeley's *The Expansion of England* (1883[1]); the founding of organisations such as the Imperial Federation League (1884); the Colonial and Indian Exhibition (1886); the Boer War (1899-1902); Queen Victoria's golden and diamond jubilee celebrations (1887[2] and 1897[3]). To briefly cite the impact of imperial feelings upon the built fabric of London it should be acknowledged as having physical effects that included the erection of the Imperial Institute (1887-93)[4] in South Kensington, and the London County Council (LCC) undertaking the Kingsway-Aldwych scheme[5] from the 1890s. Importantly though the imperial context also had another kind of reach, for occasions like the aforementioned jubilees led to celebrations that attracted dignitaries from across the empire and the industrialised world. Accordingly Londoners came to be aware that the eyes of the world were focusing upon them, and in particular their city and its form. Of great significance to this consciousness was the mass media who frequently asserted that London should be seen to be of the same ranking as cities like Rome in the history of world civilisation, and consequently the city should play a greater role in the development of global arts and culture. For some in the media the matter of London's boosterism was imperative if Britain was to maintain her position at the forefront of world affairs. In this light so that Britain could continue to present herself as a global power London had to be worthy of her role as the physical and symbolic heart of nation and empire. If the situation were not important enough unforeseen domestic affairs, as shall now be touched upon, heightened the situation further.

In 1887, the year of Queen Victoria's golden jubilee, London bore witness to events that immediately instigated debates as to its, and in turn the empire's, governability. A series

of strikes and riots, the most notorious of which took place in Trafalgar Square, London's principal urban space, raised questions about Whitehall's management of Britain, its cities, and its colonies. In such a context social disorder within Victorian Cities was quickly seen to be a threat to the stability of the nation and empire[6], and the survival of the nation and empire was identified in particular with the survival of London[7]. Furthermore with the metropolis experiencing chronic traffic congestion, slow improvement in its public health, and the rise of international tourism necessitating new hotels and shops, pleasing public buildings and streets were considered essential should the city wish to maintain itself as a place of global significance[8]. Thinking imperially and better designing the urban environment in such a milieu therefore became almost one and the same, and in this regard London society looked upon itself to fulfil its needs and ambitions. As the Thames Embankment scheme (of the 1870s) was to demonstrate, large-scale environmental projects had the means to satisfy metropolitan aspirations. As First Commissioner A.H. Layard proudly observed the magnificence of the Embankment was unsurpassed within any capital of the world. Accordingly it helped to make the metropolis worthy of its empire[9]. If it could fulfill aspirations in the 1870s why not by the turn of the twentieth century?

Instigating a memorial scheme

It has already been mentioned that after the death of Queen Victoria in January 1901 a committee was formed with the purpose of suggesting, selecting and implementing a fitting memorial. The committee, the Queen Victoria Memorial Committee (QVMC)[10], by as early as April 1901 announced that a notable British sculptor, Thomas Brock, was to be directly commissioned to produce a statue[11] of Queen Victoria[12], and that five architects, Ernest George, Dr. Rowland Anderson, Sir Thomas Crew, Thomas Jackson and Aston Webb[13], would submit designs for an architectural/planning memorial scheme. As the fundamentals of the design contest relied upon the architects' capabilities in handling a variety of planning predicaments so as to establish a suitable site for Brock's proposed statue, and to produce fine vistas to and from the monument, create open spaces about it, etc., it also rapidly became apparent that the designers had to be consummate diplomats due to many prominent members of the British establishment having their own ideas as to what the QVMS should entail. As a case in point the new monarch, King Edward VII (1901-10), wanted the memorial to incorporate a 'processional roadway' which would allow for pomp and pageantry when called upon, and connect Buckingham Palace to London's main thoroughfares because the royal residence was hitherto isolated from Whitehall and Trafalgar Square. With this affair in mind *The Building News* commented that any new thoroughfare to be built as part of the memorial scheme demanded "dramatic presentation as to immediate requirements and prospective ideals"[14]. Interestingly though the views of the general public did not express such idealistic sentiments. Instead the common feeling amongst the London public was that any new road should not further hinder London's already slow traffic flow, and likewise it should not exacerbate the city's notorious rush-hour congestion[15]. In this regards a recommendation was put forward that a new road as part of the memorial project should act as a by-pass for Piccadilly Circus, an infamous bottleneck.

The Architectural Review picked up on this very matter and proclaimed that the QVMS "calls for easy and unobstructed roadways".[16]

In July 1901 Brock's statue design[17] and Aston Webb's design competition entry both won approval from King Edward VIII and the QVMC. The architectural media, particularly the well-known journal *The Builder*, positively commented on Webb's win which it asserted was due to the excellence of his plan and its working up to the suggested site of Brock's statue (directly in front of Buckingham Palace). For Webb the competition win was particularly reassuring for it confirmed his status as *the* establishment architect[18] at the turn of the twentieth century, a position cemented in the succeeding years due to his presidency of the Royal Institute of British Architects (RIBA)[19]. Additionally, the winning of the QVMS competition served to confirm Webb's ability on combining architectural and planning matters, but in time as the project unfolded it also exposed his equally great proficiency at negotiation and balancing the demands of his clients within often tight monetary confines.[20] In the case of the QVMS, the subject of this work, Webb had to be the consummate diplomat so as to meet the demands and satisfy the desires of many elements within British society who had an active interest in the form of the memorial.

The successful plan, statues and an arch

In mid-1901, as previously pointed out, Aston Webb's proposal for the QVMS was accepted for implementation. The crux of his plan, see figure 1, was his working to and from Brock's statue of Queen Victoria, and the suggested laying out of a monumental roadway, to be known as the Mall from Buckingham Palace to Central London (to the east). The shape of this new road was palpable given the aforesaid demands of procession and spectacle: straight and broad, which afforded a dignified approach to the memorial statue and Buckingham Palace, and a spectacular vista when entering the Mall from Trafalgar Square. The main planning challenge though in laying out a long roadway directly on an alignment with the centre of Buckingham Palace was that its eastern end, i.e. that located near to Trafalgar Square, did not meet head-on with the existing thoroughfares and instead had to run through existing Admiralty Buildings alongside Whitehall and a small roadway called Drummond Bank. To resolve this predicament Webb utilised the central axis of the Strand, a road to the east, which when extended westwards along its existing course would intersect with the central alignment of the Mall.[21] Intending to mark the point at which the two road axes met with a statue of Queen Victoria[22], from which the radius of a circular space would be drawn from, a means to mask the fact that the two roadways met at an acute angle, Webb was also able to save existing buildings from demolition. For this preservation strategy Webb received much professional acclaim, as did his overall QVMS plan which was widely perceived as putting aesthetics, nature, and beauty back into the built environment of Central London, in so doing breaking the alleged civil engineers and surveyors stranglehold over the shaping of the British urban form. John Belcher, a leading figure in the RIBA, described Webb's idea to preserve existing buildings as an important, interesting, and ingenious part of the scheme, whilst additionally commenting upon

Webb's Mall as adding new 'lungs', i.e. spaces for air to circulate, within the centre of the metropolis[23].

Figure 1. The plan of Aston Webb's original proposal for the Queen Victoria Memorial Scheme (source: *The Builder*, 1901).

Although Webb initially planned for a statue of Queen Victoria to stand at the eastern end of the Mall interference by 'stakeholders' meant that this proposal was quickly shelved. In this instance the statue proposal was abandoned due to King Edward's wish for an archway to be erected where the Mall approached Trafalgar Square. Symbolically the suggestion of an archway in London was noteworthy given its iconography with imperialism, but architecturally too an archway impacted upon the form of Webb's original memorial scheme. However, the ever pragmatic Webb realised he could create a matchless vista with an arch, one that framed a view towards Buckingham Palace when entering the Mall from Trafalgar Square or the Strand, and moreover the use of an arch had the added benefit of screening the change of axis between the Mall to the Strand. However, as is to explained subsequently, the design of the arch, Admiralty Arch as it became known, led to a chorus of criticisms about the lax condition of British civic design.

Figure 2. Admiralty Arch with a view through its arches to the Mall. Note the change in axis of the roadway as it passes through the arch. Critics of the structure have insinuated that it is more office building than triumphal arch.

At the far western end of the Mall, that is in proximity to Buckingham Palace, further royal influence affected the form of Webb's QVMS. In this instance Queen Alexandra desired a 'sacred enclosure', a serene public garden complete with fountains around the site of Brock's statue so as to offer opportunities to ponder Queen Victoria's life and Britain's achievements under her reign. In Webb's amended scheme this enclosure, The Queen's Garden as he labelled it, had a semi-circular form at the heart of which Brock's statue was to be placed (see figure 3). This planning simplicity won applause from his peers. *The Builder* wrote that "The whole of this design, in fact, is calculated to secure centralised lines of vista; and that is one of its great merits - it is all laid out on a symmetrical system."[24]

Figure 3. A perspective of The Queen's Garden as suggested by Aston Webb (source: *The Builder*, 1901).

To enclose the Queen's Garden Webb ran a stone colonnade, punctuated by small pavilions placed on lines of symmetry with Brock's statue. Contemporary commentators described the colonnade as giving the effect that the columns were like soldiers guarding the statue. Furthermore by cutting it at particular points, e.g. at 90º angles to the statue, imposing vistas to the sculpture's site were manufactured, and moreover by placing the entrance gates to the Palace courtyard in positions corresponding with the ends of the main (eastern) façade of royal residence the King, who as noted earlier had become embarrassed at having to leave his home thorough a seemingly undignified minor doorway located at the back of Buckingham Palace, was granted a highly visible departure point from the royal centre of the metropolis, nation, and empire.

The Critics Arise

Webb had realised in 1901 that his initial QVMS proposal contained weak points, and that its imperfections would need to be ironed out prior to the scheme being implemented. A critic of Webb's original plan in *The Builder* in 1902, for example, described the whole scheme as "triumphal architecture crippled by a sense of duty"[25], while upcoming architect Edwin Lutyens remarked: "The Queen's Memorial is horrid as I have seen it. Aston Webb has got it all inside out and far too small in detail and too funny for words..."[26] One idea for improving the original plan was outlined in *The Graphic*, and centred upon the use of opening up new vistas. This, it was argued, would integrate outlying open areas at a distance from the site of Brock's statue, for instance

within parts of St James' Park, in the overall bounds of memorial scheme. As *The Graphic* noted improvements could:

> "be introduced at the opening from Buckingham Palace Road into the park, so that a fine view will be uncovered towards the Foreign Office, a corresponding alteration being made at the foot of Constitution Hill. From both these points excellent views of the memorial will be afforded from north and south through gates."[27]

Whereas comments such as this were designed to offer constructive assistance to Webb so that a unique national memorial could be produced and so national pride attained, the episode of creating an archway, an architectural feature suggested by the King, led to much animosity towards Webb, even though as shall be demonstrated his actions were largely tied by actions of the monarch and the Admiralty, and a lack of money available to complete the QVMS.

Beforehand it has been stated that the King put forward the idea of constructing an archway at the eastern end of the Mall, a site where Webb had initially recommended placing a statue of Queen Victoria. Circa 1905, when Webb [28] began to design an arch, it rapidly became apparent that his ability to design an edifice was greatly restricted[29]. As with other design and planning affairs in the QVMS it was not long before Webb had to radically alter his preliminary design, a consequence this time of the overbearing influence by the Admiralty who were in desperate need of accommodation space. In many respects the domineering presence of the Admiralty was a two-edge sword in the context of the QVMS. On the one hand it resolved the QVMC's dilemma of acquiring a major element of the memorial scheme for no cost as by 1905 money available was running short. Therefore the Admiralty's offer to pay for an arch, estimated at £50,000, was extremely welcoming to the cash-strapped QVMC. Yet on the flip-side by paying for the edifice the Admiralty in effect came to dictate the form of the arch, and whereas a triumphal structure was initially sought in reality what was manufactured was an office building containing three large archways at the ground floor level (in keeping with the three axial lines along the Mall). The utilitarian bias of Admiralty Arch, a result of the Admiralty's need for office space, heaped much criticism onto the shoulders of the unfortunate Aston Webb. Aesthetically his Classically formed arch found few admirers. As Alistair Service bluntly put it the resultant edifice, Admiralty Arch, granted a weak visual impression to the onlooking eye: "a heavy amalgam of arch and building".[30] Once completed in 1909 criticism of the building's design rained down upon the Admiralty, the national government[31], and Webb given his role as the building's architect. *The Architectural Review* summed up the episode as being a lost opportunity:

> "…another pitiful example of national parsimony in art. Only in our land would a government be found to demand the combination of a triumphal arch, an office building, and an official residence in a block that shall be both convincing and expressive. The new building is neither."[32]

Followers of the government in attempting to deflect criticism of the scheme from the nation's political elites put forward a very partisan perspective. Whether people liked the arch was in a way insignificant they stated. Lord Alexander Thynne writing in *The British Architect* outlined such perspective: "the site is a most important site, and the arch, whether you like its design or not, is a most important edifice."[33] Ironically, despite often harsh criticism at him during the furore over Admiralty Arch, Webb's role in the QVMS did not end at this point. By way of example, to solve the problem of the narrow entrance at the eastern end to the Mall Webb (in 1910) submitted a plan for the widening of the road and demolishing "view obstructing buildings of Trafalgar Square"[34], but this was not completed until many years later because of wrangling over who was to finance this project. However the influence of the media both at home and overseas once again should not be overlooked, for it took up the road widening affair as part of its coverage of a memorial scheme to not only Queen Victoria but also King Edward VII[35], for which the opening to the Mall would be widened and the unsightly Charing Cross Railway station would be moved (to south of the River Thames). As *The New York Times* outlined, Webb's idea to remove buildings near Trafalgar Square provides an opportunity to establish a grand vista from Britain primary urban space:

> "one will be able to obtain from Trafalgar Square a view through the new stately arch, down the Mall to the beautiful Victoria Monument, with Buckingham Palace beyond. It will be one of the finest prospects in Europe."[36]

In 1912 Webb was once again directly commissioned by the QVMC to instigate more work as part of the QVMS, this time to reface the east wing of Buckingham Palace, which like the suggestion of Admiralty Arch was not in the original 1901 brief. Yet having conceived the designs for the Mall, Admiralty Arch, and the refacing of Buckingham Palace, Aston Webb oversaw the entire architectural and planning operation of the QVMS[37], and irrespective of the form of the memorial itself for this reason alone it, and Webb, have a unique status in the history of British civic design[38] for no other scheme of this scale, or scheme with so many distinct parts, was conceived at that time. Furthermore, the QVMS was one of the first modern British planning schemes to display the influence of contemporary US urbanism[39], and by this it is meant the City Beautiful Movement[40] as put forward by the likes of Daniel Burnham, Charles Mulford Robinson, and Charles Follen McKim[41], an architect of close acquaintance with Aston Webb[42]. To illustrate this matter, albeit briefly, reference can be made to the QVMS's attempt to endow the metropolis with a sense of monumental status and style, a conscious attempt by those in positions of authority to establish London as an artistic creation so as to give aesthetic pleasure, but to also establish an environment that reflected prevalent values and thoughts in society. Moreover by promoting Aston Webb's plan[43] as a coherent grand ensemble the relation between the memorial's various elements with their surroundings are emphasised. In such a way the concept of urban beauty as an entity that encourages individual artistic ingenuity yet similarly promotes coherence and unity within an architectural framework bestows aesthetic and social notions that improve the state of urban society, and in turn the nation.

Creating a New and Suitable Palace, Cheaply

It was commented in architectural journals from as early as 1901 that "Buckingham Palace is a sorry background as it stands"[44] (figure 5) given the developments taking place to the front of its principal elevation. The palace, described at the start of the twentieth century as being the only emblematic building in the metropolis that "approaches the idea of what a king's house should be",[45] was observed to have its main façade of an aesthetic quality unworthy of the spatial changes around it, and therefore to be seen as being undignified in appearance. Accordingly a new front had to be built so as to befit the environment of the QVMS, and as such to stop the palace from becoming an aesthetic/environmental misfit within its surroundings.

Figure 4. The unveiling ceremony in May 1911 of Thomas Brock's statue of Queen Victoria. To the rear of the view is Buckingham palace's east-facing elevation (composed by Edward Blore), which was increasingly viewed as being non-palatial in character. Subsequently Aston Webb was asked to redesign the front façade of the royal residence.

The exercise of refacing Buckingham Palace, discussed subsequently, was made complicated due to the significance of the edifice, i.e. it being the primary royal home in London, and a major lack of funding – an issue shown to have led to great consternation with the design and construction of Admiralty Arch. Consequently instead of Webb having the aesthetic and financial freedom to establish a plush new façade for Buckingham Palace he was constrained to such a degree that he had little option but to rehabilitate Edward Blore's original front, in this case with the durable Portland Stone – a material popular in British civic designing during the early years of the twentieth century[46].

Figure 5. Aston Webb's refaced east elevation of Buckingham Palace with the Queen Victoria Memorial Statue by Thomas Brock in the foreground as seen around the time of the completion of the QVMS.

To help support the process of making a 'suitable' front for Buckingham Palace Webb began by designing a new main entrance gate (for the Palace's forecourt) which he placed on a direct line of axis with the middle of the east-facing palace façade, the statue of Queen Victoria, and the centre of the Mall. This was important as it acted as a marker for the frontispiece of the whole refacing composition[47] which was deliberately devoid of detail thus making the scheme rather reserved in character. The style chosen for the façade was said in *The Building News* to be Late-English Renaissance, "one fitting a Royal Palace, the site, and the occasion of its erection"[48], although the actual style is a restrained and delicate Classical form similar to that used for Admiralty Arch, influenced perhaps suggests Port (1995) by Maquet's Royal Palace in Brussels[49]. In terms of the façade's design fluted columns decorated the front, and the central balcony was extended outwards over the main archway giving the impression that it was a plinth[50], in so doing providing an outside space from which the Royal Family could greet crowds in front of the palace. The simply formed front elevation was topped by a parapet, a simple yet brilliant piece of 'beautility'[51] hid the discordant skyline of the roof and its many chimneys.

With the re-facing of the Palace taking only thirteen weeks to complete the entire QVMS was achieved by 1913. Widely acknowledged as the 'first example in recent time of town planning in the metropolis', the scheme undoubtedly captured the architectural spirit under which the competition was devised: "Whatever the faults of its individual parts, the overall scheme of triumphal arch, boulevard, rond-point and palace front, is a highly distinguished achievement of the move to give London a centre worthy of an imperial capital".[52] The importance of the scheme in large-scale design and planning terms cannot be underestimated. For a start, as noted previously, a single architect controlled and designed the whole project in its entirety. But of equal note, the QVMS

wasn't just a lesson in civic design, but one in architecture, decoration, and large-scale urban planning as the whole scheme catered for small details such as street lights through to the major details, i.e., the placing of the Memorial Statue and the problem of the Charing Cross exit. Due to Webb's designing and diplomacy abilities the QVMS scheme bestowed the impression of an environment composed as a dignified, complete and reposeful whole[53], and as John Belcher, President of the RIBA in 1905 remarked: "If we want to appreciate the full advantage of a fine approach to a great public building, we only have to note the result of Sir Aston Webb's treatment of the Mall in connection with the National Monument to Queen Victoria." So successful was the overall 'whole' effect of the project that even in the first set of plans submitted by Webb *The Builder* wrote, "One could not find a better example of the principle that plan is the basis of design."[54] The end result, of course, was urban improvement on a vast scale. The statue of Queen Victoria by Brock somewhat naturally took pride of place in a setting worthy of the monarch's imperial destiny, in so doing bestowing a commemorative endeavour to allow British citizens to reflect upon the life of the monarch, revive British self-esteem, and provide a new high-water mark of self-confidence and metropolitan aspirations in Britain's capital city[55], even though as this work has suggested the process of bringing the memorial scheme from concept to solid structure was far from straightforward, and influenced by an excess of often overbearing stakeholders.

Conclusion

By 1914 Aston Webb had established himself as one of the most renowned and respected British architect/planners of his time. Crucial to his lofty professional status was his role in the QVMS. As shown beforehand, the QVMS was of great national and imperial importance, a scheme that was integral to the promotion of London as the centre of nation and the empire. Due to the significance of the scheme many parties had an opinion as to what form it should take, and these to differing extents affected the actions, designs and plans put forward by competition winner Aston Webb. Of note too was the role of money, or the lack of to be more precise, and certainly this situation was exploited by the Admiralty in order to create an arch (Admiralty Arch). Of equally momentous influence was the function of competition winner Aston Webb, who it seems had to be on his best diplomatic behaviour in order to placate the various factions who wished to shape the QVMS. As shown these ranged from the Royal Family to the architectural profession, on whom more words shall subsequently be said.

So far little attention in this work has been given to the mind-set of Aston Webb, a consequence of the focus placed on private versus public interests in the milieu of completing the QVMS. However on this very matter a statement given in 1905 by Webb maybe best characterises his attitude to the rebuilding of cities for he perceived act of civic designing to be deeper than paying lip service to the design of large and prominent structures, and the simultaneous planning of urban spaces about them. Indeed to Webb civic design was a public service, and a patriotic duty: "…practical men are beginning to realise that noble dispositions in a town, noble streets and buildings, are an education as necessary for the higher development of patriotism and public spirit as good water and sanitation are necessary for the bodily well-being."[56] Arguably inspired by his

involvement in the QVMS, and maybe further armed with detailed knowledge of contemporary US urbanism due to his kinship with Charles McKim, Webb's sense of duty led by circa 1910, when the QVMS was coming to fruition, to the proposal to broaden the aggrandisement of London, e.g. by placing roofs on bridges across the Thames. His enthusiasm for London also it seemed extended to engage in the preservation of London's own idiosyncratic contribution to world town planning culture[57], the garden square, and in 1904 his zest for London ensured Norman Shaw was lulled out of semi-retirement to prepare a plan for rearranging Piccadilly Circus. With opportunities for urban planning possible therefore on almost every street corner Webb as RIBA President rallied the architectural profession so that they could take city planning for their own, just as they were to do in later years within the milieu of formative town planning prior to 1909[58], a cry to build city beautifuls rather than city efficients believed to have been manufactured under the urban arranging hegemony of surveyors and civil engineers[59]. Arguably the apogee of this process was the 1916 'Charing Cross Improvement Scheme' proposal by Webb, Reginald Blomfield and John Burns[60], an endeavour to utilise London's most aesthetic asset, the River Thames, and to be a memorial to the Great War (still ongoing). On such lines:

> "…an unrivalled opportunity presents itself of carrying out a far-reaching improvement in the civic architecture of London, a scheme of very real benefit to the public, and a superb national monument, as we all hope it will prove to be, of this tremendous war. On the part of ourselves and our Allies that war is over those ideals should find their expression in some enduring memorial that all may see and all may profit by."[61]

In summing up the QVMS must be appreciated for being an exceptional urban planning venture in the history of British attempts to aggrandise existing settlements, and a deliberate ploy to express the imperial fervour bubbling in society. In many respects the QVMS was exceptional due to its scale, its deeply rooted place within the imperial milieu at the turn of the twentieth century, and the large number of significant, individual architectural schemes incorporated into the project. However, frequently overlooked in the context of Planning History is the clash of interests and discord within the memorial scheme, which Aston Webb had to iron out so as to bring the scheme to completion. In this regards, as previously mentioned, Webb should be seen as being the consummate mediator at the time formative town planning emerged[62], a professional able to mediate the agendas of individuals representing both public and private interest. Due to the significance of the national memorial the voices of people interested in commemorating Queen Victoria were at times vociferous and challenging in their demands, in so doing affecting Webb to such a degree that he had to reshape his plans in order to accommodate their requirements. Arguably a messy affair from start to finish the QVMS nonetheless did help London to fulfill its imperial destiny. Commemorating a venerated monarch the QVMS thus in many respects was more than an exercise in urban planning, and in this sense various interests did at times collide, and opinions contrast about the nature, quality, and appearance of the scheme. Even so this should not diminish the value of the memorial for it is still an icon of British urbanism, a scheme prepared and implemented at a time when a greater rational control of the British urban

environment was exercised, an era when formative town planning emerged and foreign notions about architecture and planning filtered into British architectural circles.

Notes

[1] The book was printed a year after the British occupation of Egypt.

[2] The 1887 jubilee and its expression of loyalty and devotion has been described by Edward Browne in *Queen Victoria* (London: Harrap and Co., 2005) as providing proof that English people and English society were not insular, but was rather a realisation that England was a mighty nation with one sovereign head.

[3] Every single British colony sent a detachment of troops to London to represent it at the jubilee pageant.

[4] Designed by Thomas Collcutt. During his career Collcutt designed numerous notable edifices in London, e.g. the Savoy Hotel and Palace Theatre. In 1902 he was awarded the RIBA Gold Medal for his services to architecture. From 1904-6 he served as President of the RIBA. An unsuccessful entrant in the Imperial Institute design competition was Aston Webb.

[5] Mention of the LCC's imperial belief is given in the forthcoming publication *British Provincial Civic Design and the Building of Late-Victorian and Edwardian Cities, 1880-1914* by the author of this paper (to be published in 2008 by Edwin Mellen Press). The Kingsway-Aldwych scheme is shown to represent an attempt to endow London with a modern sense of monumentality, status, and style.

[10] The committee was presided over by Viscount Esher, whose title was Honorary Secretary of the General Secretary of the Queen Victoria Memorial Fund

[11] The official title of the statue was 'The National Memorial to the Late Queen Victoria'. In 1902 a sum of £100,000 was offered to Brock to pay for the cost of the statue (source: National Archives, WORK 6/663).

[12] Brock's monument's statue when completed in 1911 stood 82 feet in height, weighed over 2,300 tonnes and was built from Carrara Marble and Bronze. At the unveiling ceremony in May 1911 Brock was knighted on its steps.

[13] C.H. Reilly wrote in 1938 about Webb's architectural office with its fifty draughtsmen as being 'a mere factory for Government building'.

[14] *The Building News*, 'The Architecture of Sir Aston Webb, President of the Royal Academy', 1920, p. 63.

[15] In 1920 *The Building News* made reference to London's traffic congestion, and environmental improvement, as being a matter of life-long passionate concern to Aston Webb. In this regards the journal stated that his QVMS win must have "meant to him particularly keen satisfaction" (p. 63).

[16] *The Architectural Review*, 'The Queen Victoria Memorial', 1901, p. 199.

[17] Brock's civic sculpting included work in Victoria Square Hull, and City Square, Leeds, and a statue to Queen Victoria in the grounds of the City Hall, Belfast.

[18] At the end of the 19th century/start of the 20th century Webb was involved in some of the largest and most significant civic and colonial projects in Britain and abroad. His work included Birmingham Law Courts and University, Royal Naval College (Dartmouth), Victoria and Albert Museum, Imperial College of Science, and Royal School of Mines in London, Royal College of Science for Ireland(Dublin), and Hong Kong's Legislative Building.

[19] Around the time of the passing of the Housing, Town Planning, Etc., Act in 1909 Webb was the RIBA's Chairman of Town Planning.

[20] The entire Queen Victoria Memorial Scheme was paid for by public donations.

[21] Webb cleverly split the Mall into the sections across its width. The two outer sections, the 'Carriageways' were for public use, while the broader middle section, the central axis of the road, was to become a 'Processional Drive', to be used only by the Royal Family. The length of the Mall was to be decorated with foliage along its length for aesthetic purposes, so to blend the roadway into the neighbouring parks.

[22] The statue was to be of a youthful looking Queen. This statue was to face towards Brock's state in front of Buckingham Palace sited at the opposite end of the Mall.

[23] In his 1904 RIBA Presidential speech John Belcher declared: "The lungs of London…must not consist solely of a few parks which…are now more or less closed in but of wide channels and routes of currents of air to flow freely through." The example of the Mall, with its broad width to allow air to move along and

through it was said Belcher "a matter I commend to the attention of our Town Councils." (see *The Journal of the Royal Institute of British Architects*, 'The Opening Address', 12th November 1904, p.8).

[24] *The Builder*, 1902., p. 377.

[25] Ibid., p. 377.

[26] Letter from Edwin Lutyens to Sir Herbert Baker, 31st November 1901.

[27] *The Graphic*, 2nd November 1901, p. 586.

[28] Webb received the commission for Admiralty Arch directly.

[29] Webb's commission to design Admiralty Arch not only allowed for his continued input into the QVMS but additionally afforded him another chance to design a prominent edifice in Central London.

[35] The King died in May 1910.

[36] *The New York Times*, 1911.

[37] There is no other incident in either Victorian or Edwardian architecture where a grand scheme of great public interest and numerous facets was designed and planned by just a single architect. For this reason alone the QVMS is of great civic design significance.

[38] In the context of this work civic design is defined as "a designer's attempt to purposefully integrate new buildings of a public or quasi-public nature, or urban spaces, to their existing for the intention of obtaining pleasing effects and the attainment of convenience". See Morley, Ian, 2002, p. xxxii.

[39] Webb in 1907 visited the US and was guest of honour at the 6th Annual Dinner of the New York Chapter of the American Institute of Architects. Webb's visit to the US lasted three weeks and included a trip to Washington DC. On the outing *The New York Times* commented upon Webb's praise for skyscrapers (see 'Likes Our Skyscrapers', January 19th 1907).

[40] For further details on the relationship of the City Beautiful with the architecture and planning of Sir Aston Webb please refer to Morley, Ian, 'The Contribution of Sir Aston Webb to the Development of the Modern British Town Planning Movement, c. 1900-14', unpublished MA Dissertation, The Centre for Urban History, University of Leicester (1995).

[41] When McKim was given the RIBA Gold Medal as a show of gratitude he left at the institute a map of Washington DC and a book on American architecture.

[42] During his tenure as RIBA President Aston Webb awarded the institute's Gold Medal to McKim. Likewise in 1907 the first Gold Medal of the American Institute of Architects (AIA) was given to Webb.

[43] In 1910 Webb stated what an ideal settlement was, a place he labelled 'the city beautiful'. For more details refer to Freestone, Robert, 'The Internationlisation of the City Beautiful', presented at the 12th International Planning History Society Conference in New Delhi, India (December 2006).

[62] Attention is given to the influence historic and contemporary civic design practice in Britain had to formative town planning in Hawtree, Martin, 'The Emergence of the Town Planning Profession', in Sutcliffe, Anthony, *British Town Planning: The Formative Years* (Leicester: Leicester University Press, 1981).

Crossing through the block: permeabilities in the urban fabric of Portuguese cities

Madalena Cunha Matos
Tânia Beisl Ramos
Fernando Goncalvea
University of Lisbon, Portugal

Introduction

This project initiated as an inquiry into the repeated yet transparent use of this spatial pattern in Portuguese cities. It is an unacknowledged, unseen, unexamined pattern thus far. Nevertheless, it permeates old and new sectors of the cities, both in a repetitive, systematic and in a haphazard, one single case way. As the research probed into the motifs and models of the passage pattern, precedents were found in general law and usages, in municipal regulations, in political modes of dealing with urban land and in the more recent legacy of the Modern Movement.

Usages and laws

Passages have precedents in a practice that can be acknowledged as far as Roman law, as it is mentioned in SOUSA (1817) **The *Ordenações Manuelinas* and *Filipinas*** respectively from 1521 and 1603 allow the construction of private footbridges over existing streets. They are assemblages of codes and laws that have been recompiled respectively by order of King Manuel I and King Phillip - I of Portugal and II of Spain, the first of the 3 kings who ruled both countries in the 60 years period of the Philippine Dynasty of the Kingdom of Portugal, from 1580 to 1640. In its 1st book, this later set of Laws states unequivocally that it is possible for a landowner to set rafters across the street, if he owns houses in either sides; and to build on this bridge a story with windows opening into the street. It allows the transmission of ownership and the subsequent right to build on this trabeated or vaulted bridge. It reserves the right to demolish the whole suspended construction by the *Concelho* as it clearly states that it is the Municipality that owns the air both underneath and above it. It restates what had already been said eighty years earlier in the ***Ordenações Manuelinas***, which in turn restates what were the usages of the times.

A compilation of laws dealing with buildings published in 1817 in Lisbon replicates these statements, adding a short discussion and a negative account on this both usage and legal possibility. The author proposes that it should be forbidden and that any such built bridges existing in the kingdom of Portugal to be demolished. Almeida e Sousa substantiates this proposal with his negative account based on (a) the impairment to the visual quality of the street; (b) at night, they become hiding places for murderers, thieves and the exercise of indecency; and, when he states the conditions for not impairing third parties when such a bridge is built, (c) the disadvantage caused by their low ceiling to the transit of loaded cars and religious processions.

The **Civil Codes**, from 1867 and 1967, present conflicting concepts of absolute property ownership and appurtenant easement. The first Civil Code, which was influenced by Napoleonic Codes, states that ownership of the plot includes the aerial space above it; and so does the next important Civil Code published in 1967. In its Article n. 1344, dealing with material limits to land ownership, the 1967 Code states that both aerial and subterranean space pertain to the same possessor as owns the plot. As they adopt the standpoint that property makes a projection into the terrain, they prohibit such amalgamation of public-private rights as the residential bridges implied. No longer should they be built.

The Building Code of the City of Lisbon was enforced from 1930 to 1951 and, until 1938, permitted the existence of 'vilas', rows of housing units forming enclosed clusters separated from the public realm. They were built by private initiative and meant for workers' families. The last 'vilas' were built in the 1920's. A number of these 'vilas' and 'pátios' included private streets, of which at least 18 subsisted in 1993 (*O DIA*). In 1994, 371 'vilas' could be counted in the area of the Municipality of Lisbon (*ROTEIRO DAS RUAS DE LISBOA*). These constituted a particular form of public-private negotiation of urban land, and were brought about by the belated industrialization that completely transformed major cities in Portugal from 1870's onwards. And they are a persistent sight in the denser sections of the city of Lisbon.

In Porto, the equivalent housing units built for the workers or poorer population were the 'ilhas', long and low rows of small houses built by private initiative in the rear yard of more bourgeois blocks. Their dependence of access to the street is solved by a passageway meant for persons on foot. Since the beginning, dating from the 1830's onwards, when approximately 200 'ilhas' were numbered, they were slums in the heart of the city. At the beginning of the1880's, 550 'ilhas' housed 6000 families and almost 20.000 inhabitants, accounting for 16% of the population of the municipality. In 1939, this proportion was similar. This proliferation was possible due to a lack of control by public authorities on anything built behind the public façade. Only in 1889 a municipal by-law is changed, making it mandatory that projects for buildings less than 5 meters from the street should be approved by the Municipality. So most of the 'ilhas' built in the core of blocks averted any form of control (TEIXEIRA, 1985). And only in 1905 a new **Code of By-Laws of Porto** established the need of a Municipal approval for any construction to be built in the city, regardless of its exact location vis-à-vis the street. This finally included the 'ilhas' in the public control. At the same time, 'ilhas' were forbidden, although they kept on being built.

These cases of Lisbon and Porto show the double standards that permitted a differential relationship of land on which to build with the public realm. Privately owned and privately led, these lucrative endeavours tended to seclusion and isolation in the face of the city. The rights of way had social and physical restrictions - either a gate, a spatial funnelling or a means of access under a passage, or all three combined.

Ethos of modernity

The **Modern Movement** and the **Athens Charter** set forth a profound change in the tight stitching of the urban fabric, celebrating an ideology of openness and movement. This occurred in various stages, starting with the opening up through arches of the still perimetral built closed blocks, such as in the Spangen Housing Complex in 1918-1921. Of the more avant-garde housing schemes built in the 1920's and 1930's, a large number incorporate the figure of the portal (ARÍS, 2000) - either as a symbolic door or as a constructive novelty – a lifted entrance allowed by an inexpensive straightforward use of reinforced concrete. In the Netherlands, in Germany and in Austria this arched or trabeated feature is a recurring theme in the vast city extensions (Fig. 1).

[A]

[B]   [C]   [D]

Figure 1 [A,D]: *Arch.* M. Brinkman, ground floor plan, drawing and aerial view of Spangen Housing Complex (1918-1921), Rotterdam (Arís, 2000).

Three buildings of up most importance in the diffusion of the Modern Movement – the Narkomfin Building (1928-29) by Ginzburg, the Bauhaus by Gropius (1925-26) and the Maison Savoye by Le Corbusier (1929-30) all offer a foremost feature of interplay between people and cars, of a novel circulation or work space above ground over a void, or a recess to acknowledge the automobile. The will to move and to flow is celebrated by these suspended bridges or carved out ground floors (Fig. 2).

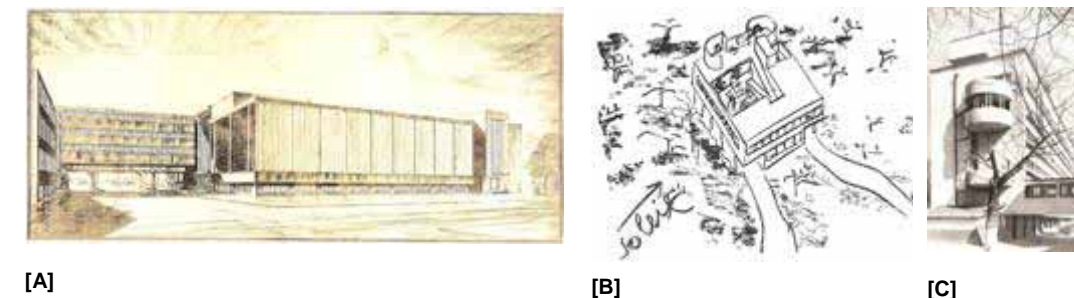
[A]   [B]   [C]


Figure 2 [A,C]: [A] *Arch.* W. Gropius, sketch of Bauhaus (1925-26), Dessau (Fiedler and Feierabend, 2000); [B] *Arch.* Le Corbusier*,* sketch of Villa Savoye (1929-30), Poissy (Besset, 1992); [C] *Arch.* M. Ginzburg, view of Narkomfin Housing Building (1928-1929), Moscow (Arís, 2000).

The passage under the building is going to be present, both in the quasi-modern projects of social housing at the beginning of the 20th century and in the housing proposals of the Modern Movement itself. In all of these projects a need is felt of crossing through the block or to give access to buildings which are very much marked by linearity in expression and by very long stretches in actual dimensions.

At the beginning of the century, Amsterdam was the setting of various examples. The workers quarter of Spaarndammerbuurt is located in the Western part of the city and includes long linear buildings that define in their inside open green areas. Various architects participated. Between 1913 and 1921 De Klerk designs three buildings. In an initial sketch of his making it is possible to distinguish the intention of creating arches in the 5 stories buildings. These passages are also present in the project of another architect, Walenkamp, for the South portal in Zaanhof. H. P. Berlage, together with architects Gratama and Versteeg designed the buildings at Transvaalbuurt.

Another sketch by De Klerk subsists, intended for double story single families housing on a row. In this project, a predominance of symmetrical and regular window arrangements is intercepted by the opening the architect creates for the crossing through the volume (Fig. 3).

[A] [B] [C]

[D] [E]

In 1924-1927 Berlage designs a generous plaza in Mercatorplein, Amsterdam, in which a prominent feature is the concave angle heavily marked by a tower and an opening meant for vehicular traffic underneath the building (Fig. 4).

[A]   **[B]**   **[C]**
Figure 4 [A,C]: *Arch.* Berlage, plan and sketches of Mercatorplein (1924-1927), Amsterdam (Polano, 1987).

In Germany, the projects for large housing estates showed much the same investigations into the new *terra ignota* – that of great stretches of land being treated as a whole and for a specific use, that of housing. The designs seem to sense, to validate a need for defined limits or thresholds in the face of the novel immensity of space and abstractionism of forms. In the Siedlung Heimat (1927-1930) in Frankfurt, the architect F. Roeckle produces a break into the otherwise oversize longitudinal dimension of a single building, and marks this break with an underneath passage, choosing to position a street so as to trespass this inflection. The plan and views of Siedlung Weisse Stadt (1929-1930) in Berlin, by architect O. Salvisberg, show a prominent 'urban door' located right at the centre of the housing area, while the core of the blocks are also permeated by this newly found fluidity.

Throughout Europe, mainly in the socialist and social-democrat municipalities of Central Europe, similar studies in the art of closing and opening the vistas were being conducted. New, anti-Renaissance ways of exploring of art of perspective were experimented. In particular, the Beaux-Arts approach to a main building, presented at the end of an axis, was abandoned in favour of an approach to a void, which gave its top built structure the appearance of a monument, as it is poised on slender columns and hovers effortlessly in mid-air.

Without the possibility, for the time being, of being able to actually built any such grand scheme that his Eastern colleagues obtained, Le Corbusier designed in 1925 the Immeuble Villas, very large blocks which added to their more celebrated characteristics the feature of interconnecting through 6 entire height pedestrian bridges over the adjoining streets. This would create a rhythm of recurring thin membranes supporting alternate galleries, flanked by staircases and lifts. The appearance would be that of a horizontal trellis high in the air and hiding of its heavy vehicular traffic in a double story street resembling Leonardo da Vinci's famed section (Fig. 5).

Living traditions and emblematic figures

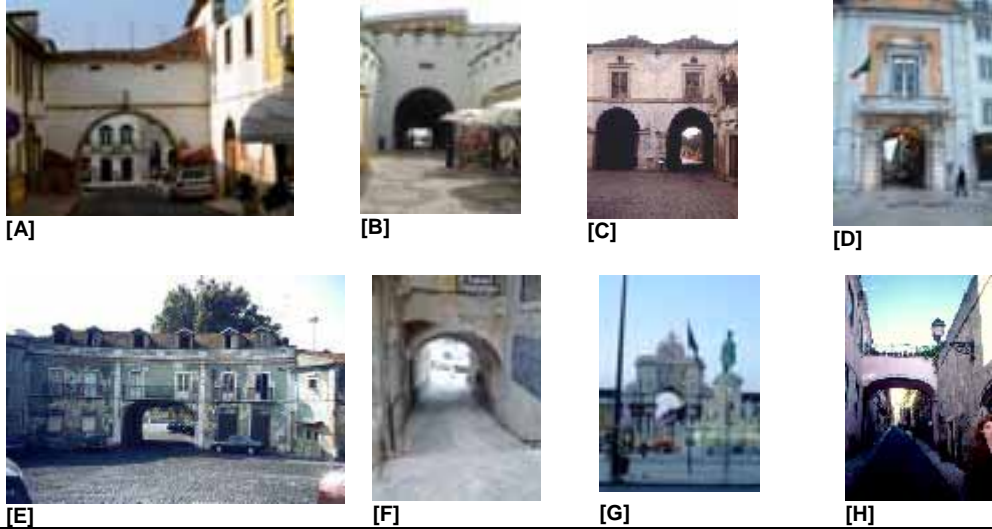
Most of the housing bridges referred to in relation to the Manueline and Philippine Codes were demolished or obliterated by time, as they were precariously build and easily destroyed. The only ones that have reached our time belong to the group of sturdy, better built bridges, usually belonged to families of higher ranks, frequently to religious institutions. In time, they have become what since the Romantics are recognizable as picturesque. Their careful design and often decorative highlights sets them as conspicuous figures in urban historic quarters. They have become emblematic of and participate in the sense of identity of the cities they embellish. Throughout Portugal, many such bridges are still in existence. In the examples shown in Tomar, in Elvas and in Belém, Lisbon, a street goes under these built bridges. In Albufeira, a similar opening acting as the main pedestrian access to the beach is in fact a tunnel underneath an existing street, complete with such buildings as a hotel. In Alfama, Lisbon, a number of such arches are doors were officially or unofficially opened in the city walls that shielded the city from the river approach. Also in Lisbon, a simple passage allows the connection of house and garden over a street. The Arch of the Tower, by the Tower of Belém, allowed what used to be a national road to cross it, where drove all the traffic to and from Cascais to the West of Lisbon. Up to the 20th century, almost all of these connections were arched, as affordable building technology privileged this constructive pattern (Fig. 6).


Figure 6 [A-E]: [A]: Arch in Tomar; [B]: Arch in Albufeira; [C]: Arch in Elvas; [D]:Arch of Bandeira, Rossio, Lisbon; [E]: Arch of the Tower, Lisbon; [F]: Arch in Alfama, Lisbon; [G]: St. Augusta's Arch, Lisbon; [H]: Arch at Inglesinhos, Lisbon.

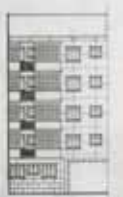
The triumphal arch of Street Augusta and the more unassuming Arco do Bandeira are landmarks of the 'Baixa Pombalina', the downtown area of Lisbon which was reconstructed by the Marquis de Pombal after the catastrophic earthquake of 1755. They act as main doors to respectively the Square of Commerce by the river Tagus and the Rossio, in the opposite side, these being the public areas bounding the perfect rectangular urban lay-out to the South and North. These and other important doors and archways are part of the monumental structure of Portuguese cities.


20th century cases

In the 1940's and 1950's an expansion of Street Sá da Bandeira in Porto was designed and built. In its Northern top, the urban lay-out and buildings are designed as a section of a modern city, including its end and intersection with a right-angle street through a passage underneath a vast urban block. Being a main street in Porto, it brings about the largest passage registered so far in a Portuguese city. Alvaro Siza's Bouça neighbourhood (1973-78; 2004-06) uses a set of passages in the buildings' design. Gonçalo Byrne's 'Pantera Cor de Rosa' (1973-1979) connects confronting buildings by means of slender pedestrian bridges, in a way reminiscent of Le Corbusier's Immeuble Villas (Fig. 7).

Figure 7 [A-B]: [A]: St. Sá da Bandeira, Porto; [B]: Bouça, Porto; [C]: 'Pantera Cor-de-Rosa', Lisbon.

A succession of nine cases was selected in the city of Lisbon to put on view the continuity of this passage solution throughout the 20th century. They spread out throughout the century from its beginning to the last decade (Fig. 8).

Figure 8 [A-I]: Perforations in Lisbon. (Cont.)

The majority of the perforations in the vaster group which were recorded create passages comprising both vehicular and pedestrian transit and sometimes they are conceived as pairs of twin passages. Other cases allow only pedestrian use, either as a level linear route or as stairs surmounting a slope. An instance of this condition is the most recent case selected – the 'Pátio Bagatela' (1992). It is located in the same place where a 'Pátio Monteiro' existed. Part of this working class housing scheme was rehabilitated by the new project, which retains other pre-existing architectural and urban characteristics – the buildings' orientation, the pedestrian passage and more volatile features such as the dominant colour. The route is public and crosses the built complex

made up of housing blocks of different heights and densities with shops in the ground floor along its longitudinal axis. It places the perforation in its Eastern end, at right angles to an important street in the urban fabric of Lisbon.

Resulting from private initiative as in the previous case, another situation where the perforation favours an exclusively pedestrian use consists of a route in the core of a block belonging to an expansion area of the city in the 1930's, the 'Bairro dos Actores' (1939). This block is made up of collective housing 4 floors' buildings with two 'doors' in either end of its longitudinal axis which are barely perceptible in the urban facades. The path is organised as a semi-public pedestrian street enclosed by a low wall forming indentations and delimiting private yards.

The third case of pedestrian passage is located in Street Sacadura Cabral, which is perpendicular to the Rome Avenue and dates from 1954. The perforation is located in the Alvalade neighbourhood, an expansion area which was planned in North-Eastern part of the city in the 1940's; it is organized in blocks whose cores are for collective use and is structured as a built *continuum*, most of it consisting in 4/5 floors' high buildings with ground floors fully built.

The Street Sacadura Cabral perforation has generous dimensions, although being used exclusively by pedestrians. It presents an expressive use of constructive structure and built-in shop units margin it transversally. It is one of the sole passages with a permanent occupation of a street café.

In Alvalade are located two other situations destined to pedestrian and vehicular crossing alike. One includes a sequence of double perforations, as the plan shows - Av. Roma /Street Edison/Av. Madrid (1952). It was designed as part of a partial urban plan. The perforation is noticeable in the façade opening into the main avenue through its double-height space, its composition and the ornamental details in its façade. The differentiation of ownership in either side of the passage is made conspicuous by a different use of colour. The two halves of this passage were independently built and made use of cantilevered volumes high up in the air.

The other selected passage in Alvalade is located in Street Alberto de Oliveira which is perpendicular to Avenue of Igreja. It is also part of a sequence of double perforations in either side of the Avenue. Differently from the previous situation, where it gave way to a open-ended street, this passage allows access to the inside of a block in the form of a cul-de-sac.

The passage situated at Street Morais Soares (1918) – the earliest selected case for this chronological sequence – gives way to a narrow single roadway curved street, set at right angles to one the main avenues of Lisbon's urban fabric.

In the Lumiar area to the North, stands another sequence of perforations (1970), this time set in the urban fabric in a non-linear scattered way, although an integral part, by means of a winding hoop, of the same street – Street Luis Pastor de Macedo. Both

perforations – of which only one is presented - are singled out by their prominent structure and corresponding contrasting colour.

In the Olivais Sul neighbourhood (1960), another set of double perforation is to be found, but this time placed in a discontinuous urban fabric. An entirely planned housing sector by public initiative where the buildings are scattered on the terrain. Even so, there is an intentional design promoting the access underneath a building in the Street Cidade de Cabinda (1958).

Finally, a case is found where a perforation gives access into a square from a street that extends it North wise. In the vast square Rainha Santa (1962), the passage is barely perceptible, although the street allows contact with the main shopping and social services area of the neighbourhood.

Conclusion

Movement and accessibility are major forces in the creation of built form. The same feature – the built passage – testifies to the continuity of this driving force. It presents many forms of variability (Fig. 9), depending on objective conditions such as constructive skills, material and labour resources, as well as on subjective ones – such as a will to protect, identify and impress. This feature as it appears in Portuguese cities is a result of public initiative in the large planned sectors and of private initiative in numerous cases diffused throughout the urban fabric. This feature acts as one the prominent elements that separate and differentiate public from non-public ground; although it can mislead on the true nature of the space it veils. It contains a contradiction in its vertical legal status, as it frequently covers public territory with private residential space. Changes in the nature of the land occur through these architectonic devices and are a result of complex interplay of forces, including profit, urban problem-solving drives, catalysts for circulation, and a will to permeate the city with accessibility filters.

Urban Renewals or urban transformations? Creation of the Avenue Magalhães de Almeida – landmark of modern architecture in São Luis, Maranhão - Brazil

Grete Pflueger
State University of Maranhão, Brazil

Influenced by large urban transformations in Europe and in the United States, the historic city of São Luis of Maranhão, northern Brazil, built according to the Portuguese colonial architecture of the eighteenth and nineteenth century, receives a diagonal avenue which rips the urban fabric, leading to the demolition of colonial houses, as well as establishing a new architectural style, with buildings in art Deco and modern architecture. This research seeks to highlight the importance of the avenue Magalhães de Almeida as milestone of modernism in the city. It also seeks to understand the tensions between private and public interests and relationships in the changing context of the city and the process of urban transformation caused by its construction.

Temporalities of the historic city center of São Luis - Maranhão

In the perspective of the twentieth-first century, we seek to understand the different temporalities of the city of São Luis, Maranhão – Brazil. With a new outlook on the tendencies and styles of architecture, dating of the end of the nineteenth century and beginning of the twentieth century, valuing this ensemble that has incorporated itself to the historic ensemble, as well as reflecting the influences of the architectural movements that occurred in Europe and in the United States.

In São Luis, the power of the colonial Portuguese-Brazilian architecture from the eighteenth and nineteenth century, recognized by UNESCO, concentrated all the efforts of research by federal, state, and municipal organizations, into cataloging these buildings for the protection of this ensemble. Therefore, the architecture of the nineteenth and twentieth century has not been thoroughly researched. This is understandable, considering the historic and cultural context. However, new initiatives started seeking to reawaken the importance of the twentieth century architecture, through researches developed by the Architecture and Urbanism department at the State University of Maranhão Uema, with the support of the Foundation of Aid to Scientific Research – FAPEMA, in the scope of the State government, and of new research organizations created, in the scope of the municipality. Together, these partners strengthened the stimuli for research on the architecture of the twentieth century, avoiding demolitions and the loss of the original characteristics of these properties.

Other modernities

In the historic Center of São Luis, it is possible to state that, at the beginning of the twentieth century, the colonial architectonic ensemble incorporated, slowly, the influences of the new European styles, using the new materials from the industrial

revolution, such as: new hydraulic installations, electrical installations, and the use of iron, glass and decorative elements.

These sophisticated elements such as parapets and balustrades ornamented by pinnacle, pediments and neoclassical colonnades, decorative elements made of stucco, eclectic elements such as garland, crowning vertical lines from the art deco on the parapets, or, round windows or doors from the art nouveau, were inserted into the façades of the buildings of traditional Portuguese-Brazilian colonial architecture. This was done specially in the higher parts of the city, above the João Lisboa Square all the way to the Deodoro Square (Rua da Paz, do Sol, Passeio, Rua Grande, etc.). Soon after, new buildings were constructed on the structuring axis of the urban growth of the city, which encompassed from the Rua Grande to the Avenue Getulio Vargas, as well as in areas subjected to renovations such as the Rua do Egito and Avenue Magalhães de Almeida.

The map below, part of the dossier created for the world heritage commission[1], shows the styles and their locations in the city center. There is a predominance f the Portuguese traditional style, followed by the other styles: *neoclassical, art deco, eclectic, modernist, bungalow, and popular.*

The Modern city – the construction of the Avenue Magalhães de Almeida

The greatest change in the profile of the city of São Luis was between the decades of 1930 and 1940, during the government of Paulo Ramos. This audacious project, according to the historian Mario Meireles[2], was initially a plan by the young urban planner and mayor of the city, the engineer Otacílio Sabóia Ribeiro, whose wish was to transform the old capital into a city with modern looks. In face of the presentation to the chamber of deputies of the necessary resources for the renovation and the polemic caused by the costs and transformations, he was dismissed from the job. Part of his plan was executed by his successor, the mayor Pedro Neiva de Santana. This meant that the Rua do Egito tripled in width in the section from the Largo do Carmo to the Beira-mar Avenue. It also meant the creation of the Avenue Magalhães de Almeida, cutting a diagonal to the new Market.

This urban transformation of São Luis, done with many demolitions, in the search for a "modern image of the city" (RAMOS: 1941), was influenced by the ideas of the urban renovations executed by the mayor Haussmann in Paris during the nineteenth century, by the works of the opening of the Central Avenue in Rio de Janeiro, during the administration of Pereira Passos, and, particularly, by the plan to remodel and beautify the city of Rio de Janeiro, by Alfred Agache (1927/1930). In Rio de Janeiro, the governor Paulo Ramos, worked as a employee of the Ministry of Finance, before taking on the govern of Maranhão.

Following the plan of Sabóia Ribeiro, who was a disciple of Agache, Pedro Neiva de Santana opened the Avenue 10 de Novembro, which, later on, was named in honor of José Maria de Magalhães de Almeida, navy officer, congressman, senator and governor of the State. This way, the pattern of the traditional architecture was replaced by the architectural language of the time, which reflected the arrival of modern times, through the *eclectic* and *art deco* styles.

Today, the new strategies of rehabilitation of historic centers avoid demolitions of pre-existing real estate stock, promoting their use and integration. The practice of demolishing buildings, which vas very common in the beginning of the century, was replaced by a vision of integrated urban conservation. According to the Lisbon Charter[3], urban renovation is an action that implies in the demolition of the morphological and typological constructions existing in a degraded urban area and its consequent replacement by a new urban pattern, with the new buildings attributing a new functional structure to this area.

The Great Avenue – Avenue Magalhães de Almeida – landmark of modernity

The change in the urban design can be observed on the cartography of the twentieth century, in the maps of 1912 and 1950. Note the diagonal alignment of the avenue.

Urban renovation

Another area of urban renovation was the Rua do Egito, which can be seen in the photograph by Gaudêncio Cunha of 1908. In this photograph, it is possible to identify the colonial houses that were demolished when the width of the street was increased. These houses were replaced by the two-story bungalows as shown in the current photograph of the street.

The term bungalow has its origin in the India. It designates a one-story house with a porch. It is important to point out that, in São Luis, the term bungalow represents a house with two stories, influenced by American Cinema and eclectic references, such as access from the side and change in frontal setback lines. On Rua do Egito, there are many types of bungalows and, at the end of the street, the State Bank of Maranhão (BEM) Building can be seen. An important modernist building, with metallic structure, it has its lateral façade covered by a decorative ceramic tile panel, which was inspired by the MEC building, in Rio de Janeiro, designed by Niemeyer and Le Corbusier.

According to Cavalcanti,[4]2001, the time period of modernist Brazilian architecture is from 1928, date of the construction of the modernist house in São Paulo by Gregori Warchavichick, until 1960, before the construction of Brasilia.

Two theoretical reference points shape the movement in 1920-21: the publication of 10 articles by Le Corbusier, based in the L'Espirt Noveau, and in 1933, the Fourth International Congress of Architecture, in a ship from Marseille to Athens, where The Athens Charter was created, along with the basic concepts of the new style. In Brazil, an important fact was the visit to Rio de Janeiro by Le Corbusier, in 1936, and his collaboration to the project of the MEC building, which was decisive for the Brazilian Modern Architecture.

The influences of the modern movement arrived in São Luis during the decades of 1940 and 1950, when they [5]were inserted into the classified ensemble, with some modernist buildings to house public organizations of federal institutions. Such modernist projects spread the new language to different areas of the country. In this context, the following buildings were constructed: the INSS or João Goulart Building in the Pedro II Square, the building of the State Bank on Rua do Egito, the house of the DNER in the Jansen Muller, and the Sulacap building on Rua de Nazaré. Within the modern buildings, the

Caiçara Building stands out, located in the Rua Grande (in the old site of the Nossa Senhora da Conceição Church, demolished a few years earlier) as the first modern buildings of ten floors in the city, changing forever the skyline of the historic city, which was characterized before by the towers of the churches.

In different neighborhoods of the Center, isolated examples show influences of the French modernism of Le Corbusier, as well as American influences of the designs of the architect Frank Lloyd Wright, which can be seen at the Dutra Hospital built in 1950 by the Cumplido Santiago & CIA company and in the houses of the Avenida Getulio Vargas, both with interesting shapes of rooftops.

During that period, the decades of 1940 and 1950, the Benedito Leite Public Library was built in the Praça Deodoro, at the old site of the Campo D'ourique. It was a contrast to modern buildings and it was associated with the initial debate *of being or not being modern*. It used the same materials of modern structures, concrete and iron, but the formal repertoire followed the eclectic language, with influences from neoclassical style. The Post Office Building on the Praça João Lisboa was also built in the Art Deco style, as well as the Hotel Central and the Roxy Cinema. The art deco style also influenced the popular or vernacular architecture, incorporating parapets, with vertical lines, in the smaller sized buildings both in the capital city of the sate and in the countryside.

The tendency of revivalism brought back elements from Portuguese-Brazilian colonial architecture. However, these new buildings combine them with changes in frontal and lateral setback lines, as well as with new materials and different forms of occupation of the terrain, creating a new effect. This way, neocolonial buildings, such as the old Liceu, were inserted into the city Center.

Illustration 10- liceu maranhense Álbum miecio Jorge, Liceu 1950.

In 1958, the engineer Rui Mesquita created a Project to remodel the urban structure of the city, with a plan to build bridges and new avenues. This audacious plan was not executed fully, only partially. In 1968, the Caratatiua Bridge was built over the Anil River, shortening the path to the neighborhood Olho D'água. In 1970, the dam over the Bacanga River was built, opening the way to the new port and to the university campus in 1970. The bridge planned to connect the neighborhood of São Francisco to the Center, which finally allowed the possibility of urban growth in the direction of the beach, decreasing the concentration in the Center.

Ten years later, in 1980, the Bandeira Tribuzzi Bridge was built, connecting the neighborhood Jaracaty to the Center. These new connections allowed new paths for the urban growth as well as new architectonic languages in the new neighborhoods.
In this context of urban growth of the city, the modernist residential architecture was consolidated by the works of the architect Cleon Furtado. Our very own "Le Corbusier", born in Maranhão, in 1929, studied architecture at the Mackenzie Institute, in São Paulo, from 1950 to 1955. He was influenced by the São Paulo school, by the works of Rino Levi and Warchavichick, and by the Rio de Janeiro school, the designs of Niemeyer and Lucio Costa.

Cleon Furtado, along with the architect Braga Diniz, innovated and dared, spreading the modern architecture in São Luis through his many residential modernist projects. He was motivated by the ideas of the German architect Mies Van der Rohe and in his statement *"less is more"*. He valued the pure form of the French architect Le Corbusier, author of the Athens Charter and the project Villa Savoye, a concrete residence built in the surroundings of Paris, shaped as a parallelepiped with a square base on top of pilotis. This reference can be seen in the works of Cleon, spread in various neighborhoods of the city: on the Beira-Mar Avenue, in Apicum, on Rua do Norte, among many others, where the five main points of the new architecture - the pilotis, the

garden ceiling; the free plan; *a fenetre on longe* (windows along the façade) and the free façade - were correctly used, bringing to the island *L'espirt nouvau*, the new language.

Many losses of characteristics – public and private – urban interests

All this modern ensemble, eclectic, art deco was still not protected by the laws of classification inside the historic city center. Only a few properties inserted in the areas of state and federal classification, are subject to the preservation laws. Some of them are excluded from the classification and are subject to demolitions and possible loss of the original characteristics of the building. In the areas of urban expansion, close to the classified zones, the area of urban growth in the twentieth century, such as the Avenue Getulio Vargas and Beira-mar, the properties are not protected, for there is no legislation. In these areas, the bungalows and the eclectic or modern houses have been frequently demolished or lost their original characteristics.

The change of the tendency from residential to commercial, specially the transformations into medical clinics, has changed some historically interesting buildings into simply colored façades, altering their typology and form.

It is fundamental to observe that, these properties are subject to renovations, for they allow for a larger flexibility than the colonial buildings, due to the use of modern materials and construction techniques. However, the total loss of the original characteristics of the building has been erasing the records of the architecture of the twentieth century, which is very little recognized and valued in São Luis.
