Significance of non-Vitruvian ideas: a study on the peculiarity of the town planning

Akihiro Kashima
Setsunan University, Japan

1. Introduction

As the origin of the modern European town planning concept, the influence of the planning philosophy and related system and standards of the Renaissance period is of increasing interest. In nineteenth-century Europe, when cities expanded outside their walls, town planning strategies referred to former practical methods. One example is the urbanization planning of the city of Barcelona in 1859, in which modern infrastructure was contrived through a homogeneous grid pattern.[1] The planning theory behind the expansion plan for Barcelona drafted by the engineer, Ildefons CERDÀ, referred to the model of town planning experiments from early modern Spain.[2]

Concerning town planning philosophy and its practical ethics in Spain, the most outstanding examples of town planning are those drawn up in the colonial period. They were very influential in the colonial strategies of neighboring countries and much attention is given to them in the history of European town planning in the modern era. Concerning town planning philosophy in Renaissance Spain, its colonial code, *Ordinances of Philip II*,[3] issued in 1573, is regarded as one of the most important town planning codes. Dan Stanislawski points out that town planning regulations in the first half of the sixteenth century were based on Greek and Roman philosophy, and the *Ordinances of Philip II*—the most complete legislative work in the Spanish colonial period in the sixteenth century—had a more general view on town planning but were still based on ancient philosophy.[4] He mentions the similarity with Vitruvius' *De architectura, libri decem* [*Ten Books on Architecture*].[5] But there are different opinions on this point. Paul Zucker mentions that the Vitruvian ideas dominated the ideas on architecture and town planning at the beginning of the Spanish colonial period;[6] however, the concepts of town planning shifted toward the ideas of the theorists in Renaissance Italy who were familiar with Vitruvius. Thus, Zucker suggests that the town planning concept in the *Ordinances of Philip II* was distanced from Vitruvian philosophy.

This paper will compare *Ten Books on Architecture* by Vitruvius and the *Ordinances of Philip II*, focusing especially on the difference between them to clarify the peculiarity of the *Ordinances*.

2. Town planning philosophy of Spain and of its colonies

2.1. Issue of the *Ordinances of Philip II*

The *Ordinances of Philip II* issued in 1573 does not consist of only new regulations. For example, the first concrete regulations about colonial town planning were the royal

instructions issued in 1513 and addressed to Pedrarias Dávila,[7] a general of Catilla de Oro, currently Darien, Panama.[8] These instructions included regulations about sanitary conditions for the selection of the town site and the location of plazas and churches. The *Ordinances* advanced these instructions to make them more practical as regulations. This is an example showing that some of the regulations in the *Ordinances* were revised versions of previous sixteenth-century regulations. Judging from that, at the time the *Ordinances* was issued, a large number of colonial towns were already constructed,[9] and the *Ordinances* emphasized a redefining of town planning philosophy through many cases of experimental town planning. Therefore, it is recognized that there were many instances of town planning before the issue of the *Ordinances* that followed the same philosophy as the later issued *Ordinances*,[10] thus showing the influence of the architectural treatises of Renaissance Italy on the town planning code of the Spanish colonies before the *Ordinances* was issued.

2.2. Influence of Vitruvian ideas

In Spain, it is also recognized that the *Ten Books on Architecture* by Vitruvius had a strong influence at the beginning of the sixteenth century. The first Spanish translation[11] was published in 1582, but even before that, Vitruvius had much influence through versions in Latin and modern Italian.[12] Humanistic philosophy had a certain influence on the system of government in the colonial period. Stanislawski indicates that a Mexican architect had a copy of the *Ten Books on Architecture* published in 1550,[13] and even before that, Vitruvius' older editions had been referred to in the colonies. George Kubler says that architects in the sixteenth century usually studied abroad in Italy and that the philosophy of architecture and town planning in Renaissance Italy was very influential in the Spain of Carlos I. Moreover, it was easy to put that kind of philosophy into practice in colonial towns.[14]

3. The *Ordinances* as the town planning philosophy

3.1. Town planning regulations programmed into colonial laws

In light of the present, the *Ordinances of Philip II* is not just a compilation of town planning laws. Regulations regarding research of the colonial town site, municipal administration, and inheritance laws are edited together with the town planning norms. Originally, the *Ordinances of Philip II* was edited as a colonial code of seven books (seven fields), and a certain part of the second book was antecedently issued to be the *Ordinances*.[15] The rest of the books were not completed and the *Ordinances* was only issued to provide the objectives of town planning, thereby giving this code an important role in colonial law history. This limited issue tells how important town planning was in the colonial policy.

The first chapter of the *Ordinances*, *Discovery* [Articles 1–31], mainly concerns general rules on reconnaissance of the town construction site and an investigation of the local society. Here the headings and methods of the investigation are given very concretely. The second chapter, *New Population* [Articles 32–137], describes the site conditions for town construction, establishment of the administrative and judicial organization,

problems of land possession, practice of town planning, and all other conditions concerning new town construction. Most of the matters relevant to town planning and layout are included here. The third (and last) chapter, *Pacification* [Articles 138–148], provides instructions mainly about the effectiveness of missionary work.

Town planning here concerns not only the solution to physical planning but also the most important matter for the colonial administration—to impose their customs and sense of values on the society of the natives of different religions.

3.2. Town planning regulations dealt with in the *Ordinances*

The *Ordinances* has three chapters: Discovery, New Population, and Pacification, and most of the discussions on town plan are present in the latter half of the second chapter, New Population. Since Zelia Nuttall discovered the *Ordinances of Philip II* in 1921 and extracted town planning related matters, the *Ordinances* has been regarded as a code showing the philosophy of the town planning model of the colonial territories of Spain.[16] The regulations in the *Ordinances* extracted by Nuttall played a major role in leading studies on Spanish colonial towns, as historical documents supporting the order and rules of the town layout. But, in fact, the *Ordinances* includes other related regulations than the town layout, such as rules on the selection of the town site. This paper discusses the peculiarity of the town planning rules given in the *Ordinances*, including not only physical matters regarding the town layout but also the criteria on the establishment of a society effectively relevant to town construction.

3.3. A code as a fundamental idea of town construction

In the *Ordinances*, the purpose of town planning is basically the mission of bringing Christianity to the natives [Article 25], and the method of the missionary work is described in detail. Negotiations with the natives are predicted. Very concrete rules about missionary work—how to communicate with the natives, how and to whom they should preach, and so on—are stated [Articles 138–148].

Under these regulations, there lies a fundamental philosophy that an understanding of Christianity would lead to the improvement of town life [Article 141], and this attitude is also recognized in the town planning regulations. The idea that the church should be a symbol for the citizens influences its architectural methods.

On town planning and construction, the *Ordinances* widely refers to the blocks, plazas, streets, plots of institutions, location of facilities, condition of locations, appearance of the streets, construction materials, and so on. The ideas on town layout, pattern of the streets, and establishment of plazas have much in common with the fortified towns, "bastides," of Southern France, where the streets are laid out in good order. However, the planning of plazas as commercial zones, location of sanitary facilities in good order, and the general appearance of the streets imply an image of the ideal city for the civilians: a colonial town rather than a town designed for military defense. These descriptions are not as concrete as those concerned with town planning in the *Ten*

Books on Architecture; however, the *Ordinances* contains clear planning rules for these contrasts.

4. Town planning philosophy in the *Ten Books on Architecture*

4.1. The fundamental attitude to the town plan

First, in the *Ten Books on Architecture*, the town planning regulations are mainly recognized in Book I, [Remark 4] which describes the construction of the town wall and sets out the fundamental attitude of town layout, and Book V, which describes the location of public facilities.

The town walls, towers, and town gates are extremely important, as Vitruvius interprets public buildings from the viewpoint of defense, religion, and practicality [Book I, Chapter 3, Section 1, (I.iii.1)]. On the basis that the town and its public facilities are very important elements for society, the necessary regulations are drawn up. Humidity, temperature, and wind direction are all taken into consideration for selecting the land for town construction, [I.iv.1] and criteria for the selection of the healthy location are described [I.iv.9, I.iv.11, I.v.1]. A concrete image of the town shape is also described from the viewpoint of defense [I.v.2], pointing out the relation between the direction of the streets and the wind, and criteria for the positioning of the plazas [I.vi.1, 8, I.vii.1]. From the selection of the town site to its layout, the design considers all aspects of health, climate, and environment. The planning concept for the plazas concerning shape, size, and the surrounding buildings is very practical [V.i.1, 2, 4].

With regard to the conditions of the town site, the quality of water in particular is mentioned with regard to health in Book VIII, and a remarkable sanitary viewpoint including various required conditions for the town site, town layout, and location of facilities is presented [VIII].

4.2. Architectural criteria as town planning regulations

Apart from Books I and V, some architectural regulations regarding town planning are recognized. Building materials [II], architectural planning and division [III, IV], arrangement of the temples [IV], housing architecture [VI] are also mentioned in other *Books*. For example, the descriptions of building materials [II.iii.1], foundations of the buildings [III.iv.2, V.iii.3, VI.viii.1], arrangement of the temples [I.vii.1, IV.v.1, 2], and matters concerning water supply in the town [VIII] are very concrete. These descriptions are apparently recognized as the basis of the regulations in the *Ordinances of Philip II*. From this point of view, concerning conditions of location, climate, town layout, location of facilities, and materials, the *Ten Books on Architecture* by Vitruvius is an arrangement of town planning conditions with the principles of usefulness (*utilitas*), solidity (*firmitas*), and delight (*venustas*).

The *Ordinances of Philip II* sets out the basis of the regulations required for the construction of a town in an undeveloped location and the management of its new

society. On the other hand, the *Ten Books on Architecture* is mainly an arrangement of architectural standards providing architectural regulations from the viewpoints of both interior and exterior space and treats a much wider range of themes than the *Ordinances*. The following section concretely compares the ideas on town planning from various aspects argued from both historical works.

5. Comparison between the *Ten Books on Architecture* and the *Ordinances of Philip II*

Here follows a discussion on the ideas concerning architectural matters and town establishment as part of town planning philosophy.

5.1. Site selection for the establishment of a town

The *Ten Books on Architecture* and the *Ordinances of Philip II* have a very common view about where to construct a town. The *Ordinances* states the conditions for site selection in detail from various angles such as height above sea level, temperature, distance from marshland, direction to the sea, and the conditions of the local inhabitants [Articles 34, 40–41, 111-ii[17]]. It also places importance on a good supply of food, water for daily consumption, and construction materials [Articles 35, 39, 111-ii]. Vitruvius also covers the same sanitary conditions and mentions the reasons and measure of investigation [I.iv.1–12], and devotes many pages to explaining the most important matter, the source of a river [VIII]. As for the conditions of the location, the *Ordinances* discusses these in terms of trade, safety, and government affairs [Articles 37, 41]; on the other hand, Vitruvius has an eye for health conditions, harvesting of the land, and freedom of transportation [I.v.1]. The *Ordinances* gives only fundamental conditions on this matter, but it is apparent that the basis of the *Ordinances* derives from Vitruvius.

The *Ordinances of Philip II*, however, includes a different kind of requirement for the selection of the town construction site. The requirement insists that in case of establishing a town along a river, it should be constructed on the east side of the river [Article 40], so that the sun always rises in the direction of the town beyond the water surface. This shows a strong intention of establishing a town image that is relevant and meaningful to the natives of a different religion. As for the matter of selecting the location, Vitruvius studies the location of the plazas, classifying cases of inland town construction and coastal town construction [I.vii.1], but the location for coastal town construction is not regularized. In the *Ten Books on Architecture*, however, the methodology of establishing an intentional image by arranging the location is recognized in the ideas for the location of temples [IV.v.1]. An image is produced here such that the temples and the idol installed in their "*cella*"[18] should basically face the west sky so that the devotees face both the temple and its idol and the east sky together, and that the idol on the east faces the devotees on the west. Moreover, when the temple is located along the river, it should face the riverside, and when along the street, it should directly face the street [IV.v.2], thus suggesting an attitude of pursuing an attractive, symbolic, and authoritative image.

Concerning the selection of coastal town location, in the *Ordinances of Philip II*, a strong consciousness of effective scene making is incorporated in the methodology of the location of facilities.

5.2. Town shape

A remarkable difference is recognized in the description of town shape. A circular town shape is evaluated highly by Vitruvius [I.v.2]. This is simply because enemies are visible from all directions. By contrast, a rectangular form or a convex polygon that produces a dead angle from a fortified town is not the best selection for the town shape. Here, defense is given priority in determining the town shape with the condition that the town is enclosed by walls. Also, elsewhere Vitruvius refers to the inside or outside of a town, as he does not break the condition that a town has a town wall as its boundary.

On the other hand, the *Ordinances of Philip II* does not make any clear statement regarding town shape or include any regulations about town walls. The *Ordinances* rather insists on town planning that anticipates a town's expansion in the future. On this point, the *Ordinances* gives importance to town planning with a clear order to obtain continuity between the expanded and existing parts of the town, and make observations on the security of unoccupied land and its use [Articles 111-ii, 129–130].

5.3. Street layout

Differences in town shape lead to big differences in street layout as well. The directions of the main streets are selected to avoid the direction of strong winds. As for the circular town by Vitruvius, eight main wind directions are formed, dividing the town radially into eight equally sized parts including the north–south axis. In order to lay out the town's main streets in a direction where they do not face the prevailing winds, the difference in the angles between the directions of the streets and the eight directions of the wind must be 22.5 degrees at most. In short, a circular form divided radially into eight parts can draw an octagon, and the direction of its diagonal is adequate as the street layout that can avoid the prevailing winds the most [I.vi.1–13]. This idea is also different from the colonial town planning of the Roman period, which suggests a street layout consisting of a radial pattern of streets as the diagonals of an octagon and a concentric polygon pattern of streets parallel to each side of the octagon (Figure 1). This philosophy would accommodate a main plaza in the very center of the town. This type of planning shows a highly centripetal and geometrical form for the layout of a town, and therefore, a town of this type is less flexible toward expansion. This philosophy of town planning can be recognized in the town layout of Palmanova (Figure 2).[19]

In the *Ordinances of Philip II*, there is less discussion on the details of town shape as in the Vitruvian ideas. But a schema of street patterns can be read in the regulations about arrangement of streets and blocks. Some explanation on the whole layout gives a hint toward understanding the illustrated image of town planning. First, the core space of the town is the main plaza, "plaza mayor," the starting point in planning a town, which

should be rectangular in form [Articles 111–112]. Four main streets are drawn from the central point of each side of the rectangular main plaza. Also, two ordinary streets are drawn from each corner of the plaza at right angles [Articles 114–115], numbering eight in total. The rectangular plaza is the basis of the layout, and determines the directions of each side of the rectangle, in other words, the perpendicular axes X and Y in the town plan. Here the direction of the X and Y axes are laid down with the wind direction in between, making a 45-degree gap. The abovementioned streets extending from the plaza are all either parallel or perpendicular to the X and Y axes. The distance between streets parallel to each side of the plaza, the street pitch, however, is not clearly mentioned in the *Ordinances*. But the idea shown in Article 111 that the blocks should be laid in a line regularly means that the whole layout of streets is considered to be a grid pattern.

In other words, in the town layout idea in the *Ordinances of Philip II*, the central rectangular block of the town and its surrounding main streets and ordinary streets perpendicular to it are the fundamentals. This central block, however, is a plaza—an open space block providing a public space for the town, and around this open space block lie ordinary building lots parallel to each other comprising the core of the grid pattern layout (Figure 3). Also, the idea of composing an ordered adjustable layout pattern in case of town expansion [Article 111] results in a grid pattern. This concept shows that the general norm of the town plan determines the composition of the town core and repeats the same structure toward the vicinities. The *Ordinances of Philip II* does not enforce a fixed shape for the whole town, nor do they ignore the geographical conditions. On this point, the *Ordinances* does not argue at all about the town boundary that Vitruvius discusses. The *Ordinances* shows the idea that strongly prescribes the layout of the town's interior, rather than the town's outline or shape, and a clear planning vision adjustable for the expansion of the town by following the same street planning scheme repeatedly. This scheme with the option to expand is recognized in the two different stages of the Buenos Aires town plan, whose town layout scheme was based on the *Ordinances of Philip II* (Figures 4 and 5).[20]

5.4. Planning process

The *Ordinances of Philip II* gives importance to the determination of the location for the "plaza mayor" as the starting point in planning a town. Considering the relation between this central plaza and the surrounding streets, a grid layout pattern of streets is calculated. Next, smaller plazas and locations for other facilities are studied [Articles 112, 118–119]. The proportions and scale of the plaza mayor direct the layout design of the whole town. On the other hand, Vitruvius first determines the main and ordinary streets, and then selects the locations for the forum, temples, and other public facilities [I.v–vii]. Both show a general methodology of town planning but a peculiar difference is seen in the planning steps.

5.5. Town core planning

Both pay special attention to the planning of the plaza. The concept of drawing a

complex core plan with architectural standards for the surrounding facilities is common to both. The location of the main plaza should be at the harbor in case of a sea coast town, and should be at the center of the town in case of an inland town. Both draw particularly detailed criteria for town core planning;[21] however, some differing points are very apparent.

In the *Ordinances*, the proportions of the plaza mayor (length/width = 1.5) [Article 112] and construction of the porticoes [Article 115] are not entirely the same as those expressed in the *Ten Books on Architecture* [V.i.1, 2]; although basically these ideas are faithful to the Vitruvian idea of shape for its use and its proportions. Moreover, both suggest a rectangular shape for the plaza. As for the scale of the plaza, the *Ordinances* not only indicates the Vitruvian idea of calculating the size by considering the number of inhabitants [V.i.2] but also suggest a concrete size for the plaza.[22] The *Ordinances* provides a direction of physical shape and an ideal model for the plaza [Articles 112–113].

With regard to the surrounding facilities of the plaza, the *Ordinances* points out the churches, royal facilities, and other public facilities, shops, and residences for merchants [Articles 118, 126]. On the other hand, Vitruvius indicates basilica (basilicarum), national treasury (acararium), prison (carcer), and the senate house (curia foro) [I.vii.1, V.i.1–10]. Naturally, the facilities argued in both are not the same because of the difference in era, but Vitruvius treats the spatial structure of the plaza and surrounding facilities as a whole. Vitruvius gives detailed regulations about a forum surrounded by two-story porticoes, its column pitch, diameter of the materials, scale, and so on [V.i]. A strong attitude of resolving subjects architecturally is recognized in the Vitruvian idea. On the other hand, the *Ordinances* is faithful to the idea of the porticoes in Vitruvius but show no detailed argument for the architectural criteria such as the scale system of columns and materials. The *Ordinances*, however, pays much attention to detailed town planning such as decoration along the streets around the plaza, the connection of streets and plaza as town scenery, and spatial structure around the plaza with regard to the path of the merchants' flow [Articles 111–115].

5.6. Location of town facilities

The *Ordinances* gives detailed regulations on the location of religious facilities. There is a deliberate control for producing a dignified view, such as the intentional location, level of the base, and distance from neighboring facilities [Articles 119–120, 124]. This idea derives from the Vitruvian idea that regulates the direction of temples and their location in the walled town [IV.v.1, 2].

Vitruvius also gives detailed descriptions of location and planning conditions for facilities such as the theater (theatrum) [V.iii–xii], public baths (balineae) [V.x], gymnasium (palaestra) [V.xi], harbor (portus), and dock (navaliorum) [V.xii]. The *Ordinances*, other than the facilities around the plaza, gives location norms for public facilities such as religious facilities, custom house, arsenal, and hospital [Articles 121], and commercial facilities that have problems of waste (butcher, fish, and leather shops), all from the

viewpoint of sanitation [Articles 122–123]. As for the hospitals, the *Ordinances* also indicates separate locations of hospitals for infectious and non-infectious diseases [Article 121].

5.7. Lot division

In contrast to Vitruvius, with regard to town expansion, the *Ordinances of Philip II* argues rather for the security of land and its use as meadow and farm land [Articles 129–130]. The *Ordinances* also provides regulations with respect to the supply of land to the colonists and its utilization; on the other hand, this kind of attitude is not seen in the Vitruvian idea [Articles 127, 130–131].

5.8. Building criteria

Ten Books on Architecture gives detailed explanations of all features, from the location of houses to the path of flow inside the house, based on the aspects of safety, health, and comfort [VI.i–viii]. The physical endurance of the buildings, especially the foundations of a building, is discussed in the *Ten Books on Architecture*, and similar ideas on public facilities such as temples and theaters are stated [III.iv.2, V.iii.3] The *Ordinances* does not widely establish a building code as in the Vitruvian idea, but the ideas on firm foundations and sanitary planning for residence [Articles 132–133] derive from the Vitruvian idea. On this point, however, the *Ordinances* also pursues economic and fast construction [Article 132], as the *Ordinances* provides guidelines for town construction in locations with a limited amount of materials and techniques. The idea of unifying the building scenery is also peculiar in the *Ordinances*. This is a remarkable regulation concerning the esthetic aspects of the town, which is not discussed in the Vitruvian idea.

6. Conclusion

With regard to the location for town construction, the *Ordinances of Philip II* and the *Ten Books on Architecture* by Vitruvius provide common aspects of usage and sanitation. Concerning town shape, however, the *Ordinances* do not argue for a town wall as the basis, and thus do not fix the town boundary. This is a remarkable difference in the basic attitude to town planning. This difference also has a considerable effect on the composition of street layout. The *Ordinances* establishes a planning methodology that corresponds to town expansion.

Thus, in the *Ordinances*, a strong, ordered design is important for the spatial structure inside the town rather than the town boundary. This is apparently the origin of the grid pattern for street layout, in complete contrast to the Vitruvian idea of a radial layout of streets and a circular town shape.

There is also a clear difference in the planning process. In the Vitruvian idea, the town's boundary and the layout of the streets are the most important, and the location for the

main plaza is selected as one of the main facilities of the town. In contrast, the *Ordinances* gives precedence to the location of the plaza, and the physical planning conditions of the plaza form the basis of the layout design of the whole town. In short, the spatial structure of the town core corresponds to the whole structure of the town.

As for the town facilities, each document discusses the different building types of each period. Therefore, it is difficult to directly compare the philosophy of the norms, but the concept of locating plazas and public facilities from the aspects of attractiveness, sanitation, and function in the Vitruvian ideas are accepted and rearranged in the regulations concerning the location of facilities in the *Ordinances*. The *Ordinances* also shows a strong intention to provide visual effects relating to the different religions of the native society. Vitruvius does not establish the same idea but the location concept of the temple as a town's symbolic facility does appear to be an intentional feature of the scenery and view; therefore, the philosophy of facility location in Vitruvian ideas has a strong relation with the idea of town location methodology in the *Ordinances*.

The *Ordinances* keeps the aspects of safety, health, and comfort as given in the Vitruvian ideas and add new viewpoints of practical methodology of town planning, which correspond to the expected town expansion by means of a grid pattern. This scheme of town layout shows an idea of town planning with high adjustability in case of expansion, which has not evolved from the Vitruvian ideas. The *Ordinances of Philip II* provides a methodology of standardization and systematization of town planning philosophy.

(16) Discussion tends to be focused only on articles 111–137 in the *Ordinances* regarding town planning regulations. The leading study is the following. NUTTALL, Zelia: "Royal Ordinances Concerning The Laying Out of New Towns," *Hispanic American Historical Review, vol.5, no.2*, (1964. Reprint of the 1922 ed.), pp.249-255.

(17) In the original text there is an error—the article number 111 is on two different articles. Here the second article 111 is numbered "Article 111-ii," and the first just "Article 111."

(18) The most sacred chamber of an ancient temple, which usually contains a cult image or statue.

(19) The town of Palmanova, Italy, a star fort town, was founded in 1593, and its form was drawn by Vincenzo Scamozzi. Reference to the figure 2: http://www.clubitalianoautogiro.it/galleria_immagini.html.

(20) The city of Buenos Aires was founded by Juan de Garay in 1580. The figure 4 (Archivo General de Indias; MP-BUENOS AIRES, 11) shows the rigid pattern of its street layout in 1583. The figure 5 (SOLANO, Francisco de (dir.)(1992): *HISTORIA URBANA DE IBEROAMEREICA TOMO III-2,* Madrid, p.682), Buenos Aires in 1713, shows that the town has expanded accepting the grid pattern which was the base of the town planning from the origin.

(21) The *Ordinances of Philip II* and the *Ten Books on Architecture* do not argue on the same facilities but both expect the main plaza to be a spatial structure with a highly ordered design as the town core. Both provide planning criteria in detail about its surrounding public facilities and streets.

(22) Article 113 of the *Ordinances* suggests an ideal size for a plaza; "The main plaza should be larger than 200 'pies' in width and 300 'pies' in length and smaller than 800 'pies' in length and 530 'pies' in width and the medium size is 600 'pies' in length and 400 'pies' in width." A pie is a unit of length utilized in sixteenth-century Spain, and was equal to 278.33 mm. Converting pie into meters, it is about (83.5 m, 55.7 m) < (X, Y) < (222.7 m, 148.1 m), and the ideal size: (X, Y) = (167.0 m, 111.3 m). X: long side, Y: short side. The unit conversion of pie and meter is according to the following study: DOURSTHER, H.: *Dictionnaire Universel des Poids et Mesures anciens et modernes*, (Amsterdam, 1965 [repr. of the 1840 ed.])

Reconstructing meaning: urban space in post-apartheid South Africa

Errol Haarhoff
The University of Auckland, New Zealand

Memory space

Among the many functions served by urban space is its role in memorialising and commemorating significant events in the life of cities and nations. London's Trafalgar Square and Beijing's Tiananmen Square are but two examples of urban spaces inscribed to commemorate important events. It is thus not surprising that from time to time urban spaces such as these become the focus for appropriating or contesting the authority they are perceived to represent. Trafalgar Square was a focus for anti-apartheid rallies of the 1980's, and Tiananmen Square, where Mao Zedong proclaimed the establishment of the People's Republic of China in 1949, the site of the 1989 student protests.

When more radical cultural and political transformations occur, such as the in dissolution of the Soviet Union, urban space inscribed with meaning significant to the old order presents dilemmas for the new. In these circumstances there may be strong desires to erase past memories, but this is not always easily achieved because urban space is a concrete artefact embedded in the urban fabric. Visitors to Berlin in recent years would not have missed the extensive urban construction projects that have followed in the wake of reunification and the reestablishment of this city as the capital of Germany. In this development there appears to be an intention to erase the distinction between East and West previously marked by the infamous Wall. Following the original route of the Wall from the Brandenburg gate it is surprising to discover little remaining evidence apart from a flagstone trace in some of the roadways, a short surviving portion in Neiderkirchnerstraße, and the previous border control post known as 'Checkpoint Charlie' in Friedrichstraße.

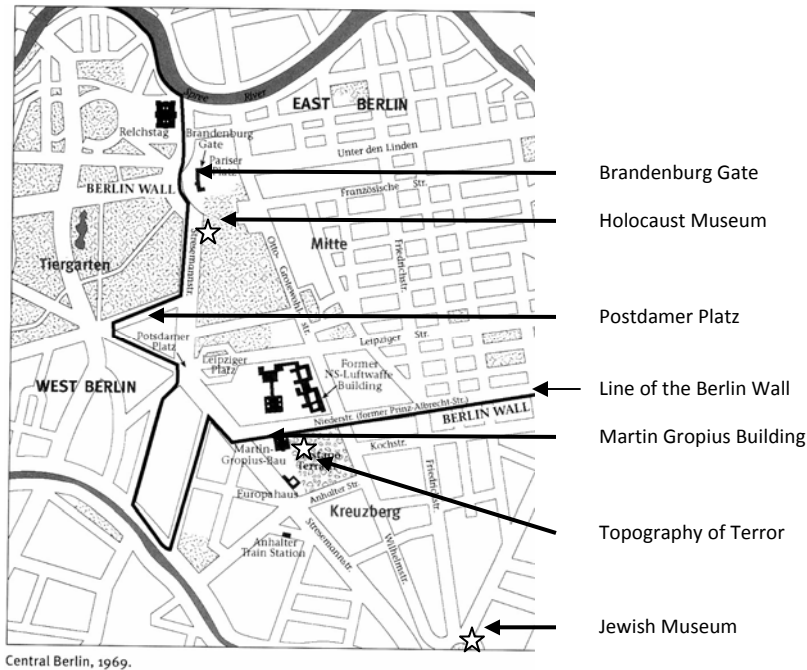
However, despite appearances, this part of Berlin contains spaces, buildings and places that have been the source of deep and divided emotions for Berliners. This includes the refurbishment of the 19th century Martin Gropius Building as a new cultural centre with questions about the adjacent vacant site previously accommodating the administrative headquarters of the Nazi Gestapo and the SS, now memorialised as the '*Topography of Terror*'.[1] Across the street (and over a short surviving section of the Wall) sits Hitler's former Luftwaffe Air Ministry (now the Federal Government's Finance Ministry). Close by, after years of contentious discussions, is the Jewish Museum designed by Daniel Libeskind and the newly completed Holocaust Memorial by Peter Eisenman, all serving to construct a visual landscape as evidence of Berlin's past (Fig 1). Indeed, Karen Tills contends that Berlin in the context of Europe now possesses the 'first cultural space…that publicly acknowledges national guilt, commemorates the suffering of victims, and represents the history of the perpetrators in a national capital'[2].


Figure 1: **Berlin's 'Memory Spaces'**[3]

This paper is concerned with the process whereby concrete and material urban artefacts such of public squares and other urban spaces are inscribed, and under certain conditions, re-inscribed with cultural narratives and meanings. Post-apartheid South Africa provides a rich context in which to examine this process in the wake of the political, social and cultural transformations that have occurred since the 1994 democratic elections.

One of the hallmarks of post-apartheid South Africa is a policy and process that seeks to reconcile the past by acknowledging the existence of collective memories of previous injustices, and by creating institutions able to give this a public voice. The Truth and Reconciliation Commission gave the victims and perpetrators of apartheid a vehicle to confront each other, and despite many flaws in both process and outcome, it did offer a way of bridging between the past and future, and moving forward.

In this context Annie Coombes has explored how various forms of visual and material culture represented in South African monuments has dramatised the tensions involved in the process of transformation from apartheid, and at the same time contributed to the process of change[4]. In a similar way Vicky Leibowitz considered the design of new post-apartheid museums and how these are giving expression to narratives and events previously suppressed or unacknowledged by previous white minority governments and institutions[5].

Two questions are posed in this paper concerning the construction of memory in urban spaces in South Africa. Firstly, how far is it possible to divest existing urban space of meanings associated with the previous colonial and apartheid pasts to make them relevant in contemporary South Africa? Secondly, how is success to be judged in new

urban spaces created since the demise of apartheid in representing cultural meanings for all South Africans?

It is argued that three different approaches can be distinguished, each illustrated by a case study. The first approach gives new meaning to urban spaces originally designed to symbolise what has become redundant, both from the colonial past and the apartheid period. The urban precinct of the 1910 Union Buildings in Pretoria that continues to serve as the administrative capital of South Africa provides the case study.

The second approach concerns the construction of new urban spaces as 'palimpsest', where the layers of past history contained within it remain visible. The case study is the urban precinct known as Constitutional Hill in Johannesburg, previously a fort and former prisons established at the beginning of the 20th century, and now the location of the Constitutional Court completed in 2004.

The third approach relates to the making of new urban spaces that aims to memorialise significant events previously suppressed. The case study is the Walter Susulu Freedom Square of Dedication completed in 2005 in Kliptown, Soweto that commemorates the life an anti-apartheid activist and the signing of the Freedom Charter in 1955.

Before considering each of these strategies and case studies it is useful to contextualise the discussion by considering the nature of the apartheid city and how this created a specific set of conditions that post-apartheid urban space construction confronts.

The apartheid city

It is often overlooked that apartheid in South Africa was preceded by a long period of colonisation beginning with Dutch settlement of the Cape in 1652. In the settlement of the hinterland and the later establishment of Boer Republics and British Colonies, land was the material issue in the conflict between European settlers and the indigenous inhabitants. From a settler perspective this was resolved early in the 19th century through the establishment of 'Native Reserves' as places of 'refuge' for those dispossessed of their ancestral land, that also created pools of labour serving white farmers, and more generally, the expansion of white capital. These reserves lay the backbone to the 'Bantustans', a cornerstone to apartheid government policy from 1948 onwards.

Rapid urbanisation that followed from the discovery of gold and diamonds in the interior, and the consequent development of manufacturing industries resulted in a major dilemma for successive white minority governments: how to ensure a steady supply of cheap labour necessary for an expanding economy on which prosperity was seen to depend, while at the same time keeping urban areas essentially white? The seeds of a solution were found in the Stallard Commission of 1923 (13 years after the founding of the Union of South Africa that united the previous British Colonies and Boer Republics) recommending that '…the native should only be allowed to enter urban areas which are

essentially the white man's creation when he is willing to enter and minister to the needs of the white man and should depart there from when he ceases so to minister.'[6]

Giving effect to this recommendation was the mandate of the 1948 Government who institutionalised racial segregation by law, effectively confining black South Africans to designated and impoverished 'Bantustans', and requiring a 'pass' to enter and work in what were designated as 'white' areas. Resistance to the 'pass laws', the consequent injustice and suffering caused by the apartheid laws, and the refusal of successive minority governments to recognise all South Africans as citizens of a unitary state, resulted in the conflict and violence that has marked South Africa's more recent history.

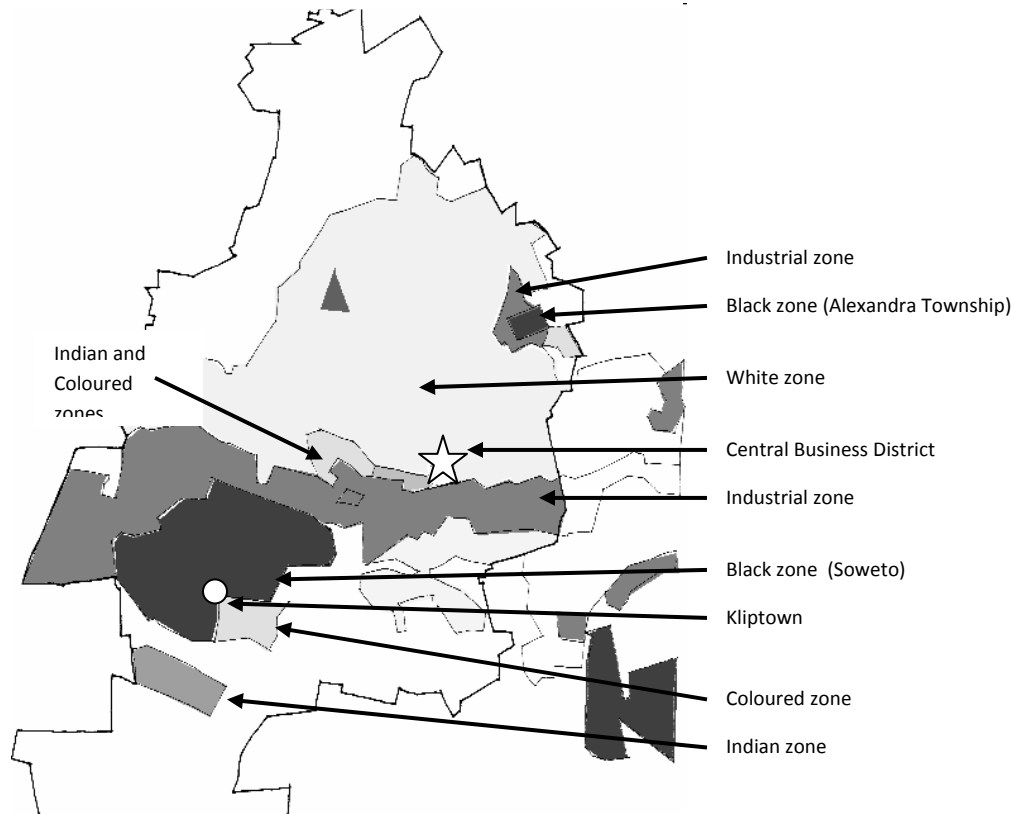
Under these policies the apartheid city acquired a distinctive urban form and structure leading to considerable suffering on the part of the urban non-white population. Essentially the city centres and prime residential areas were reserved as 'white'. Residential areas for other race groups were designated for Africans, Indians, and Coloureds, usually on the urban periphery from where workers were required to commute[7]. Residential zones were physically separated from each other by industrial zones or border security strips to eliminate neighbourliness between members of different race groups (Figure 2). The implementation of this policy during the 1960's and 1970's resulted in substantial communities of 'non-whites' who historically resided in what were designated 'white' areas being forcibly removed to their designated residential zones.


Figure 2   Map of the Johannesburg Region indicating racial zones designated under apartheid policies[8]

Among the many legacies of apartheid and enforced segregation seen by Coombes, has been the alienation of individuals and communities from their own histories – 'so much so that aspects of those histories are either ignored through disinterest or wilfully exploited for other ends and in the process destroyed'[9]. Consequently during the long period of colonial and apartheid rule, black history was largely suppressed. 'Official' South African history was constructed around ideologically biased events dominated by the settlement of the Cape by the Dutch from 1652 onwards and their establishment of a European 'civilisation' at the tip of Africa, later British settlement of the Eastern Cape and Natal and the mythologised accounts of settlers facing adversity, hardship and opposition from the indigenous population whose land was being confiscated, and an event know as the 'Great Trek' that saw Afrikaners leaving what become British rule at the Cape to regain a perceived freedom in the establishment of Boer Republics in the interior. From 1948 onwards the apartheid governments gave new voice to nationalist ambitions of the Afrikaners and their perceived claim to exclusive sovereignty over South Africa[10]. Non-white groups have thus been doubly harmed – first by being subjugated and excluded from participation in central economic and political functions, and secondly by having their very existence denied in official history[11]. Challenging the primacy of these historical constructs and accommodating the previously suppressed histories in the inscription of post-apartheid urban space has emerged as a factor in the transformation process since 1994.

Achieving transformation in South Africa, however, was always going to be difficult. Unlike the political transformation achieved on the day all South Africans went to the polls in 1994, the legacy of apartheid remains embedded in the urban form and the spatial structures of cities. Creating new meanings to urban space consequently requires mediation between existing urban artefacts largely created during colonial and apartheid periods on the one hand, and the desire to memorialise suppressed memories of the past and represent the new reality of a democratic South Africa on the other hand.

Case study 1: the re-inscription of meaning

In the debates that followed the elections of 1994, what to do with the monuments that celebrated the colonial and apartheid histories loomed large. Coombes in her study of public monuments raises a question about the 'possibilities and impossibilities for rehabilitating a monument with explicit history as a foundation icon of the apartheid state[12]'. The icon of interest was the Voortrekker Monument in Pretoria that is central to symbolising Afrikaner nationalism. She goes on to be curious to know '…how far it is possible to divest such an icon of its Afrikaner nationalist associations and re-inscribe it with new resonances that enable it to remain a highly public monument despite a new democratic government whose future is premised on the demise of everything the monuments have always stood for?'[13] The same question can be asked about Union Buildings and its urban precinct in the same city of Pretoria built to accommodate the

administrative functions of government following the establishment of the Union of South Africa in 1910.

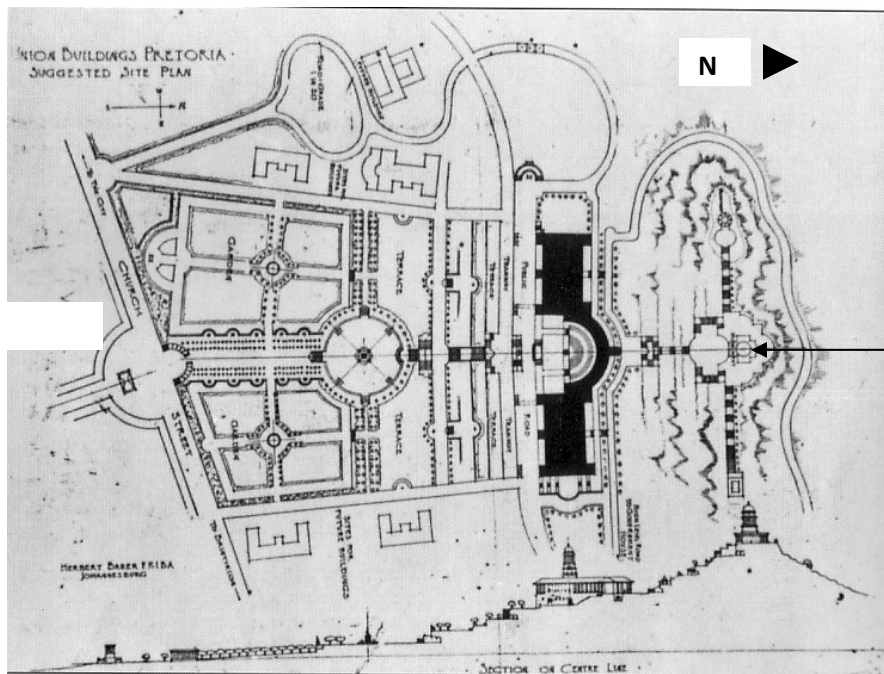
During the two decades that the architect Herbert Baker practiced in South Africa he produced a large body of work. The Union Buildings was his last major work before joining Edward Lutyens in India to plan and design the new capital of British India: New Delhi. The urban precinct of the Union Buildings was intended to symbolise unity in South Africa forged after the Anglo-Boer War. In his autobiography Baker further describes his concept as 'symbolising the two races of South Africa' reflecting the fact that the constitution at that time only recognised whites of British and Boer origin as citizens[14]. Baker expressed this perceived duality in the two wings of the building symbolically 'unified' by an amphitheatre and colonnade at its centre. The Amphitheatre sits astride a visual axis running from the city in the valley below across terraced and landscaped gardens creating an urban precinct of impressive scale (Figure 3). In Baker's original plan this axis was to terminate behind the amphitheatre on a Parliament building he called the 'Temple of Peace'. However, the decision to locate this function of government in Cape Town resulted in this part of the proposal never being realised.


Figure 3   **Herbert Baker, The Union Buildings and precinct, Pretoria[15] (Keith, n.d.)**

The Union Buildings precinct thus excluded the majority of South Africans in its inscribed symbolism. It also did not necessary symbolise 'unity' between the British and Boers either, the latter considering the Union to rather represent their defeat at the hands of the British and their imperialist ambitions. Baker's own imperial visions are made clear in his 1927 address to the Royal Institute of British Architects in London when describing the role Union Buildings would play as the capital of a colonial Empire extending northwards from Pretoria '…realising the dream of Cecil Rhodes on the highlands of Central Africa from Rhodesia to Kenya and the source of the Nile'[16].

From 1948 onwards, the Union Buildings were to house governments who conceived and implemented apartheid policies and laws. But despite representing white dominance and black subjugation, the historic symbolism it was chosen in 1994 as the site for the inauguration of the first majority elected President of South Africa, Nelson Mandela, and the installation of his African National Congress led government in ministries housed in the Union Buildings. The televised spectacle of the event in the very building where Nelson Mandela's predecessors presided over his lengthy imprisonment was a powerful symbolic gesture. This gesture both denied the inscribed memories of the place and re-inscribed new ones. It was able to exploit the advantages of its spatial construct focused on an amphitheatre organised around a visual and symbolic axis extending over the nation governed. In a similar way, the implicit symbolism of imperial rule in New Delhi has been re-inscribed to represent democratic rule in an independent India.

Further re-inscription of the Union Buildings was marked in 2000 with the establishment of a Monument to the Women of South Africa in the amphitheatre and its renaming Malibongwe Mbokodweni ('the place of the women'). This commemorated a 1956 historic gathering of 20,000 women in the amphitheatre protesting the extension of the 'pass laws' to women. The modest monument comprising of a traditional corn grinding stone under the colonnade with words from the women's petition rendered in stainless steel letters fixed to the amphitheatre stairs, is intimate and paradoxically diminutive in scale. Yet it assumes larger significance by being located on the grand axis at the symbolic heart of the nation. Disappointingly current security measures now make the monument inaccessible to the general public. Despite this flaw, the Union Buildings and its urban precinct provide a cogent example the possibility of divesting original meaning and (in Annie Coombes' terms) re-inscribing it with new resonances that enable it to remain a public monument representing new governance in contemporary South Africa.

Case study 2: urban space as 'palimpsest'

A palimpsest literally refers to a surface on which the original writing has been erased to make way for new writing, but upon which traces of the old remains visible. It is this notion that the winners of the international design competition for a new Constitutional Court in Johannesburg argued underpins their concept[17]: where the 'site is – and must remain – a place where the layers of history contained within it remains visible'[18].

The history of the precinct begins in 1883 when Paul Kruger, President of the South African (Boer) Republic, established a fort on the hill top overlooking and protecting Johannesburg and the economic wealth produced by the adjacent gold mines. Johannesburg was taken by the British during the Anglo-Boer War (1899-1902) and the fort was pressed into service as a prison. In 1902 a new 'native' prison known as 'Number Four' was built on an adjacent site, to which a women's prison was added in 1910, and an awaiting trial block in 1928. Among those incarcerated were Mahatma Gandhi, Albert Luthuli and Nelson Mandela (the latter two being later recipients of Nobel Peace Prizes) along with thousands of others, many for the infringement of apartheid laws. In 1983 the fort and prisons were closed, the buildings and area become derelict,

and given high land values was under pressure to be sold for commercial development. Its history and embedded memories would have been effective erased, were it not selected as the site for the new Constitutional Court as part of an urban precinct now named Constitutional Hill.

The awaiting trial block was demolished to create a new urban space at the centre of the precinct. However, three original stair towers were retained and memorialised by being extended vertically as sculptural glass lanterns, one now embedded into the Constitutional Court foyer, the other two free standing in a new urban space. This new space physically links the new Constitutional Court to the original fort and prisons now refurbished and developed as museums, that symbolically mediate between the past and the future (Figure 4). Previous injustice and prejudice is thus juxtaposed in a very material way against the new imagery equitable justice.

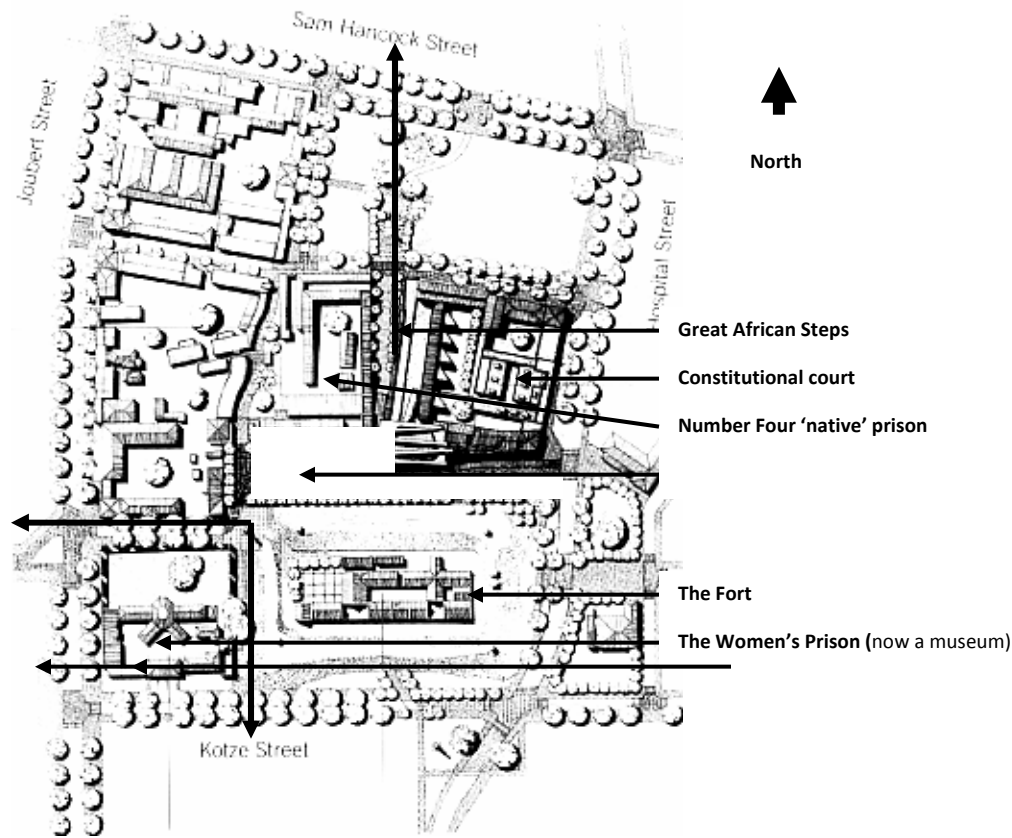
Rejecting the more familiar and conventional idea of a large formal urban space fronted by a public building (an idea well represented in the unsuccessful entries to the design competition), Constitutional Hill in the words of the winning designers is intended to be '…a place where all people would feel welcome, where South Africans from urban and rural areas, the young and the old, could gather without inhibition, and have a connection, a sense of belonging and identity.'[19]


Figure 4   Constitutional Hill urban precinct, Johannesburg, 2006[20]

The drive to be inclusive and represent every facet of South Africa is reflected in the repetition of building's name in the eleven official languages on the entrance canopy, and in the richness of the artwork and decoration striving to represent all sectors of society. This creates a very different architectural experience when compared to the more staid imagery of more formal buildings with judicial functions where the purpose is to intimidate rather than embrace users. The urban precinct as a whole creates the same effect in being more inclusive and intimate and reflective of African notions of place and space. In contrast to the aloofness of the Baker's Union Buildings, sitting on the Pretoria skyline and separated by a formal axis and terraced gardens from the city, Constitutional Hill has been woven into the fabric of Johannesburg. Consequently the precinct becomes permeable, reversing the conditions of exclusion that prevailed when it functioned as a prison. The main public square mediates between buildings of different scales and characters – the earth embankment of the fort, the brick walls of the former prisons, and the entrance to the new Constitutional Court at the top of what is called the 'Great African Steps'. More like a village, the precinct is a collection of parts, each unique and identifiably woven into the broader urban fabric of the city beyond.

Case study 3: memorialising new urban space

In contrast to the two case studies discussed above the Walter Susulu Square of Dedication in Soweto, Johannesburg is a new urban space in post-apartheid South Africa[21]. The Square memorialises a significant event in the history of the struggle for democracy– a gathering of 3000 representatives of resistance organisations meeting as the Congress of the People to sign the Freedom Charter on what was then a dusty open space in a place called Kliptown. The Freedom Charter was to become the founding document of the African National Congress, the majority political party elected to govern South Africa in 1994, and was the foundation document for the new South African constitution adopted in 1996.

The signing of the Freedom Charter in 1955 triggered the arrest of 156 delegates who were charged with treason, many, including Nelson Mandela, receiving long prison sentences. Walter Sisulu (later to be Mandela's Deputy President) died in 2003 and was also among those imprisoned. The Freedom Charter was declared a banned document by the apartheid government, although as Suttner and Cronin point out, it was 'not erased from the minds of oppressed and democratic South Africans'[22]. The memorialisation of this event contributes towards what Annie Coombes argues has been a focus on redressing the perceived imbalances of 'hegemonic historical narrative challenging the often exclusive focus on white settler histories so that voices and events previously suppressed could be represented'[23]. A cone-shaped brick structure within the Square serves as the Memorial to the 1955 event, with the words of the Charter engraved on plaques.
Figure 5   StudioMAS, Walter Susulu Square of Dedication, Kliptown, Soweto[24].

The Memorial forms part of a much larger commercial development and regeneration project for this part of Soweto designed by the Johannesburg architects and urban designers, StudioMAS. The Freedom Charter memorial is contained within the western portion of the Square at the site of the original dusty space where the Congress of the People gathered. The western edge of the Square opens to a railway line (and proposed railway station), and is hard paved as a location for outdoor events. The eastern portion of the Square has raised elements in the shape of X's symbolising crosses on a ballot paper and landscaped with trees to provide shade. This section opens to bus and taxi ranks, and across the road, to a proposed linear park. The north and south sides of the Square are enclosed by large scaled colonnaded structures that contain commercial functions such as market stalls, offices, banks, retail space, a tourism office, an art gallery, community hall, library and community meeting rooms.

Beyond the purpose of memorialising Walter Susulu and the signing of the Freedom Charter, the Square can be viewed as a conventional urban space drawing on historical urban space prototypes. However, in the context of contemporary South Africa the Square also has practical relevance. One factor is the extent to which the Square introduces a new scale and building type that was absent in the apartheid conceived urban township environment almost exclusively composed of small low-scale houses accommodating temporary residents. Although located at some distance from the central parts of Johannesburg, townships such as Soweto are now conceived as suburban areas housing permanent residents, and the Square and other new commercial developments introduce facilities previously been denied. In many ways it reflects the process of 'normalising' South Africa society in the globalisation of modern

culture, and the integration of these previous 'black' residential areas into the fabric of the greater city.

The development has not been without controversy. The proposed railway station has not yet been built to provide a source of pedestrian traffic to populate the Square and patronise traders. Partly as a consequence, but also because of high rental charges, informal traders intended to be relocated from surrounding streets into the purpose built market has not yet materialised[25]. Moreover, the investment has been perceived to be a showcase for the hosting of the 2010 Football World Cup in South Africa, rather than genuine investment in social upliftment. However, despite the perceived shortcomings, Walter Susulu Square demonstrates the possibilities of commemorating and memorialising a more inclusive history, of reintegrating previous isolated and impoverished communities into the greater fabric of their cities, and using private investment to achieve public outcomes.

Conclusions

Urban Space is inscripted with cultural meaning derived from individual experiences shaped by the collective consciousness and shared social processes. Prior to the democratic transformation of South Africa, shared consciousness was suppressed and urban space was constructed to largely reflect the hegemonic historical narrative of ruling white regimes. Following the demise of apartheid in 1994 and transformation towards a more inclusive society, there has been considerable struggle over the re-inscription of public history. What has made the process distinctive in South Africa has been to not deny the past no matter how painful, while at the same time giving voice to those sectors of society whose histories have been denied or suppressed. Apartheid and the many consequences are not denied, but now rather represents what has been overcome.

Although urban spaces are relative fixed concrete artefacts, it is suggested that ascribed cultural meanings are more flexible and fluid. Thus despite the inscription of original meaning in the Union Buildings precinct, it has been re-inscribed by appropriating the material properties of its formal elements. With an axis originally intended to symbolise British imperial rule over Africa, this was later appropriated by the apartheid regimes to symbolise their autocratic will over the nation, and now represents the transformation process in a democratic South Africa. Re-inscription of this kind is not uncommon as suggested in the case of New Delhi cited in the paper.

Less typical is the construction of meaning by way of the notion of urban space making as palimpsest, that makes the past evident and visible, while permitting the emergence of a future. Constitutional Hill is distinctive in constructing a space that is African in conception by eschewing the qualities normally associated with the formal ideas of urban space.

The Walter Susulu Square of Dedication, is in many ways far more conventional and formal in its conception, effectively using prototypical urban space elements. Its success

potentially will be derived from the context of impoverished black townships improvements in South Africa, and the extent to which it contributes towards a normalisation of the urban fabric and public memory. Moreover, it provides a positive example of private investment able to deliver social infrastructure, and at the same time memorialise histories previously suppressed. There are also potential difficulties arising from community aspirations not being met in what may be perceived as an imposed elite development.

But how do these spaces measure up to the two questions posed in the introduction concerning how it is possible to divest urban spaces of the meanings associated with previous colonial and apartheid pasts, and how is success to be judged? These are difficult to assess but can be viewed from the lens of post-colonial discourses. Anthony King was an early observer of the colonial process and insisted that any understanding of the physical and spatial arrangements of colonial environments must be derived from the social values, beliefs, institutions and social organisations operating within a given distribution of power[26]. There are now newer comparative studies that have focused on the process national identity formations in countries that sustained large scale colonisation by those of British and Irish decent in Canada, Australia, New Zealand and South Africa that all have significant indigenous populations. In this context Annie Coombes sees distinctive identity arising from:

> '…the colonisers' dealings with indigenous peoples – through resistance, containment, appropriation, assimilation, miscegenation or attempted destruction – is the historical factor which ultimately shaped the cultural and political character of the new nations, mediating in highly significant ways their shared colonial root/routes'.[27]

In looking for measures of success in the urban spaces considered, it is clear that they have redressed an imbalance in the way in which history has been inscribed and represented. The more difficult question is the extent to which they may represent society as a whole because this confronts issues of race, and racial identities. In a paper on 'subjective whiteness', Sarah Nuttall reflects on how such perceptions may have shifted between the apartheid and post-apartheid periods in South Africa, examined through the narratives of three writers[28]. She points out that the notion of 'settlers' always implies a 'native', and carries with it a master-slave dialectic: 'a relationship based on conquest and ownership on the one hand and on dispassion and subjugation on the other, in which one party acts and the other is acted upon; a relationship of response rather than co-invention'[29]. She goes on to argue that:

> '…visual metaphors have come to hold a potent influence over consciousness and memory. The privileging of the image has been ubiquitous for a number of reasons. First, cultural debates in South Africa have frequently been tied to an identity politics based on visibility based on race…Second, the experience of being the object of the look – one of the most extraordinary aspects of visuality- must necessarily permeate a context of racial scopophilia where the visible and the invisible have been racially coded.[30]

What is emerging in South Africa, Nuttall argues, is the analysis of the visual metaphors which structure 'whiteness' in this context, producing a rich set of meanings which moves closer to an understanding of racialised identity in South African. The significant shift she believes marks the change is a move from a perception of 'whiteness' based external models where 'whiteness' is seen to be secure and politically upheld, to a perception that 'whiteness' that has roots in the struggles of South Africa. This recognises that identity with past struggles are not entirely based on racial identities: both black and white participated in the struggle and its opposition. Thus while the re-inscription process of the spaces discussed can be seen to be successful in articulating past memories previous suppressed by 'white' governments, the ultimate measure would need to be the extent to which they represent 'South African' identity. While acknowledging that this is a difficult task, Nuttall remains optimistic, suggesting that 'while colonial histories still have a force and impact on contemporary imaginaries, we need also to trace their limits as interpretative frames. In this project, South African could well offer a leading vision.'[31] In the case of urban space what is evident is that meanings can be changed, and that moving towards a more inclusive South Africa identity remains a distinct possibility.

Although South Africa is often seen as a unique case, it is suggested that there are other places where political transformation may yet supplant what are currently seen as intransigent conflict. This would include North and South Korea, the divided island Cyprus, the Balkan states, and the Israeli/Palestinian conflict. In the wake of political transformation in places such as these, the re-inscription of meanings associated with urban space will emerge as issues, and South Africa provides a useful case study of what is possible.

A Latin-American metropolis in the early Twenty-First Century (a case study of São Paulo, Brazil)

Regina Maria Prosperi Meyer
Marta Dora Grostein
University of São Paulo, Brazil

Introduction

In this first decade of the 21st century São Paulo shows clear signs of the incapacity of its society and local government to deal with a number of important urban issues. It is often said that, during all of São Paulo's 450-year history, the region received very little attention in terms of urban planning and thought. Some historians have even based their analyses on the premise that São Paulo is the very negation of urbanism. But recent academic researchers on the city's urban construction tend to show otherwise. In any case, the idea of there having been no urban planning at all is an extreme over-simplification. Although the region may appear to be a perfect example of disorder and misgovernment, it cannot be assumed that this is due to the absence of urban thought and planning. São Paulo's current urban cycle is the logical consequence of a specific type of articulation between owners of private property, through their various agents, and the public powers that be, and this articulation has been operating from the very beginning of the city's process of rapid growth.

The Metropolis of São Paulo is analyzed in this paper as an *agent* of change in the recently installed process of economy and production, and not a simple *reflection* of the changes. The structural and functional organization of the São Paulo metropolis has been changing since the 1980s. The first hypothesis to explain this is that today's overall organization is based on the demands of a new model, where the metropolis plays a very active role. A second hypothesis is that the relationship between the two main material dimensions of social life – *time* and *space* – is intensely present in the São Paulo Metropolitan Region and makes it especially appropriate for studies involving these two dimensions. According to Manuel Castells (2000), space governs time in today's network societies. Castells also shows that both large and small cities participate in an international hierarchical system, where they all serve as nodal points that operate in conjunction as they command the overall global market. In this sense the São Paulo Metropolitan Area will be able to serve as the center of gravity for other Brazilian and Latin-American metropolitan areas to the extent that it can operate in a reality where the time dimension requires top performance from the spatially organized territory.

The above description of the steps already taken encourages new queries that future research should try to answer. We thus propose as a general hypothesis that São Paulo is now a regional metropolis that offers support for an emerging market. Urban dynamics are articulated in its territory that result from its more traditional condition as an eminently industrial metropolis and its new status as a region committed to advanced services and the industries associated with them. The topic of this present theme

project is the meaning of this process from the point of view of São Paulo's spatial and functional organization, and includes a description of the urban dynamics that this new status involves.

The theoretical framework and the history of what is now the São Paulo Metropolitan Area are reviewed and constructed here in order to develop an analytical model that will allow us to identify and analyze the changes that São Paulo has undergone since the early 1980s.

Intense urban change

The functional and spatial changes that have taken place in the São Paulo Metropolitan Region since the 1980s indicate the beginning of a new cycle in the process of adapting the metropolitan area to a new pattern of production, as well as further integrating Brazil into the globalized economy. As in earlier cycles in the construction and consolidation of the metropolitan area, the present period is producing its own pattern of structuring. New urban sectors are emerging, with a number of aspects that can be seen distributed throughout the Metropolitan Region and, more specifically, in the central municipality itself. These aspects include places, spatial arrangements, architectural programs, forms for the use and occupation of the land, appropriation of natural resources, and forms of illegal occupation of urban sectors. All this is occurring according to conditioners and potentialities present in the *existing city,* which today is one of the most important representatives of social inequality in Brazil, even though it still has enormous potential for economic development as this new century begins. This new urbanization is representative of the present moment, which can be described as an "advanced stage of urbanization." As in earlier phases, the current cycle is producing spaces and places that allow us to identify its historical determinants.

Today it is not enough to consider the relationships of physical and functional approximation among urban hubs within the São Paulo area, with their classical type of conurbation. Graphic representations of the region show many different geometric figures tangentially related to one another and having more or less intense reciprocal relationships. The *metropolitan city* is a space that has been urbanized in a *continuous* way and within which a very broad economic, social, cultural and functional reality has been organized. Today its most visible characteristic is the *dispersion* of urbanization throughout the entire territory. As we will see when identifying its features, this *dispersion* has not resulted in a cohesive urban territory because both *dispersion* and *discontinuity* reveal internal forms for organizing urban relationships and functions.

The explanation for this aspect could well be the embryonic nature of the process. Since the purpose of this paper is to discuss the features of this new metropolitan cycle, it must be recalled that the essence of the concept of *metropolitan city* is intimately related to the changes that are taking place in the metropolitan area. Another basic fact is that the outstanding characteristic of the present cycle is the reorganization and articulation of the existing structure and its internal functioning, in view of its active participation in the new stage.

The São Paulo Metropolitan Region and its new urban scales

Image 1 – The Macro-Metropolis

In the 1970s the specifically urban question was consolidated with the regional context through the Brazilian Federal Government's *Metropolitan Action Program.* One of the results of this program was the decision to designate a number of large urban areas in Brazil as in "metropolitan regions," one of which was the São Paulo Metropolitan Region. This metropolis stands out from the others in Brazil in various aspects, including the fact that it has the largest urban population in the country while also showing the highest demographic density (2,465 inhab/km^2)[1]. In addition, São Paulo relates intensely with cities in the surrounding region – within a radius of 200 km – known as the *macro-metropolis* or *extended metropolitan complex.* This complex includes the São Paulo Metropolitan Region (17.9 million inhabitants) plus the Santos Coastal Metropolitan Region, to the south (1.5 million inhabitants), the Campinas Metropolitan Region, to the north (2.3 million inhabitants), both of which are within 100 kilometers of São Paulo, as well as the city of Sorocaba, to the northwest, and, **to the east**, a number of slightly more distant but important cities in the **Paraíba Valley, with their respective micro regions.**.

This extended metropolitan complex covers 17.18% of the area of the State of São Paulo and has a population of 26.2 million inhabitants, meaning 71.13**%** of the state's population. It is responsible for 79.3**%** of the state's general product and 27.7**%** of the Brazilian GNP.[2] The relationships that affect the use and occupation of the land in this territory are extremely complex and interdependent, and result from processes of different natures, ranging from the macro-economic to those micro-relationships that define spaces for housing.

The São Paulo Metropolitan Region has an area of 8,051 km^2 and includes 39 municipalities, with that of São Paulo (1,509 km^2) occupying its center. This region, with its total population of 17.9 million inhabitants, has three outstanding characteristics: 95.7% of the population is urban, 10.4 million persons are concentrated in the municipality of São Paulo, and only eight of the 39 municipalities are not part of the continuous, uninterrupted geographical territory comprised of the remaining municipalities.

The data shown below indicate that the proportion of the population of the municipality of São Paulo in the Greater Metropolitan Region has been falling significantly, with a considerable concomitant growth of the periphery, as can be seen in the following table.

Table Percentage of the population of the municipality of São Paulo in the São Paulo Metropolitan Region						
Population	**1950**	**1960**	**1970**	**1980**	**1991**	**2000**
Municip. SP	2,198,096	3,824,102	5,978,977	8,475,380	9,646,185	10,406,166
SP Metrop. Region	2,696,031	4,905,421	8,172,542	12,575,655	15,452,537	17,878,703

Image 2 – Evolution of the Urbanized Area 1980/1992

In 1990 the urban sections of the São Paulo Metropolitan Region occupied approximately 1,765 km^2.[3] In fact, over the following 12 years the urbanized area grew by 443 km², occupying 2,208 km², in 2002.[4] There is no doubt that much of this increase in area was the result of the enormous growth of illegal housing built in areas that should not be occupied, usually consisting of land classified as watershed protection areas. This peripheral pattern of urban expansion has brought about chaotic occupation on the fringes of the region. In addition, general encroachment of the urban space onto environmentally important and legally protected areas, with low initial investment by government and private real-estate investors, reveals a conflict between social and environmental aspects. It also adds a further characteristic to the process of urbanization, namely, growth onto vulnerable areas, a fact that further compromises natural resources and places the populations themselves in situations of risk.

Approximately 900,000 inhabitants in the São Paulo Metropolitan Region live in public housing complexes called areas of "social interest." Since the 1970s the state and municipal governments have built approximately 210,000 dwellings in this category. Comparing this figure with data on the region's current estimated housing deficit, it can easily be seen how difficult it will be to address the demand, especially if one considers the government's limited capacity to produce housing for low-income populations and

the limited availability of financing for the income brackets of up to three times the minimum wage, where most of this deficit is concentrated.

The deficit in 2000 was 529,202 dwellings, 69.5% of which should have been destined to the population with family income of up to three times the minimum wage (total wage of about US$700 per month). In 2005 the deficit had increased to 738,334, of which 86.3% would be destined to this poorest sector.

Constructing the *Metropolitan City*

The analyses presented to date confirm that the physical changes going on in the metropolitan region as it becomes a *metropolitan city* are partially materialized by major public works in urban infrastructure. This is especially true of works related to mobility and accessibility, which, by their systemic nature and because they are operated by different levels of government, create new scales of intervention that have been centralized by the São Paulo State Government. However, the consolidation of the *metropolitan city* currently taking place can be seen as a further, more complex stage in the process of metropolization that encompasses other processes of change as well. These other processes depend on the distribution of simple and specialized services, public and private equipment, and consumption chains.

This fact can be seen in empirical research on both the outlying areas of the municipality of São Paulo and other municipalities in the region. For example, the installation of shopping malls, supermarkets, hypermarkets and fast-food franchises in the periphery is a phenomenon that has largely arisen during the last decade. Until fairly recently no establishments of this type existed in these areas.

Reorganization of the mobility and accessibility systems

Urban interventions carried out on a metropolitan scale, especially those related to costly but indispensable mobility and accessibility services, are systemic, and controlled by various levels of government.

Besides territorial aspects, socio-economic factors are also involved. The adoption of new procedures by the real-estate market in sectors that receive public investments results in chain reactions in terms of changes and impacts, and this requires discussion and planning. The basic components of the socio-economic impact are closely related to the territorial dimension, giving rise to specific positive processes collectively termed "urban development." The needs deriving from the constant expansion of the territory, therefore associated with demographic growth, were the driving force behind governmental action in the past, especially during the period of greatest expansion of the metropolitan area. However, the "negative effects" of these interventions were not clear, or were even imperceptible. Based on known, and even measurable, demands, the great public works projects associated with mass transportation proposed objective and even oversimplified solutions.

The main challenge involving projects and actions for mass transportation and mobility in São Paulo today is how to guarantee the functioning of the metropolitan machine in all its various sectors. For example, when the metropolitan area was taking shape at the beginning of its industrialization process, the removal of physical boundaries was a very important factor.

Today, however, the next steps which must be taken can no longer be reduced to unlimited urbanization in the constant search for ever more distant tracts of land. The expansion of the metropolitan territory that is behind the current plans and projects for mobility and transportation involves the articulation of the area based on pre-suppositions for expansion.

The aim is no longer to address the demand for transportation, mobility and accessibility throughout the entire area in a piecemeal fashion, since the bus system has been doing just that for the last 50 years, albeit inadequately. This now outmoded system favored the expansion of the metropolitan area far beyond tolerable limits. The centrifugal network of bus lines, insufficiently articulated with other modes of transportation, determined the growth of the metropolitan area until the early 1980s, when problems with transportation began taking on different forms. The impacts of this process were discussed above.

Therefore, the present analysis will now concentrate on the new complex of projects that have been proposed or are underway and their repercussions on the consolidated metropolitan territory. We consider that new processes are already present which were identified as the "construction of the *city over the city*." In this light, projects for mobility on a metropolitan scale were of major importance.

It is now quite clear that specific aspects of the current organization must be discussed, since the *metropolitan scale* has been considered only in reference to *surface*. To date, nothing has been added as to the way the new organism is understood, nor has any evaluation been made of the impacts of major projects in mobility that have been implemented. The exact functioning of the metropolitan gears must therefore be examined. It should also be recalled that not only have conventional forms of industrial activity been replaced with organizations that operate with new types of labor arrangements. Other complex phenomena have also taken place. For example, the attributions of metropolitan areas in this new stage of the Brazilian and international economies are expanding, largely due to the presence of organizations that are better able to perform new services and different industrial functions. Another characteristic phenomenon involved is that services have become more important than industry.

The emergence of this new pattern of production is creating a type of dynamics in the metropolis that tends to dilute conventional urban formats and establish a new order based on the dispersion of activities throughout the territory. The metropolitan area, with its new systems of mobility, is defined by the spaces where almost all activities of society, both productive and non-productive, are carried out, including daily commuting from one place to another. So, today, we are farther than ever from the simple

pendulum type of physical movement that prevailed during the specifically industrial cycle.

Metropolitan mobility as the motor for urban structuring

The so called centers, nodes, or poles of *metropolitan mobility* are specific points found in many different parts of the metropolitan area where local and metropolitan urban functions are articulated with mass public transportation. They are the direct result of the increasing complexity of the functioning of the metropolitan territory. In other words, they are clearly influenced by the urban dynamics that generate the two characteristics most in evidence in the current phase: *functional dispersion* and *territorial discontinuity*. They structure the territory, and have two basic characteristics. First, they facilitate the dispersion of urban functions, such as housing and employment, which are often located at considerable distances from one another. Secondly they also produce discontinuity in the territory.

Their emergence is therefore associated with two aspects of public mass transportation: the presence of all modes of public transportation and the guarantee of functional and territorial articulation on a metropolitan scale. In this regard these *nodes of mobility* are distinct from other forms of aggregation of functions and territorial cohesion because today they are seen as an antidote to two important factors mentioned above, namely, functional dispersion and territorial discontinuity.

In this new pattern for organizing functions and activities -*poles of mobility* - play on a decisive role in structuring the metropolitan territory, especially in their capacity to increase mobility and provide access to all the region's sectors. The current aim is not to expand the metropolitan area even further, which was clearly what happened during earlier periods of metropolization. The objective now is to adapt and articulate the existing territory and make it possible to implement the new "metropolitan paradigm." *Mobility* is thus the urban function with the greatest potential to connect urban sectors that are segregated from the social standpoint, dispersed from the functional standpoint, and discontinuous from the spatial standpoint. The consolidation of a pattern of spatial organization described as the *metropolitan city* requires an infrastructure for transportation that is efficient because it can integrate activities that are scattered throughout the *metropolitan territory.* Strong and efficient *local organizing poles* should then be set up that are capable of guaranteeing the socio-spatial integration of the metropolitan population.[5]

The future of industrial sectors and their installations

It is clear that the transformations introduced in the form of industrial production directly influence the urban functional systems on their different scales. One of their best known aspects is the installation of the advanced technology industry, based on microelectronics and informational communication which have created new criteria for choosing their sites that are different from those of traditional industries.[6] The essence of this new pattern of urbanization, generically known as "new industrial space," has become one of the major characteristics of metropolitan territories in their current phase. In developed countries, new industrial locations have corresponded to the flexibilization of production made possible by newly developed means of communication, and have brought about noticeable improvements in urban industrial sectors. Some large cities, especially those located in developed countries, have drawn up public policies to face the consequent problems and, at the same time, to make the

best of the opportunities available for restructuring urban sectors in the respective metropolitan areas.

The migration of functions related to the central area and the emergence of *new centralities*

According to some standards, São Paulo's *central functions* began migrating in the 1950s, and this fact had major repercussions on both central areas and more distant districts. Since then, many central functions have been decentralized. That is, they have been relocated to more distant districts in the municipality of São Paulo and to emerging central areas of neighboring municipalities. This was a natural process propelled by the growth of the metropolis, and can be considered positive since it accompanied the expansion of the complexity of urban life in the metropolitan region. The urban repercussions of this process in the municipality of São Paulo were significant, since, as a result, *neighborhood centers* were created or consolidated. The unfolding of these processes in the region's municipalities was essential for structuring the metropolitan area as a whole.

However, the process described above has specific characteristics and is part of a broader process that became clearer as of the 1980s. This process arose and developed in a very different way from the functional decentralization described in the paragraph above. Specifically, we are referring to a migration of central functions that have two essential characteristics. On the one hand, there was a dispersion of the traditional functions of central areas to other urban areas. These newer areas, however, could not be identified as *district centers* because their new functions did not correspond to the emergence of any centrality that might be supplementary to that of downtown. On the contrary, these more recently developed areas basically serve as alternative space for real-estate investors who, until that time had preferred to concentrate their attention on the downtown area. From the beginning this dispersion clearly corresponded to a migration of real-estate capital within the municipality of São Paulo.

The migration of *central functions* to these new areas is significant in the functional organization of the municipality of São Paulo. It is also an indispensable factor for analyzing the current restructuring of the metropolitan region in general. Although this process began and developed long before the 1980s, it became clearer as of that period.

A reciprocal process: residential emptying of central districts and the growth of inner-city slums

The *central districts* of the municipality of São Paulo have fallen in population (-1.29 per year until 1990 and –2.27 since then). This loss was expressed both by the overall fall in the number of dwellings and rented and in the deterioration or vacating of buildings in these areas, giving rise to inadequate housing, especially inner-city slums,[7] although these phenomena do not always show up in official statistics. According to the São

Paulo City Government, revenue from property taxes has fallen considerably. In contrast, and as part of the same process, the outlying areas of the metropolitan areas continue to show high rates of demographic growth. The visible face of this process, whereby the population of the municipality of São Paulo and the surrounding metropolitan area seems to be spreading out, is related to the deterioration and state of neglect in both the central districts and the outlying areas. The constant search for housing space by the poorer strata of the population is a basic factor in this process. Its irrationality is causing ruinous urban occupation whose main characteristic is that large intermediate tracts of urban land remain vacant, even though they are fully equipped with basic infrastructure.

This process was intense, and created a new urban paradox: some areas that have complete infrastructure, including mass transportation, are gradually being vacated, while distant areas of urban expansion are being occupied indiscriminately. This centripetal expansion is taking place both in function of simple housing for lower-income groups in the periphery, which is virtually devoid of urban infrastructure and social equipment, and more sophisticated regions for the wealthy, who have moved into gated communities located near expressways that link up with downtown. This situation obviously overburdens the already inadequate street and expressway system even further.

It is clear that the most essential component in a metropolitan urban policy is that it would guarantee articulation among housing, water supply, sanitation, and mass public transportation, but this need has not appeared in governmental programs. During recent decades, all those who deal with urban issues, both globally and sectorially, have stressed that the weakening of the metropolitan areas and the total disorganization of their functioning is the corollary of omission by all three levels of government in the conduction of the region's pattern of expansion.

Continuous expansion of the "*informal city*"

Three movements are taking place simultaneously: 1) the densification of large shantytowns with their occupants hoping to eventually be integrated into the urban structure; 2) the construction of illegal housing tracts through new operative strategies, especially in areas of environmental protection, thus giving rise to social and institutional conflicts, and; 3) the multiplication and dispersion of shantytowns in the metropolitan periphery, usually in situations of environmental risk. Therefore, in large and continually expanding parts of the metropolis, predatory and unsustainable processes of occupation predominate, thrust ahead by limited access to adequate housing. The occupation of watershed protection areas that supply water to the São Paulo Metropolitan Region is the most conflictive and revealing expression of this process and a clear indication of the dearth of effective urban development policies.

The concept of *informal city* is the most inclusive term used to designate urban spaces that result from processes characterized as inadequate and illegal. Such expansion thus goes hand-in-hand with social exclusion and brings about many different types of

irregular housing, including shantytowns and inner-city slums. This approach presupposes that there are many ways to access the city, and that access is always socially determined. Such parts of the metropolitan area are poorly equipped and neglected, and the spaces involved lack the basic features of urbanity. Given the predominant characteristics of the processes of urban expansion, these factors only exacerbate the already present socio-environmental disparities.

The funding of housing through public social programs has been low in comparison with the existing deficit. The demand has been concentrated in the population earning income of up to three times the minimum wage. The municipal and state housing policy, however, has gradually broadened its scope of action. During the 1980s and 1990s, new approaches were put into place to provide housing and set up action programs in informally produced areas. These actions included the urbanization of shantytowns, the regularization of unregistered and clandestine housing on new scales, the transfer of populations living in risk areas, the urban and environmental recovery of protected areas, and programs in inner-city slums. Other public programs were also involved, such as the implementation of urbanized subdivisions and the construction of housing complexes through neighborhood joint-work projects. This set of initiatives shows that the *informality* present in the production of metropolitan space has become a basic factor for projects, and even the objective of public policies. Nevertheless, the scale of the action is generally minimal in view of the degree of the inadequacy of spaces allocated for housing in such low-income neighborhoods.

Current challenges of the metropolitan city

One very important aspect in this analysis is to take into account the history of the metropolis with special attention to the tension between two different aspects of the dynamics of the urban system that operates in the metropolitan territory, namely, the industrial and the tertiary. These two aspects are sequential in time and continuous in space, but they are based on very different questions and produce urban processes that are also different. The commitments of each in regard to their respective urban cycles led them to operate directly on the metropolitan territory, and they continue to operate in this way. They make the territory an active agent, which can consist either of similarities or of contrasts, continuities or interruptions.

Both the metropolitan territory and geographical space in general are seen here as active agents in the processes taking place. Therefore, they cannot be considered mere consequences of social and economic dynamics. In other words, certain topics are taken up here to better describe the history of the changes that have taken place in the metropolis of São Paulo from a perspective that is internal to its own evolution. Although some of these topics are classified here as emerging, this does not necessarily mean that we are dealing with merely transitory events, since the situation today has its origin in earlier stages of the structuring of the metropolis. It would be well to recall that the various situations involved have generated a structure that is now seen as *contemporary.* It should also be noted that socio-spatial issues in the metropolitan territory, especially those associated with processes of ever-increasing precariousness and poverty, are presented

separately. Each topic is treated in view of the articulation of its two dimensions, which are actually two sides of the same coin, with modernized territory on one side and precariously installed territory on the other.

Studies on the processes of change in contemporary Latin-American cities, such as Bogotá, and in Europe, such as Paris and London, indicate the importance of restructuring the capitalist mode of production on the basis of new realities, especially those associated with informational technologies. The main features of this new urban context are admittedly subject to numerous generalizations. Without neglecting the importance of these aspects in the metropolis of São Paulo – since they also provide valuable information on the new process – more attention is given to the specific aspects of this situation of convergence.

The simultaneous reduction in industrial investments, on the one hand, and the growth of the services sector, on the other, has created a new urban panorama in the metropolis of São Paulo. As mentioned above, the process that began in the 1980s in São Paulo has many of the same characteristics as those seen in other large cities, where there are indications of an incipient post-industrial phase. However, although the classification is very similar, these features are not identical because their roles in globalized capitalism are different. Also different are their processes and internal material organizations. It is methodologically important to discuss the specific aspects of the process that is underway in São Paulo because the objective of an urban study with this profile is to contribute to the definition of an agenda for planning and intervention on a metropolitan scale. Although both demographic and territorial aspects of the *metropolitan dimension* are taken up here, it is important to underscore that the aspect of change is only one among many aspects that are analyzed in this paper.

A report published by the United Nations in 2006[8] lists a number of megacities and classifies São Paulo as the fourth largest metropolis in the world, behind Tokyo, New York and Mexico City. This report reinforces the phenomenon of the appearance of urban agglomerations of over ten million inhabitants in various social and economic regions as the most significant feature of the activities and functions that the new economy has made operationally indispensable. However, as is very often pointed out there is need to define the important distinctions between those metropolises that are classified as *global cities,* and those referred to as *megacities.*

Important researchers and authors have sought to broaden the consistency of the current theories and point out directions for the practical application of these two dimensions of the execution, planning and determination of public policies, and have synthesized them into two categories, *plan*s and *projects*. In terms of the theoretical and analytic formulation of political decisions, it is generally held today that urban *plans* and *projects* are equivalent forms of intervention into reality. They are also mutually articulated ways of approaching their subject. Both forms depend directly on the type and degree of knowledge of reality placed at the disposal of those responsible for drawing up, executing and administering broad, multi-sector urban policies.

Private ownership of community spaces in master planned estates in Australia: a legacy of neo-liberalism

Robin Goodman
Kathy Douglas
RMIT University, Australia

Most major Australian cities are growing at a rapid rate. Cities such as Sydney, Melbourne and Brisbane are expanding not only in population but also in geographical spread as Australians continue their preference for low density suburban living. New suburban housing is commonly now supplied by large development companies producing integrated master planned estates. This represents a shift from traditional house building to more comprehensive place making. Master planned estates (MPEs) are utilised particularly, but not solely, in the growth areas on the urban fringe. Increasingly, developers are seeking to offer more than simple house and land packages or land alone and are now marketing residential estates that emphasise community, security, a particular lifestyle in a resort environment, or a combination of all three. Aimed particularly at the second or third home buyer with greater disposable income, these estates offer a more comprehensive style of master planned living. They are part of the trend that has seen a growth in developments catering for the more affluent on the urban fringe (Gwyther 2003; Dodson and Berry 2004; Randolph 2004).

New Australian master planned estates might include recreational and community facilities such as golf courses or equestrian facilities, country clubs, water features such as wetlands and landscaped open spaces. Increasingly environmental features including retained native vegetation, water sensitive urban design, or energy efficient buildings are promoted to appeal to particular market segments. However with these additional features can come ownership arrangements of which consumers may have little experience or knowledge. Some of these community assets may in fact be owned by private corporations, however they might also be placed into some form of collective ownership which may mean compulsory membership to legal entities, such as owners' corporations, responsible for ongoing maintenance. In traditional Australian suburban development community assets such as public open space are owned by the local government authority, although it is common for developers to be levied for financial contributions towards their provision. Likewise, recreational facilities are normally planned for and provided by local government. Local councils thus have a relationship with their residents as both service provider and regulator. However where community assets are privately owned this is obviously altered, with residents connection to council, and therefore to other parts of the community, more distant.

This paper addresses aspects of the trend to place assets in various forms of private ownership which ensures that their use is exclusively for residents only. This has a number of implications relating to separation from the wider community. It also requires a greater degree of contact and cooperation amongst members of the community, and therefore has the potential to lead to greater degrees of conflict over asset management, than would traditional forms of public ownership (Goodman and Douglas

2007). In this paper we investigate the manner in which these estates are promoted, and the extent to which people buying into the estate might be reasonably expected to be aware of their legal obligations and some of the potential implications arising from these structures. This is done through an analysis of five case studies of MPEs in Melbourne which highlight a range of different assets and arrangements. The MPEs we investigate all utilise owners' corporations (previously called bodies corporate in Victoria), with shared assets that would in more traditional suburban developments remain in public hands. The particular legal structures are explored and presented here as exemplars that may well become standard practice in the near future.

Master planned estates in Australia

Much of the literature on master planned estates has been concerned with the exclusionary nature of some, particularly those at the higher end of the market, and in particular the phenomena of the security inspired gated communities (Blakely and Snyder 1997; Low 2003; Atkinson and Flint 2004; Rofe 2006). Predominant here are studies form North America (Blakely and Snyder 1997; Grant 2004; Sanchez et al. 2005) or Britain (Blandy et al. 2003; Atkinson et al. 2004; Atkinson and Blandy 2005) but there have recently been a number of contributions exploring the Australian context, some of which we outline here. However, the issues we report on in this paper are less well researched in the Australian context overall.

Most scholars writing on MPEs in Australia utilise the definition provided by Minnery and Bajracharya (1999). These authors refer to master planned communities and define them as large scale, private sector driven, integrated housing developments on greenfield suburban sites, which usually include a mix of housing types, open space and recreational, commercial and service facilities and sometimes employment opportunities. McGuirk and Dowling (2007) draw a distinction between master planned estates and communities, defining the former to be "large scale, integrated housing developments produced by single development entities that include the provision of physical and social infrastructure, and that are predominantly located on the growth frontier or city fringe" (2007 p.22). Master planned communities are similarly large scale but with a greater emphasis on comprehensive planning. Freestone (Freestone 2003 p. 1) defines them as "forms of development usually organised around a complete and manicured living package of house, land, open space and community facilities". Gwyther (2005) accepts Minnery and Bajracharya's (1999) definition but notes that there is a spectrum that can range from those with more orientation on actual facilities such as the golf course estates - aimed at people looking for a lifestyle rather than community as such - to the comprehensive master planned community with greater 'value adding' beyond simply the design and layout. Gwyther (2005 p.59) considers that "value adding refers here to the additional capital investment in design features and community facilities often absent in more conventional residential developments". She includes in this elements such as ostentatious entry points, artificial lakes, community gardens and open space, bike tracks, community centres, tennis courts, golf courses, community newsletters and community development programs.

Arguably, the most significant difference from the traditional suburb is the conscious attempt to create community. Eves (2007 p. 165) considers that this new form of estate can comprise some or all of the following: security services, including in some cases full gates and restricted access; recreational facilities such a golf course, gyms, swimming pools etc; and natural or man-made surroundings such as bushland, parks or water features. The cost of these services is borne by the purchaser with "the developer providing a lifestyle as well as a home". Much of the literature on MPEs has explored issues of community creation and social exclusion. Not all of this literature is critical of the current approach to the development of MPEs. Minnery and Bajracharya (1999 p. 41) consider that there are substantial advantages to this type of development in that it enables orderly growth, private funding for infrastructure, security, certainty for investors and economies of scale. Costley (2006) although not entirely uncritical, sees MPEs as an opportunity to ensure better planned and integrated communities with a greater degree of social coherence. However, other writers critique MPEs in relation to the issue of social coherence and community as they may encourage an exclusivity and lack of integration with the wider and more diverse community. Kenna (2007) found evidence of deliberate encouragement of socio-spatial polarisation in her case study of a Sydney MPE. She suggests that the exclusivity of some of these developments is driven more by security concerns than race or ethnic segregation as it might be in the US. McGuirk and Dowling (2007) have also focused on MPEs in Sydney. They consider that Sydney has relatively few truly gated communities and that those that do exist are probably more motivated by a sense of status aspiration than a true fear of crime. Bosman (2003) also expressed concerns about exclusion with her work on a South Australian MPE.

The degree of control exercised by developers over form and function of their estates can be criticised for the propensity to lead to a repressive degree of uniformity. Gwyther (2005) sees the origins of these types of developments in the garden city movement. She considers that they involve an anti-urban romanticised view of social harmony and a compulsory adherence by residents to a set of social standards determined by the developer. "These standards implicitly include notions of civil behaviour, pride in housing and in the estate, and most importantly, abiding by the estate's restrictive covenants, regulations and social norms", (2005 p. 57). Gleeson provides a scathing critique of these developments labeling them 'privatopias'. He contends that the prevalent general preference for private facilities over the public is fed by a combination of both security concerns and aspirations in potential buyers. He is concerned about the perpetuation of a culture of anxiety which "might well be dissipated if we were to re-establish public spaces, facilities and services that invite participation and interaction by all" (Gleeson 2003). Following her identification of the range of assets and facilities 'value added' by developers, Gwyther (2005 p. 59) points out that this practice is "an appropriation of the role of local government by MPC developers, and is indicative of the 'privatism' underpinning such developments".

In some circumstances assets and facilities that would normally be in council hands are actually owned by a private company. This choice of legal entity appears most commonly when the asset can be run on a commercial basis for profit, such as a golf

course. In other estates however owners' corporations, or bodies corporate, are created to hold title of the communal assets. Owners' corporations have been used for an extended period in Australia in developments such as multi-unit flats or apartments where there is shared property, such as driveways or stairwells, in common (Consumer Affairs Victoria 2006). Usually, purchase of a property where an owners' corporation exists involves compulsory membership of the owners' corporation, for which an annual fee is required. This trend in shared property in MPEs appears to be an expansion of this role involving more complex and valuable assets, and covering a range of property that is traditionally managed by councils. Architectural controls of the estate, in the form of building guidelines and regulations on ancillary issues such as colours, fencing and letter boxes often utilise an owners' corporation as the mechanism to approve and enforce requirements. This is also an important issue but not one that we will pursue in this paper. The issue is pursued in our larger research project.

The research reported on in the present paper is part of a larger investigation into forms of ownership in MPEs in Australia. Our empirical investigations of the five case studies detailed here, show a range of assets and a variation in the use of this ownership mechanism, and a fairly consistent approach to the marketing of these MPEs. In this paper we explore not only what the arrangements are in these new estates, but the ways in which they are promoted, in order to assess how much of this could be expected to be understood by the potential buyer. The work is motivated by two concerns. Firstly we share with Gleeson (2003) and many of the other critics, a concern for the social implications which flow from a form of urban development emphasising segregation and difference, drawing upon both lifestyle aspirations and generalised anxiety. Secondly, we are concerned for the many potential consequences from the practice of privatised ownership itself. These include the potential for ongoing community conflict in the management of these assets, the possibility of inadequate financial resources to maintain complex assets and a likely alteration of the relationship with local government and the wider community stemming from this organization of assets. Previous research (Goodman and Douglas 2007; UNSW 2008; Blandy et al 2006) has suggested that the reality of life within estates where significant assets are placed in owners' corporation rather than public hands may be quite at odds with the harmonious image of community frequently promoted.

Land use planning in Melbourne and the effects of neo-liberalism

The current system of planning and land use regulation in the state of Victoria was introduced more than a decade ago as part of a suite of changes brought in by the Kennett state government, heavily influenced by neo-liberalism (Alford and Considine 1994; Salvaris 1995; Hayward 1997; Costar and Economou 1999; O'Neill 1999; Engels 2000; Gleeson and Low 2000; Gleeson and Low 2000a). It widely understood that widespread adoption of neo-liberalism involved substantial change to the notion of governance, that is, of what governments do, and for the role of government in the land use planning system. The key tenets of neo-liberalism, as applied to the task of governance, include: the reduction of public sector expenditure, taxation and indebtedness; privatisation of government assets; competitive tendering for many

government tasks; and the removal of constraints on the operations of the market through deregulation, particularly of the labour market and the financial system, (Bell 1997 p. 130-4). Neo-liberalism established the primacy of economics as the major determinant in public policy, and this has flowed through to the planning, where emphasis has been placed on development facilitation rather than regulation, particularly in response to increased urban entrepreneurialism and city competition (Gleeson and Low 2000).

Urban planning, which can be seen as a classic nation building activity, essentially interventionist in nature, with a sense of collective and societal good rather than individual benefit, is fundamentally at odds with many elements of neo-liberalist ideology. Gleeson and Low, (2000 p. 172), went so far as to suggest that "neo-liberalism abhors planning". Healey (1997) described neo-liberalism as a reduction in the role of formal government. She contends that a neo-liberal approach to planning involves a shift from a policy framework which involves regulation and a spatial plan to one based on outputs and performance indicators. She has also pointed to the connection between a market-based, deregulated system and powerful property interests which can help shape and benefit from a more liberal planning regime. The planning system adopted in Victoria in 1996, known as the Victoria Planning Provisions (VPP) fitted well within this deregulatory agenda, removing a great deal of regulatory certainty and control from local government (Buxton et al. 2005). The system is one in which the state government, (principally responsible for planning under the Australian federal system) provides overall strategic direction and a standardised suite of regulatory tools, whilst delegating day to day administration to local government.

Recent analysis of the role of neo-liberalism in Australian planning has attempted to move away from a simplistic narrative of a historic shift from a Keysian-Fordist approach to government in Australia to a uniform neo-liberal climate of deregulation and small government, suggesting that approaches are more uneven and locally varied (O'Neill and Moore 2005). McGuirk (2005) argues in this context that recent metropolitan plans for Sydney show both elements of the classic neo-liberal rolling back of the state, and the rolling out of new forms of regulation and governance arrangements including the many variants of public-private partnerships. McGuirk suggests that the new neo-liberalist planning approaches in Sydney included a de-emphasising of detailed spatial planning, and an emphasis on flexible, place specific planning. "Spatial blue print planning was increasingly viewed as inappropriate to the dynamic uncertainty and complexity for the globalised city and its related need for adaptiveness" (2005 p. 63). Thus some of the larger aspirations for planning, such as a commitment to mitigating spatial inequality, are being lost in the detail of individually negotiated plans and special arrangements with particular developers.

The increased spread of a range of ownership arrangements, including the increasing tendency in MPEs for communal assets to be in private rather than public hands, can be seen as deriving from the neo-liberalist agenda in several ways. Firstly it indicates a willingness on the part of government to allow private ownership of community assets in order to reduce ongoing government financial responsibility, and shift if liability and risk

on to the private sector. Secondly, it demonstrates a move away from involvement in the detail of planning, away from blue print planning, in favour of outcomes-oriented planning. Thirdly, it highlights the primacy of the individually negotiated agreement between developer and local government, between developer and consumer and ultimately between residents of MPEs themselves.

Methodology

Content analysis was the methodology chosen to investigate the nature of information contained on MPE websites dealing with legal structures and in particular owners' corporations. Bryman (2004 p.183) defines content analysis as, "an approach to the analysis of documents and texts that seeks to quantify content in terms of predetermined categories in a systematic and replicable manner". We utilised this in order to analyse the kind of information available to potential consumers of house and land, or land alone, in MPEs that include complex legal structures such as owners' corporations and corporations to hold assets. MPE websites are a major source of advertising for the sale of house and land packages and development lots, with other types of advertising commonly including television, radio and print media. Websites are likely to be consulted by a significant percentage of consumers. They have the potential to contain greater detail than other forms of advertising or promotion. The use and content of websites is being increasingly analysed in social science research (Bryman 2004, p. 467). They are now recognised as legitimate sources of data and combine with content analysis to provide an insight into the framing of selected issues, such as the representation of legal structures to potential consumers of products in an MPE. A drawback of research involving websites is the capacity of these sites to change without notice. Thus the research findings of any project must be subject to the caveat that the research is accurate only for the period of data collection (Bryman 2004).

Although details regarding legal structures are generally available to the purchaser prior to the signing of contract, (in Victoria this is a requirement of recent legislation), our research focused upon an early point in the decision making process to purchase property within an MPE. In doing this we sought to establish the degree of forewarning that potential customers might have of the more complex legal structures, and the nature of the information relating to these, in the early stages of their inspection and investigation. Similar concerns have been raised in relation to research upon MPEs in England and New Zealand (Blandy et al) and in NSW (UNSW 2008). It is reasonable to suggest that information might be most useful to the decision making process at this early stage as by the time a contract of sale is viewed potential consumers are likely to be emotionally committed to the purchase and thus less likely to be able to appreciate possible disadvantages of legal structures. Advertising for MPEs is often aimed at engendering an emotional response, promoting not only the product, i.e. the house and land, but a particular lifestyle which might be assumed to come with them. Rosenblatt (2005) has argued that our homes now reflect an important part of our sense of identity and status. The extent to which advertising for MPEs that focus upon community assets also include details of the legal structures that are used to hold these assets was also investigated.

The data presented in this paper was gathered between January and March 2007. The five MPEs investigated here were chosen firstly on the basis of the developer providing a detailed website (a common occurrence in Victorian developments). Secondly, prior scoping research had established that assets, including facilities and open spaces, were included in MPEs in Victoria and that these assets were commonly held in owners' corporation or private company arrangements (Goodman and Douglas 2007). The five MPEs were chosen to give a geographical spread within and around metropolitan Melbourne, predominantly on the urban fringe as that is the most common location for estates of this type. All the estates are a considerable distance from the Melbourne CBD. The data was analysed under a number of headings which included master planning, lifestyle and resort living, open areas, community, facilities/leisure and security and exclusivity. The category of legal structures was the prime category explored and each of the other categories was considered in relation to this issue. For each category an analysis of content was undertaken (both in visual images and text) and the secondary question of where the information appeared on the web page was noted.

In addition to website content analysis we sought qualitative data by contacting the five MPEs that are the subject of our research by telephone, email or both telephone and email. We made contact with the sales office of each MPE in order to gain more detailed information about the legal structure of each development. The research questions to be answered included:

1. What discussion of 'lifestyle' assets (particularly resort style) held by the body corporate (owners' corporation) or other legal entity appear on the websites of the selected MPEs?

2. What are the legal structures utilized for ownership of the community assets in the selected MPEs?

3. What information of these legal ownership structures is available on the websites of the selected MPEs or provided by a follow up contact with the MPE sales office by telephone or email?

Promotion of lifestyle assets on the case study MPE websites

Unsurprisingly, the community assets which could be seen as lifestyle enhancing within the case study estates were described in very favourable terms in the text and visual documents stored on each website. The lifestyle and resort living promoted on the MPE websites generally identified improved living arrangements through resort, or in one instance 'escape', facilities. The range of facilities in the five case studies included golf courses, gymnasiums, tennis courts, and an equestrian facility. These are summarised in Table 1 below. Each opening page of the MPE websites referred to 'lifestyle' or 'resort living' either explicitly or implicitly. Clearly, the developers saw this theme as important in constructing these sites. The information is targeted to prospective purchasers who wish to buy into an established area with facilities, rather than merely a

house and land package in an otherwise sparse new area. Considerable emphasis within the websites was placed on the lifestyle and resort features. Sanctuary Lakes Resort, an MPE that includes a golf course, swimming pool, tennis courts, gym and restaurant, describes itself as providing a 'lifestyle opportunity' in the western fringe of Melbourne in Victoria. The opening web-page includes the following text.

> *Sanctuary Lakes Resort takes resort style living to a new level. Set around an 18 hole Greg Norman design golf course and 168 acres of lake at Point Cook, Sanctuary Lakes Resort boasts an unparalleled selection of residential land in a stunning natural, environmentally friendly setting next door to a bird sanctuary, nature reserve and Port Phillip Bay. Outstanding home sites with golf frontages, lake views and parkside locations are only part of the story… Sanctuary Lakes Resort is a self-contained lifestyle enclave where residents are members of an exclusive club.*

In the Sands, on the urban fringe near the beach area of Torquay in Victoria, the opening page of the website proclaims it as 'a stunning new resort located in Torquay, at the Gateway to Victoria's Great Ocean Road.' The focus of the opening page is upon the resort hotel, a major hotel complex that is part of this development. The estate also includes a golf course. On the opening page links are provided to other pages of the website describing in more detail the lifestyle facilities.

> *The estate boasts a $12m club house featuring a 25m four lane lap pool, tennis courts, gym, 300+ restaurant, spike bar and pro shop. And $25 million 112 room residential hotel Peppers The Sands Resort.*

Under another section of the website further information is given to potential purchasers of the resort style facilities, emphasizing their exclusivity.

> *The fully equipped gymnasium and 25 metre lap pool is the centrepiece for this incredible recreational area. The Health club is a 'Members Only' facility offering fully trained gym staff and all the state-of-the-art gymnasium equipment, making this a great place to exercise, while overlooking the practice areas of the golf course.*

Sandhurst estate in the south east of Melbourne (approximately 35 kms from the CBD on the urban fringe) also promises resort-style enjoyment for those who purchase.

> *Designed for those who aspire to the best in life, Sandhurst Club is Melbourne's first totally private master-planned club community. Exclusive yet affordable, private yet welcoming, conveniently located yet removed from the worries of the world. It's an unparalleled lifestyle offering residential and golf members all the benefits of a private club — beautifully landscaped, environmentally friendly surroundings using recycled water, a wealth of recreational facilities including two Peter Thomson designed championship golf courses, Health Club with gymnasium, indoor pool and tennis courts, clubhouse with cafe, bar and*

restaurant, and a level of personal concierge service you'd expect from a club of such high quality.

Martha Cove also claims to be unparalleled.

There is nothing like Martha Cove. It is a lifestyle concept that is unique in every sense. As a location, Martha Cove provides much more than just a place to live, work or set your boat adrift. It also provides access to the beach, and transcends architectural and lifestyle boundaries in a harmonious village atmosphere.

Eynesbury estate promotes a focus on lifestyle as an 'escape' from conventional urban living through a return to a notionally 'country' lifestyle. Here the natural environment is promoted as the vehicle of escape, and environmental features are highlighted prominently on the website. All the estates promoted elements of the natural environment, perhaps proximity to beaches or native trees, but only this estate contributed to the preservation of a significant, environmentally sensitive asset, a Grey Box Forest. The Eynesbury website emphasises the notion of escape through flash text appearing and pictures of idyllic country setting. The lifestyle represented is a peaceful and tranquil environment that residents can escape to and be enriched by. The opening page of the website has a button 'Escape to Eynesbury' and the linked page provides the following text.

It begins with an enchanting drive through an ancient forest that cleanses your mind and revitalises the spirit. It continues as you return home to relax with your family and friends in a place you can truly call your own. Just imagine being able to raise your family in a superbly planned residential community that combines the peace and tranquility of a country town with all the sophistication of city living.

This advocacy of the best elements of city and country is reminiscent of Garden City ideals, as is the estates isolation from any contiguous urban settlement (Howard 1945). Eynesbury includes the development of a town centre, a golf course, a hotel and conference facility, an equestrian centre with horse trails and open areas and significant grasslands Grey Box Forest. There is also an agribusiness. Attributes of the various estates are summarised in Table 1 below.

Local Government	Estate	Developer	MPE characteristics and size (when complete)	Legal Structures (gained through perusal of websites and contact with Sales Offices)	Legal Structure information on Website (including location)	Information from enquiry to Sales Office by telephone or email
Wyndham	Sanctuary Lakes[1][2]	LinksLiving	Security emphasis, 24 hr security guards, golf course and lake, gated sections. 2,700 lots	Owners' corporation for recreational facilities and corporation for the holding of the golf course.	Provision of constitution of the public company and two annual reports under the Members button on the website. No explanation of legal structures or a summary fact sheet.	The owners' corporation fee includes maintenance of the lake, access to facilities (including pool) including the golf club, restaurant, function room and bar access but not fees for playing golf. Owners' corporation fee is $1,500 annually or $2800 for gated section.
Melton and Wyndham	Eynesbury http://www.eynesbury.com.au/	Eynesbury Development Joint Venture	Lifestyle oriented, recreation and open space facilities. New urbanist design. Golf course. Development of a town as well as a primary school. 2,900 lots	Incorporated Association as mechanism for contributions from owners' corporation to the upkeep of environmental areas including Grey Box forest and grasslands.	Provision of summary fact sheet. Detail provided of owners' corporation and incorporated association. The link to the fact sheet is gained through a button on the first page headed 'owners association'.	The owners' corporation fee is for the upkeep of common reserves and nature areas and a shuttle bus which will run until a commercial bus company provides transport. The fee is $25.00 a week. When queried regarding the incorporated association the response was that the incorporated association was the owners' corporation.
Bass Coast	The Sands http://www.thesandstorquay.com/welcome/index.mhtml	Mirvac	Lifestyle orientated resort style with facilities incl. gym, pool and tennis courts, security patrolling Golf course with own club house (the club house includes its gym, indoor pool, practice facilities, bar and restaurant.) 200 lots and a	Owners' corporation for leisure facilities and corporation for the holding of the golf course.	No information provided	There are two owners' corporations – one for house and land and one for apartment property. Land: covered in owners' corporation fee are 2x membership to gym, pool, tennis at $1758 per yr, This gives cheaper house and contents insurance, discount at restaurant on site, access to nature strips, covers the cost of the Architectural Review Committee Apartment: investment only; you become part of the hotel. There is a guaranteed min return. You can stay for up to 28 days per year. The body corporate fee is $4,800.00.

---

[1] These are offered to the public for investment and leased back. Owner can stay in investment property for only a few weeks of the year.

			proposed 168 condominiums and 112 apartment residential hotel[1]			
Frankston	Sandhurst http://www.sandhurst.com/	Links living	Lifestyle orientated resort style with facilities incl. two golf courses. Clubhouse with health club, indoor pool, tennis courts, café, bar and restaurant. Golf retail shop and headquarters of Australian PGA. Size not specified.	One body corporate Two public corporations, Sandhurst Holding Company and Sandhurst Club	PDF of constitutions of the two public corporations provided under the 'members' button on the website. No explanation of legal structures or a summary fact sheet.	The owners' corporation fee is $2,300 per annum which includes and covers gym, pool, tennis, golf club but not gold membership, access to recycled water, and a levy to general maintenance. There is 24 hours security coverage in the estate. There is only one owners' corporation. The cost of owners' corporation rates do not vary according to land packages
Morning-ton Peninsula	Martha Cove[3][4]	City Pacific Limited	Lifestyle oriented with resort style including waterfront marina luxury lifestyle development. Some freehold marina berths for purchase or lease. 1,000 lots	Owners' corporations for Marina development waterways, boardwalk, roads, landscape and conservation areas. Swimming pool, bocce and yoga lawn	No information provided	Owners' corporation fees range from $5,000 to $9,000 per year. There is one full-time owners' corporation Management team on site at the estate. Membership of the owners' corporation gives - Maintenance of car spaces. - Maintenance of swimming pool and gymnasium - Maintenance of lift - Maintenance of all waterways (pumping and filtration systems), public garden, board walk, revetment walls. - Includes building insurance and public liability - 24 hour monitored security

Table 1: Summary of information on privatised assets in five case study estates

Presentation of legal ownership structures on websites or through other information

As indicated on Table 1 all of the five MPEs chosen included an owners' corporation (previously known as body corporate and often still referred to as such by these developers) and most also included a private corporation structure. Eynesbury included an owners' corporation and an incorporated association. The table provides a summary of the appearance of information about legal structures on the websites (including location) and information gained from the MPE sales offices.

The gathering of the data for these five case studies provided some information regarding legal structures but overall the detail provided could be said to be sketchy. We noted a discrepancy in most websites between the degree that they reported upon these benefits of these facilities and the degree that they provided detail of the legal structures that held these assets. When we inquired about the legal structures we were frequently provided information about what residents received for the owner's corporation fees, rather than what the corporation actually owned. For example, fees at Sanctuary Lakes include provision for maintenance of the lake, but it was not clear whether that meant that all residents were therefore part owners in the lake. In contrast to the primacy given to a description of facilities that enhance lifestyle, the legal structure information was either absent from the websites or minimal information was provided. The exception was Eynesbury, which provided considerable detail and placed this information behind a button on the first page of the website where an extensive fact sheet was located. This sheet explained the difference between the legal structures of an incorporated association and an owners' corporation and further advised that prospective purchasers should seek legal advice. The heading given on the web page however was not legal structures but instead the button was termed 'owners association' arguably making it harder to identify the information. Interestingly, when speaking with the sales office of the Eynesbury estate the information provided was the least accurate as the sales representative stated that the body corporate and the incorporated association were the same legal entity. From the website information this assertion is clearly incorrect.

It may be the Eynesbury provided detailed website information due to the atypical legal structures adopted by the developer. The incorporated association seems to be the vehicle for maintaining the environmentally sensitive Grey Box Forest and grasslands. The owners' corporation contributes to the environment maintenance through making payments to the incorporated association. The incorporated association can include non body corporate members such as councils. The fact sheet noted however that ownership of the forest and grasslands did not presently rest with the incorporated association but remained with a pastoral company and that access to the forest and grasslands may be restricted according to environmental assessments. This is a particularly complex web of legal structures for consumers to enter into as part of buying a house and land package.

Other structures found amongst our case study estates were also relatively complex in their organization. The information on two of the websites, Sanctuary Lakes Estate and Sandhurst, included the constitutions of corporations that appear to hold the golf courses that are part of these estates. However, there is no detailed explanation of the relationship between the corporations and the body corporate. There is no detail regarding the body corporate at all on these sites, although the sales offices were relatively forthcoming regarding information about the owners' corporations. Presumably, corporations hold the golf courses to allow non-residents to join the club and to allow residents who hold shares (there are a number of categories) to sell or lease their club rights. However, this is an assumption that is not explicitly referred to on the websites. Indeed merely including a complex legal document such as a corporation's constitution on a website does not appear to us to be a helpful method of assisting understanding of the legal structures on an estate. The Sands, which includes the resort hotel, had little information available on the website, but did provide a relatively detailed fact sheet after an email query. Similarly, the Martha Cove development did not provide information on the website, but was forthcoming when a telephone enquiry was made. No fact sheet was provided to assist understanding about Martha Cove.

None of the legal structures of the five MPEs that we studied could be described as simple. This was to be expected as we have deliberately chosen MPEs with more complex structures. For example, in the constitution of the Sandhurst Club, a golf club on the Sandhurst estate, there are a number of membership classes of the club; some of which relate to residency. This constitution is available on the website and in one section, dealing with membership eligibility (Sandhurst 2005, p. 16), reads as follows:

> *Any person who is entitled to become the registered owner of a Lot*
>
> *For the purposes of this sub-clause 11.4.21., a person is regarded as being entitled to become the registered proprietor of a lot if that person can satisfy the Board that they are in possession of an executed transfer of land capable of registration at the Lands Title Office that will enable them to be recorded as the registered proprietor (whether individually or jointly) of that Lot .*

We, as researchers (some with legal training), were at times struggling to understand these legal structures and therefore must indicate that whilst we believe the descriptions provided in this paper to be accurate, but cannot guarantee it. In order to be sure that we have an accurate sense of the legal structures in each estate we would need to gain access to the contracts for the land or house and land where disclosure would be mandatory. Our sense of confusion about these legal structures must surely be mirrored in potential purchasers' minds. This raises the question whether, at an early stage, these possible buyers are forewarned of the complexity of the legal structures that they may enter into when purchasing their dream lifestyle.

Privatized Communities

This form of development, the master planned estate, appears to be growing not only in Australia but around the world. There are many reasons why the presentation of these housing options as offering a whole lifestyle and ready made community might be very attractive to buyers. These include the desire for people in cities to feel they belong to a community, nostalgia for some of the (real or imagined) values of small town existence, the balance of attributes of city and country, or simply the added extra facilities that appear to offer a higher standard of living than the average person can normally afford. Developers are providing the types of facilities seen in our case studies in part because there are few pre-existing facilities in the green field sites on the metropolitan fringe, and local government has become increasingly unwilling or unable to provide them, or at least to the standard that developers would like. Eynesbury estate is a fairly extreme example of this, where the developers' website claims that they are constructing a whole new town. This is in part due to its complete isolation from any existing developed area and therefore from any transport and community services, and one reason why its original approval was controversial (Buxton and Goodman 2003).

The retreat from public provision of recreational, community and even transport facilities, is in part an effect of nearly two decades of neo-liberalism, and partly a genuine financial shortage as local government in Australia has to provide more and more with less (Dollery et al. 2006) (transport provision remains a state responsibility in Australia). Developers are therefore stepping into the breech, arguably in their own self-interest, and may offer design features in the assets superior to what is usually provided by government or councils (UNSW 2008). This form of value enhancement is clearly very marketable and attractive to buyers but we question whether the public are really getting a fair choice. If they were to choose between an estate with facilities and one without, then one suspects the decision would be obvious, provided the cost differential wasn't too substantial. However, choice between an area with local recreational and community facilities provided by a public authority might also be attractive, especially as most residents of either type of estate still have to pay rates to the local council in Victoria, but only residents of MPEs with owners' corporations have to pay the additional corporation fees. We only know of one estate, Sanctuary Lakes, where residents receive a rate reduction because their community open space is privately owned and maintained (Goodman and Douglas 2007).

Conclusions

It would seem unlikely that the average consumer will be aware of any of the potential problems with participation in an owners' corporation, as these arrangements in housing estates are relatively new in Australia. From our investigations there is a great variability in the amount of information on ownership forms available to the public considering buying property within one of these estates. Details provided are often complex and hard to understand, and much of this information was only supplied when specifically requested.

Research has shown that these forms of private ownership are fraught with potential for future conflict amongst residents over management of assets, particularly where as the estate expands, the original facilities prove inadequate and there are limited opportunities of financing an expansion (Goodman and Douglas 2007). There would appear to be a certain irony in the conflict that can arise in estates through the ownership arrangements of assets designed in part to enhance a sense of community. However once put in place these complex forms of ownership are hard to change. The arrangements over owners corporations in Victoria in particular are can be very difficult to alter requiring agreement from, in some cases, 75 %, or in others an impossible 100% of owners, with non-voters considered to be endorsing the status quo. Recently, in an attempt to make the arrangements in owners corporations more flexible new legislation allows for an opportunity in limited circumstances to overcome these voting requirements through interim special resolutions or where a 100% vote is required the opportunity to apply to a tribunal, the Victorian Civil and Administrative Tribunal, for an exemption from the requirement for an unanimous resolution. This opportunity requires litigation and is therefore not likely to be commonly used.

We suggest that caution should be exercised by government decision makers approving these new arrangements. Whilst the private provision and ownership of community assets may be initially attractive to local governments with tight budgets, this retreat from public provision may be an unfortunate legacy of an area of market dominated planning which will be regretted in years to come.

The private university and the public good: Illinois Institute of Technology, the South Side Planning Board, and urban renewal in postwar Chicago

Michael H. Carriere
University of Chicago, United States

On April 12, 1947, Robert E. Garrigan, Executive Director of Chicago's South Side Planning Board (SSPB), forwarded a draft of a speech he had been working on to Dr. Henry Heald, President of Illinois Institute of Technology and Chairman of the SSPB. It was clear from the attached memorandum that Garrigan was quite proud of the speech, which Heald was to present at an upcoming event. "I will not brag about its organization," wrote Garrigan, "but I think it will make good newspaper copy."

The speech laid out the mission statement of the newly organized SSPB, a group that, concerned about urban blight in the area between 12th Street and 47th Street (east of the Pennsylvania Railroad), had come together just one year earlier. "[T]he simple fact remains," wrote Garrigan, "that Chicago is rotting away." Referencing a map highlighting vacant land in the organization's area of concern, Garrigan found that "It is easy to see by looking at this map how rot is covering the entire South Side and growing and spreading away from the center of the city leaving devastation, disorganization, crime and lost lives and investments in its wake." Yet even such visual aids could not adequately represent the sheer horror of Chicago's streets. Making an incredible comparison, Garrigan found that

> This picture of destroyed buildings and homes is worse than any picture of London destruction by the German Air Raids of the last war. The lost lives, human misery and financial loss caused by blight in Chicago in the past 25 years has probably far surpassed the destruction caused by the atom bomb on Hiroshima. Because blight doesn't happen all in one day, with a lot of drama, but instead creeps on us until it strangles us without our knowing it, we give it no attention."[1]

Despite the enormity of the problem, though, Garrigan did not feel that all hope was lost. To Garrigan, the solution to urban blight could be found in the world of modern urban planning, a world that would help lead to "a definite and sound policy for replanning and rebuilding Chicago" (or, as Garrigan prophetically warned, "someday there will be no Chicago."). First and foremost, this was a project that would require incredible skill and expertise, as "[t]here are very few laymen and in fact not many technicians in the field of urban redevelopment who understand its full scope and significance." And such experts had to engage in large-scale planning, planning that dealt with every aspect of the urban dweller's life – and not just the immediate problem of adequate housing for south side residents. "It is our position," wrote Garrigan on this subject, "that it is just as important to the welfare and future prosperity of this city to plan where the people will work as it is to plan where they will live." [2]

To SSPB leaders – which included representatives from many nearby institutions and organizations – there was a clear public need for a "crusade" to contain the spread of creeping blight in Chicago, a crusade that could only be won through the implementation of a new public/private partnership that re-imagined the public good in the urban center. The driving force behind such efforts was the private university IIT, whose leaders and faculty members played vital roles within the SSPB. It was such individuals that called for the university and its private-sector allies to take full advantage of federal urban renewal grants and programs in their fight against urban decay and disorder on Chicago's near South Side. This essay focuses upon this relationship between the school and the redevelopment group, and hopes to show how these parties attempted to forge a new relationship within the postwar era that renegotiated the boundaries between public and private in their struggle to create a new understanding of the public good within the city.

This search for consensus and cooperation between the public and private sectors became a crucial component within the world of postwar American liberalism, and a close examination of the world of the SSPB provides one with a specific representation of liberal values and strategies during this important historical moment. Holding this relationship together – at least in the arena of urban redevelopment and renewal – was a confidence in the power of modernism, both in the realms of architecture[3] and urban planning. The clean, abstract lines and carefully proportioned spaces associated with modern urban planning provided both IIT and the SSPB the antidote for the urban disorder that seemed to be surrounding them on all sides. The leaders of such institutions wholeheartedly embraced modern urban planning as early as the 1940s, and a commitment to modernism became a central tenet in the process of defining the urban public good. Such a strategy played a crucial role in the urban renewal efforts that Chicago would implement throughout the postwar era.

Yet there was more to this embrace of modern urban planning than such a clear-cut contrast between perceived urban order and disorder. In addition to putting the liberal reliance on the public/private partnership on display, the turn to the modern within urban planning also came to serve as a physical representation of the values of postwar American liberalism, values that liberal university leaders (and many within the surrounding community) wholeheartedly endorsed and believed was their mission to teach to the young people of the United States. Modern urban planning – with its predilection for large-scale projects, its commitment to consensus and rationality, its embrace of expertise and specialization, its distrust of history, its vision of an evolving administrative state, and its deification of technology (among others) – proved a perfect fit not only for the broader vision of American liberalism, but also for the way many liberal leaders were coming to view the city within the postwar era. The push to suburbanize urban space and have the city serve the automobile – popular thoughts among many urban liberals – were key tenets of modern urban planning, as practiced within the SSPB and elsewhere. The actual plan of the urban university and its immediate surroundings can be read as a concrete articulation of both the values of American liberalism, and the way that liberals pictured the ideal public good in

America's cities. Such a marriage between modernism and liberalism would have tremendous repercussions for the broad arc of twentieth-century US history.

Fighting the fight against blight: the birth and evolution of the South Side Planning Board (SSPB)

In 1945, Michael Reese Hospital, centered on 29th Street and Ellis Avenue, established a group called the South Side Redevelopment Agency and provided the agency with a planning staff under the direction of Reginald R. Isaacs. The reasons for such a strategy were highly based on the desire for self-preservation: The hospital didn't want to lose its $10,000,000 investment to the urban blight that seemed to be moving in on its property. At the same time, the hospital knew that it would need to expand in the near future. Understanding that such an endeavor could profit through partnership, Michael Reese Hospital reached out to other area institutions, organizations, and individuals also concerned with the viability of south side stability and development. [4] By the summer of 1946 the group had a new name – the South Side Planning Board – and had been incorporated in the state of Illinois as a non-profit organization designed "To aid in the planning and carrying out of a program of development of the Central South Side area of the City of Chicago."

And who made up the SSPB? According to a list of those present at a spring 1947 meeting, representatives from IIT, Michael Reese Hospital, NAACP, University of Chicago, Chicago Memorial Hospital, Chicago Federation of Labor, American Society of Planning Officials, Chicago Urban League, Chicago Building Congress, Inc., and the Catholic Archdiocese of Chicago were in attendance. Members also came from prominent railroad companies (New York Central, Pennsylvania, and Illinois Central, to name a few), corporations (Hydrox, Walgreen Company, Marshall Field and Company, Eastman Kodak Company, and Mentzer-Bush Company), and many other organizations, both governmental and private. As the group grew in membership and influence, it was in constant contact and partnership with many key Chicago governmental offices. The group seemed to highlight the public/private blend of postwar liberalism perfectly: members saw the need for governmental aid and assistance, but still believed that the private sector had a vital role to play in tackling the crucial issues of the day. Yet there was one group that was underrepresented during the early efforts of the SSPB: African-Americans. Interestingly, this fact that did not go unnoticed by group's leaders: In an undated "Prospective Members" document the group noted that – in order for their efforts to appear legitimate in the eyes of local community members – the organization must include "Representatives of the Negro Community." Such individuals as Earl Dickerson, Oscar DePriest, Horace Cayton, Rep. William L. Dawson, and Metz Lochard (editor of the *Chicago Defender*) were suggested as potential members.[5]

Yet internal documents from the group reveal the struggles that the organization faced in convincing African Americans that they were on their side. In December 1947, SSPB hired an African-American man named William Hill to work for the organization as Director of Community Relations. Wilford G. Winholtz, then serving as Acting Executive

Director of SSPB, told Walter H. Blucher, Executive Director of the American Society of Planning Officials and SSPB consultant, that he thought Hill might work out because "He is a real dark Negro…" Such racial dynamics, present early in the group's history, would foreshadow the problems that the SSPB would have concerning race as their plans for the south side of Chicago continued to evolve. Put another way, how many voices should contribute to the effort to redefine the public good within the city? [6]

The SSPB started off as a rather streamlined group, but quickly grew to become more and more bureaucratic. By June 1947 the group featured the following committees: Membership Committee, Forum Committee, Planning Committee (which had four sub-committees: Planning Coordination, Utilities, Use and Value Survey, Graphic Representation), Committee on Industrial Development (three sub-committees), Local Services Committee, Committee on Community Relations, Committee on Health, Committee on Insurance Company Development, Committee on Public Housing Development, Committee on Small Investors Development, Committee on the use of Revenue Bonds for financing redevelopment, Committee on Integrated Community, Committee on Redevelopment Authority, Committee on Land Distribution Procedures, Committee on Relocation, Committee on zoning and legislative action. The push towards specialization and expertise was alive and well in the SSPB, along with the layers of bureaucracy necessary to make such a system function.[7]

Within such committees, there is little doubt that it was individuals from IIT that held the most sway. Dr. Heald was appointed the first chairman of the organization, and Executive Committee meetings were often held at the IIT student union. Raymond J. Spaeth, Vice-President and Treasurer of IIT, played a vital role in the SSPB throughout the group's history, and took over the position of chairman after Heald left IIT to become the chancellor of New York University in the winter of 1952. Heald's successor, Dr. John T. Rettaliata, also often participated in the SSPB, speaking, for example, at the organization's annual meeting in May 1952 (He spoke on the topic of "Extending our Planning Horizon"). Mies van der Rohe and Ludwig Hilberseimer, two IIT faculty members in the fields of architecture and urban planning, also had close relationships with the SSPB. A 1946-1948 membership list for the organization marks Mies a member, and both men participated on the SSPB Planning Committee. "We [IIT administrators and faculty members] were the leaders and organizers," according to Spaeth, "not just participants. IIT put a tremendous amount of time, money, and talent into urban development." [8]

As the examples of van der Rohe and Hilberseimer illustrate, architects and urban planners with an affinity towards modernism were particularly welcome in the SSPB. Individuals from the modern architectural firm Skidmore, Owings, and Merrill (SOM) claimed membership in the group, and architectural luminary Walter Gropius served as a consultant for the SSPB. Planning Committee meetings were often held in the Chicago offices of SOM, with architect John O. Merrill actually presiding. Correspondence from Heald to Blucher in November 1947 gave note of the "increased personnel and assistance of the firm Skidmore, Owings & Merrill to prepare the preliminary planning report for publication at the earliest possible date"; not surprisingly,

this document – along with, as we will see, other products of the SSPB – relied heavily upon a modernistic understanding of urban planning.[9]

The bogeyman in these early SSPB redevelopment/urban planning publications and efforts was the idea of blight, which was seen as the greatest threat to the urban public good. "Blight," according to a SSPB July 1946 prospectus, "attacks and destroys industrial and commercial areas as well as residential areas." In language reminiscent of both Kennan and Ross, the SSPB found that "Blight is a cancerous disease which afflicts and destroys cities and property and investment in them." And how did the SSPB plan to effectively deal with such a disease? Some, according to the SSPB, have advocated the "Segregation of Blight" – cordon it off and simply forget about it. "From time to time, business leaders have advanced the theory that blight could be segregated, and its effect cut off from the rest of the community." However, the SSPB found that "The collected past experience of municipalities provides clear, vivid and decisive proof that if the spread of blight is to be stopped, blight must be eliminated." The idea of containment was perhaps a start, but it was not enough.

Yet perhaps even more disturbing to the SSPB leadership was the "Run Away" approach to the problem of urban blight. "There are those in this city and in all other cities," found the SSPB,

> who take the view that blight does not concern them. They believe they can run away when blight disturbs them too much….For some years now people have been taking losses and running away from Chicago. These people have thought of the total city as a total blight….It is the story of disaster. Thousands of people and businesses have written off losses, tremendous losses, and run away. They ran away to permit blight to spread and be damned. It has spread and it has had a serious effect on all of Chicago.

"The 'run away theory,'" concluded the SSPB, "just isn't any good. It is even costly to those who run. It is cheaper to stay and fight the thing." The SSPB had then to decide exactly how to stand and fight this spread of blight.[10]

A Move towards the Modern: The Intellectual Underpinnings of the SSPB

In their articulations of strategies for fighting this blight and pushing for urban redevelopment, the SSPB found useful intellectual allies in such individuals as Mies van der Rohe and Ludwig Hilberseimer, and their plans for the rebirth of Chicago's South Side clearly drew from the work of both men. In fact, Mies's IIT buildings often went hand-in-hand with the urban renewal efforts of the SSPB, and his modernist designs put on display the values – order, rationality, and a commitment to technological advancement – that the group was attempting to inscribe on the south-side landscape. Not surprisingly, Mie's own thoughts on urban redevelopment proved a nice fit with the ideology of the SSPB. One begins to see Mie's ideas on such subjects in his introduction to Hilberseimer's work *The New City: Principles of Planning* (1944). "Reason," began Mies by way of quoting Sir Thomas Aquinas, "is the first principle of all

human work." And it is reason that should guide all efforts to redevelop the urban landscape. Mies then approvingly noted that Hilberseimer

> examines the city with unwavering objectivity, investigates each part of it and determines for each part its rightful place in the whole. Thus he brings all the elements of the city into clear, logical order. He avoids imposing upon them arbitrary ideas of any character whatsoever.

Here, Mies found great comfort in the fact that Hilberseimer – much like himself –greatly valued objectivity, order, and the rational thought: the very same values that postwar liberalism had begun to champion. "City planning," concluded van der Rohe, "is, in essence, a work of order," and this search for order led Mies to adopt the language of value-neutral social science, at the precise moment that it was gaining ascendancy in American culture.[11]

Hilberseimer himself saw the need to answer the prevailing trends of "wild decentralization" and "planless disurbanization" with a call for "immediate constructive action."[12] To Hilberseimer, what was needed was "comprehensive planning, in which all of the many and different necessary undertakings are fitted together to establish a framework for a better life."[13] One begins to see greater detail of such a philosophy in the afore-mentioned *The New City*. Here, Hilberseimer envisioned a city where "all the necessary elements of a city are segregated according to their function." In such a plan,

> the backbone of the settlement unit is the main traffic artery. On one side of that artery are located the industrial areas; on the other side, first the buildings for commerce and administration set within a green belt, and beyond them the residential area surrounded by a park with schools, playgrounds and community buildings in it.[14]

Within such segregated spaces, Hilberseimer saw the need to move beyond the accepted understanding of neighborhood, block and street systems. "The city today," he wrote, "is based on a street and block system which was used in Egyptian cities four thousand years ago and which is certainly older than Egypt. The function of the block has been the same at all times." To Hilberseimer, such a system had worked admirably throughout much of human history. Yet modernity – and specifically the rise of the automobile – had rendered such a system obsolete. As he concluded:

> However our motor vehicles have rendered this once perfect system questionable and even dangerous. We are beginning to consider and try out modifications of, and even departure from, the block system. We are trying especially to solve the problem created by the speeding automobile – the dangerous intersection.[15]

By posing the problem in such terms, it was clear that Hilberseimer now saw the car is perhaps the means of traveling throughout the city. They – and not pedestrians or other forms of public transportation – must now be accommodated.

The answer to such a problem, according to Hilberseimer, lay in the creation of a SUPERBLOCK (capitalization his), which sought to combine a number of city blocks for up to two square miles. This new mega-space would be bounded by four highways (instead of streets), with clover leaf intersections at the four corners to make sure that traffic flowed smoothly. Residences, commercial buildings, and offices would all rise high into the air within the superblock, and motor vehicles could drive underneath such buildings and even park there. Such a design – besides bringing much needed order to the chaos of the city – would also serve to open up recreational space. "The park space within such an area," wrote Hilberseimer, "could now be much larger. Schools and playgrounds could be located within these parks." And, importantly, such children-friendly areas would be located within confined, safe spaces. Little attention was paid to what such spaces might be replacing. There was an explicit mistrust of history in the work of Hilberseimer, a feeling that all that came before (as in his example of the changes wrought by the automobile) was now outdated. Any new version of the urban public good would have little to do with what came before.[16]

From word to deed: the SSPB and its plans for the remaking of central South Side Chicago

Promotional material for the SSPB stressed that they saw themselves – at least in Chicago – as the organization to begin this process. An early brochure for the group stressed this proactive stance, along with the idea that such an undertaking wouldn't be easy. Here one begins to see the use of war metaphors that would become so predominant in SSPB activities: the brochure collected copies of headlines and newspaper clippings on the young group, headlines that included "Citizens Rally to Redevelop Blighted Area," "Funds to Attack Slum Area Assured," and "Stand and Fight." A reprinted editorial on the organization, originally published in the *Chicago Sun*, found the newspaper reiterating the SSPB's message:

> No section of the city or its suburbs, however remote it may seem from blight today, is really safe from the contagion….The 'good neighborhood' of today may become the slum of tomorrow unless planned growth is substituted for planlessness….As the South Side board points out, we now possess the resources of technical knowledge and experience to make a significant attack on redevelopment.[17]

Going hand-in-hand with this idea of contagion was an obsession with order, cleanliness, and the public good within the SSPB. The foreword to a draft of an SSPB redevelopment report noted that the area that they wished to redevelop was "noisy and dirty. Its ancient buildings are frequently the victims of poor maintenance."[18] Focus therefore shifted onto how the group could create and maintain a "healthy" city. Indicative of this is an October 1946 report by Robert E. Garrigan and disseminated to members of the Executive Committee on "the problem of refuse collection and street cleaning." To Garrigan, the filth of Chicago served as a visible manifestation of the disorder plaguing the city. And within 12 pages of mind-numbing detail, Garrigan's report called for "the necessity for an educational program designed to secure the

cooperation of residents and merchants in maintaining an efficient system of refuse collection and clean streets and alleys." A clean city, to Garrigan and other SSPB members, was the first step towards becoming an ordered city.[19]

As one might expect, much of this perceived need to contain and fight urban decay came from the belief that blight would lead to declining property values and lost business opportunities for all of the institutions involved with the group. It would be a folly to not note that much of the impetus behind the founding of the SSPB was to protect the security of prominent south side individuals and institutions. As early as 1942, IIT President Henry Heald was telling Mies van der Rohe that

> In connection with the development of our campus, I feel that it would probably be desirable to have a fence or wall around the entire area….This would give us a chance to do a considerable amount of work in improving the appearances of the landscape, and also give a degree of security which could probably not be accomplished in any other way in this district.[20]

There was also a widespread belief among SSPB members that urban renewal would spur greater investment in the near south side of Chicago. An early draft of a SSPB preliminary report, for example, finds that, while the group is interested in creating a dialog with "the general public," it's efforts are – more importantly – "specifically designed to point out to housing investors the attractive possibilities of large scale urban redevelopment."[21]

At the same time, the SSPB's relationship with IIT helped to lift the group's mission above the merely economic, and it must be stressed that the SSPB always saw themselves as contributing to the greater good of Chicago. With the support of such educational institutions as IIT, the group could portray its plans and policies in a more idealistic light. By 1947, the IIT campus had grown from 7 acres to 65 acres,[22] and promotional material for the university from the late 1940s was quick to note that "One of the most dramatic aspects of the Institute's growth has been the acquisition, clearance, and rehabilitation of the blighted area in which it is building a great center of technological education and research." Here, the school – with the support of the SSPB (Promotional materials for both IIT and the SSPB were always quick to mention their working relationship with the other) – portrayed itself as bringing a vital new set of buildings to the city, buildings that would house programs that had the potential to benefit all of humanity. Returning to this image of the university as a crucial piece of the struggle to contain and overcome blight, the pamphlet continued:

> In 1940 the seven acres which comprised the former Armour Institute area was surrounded by encroaching blight and decay in a once proud section of the city. In less than 10 years Illinois Tech has expanded to 85 acres and plans to acquire another 25. Unsightly buildings have been razed and in their stead have risen the inspiring glass and brick structures of Ludwig Mies van der Rohe, distinguished modern architect who heads the Institute's department of architecture."[23]

Such promotional material made one point abundantly clear: IIT believed that it was helping to bring the benefits of modernism to Chicago's south side.

SSPB leaders were quick to adopt this more humane and idealistic understanding of urban redevelopment within the city of Chicago. The group saw itself as actively working to save the city's residents from the horrors of blight (as Garrigan noted in the speech that begins this chapter), and such individuals saw it as their mission to win the hearts and minds of all Chicago citizens in the war against urban decay. In a closer examination of the SSPB, one begins to see an almost messianic faith in long-term, large-scale modern urban planning. A letter from Wilford G. Winholtz, Director of Planning for the SSPB, to Henry Heald begins to illustrate this phenomenon. Crediting Heald for a moving speech before the Chicago Urban League, Winholtz wrote:

> I was particularly happy to be an audience on an occassion [sic] where it was both timely and appropriate to give some emphasis to the 'moral and spiritual rebuilding' factors resultant from an urban redevelopment program. These to me are of paramount importance, although on most occasions one has to emphasize the dollar values to be 'practical.'[24]

IIT President Heald also often stressed these more humane aspects of SSPB activities. According to Heald, social disorganization in the neighborhoods that bordered his university had "shockingly manifested itself in the forms of unnecessary death, disease, crime, and unspeakable filth." To Heald, such a reality "actually comprises a steady deterioration," of life in the area. Yet Heald was quick to point out that he was not referring to "property," but to "human beings." Bravely (and necessarily), SSPB had stepped up and "undertaken the task of wiping out the infamous and costly slums in 7 square miles of Chicago's Central South Side. Here, some 200,000 persons are jammed together into a mass of misery and suffering." It was up to the SSPB to liberate these individuals from such wretched conditions, to create an urban landscape that brought order to such a disorganized world.[25]

Reflecting back on the early days of the SSPB, Raymond J. Spaeth focused on the moral side of urban renewal as well. When SSPB formed, according to Spaeth, the area around IIT was "the worst possible slum, where houses had dirt floors, often no toilets, and alleys where garbage was piled 10 feet high." With a hint of liberal paternalism, Spaeth then goes on to note that "IIT assumed much of the responsibility for the people in the area," taking on absentee landlords and wretched living conditions. Dangerous, decrepit buildings were razed and "many people," according to Spaeth, "were relocated at IIT expense." All such efforts proved that IIT had "not merely paid lip service but proven its dedication" to the redevelopment of all of the central south side.[26] At the same time, however, the SSPB historically only begrudgingly helped displaced renters find new homes, and very little attention was paid to building new low-income housing projects within the vicinity of IIT and other near south side institutions. "The Planning Board [of the SSPB]," announced Reginald R. Isaacs and Raymond J. Spaeth in March 1948, "does not have responsibility for relocating families." Yet Isaacs and Spaeth didn't necessarily see this as detrimental to the futures of displaced renters. In fact, such a

strategy, they argued, may have provided them a much-needed push towards a move to the suburbs. As they wrote: "The Planning Board fully recognizes that suburban communities may be available into which families may voluntarily move." In their own way, the SSPB felt that it was helping to bring the suburban dream to those that urban renewal was beginning to displace, namely Chicago's African-American population.[27]

Perhaps not surprisingly then, the group never became too overly wide-eyed or utopian in its fight against urban decay. The SSPB clearly spelled out this realistic approach to urban renewal in an undated promotional brochure from the group. "The founders of the South Side Planning Board," according to the brochure, "have no illusions about their ability to create a Utopia on the Central South Side. Their goal is not that high." With perhaps the fear of appearing too communistic in their approaches to urban poverty, blight, and redevelopment, the SSPB adopted a brand of modern urban planning that – while eschewing some of the reformist, socialistic flair of early twentieth-century modernists – fit in nicely with the steely-eyed, postwar liberalism associated with Arthur Schlesinger, Jr. and his allies. Government clearly had a role in the group's endeavors, but it was always in tandem with the efforts of the private sector. At the same time, there was very little celebration of direct democracy or community involvement within the SSPB. The community-at-large could be consulted, but they were not seen as leaders within redevelopment projects. In fact, they were more often than not seen as impediments to redevelopment, uninformed individuals who had neither the training nor the capacity to fully grasp the details of the group's plans. Here, one sees shades of the more general relationship between postwar liberalism and "mass man," as detailed by such scholars as historian Gary Gerstle. It was often to experts – highly trained in specialized fields – to educate a public that knew little about the forces impacting their lives.[28]

To address all of these issues and concerns, the SSPB thought big – incredibly big. In the spring of 1947, the group began to work on what the press quickly dubbed the "50 year blueprint," a plan that, according to the *Chicago Tribune*, would demolish "thousands of dilapidated structures" and reestablish "communities and neighborhoods in accordance with modern planning standards."[29] Strikingly, such plans conformed remarkably well to the ideas of such modernists as van der Rohe, Hilberseimer, and Le Corbusier – and drew from the works of such sociologists as Louis Wirth, Frances E. Merrill, and Mabel A. Elliott. Yet what is perhaps most fascinating about the SSPB's efforts is how they began to equate modern urban planning with the philosophy and goals of liberalism. Building upon the realistic mindset detailed above, SSPB leaders thought that pluralism, racial equality, and a suburbanized urban landscape could all be achieved through modern urban planning, a strategy that exemplified the culture of expertise and relied highly upon the latest technological innovations. Here, at last, the group expressed their ideal vision of the urban public good.

In April 1947, SSPB member (and Director of Planning for Michael Reese Hospital) Reginald R. Isaacs drafted a document for the organization that saw the idea of the small, self-contained "neighborhood" as "a basis for social disorganization." The idea that schools, shopping centers, playgrounds, churches, and housing facilities should all

be within walking distance was inherently faulty. "The formula," insisted Isaacs, "appears very simple and is derived from janus-headed planners' nostalgic and sentimental view backward to the days before good transportation, communication, industrial development and growth of the large cities." To Isaacs, such a model was not based on the modern urban landscape, but rather on the "small colonial village," where there were "few differences of religion and none of race." For a liberal society concerned with pluralism and racial and ethnic equality, "'Neighborhoods' are a fine device and frame-work for the organization of covenants and deed restrictions against those whom the FHA terms 'inharmonious people.'" In fact, such small, tight-knit neighborhoods may have actually helped to breed intolerance, as "Many residential areas find their only bond is the fear of Negro infiltration."[30]

At the same time, such a "cellular concept of city structure tends to breed political disorder, dividing the city politically, and "discouraging 'at large' representation." Psychologically, such a set-up would discourage any sort of great vision or cosmopolitanism to develop. People would continue "to look introvertly inward to the relatively narrow confines of their 'neighborhood' and not to the purpose and well-being of the metropolitan area." To Isaacs, the ideal city would therefore be one in which "Residential areas would extend indefinitely without political or other divisions between people."[31]

Such a location could only come into existence through the development of "larger unbroken residential blocks with fewer traffic streets" The key to such a plan, according to Isaacs, was the creation of superblocks, city blocks that built up rather than out. "Rather then crowd the land with great numbers of monstrous detached houses," according to Isaacs,

> greater use is made of taller apartment structures providing the same or larger number of families with much more open space for recreation and amenity. Planners and subdividers now realize that increased densities are necessary in today's city and that they can be planned for with satisfactory relationships.[32]

Going even further than many modern urban planners, Isaacs went as far to suggest "dormitory areas" for elderly couples, childless couples, and single younger persons.[33]

As Isaacs implicitly made clear in his tract, there was a definite need for the planning expert in the creation of such ideal communities. Other SSPB publications echoed this need for expertise in modern urban planning. An undated SSPB pamphlet, for example, noted that "A definite need has, therefore, been created for specially trained people to make a specialty of relating the human or community factors to large scale physical construction." And, as such a quote also illustrates, the SSPB did not shy away from the idea of bigness. SSPB, as many of its promotional materials proudly proclaimed, was committed to "Building Whole Communities."[34] When pressed for details on what such whole communities might look like, the plans of the SSPB sounded like they based on the principles of CIAM-inspired modernist city planning. According to a preliminary draft of the group's South Side Redevelopment Report:

In order to protect the desirability of the residential buildings, the street pattern proposed will require all through traffic to by-pass the residential areas, being concentrated on thoroughfares roughly a half-mile apart. Within the super-blocks bounded by these thoroughfares, the residents will be able to supply many of their needs at convenient shops." [35]

Within this superblock, the report continued, a large community shopping center was to be placed at 35th Street and South Park Way, and a large community park was to be located north of 39th Street and west of South Park Way. Here were the ideas of Mies van der Rohe, Ludwig Hilberseimer, and Le Corbusier being adopted by a civic organization on the near south side of Chicago. The concept of the "neighborhood" – marked, according to the SSPB, by insularity, fragmentation, and unsafe street and traffic patterns – was to be replaced by a more holistic brand of community planning. The process of "Building Whole Communities" could only occur through an emphasis on the "Whole," rather than the pieces (i.e. small neighborhoods) that make up the urban fabric. It was within the large-scale superblock that city dwellers would finally find a workable community. [36]

The SSPB also toed the modernist line on the issue of urban housing. A SSPB document on residential planning, for example, saw "Multi-Family Dwellings (Apartments)" as "particularly satisfying." High-rise buildings were seen as exemplary, because such structures could leave the urban core "relatively free of congestion and with more open space and thus many of the amenities people are seeking." This was necessary not only for the good of the area, but also because such a solution "requires that there be sufficient space to adequately compete with suburban areas." This notion that the urban must begin to take on the perceived benefits of the suburban became a critical component of the plans of the SSPB. The group believed in the statement that the "essential need provided by a home as a place of refuge and isolation from noise and tension from tempo of urban life," while numerous SSPB documents stressed that the need "privacy" trumped almost all other concerns in the planning of urban housing. These were the "Psychological Needs" that the congested, unplanned city simply could not address. [37]

And how would one get around in such an environment? To SSPB, like many modern urban planners, the answer was new highways. Such highways would help solve the problem of urban "congestion," which was often seen as directly leading to urban blight. [38] The SSPB advocated the construction of the South Expressway, which involved the destruction of a large area of housing due west of IIT's campus, and called for State Street to become something of a dividing line within the neighborhood. On October 27, 1947, the SSPB "reported the recommendation that the South Expressway location now set by the City Council action, just west of State Street, be approved at its original location as initially recommended by the Chicago Plan Commission with the endorsement of the Department of Subways and Superhighways, just west of and parallel to the Pennsylvania Railroad." [39]

Members of SSPB were clearly aware of the racial implications of such highway construction. Referencing the above-mentioned October 27th meeting, Wilford G. Winholtz, in a letter to V.E. Gunlock, commissioner of the Department of Subways and Superhighways, wrote:

> As far as I have been able to determine, the main reason for placement of the existing approved location is that certain interests west of the Penn. R.R. wanted the 'race barrier' at State Street rather than so close to Halsted Street. And for obvious reasons I did not mention this matter in the meeting.

Winholtz realized that this "present location has value in helping clear slum land," but also noted to Gunlock that it removed many acres of residential land within "the Negro community which is tightly hemmed in by restrictive covenants, and thus places land available for Negro residential use at a much higher premium."[40] The expressway would go on to be described as a road that helped strengthen – in literal concrete – "the neighborhood's traditional racial boundary." The SSPB was clearly attuned to issues of racial discrimination (and one could even argue they tried to take steps that they thought would alleviate such discrimination), but redevelopment trumped all other concerns at this moment in American urban history.[41]

It should therefore come as no surprise that the SSPB displayed very little interest in preserving the history of the central south side. To many within the SSPB, the conditions that marked the central south side revealed the fact that "cities have not been planned (needless to add 'on a sound base.') Cities 'just grew' into the congested hodge-podge that exists today."[42] Such a thoroughly negative view of the history of the city (along with a tremendous faith in a progressive understanding of physical and social change), made the issue of blight a black and white one for the organization. SSPB's brand of modern urban planning saw very little worth saving among the historic buildings that dotted the south side. To them, there was no hope for the renovation or rehabilitation of the structures that they saw as contributing to the decay of their neighborhood. The only solution on the table was demolition and redevelopment.

One begins to see evidence of this position in a draft of a statement that Wilford G. Winholtz was to make at the City Council Planning Committee's Public Hearing, January 26, 1950. Winholtz was clearly upset that the Chicago Plan Commission had recently reported that

> taking cognizance of the special characteristics that apply to the area bounded by Harrison Street, Halsted Street, Roosevelt Road, and Ashland Avenue and of the initiative of its citizens; recommends that the subject area no longer be designated as blight, but be reclassified with certain exemptions as a proper area for rehabilitation of existing structures.[43]

To Winholtz, such a decision went against the objective standards of modern urban planning. "Such re-classification," argued Winholtz, "cannot be done as a matter of arbitrary decision, but must be based upon objective factual data similar to the

procedure used in evaluating the conditions which resulted in the blighted area classification." Winholtz was incredibly concerned that the idea of preserving or rehabilitating buildings might come to override all designated blighted areas, or, as he put it, "the suggestion of 'rehabilitation' might be so construed as to defeat the City's slum clearance program completely." What was needed was a fresh start based upon objective social science, not a nostalgic mindset that attempted to save outmoded and blighted structures. Any new understanding of the urban public good could not be grounded in the past.[44]

Based on such a strategy, it is not surprising that the group's efforts were often met with resistance by predominantly African-American community members. But the group did try to build a working relationship with such individuals. Spaeth and Isaacs – acting as technical consultants to the SSPB's Executive Committee – attempted to assess exactly why the community was not supporting the nascent group in a March 1948 memorandum. Interestingly, the two saw the problem as resting almost solely on the shoulders of the SSPB: they were not doing enough to educate the public on the group's mission. According to the two men, the SSPB must always maintain leadership on such issues, with community members limited to making up the rank-and-file of renewal projects. One key element of their "Community Action" plan called for the SSPB to "Assume leadership in coordinating activities of all organizations in the area, and act as spokesman for the community in planning, housing, redevelopment and civic matters." Direct democracy is thwarted as the community must allow the SSPB to speak for them. More to the point, the SSPB firmly believed that African-American leaders should cede all neighborhood power to them, the experts on matters of modern urban planning. The memorandum drafted by Spaeth and Isaacs concluded with the observation that "Organization is underway for a federation of some 1500 Negro organizations for planning action." Rather than welcome such potential allies, the two authors can only write that "This, too, is unfortunate for the SSPB. Our program calls for SSPB to coordinate all such activities and act as spokesmen. To lose this leadership will greatly weaken SSPB's position." Such a statement sums up perfectly the postwar liberal response to matters of race, urban planning, and urban renewal. When it came to efforts to define the urban public good, there was little room for voices outside of the SSPB. [45]

As the 1950s became the 1960s, individuals such as Spaeth began to see those within the surrounding community not only as nuisances or as individuals in need of leadership on matters of urban planning, but as outright threats to their development agenda – a crucial turning point in both the history of postwar liberalism and postwar urban planning. The expert, once seemingly motivated by a desire to educate and help the community-at-large, had now become the cynic. In a March 1968 letter, Spaeth, now the Vice President and Treasurer at IIT, told IIT officials and faculty members that a new line of defense was going up to secure the residents of the IIT Apartments. "For added protection," Spaeth wrote, "and to provide added security for residents, the solid fence barrier along 31st Street and Michigan Avenue will be extended on Michigan Avenue from 31st Street to 32nd Street." To Spaeth, this "barrier" would serve to give "added protection against infiltration of undesirables." Such a position would have tremendous

repercussions for the SSPB, IIT, the city of Chicago, and indeed numerous cities across the United States. By the late 1960s, the city' African-American population had begun to voice their displeasure with the organization's attempts to remake the city, and had also begun to articulate competing visions of the ideal urban public good. Unable to see such voices as little more than threats to their ideas and programs, the SSPB – as well as liberal advocates of urban renewal across the country – could not constructively respond to such critiques. It was this silence that effectively sealed the fate of both a certain brand of modernism and political liberalism in the United States. The urban landscape – politically and physically – would never be the same again, as a new vision of the ideal urban public good, one that turned its back on such concepts as superblocks, high-rise housing, and embraced mixed-use planning, began to slowly emerge.[46]

Pre-democratizing the city

Maria Prieto
University of Navarre, Spain
Center on Organizational Innovation-Columbia University, United States

Almost invisible for the scholarship on Cold War architecture, yet controversial, AZCA is a radical demonstration of the public-private urban management in driving Spain toward the European Common Market. In fact, projected as a commercial center and built as a financial hub, AZCA played the most decisive modernization of Spain in last century.

The architectural innovations, which made that complex succeed in socio-technical achievements, were managed by still unknown intelligences and modes of collaboration, in co-evolution with other European interventions, here presented as a three-fold picture:

1. The re-institution of modern architecture

How to interpret the "modernizing values" of that architecture, projected first by architect urbanist Antonio Perpiñá and, after, in collaboration with other architects and engineers, and Franquist officials? Distinct devices of innovation will be examined to draw the mental models that made possible a modern definition of the practice of architecture in Spain.

2. The re-organization of urban management

How to register the "urban values" managed by architects, engineers, proprietaries, and official authorities? The role of all who addressed the urbanization AZCA as the first laboratory of the first Land Law in Spain (1956) will be analyzed to what extent their activity was integrated as a socio-technical system in the practice of modern architecture and urban planning.

3. The re-invention of transnational city

Which geopolitical concerns led the detection of "transnational values" planned by Spain and the Western Block before its definitive Europeization? In line with a synchronization of equivalences and incompatibilities between Manhattan's financial district and other European urban models, AZCA will be explored as a interdisciplinar paradigm of industrialization for a European city.

To decipher the intellectual machinery of AZCA's architecture, throughout the key points highlighted above, distinct principles of evaluation are displayed. In addition, multifarious techniques are analyzed to be re-enacted as still effective modes for contemporary urban and architectural transformation. In conclusion, providing a firm definition of the organizational complex of AZCA will make its multifaceted architecture

a substantial contribution to the historiography of modern architecture during the Cold War.

1. The re-institution of modern architecture

The Iron Curtain reoriented international interest toward Spain in the framework of a global control plan. The Americanization of Spain was a direct result of the internal agreements of the General Assembly of the United Nations in 1947. As opposed to other allied countries favored by the Marshall Plan, the end of the autarchy in Spain meant recognizing the zero degree of architecture and technology toward the capitalist race. The authorities and architects were involved in diplomatic relations that were crucial. An urban development project inspired by an already extended Western plan of city (re)generation opened the possibility of putting Madrid on the map. Shortly after the *Pacto de Madrid*[1] and the *Ley Castellana*,[2] the Government promoted on June 16, 1954 a national design competition for the urban layout of the Shopping Center of Madrid,[3] on the axis of the then called *Avenida del Generalísimo*, the reference point for the center of power and the chimera of Great Madrid.

The design competition for the Madrid shopping center was situated in an area that had been pre-designated since the 1929-1931 Zuazo-Jansen project and reworked in the 1941-1946 Bidagor Plan as the most important shopping center in the country.[4] Winner Perpiñá's project in 1954 competition signified a critical shift in the understanding and practice of urban planning and architecture in the capital (Fig. 1).

The advance of the project for Madrid's second center —that depended on the Technical Office of the *Comisaría de la Ordenación Urbana de Madrid*— obliged him to move from Barcelona to Madrid in 1956.[5] Thereafter, he modified and extended the project planning (approved on July 10, 1957) whose development pressed the preparation of a judicial framework to efficiently resolve the urban problems of Madrid.

The Commission for the Metropolitan Area of Madrid approved on July 21, 1965 the Urban Plan for the shopping center, known as 'AZCA' since 1964.[6] The Ministry of Housing prepared an exhibition of the plan that did not only overcome the collective indifference at the official showing of the projects from the 1954 competition. This initiated a key precedent in Spain concerning the display of communicative techniques of architecture and urban planning and the architecture of information space, with an, until then, unthinkable interest in stimulating civic participation.

The public presentation of Madrid shopping center was set up in the Exco agency (Construction Information Permanent Exhibition) of the Ministry of Housing, at the South corner of Nuevos Ministerios with Castellana and San Juan de la Cruz Square. Local press announced the event months in advance.[7] Undoubtedly it was important to attract public interest when facing the most challenging and innovative urban project in Spain's capital. The authorities called the press conference on Tuesday April 26, 1966. The Vice President of the Government, the Minister of Housing, the Minister of Government, the Undersecretary and the General Directors of the Ministry of Housing, the General

Director of Fine Arts, the General Director of Domestic Policy and the Government Delegate for the Metropolitan Area of Madrid opened the exhibition at 1pm on Wednesday. On Thursday over two hundred guests, from stores, real estate agencies, banks, businesses, etc., celebrated their turn with snacks, croquettes, ham, shrimps, Spanish omelet, pasties, sweets, wine, Pepsi-Cola, cocktails, gin and tonic, champagne, Scottish and Spanish whisky.[8] General admission was on Friday.

The press visit served as a presentation of event objectives. Reports, releases and announcements used a lot of information from the urbanist Emilio Larrodera and the economist José Ramón Lasuén. They chose concepts which would entailed the center advantages and at same time interested the public: "Urban development Olympiad," "nerve center of the active life of 1975 Madrid," "Madrid 2000," "small autonomous city," "great nucleus of decongestion," "modern *agora* or forum," "pole of attraction," "island for pedestrians," "true center of collective contact [with] the advantages of the most advanced civilization of our time." Those slogans were intended to spread an unusual message: to seduce the masses as partners and investors towards the materialization of that 'mini-Manhattan'[9] to modernize Madrid.

From the majority of newspapers —being already liberated perhaps from the press law of March 18, 1966—, a certain anticipation was encouraged to know about the architecture that would build the city. The media produced articles to announce (and denounce) the different instances of the urban plan. A journalist of *Diario de la Noche* declared[10]: "[I] just witnessed the premiere of an exceptional exhibition. I don't know whose the idea is, it is almost not necessary to know, because now it is time for the idea to lead, the technical execution and everyone's contribution will be simply forgotten once we have the whole. The sum of the parts, the exhibition for the shopping center on the Avenida del Generalísimo, is the best, the most surprising and original exhibition than has been achieved up to now by any exhibition technique on any theme, at less as far as I know." That quick neutralization of the merits of the project appears that it was a common intention although not expressed by the press, affected by the easy elitism of the display, yet suspicious in view of the facing the also easy speculative abuse in the regulation of the plot.[11]

The winner of the 1954 competition for the Madrid shopping center and responsible for its urban layout since 1957, the architect and urban planner Antonio Perpiñá, collected press clippings[12] on a hundred and seven sheets of Galgo paper for two key dates for the publicity of the center during the years 1966-1977: the exhibition in 1966 (press assembly, official inauguration and public information) and the first official visit in 1969. An episode in the history of architecture and urbanism in Spain collected in newspapers as *Informacio*nes, *El Alcázar*, *Diario Madrid*, *Arriba*, *Ya*, *Pueblo*, *ABC*, *Revista SP* y *Hoja del Lunes*. Looking through the press clippings on the exhibition —ordered from more recent to older news—, only two references mention the architect as the author of the 1954 shopping center project and they do not even connect him to the subsequent phases of the planning of AZCA: in *ABC* and *El Alcázar*.[13] On the other hand, Antonio Perpiñá wasn't the person who planned the AZCA exhibition, but architect Javier Feduchi,[14] in collaboration with the audiovisual producer Enrique de las Casas and

other technical staff. Even so, Antonio Perpiñá, responsible for project planning, and Javier Feduchi, for the exhibition, both imagined a public demonstration that expanded the spatial, temporal and conventional limits of architecture, urban planning and media: the democratization of the contents of the plan and the Manhattanization of Madrid.

2. The re-organization of urban management

The Master Plan of Madrid finally legalized the shopping center's plot in 1963 and the regulation for its urbanization in 1964. Azca was defined as a 204,330 square meters rectangular area, attached to Castellana's axis from Nuevos Ministerios to Santiago Bernabeu stadium, and surrounded by Orense, Raimundo Fernández Villaverde and General Perón streets.

The March Foundation proposed to promote an Opera Theater in the middle of the new block to the authorities. Due to the complexity of the network of investors and owners, AZCA was set-up to coordinate the private and public interests of the new complex[15].

AZCA acted under the control of the Ministry of Housing through the Planning and Coordination Commission of the Metropolitan Area of Madrid (COPLACO). The Statutes of the association studied the development of a compensation system by means of a very new land distribution —which real estate company VACESA conceived and AZCA agreed as a land value points system (PVS, "puntos-valor-suelo")[16] (Fig. 2).

Perpiñá developed the plan with modifications derived from the speculative pressures that altered the equilibrium of the volumes of the original project. The project for the center entered into a process of commoditization, a phenomenon whose peak in Spain was not before the '60s, when the middle class grew (as much independent as salaried) and a new elite linked to finance was incorporated within the dominant class.[17] The modernization of the production systems, the financial investment and the propagation of the American myth of an increasingly more accessible middle class through the mass media ads led to the implementation of an alien American consumerism[18] (whose effect continued up until today's "wholesale commoditization of the environment"[19]).

The Spanish policy of economic development[20] (1964-1969) struck the materialization of the complex changing modern architecture from 'socialist' to 'capitalist'. While the '50s plan combined modern architecture (Sert) and Nordic architecture with organic spaces (Aalto, Baldrich), the ´60s plan calculated capitalist architecture (Belluschi) with commercial spaces (Gruen). As if it were a Fordist remodeling, some of those who advertised the Madrid shopping center as the most profitable business in the city were at the same time transformed into advantaged consumers/shareholders by knowing first-hand the capitalization mechanisms (in spite of the public information of any legal, fiscal, financial or urban news through the official bulletins.) As a result, the city's image was shaped by the authorities and investors (municipality, real estate agencies, banks…) under the desire of pursuing a modernization paradigm before the other countries, mutating the shopping center into an investment center.

That shift from CIAM 8's humanist urbanism to the spectacular corporate urbanism of steel and glass office skyscrapers (Manhattanization) linked the new plan with the implementation of Viennese architect Victor Gruen's commercial architecture, 'inventor' of the American shopping mall, which he had pushed for since 1954 with a tour on the theme *Shopping Centers of Tomorrow*.[21]

3. The re-invention of transnational city

The AZCA exhibition was projected not only to exhibit a 'futuristic' urban intervention, but also to inform on both an image of progress and a publicity technique: first, the representation of an urban center of Madrid 2000,[22] and second, the demonstration of its plan through diverse technical displays and media formats with the latest technological advances. With a treatment that precedes the Venturi's diagnostic of architecture mutated into an electronic board,[23] the catalogue of the exhibition was reproduced with a view of the plan's model, veiled by an intense blue color (as if it were night) with volumes contrasted in phosphoric color simulating the electric lighting from the interior. The visual effects of the model were carefully studied to favor its exact propagation through a printed publication that (re)presented AZCA in a pocket format. AZCA's exhibition pamphlet could be unfolded to discover the exhibition route distributed in six rooms separated three by three to exit at the same point. Each room contained devices with very advanced exhibition and audiovisual techniques.

Urban information was shown on six rows of screens creating slightly concave arches that involve the spectator. Each group exposed a theme organized by matrix, graphics and maps: the evolution of Madrid; the antecedents of the shopping center; the place for the center; the projection of Madrid-Region; the center; and the demand for areas in the center. The futuristic disposition of the urban development data responded to a certain evolution in the information techniques for architecture and urban planning. The purpose of informing all visitors about the present and the future of Madrid obliged Feduchi to adapt the contents with efficacy to legible formats. The arguments had to be simple and attractive so that everyone understood them. To facilitate public reception three-dimensional graphics were utilized and enforced with light and sound. The sensationalist techniques were adjusted specifically to each viewfinder according to the theme assigned.

The representation of the shopping center plan through a model with audiovisual effects was definitely the claim of the exhibition. It was placed in the center of the fourth room, on a base, freeing space on one side to see the silhouette of the assembly in contrast with the rest of the city. From two angles of the room some 200-150cm screens were suspended, on which movies and slides were projected at the same time as variable effects of light in the interior of the prototype were activated manually by two technicians.

The spatiotemporal concept of the model-spectacle had been planned in few months: "An adequate montage of movie, sound and lighting of the model and a voice in off with precise dialogue, will explain the life of the Center during twenty-four hours, to give the

visitor a quite exact impression of the day that commences in the early hours in which services work to prepare the activities; the shops, large stores, offices, hotels, restaurants are opened and operating. Vehicles come and go; in the afternoon entertainments are encouraged, one attends a performance in the Opera Theater, and the Center's life slows down until a new day."[24] The projections synchronize with the instructions of the recorded voice.[25] They introduced the urban development of modern Madrid and immediately coincided with the visual techniques of the model during the description of the shopping center.

Several phases explained the 20 minute spectacle[26] (a third of the estimated duration for a visit to the exhibition[27]). A script contained the points by which the presenter reproduced the memory of the project, indicating first the model and describing its placing, its function as a capital status and as a communications center, the introduction of the Opera Palace, etc. Afterwards the voice in off, a dialogue among various actors was initiated who discovered the center's 24 hour life. Some lateral instantaneous images supported the script of the complex with interior views of the center, whose coordinates were indicated at the same time on the model with a score of lights.

The attraction seemed real. Material and lights defined the spaces that would adjust the diverse activities of the shopping center: colored plastic on office facades, hotels and recreations; wood in flat roofs, sidewalks and open spaces; synthetic material in green areas; and fabric in streets with lines of light underneath in movement simulating the traffic flow. The merit of that system was the assembling of some very new techniques of architecture representation (additionally with a very powerful referential charge linked to the utopian image of Madrid), with a synchronic montage of image and sound that extended spectator perception into a personal experience felt as 'lived', despite its 'virtual' presentation. Perpiñá, Feduchi, and de las Casas considered this cognitive simulation as an efficient form of reception.

The impact of the new demonstration also affected civil servants, as a newspaper reported on the day of their visit: "Guided by the authors of the project, they visited the different dependencies that form this Exhibition, stopping particularly at the 'loudspeaker' model, at which they showed great interest. Mister Muñoz Grandes said that this Shopping Center presents an image of the future Madrid we all desire."[28] Among the buildings of the center the 150 meter height and more than 40 stories central tall building stand out —a tower like that of the Le Corbusier's skyscraper at Cap de la Marine (1938), Boston Back Bay Center (1953), Pirelli Tower (1956), and Pan Am building (1963) — which newspaper *Ya* compared in height with the New York UN headquarters (1950)[29]: "We can assure that it will be as tall as the building of the General Office of the Secretary of the United Nations, in New York; above all, with more stories, and that furthermore its perspective resembles in general that of New York." Six buildings of lesser height accompanied the tower, between 30-35 stories, grouped in the South; and one isolated in the North, with a row of buildings ordering the front of Orense Street. These buildings contained dwellings, hotels, apartments, offices, entertainment venues, and large stores. The Opera Theater was adjusted to a volume similar to the solution of the winner Polish team of the International Competition of Ideas in 1963.[30]

Finally a heliport was also assigned to the center, a railway junction (RENFE) and an airline terminal (IBERIA).[31]

Perpiñá published the document for the Partial Plan of the shopping center in an offprint of the magazine *Arquitectura* in April 1966 (n. 88): "The shopping center is not intended merely for locating business space and offices, but that these give the corresponding atmosphere for a series of community activities." In this way, the model was designed as a public exposition that simultaneously exposed the public to some 'civic' virtual effects. Likewise, it served also as a common laboratory for modes of perception to stimulate open formulations about the viability of the shopping center.

In the sixth room the movie "Madrid futuro" was shown. The scriptwriter Enrique de las Casas reproduced a movie dealing with aspects of the shopping center that could respond to the possible visitor concerns about "the convenience and necessity of the new Center,"[32] whose projection was synchronized with images of other commercial centers (from the Perpiñá's slides selection). *ABC* commented[33]: "Finally, we pass to a projection room with a brief but admirable movie, in which the ability and humor of its author, Mr. Enrique Casas, succeed in making an urban theme fun, which represents a true literary success." The tape consisted of a five minute documentary of two sequences that showed the possibilities of the shopping center to engage public attention: the first one, on 'Animation' (a preparatory setting with funny evocations of city's origin), and the second, on 'Real Image'[34] (an explanatory performance with examples of commercial centers). The movie revealed Madrid's recent progress through the presentation of various characters.[35] In parallel to the realization of this audiovisual display advertising trailers of the shopping center were carried out.[36]

International technology progress reached its climax in 1964-65 at New York World's Fair, where advances of the 'information age' were exhibited in telecommunications and data processing. Antonio Perpiñá took advantage of a field trip with the technical team of Galerías Preciados[37] from 8 to 24 October 1964, to the US to see the most important shopping centers in the country. He also went to Chicago and New York, where he possibly visited or followed the news on the exposition. There presented IBM a multimedia show, 'the machine of information', which was attended by three million visitors in total during the event. It began by raising 500 people on a platform up to the interior of an ellipsoidal form theater, designed by Eero Saarinen. Once inside, an assembly of fourteen projectors and nine screens, carried out by Charles Eames, explained in fifteen minutes the processing of information in the brain comparing it with that of the computer, from the obtaining of impressions, passing through the classification of data and arriving at a global interpretation to establish a specific mode of operation. The Fair also displayed the 'city of the future' (Futurama II),[38] a visionary illuminated model developed from the 1939 New York World's Fair, which represented the metropolis as a center of commerce, culture and communications with airports, railways, industrial parks and services around it (Fig. 3). The knowledge of the spatial brain-machine and of the model for the city of the future could be key transfers in the socio-technological focus of information presentation for AZCA.

The message of the show was to persuade Madrileños and Spanish citizens of the necessity for a shopping center to modernize Madrid and, also, Spain. The timing of the exhibition (from April 26 to June 15) promised a large crowd as predicted by one journalist in *Informaciones*[39]: "As the project enters the public information phase tomorrow it will be open to the public for the current month, which means that as many people will visit as a result of the San Isidro Festival as people with genuine interest. The event should let visitors know both the present and the future of Spain's capital." With some expectation the exhibition pamphlet was distributed with two gray colored suggestion cards for the new shopping center. One was darker with the title "We seek a name"[40] and a serial number in the top left corner to identify the holder for the purposes of a name competition. The other card was lighter with the title "You can help us" followed by five questions that encouraged the proposal of ideas next to their personal data on the back. The print run exceeded 10,000 copies. The media impact of the exhibition inspired a literary competition for articles written during that month.

The exhibition of AZCA's plan produced an architecture with democratizing effects, which we could call 'multimedia' and 'pluriparticipative'. We call this architecture multimedia because of both the publicity images of its architecture in diverse broadcast channels (press, NO-DO, TV…) and the multiple innovative forms of communication of its architecture within certain futuristic, space-age information environments (multisensorial cabins, synchronized audio-visualizations, multiscreening of film and slide-show…). And pluriparticipative because of both the display of public information (a sensorial-intellectual evolving experience) and the integration of citizens' interests in the project as a 'public thing' (suggestion box, naming competition, press competition). The use of those techniques advanced a phenomenon that surprises the current (re)presentation of architecture: an extreme simulacra of contents with democratizing effects, of technical and scientific[41] dominion, which precipitated an unexpected form of collaborative organization that made civil servants, experts and citizens, 'equally' interact with consultations, suggestions, appointments, competitions.

The exhibition was managed as a contemporarily bound experience whose contents are to be understood by the public as an invitation for self-modernization, for "the development of modern subjectivity."[42] In fact, the exhibition introduced a brief participatory democracy in the imagining of Madrid's future, although the private investment of capital dominated ultimately.

Also, that urban development arose in the context of the Cold War and functioned during the policy of Spain's economic acceleration with a view to entering the European Economic Community (in June 1970 the Preferential Agreement Between Spain and the EEC was signed).

Conclusion

AZCA's exhibition implied a unique citizen experience in a specific moment for the progress of urban culture in Madrid. The regime organized an event of exceptional urban signification, which at the same time served as an exception mechanism to

capture the attention of the most entrepreneurs, and lately to improve the relations with Europe. Either control pretext or power jactitation, the exhibition included a space with new European airs.

What instead could have constrained the transmission of that public demonstration until today? Paradoxically, the reception could not be realized without the public/private campaign for a modern citizenship. The mode of the exhibit's diffusion contains cultural and ideological mechanisms that suspend a city between late Franquism and before democracy. Even though, can one meet the limits of democratic fiction?

Notes

[1] The economic-military agreements between the US and Spain were signed at the *Palacio de Santa Cruz* in Madrid on September 26, 1953. The Pact favored the US in its anticommunist fight and the Spanish government in the recognition of the regime. The US considered the recognition of the dictatorship as a lesser evil in comparison with the urgency of consolidating the Atlantic block. Spain could do no more than accept American defense bases in exchange for economic and military support for ten years. The concession of American credit obliged it to take part in the US contention strategy against the USSR. The economic policy of the state attended the progress of Spain and at the same time exposed it as a potential target for the USSR. The US Embassy in Madrid (1950-55) was planned by Lelan V. King and Ernst Warlon, and directed by architect Mariano Garrigues. That building formed part of an ambitious world project of embassies of international style connected with an American international control plan. Situated in Serrano Street, its architecture inspired the promotion of free-standing blocks in Castellana Promenade.

[2] On December 3, 1953, *Ley Castellana* would be approved, an urban development mechanism that promoted (through some fiscal benefits originating from the Law of Expansion and Extension of July 26, 1892, and of Restructuring and Interior Improvement of March 18, 1895, i.e. exemption for 20 years from the excess of the urban contribution of real rights with respect to newly constructed buildings) the urbanization of several areas in Madrid: La Castellana, El Calero, La Estrella, La Pionera, La Florida, Puerta de Hierro, General Mola's expansion, Francia's road, etc. *Ley Castellana* was the immediate precedent of the Land Law of May 12, 1956.

[3] The competition announcement was published on June 25, 1954 in the *State's Official Bulletin*, n. 176. That opportunity (and an exceptional case of power relations between civil servants and architects) had as the jury Julián Laguna (General Commissioner for Madrid's Urban Planning), Gaspar Blein (Director of Urban Planning of Madrid's City Hall), Diego de Reina (representing Madrid's City Hall at the Commissary), Secundino Zuazo (named by the competitors) and Pedro Bidagor (Director of the Technical Office of the *Comisaría de la Ordenación Urbana de Madrid*). Meeting from 6 to 15 December, 1954, they concluded on December 16. The architectural magazines published the result of the minutes. *Gran Madrid* (*Comisaría*'s news bulletin) dedicated a whole forty-six page issue to the competition with the seventeen participating projects and a summary of homologous models of international shopping centers (1955, n. 28); the *Revista Nacional de Arquitectura (RNA)* documented Perpiña's project in five pages, preceding the two second prizes projects (May 1955, n. 161); *Cuadernos de Arquitectura*, surpassed this last publication, showing more detailed images and plans of the winning project and a more detached text from the official description (June 1955, n. 22); *Arquitectura* (Cuba), published five pages, three of them only images, and looser text although with a last paragraph taken from the jury's minutes (April 1956).

The special plans for the historic parts of cities. Public planning with private development. Two Galician examples: Compostela and Coruna

Xosé S. Allegue Fernández

Luis W. Muñoz Fontenla
Universidad de La Coruña, Spain

1. Objectives

Our report seeks to contribute to the Conference's debate with our experience of private developments in public planning in the historic parts of two large Galician cities, Compostela and Coruña.

In addition, we make an assessment of the political, cultural and town planning initiatives of the specific legislation that resulted from these initiatives and a method by which to address its development and management. Lastly, we evaluate the specific achievements designed and carried out under the protection of this normative framework.

2. The Galician context

An approximation of the current situation related to urban and rural rehabilitation in Galicia would be almost impossible to understand unless an effort is made to visualise the previously evolutionary context of the ideas and theories for rehabilitation fundamental within the undergoing projects; something which would also be necessary when contemplating the political and legal content wherein the gradual progress and, at times, inevitable setbacks were produced.

The incipient theoretical contributions related to urban rehabilitation (as yet, far from an official evaluation as with rural heritage or a territorial concept) were re-initiated in post-war Spain (1940). This was an undertaking based on the cultural and illustrated principles stipulated by the *National Artistic Heritage Act of 1933*. This act was instituted in order to pursue the conservation of cultural and historical landmarks from a restorative perspective.

The *National Artistic Heritage Act of 1933*, lacking a specific urban plan, was in fact the only measure undertaken for the preservation of national heritage until the passage of the current *Act for Land Preservation of 1956*. This Act proposed "special plans" as a tool and gives competence to the individual city councils.

The approval in 1985 of the *Spanish Historical Heritage Act* was passed in parallel while the first special plans mentioned above were written. There was a conflict in that the new Act of 1985 also created strict conditions for the special plans. Furthermore, the

special plans come from the *Act for Land Preservation of 1976* (a reformation of the Act of 1956), which also implemented the criteria of the previously developed Act of 1956. However, influenced by succeeding international charters and recommendations, a more urban vision was progressively established. This urban vision covered problems of deterioration of a historical city within the global dynamics involved in the city's growth. This vision joined the planning of the historical city itself with the land on which it was located, thus abandoning the previous model which was exclusive to the physical recuperation of environments and buildings.

The coming of democracy (General Elections in 1977 and the Constitution of 1978) led to the first democratically elected city councils instituted with the 1979 municipal elections. Autonomous Institutions were established in Galicia in 1982 and the Spanish State was converted into a "pseudo-federal" State. Under this new formation of the State, the historical regions progressively took over the responsibility of regulations which were previously directed from the Central Government (including Housing and Heritage). All of this created an atmosphere of great expectations with respect to the recuperation of our historic cities.

The reformed text of the *Act for Land Preservation of 1976* offered a means by it was possible, basically through planning at a municipal or local level, to ride the winds of radical change arising in the early seventies. These changes related to urban uses in a greater number of European countries whose previous chief objective in the creation of new cities had now been abandoned to focus on the maintenance and the regeneration of the existing cities. This was a change of purpose, without a doubt, consequent of the international economic crisis of 1973. However, it also resulted from painful establishment of disasters caused by indiscriminate and speculative urban development in the 1950´s and 1960´s. Such an intense urban growth had given way to degradation in urban planning and architecture not only in Spanish cities, and other European cities, in general, but also in Spanish urban life and Galician cities.

The same abandonment of the traditional nuclei and villages occurred together with the massive migration of the population along with people from the so-called historic nucleus to the outer limits of the cities. This resulted in a parallel process of deterioration both in the countryside and in historical cities with respect to the national heritage buildings, socio-economical depression and the aging of the population.
The analysis of the new conditions made many of the European theorists of critical thought, of sociology, and those involved in a more progressive urban ideology, set track on a far more austere philosophy and attitude relating to the city and the territory[1]. This was an austere and democratic concept of the worth of a city which acclaimed the maintenance, not only of the physical structures, but also of the social tissue and functions of historical cities, together with the rightful use of the fixed capital administered by each city. That is to say, the rightful administration of existing resources (i.e. empty buildings considered national heritage, public space, railway networks, services, transports, etc.) which allowed savings in public investment (i.e. costs for maintenance and urbanization of the city, larger amount of necessary equipment, etc.).

This process was intended to reduce indiscriminate expansion and also to lower social travelling expenses of home-work-leisure, thus taking in hand a means of control over the use of private transport. This also avoided the discrimination towards historical nuclei and outskirts and reduced the dangers of aggression caused to natural environments peripheral to the cities.

This situation also makes evident the definitive crisis shown in the thesis of indefinite growth of European cities. This was the end of a cycle which was initiated at the beginning of the nineteenth century when the industrial revolution provoked overcrowding in cities of medieval history as well as pre-existent modern cities. Finally, in the mid-seventies, favoured by the political atmosphere, the younger generations of Spanish town planners and local administrations themselves become aware, through European theoretical references and paradigmatic examples of the rest of the continent and particularly that of the Italian city of Bologna[2], that the problem of urban rehabilitation necessary for the re-equilibrium of a city needs to be taken in hand with the disciplinary field of Urbanism. It also needs to be taken in hand with the means disposable for that planning, confronting the recuperation of historic centres with a regional and municipal plan.

This situation gave interesting results in the Spanish experiences related to urban recuperation throughout the 1970´s and 1980´s (i.e. Gerona, Vitoria, Pamplona, Barcelona, etc.)[3], experiences which later influenced the projects in Galicia in a very determined way.

However, first let us try to understand the situation in Galicia with respect to the growth in urban life, population mobility and the territorial development from the moment in which the politics of recuperation of National Heritage buildings was set underway together with a control over the growth and expansion of cities. It is worth noting here that there was a great deal of delay in Galicia in urban restoration - practically 10 years in relation to the rest of Spain and 20 years in relation to the experiences of the rest of Europe.

Galicia has one of the lowest rates of population growth in Europe. Approximately 114,000 citizens, or 4.6% of the population, were lost between the years 1981 and 2001. At present, the population of Galicia is of 2,764,000 inhabitants (100,000 less than the city of Chicago) spread out in 315 municipal areas charged with public urban planning, where no less than 31,874 population nuclei are distributed around the Galician territory of 29,574 km2 (a fifth the size of the state of Illinois). Only two cities (Coruña and Vigo) have almost 300,000 inhabitants. Santiago, the capital of Galicia, has 95,000 inhabitants. Nearly 200 councils have less than 5,000 inhabitants[4].
In Galicia there are 315 municipalities of which: 94 belong to the province of La Coruña, 67 to the province of Lugo, 92 to that of Orense, and 62 in Pontevedra. Of these 315 municipalities, it is foreseen that almost 100 (mostly in inland Galicia) will lose half their population in about 10 years, in what has already become the greatest demographic crisis of Galician society in the whole of its history. This is a complete redistribution of the system of population settlement as a consequence of a new economic order. The

visible symptoms of this process have manifested themselves in the desertion of the interior, involving numerous villages and thousands of hamlets. This has brought about a marked territorial unbalancing, mostly due to the majority of people migrating to the Atlantic coast near the axis of the highway joining Ferrol with Tui. This area accounts for a margin of hardly 15% of the total surface of Galicia, but which gathers almost 70% of the population. 47% of the Galician population live in the 7 most important towns and cities in our weakened system of urban development, with the population coming from rural areas to crowd around the peripheral urban territories[5].

The start of this situation had been clearly evaluated within the *Territorial Director Plan of Coordination of 1976*, a document drafted by the regional administration, in itself the only attempt until the present moment to propose a territorial order in Galicia. However, this plan was not enough to cut back on the economic and demographic dynamics. An apparently contradictory factor related to these population movements was the construction of 240,000 individual family homes in the rural territory of Galicia. These were all built in the third part of the 20th century[6], a tough aggression on the land. Moreover, if we are to keep in mind the exodus of the population, this supposed abandonment was of an even larger number of houses situated in traditional population centers.

At the same time, within areas of strictly urban character, there was a new surging of the cities' central areas which lead to the loss of privileged positions for historic centres. The tertiary processes (i.e. a rapidly progressive growth of the service sector) were all being added, as well as an absence of a cultural attitude to maintenance, among other structural factors, resulting in a loss, and aging, of the population in the historic towns. Furthermore, this was looked upon officially as irrelevant, together with a progressive impairing of the living conditions in national heritage housing.

The situation in municipal Galicia was improved with the work of the first democratic city councils with a wide, generally permissive and evolutionary planning, in parallel with the scale of planning and territorial dynamics.

In effect, the uncontrolled growth of the cities have left the historic tissues and expansions of Galician cities socially degraded from an architectural and urban point of view. Rather, it has favoured a fragmentary expansion with areas suited exclusively to urban functionalism. In fact, the historical towns and centres of Galician cities continue to lose population (which specialises more and more in the service sector and then leave) while the peripheral areas continue to grow in a defused and fragmentary manner. Thus, facing grave inertias that continue to unbalance our urban and territorial system, we pose the following question related to the procedures we are to pursue for the recuperation of our historical cities:

> Can the initiatives undertaken for rehabilitation remain unaffected by the imbalances within the urban and territorial dynamics and achieve functionality for the complete recuperation of the historic cities?

The answer to this question should serve to consolidate the issues concerning the preservation of our historic cities and urban nuclei and will only be achieved with an adequate intervention of all the levels of planning and development, both with respect to territory and housing.

3. The *special plans* for the protection and interior reform of the historic parts of cities in urban planning. Two case studies (input) with two results (output).

In this section we will explain what this form of planning means, its relationship to the rest of the development planning and with the tools from the Galician urban planning legislation. (*Act 15 of 2004 and modification of Act 9 in 2002, the order for urban development and protection of the rural environment of Galicia*).

The figures for planning as stated in Galician legislation are divided into instruments of arrangement and development planning. The instruments of arrangement are bound to a hierarchical order of guidelines as well as to other instruments. The instrument for the fundamental arrangement is the *General Plan for Municipal Arrangement* -local development framework- *(Plan General de Ordenación Municipal –PGOM-)*, an urban instrument of integrated arrangement and authority of the Councils. In those municipalities that do not have a PGOM, the arrangements for urban areas are undertaken through *Subsidiary and Complementary Rules for Planning.*

The figures for development planning are basically the *Partial Plans* and *Special Plans.* These plans are able to modify the detailed planning established by the PGOM under specific conditions.

The partial plans follow the objective of regulating urbanization and construction on grounds for urbanising, developing the general plan through a detailed arrangement of a sector. In those municipalities without general planning, partial plans will also be approved for the developing of sectors of grounds for urbanising, limited by subsidiary and complementary planning norms.

The purposes of the special plans are: 1. The development of the estimated contents of the general plans for municipal arrangement, special plans will be approved and suggestions admitted with the aim of protecting singular environments, to undertake operations of interior reform, to coordinate the execution of urban facilities, to protect, rehabilitate and improve the countryside or other projects which are determined under regulations. 2. In the absence of a municipal general planning, or when a general planning does not entail adequate detailed stipulations, special planning will be approved exclusively with an aim of protecting singular environments, rehabilitate and improve the countryside and establish infrastructures and basic urban utilities, as long as these determinations require a previous definition of a territorial model.

We shall now analyse the quoted Special Plans, both within the scale of intermediary cities, which in our opinion represent emblematic examples of success and failure:

- Firstly we will deal with the *Special Plan for Conservation and Rehabilitation of the Historic City of Santiago de Compostela.* An exemplary plan when broaching the items to analyse, worthy of diagnosis and architectural proposals suited to a city which is a Heritage of Humanity.

- In the second place we have the *Special Plan for Protection and Interior Reform (PEPRI) of the Old Quarter and the Old Fishermen`s Area of Coruña.* The plan for a city which is head of a metropolitan area of a large population situated on the Atlantic Axis which, in our opinion, does not attain to the minimum requisites to a Planning document with such ambitious objectives.

3.1. Compostela

The most interesting and practical example of urban rehabilitation in Galicia was undertaken in Santiago de Compostela based on a Special Plan with rigorous documentation, keeping to the aforementioned stipulations. The exemplary character of the initial considerations and as a forerunner in Galicia, Santiago deserves an analysis of its successes and failures.

The creation of the Consortium of the City of Santiago in 1992, an inter-administrative entity legally covered by the *Act 7/1985*, which regulates the basis for the local regime, gathers economic resources for the City´s promotion. These are awarded through the central administration (65%), from the autonomous administration (30%) and from the municipal administration (5%).

We now have a political environment with more stability than the City Council and ample financial capacity. This change was requested by the Council itself in 1994 (two years prior to the definitive approval of the Special Plan and four years after the beginning of public debates entailing the first proposals). There are public technical offices with excellent facilities and there are financial resources which add to those from the State and Autonomous Planning. For the first time, Galicia witnessed a joint venture of political involvement, technical means and financial capacity.

This department is responsible for all public charges concerning the policies for rehabilitation proposed from the Plan. It is basically supported in three ways: Subsidies for personal refurbishment of homes, the restoration of monuments, and intervention for re-urbanisation in historic public spaces.

The historic city of Santiago (18,000 inhabitants and 6,700 homes in 2,800 buildings) is currently in a far better situation than other historic cities in Galicia and the rest of Spain. Even before the start of the said politics and in accordance with the Special Plan diagnosis there were streets exclusively for pedestrians and an average occupancy of homes of 86%. Only 10% of homes are in poor condition and 38% in an acceptable state, with a remarkable social and functional diversity[7]. This together with outstanding commercial activity has helped the maintenance of its central position to be favoured and, in time, this has led to the attraction of a sector of the population to live in the

historic part of the city, a movement which has become fashionable with certain cultural and liberal elites.

The head office of the Consortium works to create a joint awareness in the citizens, the technicians and the commercial companies. Throughout the initial years of the Project, no less than two hundred interventions take place annually, mostly of a light character, such as small repairs, maintenance operations, etc., with a very low rate of genuine refurbishment work. These figures gradually lowered and, to date, the economic contributions from the Consortium have disappeared. The refurbishment initiative is currently more or less managed by laws of the real estate market, i.e. private initiative without further assistance.

Over the years, it has been demonstrated that the steps taken in Compostela resulted in a wasted opportunity. The refurbishment policies in Santiago ran into the same errors as their main theoretical mentors of 25 years earlier – the same problems as had occurred in other Spanish cities whose process had begun 15 years prior to Santiago's revitalization program. Unfortunately, the Plan itself was based on experiences and theoretical cases in other European countries in the 1970´s, which were in no sense reviewed or updated.

The Plan´s schemes had been typical, formal and formed with excessive bylaws. This approach denied the stance suggested by one of its theorist fathers, Josef Paul Kleihues, with his proposal of a critical reconstruction. Kleihues himself, who criticised a historic reconstruction, maintained that "in comparison with the reductive theory of Rossi, which underlines the traditional component" critical reconstruction is "more open and also more given to experiment"[8].

Despite the methodological planning, the management of refurbishment through the office was, perhaps, too high-handed in decision making, focusing more on superficial determination than on practical conclusions and, ultimately, unheeding to more plural opinions. The interpretation formed was hyper-restrictive with respect to the norms, with a demeaning attitude towards the entrepreneurs of the sector. It rejected any collaboration from professionals in architecture, as they rejected the wishes of citizens and owners in deciding how they would prefer to live. All in all, this finally gave way to a loss of support from professional people and of the citizens' trust. In other words, there was no point of agreement with the private sector.

On the other hand, there was no public refurbishment to speak of which considered the social politics for housing in the historic part of the city. Under the pressures of speculation, the dynamics of growth could not be otherwise. Nor were there any control mechanisms for capital gains produced, which made rents and prices shoot up and the market imposed its laws. As there was no effective control over uses or activities of tourism, the historical city continued to be service oriented in an undesired way by as the traditional commerce gradually disappeared. Furthermore, within the scope organised by the Special Plan, the population continued to decrease in the rest of the city.

There was finally a clear connection between the physical recovery and refurbishment of buildings. This was the only issue in which the results were undeniable. However, the result renounced a comprehensive vision and turned the refurbishment of a country house into an end in itself and not into a means for obtaining higher goals.

The new situation disassociated in a definitive way the refurbishment from other social, cultural and economic factors with regard to the rest of the city and territory: An alarming contrast with the initial objectives of the Plan.

It is possible that this happened due to structural factors and because, from the department of urban development, a fragmentary functional specialisation was permitted. Finally, the department may have overlooked an exhaustive urban design which considered both the urban and territorial realities.

One particular urban and territorial reality plunged the planning for Santiago into a contradiction which had not been resolved by the General Plan. Santiago more than exceeded demographic expectations and competed with bordering municipalities. It proposed an immense amount of ground space suitable for urbanisation and the construction of thousands of homes. This followed a physically and functionally fragmentary extensive model of growth, and a Special Plan which required, and therefore demanded, the compact city and limited growth, as well as the final completion of the city.

3.2. Coruña

From the rigidity in application and management of a good Plan in Compostela we now turn to a laxity in application of a mediocre text in Coruña.

The *Special Plan for Protection and Interior Reform (PEPRI) of the Old Quarter and Old Fishermen`s Area of Coruña* was approved towards the end of 1998, coinciding with the definitive approbation of the General Plan for Municipal Arrangement (PGOM). The PEPRI was drafted by "PROINTEC consulting engineers", a consulting company for engineering projects set in Madrid and the same who drafted the PGOM. They appeared to lack the necessary qualifications to enter into a debate necessary for the development of a document of such importance for the future of the city. PROINTEC was an aseptic firm based too far away to be able to establish a program which can cover all the coarser local interests. But the most damaging part was the absence of political guidelines to give an idea of the atmosphere surrounding the development of the project.

The contents in the PEPRI at first sight could be seen as complete considering its length, but the document has turned out, as we will show, inefficient. After from the introduction and the historic insertion, the Plan becomes progressively weaker due to scarce urban information and this continues in the document until a decree for the construction, the management and the execution of the work. It follows with a fragmentary diagnosis of the urban problems in the area, and contains objectives and

suggestions such as follows: "The PGOM, suggests a triple strategy on urban soil: Finish, Improvement and Conservation… The Special Plan, besides developing this strategy from a prolonged study, now considers the actualization of the historic town"[9]. With this terminology, so related to the world of fashion, one could have deep concerns. The catalogue, which should in fact be the milestone of the document, is left to lie in a corner at the end, and in which only a tremendously poor relation of buildings, spaces and urban elements is taken into consideration. From the graphic documentation of the Plan, the drafts, we can specify that they cover catalogue, management and order floor plans at a scale of 1/2,000 and the elevations at a scale 1/500 where, in practice, a disastrous order of volume is established.

The field for the PEPRI covers the urban byways of the Old Quarter and Old Fishermen`s Area enlarged with the borders which are in need of a greater definition and urban aggregation as stipulated in the *Delimitation of the Historic Artistic Whole of Coruña (1984)*. An extension of almost 100 hectares with a set population with decreasing tendency (13,506 inhabitants in 1997, 12,958 in 2000 and 12,747 in 2003). There has been no significant public act related to the Plan, except for a few dispensable cosmetic interventions. It was left to ruin (private interests took advantage of the situation to "free themselves" from edifications). Eventually, an elite sector of the economic and political world purchased the buildings with a superior position. This was followed by the rehabilitation of many of them. The Plan allows for this and at present the circumstance of deterioration due to the "actualization" seems unstoppable.

In the Old Quarter and Old Fishermen`s Area of Coruña only two buildings designed by the architect Manuel Gallego remain as a paradigm of intervention. The Museum of the Arts situated in the old grounds of the convent of the Capuchinas Sisters and the small Museum of the Colegiata de Santa María, forming part of the beautiful medieval temple. Needless to say that both interventions, completed prior to the approval of the Plan, would not be possible today. These isolated examples are exceptions within the general mess of things.

The most significant conclusion we can gather from all the matters surveyed is that the PEPRI for the Old Quarter and Old Fishermen`s Area of Coruña is, in practice, after almost 10 years of application, a true instrument of destruction for that part of the city. This city within the city would have been in better conservation with the *General Plan of Urban Arrangement of 1985*. That is to say, its protection was more effective when there was no specific plan for its particular protection. This is very hard to take. And we can prove this fact by taking a look at the mess that resulted since its approval in 1998. Two singular spots in the Old Quarter which are (were) the squares Plaza de las Bárbaras and Plaza de San Nicolás, (urban spaces under protection by the PEPRI) have been seriously damaged, if not ruined, in the midst of the enforcement of the PEPRI.
We round off with the recent and awesome criticism on behalf of the prestigious architect Manuel Gallego, concerning the PEPRI for Coruña: "The Old Quarter ("city") is less and less a city and it is less and less old".

4. Public and private. Guidance and involvement

All public instruments for planning run the risk of being managed with an excessively rigid and orderly vision, which could destroy everything positive that could be contributed in aiding the future of a historic city by serious planning, private initiative and professionals of architecture. What characterises a Special Plan is the will to express a political standpoint on the soil, where a variety of departments are to go into debate on the future of the city. The lack of more complex urban proposals, of coordination in development and the necessary procedures on the part of the different public administration departments, as well as a lack of private initiative, can weaken and reduce the efficiency of the planning or even produce undesirable effects in the development of Historic Cities, progressively letting them fall into a state of deterioration which would affect the permeability with respect of the rest of the city.

We could recap from this point of view, that the process undertaken in Santiago was excessively weighted in a public sense, undermining the value of the contributions from the private sectors (architect, firms, property, owners). This is the opposite of what took place in Coruña, where there was an absence of public instruments for control and management. This unfortunate occurrence added to the conceptual weakness of the planning document which then gave way to an uncontrolled and aggressive action of private initiatives.

5. Conclusions

The gestation of a policy of intervention in a historic city starts with the conception of the 'city model' by its planners. In fact, political willingness is the first condition for a plan to be written with adequate criteria. However, this is not enough. The choice of the team members for the very composition of the document is to be studied in depth. The elected team will have an immense responsibility to ascertain a precise diagnosis and undergo proposals which may solve its process. This is all within an organism complex in its dialectic reality as a historic city.

But this would still not be sufficient. If we obtain approval of a plan, not easy by any means, we must then pass the definitive test: the management. In addition to this, the sources of public financing of the many political proposals from a plan can easily altered, cancelling its possibilities of management.

Considering all these aspects, we can understand the reasons for the success of the Compostela model and the failure of the one for La Coruña. In La Coruña, its mayor never had a city model. The destruction has been allowed as the inevitable cost of the neo liberalism in the urban exploitation of the city. Private initiative gains with a "socialist" mayor, backed by election results on six occasions, provided all the facilities necessary to turn the city into a perfect paradise for building speculation.

Thus, the recuperation of its historic city, as a part of a necessary sustained development of the city and as a cultural Project of conservation of its historic heritage

disappeared from political interest. The historic city becomes, as shown by the cornice line which determines the increase of volume allowed within the Plan, a tool for obtaining economic appreciations. A kind of "hen with golden eggs" which the irresponsible, but conscious, municipal permissiveness allows to be killed in an off-hand way. Furthermore, all values of heritage will have been destroyed, which supposes an unforgivable historic mistake which should be paid for by those politicians responsible. It is also grave to find a lack of civic culture from a citizen society which allows such deterioration of its cultural inheritance, its heritage and, naturally, on their quality of living and that of their children. This has occurred in a city which has a School of Architecture and the largest delegation of the Official Architects Association of Galicia – neither have made a difference in the process.

The example of Santiago de Compostela was very different. Its mayor, Xerardo Estévez, advised by an excellent multi-skilled team, initiated the resolution of the problems of the historic part of the city with a clear model of sustainability. It was clear from the beginning that the major problems could be resolved from the general planning approach.

The Plan generated an educated debate. In this public debate there were the architects who drafted the Plan as well as a long list of those who contributed to it, including Kleihues, Grassi, Hejduk, Lampugnani, Moneo, Siza, Gallego, Viaplana, and Isozaki. Almost all the architects named have made architectural contributions in Compostela, including the posthumous work of the genius North American architect John Hejduk. However, the public management of the rehabilitation did not obtain, as we have seen, the same positive results nor interest as in the original onset.

To conclude, we would like to underline two events of urban accomplishments currently underway in these two cities of great relevance, which will affect the development of their Historic Centres. In Santiago, the construction of the "City of Culture" (http://www.cidadedacultura.es), a project by Peter Eisenman. This is a considerable cultural infrastructure with no foreseeable use at present. And in Coruña, there is currently the construction of an exterior port which allows a clearing in the current uses of the present port area, which includes transporting of oil derivatives to the oil refinery, thus "recuperating it" for the city[10]. This circumstance has brought about the commission for a *Plan for the Port* which is being inserted into the revision of the General Plan for Municipal Arrangement (PGOM), both drafted by Joan Busquets (http://www.bau-barcelona.com). What we consider to be of more importance than the Plan for the Port and the revision of the PGOM, where the former is being inserted, is the abolition of the PEPRI and the commissioning of a new Special Plan with an atmosphere of a wider participation, open to qualified external opinions, treated in depth in a cultural debate. It is quite likely that we are seeking the impossible knowing the players as we do, but we just have to try.

Urban segregation: a theoretical approach

Lucia Maria Machado Bógus
Pontifical Catholic University of Sao Paulo, Brazil

Introduction

Social-spatial segregation has been one of the most studied issues within the area of urban studies for nearly one century.

The word segregation itself has to do with the idea of the separation of certain social groups within the space of societies. It can be considered as a consequence or manifestation of social relations that are established and based on social structure, stratification, rules and conduct codes in place then. In fact, spatial segregation expresses a larger concentration of a social group in a certain city area.

As regards residential segregation, the possibility of having access to land in different places and at different prices also has to be considered.

At first, the term 'segregation' may seem to refer to a self-explanatory phenomenon that requires no definition, for the social division of territory has existed in all cities and villages since remote times in history. A more careful look, however, allows us to note that every social division of space expresses forms of segregation and that the use of this term as a concept depends on the theory adopted to explain the phenomenon.

This paper intends to present the main theoretical approaches regarding urban segregation. It also aims at highlighting the importance of studying the spatial segregation process in order to understand social-inequality manifestations in the city areas. Thus showing how intimately related both processes are.

This reflection has been led by some questions:

- What are the main theoretical contributions to segregation studies?
- Can residential segregation be regarded as a "proxy" of social structure?
- What are the consequences of residential segregation in city areas?
- Can segregation be measured?
- What are the main methods for studying segregation?

In the past hundred years, reflections about segregation have been influenced by different theoretical assumptions including those of:

- The sociology of the School of Chicago, in the first decades of the 20th century (Park & Burgess, 1925).

- Urban Marxist Sociology in the 1960's and 1970's (Castells, 1972; Lojkine, 1972 and Harvey,1973).

- The most recent approach anchored on the paradigm of Global Cities, whose major characteristic is social and spatial duality (Sassen, 1991; Marcuse, 1989; Sabatini, 2006 and Ribeiro, 2003).

I - The very first studies

In the early 20th century, the social analysis of space was developed by the so called "School of Chicago" and was based especially on the studies by Robert Park and Ernest Burgess who worked on the assumption of social ecology to explain the distribution of the population across cities.

The key idea was that there were "natural areas" where homogeneous communities emerged, with their own systems of values and specific symbolic relationships. According to Park (1926) these "natural areas" were found in every American city of a "certain size". This ecological model was supposed to reflect the major characteristic of cities, which were organized in concentric circles occupied by administrative, commercial, industrial and residential activities.

 In addition to that, the existence of an "urban way of life" (Wirth, 1928) was believed to be the result of this spatial morphology which allowed the identification of the communities that inhabited the city, making up neighborhood units with mutual help and social relationship networks based on reciprocity.

As regards the underlying theoretical paradigm, the idea of concentration of "natural areas" takes us to Durkheim's concepts of Community and Society, sociability forms and social division of work (Durkheim, 1960). Based on such concepts, segregation is understood as the specific location of a certain social group relative to others. Spatial distance is then regarded as an expression of social distance.

Individuals therefore are thought to group according to racial, ethnic affinities and social position as a means to protect themselves from the fragmenting effects of the individualization brought about by living in cities. In this sense, residential segregation is believed to be the product of individual logics, that is, the effect of individual choices (Park, 1926).

II - The Marxist debate and its influence on recent analyses

According to a different conception inspired by Marxist Sociology, segregation is the expression of social inequalities within the territory of cities, and reflects the unequal appropriation of land, goods and services by different social classes. (Lojkine,1979)

Residential segregation is therefore thought to have characteristics that are specific to capitalist societies. It is also thought to be the result of the social struggle, which in turn accounts for the unequal appropriation of the territory, consumer goods, and housing in its different forms.

Whereas neo-classical thinking considers the individual abilities and choices as the determining factors for the occupation of certain locations within city territories (Richardson, 1977), urban Marxist sociology emphasizes the role of the State as one of the social agents that contributes the most to urban structuring.

Marxist authors propose that the State should not be considered as a mere agent that acts on technical grounds, but one whose actions are guided by ideological imperatives.

Based on this current of thought, the State plays a key role in the social division of space in cities. At times the State is identified as a ruling-class interests representative, and analyses are also carried out where the State appears as an arena where the class struggles take place and where capitalist society contradictions are reproduced (Castells, 1977, Lojkine, 1979, Harvey 1989).

More recent analyses refer to the impact of globalization on cities and the increase in residential segregation. Three mechanisms are frequently regarded as the causes of the phenomenon (Sassen,1991;1994)

- *Dissemination of liberal ideas* throughout the planet caused by globalization which has prompted changes in urban policy regulatory model and contributed to the liberalization of the land market.

- *Real Estate prices* that have become one of the most important mechanisms to distribute and determine the residential venues within the city territory. Thus reinforcing the importance of income inequalities as concerns the appropriation of urban space (M. Smolka, 1992 & 2002).

- *Privatization of urban services* which increases inequality in access to public services and collective equipment, especially as regards the quality of such services.

All these factors are believed to contribute to social dualization, which is an effect of the production restructuring and transformations brought about in the urban space.

Moreover, recent studies on segregation and social-spatial inequality take into account the fact that spatial transformation in large cities has different origins, and varies according to the social and historical matrix of each country which implies the need to further reflect on the issue.

According to Sabatini (2006) "residential segregation consists of a spatial relation: territorial separation or proximity between persons and families that belong to the same social group, whatever its definition may be".Therefore, although residential segregation is related to income and social differences, and may influence them - increasing or reducing inequalities by enabling contact between different social groups - the concept refers to a phenomenon with an essentially spatial nature.

It is also worth noting the difference between geographic (spatial) segregation and sociological segregation. There are cases where there may be a greater level of sociological segregation and a lesser level of geographical segregation (White, 1983). In regard to this, two paradigmatic examples may be mentioned: the cast system in India and the coexistence of different social classes in the Brazilian coast cities, whose beaches are considered democratic leisure spaces. Besides that, the proximity between *favelas* (shanty towns) and high-income neighborhoods (such as luxury gated communities and condos) in many Latin American and Brazilian cities, are good examples of situations that combine physical proximity and social distance (Marcuse,1989; Ribeiro,2003 ;Pasternak & Bógus, 2003).

III -The residential segregation as a "proxy" of social structure

A very important aspect in analyses on segregation has to do with the formation of spaces with a high degree of social homogeneity both in rich and upscale areas and in run down areas with a large concentration of poor people. The formation of these areas fosters the emergence of subjective perception forms about highly segregated places of residency (Sabatini; Sierralta,2006)

These perceptions may be positive, in terms of the prestige that some exclusive areas attach to their inhabitants and/or usual frequenters, and negative, in the case of degraded urban areas which are marked by a certain "malignancy" that stigmatizes their inhabitants.

The run down neighborhoods are found in most contemporary capitalist cities, and, as is the case of many North American cities, may have characteristics of a de facto ghetto, with ethnic tones, as stated by Wilson (1978) in his studies about the issue.

In the case of low prestige segregated areas, social exclusion is also considered by many authors as a phenomenon that is closely linked with residential segregation. In those areas the occurrence of various processes related to urban poverty (e.g. unemployment, low income, illiteracy),feed each other creating a vicious cycle that is difficult to break.(Katzman,1999).

In the run down inner metropolitan Brazilian areas, as in their peripheral zones, unemployment rates as well as family disintegration, drug consumption and criminality have rocketed mainly among young people. Two sets of factors may be mentioned as accountable for this situation in the last thirty years:

- *Changes regarding production restructuring and increased competitiveness among markets as a result of the globalization mechanisms.* These changes caused the elimination of jobs, the dismantling of the social security protection system, the extinction of collective work contracts and the increase of informal labor (Sassen,1994)

- *Factors related with conditions of class.* In several Brazilian metropolises-mainly in the São Paulo Metropolitan Region - inner urban areas and peripheral zones which are strongly marked by the traits of exclusion, have overlapping needs. The

outcome of this is that only the low-income -class families tend to remain in the degraded inner city areas in a segregation process centered basically on poverty(Bógus and Pasternak,1999).

Segregation takes the form of spatial and social isolation due to the distance from territories that are well equipped in terms of urban services and cultural equipment. Higher levels of family disintegration and social disqualification were also pointed out by Castel (1995) and Paugam (1991) for European cities.

This attests to the reach of globalization harmful consequences as social exclusion is reproduced in a similar manner in different nations, thus bringing about new forms of segregation in the space of cities.

IV- Social-Spacial Segregation as an Operative Concept

It is vital to consider the need of improving efforts to fully understand the segregation scope concept and its explanatory power, as well as the reach and the limits of residential segregation as an operative concept. In this sense, time length, process nature and territorial dimension of the phenomena must be taken into account.

Whether in European, North American or Latin American contexts, unequal and/or polarized access to society's opportunity structure within cities reinforces and is in turn reinforced by the spatial segregation of different social groups.

Segregation then produces two types of consequences:

- Creates opportunities in city's elite areas;
- Blocks opportunities of access in areas that are more vulnerable to poverty and social exclusion.

According to Katzman (1999) the "neighborhood effect" (which grows stronger as spatial segregation grows) may increase or block opportunities of work, employment and access to formal education, thus fostering or blocking social mobility. Such effect is applicable both to elite and poor areas.

The studies on residential segregation help us understand the social-spatial processes that account for the structuring of cities and the mechanisms that produce interaction and sociability among different groups and social classes.

In such context, it is essential to consider the importance of territory-related urban policies. They allow cities to fight against the mechanisms that produce urban residential segregation and/or minimize its effects. The policies enhance social blending in cities increasing access to urban services, thus reducing socio-spatial inequalities (Torres e Marques, 2004).

V- Scales, measures and typologies to analyze spatial segregation:

Some remarks are to be made concerning the scales of spatial segregation and the ways used to its measurement. In Social Sciences the procedures to measure the unequal distribution of social groups across the space of cities have been discussed by geographers, urban planners, sociologists and economists.

As of the mid 20th century, many studies proposed a series of residential segregation quantitative indicators. Among these, we may highlight those on *dissimilarity indexes* (Duncan and Duncan,1955) and on *exposure indexes* (Massey, Denton,1988).

According to Sabatini (2006), the degree of concentration and territorial dispersion of different social groups and the greater or lesser social homogeneity of each city area (considered by him as the two "objective dimensions" of segregation), have been studied in its most by means of indexes that refer to the composition, per group, of city residents.

The primary statistical methods used to measure are the above mentioned indexes of dissimilarity (which reflects the spatial concentration of a group) and exposure (which measure the degree of social isolation of the group).

The limitations and the explanatory power of these two statistical methods are discussed in depth by Sabatini (2006:174-190). In addition to case studies of a qualitative nature that can allow the capture of segregation "subjective dimensions", the author highlights the importance of conducting empirical quantitative work that can contribute to improve measurement techniques.

Quantitative analyses with the employment of statistical techniques and methods were developed, at first, in the studies on factor ecology in the United States (Rhein, 1994). In France, the first of such papers was published in the early 1970's, and among the more recently studies N. Tabard (1993) and E. Preteceille (1992) are especially worthy to be mentioned.

Preteceille (2004:16) also made an important contribution when he pointed out a disadvantage of using these indexes: the fact that they can hardly be used to tell whether there is more segregation in one city than in another one, an issue that becomes even harder to be resolved when comparing cities in different countries.

A widely used approach nowadays is the typological approach. It allows the grouping of spatial units studied in "types", "classes" or "clusters" which are defined according to the similarity of distribution profiles of different social categories that are present in each of the social units considered (Sposati,2000; Preteceille,2004).

With the use of factor analyses, these typological studies can capture the social-spatial structure in its complexity, thus overcoming the consideration of binary oppositions between the categories of dissimilarity analyses.

Not only do these studies consider the social-spatial structures in their complexity as a proxy of the social structure, but also define types of spaces that can be analyzed according to several dimensions and in a longitudinal fashion. However, the major advantage of such studies is the possibility of analyzing changes in social-spatial segregation patterns in time and in the different contexts compared, considering the incidence of conjunctural phenomena, including the effects of public policies (Preteceille e Ribeiro,1999).

In the case of Brazil, the use of this methodology allowed the development of a networked research – led by Ribeiro since 1998- in order to compare the behavior of segregation and its patterns in the main metropolitan regions during the last 25 years (Ribeiro,2005). In this study, the variables selected to compose the typology were: income, schooling and occupation of residents of areas and cities studied. Once combined, these variables made up an index: *the social-occupational category.*

 The homogeneous areas were built based on factor analyses. The use of the same data source (the demographic censuses) and the same methodology guarantee the comparability of the studies among metropolises. Quantitative data are also supplemented by qualitative analyses allowing to capture the "subjective" dimension of spatial segregation by means of case studies (Ribeiro, 2005, Preteceille and Ribeiro, 1999).

Regarding São Paulo Metropolitan Region, the use of this methodology has inspired and enabled the work of Pasternak and Bógus (1999;2001;2007), that has followed the process of social spatial segregation up throughout the last 25 years. This study came to be added to other empirical studies led by Sposati, (2000),Sposati and Koga,(2003) linking the segregation processes to different forms of social exclusion observed in Brazilian cities since the 1980's, as a result of social economical changes.

The group of these recent studies using the geo-processing have enabled the mapping of variables referred to urban poverty, showing thus the areas where segregation occurs the most.

Final remarks

To conclude, it is worth highlighting that even when the studies on social-spatial segregation are based on different theoretical frameworks they invariably point out to the negative consequences of the social groups' involuntary isolation in certain spaces within cities whatever the cause of such type of isolation.

Even in the case of voluntary isolation of high-income groups in residential gated communities the disadvantages may be related to the restrictions imposed to forms of sociability frequently restricted to intramural areas (Caldeira, 2000) or to adjoining areas as a defense reaction against what has been gaining ground in third world cities: violent sociability

A deep knowledge of spatial segregation and its manifestations in cities is a crucial tool to enhance public policies designed to fight the expansion of spatial segregation and the related social-spatial processes.

The State, through its multiple forms of action, interferes in the mechanisms of space production, whether through the expansion of the public services network, private enterprises support, or specific legislation concerning land-use and occupation. This promotes the increased value of certain areas and/or the devaluation of others, bringing about consequences for the resident population, and interfering also on the segregation generator mechanisms.

Canberra and the winds of change. Can the city remain a city not like any other?

Ken Taylor
The Australian National University, Australia

Part 1 Past Visions

Background: figures in the landscape

The year 1908 when the privately produced Burnham and Bennett plan for Chicago was produced was also momentous in Australian town planning history. It was in November of that year that the Australian federal government's Seat of Government Act saw the Yass-Canberra district finally designated as the location for the new federal capital of Australia. A New South Wales surveyor, Charles Scrivener, was given the task of recommending a specific site in November with the instruction that

> … the Federal Capital should be a beautiful city, occupying a commanding position, with extensive views and embracing distinctive features which will lend themselves to the evolution of a design worthy of the object, not only for the present but for all time; consequently the potentialities of the site will demand most careful consideration from an hygienic standpoint, with a view to securing picturesqueness, and also with the object of beautification and expansion.[1]

On 25 February, 1909, Charles Scrivener recommended, even though by no means ideal, that 'A city could be located at Canberra that would be visible on approach for many miles … The capital would probably lie in an amphitheatre of hills with an outlook towards the north and north-east, well sheltered from westerly winds … I regard the Canberra site as the best that can be obtained … being prominently situated and yet sheltered, while facilities are afforded for storing water for ornamental purposes at a reasonable cost.'[2]

Scrivener's recommendation was endorsed. His reference to an ornamental water body met one of the recommendations of the first conference on city planning held in Australia, the 1901 'Congress of Engineers, Architects, Surveyors, and Others Interested in the Building of the Federal Capital of Australia.'[3] This event was in the same year – 1901 – as the act of federation was passed (1 January, 1901) when the modern nation of Australia was formed. The congress coincided its meeting in Melbourne with the sitting of the first federal parliament.

The Congress posited that site selection of the capital was a matter for professional and aesthetic judgement through a commission. Harrison indicates that it also proposed that the commission, in its site selection, should take into account the need for 'abundant Water Supply ... For creation of artificial lakes, maintenance of public gardens, fountains etc.'[4] Looking out over the magnificent setting of modern Canberra, the far-sightedness and wisdom of this view are apparent (**Figures 1/2**).

From the outset therefore the concept of a federal capital, choice of site, and initial planning of Canberra from the 1911 international design competition were seen as a public undertaking. At the beginning of the process there were public finances for the competition to decide on a winning design and the intention of a federal public body to oversee development. The public were even invited to submit suggestions for naming the city.[5] Public planning has therefore been a cornerstone of Canberra's development from the start. Not least it established and maintained the fundamental priority of the concept of the setting of the city as a city in the landscape[6] through various successive federal agencies and visionary planning professionals following the initial Griffin plan. These include people like Charles Weston who came to Canberra in 1911 and worked there until 1926. John Sulman who assumed planning control of the city with the Federal Capital Advisory Committee (1921-1925) when Griffin resigned. John Butters and the Federal Capital Commission (1925-1930) then continued the early city development planning. After an interregnum of nearly twenty five years came the advisory work of William Holford followed by the National Capital Development Commission (NCDC). The Commission was responsible 1957-1988 for the remarkable thirty year period of development of the city when figures like John Overall, Tony Powell, Richard Clough guided the city's path.

The advent of self government for Canberra in 1988 saw the period of overall federal (Commonwealth) control of the city's development abolished with the exception of national areas and designated areas under a national agency (formerly the National Capital Planning Authority, now the National Capital Authority (NCA)) to formulate and administer the National Capital Plan. For the remainder of the city – that is the major extent – The ACT (Australian Capital Territory) government has been and remains responsible for land-use planning through its planning agency and the Territory Plan. Central to the planning aims of the federal and ACT plans has been the expression fundamentally of the landscape as the major foundation for the city's character. Most recently (2008) the NCA has had its federal budget cut (A$1.69 million out of a total of A$20), but more alarmingly has had to shed 33 of its 89 staff,[7] with planning staff decimated to just 4 staff and 500 applications now in a backlog.[8]

City in the landscape ethos

From its inception in the nineteenth century, and before the Walter Burley Griffin entry won the 1911 international competition for the city's design, the concept and ideal of an Australian federal capital envisaged a city in the landscape. This set in train the foundation for Canberra as a remarkable city. In the true sense of the word it is a unique city, for there is no other city like it in the world. Walter Burley Griffin declared in 1912 that he had planned a city not like any other city. These were prophetic words, for its development over the years has maintained its status of being unlike any other. Why is this? There are roads, houses, offices, schools, shops, parks – all the components we associate with urban development – as in any other city.

The underlying reason lies in the way landscape defines and articulates the city morphology starting with the Griffin plan. Changes over the years to the form of the city and hence to the Griffin ideal have taken place. Nevertheless the landscape basis which binds form and content remains vividly coherent in the city plan. The form of the physical landscape – natural and created – is a palpable, tangible presence defining the city; but equally so is its content or intangible, symbolic meaning. Places like Zurich or Kyoto are similar in the way landscape open space surrounds and penetrates the city, but not to the comprehensively planned extent or with the same founding visions as Canberra.

Underlying the city's spatial structure is the fundamental premise of Canberra as a city in the landscape. Its spatial structure has been progressively and incrementally planned from the beginning to maintain continuity with existing design elements, in particular the hills, ridges, and valleys.[9]

From the symbolic heart of the city and the nation in the National Triangle (**Figure 1**) with its serene symmetrical beauty, out through the tree-lined streets, neighbourhood and district parks and open spaces to the hills, ridges, and valleys – the National Capital Open Space System (NCOSS) – it is the landscape nature of the city that predominates physically. In turn this tangible physical presence has inextricable, intangible meanings and values, confirming that landscape is not just what we see, but as Cosgrove suggests, it is

… a way of seeing that has its own history, but a history that can be understood only as part of a wider history of economy and society; that has its own assumptions and consequences, but assumptions and consequences whose origins and implications extend well beyond the use and perception of land; that has its own techniques of expression, but techniques shared with other areas of cultural practice. [10]

When you look out over the magnificent prospect from Mount Ainslie or from Parliament House (**Figures 1 and 2**) across the city to the surrounding hills that form the embracing backdrop for the city, or enjoy the tree-lined streets, gardens, and parks of the suburbs (**Figure 3**) the landscape itself is more than physical elements. It has a meaning and significance that inform what Canberra is.

Consideration of these special aspects of the city is critical for Canberra as national capital and as home for 330,000 people. How will the city expand in the future and house a growing population whilst respecting its landscape image? What is the future for the national areas, for the parkland around Lake Burley Griffin, for the NCOSS without which Canberra would be like any other city and which gives it a special sense of place? What is the role for private enterprise and its increasingly heard voice and stress on market mechanisms?

Even before the site was chosen, landscape imagery and associated sense of Australianness drove the enthusiasm and resolution for the country to have a federal capital. It has formed a potent symbolic role in planning hitherto, but is now seemingly

of lesser significance within the mindset of private development where national standard planning guidelines are preferred. There has been a move to have a planning system that gives consistency across the eight planning jurisdictions (states and territories) across Australia in terms of development application tracks.[11] But there is also the planning orthodoxy that similar approaches across the board to residential design guidelines for urban areas are advisable. These in particular relate to increased densities, urban infill, urban consolidation and reduction in residential block sizes. One rationale for this is the ubiquitous reference to sustainable development, although what is meant by sustainable is left vague. Therefore, on the understanding that 'You can't have a future without a past'[12] it seems important to me that we have a firm perspective of where we have come from and what visions and decisions have brought us to where we are today.

City form

Driving into Canberra from Sydney, Melbourne or Cooma, or flying in over the paddocks and forested hills, is a strikingly different experience than the approach to any other Australian city. The boundary between the city and the bush is abrupt. Paddocks give way to houses, tree-lined roads, and open space with sweeping panoramas of forested hills forming an immense and magnificent landscape backdrop. In the centre around Lake Burley Griffin are the city's monumental national buildings majestically poised in a sylvan setting, again with the defining backdrop of hills. Lake Burley Griffin offers contact with nature in the heart of the city (**Figure 4**).

The reasons for these differences lie historically in the visions behind the idea of an Australian capital city. They explain why Canberra is unique internationally, different from any other city, and why in 1910 the Minister for Home Affairs, King O'Malley, proclaimed 'This must be the finest Capital City in the World – the Pride of Time.'[13] Underlying its inception at the beginning of this century lay two basic visions. The first was that a vigorous Australian national identity existed, that this was related to the ideal of the Australian landscape itself and that it could be symbolised in the layout of a capital city. The second was that city planning could create a better and healthier society.[14]

The utopian ideal of new cities and redevelopment of selected parts of existing cities as a way to social reform and realizing landscape idealism took firm root in Australia. In entering the winning design in the Federal Capital Competition in 1911 Walter Burley Griffin declared:

I have planned a city not like any other city in the world. I have planned it not in a way that I expected any government authorities in the world would accept. I have planned the ideal city – a city that meets my ideal of the future.[15]

That Griffin's city met the ideals current in Australia was no accident. The competition and the Griffin scheme were the culminating pinnacle of the utopian visions for a new Australian city that would lead the world. In short the Griffin plan – so exquisitely

illustrated by Marion Mahoney Griffin's water colour prospects – was beautiful in design conception and physical presentation. It was the City Beautiful with Garden City overtones *par excellence* and matched Australian visions of the ideal city. Here was inspiration for the creation of a grand capital that grasped the idea of landscape as the structure for a city where social reform through healthy living was integral to the structure and life of the city.

The Griffin design admirably suited the natural amphitheatre qualities of the site where, as Freestone observes, 'the setting [was used] as a theatrical whole' to give a design that 'was rich in symbolism'[16] by its use of radiating avenues with the hills as focal points and the use of dramatic views out of the city to the magnificent hill-landscape surrounds. Its geometrical major and minor axes created impressive vistas (**Figure 1 and 2**). Of equal significance was Charles Weston who, from 1913 to 1926, laid down the innovative and visionary landscape planning framework for the city with his tree planting schemes. He set up experimental nurseries to raise the necessary tree stock; some indication of Weston's achievement can be seen from the fact that between 1921 to 1924 1,162,942 trees were planted in what are now the inner city suburbs.

Notwithstanding John Sulman's support for the Griffin plan it was he as Chairman of the Federal Capital Advisory Committee 1921-24 (FCAC) who instituted changes when Griffin resigned in 1921. The FCAC reflected Sulman's influential ideas as a leading town planner and educator, in particular his advocacy of the garden city and garden suburb. The FCAC therefore declared that in the first stage Canberra was to be 'a garden town, with simple, pleasing, but unpretentious buildings'; it saw houses as single storey cottages standing in their own garden. Sulman in 1910 had suggested that Australians preferred the single storey house; evidence from various developments in Australian cities pointed to this phenomenon.[17] In 1909 before the competition for the Federal Capital design was announced Sulman wrote a series of articles in the *Daily Telegraph.*[18] In one article he stressed the need for parkways, playgrounds, vistas, and a hierarchy of streets going from wide to narrow. He advised incorporating into the plan a central area with Parliament at the hub surrounded by public buildings, shops, and hotels set within a diagrammatic radial-concentric plan with radiating avenues which he likened to a spiderweb pattern.[19]

Sulman as FCAC Director also conceived of major public buildings and national institutions as separate buildings standing in a park-like setting: an urban picturesque personified. This is the current pattern for Canberra's national buildings and institutions in the central National Triangle (**Figure 2**). The Federal Capital Commission (FCC) under John Butters continued the garden city concept in residential areas, domestic FCC style of architecture – unique to Canberra – (**Figure 5**) with its Arts and Crafts Movement genre and public buildings like Old Parliament House.

An enduring legacy

The 1920s and 1930s saw the central symbolic heart of the city and nation from the Griffin plan with its national triangle and exquisite axes and vistas established in outline. But buildings spaced in a park-like setting, not Griffin's more symmetrical urban spaces with paving, water and trees between buildings. Surrounding this were the early garden city residential suburbs of detached cottages in large gardens. Street planting had taken place and public parks initiated. The basis for the landscape city *par excellence* was in position. Even so the city grew slowly; by 1958 its population was a mere 36,000. It was at this stage that the decision was taken by the then Prime Minister, Sir Robert Menzies that Canberra should expand and that Government Departments and workers would relocate from Melbourne and Sydney. Parliament was housed in Canberra (Old Parliament House built in 1927: **Figure 2**) but not the machinery of government.

Following a 1955 Senate Inquiry on the Development of Canberra and a 1957/58 report by the British planner, Sir William Holford, the National Capital Development Commission (NCDC) was set up by Menzies in 1958 to plan, develop and construct Canberra. The underlying landscape foci briefly reviewed above were grasped by the NCDC. They continued to suffuse planning ideas during the crucial years 1958 to 1988 (when the NCDC was disbanded) where land-use planning policy and implementation integrated civil engineering and landscape concerns in an holistic approach to planning. The garden city ideal flourished to create a city known affectionately as The Bush Capital.[20] Not least was the adoption of the Y Plan in the late 1960s as a linear model for city growth, with a series of new towns rather than the concentric pattern of other Australian cities. The Y Plan, formalised in the 1984 NCDC *Metropolitan Policy Plan*, articulated the form of urban growth on the basis of a series of new towns (Belconnen, Woden/Weston Creek, Tuggeranong, Gungahlin) separated from central Canberra and each other by landscape corridors (**Figure 6**). Landscape maintained its primal position as articulator of urban form. With over 14 million trees in the city and its immediate surrounds with associated public and private open space and wildlife, Canberra became and remains the epitome of nature in the city.

Essential to the Y Plan is the integrated open space system of hills, ridges and buffers: the National Capital Open Space System (NCOSS). The 1992 report *Our Bush Capital: Protecting and Managing the National Capital's Open Spaces* refers to the NCOSS covering 72 per cent of the Territory as 'a valuable legacy of visionary design and planning.'[21] In *Tomorrow's Canberra* the forerunner of NCOSS is referred to as 'the emerging metropolitan park system [which] encompasses a wide range of parks, recreation areas, reserves, and other open space.' By 1977 in a report by George Seddon[22] the term NCOSS – reflecting NCDC nomenclature – was used. It embraced the comprehensive network of inner and outer hills, ridges and buffers, Lake Burley Griffin, river corridors and mountains with associated bushlands. The primary significance to Canberra's post-1945 planning of the open space system may

be gauged from the view expressed in the 1970 NCDC publication *Tomorrow's Canberra*:

The fourth major component of land use, open space, will probably be the most enduring element of the urban structure. [23]

It is this comprehensive network which articulates the city plan. It was pivotal in guiding the physical layout and planning structure of the new towns inherent in the Y Plan concept.

Part 2 Post-1988

Maintaining the landscape setting ethos? The devil in the detail

The inception in 1988 of ACT self government heralded winds of change. Two planning authorities – a local and national – replaced one single agency. In addition to the two statutory planning agencies, Canberra International Airport and its extensive Brindabella Business Park development of fifteen commercial office blocks has effectively become a third quasi-planning authority no longer subject to the control of either the local or national body.[24]

Canberra's population is now around 330,000 people; not big by world city standards and predictions for growth by 2032 vary from a moderate figure of 389,000 to a high of 460,000 in *The Canberra Spatial Plan*[25] (**Figure 7**). Nevertheless the issue facing the city is how to expand without destroying the rich landscape heritage and open space system that defines the city's special character. The ACT in which Canberra sits is around 2000 sq kms entirely surrounded by the state of New South Wales as determined at the time of Federation in 1901. About 75 per cent of the land is in the form of forests and river valleys. These are unsuitable for building and also comprise valuable water gathering grounds and wildlife habitats.

Various options for expansion have been considered under the aegis of the Spatial Planning exercise by the ACT Planning and Land Authority (2004).[26] Central to the options has been the goal of conserving the Bush Capital image and the National Capital Open Space System whilst acknowledging decreases in household sizes and an ageing population. The change and consequent effects on housing needs have increased the attraction of town houses and apartments and the challenge is where these can be sited so as not to destroy the leafy character of traditional suburban housing areas which many people still value. Herein lies the dilemma of occupying a living, heritage city. How may it change without destroying its sense of place?

Ebenezer Howard asked this question over one hundred years ago: 'The People. Where will they go?'[27] This is critical now to Canberra's future and the protection of its heritage context with both tangible physical values and intangible values that Canberrans place on the very nurturing idea of nature in the city and living with it. John Ruskin, the nineteenth century art and architectural critic, referred to the way people see things and attach meaning to them as 'seeing with the soul of the eye.'[28]

At the heart of attachment to the Bush Capital image is this very way of seeing so that it is not just what is seen that is important to the Canberra community, but the way it is seen and the meanings and values attached to it.

In *The Canberra Spatial Plan*[29] **(Figure 7)** the ACT Government through its planning agency (ACTPLA) proposes increased densities along transport corridors (roads) and around shopping centres which are strategically placed in the new towns. Whilst theses zones have been delineated for increased density, planning and design guidelines to safeguard residential area character have not been promulgated. Loss of landscape space results from reduced front and side setback standards for houses (see below). One visually dominant effect is a move by many developers to flat roofed, grey rendered buildings (**Figure 8**), lacking harmony and balance with their setting of Canberra's traditional, leafy residential neighbourhoods (**Figure 3**). Even in what might be seen as acceptable building form, garden space is all too often replaced by hard surfaces thereby increasing stormwater run-off and reducing opportunity for tree planting (**Figure 9**).

The Canberra Spatial Plan also proposes 33,000 houses (73,000 people) and units at Molonglo **(Figure 7)** and continuing development at Gungahlin new town with an additional 28,500 dwellings. Molonglo occupies former pine forest destroyed by the January 2003 bushfires and adjacent rural areas/open grassy eucalypt woodland along the Molonglo valley. *The Spatial Plan* approach proposes continuation of a planning system whereby the external landscape framework of the city connects with its internal public and private open space components.

The vision of the landscape city is maintained in such local planning documents as The Spatial Plan and ACT Territory Plan, but it is at the detail planning, design, and implementation levels that things start to fail the grand intention. Molonglo, for example, fractures the integrity of the Y Plan and separation of new town areas. If it proceeds in total it will effectively join Belconnen to Weston Creek/Woden, eliminating a major open space component of the city's structure **(Figures 6 & 7)**. However, the ACT Government has announced (May 2008) a 20 year moratorium on development in the central section whilst a 3 year natural resource evaluation is undertaken.[30] This begs the question of why such a study was not a core part of the planning studies some three years ago. It ought to have been. Excision of Central Molonglo would also go some way to maintaining the open space buffer between Belconnen and Weston Creek and maintain the landscape link into the urban area from Canberra's broader landscape setting.

What we also see is the ignoring of community preference for design guidelines covering architectural form, materials and tree planting space in private development. This is now left virtually to the discretion of developers as long as they adhere to minimum space and setback dimensions for housing areas in the Territory Plan. With reduction in residential block sizes and propensity for McMansion style houses[31] crowding the smaller blocks there is real reduction in private landscape space, reluctance to plant species that will grow into large trees, reduction in privacy, and

increasingly less opportunity for ground water recharge. The latter is, I suspect, likely to become of increasing concern with climate change projected to induce warmer conditions and less rainfall for the southeast region of Australia. This will compound the effect of an already dry climate with evaporation annually exceeding precipitation. Monitoring and finding strategies to maintain ground water reserves ought to be a matter of concern in policy aspects of Canberra planning, but is a subject that is ignored.

Recognising national importance, the National Capital Plan within its overall goal of ensuring that Canberra and the ACT are 'planned and developed in accordance with their national significance' embodies specific objectives reflecting the unique importance of the city in the landscape.[32] These include the maintenance and enhancement of the landscape character of Canberra and the Territory as the setting for the National Capital and the protection of the undeveloped hill tops and the open spaces which divide and give form to Canberra's urban areas (ie NCOSS).

Overview: changes and dilemmas

Can change and private interests affecting public planning be accommodated? These are complicated matters, not least given the national role of a city like Canberra and the existence of two public planning agencies. Following is a list of the nature of changes that have potential to compromise the special nature of the city in the landscape. Behind them remains the question of whether planned cities such as Canberra with a dual role of national capital and a series of distinguished historic planning sequences deserve special attention with planning guidelines geared to recognising and protecting the special role and sequences that have created the city not like any other.

i   Land sales and profits.
Increasingly since self-government successive ACT governments have sought to maximise profitability by land sales. All land in the ACT is crown land subject to 99 year leases. Prior to 1988 developers took on land with its unimproved value as a tax base and paid accordingly; they were subject to strict guidelines on such things as densities and building heights. Now land with its development rights, commercial and residential, is auctioned to developers who are able to profit by it. The initial idea of crown leasehold for the federal capital was to prevent developers from land profiteering. Packaged with this change is the fact that anyone buying land at an auction can then return to the government with a revised density proposal. A betterment levy is payable, but this is likely to be less than the price would have originally been paid if the land had been bought with the higher density figure (see also ii below).

ii   Residential planning codes and reduction of layout standards
ACT Treasury has effectively encouraged reduction in planning standards so that 'inefficient planning' does not take place. This has followed private submissions to the ACT government since 1988 (date of self government) to the effect that

reductions to street verge widths, footpaths, building setbacks (see also iii below) and amount of public open space will increase the lot yields and also englobo land (parcel of land prior to its subdivision) prices accruing to the ACT government and reduce need for municipal services.[33] In residential development in places like Gungahlin this resulted some ten years ago in minimal public and private open space standards, overly narrow streets, overdevelopment of residential blocks accompanied by block size reduction, loss of tree planting potential (public and private), increase in hard surfaces and stormwater run-off with decreased ground water renewal. Parallel with this is the separation of the Land Development Agency (LDA) from ACTPLA which originally oversaw residential layouts, including new subdivision planning and layout. LDA now controls land release and sales and lets out contracts to its own agent surveyors/planners for layouts. ACTPLA in this regard is then reduced to a development control role, rather than a strategic planning role, and its development control guidelines are regularly set aside. This, for example, occurs when a successful bidder for an englobo residential site makes a subsequent submission to increase overall yield and thus profitability on payment of the betterment levy.[34]

iii   The orthodoxy of standardisation and reduction of residential layout standards
The process referred to above is parallel with lobbying of some groups, private and professional, for universal Australian model residential planning codes: standardisation is the orthodoxy. In Canberra it has been a co-contributor (with *iv* below) to reduction of front and rear setbacks to minimum standards and side setbacks virtually to nothing with a resultant loss of opportunity to plant trees. Historically views along Canberra streets of residential buildings have been filtered through a leafy screen In a revision of the ACT Territory Plan general residential plot ratios are now increased from 35 per cent to 50 per cent, with 80 per cent in specified areas with virtually no restriction in areas within 200 metres of a shopping centre, including local residential area centres (A10 areas). Front setbacks have been reduced from 8+ metres of pre-1988 to 6 metres for single story and 7.5 metres for two storey with 4 metres in some medium density developments. 'These have resulted in the spacious leafy character changing. Some residents view the change as a change for the worse. The character they value is usually expressed as that of the streetscape. It is a factor that has consistently been used in evidence and cross examination in the Administrative Appeals Tribunal (AAT) by objectors to urban infill development proposals.'[35] (**Figure 8**)

iv   Reasons for standards being reduced
There are two reasons cited for reduced residential standards. The first is the pressure by buyers for more house on a block: the McMansion factor. The second is the planning dogma that low density development has to be curtailed in favour of urban consolidation and infill on so-called sustainability grounds. This is argued on environmental grounds, that the preference for a detached house and garden is waning, that there are significant economies of urban infrastructure flowing from higher densities, and that social interaction is damaged in the traditional detached house and garden. This planning orthodoxy has been challenged by a variety of authors and research projects,[36] but still holds sway. It is interesting how the Territory

Plan provision now for development and redevelopment for the right only to 2 hours winter sunshine on the north face of a building neatly escapes the sustainability question. The problem for Canberra in these provisions is that the very scale and character that made it *the* landscape city are compromised with building form dominant over landscape form. A particularly concerning example is Gungahlin new town centre medium density development: this is so intense and without any open space provision of note within 2 kilometres that it is likely air conditioners will have to be used in Canberra's hot dry summers. Not exactly an environmentally sustainable solution.

v   Central Canberra

Within the central part of Canberra – Civic[37] – high rise office development has now substantively blocked views of the surrounding hills thereby creating a claustrophobic character that strikes at the very heart of the Griffin vision, a vision that was continued by Sulman and later by the NCDC. The NCA announced in 2007 that it would review further the building height restriction of 50 metres,[38] the height which symbolically limits buildings being no higher than the Australian War Memorial dome and the flagpole base at Parliament House. A significant location targeted by the NCA for tall buildings is City Hill, one of the pre-eminent landscape landmarks marking Griffin's national triangle and facing Parliament House along Commonwealth Avenue. An Amendment (59) to the National Capital Plan positions 18 storey 'landmark' buildings at four corners of the hill. Such action accords with lobbying by groups such as the ACT Property Council and developers. The question may be asked "Why do we need more vertical built intrusions on Canberra's skyline under the guise of 'landmark' dwarfing the landmark of City Hill in mute mockery and blocking views to the magnificent hills that act like a stage setting for this city, helping to make it unique and not like any other The dictionary definition of landmark is 'a conspicuous object in a district; object or change marking a stage in history or turning point in history'. If allowed to proceed, the vertical edifice complex will certainly be conspicuous and will change history. It be another nail in the coffin of this city being not like any other, because we will become like other cities, hemmed in by high buildings."[39] In support of the overall proposal for land around City Hill that was the subject of public submission objections to a Joint Parliamentary Committee hearing in 2007, the NCA posited that it hoped to have the opportunity to set the design standard around City Hill … and in connection with one block of 2.65 hectares (including 18 storey building) that sold for $93 million 'we will be looking for something really outstanding.' Pouring cold water on this in response, one representative of a national firm of valuers reflected that 'If the government expect too much from the site in terms of architectural significance that would add to the developer's costs … There may be a conflict in what the NCA wants and getting the best revenue for the ACT.'[40] What price good design when land sale priorities dominate planning?

vi   Canberra Airport

Outside this, but having considerable impact on Canberra, is the privately operated Canberra International Airport. Originally the National Capital Plan included the airport land and hence the NCA controlled planning decisions at the airport. This approach

was abandoned by the previous Howard federal government and the Airport operates as a private agency with no planning control except through the federal department of transport. In addition to building 15 office blocks which has created unprecedented traffic chaos, not least for travellers trying to get to/from the airport early morning or late afternoon, the airport authority has announced it proposes to have unrestricted 24 hour flights, including commercial flights and aspires to become Sydney's second airport. Such *laissez faire* growth is projected to bring with it, according to the think-tank, Australia Institute, an increase in aircraft emissions from 117,000 tonnes of carbon dioxide in 2005 to a staggering 3.6 million in 2050. It is estimated by the institute's director that this will undermine efforts to reduce the ACT's total emissions by more than 60 per cent by 2050.[41]

Conclusion

The new federal Labor government initiated a review of the NCA's powers and the relationship between the Territory planning authority and its powers. One outcome that seems likely is that the National Capital Plan and Territory Plan may merge into one document in some form, albeit there is strong professional support for retention of an NCA agency to oversee national planning imperatives. The review is timely and after 20 years of self government and the national capital plan it is appropriate to look at options for one plan, assuming that the matters referred to above are given due consideration. But the slashing of the NCA budget and loss of staff (see above) before the review hearings suggest a self-fulfilling prophecy. National capitals, not least planned national capitals are special places and require and deserve special merit.

Whether the politicisation of planning will be given due consideration is debatable. It is vital to the very meaning and being of Canberra as national capital that any transfer from national to local control through one planning document does not put the national capital ideal and idea at jeopardy. The increasing trend of local and national government withdrawal from public interest to allow private interest to dominate and belief that national market is the best to determine what is needed is a major concern and needs to be addressed in the review. Can a predominance of the private market be relied on intellectually, politically and morally to promote the best planning outcomes? History suggests this is not always the case.

Public illusions, private spaces: vicissitudes of the transformations on the urban coasts of the Argentinean Pampa

Universidad Politécnica de Catalunya, Argentina
Universidad Nacional del Litoral, Argentina

The past as present: the recurrent controversy over coastal areas in urban planning

The prolonged, ever-recurring conflict between public walks and parks, and a harbor's infrastructure that takes place in coastal cities -especially along their waterfronts- often brings up clashes between city councils and harbor administrations. It is also a source of constant demands from citizens and thought-provoking material for city planners. The situation was quite apparent in Argentina throughout the twentieth century. Harbor areas were consistently used for specific harbor infrastructure and supporting commercial uses and activities, with complete disregard for social and urban necessities. By the turn of the century, however, harbor administrations started a process that has continued to date: vast, important harbor areas were abandoned as the result of changing needs in transportation activities, and for proposals were made to incorporate the areas into the urban fabric and put the old facilities to new use(1). Delving into the controversies that preceded this present-day restructuring process leads to a re-evaluation of the discussions, reflections, debates and proposals that ultimately led to it. Both the attainments - no matter how fragmented- as well as the failures constitute an important source of inspiration for anyone presently attempting to critically assess or implement urban transformations in harbor areas. These areas are brimful with history present not only in their visible constructions but also in the ideas put forward and the forces fighting for their control.

The challenge is, then, to put together the historical pieces that resulted in the use given to these lands. Once again, this digging into history will enhance the capacity for analysis that must precede any attempt at designing a link between port infrastructure and urban interests and demands. And at the heart of this activity lies the crucial issue of public vs. private appropriation, against an ever-present background of material profit. So, how did those old plans conceive the urban exploitation of the waterfront? What citizens' demands did they represent? How were these areas inserted into the urban fabric? What spatial forms and mechanisms were used? Was that similar to the way harbor areas are reorganized today? Or are today's interventions mere ghost images of those illusions of public urban areas around ports?

This is not about promoting exact replicas of old ideas; rather, it is about revising, re-examining them with a view to reopening the debate over the impact of present-day interventions. Previous projects aimed at inserting waterfront areas into the urban structure, providing links and intermediate areas where the man-made and natural worlds could overlap. Today's intervention plans, despite the way they are heralded, do not always contemplate strategies to devise harbor walks, circulation schemes and

neighborhood amenities as a way of reconstructing the relationship between city, old harbor facilities and the waterfront. That is exactly why delving into past practices will bring to light the merits and deficiencies of present-day propositions.

To this purpose, two cases will be analyzed: the old harbor areas in two Argentinean cities, Rosario and Santa Fe. Both cities are located on the Paraná River, in the heart of the Argentinean Pampas. This river constitutes the oldest and most important navigation way in the country and has historically been vital for its economy. As such, its ports vary greatly in size, significance and problems posed and have been subject to all kinds of historical vagaries and economic policies. The study is not intended as an exhaustive comparative analysis that would exceed the limits of this presentation, but it is hoped that it will help towards a better understanding of the processes involved in similar cases.

1. Rosario: the waterfront found

1.1 Conflicts and proposals over time

The urban coast as a social, political and cultural issue became an increasingly complex problem during the 1920's. The projected construction in 1923 of a new Railway Station on the City riverbank sparked a controversy that would reveal conflicting interests as a result of which all participators agreed upon the necessity to devise an urban plan(2). This was to become the cornerstone of what would later be the 1935 plan, which would revolve around a waterfront in perfect step with public urban areas and landscaped surroundings. The project to build the Ferrocarril Central Argentino met with immediate reject from various social and economic groups that eventually succeeded in 1924 in setting up a committee to review the project for the City Council.

The City had limited saying in these matters, as transportation companies were privately owned, if regulated by federal authorities. The erupting conflict laid bare two perfectly differentiated contending groups: on the one hand were the local residents, some seeking to bring up the value of their properties, others lobbying in favor of an increasing awareness of the need for green spaces in the city. On the other hand were the foreign companies that owned all railway and fluvial transportation lines and had complete control over the harbor infrastructure. Their respective interests were, naturally, at odds. The residents perceived the prospective railroad station as another major impediment for them to enjoy public-use walks and parks in one of the very few still unoccupied areas in central Rosario.

This confrontation was especially meaningful at a moment when the bearing and weight of "the public thing" constituted a heated debate in both the urban planning world and the finance one. In 1925 a bill is introduced proposing the nationalization of all harbor administrations(3), a clear sign of dissent with and rejection of the foreign administrations that constantly placed their own interests before the public's and as result of which no systematic planning or rational exploitation existed. This was the frame within which town planning was trying to develop.

Galvanized by the public show of widespread discontent, City Hall decides to carry out an in-depth study that would lead to a global regulatory plan that would hopefully end the dispute. Three professionals of note were entrusted with the task: Civil Engineers Adolfo Farengo and Carlos Della Paolera, and Angel Guido, a well-known Architect. All three were experienced professionals and academics who, among other important achievements, had started the teaching of Urbanism in Argentine Universities, at Universidad del Litoral – Rosario(4), and had organized Hegemann's lecture tour in Argentina, where he visited Buenos Aires, Mar del Plata and Rosario(5). In his analysis of the city, he focuses on four problems, two of which would be the railroad tracks layout and the green spaces by the river, namely the riverside avenue. He would consider these the most pressing ones and would elaborate on them in his lectures (6). The Plan Regulador, eventually drawn by Guido and ratified in 1935, pivoted around these two issues.

This Plan Regulador clearly stated that in the future, the foreign companies were to have no saying in the town planning of the city. The central coastal area would be cleared of railroad tracks to facilitate the construction of the riverside avenue, which would provide a link between the North and South areas of the city and, together with the islands on the opposite bank, would become the symbol of the city. Sadly, and despite the big success the was the banning of the construction of the Railroad Station, the Plan failed in restructuring the railroad system; it succumbed to the enormous power of the transportation companies, which continued to exercise their control of the situation in their own interests. Equally sadly, things did not change even in the 1940's, when both the Port Administration and the Railroad Companies were nationalized; decision-making government officials continued to place functional questions before recreational and esthetic ones.

Eventually the restructuring would come about, but not before changes in the production and transportation modes would render the port structures obsolete and a window of opportunity would open to give them fresh use.

1.2   Reclaiming the coast for the urban public space

Early in the 1980's, probably as a result of the country's return to Democracy, Rosario started a number of interventions in its harbor area that would continue over time. The dense tangle of railroad tracks and port infrastructure that shut the coastal area in and isolated it from the rest of the city is at present undergoing drastic transformations that have resulted in linking areas between the two and a vast webbed arrangement of parks and public areas. There was never a definitive Regulatory Plan; rather, a significant number of separate proposals that were properly channeled and debated.
All proposals pressed their claim for recognizing the public nature of the coastal area and the urgent need to find a way to reconcile the demands for recreational public use of the area with the existing port infrastructure, by now obsolete (7). Although all these interventions remained patchy and occurred erratically, they still gave the enterprise structural coherence.

The means to put these changes into practice guaranteed this coherence as they changed with the advent of each proposal and became innovative in an effort to achieve success. Eventually the long-awaited Regulatory Plan took form as a systematized compilation of all previous intervention efforts, relevant to date.

All considerations, worries and beliefs present in the original conflicts and divergences mentioned concerning public vs. private appropriation of port and waterfront areas, as well as strict building codes that would promote harmony between all contending parties, were also present in the proposals and gave origin to original and comprehensive strategies to achieve the desired aim. Participants in the mission were city planners in official positions, federal agencies owning potentially affected lands and installations, and private owners whose interests would be affected. All these concerned parts engaged in proposals, agreements, public debates and calls for residents to participate in them as well as changes in construction regulations, all of which made up a wide range of efficient tools to exercise town planning. More importantly, they went far beyond devising new strategies: they also used innovative instruments, pre-approved plans involving building and lay out practices, as well as agreements that favored to assemble between public and private interests.

One vital actor in this saga was the City Administration, who assertively and tirelessly claimed the use of the land for public use with strong, convincing argumentation that won over the cooperation of all participants.

The concern for the public use of coastal areas highlighted in the 1935 Plan reemerged quite revitalized in the events occurring at the beginning of the twenty-first century. And now it is not just about esthetics, it is about rescuing the social history of the coastal area and incorporating it once and for all into the urban scene of the City.

2. Santa Fe: the waterfront lost

2.1 Conflicts and proposals over time

As the new Santa Fe harbor was under way, in the first decade of the twentieth century, City Hall promoted it as its would-be symbol. The idea was to integrate the new port infrastructure into the urban scene, and it would resurface in the 1927 urban plan.
In the first 1910 proposals(8), the port and railroad tracks were not perceived as an obstacle in achieving this aim; much to the contrary, the capacity of the City to intervene effectively on the newly-acquired lands taken from the river was taken for granted. This did not turn out to be so, however, and multiple difficulties evidenced the presence of a serious conflict of interests. The 1927 Plan acknowledged these difficulties and drafted substantial changes such as a change of venue and restructuring of the railroad facilities.

The year 1905 saw the construction of the new seaport in Santa Fe. The new port meant the appearance of new areas in the city, located in between the old and new port venues. City Hall had its own plans for these lands, part of a comprehensive plan to restructure the whole city. The plan, informally known as "the Rosas Mayor Plan", in allusion to the Mayor in office behind it, contemplated constructing a network of important avenues that would connect equally important green spaces in the city. El "Parque Central" -as it would be called- would connect with these avenues which would, in turn, provide a physical and visual frame for the port and become a waterfront drive. The idea was, clearly, to create intermediate areas or links between city and port that would also function as recreational and social meeting points adequately provided with tree-lined walks and drives.

Unfortunately, this was scantily achieved; the grand "Parque Central" was only realized

as disconnected small parks, and only one of the projected avenues came into being: the Avenida Alem. The Port Administration would take all decisions concerning the port and its vicinities, with its interests prevailing in all spatial definitions (9).

Years later, in 1927, the idea of the Parque Central would again resurface, this time with new recreational areas that would exploit the proximity of the river and would be located away from central Santa Fe, where access to the river was blocked by the port and its ever expanding facilities. But the City Administration was badly lacking in resources to implement the plan, mainly efficient technical support capable of carrying out such ambitious scheme. More wishful thinking than feasible exploit, the plan dwindled away to nothing and never put down roots in the local tradition.
[**Figure 3**]: Santa Fe. The 1927 Plan idea was to create intermediate areas between city and port, and spatial links between port area (right) and monumental historic district (below), both the most important areas of the city. *Source:* Cabal, Julio César, "Proyecto de Urbanización". In *Arquitectura*, Revista de la Asociación de Arquitectos de Rosario, 11, sin fecha.

2.2 Disregarding the public nature of the coast

Technical advances and functional difficulties in the freight business were usual causes of obsolescence in port facilities, and Santa Fe was no exception. Studies were made to define relocation and new uses for the existing obsolete facilities. The moment had come to intervene to give these areas appropriate urban use. The Master Plan (10) for urban development that the Port Administration came up with fails to present feasible, concrete definitions for spaces to be incorporated into the urban fabric that would provide the much-needed link between port and town. All it does is provide a flexible, imprecise allotment of space for economic development in service, retail and tourist-related activities, all administered and regulated by the Port Administration with no decision making capacity on the part of City Hall. No attempts are made to create a

regulating body of a mixed nature that would act on consensus from all concerned parties, namely port and city administrations and harbor planning consultants and specialists, nor does it present a sustainable scheme of programmed stages. Moreover, the planning instruments presented –zoning, plot allotting, authorized uses (11) - have all been known to fail in the past. One cannot but wonder whether the city will ultimately recover the use of the coastal area for communal use, as it should.

One case in point is the above-mentioned Avenida Alem. This avenue was originally part of the urban development and reshaping of the city drawn in 1910 and constituted a veritable link between the two worlds, as it ran parallel to the port area for most of its extension and boasted fine elements of urban life. It was beautifully tree-lined and had been thought of a fine mix of recreational urban walk and harbor access way. In the year 2005 the avenue was widened, remodeled and turned into a highway. The "intermediate" nature was thus completely lost, as most central landscaped areas disappeared, as did most of its trees. A great opportunity was missed to capitalize on the beauty of the place and preserve it, while at the same time providing the port area with an efficient, yet esthetic access way.

The-re-urbanization operation was conceived from the start as an enclave, and all ensuing acts, steps and instruments have been consistent with this idea. All grandiloquent announcements promising urban integration, deliverance of the city's historical heritage, respect for and increased regard for the environment, as well as consensus among all parties concerned vanished, not into thin air, but into a program promoting segmentation and physical and visual alienation of port and town in such a way that the public nature of coastal areas continues to be nothing but a mirage.

[**Figure 4**]: 2007. View of Port of Santa Fe and the district center, without a veritable urban link between port and town. *Source:* Municipalidad de Santa Fe, Argentina.

3. Between old illusions and new interventions: the conflict gets updated

One major issue in this analysis is the paramount role that cultural values have played in validating these operations. The various executors made use of resounding symbolic announcements to achieve this aim. Among others, they resorted to lofty ideals like rescuing the architectural heritage, recovering new spaces for the city, gaining new accesses to the waterfront and revitalizing local characteristic activities. Thus, the "cultural factor" replaces "functional factor" when substantiating the urban operations, and recovering the coastal infrastructure of port and warehouse clusters for urban use was correlated with recovering collective memory and values (12). The significance of the operations was based on the public nature and use of the claimed areas, and all interventions acted accordingly.

Now, this public nature must necessarily be conceived in the present-day conditions of contemporary urban nature, and then must be measured against illusions and results, real and fake experiences, postulates and marketing, public use and commercial exploitation. Possibilities of success will be all the more robust by executing town planning mechanisms that will contemplate spatial and social private interventions in a far-reaching urban conception of the collective. In the same vein, segmented operations without a proper plan that will hinder public use of the space and favor private financial interests will continue to be a recipe for failure.

Such approach will unfailingly lead to a self-imposed failure made up of social exclusion enclaves with repetitive tedious architectural elements that will attempt to make up for the lack of art and spontaneity.

It is within this frame that a comparison of the two cases analyzed can be attempted: incorporating innovative ideas into the town planning mechanisms vs. promoting opportunistic interventions and repeating bland formulas void of proper planning. Such were the natures of the interventions over the urban waterfronts in the cities of Rosario and Santa Fe, respectively.

For a city to really benefit from the appropriation of its urban coastal areas and its accompanying building processes, there must exist a correlating plan that will contemplate feasibility conditions and effectively maximize communal use of public spaces with the corresponding articulation with the urban structure.

And here is where the two cases clearly differ, in the past as well as the present. The temporal repetitions of spatial conflict over the coast and the proposed solutions have fused the past and the present. To think the present-day city means to think the present, not as an independent, unconnected entity but rather a complex intricate web of past and future relations. This is how the collective memory is enhanced, but it often means merely conserving the physical architectural remains. On the other hand, opening it up to ideas, debates and proposals, and relating past conflicts with present ones expand the limits of reflection on the collective and puts up for debate the role of the public realm in urban construction, a crucial issue in today's vision of cities. The study of the

relationship between urban coast and public spaces will permit a reformulation of the discussion into a register of the present as well as the past – and probably of the future. It is in this arena that public and private will fight over the organization of areas, their use and their meaning.

Urban planning in the dictatorship. The "Mesones" General Urban Plan of 1968 for Valladolid, Spain

José Luís Sáinz Guerra
Universidad de Valladolid, Spain

Introduction

Franco's dictatorship in Spain gradually evolved from the hard post-war years, in which national self-sufficiency was established, to the process of economic growth, the so-called "Desarrollismo", with which it ended in the 1970's. Immediately after the end of the Civil War, in 1939, an economic system based on political and commercial isolation and self-sufficiency was installed: Autarchy. The defeat of the Axis in the Second World War increased this isolation even further and, for almost twenty years, the lack of diplomatic relations (as well as market relations) with the outside world exacerbated this self absorption. In this first period of the Autarchy, the governments that came and went were dominated by the ideological families from the war. The change of cycle occurred with the Stabilization Plan of 1959, which modified the rules of the economic game, breaking the dominion of the political Falangists of the immediate post-war. The economic development was further boosted through the separation of the ministries that were most closely involved in the ideological system. Thus, the influence of the authoritarian (fascist) ideology was reduced and masked behind the strengthening of everything technical and disciplinary, through technocratic governments, apparently without an ideology, in such a way that all Franco's governments from then on shared that sole characteristic. Military uniforms and party uniforms disappeared almost completely in cabinet meetings, the blue shirts of the Falange and the belts and straps of the military uniforms were reduced to a bare minimum, to be substituted by ministers with Christian Democratic roots, whose curricula were centered on legal and economic studies. Around the beginning of the 1970's, by means of such formulas, the economic system had taken off spectacularly and had overcome the problems of the end of the Autarchy. Tourism on the coast, that attracted large numbers of European tourists; the transformation of rural Spain and the industrial renewal in the most important cities (Madrid, Barcelona, Bilbao, Valencia, and others) were the basic characteristics of this period. Nevertheless, at the end of the Dictatorship, the difficulty of reconciling a liberal economic model with a dictatorial political model was becoming evident.

At the same time, the economic growth began to bring about important urban transformations in the most industrialized cities that involved real-estate operations and big profits. The disorder and conflicts that these urban operations caused gave rise to the appearance of a movement, on the part of the Administration, to find a solution to all the problems and put the sector in order.

The instruments of city planning

The Spanish state had passed a city planning law in 1956 (Ley sobre Regimen del Suelo y Ordenación Urbana). This law was in line with European legislation from the

1940's concerning the reconstruction of the cities that had been destroyed. The ministerial teams that wrote the law had taken that legislation as their reference, as well as the laws from the U.S.A. In this case, the Spanish city planning legislation took advantage of the European experience, which it both quoted and used as cornerstone. Its similarity to, among others, the Town and Country Planning Act de 1947 has been pointed out. The law of 1956 contained a hierarchy of plans (national, provincial, general and partial plans); a planning regime whereby land could be classified as urban, urban reserve and rural. Added to this was a land valuation system and a hierarchy of administrative and territorial organs in charge of the control of the administrative process. In short, a true set of legal measures capable of establishing the network on which the city planning activity of an industrialized country can be based.

City planning was an instrument that fitted Dictatorship's ideology perfectly. To order civil society, plan administrative actions and control private actions, were the bases of good government. However, the Regime found itself subject to the opposing forces of city planning understood as the responsibility of the Ministry, while at the same time allowing economic growth, which involved greater freedom for capitals to act, to authorize the deals of those entrepreneurs close to the Regime, that is, to allow land speculation or, in short, to tolerate urbanistic disorder.

Evolution of the city of Valladolid

The evolution of the city of Valladolid was very slow immediately after the Civil War, something that lasted until the mid-1950's. In the 1960's, on the other hand, there was a spectacular rise in construction work that remained constant until the mid-1970's, when, first the oil crisis, and then the uncertainties of the political transition later, caused the growth to slow down bringing about the stagnation of economic activity.

The population of Valladolid was 98,531 inhabitants in 1935. Twenty years later, in 1955, it had reached the figure of 127,568. This period included the civil War and the post-war, in spite of which growth had been moderate, around 1%. However, in 1975, after twenty years of economic development, the population had reached 285,959. Growth rates around 1% in the first period were followed by rates of 6.2%, with peaks over 7% at the start of the 1970's.

As for building work, there was an increase in licenses in line with demographic growth, due to the demand for housing in accordance with economic growth.

Until the drawing up and approval of the "Mesones" Plan, the evolution of city planning had been determined by a group of alignment reform plans, which responded to a traditional form of urbanism, reforming and modernizing the central urban space, which included the Cort Plan, the Alignment Reform Plan and the Partial Alignment Reforms. They were all plans that modified the historic city by means of the regularization and widening of the old medieval streets. Some of them centered exclusively on the city center, forgetting about any regulation of the suburbs. The old narrow, winding streets of the historic center were replaced by wide streets with straight alignments and one

parallel to the next. An elementary hierarchy of urban streets was also established and building ordinances were applied which depended on the street width.

At the same time, what was happening in the suburbs was very different to what was happening in the center. The city was exploding in what Pedro Bidagor called the "oil stain growth", meaning illegal shanty towns which were springing up next to existing roads and prolonging the already consolidated urban spaces. During that period, a series of suburbs appear of which two types can be distinguished:

1. Marginal suburbs, some of which had been started in the Second Republic (Barrio España, Pajarillos, La Maruquesa, La Rubia, La Cañada, etc.). They are suburbs created by invasion or the division of farming land and which are precariously occupied with self-built houses.
2. Workers' suburbs created by public initiative, whose names refer to important figures or events connected to the political regime (Francisco Franco, José Antonio Girón, Jesús Aramburu, La Victoria, etc.). They are suburbs far from the city, designed as independent pieces with a building typology of a mixture between the minimal housing of rationalism and rural housing.

These planning instruments, however, were soon overwhelmed by the economic growth of the city. The creation of Valladolid as the Pole of Development brought with it unprecedented growth fueled by industrial growth.

The Dictatorship's control system

General Franco's dictatorship had evolved in the 1960's, from the hard, post-war years to 'Desarrollismo'[1]. Economic development had made society evolve by incorporating important numbers of workers and technicians from an initially agricultural society. Mass tourism, attracted by low prices and high temperatures, which flooded the Mediterranean coast especially, had changed many of the social norms (behavior, dress, the arts, etc.) that the hierarchy of the Roman Catholic Church had managed to impose on Spanish society in the hardest years of the Dictatorship. It is, in fact, the Minister for Information and Tourism, Manuel Fraga Iribarne, who modifies the regime's attitude, changing, slightly but substantially, the press law, making censorship more flexible for the press, cinema and television, and opening the country up to European tourism attracted by the sun and sand. However, political and labor conflicts continue to increase with the economic development of society. Countering this, there is also an increase in police controls, making the repression of all political activity yet more intense, especially in the workers' suburbs in the large cities, where labor strikes and political protest movements are becoming dangerously strong. Valladolid was precisely a city which had, on the one hand, an industrial pole with an important number of workers and, at the same time, the University, one of the most important and dangerous focal points for political agitation. These two factors together meant that there was constant persecution of political groupings by the political police. We need only remember, as an example of this tension, the events of the strike in FASA in 1969, with almost 15,000 workers on the street and acts of protest in the University, including

concerts of protest songs, assemblies and demonstrations on the streets, ending with the closure of the University in 1974 for the rest of the course. So, at that time, society in Valladolid finds itself in a situation in which it is impossible to carry out debates on urban matters without them being interpreted as acts of political opposition fostered by illegal parties. Especially dangerous for the Regime was the Communist Party of Spain, which was very active at that time, together with a host of similar, small political groups throughout the University (communists of diverse tendencies: trotskyists, maoists, socialists and others), as well as trade union groups in the factories, such as 'Comisiones Obreras' (Workers' Commissions) or the 'Unión General de Trabajadores' (General Workers' Union). Civil society did not have any means by which it could demonstrate its opposition to the Regime's urban policies and the normal reaction to any protest against the policies carried out by the City Council was to consider it a form of political opposition instigated by the clandestine parties. Such protests were, therefore, censored in the press. For example, some University lecturers from the Arts Faculty disagreed with city planning, especially the destruction of Renaissance palaces that was taking place in Valladolid at that time, to be replaced by blocks of flats. However, the political situation was not conducive to the start of a debate on the subject, as it could be used by radical groups against the Regime. For some of the said lecturers, the solution was to take part in the commissions that took the decisions to destroy the country's patrimony and thus try to save some parts of that heritage, such as doorways, columns of patios, coats of arms and other elements that were not an obstacle to the real estate business.

The role of a group of architects as ideologues of the city's production

Valladolid had a very small number of architects, closely related to the most important promoters of real estate, who were strategically placed in the City Hall and the Provincial Diputation, thus monopolizing construction work. The situation was so extreme that only three offices, that of the architects Isaías Paredes Sanz and Angel Ríos Gómez, that of José Luis Tuesta Caballero and that of Julio González Martín, through 1,145 projects for 39,479 houses, monopolized 41.8 % of the building schemes and houses and flats built in Valladolid between 1960 and 1992[2]. This can be explained by the lack of control within the City Hall and the Administration's favoritism with private interests, and also by the existence of a very liberal incompatibility regime. The most curious case is that of the offices created by the two architects Isaías Paredes and Angel Ríos, the former being an architect of the City Hall and the latter of the Diputation, so that, when one of them was declared incompatible because the project belonged to a particular administration, or was in the jurisdiction of that administration, the project was signed by the other.

Alongside this group of architects who effectively controlled the city, there was another much more numerous group, but with less social influence, who, from a more critical position, took part in various places. They also acted from the official organisms, but in particular from the College of Architects of Valladolid (then dependent on the Official College of Architects of Madrid). In the mid 1979's, they exercised a certain amount of pressure, by means of planning allegations, in favor of carrying out city planning legally,

protecting the city's patrimony and acting rationally, both in the capital and the villages of the province.

In any case, it should be pointed out how such a lack of definition in the alignment reform plans favored freedom of action in the application of city planning in the City Council of those years. The Council architects had the power to increase or decrease the profits of an operation, and even to stop it. The alignment reform plan left many elements undefined, so that in the preliminary projects and more detailed studies of the development of a particular area, the municipal architect could apply one depth of edification or another, one height or another with respect to very flexible criteria. In the same way, the municipal architect could promote or encourage such planning reforms as he felt necessary, making density changes and other similar acts that would directly affect the profitability of the operation. One well-known case is that of builders who contract the offices of the municipal architect to design their projects as a way to avoid problems of red tape.

The General Local Plan of 1969, known as the "Mesones" Plan

The fact that the Alignment Reform Plan of 1952 was not functioning properly, plus the existence of new city planning legislation that required provincial capitals to draw up general plans, as well as the conflicts caused by the impossibility of growth beyond the limits of the said plan of 1952, had all created numerous problems in the municipality. The Ministry's Directorate General of City Planning was pressurizing the City Council to draw up a new planning instrument. Finally, the City Council agreed, in 1962, on the drawing up of a General Plan, as required by the then current legislation. This was done by the architects Javier Mesones[3], Miguel Durán-Lóriga and Manuel Cortés.

The work of drawing up the Plan began with the compiling of the urbanistic information and its delivery to the City Hall. A new plan of Valladolid was made from the projection of 1962. Nevertheless, the drawing up of the plan was halted for reasons that remain unclear. It was six years later, on the instances of the new mayor, Martín Santos, that the writers were once more asked to finish their work. Meanwhile, the Ministry was drawing up the plan of the road network in Valladolid, a very ambitious plan involving a change in scale and budget. So, when the work began once more, in the next phase of drawing up the plan, the project was significantly modified. The range of the plan changes to take in several of the surrounding municipalities, thus bringing about a change of name as well: General Local Plan. The municipalities included are those that form a crown around the city. They are small villages in comparison with the provincial capital. Arroyo de la Encomienda, Boecillo, Cabezón de Pisuerga, La Cistérniga, Fuensaldaña, Laguna de Duero, Renedo de Esgueva, Santovenia de Pisuerga, Simancas, Tudela de Duero, Viana de Cega, Villanubla and Zaratán. Only Arroyo de la Encomienda, Laguna de Duero and Tudela de Duero stand out from the rest, the first with an incipient illegal construction, called La Flecha, the second with the first residential developments associated with the automobile factory, FASA, and the third, being sufficiently far from the city to have its own dynamics as a small capital. Except for these three, that have a greater dynamic than the others, the rest are clearly little

more than villages with a completely agricultural activity in spite of their proximity to the capital. Renedo de Esgueva, Villanubla and Zaratán were the smallest. Another question of interest is the plan's financing. The Directorate General of City Planning participated generously in the payment of expenses incurred while drawing up the plan, followed by Valladolid City Council and the municipalities of the surrounding area, which jumped on the band wagon at the last moment.

The Plan was provisionally approved in 1969 by the City Council, and definitively in1970 by the Ministry.

The contents of the Plan

The General Local Plan of Valladolid is clearly different from the previous urban plan for Valladolid. It is not an Alignment Reform Plan, as the previous plans were. It radically changes the method used for drawing plans. The new plan turns to a city planning of striped areas and checked areas, leaving behind that of new alignments. The Cort Plan was a plan of colored lines, with red lines for new constructions, black for building to be maintained, green for the parks and gardens and blue for the rivers. The Mesones Plan is in black and white. It uses the system of drawing areas, that some English and American firms at that time had put on the market.

The Plan clearly differentiated, in its method for depicting the city, the treatment of the historical quarter (a generic dark area) from that of the rest of the city (containing various areas, of bricks, circles and different kinds of dots). While the city outside the historic quarter is treated differently in each zone, the center is homogeneous, all the same area. The areas used make reference to the new concept of zoning. The zones are drawn in areas, so that each area is different according to the different uses, urban, residential or industrial. Each zone thus drawn corresponds to certain regulations that control the construction activity in that area. The different zones are connected by a powerful road structure. There is a contrast between the new structure of roads, with great widths, and the existing structure, much narrower, in which the city's traditional roads can be identified, such as, for instance, the Paseo de Zorrilla, three times narrower than the proposed new roads. An important exception is a new road following the river Esgueva, and thus of a necessarily reduced width, as it is in an already existing space between peripheral suburbs and the river.

It is a question of making a new kind of plan, more closely allied with the English "structure plan" than with the traditional alignment plans. In effect, there are similarities with some English plans, as we shall point out later.

The city model proposed in the Mesones Plan can be summarized as follows:

1. Growth to the South, over a flat space, with a large scale network
2. Growth to the West with an organic form, that adapts to the topography
3. Industrial growth to the East, continuing the industrial estates of Argales and San Cristóbal

4. Continuity with the regulatory systems of the existing city
5. Large size road system, designed to cope with extraordinary growth in the number of automobiles

The growth to the South is perhaps the most characteristic element of this proposal. It involves directional growth southwards of 24 superblocks organized in five great avenues in parallel in a southerly direction and another seven perpendicular to the others forming an enormous, rectangular network. The proposal for this area ignores the presence of pre-existing infrastructures, considering agricultural land with roads, railways, rural paths and irrigation channels, already in quite an advanced state of urbanization, as "tabula rasa". It also ignores the presence of "El Pinar", a tree-covered area belonging to the municipality since the 16th Century and serving as an area of leisure and as the city's lungs. The similarity with the English plans mentioned above is particularly noticeable in the case of the mega reticule of the southern extension of the Mesones Plan and its similarity to the proposals by Colin Buchanan and Associates for reticule growth in South Hampshire, published in England in1966[4]. It is a plan with a certain parallelism, taking into account the expected growth in both cities at the time.

The growth towards the West is organized according to the roads that adapt to the contour lines, avoiding Contiendas hill and developing along the flatter areas. The streets designed thus are curved, giving rise to blocks of differing sizes and, most of the time, trapezoidal in shape. The expansion area to the West starts from the ordering of Huerta del Rey, which had been opened to competition a couple of years before by the Housing Ministry, resulting in a suburb with a rational and functional layout. The connection between the existing suburb and the new one demonstrates the different ways of understanding the new city, even though a great part of the concepts of the new city planning are shared by both.

The industrial growth proposed by the Mesones Plan is part of the plan's continuity in policies with those proposed by the INUR, the National City Planning Institute, dependent on the Ministry, which had set in motion the two industrial estates of Argales and San Cristóbal. The Plan takes up the tendency to industrialize the eastern part of the city by situating there both publicly sponsored industrial estates and also takes advantage of the existence of the FASA factory in the area to consolidate the whole area covering the road out of Valladolid in the direction of Madrid as far as Laguna de Duero as industrial.

Undoubtedly, the most transcendental decision of the Plan is that of respecting the previous city planning regulation for the existing city. The area defined as the "casco actual" (or current city) was provisionally regulated according to the previous norms, so it was possible to build using the ordinances of the Cort Plan and the alignment reform plan of 1945. According to some authors, it was a decision "that is more the consequence of a lack of work on the part of its instigators than anything else" ("que es más bien fruto de un escaso trabajo por parte de los redactores")[5]. Whatever the real reason for the decision, the truth is that the said decision clearly shows that the local agents, businessmen, constructors, promoters, and even the municipal architects, were

highly satisfied with the existing planning, and that they had no intention of modifying it. Only pressure from the General Directorate makes the carrying out of a plan with criteria clearly dictated from above possible. On the other hand, the edificability authorized for the "current city" of 12m^3/m^2, allowed the group of agents acting in the center to do good business.

The road network of Valladolid had then been designed in the Ministry of Public Works, in its 1966 plan. The criteria were those of a new network of infrastructures to serve the automobile. As though Valladolid were a large metropolis, the size of the road system was that of a city which did not yet exist and which would, supposedly, undergo extraordinary growth. The Mesones Plan only took on board this plan for infrastructures and set it down in the city plan. In any case, the truth is that the growth in the number of automobiles was not as large as expected, especially if we take into account the fact that the petrol crisis began on an international level in 1973, only a few years after approving the plan, and ruining developmentism's continuous growth idea. At the same time, there was no public investment in infrastructures, so the road network envisaged by the Ministry was begun twenty years later, with a different political regime and a very different economic situation.

The results of the Plan

The interesting thing about the Mesones Plan resides in the urbanistic operation it proposed, halfway between the orthodox urbanism of that historical moment, as defined by the techniques of the Ministry, which proposed a growth model for the city of large packages, supported by grand infrastructures; and the urbanism catering to the local powers that be, an urbanism that adjusted to the size of local firms and the city's market, but which, at the same time, does not value the city's patrimony. The Mesones Plan basically established two types of intervention. On the one hand, the idea of the General Directorate of City Planning, to encourage urban development in large packages, creating new urban land beyond the existing city. This would require investment in urban infrastructures that the Ministry expected to carry out in an undetermined period of time, and which the private agents were neither financially capable of taking on and nor were they willing to do so. On the other hand, the Mesones Plan made it possible to continue the kind of intervention that up until then had been taking place in the historic quarter. A kind of intervention that could be summarized in: the densification of the urban space by means of the purchase of several old buildings next to each other, joining them together in a single, large plot, constructing one building tripling the previous heights and building ten times as many houses as existed prior to the new construction.

Of these two formulas, the clear winner was the local option, the local plot, supported by a reduced firm size that fitted better with small or medium-sized operations, as was the norm in the real estate operations that had been taking place in the historic quarter. The purchase of large areas of land and its subsequent urbanization to develop partial plans needed financial conditions that were beyond the reach of the local promoters.

All the time the Mesones Plan was in force (1969-1984), only the public agents transform new land for new growth, because the cost of infrastructures. The option of new land for growth was only developed by the public sector, whether for social housing or the creation of new industrial land.

In spite of the local option's clear victory, certain agents, large landowners, promoters and constructors took up positions with respect to the development of grand partial plans. Some large landowners, hesitantly began to commission development plans, as was the case of the Parque Alameda Partial Plan, entrusted to the architect Longoria by the landowner. This initiative failed in its attempt to develop it because of delays and the lack of a determined management. A group of constructors and promoters gradually bought up the land in the southern zone, but its urban development took place twenty years later, with a different urban plan. The most successful initiative was, without a doubt, the Parquesol Partial Plan. In spite of its success, the bulldozers did not move in until the new General Plan had already begun to be drawn up.

Conclusions

City planning during Franco's dictatorship in the city of Valladolid clearly shows the distance that existed between the desire to rationalize building activity on the part of the Ministry, the technical aspects of city planning, and the reality of the facts, characterized by the continuation of the old ways of going about things. It shows the complete supremacy of the local architects' and businessmen's plot.

1. The Mesones plan was initially, a positive instrument, with a clear idea of the new city. However, it ended up as a tool of little use, rhetorical and ineffective with regard to the regulation and control of the building activity in the city.
2. All the time the Mesones Plan was in force (a plan characterized by its extraordinary proposal for directional growth supported by grandiose road networks), only public agents transform new land for new growth, because the cost of infrastructures. The option of new land for growth was only developed by the public sector, whether for social housing or the creation of new industrial land.
3. The private agents continued to intervene in the historic quarter, with no control whatsoever, using 19th century planning techniques of street widening, increasing heights and densification. In the end, this was the death knell for many of the historically valuable buildings and resulted in a radical transformation of the historical landscape.
4. This behavior was founded on an agreement between local businessmen and some municipal architects with private offices. The latter acted as 'intermediaries' for the businessmen, ideologically nurturing the modification of city planning from their privileged posts in the City Council and drawing up the projects in their own private offices.
5. As a continuation of the above, they also intervened on the outskirts of the city and its interstices, the peripheral suburbs, where less important promoters, businessmen and landowners took part.

6. Despite the Mesones Plan's lack of efficiency, with respect to the modification of the model of the city (with the proposal to create large new areas that would depend on a powerful, new road network), the truth is that the plan was of use in carrying out operations to buy up agricultural land in the areas that the plan proposed for the development of the new city. These purchases were carried out by external operators, but the local operators also came together in associations in order to buy up large areas of land, which were developed in the next decade, with the General Plan.

7. Spain's transition to democracy from 1975 onwards, the new democratic town councils in 1979, and the criticism aimed at the rampant speculation in the previous period all contributed to inverting the situation, reducing the possibility of intervention in the historic quarter, forcing real estate agents to act in the new areas of growth from the 1980's onwards.

Urban design controls and city development in a New Zealand context: reflections on recent experiences in Auckland's urban core

John Hunt
University of Auckland, New Zealand

Introduction: a brief history of the legislative context of planning in New Zealand

Like a number of other countries, New Zealand is experiencing a greater focus on the quality of its urban environment. This 'urban renaissance' [1] has turned attention to the interface between processes of city planning and urban design and the need for planning processes that will promote strong urban design outcomes.

As a small country New Zealand has relied on national legislation to direct the physical development of both urban and rural areas. The Town and Country Act (TCPA), established in 1953, had its origins in an amalgam of British and American legislation of the 1950's [2] and was significantly revised in 1977. Williams notes that over a thirty five year period the provisions of the Act progressively evolved through the influence of Planning Tribunal case law and by the experience and expertise of the professions involved in planning practice.[3] While it is speculative to suggest that the TCPA would have coped more effectively with the 'urban renaissance' than does our current planning legislation, some planning professionals with experience of both regimes suggest that this is so.[4]

In 1987 the Government commissioned a review of the TCPA [5], prompted by an increasingly deregulated national economy, greater government responsiveness to 'market forces', and an associated concern for individual property development rights.[6] Williams records two opposing trends during the 1980's: pressures for less delay in the development approval process, and the right to object to planning decisions. He points out that these trends are mutually exclusive and that all that can be hoped for is a balance between them. [7] In his view the TCPA achieved this balance. Interestingly, Hearn in his 1987 review of the TCPA, while suggesting a number of amendments, notes that "if my recommendations were adopted, much of the Town and Country Planning Act would remain the same".[8]

In 1991 the TCPA was replaced by the Resource Management Act (RMA). Much wider in scope than the TCPA, the RMA amalgamated existing town and country planning, water and soil, mining and coastal legislation. In respect of urban planning, experience during the sixteen years since its introduction suggests that the above noted balance between speedy development processes and rights of objection has not been achieved, and that a 'market forces' emphasis remains at odds with processes that deliver high quality urban design outcomes.

The resource management act

The fundamental intent of the RMA is to promote the sustainable management of natural and physical resources. [9] Sustainable management is defined by the Act as "managing the use, development and protection of natural and physical resources in a way, or at a rate, which enables people and community to provide for their social, economic and cultural well being". The Act identifies three key objectives of this management regime: sustaining the potential of natural and physical resources to meet the reasonably foreseeable needs of future generations; safeguarding the life-supporting capacity of air, water, soil and ecosystem; and avoiding, remedying or mitigating any adverse effects of activities on the environment. Despite reference in the definition to social, economic and cultural wellbeing, the bio-physical focus of this statement of purpose will be evident, and has been commented on in the international planning literature.[10]

At the time of its introduction the RMA was lauded by some as world leading legislation.[11] In practice the Act has proved to work well in some situations but not others. In 2007 a national conference was held which focused on the effectiveness of the Act in a number of contexts. Organized by the Environmental Defence Society (a leading New Zealand non-governmental agency), the title of the conference - "Beyond the RMA"- invited consideration that it might be time to consider replacing the Act. Speakers argued that in most areas of environmental management the Act merely needed fine tuning and more rigorous application. However, a number of speakers suggested that in respect of urban development all may not be well. In a scene setting paper, Oram [12]suggested that in urban areas the RMA works well for minor works but was inadequate for dealing with wide-area, long-term and strategic issues of urban development. Peart [13] noted that the ecological focus of the Act provides little guidance or support for the management of the built environment. She argues that "a better tailored regime for urban planning could be developed, more alive to social and economic as well as environmental issues". Hill identified metropolitan planning as in need of more effective institutional decision making arrangements, and he offered the opinion that "that urban design and transport planning are increasingly 'edgey' in terms of core RMA activities". [14] In the context of infrastructure delivery, Selwood [15] identified a number of shortcomings with the Act and its application. Relevant issues in respect of urban planning include the lack of recognition of the national significance of essential infrastructure related to community needs; an emphasis on adverse environmental effects and the need for these to be better balanced with the positive wider economic, social and environmental effects of improved infrastructure provision; the lack of national guidance or standards; conflicts between regional and local consenting processes; inconsistencies in approach and interpretation between different local authorities; and the use by public interest groups of the Act's provisions for objecting to developments, in which environmental concerns become a proxy for self interest.

The RMA and development approval processes

The RMA is given effect in the context of urban development by way of District Plans, and the responsibility for preparing and implementing these plans lies with local authorities (district or city councils). The RMA focuses on the effects and impacts of development rather than on the nature and scale of development. Section 3 1(a) of the Act requires that District Plans focus on the "integrated management of the effects of the use, development or protection of land and associated natural and physical resources". Peart [16] records that RMA plans have been effects based rather than strategic, and mitigation-oriented rather than goal-oriented. The RMA replaced the zoning based legislation that previously governed both urban and rural planning, and as Jay [17] notes, under this new legislation zones in District Plans are related to the types of effects generated by activities, rather than types of uses.

Section 75 of the RMA requires that District Plans identify significant resource management issues and in response develop an integrated package of objectives, policies, and rules (if any) to implement these policies. Local Authorities are also able (although not required) to indicate the anticipated environmental outcomes of the policies and where this is done it provides a basis for understanding the rules. The RMA allows alternative methods of implementation of policies, although as Miller [18] has noted, an examination of District Plans reveals a consistent reliance on rules and regulatory mechanisms.

Those seeking development approval (or to use RMA terminology, a resource consent) must demonstrate that their proposals meet the provisions of the District Plan, and in particular that the effects of the development (including the effects of the uses or activities that the development will make possible) are no more than minor. In evaluating development applications the local council must decide the extent to which there are directly affected parties, and whether the applicant has already gained the approval of such parties. Resource consent applications may be processed on a non-notified basis (where there are considered to be no affected parties or where such parties have signed their approval), on the basis of limited notification to affected parties, or on the basis of full (public) notification. Traditionally, analysis of effects has focused on biophysical effects, and issues of design quality have not been considered. However, a recent landmark judicial decision has significantly changed this approach to development assessment. Key features of this case are outlined below.

The changing context and status of urban design in Auckland City

There are a number of pressing reasons why it has become necessary for Auckland City Council (ACC) to move quickly to promote quality urban development and urban design. Auckland city and its surrounding region are experiencing extreme growth pressures. On the basis of present forecasts the region could have a population of approximately two million people by 2050, representing a 65 % increase in current levels.[19] During the next 20 years it has been estimated that the residential population of

the city will grow by approximately 140,000 people, with the urban core designated as an area of population intensification.

An early response to these pressures has been significant development of apartment buildings within the central city area, and the poor quality of many of these developments has resulted in extensive public criticism. This public pressure constitutes a second reason for improved urban design processes and outcomes. In one instance public pressure forced the withdrawal of an already granted development approval. The outcome of the judicial hearing regarding the St James apartment tower in the central city has the potential to redefine the way in which the assessment of effects, and in particular who is affected by a development, are treated. Salient features of this case are now outlined.

Resource consent was granted for this 29 level tower block on a 7 level podium that incorporates a heritage protected theatre, on the basis that neighbouring property owners and the heritage protection agency (the New Zealand Historic Placed Trust) had agreed to the development. This decision was challenged by a group of concerned citizens (incorporated as The Society for the Protection of Auckland City and Waterfront), who argued that a development of this scale and prominence called for public notification, since it created adverse visual effects for the public at large and that these effects were more than minor. In reply, the City Council argued that aesthetics are subjective and that the Council could not be prescriptive on matters of taste, and furthermore that the citizen group could not claim to be representative of wider public views. In their submissions the Council noted that the citizen group was not challenging either the size or location of the design and therefore that the visual effects that were being objected to were due only to the building's design. The fact that this position could be advanced by the Council as a defense highlights the limited basis on which visual effects have typically been assessed under the RMA. Predictably, both the Council and the developer argued that in any event the visual effects were no more than minor. In his landmark decision, the judge determined that "these issues are not to be disposed of by saying that design is a matter of aesthetics, that aesthetics is taste by another name, and that taste is irretrievably subjective and individual. That proposition is at odds with the ordinary principles of architecture and design, and of planning".[20] This decision has provided case law that is certain to change the way in which visual effects will in future be considered, and has highlighted for all local authorities the need to have urban design matters included in resource consent assessments. This particular legal challenge was also a factor in the establishment of an independent urban design panel (in May 2003) to review all central city development applications, and the introduction of urban design assessments as part of the resource consent process.

A third key factor in the changing context and status of urban design has been the establishment in 2005 of a national Urban Design Protocol, aimed at raising awareness of urban design and seeking commitment to a number of key actions by protocol signatories. Auckland City Council become an early signatory to the Protocol and has consistently sought to implement the Protocol's action plan.[21]

The ACC Central Area District Plan and urban design initiatives

The views of a number of commentators regarding shortcomings of the RMA in relation to the management of urban development have been outlined above. A key issue facing New Zealand is whether District Plans and the procedures that they require, are able to accommodate measures that will proactively promote and guide sound urban development. In this regard the measures that have been and are being adopted by Auckland City Council for the central city (referred to as the Central Area in the District Plan), warrant discussion. Following sections of this paper outline these measures and comment on their actual and/or potential effectiveness.

Auckland City's District Plan currently divides the central city area into five "strategic management areas", reflecting the RMA focus on management rather than design. The Plan also identifies fifteen precincts and defines these as "areas that have distinct environmental characteristics which require special management". [22] The idea of a 'precinct' invites urban design consideration, and two of the early precincts to be identified (the Viaduct Harbour precinct and the heritage based Britomart Precinct) have precinct-specific urban design guidelines. Both precincts have a clear identity and clear boundaries, but not all of the central city can be classified in this way. A number of contentious developments, located outside of precinct areas, have been approved on the basis of District Plan provisions that were not design based. As a result of public pressure, the City Council has introduced new provisions, applicable to the whole of the central city and addressing urban design quality and residential amenity. As such they have provided both the urban design panel and City Council staff assessing development applications with a basis on which to engage with such matters. However, it should be noted that these additions were a reaction to deficiencies in the Plan that derive from the focus of the RMA, and took more than two years to develop and be steered through the process of public submissions and hearings. Several matters remain to be resolved through judicial mediation processes.

A second way in which a more comprehensive set of design-led provisions is being grafted onto the existing Plan is by incorporating each part of the central city into a 'Quarter' and developing urban design frameworks for each Quarter. Some eighteen quarters have been proposed, and are currently being reviewed with the intent of amalgamation. In respect of this geographic comprehensiveness, the Quarters may be compared with the five strategic management areas noted above, but as more fine grained and hence potentially responsive to differences in character within the central city.

To date, urban design frameworks have been completed for three Quarters. Development projects prepared within the context of the first of these Quarter Plans are achieving higher quality design outcomes than has been the case for recent developments on nearby sites. But perhaps the real significance of the move to Quarters is that in due course each part of the central city will come under close urban design scrutiny and that design-led objectives, policies, rules and assessment criteria will be incorporated into the District Plan by way of 'Plan modifications'. Whether each

Quarter is developed in a way that becomes distinctively different from neighboring Quarters is perhaps less important, given the large number of Quarters in a relatively compact central city area.

The place of Quarter-based urban design frameworks

As noted above, the future planning provisions for each Quarter will be derived from a design-led exercise that culminates in an urban design framework. As the term implies, a framework is more generic than the traditional masterplan. Nevertheless, it is a plan in the sense that it is primarily graphic. (In the context of the RMA the term "plan" is used to describe documents that are largely or entirely written, and for many built environment design professionals this remains problematic.) The most recently completed framework is significantly more sophisticated than its two predecessors, suggesting that future such frameworks may become good examples of their type. However, whatever the strengths of these frameworks, they will remain non statutory, and be given effect largely by the careful drafting of objectives, policies and rules. There is some scope for including rudimentary drawings within a Plan modification, but typically these are for the purpose of describing how the various rule-based development controls apply to the area in question. More significantly, once a framework has been so translated and gains statutory status, it may be varied only by further Plan modifications, to which affected parties may object at hearings. Opportunities for discretionary, design-based, assessments in applying a Quarter Plan are limited, in contrast to the relative freedoms that design professionals associate with drawn plans and the capacity to revise these.

A recent development that seeks to introduce greater local authority discretion into the process of implementing a Quarter Plan is the requirement for the owner or developer of large sites, where development entails a number of buildings and open spaces, to prepare a Comprehensive Site Structure Plan (CSSP) for design review and approval. The development of such structure plans that carry statutory weight, and which must conform to a larger urban design framework, represents a significant advance in assuring high quality urban design outcomes.

However, even with a comprehensive set of urban design frameworks for each Quarter there remains a need for an integrating framework that addresses urban design issues at the level of the whole of the central city area. At this larger scale such a framework must relate to other aspects of metropolitan development such as transportation strategies and other infrastructure provisions. To date Auckland City Council has completed a city wide urban design framework and is currently preparing a framework for the CBD. However, both documents are neither part of the District Plan nor do they include physical plans. As such, they can be expected to offer little direct guidance for development on the ground. The challenge remains to develop spatial and built form plans at the scale of the central city area and to give these statutory authority.

Other Auckland City Council urban design initiatives

The fact that national legislation (rather than city by laws, for example) governs urban development at all levels means that without the statutory authority afforded by the RMA, urban planning and urban design initiatives that sit outside a District Plan potentially remain unenforceable. Despite this limitation, ACC have implemented a number of such non statutory measures, aimed at improving the urban environment of the central city. While the two frameworks noted above operate at a broad level, urban design guidelines have also been prepared for several parts of the central city. In addition, a city waterfront masterplan has also been recently completed, to demonstrate how a previously established vision (the "Waterfront 2040" exercise), based on extensive public consultation, might be interpreted on the ground. Producing a physically explicit plan (rather than a more abstract urban design framework) was possible because of the high specificity of the existing waterfront environment and the fact that all the land and over-water structures are in public ownership.

A third non-statutory initiative is the establishment of an urban design panel, and a panel process modeled on that introduced some years ago in Vancouver. The panel comprises representatives of the architecture, landscape architecture and planning professions, together with members of the Property Council (a national body that represents urban development interests). Recommendations of the urban design panel are incorporated into the reports prepared as part of the resource consent granting process. In addition, the city council's own urban design staff prepare separate evaluations that also inform these reports. But there have been instances where the commissioners determining the outcome of a resource consent hearing have not followed the panel's recommendations.

An evaluation of the effectiveness of the RMA in regard to urban planning and design

The initiatives outlined above do not exhaust the possible ways in which statutory or non statutory measures may be developed within the context of the RMA. Although the effectiveness of the RMA has been debated in legal, environmental and planning literatures, little consideration has been given to this question in the context of urban planning and urban design. To begin to answer this question requires a consideration of aspects of the Act and of the processes by which it is implemented. The first three subheadings below address the broad thrust of the Act, followed by a consideration of the processes by which development approvals are gained.

2. Biophysical emphasis

The biophysical emphasis of the RMA has been previously noted. Section 6 of the Act identifies seven matters of "national importance" of which only one, concerning the protection of historic heritage, has any direct bearing on the built environment. Section 7 of the Act identifies eleven "other matters", of which only two have a direct bearing on the built environment. These concern the maintenance and enhancement of amenity

values, and of the quality of the environment. It has to be said that the RMA attaches little importance to the urban environment.

2. Management rather than development

As previously noted, the focus of the RMA is on processes of sustainable management rather than sustainable development. Coupled with the focus on biophysical issues, this places the Act at a significant distance from issues of urban planning and development, and Gleeson and Grundy have observed that this "threatens to result in the replacement of planning by environmental management, a liberalized and de-socialized regulation of bio-physical processes".[23] Commenting on the distinction between sustainable management and sustainable development, Morgan Williams (a former Parliamentary Commissioner for the Environment) has suggested that what New Zealand needs and wants from the RMA is the latter, and that the RMA needs to be integrated with a wider suite of sustainable development policies and initiatives.[24]

3. Procedures rather than environmental outcomes

Given a focus on management rather than development, it is nevertheless possible to distinguish between procedures and outcomes. Barton records that "there is a widespread feeling amongst commentators and professionals that the Act is bogged down by legal formalism", and that there is "too much emphasis on procedures, not outcomes".[25] A cursory study of the Act reveals that most sections are procedure-focused. A greater focus on outcomes would lead to a focus on strategies and tactics needed to achieve these, a point that has been emphasized by Williams.[26]

4. Focus on development effects rather than development outcomes

The RMA requires a focus on the effects and impacts of development rather than the nature and scale of development. Murray and Swaffield have observed that the prediction of environmental effects presents a number of technical problems that have been widely explored in the literature on environmental assessment.[27] The focus on effects as the basis for development evaluations raises a number of issues.

4.1 Emphasis on quantifiable effects

Effects that can be quantified are easier to assess than those that cannot be so measured, and significant energy is devoted to arguing the latter, particularly in hearings proceedings. The recent decision of the Environment Court in respect of an appeal against a resource consent granted for the construction of a hotel on one of Wellington's historic waterfront wharves, vividly illustrates this issue. In respect of the effects (both beneficial and adverse) of the proposed development, the presiding judge and two commissioners saw fit to record that "whether or not many of the benefits identified….were real or illusory, and the extent of those benefits were the subject of much of the debate before us". [28] The Court's Decision traverses the debate on effects at length, noting that not even the judge and commissioners could agree amongst

themselves on whether certain adverse effects were more than minor.[29] In addition to being unable to agree amongst themselves, they also observe that "in a number of matters we have reached different conclusions to the *(Resource Consent)* Hearings Commissioners".[30] These remarks highlight the potential subjectivity of assessments that many assume are made within a framework of instrumental rationality.

Urban design matters typically have to be argued for in hearings, with no guarantee that quality design outcomes will be recognized and endorsed. One of the few concepts advanced by the Act that gives focus to the assessment of the qualitative dimensions of effects is that of "amenity value", defined as "those natural or physical qualities and characteristics of an area which contribute to people's appreciation of its pleasantness, aesthetic coherence, and cultural and recreational attributes". Putting aside that the focus of this definition is on existing amenity (reflecting the management rather than development focus of the Act), the concept of "amenity value" is of itself not particularly discriminating, and some big leaps are required to link the specific urban design qualities of any development proposal to its amenity value. Design proposals that contain serious shortcomings may be argued in terms of the specific amenity that they offer, with the aim of convincing resource consent commissioners that the proposal is nevertheless a good one and that any adverse effects are no more than minor.

4.2   Level of impact of any effect

Section 104D of the Act requires that before a resource consent may be granted the consenting authority has to be satisfied that the effects of an activity on the environment are no more than minor. Any effect considered to be more than minor triggers public notification of the development proposal. What constitutes a minor effect is a matter of judgment and hence a source of debate. For example, when altering a building with heritage value, at what point would that value be diminished to an extent that is more than minor? The inherent subjectivity of such an assessment means that individual hearing commissioners can have a significant personal influence on whether a resource consent is granted.

4.3   Cumulative effects

Section 3 of the Act outlines the meaning of "effects", and includes "any cumulative effect which arises over time or in combination with other effects……." This aspect of the definition compounds the problem of subjectivity noted in section 4.2 above. For example, while a number of individual effects may each be no more than minor, at what point do they add up to an overall effect that is more than minor? A further complication is how to relate the effects of existing buildings to be retained on a development site with the additional effects of proposed development. The difficulty in reliably assessing cumulative effects within a single development proposal encourages those responsible for making a resource consent decision to avoid considering this possibility. One of the few references to cumulative effects in the literature on the RMA can be found in a report on the management of suburban amenity values prepared by the Office of the Parliamentary Commissioner for the Environment.[31] However, examples given are

confined to situations where the granting of a resource consent for infill housing on a single lot was declined on the grounds that subsequent infill development on other nearby lots would have cumulative adverse effects deemed to be more than minor. This is an example of cumulative effects arising over time, as distinct from cumulative effects arising in combination at any point in time. However, the Commissioner's report makes no comment on this latter type of cumulative effect.

A further issue in the assessment of cumulative effects relates to the need for larger frames of reference. Commenting on development at a regional scale, Elliot observes that in the absence of such strategic frames of reference "the 'effects' of individual decisions may appear to be innocuous at the time that they are made, but over a period piecemeal decision making could result in commitment to a direction or form of growth which has major costs that could have been avoided". [32] A similar point can be made in respect of individual urban development projects that proceed in the absence of larger scale urban design plans, frameworks and such like.

4.4 Mitigation of adverse effects

Section 17 of the Act calls for the mitigation of any and all adverse effects in those situations where they cannot be avoided altogether. However, given the multiple effects of any urban development, and the fact that some individual effects are likely to be adverse to an extent that is more than minor, there is a risk that a development with strong overall benefits may be halted because of one or more such individual adverse effects. For example, a high rise development offering a number of benefits might also incur adverse effects with respect to traffic generation that cannot be addressed within the scope of that development. This situation highlights the holistic nature of good design as a process of making tradeoffs amongst a number of factors, in order to optimize an overall outcome. Notwithstanding the need to meet certain thresholds of acceptability in respect of individual impacts, design evaluation needs to also ask "has the overall outcome been optimized?" Williams has stated this in a broader way, when he suggests that "our sustainability focus needs to extend from mitigating effects to include much more focus on efficiencies of resource use".[33]

4.5 Effects assessment rather than design review

Sound development approval processes need to incorporate some element of design review. In an Auckland City context, until the formation of the urban design panel this typically did not happen. However, resource consent hearings are required to focus on effects assessments, with the outcomes of design review having little role. A fundamental issue here is that one can consider effects only in respect of a specific design proposal, whereas design review has the potential to consider or suggest alternative or modified designs that would represent better outcomes. Such deliberations are necessarily excluded from resource consent hearings, and City Council planning and urban design staff have no power to require a development applicant to consider such alternatives.

The assessment of design proposals in terms of recognized principles and practices of sound urban design, rather than in terms of their environmental effects, would be a more effective process, and one which all of the built environment design professions would respect.

5. Implicit reductionism in the resource consent decision making process

It follows from the above observations on effects assessments that several levels of reductive thinking are invoked by the RMA. At the level of resource consent decision making, there is a risk of focusing on individual effects in turn and so treating the whole as no more than the sum of its parts. At the level of sustainable management, an approach based on the avoidance or mitigation of adverse effects, rather than a consideration of efficiencies of resource use, represents a further reductionism. And it can be argued that to treat the environment as a set of discrete resources is also a reductionism. For as Murray and Swaffield have noted, "an ecosystems view emphasizes that human activity is part of a complex and indivisible web of relationships…."[34]

6. A "market forces" planning model

At the time of the introduction of the RMA the Minister for the Environment declared that "for the most part, decision makers operating under the Act's provisions will be controlling the adverse effects, especially in relation to the use of private land".[35] That planning functions could be curtailed to this extent reflects the preferences of the government of the day in favour of the operation of unfettered market forces. The inherent contradiction between this neo-liberal New Right position and the notion of sustainability has been noted by a number of writers. As Daly and Cobb have pointed out, the free market has no means of ensuring an optimal scale of the macro economy relative to the ecosystems in which it operates, yet achieving such a scale is fundamental to ecological sustainability.[36]

Given the freedoms offered by the RMA, where such freedoms result in poor urban development proposals then the only redress is by way of objections to notified resource consent applications, and the presentation of one's case at a resource consent hearing. Unsuccessful objectors may also challenge a resource consent decision in the Environment Court. The cost of such processes is high, and for this reason Gleeson and Grundy note that many community groups will no longer consider this route.[37] Despite this, the wait period for an Environment Court hearing has recently been in the order of several years. The success of alternatives such as mediation and other non statutory processes is dependent on the willingness of development promoters to engage in such processes. Conversely, where a development proposal (or a proposed modification to an existing District Plan) represents a possible loss of commercial opportunity, the larger developers or commercial organizations are likely to threaten costly legal proceedings.

If objecting to development proposals is a reactive form of public involvement, then proactive involvement via consultative processes is also promoted by the Act. While public consultation is usual at the inception of a major project (and local authorities are required to consult in regard to their own projects, including District Plan reviews and modifications), the absence of more traditional "blueprint planning" processes in the RMA means that this consultation is typically conducted without physically explicit design proposals, leaving these to be debated in the adversarial context of the resource consent hearing.

The RMA and urban design outcomes: two examples

Two current examples of urban redevelopment highlight the potential and the challenges presented by RMA processes in achieving high quality urban design outcomes. These are briefly outlined.

The Britomart redevelopment project, Auckland

The Britomart project involves the comprehensive redevelopment of three city blocks in downtown Auckland [38], and is an example of design led processes at each stage of the project. The outcome of a two stage international design competition formed the basis on which a development masterplan was prepared by the winning design team. This was subsequently incorporated into a modification to the District Plan, giving the proposal statutory status. Non statutory design guidelines were also prepared by the design consultants. Each of the individual projects (some sixteen heritage building refurbishments and four major new buildings) and the associated streetscape and public open space projects, is presented to the urban design panel prior to granting individual resource consents. All work on existing buildings is carried out with reference to heritage conservation plans for each building.

This strongly design-led redevelopment process has to a large extent been possible because the City Council owns the land and is able to control the terms of the development leases. In addition, the heritage-responsive development that has been strongly advocated by Auckland citizens has required a reduced investment return, given that new buildings within the precinct will be significantly smaller than that allowed under the District Plan prior to the Britomart plan modification. It has been estimated that the City Council has carried a $50 million reduction in the development return that would otherwise have been possible. However, the political as well as the urban design benefits of so doing are widely recognized.

Notwithstanding these positive project conditions, the developers are seeking to construct a tower that significantly exceeds building height controls, alongside a number of three and four storey heritage buildings. A 'private plan change' process (as allowed for by the RMA) has been launched by the developers to achieve this end. Given that the plan change is very likely to be rejected by the City Council, not least because of the risk of a public outcry, the developers can be expected to pursue their plan change by way of a public hearing. This hearing will be presided over by commissioners who will

be required to consider arguments based on assessment of effects (including visual effects.) Given that the proposed tower has been sized and designed to attract an international five star hotel chain, it can be expected that the economic benefits of such a hotel for the city will be strongly argued by the developer. There is the possibility that a plan change might be granted, despite the fact that the proposal would represent a significant divergence from the urban design principles previously established for the Britomart project. This situation highlights the vulnerability of design led planning controls in the face of the effects-based assessment regime of the RMA.

The "Bowen Integrated Campus" development, Wellington

The so called "Bowen Integrated Campus" project involves a major commercial office development at the edge of the central business district and alongside the site of New Zealand's Parliament complex in the national capital of Wellington. The proposal has been granted a resource consent following a hearing, and the Government has reluctantly decided to challenge this decision in the Environment Court. The Government, by virtue of their status as adjoining property owners, were the only party given the opportunity to make submissions on the development consent application, and had they not opposed the application a resource consent could have been granted without a hearing.

Existing buildings on the development site, both individually and as an ensemble, are widely considered to possess heritage value as an example of modernist government buildings from the 1960's. Although the Wellington City Council, the NZ Historic Places Trust, and independent heritage consultants all agree that they would become 'listed' and therefore protected heritage buildings in due course, they do not currently have this status.

The property was originally developed and owned by the Government, but economic reforms in the 1980's saw all such office properties sold to private development interests, and the new owners are seeking to maximize the amount of accommodation on the site. The proposal involves demolishing one building and incorporating the other two into a single continuous floor plate that extends to the site boundaries and to the maximum permitted new building height, leaving a number of floor levels of the existing buildings protruding above the roof of the new complex. No public open spaces are proposed within the development to replace existing open spaces. In justifying building up to the site boundaries the developers have cited a general design guideline in favor of active edges, contained in the Wellington City Council District Plan. However, an appendix to the design guidelines also analyses the special character of the Parliamentary Precinct and adjacent areas (including the development site) and identifies a pattern of freestanding buildings set back from street edges in an open space setting. No design guidelines have been developed which recognize and seek to protect this aspect of the urban form and character of this area, and given this omission the developers have seized the opportunity to build to the site boundaries. In this they have been supported by the City Council's urban design staff, but not by the heritage advisory staff. In addition to these issues the proposal obscures several significant but

unprotected view-shafts, and treats its boundary with the Parliamentary Precinct as a public frontage by borrowing light, sun and outlook for the new office interiors along this edge.

In reaching their decision to approve the development [39], the hearing commissioners have placed great emphasis on the arguments advanced regarding the various effects assessments, and their decision and its supporting rationale reveal many of the vexatious matters noted above with respect to the assessment of environmental effects. Significantly, no consideration was given to a City Council prepared strategic plan for the future development of the Parliamentary Precinct and neighbouring properties (including the development site) because the Council had not incorporated it within their own District Plan.

Lessons from Vancouver

Like Vancouver, Auckland is a city that aspires to position itself globally in part by the quality of its urban environment. There are a number of other similarities between these two cities which suggest that Auckland might learn from the kinds of urban planning and design policies and practices that Vancouver has developed. These policies and practices have been comprehensively reviewed by Punter [40], and it is evident that they differ in significant respects from those instigated by the RMA. Four aspects of these differences are worthy of comment.

1. A design-led approach

Most significantly, Vancouver's urban planning and development control processes are design-led in the sense that securing the best possible design outcome is a fundamental objective of each step of the process. This feature typically results in documents (notably a suite of 'Official Development Plans') that include physical plans and other kinds of graphic representations of desired outcomes. While such design-led documents are typically based on what Punter refers to as "community visions", he also records that they "can build consensus within the city bureaucracy and enthuse the development industry and community at large".[41] By contrast, the New Zealand process typically sees design proposals revealed at a later point in the consultation process, if at all.

2. Statutory versus non-statutory measures

Vancouver's urban planning and urban design measures are not subject to the provisions of national legislation, and where community participation expectations have been met then such design-explicit measures become incorporated within city bylaws. As such they are also easier to amend, as is demonstrated for example by numerous amendments to the Official Development Plans that are documented on the City of Vancouver website. This contrasts with an urban development process in New Zealand that often revolves around the prospect of litigation and the understandable conservatism of local authorities in order to avoid this wherever possible.

3. Regulatory and discretionary elements

A distinctive feature of Vancouver's urban planning and design strategy is the balance between regulatory and discretionary measures. Punter notes that "in the official development plan process, as elsewhere, the Vancouver approach has been to parallel the regulatory element – the zoning bylaw – with a discretionary element – design guidelines" [42], and he notes that the design guidelines "carry a wealth of advice about all matters to do with building forms and the public realm". In contrast, the RMA focus is on activities and their effects, with limited discretion beyond rules that typically apply to any development proposal. The idea that the discretionary powers of the local authority should be increased in respect to matters of design quality cuts across the permissive intent of the RMA. Despite this, some of the urban design initiatives that have been adopted by Auckland City Council, including the recommendations of the urban design panel and the growing use of assessment criteria rather than rules, represent an increase in discretionary measures.

4. Certainty of urban design outcomes

Despite significant discretionary powers embedded within Vancouver's development approval processes, the design-led approach noted above also provides a high level of certainty, both for the development applicant and in regard to ensuring high quality urban design outcomes. By contrast, urban developments in New Zealand are typically assessed on a site by site basis, in the absence of broader statutory urban design and planning proposals. The issue of whether a particular development positively contributes to a larger urban design or urban planning vision is difficult to assess when such visions have not been defined, or have been defined in a way that provides no clear design direction.

Conclusion

Debate amongst urban design and urban planning practitioners in New Zealand suggests that opinion is divided regarding the potential for RMA processes to promote measures that will ensure consistently high quality urban planning and urban design outcomes. On the one hand the suite of measures recently developed by Auckland City Council could be taken as evidence of an intrinsic adaptability of the RMA and the District Plan process. On the other hand, an emphasis on sustainable management and effects-based assessments, and an underlying permissiveness towards development options, continues to impede progress towards consistently high quality urban development.

While there is no doubt further adaptive capacity within the Act in relation to urban planning and urban design imperatives, at some point this adaptive approach will no longer accord with the underlying purposes of the Act. Some might argue that this point has already been reached. In this regard the remarks made ten years ago by a former

Parliamentary Commissioner for the Environment, are worth revisiting. What was needed, in his view, was a shift in focus from the mitigation of effects to a focus on the efficiencies of resource use. To achieve this Morgan Williams argued for the integration of the RMA with a wider suite of sustainable development policies and initiatives.[43] In respect of urban development, a visit to the websites of leading cities such as New Zealand's near neighbors – Melbourne and Sydney – suggests that he was right.

Alvalade Neighbourhood (1945-1970): a paradigm on Portuguese urban planning

João Pedro T. A. Costa
Technical University of Lisbon, Portugal

1. Introduction

Being a city of quite diverse formation, one of the forms of Lisbon's urban growth during the 20th century was the accomplishment of great housing expansions of public promotion.

The Alvalade Neighbourhood corresponds, in the *Estado Novo Regime* (1926-1974) to the first big housing expansion of public promotion in Lisbon, in which typologies of collective housing were adopted, ensuing the common practice of the 30's decade of promotion of neighbourhoods of villas, inspired in city-garden references that prolonged in the city the rural tradition with the land.

Focusing on approximately 230 hectares, Alvalade had as source the Urbanisation *Plan of the Area South of the Alferes Malheiro Avenue* (1945) that predicted a spatial organization commencing on 8 housing cells centred in school equipment. Carried out until the 70's, through the accomplishment of several detail studies and conjunct projects, the Alvalade Neighbourhood developed a groundbreaking urban design solution in the existing Portuguese urban practise, reusing aspects of several concepts, models and contemporary urban experiences, namely (1) the «pre-industrial» city of blocks and streets, (2) the garden-city, (3) the modern movement, (4) the south and west expansions of Amsterdam, (5) some Berliner Siedlungs and (6) the neighbourhood unity.

Of the Alvalade experience, remains the lecture of the application of the models, not only for their idealism but also the withdrawal of techniques, forms and particular concepts – its capacity to the resolution of specific situations of urban design, constituting instruments of lexis in the hands of urbanists.

Associated to urban design, the Alvalade Neighbourhood also marks the Portuguese reality in consideration with the study of the housing unit, having corresponded to the first great experimentation of the left-right typology rationalization – e.g., minimum areas for residential functions, reduction of the circulation areas, optimization of infrastructures – and the standardization of its constructive elements, to the extent where the urbanisation plan was accompanied by projects of low rent building-types.

Used as basis for the several subsequent housing projects, the housing unit study that took place in Alvalade was also a support for the creation of the first modern ruling on Portuguese edification – the RGEU, published in 1951.

The paper is intended to publish, towards the international scientific community, one of the most relevant accomplishments of 20th century Lisbon, which should have a bigger acknowledgement outside of Portugal. It is supported on a research that took place between 1995 and 1998, from which resulted a master's thesis (1998) and a book (2002, 2005 and 2006).

2. The Alvalade Neighbourhood in the context Of 20th Century Portuguese urbanism and architecture

The 20th century housing in Lisbon, through large initiatives of public promotion, is characterised by the existence of 3 main periods, each corresponding to a specific political context.

In the first 25 years, corresponding to the last years of the Monarchy (until 1910), to the Republic (1910-1920) and to the transition to the *Estado Novo* (New Regime, 1926-1974), the political instability had as consequence large investment on public housing programmes weren't a priority. A reference must be done to the first plans prepared to the *Arco do Cego Neighbourhood* during the Republic, even if its main implementation did only occur until latter.

During the *Estado Novo* first period focus was on the economic and constitutional stabilization and housing programmes weren't also the priority.
Identified as the *Modernist Lisbon* [França, 1980], the period between 1910/20 and half of the 1930's is characterised by the reduced attention from the administration to the municipal problems, which verified a current management of the problems reveled since the Republic.

It was, therefore, a period when «*Lisbon extended without a unified plan. It developed throughout neighbourhoods, nucleus, rural areas urbanized one by one in a rather anarchist way, and little or nothing related with the units, still rural, or already urban, contiguous to them. Also, in the need to accomplish conjoined projects that could guide the development of the city, although some studies[1] were in fact elaborated, nothing permanent was finalized in this field*» [Marques, 1967, p.4].

This moment of less interest on behalf of the central government and of less glamour from the municipal authority, constituted itself as a paradox – or maybe not – as a period that, on an architectural level, some visions of the modern European movement would be continuously approached on an experimental point of view.
The 30's corresponded, even though weighting the inexistence of a regulator plan, to a moment in which the city started to accelerate its rhythm of development, caused essentially by two major factors: the private housing outbreak, generated by the Decree nº 15289, of 1928[2], and a partial reappearance of a public construction policy, complementary to the referred decree, focusing specially in the construction of equipments of various types.

The year of 1933, date of the approval of the Constitution and formation of the National Propaganda Secretariat (SPN), would reveal itself as a hinge point in the evolution of this conjecture, marking its turn. It corresponded to a moment where the country was more stabilized and started looking at its internal accomplishments.

The corporative nationalism, the strong Government, the social-economical interventionism and the colonial imperialism were defined in the «*constitutional commitment of 1933*» as the «*fundamental principals of the political revolution*» that is intended to be put into practise [Rosas, 1990].

A new urban policy of interventionist characteristics was launched, supported in three factors: the elimination of the private monopoly of the urban soil, the subsidy for work and the implementation of great public work enterprises.

«*In the case of Lisbon, this intervention resulted on the definition and construction of the fundamental roadway network for the city and its connections to the Centre, North and South of the Country…, as well as the expansion of the port and the construction of the airport. In a word, the new urban policy consisted in the creation of the basic infrastructures that allowed the expansion of the internal market*» [Silva, 1994, p.13].

The attempt to elaborate a Master Plan for the city was once again stimulated. In that same year, in relation with the presence of Agache in Portugal, the Government Decree nº 24802, of 12/21/1934, was promulgated, the first regulation concerning the elaboration and approval of City Hall Urbanisation Plans, substituting the anterior figure of the General Improvement Plans.

At this phase, the *Regime* felled the necessity to create a unique architecture, to express the values that it sustained: authority, discipline and order on one side and the cult of nationalism, of family and the rural world on another[3].

Salazar affirmed then: «*We are all against all the internationalisms, against communism, against socialism, against the libertine socialism, against all that diminishes which divide and desegregate the family*» [Salazar, 1937, p.92].
In this context, it should be considered the action of the Directorate General of Buildings and National Monuments – responsible entity, from 1932, for the recovery of several monuments throughout the Country –, aiming the preservation, depuration and purification of the national values; «*When one is old and has besides some centuries, a history, one feels that other values exist and these are at the same time patrimony and imperatives of the national life. Reason complies to the conservation of one and faithfulness with the others…*» [Henriques, Melo, 1989, p.58].

The harsh criticism made by the more conservative sectors to the internationalism of modern architecture, founded herewith arguments in the vanguard work that emerged in the country and adhering to the problems of the Casa Portuguesa, enflamed the clamour, affirming: «*make Portuguese houses in Portugal*»[4]. The doctrinal bases that justified, in the ideologist plan, the appearance of the so called *Estado Novo*

architecture, emerged therefore from opposite horizons, conferring some theoretical support to the architecture that the *Regime* needed – and marked the context of the urban and architectural culture, in which the proposals for the Alvalade Neighbourhood would start beginning in 1938.

In effect, 1938 sated the beginning of a new period in the City Hall of Lisbon, (CML), with the entrance of Engineer Duarte Pacheco for its presidency, in accumulation with the functions of Minister of Public Works (MOP). His actions regarding the city policy were characterized by a dynamic, modern posture and authoritarianism «that were articulated in a same aesthetic and political attitude» [Ferreira, 1983b, p.30].
A vast program of land expropriation was then launched, that would last for several years, despite the strong protests from the owners which only the consolidated position of the *Regime* could overcome – land that constituted the territorial basis, not only of the Alvalade Neighbourhood, but as of many of the city's main public accomplishments until present day.

Also connected to his actions in the City Hall of Lisbon, was the achievement of the General Urbanisation and Expansion Plan of Lisbon (PGUEL), started in 1938 with the participation of Etiènne De Gröer that «*defined the major development lines for the city (partly resuming Agache's orientations of 1933)*» and «*writing the program for the analytical base study towards the establishment of the Main Plan*» [Silva, 1994, p.15]. During the development of PGUEL several studies were made in parallel, of which resulted, for example, the *Encarnação*, *Campolide*, *Madre Deus* or *Caselas* neighbourhoods. The promotion of these neighbourhoods fitted in the «Economic Houses» program, launched in 1933[5]; by establishing several incentives, this programme promoted the typology of isolated houses for single families obeying to a clear directive:

«*We will start the construction of the economic house, the house of the poorer, (…) arranged as a nest - home of the working family, modest home, secluded, Portuguese*»[6].

The transition to the 1940's was marked by the realization of the Portuguese World Exposition, important display of the *Regime* that fulfilled the role of ideological propaganda, its virtues and growing nationalism, being the architecture the means to enhance it. The direct intervention of Salazar, his nationalist and historicist speech, conservator and filled with unanimity, coexisted with the rationalism and internationalism of Duarte Pacheco and the architects by him mobilized.

«*It was mainly from this event and as the vast public work program advanced with "constructions type" throughout the country, that the "Portuguese architecture" or the "soft Portuguese" style was typified, a mist of nationalism and internationalism, similar to what happened in Italy, Spain and Germany. Monumentality, regularity, architectural references of mannerist and baroque evocation, materials and modern constructive solutions but of formal traditional inspiration, were some of the ingredients of this new*

language that developed in the 40's and 50's and to which convincingly or ironically, many of the architects of that time joined» [Calado, 1994, p.13].

«*In 1943, The Urbanisation and Work Direction Services considered concluded the study of the great lines of PGUEL and established the bases in which would be settled the "detail studies to elaborate in parallel with the necessities of expansion of the city"*» [Silva, 1994, p.16]; however, this Plan would never be officially approved.

The modern movement architecture in Portugal was then substituted by a new cultural vision of architecture, connected to certain European nationalist movements, having in Portugal particular characteristics.

Paulo Varela Gomes identifies also the 40's with the formation of a «*third via of the Portuguese architecture*», a modern architecture non internationalist, organized, aware of the lost values of the vernacular and erudite tradition, which will later on, result in the realization of the «*Inquiry to the Portuguese Regional Architecture*»[7] [Gomes, 1991]. Therefore, the architecture of the Estado Novo, developed predominantly during the 40's, can be characterized in general terms in the following way:

- In terms of public buildings, the search for monumentality as expression of grandiosity of the Government, demonstrating a sense of authority and order, with frequent use of a classic vocabulary, either in terms of architecture expression, or in terms of its urban insertion (creating street threading, excelled squares to the public buildings, etc.).
- On a housing level, a traditionalism while representation of national values, recurring to elements of regionalist architecture and classicism, raised to a national category

.
These two lines of expression appear frequently overlapped, especially in the buildings that, by their function or dimension, are part of the two categories – buildings of urban housing, public buildings in small agglomerates, etc.

This characterization corresponded effectively to the ideal of edification of the *Regime*, expressed in Salazar's own words: «*This work, varied and multiform, of majestic buildings or small gracious houses, of large roads and rustic paths, of factories and churches, of ports and dams, of schools and of hospitals, of castles and military barracks, wasn't born by chance, but by our own concept of Government and of the Portuguese society, this is, a hierarchic society without privileges, worker without servitude, modest without misery, progressive without detaching from the past of which is proud of…*» [Salazar, November 7th, 1948, in: Henriques, Melo, 1989, pp. 180/181]. The profit housing-building of Lisbon also played a main part in the urban dynamics of that time, adhering to the "official" model of taste and contributing for its divulgence. With the death of Duarte Pacheco in 1943, victim of an automobile accident, this interventionist project for the city of Lisbon, suffered a harsh setback, situation worsen with the publication of Law nº 2018, of 07/24/1946, and of Law nº 2030 of 06/02/1948, which reintroduced the judicial phase in the process of land expropriation. However, as

for many other public initiatives, the basic lands for the Alvalade urbanization were guaranteed.

It was necessary to get to 1945, époque in which the housing needs increased, for a first concession of Salazar to the model of the Casa Portuguesa. The «Low Rent Houses»[8], aimed towards the urban medium classes, allowed for the first time multifamily buildings, settling a maximum of 4 floors. It was in this frame that was initially developed the Alvalade Neighbourhood, in sequence to PGUEL, built by the City Hall of Lisbon.

«A total renovation, in 1938, of the principal guiders of the Municipality, allowed that, in 1944, the City Hall of Lisbon, having already a large direct experience of solution of Lisbon's problems, opened way to large urbanisations, totally integrated in the modern rules, accepted as guidelines of a better resolution of the city development, benefiting the general population. Until 1938, little or nothing had been advanced in terms of evolution of the concept of urbanism, as it started to be accepted and practised in the large European agglomerates, to quote the ones that were closer to the door». [Lobato, 1951].

The year of 1948 marked the realization of the 1st National Congress of Architecture, which was a turn point in the posture of many professionals and the beginning of the condemnation without subterfuges, of the *Regime*'s architecture. This moment of hinge in the aesthetic party of the new generations of architects, would reveal itself determinant from hereon, marking a return attempt to the modern movement, but this time, against the will of the Government.

It was from this date on that numerous projects of modernistic character were developed, including several detail units in the Alvalade Neighbourhood, e.g., the *Estacas Neighbourhood*[9], the *Brazil Avenue*[10] or the *United States of America Avenue*[11].

«In 1948 the Government initiated a period of economical conditionings, which took the CML to concentrate their financial means and technical capacities in the conclusion of works already initiated or predicted in the 1947 Plan» [Silva, 1994, p.17], reducing substantially its operability in terms of territory intervention.

In Alvalade, the main consequence was the incapacity of urbanisation through the program of «Low Rent Houses», totally dependent of the Government, and its substitution for the program "Houses with Limited Rent", permitting from then on, a variety of urban detail studies and the participation, even if conditioned, of private initiative.

Arriving to the decades of the 50's and 60's, the Government priority was orientated toward invests in infrastructures, transportations and communications, in an effort to give the Portuguese economical activities an oriented global framing.

In what concerns the planning issues, in February of 1954, the CML created the Cabinet of Urbanisation Studies, which main function consisted in the revision and actualization of the *Master Plan of the City of Lisbon* of 1948, from which will result the *Master Urbanisation Plan of Lisbon* of 1959.

By this time, the Alvalade Neighbourhood was in great part built or projected, even if several areas were accomplished in subsequent dates.

3. Alvalade Neighbourhood, a synthesis of the Urbanisation Plan (1945) and its implementation until the 1970's

At the time located on the north exit of the city, the urbanisation of the Alvalade Neighbourhood had as basis the *Urbanisation Plan of the Area South of the Alferes Malheiro Avenue*, approved by the Government in October of 1945. This base plan was elaborated, as observed, in a period of full consolidation of the Estado Novo *Regime*, when more attention was given to the cultural issues, after an initial phase of priority investment in the economical and constitutional stabilization of the country.

However, the first urbanisation rehearsals for Alvalade had its origins in the studies of the *Master Plan of the City of Lisbon*, initiated in 1938 in the municipal services, under the direction of Etiènne De Gröer, defining the main development lines for the city. In its first references, (1938-39), the studies comprehended the area of the future urbanisation plan in a wider area foe the expansion of the city: from the actual *Chile Square* to the *Alferes Malheiro Avenue* (actual *Brazil Avenue*). In these first rehearsals the tracings of the *United States of America Avenue* (the new circumvallation via of the city proposed by the *Master Plan of the City of Lisbon*) and the *Rome Avenue* were considered, as well as the limits by the *Alferes Malheiro Avenue*, the *28th of May Camp* and the railway belt.

The first rehearsals of urban design had continuity in 1941, with the accomplishment of the *Joint Study of the Area South of the Alferes Malheiro Avenue*, concluded in 1942, which suffered, in 1944, deep changes. It is important to note that, from this phase on, the design of Alvalade knew already the participation of the architect-urbanist Faria da Costa, author of the urbanisation plan approved in October of 1945.

As mentioned, and also in the ambit of the *Master Plan of the City of Lisbon*, took place, in parallel, a general process of land expropriation, focusing particularly in the surrounding areas of the city (*Monsanto*, *Airport*, *Alvalade*, *Caselas*, *Restelo*, etc.) This process, that took place until 1946, was legitimated by legislation of 1938, reinforced in 1944, in order to allow its applicability towards the execution of new urbanisation plans, after previous approval by the Government. This legislative context allowed, in 1946, the City Hall of Lisbon to become proprietor of the main part of the land in the approximately 230 hectares correspondent to the area of the *Urbanisation Plan of the Area South of the Alferes Malheiro Avenue*.

The Plan area was divided in eight cells, defined by the main road structure, forming distinct urbanisation units, separated between themselves by the surrounding traffic lines. Each of these cells[12] was organized around school equipment, constituting the simple street layouts access areas to the houses.

To overcome the initial inertia and create a strong construction dynamic in the area of the plan, the municipality provided the projects for low rent houses[13] and the infra-structured terrains, also taking responsibility for the construction of the first units. It was the municipality that started the construction program, in a large enough scale so that its accomplishment could become a clear example and stimulation to private activities, creating through this a growth dynamic that would become autonomous of its intervention[14].

With this initiative, by assuming the responsibility for the construction, the municipality could also motivate the civil construction sector, allowing the introduction of new technologies and perfecting the construction processes.

Even though this strong intention in fomenting the construction of low rent housing, the urbanisation plan also predicted the coexistence of different social category houses, continuing the city's tradition and rejecting some contemporary housing theories. The solution was to attribute distinct areas for houses of families with different incomes, following the intention of integration and social complementation.

The plan also predicted the existence of housing with non controlled costs, through the reservation of land for the free market, including the most valuable areas, correspondent to the structural avenues.

The «*elements of general interest*» of the neighbourhood – main free spaces, equipments, public services and commercial areas[15] – were disposed aiming a rationalization of the accessibilities within the plan area, in a way they could be reached by the residents of the eight cells through convenient and not extensive routes, crossing the principal traffic intersections only when it was indispensable.

The total proposed population was 45.000 inhabitants, corresponding to a density of approximately 200 inhabitants per hectare[16] – a density superior to the one until then practised in Lisbon in public housing promotion.

Concerning the urbanisation and edification of Alvalade, the priority of the City Hall of Lisbon was the infra structuring of the area of the plan, which allowed, still in 1946, some street paths were built and, in 1947, almost all the streets were concluded – fulfilling the plan's intentions and making available infra structured land for the housing construction.

Accomplished this priority, the municipality assumed itself as an entrepreneur agent, through the construction of low rent houses, between 1947 and 1956[17], generating, as

the plan intended, construction dynamics that guaranteed the adherence of private agents.

Making a review of the low rent houses programme in the Alvalade Neighbourhood, approximately 2.900 housing-units were built, corresponding to a population of 12.000 inhabitants, when, in its initial program, the *Urbanisation Plan of the Area South of the Alferes Malheiro Avenue*, predicted the construction of about 7.470 housing-units in collective housing of low rent, to host around 31.374 inhabitants – corresponding to an implementation tax of 38%.

As mentioned, this fact was due to the alteration of the economic conditions in the City Hall since 1948, associated to the appearance, still in 1947, of the new legal figure of the «houses with limited rent».

This new legal figure presented a wider range, allowing the construction by privates through the fixation of a limited rent, as well as a subsequent alienation of the construction in public lands, following specific forms and terms[18].

Comparatively the houses of economic rent, this legal figure also allowed the affectation of the ground floor for commercial usage.

From 1947, the figure of the «Limited Rent Houses» progressively gained importance in Alvalade's urbanisation, in the proportional inverted sense of the «Low Rent Houses», affirming itself as a legal figure of impact in the housing construction of controlled costs. In the execution of its detailed studies, the action of the municipal services consisted in the coordination of the urbanisation, organising the plot division process and promoting the construction according to project-types (in an initial phase), or the alienating of land with projects and afterwards overseeing the works.

In some situations, e.g. the single-house area of the *Airport Avenue*, after its division in lots was complete, the terrains were simply transferred, without project.

Initiated in 1949, the Alvalade urbanisation through the figure of the «Limited Rent Houses» dominated the decade of the 50's, having also allowed the realization of several housing detail-studies and project-types by different architects, which respected more or less the initial proposals of the plan.

The urbanisation of the Alvalade Neighbourhood was concluded in the 70's. Detailed information concerning the Alvalade Neighbourhood can be consulted in specialized research, mainly regarding its planning, urbanisation and edification process [Costa, 2002], and the sociologic perspective of the location of the social classes [Janarra, 1994].

4. Alvalade Neighbourhood, synthesis of international influences: a paradigm urban design solution in the Portuguese urban practice

As demonstrated on previous research on the Neighbourhood, Alvalade is an example of eclectic[19] urban design and a paradigm on Portuguese urban planning [Costa, 2002]. Illustrated bellow, one can identify in the Alvalade Neighbourhood urban concepts used in different models of city and in several previous experiences, some constituting paradigms in the urbanism theory.

Its urban design didn't simply reinterpreted one of those models; it wasn't inspired exclusively in a determined previous experience. On the contrary, in the Alvalade Neighbourhood it was achieved a synthesis of variable influences, some token initially as totally antagonists; and the new synthesis constitutes a paradigm, at least in the context of the urbanism in Portugal – therefore the eclectism.

Observed in the primary fonts[20], in the Alvalade Neighbourhood were identified morphological elements proceeding from:

1) The «pre-industrial» city of blocks and streets, e.g.:
- The definition of urban spaces based on a rectilinear street canal, limited by marginal façade plans;
- The application of the concept of avenues and squares as structuring elements of the urban tissues, even if building those urban spaces and the marginal plan of façades with modern architecture;
- The definition of urban perspectives in its main and local structures, marking the longitudinal spaces of street–canal with urban art, in the crossing between axles, or by threading over public equipments, in its end.

2) The Garden City, e.g.:
- The typological proposal for cell 4, with its occupation with single and double family houses, disposed through an organic curve street system;
- The application of the urban model of the housing impasse, proposed by R. Unwin in Town Planning in Practice, and its systematical use in different cells – detailed by different detail studies and built with different architectures;
- The use of other typologies of urban form proposed by Unwin in Town Planning in Practice, specially the retreat of the edification in the interception of the secondary streets, when one finishes;
- The application of a network of interior pedestrian paths to access the school equipment, separated from car traffic;
- The concept of a central public space in each cell, dominated by an intense green mass – the local centrality as a green area;
- The multiplication of green spaces along the plan area, with strong presence of nature in the interior of the cells, including in the backyards and in the street corridors.

3) The Modern Movement, e.g.:

- The application of forms of functional zoning – segregation of the urban functions –, particularly in the plan initial proposals, with the distribution of monofunctional houses of low rent and the concentration of jobs and commerce in located areas;
- The use of the typology of the block perpendicular to the roads, in particular in the main crossing axles, creating new public areas and protecting the building façade from the main road traffic;
- The systemized study of the housing unit in the houses of economic rent – also a base for the following detail studies – and the building of the city through the repetition of the housing plot;
- The rationalist form how the block corners are treated in houses of economic rent: the housing unit generates the building-type and its repetition generates the urban form; the situations that the building-type doesn't solve stay intentionally signaled, in an attitude of extreme rationalism, by opposition to the great richness of corners as an exceptional situation, for example, in the expansion of South Amsterdam;
- Located application of the building over «pilotís» and of the housing block in height, although this «housing unit» almost always corresponds to two /three buildings of left-right side grouped together.

4) Amsterdam Expansions, 1910's (Berlage) and 1930's (Van Eesteren), e.g.:
- The process of opening of the block, being a paradigm the evolution of the commercial block – predicted in the plan as closed, built on cell 3 as a block with na "U" shape, and developed in the Estacas Neighbourhood as a open block, suppressing the two top sides;
- The intermediate stage in the opening process of the block, elected as the dominant urban form, as we can see in the block-type;
- The interior block equipment – the potential that remained to be fully developed in the Alvalade neighbourhood;
- The references made to the treatment of the blocks interior in these 20th century paradigm housing expansions.

5) Some Berliner Siedlungs, e.g.:
- Morphological references in the economical housing buildings to several Siedlungs, being the most significant the proposal of semi opened block integrating an impasse developed at the Siedlung Diesdorferstrasse, J. Goderitz, Berlim 1925;
- The study of the housing unit, with adoption of the methodologies used in the studies of Alexander Klein to the left-right typology;
- The volume scale and the image of the adopted architecture, in particular the first accomplishments of the "Regime Architecture" until 1945.

6) The application of the «Neighbourhood Unit» concept, proposing housing cells with 5.000 inhabitants, centred on the school equipment, and developing a neighbourhood community lifestyle.

In the Alvalade Neighbourhood it can be identified references to morphological elements of models or enounced urban experiences, which have the value of instruments in urban design. With particular characteristics, these elements can be

withdrawn of its original context and again applied in the design towards determined objectives: they are typological elements of urban composition.

The street-corridor valuating the perspective was not applied intending to remake the baroque city; the block with «pilotís» was not applied intending the recreation of the CIAM; the concept of «neighbourhood unit» was framed into the dimension of the national school districts and its application did not create sub-neighbourhoods, isolated and separated between themselves; the application of the impasse and the investment in the green structure did not meant a variant to the garden-city was being looked for. Each of these elements was not valuable by the model or origin experience in which they were developed and to which are referenced. On the contrary, each morphological element was understood as a typological element in urban design, separated from its original context – to which it is associated –, having a determined potential for combination in design. It constitutes a unit within a vast lexis that are basic elements of urban design.

Attending to the obtained synthesis, the Alvalade Neighbourhood constitutes a paradigm in the Portuguese urbanism and a reference that is important to make known internationally in the theory and history of urbanism, in the decades of the 40's and 50's.

5. Alvalade Neighbourhood and the Rgeu, an experimentation laboratory on the Portuguese regulation of the housing unit

An important reference of the housing program in the Alvalade Neighbourhood concerns the development of a profound study for the housing units of the low rent. This unit was also the basis for several posterior proposals, developed by different architects under the figure of the houses with limited rent.

In a large part of the adopted solutions – starting with the initial ones –, the edified urban structure was generated by the repetition of the building-type, which resulted from the study of the housing-unit for the left-right typology.

Therefore, the low rent houses urban areas of the Alvalade Neighbourhood (Cells I, II, V and VI) verified, simultaneously: (1) a road system based on the street-corridor, defined by the front-façades plan, and; (2) an edified urban structure generated by a detailed study of the housing-unit, which was the base for its urban form.

The housing-unit constituted, in the houses of low rent (and further detail plans), the first element of urban design, starting from the particular towards the general in the definition of edified structure.

It is important, therefore, to register the fact that these projects, predicting its construction in large quantities, resulted from an intense research of the housing-unit in terms of: (1) the optimization of the minimum habitability areas; (2) the disposition of the several housing functions; (3) the reduction of its lost areas, and; (4) the systematization of its constructive process.

Not regarding its architectural image, the nature of this research, generating several housing-unit types, is clearly identified with the housing studies of the modern movement, e.g., looking for the minimum areas of the housing-unit based on man's ergonomics, the systematization of typologies and the rationalization of the housing space.

Alexander Klein studies found expression in these projects, mainly through the use of the author's methods for the right-left typology housing-unit [Costa, 2002, p.162]. The research for the houses of low rent fitted in the modern movement, and was considerably marked by the scientific depth that Alexander Klein added to the composition of the unit during the 20's.

Respecting the housing-unit intensive research in Alvalade, a non proved hypothesis suggest this detailed study could have been the technical support for some housing definitions in the *General Ruling of the Urban Edifications* (RGEU), published in Portugal in 1951 and still in exercise nowadays.

Corresponding to a high moment of the modern movement in Portugal, the profound typological and constructive study of the housing-unit in Alvalade determined: (1) the establishment of minimum areas by housing function; (2) optimum spatial dispositions, and; (3) minimum dimensioning of constructive elements.

These definitions are very similar close to the ones published 6 years latter in the RGEU, e.g., the definition of minimum areas and of ideal dispositions concerning the different compartments.

Still needing more investigation, this hypothesis finds a support in the analysis of the first indicators: not very divulged, the modernist research of the housing-unit achieved in Alvalade and promoted by the administration did not had a parallel at the time and coincides in the conclusions with several of the parameters disposed in the RGEU in 1951.

6. Conclusion: the Alvalade Neighbourhood as a reference case in the European housing and planning history

Considering the different characteristics enumerated, the planning and edification of the Alvalade Neighbourhood constitutes one of the highest moments in the 20th century Portuguese history of urbanism and housing.

As observed, in the Portuguese context Alvalade was innovator in several aspects and represented a steep ahead in the modernist housing programme, even though having a nationalist image in its first buildings. It represents a moment when the modernist research on housing lived together with the nationalist image of buildings in one of the dictatorial European countries.

Allowed to developed modernist architecture also in its image since 1947, the Alvalade Neighbourhood reveals the adoption of an eclectic and contemporary solution of urban design, developing a new synthesis starting from diverse and apparently contradictory elements of the urbanistic culture.

Its experimental character knew diverse innovative aspects – e.g., the new scale of public urbanisation in Portugal, the study of the housing-unit and its possible relation with the ruling of 1951, or the laboratory of urban and architectonic quality solutions and its integration in a coherent group –, being a social based neighbourhood who, 60 years latter, is a quality area in the consolidated city, very competitive in the used real state market.

The present article fulfils the objective of disseminate the Alvalade urban planning, urbanization and edification towards the international scientific community. Further specific aspects of the neighbourhood, here superficially mentioned, area available in specific bibliography, and might be developed in future specifically orientated papers.

[7] Inquiry to the Regional Portuguese Architecture accomplished between 1955 and 1960 by several architects, distributed by areas, after published by the then National Syndicate of Architects under the title of «Arquitectura Popular em Portugal». Republished in 1988 in its 3rd edition.

[8] Program of «Low Rent Houses», regulated by the Decree nº 35611, of 04/25/1946, under the Law nº 2007, of 05/07/1945. Considered "houses of low rent" by «*being edified by corporate or anonymous societies, specially constituted for the purpose of this diploma or in it integrated by corporative organisms…*» - quotation of the deferred Decree.

[9] *Estacas Neighbourhood* by Formosinho Sanches and Rui D'Authogia, developed between 1949 and 1952.

[10] Project of Jorge Segurado developed in 1958.

[11] *United States of America Avenue* developed through the project of several authors during the 50's, e.g., Segurado, Filipe Figueiredo, Manuel Laginha, Pedro Cid or Croft de Moura.

[12] The medium dimensioning of each cell took into consideration the maximum limit distance of 500 meters from the houses to the school, located in its centre, which translated in a population between 4.000 and 5.000 inhabitants for cell, values adjusted to the data of the school planning at the time.

[13] Nine type-projects accomplished simultaneously with the Urbanisation Plan by Miguel Jacobetty.

[14] This logic supported the option to initiate the urbanisation by cells 1 and 2, located north, valuing the terrains of the remaining cells, located south and meanwhile involved by urban areas.

[15] Are examples of these main spaces, among others, the *S. João de Brito Church*, the social centre and the civic centre (not built), the two markets (built only one), the school of higher level, the sports area (today the INATEL sports park), or the *Alvalade Wood*.

[16] The proposed population would be distributed by collective housing of economic rents (31.000 inhabitants), collective housing of noon limited rents (9.500 inhabitants), single family villas of non economic rent (2.500 inhabitants) and single family villas of economical rent (2.000 inhabitants)

[17] The housing construction of the Alvalade Neighbourhood began with the realization of the first four construction contracts of the houses of economic rent, located in cell 1 and 2, promoted by the City Hall of Lisbon.

The housing program of the «Economic Rent Houses» had continuity in cell 5, in the area south of the Church Avenue and north of the Maria Amália Vaz de Carvalho Street, between Rome Avenue and Rio de Janeiro Avenue.

The second phase of construction of the «Economic Rent Houses» of cell 5 occurred together with the start of this program in cell 6, in which was predicted an occupation of 62 houses, located on the east of the cell. This process was never completed, being only accomplished a contract for its construction, of which resulted the edification of 42 houses of economical rent of type 2, 3 and 6. The accomplishment of this construction contract was signed in 1952, being the works done between 1954 and 1956.

[18] The city was asked to supervise the construction and to inspect the houses, after which issued a certificate as a house of limited rent.

In return, these constructions had significant fiscal benefits, namely the exemption of taxes in the first land transmissions and in the first transmission of the house, the exemption of the building contribution for a period of 12 years and the absence of expenses in the building regime.

[19] Eclectic, in the method sense: «*Reunion of conciliated thesis withdrawn from different philosophy systems and that are juxtaposed, neglecting pure and simply the parts that aren't conciliated of those systems*» or «*Conciliation through the discovery of a superior point of view of philosophical thesis, presented in the beginning as opponent*».[Lalande, 1968].

[20] In the referred research, constituted as primary fonts the territory, the plans, group studies, projects-type, architecture projects, public space projects, including the several versions of written and drawn pieces, complemented by interviews with several architects and other responsible.

More than a space race: post-war American influences on public and private spaces and buildings in Woomera Village, South Australia

Iris Margery Iwanicki
University of South Australia, Australia

This paper is concerned with various aspects of US influence on the existence of a 'secret' Cold War settlement within Australia. As an example of public planning within the Cold War context, the settlement known as Woomera Village was an integral part of the development of the largest land based rocket range in the world a process comprehensively described by Morton, in 'Fire across the Desert'[1]. (Figure 1) In its earliest years, the Village was the creation of the Joint Project between Britain and Australia, but its design and ultimate survival as a purpose built remote settlement up to the beginning of the twenty first century derives more from US than British influences. While US influences upon the design and adaptation of public and private spaces and buildings can be seen in aspects of its layout and community assets, they are also evident in the wider international context of the Cold War within which the Joint Project was conceived.

US influence on the establishment of Woomera-the international context

America's dominance in the process of scientific weaponry research and the development of the Cold War internationally, particularly its relations with its ally Britain, has been well documented by various historians.[2] In 1944-1945, Hitler's V2 rocket bombardment had destroyed large areas within London and it was realised in 1945 that England could no longer rely upon conventional weapons in any future defence of the island. The British were determined to develop and better the V2 rocket for defence purposes, despite pressing needs for reconstruction of the country after the end of the war in 1945. After the US nuclear bombing of Hiroshima and Nagasaki in 1945, post-war collaboration over the development of nuclear research between England and the US changed. When the US McMahon Act (The Atomic Energy Act) was passed by Congress in 1947, it formally marked the end of war time collaboration between Britain and the US in the development of nuclear weaponry. No longer was America to share nuclear secrets with its Allies, including Britain. [3]

After prior discussions, Britain and Australia established a UK/Australian Joint Project in 1947, involving a collaborative scientific and weapon research program based in Australia. From Australia's point of view, the establishment of the joint project was attractive for a number of reasons. Apart from ties of history, some Australians felt Britain's lack of defence of Singapore against the Japanese was a consequence of Allied concentration on the conflict in Europe.[4] Without the attack on Pearl Harbour, precipitating America's entry into the war, Australia would have been hard-pressed to defend its territory against a Japanese invasion.

The period of nuclear information shutdown between Britain and America between 1947 and 1958 saw the rapid development of the UK-Australian joint project, encompassing a massive industrial complex at Salisbury in metropolitan Adelaide[5], an air force base at Mallala and the establishment and use of the Woomera Rocket Range, declared as the Woomera Prohibited Area (WPA) in South Australia.[6] Situated 500 kilometres north of Adelaide, the WPA extended across to the coast of Western Australia, covering a remote area of 270,000 square kilometres[7] and provided ideal conditions for the testing of rockets and weaponry, both nuclear and non-nuclear.[8]

In 1947-1948, over 2,000 construction workers began building airfields, roads, pipelines and establishing the layout of the Village to house a resident population on the edge of Arcoona Sheep Station in what was to become the south-eastern corner of the massive range.

The progress of the weapons testing on the Range during the 1950s appears to have been influential in persuading the US to review their relationship with Britain. Secret discussions between the Australian Cabinet and the British Minister of Supply during the latter's visit to Australia in 1958 acknowledged the role of the Joint Project in influencing an amendment to the McMahon Act in the same year. The amendment effectively reinstated a limited exchange of scientific nuclear dealings between the United States and Britain. The Minister advised the Australian Cabinet in Canberra that the amendment 'could not have been achieved had not the United Kingdom already made advances in the nuclear field. Similarly, co-operation with the United States in the missile field can only result from Britain developing her own knowledge'. The Minister continued: 'the United Kingdom's missile programme would be impossible of achievement without the Woomera Range. Similarly, without Maralinga, the testing of kilo-ton nuclear devices would be more difficult'.[9]

While Reynolds[10] persuasively outlines the role of the Joint Project in Britain's nuclear ambitions, the Woomera Rocket Range distinctively separated the UK/Australian Joint Project and associated facilities including the Woomera Village to the east, and nuclear testing at Emu Field and Maralinga approximately 500 miles to the west of the Village. US policy in the global play during the early years of the Cold War decisively determined the path taken by the UK and Australia in the establishment of the WPA. It continued to influence the Range's ongoing activities, and the fortunes of Woomera Village, over the succeeding years during disarmament, technological advances and the collapse of the Soviet Union.

Early US involvement

Potential US involvement in the WPA was mused over in the press during the 1950s[11], with one editorial observing in 1958 that 'Australia is entitled to urge that the greater the US involvement in Australian defence projects the better Australian national interests are served and that close cooperation with other members of the Commonwealth should never prove an obstacle to the close cooperation with the United States.[12] In Australia, initial US activity on the Woomera Rocket Range was neither officially

publicised nor confirmed. The Australian press ran a series of articles on possible US involvement,[13] while the British Minister of Defence denied any arrangement. [14]It appears that as early as 1953 the US expressed interest in Woomera, with tests commencing in 1957 where it was 'impossible or impractical to perform elsewhere'[15].

In fact, the US National Aeronautics and Space Administration (NASA) completed its first space tracking station at Woomera in 1958, with other stations built as the local NASA mission grew to include such space projects such as Gemini, Mercury, Mariner and Apollo.[16] This represented the first stage of American involvement in the Village, culminating in NASA's departure in 1973, 'leaving its houses and flats to another group of Americans'. The latter group were associated with the Joint Defense Space Communications Station (JDSCS) activated in mid-1970 near Woomera at a place named Nurrungar, with the First US Air Force personnel arriving in January 1971. The JDSCS was renamed the Joint Defence Facility Nurrungar (JDFN) in the early 1990s and was run with Australia along similar lines as the UK-Australian Joint Project, with Australian personnel taking an increasing role in activities.[17] While the number of US people living in the Village was initially not significant, and certainly not publicised, the last decades of the twentieth century saw the Village surviving because of the US presence when other projects faded and closed. This presence manifested itself in the social life, the use of public spaces, housing development and facilities within the Village. In view of Woomera Village's history, the involvement of the US in Woomera Village from the 1960s onwards during a period of British withdrawal could be considered to be equal to, if not greater, than that of the UK in its design, planning and ongoing development and de-development history.

The Woomera Village Design – US planning influences

US town planning examples and housing were officially and popularly promoted within post-war Australia, [18] in a process where public expectations of peace time reconstruction and recovery were well informed by progressive theories of overseas town planning.[19]. For example a 1944 exhibition entitled US Housing: Past, Present and Future in Victoria's capital, Melbourne, drew over 20,000 people, and the Australian Women's Weekly, a magazine of national importance, ran a competition for 'Victory Homes'.[20] The popularity of future planning was good for war-time morale, shared by professional architects, social planners and citizens alike. As part of this national interest in community planning, the wider planning theory and development trends within the USA exerted a considerable influence on the design of Woomera Village through the experience of the architects and town planners involved.

In the planning stages, the site of the Village was decided on 'an undulating area which would give natural help for drainage purposes, and on a slightly lower level than the tableland, a feature which would be desirable for the pressure of the water table to be laid on to the settlement from storage tanks'[21] . (Figure 2)

With the location chosen, the task of designing the Village was given to the Commonwealth Department of Works and Housing (CDWH), a new government

department formed in 1946 headed by an engineer, Louis Francis Loder. His assistant, Lionel James Price, chaired the Main Works Committee (MWC) and several subcommittees overseeing the development of the Village design. Within a complex departmental structure, a team of architects responded to the instructions of a Board of Administration Long Range Weapons Organisation Australia (BLRWOA) in a collaborative and consultative manner throughout 1947. Earlier, in 1945, the Director General of the Commonwealth Department of Works and Housing had sent Charles Vincent Howard, William (Bill) Reilly and Clyde McGrouther, all architects involved in designing projects required by various government agencies, on a study tour to Canada, the US and South America to 'bring back information about the latest developments in tropical architecture and town planning'.[22] Places on their itinerary included new housing estates designed in response to the topography and setting of the surrounding environment and exhibiting the latest in neighbourhood unit planning and community housing methods. Notably they visited Sunnydale, San Francisco, private garden park developments at Lakeside, San Francisco, and Syvern Woods, Los Angeles. The three also travelled to the 'secret' city of Oak Ridge, Tennessee, a nuclear research town designed by Skidmore, Owings and Merrill and established as part of the Manhattan Project during 1942 -1947. Oak Ridge had many characteristics relevant to the planning for Woomera Village. As outlined by Jackson and Johnson,[23] the original design for Oak Ridge called for 10 dormitories in which to house single persons, the heart of the design was a limited number of single family dwellings based on plans provided by the Pierce Foundation. Houses were to be 'arranged on curving streets and roads in such a way as to dot the ridge behind what was to be the town centre.' Further, 'at the town centre there would be a cluster of stores and supermarkets with adjoining parking lots laid out in what would be the fashion of post war shopping centres'.[24] Despite the enormous differences between Oak Ridge and Woomera in size and topography, there are similarities in intention. A design intention to separate accommodation types in distinct areas around centralised services is also a feature of the Woomera layout. Both Oak Ridge and Woomera were hybrid military and civilian settlements, not unlike a traditional company town, with government analogous to private management.

Both were fully planned, and owned by the government. In the case of Woomera, the locality of the Village was Crown land on 42 year pastoral leasehold and while pastoralists and Aboriginal people remained, the government restricted access and controlled who lived and worked in the Village and on the Range.

There was also a frontier mentality about both settlements as roads, housing and facilities were established as a corollary to the main project. In Woomera's case the establishment of the rocket range was a priority. In the early stages of planning for the Village, provision was made for a large central space for a shopping centre, three sites for churches, worship, hospital, fire and police stations, court house, recreational and open space areas and the early establishment of trees and shrubs to provide a model village. Many of the intended Village buildings were postponed as more urgent Joint Project buildings and infrastructure took precedence over such projects as the local hospital and housing.

Both settlements experienced housing shortages as population increased. Unlike Oak Ridge, Woomera accommodated a peak population of about 6,800 in the 1960s within the original design. Oak Ridge rapidly reached 75,000 by June 1945 in ad hoc housing development; the initial housing being planned to accommodate 2,500 people.[25]Woomera Village has contracted to a vestigial Defence base/township, while Oak Ridge has continued to service a privatised scientific research industry on a much larger scale.

In contrast to Oak Ridge, the details of the Village design were worked through in a highly consultative manner. In July 1947, Price wrote to Evetts that Village planning was in train and enclosed a copy of the proposed layout.[26] A questionnaire from the Assistant Director of CDWH covering a range of issues about village design was circularised and comments received back assisted refinement of the detail of the Village design.[27] In June 1948, an inter-departmental committee noted that it was 'mindful of the fact that Woomera is an isolated locality, and the Prime Minister has expressed the view that that maximum possible amenities should be provided for the staff required to reside at this locality.'[28]

The Radburn plan

Also, of major influence on the overall design of Woomera Village is the neighbourhood unit developed by Clarence Perry, Clarence Stein and Henry Wright in the US prior during the 1920s. (Figure 3)Woomera features elements of the Radburn plan and precedes a number of similar examples of planning in Australia.[29] Freestone, Johnson and Garnaut in their close analysis of the Village layout have identified post-war planning trends influencing the Village morphology: namely, the emphasis on building a new social and physical order, the role of community planning as an integral part of new towns, with desired outcomes of health, safety, economy, order, convenience and beauty. Ideal communities were accommodated physically by compact towns featuring variously green belts, land use zoning, car friendly shopping centres and centrally located civic services within accessible walking distances. [30]

The Radburn estate at Fair Lawn, New Jersey, designed by Clarence Stein and Henry Wright and commenced in 1928 incorporated a response to the rising levels of car ownership through the segregation of people and vehicles. In a hierarchical road system, major collector roads defined and divided a superblock, with through main roads linking sections within the block and local streets in the shape of culs de sac. In addition, internal parks formed the backbone of the neighbourhood. Positioned in the centre of the super block and faced by the living and bedrooms of adjacent dwellings, the parks created continuous wedges of green that not only connected residential areas with a centrally sited school, shops and community facilities but also offered convenient and attractive recreation areas. This approach was suited to the requirements for Woomera Village, including the accommodation of a limited population size and every day facilities in pedestrian accessible locations.

Woomera's layout reflected the Radburn model in a number of aspects. (Figure 4) The Village was on a roughly rectangular site about 1 square mile in area, and divided into 6 sectors determined by the position of cross roads. Within a harsh environment, the Village setting is softened and defined by an encircling perimeter road that followed the loop of a creek bed around eastern and southern edges of the Village – with an Arboretum, water towers and eventually an oval immediately north of perimeter of the Village Within the Village, distributor roads carried through vehicles on each of the north, south and east-west axes. U-shaped roads provided a variation of the Radburn culs-de-sac for local access to residential areas. The separation of pedestrian and motorist was achieved through the provision of pedestrian paths at the closed end of the loop, permeating open space areas behind the houses and providing a road free link to other dwellings and community facilities. Separate areas were defined for residential, community and recreational functions. As previously mentioned, the focal point of the Village was the centrally located community centre, providing all services required for a neighbourhood unit. The shopping centre within the 'core' of the Village was modelled on US examples and centred around an off street car parking area for ease of access. This reflected the increasing dominance of the motor car on urban form within America at a time when there was minimal car ownership in Australia. Nearby facilities such as the school, post office, temporary hospital, original theatre, swimming pool, court room, police and fire stations were within walking distance of all residential enclaves. Married and single persons' sectors were designated in the residential parts. Within these, the various ranks of service personnel – officers, non-commissioned officers (NCOs') other ranks – were allotted specific sites, with civilians being 'ranked' according to salary.[31] Military aspects of the Village, such as the messes for various levels of military hierarchy, were integrated into the Radburn plan in a non-dominant manner; they were situated in the eastern and western areas of the Village, away from the centre. The philosophy was to create an ideal community based upon a neighbourhood unit, even though the overlay of military life was unavoidable, for both traditional and security reasons. A construction camp established west of the Village and known as Woomera West initially accommodated contractors and workers; it also had a Works Mess. In time, Woomera West developed as a de facto industrial zone servicing the development and management of the Village.

US influences – fact and fantasy

In a climate where everything to do with the Woomera Rocket Range was top secret, the design of the Village was hazily attributed to US exemplars early after its establishment. After the Village was established, censors allowed an Adelaide journalist to write a series of articles on Woomera Village. He enthused the Village was 'to an US plan ... you can almost imagine you are in America when you look in the telephone book and see an address like 560 Ninety First Street, Village"[32]. Other accounts of Woomera Village allude to an international contest, with survey charts of the town site given worldwide distribution and plans called for submission, with the winning entry coming from an US, and based on a similar town plan in southern central California[33] Certainly the example of Inyokern, a defence town in California provided a management structure for the Village[34]. Given the secrecy of the Joint Project, and the assiduous role of

censorship in all matters related to Village organisation and life, an international competition was unlikely and is not substantiated by research. In South Australia, as probably elsewhere, new town surveys resorted to numbering streets initially until naming occurred later. Woomera was no exception, and later the Village streets were given euphonious Aboriginal names ordered in alphabetic and geographic proximity for ease of discovery.[35]

Changing Fortunes of Woomera Village

The 1960s was a decade of significant development in satellite communication and surveillance, and increasing US activity at Woomera, and elsewhere in Australia. Apart from the construction of NASA's Deep space Instrumentation Facility (DSIF) at Island Lagoon near Woomera Village in 1960, increased Australian co-operation with America saw the subsequent establishment of Pine Gap near Alice Springs in 1966, and Exmouth in WA in 1967.[36] All these facilities were for space and defence surveillance purposes, a major Cold War activity.

Initially the number of US personnel in Woomera was not high. In 1961 there were 81 actual and expected NASA staff working on three projects at Woomera; DSIF, Satellite tracking and Project Mercury.[37] NASA was offered accommodation at Woomera for personnel on NASA projects 'commensurate with the NASA contribution to housing",[38] which equated to NASA's funding 53 married and 50 single accommodations within the Village in 1962, at an estimated cost of US $1,536,000. This was also the decade of the first of a number of transitions for the Village. In 1960 it was announced that the British Blue Streak project would be cancelled. However the following year the UK announced the European Launcher Development Organisation (ELDO), involving up to 300 British, French, West German, Belgian, Netherlanders and Australian personnel. The ELDO project injected new life into the Woomera community, and the population peaked at around 6,800 by the mid 1960s. It was a time of increased construction of a wide range of accommodation[39] and public buildings. (Figure 5) A special mess and accommodation blocks were built for the Eldo project in the Village, and Americans and Australians lived and worked with a strong emphasis on leisure activities to offset the geographical isolation and restricted nature of the work. No less than 82 sporting and leisure clubs were serviced by four ovals (playing fields), swimming pools and various tennis, bowling and squash courts. American influences on the Village during this period appeared to have been participatory, with shared social activities, certain areas devoted to US accommodation namely along the western edge of the town plan, and extra housing provided for a time east of the loop perimeter road.

With the conclusion of British projects on the Woomera Range during the 1970s, the Village population declined to about 4000, reducing further to 2,700 people by 1979. Consequently the Village's role changed to that of a residential and support base for the USAF Joint Defense Space Communications Station at Nurrungar (JDSCS), later Joint Defense Facility Nurrungar (JDFN). This heralded a much more important role by the USAF in the survival of the Village.

Social impacts

Both US and Australian authorities were committed to a complete integration of Australian and Americans as part of Village life. In 1971 a report by the US administrators of Nurrungar advocated improved leisure facilities, including a bowling alley, a gym, a day room, an auto repair shop and a hobby shop of woodwork and ceramics. The Nurrungar commander regarded a Woomera posting as a 'hardship posting' for his staff, stating that despite the private clubs the only two places of public entertainment in Woomera were the pool and the theatre. The closest town was over 180 kilometres away, over 'a treacherous dirt road' and there was no television. 'The radio station is a five watt subsidiary of the ABC. The programs are stodgy and dry with very little popular music'[40]. However the situation improved over the next two decades. Officially, Congress funds were paid into the Reserve Bank of Australia, and the interest earned on reinvestments at a time when interest rates were high underwrote maintenance of Village buildings and infrastructure.

By all accounts the Village adapted into a mini US/Australian community where one in every three students at the public school was American.[41] The Gibber Gabber, a regular weekly paper produced by the Woomera Board, featured regular articles regarding social events for Independence Day celebrations on 4 July, Halloween, Thanksgiving and St Valentine's Day. USAF staff socialised with townspeople at the many clubs within the Village, on the playing fields, and in the recreational facilities, with comings and goings of all personnel, both Australian and US duly reported in the paper. Sport played a major part in the Woomera posting, with baseball, softball, squash, and volleyball played as well as cricket matches between Americans and Australians. The sporting emphasis was reflected in the attention given to the ovals and other sporting facilities, and the prioritisation of the maintenance of outdoor and indoor leisure amenities.

US contribution to village spaces and places

A large gymnasium was built at the state school and later extensively refurbished for use by all villagers. The Oasis, a large purpose built building complete with bowling facilities and café, catered for US staff and was designed to US specifications. (Figure 6)The ovals were rationalised, with the O'Donoghue Oval lit to stadium standards for night games, including baseball. The Youth Club was established with a full time Youth Officer, and the school underwent refurbishment. Housing improved with a number of prefabricated and ATCO buildings allocated to accommodate Nurrungar staff during the 1970s-1980s. When the Joint Project with Britain formally closed in the mid-1980s, a process of town 'normalisation' commenced. The eastern area of the Woomera Rocket Range around the Village was excised from the Range and the Village was de-restricted and opened to the general public in 1982. Newer housing was provided as original housing stock was demolished or sold off. Following the collapse of the Soviet Union in 1990 and scientific advances in satellite communications, a process of adjustment leading to the shutdown of Nurrungar by the end of the decade led to a re-examination of US requirements and the future of the Village. At this stage, accommodation

standards for USAF personnel were 'satisfactory' and it was considered 'the substantial improvement in the morale of personnel and families living in Woomera Village since the opening of the Oasis Community Centre … would only improve with more facilities'. With regard to Woomera West, the report commented that the facilities were 'inadequate for the current use as they were intended for different purposes, are in poor condition and were not well maintained'. Woomera West was therefore closed and the Village was to provide all support facilities for the USAF including transport storage, furniture warehouse, family housing, chaplain, commander and administration.

The report suggested that the Village needed a more 'enhanced architecture' and that 'temporary buildings remaining are old, of a poor standard, are costly to maintain and have passed their economic life.' Temporary housing should be progressively replaced with 'new, well designed houses for the area, set on compact land blocks with reduced requirements for maintenance' and 'denser landscaping which would improve the amenities of USAF staff in this harsh environment'[42]. The realignment of selected sites within the Village saw the creation of three allotments from two, with USAF housing originally allocated to the redesigned sites. The report identified the progressive contraction of the Village to the community centre and residential enclaves west of the centre. A programmed implementation detailed changes to the Village, including refurbishment to specific housing, replacement of storage sheds and housing, extensive refurbishment of dormitory blocks, (Figure 7) the construction of 41 military housing units, extensions to the community centre, the construction of a health and fitness centre, and a consolidated art and craft/auto hobby shop.

These recommendations were promptly followed through –in an end of year report in the local newspaper, Lockett reported that during 1992 USAF had provided funds for a major upgrade of the Youth Centre, the oval upgrade, the oval pavilion (Figure 8), major refurbishment and renovations in Butement Square adjacent the shopping centre, enabling USAF and contractor staff to transfer offices from Woomera West.[43]

The closure of Woomera West involved renovating the former Jazza (Junior Officers) Mess in the Village. During the 1960s the Jazza had been the main club for the town, boasting impressive facilities including an outdoor atrium, timber bar and large areas for entertainment. The USAF planned to accommodate the Woomera Public Works and USAF Housing Maintenance functions within the vacant building, with the USAF having all the housing maintenance supplies, furniture storage and issue provided in the Jazza.

The program of maintenance and improvements continued resourced by US funds continued until the final shut down of Nurrungar in 1999, and by March of 2000, all USAF personnel had left Woomera. The US decision to invest in the Village infrastructure was a deliberate one. Money in the US budget had to be spent through collaboration between the Area Administrator of Woomera and the Commander of Nurrungar. Both worked to ensure that projects to progressively shut down large sections of the vacant residential sectors continued while improving infrastructure and facilities for the remaining Village. (Figure 9)

Today, changes to the Village during US involvement are evident in the buildings such as the Oasis, now renovated to provide an interpretation museum, café, tourist office/shop as well as the 10 pin bowling alley, the swimming pool complex, school facilities, oval improvements and newer housing, including the remaining ATCO transportable houses along the main north-south road, Dewrang Avenue. (Figure 10)

Unlike Exmouth in Western Australia, where the US Navy removed everything brought to the town, including even the church bell, at the conclusion of the naval communications station in 1993, the USAF ensured Woomera Village benefited substantially from its financial investment during the period between 1970 and 2000. This approach protected the major design features of the centre and residential template within the Village, while removal of obsolete sectors was being undertaken during the 1990s shutdown process.

Conclusion

In its modernist design, functional housing and current amenities, Woomera Village today reflects the significant US contribution to its history and built environment. The Village originated as part of British/Australian efforts to keep up with the arms race that characterised the Cold War period, between 1947 and 1958 when the McMahon Act prevented full cooperation on nuclear research. With regard to its design, the Village is the earliest Australian post-war example of a town designed and built upon the Radburn approach to town planning. Principles of the neighbourhood unit and variations on the Radburn plan were advocated and implemented internationally prior to World War 2, but not prominently in the UK until after the war.[44] Influenced by US examples, including Oak Ridge and the Radburn model, the original intention to design a Village providing every possible amenity of a modern settlement in a desert setting was realised. Subsequent investments within the Village by NASA and USAF, both socially and in the physical improvements to public spaces and facilities, sustained this original intention.

[5] The Weapons Research Establishment at Salisbury was a conversion of Australia's largest munitions factory built during the war years.

[6] In 1946, an Australian Committee on Guided Projectiles (the first of a number of organising bodies) was formed to liaise with a British delegation to Australia led by Lt. Gen John Evetts to determine the location of the range and facilities. Evetts stipulated at the outset that planning a village at the rocket range for personnel and their families was to provide 'every amenity and excellent living conditions'. A Board of Administration Long Range Weapons Organisation Australia (BLRWOA) was formed within the Department of Munitions to oversee the establishment. The Rangehead site chosen was on a tableland about 500 kilometres north of Adelaide in the vicinity of Pimba/Phillip Ponds with survey undertaken to establish an airfield, village, technical area and launch site in 1947.

[7] The WPA was later reduced to an area of 127,000 square km. and is still the largest land locked range in the world.

[8] The first missile and bomb tests on the range occurred in 1949, followed by detonation of UK totem 1 and totem 2 atomic bombs at Emu and the commencement of UK atomic trials at Maralinga in 1956-7. In all 7 major nuclear tests occurred as well as testing of components for thermo-nuclear weapons and minor tests at emu and Maralinga between 1953-1961. Woomera Village differed from other facilities on the range; namely the Koolymilka, Phillip Ponds, Woomera West, Maralinga settlements and other smaller installations of supplies and labour which were laid out as military camps with mainly tented accommodation.

Constitutive contaminations in urban space: urban culture through the "inter-textuality" and the concept of *in between*

Igor Guatelli
Mackenzie University, Brazil

Introduction

Based on the theories of the Russian semiologist Mikhail Bakhtine, Julia Kristeva created the concept of "inter-textuality", in which she states that every text is the absorption and transformation of a multiplicity of other texts, or "every text is built up from a mosaic of quotations, every text is the absorption and transformation of another text. In place of the notion of inter subjective the notion of inter-textuality is set up."[1] Perrone-Moisés states that "inter-textuality is to be understood as the constant work of each text as related to others, this huge and unceasing dialogue among the works that constitute literature. Each piece of work presents itself as a new voice (or a new set of voices) which shall make the previous voices sound differently, extracting new intonations – infinite dialogue/unfinished work".[2]

The concept of inter-textuality in literature also applies in philosophy, as demonstrated by Derrida in his works. As we may conclude from Kristeva's and Perrone-Moisés' words, inter-textuality of an intermediation space among different voices is a space resulting from the dialogue among different works, texts, not necessarily belonging to the same historical time. Specifically about the urban space, we could discuss a space of intermediation among different actions [as from different voices] with conflicting intentions that could engender new possibilities, possibilities of de-territorializations and re-territorializations.

Through this "process" of inter-textuality, emerges a space where the constitution of a hierarchical concatenation of discourse, herein understood as programmatic intentions and design determinations defined by the architect, is no longer possible, or of authority and autonomy of a text over other(s); the center, or centers, previously located exactly in the texts, is transferred to this intermediary zone, to this space among the texts and the relation, "the dialogue" which is established among the texts prevails over the previously inviolable unit of the discourse of each text if considered in isolation.

Very close to what we designate as transdisciplinarity, inter-textuality, in this process of inter-relation among works, opens a possibility for the [transcendental] unit of a theoretical building no longer to be conceived *a priori* or for the discourse to be coupled with a guiding-principle capable of influencing, or directing, or conducting, or concluding the post expressions which followed, in a way hindering creation, especially in architecture, which is the subject matter of our research.

In literature, as well as in philosophy and in architecture, the discourse is traditionally concerned with the explanation, clarification, evaluation (transitive properties) of the object, with a tendency to the final unification of meaning, maybe with a view to its

permanence and its transformation into reference, leading to the predictable homogenizing readings.

On the other hand, with inter-textuality, instead of the prevalence of stability, the absolute, hierarchy, legibility, the dominant discourse, we have a hybrid object, a non-centered structure open to ambiguity, ambivalence of senses, paradoxes, instability of the certainties previously considered as unquestionable.

Therefore a phase in which the interstitial, intersections, the *in-between* prevails is inaugurated, constituting a productive field for experimentation, free appropriations, event, creation and "jouissance"[3], as its objective is not its validation by means of the explanation of other texts, but it own production, open to infinity and the non-depletion, always in process, a time always to come — such aspects shall be better discussed in the light of architecture — "with no intention to establish a final sense — coincident with or contradictory to the incorporated sense"[4].

However, according to Perrone-Moisés, what we traditionally have in the areas of language (Literature, Philosophy and, as we may realize, also in Architecture) is the prevalence of what is known as meta-language, a language "the objective of which is to clarify another language [...] We cannot imagine a meta-language of the logical type which leaves senses in suspension, which allows reticence, unconscious or sensorial suggestions, which assumes in its own texture that which is not-said by the unconscious, its incalculable losses, favoring the indefinite proliferation of senses"[5].

From this point of view, what would be historically connected to a tendency of institutionalization and compartmenting of knowledge according to academic models – separation between scientific and artistic disciplines, for example — with the formatting, **and institutionalization**, of a discourse in which the search for a meaning was fundamental, in which, again according to Perrone-Moisés "the general sense converged to a priority meaning (monologue discourse)" — wouldn't then architects be close to the writing in literature? — with inter-textuality, the need for a final coherent unification giving place to the "interchangeable"[6].

We should then understand such "interchangeability" as constant dislocations and plurality of meanings and senses made possible by an intense crossing of several texts, distant in time, different in gender, prerogatives, objectives, therefore stimulating the forming of knowledge in constant process, fed by unceasing elaborations and re-elaborations made concrete exactly by the multiple relations, based not on casualties or continuities and concatenations of meanings and senses among texts, but on transgressions of such senses, on times to come that may result from the crossing of works, languages, whether scientific or artistic.

Wouldn't the position adopted by certain architects be very close to that adopted by writers in literature? For instance, the artistic production as theory of architects such as Peter Eisenman[7]and Bernard Tschumi, for example, and the close ties with linguistics and philosophy [inter-textuality]. We may even say that, with inter-textuality, human

existence would no longer be tied to the unceasing task of persecuting its essence through *its different and compartmented forms of thinking and being.*

However, so far we have talked about an inter-textuality which is more related to the "immaterial" idea of a space of intermediation, once it is understood as a strategy which intensifies and triggers a process of crossing of different and several texts, discourses, languages, rather than strictly to the constitution of a "material" space (herein the term in its architectural dimension, that is, related to "situations" used in architecture as inside/outside, public/private). What if, as from this moment, we started to call this intermediation space, in its immaterial sense, applicable to literary pieces, of intermediary space, or *in-between* in architecture, that is, a material space, once constituted from the relations between inside and outside? Although Derrida himself has made it clear once that architecture is construction, material, there are correspondences, as we have seen, between *the literary and architectural intermediation spaces*[8].

In *Le Plaisir du Texte,* Barthes makes a distinction between what he designates as pleasure Text and Joy Text ("jouissance", as mentioned above), the first being that which gives joy, fulfills, gives a sense of well-being, that which comes from culture, does not break off with culture, is connected to a comfortable practice of reading, and the second being that which creates a state of loss, which causes discomfort, makes the reader's historical, cultural, psychological foundations, the consistency of his tastes, his values, memories hesitate, creates a crisis in his relation with language[9]

If we consider those two definitions, we shall clearly see the correspondences between this differentiation Barthes makes between the text and the discussion about the mono-logical discourses and inter-textuality — a condition Perrone-Moisés designates as Dialogical Discourse, in which "the word tends to be 'bi-vocal' or 'multi-vocal', establishing multiple contacts inside the same discourse or with other discourses"[10].
However, which relations could be established between the discussions made so far, applicable as we have seen in the field of written languages, with Architecture? Could be possible another Architecture?

In the history of Architecture we know that the architect has almost always played the role as that who defines the spaces and the uses that such spaces should shelter. It is hard to imagine something far different from such role which is bestowed on him as, after all, the translation of spaces into something adequate "to living", in the broadest sense of the term, has always been a prerogative of such profession.

The question is probably evidenced when such spaces, which initially were answers to the wishes and necessities of the moment, have become self-evident architectural references, that is, solutions which started to be used as true project premises adopted in an indiscriminate way.

As a result, we have some correlate questions: do all people appropriate and realize space, or shape, at least most times, in the same way as the architect intends them to

realize or appropriate? Is it possible for the architect to determine that there is an adequate form for each type of use, imagining a uniform perception of form-space or a prediction of the movements of people in such space? Spaces traditionally identified as circulation spaces such as a viaduct or bridge, for instance, which are used for leisure by people who practice some radical sports or open their own business, seem to demonstrate this is not so. As a concrete example, we may quote the case of former amateur boxer Nilson Garrido (figures 1 and 2).

Fig. 1 and 2 – Café Viaduct: Constitutive contamination. Gym, Boxing, Toys room and Library. Support space – Re-programming – Sports and cultural square.

São Paulo Brazil.

The case of Café Viaduct

Known all over the country, subject of articles and publications, Garrido, the "manager" of Boxing Academy Cora Garrido, located under the Café Viaduct in São Paulo, shows us a possibility in the process of constitutive contaminations of central urban residual spaces associated to the existing structures as from voluntary work (the *wish to* act).

A dweller of the *location*, due to having no *location*, Garrido, together with Cora Batista Garrido, undermine the "representation" (what it merely "represents", a weak being, a spectrum, a ghost) and "original identity" of a *location* (non-location?) "historically" undesirable and prone to condemnation when they create and structure a hospitable sports and cultural *location*, a "re-socialization center", formed by a gymnastics academy, a boxing ring, together with a children's library and kindergarten, that is, a sports and cultural square, public and free. Applying for a registration to act as a non-governmental organization (NGO), they have been trying to establish, in a verbal agreement, a partnership with the municipal government to disseminate their "squares" to similar locations in the city, thus generating *intensities* (qualitative differential) under

viaducts, transforming them, neither accepting nor submitting to the representation such spaces have acquired throughout time.

Contrary to (denial) strategies based on obstructions, fake embellishments, emptying and inhibitions, what we see is the empowering of a support-space, which is now of unconditional social welcoming, stimulating productive occupation, generated by programmatic congestion and "promiscuity", of continuation and concomitances of non complementary activities; after all, what is there historically in common between a library and toy collection and a boxing ring?
Therefore we ask whether this corruption of the "sense" given to something intends to modify it or deny it.

Built in 1969, approximately 280 meters long, Café Viaduct [which was designated as such due to a coffee industry which was installed in the district] in an important axis of connection between downtown São Paulo and the traditional Italian district of Bela Vista, known as "Bixiga" and famous for its gastronomy and Italian popular festivities. According to the logics of the so called functionalist Urbanism of the 50's and 60's, the construction of Café Viaduct happened exactly during a time of huge viary interventions in the city of São Paulo. Avenues and viaducts were built so as to articulate distant areas of the city.

However, as it is well known, this search to solve the problem of mobility in macro-scale of the more and more congested and spread out urban territory resulted in the appearance of large residual areas (the lower part of the viaducts - no man´s land) thus creating frontier zones which contributed a lot to the disarticulation of the urban frame at local district level.

Built close to the main "entrance" to the Bela Vista district, Café Viaduct and the resulting residual spaces were greatly responsible for the deterioration process suffered by the vicinities.

From the strategy of a "doing almost nothing" when conceived as support, the architectonic project developed for the lower part of the Café Viaduct, for this specific place, intends not only to reinforce and improve the working condition of the existing social Project [jeopardized by the precariousness of the location], but also to promote the urban reintegration of the district through the unveiling and strengthening of its main access. In short, making a place yet beclouded by the presence of the viaduct more legible.

The architectonic project (Fig. 3 to 5) opts to emphasize for emphasizing the duplicity of the condition of such location through the creation of a *location* of multiplicity, combining spaces of greater programmatic specificity, such as a Library and a toy collection, with more fluid spaces, of greater freedom of action and possibilities of momentary reconfigurations, which we could designate as *Infrastructural Architecture*, an architecture which is no longer seen as an independent, scenic object, but as a cub-

object (*subjectile*), a support for interrelations, a structure of support and energy, potentiality of something to come.

Boxing rings sliding in rails, with flexible positioning according to the needs of the moment, steps as an arena, pivoting files, spaces in plateaus, parlatory-conteiner, infrastructural combinations which try to guarantee a stimulating space for spontaneous and fortuitous occupations. Voluntary urban actors in partnership with architects and public power, maybe this is the configuration of new type of urban management and the engendering of new situations and forms of local democracy.
Fig. 3 – Aerial view with the viaduct: sliding boxing rings + containers + mezzanine + steps in arena + perimeter Cooper track

Fig. 4 – Boxing rings and steps in the center. Easily detachable, the rings make it possible to create wider spaces for the concentration of people when of "events".
The Mobile Rings are justify because of the situation: constitution of a "square" of events in the middle or release of the place of charge and discharge between mezzanine and red containers, under the long red container.
Fig.5 – General cuts: highlighting the multi-function space in the mezzanine, containers and steps as arena.

According to Bernard Tschumi and his inquiries about architecture, in his work *Architecture and Disjunction*[11] is it possible to say that there is a language of space or form? The form determined for a use may be the aprioristic representation, intelligible, of an idea, as many architects want to believe, or would it acquire meanings and senses as from the several and different appropriations, as in the case of Café Viaduct? On the contrary, is it possible to think about an architecture formed only by spaces *in process*, that is, spaces which are not determined for their possible uses? Would architecture only of *in-betweens* be possible, of residual and interstitial spaces? With no intention to produce an answer for each of such questions, we shall use the same questions as delimitations for our inquiries, readings and questioning about space in architecture.

The dominant history of architecture, based on a history of meanings which are constantly reinterpreted (orders, hierarchy, composition unit, axial perspective), although not questioned whether they are necessary or not, is being revised by the so called "writer" architects, who have become known to all with the deconstructionists, who have started to question the validity as related to the necessity of such composition rules and, moreover, the cause and effect relation between significant and significance, between the proposed form and the resulting appropriations.

As said by Tschumi, "long before such questionings about the need of causal relationship between form and function have been raised by deconstructionist architects, Jacques Lacan already noted that there was no cause-effect relation between the significant and significance, between the word and the intended concept[12]". The significant would not have to respond, for its existence, to a hypothetical signification. As in literature, or in philosophy, and according to Derrida, the architectural significant need not be represented by a significance, opposite to what architects herein designated as "writers" think.

As we have seen, through an attitude guided by deconstruction, de-regulation, disjunction, discontinuity, dislocation of the relation between the significant and significance, between form and function, and, at the same time, a valorization of what is designated as being *in-between,* of what is in constant process, of what is transitory, ambiguous, a transgression of historical architectural values and the opening of new possibilities is searched.

But, back to the question presented in the beginning, if architecture deals with permanence, and such permanence is strictly, or at least it should be, linked to man, wouldn't this man be turning fragile among so many non-definitions, uncertainties, dispersions and decentralizations? Maybe this is where one of the differences between literature/philosophy, especially from the propositions of Barthes and Derrida, and architecture stands; as we have seen, for Barthes, writing, or the practice of "joy texts", does not determine, nor does it reveal a proper being, but it produces a subject in permanent crisis and mutation, not a subject "in process".

Urban incubators – consistent voids

Program has long been an integrating part of the architectural process and its requirements, apparently objective, have always broadly reflected cultures, habits and specific values related to social environment and time, but which were not necessarily translated into precise forms or ideal types; as an example, we could mention train stations, large magazines, museums and art galleries of the XIX century, which sheltered a complex program, but which were not necessarily linked to a precise and ideal form.

Quite on the contrary, those were flexible enough to provoke dissociation between form and content, as we may see from the innumerous recycling of use such edifications have undergone a long history; many of them, for instance, have sheltered, and do shelter, functions which were inadmissible for the time, serving as "containers", shelters, of architectural "events".

 However, with the advent of the so called functionalism and the search for a correspondence between contents and form [character?], materialized in a new discourse, especially a new language and its pretense "universalization", flexibility [momentary alterations of the "nature" of a space] and, consequently, the possibilities of manipulation and intervention in such spaces on the part of the people have decreased. A set of ideas was created and, with it, as we have seen in the writings of Le Corbusier, the formulation of a new receipt of social behavior, so as to reach a total integration between society and architecture[13].

The regional and national cultural differences would be deleted in favor of a necessary social adjustment to new demands, to transformations, especially technological, in course and the "new language" of architecture. Would it be really possible to establish a cause and effect relation between such "new language", with its precise forms adjusted to the "new time", and the actions of people in the space offered by such architecture?

History itself has already showed it is not possible, in spite of a situation which lasts up to today, the desire of the architect for control and total definition of space, the search for an adjustment between form and content and the manifest social appropriation, whether on the level of the building or of the city, or that we could designate as being a link between the proposed significance and the significance which has appeared.

Far from such worry, quite on the contrary, nowadays we frequently witness the flourishing of events, of happenings, verified in the most diversified scales, which break off with what was originally proposed, "exceeding", through its use, the uses and functions initially predicted as being the most appropriate ones; from bridges and staircases "climbers", urban staircases which are transformed into squares (momentary

agoras) of contemplation or meeting points for conversation (figures 6 to 8), to the streets, framework of all kinds of activities, as mentioned by Bernard Tschumi when quoting "Les Evénements" of Paris[14], in 68, and the students' barricades in the streets as an example of the rupture of this proposed relation of form and content, that is, the imagined local-destination relation.

For the deconstructionists, the current architectural doing is directly linked to questions related to space; they even talk about a new rationality, a new intuition of space while an [inter]active means, formed by events (one should read, profusion of elements and unpredictable events, sometimes ambivalent or bivalent, or non-immediate apprehension and reading) adjacent and remote, promoting other and adverse routines and logics, a process which we could designate as *constitutive contamination*.

This space would be the one we have constructed for our inhabiting, and where, for Foucault[15], "we always become something different from what we are", or for Derrida[16], "where the possibility of something that would change us would be created", or yet, for Gilles Deleuze, "where the occurrence of the 'virtual' would be possible, that is, a reality of which we do not yet have the concept"[17]. Finally, it would be in the space, not in the pre-determined space, but in the "in-betweens", in the spaces free from pre-configurations, that we would experience such "moments of invention" and we would create the condition for the *devenir autre*, going beyond the limits imposed by the "natural" [is it possible to say that it would be *characteristic, essential* of one "location"?], by history constructed by dominant discourses.

Events, invention, *devenir autre*, terms directly linked concurrently to the search of normative de-regulation of architecture, of its systems of values based on a strict causal connection between program (content) and "type"— more specifically the typological studies which have always conducted architecture to a search of "ideal types" [universal types?] of buildings, forms which are "adequate" to its contents — and to a conceptualization and valorization of in-*between,* of the intermediary space, for the deconstructionists.

Therefore, contrary to "ideal types" as syntaxes serving a functionalist discourse and doctrine, we would also have a consistent space of *not much-design* in traditional senses, or of the design which is not clearly and excessively determined, organized and ordained [in certain cases, with purposes clearly higienists] , but moments of a design of neutralization of senses or aprioristic meanings of such space, space open to multiple and non corresponding interpretations and appropriations. A supporting space capable of absorbing and registering the marks left without, however, acquiring a sense that could be adopted as being the most adequate, and, soon after, of being capable of returning to its situation of significance, waiting for new meanings, interpretations, interventions on the part of the people.

 We could talk about a space based more in accumulation than composition, an urban space as a productive machine free from the primary intentions of the author, remaining only as a trace, a marking trace always open to acceptance and ready to fecundate, *Khôra*[18].

Again, the relation with the Deconstruction philosophy of Derrida, more specifically with the "revised" concept of Khôra. To Derrida, the concept of *Khôra* "would be a region, a receptacle, that would have a form as from the external interpretations, that would leave on it the schematic mark or its impression and contribution. Notwithstanding, the *Khôra* would never allow it to be reached or touched, and, above all, it would not allow itself to be depleted by such types of tropic or interpretative translations; the Khôra would be capable of acquiring the most varied forms, but at the same time would be capable of remaining in its original condition". Wouldn't that be, exactly, the principle of *in-between* in architecture, a space "in condition" to assimilate the constant and different inquiries and requirements possibly resulting from the users?

This does not mean that for the deconstructionists there should not be a program, incurring in risks of what we could designate as being autonomous design, in which the pre-signification would be the justification for total spatial, formal lack of definition, or the absence of commitment on the part of the architect with the problems to be faced or solved.

The intermediary space would be understood herein exactly as a lack of definition, a space open to significations *between* defined spaces, spaces that would be the catalyzing agents, motivators of such actions of the users, of such events, such unexpected happenings that would appear and would remain always in process, transitory, and would never become a dominant activity which could be transformed into a convention of use, and where the program would not be entirely determined by the architect, but would be mutable, would always be requested and conformed by such actions. The role of the architect would be, I believe, that of attempting to promote an interaction between the defined and the non-defined, the design and the non-design, the understandable and the non-understandable, after all, creating a condition for such events to arise, be intensified through the establishment of tensions, more than hierarchical concatenations, between programs and urban ambiences, between cross-programming [inter-textuality] streams and voids.

In the search of constant definition of spaces, of its contents and, consequently, of precise forms, models of uses for such spaces end up by being created by repetition, taking to a certain conditioning as related to utilization, movement and appropriation, on the part of the users, of such spaces. Directed by spaces with pre-determined utilizations, accepted as natural and inexorable by historical process, the attitudes have been gradually incorporated and treated as intrinsic to such spaces; the unexpected happening, what Derrida designates as "events", the rupture with the "natural" would exactly represent an attempt of affirmation, of the "wish for power", according to Nietzsche, as if revealing a pleasure in saying no to simplifications, to oppositions and cultural, psychological and historical values, whether or not "appropriate", whether or not "adequate"[19].

Back to Barthes, in *Le plaisir du texte*, the term "jouissance", or the "jouissances" of a text, is related to the significant, to the idea of rupture, to the incomplete discourse, reversible, ambiguous and the text, instead of having the finished phrase as a model, would be "an unceasing casting of words, an infra-language exercise". Infra-architectural, as it does not have a defined language or design, once it occupies an intermediary position among defined and "dominant" spaces, or an aprioristic meaning, thus remaining, as the "Khôra", in a state of significance, of latency, awaiting for "events", the *in-between*, the intermediary space, the line-trace — instead of the line-discourse, as it suggests neutrality and non-determinist intentionality —, and this moment in architecture, the moment of invention, would be the one to be configured as the space of "jouissance" in architecture, a fertile location for the *excess*, the pleasure of going beyond the "natural" or the stipulated, for the exercise of conflict, in which we would be far from what we are and would open space for the advent of another, of the time to come, according to Derrida.[20]

Yet, as in the writings by Barthes and Derrida, where the author is "dead", the text and the words being free of meaning and incorporated senses, the *in-between* in architecture would be a place where it can be said that the architect-author would be [almost][21] dead, as the space, free from the meanings and representations resulting from the intentions of the architect, would be constantly open to the significations and re-significations on the part of the users creators – the users.

As for the excess and the pleasure, in his book *Erotismo*[22], George Bataille says that one should differentiate the excess of pleasure from the pleasure of excess. Foucault said that people know quite well what they want, the problem was how to get rid of the chains that held them to dogmas, values and historical moral codes. When making the *in-between* possible, wouldn't the architect be exactly contributing for the flourishing of such questioning, active attitude, stimulating, through such "neutrality" — a paradox? — other formulations, beyond the habitual, and an attitude of going beyond the stipulated, that which is determined by historical repetition on the part of such people?

The pleasure of excess could possibly be translated herein as the possibility of manifestation of the desires of the user, many times distant from that intended by the architect and of the user himself, going from a reproductive imagination to a creative imagination.

That is, if we understand reproductive imagination as something coupled with the daily non-critic doing and the creative imagination as something related to thinking, critical reflection, excess for us would be considered herein as a necessary moment in this process of rupture with history, with reality which is presented to us.

This would imply, in our case, in a rupture with historical associations (the forms of spaces justified by its uses and this causal relation being transformed into habits and common sense, totally justified by the practice along time), with the "truths" in architectonic language — the form of space and its meaning conditioned to uses and attitudes, producing the stereotypes and conventions — and, opening the possibility of difference, of the constant process of differentiation (such as the concept of "différance"[23] of Derrida) through intense experience of space and , consequently, the possibility of contact with the Other, understanding the other not only as the fellow man, but as something into which we are being transformed or about to be transformed but yet not consciously; as Barthes says "the pleasure of text is this moment when my body shall follow its own ideas, because my body does not have the same ideas as myself"[24]. Maybe we could substitute the term "*texte*" for "*architecture*", more specifically the condition of "spacing"[25] in architecture herein expresses by the *in-between*, by what is neither absolute presence nor absence, but a space generator of differences and alternation.

Even in periods which are initially contrary to such positioning and favorable to a revision of such values, historically, dominant architecture of different periods, herein with emphasis on the functionalist architecture of the Modern Movement, has been seen

as sets of rules, rapidly transformed into conventions, once stable and, almost invariably, general, based on utility, on a culture of utilitarism/functionalism; besides the need of such architecture, as a social institution, of being always validated or of explaining itself through its utility.

Maybe, also as a result thereof, it has become limiting when needing to establish links between form and content, thus indirectly "suggesting" models of actions more appropriate to the formed set. A moment which is favorable for questioning: having been constantly criticized up to the present moment, this linear relation between form and content, how would it then be seen that which would provoke, stimulate, what would be the possible consequences of a rupture of such logic between form and content?

In theory, the concept of *in-between* seems to break off with such "culture", and the transposition of focus to the importance of space in architecture and the strengthening of unpredicted actions and the making as from the spatial re- or de-programming; as seems to indicate the dynamic proposal for the Café Viaduct.

Contemporary cities express the anguish and anxieties emerging from the regulating and ruling course of globalization, the more exaggerated as the greater is the complexity it elects, inventing the object which more efficiently corresponds to the requests of its pattern: form, domain, the fashion of post-modern temples and icons. It is then imperative to explore the interstices of such culture and underline counterpoints of a new thinking, the importance of thinking about *strategies* [a bet, uncertain] that emphasize cultures of glorification of the collective doing, spontaneous, aggregating, emancipating.

Reviewing and re-thinking relations between man and built environment and man and its major product, the city. With the theories in Roland Barthes's text and the de-constructive concepts of Jacques Derrida, thinking [about] the space and urban "spacings" which may expand the scale of the object, intensify the collective doing, spontaneous, creative, interpreting the quality of the open space as an extension of the object which is not imprisoned by the pragmatism of form and domain.

Such disposition of the new doing to the quality of "in-between", a rupture of the restricted, formal, programmed and pragmatic, "culture" of the imaginary space, of the space in transformation and of the time to come, of the scale of that who does and not of what the restricted function programs is contextualized.

There is, therefore, in this cultural interact, an attempt ro build a bridge with the post-structural thinking as a strategy to think the city space and, therefore, the possibility of "affording passage" to the re-appearance of humanity values, based not on classical, metaphysical humanism, criticized by Derrida, but maybe on a *praxis humanism -culture as practice of life, as realized life-*, vital to the future of the city and man itself, of its erratic creative and emancipating will. Concurrent iteration and alteration; not only [but also] the acceptance of that designated by the object and its destinations, but the

permanent inquiring and requesting (the non-decisive) of the "support" to verify its capacity to respond to us and shelter our intentions, *intense-actions.*

This alternative architectonic will is based on the quality of the residual urban space, which is a place of meaningless rupture of what is restrict, formal, programmed, pragmatic and accurate. Such place becomes the culture of the imaginary space, the space in constant transition. Besides this residual space enables the emergence forthcoming events, going beyond what the restricted function programs as the most adequate use of this place.

Conclusion

The problem of aprioristic representations and their consequences [prevalence of one identity, constitution of an essence, crystallization of a sense, stigmatization] have always been a core theme for post-structuralist thinking. Finding ways to confront them so as to potentialize *devenirs,* other understandings and the proliferation of senses has always been a crucial question for philosophers and thinkers of such tendency.

Particularly, the lower part of viaducts, stigmatized urban spaces, usually associated, on the one hand, to abandoned spaces, a shelter for homeless, a spot for the traffic of drugs or, on the other hand, used as strictly commercial areas (restaurants, shops, galleries), both very little social, find an alternative of having a new meaning in this experience observed in the lower part of the Café Viaduct, when offering a new possibility of relation between the public and private spaces in contemporary city and , consequently, the overcoming of a representation.

Usually de-territorialized, turned into nothing, or re-territorialized so as to turn them into spaces exclusively dedicated to commerce, consumption, mono functional activity, such residual and expectant spaces under the viaducts, the *in between* spaces, acquire a new meaning with the construction and manifestation of this social machine under the Café Viaduct. There a new situation of the urban collective space through a voluntary action [concealed, yet extremely potent] is configured, a situation which as aforementioned, undermines and overcomes the aprioristic representations of a space, making a space of "jouissance" possible when it stimulates the excess, beyond what was imagined and what could be fitting for a determined location.

Therefore, a question is presented, which I believe must be considered and thought over. To what extent the submission of a possible action, whether proposed by architects or by the population, to the representation or to what seems to be the essence of an urban location, would add to the frailty of the actions under such location? Allow me to make myself clear. Would it be possible to think about deeper reconsiderations and ruptures and, with that, other re-territorializations, in urban spaces which already have a strong historical-social representation?

Programmatic tensions obtained by unusual associations of activities – *intertextuality* – would be a possible strategy for the destruction or overcoming of a historic representation capable of condemning a location to a negative identity which, often,

suggests fragile, mistaken, conventional actions, specially because they follow what has always seemed to the most adequate and fitting for such place?

Spontaneous and informal micro-actions, capable of constituting something beyond what is foreseen and usual for a determined place; micro-political actions started by the social wish and commitment of some urban "clandestine tenants" [the Garrido couple could be considered a kind of local policymaker], worked out and potentialized by architecture, would be capable of initiating another urban to come and proclaim, through such special enunciation agencies as that of the Café Viaduct, another possibility of urbanization and administration of areas which are considered to be in limit and ungovernable situations?

[25] More specifically, *Spacing* is a term which is suggested for the first time by Derrida [and mostly discussed in his work *Enlouquecer o Subjétil* (1998), translated from *Forcener le Subjectile* (1986)] with reference to scripture, as a form of differentiating this, scripture itself, from what he designates as being architectonic scripture. Derrida says that for him architectonic scripture would imply in a condition of inventive reading of space, that is, the possibility of a non-conventional reading, so far inexistent. It would be the reading of a subject that would not be limited to moving through the space according to predeterminations or "projectual" suggestions, but that, through and emancipating attitude, would try to transform and transgress established conditions, predictable and habitual. Planning against droughts: a spatial dimension on the combat against droughts in the Brazilian Northeast (1877-1937)

1. Introduction

The systematic knowledge and control over national territories was essential in the context of the formation and consolidation of modern nations in the nineteenth century. Brazil, and Latin America as a whole, was no exception to this. Legal changes in land regulation; reforms in port areas; efforts towards the creation of laws and nationwide government action in the sanitary, military, commercial and other fields; demographic pressures; diversification of the productive system; the construction of an encompassing transportation system, etc.; are some of the issues inherent to this process.

These issues were faced directly by professionals and intellectuals involved with the nascent discipline of modern urbanism and planning, and would be cornerstones in the history of its formulations, debates, proposals and actions until, at least, the middle twentieth century. It's significant to observe an important technician such as P. Abercrombie reassert, in the 1930s and 1940s, the "location of Industry", "the place of agriculture in planning", and the quest for "solution of the Land question" as fundamental issues in town and country planning[1].

The present quoting of Abercrombie's book is purely incidental. It does, however, serve us as a reference in two aspects. First, as a synthesis of the then-coetaneous discussions on the disciplinary field of planning, recovering the origins and fundamental points of modern formulations. From this set of ideas, models and instruments in debate since the late nineteenth century, the preeminence of the issue of land and the place of agriculture in planning should be underlined. The second aspect is their indication of a common background of concerns and debates related to the formation of modern technical culture in the nineteenth century; an arena in which British experiences were among the main references, as can be detected in the debate concerning the combat against droughts in Brazil.

Hence, this paper aims to comprehend how the initial discussions on technical solutions for the effects of droughts evolved, as spatial conceptions, into a set of regional planning ideas – even if the result was not entirely systematic. Within this conception, large water reservoirs were meant to congregate and stabilize population, whereas roads and railroads would connect productive and commercial centers, forming a hierarchical urban network. The study of these proposals – which predated by decades the institutionalization of regional planning in Brazil – brings about new elements

towards the comprehension of spatial intervention policies, as well as the establishment of planning as a discipline in this country.

Were these actions of combat against droughts, developed predominantly after 1877, precursory to what would later become the disciplinary field of regional planning in Brazil? And, furthermore, is the regional planning institutionalized in the 1950s somehow related to those reflections and actions carried by technicians and intellectuals almost a century before, moving through little-known lands, facing apparently inhospitable conditions, witnessing the human tragedies exacerbated by the climate phenomenon?

Before outlining possible answers, we must first expose a brief genealogy of the actions against droughts in Brazil. This history goes back to the mid-nineteenth century, when the droughts became the object of systematic reflection and more comprehensive combat strategies. It is, additionally, closely intertwined with the history of the Brazilian Northeast, which would only become recognized as a separate geographical entity in the beginning of the twentieth century, thanks in large part to the representative association between the Northeastern provinces and the droughts.

Picture 1: The nine Brazilian Northeastern States. The current officially-designated "semi-arid" region is represented in yellow. (Source: developed by the authors. Base image ©NASA, 2004)

Having once been the center of the Portuguese attentions in the first centuries of colonization, the Brazilian Northeast of the mid-nineteenth century had become secondary in economical and political relevance to the southern provinces. The region's major cities were located in the humid, sugar cane-producing coastal area, while the interior, the *sertão*[2], was occupied mostly by cattle ranches and small subsistence farms. The semi-arid *sertão* receives little to no rain during most of the year, but a rainy period between March and June provides enough water to sustain the populations and agriculture in normal circumstances. It is, however, a fragile balance; there are years when this natural cycle is broken, and the rain is either insufficient, or comes too late: this susceptibility to droughts is the main characteristic of the *sertão*, and became one of the images closely associated with the Northeast (see *Picture 1*).

Even though droughts in Northeastern Brazil, as climate phenomena, have been reported by chroniclers since the beginning of

colonization in the sixteenth century, and although the existent statistical information, while vague, mentions several great calamities causing severe loss of population, little was known about their nature up until the mid-nineteenth century. The first significant effort undertaken by the State to promote knowledge of the region and understanding of the local climate was the 1860 scientific commission to the then-Imperial Province of Ceará, whose findings were only published in 1877, as one of the most devastating droughts in recorded history affected the Northeastern provinces. Aided by the developing press, numerous reports of human suffering and death, epidemic disease surges, mass migration and economic disaster reached the Imperial Capital in Rio de Janeiro, bringing the drought phenomenon into the limelight. This would prompt deeper and more extensive scientific discussion, headlined by a series of dedicated sessions in the Instituto Polytechnico (*Polytechnic Institute*) led by the Empire's foremost engineers and technicians.

Over the remainder of the eighteen hundreds and into the twentieth century, the causes and effects of droughts were discussed at length, and a certain understanding of the climate system began to surface, intermingled with theories on solar spots and other matters, which was nevertheless unable to allow the accurate prediction of the droughts' arrival. Isolated action against its effects was being taken in the form of emergency relief supplies, and the providing of work in the building of railroads and *açudes*[3]; it was only in 1909, however, that a dedicated, State-run department – the IOCS[4] – was created, aiming to better manage the resources applied in the combat against droughts and guide the public works in the region. While the first half decade of this Inspectorship's work was devoted mainly to studying Northeastern climate and geo-physical characteristics, the demand for action soon turned it into a mostly construction-oriented department; again renamed – as DNOCS[5] – in 1945, it remained until the 1950s as the main participator in the actions against droughts, planning and executing numerous works in the affected area.

Picture 2: The IOCS headquarters in Rio de Janeiro (Source: *Ilustração Brasileira*, 1922)

New initiatives, aimed at supporting economic development in the Northeast were taken with the creation of the CVSF[6] in 1948 and BNB[7] in 1952. Despite all previous efforts,

however, the most widely-accepted starting point in the history of organized Regional Planning in the Northeast – and in Brazil as a whole – is the 1959 foundation of SUDENE[8], a Federal department led by a group of young economists which would, over the following decades, dictate the course of investment in the Northeast, overtaking the DNOCS's engineers as the main directors of public works in the region.

The consideration of possible relations in ideas and practices in distinct fields – such as regional planning and the combat against droughts –, requires investigation on the history of institutions, ideas and actions, on the formation of disciplinary fields, as well as on individual trajectories – which can bring out connections between distinct historical times and geographical spaces[9].

With this in mind, as well as the set of themes that make up the "technical dimension of droughts" and the vast amount of primary material already collected by the research that is the base for this article, we propose an analysis of the discussions surrounding two of the fundamental types of actions against droughts: the constitution of an integrated road system (see item 3) and the construction of *açudes* as nucleating elements for social, and especially economic, activity (see item 4).

But how were these actions formulated as fundamental? In what context were they debated, proposed, put in practice? How did, after all, and essentially, the issue of droughts emerge as a technical problem whose solutions pointed towards an encompassing perspective of knowledge and building of a territory – a perspective for which, we accept as a hypothesis, the spatial dimension was of paramount significance? This is what we intend to outline in the following item.

2. Building a Nation, building a territory

The perception of a re-emerging territorial perspective in the realm of planning, after decades of strong emphasis on mostly economical aspects, brings back into question the fact that the consideration of projects for a Nation presupposes the consideration of the territorial structure that supports it, the space that defines it. This presupposition was built as national problems were faced over the second half of the nineteenth century. Speaking of national values indicates, naturally, the very effort of thinking about and defining what could be considered a problem. It also indicates the existence of intellectual, technical and professional groups capable of articulating investigations, analyses, and proposals.

In fact, there is a confluence of factors that allow the understanding of those issues' maturing in that moment. Without moving deeper into the theme, it's worth mentioning: the formation of new generations of superior-level professionals in the national colleges; the creation of institutions dedicated to the discussion of Brazilian themes, such as the IHGB[10]; the appearance of countless technical-scientific magazines, beyond the predominant literary and political publications; the accumulation of knowledge produced by the many foreign scientific commissions that braved the country's territory in the first half of the nineteenth century. The creation of several arenas of technical and public

debate can also be noticed, which would grant legitimacy and allow the circulation of ideas and proposals, expose divergences and construct agreements, such as the creation of the Polytechnic Institute of Rio de Janeiro in 1862; arenas in which projects for a Nation would be formulated and resonated.

In this context, an issue was considered essential: the consolidation of the political State as a territorial State. The need for "maintenance of territorial integrity", amidst diplomatic or even military disputes for national borders and the lack of technical and scientific knowledge of the countries' vast interior, was considered by the Imperial elites an urgent task[11]. A political problem, but also, and mainly – at least according to the engineers – a technical problem.

The droughts exacerbated this urgency. How could a problem be faced and solved if that very problem was unknown – as an objective *datum*, quantifiable, "scientific", after all? What could be done to understand the phenomenon's causes, the affected region, its social and economical impacts? When another great drought erupted in 1877, a discursive base for debates on the phenomenon already existed. It was no coincidence that the session gathered in the Polytechnic Institute to discuss proposals for the facing of the drought would accept as a starting point the 1861 "plan" by the geographer Gabaglia (see item 4). The conjunction of discussions show, beyond the disputes among different visions for the country's modernization, the preeminence of the role the engineers were to play in this process. Originating from a polytechnic formation, with a strong positivist slant, they would seek to articulate the facing of an emergency situation and the possibilities of constructing structural works – dedicated to the stabilization of drinking water and irrigation for architecture, for example.

This is reflected in various proposals that point clearly to the vision of integrated action over a territory to be constructed. André Rebouças, one of the most influential engineers at the time, would propose "the construction of a railway system that allowed a fast articulation of the province [of Ceará], both in order to send assistance as well as, and especially, thinking about the future economical reorganization of the territory, so as to allow distribution and circulation of agrarian production, manufactured goods and people"[12]

Furthermore, it's clear that the droughts were taken, in the discussions in the Polytechnic Institute, beyond their inherent issues and as a problem that allowed the discussion of other issues, considered essential in that period. Beyond a territorial structure for a political State, the formation of a people that could overcome the atavic burdens of colonization and miscegenation was considered fundamental. However, instead of fatalistic condemnation, it was believed and supported that the transformation of the natural environment into a structured territory would lead to the construction of a new social environment, of a new man.

The notion of comprehensive and integrated action over the region is thus consolidated, requiring the definition and delimitation of the region that would be the target of intervention. Even further, this notion would imply the construction of a spatial

dimension, i.e. the evaluation of the (natural and social) landscape, the soil, the topography and hydrography. When the engineer Saturnino de Brito was called upon in 1892 to study the area to be crossed by an extension of the Baturité Railway (which would connect the city of Quixeramobim, in the Province of Ceará, to the São Francisco River, in the border between the provinces of Pernambuco and Bahia), this notion and dimension were clearly defined. His field work took over 40 days, as he evaluated the several trajectory options for the railway tracks based on technical, economical, social and aesthetical considerations. Brito's proposal was to articulate the railway project with *açudes* as a source of irrigation, granting the region's productive segments permanence and viability[13].

This comprehensive approach, which presupposed a notion of integrated action and a clear spatial dimension, would become dominant in the formulations of the combat against droughts. Furthermore, the idea of a general plan (to articulate all these efforts and resources), supported by Brito in 1892, would begin to disseminate in the discourses. The institutionalization of works against droughts, with the creation of IOCS in 1909 would reassert the need for planning.

Over the next two items, we will discuss how this notion of a more comprehensive and integrated action appeared in the proposals for circulation systems and *açude* construction.

3. Road network plans

The transportation network in the mid-1800s' northeastern *sertão* consisted of few and precarious trails created as the colonization frontiers were pushed towards the region's interior during the colonial years by farmers and cattle ranchers. These long and winding paths, often unmapped and unmarked, were rough for the carriages and oxen carts to traverse during the dry period, and practically impossible to be followed even on foot or on horseback in the rainy months, when they became slippery and dangerous patches of mud[14]. In 1858 and 1863, private investor groups built the first two railroads in the Northeast, both short sections located in the sugar-producing coastal area; as most early railroads in the country, they were problematic and unprofitable. In 1873, nevertheless, another group began the construction of the first railroad that actually penetrated the *sertão*, the *Estrada de Ferro de Baturité*. During the 1877 drought, as the private consortium found itself financially unable to maintain the enterprise, the Imperial government intervened, taking over the railway. The construction works were then used as means to provide employment to the masses of people dislodged by the climate and to move relief supplies to the interior and migrating population to the coastal cities. It was the first experiment on what would become a model of work against the droughts in Brazil, closely inspired by similar efforts undertaken by the British administration in India.

Over the remainder of the nineteenth century, other privately-funded roads with similar objectives – connecting the isolated *sertão* to the rest of the nation, developing its economy, and providing relief to the population during the droughts – were built.

Because the State offered financial aid based on the railroad's length, however, they were usually meandering paths, rarely following an optimal path for efficient transportation. The operation of these isolated railroads, more often than not, suffered from severe financial deficit. In 1903 the State decided to again take action, expanding the lines so as to connect the existing railroads and approving projects for new railways in the Northeast. By 1907, the engineers could declare that "a railway plan in the interest of [the Northeastern States] is finally being outlined, and the idea of another internal connection between the North and South emerges, through a line more or less parallel to the coast"[15].
Picture 3: Engineers inspect the building of a railroad in the Northeast
(Source: *Ilustração Brasileira*, 1922)

These engineers were aware of the need of a "general railway plan", forming a "network" – both oft-mentioned concepts –, and stressed that the roads must be profitable on their own, and the course of the lines must follow the technician's design, rather than whim of politicians, as often happened. Various proposals for "general plans" for the region were mentioned in the engineering magazines, such as Raymundo Pereira da Silva's plan for over 13 thousand kilometers of railroads, whose main lines were to follow the paths "indicated by nature", over which populations, economic and administrative interests had been "unconsciously grouped" over the years[16]. Paulo de Frontin, the President of the *Clube de Engenharia* (engineering club) of Rio de Janeiro, presented in 1912 a national plan for railways and transports with a similar objective of extending and integrating the Northeastern railways, but also detailing ways to connect it with the country's South and with the whole of South America[17]. An influence to which this debate could be directly or indirectly linked can be traced back to the late Imperial period, when several proposals for transportation systems (some articulating railways to river basins) were put forward by national technicians[18].

Another engineer, J. S. de Castro Barbosa, approached the Engineering Club in 1909 with a different proposal: two main lines, he suggested, should be created, connecting

the cities of Recife to São Luiz and Recife to Fortaleza, which were to cross in the middle of the *sertão* (see *Picture 4*). At the crossing point, in the small village of Leopoldina or nearby Ouricury, a city would be developed, from which one would be able to reach Natal – the furthest port in the Northeast – in 36 hours, or travel to or from Rio de Janeiro in only 5 days. This crossroads city would be the headquarters of all military forces in the region, where they could be easily maintained and trained, and kept away from "the politics and other distractions of capital cities". This concentration of personnel and the access to easy transportation would allow "the foundation of an important commercial emporium in the *sertão*"[19]; the soldiers would also serve as cheap and regular workforce for the works against droughts, as opposed to the usual policy of waiting for droughts and using the dislodged population as workers.

Picture 4: A reconstitution of J. S. de Castro Barbosa's railway plan. The red dot indicates the "crossroads city" in Paraíba.(Source: developed by the authors. Base image ©NASA, 2004)

While there was an abundance of proposals and plans, the actual construction of railroads was not an easy task, as is evidenced by the history of many individual railways planned for the Northeast. Even when their existance was justified – in some cases even fiercely defended[20] – by engineers, with basis on hard economical data and projections, a lack of financial resources or political interest meant the construction was often delayed and extended over large periods. By the late 1920s, when rail infrastructure could finally provide some basic integration between some of the region's main commercial and population centers, the railroad system was no longer the main point of interest for Brazilian engineers, having been overshadowed by a new development: the automobile.

Having enthusiastically followed the new invention since its introduction in the turn of the century, many technicians became proponents of an automobile-centric road system over the first decade of the 1900s. By 1914, as the First World War made the materials needed to construct railroads scarce and expensive, and in face of a still-incomplete and often problematic national rail system, the impetus of the works quickly moved towards roads intended for automobile use. During the 1915-1918 period, when the notorious engineer Aarão Reis held the office of Chief Inspector, not a single railroad was built or extended by the IOCS; Reis's reasoning was that the roads' easier, faster, and less costly construction was enough to justify the exclusive investment.

Over the years that followed, the Inspectorship's regulation towards road building was vague, with most roadways being created so as to connect the ports and larger urban centers and the construction sites of large *açudes*, allowing the transportation of the necessary building materials. The workforce used in the services consisted mostly of population displaced during the drought periods, so the rhythm of works fluctuated with the seasons and the weather. During the 1920s, the automobile road was consolidated as the model to be followed in the minds of a majority of engineers[21]; in 1927, as an example of this development, Paulo de Frontin, who had been a strong supporter of railroads, addressed his peers with a proposal for a large, integrated national system of roads with seventeen main lines (four of them in the Northeast), explaining that, in the United States, "where automobile roads have reached maximum perfection in their design and construction, the volume transported through them is double that of the railroads"[22]. An actual integrated roadway plan for the Northeast wasn't implemented until the early 1930s, its construction started in 1932, another year of drought, as a relief service to which were credited the salvation of over a million people, "through transportation of families and workers and supplying of materials and provisions to hundreds of service centers"[23]. As a relief system and in their final objective of connecting urban and production centers, the roads functioned, despite the changes in equipment and construction, very similarly to railroads, acting as a complement to another fundamental element in the combat against droughts: the *açudes*.

4. *Açudes* and the consolidation of the urban network

> The Northeast has a relatively large population of about 2 ½ million inhabitants, spread over every spot that has longer-lasting waters, and the urban settlements of the *sertão* and highlands are located in the surroundings of the deeper, more consistent *açudes*.[24]

As part of a report made by the "Rondon Commission", sent by the Federal Government to review the progress of works against the droughts in 1922, the aforementioned analysis denotes a clear conscience of the importance of the *açudes* as defining elements in the foundation of the urban network in Northeastern Brazil. While the availability of water is naturally a condition for the growth of human settlements, the commission's assertion would not, however, have been true a few decades earlier, when *açudes* were few and far between, and their much smaller dimensions were barely enough to sustain the production in private farms, let alone the population of larger urban concentrations. The verdict on *açudes* reached by the 1860 comission sent to Ceará was, in fact, quite diverse.

Giacomo Raja Gabaglia, geographer and professor in charge of writing the report covering the 1860 scientific commission sponsored by the IHGB, considered the *açudes* "more profitable to the wealthy and favored by fortune than to the general populace"[25]. This impression is justified by the fact that in that period – and ever since their inception in colonial Brazil –, *açudes* were small structures, with earthen or masonry walls built by a farmer to provide for his own lands' needs. Gabaglia thought the building of public *açudes* was not viable, as he considered them too costly, and expected problems with

the availability of workforce and the distribution of the works amongst the province's farms.

Regardless of Gabaglia's concerns, and in response to the drought of 1877, the Ministry of Agriculture decided to create an "*Açudes* Comission", led by the British engineer J. J. Revy[26] and sent to Ceará in 1879. The main result of this Commission's studies was Revy's 1882 project for the "Cedro" *açude* in the municipality of Quixadá, a work much larger than anything Gabaglia had seen or suggested. Between 1890 and 1906, facing droughts and other operational problems, its four stone walls were erected (see *Picture 5*), enclosing a 224 square-kilometer river basin, and granting the *açude* a water storage capacity of 125 million cubic meters. It was the first of a new kind of work against droughts in Brazil – the large, public *açude* –, and was visited by the Republic's President shortly after its inauguration, despite it being located in the far reaches of the arid *sertão.* It was also by and large a design failure, its waters completely drained by 1907, due to the strong natural evaporation – a severe letdown for the project's supporters, who nonetheless considered this as a lesson taken, and one that ought to be kept in mind when designing other large *açudes* from then on[27].
Picture 5: One of the Cedro's walls. (Source: *Ilustração Brasileira*, 1922)

The Federal Government wasn't discouraged by this failure, either, and the 1909 guidelines for the newly-founded IOCS had *açudes* as the very first kind of work listed and detailed. The guidelines categorized the *açudes* as either small (minimum capacity of a half million cubic meters, depth to shallower than four meters), medium (capacity between two and ten cubic million meters, average depth above five meters), or large (capacity of over ten million cubic meters, average depth above six meters). The small and medium *açudes* were generally the ones built in private lands, and the Inspectorship was in charge of evaluating requests from land owners, elaborating the

projects for *açudes* deemed important enough, and refunding the owner of half of the construction costs after the work's completion. In exchange, the owner would accept to "supply water for the domestic needs of the surrounding population"[28]. In their attempts to convince the Inspectorship of their proposal's public usefulness, and thus be granted the State's help, farmers would often cite an area's high productivity and large resident population as their main justification. This small- and medium-sized works were, thus, aimed at improving the rural production and granting the local population a higher resistance to dry periods; because of their smaller size and great dispersion, however, its effects are not easily quantified; also, the local oligarchies' interests often interfered in their distribution and prioritization. The large public *açudes*, on the other hand, would have a more defined role in the configuration of human settlements in the Northeast.

Large reservoirs such as the Cedro and others that followed it, on the other hand, could not be created wherever the engineers (or the oligarchies) deemed them needed. The requirement of certain natural conditions, both topographical and hydrological, meant that it was the terrain, and not the human occupation, that determined their location. Their presence, as mentioned by the 1922 Rondon Comission, imposed "the concentration of population centers on a relatively small area, to which all are forced to come in the times of drought"[29]. The very process of building large dams in the *sertão*, far from the capital cities and ports from which workforce and equipment had to come (see *Picture 6*), required the creation of settlements near the construction sites, many of which endured and developed after the *açude* was completed. These settlements were accordingly planned and equipped, as evidenced by the report of a journalist visiting one of these construction sites:

> In S. Gonçalo the workers' homes already form a veritable city, with a medical station, drugstore, school, drinking water filter, etc. The houses are not light buildings meant to endure a season. Carefully built, they will later serve as definitive homes, because in the locations where today these vast hydraulic works are built, shall, in the future, be raised large population centers, destined to attract even the workers of nearby settlements.[30]

The concerns that went into the planning of these nascent cities went beyond the mere needs of the construction itself: the journalist, whose tour was closely guided and instructed by both Brazilian engineers from the Inspectorship and "North-American technicians who supervised the works in the Northeast", enthusiastically emphasized the Inspectorship's intention of providing education and literacy to the local population and introducing notions of hygiene, thus enabling these "desolate regions" to fully contribute to the nation's development.

Beyond providing water for the population's domestic use, the *açudes* were meant to improve agriculture in the surrounding areas, both through irrigation of nearby land, and through use of the *açude*'s area itself in what was called *vazante* agriculture[31]. In his studies regarding a series of *açudes* projected for construction in the Rio Grande do Norte State in 1925, the engineer Eduardo Parisot, under service of the IFOCS, took into consideration the amount of land that would become available for *vazante*

agriculture and, through careful calculation, demonstrated these areas could support a population of 40 thousand people. Additionally, taking into account the population density of Egypt and transporting it to the area, he came to the conclusion that up to 140 thousand people could be sheltered there in times of severe drought[32].

Picture 6: IOCS trucks move through a newly-constructed road, carrying building materials to an *açude* construction site. (Source: *Ilustração Brasileira*, 1922)

As evidenced by this type of analysis, even if their proposition was not exactly methodical, and despite being commonly affected by problems during their execution, the large *açudes* designed by the Inspectorship were rapidly evolving away from the mostly trial-and-error process that characterized the building of the Cedro. The new *açudes*, larger and more numerous, were a more carefully thought-out intervention in space, clearly aimed at orienting the placement and structuring of human settlements and distribution of population in the semi-arid areas of Northeastern Brazil.

The crucial element which allowed the continued construction of these large-scale works in the *sertão* was undoubtedly the introduction of reinforced concrete building techniques[33]. In a 1910 conference, the engineer J. S. de Castro Barbosa stressed the importance of this new material, successfully employed by Brazilian engineers in civil construction since 1905, for the building of cheaper, larger and more effective dams, citing the Snake River dam in Twin Falls, Idaho, with which the American engineers had managed to "dethrone India and Egypt itself in this type of works"[34].

The admiration for North-American dams and other hydraulic works in the American West was reflected in many articles that dealt with the problem of droughts in the Northeast, and they were often shown as inspirational examples for state intervention in the region. The ostensive presence of foreign firms[35] and technicians[36] carrying out the construction services, on the other hand, was harshly criticized by some Brazilian

engineers, who were adamant that the national professionals had the means and the knowledge and were up to the task of commanding these works. This fact, combined with State's necessity of lending money from British or American banks in order to carry out the works, led to protests that warned about the country falling victim to financial and ideological colonialism[37]. When not directly competing for work, however, the tensions were eased, and local engineers usually collaborated with foreign technicians with little conflict[38].

5. Conclusion

The influence of foreign engineering was not limited to the presence of American and British technicians in Brazil. Imported bibliography, participation in international Congresses and exploratory travels to North America and Europe were often cited sources of knowledge in the Brazilian engineers' articles and conferences. The American stance towards the preservation and management of forests was also widely advocated as a way to lessen the drought and desertification problems, and the regulation of some States in the USA concerning the public use of water was often cited as an essential example, which should be closely followed.

While the foreign experience and example were always welcomed, the engineers knew they had to be adapted and transformed to the Brazilian reality and the available resources.

> Because we are in very different conditions from the arid and uninhabited dry North-American region, we had to act, motivated by calamity, even with the general elements we possessed to fulfill the need of promptly rescuing a region as densely populated as the one we desired to help.[39]

Similar references can also be found dating back to the second half of the nineteenth century, when ideas, proposals and actions against droughts were maturing. References which, in a way, helped forge a knowledge and a practice, a tradition, and finally, a history.

Hence, they helped the building of a notion of comprehensive and integrated action over the region, delimiting and structuring the territory. A notion that, as previously said, appears outlined in the discussions from the 1870s and, especially, as a more consolidated approach, in the 1890s onwards, as exemplified by the reports by Saturnino de Brito (1892), the founding regulation of the IOCS (1909) and the report evaluating the Inspectorship's actions over a decade of existence (presented by the engineer Aarão Reis, in 1920). Furthermore, it can be said that *açudes*, railways, and other works did have a significant impact on the organization of the territory and urban network in the Northeast.

But what is the legacy laid by these actions in the context of regional planning in Brazil? The current verdict is that the engineers' spatial proposals for planning in the Northeast were largely abandoned when their authority to intervene in the territory was

overshadowed by that of the economists, with the creation of SUDENE. It is known that SUDENE itself included some spatial studies and proposals in their plans, created with the help of geographers (and not engineers), especially from the late 1970s onwards. While some of the principles that guided these studies are similar to those used by the engineers decades before, the correlation between these propositions is not yet clear, and demand further investigation. While the engineers continued to propose and execute works against droughts under the DNOCS, their position as the main developers of theories and plans for the development of the Northeast had been lost. Is it, then, possible to find in the engineers' actions consistent evidence of the origins of regional planning in Brazil? Is it possible to map the relations that would demonstrate how the facing of an issue, at first specific and localized, evolved into a comprehensive understanding of the problem? i.e. in a similar way to Francesco Dal Co's study, which demonstrates how, within the progressist ideology of the USA's urban planning, the proposals for parks in the mid-nineteenth century led to the proposals for regional planning from the 1920s onward?

These questions also characterize hypotheses for research. Indirectly, it can be asserted that, yes, such relations can be mapped. In the very core of the formulations of works against droughts are themes central to modern planning, such as "the land question" and "the place of agriculture in planning", to make use of Abercrombie's terms, as previously cited; in the same fashion, the need for the structuring of an integrated circulation system (for goods, people, information) constitutes a common motive in the origins of town and country planning. Furthermore, it's known that many of the professionals involved with the issues of droughts had long and influential careers as town planners (such as projects for urban reform and expansion, technical sanitation and water distribution networks for the cities and surrounding areas, or even in the formulation of public policies), as is the case of Aarão Reis, Saturnino de Brito and Henrique de Novaes.

These indirect relations help the understanding of the formation and circulation of modern technical culture in Brazil, initially in a diffuse or even imprecise manner, in a moment that predates the processes of institutionalization and formalization of planning as a discipline (one which would begin to be taught, in the context of the Academia, in the 1970s).

What about the direct relations? There is a series of leads and many research tasks to be undertaken that would allow the mapping of these possible relations. Furthermore, one mustn't forget that new interventions and readings would inform the process of formation of regional planning in Brazil in the mid-twentieth century, such as the circulation of Geddes' theories via regional planning in the United States, especially through Mumford's writings.

Along with these considerations, one must not neglect the urgency of action dictated by the droughts' devastating humanitarian and economic effects meant the Brazilian engineers had to come up with comprehensive, yet readily applicable solutions. Their dedication to understanding the space over which they should intervene, and their

accumulated knowledge over technical and scientific aspects, as well as their familiarity with intervention upon the spatial dimension, allowed them to create proposals and plans that were infused with ideas and concerns that were key to nascent discipline of regional planning. The need to deal with an extremely adverse situation, while hurdled by political intromissions and an always tight financial situation, combined with their practical mindset, meant the Brazilian engineers had little chance or motivation to abstract their plans into a set of theories. The proposals did, however evolve significantly over the decades, based on national and foreign experience and practice, and a good dose of trial and error.

Furthermore, even if no palpable connection can be made between these engineers' proposals and the work of planning pioneers such as Patrick Geddes and Lewis Mumford, contemporary to their own, it's evident that themes such as the relationship between the country and the city, the circulation of materials, people, and ideas, and the management of urban population, were being discussed and solutions based on quantifiable data and scientific predictions were in construction, following parallel trajectories determined by each country's specific needs and available resources.

Even still, such ideas met a complex intellectual arena of discussions on planning that found in the theme of the droughts a privileged space for discussion. In this sense, the work of the engineer Saturnino de Brito can be emblematic. The author of dozens of plans and works (of sanitation networks, urban expansion and reform) for countless Brazilian cities, his participation in the works against droughts as early as the 1890s, producing extensive studies and reports, observing and constructing various analytical perspectives, reasserting its condition as a problem of national scope, pointed towards new paths. In the one hand, it consolidated the comprehensive approach and incorporated the spatial dimension of territory. On the other, we could surmise, it meant the definitive overcoming of the illustrated and erudite look of the chroniclers and early scientific commissions, towards a systematic observation of nature in its multiple dimensions – thus approaching the formulations that characterized the scope of Survey, either regional or civic.

[18] On this respect, see Souza Neto, 2004, pp.77-156; those were plans by the geographer-engineer Eduardo Moraes (*Navegação interior do Brasil*, 1869), the engineer João R. de Queiroz's (*Esboço de um plano de viação geral para o Império do Brasil*, 1874, and *Recursos financeiros à execução de obras públicas no Império*, 1882), the engineer André P. Rebouças (*Garantia de Juros*, 1874), the then-director of Roads and Public Works from the Ministry of Agriculture Honório Bicalho (*Rede geral de comunicações*, 1881, the first official plan under the Imperial government), Antonio M. de O. Bulhoes (Plano *Geral de Viação do Império*, 1882 – the first elaborated in a collective manner, with collaboration of several engineers and presented in the first railroads congress of Brazil, organized by the engineering Clube, in 1882).

[19] *Revista do Clube de Engenharia*. (Rio de Janeiro, Brazil: Imprensa Nacional, 1910). Issue 22, p. 77-78

[20] The Mossoró Railway is one such case. It was first requested in 1875 as a means to cross the sertão from north to south and reach the São Francisco River, allowing for transportation of people and goods – most significantly large amounts of salt extracted in the vicinity of the city of Mossoró. The actual construction only began in 1909 and ceased in 1933, when less than half of the originally planned distance had been covered.

[21] Exclusive investment on them was not, however, agreed upon unanimously. Over the 1930s and beyond Henrique de Novaes and other engineers still defended the parallel and complementary use of railroads, especially to transport heavier, lower-value cargo. It was only in the 1950s that the automobile-road system became virtually hegemonic in Brazil.

[25] Capanema, and Gabaglia, 2006, p. 132.

[26] The majority of evidence points to his full name being "Julian John Revy", despite some claims of him being French and named "Jules Jean Revy". His reports to the commission are written in either English or Portuguese, and always signed J. J. Revy.

[27] The 1923 Rondon Commission's report revealed the Cedro's reservoir hadn't yet reached full capacity despite rainy periods since its construction, and regretted that no action had been taken to establish permanent meteorological stations to perform studies in the area, which they believed could be invaluable for understanding the climate and building new *açudes*. The Cedro reached full capacity for the first time in 1924, was completely dry again in 1930, and only in 1974 it was able to reach its full level once more.

1. Introduction

1.1 Situation of Aging in Beijing

Beijing became an ageing city since 1990. At the end of 2005, the population of inhabitants over 60 years, which is defined as ageing population, is 2.243 million, accounting for 14.6% of the whole inhabitants in Beijing. It is estimated that by 2020 the ageing population will be 3.5 million, which will be 19% of the total population of Beijing (Figure 1).

However, comparing to aging increasing, the elder care ability of traditional Chinese mode is decreasing. Firstly, the population in a family deceased because of the implementation of the policy of family plan since 1980.And the elder-only family number is increasing. In 2005 the elder-only family number (including the family of one elder or one elder couple) in Beijing is 504,000, which counts for 33.3% of the total elder families. Secondly, the earliest one-child-families become aging increasingly. So that the child of one-child-families have to care his/her parents, i.e. two elders or more if grandparents are alive. This kind of elder care system is difficult to continue. Thirdly, limited by the national welfare resources and funds, government-built elder care facilities are too few to match the aging with fast increase speed. By the end of 2005, the number of elders living in elder care centers is 17,000, which is 0.8% of the elders in Beijing. Now in Beijing there are 313 elder care centers and 30,267 beds, which means 1.3 beds per 100 elders.

Therefore, in order to solve such problems, in Beijing and other cities with high aging rate, such as Shanghai, Jiangsu, Dalian, Qingdao, etc., a new elder support pattern, "elder care at home (居家养老)", is under exploring and trying. This paper analyzes the situation of "elder care at home" in D-community in Beijing, which is pioneer in exploring the pattern of elder care at home.

1.2 Situation of Communities in China

Chinese housing support system was reformed since the middle of 1990s. The housing policy reform changed urban housing system from the national house supply welfare to commercial housing. Therefore the commercialization of urban housing developed quickly and commercial houses occupy a large ratio. Accompanying to the

commercialization of housing system, the house function is being subdivided, especially housing estate for elders appeared because of the rapid increase aging population.

In China, communities can be divided into seven types, which are old type Community, single or multi Work-Unit (in Chinese 单位, Danwei, company, organization, etc.,) Community, High-class residential Community, immigration Community, commercial residential Community, Jizhen (in Chinese集镇, market town in countryside) Community, and newly urbanized Community. Most are Work-Unit Community, which are 42.3% for national average and 40.1% in Beijing and east China region.

Before 1998, the workers in urban area could obtain houses from Work-Unit and could live with low rent fee, which is a national welfare. Work-Unit took charge of the building management and maintenance. In 1998, the housing welfare policy was abolished and the formal welfare houses were sold to the residents and became private, which are called Fanggaifang (in Chinese房改房, policy-reform house) and are permitted to enter house market for trade. Accompanying to the house privatization, Work-Units become not provide maintenance and services to residences, which is not good for elder-care-at-home. The former Work-Unit Communities became commercial Communities and residents cannot obtain support from Work-Unit.

On the other hand, the services for retired workers become public-supported and Work-Units do not support retired worker any longer. Under this situations, the existing Resident Committee (RC, in Chinese居委会, Juweihui,) turn to be important in some types of communities. But in commercial residential community like D-community, there was no RC at the beginning. Residents service here must depend on the real estate development companies (REDC).

However, REDC certainly aim at benefiting from estate development projects. While setting up the Supporting System for the Elderly at Home (SSEH)[*1)] belongs to the public realm. It seems that companies' private interests conflict to that of the public realm.

This paper studies the situations of SSEH in D-community (D-SSEH) in Beijing and argues that private interests can match public realm if the REDCs can develop a plan considering the needs of elders.

Yao (2007) and Yan (2003) studied D-community from the viewpoint of architecture and Sociology. Zan (2003) studied D-community in the field of Enterprise Management. However no research focuses on analyzing SSEH from the viewpoint of urban planning. Therefore this research aims to analyze the evolution and characteristics of D-SSEH to clarify the following aspects: (1) For the aspect of the REDC: why did it choose to plan and build community for elders? How did the REDC benefit from this project? (2) For the aspect of residents live in D-community: Who choose to live here and for what

reason? How do the residents feel about the market-leading D-SSEH? (3) Games between the stakeholders in D-SSEH; their relationships, and the operational pattern of D-SSEH.

Three times investigation were conducted in March 2006, September 2006 and January 2007. Field survey of buildings, public space, services facilities was conducted to obtain intuitionist image of the physical environment of D-community. Interviews to elders living in the community and staffs of REDC, Property Management Company (PMC) were conducted to obtain objective data and opinions on the appearing and evolution of D-SSEH and its effect. Literatures and reports on ageing condition of Beijing, community research and D-SSEH were collected from publications and web sites to complement the field survey data. Two copies of questionnaires were delivered to one household and the collection was conducted by post mail. The investigated number and collection rate are shown in Table 1.

2. Introduction to D-Community

D-community was constructed in 2003 in Beijing. It was one of the earliest residential communities orientated to the elderly since the 1990's housing reform in Chinese cities and it is the largest retirement community in China by far. People focus attention upon it because a new kind and elder service market decided elder care system, SSEH, was introduced under the background of population aging, elderly care mode changing and housing support policy reform.

D-Community (Figure 2, Table 2) is a commercial residential community developed, constructed, sold and managed by a REDC. It is orientated to retired elders. It is designed by referencing the experiences of American retired community, especially the project of Sun City Center developed in 1961 in the United States of America.

The site area is 2,350,000 square meters. The total floor area is 700,000 square meters, consisting of 650,000 square meters of residential buildings and 50,000 square meters of public buildings. The floor area ratio is 0.3.

The community is well planned to offer elders good living environment. An artificial lake of 160,000 square meters is constructed and green spots with total area of 750,00 square meters are scattered among the buildings. For the convenience of elder living, building types are limited to Si-he-yuan (Chinese: 四合院, is a type of residence that was commonly found throughout China, but most famously in Beijing. The name literally means a courtyard surrounded by four buildings), two or three-story detached or connected house, and four-story apartment with elevator. The community is no-barrier designed and equipped with infrared security system, water source or ground source heat pump system, etc.

The community is developed in three phases and consists of seven parts.
(1) Phase 1, finished in April 2003. Apartment buildings consisting of houses of 70 to 230 m^2 floor area were constructed. Post office, supermarket, and restaurant were constructed as well. In order to make residents live interestingly, table tennis circle, chess circle, and fishing circle are set up in July 2003. But medical facility was not realized although it is planned in the development scheme.
(2) Phase 2, finished in 2005. Except residential buildings, public service buildings were constructed as well.
(3) Phase 4, finished in 2007. An artificial lake of 40,000 m2 was constructed so that the community environment become quite well. The medical facility was finally completed in November 2007[*2)].

The investigations conducted by the authors shows that the residential buildings, outdoor environment, leisure places, service facilities are well planned and constructed. Service facilities, such as supermarket, can basically fulfill the residents' requirements. Although the medical facility is completed four years later that that planned, it is become very important because the community is far from downtown city.

3. The REDC: balance between commercial interests and public realm

3.1 Why the REDC orientate D-community to elders?

For a commercial company, of course benefiting is the only purpose. The REDC of D-community decided to develop a community for elders based on the consideration of community location, aging situation in Beijing and the background of Chinese house policy reform. The REDC found the gap between the customer requirements and the available houses developed by real estate developers. The REDC of D-community developed a special plan that can fulfill both the requirements of company and customers. Such a community is co-formed by the development of Chinese society and real estate industry.

The first reason for developing an elder-orientation community is the community location. The community locates at the northeast suburban of Beijing and is 45 kilometers far from downtown Beijing (Figure 3). Although there is one bus route available for residents to go to downtown or go conveniently by private car, the traffic conditions are not so convenient for salaried workers to go to and fro between home and workplace. But the land price is cheap so that the location is suited for developing an elder-orientation community.

Secondly, the population aging problem in Beijing is another main reason for the REDC deciding to develop an elder-orientated community. REDCs in Beijing like new concepts. The leaders of REDC who developed D-community think that it will benefit much if they firstly propose the concept of elder-orientated community and offer special houses for elders. Main benefits are as follows. 1) They can barrier rivals from entering

this market. 2) Currently the elder-orientated houses are needed while no REDC provides such house[*3)].

Thirdly, since 1998 the Chinese housing policy was reformed. People can no longer obtain houses from the country but have to buy houses. Accordingly the house maintenance and community services are no longer provided by the institute where the residents work. So that if a REDC can provide such service, even in commercial way, elders can worry nothing about the house maintenance. This is a very important issue that makes D-community be sold well.

3.2 How does the REDC operate the SSEH in D-community? It's advantages and difficulties.

For the purpose of building a comfort community for elders, the REDC has to build a residents satisfied SSEH. Advantages and difficulties that a REDC faces were summarized using the investigation data.

Advantage -1) A REDC can financially support the improvement of SSEH. It can set up, manage, or introduce a service for elders. In D-community, the REDC constructed public facilities and commit the building maintenance and services providing to a professional Property Management Company (PMC) [*4)]. Because REDCs have fund and authority for constructing public facilities for communities, this is very advantaged comparing to traditional community elder support mode, which is managed by RC. Generally a RC does not have enough funds to construct facilities for elders. With respect to introducing services, a REDC can use cooperation or commit professional company to provide necessary services for elders.

Advantage-2) A REDC can provide elders communication place and help to set up resident organizations. For example, in D-community the REDC provides a lot of places for elders' communication and helped to organize several activities or circles to make elders' life become interesting, for example, new year party, singing circle, dance circle, sports circle, etc[*5)]. The PMC provides place and a part of fund. The participants need to pay the rest fee by themselves. Of course residents set up organizations by themselves as well. Both types of residents' organizations are well developed and totally self-managed.

Difficulty-1) REDCs have not authority to use administrative resources so that they have to communicate with government. A REDC itself cannot complete a service that needs administrative resource, for example, post service, medical service, etc. Now the Chinese social reform is not yet completed, so that many services planned by the REDC of D-community cannot be smoothly fulfilled but have to negotiate with government to obtain government support or look for new solutions.

Difficulty-2) REDCs cannot directly know residents' wish so the cooperation with RC or residents organizations is necessary. Because the main purpose of a REDC is to benefit from a project and the work contents is different from RC, they cannot well know the real requirements of residents. But a REDC has to well understand residents' requirements; otherwise they cannot set up a good SSEH. Therefore how to cooperate with RC and residents organizations is a big problem that REDC have to face to.

4. Elderly Residences: Living Conditions of D-community

4.1 Who are living in this community?

Firstly, according to the outcomes of the questionnaire, it is found that the elder residents here are mainly healthy and young elders, generally younger than 75, who are nearly 80% of total residents. Their education level is much higher than the average of elders in Beijing.

It is also found that on the one hand there are quite a few middle-ages in their fifties purchase houses here because they will retire soon. On the other hand there are some two-elderly-generation families, including several long life residents over 100 years old. The residents also include a number of employees of some companies nearby. Thus it is evidential that on the age composition young elders are the main part of the community and it is a mixed retirement community with all ages as well.

Secondly, with respect to family structure more than 60% of the families are empty nests with one old couple besides few single elder households (Figure 4). And over three-quarter families only have one or two children. Moreover over half of total families have no more than one child living in Beijing and some ones have no child living near. The main purpose of their children's visit is to get together only except for few household taken care by their children with several visits every month. So it is shown that most elder families here do not obtain cares from their children.

Thirdly, the education level of residents here is much higher than the average of elders in Beijing. The residents having university education are the most at 38% and resident educated over junior college account to 77% of total. With respect to the occupation before the retirement techno-professional is the most, 39% of total, followed by office clerk, civil servant and teacher. It is obvious that these new middle classes in China cities are the main body of this community, which matches the sale orientation of the real estate developer, which is for high education and high income. At the same time, the class composition leans to participate in community activities zealously and develop their own community culture.

Their former houses before moving to D-community mainly concentrated at the northeast part of Beijing city, near to D-community and with convenient transportation. (Figure 5)

4.2 Why do they move to D-community?

The former houses of the residents before moving to D-community mainly concentrated at the northeast part between Second Ring road and Fourth Ring road of Beijing city, near to D-community and connected to throughway. Thus it should be carefully considered of transportation and orientation when locating new built retirement communities in suburb areas. (Figure 5)

As to the reason of moving, 98% of residents like elegant environment here. Barrier free and community activities are also important reasons. (Figure 6). Low building density and stories, open space and nice green provide a plenty of outdoors activity grounds. According to the questionnaire walking is the most popular daily exercise for the old people, which is supported by safe walk system and pretty environment. Green, cleanliness and safety are the three most satisfactory environment factors regarded by the residents here.

More than half objects will continue to live here but better elderly care is expected. (Figure 7)

4.3 How do they evaluate the community facilities?

When evaluating the life service facilities the residents answer of "not very satisfactory and not satisfactory" occupies larger proportion (Figure 8). The main reason could be taken for that almost all service facilities provide by developer alone so they are limited in quantity and variety. Furthermore there are few other available service recourses nearby. Next, most houses are in occupancy only on weekends and the ratio of residing perennially is not high enough to keep the business of some shops or restaurants continuous. Especially the most critical opinion focuses on the lack of community medical service that is thought to be the firstly provided service in a retirement community by all residents.

As to the exercise and entertainment facilities, with a relatvely high usage, the evaluation of most residents is positive while lower expense is expected considering consumption level of retired persons. In addition it meets the needs of most investigated objects that a variety of community activities are carried out by Community Services Company or by the residents themselves. Moreover many old people look forward for more especial elderly care such as visiting service of medical or housekeeping and emergency help, etc. (Table 3,4,5)

To conclude, the quantity and quality of hardware facilities offered by REDC in D-community is on a high level; but the services and management quality cannot make the residents satisfied

5. D-SSEH：Its pattern and the relationship among stakeholders

5.1 D-SSEH is led and set up by the REDC of D-community. (Table 6)

   1) At the beginning of the D-community, only basic SSEH services were provided by the REDC through PMC and residents circles. The first characteristic is the services could not fulfill the elders' needs. Therefore many elders bought houses but did not move to live in D-community. The second characteristic is that the REDC wanted benefits so many services are charged services and the fee were more expensive than that in other communities in Beijing.

   2) Accompanying to the community construction and increasing of resident number, the REDC solved some problems through negotiating with Beijing government. The government made new policy for commercial community built in rural area to solve urgent problems, for example setting up post office and bank office, etc. The support of government made the community services more abundant. On the other hand, the residents used the facilities provided by REDC and PMC or the activities organized by REDC to set up several amusement circles. The circle members also discussed how to improve the SSEH. Finally several Residential Organizations (RO) were set up. The RO is most close to elders and is able to collect elders' needs. At the same time, the RO takes part in the activities organized by government and set up connections with government so that they can obtain government support to help the improvement of SSEH.

   3) The set up to D-community RC indicates that the government factor was introduced into the D-community. According to Chinese law, a RC should be set in a community. It is administrated by Jiedaobanshichu (Chinese: 街道办事处, the lowest level administrative subdivision) and takes in charge of transferring government policy to community residents. In a general community, RC is the government-representing organization that is most close to residents. Generally the staffs in a RC are the residents living in the community. They communicate much with all community residents and are easy to help residents and obtain the trusts of residents. But in the newly developed D-community, the staffs of RC are not the residents of D-community. They do not communicate much with the residents and have not yet gained the trust of residents. Their work need to be improved.

5.2 Stakeholders in D-SSEH (Figure 9)

1) Market: REDC, PMC, and Club
D-community is a newly developed commercial house estate and locates in the suburb

of Beijing surrounded by rural district and forest. Two aspects of influence to the community are caused by the surroundings.

First, REDC had to take charge of every community service by itself at the beginning of the community because there was no RC then. Everything related to residents was handled by the PMC. All the services, including hotel, restaurant, conference, health care, sports, amusement, elder college, etc., were provided by the D-Community club affiliated to the REDC. These organizations share the nice view of the community and provide funds for environmental maintenance.

Second, because the community locates in rural district, the facilities generally constructed in an urban community, such as medical facility, post office, public transportation and commercial facilities, were not constructed from the beginning. The facilities are set up gradually by the REDC and government. Supermarket shop, restaurant and amusement facilities are constructed by the REDC. Post office and bank office are set up by the cooperation of REDC, government and other public organizations.

2) Community: Resident Organization (RO) Accompanying to the increase of residents, PMC organized a serial of amusement activities, such as New Year party, singing circle, dancing circle, sports circle etc. PMC provides place and funds and participants also need to pay a part of fee. Residents also set up some circles by themselves. Resident organization denotes to the elder support system mainly in two aspects. One is that some circles, for example singing circle, have high performance level and are often invited to perform by local government. Through these activities the connection between government and residents is strengthened and government can know more about the community requirements. The other is that the resident relations are improved by attending these activities so that the residents can help each other and communicate to handle some community issues. The function of RO exceeds the scope of amusement.

3) Government: RC and Public Service Organization
Accompanying to the increase of residents and the operation of the community, the local government set up a RC. Different to traditional RC, the staffs of the RC are not the residents of this community. They live in other places far from this community therefore they are not close to the residents and are not so trusted by residents as other traditional communities. Therefore the RC in D-Community does not function much in the daily community affairs.[*6)]

Medical Treatment Station (MTS): In all the public services, the most difficult and mostly cause the elders' attention is the set up of a MTS. Although the REDC promised to set up a MTS, it cannot do it by itself. The supports of government and health department are needed. According to the current policies and rules, the basic heath facilities provided by local government should be configured on two or three neighborhoods level

in urban areas and on one village level in country areas. Although D-community is so large in size as to hold nearly 2000 households in the first and second phases, it only occupies one unit part of the original village legally, whose address is named X village No. 1. Therefore D-community can not reach the standard of heath facilities configuration so that it can not get the finance and staffs from government resources. It is found that REDC should collaborate with local government and health department actively to set up community medical facility by changing the land use level. Moreover, it is necessary to collaborate with relational parties and acute, active response to the new situation resulted from new housing system. At last, until November 2007 was the D-Community MTS built up.[*7)]

To sum up, in D-Community the organizations related to elder care at home include REDC, PMC and club, RO, government, and government built organizations, such as RC and MTS.

5.3 The Inspirations of D-SSEH

D-community is one of the newly appeared community types under the situation of the reforming of housing system and population ageing in cities. D-community is developed facing to the elderly people, which is the key point that decides whether D-SSEH is set up and whether it acts effectively. There are some inspirations that are drawn from its experiences for the same kind of communities in the future.

Based on the characteristics of D-community that the real estate developer provides houses and relevant services and facilities, it is found that D-SSEH is gradually formed under the leading of REDC. The concrete affairs of D-SSEH are taken in charge by PMC and club, which are both subordinate companies of REDC. On one hand they provide facilities and services within the community, On the other hand they organize and cultivate various kinds of residential organizations (CRO) around all community residents. But limited to policies or embarrassed by the new appearance of this kind of community REDC manages to cooperate to local government and related departments in order to solve some issues beyond its duty. Recently the basic administrative community organization, Community Residential Committee (RC) has been sent here according to new community management rule, which is expected to be able to operate SSEH well like it acts in most communities of urban areas.

In the process of nearly four years' development, until the end of 2007, D-SSEH is set up basically by the leading of REDC with the assistance of residential organizations, government and RC. It is evidential that the services are of satisfactory to most community residents. Although the model of D-SSEH, as a developer leading type, still has lots of problems to be regulated and improved continually in the further, it does enlighten more and more commercial residential communities with inspirational meaning of its creation and innovation in China.

6. Conclusions

1) The real estate development plan can fulfill the requirements of both REDC and elder house buyers. Most elder residents are satisfied to the living environments of the D-community, which is the main reason why the houses in this community can be sold well. This shows that private interests can be in conformity with the needs of public realm.

2) The SSEH can be set up in a commercial developed community to meet elders living requirements if the REDC or PMC can provide and adjust some services suitable for elders.

3) Some issues need to be solved to make SSEH work better. For example, in this case the MTS is not well configured because a REDC does not have the right to configure a medical facility so that for many years a medical treatment building is constructed in the community but there are no doctors and nurses. This shows that it is very important to harmonize the private interests with the resources of public realm. The current public resources configuration method in Beijing needs to be reformed to exterminate the barriers to the effective use of public resources.

4) D-SSEH could be a model for future commercial developing communities. Both its advantages and disadvantages might give inspirations for the new comers.

*4) According to Chinese law, the PMC of newly developed community firstly is appointed by the REDC.
After the community RC is set up, the PMV should be appointed by the RC.

*5) Elder college consists of Taiji Sword, Folding Fan Dance, Drum Dance, Ballet, Sing, Chinese Dance,
Golf, Swimming, Bowling, Badminton, Table Tennis, Tennis, Computer, etc. Indoor activities are
conducted in Elder College in management building. The indoor sports are conducted in the gymnasium.

*6）Whether RC can be reformed to adopt D-community residents, or the RC can actively attend the
community affairs need further investigation.

*7) D-community hospital has floor area of 2200 m^2 and 20 beds. It consists of 15 departments of
internal, surgery, emergency, laboratory, radiology, genecology, orthopedics, otorhinolaryngology,
physical therapy, Chinese medicine, B ultrasonic, electrocardiogram. It was built up by the cooperation of
ministry of health, organization department of central government, the academy of science, Beijing health
department, and Shunyi district government.

	Medical service	Activity grounds	Infrastructure
Facilities• House• Environment	The problem of hospital must be settled urgently, otherwise many elders have to remove. This is the most important in planning elderly community.*01-F* Must set up hospital or out-patient department as fast as possible to settle the urgent service such as pharmacy, injection and assay.*03 －M* Except medical, everything here is satisfactory. A health station not a big hospital is required in which injection, emergency help can be provided. A seasoned charge nurse could be competent.*18-F*	There is no free place for old people in the club. Old people and salary-person cannot afford to it.*01-F* Amusement place can be used to communicate. But now it is canceled by the developer.（When we moved in, we can chatted, played chess and card there, and have a lot of fun. Everybody is disappointment when it was canceled.）*05-M*	The gas system is not connected with the city gas system. So the price here is higher than down town. And it would be no supply time to time.*01*-F
			Public Traffic
			It is not convenient to go down town by public traffic from here. The line and time are both too long.*04-F*
			Environment
			The lake water should be more clear here.*11-M*
	Expense	Management	Elderly Service
Management•Service	PMC service is tooexpensive.*03 －F* It would be better if the service price may be lowed down. Because our pensions are not so much.*22 －F* The amusement places in community cost too much for those old people who live here and depending on pensions. We wish to pay less for each time.*29-F*	The service establishment is not enough according to the contects.*03 －F* The environment quality should be improved a ot.11-M The visiting service system should be better. *23-F*	A nursing center is needed in the third period of construction, as the nest families increasing.*07-C* The cost of elder restaurant should be lower than 5 yuan; retired old people are so weak to be assisted.*25-M* SOS must be put into effect especial at night to assure safe to elders.*17-M*
Developer	Elderly communities only be planned by government because that only government could consider common people and any enterprise runs based on profit. Enterprises have no social responsibility.*01-M* No free activity grounds and everything is charged. Chess room, activity room and elderly school aim at profit now which were promised to be free of charge by developer.*35-F*		
Other	Totally this community is satisfactory.*16-F* Continue to carry forward its adventages.*11-M*		

Nantong: how an individual influenced city planning

Haiyi Yu
Takao Morita
Kyoto Institute of Technology, Japan

1.   Introduction

1.1   Zhang Jian and Nantong Model County

In Chinese modern history, Zhang Jian (Fig.1) is well known for his urban construction work done in Nantong. It was regarded that Zhang Jian's achievements depended on Nantong and modern Nantong's developments depended on Zhang Jian's direction (Uetsuka, p47).

Zhang Jian obtained the "Number One Scholar" (in Chinese Zhuangyuan,   , the one got the best score in the annual imperial civil service examination) title in the national exam of Qing dynasty in 1894. From then on, Zhang Jian became an officer in the central government. Less than one year later he left the central government being disappointed in the politics of central government, and went back to his hometown Nantong in Jiangsu (   ) province. There he conducted a wide range of city development including urban construction by the thoughts of "self-government". Tong prefecture (in Chinese Tongzhou   , which is renamed to Nantong county in 1911, and to Nantong city in 1949) was located at the north bank of Yangtze River (   ) and the west coast of Yellow Sea (Fig.2). Modern Nantong shows special experience in China for it was mostly planned and constructed by a Chinese person, Zhang Jian, compared to most other Chinese cities remained feudalistic mode or some foreign settlement cities were mainly planned by foreigners.

Zhang Jian founded the modern industry, agricultural, commerce and education system, etc. (Fig.3) in Nantong County and Tonghai region, and made it a modern city through the efforts of himself and people around him (his students, friends, and staffs in his companies). Nantong thus was called "model county (   )" by Chinese media in 1914 for its comprehensive construction in city infrastructure and social system, which motivated him much more to continue city development in Nantong.

From 1895 to 1926, led by Zhang Jian, Nantong became a "model county," then a "model city", which consisted of a new downtown with an array of modern institutions, western style buildings, paved roads, and public parks, showing the appearance of an advanced modern city.

Modern Nantong was featured of the structure of One-City-Three-Towns (, Fig.4): the city zone (old urban area,   , was the area for education and commerce), Tangzha (was mainly the area of industry and company town), Tiansheng Port (, was the area of transportation), and Langshan (, was the area for leisure

and sightseeing). The four parts formed the Nantong County. Four arteries connected them together. This structure continues in use till now.

Furthermore, Nantong's special development was not limited to the city area. It took place in the rural Tonghai (   ) region as well. The broad planning of Lianghuai Saltern and Cultivate area (   ) benefited regional spatial planning in new town network forming, population growing, and regional infrastructure system construction.

1.2   Purpose of this paper

As Zhang Jian was not a government officer responsible for city development, this paper focuses on the motivation of his efforts in city construction and by what means he managed to gain the power in land use and city development.

1.3   Research approach

During the last 10-20 years, many researches are conducted on Zhang Jian and Nantong in the fields of history, sociology, economy and law, etc., which make plenty of literatures available. Thus this paper uses the methods of literature-review and expert-interview to search the answers to fulfill the research purpose.

This paper begins with a glance at Zhang Jian's professional experiences, which influenced his later social activities much. Then the reasons of Zhang Jian throwing him into the local city development are analyzed, which may contribute to later analysis on his power-gaining. Finally the paper discusses how he obtained the power.

2.   Zhang Jian's professional experiences

This part introduces the main professional experiences of Zhang. Both his working experiences in central government and the dignitaries with whom he worked with are the key points of his later power gaining in Nantong city development.

In the period before 1894, Zhang worked as the secretary in central government. This experience helped him extend his sight besides ancient books he learned and write some famous articles. Those articles caused Weng Tonghe's (, 1830-1904) attention, which conduced to his success in 1894's imperial civil service examination. Since 1895, during his business activities, the title of the "Number One Scholar" and his relations with dignitaries helped him in funding, buying equipments and dealing with the human relations. He gradually became a powerful gentleman in local affairs. He could influence the determinations of important issue in Nantong with the support of local government and even could influence the personnel configuration of local government to maintain this supporting (Zhang Jian, 1918, Preface). Since 1911, Zhang became more powerful in Nantong as he and his family members directly occupied important positions of Nantong, including the military position.

2.1   Before 1894

Zhang Jian devoted to the civil service examination from his teenage to his forties. Before 1894, he worked firstly as a secretary for Sun Yunjin (in Chinese   head of Jiangning Taxation Bureau), then for Wu Changqing (in Chinese   commander of Huai Troops). He went to Korea with the troop in 1882 and wrote a famous Memorial to the Throne (in Chinese   ) (*The Six Policies on dealing with Problems arising from Korean Renwu Mutiny*, in Chinese   ) on the policy of solving Renwu

Mutiny (in Chinese   ) there. This article and Zhang's excellent mediatory work during his stay in Korea was very much appreciated by Weng Tonghe, the Grand Minister of State, which is said to be the reason for Zhang Jian's success in the imperial civil service examination. In any case, the recognizing from Weng and later working with him was propitious to Zhang Jian and benefited him much in his promoting and enterprise, in both experience and human relations.

2.2   1894-1895

In 1894, Zhang Jian won the Number One Scholar in the imperial civil service examination. This is the turning point of his life. He was appointed the Editor of Imperial College (   ) and he here from entered the gentlemen class of the Chinese society then. Even after his backing to his hometown, Tongzhou, in 1895 without any official position from the Central Government, the identity of the Number One Scholar kept him in the gentlemen class.

2.3   1895-1911

In 1895, Zhang Jian's father died so he left the central government and went back to Nantong to go in the mourning for his father. By the commission of Zhang Zhidong (in Chinese   1837-1909), the Governor-General of Hunan and Hubei Province (in Chinese   ), Zhang Jian took in charge of establishing the civil corps of Tonghai region (in Chinese   ). This offered him opportunity of implementing a duty under the central governor's commission and obtaining the assistance of local governors and gentlemen. It also helped him to enter the network of central government, local government, and local gentlemen and to exercise how to handle things among them. From then on Zhang Jian kept close relationship with Liu Kunyi (in Chinese   ) and Wei Guangtao (in Chinese   ), the successors of Zhang Zhidong, both of whom gave him important help in his business later.

The Sino-Japanese War lasting from 1894 to 1895 directly accelerated Zhang Jian's founding modern industry, agriculture and commercial in Nantong in local level based on the effort of local elites. From then on, he mainly dedicated himself to the local affairs of city construction and just accepted official positions occasionally on his interests on commercial or water conservancy enterprise. Such as in 1899 he was the consulting official of Bureau of Academic, in 1904 the top consulting official of Bureau of Commercial, etc.

Besides the positions in government, Zhang Jian occupied many positions in social institutes during the later years of the Qing Dynasty, such as the president of Jiangsu Academy Institute (in Chinese   ), the director of Zhendan College (in Chinese   later Fudan University   , Shanghai) (1905), the president of Preparative Constitutionality Association (in Chinese   )(1906), the prolocutor of Jiangsu Parliament (in Chinese   ), the president of Jiangsu Education Institute (in Chinese   ) (1909), etc. These positions showed the social

recognition of his achievement in local businesses within the province area and might benefit him.

2.4   1911-1926

1911 is a tuning point in Chinese history. It saw the over of more than 2000 years of dynasty history and the entrance of Republican China era. Zhang Jian visited Japan in 1903 and changed his political standpoint to supporting constitutionalism after coming back from Japan. So he was commissioned the Ministry of Industry in the Interim Government of the Republic of China (in Chinese   , 1911) and later the ministry of Agriculture, Forestry and Business (1913-1915). These positions all lasted for a short period because of the different opinions between him and President Yuan Shikai (in Chinese   ). Again he focused on local construction business and took charge of constructing the canal of Jiangsu (1919), Wusong Commercial Port (in Chinese   , 1921-1923), etc.

3.   Zhang Jian and his power

3.1   Why was Zhang Jian interested in City Development?

Zhang Jian felt fully disappointed with the central government after the "Treaty of Shimonoseki (in Chinese   )" was signed between Qing court and the Japanese government in 1895. In order to stop foreigners' economic invasion, together with other elites all over the county, Zhang Jian began his lifelong practice of "saving the country by developing industry" in his home town Nantong (Zhang, Xuwu. ed. *Zhang Jian*. 2004. p217). Thus Zhang Jian planned to build a "rudiment of new world (in Chinese   )" in Nantong to be a model for other counties to follow (Zhang Jian. 1911. *On history of Tong Hai Cultivation Company* (in Chinese   ) *in the first stockholder's meeting, Zhang Jian Quan Ji*. (edit by Cao Congpo et al.) ,1994, Vol.3, p387). In his paper *Shun was an Industrial Politics* (Zhang Jian. 1904, *Zhang Jian Quan Ji*. (edit by Cao Congpo et al.) ,1994, Vol.5, p151), Zhang Jian put forward his thoughts of "to be village, to be state, then to be capital (in Chinese   )", which reflects his broad planning of local, province and country area.

So he participated in all issues relating to city development, from developing industry, agriculture and commercial businesses to construction schools (including school for blind and mute children, for poor people, for women, and for adults etc.), hospitals, rest homes, parks, roads, sports ground, theater, museum, library, etc. Actually it seems like that Zhang Jian wanted to build a whole Nantong city.

3.2   How did Zhang Jian get the power?

At that time in China, the lands were private or belonged to the government. It is interesting that how Zhang Jian got the authority for land use and all those construction items during the city development progress in modern Nantong. Basically every piece of the lands was bought, although some of them were free of charge. The detailed answer

for this question can be found through reviewing the development history of Nantong, which can be divided into the following four phases.

3.2.1 Phase 1. 1895-1903: Government-supporting

In this period a series of single items were constructed, including Da Sheng Cotton Mill (in Chinese   , 1895), Tongzhou Normal School (in Chinese   , 1902), and Tong Hai Cultivation Company (1901), which were the first industrial, educational and agricultural items. They are the bases of modern Nantong city planning.
Da Sheng Cotton Mill was a stock company for which central government financial supporting was obtained. Its land was near to old Nantong city and was bought from private with no much trouble. Tong Hai Cultivation Company was also a stock company but its location was far away from old Nantong city and the land owership was so complicated that even the government could do little to help Zhang Jian in solving the entanglement. The conflict between the company and former landlords lasted for about eight years. Tongzhou Normal School was set in the site of a scraped temple. By then the government allowed people to found new style schools use some scraped temples, so it did not need money but government permission to use the land. The fund for building school was supported by Da Sheng Cotton Mill. A certain proportion of income of this company was used to support local education or other social enterprises from the very beginning of its foundation. It was Zhang Jian's idea that "education is father and industry is mother".

To sum up, in the first period of modern Nantong's construction, Zhang Jian mainly used money earned by his companies to support other parts of his entire plan. The officers of central government helped him in capital and in dealing with relationships with local government.

3.2.2 Phase 2. 1904-1911: Institution-setting

Zhang Jian conducted a field investigation on Japan's agriculture and education in 1903 and returned with a new idea of "self-government" instead of his former "village-ism", which became his useful academic tool to deal with relations with local government.

In name of self- government, many institutions were set up by Zhang Jian in this period to help him enlarge his enterprise. The institutions such as the Commercial Association, Education Association, Water Conservancy Association, and Flood Control Association, etc. just took care of their own businesses at beginning. But some of them became local forces later. For example, in 1899 Zhang Jian set Factory-Militia in order to safeguard the factories and businesses of him. Later it became Industry Security Crops that was admitted by the government. At last, this Industry Security Crops took charge of some duties of local police. So Zhang Jian's influence was gradually filtered into more and more local affairs.

So in this period, Zhang Jian founded institutions to manage his businesses; some of them had new functions of implementing the government's duties.

3.2.3 Phase 3. 1912-1921: Government- infiltrating

On one hand, at the turning point of social change, Zhang Jian's elder brother Zhang Cha (in Chinese   ) became the general of local military. And Zhang Jian might influence many local governors appointment and dismissing. By this way, he can select those persons who had the same idea with him to occupy useful positions so as to help him in important policies' decision. Thus in some degree Zhang Jian's opinions became the government's. Zhang Xiaoruo, the only son of Zhang Jian, founded Nantong Self-government Institute in 1921 following the western style.

On the other hand, as Zhang Jian's businesses went to its high tide, he accumulated his prestige in local, regional, and country range. This gave him additional power in local businesses. For example, he planned to build a road system within the Tong Hai region area. So he called together some gentlemen to discuss, subscribe, and share the duty. Then they publicized their planning and put forward the detail, blueprint, and needs, such as labor, land, etc. Afterwards, to their surprise they even got some lands for free and so did some labors.

To sum up, during this period, Zhang Jian gradually grasped the real power in Nantong through his and his brother's position in central and local government. Whenever they had some idea to do something, they discussed and planned firstly and then submitted it to the local government to request for authority with the name of self-government. This kind of power is not very reasonable but it did benefit local people with a broad construction of the road network and school network within Tong Hai region, parks, bus system, water supply system, and many other cultural and urban infrastructures.

3.2.4 Phase 4. 1922-1926: Power-declining

Due to Zhang Jian's random using of the power and the capital of Da Sheng Company, Nantong's economic circumstance went flinty accompanying to the changing of outside market. Not only the power of influencing Nantong city, but also the power within his Da Sheng Company turned to be weak. Together with his death in 1926, the times of Zhang in Nantong passed away too. (Fig. 5 Zhang Jian's Power Development in the Four Phases)

3.2.5 Brief Summary

Zhang Jian in Nantong is a special example of individually participating in city planning under a kind of unusual circumstance. His power is beyond normal range especially in nowadays society. There were also other similar examples in China in those days, such as Lu Zuofu(in Chinese   ) in Beibei (in Chinese   ), Sichuan (in Chinese   ) province; Ha Rui (in Chinese   ) in Xining (in Chinese   ), Ningxia (in Chinese   ) province; Huang Yizhu (in Chinese   ) in Xiamen (in Chinese   ), Fujian (in Chinese   ) province, etc. All of these show that if a person cares about the city construction issues, and tries to do something on it, more or less, he can obtain some

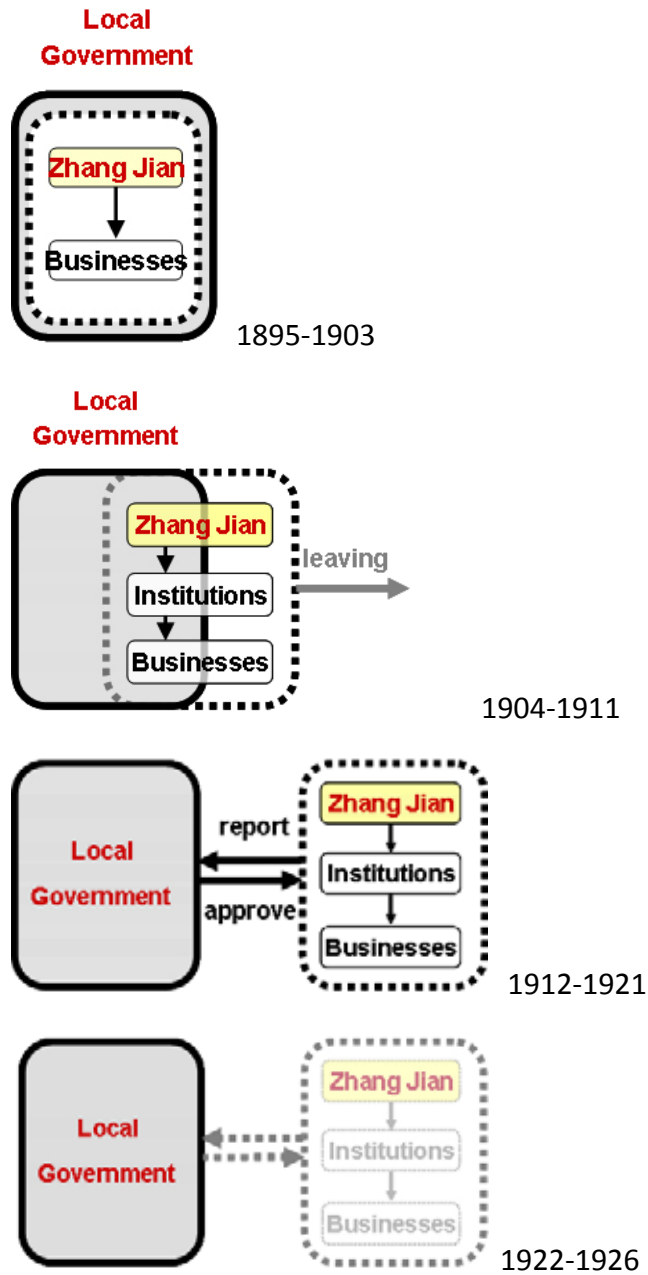
power to make some influence on politics, society and economy in the time. The key points are: first of all, d you care? second, have you gone for it?


Fig. 5 Zhang Jian's Power Evolvement in the Four Phases

4.   Conclusions

1   Zhang Jian continued the role of gentleman of traditional China. In the meanwhile, he learned the advanced thoughts such as self-government from Japan. Finally, through official relations he accumulated from his own professional experience, in the economic way of starting companies, and by the social means of self-government, he gained the power of conducting city planning and city development. The power even could influence the appointment and dismissing of local officials so that contributed to the spreading the thought of self-government.

2   Although the practice of Zhang Jian in Nantong (1885-1926) is a specific case, its meaning is far-reaching. Besides the government officials taking charge of city planning, everyone has the right and could obtain power to participate in city construction. If people want to influence city planning efficiently, firstly they should have a strong desire and then they need to make efforts to use social resources as much as possible. With these two conditions they can own corresponding power.

Two different approaches to planned tourism development in Mexico

Guadalupe Aldape-Pérez
Polytechnic University of Catalonia, Spain

Introduction

Throughout the past 3 decades there have been changes in the political and economic scene in Mexico that have modified the way in which Central Government has encountered sustainability in the tourism development process on the coasts.

A major top-down comprehensive planning process in Cancun[1] could be said to be unique in tourism planning history in Mexico, not only for its economic success at national level but also for the planning methodology that has been developed from this case. This article will draw on the circumstances that have made Cancun case study develop from a top-down strategy and the consequences. It will show the way the planning agency has prepared and set the scene to invite the private sector become part of the development process.

Given the fact that there was not any human settlement or strong local organisation for tourism before the arrival of the planning agency to the site where Cancun sits today, in the beginning the process in Cancun has been very much oriented to creation, innovation and implementation by Central Government.

The Nayarit case study differs from the first case not only in location but in budgetary resources and in stage of the development process at local level. There are existing features in Nayarit that impinge on the development of the new tourism development such as local organisations, existing human settlements and on-going tourism dynamics. The development process in Nayarit emerges from a local initiative and relies on private sector. However the process in Nayarit could still be considered a top-down initiative as Central Government guides the process though it has a strong bottom-up input. In this way, Central Government could be able to focus more on punctual interventions and strategic moves to reorder and support the on-going tourism synergies on site.

Tourism planning in Mexico

The introduction of tourism in any region has been widely recognised for its contribution to the activation of economy, the expansion of employment and the reduction of poverty[2]. Generally speaking, local economic processes become activated by the arrival of tourists in any place. Tourism, especially in decaying regions, has been used as a strategic tool for fostering development.

Until the early 1970's, massive tourism on Mexican beaches have evolved in a non-planned manner in the most important national ports. Tourism activity has begun as a secondary activity in places such as Acapulco, Veracruz, Manzanillo, Puerto Vallarta

and Mazatlan. These ports started to receive visitors not only for business purposes but also for relaxation and well-being. Deterioration of the natural resources and the landscape came when the arrival of a massive influx of tourists exceeded the capacity of the scarce infrastructure for tourism purposes[3] .

As a reaction to this kind of un-controlled tourism growth and in order to reverse the out-migration and the decaying trends in certain regions in Mexico, the Ministry of Tourism has elaborated a strategy to encourage massive tourism sustainable development through the creation of ex-novo tourism resorts in remote places with adequate infrastructural premises for the allocation of tourists[4].

In 1974, Central Government through the Bank of Mexico has launched a trust fund called FONATUR (National Trust Fund for Tourist Development) which collaborates with the Ministry of Tourism in planning tourism on Mexican coasts. Thereafter planned massive tourism development on Mexican coasts has been encouraged and guided by FONATUR.

During the 1970's and 1980's the trust fund focused solely on one type of strategy: tourism promotion on regions that lacked of important settlements, showed characteristics of severe poverty, abandonment and were in great need of major economic activities[5]. In this way, remote sites with high out-migration rates could become attractive employment sites which would encourage regional economic development.

In this order of ideas, FONATUR has chosen five regions of untouched natural beauty where it has launched five resorts. The resorts have been called CIP's (Integral Planned Resorts) namely Cancun, Los Cabos, Ixtapa, Huatulco and Loreto. The following image shows the location of the five CIP's and some of the most relevant numbers of the five resorts.

Figure 1. Location of the five CIP's in Mexico

Concepts	Cancún	Ixtapa	Los Cabos	Loreto	Huatulco
Area (Ha)	12,700	2,016	990	9,970	20,975
Urbanised area (Ha)	3,643	799	328	345	1,915
Government Investment	937 MUSD	329 MUSD	254 MUSD	337 MUSD	542 MUSD
Rooms (April 2005)	27,193	3,827	5,835	720	2,063
Inhabitants (2000)	419,815	95,548	105,469	11,812	28,327
Direct employment opportunities (2000)	32,178	9,231	7,793	771	1,390
Indirect employment opportunities (2000)	88,810	10,893	15,430	1,790	3,780

Table 1. Facts of the five CIP's from FONATUR Basic Data

In the beginning, FONATUR had received economic support from development organisations such as the Inter-American Development Bank[6]. Lately, the role has turned to national development banks to support FONATUR programmes.

The methodology FONATUR has developed could be considered as an integral planning process in two ways. First it relies on previous physical, geographical, economic and social studies to assure the feasibility of development. Secondly FONATUR master plans work in accordance to the National Development Plan and the corresponding regional and local plans, in this way, economic, social and environmental issues become requirements of the tourism development process.

FONATUR planning methodology has been based on a master zoning plan which determines land uses and densities. Other more detailed documents such as design guidelines and briefs become statutory when acquiring a plot of land for tourism development.

As a result, FONATUR has been able to set its own design parameters and standards. Innovative trends as well as the latest technology in the construction field have been used to develop the CIP's. Thereafter infrastructure and services that have been introduced in these regions have been highly efficient and cost-effective.

In CIP's, FONATUR has become main facilitator of the development process. FONATUR has participated in a variety of main actions that comprise fund raising, acquisition of land, site development design and construction of infrastructure, promotion of urbanised plots of land and recovery of funds to settle the debt. FONATUR has created complete cities and encouraged tourism-related activities in many ways. This circumstance has put public sector in a difficult position which has resulted in conflicts of definition of private interests and public realm.

This kind of strategy which has been used throughout the development of the first five CIP's has been of huge costs and liabilities for the agency. Conversely, in the beginning of the XXI century, FONATUR has launched a new CIP with a different strategy. This time, FONATUR seems to take a more cautious, secondary -perhaps conservative- role which enhances strengths of an existing neighbouring tourist destination and controls the risks of an on-going development process on site.

First case study. CIP Cancun

Cancun has been the first CIP to be developed by FONATUR. The site where Cancun lies nowadays was a desert beach of outstanding natural assets with no infrastructure or existing human settlements[7]. In other words, it was greenfield in every sense. More than half of the territorial reserve belonged to Central Government. There were some plots of land that were private property and that had been bought. The rest was mainly communal land that has been expropriated.

The development process in Cancun has begun with major political moves that comprise the change of political status of what has become the State of Quintana Roo. This territory of the Yucatan Peninsula was divided and the north-eastern part of the Peninsula became the member State of Quintana Roo in the Mexican Republic in the early 1970's[8]. At the same time, with 12 700 ha. territorial extension, the Central Government has created a new municipality for the allocation of the tourist resort called Cancun.

Finally through the Ministry of Tourism and with national and international economic support, Central Government has launched FONATUR, a planning agency in charge of developing the site and creating a new city.

In the beginning, the planning agency has worked very much on its own. FONATUR as a recently created organisation had not had reputation or previous background from its outcomes. The local private sector was not strong enough to participate actively in the process and the international private sector showed little interest since it might have been considered risky the fact that a desert beach with no infrastructure could hardly become a feasible business in the short term.

The uncertainty for private sector in the initial phase of development made the agency, with the economic support of the international development organisations, take direct action in tourism businesses. Having said that, not only has FONATUR had to urbanise, design and build the physical premises for tourism related activities but also it has had to encourage the synergy to keep them growing and going on. In this way, Cancun has caught the attention and began to raise the interest of the private sector.

For launching tourism development in Cancun the budgetary resources came from three stakeholders. The participation of the Inter-American Development Bank accounted for one third of the total investment. Another third came from Central Government and the last third corresponds to the private sector contribution. The

following list comprises the main works of the first loan of the overseas bank to FONATUR.

Project	Comprises
Transport	Internacional Airport located 17 km. from the junction of Tulúm-Puerto Juárez and Puerto Juárez- Mérida freeways. Enlargement of Puerto Juárez Bridge to join Cancún island with the continental zone - 80 mts. Long - Filling and dredging works Acquisition of ship for passenger transportation
Water and sewage systems	Potable drinking water system for 40 000 people Sewage and water treatment system for the same population Insect plague control, solid waste refuse dump and environmental sanitation in Isla Mujeres
Electricity	Construction of a transmision line between Tizimín and Puerto Juárez - 150 km. de long- Substations and terminal stations in origin and destination transmision lines Construction of aerial and underground lines for 5 000 housing connections and public lighting
Telephone	Central station for 1 000 lines
Fuels	Construction of two service stations
Urbanization	Streets and avenues Urbanization Works including street building and paving Betterment of the tourist zone which comprises street paving and open space maintenance Betterment of the commercial zone which comprises a convention center and golf course club house
Ancillary works	Construction of a 18-hole golf course Restoration works of archaeological sites

Table 2. Main infrastructural works for launching the CIP Cancun

FONATUR performance was based not only in creation and innovation but also in implementation, management and encouragement of many tourism-related issues. For instance, in the case of the city airport, the planning activity not only accounted for site planning, but also for fund raising, design, construction and the implementation of a management scheme for airlines[9]. This circumstance has made the agency play a very broad and paternalistic role in the whole planning process.

Furthermore FONATUR has also become an important figure not only for the private but for the public sector. In the beginning, the agency has supported local authorities such as the recently created municipality of Benito Juarez. For example, the first Municipal President of this entity has previously worked for FONATUR[10]. Consequently

FONATUR has acquired both, great liabilities and power in the region which also could raise questions of subsidiary and proportionality of authority.

Nowadays tourism development has extended throughout the south of the Mexican Caribbean coast called Riviera Maya. Though the private sector has grown and diversified and the municipality has got stronger, FONATUR could be said to still be playing a crucial role and have an input in the planning process of the site.

Second case study. CIP Nayarit

The second case study differs in many aspects such as size and budgetary expenditure however it still holds the status of CIP. The new CIP in Nayarit has been included in a new programme to impulse traditional tourist development zones that face sustainability issues. The development strategy is being guided by governmental powers. The role that FONATUR intends to play is the coordinator between parties to increase site sustainability.

The new CIP is located in the State of Nayarit on the coast of the Pacific Ocean, north of the State of Jalisco, where the world-wide known tourist resort of Puerto Vallarta lies. Both States Nayarit and Jalisco, share the largest bay in Mexico called Bahia de Banderas. This bay has been recognised as one of the most dynamic tourist destinations nowadays[11].

Originally tourism development in Bahia de Banderas had remained in the State of Jalisco. Nevertheless lately, tourism success has overburdened northwards Jalisco political limits. Social and economic characteristics of both States differ considerably. For instance, in 2005, whilst the State of Jalisco had 6 752 113 inhabitants, Nayarit had only 949 684[12]. The annual growth rate between 2000-2005 was 1.2% for Jalisco and 0.6% for Nayarit according to INEGI[13].

Fig. 2. Location of Tourism Corridor CIP Nayarit

Though tourism development in the State of Nayarit is in its early stages, it lies besides a consolidated tourism resort. Its location takes advantage of the existing infrastructural premises such as the international airport and the cruise port in Puerto Vallarta as well as the existing freeway that connects Puerto Vallarta with the city of Tepic, capital city of the State of Nayarit[14].

A new strategic vision of tourism development in Nayarit is intended to be joined to the existing development creating a diversified tourism corridor from Puerto Vallarta, State of Jalisco to San Blas, State of Nayarit. The new scheme is looking forward to allocate a new sector of the sun and beach market based on higher income in specific points along the corridor. In this way high quality products are intended to enlarge the time period of the tourist stay on the existing corridor[15].
Fig. 3. Map of Tourism Corridor of CIP Nayarit.

The planning process in this place has emerged from a local tourism trust fund interest. The local trust called Fideicomiso Bahia de Banderas (FIBBA), has administered various plots of land for tourism purposes that belong to the State of Nayarit. FIBBA has asked FONATUR to guide the development process.

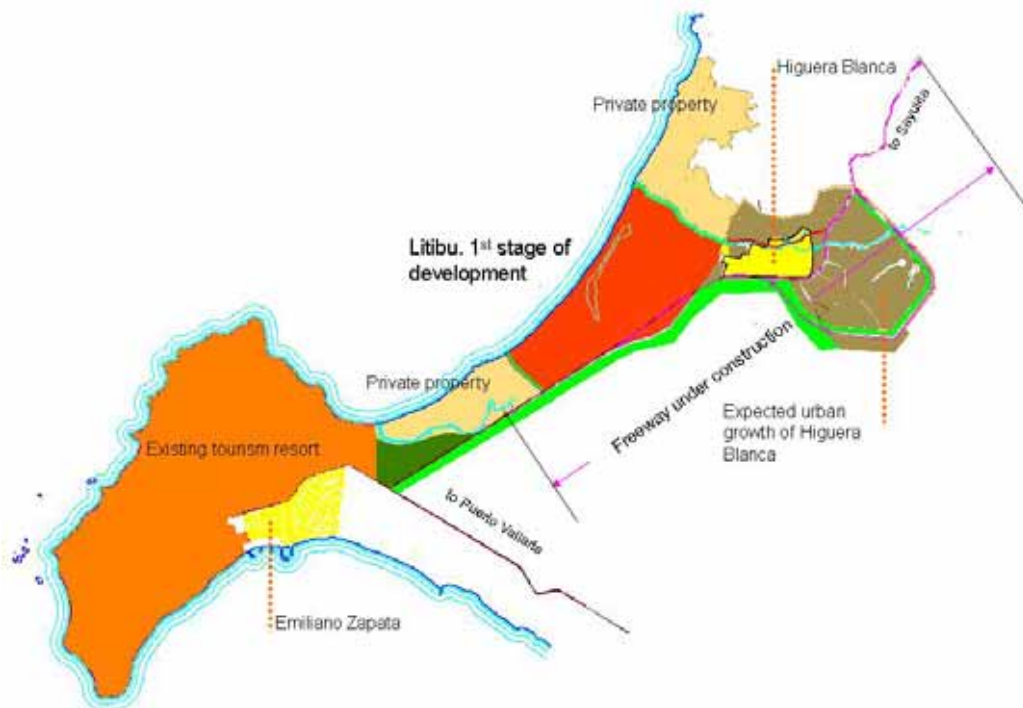
The first stage of development in Nayarit is called Litibu which sits on 167 ha. plot with 2 km. beach front. The development comprises a PGA golf course that faces the beach and the mangrove. Its total capacity is 4 100 lodging units for tourism residential and hotel use. Litibu is just besides an existing town called Higuera Blanca. The main infrastructural works for Litibu such a desalination plant for drinking water and a sewage treatment plant will also serve Higuera Blanca. Higuera Blanca is expected to allocate the working class of Litibu. The new freeway which is under construction from Jala to Bucerias will give great accessibility to Guadalajara city and the central part of Mexico. In this way Higuera Blanca is expected to grow and consolidate as a transport hub.


Fig. 4. Map of Litibu, 1st stage of development of the Tourism Corridor CIP Nayarit.

The second stage of development is approximately 50 km. north from Litibu. It is still under project. It will follow the same formula as Litibu. It comprises 5 900 lodging units that will surround a PGA golf course in front of the sea and the mangrove. The second stage of development lies also besides an existing town. The total capacity for the corridor will be 14 500 lodging units so other territorial reserves are subject of study for subsequent stages of development.

The role of FONATUR and process of site selection and acquisition of land in the case of Nayarit has differed from the previous cases. FIBBA has collaborated in the process of site selection and acquisition of land for Litibu. The highly privatised waterfront in Nayarit made FONATUR get acquainted with the existing real-estate market activity and

organisation. The property on the Nayarit waterfront has almost been privatised. FONATUR has had to approach land acquisition through negotiation with private landowners. This circumstance constrained to a larger extent, the possibility of acquiring by purchase order or compensation as in previous times.

Two pieces of land were ceded by FIBBA to FONATUR for the first stage of development in Nayarit. Both plots of land were separated by other two small properties that FONATUR has purchased. FONATUR has conducted negotiations with both landowners of the smaller properties. They were not interested in selling, though they wanted to become part of the development process. Separate negotiations with both leaded to subdivision of property and compensation for the land ceded to the reserve.

The change of FONATUR model for encouraging a more horizontal scheme responds to two main reasons; on one hand, the decentralization of Central Government and on the other, the emergence of a participative local private sector.

There has been a reduction of FONATUR budgetary resources. Nowadays FONATUR is not being sponsored by the international development banks anymore. It works with national financial resources and more rigid credits.

FONATUR raises funds applying to national development banks for economic resources for each project with no special consideration whatsoever. In every case, fund raising applications that are based on the previous feasibility studies must comply with mortgage repayments in rigid time schedules.

At the same time, there have been various organisations and groups of citizens and businessmen that are participating actively in the development process in Nayarit. A group of tourism investors in the State of Jalisco have also shown interest in the neighbouring development process.

Whilst there has been an increasing political and economic decentralization movement raised by local governments and local groups, there have also been other circumstances that have impinged on the decentralization movement such as the evolution in the legal framework involving the environment. Nowadays it is compulsory the elaboration of environmental studies and EIA (Environmental Impact Assessment) to maintain the balance between inputs and outputs in any development action.

Moreover the authority in charge of the environment and natural resources, SEMARNAT gives an approval and conditions the way in which development can be carried out. Its requirements are integrated as in design guidelines by FONATUR that become statutory documents for developers and owners [16]

The public and the NGO's have shown special interest and participate actively in the procurement of the ecosystem and the species of the site. This is the case of Alianza Verde, a group that has shown interest in caring about the native fauna of the place and the impact of the new phase of development in Nayarit[17].

Lastly there has been a change of view on private property and the legal framework for human settlements. Topics such as human rights have impinged on Mexican law and regulations. Nowadays the public is increasingly aware of their rights and assets as property owners and the methods to appeal or sue for them in case of unfair expropriation and compensation.

The new approach – a sustainable process?

It is important to note that internal and external circumstances have modified FONATUR performance and objectives through 3 decades. In financial terms, economic support from international banks has been diminished and today the agency relies mainly on national funds and the support from the local organisations and groups.

In Nayarit, the private sector has experienced a growing tourism influx and it is eager for it, though aware of the natural decline that un-controlled tourism growth may mean to the region. The planning exercise in Nayarit may have been swifter for FONATUR that has focused more on monitoring, assessment and recommendation than in executive tasks.

The process in Nayarit has done a revision of assets and methodology. First, the agency has made a revision in terms of local strengths and weaknesses before taking any development action on site. Secondly, the agency has revised its own planning method through a 30-year life span experience. The extent to which this approach to tourism development process could be said to be sustainable stems from a range of factors.

To find out the degree of sustainability the second approach in CIP Nayarit could be said to be reaching in comparison to the first case study, some issues that are most relevant to the sustainability discussion in the kind of development will be presented as follows.

The definition given by the Brundtland Report 1987[18] states that sustainable development is *"development that meets the needs of the present without compromising the ability of future generations to meet their own needs"*. This definition may be interpreted in social, administrative, environmental and economic aspects.

Socially, it could be that FONATUR has intended to encounter more social and local aims encouraging and strengthening existing local communities and organisations. The agency could be walking towards the creation of more sustainable communities in the way of respecting local groups and local synergies. Existing human settlements are intended to become highly benefited and integrated to the development process.

The planning agency seems to prefer to undertake betterment works in existing towns and routes than to build new towns and new routes near the development sites that could segregate old towns. It could be noted the desire that local people will be the first-

incorporated to the new labour market and the economic process without leaving their home. Under this order of ideas, the agency could be taking a lesser influential role on long-migration patterns as well as will being less liable for creating a new social structure.

Moreover respecting the existing commercial activities, the commercial routes could remain the same and in this way would be reinforced rather than changed. The already established retail could be said to find that the incoming groups of workers and inhabitants would make their commercial activity more robust. Hence the entire community could have the opportunity to diversify in cultural, recreational and retail services and facilities.

Administrative sustainability in Nayarit could be encountered in the desirable possibility of developing tourist resorts that can become self-managed and self-controlled as early as possible. By working with the local trust and the local people, FONATUR could make decrease the agency staff on site and focus on monitoring tourism activities instead of intervening directly. Experts in certain fields could work on punctual topics with representatives of FONATUR and the local trust on site.

It could be thought that less control and involvement of FONATUR in the development process could leave aside the social governmental statutory principles. Nonetheless local private sector participation has been shown to be positive of the new CIP in Nayarit. For FONATUR, local participation has meant the decrease of participation on ancillary matters in the development process. This circumstance has given the agency the opportunity to intervene more on decision-making and co-ordination which could be leading to implementing and managing programmes for procurement of local conditions in health, education and public realm.

In environmental terms, FONATUR has procured a highly sustainable vision in respect of existing resources. The agency could be targeting to preserving the existing infrastructure and routes as well as the human settlements. In any case, this could be allowing the rational introduction of new development to enhance the existing one and could be leaving the environment untouched in regions where development has not reached.

The presence of a real estate market on site could result in the independence of FONATUR from real estate activities. In the second case study FONATUR has not been involved in subsidy of private investment and has not have any direct influence to raise or lower the real estate market.

Hence the development promoted by FONATUR on the tourism corridor would be integrated as a competitor in an autonomous and independent real estate market that manages and controls itself. Consequently both FONATUR and the real estate market could be said to perform in a healthier and swifter manner as both have gotten a non-compromised attitude amongst each other.

FONATUR liabilities on infrastructural premises could have changed. The role of the agency has changed from being the designer and the builder of main infrastructural premises in previous CIP's, to being the coordinator of negotiations and supervisor of the building and management processes amongst different organisations that provide public services such as energy and water. This is due to the fact that, to a greater extent, the region has already counted on existing infrastructural premises and nets.

Conclusions

This paper has presented two case studies of tourism development on the Mexican coasts. The characteristics of both processes differ considerably in context and time; however they share the guidance of a planning agency in charge of promoting tourism sustainable development.

The first case study has been considered a top-down comprehensive exercise in the sense that it was a Central Government initiative with a scarce local input. The encouragement of massive tourism development in declining regions has proven to be an effective tool; however this article has shown that local organisations and local authorities could facilitate to make the development process more sustainable and cost effective.

The first case study has implied large sums of economic resources, wise moves in the political arena and huge risks in social and administrative terms which to a larger extent could have put Central Government through difficult position. In Cancun, the planning agency has become a crucial figure in most political, economic and social actions. Even nowadays that Cancun could be said to be walking towards being a consolidated city, FONATUR could still hold great liabilities and powers on site.

Conversely the second case study has been presented in a different setting. The planning exercise has been done through the consideration of opportunities and threats of the site as well and most importantly, the exercise has revised the planning method itself.

The agency could have found a more manageable size of the development in extension, time and investment.

The Nayarit case study intended to enlighten the extent to which a cautious strategic vision for tourism development could have approached sustainability in a more efficient manner through the revision and the consideration of the existing assets on site. It has also been shown that the integration of a participative society in the development process could result in a more sustainable process as long as it can be placed in a broader framework with clear national and local guidelines to follow.

This paper has explained that being FONATUR the coordinator more than the actual builder of infrastructural works might mean a shorter presence of the agency on site with fewer liabilities for infrastructural premises than in previous cases.

In the social viewpoint, this paper talked about the benefits for local people as in getting a closer to home labour market, reinforcing retail and commercial activities, improving services and facilities and enlarging the variety of cultural, recreational and retail choice in town. The development process in Nayarit could be working towards being more sustainable in terms of supporting local dynamics, reinforcing the existing communities transport nodes and exchanging points of services and facilities more efficiently.

Economically, it could be argued that local economic dynamics have been reinforced yet not at FONATUR costs. FONATUR has left aside the great responsibility of creating and procuring a real estate market, which could result in a much healthier process in sustainable financial respect.

In terms of the planning process, public participation in various stages and fields has put the development process under a wider and more horizontal structure, with more actors and groups involved. For FONATUR, tourism development may have been diminished in territorial extension, yet it has not been in terms of political action and local compromise.

For FONATUR the Nayarit case study could be working towards the desirability to develop tourist resorts that can become self-managed and self-controlled as early as possible. FONATUR intervention may take a shorter period of time than in previous cases which is a desirable feature for both the agency and the development itself.

In the case of Nayarit, the process may have been swifter and more agile than the one in Cancun as the result of two circumstances. On one side, the evolution of a planning tourism exercise during 30 years by an agency searching for more sustainable forms of developing the coasts of Mexico and the existence of local authorities and organisations who want to develop their region in a participative manner.

Urban watershed management: decision-making in Jacarepaguá Lowland Watershed, City of Rio de Janeiro, Brazil

Gabriela da Costa Silva
Federal University of Rio de Janeiro, Brazil

Introduction

In the City of Rio de Janeiro, Brazil, Jacarepaguá Lowland Watershed emerges as an example of the State and the Municipal Governments' incapacity, towards the natural resources, especially water bodies, in promoting urban sustainable development in the Administrative Regions of Jacarepaguá (XVI AR), Barra da Tijuca (XXIV AR), and Cidade de Deus (XXXIV AR). Since 1970, despite the fact that this lowland has become object of huge public and private investments, achieving significant economic development, mainly in Barra da Tijuca, the absence of a region sewer system to collect and to treat effluents has been contributing enormously to the pollution of its lagoons: Jacarepaguá, Marapendi, Lagoinha, Tijuca and Camorim (Silva, 2005). Consequently, in Jacarepaguá Lowland, the programs and projects implemented by the public administration to mitigate local environmental problems reveal not only the disconnection between public activities but also the refusal to consider its watershed as a management and planning environmental unit.

Concerning this, Neder (1997) affirms that since there are neither efficient nor innovative models of environment management in Brazil, the main activity of public environmental policy is to regulate private activities in order to preserve and to conserve natural resources. Therefore, the absence of political strategies to integrate environmental elements and macro-social-economical decisions reduces the participation in environmental decision-making discussions. In addition, according to Cunha & Coelho (2003), the Brazilian model of watershed management is based in the co-management and the decentralization of decision-making, promoting the need to conciliate antagonist interests, the control of conflicts and the redefinition of responsibilities among regional watershed committees and national water agencies.

Indeed, as far as the state and the municipal governments are concerned, the programs and the projects that have been developed in Jacarepaguá Lowland Watershed, usually, do not attempt to the fact that effective environmental planning and management depend on the recognition of its watershed as a territorial unity able to integrate environmental, social and economical dimensions. For that reason, this study intends to examine the limits and the perspectives of the public administration in conciliating private and public interests towards the environmental management of Jacarepaguá Lowland Watershed, as an important urban watershed in the City of Rio de Janeiro. In addition, it aims to analyze the existing legal instruments, recognizing this watershed as a management environmental unit to establish the inter-relationship between multiple public and private actors.

Urban evolution of Rio de Janeiro

The evolution of Rio de Janeiro urban fabric is closely related to its socioeconomic development, which guided, and still guides its territory sprawl. The production of selected noble spaces in the city had appeared after the middle of the 19th century, when in 1870 rich social classes started moving to the south, where the government implemented new means of transportation (Leitão, 1995).

Before 1930, high-income classes had occupied the "new" neighborhoods in the South Zone of the city: Copacabana, Ipanema, Leblon and Gávea. The bourgeoisie medium social classes had lived in the "old" neighborhoods of the South Zone: Catete, Laranjeiras, Flamengo and Botafogo, and neighbourhoods of the North Zone: Andaraí, Vila Isabel, Tijuca, Aldeia Campista and Rio Comprido. In addition, the labor social classes of low income had resided in the periphery of the city, where industry was located, such as São Cristóvão and its suburbs. It is important to recognize that the government and its public services companies commanded the occupation of the South and North Zones by medium-high social classes. On the contrary, labor classes had occupied the city suburbs regardless government authority and regulation (Abreu, 1997).

In reality, at the end of the 19th century, the seashore of Copacabana started expanding; and at the beginning of the 20's, buildings of many pavements were constructed in place of old residential houses. However, the urban occupation of this neighborhood started in the late 40's, due to the success of real state agencies activities; so much so that, in the 50's, Copacabana was highly occupied (Leitão, 1995).

After the 50's, because transportation system had not developed as territory enlargement, two situations appeared in the city. First, labor population had started locating themselves close to industry and service job offers, in regular and irregular areas, occupying vacant land due to difficult access, such as slopes, mangrove, rivers edges, or lack of use by its legal owners; therefore, funding slums (Abreu, 1997).

The urban sprawl of Rio de Janeiro expressed a radiate form determined by its physical configuration of mountains and lowlands, which turned difficult the access to many neighborhoods, such as Barra da Tijuca. Thus, between the 50's and 70's, car circulation raised and changed the landscape configuration because the government had invested in express roads, tunnels and viaducts to enhance vehicular flow and accessibility within the city (Abreu, 1997).

After the 70's, the urban development followed the beach shore of the city towards west, in direction to Ipanema and Leblon. Indeed, the union between government and real estate companies had promoted the expansion of the city south zone, and had reinforced urban segregation because these neighborhoods were destined to high income classes; as a consequence, from the early 60's to late 70's, the public administration had implemented an eradication polity towards the slums located in that noble area (Leitão, 1995). In that period, the noble social classes started moving to São

Conrado and Barra da Tijuca, which is located in Jacarepaguá Lowland. Although the occupation of Barra da Tijuca followed the dynamics of segregation in urban space, with privileges to medium-high social classes and combination of public and private interests, differently from the urbanization of the south zone, after 1969, it had to be urbanized taking into account the plan of Lucio Costa to regulate the urban development of Jacarepaguá Lowland. Therefore, the urban morphology of Barra da Tijuca is a lot different from the other noble areas in the city because it was based on the rationalist concepts of modern urbanism, which creates and ordered urban landscape (Leitão, 1995).

Urban development of Jacarepaguá Lowland Watershed

The urban development of Jacarepaguá Lowland Watershed, administratively composed by the regions of Jacarepaguá (XVI AR, Administrative Region), Barra da Tijuca (XXIV AR), and Cidade de Deus (XXXIV AR), had depended mostly on the implementation of Lúcio Costa Urban Pilot Plan for the region Barra da Tijuca, in 1969 (Illustration 1).

In the end of the 60´s, Barra da Tijuca (XXIV AR) had a recent urban development due to its geomorphologic characteristics, surrounded by the Massifs Pedra Branca and Tijuca, which made difficult the access to it. However, during the last few decades, the region that used to be mainly residential and rural has been expanding not only because of the accomplishment of important real state agencies in selling houses and apartments to high-income classes, but also due to the sprawl of slums, where lives the low-income community[1]. From 1991 to 2000, slum population in Barra da Tijuca had represented a growth index of 2.23, the biggest in Planning Area 4 (AP-4,)[2] where population had doubled (Table 1). Consequently, the demographic growth of Barra da Tijuca is one of the most significant in Rio de Janeiro. The population in Barra da Tijuca (XXIV AR) increased from 2,580 people in 1960 to 174,135 people in 2000 (Table 2). Additionally, it grew 21.91 times more than Jacarepaguá (XVI AR), which is the administrative region that has been developing due to Barra da Tijuca sprawl.

Source: Modified from IPP (2001b).

According to Cardoso (1987), in the early 70's, the population of Barra da Tijuca grew 160%, in contrast to 30.7% in the city and 116.8% in Jacarepaguá region, which expresses that, maybe, these two close regions expanded based on the same urban development parameters. However, in the late 70's, Barra da Tijuca population grew 627%, against 21.8% in the city and 42.3% in Jacarepaguá. In fact, the urban expansion process in Barra da Tijuca accelerated especially after 1974, when the region had become object of real state agency practices in order to achieve high profits standards. In Barra da Tijuca, between 1974 and 1976, the urban fabric licensed to build corresponded to one fourth of the residential area of Rio de Janeiro City (Cardoso, 1987).

In the 90's, Barra da Tijuca region had the biggest demographic growth in the city: 44%, corresponding to 124,000 inhabitants. In that decade, 28.5% of the region residents had been living there about less than a year (Ribeiro, 1997). However, the major population growth, of 26% or 45,721 new residents, occurred in the middle 90's when the migratory movement to the region represented 21% or 37,341 new inhabitants (IPP, 2003).

Actually, there were many reasons that added to this considerable urban expansion. First, the real state agencies had massively used the natural beauty of the region (the beaches, the lagoons, and the mountains) as a marketing slogan to advertise apartments, especially, for medium-high income classes. In fact, the real state market announced the region as a new selected area, likewise the south zone of the city, where noble families would find security and leisure (Leitão, 1995). Second, one third of the

region land belonged to only four owners, who had not divided it very much; therefore, accelerating the occupation process. Third, in the 70's and 80's, the federal government invested in the region through its financial agencies and resources from the Housing Financial System (SFH, Sistema Financeiro de Habitação) that lend housing lines of credits; thus, benefiting the real state agencies in accomplishing its enterprises. Last, the public investments in infrastructure, mainly in road network, according to the Pilot Plan conceived by the architect Lúcio Costa, made likely the activity of the real state agencies to develop the urban fabric; hence, achieving high profits standards (Leitão, 1995).

Indeed, the purpose of the plan was not only to organize the urban land use of the region, based on the ideas of the modernism[4], but also to integrate it to the historic center of the city and the new center of Santa Cruz; thus, connecting the city from the west to the east (Illustrations 2 and 3). Lúcio Costa created the urban plan for Barra da Tijuca to be an instrument capable to avoid a predatory and an indiscriminate urban occupation. In this sense, Lúcio Costa Plan was also a legal instrument to protect the environment, especially, the lagoons of Jacarepaguá Lowland Watershed. However, this original urban plan has suffered many changes since its implementation in 1969. Among the changes, the most impressing is the densification of the land occupation, which was a result of the pressure of the important real state agencies against the government administration (Ribeiro, 1990, Leitão, 1995, Table 3)[5].
Illustration 2. Urban Plan for Barra da Tijuca and Jacarepaguá Lowland.

Table 3. Population Density in Barra da Tijuca and Jacarepaguá (inhabitants/hectares)[6]

Place	1980	1991	2000	Growth Index
Rio de Janeiro	50.9	54.8	58.6	1.15
V AR Copacabana	442.5	351.2	333.6	0.75
XVI AR Jacarepaguá	33.1	45.0	49.3	1.49
XXIV AR Barra da Tijuca	3.2	7.7	13.6	4.25

Source: IPP (2001b).

In addition, concerning infrastructure, the public administration implemented the road system in the 70's, mainly between 1966 and 1982, improving the access to the region and benefiting the construction of huge residential condominiums. From 1980 to 1983, the state government provided some urban services, such as provision of water, electricity and gas (Leitão, 1995; Gonçalves, 1999). However, since the state government had not implemented in the region a sanitary system to collect and to treat sewage, the solution was to construct small sewage treatment plants inside the residential condominiums; yet, most of them even works badly or does not work (Santiago, 2004).

As far as the claim for a regional sanitary system is concerned, the state government proposed the implementation of a submarine emissary. Because of this, from 1982, the

Association of Inhabitants and Friends of the Barra da Tijuca (AMABARRA) had started to discuss with the state government an efficient equipment capable to mitigate the environmental problems caused by the absence of a sewer system (water pollution, contamination of water table levels, etc.). In contrast of the typical claim for sanitary equipment, made by poor social classes, in the Barra da Tijuca, the middle and upper middle classes had led the claim, which also counted on the participation of the poor residents of slums (Evangelista, 1989). Due to the urgence of the theme, in 1999, the City Hall demanded the right to implement the sanitation in the region, which is a legal responsibility of the state government. However, in 2000, the state government affirmed its liability on this subject; and finally, in 2001, the Water and Sewage State Company (CEDAE) started implementing the Program of Sewerage in Barra da Tijuca, Recreio dos Bandeirantes and Jacarepaguá (PSBJ).

Therefore, despite its impressive urbanization, largely oriented by the real estate market, the lack of a region sewerage system appears as the main obstacle to its sustainable development, and thus, contributes to increase environmental impacts and problems especially towards the water bodies of Jacarepaguá Lowland Watershed (Silva, 2004). The degradation of water resources in Jacarepaguá Lowland, concerning eutrophication and water pollution, results, mainly, from the lack of a regional sewage system. The presence of pathogenic microorganisms in the lagoons, due to industrial and, especially, domestic effluents discharges, damages not only the environment but also public health, since they sustain fishing and leisure activities (Illustrations 4 and 5). In relation to the environmental degradation of Jacarepaguá Lowland Watershed, there are two main conditions responsible. The first condition refers to the illegal occupation on the edges of canals, rivers and lagoons, generally with indiscriminate earth embankment, that takes place not only in slums, where the poor communities live, but also in luxurious houses. The second condition relies on the lack of a sanitary sewer system to collect and treat the domestic effluents discharged *in natura*, by industrial, commercial, and residential real properties in the lagoons of the region.

Illustration 4. 545 tones of aquatic plants due to domestic effluents discharge in Barra da Tijuca.

Illustration 5. Slaughter of more than five tones of fish due to water pollution in Lagoon Tijuca.

Watershed as an environmental planning unit

A watershed is a topographic area, drained by a water body, commonly a main river, or a system connected to water bodies, usually its tributaries (Lima-e-Silva, 1999; Polette, 2000). The scale of a watershed as a planning unit depends on the inter-relation of socio-economical and ecological systems, which compose the environment, in order to program present and future availability of natural resources towards society needs (Attanásio, 2004). Considering environmental planning, a watershed emerges as an ideal unit regarding the study of geo-ecological interactions between the earth surface and its structural and functional components; landscape elements; and biogeophysical, economical and social processes (Guerra et al., 1999; Tundisi, 2006).

As far as watershed management and water resources management is concerned, it is important to establish some differences. Lanna (1995) affirms that the first one refers to the management of just one environmental resource concerning the watershed itself; and the second one proposes the management of all the resources and the uses within a watershed, therefore, it needs a special planning methodology. According to Dourojeanni (1993), watershed management presents different activities grouped in three categories, such as: (i) restoration, conservation, or protection of natural resources associated to water; (ii) use and control of water resources to sectorial and multi-setorial matters, based on the planning, project, construction and operation of hydraulic workmanships to promote socio-economical development; (iii) well-fare promotion to watershed resources users. Indeed, Frank (1995) affirms that, generally, the projects and the programs proposed to watersheds management include activities related to more than one of these categories.

Indeed, there are some advantages concerning the adoption of watersheds as environmental management and planning unities. The first and, probably, the main advantage presents the possibility of an integrated environmental management as a dynamic instrument capable of adjustments during its implementation, especially, taking into account those situations which were not predicted in the initial phase of planning or which deals with futures sceneries (Lanna, 1995). The second one refers to the fact that most of the cause-effect interactions related to water resources take place in watershed drainage network (Lanna, 1995). The third advantage concerns the identification of environmental results and the measurement of environmental impacts, either positives or negatives, based on water quality and quantity parameters (Gualdani, 2004).

However, it is important to observe that governmental agencies and society representatives might also face some disadvantages. First, the fact that topographic divisors of watersheds and their subsystems usually do not correspond to the political-administrative limits established by government agencies troubles environmental planning and management as far as projects and programs implementations are concerned (Franco, 2001; Cunha & Coelho, 2003; Lamonica, 2004; Cury, 2006). For that reason, decision-making process, even though it may consider society participation, depends on public administration, which is responsible for the environmental

management of a territorial area. In fact, whenever it does not correspond to the political-administrative limits of a watershed, its environmental management and planning demand, essentially, the cooperation between the different administrative levels. This fact justifies the long terms that often the public administration takes into managing and planning environmental issues for watersheds.

Second, the choice of the scale in which planners and managers may address a certain watershed is the basis to an adequate and a successful environmental study. According to Lanna (1995), considering watershed environmental management, there are two distinctive scales that refer to activities such as: (i) those that consider the complexity of the inter-relations between the whole and its parts, that is, between the watershed and its parts; (ii) those that treat specifically the parts through its restrictions, limitations and demands imposed by the whole.

Third, Cunha & Coelho (2003) agree that the model of watershed management in Brazil is based in the co-management and the decentralization of decision-making, promoting the urge to conciliate antagonist interests, to control environmental-social conflicts and to redefinition responsibilities among regional watershed committees and national water agencies. Indeed, the Federal Law 9.433 (1997) is the legal motivation to the adoption of watersheds as territorial planning and management unities, instituting the National Policy of Water Resources (PNRH) and the National System of Water Resources Management. The refereed legislation intends to discipline the use of waters and, chiefly, to define legal instruments to guarantee the rational and integrated use of water resources in a sustainable manner. Concerning this, Cardoso (2003) affirms that this law avoids the monopoly in the management of water resources, since it enhances the representation of different social, political and economical groups; meanwhile, it does not consider the adoption of smaller analysis unities such as sub-bays or micro watersheds to the mobilization and reunion of social actors (Cardoso, 2003). Moreover, according to Muñoz (2000), the Federal Law 9.433 (1997) constitutes an important legal instrument in the construction of a sustainable development ideology because it institutionalized a participative management among municipal, state and federal levels. Nevertheless, the author recognizes that the challenge to implement this law relies on the fact that its legal and institutional mechanisms of a participative democracy exist in an administrative system based on a representative democracy.

Regarding civil participation in watershed management processes, it is vital to emphasize that the National Policy of Water Resources (PNRH) considers as civil organization: (i) inter-municipal partnerships; (ii) users associations; (iii) research institutes; (iv) nongovernmental organizations (NGO); and others admitted by the National Council of Water Resources (CNRH), or State and Federal District Council of Water Resources (CERH). It is significant to observe that, especially since the 90's; the nongovernmental organizations acquire importance towards either the formulation of environmental politics or the management of natural resources (Cunha & Coelho, 2003). However, it seems that nongovernmental organizations in Brazil are essentially dependent on governmental finances. Last year, the Brazilian Court of Accounts (TCU) affirmed that the federal government sponsored around US$ 1.4 billion to Brazilian

nongovernmental organizations, most of them, selected according to deputies and senators' interests (O Globo, 2007).

Limits and perspectives of the public administration

In Jacarepaguá Lowland, regarding the role of the public administration as far as watershed management and planning is concerned, it is important to observe the limits and the perspectives of not only the municipal but also the state governments. Indeed, since the last decade, in particular, both institutional administrative levels have been implementing some projects and programs with the purpose to minimize the environmental problems in the Jacarepaguá Lowland Watershed.

The first one, carried out by the municipal government since December 1997, is called Program of Environmental Recuperation of Jacarepaguá Watershed. The aim of this program is to implement a storm water sewer system in the region, especially in the areas close to the slums on the lagoons edges. For that reason, three stages compose the program, considering Jacarepaguá Watershed as three sub-watersheds. The main goal is to avoid that the garbage from the poor communities, which the municipality generally does not collect, and the domestic effluents, which are not treated, reach the water bodies, thus, polluting the surrounding lagoons. In this sense, in September 2002, the Municipal Secretariat of Environment (SMAC) of Rio de Janeiro brought up the idea of constructing small sewage treatment plans alongside Canal Arroio Fundo and Canal Arroio Pavuna, the two most polluted bodies of water in the region. According to this municipal agency, it would reduce the pollution in the surrounding lagoons, especially Lagoon Tijuca and Marapendi. However, the municipal government had never implemented this idea. In fact, the municipality has been piping the channels in order to prevent from floods, which tend to occur in the summer because of storms.

The second one, developed by an important real state agency with the coordination of the state government since January 2002, is called Dredging of the Lagunar Complex of Jacarepaguá Lowland. The objective of the project is to dredge up the sludge from the bottom of the lagoons, increasing its depth, which now turns impossible navigation. The State Agency of Rivers and Lagoons (SERLA) has been dredging Lagoon Tijuca, with the intention to open a stream in the central area in order to facilitate the circulation of water between Lagoon Camorim and the sea. This stream is supposed to have 1.7 km in length, 0.80 cm in width, and four meters in depth, which is the minimum to maintain sun light penetration in the water body (COOPETEC, 2001). However, the mean depth of the lagoon must have 1.54 meters. For that reason, SERLA was supposed to dredge out 4,000,000 m³ of sludge from the bottom of Lagoon Tijuca (Illustrations 6 and 7; SERLA, 2002). The main problem of this project concerns the schedule, which fixed the deadline for the completion of the works on January 2004 and still is not finished.

Illustration 6. Dredging in Lagoon Tijuca.
Source: Silva, 2004.

Illustration 7. Sludge from Lagoon Tijuca.
Source: Silva, 2004.

The third program, which is been carried out by the state government, by the Water and Sewage State Company (CEDAE), is now named Program of Sewerage in Barra da Tijuca, Recreio dos Bandeirantes and Jacarepaguá (PSBJ). The purpose of the program is to implement a sanitary and a storm sewer system capable to avoid water pollution in Jacarepaguá Lowland, as well as to provide water supply and underwater dredging (Illustrations 8 and 9). It is important to observe that from 2001 to 2006, this program did not consider Recreio dos Bandeirantes, but still, it does not consider all the neighborhoods that compose Jacarepaguá Lowland (Illustration 10).[7]

Illustration 8. Construction of submarine emissary.

Nevertheless, the state government had focused on the implementation of a sewerage system, especially on the construction a submarine emissary that leads into Barra da Tijuca Beach, which is already on operation. The program, which started in April 2001, after almost 20 years of misunderstandings between the local inhabitants and the municipal and state authorities, was supposed to end in January 2004; however, its deadline is now by the end of 2009. Consisted of three phases, the program, which includes the construction of a sewage treatment plan, an earthy and a submarine emissary, pipelines, pumping stations, sewage pumps, collecting sewers and buildings connections, had costed around US$ 260,000,000 until August 2007 (CEDAE, 2008). Besides the schedule delay problem, the local inhabitants and their representatives have been criticizing this program as a solution for the environmental problems in the region, due to the following reasons:

i. Lack of transparency during the development of the program, because the communitarian commission charged to inspect the works did not have access neither to the execution projects nor to the place where the works were developed;
ii. Absence of a study and a report of environmental impact, both legally demanded by the National Council of Environment (CONAMA, 1986);
iii. Absence of a solution to the problem of the sludge produced in the wastewater treatment plant.

Finally, the state government and the private sector, by the State Agency of Rivers and Lagoons (SERLA) in partnership with the Getúlio Vargas Foundation, developed the Ecobarriers Project, which purpose is to reduce the amount of floating garbage that reaches Guanabara Bay and the lagoons of Jacarepaguá Lowland Watershed (Capell, 2007). Considered as a simple solution with a low cost, the ecobarriers – composed by

buoys of nylon and bottles pet - consist of structures made with recycled material and installed in certain points of rivers next to the estuary. In Jacarepaguá Lowland, the ecobarriers are located near Canal Arroio Fundo and Rio das Pedras. It is important to observe that this project, besides enhancing the environmental quality of water bodies, it generates income and provides social inclusion, because local garbage pickers collect the garbage and carry it for boats up to 'ecopoints', where the material is separated, pressed and finally destined to the recycling in local cooperatives. Since 2006, the Brazilian Development Bank (BNDES) has been financing the Ecobarriers Project.

Besides these programs and projects, the municipal and the state governments find difficulty in promoting an integrated environmental management regarding the coastal zone and the watershed, in order to support urban sustainable development in the Administrative Regions of Jacarepaguá (XVI AR), Barra da Tijuca (XXIV AR), and Cidade de Deus (XXXIV AR). Consequently, in Jacarepaguá Lowland, the public investments to mitigate local environmental problems reveal not only the disconnection between public activities in different institutional levels but also the refusal to consider its watershed as a management and planning environmental unit. Moreover, these prospective studies do not recognize the integration between social and environmental components in the study area; thus, diminishing the efficiency in public decision-making (Silva, 2004).

As far as the state government is concerned, in 2005, the Decree 38.260 defined that Guanabara Bay Hydrographic Regional Committee is also responsible for the environmental planning and management of Maricá and Jacarepaguá Watersheds (Governo, 2005). Nevertheless, these two watersheds pertain to two different cities, respectively Maricá and Rio de Janeiro, where social-economical and environmental realities are extremely diverse. Moreover, Guanabara Bay influences 16 cities, which integrate this committee as well.[8] In effect, the role of these committees is to engage state and municipal administrations, water services users, and community representatives, in order to come up with regional solutions to protect, conserve, and restore water bodies. This fact shows that the state administration still do not recognize the different social-environmental problems of all these watersheds, consequently, contributing to an incipient decision-making process, which decreases the effectiveness for environmental planning proposals. Due to this, according to Britto (2007), there was a social claim to establish a new committee, which should have been nominated until March 2007, but remains the same. Furthermore, the National Plan of Coastal Management (PNGC), institutionalized by the Federal Law 6.938 from 1981, settles on the responsibilities of the municipal governments in elaborating, implementing, executing and accompanying the Municipal Plan of Coastal Management. However, the City of Rio de Janeiro still do not have water resources management plans for its watersheds (FEEMA, 2007).

Conclusion

The urban development in Jacarepaguá Lowland, in Rio de Janeiro City, shows that the region appears as an icon urban space for huge investments of public and particular

capital, thus, achieving important social economical development. However, concerning the role of the public administration, either municipal or state, we must consider some aspects.

First, it is important to observe that since the state government had invested in the most essential components of infrastructure to the urbanization process (e.g.: road system construction, water provision, electricity supply, gas furnishing), it expresses the focus on the urban dimension of the region. Second, because the public administration did not implement sanitation facilities, through the construction of a sewerage system to collect, to treat and to dispose sewer effluents, whose discharges have been contributing to cause environmental impacts, it had not concentrated the natural dimension of the region, contributing to the water pollution in Jacarepaguá Lowland Watershed.

Consequently, these factors added, directly or indirectly, to the appearance of environmental impacts, such as: (i) inadequate use of natural recourses, (ii) transformation of urban land use, (iii) transformation of urban landscape, (iv) transformation of natural systems, etc; and environmental problems like: (i) water quality deterioration, (ii) gradual degradation of mangrove, (iii) reduction of water bodies edges, etc. Actually, the public politics concerning urban management commonly act in a punctual intervention that does not establishes the connection between all the systems operating inside the city. In Jacarepaguá Lowland, historically, the government has been focusing in one dimension of the urban complex; consequently, it does not enhance the association between urban infrastructure and environment.

Third, the fact that the Jacarepaguá Watershed Committee is part of Guanabara Bay Hydrographic Regional Committee shows that the state administration do not identify the different social-environmental problems of these watersheds, which contributes to an incipient decision-making process, as a result, decreasing the effectiveness for environmental planning proposals.

Finally, the weakest point for most environmental projects and programs in the region is that, commonly, they involve many government agencies with overlapping responsibilities. Moreover, it is vital that the municipal and the state authorities demonstrate a strong and a true political commitment concerning the environmental local problems.

Therefore, the challenge is to unite governmental and communitarian interests in order to mitigate the cumulative effects of poor environmental management that might cause some irreparable damage to rare natural resources, in particular, to water resources. In addition, it is vital to rethink about the present model of urban development in the region, for to enhance the socioeconomic development linked to the improvement of environmental quality in Jacarepaguá Lowland Watershed.

---

[1] It is important to observe that Cidade de Deus (XXXIV AR) is located in a low-income region, mainly composed by slums, referring to irregular urban occupation.

[2] Planning Area 4 (PA-4) is formed by the Administrative Regions of Jacarepaguá (XVI AR), Barra da Tijuca (XXIV AR), and Cidade de Deus (XXXIV AR). The area that has been spreading out enormously in the last decades: Barra da Tijuca has been occupied by medium-high-income classes, Jacarepaguá by medium-low-income classes, and Cidade de Deus by the poor living in slums.

[3] It does not include slum population.

[4] The Pilot Plan for Barra da Tijuca was based on the implementation of huge blocks of apartments (from 25 to 30 pavements) alongside axial roads and around small centers, both responsible for the structure of the urban fabric (Cardoso, 1996, Pinheiro, 2001).

[5] The densification of Barra da Tijuca results, mainly, from the expansion of residential areas in its urban fabric due to the implementation of huge blocks of apartments.

[6] The insertion of Copacabana is because it has the second highest population density in Rio de Janeiro City. The densest region in the city is Catete (395.2 inhabitants/hectares), not including the slums.

[7] Jacarepaguá Lowland is composed by the Administrative Regions of Barra da Tijuca (XXIV AR), Jacarepaguá (XVI AR), and Cidade de Deus (XXXIV AR); and the neighborhoods of Recreio dos Bandeirantes, Vargem Grande and Vargem Pequena. These last two neighborhoods are not considered in the program mentioned.

[8] Guanabara Bay influences 16 cities: Rio de Janeiro, Duque de Caxias, São João de Meriti, Nilópolis, Mesquita, Nova Iguaçu, Belfort Roxo, Magé, Petrópolis, Guapimirim, Cachoeiras de Macacu, Itaboraí, Tanguá, Rio Bonito, São Gonçalo, and Niterói (Governo, 2005).

1.   Introduction

The first decades of the 20th century in São Paulo were the first significant time when public planning reacted against the intense urban sprawl that was taking place in the city. The former balance between built and open areas was then suddenly broken and the village, which had a well-defined form, became a sprawling city without clear boundaries. The urban growth promoted by land developers sparked intense debates, amongst engineers and architects who worked in the public planning departments, on the need to create a general plan for the city.

The intrinsic relationship of the land market, the spread of the *quadrillage* and the idea of progress was described by Manieri-Elia as a distinguished particularity of the *laissez faire* - American city in comparison with the bourgeois European city.[1] In São Paulo both were seen as models for the constitution of the modern city, evidently from different points of view. The American city was a clear reference appropriated mainly by local land developers who considered the grid as the easiest and most profitable way of dividing the land and as a sign of modernity. On the other hand, it was not in the expansionist model present in the United States, nor in the worldwide famous works of Haussmann in Paris, that the municipal public planning was mostly interested. Since it was in the United Kingdom and in Germany where the effects of the Industrial Revolution were mainly observed and that the urban plans carried out there were internationally recognized, the first public plans in São Paulo would look carefully at those experiences in order to prevent the dreadful consequences of the urban, population and industrial growth.

This paper will expose how the processes of change in São Paulo from a small village into a complex city revealed two diametrically opposed views. On one hand, it will show how the land developers adopted the American grid as a new spatial pattern capable of providing maximum profits in the creation of lots, and also considered as a symbol of modernity; and on the other hand it will analyze the reaction of the public planning departments in the sense that they tried to defend the irregularity of the historic city, its well-defined shape and the balance between built space and greenery. It is important to stress that the international planning examples from the *Städtebau* of the German and Austrian planners; from the British Town Planning, and the ideas of Eugène Hénard were the main references adopted by the first municipal public plans for the city aiming at creating a modern green city.

Furthermore, it will focus on how the creation of garden suburbs by Barry Parker and his proposition for the creation of a green-belt around the city represented a model of semi-private planning– as opposed to the examples of other land developers based on the use of the grid– and in agreement with the public aims of creating a green city with a well-defined shape.

2. The shapeless city: private land partition

São Paulo was founded in 1554 as a Jesuitical settlement and only occupied the high lands amid Tamanduateí and Anhangabaú rivers. (Fig. 1) This location was important to avoid floods and for military protection against the Indian attacks. The occupation of the low lands was, hence, systematically avoided basically until the end of the nineteenth century, when several contextual issues led to drastic socio-economic changes which had a significant impact on its urban form. It is worthwhile mentioning that the new attention towards the city emerged with the conjunction of combined events, such as the enrichment of the farmland owners due to the exportation of coffee, the arrival of the railways and the new possibility of speculating with the urban land, established with the land property law of 1850. In fact, it was principally because of these three combined events that the structures of the historic city started changing. The money derived from the commerce of coffee, the improvement in the infrastructures and the land market created the basis for São Paulo economic growth and urban development. Evidently, the industrial activities acted as important driving forces for change, though they were going to be even more significant in the following decades.

Figure 1. Plan of São Paulo, 1810.

Regarding the population growth, it is worthwhile mentioning that the village which had 10.000 inhabitants in the mid-eighteenth century reached a population of 30.000 in 1872, 60.000 in 1890, 240.000 in 1900 and 580.000 in 1920.[2] In relation to the urban expansion, it was irregular, discontinuous and followed the will of the land owners. The farmlands around the city center, that previously formed a belt of agricultural lands, started being divided in lots and became part of the urban area. Therefore, the urban elites consisted of the same groups of coffee growers of the nineteenth century, who

preserved their power in the city development and were now interested in the land market. New possibilities for investment in the city and the maintenance of the former social and economic structures of domination and power, which supposed a weak public control, caused the land owners to be the main group responsible for the creation of the city's new areas of expansion. As a result, the subdivision of the farmlands in urban lots took place discontinuously and fragmentarily in different areas of the city, which created islands of residential suburbs isolated from the urban tissue, such as the districts of Santana, Vila Gomes Cardim, Ipiranga, among others. This process was greatly facilitated by the creation of tramway lines at the beginning of the 20th century which connected these areas with the city center, which increased the land value and stimulated the appearance of other districts with similar characteristics.

The ruling elite kept preferring the high lands and crossed the Anhangabaú valley towards the west and southwest hills, where new residential areas were being settled by private land development, such as Santa Efigênia and Campos Elíseos (Fig. 2) quarters in 1879 and the Paulista Avenue region, twelve years later. Meanwhile, the working class and industry occupied the cheapest and most problematic areas, principally placed alongside the railways and the river valleys.
Fig. 2 – Plan of São Paulo of 1890 showing the irregular streets of the city center and the new residential districts based on the grid.

It is important to stress that this new urban activity (the land division and real-estate market) aspired exclusively to obtain maximum benefits and was based on the use of the grid. The principle of order, rationalization and efficiency of the capitalist system of production applied to land subdivision intended to create lots within a common structure and which could be sold at a maximum profit. The election of the grid as the main spatial pattern coincided with the emergence in São Paulo of urban capitalism and looked closely at North-America cities, such as Washington, New York and Chicago and also at Haussmann's works in Paris. These references were also then taken in São Paulo as symbols of modernity, as opposed to the picturesqueness of the historic European cities. In fact, the narrow and irregular streets of São Paulo city centre, as well as the arrangement of its blocks, were shown as belonging to the past and the grid was sold to the economic elites as a modern feature par excellence.

The grid was not accompanied by high-rise buildings, as was common in the American cities. The rural aristocracy, who was moving to the city, was not eager to lose the privilege of living in a big house with a wide open area surrounding it. In a way, the new residential districts for the elites tried to fulfill their wishes to live in close contact with nature and this fact can also be considered as one of the reasons for the local success of the garden suburbs model of creating residential quarters. One of the most important cases in that period in São Paulo was the land development that took place in the Bela Cintra farmland, which was followed by the construction of the Paulista Avenue, placed as a boulevard in the ridge of a hill; and of a square designed by Paul Villon in 1892. (Fig. 3) Thus the grid, the boulevard, and the square appeared as symbols of urban modernity based on examples taken respectively from the American cities, from the haussmannian works in Paris and from the British fixation with low-rise dwellings amidst green areas. Therefore, on the one hand the green areas in the elite's new residential quarters in São Paulo were fundamental to fulfilling their desire to keep living in contact with nature, in a similar way as they were used to when living in the countryside; and on the other hand, they were symbols of status and urban modernity. In this allegoric and cultural construction, the garden, the square and the boulevard had a crucial role. The green areas around the house was no longer the productive garden of the farmhouses, but an ornamental one, which was supposed to demonstrate the owner's cultural trendiness and economic power. The 'square', designed by Villon, followed the British model as described by Giedion[3] and was thought to be a closed semi-public green area for the inhabitants of the quarter. This square and the boulevard were the main places for social encounters and personal exhibition. It is no less correct to state that the permanence of the will to keep the contact with green areas and its new urban symbology are going to be on the basis of the success that the garden quarters had in the city during the following decades.
Fig. 3 – The use of the grid in the district around the Paulista Avenue. The square and the avenue are marked.

In fact, the provision of garden areas in the rich residential quarters was made as a way of increasing the attractiveness of the site and was not offered in the popular districts. Furthermore, with the increase in urbanization and industrialization, the open spaces were quickly disappearing from the urban tissue, and the municipal commissioner of public works foresaw that the city was about to face the terrible effects of the uncontrolled sprawl and of the industrial growth that several European and North-American cities had already suffered. In a short period, the picturesque village of the colonial times lost its urban form, balance between open and built areas and – led by real-estate speculation – became an amorphous city in a continuous process of expansion.

It was in this context that the need to think about the city as a complete organism and to propose a comprehensive and general plan was discussed inside the public administration. Among other preoccupations, it appeared to be fundamental to control the urban sprawl; embellish the city, combat the loss of the city shape; reconnect the urban tissue, improve the traffic system and create green areas. The newly created discipline – the urbanism –then took place in the debates of the professionals involved with the realization of public works in the city, especially in the discourses of Victor da Silva Freire, the municipal commissioner of public works.

3.   The defined form green city: the municipal planning reaction

In 1911, Freire delivered some speeches on urban planning and advocated the creation of a comprehensive plan for São Paulo. He detailed the city problems, expounding clearly how private planning was destroying the city's picturesqueness, causing its dissociation and leading it to a state of chaos. As mentioned before, at that time the works of the *Städtebau* and of the British *Town Planning* were two of the most recognized experiences in the construction of the urbanism as a new disciplinary field, and they had a fundamental role as successful examples to be followed in the constitution of the first comprehensive plans for São Paulo.[4] The dissemination of their ideas was particularly important after the *Town Planning Conference* held in London and organized by the Royal Institute of British Architects in 1910. There the main urban movements were represented, such as the *City Beautiful* of Burnham and Robinson; the *Städtebau* of Stübben and Eberstadt and the *Town Planning* of Unwin and Geddes. Against the *Beaux-Arts* methods, the *Städtebau* and the *Town Planning* urged for the establishment of a new disciplinary and scientific field of action in the cities, considering also its historic urban development, the geography and its local character. In this sense, Baxter affirmed that:

> The new school is particularly severe upon the 'handsome-picture plan' method which seeks a symmetrical layout and aspects of balance that are effective mainly upon paper, the qualities aimed at seldom counting for anything in practice. It has been remarked that to practice this method the sole equipment called for consists of nothing but straight lines and some circles. This academic procedure induces peculiarly involved street relations. Gurlitt remarks that the author of such planning, one might almost believe, appears to be

influenced by considerations of arabesque ornament in his endeavour to bring together many lines at one spot, in order to create crossing-points for artistically working up his lacework of streets. Invariably typical of the 'handsome-picture plan' is the circle always created at such points of intersection. Open spaces of this sort are objected to as tending not only to monotony, but to obstructiveness--complicating, confusing, and entangling traffic, by causing several main thoroughfares to converge, thus tying up the streets into a sort of enlarged knot. These circles are monotonous; a city thus conventionally planned is dotted with them. But the proper sort of open space is developed out of local circumstances thoughtfully considered in careful planning according to topographical conditions.[5]

Freire was particularly interested in those urban movements, in the sense that they did not deny the historic city picturesqueness, beauty, and form; but intended to create new urban patterns of development taking these aspects into consideration. The aesthetics of the European medieval city reviewed by Camillo Sitte and extension plans by professionals like Theodor Fischer and Joseph Stübben caught Freire's attention.

In contrast, the combination between the grids and diagonals of the *City Beautiful* was rejected as a model for São Paulo since it was opposed to the picturesqueness of the historic cities and to its disregard for topography; both arguments that Freire strongly criticized in the private planning that was being conducted in the city.

Thus, the future city should keep its irregular street pattern and preserve its picturesqueness. He defended flexible delineations and the use of the curve where adapted to local topography and historic issues. He stated that:

> Our city center is an irregular or picturesque conglomeration – this is the technical term that, in this case, it is used to show the exact impression of truth – where the streets followed, as in the European cities, the fantasy of the constructor, and not the implacable twine of the aligner.

> Is it not the curve that precisely best adapts itself to our rough land, from where the city gets its most characteristic element of charm: the picturesque?[6]

As proposed both by planners of the *Städtebau* and of the British *Town Planning*, the modern city should have a well-defined shape, be encircled by a green-belt, and recover the balance between buildings and green areas.

The challenge of reorganizing the industrial cities, planning their expansion, promoting a healthier environment and urban embellishment – which were part of the basis of the formation of the urbanism as a scientific discipline in Europe– included the preoccupation with reestablishing the connection between man and nature. The park – as analyzed by Chadwick, regarding the European cases, and Dal Co, considering the American cities – was then a fundamental element of the modern life and of planning the modern cities.[7]

In São Paulo, according to Freire, it should not be different. The planning of the modern city should consider the creation of a park system connected to the street system. Some

specific ideas and plans served as direct models for his propositions for the city, such as: the Ringstrasse of Vienna, Stübben's extension plans based on radial arteries and ring streets, the statements of Hénard at the beginning of the 20th century and the garden-city legacy developed by planners like Unwin.

Freire proposed the construction of a ring around the city centre - as a small-scale Ringstrasse and *Boulevard à Redans* – that should distribute the traffic into the radial arteries and become a pleasant walk for the population. It would also connect different green areas alongside its path, such as the two major urban parks that should be created: the Anhangabaú Park and the D. Pedro II Park, both occupying the two main river valleys enclosing the city centre. (Fig. 4) It is also worthwhile mentioning that Freire cited, in his report, the *Königstrasse* of Nuremberg, Theodor Fischer's plan for Frankfurt and the ring road proposed by Karl Henrici for Dessau in order to stress the need of building a city ring in São Paulo. In addition, he valued their respect for the historic city, the definition of expansion areas based on ring streets and radial arteries and on the propositions of park systems connected to the street systems.
Fig. 4 – Redesign of Freire's plan for São Paulo. The street system, the squares, the area of the Anhangabaú Park (on the left) and of the D. Pedro II Park (on the right) are highlighted.

Instead of preferring the construction of large-size green areas, like the Bois de Vincennes or the Bois de Boulogne, Freire advocated the proliferation of small-size parks and squares all over the city, which would meet the recreational needs of the population and spread the good effects of pure air and sun all over the city. This solution was fundamentally based on Hénard's propositions for Paris and on Unwin's admiration for the connections of the squares, parks and streets in London as presented in his book *Town Planning in Practice*.[8] Besides their role in the embellishment of the city; improving citizens' health and combating unhygienic conditions, the green areas were thought to be used for the recreation of the population at large and as instruments of structuring the city growth. It was the first moment in São Paulo planning history that the green areas were considered as an integrated system in a general plan for the city.

Olmsted's design for the Central Park of New York - as well as his plans for suburbs, parkways and park systems - was evidently observed. The Central Park became the main international example of an urban park connected to the city tissue and influenced the creation of innumerable parks around the world. Riverside, designed in 1869 – more than 10 years before Unwin's plan for Port Sunlight and almost 20 years ahead of Howard's garden-city idea – was a strong example of suburban residential land development that tried to reconnect man and nature, city and countryside. It is important to state that these elements were used in the creation of green cities by the most important urban movements, such as the *City Beautiful*, the *City Planning*, the *Städtebau*, the British *Town Planning* and so on. The interchange of ideas among them was evident, with visits from American planners to Europe and vice-versa; and among them, we can mention the excursion of Daniel Burnham, Charles McKim and F. L. Olmsted to Europe – after the creation of the *Senate Park Commission* and just before their plan for Washington central area and the development of a park system plan. Freire's proposal for São Paulo, as said before, considered the creation of two central parks; parkways, a park system connected to the street system and the creation of garden-suburbs as a solution to suburban development, like those designed in the United States, by professionals such as Olmsted, and in England, by planners of the *Town Planning*, such as Unwin and Parker. The contemporaneous discussion on the creation of a green city was adopted from the international movements, being of special interest Freire's mention of examples of the Städtebau, his interest in the American idea of Central Park, the Boston park system, and their garden-suburbs; as well as the comprehensive town plans and suburb designs of the British *Town Planning*.

Not only was Freire acting against uncontrolled private land development, but he was also competing with other plans presented to the public administration at the same time. One of them was known as Alexandre Albuquerque's plan, and consisted of a series of *Beaux-Arts* avenues focusing on increasing the land value in the areas of interest of his partners; and another plan was defended by the state government and was carried out by the engineer Samuel das Neves. Freire strongly criticized, above all, Neve's solution, condemning his proposal for following the haussmannian model of intervening in the city, expressly because of his intention of opening long, wide and straight arteries. In his words:

> Keep oneself in the illusion that to solve the city center problem it is enough to know how to draw plans of the city, deal with the square and the drawing pen, is to have a notion of things out-of-date for almost half a century.

> The origin of this false notion comes from the transformation of Paris started after the Revolution, but really carried out in the Second Empire, by the Baron Haussmann. He largely used the straight alignment, regular, over long extensions of land.[9]

Another point strongly attacked was the suppression of the Anhangabaú Park and the construction of an Avenue in its place. Hence, against a private plan and another supported by the state government, the municipal commissioner of public works had an important ally to defend his ideas: the French architect Joseph Bouvard. Shortly before, he had presented plans for Buenos Aires and Rosario in Argentina, and was invited, in

March 1911, to express his position about the impasse created. Curiously enough, he did not argue in favor of the *Beaux-Arts* methods he himself had endorsed in his previous plans, such as those in Argentina, but supported Freire's ideas. This fact endorses the supposition that his name was directly indicated by the commissioner of public works to solve the dilemma. Bouvard defended the same principles Freire was propagating and presented a new plan, which also advocated the respect for the historic city, for the geography, and the defense of its picturesqueness and irregularity.

It is worthwhile to stress his shift from the former academic plans to this one for São Paulo in which he considered the characteristics of the place and the picturesque. This could, on different levels, be the effects of the criticisms he received in Argentina, part of a process of revising his principles according to the consolidation of the *Städtebau* and of the *Town Planning* in the international debates, and the influence of Freire. It cannot be forgotten that the translation to French of Sitte's book was carried out in 1902 and that the following year the foundation of the *Association Française des Cités Jardins* took place. It is also remarkable that Sitte's and Unwin's influence in France became wider and wider in the first two decades of the 20th century and their ideas were spread mainly by members of the *Société Française des Architectes Urbanistes*, founded under the presidency of Hénard and Risler the same year of Bouvard's plan for São Paulo, in 1911. Aware of these discussions - and therefore in accordance with Freire – Bouvard stated that:

> It is necessary, from now towards the future, fill the empty spaces, what is going to be easy, if a firm decision of adopting a certain number of measures aiming at the achievement of a great effect, as interesting as picturesque.
>
> It is needed, for this purpose, to abandon the archaic system of the absolute grid, the principle of the straight line, which is excessively uniform; the secondary streets which emerge always perpendicularly from the main artery. It is necessary, in one word and considering the state of things today, to go toward the use of convergent and involving lines, according to the specific cases. (…)
>
> As a result, we have: for the city centre, for the urbs, respect for the past, the understanding of the uselessness of exaggerated street openings and enlargements - the understanding of the uselessness of putting to work, without stop, the pickaxe, as the only result of making the city historic character, archeological and interesting aspects disappear.[10]

His plan preserved the basic structure suggested by Freire, with the adoption of the radial and ring streets system and its connection to a park system, while widened the scale of the intervention. The proposal for the Anhangabaú Park and D. Pedro II Park was preserved, as well as the creation of several small squares and other green areas spread over the urban tissue. The first park was built from 1914 to 1918, and the second was completed in 1922.

Bouvard's plans were developed by the municipal department of public works, led by Freire, and was accordingly built following his ideas without significant changes. It was noticeable that the development of Bouvard's plan took into consideration the

connection of the new garden suburbs, which were being built in the southwest quadrant of the city, with the city center. As mentioned, already in 1911, Freire had defended the garden suburbs as the optimal solution for the residential areas in opposition to the grid and lack of green areas generated by other private land developments that were taking place. Therefore, the construction of the garden suburbs, held by the *City of São Paulo Improvements and Freehold Land Company Limited* (called City Company) after 1917, was an initiative to be encouraged.

4.   Garden-city: the semi-private planning solution

Barry Parker, who together with Raymond Unwin had planned the first garden city, Letchworth, in 1903, was invited by the City Company to design some garden suburbs in the land they had acquired previously. The connections between Freire, Bouvard and Parker are not totally clear. However, Freire seems to have had an important role in bringing Bouvard to São Paulo in 1911, and he himself became a member of the City Company's board of directors in 1938. Moreover, Bouvard was the vice-president of the Company when founded and his son – Roger Bouvard – was sent to São Paulo to decide which lands to buy. Finally, it is possible that Parker might have been contacted by Joseph Bouvard to come to São Paulo and it is a fact that he became, at the age of 71 years, the Company's vice-president.[11] These events suggest the interconnections between the public and the private spheres in the city planning, which was permanent in the following years.

Hence, from the point of view of the private investor, the option to build garden suburbs became worthy of interest for several reasons. Firstly, it had the support of the public planning departments that considered this model the best way of developing land. Secondly, as the preferences to live in the high lands were overwhelmingly spread among the elites, the valleys were the empty areas to be built. Therefore, the irregularity and curves of the garden suburbs pattern designs – that were principally developed in the United States and in the UK – would both suit the topography of the sites and would promote a new and modern way of living in a thoughtfully designed green quarter.

For Freire, thus, the construction of these suburbs would help promoting the creation of green areas at the same time it would fill the empty spaces in the urban tissue. It would put forward the dissemination of a high standard model of planning that was in accordance with his ideas and with the main international urban debates. Afterwards, the public planning should stimulate their construction and articulate them to the existing street system and consider it part of the city park system. In this sense, the construction of the modern São Paulo was thought to be achieved by the combined actions of the public planning and the private promotion of garden suburbs.

From 1917 to 1919, Parker stayed in São Paulo and developed the garden suburbs designs for the City Company, redesigned an existing park and proposed a park ring around the city. (Fig. 5) This greenbelt was much larger than the ring formerly proposed by Freire, and would enclose the whole urban area, reestablishing the city's former circular shape on a larger scale. It was the first time that an outer greenbelt following the

river valleys, mainly of the Tietê and Pinheiro rivers, was presented as a solution to control the urban sprawl and to provide huge areas of greenery for the city.

Fig. 5 – Plan of São Paulo from 1916 showing the park ring proposed by Barry Parker.

If in European cities the rings were mainly created to replace the city walls – in the borders of the city, as in the case of Paris and Vienna; in São Paulo they were to transform the valleys, both in Freire's conception and in Parker's ring park. The greenbelt, which became an element of several plans in Germany and in the UK in the 19th century, was an important instrument in defining the shape of the modern city, both in the works of the *Städtebau* and of the British *Town Planning*, evidently influenced by Howard's appropriation of this idea.

After Parker's proposal, the canalization of the Tiete River, which had been considered since the end of the 19th century observing mainly technical aspects, started being understood as part of the urban plans for the whole city and also as a remarkable opportunity to create an enormous park ribbon in the lowlands alongside the river bed. Instead of being a utopian solution, this idea was taken as a stimulus for the local planners to widen their focus, proposing plans that considered larger areas and aspiring to the creation of a vast number of parks and pleasant walks along the borders of the city.

Therefore, if the private land development carried out in the city based on the grid and regular street and blocks patterns was creating an amorphous, fragmented and gray city; the first public plans initially led by Freire, and then observing Bouvard's proposals, started combating it and struggled to recompose the shape of the city and the balance between built area and open spaces. The garden suburbs and the park ring acted in favor of what Freire defended and were solutions that could help to bring greenery back to the city, to restore the continuity of the urban tissue, to promote an urban model highly admired in the international scenery, and to redefine the form of the city.

Conclusions

The emergence of the urban question in São Paulo appeared only at the end of the nineteenth century when the former state of equilibrium between the city and the countryside, built area and greenery started becoming unbalanced. The contextual issues led by the arrival of the railways, the profits obtained from the coffee trade and by the emergence of real-estate market sharply shattered the colonial facet of São Paulo and threw it into immeasurable process of sprawling.

The private land development since the end of the 19th century adopted the grid as the best solution to obtain maximum profits. In the absence of a master plan, the land was fragmentarily divided and, consequently, the urban tissue lost its cohesion. The former defined shape of the city turned into a formless agglomeration that was growing indefinitely. Just after the first *Town Planning Conference* in London, and alert to the international urban debates, São Paulo's municipal commissioner of public works defended the need to create a comprehensive plan for the city, to prepare its future by acting in the present. The urbanism, as a new disciplinary field, appeared thus in São Paulo as an instrument of planning the uncontrolled process of city growing. Hence, he put himself in favor of the *Städtebau* and of the *Town Planning* methods – which at that time were the main international urban movements opposed to the *Beaux-Arts* schemes. The consideration for the historic city, for its picturesqueness, beauty and form – together with the creation of comprehensive street systems and park systems – were basically the fundamental elements that Freire considered adequate to reflect on in the planning of São Paulo, and that soon after his plan Bouvard adopted. Therefore, the ideas of Sitte, Stübben, Hénard and Unwin prevailed in this specific way of understanding how to plan the modern city.

The loss of the city's shape, beauty and picturesqueness, as well as the occupation of the land and consequent absence of green areas were faced as vital problems to be solved. Therefore, the public planning, represented by Freire and afterwards by Bouvard, aimed to create a picturesque, modern and well-defined-form green city, theoretically supported by the works and ideas held mainly in Germany, Austria and in the UK at the time. The idea of creating a park system in São Paulo emerged both from the observance of these European cases and from the United States examples known worldwide.

The accordance between private endeavors and public planning had in the plans for garden suburbs the object of a mutual cooperation. For the private investor that adopted the urban development pattern derived from the garden-city movement and from the United States' suburbs, it was a way of combining at the same time the best solution to planning in the topographically irregular areas and to creating a high quality design model to attract the elite's interest. For the public planning it was in accordance with their urban ideas, being the best way to promote the expansion of the city. It would help to bring nature back to the quarters, to increase the acreage of green public spaces; to occupy the empty areas in the urban tissue, to create picturesque sites and to redefine the urban form. The ring park would consolidate this process of creating a new city

shape, restraining further sprawling, and provide an immense strip of greenery for the well-being of the citizens.

The relationships between public and private planning are not clear, considering the construction of the garden suburbs. The efforts of the public administration to join these areas to the street system of the existing city and other improvements in these suburbs areas are noteworthy. Almost certainly, economic interests took an important role in these endeavors, but it is important to stress the fact that the support of the public planning it had was strongly encouraged on account of being in accordance with public planning ideas about how the modern São Paulo should be shaped.
Fig. 6 - Plan showing the urban sprawl in São Paulo from 1881 to 1930.

Unfortunately, several obstacles appeared and the public planners at that time did not have the necessary power to put forward some of its most important plans the way they wanted. For instance, the Tietê River plans which would create an impressive strip of parks, residences and public buildings with time were simplified and limited to the construction of highways on both sides of the river. Neither was it possible to stop the urban sprawl that prevailed over the creation of green areas. São Paulo kept growing strongly (Fig. 6) and its population increased overwhelmingly until the exorbitant numbers that the contemporary metropolis presents. Private planning, on the other side, even under some control and regulations, had grown its power within the definitions of the course of the city, prevailing over the public ones in São Paulo's urban history.

Agache's Plan in Vitória nowadays

Eneida Maria Souza Mendonça
University of Espírito Santo, Brazil

Introduction

This paper is based on a 1940's plan for Vitória, the most important city in Espírito Santo, Brazil, supervised by Alfred Agache.

Agache was a French urbanist, who worked on urban planning for several Brazilians cities. *Agache's Plan for Vitória*, as the general plan is called, was made to order for *Empreza de Topografia Urbanismo e Construções* – ETUC -, a private enterprise established in the city of Rio de Janeiro. The goal of the current study is to analyze the importance and the significance of this plan at the time it was drafted and its current meaning to the urban and metropolitan reality.

First of all a brief introduction of Vitoria's evolutionary history is necessary. It is one of the oldest cities in Brazil, founded in the year of 1551. However, its urban and economic development dates to more recent periods. Since the early 19th Century the state's economy began an ascending process, connected to the coffee agriculture and its exportation. This process was facilitated by the creation of colonies formed by European immigrants' in the state's country side. These immigrants, the great majority Italians, were responsible for the growth of the agro-exportation business and for the state's cities network growth. It is worth mentioning that up to that time the territory's occupation was basically on the seashore and in few urban nucleuses. The lack of occupation in the country side was due to a Portuguese ban to a west expansion, to avoid precious stones being smuggled from Minas Gerais (NOVAES, Maria Stella de; OLIVEIRA, 1975: MENDONÇA, 1985). From 1500 to 1822 Brazil was a Portuguese colony becoming a republic in 1889 when the monarchial regime was over.

Thus, by the end of the 19th Century, Vitoria's economy was closely linked to the coffee agriculture, and this commodity price fluctuation on the international market regulated the city's life until the beginnings of the 20th Century. In the good times there were several urban improvements and their interruption, or even changes in urban policies, during times of crisis (illustration 1).

A poignant moment happened in the 1890's when immediately after launching a daring government program, the work was all of a sudden interrupted due to a steep fall in coffee value and consequently in its market share (CAMPOS JUNIOR, 1996). The program content included **re-restructuring the state railway system**, so that the state and part of Minas Gerais' agricultural production would flow, **re equipping the port**, as a necessary support for the exportation of this production, and **city expansion** (CAMPOS JUNIOR, 1996), folded six times (BRITO, 1996) toward east, in the form of garden suburbs (ANDRADE, 1992).

This new project was written in 1896, by sanitation engineer Saturnino de Brito, following aesthetic and hygienic principles argued worldly (illustrations 2 and 3). The new suburb for Vitória, as the project was named, was the first of many others in the author's career, who worked on the expansion and sanitation of several Brazilian cities in the northeast and south of the country (ANDRADE, 1992).

All government's propositions at the time, to the railway network, the port and city expansion, were too broad considering the simplicity of the urban space at that time, its infrastructure and the financial amount needed to accomplish them. Its proposal would only be valid if possibilities of a continuing financial growth of the state's main product: coffee (CAMPOS JÚNIOR, 1996; CAMPOS JÚNIOR, 1993; ALMEIDA, 1986) were considered. It is observed that the financial crisis that happened right after its launching didn't annulled completely the program originally conceived. However, the program was done in steps during the first half of the 20th Century, taking into account the rhythm of the coffee value in the overseas market as already explained (MENDONÇA et all, 1996).

In the first decades of the 20th Century there were several urban plans proposed for Vitória. All of them different from the *new suburb* early proposed about the involved areas. While the latter, programmed a secular expansion, the others were set on a more immediate remaking of the existing urban nucleus, including some territorial extension, although more modest.

In the first three decades, it is important to highlight the establishment of the urban infra-structure, which modernized Vitória (CAMPOS JÚNIOR, 1996; MENDONÇA, 2000). The government actions were incisive in relation to buildings stairs, squares and public parks, rebuilding paths and opening boulevards, like in Paris and Rio de Janeiro. There was also concern about public lighting, water supplies, and the establishment of cable cars lines that extended the city to the west as to the east, contributing to accomplish the new plans for the new suburb step by step.

Several of the buildings done were based in plans developed for Vitória. Thus, it is fair to highlight the City's general plan of 1917, developed by Henrique de Novaes' administration, who besides being mayor, was an engineer and the author of the proposal (VITÓRIA, 1917). Although Novaes was not as well known as Saturnino de Brito by the Brazilian urban historiography, he was also author of proposals for rebuilding, expansion and sanitation to several cities in Brazil. It is worth mentioning that besides his technical capacity, his political activity was relevant in the local as well as national agricultural scenario (MENDONÇA, 1999).

It is observed in the 1917 plan, among other aspects, its concern in promoting the connections between the high and the lower parts of the city, as well as the east-west ones (NOVAES, In: BRIGIDO). To facilitate the redefinition of these flows, which were closely related to the port operation, the proposal to undo a hill becomes important as it took reference in the undoing of Castelo hill in Rio de Janeiro.

In 1931, Novaes developed the Urbanization Plan for Vitória, in which several proposals from the 1917 City's general plan were re-edited. The new proposal was more daring than the first one as it extended considerably the urban expansion area, even proposing, extending landfill to broaden the New Suburb project, written by Brito in the late 19th Century and still weak in occupation (illustration 4). Even though this plan contained several attributes in its contents worth mentioning in Victoria's urban evolutionary context, not to lose our focus in the main subject of this paper, only some will be mentioned. So it's worth mentioning that Novaes was the politician responsible for hiring urbanist Alfred Agache to work in Vitória in the 1940s and he was also responsible for the technical definition of the content agreed (ETUC).

Therefore, focusing on the 1931 plan content, it can be seen that while dealing with a broader territory than the early plans and projects, this one functioned preliminary as a kind of functional subdivision that in a certain way corresponded to a simplified essay to the future urban zoning.

So, it is clear the attention directed to the remodeling of the high city, as an area of well enhanced civic-religious character. Although it did not eliminate the possibility of city growth westbound, the plan highlighted the east expansion. The idea of predicting the functionality of the territory covered beyond what was marked for downtown, as well as the forethoughts for the port and industrials functions in the east, but still close to the central area, and the forecast of a residential neighborhood in the landfill area in expansion projected by Brito (NOVAES, In: BRÍGIDO) were all in the plan. Novaes importance to this remote zoning here mentioned is meaningful in the overall scope of this article if we consider him to be the key person in communicating with Alfred Agache in the next decade what will be deal about in the next chapter.

Agache Plan in Vitória – foregoing

In 1945 Henrique de Novaes was Vitória's mayor for a second time. In this occasion he hired the services of a carioca company to perform a broad action in the urbanistic field, including drawing registers, topographic services, registering and census as well as an urbanization plan. Together with the services of the so-called *Empreza de topografia urbanismo e construções ltda. – ETUC*, they also hired the French urbanist Alfred Agache as the plan supervisor (ETUC). Agache who had created the French Society for Urban Studies, and was its vice-president, was working in South America, having already created an important plan for the city of Rio de Janeiro.

The Urbanization plan agreed on included a main plan, projects for a civic center, creation and remodeling of neighborhoods. Besides these aspects the plan dealt with traffic flow, called functional elements and free spaces, including issues related to recreation, sports and landscape architecture. As to the urban expansion, it is observed that the plan also cared for aspects named immediate and remote expansion, characterized as zoning.

Besides the drawing registry and the urbanization plan, it is observed that the report included, in the end, a chapter that deals with the conclusions, final suggestions and recommendations about the success in the development, advertisement, commission in the city's plan, special legislation and the necessary financial resources to its implementation (ETUC).

The first aspect to be emphasized is the direct relation between the propositions in this new plan for Vitória and the content of prior plans, overall the ones in the 1931's. This fact, highlights the role of engineer Henrique de Novaes in the technical and political leadership of the urbanization plans for Vitória in the first half of the 20th Century and it also indicates, in a certain way, his role as liaison partner to the urbanistic procedures adopted in the beginning of the second half of the same century. On this last item it is proper to highlight the implementation of the urbanistic zoning in Vitória by the 1954 municipal code, even though it wasn't specified as so (VITÓRIA, 1954; MENDONÇA, 2001).

The second aspect to be dealt here is the general content of the proposal, that for some decades was a fundamental reference for the planning and management of the area. The third and last aspect to highlight about Agache's plan, focused in this article, refers to one of the neighborhoods created, called at that time *Saldanha da Gama* (illustration 5). It's about this last aspect that a study will be developed following the current aspects of the plan here focused.

The development of each one of these aspects, in the following chapters allows us to understand the importance of Agache's plan not only for the moment it was proposed, but also for the present.

Agache's Plan in Vitória – the contract requirements

The idea to expose here some aspects related to the contract signed between Vitória municipality and ETUC, aims to show that the plan developed received general lines from the local administration and that engineer Henrique de Novaes, in the occasion mayor for the second time, had a key role in the process.

Therefore, the main document to be examined is the invitation for bid sent by the mayor to ETUC (ETUC). In the document there is an estimate of a maximum of 18 months for the accomplishment of the city registration charter and for the organization of the urban plan for Vitória and Vila Velha. It is worth mentioning that Vila Velha located south of Vitória, was the first inhabited nucleus in Espírito Santo, in the 16th Century, formed by Portuguese settlers, who soon transferred the city's facilities to Vitória, the territory capital, a place safer from Indians and foreigners attacks (NOVAES, Maria Stella de; OLIVEIRA, 1975).

About the registration charter, it is observed that besides the interest in establishing it as a mapping base for the urbanization plan it was also used for fiscal reasons, as a comprehensive real estate census, which included finding out property deeds.

As for the urbanization plan, the contract mentions the necessity to follow the *general guidelines drawn by City hall, so that the city would be divided into six zones* (ETUC) The definition presented by City hall previewed the first West zone, *as firstly and foremost a working-class zone, with the exception of the lots taken from the mangroves… to which will be given mixed use: three store pavement blocks, adaptable to trade, offices and apartments on the upper floors* (ETUC)*.*

For the second zone located south of the so-called urban nucleus of Vitória, the prediction was for *heavy industry, with its necessary proletarian satellite neighborhoods* (ETUC).

The third zone was formed by the existing urban nucleus for which the port and central functions were forecasted, including specific attention to the civic center in the High City. The fourth zone comprehended an East expansion from the existing urban nucleus to become *a clean and light industry nucleus (food, furniture, fabrics etc.), surrounded by residential belts* (ETUC)*.* It is observed that these belts would occupy the areas near the sea shore; while farther from them would be *working-class satellite centers* (ETUC)*.* The fifth zone located in the extreme east of the island of Vitória, is presented as a guideline that will strictly follow Saturnino de Brito's plan, adapting to it the area taken from the sea. The sixth zone refers to Vila Velha and it is barely mentioned.

The other data in the invitation bid document, concerning the maps formats and material to be produced, as well as the deadlines and conditions to be fulfilled won't be listed here as they aren't as important for this study as the guidelines mentioned for the creation of a zoning.

That is why there is a lack of information about Vila Velha as well as specific indications presented for the majority of the zones, surely originated in prior urbanization plans, specially the 1931's. The slight expansion to the west, the special attention to the Civic Center and the real extension of the city to the east, creating territories with landing propositions and sharing of established uses, refer to the urbanization plan of 1931, which Henrique de Novaes rewrote in form of guidelines for the city's occupation plan in this invitation bid.

It is still worth mentioning a possible influence of Novaes, in the presence of Agache as plan supervisor hired by ETUC. During the first half of the 20th Century, Henrique de Novaes role in the production of urbanization plans for Vitória, as his presence in the political scene was, as already mentioned, meaningful. This context allowed, technically as well as politically, the permanence of Novaes, during several periods of his life, in the country's capital at that time, Rio de Janeiro. Novaes technological knowledge about urbanism had already allowed him to quote Agache in his argumentation developed in his 1931 urbanization plan (NOVAES in BRÍGIDO). Besides, in some of Novaes proposals for Vitória can also be observed influences by the urbanization acts done in Rio de Janeiro. These reasons plus the fact that Agache had already done important urbanistic projects for Rio de Janeiro, that had had meaningful repercussion, allow us to

hypothesis with some certainty Novaes preference for the French urbanist hired. It corroborates to the hypotheses the following extract from ETUC's work reports.

> *From conversations in Vitória, with Mr. Mayor and members of the decision committee, it was agreed that the part concerning the urbanization should also be awarded naming professor Alfred Agache as City hall Plan's representative, coordinator and supervisor* (ETUC)*.*

It is also observed that along with the contract between City hall and ETUC it was signed a contract between City hall and urbanist Alfred Agache. In the latter were established his obligations and fees to be fulfilled as shown in this extract:

> *This agreement is an addiction to the contract signed between Vitória City hall and Empresa de Topografia Urbanismo e Construções Ltda. on May 23, 1945 about the organization of Vitória's Main Plan* (ETUC).

Having done these considerations it is now possible to deal with some aspects of the general content of the plan in the following chapter.

Agache's Plan in Vitória –the plan's general content

Considering the scope of the activities in the report presented by ETUC, which included drawing the registers, urban planning and conclusions, it was opted for the current approach to deal only with the urbanization plan.
According to the determinations in the invitation bid, the urbanization plan was composed of five titles:

1 *Main plan and its guidelines*;
2 *Civic Center – created neighborhoods- remodeled neighborhoods*;
3. *Functional elements in the plan- traffic flow*;
4 *Free spaces- recreation- sports – urban landscaping and*
5 *Immediate and remote extension – zoning* (ETUC).

In the first title about the *Main plan and its guidelines*, the report highlighted the difficulties in establishing a road network in the city, due to its long lineal and topographic characteristic, between mountains and the sea. It emphasized that although, a city of small proportions, its neighborhoods are in general, away from the commercial and administrative center. This distance demanded long cable cars' and buses' lines and transformed downtown into a mandatory stop for transferring among neighborhoods. In terms of propositions the plan indicated the fore-planning of marginal paths by the sea. It previewed a balance in the remodeling and creation of neighborhoods, and that *hypertrophy of some at the expense of others* (ETUC) would not happen. This aspect is exemplified with special care to *Santo Antônio* neighborhood in the west in balance with *Saturnino de Brito* neighborhood in the east, with all their blooming characteristics. The search for a group harmony was also mentioned in relation to the functional elements and the attractiveness.

The second title about the *Civic Center – created neighborhoods - remodeled neighborhoods*, dealt with the urbanistic re-structuration of certain parts of the city and the creation of new neighborhoods. Initially the report highlights the fact that besides the central area, Vitória still did not have heavy occupied areas. This fact wasn't enough to justify, the creation of new neighborhoods but the fulfillment of empty spaces to be stimulated by the implantation of infra-structure was. Nevertheless a residential neighborhood project between *Saturnino de Brito* neighborhood and downtown was allowed to be created, demonstrating that this was the municipality's prior intention. The report also forecasted its slow accomplishment because this task demanded receiving the land from the pier job, reason for considering the possibility of this neighborhood to exist *as long as it wouldn't harm the growth of the others* (ETUC)*.* It is also interesting to highlight the transformation of *Ilha do Príncipe into a prime residential neighborhood because of its privileged position* (ETUC), as city's gate.

Santo Antonio neighborhood, in the west would be remodeled as well as the Civic Center, with special attention to the religious and administrative buildings specially the cathedral and the Governor's Palace. There is also some reference to *Saturnino de Brito* neighborhood in the east, indicating the necessity to create another water access, predicted for the new neighborhood, as well as the importance to stimulate the density growth (ETUC).

The third title referred to the *Functional elements in the plan –traffic flow*, proposed heavy machinery, analyzing its function and location in the city and at the same time examined the aspects related to traffic flow. The facilities mentioned were: the port, bus station, boat pier, railway station, airport, hydroplane station, municipal stadium and a commercial and administrative center. As to the circulation, the main aspect of the proposal referred to *Beira mar* Avenue that should have an avenue park characteristic, with future forethoughts of surrounding all the island of Vitória (ETUC).

The fourth title referred to the *Free spaces- recreation – sports - urbanistic architecture,* the report highlights the scarcity of free and arborized areas in the city, making specific recommendations for each remodeled and or created neighborhoods as well as indicating the kinds of trees for the arborization of the designed paths (ETUC).

The fifth title, involving the *Immediate and remote extension- zoning*, indicated that the plan followed the zoning that already existed in the city, probably meaning accordance to what was established in the invitation bid. In general lines it indicated the use characterized in the created or remodeled neighborhoods, referring though to the delimitations of each zone by the legislation or building code to be done. The elaboration of these norms, including the zoning, is attributed to the City Plan Commission whose acts were also present in the report (ETUC).

Having presented the general content of the plan, it seems that it presented wider and more complex dimensions than the possibilities and aims of this article. That is why it was decided to deal in a more specific way with the neighborhood created east of

Vitória, for analyses effect and context proposed in Agache's plan and the current context of the neighborhood.

Agache Plan in Vitória –the New neighborhood

Dealing exclusively with the new neighborhood projected east of Vitoria's central area it is possible to go back to its proposal in the 1931 plan by Henrique de Novaes. Agache's plan while introducing the new neighborhood, explicitly followed the *municipalities ideas* (ETUC), also justified it, considering new access by the sea to *Saturnino de Brito* neighborhood in the island's extreme east. This access was originated in the already mentioned expansion project forethought in the end of the 19th Century and still with a low occupancy in the early 1940s.

The description, in the report of the works in the projected neighborhood, allows us to see it as a continuity of the landing already done immediately east to downtown, to which there had already been a *street project approved* (ETUC)*.* To confirm the idea that the project recovered a prior idea, there is the following description of the grid and some characteristics planned for the new neighborhood:

> *Reviewing this initiative we have designed a new residential neighborhood in simple lines according to technical norms with broad ways and regular blocks taking advantage of the higher elevations for landscaping motifs, forming small parks that will break the monotony of an entire flat area* (ETUC).

Although it predicted the territorial incorporation, by landfill from several islands, the report only referred to attaching *Ilha da Fumaça* (smoke island), near where it was predicted a site for tourist activities connected to shipping and fishing and *also an interesting point with the possibility to form a long beach, eye catching for the new neighborhood and where there would be hotels, casinos and sea shore activities* (ETUC)*.*

The description also highlighted the park-avenue, in *a simple line but with neat lanes and garden spots* (ETUC)*,* as a side way in the neighborhood, connecting downtown to the beaches zones (AGACHE). Even though it was forecasted as a residential neighborhood, it was mentioned in the report the possibility in a distant future that the central area in the neighborhood would shelter the Civic and administrative Center, supposing that the existing one would change function to become museums or research centers (ETUC).

A tourist hotel was predicted in the park-avenue in the vicinities of *Saturnino de Brito* neighborhood, featuring private beaches, parks and interesting sites. As for the lower elevations, it was predicted their undoing for progressively build the landfill that would generate the neighborhood. However, enhancing even more the landscaping aspect of the proposal, the prediction for the higher hills was to transform them into zoos and botanic gardens. In the latter it was planned an orchid center on which high

expectations were placed due to the variety and quantity of the species in Espírito Santo (ETUC).

With these characteristics defining the new imagined and designed neighborhood, already named *Saldanha da Gama* neighborhood, it is reasonable to follow how this establishment and development happened.

The new neighborhood development and its future perspectives

As the area for the new neighborhood was on an enormous mangrove, it was imaginable that the designed neighborhood in the early 1940's, took some years to have part of its area prepared to receive the first buildings. The landfill was done between 1950 and 1954, paralleling to the making of another landfill continuous to downtown in an area called *Esplanada Capixaba*, both linked to the task of improving Victoria's port (CAMPOS JÚNIOR, 1993; MENDONÇA, 2001).

The grid drawn for this new land followed the general guidelines of the project supervised by Agache. However, with the exception of two small squares symmetrically placed in the east part of the neighborhood and a path with a central flowerbed, none of the other landscaping predictions were done during the project's implementation. This lack of a landscaping aspect is also found in the sea shore avenue, that although it fulfills the plan's prediction as a connection between downtown and the beaches it did not become a park-avenue as it was designed.

However, it is proper to consider that the mentioned neighborhood is exerting an important role in this urbanist intermediate context in which it was proposed, between downtown and its prime area, the east of the island.

Following some indications previewed in Agache's plan, the municipal code that defined an urbanistic zoning for Vitória was approved in 1954. This launched a special proposition for the new landing continuous to downtown, *Esplanada Capixaba* that was contemporaneous to the landfill of the new neighborhood *Saldanha da Gama*. For *Esplanada Capixaba* it was previewed the establishment of the city's tallest buildings that would be eight to twelve floors tall. At this time there were already several buildings downtown Vitória, although the height still did not reach twelve floors (MENDONCA, 2001). Downtown was the favorite place by the construction sector to build buildings. Although the area east of Vitória, including the old *Saturnino de Brito* neighborhood, now called *Praia do Canto* and the new neighborhood *Saldanha da Gama* had already some buildings, in the early 1950's, they were of small height and spread throughout the area without showing any kind of polarization (MENDONCA, 2001).

Under this light these neighborhoods were different from downtown that was without any doubt, the area with the greatest real estate interest in Vitória. In this context, the creation of the new area continuous to downtown, expanded the area proper for verticalization building in downtown's surroundings and delayed its extension to the city's east (CAMPOS JÚNIOR, 1993).

A study about the verticalization building process in Vitória (MENDONÇA, 2002) noticed the change in interest in the location of the buildings in the area, following a route east, pursuing the urbanization process in the establishment of the urban infra-structure. The author also identified, that gradually the population interest for buildings in Vitória left downtown and migrated to the beaches, always following the urban infra-structure (MENDONÇA, 2001) possibilities.

It is worth mentioning that before the real estate interest changed objectively to the beaches, there was an intermediate period, when a certain attention was on the new neighborhood designed by Agache, nowadays called *Bento Ferreira*. It is noticed that the broad avenues and large plots allowed creating an occupation similar to *Brito's* neighborhood, although not close to the beach. Thus, the new neighborhood permited the occupation to be done by one family comfortable house, but it also attracted the eye of the real estate business for the construction of buildings similar to the ones in the area near the beach. This procedure done in different periods of the 1970s was due to some circumstantial qualities of the new neighborhood. Among them, the size of the plots and the paths similar to *Brito's* neighborhood and also the closeness to downtown, still the main building area for real estate (MENDONÇA, 2001).

It was observed though, that as the urban infra structure was extended, even to east of *Brito's* neighborhood, *Bento Ferreira*, as downtown began to lose importance comparing to new market preferable areas, that besides urbanization were also near the sea. Before ending this chapter, it is worth mentioning the qualitative potential of *Bento Ferreira* neighborhood, as well as its proximity to Victoria's new center, immediately east of this neighborhood, allowing the market to shed an entrepreneur's eye on it, in spite of its lack of landscaping attributes previewed in Agache's plan.

Conclusion

Based on what has been written, it is noticed that Agache's plan for Vitória was developed in the end of the first half of the 20th Century, in a time still heavily influenced by agro-exportation economy related to coffee culture. It was also seen that several of the propositions were in fact the continuity of propositions previously proposed in early studies.

Thus, it was possible to notice the prominence given to Saturnino de Brito's project expanding the city to the east, as well as Henrique de Novaes' plans, that in a certain way monitored Vitória's urban context, culminating with the invitation bid to ETUC.
It was also observed that in the Agache's plan proposal, the regions located east of the city were projected as prime residential areas, mainly the ones on the coast. It is interesting to observe that this guideline was present in Brito's project as well as in the predictions of Henrique de Novaes, becoming a reality that is still on nowadays.
It is suitable to follow the gradual elaboration of the urbanistic zoning as a building norm rehearsed before, but objectively set and defined in de Novaes' bid invitation and elaborated after Agache's plan, becoming in 1950s a municipal law.

Vitória, from the tiny urban area in the 1940s to the central metropolitan area of seven municipalities of today, totaling about one million and five hundred thousand inhabitants, underwent several and profound transformations in the areas reported in Agache's plan. Concerning the neighborhood of *Bento Ferreira*, conceived at the time east of downtown with the name of *Saldanha da Gama* neighborhood, it is observed that its previous condition facing the landfills refers to Vitória's occupation history. Since the beginning of its occupation, even more from the second half of the 19th Century there were several landfills always trying to generate among other aspects expansion territories, contributing to keep Vitória's political position as the state capital.

The tourist feature as well as the landscaping characteristic shown on the project supervised by Agache for *Bento Ferreira* deserve an specific study later. They were briefly mentioned here. Tourism as a seashore notion in the state of Espírito Santo was used for the city of Guarapari, although present in several other prior propositions for the city of Vitória as well. As for the elimination the landscaping proposed, when the projected was done, it is noticed that the neighborhood occupation from 1950s matches the period that began in Vitória as in other cities in the world the high in real state value in spite of urban aesthetic and the preservation of public spaces.

As for real estate valorization it was possible to notice the attributes of the projected neighborhood (illustration 6), the large size of the plots as well as its location near downtown. After a period of real estate inertia, away from the market interest, it is observed its new vitality by the number of real estate new proposals.
Keeping the inherent quality of the land division, the advantage in localization nowadays, a privileged place between two centers, the old historic with a re-qualification project and the new to where the main offices, business and state departments are moving.

In spite of its lack of landscaping, that surely would enhance the urbanistic quality of the neighborhood, it is possible to say that its localization and grid take us back to the project developed and supervised by Agache and to the technical and political lead of de Novaes to its accomplishment.

Brasília as a concrete object of analysis of the interaction between urban planning and private actions in Brazil

Gabriel Dorfman
Emelia Stenzel

1. Realising and facing interests. The planning of Brasília in historical background.

In 1957 took place the national competition for the design of the new capital of Brazil, to be built in the interior of country. At that time, the capital of the country was Rio de Janeiro, which, approximately two centuries before, had replaced the first capital, Salvador in the State of Bahia.

The idea of settling the capital in the very deep interior of the country, far away from its coast, was an endeavor whose roots reached very deep in Brazilian history. The change had been a subject of consideration since the time Brazil was a Colony. Sebastião de Carvalho e Melo (1699-1782), the Marquis of Pombal, one of the strongest figures in the shared history of Brazil and Portugal, took some concrete initiatives in order to establish the conquer of the hinterland with the foundation of new Planed Towns, the so called *Pombaline Cities* [1]. In order to protect the valuable resources of that huge possession of Portugal from the greed of some more powerful European countries, the Marquis considered on eventually moving Brazilian capital to its hinterland. [2]

The decision to establish the conquer of Brazilian hinterland was embraced by the republicans and interwoven with the creation of a new capital, written in the new Constitution.

But the decision to move the capital gave place - in the first republican period, as well as in the Vargas Era - to the development of existing state capital, or foundation of new ones in the Central Western Region. In this move towards West emerged two new regional capitals: Belo Horizonte, in the state of Minas Gerais and Goiânia, in the state of Goiás.

While running for presidency of Brazil in 1955, Juscelino Kubitschek made public his intention to accomplish that old plan – to move the nation's capital - and, after being elected, decided to put it forward, taking the huge risk of making the change complete in the five years of his presidential term.

At the time Brasília was being constructed, the great majority of Brazilian population was settled mainly along its coast, the only significant exception being the state of Minas Gerais. There, where in 17th. Century the gold rush had taken place, a thick urban network was established upon the structures of that former roaring economy. Building the new capital was regarded as the central issue in the bigger plan of

occupation of Brazilian hinterland, the better way to improve economy and settlement in these regions, and so diminishing the acute regional unbalances.

The construction of the new capital not just launched the development of the hinterland, but that of the whole country as well. The modern capital of the *período desenvolvimentista*, helped to define a new identity for Brazil as a modern country, a country that would be about to overcome remaining archaic economic and social structures.

A first significant moment of frontal collision between public planning and private interests, was possible to detect already during the construction. Like in other similar historic case of radical change of a *status quo* to a new situation, resistance among those about to lose some, or eventually all benefits enjoyed in established situation was bitter and fierce.

Chronics of the 20th Century tend to present the change of capital from Rio de Janeiro to Brasília as a move made to put the forces detaining political power apart from direct contact with a political engaged population, a population which exercised concrete pressure in the streets surrounding government palaces and facilities in Rio de Janeiro, what is also right.

But among the reasons explicitly assumed by Kubitschek on founding his decision to put forward the move to the new capital – to protect national politics against too strong influence of established interests [3] – some other groups of interest must be mentioned.

Among those who fiercely fought against Brasília were the strong conservative political powers, opposed to the emerging industrial and labor forces that supported Kubitchek's party and its development policy.

Arm in arm with them were the economic actors which anticipated a loss of access to instances of political and economic decisions made familiar during decades or even centuries of chumming up, as well as the groups bounded to the economy of old capital and surroundings, which foresaw the period of economic restrain, which actually took place in Rio de Janeiro.

Also to mention the resistance of thousands of members of the federal bureaucracy, faced with the contingency of being forced to abandon one of the most beautiful and cosmopolitan cities in the world and move to some provincial backwater in the middle of nowhere. For most of those families and individuals forced to move, the change – despite the substantial economic advantages offered – was a nightmare, since the losses, difficulties and discomfort they were about to go through, did not count among national interests.

A great deal of public effort during the construction was directed to a huge advertising campaign, which sought both national and international spotlights, to overshadow the strong reaction against Brasília lead by these groups. [4]

The power and the influence of those forces in shaping sectors of a public opinion, which reacted – and still reacts –to the plan in which Brasília took place and to the city itself, should by all means not be underestimated.

The construction of Brasília – with the alleged corruption involved in construction contracts - gave the central issue of the Presidential Campaign of 1960, won by Jânio Quadros, a right-wing populist. After six months, Jânio Quadros resigned, pushing the country into a crisis that lead to the military coup of 1964.

After a short period of hesitation, the right-wing military dictatorship took on the task of bringing the left-wing project to its conclusion, not being afraid to use without constraint their power, in order to assure success. The new capital, barely populated, was in fact able to assure much more urban-calm then the old one.

From the time Brasília became a project of the dictatorship, th city gained new opponents, now in the left wing of the political spectrum. The order that was to anticipate the new and modern Brazil, turned to be identified with the authoritarian order established by the conservative powers.

2. Realising new urban values. The capital planned by Lucio Costa

> "We would fain take that walk, never yet taken by us through this actual world, which is perfectly symbolical of the path which we love to travel in the interior and ideal world; and sometimes, no doubt, we find it difficult to choose our direction, because it does not yet exist distinctly in our idea." [5]

In the design competition for the new capital, in which only Brazilian architects were allowed to participate, the design submitted by Lucio Costa won the first prize.

Brasília is worldwide known for its representative public spaces, specifically for its "*Esplanada dos Ministérios*" (Ministry Esplanade), with the new typology of palaces and public buildings designed by Oscar Niemeyer, which surely belong to the most meaningful examples of the architecture of 20th. Century. It is also well acknowledged that with its conception of a new balance between built and inbuilt space, between handmade and natural elements, Costa's plan established a new pattern in the urban landscape, not just for Brazil.

But Brasilia is also a conception of a new, specific form of interaction between public and private spaces. And in order to examine this aspect of the city, an essential aspect for its inhabitants, one has to shift from the representative spaces of the capital and look into its residence blocks – its "*superquadras*".

Here, at these *superquadras*, the soil is conceived free from physical barriers and open to anyone to walk it through in any direction. The private spaces of apartments stand above it, resting on pilotis. On the ground, tiny lobbies are the only allowed restricted areas.

It is very well known that this idea was not Costa's creation, but was first delivered in the writings and designs of Le Corbusier. But in order to implement Corbusier's idea in Brasilia's superquadras, a new form of appropriation of urban soil had to be established: there should be not the typical parcels of traditional cities, but only "projections".

In the very core of Costa's plan is this new conception of urban soil as a public good, in which barriers imposed by private property should not be allowed to exist. Urban soil was meant to be public not in the same sense of some public facilities like a school, or a hospital, but as the basis of a new urban environment. Such an environment, configured much more within the dominance of its natural elements and its emptiness, than within the frame of its building elements, was to be shared by everyone, made accessible for everyone, disregarded the function or purpose of its dislocation. In other words, the city planed by Costa regarded for its inhabitants, the possibility of walking in a park like city [6]. That means, talking a walk in the city, in a sense that is nearer to the one Thoreau applied to it: walking as an experience of freedom.

At the time of the construction of Brasília, nothing could fall farther from the ruling functionalism then the introduction of such concerns in the agenda of a new city, not to mention in the agenda of the capital of a country like Brazil, a country whose urban history is the history of the rising of cities in opposition to the threatening nature.

Another aspect to be considered in the urban context fabric proposed by Costa, was the creation of neighbourhood unities, ensembles of four Superblocks - each Superblock with eleven apartment buildings spread in a square lawn surrounded by trees on all its borders, but one limited by a strip of local shop - which share public facilities, like school, church and club, in a in-between area. Such neighbourhoods are a housing cell which, reproduced along the north-south axis, assured within the capital the development of a strong domestic life.

In the neighbourhood unities of Brasília, the city better known as the capital built for the era of the automobile, pedestrians have the forehand. Each of these ensembles were planned in order to allow its inhabitants to go shopping, praying, dancing, swimming, sporting, or meeting each other solely by walking. In other words, allowed a neighbourhood community built by pedestrians, a community built by walking and through walking.

What could have possibly mean the affirmation of this specific value in a social and above all in a cultural context like Brazil some fifty years ago?

First of all, it meant that a small group of architects managed to attach to political power in order to implement new solutions for the urban context, solutions that had been

object of concern and discussion in the academic community worldwide for at least 25 years.

The engagement of modernist architects in state politics in order to implement new practices in urban planning goes back to the thirties of the last century. It was during the period of the Estado Novo, in the Vargas Era, that modernist intellectual and architects working inside Government launched a revolution in the identity of the country, shaping Brazilian modern architecture in association with a new evaluation of its cultural heritage. [7]

Aware of the possibilities opened by the planning of actions within public institutions, as experienced in that former strategy, Costa aimed at more ambitious targets, by introducing new actors in urban dynamics. Not primarily the interests of the common private economic agents was to be considered in his plan, but a much broader social project should be realized and supported, by means of the planned structure of the new city. In a country with a barely articulated civil society, which did not develop institutions able to give resistance to the interest of economic forces, such association of the architectural elite with state powers resting on broad popular approval - like those of Juscelino Kubitschek and Getulio Vargas - gave the chance for introducing radical changes in urban dynamics. It was due to this association that Lucio Costa could define, without precedence, the space of the capital as common public space.

3. Change of actors in the development of the City

From the seventies on, the city developed to become not just the real capital of the country, but the magnet that launched the development of a metropolitan region that reaches more than two million inhabitants, distributed in 19 administrative regions, one of them corresponding to the historical core of the city, the so-called *Plano Piloto,* with nearly 200.000 inhabitants*.*

Regiões Administrativas	Área total (km²)	População*	Densidade Demográfica (hab/km²)

(Figures Nr. 1 and 2)

Most of the satellite cities around Brasilia, some of them founded during the construction of the new capital, followed functional urban principles while maintaining traditional urban soil property.

As perspective of big profits in real estate business became more and more attractive – what happens not just in the Plano Piloto, but also in some of the enriched "satellite cities" – like the one of Taguatinga, for example – the pressure on public free areas became enormous and conducted to the urban scenario typical of other Brazilian cities.

The inclusion of the Plano Piloto in the World Heritage List introduced another actor in the urban dynamics – the National Inheritance Institute - which changed the balance that prevails in the surrounding administrative areas, by promoting a reevaluation of the original plan.

How has the city developed in these 48 years after its inauguration in the action of such opposed actors and principles? How have individuals and small groups adapted to the values of public life as affirmed in the city design?

The first concrete case to be examined consists of the changes, which the car channels that lead to the *superquadras* and the shops located along them went through.

Originally thought by Costa to serve exclusively as channels for the people to drive through on their ways home to the superquadra and for the use of the providers of the local shops of the superquadras, located along them, these channels turned to be streets in a more traditional way.

In Costa's Plan customers were expected to come just from the superquadra, looking for items of daily consumption – milk, bread, newspaper and so on. [8] But it did not take too long for shop owners to realize how interesting for their business it would be, if they turned the front of the shops to the street, becoming much more visible for people coming from or driving to other superquadras.

This inversion of the original idea of Costa, brought by private initiative, turned those car-channels into traditional streets – almost Corbusier's *rue-couloir*, only not so narrow and not so shady like Corbusier used to depict them – with unequal consequences for Brasília.

At one side, in the years following the inauguration, the city administration increasingly gave in to the pressure of shop-owners, relieving local shop strips from the planed balance of uses, and so allowing the development of specialized shop strips. "Pharmacy streets", "Restaurant streets" "Household streets" and other emerged to attend not just local customers, but that ones coming from all over the Plano Piloto. This change not only forced the superquadra dwellers to drive by car to buy the daily supplies they once could acquire by walking, but also occasioned traffic problems that today, in same extreme cases, bring local traffic almost to collapse.

On the other hand, by turning their fronts also to the car-channels some of those shop strips that did not specialized use, became the places where life in Brasília comes nearest to the way urban life takes place in a "normal" city. People go out for shopping or only to look at the shop windows, people linger at restaurants and bars with their tables and chairs on the sidewalks, sipping their drinks, or just looking at and being looked by other people.

(Figure Nr. 4)
A local shopping strip in the late sixties

In another case of withdrawal of public action and planning in favor of private initiatives, the city administration increasingly abandoned the education system initially proposed, on the basis of the neighbourhood unities, favouring another development pattern.

During initial decades of the capital, the proposed education system was based on the so-called escolas-parque and escolas-classe, which followed the distribution pattern, set by the neighbourhood unities. Located inside the in-between area of the superquadras, both "escolas-classe" and "escolas-parque" shared the same open spaces with the apartment buildings of the neighborhood, their playgrounds been practically a kind of extension of the gardens and playgrounds that surround the homes of the children living there [9].

This initial synergy between education system and urban plan was brought out of balance with the decay of the public education-system of Brasília, caused by the lack of investment in the existing schools, with consequent low salaries and the decaying of building facilities. This system has been progressively replaced by another of private schools located in a new sector far apart from the superquadras. As consequence, of school-busses and cars filled with children have to travel twice a day between home and school, not just overloading the city traffic-system, but mainly impoverishing the development of city life in the scale of the local communities.

The consequences of both factor mentioned above in the decaying of community life in the superquadras - specialization of shop strips and the abandonment of local schools - can be better understood in the way a different trend was set in the relation of superquadra's dwellers with its public spaces: at the same time that superquadras and their adjacent areas became increasingly places where children do not spend the most of their time, they are being progressively subdivided into independent plots, each of them being fully isolated from the rest by low fences and walls.

Thus the original conception of Costa's design of a common urban space shared by all people walking in all directions, free from physical barriers imposed by private property, is going lost in those individual actions that became more and more intense in the last decades.

(Figure Nr. 5 and Figure Nr. 6)
A space once planned to be integrated – open areas were meant to be shared by apartment buildings and schools, with no barriers between them

If one considers the issue of general insecurity In Brazilian society, it is probably easy to understand how high fences and walls are considered as an effective way to provide some protection. But this is not the case of the superquadras, in which modern camera systems have already been introduced, responding – in association with security personal - for the problem of criminality.

This same logic is nevertheless not sufficient to explain why spaces that lie underneath the apartment buildings and around them are being subtly but progressively appropriated by people who live above them and cut off of access for other people – the so called "strangers".

By looking with some attention to the way the appropriation of ground-areas of superquadras has evolved, it is clear that areas kept under private or semi-private access are slowly but firmly extending. In most cases, this extension happens in a very

gentle way: green borders and low bushes are planted here and there, subtly drawing lines which progressively establish rigid limits on freedom of movements on public soil which once prevailed.

(Figure Nr. 7)
Low walls, low fences and green borders extend semi-private and private domain underneath apartment buildings and beyond it

Considering that the argument of people's necessity for more safety is by no means applicable to these cases (despite the frequent times it is expressed), there have to be surely other factors playing an important role in this process.

Such apparently small and harmless transgressions of the rules implicit in Costa's design for Brasília are not essentially different from the appropriation of public areas along commercial streets made by shop owners in a very explicit manner.

This similarity between both attitudes becomes very clear in the cases where inhabitants of apartment buildings let party-rooms be built on the ground floor of their buildings. And it cannot be overseen in this case, that also the lost of the local character of the shopping strips, which do not attend primarily communal life, contributed to a lack of interest in the preservation of those public areas.
Such attitudes can be better understood by looking at them against the background of the history and culture they belong to.

(Figure Nr. 8 and Figure Nr. 9)
Two examples of explicit illegal appropriation of public spaces by private initiative on commercial streets between adjacent superquadras

(Figure Nr. 10 and Figure Nr. 11)
Example of explicit illegal appropriation of public area underneath an apartment building which blocked movement on the ground of a superquadra

4. Evaluating the experience of Brasilia in the Brazilian cultural context

It cannot be underestimated, in the establishment of such attitudes, the evolution of the political culture of the country, during the 20 years of dictatorship.

If it is true that the militaries embraced the conclusion of the new capital, and assured the realization of the proposed urban structure, it is also true that they were not particularly committed to the principles thought to govern the development of the plan.

The militaries split with the cultural elites that were engaged in the discussion and the shaping of new social projects in the Kubitschek period, replacing the effort of constructing a political and social culture by the propaganda of the primacy of technological and economic factors, in the pursuit of social development.

The cultural resentment that marked the decades of military dictatorship, allowed the reemergence of attitudes rooted in old practices, practices that historically defined urban dynamics in Brazil, as a dynamic in which public spaces are considered as spaces to be privatized.

Such attitudes, which pervade all strata of the social spectrum, are deeply rooted in the colonial history, which set the pattern concerning private x public relations.
By examining the cultural formation of the country, historians from Brazil and abroad tend to agree that the awareness of common interests and the recognition of a public sphere is not so developed in Brazilian culture as in some other colonial countries, like the United States, for example.

In his classic work "*Raízes do Brasil*", Sérgio Buarque de Holanda exposed the idea that Brazilians tend to overestimate the significance of personal relationships, normally preferring them to the anonymous ones, which are ruled by clear socially defined roles and since Max Weber's analysis are considered as characteristic for modern societies. [10]

Such consciousness of a clear distinction between public sphere and private interests is not much developed in Brazilian culture, as a matter of fact until today (eventual doubts on this issue would probably fade away by hearing or reading the daily news about corruption in all spheres – whether public or private - of the country).

Different from other countries and cultures, situations where public sphere has to be protected against predatory attacks from individuals and small groups of interest are not rare in Brazil.

Considering this historic and cultural background, concrete cases of dispute for soil in Brasília can be better explained as disputes between social and private interests rather than disputes between the pretensions of state control against free citizens struggling for the right to shape their own environment.

The automatic application of explanation keys developed in other contexts, in which the so-called civil society constitutes a strong power, able to defend their interests and face regulations imposed by state agents, in Brasília the most aggressive forces opposed to the planned structure come from private agents, being these either individuals or groups.

The preservation of public space performed through urban planning has been until today the most effective way to prevent urban environment from being fully appropriated by private interests. It is also a way to prevent the spaces of Brasilia from been converted to the standards of the cities shaped by Brazilian economic agents, which pursuit profit making without any consideration of their social responsibility.

It is also the only way of keeping from destruction the aesthetical qualities of he urban spaces in Brasília, which offer the most valuable experience to its inhabitants. Walking through the spaces of Brasilia – which are not just those in the Monumental Axis, but mainly those in and around its Superquadras - is a unique chance for having an experience, that cannot be replaced by the ones found in historical cities or parks.

This consideration is not unimportant on evaluating the significance of private actions that are progressively but radically altering the balance between built and empty spaces in Brasília – a balance which is fundamental in Costa's design.

This unique balance sets the pattern, which enabled to reshape and reintroduce communal life in the planning of big cities in Brazil, by means of setting the basis upon which other social systems could be planned and developed. In this sense, enabling the experience of another citizenship.

The plan of Brasília was the clear statement of values mainly concerned with broadening the frontier between public and private realms. Blurring the consciousness of this frontier has been mostly a way to conceal public sphere in favor of different private interests. In Brasilia urban planning appears as an instrument for strengthening a consciousness that could never emerge in other developments of urban life in Brazil.

The permanence of Brasilia's plan is a strong affirmation of the permanence of public realm and of its prevalence against private interests. And that sort of affirmation, through its architecture and urban planning, turned to be - in the recurrent critical political times that the capital experienced in its half century of existence – remained as the only affirmation of dignity and clarity of thoughts and values. Values that survive and prevail through the urban experience brought by a case of urban planning, that conveying a new idea of city and citizenship, resists to the everlasting recurrence of the archaic.

Designing the city: the Modern Movement and proposals for new urban forms between the two world wars

Eloísa Petti Pinheiro
Universidade Federal da Bahia, Brazil

Introduction

In the last 30 years, we can identify two related phenomena in urban studies: the architectural dimension of the urban environment as a renewed protagonist, with an emphasis on urban projects, and the resurrection and development of historical urban studies, with the proliferation of analyses on the evolution of urban forms. All of them work from the basis of the city as architecture or as a group of large-scale architectures. (Monclús, 1995)

This is the starting point for my paper which will attempt to provide a systematic summary and synthesis[1], of the main proposals for new urban forms between 1920-1940. This analysis is based not only on designs and plans for cities, but also on theoretical proposals and studies, both published and unpublished, that were translated into concrete plans, albeit with exceptions.

The time frame focus of this paper covers the years 1920 to 1940, when the architects of the Modern Movement proposed a new urban form in stark contrast to the traditional city model. However, the ideas proposed by the CIAM (*Congrès Internationaux d'Architecture Moderne*) and the Athens Charter do not represent the only approaches in circulation during this period; there were alternative proposals for urban forms that are not identified with the Modern Movement. Some of them proposed a return to the traditional or classic form, while others searched for a new urban form which appeared to oppose urbanization or focused on a new function for the traditional urban centers. I have attempted to discover, through the works of these urban scholars, how contemporaneous proposals looked at different urban forms and structured the needs of new urban life-styles based on common problems. The starting point for the various proposed answers to urban problems was the poverty and chaos in industrialized cities. Discussions on these issues began in the middle of 19th century, the time when we can identify the ideology of modern urbanism as the confrontation between liberal myths and the misery of the proletariat (Ragon, 1986, 232). This problem was further aggravated between the two world wars.

Rational urbanism, represented by the CIAM and Le Corbusier, refers back to the theories of Tony Garnier's industrial city and the methods considered by Soria y Mata and Eugène Henard. It locates itself within socialist ideology, from Saint-Simon to Marx moving on to Charles Fourier and Etiene Cabet. In contrast, we have the no urbanism of Frank Lloyd Wrights and Lewis Mumford, who follow the ideas of Ebenezer Howard (the city garden) and Patrick Geddes (the city in evolution). Both rational urbanism and the no urbanism had to meet the challenges of early socialism (no longer theoretical but real) that materialized in the Soviet Union (URSS).

The Modern Movement urban form

The end of an era, which had begun during the Renaissance, gave rise to a new city: the modernist city. The solution to city design problems was not based on the form or on the relations between symmetry and geometric rigidity. A new geometry of relations in building design can be found in many 20th-century architect projects which spread out like a great composition.

The modernist city originated from experiences and theoretical formulations that, in the first half of the 20th century, rejected the traditional city and substituted it for a new model. These ideas came to substitute the residues of formal urbanism. Between the two wars, modern architects worked hard opposing formal urbanism and organizing the structure and morphology of the new city. Both architecture and modern urbanism attempted to counter the traditional ways of building houses and cities. This anti-historical approach rejected shapes associated with the old city, an attitude which is also illustrated by their rejection and destruction of historical centers.

During this phase, attempts were made to destroy or abandon the idea of the block, street or even the square. Instead these new proposals offered typologies of towers, condominiums and blocks, and the city was no longer structured on mixed functions to be zoned, breaking the reciprocal integration of the various morphological elements that constitute the urban structure. The new organization models for urban space rejected the forms and the morphology of the traditional city.

The period between the two world wars was one reconstructing European cities, and was thus an important moment to re-think and reorganize traditional cities. It was also a time of social tension with heavy unemployment, migrations and the lack of housing. What was needed was large-scale and fast rebuilding: new housing within planned quarters, urban condominiums, low-cost housing and a new urban ordinance programme. After WWI, the need to build cheap standardized housing became apparent. This was the new spirit proclaimed by Le Corbusier in 1920: build serial houses, live in serial houses, and conceive serial houses.

The debate about housing was the beginning of the search for solutions to combat poverty in major cities. It was necessary to incorporate advances in technology and industry into building houses, and from the solution to the housing problem, the debate extended to including the city as a whole.

Throughout Europe, legislation in the area of city and territorial administrations were under review; a fact which allowed for rethinking territorial planning for big and medium-sized cities. As opposed to the traditional city, the buildings were conceived as separate items, with a wax composition, where the pieces can be moved and repositioned. Thus, the urban form dependent on housing considerations without taking into consideration the composition of urban spaces. The new housing typologies, which spread throughout the land, according to needs such as hygiene, insulation, ventilation

and access, meant that buildings stopped being part of the superior block structure to gain autonomy. The streets no longer belonged to the physical-spatial relations of the city being reduced to transport and services lines. The positions of the buildings were based on better living conditions and not to its position in the block.

The modern city is, therefore, different from the traditional city, where housing and residential constructions were determined by lots and generated by the position and implantation determined by previous urban forms. In the modern city, construction determines the urban form and the space between constructions becomes merely a residual space that was not the object of urban design.

In Germany, after 1923, the *siedlungen*, (Fig. 1) (great separate blocks of common housing set among gardens) were constructed, which faced sunwards and also included schools and stores. They were constructed with standard materials, with the systematic use of concrete flagstones, using simple finishing techniques and takes on geometric dimensions.
Fig. 1 – Siedlung Britz, Berlim, 1925, M. Wagber and B. Taut project.

However, the architectonic quality of the different isolated or contiguous buildings alone could not confer shape to the urban environment. Even quality condominiums emerges as disarticulated and devoid of real meaning if they are not integrated into a context. Architectonic discourse assumes that there is an interrelation between buildings and urban space which must be framed into a structure.

By means of *tabula rasa*, the modern metropolis projects rationalized building typologies, separated residential blocks from the road network, emphasized the hygiene of linear residential blocks by organizing them on undeveloped land, and, above all, separated roads for vehicles from pedestrian paths, and business areas from residential areas. According to Gravagnuolo (1998, 336), it is the "steel frame" of an anti-city abstract ideogram. In pursuit of new forms, architects announced the death of the street, negating the traditional city.

Summerson (1994) asks where the classic language of modern architecture is. To understand modern architecture, the theory describes the benefits of certain innovations, its relations in time and space and its gradual disturbance of the general trends in architecture theory and practice. The bases of modern architecture are in the

doctrines and the accomplishments that, in turn, are very closely linked to the classic traditions of their own century and those before, how far or how close it was to them.

> And not only that, but inside those consecutive traditions there are already precedents of modernist thinking dating back to the mid-eighteenth century.(Summerson, 1994, 132)

But modernist urbanism was not the only approach which proposed major changes to urban forms. There were other contemporary architects and city planners with alternative ideas about the city and its forms, so can we really classify them all as modernists, that is, as being part of the Modern Movement? What are the differences and similarities between their urban ideas and forms?

In the period covered here, it is functional urbanism, from the taste for abstraction to to the extreme essentiality of a rationalism revealed in its schematic purity, the demand for a static order and an underlying structure in the composition until the principal of the group and of the separation of the elements as a project methodology. The theory of functional urbanism presented itself as being the most advanced and progressive cultural position to such a degree that it is often identified with the same notion of "modernity". We should not confuse functional urbanism with modernist projects, as it is only part of the picture and also because modernity has a long history of diverse interpretations.

After WWI, the urban problem that had previously been seen as something that would occur in the future was now becoming an acute and critical fact. There was the functional dimension –the city was a productive organism. There was the social dimension –the working class was the strongest component of the urban community. There was the health and hygiene dimension –because the industrial city was an unhealthy environment. There was the political dimension –it must be taken from those who exploit it for their own personal profit. And, finally, there was the technology dimension –industry and construction technology. (Argan, 1992a, 263)

This radical innovation, desolating act of cultural *tabula rasa* that led to an absolute disdain for the traditional city, idealized the technology to obtain an absolute functional perfection of the urban machine when the ideogram of the new city also look for the new man, absolutely rational. Nature did not exist, only industry, the productive gearing without soul and the apparent logical-economic perfection; the metallic beauty of the machines and the technological efficiency of the assembly line. This was the new spirit that we can define through the words of Le Corbusier:

> A great time has begun. A new spirit exists. Industry, which follows its own path, brings us new instruments for this time encouraged by a new spirit (...) We need to create the spirit of the production line, the spirit to build production-line houses (Le Corbusier, 2000, 159)

This ideology is based on The Enlightenment, in other words, by the exaltation of pure reason as the only legitimate principle of "progress" and social "emancipation". The modernist city employed *tabula rasa* and kept only some monumental testimonies – according to the Athens Charter of 1933.

The CIAM, which started in 1928, broke with the past and used vanguard experiences as its theoretical basis. The block was dissolved, the simplification of formal vocabulary continued –the suppression of the differences between façades and the floor layout originated from the homogenization of spaces, translates into the equal treatment of façades and housing units that perpetuates itself and no longer expressed a dialogue with the urban space.

This re-thinking of the new city in Europe can be found in a number of examples: in Vienna, the social democrat city council constructs urban areas based on progressive models - e.g. the Karl-Marx-Hof condominium; in Germany, after WWI, Berlin became the European capital of urban architectural renewal. The social democrat Government of Saxon-Weimar wanted to set up a school that would renew the tradition. It was the Bauhaus school, directed by Walter Gropius, first in Weimar, later in Dessau. At this moment, the Bauhaus school became the epicenter of urban research. Gropius, as opposed to Le Corbusier, adopts a pragmatic approach based on immediate needs, with the relation between exterior and constructed space; the orientation most favorable for insulation and aeration; the proportion of the blocks; the study of building archetypes; and the relationship with the existing city.

The proposals

If we look at Le Corbusier's projects for the ideal metropolis, as well as other contemporary city planning projects during the period under study, what becomes clear is the rejection of the past and the traditional city. But on closer analysis, can all of them be classified as modernists?

I believe that the inter-war urban form can neither be summarized by the CIAM dictates nor based exclusively on the rules of the Athens Charter. As mentioned earlier, the great German housing condominium predates these. Urban zoning is not an invention of the CIAM: in New York, legislation was passed in 1916 that attempted to control the reigning chaos by establishing a classification for land use into three categories: residential, business and open. In Tokyo, after the earthquake in 1923 which destroyed half of the city, five zones were established for the reconstruction plan: commercial in (front of the bay), industrial to the north, industrial to the south, residential (around of the Imperial Palace) and mixed. (Ragon, 1986, 250)

In the Modern Age, fast and uncontrolled urban growth created chaos, the enemy of social harmony and here we can, identify two schools of thought that attempted to find solutions to urban problems: 1) the authoritarian and rational school, which included E. Howard, Le Corbusier, Frank Lloyd Wright, Josep Lluis Sert and the anti-urbanism of the USSR that disregarded pre-existence; and 2) the social and preservationist school,

which included P. Geddes, L. Mumford, Camilo Sitte, Gustavo Giovannoni and Gaston Bardet, which coexisted with pre-existence. In this paper I will give priority to the proposals of the first group, although here I include Werner Hegermann and Elbert Peets' manual of Civic Art, which serves as a counterpoint.

1. Le Corbusier

Le Corbusier studied the city as an architectural object which contemplated the destruction and reconstruction of the historic center and defended the use of straight lines and right angles. The city was to be projected through a spirit of geometry, with uniform details harmonious with the overall project that ensured there was a proportional average, a common scale between the individual and the streets and its buildings.

As one of the major proponents of the Modern Movement, Le Corbusier had a major influence on architects and city planners, but his urban projects and ideas about the city, with the exception of Chandigarh, were limited to theoretical exercises. Le Corbusier's way of conceiving urban areas was developed in a scenic context of advertising projects and conferences, where solutions were proposed like a narrative, and each project became literary fiction.

In 1923, the Congress of Urbanism of Strasbourg established 4 guidelines for cities: 1) relieve downtown congestion and deal with traffic requirements; 2) increase urban center density to facilitate the connectivity needed by businesses; 3) improve mobility means, thus completely changing the concept of the street that was losing it former use due to the introduction of new modern transport means such as subways, cars, trams and airplanes; and 4) increase the arborous areas, the only way to assure a healthy environment and a calm work environment demanded by the new rhythm of business.

The first Le Corbusier urban plan, the *Ville Contemporaine pour trois millions d'habitants*, (Fig. 2) was presented at the Paris Autumn Hall in November 1922, stressing circulation and speed. Its central focus envisaged the city as a machine for moving about but which now played a new role as a machine for living in and for providing services. It was in this project that Le Corbusier developed the urban connotations of his architecture.
Fig. 2 – *Ville Contemporaine pour trois millions d'habitants*, Le Corbusier, 1925.

The concern for integrating architecture and nature could be found in 1925, at the New Spirit Pavilion of the Paris Exposition, where the building embraces a tree, and the tree-top rises up through the roof; nature, seen as irrational, cries out to be admitted into architecture once more.

But after 1925, Le Corbusier began to seriously criticize the city-gardens, because he believed that the underlying model was too individualistic. Most of his research efforts during the two following decades were devoted to individual housing that was not in opposition to the city, but which clearly reveals a higher population density model closely linked to public infrastructure services (transport, schools, hospitals, etc.) For Le Corbusier, the urban revolution was the only one that would restore the art of housing when the relationship between buildings and streets is lost (including the concept of road alignment). Rejecting the idea of the garden, he proposed the alternative of groups of practical housing buildings developed vertically and horizontally, and concentrated to such a degree that it freed up a considerable amount of land. He also proposed separate routes for pedestrians and vehicles: pedestrian paths had to be free from obstacles with no buildings, which explains why they were to be raised on "pilotis". So, the city is thus transformed into a park, with the ground left free for appropriation by citizens.

Turning to buildings, Le Corbusier believed that buildings for businesses should be located in a "vertical" center in the form of big towers, like the Auguste Perret city-tower, 1922. Housing should adhere to the principle of "overlapped houses", mainly extending horizontally. The great blocks of "*immeubles-villas*" are linked by catwalks forming a continuous network of "streets in the air" -this allows the inhabitants to walk from one building to another without going down to the ground floor. We find the same idea in the "*à redents*" buildings that is even more closely related with the organization of the buildings.

In the Voisin plan for Paris, 1925, Le Corbusier proposed demolishing the traditional Paris buildings, with the exception of a few important monuments and (in some cases) the relocation of others, and instead the entire area was to be replaced with 18 towers

220 meters high. This plan illustrates his rejection of the past and the historical city. But, there is also an immense square in the *Boulevard Sébastopol* area, where one could observe two elements (the St. Denis and the St. Martin Door) that recall the obelisks in the Pierre Patte plan, 1767, next to *Pont Neuf* or the proposal for the *Place Louis XV*, later *Place de la Concorde*.

Le Corbusier, in his Buenos Aires conference, in 1929, approaches the idea of a continuous "*à redents*" building, linked to a transit axis which extends uninterrupted wherever one wants. From the moment he allowed such a limitless extension of the "*à redents*" buildings, Le Corbusier was effectively proposing the possibility of an open program. (Weber, 1998, 66)

The way Le Corbusier relates his urban projects to the local geography is not always clear and an initial analysis of these projects reveals little or no relationship with the elements that belong to the place. This interpretation can be attributed to the contrast between the traditional city fabric and the one conceived by Le Corbusier, where the binomial street-house normally disappears. This geography-city relationship can be seen in the way he resolved building on uneven land or slopes. The traditional street layout goes around the hillside and the houses following the alignment of the slope, and is thus chaotic and arbitrary. In the modern urban project, the buildings are located on the acclivity and the street is located halfway up the hillside, acting as a link. (Le Corbusier, 1980, 93)

In the projects for Rio de Janeiro and Algiers, geography and city are fused elements. After visiting the slum quarters of Rio de Janeiro and taking in the view, Le Corbusier was able to establish a close relationship between the modest houses situated on the hillsides and the bay landscape. He used this experience to propose the option of rescuing the major positive feature of the slum quarters –the incredible view of Rio– to project the housing above the viaduct.

The linear structure, of the Algiers *Obus* Plan, can be likened to some aspects of the Linear City project by Arturo Soria y Mata, for Madrid, 1882, which comprised a street 500 meters wide, with no fixed length, which could be extended as required.
In Algiers, the great *redents* in *Fort l'Empereur* were attempts to integrate the local habitation culture and individual housing into a close relationship with the natural landscape.

In the *Obus Plan*, Le Corbusier proposed an arched building with different residence modalities giving freedom to the proprietors to choose the best form or style, as needed. The distinguishing feature here is the plan and its great structure, not the concrete form of the houses.

The plans for Rio and Algiers were the last of his major proposals for urbanized areas. After these, he became more pragmatic and proposed less idealized forms. The *à redents* blocks that have an Arabian form in the *Obus Plan*, later disappear completely. Later, in the "Three Human Establishments", he again takes up the idea of linearity in its

industrial suburbs, which can be identified with the ideas of the Spanish theoretician Arturo Soria y Mata and his Linear City.

In the thirties, Le Corbusier changed his position: he was losing faith in capitalists and began to adhere to the idea of planning focused through unionism where everything would be collective.

In 1935, Le Corbusier presented his new project – The Radiant City – the negation of the city which was a project only, with no name or place referent. It was a site devoid of geographic features, not even a river. It was an ideal plan that could be applied to either a new or an existing city. There is head, a business center with 14 skyscrapers and a vertebral column with functional divisions: open, hotels, embassies, housing, plants, warehouses and heavy industries subordinate to an axis.

2. Josep Lluis Sert

The Catalan architect and city planner Josep Sert was familiar with Le Corbusier's work and ideas before he met him in 1928 when he visited Barcelona. Two years later, Sert and other young Spanish architects formed the GATEPAC (Group of Spanish architects and technicians for the progress of contemporary architecture) – a group based in Barcelona. Sert and the GATCPAC fostered the development of modern architecture while at the same time tackling urban development problems and projecting a functional city. Their proposal for the "Chinese Quarter" in Barcelona was to clean up, modernize and rationalize the city by demolishing this city district. GATCPAC asked Le Corbusier to collaborate in an ambitious plan for urban reform in Barcelona, known as the Macià Plan.

The Macià Plan was a revision of the earlier Cerdà Plan, itself designed to meet the needs of the industrial city, and adopted Le Corbusier's theoretical models. Part of the Port Vell was demolished to make way for developing a major avenue, or strip, like a kind of backbone running parallel to the sea which housed administrative buildings and two tower blocks. The plan attempted to reorganize the Cerdà Plan blocks in 400 x 400-meter modules and separate road traffic from pedestrian walkways. The blocks are linear in the form of a dentate chain. (Fig. 3)
Fig. 3 – Barcelona Plan Macià, Sert, 1931.

Sert carried out a series of urban projects for Latin America in which he applied the four basic functions laid out by the CIAM (work, recreation, circulation and dwelling), where neighborhood units were the basic planning unit, and the smallest unit would house 6,000 people. But, Sert's projects respected local, autochthonous and pre-modern characteristics, and he introduced the notion of "heart": each quarter has its "heart" where the school, the day-care center, the church and the stores are located. Green areas connect the "heart" of each district to the "principal heart" of the city where the administrative buildings, library, museums, hotels, etc. are located. There is a place to arrive on foot providing a social space for the inhabitants.

Another new item we can see in his projects is the inclusion of gardens of varying sizes which act as meeting places for the inhabitants. The house garden is an open space which acts as a transition between the house and the external area; the district garden offers privacy in a delimited and open public –differing from a park in that it is limitless; and the Civic Center garden, in the "heart" of the city, is transformed into the principal city outdoor space. Size is determined by the use of different pavement levels and trees to adapt the place to the human needs.

Sert published two important books: *Can our cities survive? An ABC of urban problems, their analysis, their solutions*, in 1942, and *The heart of the City: toward the humanization of urban life*, in 1952. In the first, Sert wanted to introduce major changes and so it was important to expand on the 1933 CIAM ideas. But, his ideas also appear to further develop the four aforementioned functions: in addition to work, recreation, circulation and dwelling, he included the importance of strategic places as civic centers. Some of Sert's ideas are decisive for his future approaches and positive self-criticism of the previous functionalism: the need to recoup city civic centers, as in other European

examples; the importance of interdisciplinary contributions; and to think of the city in terms of human parameters and Keynesian ideas. (Rovira, 2005, 147)

The second book, *The heart of the City*, is also based on one of CIAM's meetings and its members' projects, but it does not attempt to be a manual on urbanism. As Sert himself states in a letter to Serge Chermayeffm (01/02/1951),

> We set out to make a 'symposium type' book, with color illustrations, something that is quick to draw up but which does not attempt to be all-inclusive. I think that the Le Corbusier criterion is the most appropriate for this type of book and, what is more, all-inclusive books on architecture and urbanism are far too boring. (apud Mendelson, 2005, 136)

In this book we find Sert's ideas about public space which were directly translated into projects in Latin America. In this document he defines the notion of civic center and urban nucleus, which meant a decisive change in Modern Movement urbanism.
In his project for the Engines City[2], an industrial city for 25,000 inhabitants, Sert applies zoning principles according to the CIAM's four functions and connected them by freeways. The project is conceptually different to the civic center, which has a major and very specific architecture not found in other parts of the city, and transforms the civic center into an important place for the city, or in his own words, "the heart of the city life". As Mumford states (1997, 55), the project comprised constructing an auditorium, municipal offices, a hotel tower block and an arcade of stores and restaurants covered with a marquee which opens on to a square, a cultural center, a technical college, exhibition halls, a library and a large stadium. In this project Sert and his partner, Wiener, attempted to create a model for other similar projects, as we can see in the Chimbote plan, on the coast of Peru, where they incorporated a civic center as the fifth function.

3. USSR Rationalist urbanism or antiurbanism

Modern urbanism, whether developed based on integrating society or on a utopia, became a reality for the first time in the USSR between 1917-1939. Early debate revolved around housing –whether it should take the form of large properties with common services or small well-planned residences. They looked for ways to eliminate the difference between countryside and city with a balanced distribution of the territory's population.

Ragon (1986, 282-3) identifies four basic points for founding new Soviet cities: 1) introducing the city garden from E. Howard; 2) total destruction of the large city; 3) a return to the Fourier idea with the construction of community housing forming agglomerations from 40,000 to 100,000 inhabitants; and 4) "*ville-fusée*" that was developed from a horseshoe-form industrial complex, with the linear center in the middle, the housing between the center and the plants, which would permit indefinite growth –with Soria y Mata's "Linear City" as a point of reference. (Fig. 4)
Fig. 4 – N. Ladovsky project to Kostino nucleus, 1929.

In Moscow, in the 1930's, an ambitious urban plan established a dialogue between the architectural vanguard and Bolshevik power: the Moscow master plan established a commitment to modernity and monumentality.

Around 1930, the most radical and innovative direction of Soviet urbanism was that adopted by the constructivists –the OSA productivity groups (Sica, 1981, 292) that started to move towards defining territorial structures adapted to the principles of a socialist society. This was a literal interpretation of Engel's thesis of the inevitable end of the opposition between city and countryside, rejecting the traditional concentration of urban centers to provide a new distribution of population and activities in the territory. Some constructivists (city planning) considered starting with the disaggregation of the existing cities based on the basic elements of collectivized life. The anti-urbanists proposed a more radical alternative, once the city was considered to be irretrievable: the creation of a new city in linear strips, bordering the canals, which allowed for mobility of the citizens and further territorial settlements, known as "settlement strips ".

The "settlement strips " are composed of six strips: railway, factory, green area, roadway, housing and park. These linear cities, situated next to industrial and agricultural zones, stood in contrast to the great agglomeration formations and the dispersion or isolation of the inhabited countryside nucleus.

4. Frank Lloyd Wright

In the first decade of the 20th century, Frank Lloyd Wright began an approach to space which differed from that used by the rationalists. His approach launched the conceptual bases of organic space, where architectural creation and landscape were combined without restrictions. The idea was to use construction elements as much as possible in their natural form or in balance with the nature. Wright's "organic architecture" is demonstrated in a clear and all-encompassing theory about the cities should take on, and developed in of his books: *The disappearing City*, 1932; *When democracy builds*, 1945; and *The living City*, 1958.

Wright's ideas were based on the analysis of the way cities were structured at the beginning of 20th century. These structures generated a major centralization and re-evaluation of areas, with densely built-up areas, juxtaposed constructions, small spaces, poorly ventilated, lacking in natural light and contact with the outside surroundings. For Wright, in this kind of city the citizen does not have access to property, but rather rents a cubicle in a building. Mobility becomes difficult because of a disorganized and precarious road network where the automobile generates chaos. His philosophy added the technology dimension to achieve a new agglomerative urban form, and used technology to his advantage. Not only was a new city being conceived, but also a new American society.

Wright presented his first version of Broadacre City in 1932, but he also continued working and developing a 16^{m2} model in more detail, up to 1958, when he published *The Living City*. (Fig. 5) This book was not only concerned with a proposal for city planning but also entails a reform of American society. For him, everyone has a natural right to the land. The center of the usonian[3] democracy is the family. Technology, the use of the machine, must be given a free leash and the car is the major invention of the century at the same time that distances become relative depending on time, thus allowing for a decentralized but articulate society.
Fig. 5 - Broadarcre City Model StudioMAS, Walter Susulu Square of Dedication, Kliptown, Soweto[4].

To put his urban ideas into practice, the new usonian city had to be located on a new site and it did not have to overlap or modify existing cities. It had to be free from boundary limits so that it could spread out across the territory. To achieve this, the grid defines design parameters, allows the organization of the buildings and is responsible for the mobility orientation. The streets are no longer a place for cohabitation and begin to take on a primordial role of a communication space. The model proposes low-density population areas spread over a greater distance connected by the speed of the automobile and the new telecommunications such as the telephone.

Technology also had to be used in construction with standardization and prefabrication to build new single-family houses (the usonian house) and applying organic architecture principles.

Ragon (1986) calls this model antiurbanism. Wright, influenced by Emerson, Jefferson and Kropotkine, revised Ruskin's ideas of nature guiding humankind towards harmony, the opposite of the artificial and alienating industrial city (Ragon, 1986, 276). In his project, the city effectively disappears inside nature which provides a constant environment. He gives priority to individual houses and to the automobile, and the workplace must be located close to the home. The skyscrapers allow for agglomerations of offices, but they must be separated by green areas. For Ragon, Broadacre City was, in part, inspired by the "settlement strips" proposals for the Soviet territory (Ragon, 1986, 284).

Some ideas, but not a conclusion

As mentioned at the beginning of this paper, this is a research project in its initial phase. By analyzing and systematizing the writings and/or original plans for new cities or existing city projects, this research project attempts to understand how form becomes important when conceiving urban areas from the moment the city started to become a problem. So in this introductory paper, analysis is limited to some of the proposals for the period comprising 1920 and 1940.

After systematizing the data, theorists and their proposals are recorded and analyzed, but clearly there have been many published and unpublished studies and plans during this period which still need to be analyzed. This research is currently focused on analyzing and systematizing the ideas proposed by Patrick Abercrombie, Gaston Bardet, Gustavo Giovannoni, Giulio Carlo Argan, Eugéne Hénard, Lewis Mumford, Werner Hegeman and Elbert Peets, Marcel Poëte, Walter Gropius, Ludwig Hilberseimer and the City Beautiful movement, the critics of the Modern Movement like Team X, Smithson, Peter Cook, Jane Jacobs and Yona Friedman.

With the material that has already been classified and presented in this paper, we can see both common and contrasting points. The CIAM and the Athens Charter have not been hegemonic in schools of thought on urban forms in the period under study. In some proposals it is possible to find references to the Functional City, but one can also

find others that are totally different, where urban forms are considered the opposite of those in the Modern Movement.

Another partial consideration that can be drawn is that the European Functional City could be characterized by the definition of basic function zones each with different formal characteristics. In the American example -Broadacre City-, a more homogeneous composition can be seen.

Like Le Corbusier and Sert's proposals, Wright also believed that this was the end of the traditional street (local or urban cohabitations) and transformed it into a mobility space which connected the different parts of the city, making the car and speed the ideal features. Neither have I found proposals for buildings of a mixed character. In contrast, I have been able to identify some differences during the time that Wright proposed a non-zoning model, where I would like underline the absence of a center It is a completely decentralized proposal and, like the Soviet "settlement strips", does not consider a countryside/city approach, but rather a complete fusion of both spaces.
As I said earlier, I have not arrived at any definitive conclusions, only some early indications that still require further development in addition to other plans and texts that complement this research.

Cowes to Valencia: urbanizing the America's Cup

Diane Brand
University of Auckland, New Zealand

Introduction

The interplay between the private interests of business, individuals and non-governmental organisations versus the more public interests of the city, region and nation are epitomized in the contemporary processes for the delivery of facilities for hallmark events. The America's Cup Regatta is an event which has grown in scale from an essentially private and elitist race to an international spectacle involving all of the above protagonists. In the last 15 years the venues for the race have not only facilitated sporting and technological excellence, but they have also enhanced corporate and sovereign marketing ambitions, and the desire for regions to capitalize on the urban investment to catalyse other municipal design initiatives. The result is an uneasy tension between the creation of good public space which showcases the event, and safe camera-friendly stage sets which will provide props for a sponsor's product.

The America's Cup has traditionally been a boat race for very rich men, and for the first century of its life it was sailed principally between two nations: Britain and America. Initiated by the Prince Albert in 1851 to demonstrate British boat-building hegemony in conjunction with the Great Exhibition in London, it was raced from anchor at Cowes on a course around the Isle of Wight. The audience was principally other rich men who viewed the competition from their own luxury yachts and retired to their own exclusive yacht clubs for after-race festivities. The race was won by *America* and the cup began a 132 year residence at the New York Yacht Club. Over the course of the twentieth century the competition to challenge for the prize was opened up to other nations, and international media began taking the events on and off water seriously. In 1983 Australia II won the cup instigating a global journey for the event from America to New Zealand and ultimately back to Europe.

From Newport [1851-1983] to Perth [1987] to San Diego [1994] to Auckland [2000, 2003] to Valencia [2006 and perhaps 2009] the America's Cup has not only become nationalised and corporatised, it has become urbanized and latterly privatised. Beginning in Fremantle with national syndicate bases scattered around a working harbour, and ending with the full Port America's Cup super-village in Valencia, the event has provoked huge scale infrastructural and development investment on behalf of its hosts and sponsors. This paper will evaluate from an urban design perspective the engagement of the event and the harbours in which it has been sailed, with the cities behind, and will document the advent of mixed-use neighbourhoods, public space networks and privatised leisure precincts which have been generated in its wake.

Events urbanism

Events tourism theorist Colin Hall positions the America's Cup Regatta as a special event (Burns and Mules 1986, 7) within a matrix of 'hallmark events' (Ritchie 1984, 2) or ' mega-events', arguing that it caters primarily to an international market while drawing funding from government at national and regional levels:
The expression hallmark event therefore applies to a wide range of events, including festivals and fairs, which exhibit a broad range of economic, physical and social impacts at various scales. Mega-events, such as World Fairs, and Expositions, the World Soccer Cup Final, or the Olympic Games, are events which are expressly targeted at an international tourism market and may be suitably described as 'mega' by virtue of their size in terms of attendance, target market, level of public financial involvement, political effects, extent of television coverage, construction of facilities, and the impact on the economic and social fabric of the host community. Similarly special sporting events such as the America's Cup, or the Adelaide Grand Prix are substantially international in their market orientation (Hall 1992, 5).

The genesis of a special sports event generates a customized set of urban facilities and a deadline for their delivery, diverting public funds into large one-off construction initiatives. While such events are widely perceived as an economic windfall for the city in question they rarely deliver a net gain. Many studies of the economic impacts of stadium construction in the United States have indicated that the overall economic payback to cities is negligible, while the buildings themselves create urban 'black holes' in terms of activity and ongoing uses. For example a $276 million redevelopment of Yankee Stadium in the Bronx has not increased the number of seats at the venue and therefore will not enhance visitor spending, and the facility has encroached on local parklands in an underprivileged borough (Fainstein 2007, 72). The 1992 Barcelona Olympic Games were the first to boost the city's image and income after the event since the Tokyo in 1964 (Rowe 2007, 82). Other researchers have focused on the wider impacts of hosting such events and found the simple economic criteria for evaluating event success flawed (Barker, Page and Meyer, 2001). Timing is also a contentious issue with cities racing to deliver amenities at breakneck speed. Sir Peter Blake, CEO of Team New Zealand, who had won the cup in San Diego in 1995 delayed the 30th defense of the America's Cup until 2000 to allow sufficient time for the redevelopment of Auckland's Viaduct Basin into the America's Cup Village (Hinch and Higham 2004, 137).

The America's Cup event has emerged from the enclave of the exclusive yacht club, and increasingly engaged with urban waterfront public space as its popularity and international following has grown. While in San Diego team bases were scattered over distances measured in kilometers over the vast necklace of existing marinas and naval bases, detracting from the atmosphere created at other venues by virtue of concentration, Fremantle and Auckland integrated their venues with their cities, using the spectacle to accelerate other latent urban initiatives. In Perth the preparations for

the America's Cup were undertaken as an extension of previous projects and Fremantle experienced a gentrification and the preservation of heritage building stock as a result. The historic fabric of Freemantle was revitalised as an attractive robust mixed-use urban backdrop to a necklace of syndicate bases which supported the on-water competition. In Auckland the America's Cup provided a mechanism for giving public access for the first time in the city's history to a major section of the urban waterfront. This new neighbourhood revitalized a redundant piece of its nineteenth century port infrastructure with new buildings and public spaces.

The tenure of sports events is another matter as organizers and sponsors scan the horizon for the next hot destination. The America's Cup winner normally holds the event in its national waters. The Cup is currently held by Switzerland, a country without coasts, so Europe as a whole is deemed to be the host territory and an auction for the right to host ensued between cities such as Valenica, Sete, and Cascais prior to the 2007 Cup. The current impasse over the staging of the next regatta has seen Valencia convert its new purpose designed venue into a Formula One track for an already secured event [**Figure 1**].

Urban design and the America's Cup

While hallmark events ostensibly offer all target destinations urban design opportunities, America's Cup regattas are especially able to deliver this because of a combination of situational advantages. The locations must be coastal, and they typically comprise of upgrades to industrially redundant pieces of high value waterfront real estate. These components add two important urban design elements to the events equation. Firstly, waterfront locations have immense scope for development as public space, and secondly, under-utilized waterfront land offers great investment potential to development agencies be they public or private sector. America's Cup venues have all in some way capitalized on these advantages in the last two decades. Fremantle revitalized its waterfront and heritage precinct, San Diego extended its already enviable complex of marinas and recreational boating infrastructure, Auckland built a new waterfront quarter with promenades, squares and exhibition areas, and Valencia provided new marina facilities and extensive public parks in association with the event. All the sites created off shore yachting arenas or bluespace (Brand 2007) in their coastal waters. Urban waterfronts often incorporate existing industrial conditions which make them attractive from an urban design perspective such as heritage structures (bridges, bond stores, warehouses) and enticing edge conditions against water where there is a lot of shipping activity and movement.

The Regatta

Match racing and urban design have proved a potent mix combining waterfront proximity and sporting spectacle. Christine Boyer has identified the traditional theatrical nature of urban life and public occasion:

How many times have the city, its architecture, and the theatre been intertwined, for theatre is often a foil for the representation of public life, and public space frequently is arranged as if for a theatrical performance. Both theatre and urban space are places of representation, assemblage and exchange between actors and spectators, between the drama and the stage set (Boyer 1994, 74).

Opportunities for urban theatre exist that are particular to the staging and nature of competitive yacht racing. These include high production values (a term used in the film industry to indicate the quality of location, sets, actors and equipment), cutting edge technology, international level sponsor product placement and branding, procession to and from the courses, and ultimately a challenge on the water. The twice daily parade is a function of the fact that the yachts lack motors (to save weight) and must be towed to and from the race grounds. This enables a regular processional exit and entry from and to the cup village, with a cast of thousands of fans, support staff, media and celebrity crews as these sleek vessels are assisted from their syndicate headquarters to the water arena. People, public space, movement and the reflective surface of the water combine to enhance a pre- and post-race rite of passage from shore to sea and back again.

Canaletto's paintings of St Mark's Square in Venice are an example of this kind of pageantry in an earlier age as they highlight the relationship between the square and the adjacent water, and give a fulsome portrayal of everyday life and civic ceremony in the sixteenth century city. In painting urban Venice Canaletto recognized both the commodity value of the water city (Boyer 1994, 176) and the capacity of pageantry to enhance the impact of the image. Two paintings in particular capture the movement, the display the setting and the architecture of the place and time: *Reception of the Imperial Ambassador, Count Giuseppe di Bolagno, at the Doge's Palace* and *The Bucintoro preparing to leave the Molo on Ascension Day*. The first painting focuses on the dignitary in question while the second shows the wider water context of the event. Both images however illustrate water and land as equally important to the ceremony depicted. .

While the physical setting of the city at the water's edge adds value to the spectacle and drama of the occasion, a technical innovation introduced at the 2000 regatta gave yachting a new appeal as a mass sporting event. A small Dunedin software company, Animation Research, in association with Terabyte developed Virtual Spectator, a GPS enhanced computer graphics package which allowed competing yachts to be tracked with extreme accuracy [**Figure 2**]. Real-time on-board shots, helicopter images and sound, enhanced the commentary which followed the progress of the race. Detailed graphic enhancement and spontaneously drawn diagrams explaining the logic of match racing allowed any audience to intelligently follow the race strategies and outcomes. America's Cup yachting, an exclusive and arcane enterprise became an overnight broadcast phenomenon, raising both the profile and stakes of the Challenge series. While the technology raised the profile of yachting as a spectator sport it also raised the profile of the harbour and port as an urban arena to rival on-land stadia. While Stern and Ballentine (1987, 115) lament the compression of the event to a small screen in a

Fremantle pub as the real event takes place a few kilometers away, this is the most effective way to view the event and now not unlike other remote sports broadcasts. The mass viewer is the target audience for, and ultimately the source of advertising revenues which underpin the sponsorship of the sport.

Urbanisation or privatisation

Progress in urban design quality and the public's ability to engage with the regatta progressed with the facility built in Auckland. The concept of a cup village was extended from one with only syndicate bases, to a neighbourhood with residential and commercial uses and integrated public space at the harbor edge [**Figure 3**]. The existing configuration of the basin area, with the long narrow dead end canal called the Lighter Basin, enabled the syndicate bases to be built on the western side with public promenades and apartment complexes to the east. This enabled the public to easily view the bases and the travel lifts which manoeuvred the boats in and out of the water, thus presenting a series of working stages to the public spaces of the precinct. The Young Australia syndicate who lacked funding for a home base had their yacht craned on and off an anchored barge positioned immediately off the principal public square of the precinct [**Figure 4**]. In Valencia the configuration of the bases around a circular harbour centred on a super-yacht hub with the streets running to the rear of the bases reduced this possibility, with only one short wharf side promenade available for viewing the adjacent syndicate bases.

Both Auckland and Valencia capitalized on the ceremonial departures and arrivals associated with the event. In Auckland the procession to races occurred through the reconstructed Viaduct Basin, through Auckland's working port and out through the naturally contained Waitemata Channel to the waters of the Hauraki Gulf. Viewing opportunities in this case were afforded by the enclosing volcanic landscape of the Auckland Isthmus, and the racing could be viewed from vantage points on adjacent promontories and as well as from vessels congregated at the start and finish lines. In Valencia a purpose built canal [**Figure 5**] lined with restaurants promenades and public parks separates the boat harbour from the adjacent working port and leads directly to the courses immediately off the Mediterranean Coast.

The major difference in urban design terms between Auckland and Valencia is the relationship between the newly constructed yachting precinct and the city behind. While the America's Cup village was conceptualized as an extension to the existing city in terms of street structure, public space and residential and commercial use (albeit exclusive versions of these), in Valencia the facility is deliberately cut off from the city behind and dedicated to the event alone. The cup village at Valencia is ringed with robust steel security fences with access to the area restricted to two entry points marked by mast and tent structures [**Figures 6 and 7**]. Inside, the precinct is bristling with security cameras [**Figure 8**] and the syndicate bases present their forbidding backs to the main thoroughfares [**Figure 9**]. The only active uses are the small frontages of syndicate retail outlets. The wide promenades facing the canal are backed by fortress-like car parking structures [**Figure 10**] and the restaurants are positioned on the level

above with views not of the canal but of the cranes and containers of the adjacent port operations [**Figure 11**]. The design of the facility maximizes the amenity for the event itself in terms of exclusive access, secure parking, visible surveillance and food and beverage outlets, but as a piece of city it falls short with a lack of community and mixture of uses, vast areas of public space with inactive edges and a menacing security presence.

The problem with the America's Cup event is that while the ceremony and display of the event captivate and energise the local population and international visitor, in the longer term the venues struggle to ever again achieve the vibrancy of a short lived event, or in some cases even incorporate memories of their raison d'etre. In Fremantle the syndicate bases have been converted into a variety of businesses and only brass plaques mark the locations of the challenger's headquarters. In Auckland the America's Cup Village is now home to exclusive apartment complexes and expensive restaurants and in Valencia bulldozers erase the vast public parks and resurface them for racing cars [**Figure 12**].

Conclusion

While the facilities which support the America's Cup Regatta in the twenty-first century are urban in character, the type of city supporting the event has undergone a significant metamorphosis in its move from Southern to Northern Hemispheres. In Auckland the urban structure (streets and squares) of the precinct was fully public. In Valencia the space became quasi-public (as in a shopping mall) in response to the increasingly corporate requirements of the race organizers. Peter Eisinger encapsulates the fundamental dilemma in developing facilities for hallmark events at the expense of investing in the city proper:

> The amount of fiscal and political resources and the level of energy that local elites must devote to the realization of large entertainment projects are so great that the more mundane urban problems and needs must often be subordinated or ignored. In pursuing big entertainment projects, local elites create a hierarchy of interests in which the concerns of visitors to cities including day-trippers, tourists and business travelers-take precedence over those of the people who reside in the city (Eisinger 2000, 322).

Viable urbanism in concert with the America's Cup reached its apogee in Auckland in 2000. What remains is a viable if under-institutionalised precinct which has given the city its first significant piece of inner city waterfront public space. Valencia on the other hand has been bequeathed an empty sports venue and marina complex [**Figures 13 and 14**] with tenuous connections to the city and the adjacent urban beaches. Now a construction site for another sports event this part of the city risks becoming a public arena or showground for whatever event the municipality successfully bids for. The reasons for this outcome can be traced to the hard-nosed corporate approach the Alinghi syndicate took to staging the event. At Valencia the strategy towards site security and access was architectural in derivation and relied on technological

surveillance, controlled and limited entrances, bunker-grade barriers and security policing. An urban design solution to security would involve a vibrant mixed-use urban quarter which inherently incorporates adequate levels of passive surveillance, while contributing to the longevity of public sector investments.

Not only have the crews become multi-national and corporate in character, the space of the America's Cup has taken on the privatized and gated aspects of corporate culture. The future of the Cup in its traditional form as a high-end boat race between nations looks increasingly threatened as the denouement of the 32nd America's Cup is fought in court. In the meantime sponsors such as Louis Vuitton have jumped ship as the new aggressive globalised image of the event does not align with that of traditional, urbane sporting elites toting luxury luggage and apparel. Under such circumstances the America's Cup could not easily return to the Auckland site, as a city is no longer an appropriate place to hold a segregated barricaded and surveillance ridden corporate event. The Valencia facility was good for the event but less constructive for the sport of sailing or for the city.

Missing the Gold Coast train?
The interaction between private development and three levels of government planning in attempting to co-locate a new railway station and a major new town centre

Daniel O'Hare
Bond University, Australia

Introduction

Robina is a developing regional centre on Australia's Gold Coast, in the expanding South East Queensland city region centred on the state capital, Brisbane. Robina has been gradually developing, over the period from the 1980s to the present, as an 1850 hectare masterplanned community for approximately 25,000 people. Currently, the major component of Robina's town centre is a large shopping centre, which opened in 1996 and is currently being expanded. 700 metres straight-line distance to the north-west is the Robina Railway Station, which was designed and developed simultaneously, and which opened in 1997. The pattern of streets and pathways established at the time, makes the walk from Station to town centre a 900 metre walk – a considerable distance in a subtropical climate, and perceptually daunting while the land between the two remains largely undeveloped.

The railway station is surrounded by 600 commuter car parking spaces, and the Town Centre has over 3000 parking spaces for shoppers. The current emphasis on the car, together with the present separation of Station and Centre, appear at odds with contemporary ideas of Transit Oriented Development (TOD)[1] and with longstanding planning ideals of integration of transport and land use. The separation of Station and Centre has attracted much anecdotal criticism over the decade since their development, but there has been little or no analysis of how and why this separation occurred, and little available analysis of whether Robina may in fact ultimately develop into an example of TOD as its development continues. One barrier to understanding has been that the major shopping centre known as "Robina Town Centre" is in fact only one element of what is intended to be a major regional centre. This perceptual issue is important, as Robina Town Centre has always been intended to be much more than the current major shopping centre.

Aim of this paper

The main aim of this paper is to show how a major regional centre in a masterplanned community has been driven by private sector development initiative, and how this private planning has been both supported and frustrated by public sector planning by local, state and federal government. The particular focus is on efforts to create an integrated Urban Transit Oriented Development (TOD) centre. In this focus, the integration between a publicly planned new Railway Station and the new privately developed centre is critical.

Research methods

The methods for this research have involved triangulation between key informant interviews, documentary research and literature review. Limitations of the research include the limited number of key informants for the in-depth conversational interviews, and the inability to contact Queensland Rail (QR) informants who were involved in the planning but have either retired or moved on to new positions outside QR. A consultant who evaluated proposals for both QR and the private development company unfortunately was deceased in 2006. These limitations are offset by the fact that the four interviewees were intimately involved in the planning and development of Robina at critical periods. An additional limitation is that some key documents were unexpectedly unavailable in public repositories, and there was insufficient time to retrieve them from government and private archives.

Robina overview

Robina was planned as a master planned community in the 1970s and '80s, a time when cars were thought of as the main transport consideration. Its earlier developed areas manifest the planned sprawl characteristics of mid-twentieth century suburbia,[2] such as separation of land uses, large areas of mainly low density detached residential dwellings on large lots, road hierarchies, streets designed more for individual cars rather than for pedestrians, cyclists and public transport, and local centres and a major shopping centre designed primarily for access by car, with other modes of transport being secondary. The developers looked to the USA for models of urban development. They engaged Moshe Safdie as design consultant, and made 70-80 trips to new and established American cities to view exemplars for the type of town they sought to create.[3]

One long term Robina resident tells of how his son attends a high school located just one kilometer straight-line distance from his home, but has to walk 4.5 kilometres to get to school due to the disconnected street pattern of crescents and culs-de-sac.[4]

Robina's place in time is most visible when contrasted with the adjacent 1990s master planned area known as Varsity Lakes, which incorporates mixed use, mixed densities, employment close to homes, and connected street patterns.

Robina town centre has been envisaged as a major regional centre since the earliest planning for Robina by the Robina Land Corporation in conjunction with the then local government, Albert Shire,[5] and later recognised as such by Federal Government initiatives, State Government regional planning, and current local government planning.[6] The long development time frame of such a centre has been beneficial, as those planning the regional centre have benefited from changes in planning ideas from the mid-twentieth century to the turn of the 21st century.

The rise and fall and rise of Gold Coast railways

Queensland's Gold Coast developed as a collection of coastal tourist resorts by the late 19th century. The early seaside resorts on the coast south of Brisbane, at Southport, Burleigh Heads and Coolangatta, were initially accessed primarily by boat. A coastal horse-drawn coach service, using the hard sand on the shoreline as a road, was established by a hotelier in 1888.[7]

Private development was later stimulated in the conventional way, by State government provision of transport infrastructure. The main resort areas flourished due to easy public access via a railway line from the State capital Brisbane. The first South Coast rail line, from Brisbane to Southport, was opened in 1889, providing convenient access for weekend beachgoers.[8] The line, primarily to support the farming industry, was gradually extended further south, reaching West Burleigh in 1901, and the twin towns of Tweed Heads and Coolangatta, at the southern end of today's Gold Coast, in 1903.[9] These rail lines were closed in the 1960s, with the last train service to Southport occurring in 1964.[10]

During the 20th century a much larger network of Gold Coast holiday resorts and retirement suburbs was created due to the greater mobility allowed by increasing car ownership. Major public investments were made in roads and bridges, assisting Surfers Paradise to assume primacy as Australia's most fashionable coastal resort for most of the 20th century. After the original Gold Coast railway line was closed in the 1960s, its corridor was gradually redeveloped for a mix of private development and publicly funded motorways. By the 1990s, the Gold Coast was well advanced in its transformation into a largely car-dependent city region, as a major part of the rapidly urbanizing South East Queensland region.

Less than twenty years after closing the original South Coast railway line, the Queensland Government commenced feasibility studies for a new Gold Coast rail link in 1983.[11] The government's commitment to the project was announced in State Parliament by the Premier in 1988,[12] but no funding or commencement date had been announced before the Federal Government's Building Better Cities (BBC) program allocated funds and coordination assistance to bring forward the $280 million project in the early 1990s. The contribution of the BBC program is outlined below. The new railway line to Robina was opened in December 1997, and is being extended further south in 2007-2009 under the State Government's *South East Queensland Infrastructure Plan and Program* (SEQIPP).[13]

Robina as an outcome of private sector initiation and later collaboration and support by public sector planning

The Gold Coast has been described as a city designed and developed by the private sector, by "the creative leadership and extraordinary 'can do' vitality of incredibly

courageous and creative people, with big risks at stake, but with room to move."[14]   The author of ten local histories of the Gold Coast depicts the 1950s to the 1980s as a "Golden Age of energetic entrepreneurs and colourful characters", when "visionaries and promoters" established a city that was very different from the Australian norm.[15] A tourism academic argues that this entrepreneurial character was significant to Gold Coast development throughout the 20th century.[16]

Integrating planning and private development by public sector leadership: Australia's Building Better Cities program, 1991-1996

> The Federal Government initiated the Better Cities concept in 1991 as a means of reforming urban management processes by creating model partnerships between the three tiers of government, the private sector and the community.[17]

The federally funded Building Better Cities (BBC) program of 1991-1995, which was discontinued by the conservative national government of 1996-2006, sought to introduce an integrated approach to the planning and development of transport, infrastructure, and urban development. The means for achieving this, in established and newly developing urban areas across Australia, was the development and support of "area strategies" for 26 demonstration projects.[18] As well as fostering higher quality urban development, for the social, economic and environmental well being of Australians, the program was important in countering the severe economic recession that Australia experienced in the early 1990s. The Federal Government contributed $816 million over the five years, with State, Territory and Local Governments bringing the total public sector investment to approximately $2.3 billion.   The Federal Government estimated the multiplier effect of this investment on private sector investment as 1.6 to 1.8, generating an increase of about $4 billion in Australia's national income associated with the program.[19]

The Gold Coast Corridor project, focusing on integrating urban development and transport infrastructure around a 43 kilometre rail extension to Robina, was the largest of the six Queensland BBC projects. The new Gold Coast Railway was intended to service the rapidly expanding suburban areas behind the coastal resort strip. The new rail line was seen primarily as a commuter link to connect the expanding outer areas of the South East Queensland city region to the main concentration of workplaces in Brisbane's city centre. As discussed by key informants in this research, conceptualisation as a commuter link offered both strengths and limitations. Given that the rail line connected one of Australia's leading holiday destinations directly with Brisbane International and Domestic Airports at its northern terminus, and was intended eventually to connect at its southern terminus to the Gold Coast Airport, a major node for domestic tourists, the commuter focus seems even more limiting in scope. Despite the emphasis on commuting to Brisbane, there was some concern by the BBC planners that there was a need to encourage more intra-Gold Coast travel via the rail line.[20] The author of this paper, as a regular commuter on this railway line, observes that there is now considerable local travel by school students, university students and workers.

The Federal Minister responsible for the BBC program, then Deputy Prime Minister Brian Howe, claimed that public investment in the Gold Coast Railway was "directly responsible for massive private sector economic investment at Robina with its sound centre development,… showing the complementarity of public and private investment"[21]

Status of Robina Town Centre in regional planning by State and local government

By the 1990s, the Gold Coast was a rapidly expanding urban sub-region of Australia's fastest growing region. In response to this rapid growth, the Queensland Government in 1990 initiated SEQ2001, a non-statutory regional planning exercise involving voluntary cooperation between the State and the then 18 local governments in the region. [22] With input from the South East Queensland Organisation of Councils (SEQROC), the community and business, a "Regional Framework for Growth Management" was introduced in 1995 and updated in 1998 and 2000. The voluntary regional planning process was widely considered to be ineffective in managing the rapid urban growth, so the State Government commenced a statutory regional planning process in 2004.

The statutory *South East Queensland Regional Plan 2005-2026*[23] (SEQRP) designates Robina as a Principal Regional Activity Centre, one of two in the Gold Coast sub-region, and one of 14 in the SEQ region. Such centres are intended to "provide the key focal points of regional employment and in-centre residential development" and to be "key nodes in the regional public transport system"[24] These centres are intended to be supported by net residential densities of 40-120 dwellings per hectare or greater. In addition, development in all regional activity centres is required to conform to transit oriented development (TOD) principles, and to become mixed use high density residential and employment areas "designed to maximize the efficient use of land through high levels of access to public transport [… and] a walking and cycle-friendly core…."[25]

Implementation of the SEQRP will be through local government controlled Local Growth Management Strategies (LGMS) and the draft Gold Coast LGMS supports the Principal Regional Activity Status of Robina.[26]   Implementation involves major infrastructure provision by the Queensland Government, statutory planning by local government, and extensive urban development by the private sector.

The following sections discuss the main reasons for difficulties in co-locating Robina Railway Station and Robina Town Centre.

Design and siting issues

Robina Town Centre is located adjacent to a large floodplain, across which the new railway line runs. The Centre's designers reconfigured low lying land to create an attractive town centre site and focal point by developing lakes along the creek line. Fill

was provided by removing 60 metres from the elevation of a hill approximately 300m to the south of the town centre site.[27]

The waterway between the existing Town Centre and the Railway line was a barrier in terms of engineering and construction considerations, as well as the urban design aspirations of RLC.[28] Movement of the railway alignment further east, to allow the track to run either under the Town Centre or immediately along its western side, would have caused engineering problems and additional railway construction costs by lengthening the viaduct across the floodplain.[29]

Robina's designers were impressed by a visit to San Antonio's Riverwalk,[30] a well known urban design success story with its intimate scale, many crossings, and proximity of commercial development and medium-high density housing. The Robina team saw this as something they could recreate in their reconfiguration of the creek along the western side of their town centre site. Taking into account the unpredictability of the final design and timing of the railway line and station development by the State Government planners, they felt this Riverwalk vision was a good reason to keep the railway more distant from the centre. Robina's Riverwalk precinct, on the western side of the major shopping centre, is the outcome. Although not directly replicating the small scale intimacy and enclosure of the San Antonio exemplar, it does create a water oriented precinct that would not be possible with a railway line in that location.

Railway operational considerations

According to key informants, and to the anecdotal reports of urban designers and planners at the time of construction, the operational requirements of the trains were QR's main priority. These operational requirements included park-and-ride capacity and a consequent preference for non-urban station locations. In the 1980s and early 1990s, when car dependent 20th century urban patterns were rarely questioned, and the term 'TOD' was unknown in Queensland, the railway was conceived as a commuter link for patrons accessing stations by car. The planned railway route therefore generally avoided existing and planned urban development, and stations were required to have at least 600 car parking spaces.

To facilitate rapid journey times, and to minimize loss of time at stations, the stations were required to be relatively evenly spaced. To maximise train speeds, large radius curves were required. Where possible, stations were to be located on top of a rise, to save power and time consumption by trains stopping and starting.

Informants from both public and private sectors state that an early intention was to locate the station directly beneath the Town Centre, and that this location would facilitate the later southward extension of the railway to Gold Coast Airport. A range of barriers to the under-centre proposal cumulatively led to a decision by the State Government to unilaterally "pull rank" and abandon that integrated location.[31] Locating the station beneath the centre would have incurred prohibitive costs in additional rock excavation, despite the location on a rise.[32]

QR was allegedly also reluctant to locate the station under the town centre as the slight increase in track length would disturb the evenness of the intervals between stations. When the decision was made to locate the station west of the town centre, separation was increased to the 700 metre straight-line distance north-west, in order to avoid locating the station on a curve or an incline, as would have occurred if the station were sited directly to the west.[33]

Shopping centre operational considerations

The option of locating the station beneath the town centre also presented operational constraints for the shopping centre. The principal concern of the developers was that siting of the station beneath the shopping centre would impose additional construction costs associated with dampening train-generated vibrations and reducing noise.[34]   It was also argued that a railway line bisecting the centre's undercroft would interfere with the building services and servicing requirements.

As one of the Gold Coast's two largest shopping centres, Robina Town Centre attracts considerable car traffic to the 3000 car spaces servicing its car-based retailing which includes two large supermarkets, as well as a national chain department store and two discount department stores. The developer and centre management argument, as put by Tony Winter, is that long term commuter parking would compete with shorter term shopper parking if the station and centre were closer.

The difficulty of coordinating private and public sector timelines for planning and development

Although the new Robina rail station and town centre were built almost simultaneously in the mid-1990s, their integration posed major challenges for all parties. Coordination of timelines for design and development – by private developers and State and Federal Government agencies - is identified by key informants as the most difficult issue. On the basis of the limited number of key informant interviews undertaken, it is inferred that this was the most significant factor precluding the integration and co-location of the Rail Station and town centre development.

The Queensland State Government began planning for the new Gold Coast Railway in 1982, reinforced its commitment to planning it in 1988, but still had not committed funds for its construction prior to the Federal Government allocating the BBC funds in the 1990s. Planning for major transport infrastructure takes a long time, as indicated by this delay of over ten years. By the time the Federal Government initiated its five-year BBC program, the State Government had already 'set in stone' its assumptions on the best route alignments and station locations. The five year timeline for the Federal funding, together with the political need to demonstrate outcomes on the ground within three-year electoral cycles, meant that there was little scope for major revision of prior positions.[35] For example, all of the key informants for this study mentioned Queensland

Rail's steadfast preference to enable fast trip times by minimizing the number of stations and, where possible, by locating stations at the top of rises or hills.

The Masterplanned new town of Robina had been conceived and masterplanned by private sector interests since the early 1970s economic boom, with planning continuing by a single consultant on behalf of successive national institutional owners and their receivers through the booms and busts of the 1970s and early 1980s.[36] Following the 1980 purchase by what became the Robina Land Corporation (RLC), Robina was gradually developed during similar economic cycles during 1980s and 1990s. Its town centre, conceived from the outset as a regional centre, was in the planning from the 1980s, and RLC involved the local council in its masterplanning, in what the then senior local government planner described as a precursor to today's PPPs.[37]

According to a former senior member of the Robina Land Corporation (RLC) team,[38] timing was critical to the RLC attitude to whether the rail station could be incorporated within the town centre. Because RLC could not control the timing of Queensland Rail's masterplanning and construction, the company was very wary of the potential for the new centre's image and viability to be damaged by delayed construction of the railway and station.

If the train won't come to Robina, Robina will have to come to the train

As part of the regional planning exercise, the State Government commissioned a "key centres study" which noted that by 2000, Robina Town Centre was a major regional centre with a large shopping centre (with just under 70,000 square metres of retail floor space and 4,330 square metres of office space), a hospital, a State High School, retail showrooms, and service industry areas. Employment was projected to reach 7,500 by 2011.[39] The study noted the inconvenience of the separation of Robina's Town Centre and Railway Station, but commented that this separation would diminish as additional town centre uses became established along the 900m pedestrian route through the "land bank" between the two.[40] In order to hasten this consolidation of the centre, this study advocated six priorities.[41] These are set out below, with the current author's 2008 observations on implementation added in brackets:

1. locate government offices at Robina (some State Government offices have leased space in the centre, and Gold Coast City Council is considering developing its new headquarters between the Town Centre and Railway Station);
2. improve road linkages to the east and south (completed in 2004-2006, and undergoing duplication in 2007-2008);
3. extend the railway further south (construction underway, with the next station to the south due to open in late 2009);
4. attract IT and telco offices to Robina town centre (this has occurred to some extent, for example with major office buildings being occupied by Foxtel and other ICT firms);
5. develop high density residential development in the centre (much high density housing has now been developed, and more is proposed); and

6. improved visibility of the centre, such as by development of high-rise buildings (a 16 storey office building, "The Rocket", commenced construction opposite the Railway Station in 2007).

Although progress is being made towards achievement of all these priorities, the most significant contribution towards centre consolidation and TOD realization will be the necessary infill of the 12 hectare 'land bank' between the station and the existing Town Centre. Curiously that is not included in the priorities in the above report.

Prospect: catching the Gold Coast train

Rather than 'missing the train', Robina is still making its way to the station. Although Robina is intended eventually to be a Principal Regional Centre with a comprehensive range of urban services, the large building now known as Robina Town Centre is effectively a shopping centre supplemented by cinemas, commercial space and some community facilities. The still largely vacant area between the current Town Centre and the Railway Station has long been intended to accommodate more regional centre 'CBD' uses, high density housing, civic functions and community facilities, linked by walkable streets. Contemporary informal criticisms of the 900 metre separation between existing centre and station are arguably unfair in this context. Infill of the area in between, if carefully designed and executed for walkability, and if combined with improved street-based public transport (buses or light rail), promises to ultimately deliver an "Urban TOD".[42] With the car based shopping centre at the eastern end, and the major transit node of the station at its western end, flanked by Robina Hospital and the 3000-student Robina State High School to its west, Robina when fully developed as a regional centre appears set to exhibit TOD characteristics. At the very least, the existing siting decisions for the station and "Robina Town Centre" retain this possibility and likelihood.

Prospects for TOD to come to fruition at Robina town centre are enhanced by preliminary 'new urbanist' master planning by the major land owner in the vacant 12 hectare site between station and 'centre', as well as by the current construction of a 16 storey office tower with active street frontages, adjacent to the station. In addition, this area is reputedly on the shortlist as a potential site for Gold Coast City Council's new headquarters.

The Gold Coast's major stadium opened adjacent to Robina Railway Station in early 2008, and the land surrounding the stadium is proposed to be developed as a mixed use Stadium Village with a fine grained street pattern. In fact, existing development trends appear to be moving towards the gradual achievement of both TOD and Principal Regional Centre status.

Conclusions

It is far too early for Robina to be dismissed as a failure in terms of contemporary planning ideals of TOD. Continuing anecdotal criticisms of the existing separation of

Railway Station and Town Centre are based on a limited conception of what a town centre is, and an under-estimation of the type of Robina Regional Centre planned by the private sector initially in close association with local government planning and more recently supported by the South East Queensland Regional Plan. Additionally, such criticisms suggest a lack of understanding of the implications of the long time frames for major developments of master planned communities and their associated infrastructure.

The author intends to conduct further documentary and additional key informant interview research, including feedback on this paper (in a modified Delphi style), following the IPHS 2008 conference.

The role of foreign experts – Robert Moses and the International Basic Economic Corporation – in transforming the Latin American modern city

Maria Cristina da Silva Leme
University of São Paulo, Brazil

"Brazil is a country which will be heard from in the future and my hunch is that before long, Sao Paulo will be one of the world's great industrial cities"
Robert Moses, April 28 1950[1].

Introduction

In 1950, Lineu Prestes, then mayor of São Paulo, commissioned a study to *International Basic Economic Corporation, IBEC*, a company headquartered in New York and owned by Nelson Rockefeller. Urban planner Robert Moses[2] was appointed director of studies and another ten advisors worked in the "Program of Public Improvements,"
The improvement plan for São Paulo was not an isolated initiative among those developed by IBEC, but,it was very different from the other planning studies that had been conducted up to then. It was actually a consulting assignment in the sense that, while performing technical studies, IBEC also identified opportunities for American companies to operate in Brazil. The plan aroused great controversy in the technical and political milieus since its According to the contract, it was to be a detailed report to inform the local administration's planning of works.

IBEC had been operating in Brazil for some years by then and had undertaken a consulting assignment for *Light Tramway and Power* Canadian electrical energy and transportation company, about the use of certain areas after the opening of the Pinheiros River canal.

The very foundation of IBEC attests to the potential of Brazil as a market for American companies. Considering the business intermediated by IBEC, this potential was found mainly in innovation-driven industries. In the farming industry it focused on farm equipment, seed production, fertilizers; in the agribusiness industry, on soluble coffee and powdered milk; in the financial industry, on the creation of mutual funds and in the retail industry, it focused on the organization of the industry through the establishment of supermarkets.

The reading of the contracts and of the correspondence between the parties shows that IBEC worked also as a channel of information about the local political and technical spheres. One example of this is the information it conveyed about the integrity of local top authorities.

The ways IBEC operated, through contracts for intermediation of business between Brazilian and American companies and government agencies reveal the new rationale underlying its operations: the arena of economic interests.

From the point of view of urban planning, there is continuity between Moses's Plan and the Plano de Avenidas (The Plan of Avenues), developed by Francisco Prestes Maia[3], in 1930, since the solution proposed by Moses for São Paulo emphasized road transportation in a system of expressways. IBEC's plan approached two issues: it advised on the purchase of buses to meet the needs for mass transportation across the city and proposed the formation of a corporation together with *Light Tramway and Power* to urbanize the land tracts alongside the Pinheiros River canal. These two items reveal that the plan dealt not only with urban planning but also with the opening of business possibilities between foreign companies and the municipality. However, among the activities developed by IBEC, both the consulting assignment for *Light* and the plan for the local administration of São Paulo seems of little importance, as they were not mentioned in the case study written by Wayne Broehl in 1968[4].

This paper seeks to establish how the Program fits into the political and economic context of the post-Second World War period amidst the activities developed by Nelson Rockefeller in Latin America and Brazil. From the point of view of urban planning, this paper analyzes the role played by the Program of Improvements in the planning and development of the city of São Paulo. This study considers not only the interventions proposed by Moses for São Paulo but also his proposals for New York City and highlights the anachronism of the proposals included in the Plan in view of the criticism that his proposals had given rise to in the United States.

The political and economic conditions for the metropolization of São Paulo

São Paulo is a city that grew very sharply in recent times. In the early 20th century, it was just a small city with a little over 200,000 inhabitants. In fifty years the city's population grew to top two million, one hundred and fifty thousand inhabitants. The city spread to occupy a larger area, with no equipment or services such as water, light and sewages, and with low population density. The city, which in 1930 had not yet reached a population of one million over an area of 130 sq km, grew to occupy an area of 420 sq km in 1950. São Paulo grew thanks to the industrial development of the municipality. The transformation of the industrial base into a manufacturer of durable and capital goods took place in new locations, by the roads, in conurbation with neighboring municipalities thus initiating a process of metropolization.

The end of the Estado Novo[5] period introduced a new political period, with elections for the Executive and Legislative branches. However, São Paulo, classified as a "military base of exceptional importance for the country's defense" then underwent a period of political transition where the City Council was elected by the people whereas the mayor was appointed by the state governor. Adhemar de Barros, first governor elect of São Paulo after the redemocratization, in response to political pressures, changed the city

mayor five times during his term. Lineu Prestes, who hired IBEC to conduct a study on São Paulo, was the fifth mayor of this very turbulent period.

Creation and operation of IBEC

When studying Nelson Rockefeller's actions in Latin America in the post-Second World War period, it becomes apparent that he established very complex relationships in different fields: political, economic and cultural. The formation of IBEC was one of the results of his policy.

The origin of IBEC dates back to the post-war period as part of an economic development policy for Latin America with a view to "fostering industrial development and raising the population's standard of living". He founded the company *American International Association for Economic and Social Development* (AIA) in 1945. It was designed to be a non-profit company established with American and Latin American capital. The new company started operating in Brazil in the field of seeds. Given the success and the activities developed, an association with a Brazilian company was proposed. It soon became clear that it was impossible to be at the same time a philanthropic organization and a commercial, for-profit company. This fact led to the creation of a new organization, a genuine for-profit organization: IBEC.

IBEC therefore was created to support the development of associations of American and Latin American companies. The basic philosophy of this new enterprise was the employment of United States capital and technical skills where they could provide the greatest service. The founders believed that other private companies in the developing world could be persuaded to follow this example and that the multiplier effect of IBEC would then be felt.

IBEC was founded in 1947[6] and started operating in Brazil and Venezuela. In two decades it founded[7] two hundred companies in thirty-three different countries which operated in areas such as supermarkets, agriculture, industrialization of dairy products, mutual funds, housing for the middle class, cattle raising and manufacturing.

In its first phase in Brazil IBEC[8] chose a comprehensive approach to address the food problem. Among different activities, the company provided specialized services to make farmers increase production. Four projects were implemented: one in the production of seeds; another in enterprises relating to the fostering of farming and ranching; the third one in the transportation industry, in association with *Standard Oil* and the fourth involved a company investing to purchase land in the Bocaina Mountains Rang. Only one company was directly linked to the *American International Association for Economic and Social Development* (AIA) and operated a program in the area of nutrition.

But soon it became necessary to create another enterprise, the IBEC Technical Service Corporation, a company specialized in provide technical assistance to Latin American Countries. The memorandum[9] from Rafael Oreamino to Nelson Rockefeller exposes the conversations taken in Washington to make the Rockefeller Corporation known as an

available means of carrying out technical services on other countries. One of the activities carried by the new enterprise was to provide technical assistance to Latin American countries for the presentation of loans requests. The necessity to provide technical services to Latin American countries was a result of discussions held in a conference in Bogota, Colombia with the participation of the US Department of Commerce. They were concerned with the many economic and ethic limitations presented by the Washington lending institutions, Export Import Bank and International Bank, to provide at the same time technical assistance in connection with an application of loan which the Bank subsequently makes.

The role of Nelson Rockefeller and IBEC in São Paulo. .

In the early 1950's an important event in the visual arts – the creation of the São Paulo Art Museum (MASP) – had the support of Nelson Rockefeller. In the Museum's opening, Rockefeller made a speech in which he sought to link democratic freedom and the development of the arts and culture as a reaction in the context of the cold war and the criticism of Brazilian intellectuals of American presence.

In his speech, he stated that in view of what had been said by the previous speakers the mission of the museum was clear: it was dedicated not only to peace but also to the pursuit of peace, and he added that the arts, which dignify and enhance life, can only flourish in an atmosphere of peace.[10]

This network of relationships in different fields became clear in the first contacts made by Robert Moses through letters of introduction written by Nelson Rockefeller. Letters of the same tenor[11] dated October 19, 1949 were addressed to figures of the political milieu such as General Gaspar Dutra, President of Brazil, and Raul Fernandes, Foreign Affairs Minister, and of the business community such as Ary Torres of Companhia Brasileira de Materiais Ferroviários (a railroad supplies company).

According to a memorandum by Robert Moses[12] that was addressed to Nelson Rockefeller in August 3, 1949, a letter of agreement between IBEC *Technical Services Corporation*, IBEC's technical office and the *São Paulo Tramway Light and Power* was firmed for consulting services focusing on the recovery and use of land tracts alongside the Pinheiros river canal extending from the confluence with the Tietê River to the Rio Grande dam. Robert Moses came with his wife at the end of October and stayed in Sao Paulo until December[13].

These land tracts were included in the contract between *Light* and the government of São Paulo State for the construction of an energy system. Under the contract, the Company was expected to dispose of all the excess land within the original flood *limits* of the Pinheiros River after the completion of the deepening and widening works of the canal required for power and flood control purposes.

The first and major issue of this project involved the title to the land where the canal was to be opened. According to Moses, most of the land belonged to *Light*. The opening of

the canal required five thousand hectares of land, of which eight hundred had been purchased by *Light*, four hundred were being used by *Light* through a contract with a clause providing for the redelivery of the land to the previous owners upon payment of the improvements made and another six hundred were to be acquired later by the company subject to certain rights of the previous owners. *Light* had also purchased four hundred hectares for its own use. The remainder of the land was owned by private and public organizations with no link with the Canadian company.

These land tracts, according to Moses, had a great potential for industrial facilities, offices, housing, leisure and other public and private purposes.

> "Here are some twenty thousand acres of reclaimed lands forming a wide belt around and well within a tremendously energetic and strategically located City of rapid growth, with a mixed population of extraordinary ambition and energy, a City needing nothing more than an integrated, long range program planned in the public interest, and the intelligent cooperation of public and private enterprise to insure its success"[14].

IBEC's assignment was to design a plan to occupy the area, and it advanced some proposals for use, such as the Jaguaré industrial district, with its division into industrial and intermediate residential zones, adjoining the University of São Paulo and located in the area close to the Jockey Club "a continuous space for public and quasi public parks and playfields. By quasi public I mean the kind of sports clubs and associations of working people, civil servants, unions etc which flourish in Buenos Aires on the reclaimed land between the Plata River and a the *avenida* flanking it. (..) I would suggest that not less than two miles be set aside on this side of the Canal for these purposes"[15]. He also added that any plan for such area should also include the elimination of the sewer running from the Tietê River into the Pinheiros River[16].

He also stressed that the plan should be accompanied by a zoning initiative, an urban planning tool that existed in a rudimentary and unsatisfactory fashion. "The Canal could serve as a forerunner and model for a general zoning system for the city[17]."

He produces a cost estimate that included: the purchase of land (from US$80 to US$100 million), the dredging and disposal of land to enable the opening of the canal (US$ 4 million), the cost of railroads, expressways, bridges and other improvements (US$ 10 to 12 million.)

To carry out these works, Moses stated that the Canadian company and other interested parties were considering the possibility of organizing a company that would acquire the rights of former owners and owners to implement the plan and develop the area flanking the canal. This proposal articulated the consulting services provided to *Light* and the Program of Public Improvements developed for the São Paulo Administration as we will see below.

The program of public improvements for São Paulo

On July 14 1950, a contract[18] is signed between the São Paulo Administration, represented by the mayor, Lineu Prestes, and IBEC for the conduction of the following studies: a general map and zoning study; a proposal for a system of expressways; a mass transportation system; a system of parks and playgrounds; the canalization of the Tietê river and the use of the land tracts flanking the river, sanitary engineering and suggestions regarding the funding methods for the execution of the public works and services proposed.

The report was to be ready and printed in six months. The contract also specified the amount payable by the São Paulo administration.[19] In October, a letter from *IBEC Technical Services Corporation* addressed to IBEC International Basic Economy Corporation established the terms for the services provision and the engagement of the services of Robert Moses and Frederic Collins who would oversee and direct the services.[20]

The report forwarded by Moses[21] added two objectives to those defined in the contract: by initiative of the American team, the plan of improvement and urbanization of the Pinheiros canal was added; and upon the request of the mayor of São Paulo, the issue of solid waste elimination was included. The report began by recommending an aerial photogrammetric survey of the urbanized areas in a 1:2000 scale. Based on this survey, the official plan of the city was to be developed.

The consultant team drafted a zoning proposal that was not different from the one that was being developed by the São Paulo administration, which defined zones of use so as to protect property rights.[22] They defined nine categories of use (industrial, commercial and residential) which were combined in zones according to a spatial model of concentric circles.

In the central area, a zone of commerce, services and light industries. In the area surrounding this central area, light industries and warehouses would be allowed. Alongside the Tietê river, near the city's eastern border, and in the vicinity of the Pinheiros canal were the industrial zones and the remainder urban area was a residential zone. They suggested that the zoning decree should be developed based on the New York zoning, and attached a copy of the New York zoning legislation.

The problem of mass transportation system in the city was thought to be an urgent one to solve. They proposed the replacement of the bus and tram fleets and suggested the immediate purchase of 500 new, large and spacious buses. Another hundred buses should be purchased yearly over the next ten years to complete the fleet. These buses, equipped with diesel engines manufactured abroad, could be assembled in Brazil. They also included recommendations on repair shops and bus routes and changes in the road system.

An important point of the report was the proposal of an expressway system[23] and bus routes with estimates of the cost of the land that would have to be expropriated and the cost of building the system. A new design proposed for the Anhangabaú Avenue cut through the Ibirapuera Park while replicating, with 9 de Julho Avenue, the "Y" design of the Plan of Avenues. The major novelty was the articulation between the roads heading to Rio de Janeiro and the Anhanguera road, forming the Tiete expressway. The Anchieta road would head to the city center and cut through the Ipiranga neighborhood as an expressway. In the East region, parallel to Celso Garcia aveny, only a single new expressway was proposed. There was great difference in the solutions proposed for different quadrants of the city with the West and Southwest quadrants having a greater number of roads and articulations between existing and proposed roads.

São Paulo Tramway Light and Power would play a key role in the proposal of forming a company to urbanize the land flanking the Pinheiros canal. As has been mentioned earlier, this company was in charge of dredging the river, and therefore had land available and had acquired land that was to be returned to the municipality and the previous owners once the canal works had been completed.

In the plan developed for the São Paulo local administration, Moses completed the *Light's* consulting assignment and proposed that the new company should be the proprietor of the area by the canal and should be in charge of developing activities there. The municipality then would hold the right of way to build roads, railways, bridges, transmission lines and other public services on that land.[24]

The American consultants also suggested that the State should hand traffic control over to the Municipality. The issue of shared tasks and lack of coordination between the State and the Municipality was also approached by Moses as regards the water supply, the sewer network and waste collection.

Specific recommendations were made as to the need to build a treatment station and enlarge the sewer network. The report also pointed out the need to mechanize waste collection, to have a landfill program and to build incinerators. As regards funding, they studied the possibility of increasing the municipality's indebtedness levels by issuing municipal bonds. Four municipal engineers were invited to visit public works in New York thus further cementing the relationship between the local administration and IBEC[25].

The repercussions of the program of improvements: criticism and negotiations.

On December 14, 1950, the governor of São Paulo, Adhemar de Barros and mayor Lineu Prestes presented the Program of Improvements to a large audience made up of city councilmen, municipal technicians and the press. The first repercussions were reported immediately to Moses[26] and reflected the bitter criticism it aroused. Among the editorials published in the mainstream press and in specialized journals, the major criticism which caused immediate repercussion, according to a letter send by IBEC to

Nova York [27], was that made by the São Paulo Chapter of IAB, the Brazilian Institute of Architects.

Architect Oswaldo Bratke, president of IAB's São Paulo Chapter was harsh and emphatic. IAB had recommended the design of a plan for São Paulo, but "The report presented by the foreign specialists is definitely not the plan which the IAB has been demanding, although the publicity given to the report calls it the overall plan.

The report does not substitute, in any way, for an overall plan, in spite of the declarations to the contrary made to the press by the president of the Public Works Council of the City Government.

The report presented by the foreign experts is not satisfactory even as a simple program of improvements because, in spite of being based on studies made by our specialists, who understand the local problems, it is absolutely impracticable for it contains elementary errors resulting from the fact that its authors do not know us, do not know our city and did not even have contact with its more superficial aspects as they themselves declare."[28]

IAB's criticism influenced other criticism such as that made by Leo Ribeiro de Moraes in a meeting of Sociedade Amigos da Cidade, (Society of Friends of the City)[29] . But there were favorable remarks also. The most favorable ones were published in the newspaper Diário de São Paulo, owned by Assis Chateaubriand, and were made by engineer Henrique Neves Lefevre and Ranulpho Pinheiro Lima, editor of the Revista de Engenharia, the Journal of the Engineering Institute[30].

Prestes Maia's reaction to Moses's Program of Public Improvements attests to his adherence to the same tradition of urban planning based on the execution of public works, but his criticism marks an anachronistic approach relative to the thinking of local urban planners. He ironically observes that those who expected "fantastic perspectives, green areas, huge Corbusier-style skyscrapers and English-style gardens" had forgotten that Moses belonged to the school of urban planning that "executes [public works] and is not inconsistent as is the case of some urban planners who spend their lives preaching about utopias and die without ever designing a mere set of streets that could be their legacy".

Prestes Maia distanced himself from theoretical concerns, and did not believe the transforming potential of utopias, whether the modernist or the garden city models. He once again took the opportunity to show his deep knowledge of the city's physical structure, of every detail of the road system and of the functioning of the water, sewer and drainage infrastructure. He was the only one who demonstrated knowledge of the scope of IBEC's activities in Brazil. "The first absurdity was the way the consultation was requested. It was through a very well reputed organization, but a predominantly commercial and agricultural one, that imports farming machinery, seeds, fertilizers and stud-horses as well as technicians and urban planners who are brought to Brazil without knowing why or what is expected of them"[31].

Prestes Maia, in 1930, in Plano de Avenidas (Plan of Avenues), had already criticized those "passing-by, inquisitive experts", but this time his criticism was fiercer. He considered the American report as a pre-technical report with general recommendations, whereas urban planners working in São Paulo such as Victor Freire, Ulhôa Cintra and himself had already moved from the realm of ideas into executing works. As regards the recommendations, he thought that the report brought nothing new and "merely confirmed what had already been diagnosed, solved or was being implemented." He claimed that urgent issues had to be addressed such as the need for "proletarian housing" in view of the growth of *favelas*, and the issue of fast collective transportation, a surface light railway network. His criticism reflected urban planning principles that were in sharp contrast with those advocated in the Program of Improvements.

Soon after the report was delivered, mayor Lineu Prestes started negotiations to obtain funding to implement it.[32] However, in February, Lucas Nogueira Garcez was elected Governor of São Paulo, and he appointed Armando Arruda Pereira as mayor. A CV of the new mayor was attached to one of the letters exchanged between Henrique Dumont Villares and Moses, with praises to the new mayor and highlighted his Master's from the NYU and his ties with the Rotary Club. Although he was apparently more in tune with the American technical and political milieus, there was no further news on the negotiations to fund the plan.

But the activities of the IBEC in São Paulo continued.In 1956 there were references[33] to the studies conducted by the corporation about land purchase options to open supermarkets, a key business in Latin America.

The critics about Robert Moses.

Criticism and strong reactions to his projects had always been part of and fueled Moses political and professional career. In New York, in the early 1950's, the reaction to a highway that cut through Washington Square attested to the growing importance and strength of the opponents of his urban planning proposals. Robert Fishman[34] takes us back to that key moment and reminds us of the role played by local activist Shirley Hayes, leader of the movement that challenged Moses for six years. But it was Jane Jacobs's book Death and Life of Great American Cities that turned this local movement into a new and critical theory of modernist urban planning and created an international movement against this form of urban planning of which Moses was the most important representative: a current that advocated the demolition of entire neighborhoods to build bridges and expressways.

Robert Moses's career has been the object of recent studies and reassessment. Following the devastating criticism voiced by Robert Caro[35], Hilary Ballon and Jackson Kenneth's new book[36] "Robert Moses and the modern city: the transformation of New York" proposes a new perspective about the impact of Moses's urban renewal program for New York.

Robert Moses conceived and set into motion one of the largest slum clearance –urban renewal programs in the United States as Chairman of the Mayor's Committee on Slum Clearance, the entity through which he ran Title I from 1949 to 1960. Moses was forced to resign his post as the head of the Committee and his methods encountered harsh criticism. He was accused of secretive selection of sites and sponsors, privatization of relocation, and opposition to preservation. His antidemocratic methods and indifference to community values had incited a citizen planning movement that he did not comprehend and could not accommodate.

Hilary Ballon though observes[37] that despite this criticism, we should recognize that Moses had a coherent and clever plan and a strategic and pragmatic vision for New York's future. His aim was to strengthen the city center in an era of decentralization, suburbanization and urban decay. With this purpose in mind he pursued a threefold strategy: his first objective was to prevent the polarization between rich and poor. In order to provide housing for the middle class, the alternative chosen was to establish cooperatives that allowed the reduction of down payments, low cost, long term financing and tax deductions. This policy allowed Moses to have a mechanism to control the land market and to increase the share of middle-class homeowners. His second objective was to expand higher education – he designed projects to benefit private universities such as New York University and NYU Medical Center, Long Island University, Pratt Institute, Fordham University and Juilliard School, in addition to academic institutions such as Morningside Heights, Yeshiva University and Cooper Union. His third objective was to give national prominence to the city by establishing new institutions such as Colisieum and Lincoln Center so as to lend prestige, international recognition and cultural prominence to the city.

I would like to take the remarks made by Hilary Ballon and Robert Fishman regarding the impact of Robert Moses' ideas on Nova York to illustrate the complexity of this analysis.

The impact of ideas and proposals regarding urban planning on the processes that transform Sao Paulo.

In previous papers[38] I approached the issue of the circulation of urban planning ideas and some statements seem to have been the object of consensus. Firstly, urban planning has to be considered as a movement of international reach in which some key ideas change once they circulate in different countries and acquire new characteristics related to the local urban planning milieu and political, economic and social context. There is also consensus about the understanding of urban planning as an arena for exchange of experiences, and that the professionals involved change as a result of these exchanges. And lastly, the changes that occurred in the forms of appropriation of urban planning ideas and models in the 20th century should be interpreted as indicators of the growing consolidation of urban planning as a field in each country.

The first references to American ideas and urbanists for the urban planning of São Paulo were made by Victor da Silva Freire[39] when he proposed a new street system design. The article "Melhoramentos de São Paulo [Improvements of São Paulo]", published in 1911 on Revista Politécnica, a journal of the School of Engineering, is a seminal article in the history of urban planning in São Paulo, as it presents key concepts and theories on urban planning. The article's main objective was to put forward a proposal to redesign the street system on the city's central hill. To support his argument, Freire drew on two different and even antagonistic aesthetic conceptions: the ideas of Austrian urban planner Camillo Sitte and those of the American urban planner Mulford Robinson, who some authors identify as one of the followers of *City Beautiful* current. Freire's proposal to redesign the street system in the São Paulo central area transpired a synthesis of his perception of these ideas: the aesthetic aspect, under the influence of Sitte's ideas, and the functional-aesthetic aspect, influenced by the principles upheld by Robinson.

Twenty years later the Plano de Avenidas (Plan of Avenues) developed by Prestes Maia proposes the design of the avenues flanking the Tietê river as a system of parkways in line with the most recent American urban planning current. The road system design proposed in the Plan included three ring roads articulated by means of a radial avenue system. The first ring road was inspired by the inner *boulevards* of Paris. It was called Perímetro de Irradiação ("irradiation perimeter") and encircled the downtown area and the new commercial district located on the slopes of the Anhangabaú valley. Integrating both centers and going beyond the valley was very important at that time. The more sophisticated commercial areas, headquarters of companies, and cultural activities had been moving to the other side of the valley. The new avenues and bridges projected signaled the importance that this new center was going to have to the municipal administration.

The second ring, the outer *boulevard*, was designed to partly overlap the beds of the Såo Paulo and Sorocabana Railways and cut through the neighborhoods of Barra Funda to the north, and Higienópolis, Cerqueira Cesar, Paraíso and Ipiranga to the south. The railroads were to be removed to the area alongside the Tietê river in order to, on the one hand, improve the circulation of vehicles thus preventing crossovers, and, on the other hand, unify and rationalize the railroad service. The third ring encircled the area urbanized at that time and was called the Parkway System. It encompassed the roads flanking the Tiête and the Pinheiros river (the *marginais*), and continued to the source of the Ipiranga river, then down the Tamanduateí river valley up to its confluence with the Tietê river. The right margin of the Tietê canal was reserved for the reallocation of railroads and the setting up of a new Central Station. The marginal roads should be built on the left margin, and should interconnect the parks that had been proposed in the plan. These three rings would be connected by a set of avenues that departed from *Perímetro de Irradiação* towards all the quadrants of the city.

This radial-perimetral system would allow the city to extend limitlessly while ensuring a more efficient integration between different neighborhoods. The predominance of cars and buses relative to other means of transportation was evident in the Plan. The

argument of traffic flow is used to justify the displacement of railways and to impede the traffic of trams on avenues.

The idea of a system of parkways in São Paulo had first been proposed by the English architect Barry Parker to the mayor of São Paulo in 1919, as a way to contain the expansion of the urban area. But the parkways system proposed by Prestes Maia in the Plano de Avenidas had completely different purposes. They allowed the expansion of the city, occupying an area subject of successive inundations. Inspired by the sinuous design of Northern State Parkway and Grand Central Parkway the first avenues proposed by Robert Moses for the region of New York, the parkways of Sao Paulo evolved to give rise to more complex systems with more varied elements.

The Program of Improvements for São Paulo, coordinated by Robert Moses, was completely different from the previous consultancies, either from the point of view of its comprehensiveness – the whole territory of the city - and also for proposing initiatives to establish economic relations and open fronts for new investments and partnerships. The Program of Improvements for São Paulo, coordinated by Robert Moses, was completely different from the previous consultancies, both in the point of view of its comprehensiveness – the whole territory of the city - and in the proposed initiatives to establish economic relations and open fronts for new investments and partnerships.

The Program was the first comprehensive plan made by a foreigner urban planner for Sao Paulo. Though it is difficult to establish the actual effects of an urban plan on the urbanization process of a city, two aspects of the Program proposed by Moses seem to have had a permanent and definitive impact on the development of the city and on the urban planning milieu: the proposal for a system of expressways and the mass transportation system by buses. These two interlinked propositions confirmed the option for a main car system and delayed the studies and proposals for underground or surface mass transportation for the city. This was a very strong point made by the architects and urban planners of Sao Paulo against their critics and arguments against the Plan. The proposed express way system represented a new street system for Sao Paulo. The new avenues were planned to be larger and built independent of the preexistent system, under or over it.

In regard to IBEC's role and its importance to Sao Paulo, I also reflected upon the relationship between the proposals for urban interventions and the economic and political scenario in the post-war period. In this sense the urban impact of IBEC's Program of Improvements for Sao Paulo cannot be understood solely from a technical point of view. It must be analyzed also as part of more complex context formed by the initiatives of the Brazilian and American governments and the respective business communities which established economic relations and opened fronts for new investments and partnerships.

[39] Victor Freire was born in Lisbon, studied at the Polytechnic College in Paris, and took the course of the *École des Ponts et Chaussées*. He graduated in 1891. In 1895 he moved to São Paulo where he taught at the Polytechnic College which he directed between 1932 and 1933. In 1899 he was invited by the mayor of São Paulo, Antonio Prado, to head the Department of Municipal Works, a position he held for 26 years. He played an important role in the establishment of Companhia Imobiliária City and was one of the first to sponsor the visit of Joseph Bouvard in 1911.

The Brazilian new democracy and local participation in public urban policies of local heritage preservation

Nilo Lima de Azevedo
Universidade Estadual do Norte Fluminense Darcy Ribeiro, Brazil

Introduction

The present work deals with an important local public policy of urban planning also responsible for the formation of the identity of the Brazilian cities: the public policy of local heritage preservation. That policy is fundamental because many of the urban development plans should take into account the protected properties and their environment. The properties under protection in many occasions are located in valued areas, which creates a conflict among three groups of interest: the local government, the real estate market representatives and the ones favorable to the preservation of the local heritage (some non-governmental organizations for example).

In a lot of important Brazilian cities (Rio de Janeiro, São Paulo, Belo Horizonte and others) those conflicts are solved in Municipal Councils, which combines participation by representatives of the State and the organized civil society. Those local institutions, responsible for many issues, are considered one of the greatest institutional innovations recently occurred in the local Brazilian government, and only possible after the return of the democracy

It that way, new decentralized forms of participation appears, beyond the traditional ones as the vote, or the filiations in political parties. But that over all, it is relate to a new form of relationship between local government and society, where the Brazilian democracy search new forms of accountability, that impute more responsibility the local governments in its action, and a permanent communication channel between the Estate and civil society not only in the electoral periods.

This democratic transition stared in 1985, the Brazilian Electoral College elected president a civilian, Tancredo Neves, after 21 years of authoritarian military regime, finally accomplishing the "opening policy". This delicate transition moment of a country, whose democratic experience during the whole XX century manifest itself in few and distinct moments, made plain the difficulties of consolidating the new regime, especially the need of a long process in order to settle down democratic institutions, culture, and legislation (MOISÉS, 1989, p. 120).

The Brazilian democratic transition process took place under arrangements between the principal political forces. The militaries and their political support group were already worn-out due to the suppression of the legitimate political mobilization forms, and the lack of communication between the government and the demands of the society. But they were still strong enough to impose a passage of government that did not conflagrate the regime's defeat through the popular vote.

On the opposite side of the military group, there were moderate democratic political sectors, strengthened by a campaign on behalf of the popular vote for the Republic President's post, called "Diretas Já". Those democratic sectors were satisfied by the idea of obtaining future political gains from the agreed transition that could guarantee the institutional stability and the rules of democracy.

In this context, searching to solve such institutional democratic consolidation dilemmas, a Constituent Assembly was formed in1986 and, even troubled by the shock of the conservative forces and the left-wing sectors, achieved to promulgate a Constitution with democratic character in 1988.

In fact, the Brazilian constitutional text raises, in the very first chapters, the fundamental rights. The topic of State organization, typical object of the constitutions, is included in its subsequent chapters.

Constitutional defense against State's abuses were also guaranteed, with some juridical instruments such as the writ of mandamus, the writ of injunction, the habeas corpus and the habeas data. The mechanisms of a popular and direct participation were contemplated in plebiscite, referendum, among others.

Check and balance mechanisms were established. The Public Prosecution Service was raised as a regulator State organ charged with the inspection of the democratic regime. In this sense, Brazil formally qualifies itself to be included in a democracy.

However, among this constitutional-legal set of measures, which contribute to the Brazilian democratic formation, some had a special role in the development of participative local management public policies, also including the Municipal Councils.

1. The municipality role in the Brazilian federative form

It was the decentralized federalist form that Brazil started to assume, after 1988, the responsible for some of its largest transformations. The new Constitution, besides the Union and the States-Members, also started prioritizing Municipalities' administrative and legislative autonomy. The degree of competence that the Municipality has to collect and allocate its tributes demonstrates the degree of its autonomy in the Brazilian state.

It means that the Municipality is able, through a law (political autonomy) to organize the entities and organs of its direct or indirect administration in the way it considers the best, respecting the constitutional limitations (administrative autonomy).

Is that connected autonomies that allow the local institutional democratic innovations, as the creation of organs of the direct administration, such as the Municipal Councils, or innovatory experiences of management, such as the Participative Budget.

It is valuable to understand how the competences of the federated members in the Federal Constitution of 1988 are established. In this aspect, some considerations about the political-administrative decentralization are necessary. It is important to emphasize that the relation between federalism and political-administrative decentralization is not obvious. The Brazilian federation design, originated from the Federal Constitution of 1988, opted to maintain the Central Government responsible for a series of activities that put it in an advantage political position regarding the States-Members and Municipalities.

The privileged position of the Union regarding other federation members is easily observed. It is enough to check article 21 of the CF/88, which stipulates the private competences of the Union, among them the legislating on Civil Law, Commercial Law, Criminal Law, among so many others, meaning that it is prohibited to the States-Members and to the Municipalities to legislate, for example, on penal conducts or on civil responsibility.

However, it is possible to affirm that the political-administrative decentralization is one of the outstanding characteristics of the Brazilian federalism, considering that the attributions and competences of federative members do not come from a Central Power, but from the Constitution itself (DI PIETRO, 2004, p. 349)[1].

The bonds that exist between the federative members are different from the hierarchical bond. In other words, in what refers to the original constitutional attributions, there is no subordination of a federative member regarding the others (MELLO, 1997, p. 97).

This is the key to the question: political-administrative decentralization transfers the relations between the federative members to other spheres than the hierarchical one.

> "Under this perspective, the basic problem of the federative question is finding the appropriate institutional drawing to the resolution of the conflicts between the government levels, without destroying the autonomy of each member and the inherent conflicts of federative pacts" (ABRUCIO and COSTA, 1999, p. 19).

State federative relations are ruled by the cooperation and competitiveness, being possible to think "the intergovernmental relation in the federalism as a problem of collective action, in which more than one answer is possible" (ABRUCIO and COSTA, 1999, p. 21).

Among other constitutional competences, the local management of federal funds reveals the competence of the Municipality to manage the health, social assistance policies and urban policies, among others.

2. The compulsory creation of Municipal Councils to manage federal funds

The institution of the local management of federal funds was a basic factor that helped introduce Municipal Councils experiences in Brazil. These Municipal Councils were born

as an institutional innovation from the Federal Constitution of 1988 and the infraconstitutional laws. They "became compulsory in several levels of policies definition, they were considered legally essential to the transference of federal resources to States and Municipalities, constituting central pieces in the process of decentralization and democratization of the social policies" (TATAGIBA, 2002, p. 50).

Among these social policies, the health policy (Organic Law of Health), the social assistance policy (Organic Law of the Social Assistance), the protection to the child and to the adolescent policy (Statute of the Child and of Adolescent) and, more recently (2001), the urban policy (Statute of the City) are outstanding.

All these policies and respective legislation would set the principle of the popular participation as something needed, representing, thus, significant profits for the social movements. "Each one of these legislations established the participation in a different way, but since the 90´s, all these forms of participation became known as councils" (AVRITZER, 2006, p.38).

The introduction of the universal character Brazilian Health Care System (SUS – Sistema Único de Saúde) was "resulted from an intense social mobilization that began in São Paulo, in the middle of the year 1970, getting national visibility in the beginning of the year 1990" (TATAGIBA, 2002, p.51) and it has, in the article 198 of the Federal Constitution of 1988, among its directives, the decentralization and the popular participation.

With this intention, aiming at allying this participation to a more effective form of control over the federal resources, without, however, keeping in check the autonomy of the Municipality granted by the federative pact, the Transitory Constitutional Provisions Act (ADCT) stipulated that these resources would be handed over through a fund (Health Fund) managed by a council (Health Council).

In the same sense, it is possible to find, in CF/88, in the article 88 referring to the policies of protection to the child and to the adolescence, and in the article 204 related to the policies of social assistance, the principle of the participation and control over the federal funds: The format of the Councils incorporated the interests of the most conservative sectors, as an instrument of control and regulation, as well as the interests of the left-wing sectors worried about the popular participation.

The Municipal Councils do not need to be linked to a federal fund, or to any other type to exist, since the Municipality has administrative autonomy. However, those councils that tied themselves to funds, principally to those of health and of social assistance, were the ones that served to the expansion of the model in several thematic areas, as the urbane policy, protection of the cultural heritage, tourism, carnival, environment, transport, among others.

Also, according to data obtained by Avritzer (2006, p. 39), the traditional Municipal Councils (health and social assistance) are the most spread across Brazil. According to

the Municipal Basic Information Research of the Brazilian Institute of Geography and Statistics (IBGE), carried out in 2001, there were health councils in 98% of the Brazilian Municipalities, 93% have social assistance councils, while 77% and 73% of the Municipalities present, respectively, councils of the child and adolescent rights and education councils.

Though the methodology used by the (IBGE) is questioned by Avritzer, as there are merely formal councils, which do not work in fact, the author himself concludes that this statistic "leaves no doubts on the proliferation of councils in democratic Brazil" (AVRITZER, 2006, p. 39).

Finally, other factor that stimulated, and may come to stimulate the councils in subjects connected to the urban management, was the competence conferred to the Municipality to manage urban policies.

3. Municipality competence for urban policies

The municipal competence to deal with urban policies, granted by the Federal Constitution of 1988, in its article 182 and 183, was also a conquest of social movements.

The National Movement for the Urban Reform (MNRU) originated in the discussions carried out in the beginning of the decade of 1980, but its formation was consolidated by social movement organizations connected with the subject in order to act at the Constituent Assembly of 1986. The draft of the Constituent Assembly, of 1987, predicted the participation of different society organized sectors through the presentation of constitutional amendments. There were two presuppositions for the legislative initiative: a) the amendment should be presented by three associations; b) the amendment above-mentioned should have at least 30.000 voters' signatures (SANTOS JUNIOR, 1995, p.43).

After the amendment, the National Forum of Urban Reform (FNRU) was founded. Orientated by the principles of the urban property social function and democratic city management, the Forum was able to articulate discussions and actions that became responsible for the introduction of several of these principles in State Constitutions and Organic Municipal Laws, besides disseminating this ideal in national and international forums, congresses and seminars (DE GRAZIA, 2002, p.18).

> "Amid its activities and struggles, the FNRU was the only actor that, in constant and efficient form, opted for the pressure / negotiation with deputies, government sectors and property sectors to conquer a legislation of urban development that fundamentally was regulating the articles 182 and 183 conquered in the Constitution. The international articulations carried out around the conferences also had the objective to make public the concept of the social function of the property and of the city, a difficult notion to be dealt with in these spaces" (DE GRAZIA, 2002, p. 18).

The resistances and negotiations were many, principally regarding the sectors of the real estate market and the Foundation to the Defense of the FamilyValues and of the Property (TFP), which, besides sending insistently documents with criticism to the Congress, was passing petitions in public squares and in the centers of some capitals like São Paulo, Rio of Janeiro and Belo Horizonte against the urban reform.

> "The opposition parties, principally PT, and part of the Federal Government guaranteed the defeat of the appeals by one vote in February, 2001. The FNRU, the IAB (Institute of Architects of Brazil) and other entities handed over the petition to the Chamber of Deputies Presidency and to parties leaders in the previous days, action that has truly collaborated for this victory" (DE GRAZIA, 2002, p. 32).

Finally, the project was approved in 2001, being today known as the Statute of the City (MOREIRA, 2002, p. 41).

The approach of the policies for cultural heritage protection, carried out in this work, reconciles its cultural and urbanistic aspects, with distinction to the last ones.

The previous report on the Statue of the City submission process was necessary once the controversy of interests and values displayed in the project approval process represents basically the same arguments presented by the different sectors around the public policies for cultural heritage protection

In one side, there are articulated sectors of the organized civil society, they defend an urban project that takes into account the inclusion of urban plurality, the social function of the city and urban property, as well as the democratic management. In the other side, there are sectors of the real estate market, and, in the case of the cultural heritage, sometimes, the owners of the properties nominated as cultural heritage.

The principles approved in the Statute of the City outline somehow the policies of protection to the local cultural heritage once the Statute of the City expressly mentions this policy as the following legal devices demonstrate**:**

> "Art. 2nd. The urban policy's objective is to organize the full development of the social functions of the city and of the urban property, by means of the next general directives: (...) *XII - protection, preservation and recuperation of the natural and built environment of the cultural heritage, historical, artistic, related to the archaeological and architecture landscape.*

Two important propositions can be affirmed from this article. First, the policy of cultural heritage, besides being a policy properly stated, is also an urban policy. Second, cultural heritage protection, preservation and recuperation represent one of the city and urban property social function's premises. Hence, one enters in the fragile discussion between the individual rights and the social ones or between the civil and civic spheres of the citizenship.

Another important legal instrument for the cultural heritage police is the article 4 of the Statute of the City, which deals with the urbanistic instruments for the urban policy, having as the most controversial institute of the heritage protection: the so called "tombamento".

The Statute of the City enables the creation of new instruments turned to the urban policy; that happens because the roll of instruments is an exemplifying and not a categorical one.

The connection between the Statute of the City and the policy of cultural heritage protection in the municipal extent seems to be clear. It is necessary, however, to establish how the use of the councils happens as managers of the cultural heritage policy and the Statute of the City.

When observing the policy of cultural heritage also as an urban policy, it is necessary to follow the kind of management that the Statute of the City determines, that is, the democratic management. The second article from the Statute of the City gives the directive of this type of fulfilled democratic management "through the participation of the population and of the representative associations of several community segments in the formulation, execution and attendance of plans, programs and projects of urban development".

It is noticed, so, that the democratic management is the instrument that enables the participation not only of representative associations of several community segments, but also of the population. This is the directive of a democratic management; it must be participative, in the formulation, as well as in the execution of the urban policy.

According to Avritzer, the Municipal Councils are "hybrid institutions in which there are participation of the Executive and of civil society actors connected with the thematic area in which the council acts" (AVRITZER, 2006, p. 39). It is noticeable that, because of its characteristics, the Municipal Councils have multiplied themselves across Brazil as managers of several policies and as a synonym of democratic management.

4. Municipal councils

4.1. The Municipal Councils and participation

Summarizing the main arguments previously exposed, it is possible to affirm that:

a) the brazilian federative form was a important factor for the Municipality administrative and political autonomy, so the direct and indirect local administration may be constituted in an independent way from a Central Power, also opening space for institutional innovations, as the Municipal Councils, to deal with competences designated by the constitutional and infraconstitutional legislation;

b) the compulsory creation of some Municipal Councils to manage funds originated from federal resources, aiming, on the one hand, at higher efficiency and, on the other hand, to guarantee the principle of the participation, and constituted the model to the councils forms that were spread across the most varied issues;

c) the urban policy competence transmitted to the Municipality for the Federal Constitution of 1988 and for the Statute of the City made the policy of cultural heritage protection, besides a cultural policy, an urban policy, thus, necessarily significant to the city and urban property social function, with the need of being managed according to a democratic management and collegiate organs.

In the Brazilian redemocratization scenery, the Councils to be constituent of a set of institutional innovations that:

> "(...) refers to the improvement and to the solidification of the democratic institutions, aiming to allow its operation in the electoral interstice, connecting to the classic mechanisms of the institutionalized representation forms of political participation, which enables the enlargement of the right of vocalization of the citizens preferences and the public control over the exercise of power" (ANASTASIA; AZEVEDO, 2000, p. 03).

Among the important characteristics observed in the Municipal Councils for the expectations fulfillment, it is possible to quote "its deliberative or advisory function, its internal composition and its degree of flexibility to incorporate new collective representations" (CUNHA, 1997, p. 96). These suggest bigger or smaller chances of success for the democracy challenge. Under this perspective, the participation and the representation can be seen as two faces of the same coin; these are the two variables around which the other questions gravitate.

Conceptually, the municipal councils are public organs of the local Executive (GOHN, 2001, p. 11; AVRITZER, 2006, p. 39). Consequently, the Municipal Councils, regarding the result of its deliberations, make their wills, the aggregated or consensual interests of the participants inserted in the arena of discussion, the will of the State itself.

The peculiarity of the management Councils, at least those of deliberative nature, regarding other organs of the administration, consists in the fact that its acting is not hierarchically linked to the local government. The municipal secretariats, the local advisory bodies, the public foundations are controlled by the central organ of the administration, i.e., by the power that this one has of nominating, dismissing the leadership posts and establishing the directives of acting of the administration as a whole.

How would be possible the enlargement of the vocalization of the participant' preferences and the public control over the exercise of power if the Municipal Councils were an object of the hierarchy originated from the Municipality's Administration? The needed constraints to produce the feeling of unity of the government would obstruct the autonomous action of the civil society's representatives in front of the local Executive,

damaging a participative development of the public policies directives and the public control over its actions.

What appears original in these Municipal Councils experiences is the interaction between State and society showing a new way of the political power use, i.e., a democratic government that involves "besides the political-institutional questions of making decision, the forms of interlocution of the State with the organized society groups, in what refers to the process of definition, attendance and implementation of public policies" (ANASTASIA an AZEVEDO, 2000, p. 02).

The Municipal Councils have modified the political functioning and the identification of civil society sectors with the government. Previously excluded from the institutionalized political life, these sectors begin to demand each time more its apparition in public space. This claim is linked, in its origin, with the new associativism, represented by a new standard of collective action and occupation of public space, appeared in the beginning of the decade of 1980, that, with new associative forms, privileged the plurality that was formed through affinities, identities or sharing of values, whose examples are the movements of gender, ethnic groups, environment defense, protection to the childhood, among others (AVRITZER 1997, p. 163; BOSCHI, 1987, p. 41).

The change of standard of the collective action also happened in the forms of popular participation, the typology of limited or instrumental participation and of enlarged participation or neo-cooperative carried out by Azevedo and Prates has already become a reference on the understanding of the participative models in Brazilian reality.

The limited or instrumental participation takes place when the organized society of low income, in districts associations and other types of communitarian groupings, enters into negotiation with the state power to provide a punctual demand of collective consumer goods, in a short term. The State stimulates such population organization and, through it, employs a policy of "partnership" in which the population participates with free or sub-paid labor, while the State, in counterpart, offers a sum of resources greatly below of the existent demands.

The criticisms to this type of participation are several: first, it assumes the traditional forms of clientelism, and, perversely, demands from the part of the population with less acquisitive power a counterpart that should be a responsibility of the State itself. Finally, great part of the population would not be involved in this type of participation if the State apparatus served the society within its basic functions.

Nevertheless, these criticisms must not commit the fault of going to a Manichaean analyses of public programs that use this form of participation, because they can present, also, several positive aspects, outstanding among others: the possibility of delivering resources in areas extremely deprived of public services; the public power subsidy the resources allocation in subjects recognized as priorities for the population of

that area; and to allow sometimes citizenship profits (AZEVEDO and PRATES, 1991, p. 137).

On the other side, the Municipal Councils would be fitted in the so-called enlarged or neo-cooperative participation. This second model refers to the interest groups and social movements' capacity.

> "(...) to influence, direct or indirectly, in the formulation, restructuring or implementation of programs and public policies. It refers to, similar to what takes place in the scenery of the capitalist central countries, an effective direct involvement of the organized society sectors in the decision State arena" (AZEVEDO and PRATES, 1991, p. 136).

The Municipal Councils focus their acting in the claiming for the inclusion of new actors in the process of participation and in the demand for the insertion of new topics in the political agenda. The democratization of this process enables some issues, as the cultural heritage protection and urban planning, which do not have a great collective appeal, as it is the case of health and education, to get a space in public discussion.

> "The processes of liberation and the processes of democratization seem to share a common element: the perception of the possibility of innovation understood as an enlarged participation of social actors of several types in taking decision processes. In general, these processes implicate the inclusion of themes, up to that time ignored by the political system, the redefinition of identities and entails and the increase of the participation, especially at the local level" (SANTOS and AVRITZER, 2002, p.:59).

It is presumed that a change of paradigm of this nature, which produces a complementary relation between the representative democracy and the participative democracy, recognizes in the government approval one of its legitimacy bases (SANTOS and AVRITZER, 2002, p. 76), as the Municipal Councils act in the public space, firstly engaging in determining the general directives of a specific public policy and, subsequently, in making the Executive hand over the power of decision, of deliberation, to its area of acting.

The democratic participation is enlarged while conjugating the traditional forms of participation, as the vote and the pressure so that the elects one are responsive, to the deliberation popular forms.

4.2. The Municipal Councils and the representation

The transference of political power decision to the Municipal Councils means that political decisions became collective choices, and also made those decisions compulsory to the group issues related. In this manner, **it** is possible to identify what Sartori (1994, p. 291) denominates the two spheres of the collective decision: a

deliberative organ that defines the political rules in the name of all group issue related; and that extern group exposed to deliberations and the risks originated from them.

While the extern group is exposed to the risks of the deliberations, the deliberative organ must deal with the procedural decision cost, related "to low productivity, inefficiency, immobility and paralysis" (SARTORI, 1994, p. 291).
The equation between decisive costs and extern risks is given in the following way: as the extern risks reach only the extern group, the bigger the number of members of the deliberative organ, less the effect of the extern risk, however with higher decisive costs.

Decisive costs increase in this equation, considering that deliberative process cannot be aggregative, whereas the aggregative processes only ratify what has already been decided. The deliberative process must take into account "independent, and auto controlled, free to express" political actors (SARTORI, 1994, p. 291). Concluding, the bigger the number of subjects expressing in the same arena, the higher will be the decisive costs.

> "The key is the representation: since only the drastic reduction of the universe from the represented ones for a small group of representatives allows an important reduction of the extern risks (of oppression) without aggravating the decisive costs" (SARTORI, 1994, p. 298).

The author demonstrates the importance of the representation level regarding both the extern risks, and the decisive costs. Nevertheless, Sartori´s answer to the collective political choices equation returns to the Municipals Councils in the brazilian experience the problem that it came to solve, which is the problem of the representativeness, since the key dilemma of the representativeness is the legitimacy of its representation.

Municipal Councils present themselves as an alternative to the insufficiency of the electoral representative systems, guaranteeing a minimum representation normative, in which the representative should "act on behalf of the interest of the represented one" (LAVALLE, 2006, p. 58). This insufficiency originated from the complexity of the modern society, which makes unrealizable the preferences transitivity by the simple electoral aggregation (Arrows Theorem), brings up other questions connected to the legitimacy of the representation or the representativeness.

Though Municipal Councils don't typify classic representation instances, as the Legislative and the Executive Powers, in a similar way, they face representativeness problem, as rules start to exist to establish who can participate in the deliberative process and how it must be carried out. The representativeness is a guarantee that the collective decisions in the Councils will be legitimized, otherwise the damaged sectors will look for other alternatives for the attainment of its objectives.

> "The solution propitiated by the representative method caused the production of new problems, followed: (1) the bonds nature that join represented and representatives; (2) the represented capacity to call the attention to their

preferences before the representatives, and their capacity to supervise and to monitor their actions and omissions; (3) the representatives will and capacity to effectively act in the name of the citizens and in the defense of their best interests" (ANASTASIA and NUNES, 2006, p. 18).

Thus, the more consensual and democratic the representativeness, fewer distortions will take place in the political representation (ANASTASIA and NUNES, 2006, p. 28).

There are basically four commonest ways of establishing an entity as integrant of a council: a) by the law; b) by a plenary assembly with their peers; c) by the choice of the mayor; d) by the mixed form, which conjugates more than a form of choice.

The idea is to make the entities the more representative as possible of the society sectors connected to the Council issues.

The choice by the law occurs by the fixation of a categorical roll previously determining which will be the society representative entities in the Council. In this case, there is a freeze in the formation, as the listed entities cannot be altered but by decree. The choice by the law, even originated from a huge discussion, presents two main disadvantages regarding the representativeness: the impossibility of the representation enlargement through the choice of the representatives in the Council; and the possibility of a possession feeling of the Council chair by the representative entities, which gives it a power of bargain to defend its interests to the detriment of the representation of the sector to which it is tied.

Now the choices carried out through a plenary assembly among the peers have several advantages: the first one is that meeting act as a space of sociability of strategies position among several social sectors, increasing the representation level, as the choice of the representatives depends on the effective participation of all the interested ones.

A second advantage is that the plenary assembly can work as a way of control over the entities that are representing the others. However, the plenary assembly sessions are not a guarantee of the biggest possible representativeness presupposition, since they can have a perverse effect, which is sending a major number of entities that share the same values, leaving out of the process entities that think differently from the majority, but represents strong and important interests in the dynamic of the city politics.

The free choice of the organized society entities by the mayor is the least democratic practice, as, if all the entities subject themselves to this type of choice, there will not be space of prior interaction between the several entities. The mayor can, in these circumstances, rule the Council, choosing only the entities that engage with his way of acting and thinking.

However, in the type of mixed choice, the possibility of the mayor to indicate some entities can be a improving cause of representativeness, when representation is

attributed to a minority that represents a important interest excluded from other processes of choice.

The mixed form of counselor' choice has the advantage of handling, case by case, but also can produce distortions of representativeness, thus, the most important thing is to observe how the choosing formats are built, in order to give efficiency to the Council functioning.

Finally, it is useful to think whether the direct participation and the representation can be complementary. There is no way to deny the dimension of the direct participation in the Councils; however, the actors that participate are collective. It is prominent to see that it does not concern with the population participation, case in which the democratic dilemma that the Council aims at solving would be reproduced. However, because they are collective actors that represent a interest group, the more representative the collectivities of the city connected to the issue, the less the external risks.

However, a specific extern group, the owners of real estates nominated as a cultural relevant, as a rule, have no representation, as the administrative act happens individually, what is similar to say that, for the defense of their interests, they usually use a derived representation, it means, they look for, among the varied interests, the ones that are closer to theirs.

The normative purpose that asserts that the public policies will be better formulated and the State action more responsive if the several interests of the organized society are represented, and they, by the State side, deliberate about the political directives of the determined issue, caused several Municipalities to opt for the Municipal Councils to deal with the urban planning, including the protection of the cultural heritage policies.

In conclusion, the Municipal Councils of Cultural Heritage Protection is crucial to the Brazilians city planning since several of the protected real estates are usually situated in noble areas of great interest to the real estate market. The Councils, in this sense, can be shaped as instruments able to make real clear rules for urban planning and negotiations.

Reimagining civic art in the postwar boom: Christopher Tunnard, Kevin Lynch and the aesthetic genesis of 'Imageability'

Anthony Raynsford
University of Pennsylvania, USA

A significant portion of what is now falls under "urban design" emerged, not in architecture schools but in American schools of urban planning in the 1950s, particularly at Yale and MIT. The 1960 publication of Kevin Lynch's, *The Image of the City*, in foregrounding the visual aspects of urban form, seemed to produce something like a rupture within American planning discourses. In his introduction, Lynch gave the impression that he was entering into a little-explored terrain. "Giving visual form to the city," he wrote, "is a special kind of design problem, and a rather new one at that."[1] In fact, however, Lynch did not invent the visual design of cities out of whole cloth, nor was the problem entirely new to American urban planning. Lynch's renewed interest in urban aesthetics had strong conceptual links to the earlier City Beautiful Movement and to what had long been called "civic art." While modernist architects in the 1950s continued to critique the tradition of civic art, with its figural monuments and axial perspectives, a key group of American planners had already begun to reinvent the aesthetic techniques of civic art within a modernist framework of urbanistic pluralism and visual abstraction. In 1953, Lynch's friend and city planner at Yale, Christopher Tunnard published *The City of Man*, in which he had called for a revival of a civic art tradition that he traced back to the Italian Renaissance and to the American City Beautiful Movement.[2] While Tunnard stressed the historical continuity between his aesthetics of "creative urbanism" and earlier versions of civic art, Lynch deliberately repressed them. However, it is only by examining both authors in the context of a larger planning conversation that one can begin understand reasons for the surprising revival of civic art in the 1950s and well as its transformation into Lynch's cognitive model of "imageability."

This essay investigates the interconnected work of Christopher Tunnard and Kevin Lynch in the early 1950s, arguing that their theories effectively revived but also transformed an older civic art of monuments, streets and squares into contemporary paradigms of urban design. In the 1950s the phrase, "civic art," commanded little consensus among planners and architects, either in terms of its relevance to city planning or in terms of its theoretical underpinnings.[3] As an area of professional concern, civic art had come to hold an increasingly marginal position within urban planning. Not only were aesthetic issues difficult to define as a public good, but it was also domain over which few could claim professional authority. As urban planning became increasingly dominated by various applications of social science, civic art had become increasingly marginalized as a specialization attached to "physical planning." Rather than being seen as a central organizing device for urban reform, civic art was seen increasingly as an aesthetic supplement to planning, even a superfluous one.[4] Tunnard's revival of civic art, in particular, contrasts with the better known Urban Design Conference of 1956, whose organizers continued to reject the terms 'civic art' and 'civic design' for their association with City Beautiful aesthetics and ideologies.[5] In beginning to spearhead a movement for civic art, therefore, Tunnard had to reassert its coherence

and relevance for contemporary urban planning in the wake, both of architectural modernism and of an urban planning increasingly dominated by social science. In doing so, he laid some of the foundations for Lynch's apparently new and scientific understanding of the city as a visual form and for environmental design as an emerging interdisciplinary profession. Thus, the reinvention of civic art in the 1950s constitutes one of the significant but little-studied moments in the history of urban planning.

I.   Reviving the City Beautiful in the 1950s: Christopher Tunnard

Christopher Tunnard first began to turn to City Beautiful aesthetics against the grain of his earlier modernist convictions. He had started his career in Britain as a landscape architect closely associated with the British modernists of CIAM. His first book, *Gardens in the Modern Landscape*, published in 1938 and based on a series of articles he had recently written for the *Architectural Review*, attempted to strip landscape architecture of all its historical preconceptions and romantic associations. Tunnard's main thesis was that landscape architecture had failed to keep pace with the other arts, particularly with architecture. It was this close alliance with European modernism that initially brought Tunnard to the United States in 1939. He first arrived as a lecturer in landscape architecture at Harvard's Graduate School of Design, having been invited there, along with Bauhaus founder Walter Gropius, by the dean of that school, Joseph Hudnut.[6] As dean, Hudnut was perhaps best known for having purged Harvard of its Beaux Arts tradition in architecture. At the same time, however, he had remained ambivalent toward the modernist urbanism developed by CIAM in the 1930s.[7] Whereas Gropius continued to push the teaching urban design as an extension of the Bauhaus method of abstract form and composition, Hudnut had begun to teach a series of civic art courses, using historical cities such as Rome and Paris as case studies.[8] Arguing more generally against the modernist placement of buildings as isolated objects in park-like settings, Hudnut proposed "that the walls of the buildings should follow the lines of the streets."[9] Thus, the questions of visual scale, enclosure and continuous street fronts turned, not only on a continuity with an earlier civic art, but from a metaphor of street-as-theater derived from Renaissance humanism. As Tunnard switched from landscape architecture to city planning in the late 1940s, he also increasingly became an advocate of Hudnut's version of civic art.

By the early 1950s, Tunnard was beginning to apply classical principles of urbanism, including the use of axial vistas, to contemporary urban planning and was soon calling for urban planners to reconsider, not just civic art in general, but the City Beautiful Movement in particular. The City Beautiful Movement seemed useful for two reasons. In narrative terms it represented the most recent historical moment in which architecture and city planning had been firmly united, and thus it framed a 'usable past' for theorizing a large-scale visual planning. In aesthetic terms, the City Beautiful principles of axial views and monuments suggested a method for visually coordinating postwar American cities, especially central city areas that had suffered from physical neglect, obsolescence and economic abandonment. When Tunnard first explicitly advocated a return to City Beautiful principles in an article in 1950, he did so tentatively, almost

apologetically: "My excuse for discussing somewhat familiar material is based on a conclusion that the City Beautiful movement stood for more than its official title implies and that the most important contributions to American planning have been obscured in recent years by a fashionable denigration of its architects and their ideas."[10] Tunnard did not immediately tackle the more controversial issue of the movement's Beaux Arts classicism, but focused instead on its visual coordination of the city and on its proto-regionalism, points on which many modernists might agree with him, at least in principle.

For a city planner to actively advocate a revival of the City Beautiful principles in this period would have been seen by most planners and architects as extremely regressive and anachronistic. For most experts, the City Beautiful Movement was both aesthetically and functionally obsolete, and even probably misguided in its own time. Echoing a common opinion of the period, the planner Henry S. Churchill wrote of City Beautiful aesthetics in 1945: "Fortunately, little of it came to pass, except in Washington and an occasional place that got out of control like Harrisburg."[11] Although City Beautiful advocates, such as Daniel Burnham and Charles Mulford Robinson had attempted to treat the city as a functional whole, especially in terms of transportation and zoning, the movement had become mainly associated with expensive, classically inspired civic center groupings, either partially realized or remaining, as in Chicago, only a fantasy on paper.[12] In pragmatic terms, its formal model of monuments, boulevards and public squares were increasingly seen to be at odds with contemporary functions, such high-speed automobile traffic and newer patterns of housing. Most notably Le Corbusier, whose writings on urbanism increasingly displaced earlier civic art theories, had called for the death of the traditional street, or *rue corridor,* and thus the possibility of forming street pictures, the traditional perspective views, or *veduti*, of civic art.[13] If the City Beautiful forms were considered functionally obsolete, its aesthetic principles were beyond the pale, both in its use of Beaux Arts classicism as a unifying theme and in its use of grandiose monuments to act as visual focal points along major axes. With the ascendance of architectural modernism in the United States in the late 1930s, many found civic art treatises, such as Werner Hegemann and Elbert Peets' 1922 *American Vitruvius: An Architect's Handbook of Civic Art*, not only historicist but visually outmoded in its emphasis on classicism and perspective views. Beginning already in the early 1920s, modernist critics such as Lewis Mumford had derided, as aesthetically false and pompous, the classically derived forms of civic centers that had been the urbanistic crown jewels of the American City Beautiful Movement around 1910. Modernists had critiqued both the meaningfulness and usefulness of traditional urban monuments, especially figural monuments.

Tunnard, however, was not advocating a literal revival of City Beautiful plans; rather he was attempting to adapt its pictorial modes of representation to contemporary urban conditions. His 1951 article, "Creative Urbanism," functioned as a manifesto for the type of pictorial urbanism that he envisioned. The article set out first to define the role of the creative designer as a professional who would be equal in status to various planning experts, such as social scientists and engineers, and whose proposals for visual form of the city would take the advice of such experts into account. The visual designer, he

wrote, must replace the technocrat as the coordinator of planning decisions. At the same time the tools of civic art must expand to account for new social patterns in the city: "Questions of scale and proportion, apparent size and other relations must be thoroughly studied… especially in relation to problems of density and economics suggested by the social scientist."[14] The modern city, accordingly, could be mapped by "strategic points" of high functional significance, to then be designed in three dimensions by the visual designer to enhance and frame views of these strategic points. Thus existing urban monuments might be scenographically framed as the visual focal points for distinctive urban districts, thereby making the city, as a whole, socially and functionally visible. Part of Tunnard's project, which would later become central to the work of Kevin Lynch, was to identify "related areas" of the city that already contained some social or historical meaning and, using their aesthetic qualities as "starting points," develop a comprehensive three-dimensional urban form: "The actual urban form is variable and of patterns on the ground there are a thousand possibilities, but the forms will already have a quality stamped by variety in height, in vertical and horizontal emphasis, in looseness or compactness of structure."[15] (Figure 1.) This particular passage, which combined elements from the picturesque theories of Townscape as well as modernist formalism, spoke to the eclecticism of Tunnard's aesthetic sources. It was only in linking such related areas within a visual totality that City Beautiful strategies explicitly emerged. However, where City Beautiful theorists, following the older Baroque tradition, had proposed linking significant monuments placed axially on major avenues, Tunnard proposed that the linkages would be mainly visual ones. High speed traffic, according to modern requirements, would then be accommodated separately from the arrangement of axial vistas.

Despite Tunnard's somewhat abstract and partial adaptation of City Beautiful principles, his increasingly strident polemics soon branded him as a classicizing reactionary. In his 1953 book, *The City of Man*, Tunnard attacked the modernist architectural establishment while also advocating the metaphor of the city as stage scenery. European modernist urbanism, in his view, was a failed experiment. Architects today, he claimed, should not look back to the utopian urban schemes of the 1930s, rather their "new urbanism" should restore the visual principles of "Grand Design," distinguished by "an emphasis on scale and proportion, on *ensemble*, on ornament, on humanism."[16] More generally repudiating modernist methods of extrapolating urban forms from functional zones and circulation patterns, Tunnard proposed a visual conception of the city as a series of integrated viewpoints, urban backdrops, whose functions would continually shift: "We must learn not to create space patterns from space-flow diagrams for people to follow in their daily lives, but to create *space* in which people can form their own patterns… a secret known formerly to urbanists of the Renaissance."[17] The seeming humanism of the Renaissance city had lain in the mediation of the artist between the city as a functional aggregate and the viewer in the street.

In April 1953, Tunnard co-curated a small urban design exhibition, entitled *Ars in Urbe,* that took place in the Yale University Art Gallery. The exhibition presented urban scenes and fragments in what it called the "style image" of ancient Rome. A triumphal arch at the entrance had been painted for the occasion by students in Yale's drama

department, which had also lent an engraving of Serlio's "Model Scene for Tragedy." (Figure 2.) After passing through the canvas arch, visitors saw recent photographs of Roman ruins, architectural fragments, a copy of the 1551 Bufalini map of Rome, and various painted views, including two Canaletto depictions of the Piazza San Marco. For most observers trained in modernism, the challenge posed by *Ars in Urbe* was less the fact that it represented the past, as it was the particular *way* in which it represented that past. The objects in the exhibition combined various perspectival views with sculptural artifacts and devices clearly associated with an older Beaux Arts pedagogy.[18] For example, the section on "Roman Ornament," displayed plaster casts of the "classical orders of the column" next to a Pannini painting of the Pantheon and a portrait statue of Caligula.[19] Critics were particularly provoked by the last section of the exhibition, which focused on American Beaux Arts images from the early 1900s: A Jule's Guérin painting from the 1909 plan of Chicago; an interior view of McKim, Mead and White's Pennsylvania Station; and a 1902 sketch for Edwin Austin Abbey's allegorical painting, "The Apotheosis of Pennsylvania."

The fallout from *Ars in Urbe* quickly took on the quality of a scandal both within Yale's School of Architecture and among a wider public. Various Yale faculty and administrators expressed their concern or alarm over the *Ars in Urbe* exhibition, particularly the last section on the "Persistence of the Style Image," with its Beaux Arts imagery and its suggestion that in such images lay the future of American civic art. In August 1953 the dean of the School of Fine Arts, Charles H. Sawyer, in congratulating Tuunard on the publication of *City of Man*, nevertheless expressed his dismay over what he saw as Tunnard's anti-modernist interpretation of civic art: "Beauty is an active rather than a static concept to my way of thinking and while I can respect the Fair of 1893 for bringing a sense of order or oneness into a larger an monumental composition I shudder at the thought of re-enacting it in the mid-twentieth century in any similar dress."[20] From the dominant modernist position of the period, Tunnard's version of the classical urban past, consequently, seemed to be embodied in an all-too-literal way. "It is surely true that there is much to be learned from the past," wrote the architectural critic Aline Louchheim, who reviewed *Ars in Urbe* for the *New York Times*, "But it seems defeatism to hanker longingly for the scale, the ornament, the vocabulary, which another age evolved to express itself."[21] What annoyed Louchheim was the consequent failure to differentiate between an authentic classicism and its stage-like simulacrum.[22] In response to a caption praising the 1893 World's Columbian Exposition, Louchheim asked: "Hadn't the [Classical] style become then in meaning what it was in actuality – plaster facades like movie sets?"[23] *Ars in Urbe*, if not quite a movie-set itself, nevertheless encouraged the metaphor of city-as-scenery. After 1953 Tunnard's advocacy of the City Beautiful would be increasingly marginalized within the mainstream of American planning and architectural discourse. His continued interest in classicism would find outlets mainly in such antiquarian venues as *Classical America*.[24] However, some of the more general problems raised by Tunnard's City Beautiful polemics, especially questions of visual scale, axial views and "related areas," would reemerge in the works of other planners, notably forming a significant part of the theoretical background to Lynch's *Image of the City*.

II. Crisis of scale – the Civic Art Conference of 1952

If Tunnard's idea of reviving the City Beautiful Movement in the 1950s proved quixotic, the public discussions of the topic spurred a fresh wave of creative rethinking about the postwar city. In spring of 1952, Tunnard had organized the Civic Art Conference, which was attended by a broad cross-section of architects, urban planners and art historians. Tunnard divided the conference into three sessions, according to what he considered the most pressing issues: Urban Esthetics; Monumentality and Modern Architecture; and Patronage and Civic Art.[25] It was an eccentric theme by mainstream standards of American urban planning in that decade. Conceived by Tunnard as means of reconsidering the great tradition of civic art, spanning from the Italian Renaissance to the American City Beautiful Movement, the conference was intended to reinsert what Tunnard explicitly called "beauty" into the center of urban planning concerns. To set the mood, he invited historian Fiske Kimball, the once prominent promoter of American classicism to deliver the keynote address on the topic of "Jefferson and Civic Art."[26] If the conference had been intended at the outset as a kind of provocation against modernist architecture and 'scientific' urban planning alike, it also served as a catalyst for a rethinking of modernist aesthetics and visual planning that extend far beyond Tunnard's intentions or expectations. The conference brought together planners, architects and historians, many of whom were embroiled in the upheavals of urban redevelopment and highway building and thus who viewed the matter of civic art through a distinctly contemporary lens.

Narrow questions of style and ornament soon led to more general questions of visual perception and subjective alienation. One of the discussants, Anthony Garvan, a professor of American Civilization summarized the sense of perceptual crisis underlying the desire to revive civic art: "There is another question here – not only of ornament, not only of moving at speed- but the important one that buildings before our time were designed for men and the individual observer. That is the utterly terrifying fact about modern architecture- that so many buildings are not designed for individuals, walkers, drivers, or anything else; but in fact they divide men, push them out (a complete misreading of early writers on functionalism)."[27] This was an issue quite apart from the particular forms of City Beautiful aesthetics. To the extent that modern buildings no longer seemed even to direct themselves to an individual observer in the street, the city itself seemed to have become opaque, out-of-scale, indifferent to its inhabitants.

This comment, in fact, echoed a much wider discussion that had gradually been emerging over the previous decade. By the time of the Civic Art Conference, American planners and architects, holding a wide range of aesthetic and ideological positions, had begun speaking of the need to "humanize" the city. This discourse of humanization focused on an imaginary, average viewer who was thought to be alienated and disaffected by the physical appearance of the city. Many described American cities as being out-of-scale, visually chaotic, overly mechanized, and hence also, "inhuman." Architects, in particular invoked public art and their corresponding urban spaces, now as a means of overcoming the twin deficiencies of rigid functionalism and an aesthetically

indifferent "social" planning. Others spoke of the need, not only for planners and architects to transcend functionalism aesthetically, but also to make functional forms visually meaningful to individual perceivers. Thus, a 1945 conference, entitled "Planning Man's Physical Environment," which brought together leading planners and architects from the United States addressed "the philosophy and the psychological effect of form," including "the necessity for architecture's transcending its utilitarian functions" and "the relation of significant form to experience and purpose."[28] In each case, there was a sense that urban dwellers needed meaningful urban forms, either through symbolically important monuments or through forms that communicated some level of social function. Hoping to reintroduce a conscious aesthetics into city planning, they claimed for urban aesthetics a corresponding social need. Likewise, the British Townscape writings of the mid-1940s, which became widely known in American architectural circles, addressed a theoretical "man in the street," who had become alienated by modernist urbanism and who needed to be addressed in an aesthetically accessible manner.[29]

When Kevin Lynch attended the Civic Art Conference, he was thus also participating in this wider conversation. Writing to Tunnard in early May, Lynch described the Civic Art Conference as having been "a very stimulating affair," adding: "My only regret is that we did not have more of our students sitting in, but to make up for it we are staging a review and discussion of the conference here this evening."[30] The great conundrum raised by a number of the speakers, namely how traditional theories of civic art could be reconciled with the expanded scale of the metropolis and mechanical upheavals, proved to be a fundamental starting point for Lynch's work. More specifically, the conference helped him to focus on two particular issues that would increasingly converge in his thinking: the problem of visual scale in viewing cities from the ground and the question of mentally forming an overall picture out of a series of views. In the spring of 1952, when he attended the conference, Lynch was about to embark for Italy on a Ford Foundation grant, and it was in Italy, especially in Florence, that he would begin to extend the questions of scale and perception into a discourse of memory and consciousness. Tunnard, who had helped Lynch to secure the grant, had been steadily advocating that Americans go to Europe to study its historical examples of civic art, to observe these cities directly rather than relying only on their pictorial representations.[31]

One of the papers delivered at the conference by a German émigré planner named Hans Blumenfeld spoke precisely to Lynch's interest in Florence.[32] For Blumenfeld the expanded form of the metropolis posed a perceptual crisis for the observer on the ground, for whom buildings, streets and the city as a whole were no longer in scale. The perceptual problem extended to professional urban planners, who, caught as they were in the mediations of specialized knowledge, were unable to see in their minds the physical cities that they were planning. In his paper, entitled "Scale in Civic Design," Blumenfeld began with one of the basic conundrums that this issue of scale had raised for city planners. It sometimes seemed, Blumenfeld remarked, "that the designer has only the choice between attempting to master the metropolis by blowing up all the elements of design to a gigantic scale, or renouncing any attempt to master it as a whole, and being satisfied with decorative embellishments of this or that part."[33] The more architects and planners tried to deal with elements scaled to the views of

individual observers in the street, the more they lost track of the relationship between these parts and some larger urban whole. However, the more architects and planners designed large scale schemes or structures that might formally unify the urban whole, the more such elements appeared to be inhuman, or as Blumenfeld described it, extra-human, simply beyond the scope of ordinary visual perception. A city such as Florence, according to Blumenfeld, could either be seen from the inside as series of streets and squares, or from the outside as a silhouette. From either perspective, one could still perceive the entire city, or, as Blumenfeld phrased it, form a "mental image" of it. (Figure 3.) "The desire to grasp the city as a mental image," Blumenfeld stated, "is deep seated and powerful."[34] He made these remarks on the "mental image," almost parenthetically, suggesting that it was central to the whole problem of urban aesthetics but without explaining it further.

III.   Cinematic optics and the "mental image": Kevin Lynch

In some ways Kevin Lynch seemed the least likely candidate to take an interest in Tunnard's apparently regressive idea of civic art. Like many architects and planners in the late 1940s, Lynch had been engaged with the problems of urban obsolescence and design flexibility. How could the urban infrastructure keep up with the rapid pace of social and technological change?[35] Moreover, when Lynch joined the MIT faculty just a year later his closest associate, György Kepes was an avowed modernist in the Bauhaus tradition of László Moholy-Nagy. Although Kepes was not himself an architect, he strongly favored a Miesian aesthetic of glass-and-steel buildings and light, modular assembly. As he became increasingly involved in visual issues of urban planning, moreover, Kepes clearly envisioned some version of this modernist aesthetic extending into the built environment as a whole. Nevertheless, Lynch soon found common ground between the aesthetic positions of both Tunnard and Kepes. Despite their overwhelming differences of approach, Kepes and Tunnard were equally committed to problem of connecting the visual impressions of the individual observer from the scale of particular views from within a street to the scale of the city as a whole.

Kepes, who joined the School of Architecture and Planning in 1946, had from the beginning been dealing with the question of subjective orientation, framing it as a crisis of the individual amidst an uncontrolled expansion visual scale and complexity in the urban environment. Kepes saw the chaotic, visually fragmented, modern city partly as a subjective failure to assimilate such phenomena into perception and partly as an artistic failure to coordinate the city visually. He repeatedly described the modern city as having become too fast and complex to accommodate subjective orientation. The speed and discontinuity of the visual environment was thus out-of-scale with subjective consciousness. In his 1947 essay, "The Creative Discipline of Our Visual Environment." Kepes called for consciously ordering the new forces of technology, and then giving that order an environmental, visual form.[36] The contemporary built environment, Kepes claimed, prevented the individual from establishing mental connections to the larger social world, in a way that would allow visual subjectivity to encompass wider and faster sequences of visual impressions.

When Lynch began to collaborate with Kepes in the early 1950s, one their central questions was the relationship between visual impressions of the city experienced over time and the cognitive structures of meaning and memory. Both saw an obvious analogy with film, in which a flashing sequence of images might add up to a meaningful narrative. In the fall semester of 1951, Lynch led an "Experimental Seminar in the Visual Form of the City," in which he and Kepes began to investigate the question of visual subjectivity in urban form. The annotated bibliography that Lynch prepared for the seminar is instructive, for it reveals the types of visual materials that Lynch found most compelling in studying this problem. Many of the writings in the bibliography, drawing on both well-known civic art treatises, such as *The American Vitruvius* and British Townscape writings, directly or indirectly suggested a cinematic analogy. [37] Raymond Unwin's 1909 *Town Planning in Practice*, included in the bibliography, echoed the City Beautiful theory that streets and roads should be arranged, not only for traffic flow, but also for the provision of effective sequence of street pictures, as produced by effective groupings of buildings. At the same time Unwin provided a proto-cinematic approach to urban views. Of Oxford High Street, he wrote, for example: "the curved road affords to those passing along it an ever changing picture, a new grouping of buildings coming into view at every point."[38] Gordon Cullen's "Townscape Casebook," also included in the bibliography, compared the eye with a movie camera and illustrated a sequential panorama of the houses of parliament, showing the continuity of shifting perspectives as seen from an imaginary walk. (Figure 4.) On the same page a sequence of three photographs traced a visual path through an arch and toward a Gothic tower beyond.[39]

Part of the purpose of the experimental seminar was to test the adequacy of pictorial analogy by comparing it against direct visual experiences of the city. Much of the seminar was literally experimental in as far as participants were asked to produce their own subjective impressions, either from memory or during collective walks around Boston and Cambridge. Summarizing one of the discussions, Lynch described a variation on the cinematic analogy: "In most cases the individual receives his impression of the city from small bits, as a sequential series of images, loosely composed. The photograph may often falsify the true impression received by the eye, since the photo has a frame, a static quality, and lacks the small-area focus." When moving through the city attention seemed to be drawn in every direction. Lynch noted the "chaos of detail in the city and the constant exercise of selectivity by the individual."[40] Unlike the camera, the eye did not frame a sequence of organized views but moved from one detail to the next as static or ephemeral shapes came to attention. Turning to the question as to why ancient cities seemed to be more visually satisfying, the seminar addressed again the sequence of views and their visual coherence.

Such visual coherence, however, could not be entirely separated from a kind of symbolic coherence. In the various presentations and discussions of historical cities, the emphasis turned to processional, ritual spaces and monumental building groups. Edmund Bacon of the Philadelphia Planning Commission delivered a lecture on the spatial articulation of symbolically significant spaces in Jerusalem and Beijing, the latter with its "progressive series of space experiences climaxing in the throne room."[41] A

series of student presentations then focused on examples such as the medieval town of Warwick in England with "its foci of church and castle, [and] the harmonious mixture of styles on the main street." Another presentation examined18[th] century St. Petersburg, whose unity was generated by its "control of silhouette, great central square, [and] long processional streets."[42] The sequence of views in such cities, it was implied, followed a symbolic logic that linked them together. Such sequences, punctuated and made meaningful by the framing of monuments depended on the visual as well as symbolic weight of these monuments. However, for Lynch such unified, collective symbolism could no longer be attributed to modern viewers. Urban societies had become too secular and pluralistic.

Rather than seeking symbolic unities in cities such as Florence Lynch sought to apply the formal, structural principles of civic art, particularly the idea of visually unifying different parts of the city in an abstractly functional but visually dense manner. Lynch's interest in a variety formal elements and urbanistic traditions, including axial views of monuments, grid systems and picturesque contrasts, ultimately aimed at their combined effect in orienting an individual observer. Thus, when Lynch arrived in Florence in the fall of 1952, he already knew, to some degree, what he wished to find. "One of the most important features of a city" he wrote in early November, is "that it express relationships, i.e., that it have parts of specific differentiated character, which are already related, so that it is easy to move where you want to go, and so that in one spot you are conscious of the relations with all the other parts."[43] In order for these relationships to become apparent, Lynch continued, there had to be establishing views, such as the panorama of Florence from the surrounding hills or else views of dominating towers from within individual streets.[44] Relating the different parts of the city in consciousness, through seen and remembered views, amounted to having a mental image of the city. However, these parts had, for Lynch, no inherent meaning or content. They were semantically abstract forms, whose structure could accommodate multiple significations within a stable structure of relations. Lynch's primary concern with Florence was with its contemporary impact on perception, on himself and on the contemporary Florentines. If the city had a distinctive form, its possible meanings were as varied as the perspectives of its different inhabitants. Thus, the core of Lynch's theory of imageability existed, *in nuce*, before he even began the official project in 1954, funded by the Rockefeller Foundation that would lead to *The Image of the City*.

Conclusion: Imageability as abstract civic art

In *The Image of the City*, Lynch suggested that his findings emerged primarily out of a series of interviews with urban inhabitants, asking them to describe and draw their mental images of their own cities, specifically Boston, Jersey City and Los Angeles. Lynch also indicated that his theoretical interpretations engaged perceptual psychology, environmental anthropology and even animal behavior. As the archive makes clear, however, his concepts had already been fundamentally shaped by the earlier discussions of civic art, including Christopher Tunnard's revised version of the City Beautiful. Let us briefly reconsider the five visual elements that Lynch famously found to form, in combination, the mental image of the city: the path, the node, the edge, the

district and the landmark. (Figure 5.) If one substitutes the following words instead: the avenue, the intersection, the wall, the precinct and the monument – which would constitute specific examples of Lynch's more general categories – then one can find, in each case, urbanistic precedents, of which only the most obvious is the Baroque tradition of avenues and monuments, which formed part of the aesthetic core of the City Beautiful. Lynch's abstraction of such elements, however, was not merely a matter of hiding their aesthetic genealogy. It was also a matter of removing from them any specific forms or associations. Landmarks could look like anything as long as they were visually distinctive. They could carry any number of associations or meanings, even conflicting ones, as long as long as they remained embedded within a strong visual structure.

Lynch's abstraction of City Beautiful aesthetics from specific content, in fact, paralleled the moves of other planners in the early 1950s with whom Lynch actively corresponded. In his 1954 essay, "Urban Aesthetics," for example the American planner Sydney Williams described the importance of both "formal" and "informal" vistas as providing a structure for orientation and meaning: "Individually significant architectural masses, together with urban open spaces, should be linked with vistas, and used to provide an essential set of visual reference points for the orientation of the individual within the city."[45] Just as with Lynch, the axial boulevard leading to the monument, or "formal vista," becomes just a subcategory of the more general urban vista, whose exact form and meaning remain indeterminate. Thus, Lynch's conception of imageability transmuted the earlier concerns of civic art with the siting of monuments and the promotion of civic unity into a more open-ended, abstract sense of the subjectively meaningful cityscape. In an era when traditional monuments could no longer signify the same way, Lynch continued to insist that the city required interconnected, visual focal points, psychological anchors for a modern urban subjectivity. The imageable city was not merely a place in which one might be well oriented in a topographic sense. Rather the imageable city was also a place in which personal and collective experiences would imprint itself on urban form. The distinctive nodes and landmarks of would collect memories and associations, orienting the subject both spatially and narratively. It is in this sense of perspectival subjectivity that one might profitably speak of the *Image of the City* as presupposing an existential optics, in which in which the city becomes, not an object of fixed or pre-ordained signification, but rather the site of possible meaningfulness that is completed by the individual pathways of many individuals. Rather than presenting some unified or organic coherence, unifying both social and urban forms within some mythical universal, Lynch's work suggested a way in which a pluralistic urban society, characterized by multiplicity and difference might, nevertheless, share a common urban space.

Although Lynch's and Tunnard's work emerged out of the same set of discussions on civic art and urban aesthetics in the 1950s, Lynch himself increasingly suppressed this history. In his 1985 essay, "Reconsidering *The Image of the City*," Lynch recalled, "The research was done by a small group with no training in the methods they used, and no literature to guide them."[46] Lynch's discounting of the abundant literature on urban aesthetics that, in fact, guided his research resulted from his deliberate turn to social

science as a legitimating paradigm for visual planning. When Lynch asked the sociologist Herbert Gans to respond to his early research in 1954, Gans responded "Architectural ideology always makes assumptions about emotional effects of structures, but we really don't know whom they affect, besides architects, and if so, how."[47] Over the course of the 1950s, Lynch became increasingly sensitive to the charge that he and others concerned with urban aesthetics might be imposing an arbitrary, if not elitist ideology of urban form. Tunnard's model of civic art seemed increasingly out of step with theories of scientific planning and pluralistic, democratic societies. Whereas Tunnard, confident in his own aesthetic connoisseurship, advocated an enlightened patronage for civic art, Lynch increasingly avoided the term aesthetics and attempted to ground his theories in seemingly objective, scientific theories of perception. Therefore, foundational and, in fact, structurally essential sources for Lynch's theory of imageability became increasingly illegitimate until their status as sources were erased or forgotten.

[1] Lynch, Kevin, *The Image of the City*, (Cambridge, MA, MIT Press, 1960), p. v. The fact that Lynch's cited sources derived mostly from psychology and anthropology reinforced the impression that he was somehow inventing a new science, in which he needed to cobble together scattered ideas from other disciplines.

[2] For a detailed history of the City Beautiful Movement and its ideology see: Wilson, William H., *The City Beautiful Movement*, (Baltimore, Johns Hopkins, 1989).

[3] The main opposition lay between those favoring the retention of earlier models of civic art, including the perspectival traditions of the Italian Renaissance and the English picturesque, and those who proposed adopting some form of European modernism, derived from the early 20th century avant-gardes who had posited the emergence of novel, anti-perspectival sensations of space. The 1944 collection of essays, entitled *New Architecture and City Planning*, which contained sections on civic art as well as on monumentality, set forth opposing opinions on the forms that urban aesthetics should take in the postwar rebuilding of American cities.

[4] By the 1930s already, the emphasis of American city planning had shifted away from aesthetic ideals to more purely practical and functional concerns. Histories of American urban planning have often described the shift from the City Beautiful ideal to those of the "City Functional" or "City Beneficial" after 1910. See, for example, Mel Scott, *American City Planning since 1890*, University of California Press, Berkeley, 1969.

[5] The conference was organized by José Luis Sert, dean of Harvard's Graduate School of Design and was the first in a series of 13 conferences that lasted until 1970. For a summary of the 1956 conference, see "Urban design," *Progressive Architecture*, August 1956, v. 37, p. 97-112. For a historical perspective on the 1956 conference and its impact on the idea and practice of urban design, see *Harvard Design Magazine: The Origins and Evolution of "Urban Design," 1956-2006*, Spring/Summer 2006 (entire issue). In his article, "The Way We Were, The Way We Are," Jonathan Barnett remarks on the negative consequences of conference's disavowal of the "civic," *Harvard Design Magazine," 1956-2006*, Spring/Summer 2006, pp. 61-62.

[6] There are differing accounts as to who instigated this invitation. According to Lance Neckar, Hudnut was either persuaded by the landscape architects, Dan Kiley, Garret Eckbo and James Rose, or by Walter Gropius. See Neckar, Lance, "Strident Modernism / Ambivalent Reconsiderations," in *Journal of Garden History*, v. 10, Fall 1990, p. 241

[7] In many ways he had also remained sympathetic to his former colleague Werner Hegemann's approach to civic art, with its emphasis on streets, squares and monuments. The cities that Hudnut illustrated in his lectures, moreover, came largely from the very Renaissance and Baroque tradition that European modernists had soundly rejected in the 1930s.

[8] For a detailed analysis of Hudnut's struggle against Gropius' version of modernism, particularly his method of urban design, see Jill Pearlman, "Joseph Hudnut and the Unlikely Beginnings of Post-Modern Urbanism at the Harvard Bauhaus," *Planning Perspectives*, vol. 15, 2000, 201-239; see also Pearlman's

dissertation, *Joseph Hudnut and the Education of the Modern Architect*, Department of Art History, University of Chicago, 1993, pp. 225-295. Curiously, Pearlman does not mention Tunnard's role in this critique of modernist urban design.

[11] Churchill, Henry S., *The City Is the People*, (New York: W.W. Norton & Co., 1945), p. 69

[12] Even Hegemann and Peets' *American Vitruvius*, which included plentiful examples of City Beautiful groupings as models for civic art, had cast doubt on the idea that the principles of the City Beautiful Movement could aesthetically transform the city as a whole, noting: "It would, however, indicate forgetfulness of the sore fate of great ambitions if the American city planner should too optimistically hope for a transformation of such large cities as New York and Chicago from their present state into 'cities beautiful.'" - Hegemann, Werner and Peets, Elbert, *The American Vitruvius: An Architect's Handbook of Civic Art*, Architectural Book Publishing Co., New York, 1922, p. 227

[16] Tunnard, Christopher, *City of Man*, Charles Scribner's Sons, New York, 1953, pp. 233-34. Tunnard most likely picked up the phrase "new urbanism" from the title of Gaston Bardet's 1945 book, *Pierre sur Pierre: Construction du Nouvel Urbanisme* (Editions L.C.B., Paris). Bardet's book included a devastating critique of Le Corbusier's *Ville Radieuse*, which he dubbed "la Ville Ombreuse." (p. 180) In *City of Man*, Tunnard reproduced Bardet's diagram of the long shadows that would be cast by Le Corbusier's projected apartment blocks, undermining one of Le Corbusier's primary functional justifications for the scheme.

[17] Tunnard, Christopher, *City of Man*, (New York, Charles Scribner's Sons), 1953, p. 344

[18] Furthermore, the different sections of the exhibition were given such titles as "Source of the Style Image" and "Persistence of the Style Image," bringing the classical city under the signs of fashion and external appearance. Modernism, by many accounts, was supposed to have dispensed with styles, and, in its social concern, emphasized programmatic content over image. To attach 'style' and 'image' in the same phrase describing urban design was to commit a kind of double offense against such modernist sensibilities.

Redefining the dual city: changing ideas of plural citizenship in colonial/postcolonial Singapore

Anoma Pieris
University of Melbourne, Australia

The dual or dialectic thesis underlies many of the histories of colonial urban contexts, where as argued by Kaplan and Holloway, asymmetrical race relations, the struggle between capital and labor, and the conflicts caused by repression and resistance offer simultaneous social, economic and political readings of the dialectic.[1] The term 'divided city,' which was used to illustrate economic and spatial divisions in Europe, typically describes racial segregation in the colonies as evident in 'orientalist' accounts by travelers and colonists such as W.H. Russel on India and John Cameron on Singapore.[2] In many colonial societies, social distance based on race and class was interpreted as spatial distance and maintained through practices of differentiation, discrimination and self-segregation, and by identifying deviance.

There have been substantial contributions to the historiography of the colonial city during the late twentieth century influenced by Edward Said's book *Orientalism*, postcolonial studies and post structuralist theory.[3] The work of Franz Fanon, Janet Abu Lughod and others, addressed specific notions of colonial urban duality, based on readings of dialectic materialism.[4] Orientalist spatial strategies, representations of power, and the production of new forms of metropolitan and colonial subjectivity were subsequently explored in the work of Anthony King, Thomas Metcalf, Norma Evenson, Gwendolyn Wright, and Paul Rabinow.[5] Similar patterns of dominance were recognizable in various cultural encounters, and numerous interpretations of the dialectic resulted; such as the gendering of colonial Algeria described in the work of Zeynep Çelik or contestation over Singapore's public spaces in Singapore, described by the geographer Brenda Yeoh.[6]

More recently, the work of a new generation of scholars focuses on the de-centered narratives of the subject populations under colonial rule, as investigated in the anthology *Colonial Modernities* by Vikramaditya Prakash and Peter Scriver.[7] The work of Jyoti Hosagrahar and Swati Chattopadhyay, included in this collection, explore indigenous constructions of modernity intersecting with elite, colonial, material culture.[8] For example, Chattopadhyay challenges representations of the colonial dual city as separate and distinct arguing that "the economic, political and social conditions of colonial culture penetrated the insularity of both towns."[9]

Southeast Asia, identified through itinerant kingdoms, migrant trajectories, and settler histories, offers a correspondingly different interpretation of colonial power relations and built environments. The conflation of immigrant and urban identities in many locales prevents the easy dissection of colonial society into 'indigenous' versus 'European,' 'black' versus 'white' and injects issues of geographic belonging and displacement into an already uneven cultural mix. Considering Malaya as an illustration of this point, pre-colonial settlers had developed an "archipelagic pattern of flexible ethnicity," which took

the co-existence of Indian and Chinese immigrants with numerous Southeast Asian ethnic communities into account.[10] Some of these groups were incorporated into existing social hierarchies while others remained distinct for cultural or economic reasons. Therefore in Singapore, while urban social divisions were planned and the structure of the economy was dialectical, in many respects, the operation of power was both politically and socially differentiated due to the racial diversity of the settler population. The structural order was imposed in order to compensate for the lack of colonial authority, due to subordinate systems of self-government. Singapore provides an interesting application of the plural social model to the dual city.

The objective of this paper is to examine how an urban system devised for duality: i.e. the separation of Europeans and natives was applied to an ethnically diverse settler population, and to explore its consequences for the plural political model that evolved in Singapore. In doing so it links specific forms of urban development to postcolonial strategies of social engineering and systems of governance, which are largely taken for granted. This paper argues that colonial strategies of ethnic division persist in nationalist urban development and inform policies on labor and citizenship that are yet to be decolonized.

Plural citizenship

J.S. Furnivall, progressive reformer and prominent scholar/critic of colonialism during the 1950s, described "tropical dependencies" as dual economies comprised of two distinct economic systems, capitalist and pre-capitalist, with a "western superstructure of business and administration rising above the native world…." [11] In the colonial plural society, "different sections of the community live side by side, but separately, within the same political unit." [12] Identified by their religious and cultural practices, each of these distinct communities encountered the others in the market place. Colonial laws categorized them according to race and organized them hierarchically according to the functions they performed within the colonial economic structure. In Furnivall's view, the colonial 'market mentality' destroyed pre-colonial social relations idealized by him around corporate tribal or village life. Institutional self-sufficiency and external forces precluded the development of 'a common social will' directed toward the general welfare of the population or territory. In short, under colonial rule, integration as a common territory was achieved through coercion.

Furnivall's critique of colonial society has shaped our understanding of the plural model adopted in contemporary Singapore and Malaysia. The model is divisive rather than integrative, highlighting a critical difference between the division of labor in a culturally homogeneous society (Adam Smith's model) and in one where cultural cleavages may be exacerbated through economic competition.[13]

A more nuanced interpretation is offered by Judith Nagata, who observes that societies labeled plural "are invariably defined politically at a maximum level…and marked by considerable social and cultural heterogeneity at lower levels."[14] In short, the assumption that ethnic reference groups take primacy over national loyalties and the

focus on social and cultural incompatibility is often used to justify political coercion (in both colonial and postcolonial periods). Nagata believes that there may be different levels of pluralism in the private and public spheres, where a society may be integrated in public life at the level of political institutions and compartmentalized in private life in the cultural arena. In such examples ethnicity operates in a domestic or ritual domain while nationality defines the public political sphere.[15]

Due to several factors, the Straits Settlements differed radically from Britain's other Indian presidencies. Because the annexation of the settlements followed peaceful monetary exchanges between the British and Malay chieftains, British authority in the region was limited. Politically, the settlements were on the periphery of the Calcutta-centered colonial administration and were neglected because the freedom of their ports severely curtailed the revenue accruable to the Company. They were dependent on attracting large groups of regional settlers who were free to travel across the settlements' borders. In fact, in comparison with the Indian subcontinent, all three of the Straits Settlements promised regional migrants greater rights to self-determination. But such freedoms, operating under colonial rule, required careful management through covert strategies that would maintain racial hierarchies and ensure British authority. The colonial solution was a divided urban landscape where migrant communities would remain segregated. In the Straits cities, experiments with racial segregation, applied over time, ultimately produced a spatial template for a plural society, a system of citizenship for those territories which were precariously placed between colonies and dominions.

The Straits Settlements

The British East India Company annexed the Straits Settlements of Penang, Singapore and Melaka in 1786, 1819 and 1825, respectively, following the shift of regional power in Southeast Asia from Dutch to British hands.[16] In 1826 they were collectively designated as an Indian presidency. However, unlike other Indian presidencies the Straits Settlements had free trade, light taxation and laissez faire government, carving avenues for private enterprise and secularization.

Writing on this early period, scholars assume, far too easily, that language, ethnic occupational speciality, custom and religion separated racial groups quite naturally, precluding any need for a 'divide and rule' policy.[17] Descriptions of colonial Singapore corroborate such assumptions by reproducing plural racial divisions in its urban landscape. Accordingly, Chinese, Malays and Indians resided in separate and spatially distinct ethnic neighborhoods outside Singapore's European Town. Although many different racial and language groups were contained within these larger categories and shared both residential and public space, they were reduced to racial stereotypes that fitted conveniently into the colonial economy. In fact, the European town was placed so as to physically divide the natives and settlers from neighboring geographies – i.e. natives –from new immigrants.

Although the Malaysian Straits Settlements, the settlements on the hinterland, had a plural society dating from the same period as Singapore, the outcome was very different. The population of the sultanate of sixteenth century Melaka, prior to colonization, was comprised of numerous regional ethnicities including Chinese and Indians. Following their colonization, ethnic groups in Penang and Melaka resided in adjacent *kampungs* or streets where racial and territorial boundaries were often blurred. Hybrid communities such as Malay-Chinese Babas, Peranakan-Indians and Eurasians of Portuguese descent were already in place, the former two from the pre-colonial period. The British dual system of government sought to reinforce ethnic divisions that excluded such hybrid categories.[18]

The term 'divided landscapes' as it is applied to the Straits context can therefore suggest divisive strategies enacted at different scales, beyond physical urban duality. There was a complex graduation of color, status and relationship to colonial authority between the predominant racial groups, and racial categories were blurred by minorities, regional migrants and hybrid identities originating from the pre-colonial period. The colonial government's desire to organize race into coherent categories comes therefore from two very different motivations: economically, to establish a race-based division of labor that can be quantified in terms of the profitability of the settlement; and politically, to prevent the different races combining for anti-colonial resistance. More importantly, racial segregation became necessary to prevent the blurring of the very different cares and conditions by which the colonial government's relationship to each racial group had been negotiated. It appears that a very different system of entitlements and privileges was meted out to each of the different racial groups and legislated by colonial laws, which Aihwa Ong has described as 'graduated sovereignty.'[19] Similarly, Malay loyalties were to chieftains on the adjacent mainland, whereas the Chinese who were relatively distant from China focused on clan loyalties. Indian sepoys and convicts were governed by different laws to those legislating Indian settlers. The plural society which was thus defined by its political and socio-economic structure demanded varying degrees of loyalty to the colonial state and was deliberately shaped and managed through its urban plan.

The urban plan

"Sedentarization," argues James Scott, was a key ingredient in the civilizing process and Southeast Asian societies that were land rich but lacking in man power tried by various means to attract peripheral populations to the center.[20] The colonial cadastral survey, perhaps the most effective device for making lands and populations visible, materialized this desire as part of a tax regime, tied to individual property ownership.[21] It also changed the perception of two elements critical for defining Southeast Asian settlements, the river and the ocean, from economic conduits to political and cultural boundaries.

Stephen Dobbs, writing on the Singapore River, argues that Stamford Raffles the Lt Governor of Benkulen, in his original plan for Singapore, used the river as a dividing line between European and native towns on the north and south banks respectively, and

emphasized its importance as the commercial life line of the settlement.[22] The European town was additionally flanked by a zone for government placed opportunistically along the river bank, where the full scope of authority could be visualized. On the annexation of the settlement in 1819 twenty or so plantations owned by Chinese and Malays were acquired, so that Singapore presented a *tabular rasa* opportunity for urban and demographic experimentation.[23] The "lower classes" were removed onto swamplands further north and south, whereas the high ground was "set apart exclusively for the accommodation of Europeans and other principal settlers."[24] The native Malay population, were relocated further north beyond the European town, thus dividing the groups of Malays into local and migrant groups and the Malay migrants from the Chinese.[25] Thus, just as in other comparable colonial settlements class distinctions produced a *de facto* system of racial segregation. Raffles added the commercial square to the by now familiar symbols of liberal government – the urban grid and the governor's residence, a neo-classical building on a hill overlooking Singapore town.

These covert urban strategies of segregation provoked the introversion of the native towns into tightly knit residential enclaves. The differentiated spatial configuration of European and native towns contrasted sharply with the "socially neutral" and "rigidly defined" public spaces of England's emerging industrial order.[26] Segregation was justified in the colonies by identifying natives as racially distinct collectivities with pre-modern practices, who were in need of colonial patronage and government.

The town plans for Singapore produced from 1822 to 1857 show the orthogonal grid used in the Straits to generate property, taxes and ensure long-term settlement.[27] The grid not only determined the size of building blocks, but it also managed particular relationships between different races and facilitated governance. In contrast with the idealized plan, an actual survey of the town of Singapore in 1836 showed a number of man-made grids competing for authority, where the market gardens, paddy fields and brickfields of the non-European population, made temporary claims on arable land.[28] Seven years later in 1843 we see the transformation of Singapore into a marked ethnic landscape with distinct building types for distinct groups of migrants.[29] The public (civic) landscape was separated from native space, integrated with the European town and catered to European citizenship concerns.

The public and private landscapes of Singapore

Colonial stereotypes of the dual city are invariably reproduced in discussions of Singapore's public landscape, positing an orderly European town against multiple chaotic native quarters. The first institutional works undertaken during the early years included religious and secular establishments. Most significant among these examples was the early introduction of modern colonial institutions, which imposed new forms of rationality, such as timetables and regulations, on colonial subjects. An 1857 map of Singapore is particularly useful for understanding the public landscape.[30]

At the highest point in the map is the Government House atop Government Hill and the military cantonment with a panoptic view of city and harbor. At the very center of the

map was the Convict Jail, the largest complex of buildings within the European town. The sheer expanse of the prison was countered by the competing heights of adjacent church spires of the French, Armenian, Portuguese, English communities.[31] On the north bank of the Singapore River was the Esplanade, the official public space, flanked by government buildings and offices. They included familiar symbols of authority, the Courthouse, Town Hall, Resident Councilor's House and Government Offices.

As observed by Robbie Goh, many of these institutions began life in vernacular style shophouses in the native quarter, entirely appropriate to their original mission, but gradually shed these associations and physical elements to emerge as over-determined symbols of colonial power.[32] They subsequently "reproduced and extended themselves through the colonial city, rewriting space into the image of [their] own Anglocentricsm."[33] Educational institutions created a comprador class sympathetic to colonial rule by fashioning European subjectivity as distinct from the native experience.[34]

As for the lower native classes, the report on the administration of the settlements noted that immigrants from "China, Arabia, Continental India, Burma, Siam, Sumatra, Java and sundry other places to the eastward of the Bay of Bengal," congregated "as on neutral ground" with "no feeling of citizenship and no common desire to co-operate for future and general benefit."[35] The desire to discipline them was evident in the public buildings outside the European town which comprised of asylums, hospitals and police stations. Public spaces, such as the Racecourse, the Botanical Gardens and the cemeteries were also located there for sanitary reasons. The Commercial Square signaled the only public activity common to both Europeans and natives.

Race and class barriers confined large immigrant communities to native districts that housed a diversity of crafts and trades.[36] Their shared poverty and interdependence forced forms of reliance on cultural and communal relationships that in turn enabled specific forms of autonomy. As described by Brenda Yeoh, property use "sought to minimize travelling and maximize the versatility of each individual locality," in short zoning was a luxury they could not afford.[37] Moreover, the migrants depended on the support of an intricate social and economic network "for none of the institutions in which they lived were capable of self-support."[38] These attributes reminded Europeans of their medieval towns where similar inter-knit moral economies had been the norm.

The public spaces of the native towns were pedestrian environments, streets and open spaces related to religious buildings, community associations such as *kongsis*, and markets. From among these, the market, a source of rental revenue for the government, was the native public sphere, the common secular territory. As observed by Anand Yang, they demonstrated the marketization of society and the imbrication of new immigrants in the world capitalist system.[39] In his view, the colonial desire to contain native commerce in designated buildings was also an attempt at surveillance and control, of imposing law and order against collective violence. Conversely, the spontaneous emergence of markets, the dissemination of goods by hawkers, and the expansion and multiplication of market space in the Straits suggested a sphere of activity that was not totally subordinate to colonial rule.

The private residential spaces were likewise differentiated with European colonial bungalows located in areas zoned specifically for residential development. They were objects in the landscape and embodiments of the Victorian garden suburb. The native towns in contrast were confined on marshy ground where a growing population was confined in contiguous mixed-use shop houses. Initially spatial arrangements in the Chinese and Malay towns were distinct and related to religious buildings and houses of chieftains.

The clan house or *kongsi* was the most important building for each Chinese clan group and acted as a commercial organization, a bank, a community center and a safe house for new immigrants. It was located within the community and often housed secret societies that protected and defended their clan members.[40] *Toa Por* (the great town), at *Kreta Ayer* to the south of the river was a tightly packed urban space of contiguous two or three story shophouses.[41] In contrast, the Malay quarter in Singapore, known as Kampung Gelam was organized by hierarchy around the main mosque and the dwelling of the Sultan.[42] Timber and *attap* stilt houses were clustered around this center in the form of a number of kampungs of various regional migrant groups. The Indian communities were interspersed among the Chinese and Malays, as evident from the location of the earliest Hindu Temples in the Chinese area. Gradually, with increasing settlement and urban regulation rural architectural forms gave way to contiguous shop houses.

The division of public and private space in colonial Singapore thus coincided with a particular interpretation of the dual city as one in which Europeans constituted the proper public and the natives operated in their own private sphere. Politics and culture were likewise divided as was the notion of modern and traditional, civilized and semi-civilized: the formula for the colonial dialectic. According to colonial travelers, the native town was busy, congested and dirty and the streets were narrow and chaotic. [43]Native domestic life was scrutinized as the generative site of non-European morality and used for justifying colonization.[44] Underlying this dialectic was a colonial economy in opium.

Carl Trocki describes Singapore as "Opium Central Southeast Asia," and the British Empire East of the Suez as essentially a drug cartel.[45] In fact, British merchants initially employed opium as one of their major forms of capital and Singapore's continuing status as a free port was only possible because of excise farm revenue.[46] Opium was a major exchange commodity for local Straits' produce; its price affected the value of other commodities; and the distribution of opium to the local Chinese "constituted the first and the most enduring link between the colonial administration and the population."[47] Marginal spaces related to this economy such as brothels, bars, opium dens and gambling houses were confined within the city's native quarters on the south side of the river. In facilitating various forms of "useful delinquency" as proper channels for economic activity the administration both exploited and produced a divisive environment.[48]

What we find in our analysis of the colonial period is a plural society that is contained within a dual city, where the dialectic is used to establish colonial authority, European

cultural superiority and to disguise the illicit economy that determined Singapore's success. In short, the plural model is not clearly identifiable either in terms of race or space because of the interdependence of cultures and economies within the confines of Singapore's native enclaves. Architectural form appears to be converging towards the Chinese shophouse template and by the end of the nineteenth century racial groups traveled across the European town blurring the segregated plan. *Sao Por*, little town which housed late nineteenth century Chinese immigrants attached itself to Kampung Gelam and Indians moved to the adjacent Serangoon area. However, Singapore would continue to be regarded as a plural society and would be identified as such through a plural political model post-independence.

Graduated sovereignty

Undoubtedly, particular forms of pluralism operated at a structural, cultural and social level in the Straits Settlements, in fact more so than in other colonial environments, and were hardened during the transformation of the region from multi-centered to monopoly economies. However, as argued by Robert Hefner, Europeans did not create a plural society. They "seized the commanding heights of an already plural civilization, expanding and expropriating its wealth while re-organizing and segregating its constituent Asian communities."[49] According to Hefner, it was in objectifying immigrants that the colonial era achieved its most enduring categorical legacy.[50] By assigning different ethnic groups to specialized positions, and offering political or economic privileges to newcomers and minorities, the distinction between indigenous communities and immigrants was emphasized. In short, the assimilation demanded of immigrants in British dominions and their selection through racist policies was not mirrored in Britain's Asian colonies.

Although notions of economic stratification, ethnic division and political entitlement thus complicate our analysis of the plural model there is a commonly held definition that in Singapore,

> Spatially, ethnic communities lived in relative isolation from each other in their respective enclaves…[and] the most ubiquitous community establishments were religious institutions such as mosques, Chinese temples, and the respective vernacular primary schools.[51]

The public/private dialectic that is raised by Nagata is evident in this definition and is one avenue through which we might reconsider the plural landscape. We are confronted with several arguments: that the model was originally one of integration, assimilation and cultural hybridity; that separation into plural categories by colonial census and nationalist structures responded to increased immigration; and that economic divisions across race rather than class effected these changes. As evident from our discussion so far these transformations cannot be traced as easily in the complex transformations of the colonial built environment. How are they reproduced in postcolonial urban processes?

National culture

The universalized systems that accompany democratic government are undoubtedly manifested in contemporary Singapore's civic district, in institutions that during their colonial history shifted in their meaning from Anglo-European cultural artifacts to ostensibly neutral symbols of authority. These substantial colonial buildings have suffered far less at the hands of developers than the shophouses in native enclaves. The Government House, renamed 'the Istana,' is the official residence of Singapore's president while Commercial Square, which was renamed Raffles Place in 1858, is an ornamental public space surrounded by corporate office towers at the heart of Singapore's financial district.[52] As observed by Robbie Goh, "the symbolism of power and justice in the postcolonial nation thus derives in many ways from the spatial forms inherited from the civic buildings of the colonial metropolis." [53] Not only are they privileged along with their historical significance and symbolism but in accruing this new layer of national authority they marginalize the "uncivic" spaces and structures of retrogressive Asian identity.[54] The Singaporean state borrows its cues from the residual and consequently a-cultural spaces of the colonial project. Historically the civic district implies the creation of citizenry that is modeled according to a European cultural template, an association that is continued by Singapore's political elites. In contrast, the most productive site of citizenship construction for the ordinary citizenry occurs in Singapore's private sphere, in an interesting yet complex inversion of public and private.

At the height of the economy, in its most privileged local geographies, elite and expatriate residents occupy landed housing, a dear commodity in a land scarce city-state, thus contributing to and perpetuating a form of internal colonialism. Their houses, in fact, often take the form of colonial or tropical bungalows and are located in elite neighborhoods once inhabited almost exclusively by Europeans. Several military encampments have retained clusters of colonial-period housing that are available on lease and these, along with their attendant life style, are particularly attractive to the western expatriate population. These secure private properties (Portsdown Road, Seletar, Changi, Holland Village) away from the hustle and bustle of city life are reminiscent of the garden suburbs of nineteenth century urbanism. Private condominiums provide a third category of housing that signifies affluence. These categories comprise eleven point one percent of the housing stock.[55]

Private home ownership of detached residences is unaffordable to the majority of Singaporeans who dwell in vast Housing Development Board (HDB) public housing estates, where private ownership is governed by public regulation. In Singapore, apartment ownership is the primary modern citizenship entitlement, and as observed by Goh, carries a "significant ideological burden of the modern nation state."[56] These residential neighborhoods of prefabricated modernist apartment blocks, which are serviced by an up-to-date infrastructure, are organized as satellite townships: dormitory settlements surrounding the metropolitan center, and are ethnically integrated. In fact, writes Goh, they have come to symbolize "the nations own path to modernity," and the socio-economic profile of apartment owners converges with the national profile for a

middle class "stakeholder" citizenry.[57] The HDB policy's responses to ethnicity are particularly revealing.

Following communal violence in 1964 and as a deterrent to its recurrence, the Singapore government used its housing policy to prevent the formation of ethnic ghettos. Racial integration was achieved by: a) allocating apartments according to strict ethnic percentages that reflect larger demographic ratios; b) requiring a member of a particular ethnic group to sell only to another of the same ethnicity within a prescribed quota; and c) artificially inflating the price of properties and thus magnifying the individual's investment in the national economy.[58] Although public housing acts as a homogeneous grid that imposes a common Singaporean subjectivity on equal citizens, it simultaneously identifies and individuates ethnic difference. The cultural neutrality of the architecture and the highly regulated and sanitized public spaces that surround them effectively strip them of ethnic associations, disciplining the stakeholder population while claiming their loyalty to the nation-state.

As observed by Goh, this strategy "removes from the heart of communal housing the signs of racial and cultural differentiation such as vernacular design elements and ritual spaces."[59] The void deck (the free area on the ground floor, which is raised on pilottis) substitutes as a communal space for religious rites and funeral rites. Ethnicity is thus disciplined and aesthetically neutralized in the grid of everyday space and reorganized to prevent physically or spatially inscribed forms of collective action. Indian - Singaporeans as a small minority within this Chinese-dominated grid often find themselves culturally isolated and socially marginalized. Meanwhile, the symbolic sites of these collectives, the metropolitan areas associated with Chinese, Malay and Indian settlement, have been converted into a form of tourist spectacle.

The gentrification and conservation of shophouse environments in the so-named 'heritage districts' has removed internal divisions converting them into exclusively residential (hotels) or commercial properties (restaurants, shops and offices) and their former inhabitants have been relocated in public housing. As designated tourist districts the 'ethnic' shophouse neighborhoods are expected to attract contemporary Western/westernized tourists. In fact, the heritage districts 'orientalize' the immigrant histories of Singapore's ethnic communities and repackage them as historic narratives of traditional, parochial and pre-modern cultures and behaviors. The tourist spectacle provided by these districts is expanded by the presence of a third social category of immigrant labor.

Singapore's foreign labor component can be divided into two categories, foreign talent and transient foreign workers who collectively contributed thirty-six point nine percent of the GDP growth from 1991 to 2000 compared to the fourteen point one percent contributed by local labor.[60] The consequent docility of an imported working class has been exceedingly beneficial to the country's rapid development. Indeed, Singapore's progress can be partially attributed to a productive politics of labor management. The 'dual economy' associated with colonialism is translated into the cohabitation of a hi-tech computerized professional class and a low wage, labor-intensive system of

production within the same economy. Unskilled labor is largely deployed in the construction industry and can be found living in temporary or vacant structures.

When compared with a transient working class, Singapore's plural society is located as a privileged site of local citizenship. The contemporary interpretation of plural citizenship, as homogeneous yet divided categories set in the vertical grid of urban apartments, expands upon the many readings of the grid we have encountered so far. The spatial distinctions between the detached housing of expatriates and the dormitory settlements in their rigidly disciplined urban landscape echo the relative advantages and treatments experienced in the dual city. Thus, the systems of entitlements and restraint through which specific categories of modern subjects were measured during the colonial period persist. However, graduated systems of 'property ownership' and the disciplining of apartment dwelling subjects into forms of 'social modernity' (hygiene, politeness, order) coincide with the creation of a stakeholder citizenry and the successful elimination of homelessness. The location of unskilled labor outside the national geography prevents the kind of political activism that may be threatening to the nation state. Chua Beng Huat also argues that the Singapore government finds the plural ideology politically useful for freezing cultural categories in a traditional model and thus suppressing the cultural critiques that inevitably emerge in a capitalist culture.[61]

Conclusion

The Singapore government's co-option of the island's colonial history and western influences alerts us to persistent postcolonial undercurrents, which as argued in this paper are reflected spatially in the country's political self-construction as city and state. As Jan Nederveen Pieterse and Bhikhu Parekh observe, "Decolonization is a process of emancipation through mirroring, a mix of defiance and mimesis. Like colonialism itself, it is deeply preoccupied with boundaries – boundaries of territory and identity, borders of nations and state."[62] The nationalist discourse is often constructed through essentializing difference."[63] Similarly, in their discussion of the Singapore government's efforts to maintain colonial period demographic quotas, Janadas Devan and Geraldine Heng argue that "An internalized 'orientalism' makes available to post colonial authority the knowledge-power that colonial authority wielded over the local population."[64]

A study of architecture and urbanism reveals that lingering colonial hierarchies do continue to influence the constitution of Singaporean subjects by the contemporary nation state and that their deconstruction is crucial to effective de-colonization. Urban spatial organizations do produce and determine contemporary social relationships. While plural race relations are defined against the secular territory of the civic district and public housing – by locating culture in the plural spaces once attributed to colonialism – hybrid identities or spaces of ethnic integration beyond the prescribed quotas, are suppressed and identified with the colonial past. Plurality in the Singapore example as interpreted by the nation- state is located in this manner within a different dialectic of past and present applied across history. Nevertheless, in a curious inversion of public and private the plural politics of cultural difference is applied externally to

organize the political subject while duality, identified as modern versus traditional or East versus West is internalized.

Urbanism, modernity and nation-building: the Agache's Plan for Rio de Janeiro, 1928-1930

Fernando Diniz Moreira
Federal University of Pernambuco, Brazil

Theories of urbanism, which were developed in response to an European context of social modernization, began arriving in Brazil even before the country's actual political and social modernization. This gap provokes intriguing questions. If we accept that Brazilian modernization is incomplete, as local elites attempted to modernize the country without transforming its social structure, we can argue that urbanism– as well as factories, networks of transportation and skyscrapers – acquired a patently symbolic nature. My argument is that, in Brazil, the urbanism attempted to create spaces for a modern society that did not exist yet, reducing itself to fragmentary images suggesting modernity. However, these images suggest a way of behaving for the future Brazilian masses and illuminate the conceptions Brazilian society held for its future.

This paper reflects on these issues taking into consideration Alfred Agache's plan for Rio de Janeiro, elaborated between 1928 and 1930. This plan was a hallmark in the evolution of Brazilian urbanism and one of the best examples of the urbanism proposed by the *Societé Française des Urbanistes* (SFU).[1] Its objective was to solve the city's functional problems, to provide it with an expression of a capital, and to inculcate Rio's inhabitants with a social ideal of modern life, while still considering functional requirements, such as zoning and circulation.

One of the most meaningful aspects of Agache's plan was the emphasis on the symbolic and aesthetic dimension of modern urban centers. The two most prominent of his proposals were the Gateway of Brazil, a vast and monumental square facing the sea and surrounded by uniform classical buildings, and the Castello Square, square encircled by prominent high-rise office buildings. In both examples, urban design and architecture were unified in a stable and coherent image of city free of contradictions or disorder. During Vargas period (1930-1945), these images were suitable to an aggressive campaign to shape a national identity and to inculcate civic pride and patriotism through parades and civic commemorations.

Little known by the historiography, the figure of Agache was only studied by Catherine Bruant and David Underwood. Bruant's works are mostly focused on Agache's sociological background and its impact on his vision as a planner.[2] Underwood provides a rich analysis of Agache's plan for Rio showing how it was influenced by Edmond Demolins's sociological methods and by Gabriel Tarde and Frederic Le Play's ideas.[3] These pioneering works provided important insights on Agache's ideas. Without refusing the importance of the discipline of sociology in his work provided by these authors, my paper emphasizes the importance of Agache's background as Beaux-Arts architect. It shows how this approach informed his plan and how it was mediated with local society. In addition to the analysis of the commissioning of Agache and his

relationship with local elites, this paper explores the subtleties of this iconic plan and its meaning for local society.

The first section of this paper considers the process of commissioning Agache, while the second discusses the general aspects of the plan. The third and fourth sections deal with the two major spaces aforementioned. The following sections describes the other parts of the plan and the relationship with the local milieu, and the conclusions, respectively

The tropical faith in Urbanism: Agache and his clients

Educated in the *École des Beaux-Arts* of Paris between 1896 and 1905, Donat-Alfred Hubert Agache (1875-1959) was devoted to the new discipline of urbanism (fig.1).. He worked diligently toward the creation of laws, codes and plans in order to promote urbanism in France and worldwide. Agache was one of the founders of the Societé Française des Urbanistes (SFU) and its first secretary.[4] He worked on numerous plans for French cities, such as Dunkirk, Tours and Dieppe. His has an impressive record of publications between 1910 and 1920, most of these writings culminated in the a more systematic work called *Comment reconstruire nos cite detruites*, published in 1916, with Jacques-Marcel Auburtin e Edouard Redont.[5] The book was a complete explanation of the SFU program of urbanism, anticipating in detail an extensive program for the reconstruction of French cities after the war.

The process of commissioning Alfred Agache embodied the aspirations of a generation of Brazilian urban planners and revealed the particularities of the introduction of modern urbanism in the country. In Brazil, modern urbanism emerged among fierce debates about nationality, identity, and the future of the country.

In Brazil, from the 1920s on, a long discussion about the nature of Brazilian city and its transformation in a modern metropolis began. A new generation of professionals specialized in urbanism emerged, including figures like Ulhôa Cintra, Prestes Maia, Anhaia Mello and Armando de Godoy. This generation conveyed a new planning mentality which included: an integrated view towards cities; a conception of the city as an organism; a concern for efficiency and rationalization; and the introduction of a new vocabulary. Campaigning for zoning laws, building codes, green areas and housing, these young professionals attempted to instill in society the need of plans made on a technical and scientific basis.

At the end of the 1920s, urbanism had gained some legitimacy in political and cultural circles. The idea of commissioning a planner to design a new plan for Rio had the support of a broad coalition of engineers and architects, municipal officers and elite groups, such as the Rotary Club. If a consensus that Rio needed a plan had been reached, the debate focused on who would design it and its nationality. There was an intense debate between nationalists and the supporters of a foreign planner. Some favored foreigners due to their superior technical skills and to the fact that they were

unaffected by parochial interests. Those who opposed a foreigner believed that they would be unable to grasp the unique and complex natural setting of Rio.[6]

This was a complex moment, in which many issues intersected in the debate: engineers and architects were disputing professional roles; a new field of specialization, urbanism, was emerging in the midst of this dispute; and a more complex discussion was beginning about the identity of Brazilian society itself. What was at stake was more complex than the person of Agache or the need for a plan. The debate over foreign expertise provides important clues about the reception of urbanism by the educated elite.

When the new Mayor, Prado Junior, took office in early 1927, the need of the plan was already consolidated. Prado Junior supported the commissioning of a foreigner and initiated contacts which culminated in commissioning of Alfred Agache in the mid of that year.[7] This fact was celebrated as a hallmark of a new era for Rio de Janeiro. Armando de Godoy remarked the power of the new science, urbanism, and the positive effects that the commissioning of Agache would have particularly to the scholarship of the local professionals.[8]

Why was Agache interested in visiting Brazil? In addition to a propaganda effort for the *Societé Française des Urbanistes* and the lack of work in France, Rio de Janeiro was a privileged space to concretize ideas about modernization and to show the potential of his urbanism to an international audience. His visit was also an opportunity to grasp the commission for the future capital of Brazil, which was already under discussion.

Why was Agache chosen by the Brazilians? What did Agache represent to these professionals? In addition to his prestige earned by his plans for Camberra and Dunkirk, Agache had familiarity with different features of urbanism. His prominence in the Parisian professional environment gave him authority to represent a synthesis of French urbanism. More important, Agache, in his emphasis on both technical and artistic aspects of the modern city, summarized aspirations of both the architects and engineers. He convinced both professions that he was able to think of the city in technical, functional, and artistic terms. Although most of the architects were against a foreigner, they started to see him as a positive influence for the profession helping their search for social affirmation and recognition. His sociological background also impressed those members of the elite inclined to social reform. Agache also stood above local political disputes.

The position of Agache as Beaux-Arts architect was not an issue at this moment. The discussion transcended formal and aesthetical issues. It seems that the local professionals were more interested in a method, a new way of thinking about cities. Agache appealed to this audience, not particularly because of his style, but for his ability to rethink existing cities. His Beaux-Arts approach, however, also attracted the support of those members of the political elite, who persisted in their search for Parisian images, as in the previous decades. The figure of Agache appealed to many different audiences, most of which had different motives. Agache arrived on June 25, 1927, aboard the *Massilia*, the same ship that brought Le Corbusier two years later.

Agache's Plan: Circulation and Zoning

Agache's plan for Rio was composed of three parts. The first part is an extensive study of the city, while the second, which will be discussed with detail below, is the core of the plan. The third, "The Great Sanitary Problems", addresses environment, water supply, flooding, and used water sewage.

The first part, "The 'anthropogeographic' components and the general analysis of the urban situation", is subdivided in two sections.[9] While the first is a rather dry and descriptive historical account of the Rio de Janeiro's evolution, the second is a complete geographic study, influenced by Marcel Poéte and Patrick Geddes, summarizing the particularities of the site and its economical and demographical patterns. Agache approached the analysis of the city as a scientific experiment, first identifying problems through extensive observations in order to propose solutions. Agache understood the character of the city defined by a complex and delicate intertwining of urbanized patches of land stretching between rocky mountains, bays, forests, lagoons and the sea. Influenced by the *Musée Social's* methodology on surveys and by Demolins's and Le Play's ideas, his in-depth analysis included a complete survey of the economy and social topography of Rio. In sum, he confirmed the role of Rio de Janeiro as a regional, industrial and commercial metropolis, revealing an intricate web of relationships, and movement, of goods, people, products within the city and the region.

In the second part of the report, "The Greater Rio de Janeiro", Agache presented his plan. The Frenchman emphasized Rio's two essential functions: its political-administrative function as the capital of the country and its economic function as an important port, commercial and industrial city. Rio's problems were of two orders: function and representation. On the one hand, the city was not adequately performing its basic functions: Agache identified such problems as poor traffic flow, insufficient public transportation, the erection of tall buildings in the narrow colonial streets, and inadequate infra-structure.[10] On the other hand, the city had a problem of representation. It did not possess the appropriate appearance for the capital of a new country. The city lacked what Alberti and Vitruvius called 'decorum'. According to Agache, Rio urgently needed an appropriate image:

> Here is a capital of a country with 40 million inhabitants in which the Senate is housed in an exhibition pavilion. Although the Hall of Deputies is relatively recent, it is undersized and inadequately located between two narrow streets. Except for the Ministry of Foreign Affairs and the Postal Services, which occupy buildings designed for them, all the other ministries are housed in inappropriate and uncomfortable places. The city neither has appropriate places for military parades or patriotic demonstrations, nor suitably designed large and wide avenues.[11]

After arguing that the city was unable to adequately perform these functions, Agache started to sketch the "skeleton" of his plan. His overall aim was to "assure the existence of the functional elements and allocate them in the city appropriately" and to "establish a

network of streets in order to provide a rapid connection between these elements and the rest of the city".[12] In the new design, the city was physically split into different sections, but soon rearticulated as a unified whole through a coherent circulatory system. Therefore, the two major points in which Agache focused his attention were circulation and zoning.

The future of Rio de Janeiro would depend on a good scheme of circulation. Agache attempted to solve Rio's traffic problems and to facilitate communication between the different districts, which were made even more difficult by the city's difficult topography. He proposed a skeleton (*ossature*) that defined the major lines of the project (fig.2). In his scheme, a system of expressways, *carrefours*, and crossings, would make the city fluid. This scheme was clearly influenced by Henard's 1903-09 schemes for Paris, whose *nouvelle croissé*'s function was to connect distant suburbs and even parts of the country.[13] The use of traffic circles (*étoiles)* was also drawn from his Parisian experience.

As in Henárd's schemes, the road system expanded beyond the city proper. Like in his native country, Agache believed that a capital needed to centralize the socio-political and economic life of the country. Rio should be the brain of a national network of communication, which included railway, roadway, and telephone systems, and each part of the city should be prepared for this new demand. Therefore, he pointed out the need of regional and national routes to penetrate the core of the city.[14]

In his scheme, two major interpenetrating avenues, Paulista and Petropolitana, crossed each other in *Bandeira* Square, where a new train station was proposed. A peripheral circular avenue, probably influenced by the Leon Jausselly's 1905 plan for Barcelona, facilitated communication between the different outer parts and the center. Agache compared this conceptual scheme to a hand.[15] Agache also proposed a comprehensive reorganization of the transportation system, which included the elimination of trolleys, the construction of a subway and the reorganization of the railway system and its terminals.[16] The new system would reach all the parts of the city transporting its citizens more efficiently not only within the city but also to other regions of Brazil.

The other major issue of the plan concerned zoning. According to Agache, the urban life of Rio depended on the proper functioning of certain elements (areas or district). These functional elements were grouped under seven categories: the post of command (the legislative and administrative center), the interchange districts (the central business district and port district), the commercial districts (retail commerce and food supply center), the production districts (industrial and agricultural center), residential districts (luxury, bourgeois and working class), university district, and recreational areas (parks, open spaces, museums, theatres, and cinemas). Each of these elements had a specific role to play in the city. It was necessary to identify the elements that made each district particular, to analyze them and to distribute them appropriately in the city, establishing correct relationships between the parts.[17]

The major questions Agache posed were how to establish the size of the districts and how to define their place in the urban structure. The creation of the plan was based on the orchestration of sizes, functions, and densities according to transportation system and infrastructure requirements. According to Agache, zoning was the essence of urbanism, a rational instrument to intervene in the city and to manage its growth. Zoning established a framework in which the urbanist can work. Each zone should have codes developed to its own specific needs. Agache distributed activities in the space and translated them in architectural forms. For each quarter, Agache fixed heights, types of buildings in order to create different images and urban patterns for the city districts, assuring a degree of hierarchy among them.[18] He was concerned with a certain uniformity of the urban parcels.[19] This conjunction of urban morphology, zoning and architectural type defined the appearance of each quarter. Zoning differentiated these districts and insured that they maintained their character: "its aim is to avoid the invasion of districts by buildings which would change completely their character."[20]

Zoning was not understood by Agache as a simple set of rules, which created the city mechanically, but as an important element to shape the plastic and spatial aspects of the city. Unlike the Anglo-Saxon tradition, which mostly focused on the exclusion of undesirable uses from certain areas, zoning for Agache was a positive instrument to define urban morphology (fig.3).[21] He was concerned with the creation of a city in which functions and districts would be associated, taking into account urban aesthetics. We believe that his urbanism was an art of composition that insured that quarters or districts had their own distinctive architectural image, but combined in a coherent and stable image of a modern city. Agache's city was composed by a morphology of solids and voids, continuous volumes and open spaces. The planning of such a city was an architectural act.

Agache's approach to the central area was informed by his Beaux-Arts education. According to him, the city should have an *echelle des types,* a gradation of types and heights, which would result in a denser and taller silhouette at the center and a less denser one in the suburbs. In his plan, the center of the city occupies the most significant position in the hierarchy and the most representative buildings were located there. The tallest buildings in the center created a coherent image of a city.

Agache's major scheme for the center had a roughly triangular shape (fig.4). The axis in the base of the triangle, the Rio Branco Avenue, and the inclined axis, *Mem de Sá* Avenue, already existed. They were the result of the works promoted by Pereira Passos twenty years before. Agache proposed a third side of the triangle, the vertical axis, a superboulevard (the future Presidente Vargas) that connected the Bandeira square to the port, crossing the densest area of the center of Rio. The Candelária Church was left intact in the middle of this superboulevard, as an importat focal element. The Frenchman also proposed a new avenue, *Santos Dumont*, which played the role of a "second base" of the triangle, and two other smaller avenues, vertical and horizontal, to complete the scheme.

Six squares concentrated the hub of activities in the center. These squares were located in the vertices of these triangles, working as a nucleus of reception and irradiation and their significance was reflected in their form, generally an *etoile*. Each square was associated with a specific function. Of the six major squares, Gateway of Brazil, Castello, Paris, Bandeira, Santo Antonio, and Candelária only the first two received a detailed treatment by Agache.[22] Although Agache himself recognized that some of these squares were important points of traffic connections there were very few details about the design of these three last squares. It can be argued that Agache's emphasis on symbolic elements directed him to concentrate on the Gateway of Brazil and the Castello Square.[23] These squares symbolized the powers of the new state and the big business community.

The gateway of Brazil: 'decorum' for an entire nation

Agache's preoccupation with symbolic elements and with the need to reassert the role of Rio as a capital was clearly materialized in the Gateway of Brazil, a vast square facing the Guanabara Bay surrounded by uniform classical buildings. With this ensemble, Agache aimed to provide a monumental entrance for Brazil, a setting for parades and civic commemorations. The ensemble would have represented the affirmation of a young nation, providing decorum for an entire nation (fig.5-7).[24]

In order to create this square, Agache proposed straightening the coastline with a landfill (using material from the demolition of Santo Antonio Hill). The semicircular square was 250 meters by 350 meters. The most representative civic buildings were located there and the entire ensemble was to be seen from a distance at sea. The central building incorporated a huge auditorium, a public hall and convention center. The building presented a pantheon-like structure, the plinth of which had a Greek temple façade facing the square and was flanked by two geometric towers. Next to the auditorium stood the identical buildings of the Senate, on the right, and the Assembly, on the left. Both volumes were masked by massive classical facades. Completing the composition and bordering the bay, was the Palace of Fine Arts (on the right side of the auditorium) and the Palace of Commerce and Industry (on its left side). Although functionally very different, these buildings would have similar forms in order to complete the composition. The influence of Daniel Burham's plan for the Chicago Civic Center is evident and can be seen in many points of the ensemble.[25]

These ten-story buildings would have heavy corners and horizontal bands acting as a single cornice, punctuated by deep windows, which terminated and unified all the buildings. Colossal paired columns without capitals supported this cornice and create a dramatic play of light as the façade receded into depth and shadows. The repetitive and uniform nature of these buildings and their architectural motifs created a unifying identity throughout the square. Everything was subservient to the norms dictated by the square; every detail submitted to the whole and no building possessed any marked individuality. The Beaux-Arts approach of the plans were shaped to fit the patterns dictated by the urban design, with façades pushed to the curb line and internal courtyards.

The square was a platform elevated 1.50 meters, with sunken gardens in front of the buildings. Two huge ceremonial pylons, toppled by powerful lights, framed the square. On this platform, orderly regiments of marching soldiers are shown, making a choreography that seemed to be related to the architectural elements. The square created a strong sense of theatricality, which contrasted with the bustling commercial center some blocks away.[26]

According to Agache, this monumental gateway was a reception space for important persons arriving in Brazil, a majestic space to show the importance of this young nation: "in this place, soldiers will parade, authorities will receive eminent personalities arriving from the sea, by ship or by seaplane."[27] This "attractive and imposing maritime façade" would symbolize values and qualities to be admired, such as equilibrium, harmony, morality and organization, as Underwood noticed.[28] There was a clear belief that the creation of urban ensembles could subordinate individuals to the national power, which represented the general interest of a modern and organized society. The role of the urban planner was to help to concretize this image, to create a vocabulary to express this order, and to make these values apparent. Like his French predecessors a century earlier, Agache firmly believed public spaces and buildings would support a modern civic life and shape a new sort of citizen.

The square, the austere facades and the orderly marching of soldiers, however, foretold tragic events: the totalitarianism that would triumph over Europe and Brazil in the following years. We cannot say that Agache and his colleagues from SFU, had totalitarian inclinations. According to David Underwood, Agache's monumental ensembles reflected his interests on sociology.[29] Beaux-Arts methods were associated with ideas of the modern sociology, particularly the Durkheiniam theory, which emphasized discipline and patriotism as values essential for the formation of a collective conscience. Military order, morality, and social solidarity formed the basis to the creation of disciplined citizens and masses. By elevating the square, Agache provided a stage, which represented a corpus of social doctrine for the formation of a modern Brazilian society. This square, which Agache eventually called "the post of command", was the place to which Brazilians were supposed to look to be instructed about modernity.[30] Brazilians would not enact spontaneous parties and carnival on this stage, but rather ordered and composed parades. The Post of Command would set an example for the rest of the country. The new ideals of urbanity and civilization were to be received from abroad, as the European shape of the square suggests, and radiate to the entire country. The square turned its back upon the masses living in the hills and opened itself to the sea, waiting for new ideas and goods, brought by ship or airplane. Like the urban remodeling of Rio de Janeiro in the 1900s, this intended to work as window, showing to foreigners that Brazil was an organized and modern nation.

Castello Square and the harmonic skyscrapers

According to Agache's plan, the headquarters of corporations, as well as newspaper offices, hotels and luxury shops were concentrated around on the Castello Square, an hexagon-shaped square which replaced the void left by the demolition of the Castello

Hill in 1922. This square was crossed by three avenues, one of them derived from the Gateway of Brazil, resulting in an ensemble of six blocks (fig.8). Six massive buildings occupy the outer limits of these blocks featuring galleries and shops at the ground level and internal courtyards. From these buildings, sixteen 100-meter tall isolated towers rose, expressing the dynamism of dynamic of the new economic forces of modern Brazil (fig 9-10). Agache emphasized the need to group buildings in order to reinforce their meanings:

> Instead of dispersing the elements of urban modern life throughout the entire city, losing their symbolic expression, why not reunite them… in an organic ensemble of buildings and public spaces, achieving great monumental centers in order to express the social and economic ideals of our time? [31]

If in the medieval city, the cathedral was the supreme expression of the soul of a community, marking the skyline and concentrating its artistic and religious aspirations, in the modern city the ensembles of new office buildings would express the major forces of modern communities.

For an architect like Agache, concerned with both formal and functional aspects of the city, the solution to the artistic problem of the city laid in the construction of appropriate architectural ensembles. Architectural ensembles represented the social ideals of modern city better than individual buildings. He promoted the grouping of buildings as a form of theatrical setting, which possessed continuity with the nineteenth century city:

> The buildings, if carefully studied and integrated in the whole, will contribute to the formation of the general 'decorum': their position, appearance, perspective are some of the elements contributing to the urban embellishment and to the expression of the civic genius. Hence, it is necessary that the urban planner works not only in the design of the buildings in the plan, but also imagines their volume.[32]

In 1928, responding to a question from a Brazilian newspaper about the appropriateness of skyscrapers in Rio, he said:

> I am not an enemy of the skyscraper if it is well built and judiciously placed in the adequate district. In my new plan for the Castello area, I reserved spaces for some skyscrapers. They are sensibly disposed in such a way to create a decorative ensemble.[33]

For the French planner, the organization of good complexes was the means of achieving a perfect city. In his approach, the smallest detail was subordinated to the whole.[34] Agache's design reflected social conceptions and demanded a certain behavior from the citizens. Like the details of a building, individuals were expected to submit to the whole, to the general interest of the society, as in the Durkheiniam ideal. This was also a means of achieving modern society that corresponds with the notion of *Economie Sociale* of *Musée Sociale*.[35] Like the Gateway of Brazil, Castello Square was supposed

to transform masses of undisciplined and lazy people in organized, disciplined and efficient workers.[36]

Industries, parks and residences

Although the construction of the Castello Square and the Gateway of Brazil would not have required large demolition, since the former occupied vacant land from the razing of the Castello Hill and the latter was built on land reclaimed from the sea, the treatment of the center city, particularly the banking district, would transform the core of the colonial urban fabric. In his attempt to improve vehicular circulation in the core, Agache realized the impossibility of street-widening and kept the street pattern, but not the buildings. He reorganized the traditional narrow and long lots into larger lots to erect twelve-floor buildings with internal courtyards following the patterns provided for the Castello Square. The architectural procedure was to be agreed upon between the many lot owners and the new entrepreneurs. These buildings satisfied the modern requirements of ventilation and illumination and increased considerably the available area for office and shops, with ample parking underground. The ordinances proposed by Agache proved to be powerful models for later urban remodeling in other Brazilian cities.

Despite Agache's attention is focused to the center city, he proposed the creation of a industrial zone, a system of parks and residential areas. He rectified the northern coastline, filled the marshy plains and channeled rivulets in order to create a modern industrial zone adjacent to a new port, which would include all the facilities for an industrial district: modern docks, warehouses, railway terminals, naval shipyards, factories, and also residential quarters for workers. Economy and efficiency of movement guided Agache in the planning of this productive sector of the city. The entire district was conceived as a network in which factories, products, warehouses, ships, trains and workers are in movement, performing their functions as on an assembly line.

Open spaces were also a significant part of Agache's strategy, since "parks, gardens, sports fields and green reserves are vital elements for the healthy growth of the city" and "essential elements for our modern lives". [37] The French planner proposed a system of interconnected parks, which would stretch through the valleys, making green areas accessible from every part of the city. Some of these new parks were formed by native forests, which were conserved and enlarged.

Agache suggested a new strategy for the residential districts, calling attention to the fragmented nature of the city, which spawned disconnected pieces of development. He opted for calculated expansion through the valleys, respecting the topography and leaving green spaces inside the urban boundaries. He proposed distinct neighborhoods composed of isolated villas, medium sized buildings of three to four floors and high-rise buildings, but provided few details about the location of residential types in the urban structure.[38] Agache was not unaware of European social housing movements and he firmly believed that the government should act to improve housing. However, it can be agued that housing was not among his priorities.

Struggling in the local milieu

The positive climate of Agache's initial reception in Brazil did not last long. After settling in the city in early 1928 and starting to work on the plan, he began to face resistance. Despite Mayor Prado Jr.'s attempts, the municipality did not involve local professionals in the discussion, except for those few supporting Agache.[39] Repeatedly, the Chamber halted payment declaring lack of results.

Due to the pressure, Agache decided to show some results, publicizing features of his plan in November 1928.[40] For his surprise, he was promptly accused of plagiarism by the Brazilian architects José Cortez and Angelo Bruhns, who had developed a proposal with similar features for the area of the Gateway of Brazil in 1921. This engendered a debate that lasted for months and made Agache's position delicate.[41]

The debate also involved political questions. Attacking Agache became a way for local opposition politicians to criticize the Municipality. In some cases even the mayor was forced to come out in support of Agache. Although most of these critiques were motivated by professional jealousy or political motives, they also addressed the plan itself and the cultural aspects of the whole enterprise. The engineer Costa Moreira criticized Agache's designs *à vol d'oiseau* and his inability and to apprehend the Rio's topography and nature and to integrate cultural aspects of an American culture. According to him, Agache was "so disoriented by our exuberant topography and nature that he had been going to Paris often to hear his masters from there."[42] Arguing that there was a "fundamental difference between the European and the American city" a local journalist criticized Agache for his inflexible European approach to the local reality:

> It is not following the model of the famous cities of old civilizations that we will build a capital representing our modern American spirit... We should not forget that the values for our progress will not be found in Europe, but in the dynamic North American life. New York and Chicago with their cyclopean skyscrapers, contain more appropriate inspirations to the needs of the new Brazilian spirit than the elegant and delicate lines of Parisian architecture.[43]

Agache was accused of being picturesque, of proposing ready-made formulas which failed to take into consideration the real possibilities and problems of the city.[44]The year 1929 was even more difficult for Agache, as provocations and attacks continued. He was constantly asked to explain his work.[45] In October 1929 the mayor asked the Municipal Council funds to pay Agache's honorarium. The request was approved, but with strong opposition and complaints. In his last speech in June 1930, the mayor ratified his position and attempted to prove the importance of the work, which was being published.[46] In the following month, during the Fourth Pan American Congress of Architects in Rio de Janeiro, Agache presented a model of his plan. His work was again harshly criticized. Even old supporters were turning against him and his position became fragile. Agache left Brazil in August of 1930, just before the turmoil of Vargas Revolution in October. At the end of that month, he sent the final version of his plan from Paris to Brazil.[47]

Agache was continually thwarted by professional antagonism and lack of funds. His plan did not create a consensus even in the beginning and he was not able to appreciate the complexity of Rio de Janeiro and its society. In addition to provincial political rivalries, he had to face a society in a process of national affirmation, which was no longer a passive receiver of imported ideas.

An efficient and beautiful city

Agache aimed to transform Rio into an efficient and beautiful city. In functional terms, each part fits each other, with its right size and shape. The plan is well ordered in its totality, having proportion and coherence in the relationship between these parts. But it was unequal, since he designed some sectors in detail, while only defining the overall shape of others. This imbalance between parts of the plans suggests that Agache was pressured to submit the final document. In addition, the plan demanding the construction of an extensive network of tunnels and bridges was completely unfeasible to Rio de Janeiro financial reality.

The classical features of Agache's design obscure the complex process by which the plan was made. His plan encompassed a wide range of subjects, including regional planning, transportation, zoning, urban design, building codes and even architectural details. The plan was so complete that, when publishing it in French, two years later, Agache dropped the mention of Rio de Janeiro from the title in order to express its universal applicability.[48] Because of its scope, the plan was used for decades as a reference work by Rio planners . Its legacy of this plan can be found either in methodology and forms. The plan, with its extensive analysis and instruments, provided Brazilian planners with a method of planning and a managing culture. On the other hand, the image of massive buildings occupying the outer limits of the blocks and presenting arcades at the ground level proved to be a useful motif for other cities.

The belief in the ability of the architect to face the challenges of a big city, the power of the technology and the search for a utopian ideal were strongly present in the work of Agache in Rio. In spite of the inclusion of a sociological approach in his background, Agache was at the end an architect and he firmly believed that architecture could shape the city. The Beaux-Arts approach, with its coherent and regular axes, acted like a matrix, organizing the formal aspects of the plan. According to Agache, beauty in the city would be achieved through the construction of classical ensembles of buildings. Representing the great French tradition, Agache employed architectural composition in order to define urban spaces and to confer monumentality and majesty to the buildings. Urban design and architecture were unified in a stable and coherent image of a city free of contradictions or disorder, which was useful later for the new centralist and rational bureaucracy promoted by Getúlio Vargas.

Agache's idea of the three-dimensionality of solid and continuous masses and textures of modern city was rooted in the nineteenth century conception of city (fig 4).[49] This approach led to some problems in the plan. Agache mediated between his ready-made formulas and local conditions, attempting, mostly unsuccessfully, to compress classical

geometries into the irregular topography. He struggled to accommodate his ordered forms to the irregularities of the site, attempting to tame the stubborn nature of Rio, to give shape to the unshaped and uncivilized. In his insistence on a unified composition for the city, Agache did not admit the adaptation and flexibility required by any urban structure. His plan was schematic and very rigid in its zoning proposal. It also promoted social segregation and lacked sensitivity to the site and to local urban patterns.

Technology was also a crucial element for defining the form of the city. Agache inserted Rio in a extensive network of communication. He thought the city in terms of circulation, improving connectivity with different means of transportation. The transformation of the street into a rapid transit motorway at the early twentieth century preoccupied not only planners, but many intellectuals observing urban life. Agache attempted to make sure that the street would remain as irreducible element of human experience. It can be argued that he attempted to reconcile the conflict between mobility and permanence. To achieve usable, livable and good quality spaces in a modern city, Agache also recognized that it was necessary to provide a sense of permanence given by a continuous city fabric, while assuring rapid transportation. This approach led to an intricate combination of city of spaces with flow and stopping. Buildings were understood as simple masses without details and were defined only in dialogue among themselves. They were also though to be seen in movement, from automobile, plane or ship. The conception was rooted in the Hénard's ideas of the great *croissé* for Paris.[50]

Agache's plan also express the long conflict between artistic form (beauty, permanence, representation) and modern forces (development, growth and technology), which was so acute in the early 1900s. In an emerging metropolis like Rio, Agache struggled to reconcile his artistic and architectural vision with the practical and technical needs of the metropolis, attempting to keep united two worlds, which were going apart. As he affirmed in an interview quoted before, he was not against skyscrapers, these symbols of modern forces, but wanted to have them integrated in decorative ensemble− forces of modernity should be domesticated. He wanted to reconcile the logically and technically oriented world with the artistic and personal view of the architect, who wished to communicate with his culture, surroundings and historical experience. Like Otto Wagner in Vienna, Agache wanted to show that the planning of modern infrastructure was still the task of the architect.[51]

The urbanism of Agache, as well as of his colleague Le Corbusier, incorporated an intense utopian component. Utopian features had always been an essential in the attempts to improve life in cities. As Françoise Choay argued, the utopian genre was, along the architectural tradition of treatises, an important element informing the thinking on cities since the Renaissance and thus influencing the formation of modern urbanism.[52]

Agache's plan implied a complete transformation of Brazilian society, but he did not present any clue on how to achieve this transformation in practical terms. The plan revealed itself unreal when facing the concrete reality and disconnected from the real city. As other planners of his time, Agache believed that he could solve complex problems simply by identifying them, proposing solutions and imposing codes. When

suggesting that deprived people from the *favelas* could move to the garden cities that he designed in the periphery, Agache naively misunderstood the complexities of a society founded on immense social inequalities. His housing solutions for the lower classes implied the presence of a strong welfare state, which was unrealistic at that time in Brazil. He aimed to create spaces for masses of disciplined citizens, but the problem was that theses masses did not yet exist in Brazil, they had to be created. In the same way, he designed offices for big corporations that did not exist in Brazil. If urbanism emerged in Europe in order to make an environment for modern society, in Brazil it arrived before the modern society itself.

This belief in the power of technology, architectural ideas and utopian features to transform cities was present in both Le Corbusier and Agache. This tripartite belief can also be found in Tony Garnier, who, like Hénard, provided a common ground for Le Corbusier and Agache. Although peripheral to the SFU, Garnier's *Cité Industrielle* proved that these three features were present in the genesis of French planning of the early 20th century.

Agache came from a cultural and professional context, with its own ideas, conventions, and practices. In Brazil, he had to face a specific local context. Agache attempted to create in the tropics a version of Paris and although the buildings of Castello Square were reminiscent of Chicago's skyscrapers, they were filtered through the lens of a French planner. In his rendering of the new center of Rio, even the intensely blue hues of Brazilian sky were turned to a gray sky typical of northern France (fig.11-12). It is quite difficult to imagine the irreverence and informality of the Brazilians in these new spaces. Carnivals and parties would contrast with the formality of the spaces Agache designed, but he cannot be blamed solely for that, as his Brazilian clients, wishing to obliterate the obvious differences between France and Brazil, were not encouraging this compromise.

* * *

Cities are places where the intentions and aspiration of inhabitants, rulers, designers, and builders meet.[53] Far from being an isolated and unbiased practice, urbanism is in the intersection between politics, aesthetics, technology society and scientific knowledge. Urbanism embodied visions that societies held for their future and reconciled intricate worldviews. Agache's plan is a complex document that reveals values and conceptions of a society. Brazilians hoped that a beautiful urban plan could provide a passport to modernity, bypassing an arduous process of social modernization. In Latin America, the qualities of urbanism as a condenser of social aspirations were even more heightened, as the Uruguayan critic Angel Rama noticed:

> The cities, before being concretized, existed as symbolic representations, through discourses, images, blueprints, drawings, which expressed a wish and a dream: that one of transforming the space as a concretization of an idea, to transform the real city in the ideal city.[54]

Just after the departure of Agache, Brazil entered into an era of profound political transformation. A complex and intricate mix of modernizing forces led by Getúlio Vargas toppled the aristocratic regime in October 1930. If the late 1920s were years of an intense discussion about Urbanism, 1930 would create an appropriate environment to put in practice these ideas. The Vargas era provoked many expectations among planners. Agache's plan was a pivotal piece in the subsequent development of Brazilian urbanism.

The attention Agache, as well as his colleague Le Corbusier received in Brazil was strikingly different from the rejection they suffered in their land. Due to the reluctance of French municipal authorities in enforcing plans, they had few chances to work in France. Both found in the tropics, an entire nation eager to listen to them, eager to be modern. They found in Brazil a chance to concretize their dreams.

Locating power and decision-making : a case study of giving Orissa a new face-lift

Amal Kumar Mishra
Utkal University, India

Orissa situated on the eastern sea-board of India extends from 17^0 49' N to 22^0 34' N latitude and from 81^0 27 E to 87^0 29' E longitude.[1] With a hoary past and great cultural legacy it emerged as a separate province, as states were called then in India, on 1 April, 1936 after a long travail under British colonial rule.[2] Long years of foreign rule and because of the deprivation caused by so many important factors beyond control the land of Orissa was pushed backwards and had not progressed at all till then. Therefore, it came as a great challenge to the indigenous leadership to give a new direction to the state and lift the people, whose representatives they were in the Assembly, to greater heights. And, for that quick modernization and rapid industrialization were very much needed. For this, what was needed most, was power generation. Indeed, it was a paean to nationalist desires and political figures including Harekrushna Mahtab, who became the Premier of Orissa on 23April, 1946[3] after the war years. He was crucial in setting up and pushing through Orissa's industrialization policies of the period. Thus, he took up the task and responsibility to give a new identity to Orissa and locate it in the industrial map of India.

Incidentally the nationalist movement was at the fag end of its course at that time in 1946 with the country attaining her independence very soon in 1947.[4] The 1950s were a unique period in Indian history when there was a great deal of idealism and desire to see India develop, although in hindsight it is known, many of these policies did not achieve the desired outcomes. However, the Government of Orissa under Mahtab saw to it that two important river valley projects, among others, one called the Mahanadi River Valley Project and the other, Machkund-Duduma Project were taken up in right earnest to generate hydro-electric power.

But that was no smooth affair from the very beginning. It required a lot of technical arrangements as well as financial aid and assistance. Added to it the possible displacement of people and the consequential agitations caused a lot of tension to Mahtab's ministry. The anti-Hirakud dam agitation, based on large scale displacement, lack of adequate compensation and resettlement procedures as related to *adivasi* (indigenous communities) , and other environmental problems, took a very nasty and ugly turn with political parties and vested interests opposed to Mahtab inciting the people to rise up against his government. But there was no despair either. Mahtab, the Premier, was determined and he faced the challenges successfully in a most democratic manner by putting down his political opponents while addressing the humane issues to the best of his abilities.

Here, we take up the matter relating to Mahanadi River Valley Project and how that gave Orissa a new facelift as our main case study since that was a far bigger issue than

the other one, which involved a lot of interests at that particular period of time, 1937-1957. It continues to be so, more or less, even till the recent times.

Now the moot questions: what were the needs and requirements of the time, the circumstances leading to the selection of the site, the demands of the leaders of the agitation and the possible areas of conflict between those ousted and the government and how ultimately the decision made by Harekrushna Mahtab, the Premier, stood him well and how Orissa became a power plus state ultimately that quickened the pace of industrialization besides helping agriculture to grow by way of providing irrigation facilities.

The case study of giving Orissa a new facelift is thus quite interesting as well as a refreshingly new attempt at serious research.

Jawaharlal Nehru, the first Prime Minister of India, had told on 12 April, 1948: *Our wealth lies in our rivers.*[5] True to his very words the need and requirement of the time was to harness the water resources of the river Mahanadi considered the life-line of Orissa. Originating from the Raipur district of present Chhatisgarh state, the river enters the state of Orissa from the north-west in Sambalpur district and runs a course of 533 miles towards the south-east before meeting the Bay of Bengal at Paradeep in the district of Jagatsinghpur. The catchments area covering about 51,000 square miles above Naraj in the district of Cuttack, receives an annual rainfall of about 55" on an average. As per an estimate, its mean annual discharge at that time was about 1 lakh cusecs, which on occasions rose up to 1.5 million cusecs. During rains the river generally swelled up and acquired monstrous proportions in size with water all the way and covered a vast area of 2300 square miles, considered some of the most fertile and populous tracts in Orissa. The question of controlling the swelling river and possible consequential devastations in terms of loss of life and property besides the fact that a lot of water was going waste all the time, engaged the attention of everybody. Accordingly, the idea mooted was to build up a multipurpose reservoir.[6]

In 1937-38, Sir M. Visweswaraya, an engineer of very high repute in India, was engaged by the ministry of Biswanath Das in order to make a scientific enquiry and suggest suitable measures in this regard.[7] A.V. Thakkar, the President of the Orissa Flood Enquiry Committee, also gave a favorable view in the same year. But, a storage reservoir was calculated to be too costly at that time and the matter was deferred till 1943 when another terrible flood swallowed millions of lives besides causing a huge loss of property. The attention of the government of India was drawn to the great usefulness that the Damodar Valley Project in the north and Tungabhadra Project in the south had achieved in a short time. Dr. A.N. Khosla, Chairman of the Central Water and Power Commission, Government of India, then got convinced after a visit to Orissa in 1945 that for the too many ills of Orissa like poverty, disease, drought and flood the only remedy could be the storage water dams. Dr. B. R. Ambedkar, the Labour Member, Government of India, the representatives of the Eastern States' Agency, the Governments of Orissa, C. P. & Berar - all acceding to such a move and course of action the Chief Engineer, Government of India, made an ariel survey of Hirakud,

Tikarpara and Naraj to locate the exact site of the dam. The final decision, however, went in favour of the site at Hirakud near Sambalpur. The model of Tennessee Valley Project, U.S.A. appeared as a bright example.[8]

Harekrushna Mahtab, the Premier, could further enlist the support of the Governor, Sir Hawthorne Lewis and Lord Wavell, the Viceroy, who in turn pressed upon the Secretary of State for India in Britain in 1946 the urgency of the matter which was pending before the public for long and thus, was regarded overdue.[9]

It was on 15 March, 1946 Sir Hawthorne Lewis, the Governor of Orissa, caused to lay the foundation stone of the dam for which the Governor-General and Viceroy of India, Lord Wavell, sent a message of congratulation. However, the real construction work started much later after the independence of the country. On 12 April, 1948 Jawaharlal Nehru, the then Prime Minister of India, himself began the cement concrete work in the dam site. On that occasion, Nehru observed :

> *The Hirakud is a great project. It has immense possibilities*
> *and after a full consideration of the Central Waterways,*
> *Irrigation and Navigation Commission, I have come to*
> *inaugurate work on the dam.[10]*

The work of preparation of the design of the dam at Hirakud was, however, handed over to the International Engineering Company, Colorado, which submitted it in December, 1949. Thereafter, a lot of revisions and considerations were made and the final form of the design could come up in June, 1951 and was given to the ground staff at the project site in the month of September, 1951. The cost of the project was estimated to be somewhere around 60 crores of rupees at that time and according to a comparative analysis it amounted to twenty five years of the state's revenue.[11]

In January, 1952 the Government of India set up an Advisory Committee with three members called Mazumdar Committee which quickly submitted its report within two months in March, 1952. Its terms of reference were to find out the technical feasibility, financial aspects and the manifold possibilities of power generation, irrigation facility, the quantum of payment of compensation to those ousted etc.

However, the Hirakud dam was meant to be constructed in three important phases. The first phase would be the construction of "the main concrete dam over the two channels of Mahanadi with the two earthen dykes on both sides of the dam."[12] The transmission lines with power houses for electricity generation and distribution and also the digging of a canal in Sambalpur were to be taken up in the first phase itself. In the second phase, the building of a subsidiary power house at Chiplima was proposed to be taken up. The matter of Delta Irrigation Scheme was proposed in the third and final phase.

However, the main dam after construction is about eight miles long with thirteen miles of dykes both on its right and left. Its height is 200' and the length is 958'. As per an estimate, "it has consumed 15 . 58 lakh cft. of mass concrete and 1036 lakhs cft. of

R.C.C. and masonary of 60.25 lakhs cft. and reinforcement of 1,154,80 tons. The total cost of this work is about Rs.1.74 lakhs".[13]

Hirakud now boasts of being the longest earthen dam in the entire world of that period which was completed in 1956 with an estimated total cost of Rs.5.86 crores. It has two parts. "One is in the left bank between the left abutment and the left channel concrete dam and the other part of the earth dam is between the left channel and right channel concrete dam over the Hirakud island".[14]

The reservoir covers an area of 288 square miles belonging to Sambalpur in Orissa and a part of Raigarh district in Chhatisgarh state. It has displaced about 249 villages having 18,432 houses with 22,144 families besides inundating 1,63,061.40 acres of land mass; the actual agricultural fields amounting to 1, 12, 038.59 acres in Sambalpur. The people, on the other side of the border i.e., in Chhatisgarh, suffered a loss of 36 villages with a land mass of 4315.83 acres ; the agricultural lands amounting to 3089.38 acres.

The power generation and transmission work, which was another important aim of building the Hirakud dam, was started in December, 1956 at a cost of Rs. 16.27 crores.

Still another big objective was providing water to the cultivators and initially two main canals catered to 6.27 acres of lands in Bolangir and Sambalpur districts annually. It all started on 7 September, 1956. These were followed by some more canals beginning from 2 October, 1956. Thus, the canal system of irrigation served about 454, 000 acres of cultivable area.[15]

Now a discussion follows regarding the dispossessed people, the anti- Hirakud dam agitation and the role of Mahtab's ministry and government.

Immediately when it became known in 1946 through initial notifications that a large number of prosperous areas were going to be submerged for all time to come there were severe and loud protests all around. The anti-Hirakud dam agitation which gradually took the shape of a movement was born out of it when people in the affected areas particularly at Rampella, Mahadebpalli, Mura etc. realized that they were going to lose not only their hearth and home but also the temples and a large amount of prosperous agricultural lands for the purpose of the dam.

The failure to be consulted and informed about the proposed dam with little or no information regarding subsequent submergence of village hutments and possible shifting and displacements and apparent ignorance of compensation and rehabilitation packages for project affected population built up the right kind of material for a mass movement to grow very soon. It appeared that the project authorities were only interested in relocation and not rehabilitation or long term welfare of the people as defective and incomplete information was passed on to them in the absence of advance and comprehensive planning for rehabilitation on the part of officials in charge. The failure to provide alternative livelihoods and fishing rights enraged them further. Under the circumstances not only the tribal population but also scores of women, children,

destitutes, the uncared for aged and the disabled became the worst sufferers as they became the marginalized groups found at the receiving end. Eminent scholars like Scudder and Cernea in the recent times call for reconstructive actions on the part of the state to reverse the risks of dam-induced resettlements .[16]

Jawaharlal Nehru while inaugurating the work on the Hirakud dam site on 12 April, 1948 had told emphatically:

> *In all such projects some people have necessarily to suffer*
> *and they should suffer gladly in the interests of the country*
> *as a whole.[17]*

He further added:

> *Criticisms have been leveled against the Hirakud project by*
> *some people. Politics are important but surely a country*
> *cannot progress by politics alone. The people themselves*
> *should be in a position to march forward. A country can*
> *progress only when the people are relieved of their*
> *miseries. The Hirakud project is a work which will not*
> *cause more misery to the people but it will bring about an*
> *end to their miseries.[18]*

But the mood of the dispossessed people, who felt harassed and humiliated since they were uprooted from their mother earth for the dam site, was totally different. They did not take all these lightly. Under the pressure of the circumstance many ideological skeptics, which included also followers of Gandhi like Bodhram Dube and Sankar Prasad Mishra, who did not fully appreciate this model of development from the very start, soon challenged the government of Mahtab and the atmosphere got surcharged day by day by way of making allegations and counter-allegations.[19] Enough mud-slinging was done on the Mahtab ministry. In fact, all these had begun at the outset of the survey work. Sir Akbar Hydari, the Executive Councilor in charge of Works, Mines, Power and Labour, urged upon Mahtab to adopt certain measures in order to put an end to the ongoing agitation.[20]

The ministry of Mahtab also took up propaganda work with a view to educating the public on the possible benefits that would accrue once the dam in Hirakud was completed. The Publicity Department, Government of Orissa, also undertook measures to spread public awareness for the cause of the dam. Mahtab and Nabakrushna Chaudhury, a youthful minister in charge of Revenue Department at that time, paid many visits to different parts of Orissa, particularly the affected areas, and tried their best to convince the people on the multipurpose utility of the dam. Also very categorically they spelled out the compensation package to be handed over to the people who were to be displaced or somehow affected by it.

The anti-Hirakud dam leaders even tried to contact the Interim Government at the center in New Delhi at one point of time in 1946-47 but that did not work. Sardar Patel, who was in the party high command and generally regarded as the Iron Man of India, on the other hand, gave specific instructions to Mahtab not to bend but to go ahead in the work of construction despite the pitfalls and challenges that he might face.[21] On 22 August, 1946 Dr. A.N. Khosla visited Cuttack, met the opposing leaders like Bodhram Dube, Sankar Prasad Mishra and a host of others and tried to dispel all misgivings regarding the dam and clearly told about the merits of such a big endeavor. The ministry of Mahtab must investigate the individual cases and definitely give compensation to everybody affected by the construction of the dam, he assured.[22]

However, the leaders of the movement had called upon the people to participate in a conference which was held on 28 April, 1947 to take stock of the situation. A demand was made to abandon the dam and launch a *satyagraha* i.e., a mass movement which was to start from 21 May, 1947 at Sambalpur. Even an attempt was made to separate Sambalpur from the rest of Orissa and join the Eastern States' Federation in stead. The *maharaja* (king) of Patna was reportedly found siding with the leaders of Sambalpur on this issue. Therefore, the Governor of Orissa as well as the Viceroy of India wrote to the concerned officials in order to dissuade the king from adopting such a path of confrontation with the Government of Orissa under Mahtab over this particular matter.[23]

Harekrushna Mahtab, the Premier, made a statement in the state Assembly relating to Hirakud dam and tried to assuage the feelings and misgivings long entertained by some of the members. Even the landless people would also be rehabilitated suitably, he assured on the floor of the Assembly. The Assembly, however, took the momentous decision on 28 August, 1947 by unanimously adopting a resolution favouring the construction of the Hirakud dam for public good.[24]

The resettlement and rehabilitation work, as promised both to the Assembly and the public by Mahtab, were taken up in right earnest. A new Department of Hirakud Land Organization was created for supervising proper evacuation, resettlement and rehabilitation of the displaced humanity under the Member, Board of Revenue, Government of Orissa. The actual evacuation programme was however taken up in 1955. But before the arrangements were made for providing compensation, land for both habitation and cultivation, and to build model habitats in villages in order to accommodate the displaced people. Mahtab's ministry and government tried tirelessly to fulfill their commitments made to the people, but it was also a fact that many of those who were ousted remained dissatisfied. According to a report,[25] *only 1/3 of the compensation claims had been disbursed and 11, 341 arbitration cases were pending, when in March, 1956 people were displaced without compensation, rendering them homeless as well as resourceless.*

The anti-Hirakud dam agitation, however, could not materialize and continue to make further progress, reportedly because such early protests soon after independence were not sustainable for long. It was also … *because of their failure to attract larger alliances, under the overwhelming influence of the nationalist rhetoric of nation-building that*

accompanied the construction of large dams in India.[26] For example, to quote Jawaharlal Nehru in this regard :

> *But these constructive feats will not only change the face of*
> *India and bring prosperity to millions, but will make that*
> *prosperity endure for a thousand years.*[27]

Dedicated to the service of the nation on 13 January, 1957,[28] the Hirakud dam project took nearly ten years and eight months for completion and became a role model and good precedent before such other mega projects which symbolized breaking the colonial chains of underdevelopment in independent India.

In the recent times,[29] however, a lot of hue and cry is raised over the use of water of the Hirakud dam. As alleged by the farmers, who had their lands near the downstream and canal areas, the growth of so many industries in and around Hirakud dam site have led to the consumption of water in double speed leaving them almost high and dry. A conflict between head-ender users and tail-ender farmers has developed which has created a near law and order situation in the otherwise peaceful Hirakud region. The Government of Orissa maintains that there is specific allocation of water for the industries and for them only 0.252 M ac.ft per annum of water is allowed. They cannot go certainly beyond this limit leaving enough for the farmers, yet the later do not seem to relent and appear satisfied. Further, the collection of water tax from the farmers and non-collection from so many industries which are reportedly in arrears of crores of rupees have raised more issues.[30] Added to it, the fishermen community which depends on the water body largely i.e., the reservoir also alleges large scale pollution of water due to huge garbage discharges made by the nearby industries.[31] Under the circumstances a paradigm shift in the concept of planning and technology is required. It remains to be seen how the situation is tackled effectively bringing back the Hirakud region to normalcy by way of satisfying all interests through democratic and peaceful means based on public-private partnership.

_____

The city of São Paulo between private capital and public interest: 1890-1930

Maria Stella Bresciani
State University of Campinas, Brazil

Luiz I. R. Anhaia Mello – engineer-architect and urban planner. Sketch for the study of a career

In his long professional career, engineer-architect Luiz de Anhaia Mello was constantly working both in various dimensions of the local administration and the academy (he occupied important positions at the City Hall of São Paulo and taught at the Polytechnic Institute and at the Faculty of Architecture and Urban Planning) and in the private sector (son of an industrialist, he was a partner in financial institutions and a civil construction company). He was undoubtedly one of the most authoritative figures of São Paulo urban planning.

Author of many texts,[1] Luiz de Anhaia Mello played an essential role: in the academy, where he produced scholarly knowledge in the areas of civil engineering and urban planning; in associations; and at the City Council and in the public administration of São Paulo, where he created a local Department specialized in urban interventions. All Brazilian specialists agree on his importance According to architect Maria Cristina da Silva Leme, for almost half a century, Anhaia Mello was the main theoretician of urban planning in São Paulo and his intellectual production defined the trends of this field,[2] an opinion ALSO shared by two others architects, Sylvia Ficher and Sarah Feldman.[3] In a thesis that retraces the career of teachers and architects graduated in the Polytechnic Institute, Ficher offers indispensable biographic references. With regard to Anhaia Mello, she gives essential information and keeps track of his different lines of activities as a teacher at the Engineering School of São Paulo, as a local administrator, as an employee of the local Public Works Department and as a member of the *Sociedade Amigos da Cidade* (Friends of the City Society).(Ficher:143-153) Feldman, as for her, follows Luiz de Anhaia Mello's career in an excellent study of the main urban planning guidelines. She highlights his leading role in the definition of the urban planning trends in that city, since, in the 1940s, he introduced the notion of zoning for urban interventions, which he later extended to the regional plan.[4] In addition, from 1947 onwards, many of his proposals helped restructure the local administration (Feldman: 73). As an example, the Urban Planning Division of the Public Works Department became a separate Department and since "its effective operation area as a normative agency (...)" was clearly delimited, "the idea of zoning as a planning tool *par excellence* was strengthened". (Feldman: 110)

Anhaia Mello had a constant influence on various dimensions of both the academic and public lives. To defend his ideas, he often engaged in open confrontations with other urban planners, as with the author of the 1930 *Plan of Avenues for São Paulo*, Francisco Prestes Maia, who, as himself, was a former student and professor of the Polytechnic Institute and an official at the São Paulo City Hall.

Landmarks in Luiz Ignácio Romeiro de Anhaia Mello's career include[5]: he studied at the Polytechnic Institute of São Paulo where he graduated in engineering in 1913; he began his academic career in 1918 as a substitute professor at this Institute, was tenured in 1922 and retired in 1968. There, he created the urban planning course in 1926, after the 1925 curriculum reform transferred the "urban planning contents" from the Chairs of "Urban Hydraulics and City Sanitation" and of "City Architecture" to the new Chair of "Aesthetics: General Composition and Urban Planning I and II", through Act # 2128.[6] He was the vice-director and director of this Institute between 1928 and 1930 and again in 1931; He participated in the foundation of the Faculty of Architecture and Urban Planning of the University of São Paulo, which he directed from 1948, year of its creation, to 1951; he was the pedagogical director of the *Liceu de Artes e Ofícios* (College of Arts and Crafts) from 1927 onward; he created the Urban Planning Department of the Engineering Institute of São Paulo in 1928, was its president between 1929 and 1930 and a member of its board between 1933 and 1934. In 1935, he participated in the foundation of the *Sociedade Amigos da Cidade* (Friends of the City Society), a private organization that "demand[ed] improvements, regulating plans, progress, higher quality of life and the splendor of civilization", and became its president in 1945; he was a City Councilor, official at the City Hall and Mayor of São Paulo for two brief periods, between 1930 and 1931.[7] He also worked in the private sector, since, "freshly graduated, he was hired by F.P.Ramos de Azevedo & Cia Iniciadora Predial" where he remained until 1964 and was the director of the Villa Prudente Pottery, both established by Ramos de Azevedo;[8] In addition, he designed private houses and churches, as that of São Luiz, and the Institute itself.[9]

1. An example career

The present study is part of an effort to propose an alternative, complementary study that contributes to the collective task of unveiling the bases of urban planning in São Paulo. It retraces the influence of Anhaia Mello not only as a theorist, a teacher and a local authority, but also as a tireless disseminator of urban planning principles in private institutions and public interest bodies. In fact, this engineer-architect played a leading role in the creation of this field in São Paulo and in the way it was structured. Based on the assumption that "as any technique, planning is politically neutral" and therefore does not depend on political contexts (Anhaia Mello, 1945: 87 apud Feldman: 49, 81), he helped give it a professional configuration. Although Feldman's book *Planejamento e zoneamento. São Paulo 1947-1970* (Planning and zoning. São Paulo 1947-1970) does not focuses on him, the space he is given incites us to look for his main agreements and disagreements with other authors..

Feldman, Leme and Ficher stress Anhaia Mello and Prestes Maia persistently quarreled on issues crucial to the Urban Planning Department. On the one hand, Anhaia Mello was a declared advocate of the interdisciplinary conception of urban planning with a special attention to the psychological dimension (Simmell). He recommended constituting a Planning Commission with a multidisciplinary profile, part of which would not belong to the local administration (Feldman: 65). On the other, Prestes Maia, who

supported Betham's idea that space should be organized by specialists so as to induce behaviors, valued local engineers in his 1930 *Plan of avenues*. He and his colleague and collaborator, engineer João Florence de Ulhôa Cintra, followed the prevailing ideas defended by Freire. Actually, after twenty-six years working at the Local Public Works Department (1899-1926), Freire was an unquestionable authority among local engineers. In addition, he had disseminated his positions to a wide public that included his students at the Polytechnic Institute. These attended his lectures at the *Gremio Polytechnico* (Polytechnic Association), which were then published in the journal *Polytechnica*. Freire had already vehemently defended the competence of his Department team in a controversy, when his 1911 plan, designed with Eugenio Guilhem, competed with three others to define interventions in the downtown area.[10] Such position was maintained by Ulhôa Cintra and Prestes Maia in the articles they published in the 1920s. In addition, as Freire, the former had proposed a street plan with an irradiation circular avenue that the latter included into his 1930 *Plan of Avenues*.

The struggle between both urban planners was so tough that, according to Feldman, "the conception of organization and the ideas of Anhaia Mello were only accepted among the technicians of the local Urban Planning Department, where Prestes Maia's ideas were strongly rooted, from the 1930s onwards, when a growing movement sought to include planning among government functions". And probably because of the weight of his political relationships, as the author also recalls (Feldman: 76). As we have seen, while Prestes Maia advocated orderly, albeit unlimited, growth of the city, Anhaia Mello, in his reading of Ebenezer Howard's conception of garden cities, considered growth should be controlled and the city surrounded by a green belt. Actually, the very conception of urban expansion only shifted in the beginning of the 1950s. Anhaia Mello's positions reemerged in the first publication of the Urban Planning Department, in 1951, in articles by two City Hall engineers: Carlos Alberto Gomes Cardim Filho, director of the Urban Planning Department, and Carlos Brasil Lodi, head of the City General Planning. In fact, ever since he assumed office, Brasil Lodi persistently followed Anhaia Mello's ideas. As an example, in addition to separating planning and designing in different divisions, he considered planning should be in charge of a multidisciplinary team and therefore collective, as defended by Anhaia Mello in his 1928 speech at the Rotary Club.[11] (Feldman: 50, 87)

The author then describes the actions and struggles that followed the creation of the local Urban Planning Department and the adoption of these guidelines. She highlights the clear distinction between two "functions": a "line" function that should handle routine decisions and everyday problems, and a "staff" function, in charge of the planning, research, investigation, forecast, survey and data interpretation activities. The second one should be "directly subordinated to the Mayor, [as] a kind of super-department... and to the Guidance Commission of the City Plan".[12]

Feldman's book is undoubtedly strategically organized. It supplies the general reader, and especially researchers, with priceless information without resorting to Manichaean explanations. The "elites" or "bourgeoisie" are never accused of making decisions in their own benefit or of deliberately segregating the working class or low income

populations into degraded or peripheral areas. Yet, this does not mean the author assumes a "neutral" position: the ideas and practical decisions of urban planners are analyzed within the sphere of specialized trends and of opinions that prevailed at that time. They are not free of the very *parti pris* of urban planning strategies. In addition, an important element of Anhaia Mello's proposals to "humanize" the living conditions of the working class families is little explored: the creation of parks intended to offer a pleasant environment for the leisure of whoever had no access to clubs and sport associations.[13]

Another important facet of Feldman's study is that its time markers are the struggles between diverging positions or the changes intrinsic to the formation of the field of urban planning. No temporality external to her study object is ever evoked. For a historian, it is a salutary break from the most usual procedure in this area, which superposes the temporality of economical and/or political processes to sequences of constructions, architectural styles and/or changes in the way of thinking and intervening in the city.

In addition, the author always establishes dialogs with both other colleagues from the Polytechnic Institute (founded in 1893) or Mackenzie Engineering School (founded in 1894) and foreign urban planners contemporary to them. In addition to urban planning theory and its theoretical assumptions, she also mentions the legal provisions intended to regulate São Paulo's urbanization. The latter are often compared to their transgressions so as to expose the constitutive distance between law and its effective enforcement. This line of argumentation reveals her concern to expose the circulation of ideas, assumptions and ways of organizing urban planning theory and practices from different countries. According to her, these supplied models adopted by São Paulo's urban planners, but often applied acritically, as is the case of the changes introduced by Anhaia Mello at the local Urban Planning Department. (Feldman: 72)[14]

Besides, as many other scholars, Feldman thinks that U.S. references were more than an inspiration to Anhaia Mello: they are inextricably linked to his career and, in the 1930s, they marked "a decisive moment in the spreading of American urban planning among Brazilian professionals". In fact, such references began to prevail in the ideas, practices and models of institutions chosen (Feldman: 28-29). This is confirmed by the options for: the model of garden cities for the new districts; the notion of zoning to regulate urban growth; the models of "cell cities" and "neighborhood units", supposed to form "decentralizing cores" and invert the characteristic monocentrality of São Paulo; the organization of the City Hall activities; and the close relation between planning and local administration, in 1947. (Feldman: 71-72)

2. Proposal of an alternative and complementary study

This paper is part of the thematic project "Scientific and Technical Knowledge in the Configuration and Reconfiguration of the Urban Space. São Paulo, 19th and 20th centuries", in which I coordinate the team studying how the urban planning theory was created in the first half of the 20th century. Our hypothesis agrees with most studies that urban planning actually emerged during the 19th century from the interaction between hygienist doctors and sanitary engineers, knowledge fields which, supposedly,

separated in the 1930s. Nevertheless, we think the conceptual framework based on the sanitary or "aesthetical-sanitary" assumptions has never been overstepped by any wider conception.

After presenting Anhaia Mello's career according to Feldman, I propose to reassess the formulation of the conceptual guidelines of the urban planning theory by testing the hypothesis that guides our project. Based on a preliminary analysis presented in the research report *Le brouhaha des petites mémoires à la rencontre des langages savants: esthétique moderne et citoyenneté à São Paulo, 1890-1940*,[15] I assert that the sanitary base became more complex but was still a guideline of urban planning, even when its assumptions were appropriated and translated into technical devices of the specialized knowledge of engineers and architects, in the 20th century. Not only did the aesthetical-sanitary conception remain, but it expanded when it assumed "the technical and street principles"[16] intended to free the traffic flows from obstacles or interruptions, according to the image of good blood circulation. This image would also be used for water supply and sewerage systems[17], district specialization, improvement of the transports and other measures designed to ensure "the good functioning of the urban organism". Medical metaphors were associated to biological notions[18] to form the ideal/idealized picture of a harmonious city without conflicts.[19]

Another crucial issue in the study of urban planners' writings, and not only theirs, certainly regards the analysis of their language(s) from different points of view: the text structure in conceptual terms, how the arguments are developed -- with a special attention to the recurrent use of metaphors --, the public to which the speech, article, plan etc. is intended, what remains and what is modified in the conceptual field during the professional evolution of the authors or group of specialists in focus and, most importantly, the interlocutors with whom the authors dialog or among whom they find examples of experiences, be they succeeded or not, to illustrate and corroborate their theses. I follow this procedure not "to let the document speak by itself" and find formulations that go beyond the names of specialists and situations quoted. I try to reach notions and precepts subsumed in a field of knowledge, whose spreading transforms them into the common sense of a culture, in our case, the so called "Western culture".

I chose the notions of cleanliness and of regular and orderly growth, i.e. of harmonious growth, because they convey the aesthetical conception of "beautiful" in contrast with that of "sublime". The latter provokes ecstasy and the suspension of rational activity, such as re-presented by authors from the 18th century, in particular the reading of Longinus' fragments by Edmund Burke in his 1756 *A Philosophical Inquiry into the origin of our Ideas of Sublime and Beautiful*.[20] In the relationship of men to the world and their fellow men, this author gave primacy to the "image" because the contact with the outside passes through the senses and settles in the "imagination" before it is handled by wit or reason. Among the languages produced by men, Burke chose the power of architectural language – the imagetic and emotional impression produced by monumental edifications, for instance – as a strategic tool to affect people's sensitivity.[21] This conservative thinker[22] was not the only one to believe the suggestive power of

architectural language could produce effects that precede and even dispense with reasoning. In an opposite political position, the also jurist Jeremy Bentham bet on the architectural language as a means to obtain human reactions and behaviors that do not necessarily pass through reasoning.

These different forms of language also point to another important element that must be taken in consideration when instrumentalizing the notions of "beautiful" and "sublime", from the 18th century onward: the discipline obtained by the way space is organized to induce or oblige people to behave accordingly to what the designers planned.[23] Such intention is clearly defined by Jeremy Bentham and expressed in the letters on the Panopticon that he synthesized for the French House of Representatives in 1790. Later, not always devoid of its omnivident element, Bentham's proposal would even be extended from spaces intended to shelter a great number of people to workers' houses, for instance. It defined the places suited to the different daily activities and eliminated environments considered promiscuous and improper to the dwellers' bodily and moral health. In both authors –conservative Burke and radical liberal Bentham–, the notion of language is strategic to understand the action of planning space organization and the very relationship of the people to the built environment. Although they had opposite political positions –in Choay's classification, Burke would certainly fit among the Culturalists and Bentham among the Progressives–, both authors assumed the efficiency of languages that emotionally induce their interlocutors to given behaviors and can or rather must dispense with any rational activity. If, for Burke, architecture was one language among others, Bentham saw space organization as the foundation of a disciplined behavior.

I will only give an example of the resort to one of these notions – that images have a suggestive and inductive power. In his 1928 speech, Anhaia Mello quoted "Arousing the Public Interest in City Planning", presented at the 1928 National Conference on Urban Planning, in Dallas, Texas, by Harry Overstreet. This quotation helped him defend the need to create an environment favorable to urban culture – the "*urbanocultura*" -- since he considered that "the weakest link in the chain of urban planning [was] the fact that the public does not understand what it is nor what its ends, methods, advantages, costs and justifications are". "In his study, Anhaia Mello says, Overstreet stresses the advantages of constantly showing to the public the drawings, plants, diagrams, perspectives and the budget of the works to be constructed". He then quotes in English: "Seeing is easier than thinking", which he completed, in Portuguese, "And it has the advantage of interesting the illiterates, too."[24]

A second idea guides this research: the "classification" Françoise Choay proposed in her 1964 *L'urbanisme, utopie et réalités* may be a reductive classificatory model, as the author herself acknowledged, but it has not yet been surpassed. Actually, the political-philosophical bases of the observations of authors who analyzed the 19th century European cities –a period she calls pre-urban planning– remain valid. They can even be detected in the positions assumed by the authors analyzed in urban planning studies, although these sometimes mixed up opposite political-philosophical elements. Another dimension of the work of Choay should be given attention in the reading of urban

planning theory and practice: the utopian dimension that feeds the active optimism evident both in the proposals trying to configure the "good, harmonious city", and in their reverse, the pessimist criticisms to the results of urban planning from the 1950s onward, especially in the 1970s.

Finally, and it might be the most complex and polemic questioning that guides our team research, the conception of a "common domain" of scholarly and technical knowledge for the intervention practices in the urban has a patent inter-national character. In fact, all categories and concepts became more accurate through a dialog both among the specialists present in the most various congresses, exhibitions and other kinds of meetings and in different publications –books, articles, communications, administrative reports, plans, projects, manuals, etc..[25]

To show the importance of what has already been called "the ritual historians use to approach their documentation" and pinpoint that an argument must be followed in its integrality, I will give an example. In the beginning of his 1928 speech to the members of the Rotary Club, and it is worth noting that it was a non-specialist public, Anhaia Mello said:

> We can assert and easily prove with positive data that our current urban problems, which seem very far from a solution, have already been integrally solved in many foreign cities, mainly in U.S. cities.
> This is what we must copy, not only because the situations are the same but also because the model is excellent.

Detached from its context, these sentences would only partly transmit the author's argument. In fact, if we consider the very beginning of his text, they can be understood differently:

> Nothing will progress if we insist in following anew the ways already opened by others and, instead of starting our research through foreign experience, grope our way forward, looking for shortcuts to find solutions that others, older or more sagacious, have already found.
> This is a general norm in scientific research, which we must obey in the particular case of the study of our urban problems.
> It does not mean that the complex problems of modern urban planning have ever been given a perfect and integral solution. In fact, they are not definitive equations, but issues with multiple aspects and forms, which appear all the time, interlace and fit together in this capricious kaleidoscope we call a modern city.[26]

Here, two ideas are particularly worth stressing: the resort to foreign experiences because they already happened and, most importantly, the assertion that the situation of U.S. and Brazilian cities is the same or similar. Why? Because, differently from European cities, they were new and had not yet constituted an old urban fabric with much more complex problems? Because they used to be small villages, as was the case of Chicago in the beginning of the 19th century and of São Paulo in 1880? The idea

of examining foreign experiences is found in the 1909 *Plan of Chicago* by Daniel H. Burnham and Edward H. Bennett, but it was already present in Jules Rochard – *Traité d'Hygiène Sociale* (Paris: Adrien Dehaye et Emile Lécrosnier, 188) and *Encyclopédie d'Hygiène et de Médecine Publique*, Tome Troisième (Paris: Lecrosnier et Babe, 1891), and later in Victor da Silva Freire in 1911 (*Melhoramentos de S. Paulo* [*Improvements for São Paulo])*, in Francisco Prestes Maia (*Estudo para um Plano de Avenidas*, [*Study for a Plan of Avenues* - 1930]) and in countless writings by Anhaia Mello, among others. Working this way means retracing what has already been done and its results, as when we go through a bibliography on a subject we are studying. We can call an academic procedure what Anhaia Mello called a "general norm of scientific research".

It is now important to bring into the debate a text that I consider fundamental to further this issue.

In *Storia dell'urbanistica europea*,[27] Donatella Calabi asserts that the urban planning practices spread through different channels and that "the knowledge and experiences collected by the first scholars of urban problems were debated and transmitted, which ended up creating a more or less specialized disciplinary body, restricted to a small number of people, and constituted the urban planning culture of the time". A kind of international urban planning society then emerged, which is present in the propaganda of the very operational sphere and helped organize exchange and comparison situations.

Professionals, who were not always engineers and/or architects, formed people and information networks and collaborated to create this common domain knowledge. It is clear that knowing and sharing previous foreign experiences is a constitutive part of the urban planning discipline, which, as Calabi stresses, is fundamentally operative or pragmatic. Visits and travel reports gave rise to a professional community based on the circulation of experiences in an attempt to form a common language and build a consultant network, organize debate and diffusion forums to systematize knowledge, theories and postulates, and to regulate legally the professions of engineer and architect.

Accepting the international character of the common domain of urban planning knowledge, which includes its practical dimension, then converges to the position defined by this historian of urban planning:

> The international dimension becomes crucial because, for the first time, it allowed to constitute a sense of professional community that exceeded national borders by accepting the circulation of experiences in an attempt to find a common language and build a consultant network to which one may recur whenever necessary. (Calabi: p.21)

These are the questionings of theory and method that I brought to this conference and that I wished to share with you. Obviously, other questionings, especially about the different forms of "ritualizing" the way documentation is approached, concern the

different positions occupied by who delivered conferences; wrote articles in specialized journals, large-circulation newspapers and magazines, in the working class press, or even in administrative reports or debates at São Paulo's City Council or at the State Legislative Assembly; gave their witness; wrote memories, travel reports, short stories or novels; and produced etchings, pictures, statistical tables, diagrams, maps and other graphic forms. Because of their wider character, and since we are only working on one dimension of the scientific and technical knowledge, these questions will have to wait for a next conference.

---

[1] In her Master's thesis, Jhoyce Povoa TIMÒTEO established that Anhaia Mello's first paper "Problemas de urbanismo: mais uma contribuição para o calçamento" (Urban Planning Problems: one more Contribution to Paving) was published in *Revista Politécnica*, n.83, São Paulo, jun. 1927, p.343-365 and the last one, "Considerações a respeito do Planejamento Regional de São Paulo" (Considerations on the Regional Planning of São Paulo), was published posthumously in *Engenharia Municipal*, n. 62, São Paulo, jan.-mar. 1974, p. 06-10.

[7] From December 1930 to July 1931 and from November 14 to December 04, 1931.

[8] Francisco de Paula Ramos de Azevedo (1851-1828) graduated at the *École Spéciale du Genie Civil et des Arts et Manufactures* of the University of Ghent in 1878; from 1896 on, as a professional, he dedicated himself to the Technical Office Ramos de Azevedo, with the collaboration of foreign professionals. In 1908 he became a partner of Ricardo Severo and Arnaldo Dumont Villares. In addition to important activities in the branch of civil construction for particulars, his office was responsible for most public buildings in the city of São Paulo (among them, those of the State Department of Treasury, of the Department of Agriculture, Commerce and Public Works and of the Department of Justice, not to mention the Teacher Training College, the Municipal Theater, The Central Post Office, the Municipal Market, the Carandiru Prison and the College of Arts and Crafts and of the Polytechnic Institute). He also was one of the founders of the Polytechnic Institute of São Paulo, where he taught until 1928, the year he died, and of the Society of Architects of São Paulo in 1911. He was also a private company administrator. Ficher, op.cit., pp.51-69.

[9] Fisher, op.cit., p.143-144.

[10] The authors of the different plans were: 1. engineer-architect Alexandre de Albuquerque (supported by a group of entrepreneurs); 2. Victor da Silva Freire and Eugenio Guilhem (City Hall); 3. engineer Samuel das Neves. All were analyzed by J. A. Bouvard, who was visiting São Paulo, and signed his report as the "Honorary Director of the Services of Architecture and Walks, Streets and Plan of Paris". He praised the City Hall Plan, which he modified into a fourth plan. His alterations concerned the gardens of the Anhangabaú river valley and of the Várzea do Carmo, by the Tamanduateí river. All plans were presented in the *Revista de Engenharia* (Journal of Engineering), a monthly publication on Civil and Industrial Engineering, Architecture and Agronomy, (Primeiro Volume, São Paulo, jun. 1911-maio 1912, p. 37-45), which also published Alexandre de Albuquerque's criticisms to the fact that the Mayor had resorted to a foreigner when the Polytechnic Institute of São Paulo had already formed good professionals.

[11] ANHAIA MELLO, Luiz de. O Problema Psychologico. Bases de uma campanha pratica e efficiente em prol de São Paulo maior e melhor (The Psychological Problem. Bases for a Practical and Efficient Campaign for a Larger and Better São Paulo), a speech delivered at the Rotary Club of São Paulo, on September 21, 1928. It is the first text of the compilation *Problemas de Urbanismo. Base para a resolução do problema technico* (Problems of Urban Planning. Base to solve the technical problem). Boletim do Instituto de Engenharia de São Paulo, São Paulo: Escolas Profissionais Salesianas, 1929. This position already appeared in the introduction to the compilation, dated February 1929.

[12] Anhaia Mello insisted on the need to maintain the "staff" function above the administrative routine of the Department of Public Works and Services in his speech *O Plano Regional de São Paulo.* Uma contribuição da Universidade para o estudo de "Um Código de Ocupação Lícita do Solo" (São Paulo's Regional Plan. A Contribution of the University to the Study of "a Code for Legal Land Use") delivered on November 8, 1954 as part of the commemorations of the World's Urban Planning Day. It draws on the text "Elementos Básicos para o Planejamento Regional de São Paulo" (Basic Elements for the Regional Planning of São Paulo) he presented to the Guidance Commission of the City Plan as a representative of the University of São Paulo. Monographs, USP-FAU 711.43098161-E2. Quotation pp. 3-4.

[13] The implantation of "active recreation" is a privileged section of Jhoyce Povoa TIMÓTEO's Master's dissertation, where she suggests the paternalist bias of Anhaia Mello's concern and highlights his conviction that specialized spaces – play-grounds and areas with sport equipment – explicitly meant to renew the workers' energy after a day or a week of work were necessary. Op. cit.

[14] In Brazil, it is almost a commonplace in the studies on urban planning and city history to recur to the word "influence" as a notion to explain the adhesion of Brazilian professionals to theories and concepts that were common in this specialized professional milieu. This notion of influence has unfolded in others as those of "importation", "transfer", "translations" or "copy" of "ideas or theories" formulated in other countries. This hinders a more careful reflection on the fact that the conceptual field of urban planning and the different forms it adopted when divulged and applied in many countries constitute a "common domain knowledge".

Reconciling public and private interests in the planning and development of airports: the Australian experience, 1995-2008

Douglas Baker
Queensland University of Technology, Australia
Robert Freestone
University of New South Wales, Australia

Introduction

In the wake of the deregulation of the airline industry since the 1980s, there is now a new history of airport privatization around the world that is continuing with the proposed privatisation of American airports. The process has been driven by neo-liberal philosophies interlinking the desire for greater competitiveness, efficiency and growth with massive investment requirements in infrastructure beyond the scope of the public purse. The result has been an inexorable increase and diversification in airport commercial activity as operators seek to maximize returns on investment. A new urban landscape has emerged over the last two decades as airports have evolved from specialised transport hubs to mixed activity centres of increasing regional significance.

One of the challenges of privatization has been the shift of a public icon – the city airport – to a privately run operation. The concepts of the public interest and public value are germane to the political processes that have framed the privatization of airports. Private operators are adamant that diversified landside revenue is required to maintain the quality of airside service and infrastructure, keep aviation charges down, and return dividends to shareholders. But public interest questions surround the commodification of public assets. In addition, the roles of corporate, government and citizen obligation have shifted and the transition has created conflict in a number of Australian capital cities.

The purpose of this paper is to review the recent Australian experience. A series of long term leases for Adelaide, Brisbane, Canberra, Darwin, Hobart, Melbourne, Perth and Sydney airports has been progressively sold to private corporations and consortia. Although air traffic control and safety remain primarily public responsibilities, the onus for airport development including major infrastructure provision and maintenance has shifted completely to commercial interests. Three key issues are explored. One, the planning process for and around airports has been fractured between state and federal control, whereby airport land effectively remains a national asset (albeit privately managed) but insulated from state and local planning controls. A growing concern has been new owners seeking to improve income generation by diversifying landside operations with non-aviation development such as retail centers which are not necessarily sanctioned by local planning controls or strategic regional policies. Secondly, the role of the federal regulator has changed from ownership/managerial to planning and policing, and it is struggling with a new regime of airport master-planning and the surrounding land use controls. The third element concerns challenges for both public and private interests in the wider community. These relate not only to familiar issues of noise, traffic, and safety, but also conflicts with other private investors who find

themselves in competition with airport businesses sanctioned by a different approvals regime. Overall, the Australian experience highlights the historically poor integration of airports into metropolitan and regional planning.

Planning Australian Airports: moving from public to private blackholes

Airports have been privatized world-wide over the past two decades and a considerable literature has followed this trend with respect to the changes in operational efficiency and ownership regimes. The manner in which airports have been privatized and the policies under which they are planned, of course, varies across countries.[1] Detailed accounts of the privatisation of Australian airports are available from a variety of sources.[2] The purpose here is to provide a general overview of the process as a means to introducing the planning process.

In Australia, a similar privatisation process occurred where, prior to the 1980s, all of the major airports were owned and operated by the Commonwealth (federal) government. The shift to transfer operational control and fiscal responsibility from the federal government started with the 1958 Aerodrome Local Ownership Plan (ALOP). This strategy was devised to transfer the ownership, operation, and maintenance responsibilities of local service airports to local authorities for no cost and a grace period of financial support. The Commonwealth gradually divested itself of the responsibility of managing smaller local airports by turning them over to local councils (free of charge) and paying for infrastructure and maintenance over an agreed period of time. By 1981, the Commonwealth government was responsible for 436 aerodromes eligible for assistance, in addition to managing 81 civil airports. The ALOP was accelerated in the early eighties, and the financial assistance to airports was reduced as the government devolved itself of funding airports.

As part of the neo-liberal reform in the Australian economy, the Federal Airports Corporation (FAC) was established in 1988 as part of the cost recovery strategy for airports to improve competition in the public sector. The FAC was responsible for airport planning, operation, terminals, and commercial services. The objective was to have the FAC operate airports as commercial enterprises, utilising the governance and strategic management methods of the private sector to generate profit. The FAC commenced with 17 airports and an asset base of $1.7 billion (Aus), and a further six airports were added in 1989: with only 23 airports under Commonwealth control at this time. The FAC was formed to make a profit from airports and the increase in freight and passenger movement. Several authors have noted that the FAC was successful in its endeavours to make airports more profitable, but the push for privatisation and the sale of the airport assets over-shadowed its success.[3] The FAC lasted as interim measure to privatisation, which began in 1997.

Hooper et al. (p.191) provide a chronology of the sale of Australian airports from the decision to sell the airports to when the new airport owners take control of the first sales. In summary, the privatisation process involved a leasehold arrangement rather than an outright freehold sale of property. This was based on a decision by the

Commonwealth government to issue 99 year leases and still retain federal planning rights over the property – rather than have it succeeded to municipal control as private property. Thus, the new airport operators purchased a range of development rights with no restrictions on land use (other than compliance with the *Airports Act 1996*) and the sales team from the Commonwealth government emphasized the market opportunities for revenue from property development, car parking and commercial initiatives.[4] This land use control historically fell under Commonwealth jurisdiction and continues to fall under the federal Airports Act (1996).

The sale of Australian airports proceeded under three phases: the first phase, May 1997, involving the sale of Brisbane, Perth, and Melbourne airports; the second, March 1998, consisting of Adelaide, Darwin (& Alice Springs, Tenant Creek), Archerfield, Canberra, Coolangatta, Hobart, Jandakot, Launceston, Moorabbin, Townsville (& Mount Isa); and the final phase, June, 2002, leasing the largest airport – Sydney. The five year process involved all the major airports in Australia.

The new operators of the airports were bound by the *Airports Act 1996* and the federal government regulations that also controlled aviation. The *Airports Act 1996* provides for an airport master plan that has a 20 year indicative vision that is replaced every five years. The master plan incorporates public comment and remains in force for each five year period. Major development plans are required for developments at airports where the cost of construction exceeds $10 million and include: environmental impact assessments, public comment, consistency with the master plan, and approval by the federal Minister.

A lack of integration

The historical change in airport planning, and indeed the general transformation in the management of infrastructure worldwide, reflects a more fundamental shift in the dynamics between government, the market place and communities. This broader context provides a framework from which to evaluate the more "micro" changes that have occurred in Australian airport planning and management. The use of market mechanisms to supply public goods has gradually increased over the past century. What is relevant to planning is how such market mechanisms have altered the fundamental relationships between government, the public and private interests.

The history of airport and urban planning continues to demonstrate a lack of integration between the airport and urban surrounds – and as a result, very little citizen participation has affected the development of airports in Australia. Rather, the history of airport development and planning has moved from the construct of the citizen as benefiting from airports as an essential element of Australian infrastructure – to becoming a customer of a privatized commercial service. The unique history of airport development in Australia has facilitated this duality. As a result, the privatization of Australian airports presently faces challenges in meeting the public's expectations of a traditional icon, and the historical governance framework is ill designed to deal with increasing urban pressures around airports.

During World War 2 the Commonwealth introduced maintenance grants for all aerodromes with regular passenger and transport services. The demand for federal funding increased significantly at the end of the War as many airports became available for civil aviation operations – and as air traffic volumes increased, Commonwealth Government finance was mainly directed at the busiest airports servicing larger aircraft.[5] Thus, by 1981 the Commonwealth Government had reached its hiatus in the management and ownership of Australian airports (as already noted: 436 aerodromes eligible for assistance, in addition to managing 81 civil airports).

The important role airports and aviation played in the development of Post-war Australia impacted the cultural identity of Australians. Cultural icons such as the Flying Doctor service and Qantas exemplified the important benefits that the airline industry provided to all of Australia. The relatively small population of Australia and the considerable distances between urban and rural centres reinforced the need for air travel and suitable airports to service air traffic. Despite the significance of aviation and airport development to the country and Australians – the role of town planning and airports evolved separately. Airport planning and the development of airports remained under Commonwealth control and considered of national significance, which allowed them the freedom of the constraints of local or metropolitan planning. For example, airports in Adelaide and Brisbane planned within their boundaries and the cities planned around them; in many cases this was not a problem, as the airport was located 20-30 kilometres from the urban centre. However, urban growth since the 1980s, such as in Melbourne or Brisbane, soon united the city and airport; yet the planning processes remain separate.

The earliest Australian airport literature documented the military importance of aviation, however, similar to the American experience, early Australian town planning interest was muted.[6] Sulman briefly dealt with the space demands of modern aerodromes as a form of specialised urban space alongside racecourses, drill grounds, and zoos.[7] Brown et al. provided a more expansive treatment, emphasising the importance of physical planning, design standards, site selection, and the 'general effect of an airport on the planning of a town'[8] The significance and influence of airport site selection and its implications in determining adjacent land uses, primarily in relation to the impact of noise and in the interests of safety, were key aspects of this early airport literature. The value of adequate transport connections between the airport and town to ensure maximum benefit from the provision of air services was also recognised.

The 1960s and early 1970s saw spectacular growth in aviation and airports both through technological advancement and the growing accessibility of air travel to the greater public. During this time, regardless of ownership structure, airports were managed as publicly owned and controlled utilities with public service obligations associated primarily with their transport functions, commercial and financial management had a low priority.[9] The benefit and impact of necessary airport expansion plans and duplications of runways was evaluated, modelled and debated; and by the 1980s, airports were stigmatised as an urban inconvenience and their public costs

versus urban impacts were questioned by government and the surrounding public alike.[10] The expansion of the existing airport and aborted development of a second facility in Sydney attracted significant academic interest and by the 1990s the environmental and social disbenefits of airports were a major concern.[11]

In summary, much of the planning of Australian airports by the Commonwealth Government has occurred separately from local communities for the benefit of the Australian public. Planning was conducted in a paternalistic "black hole" where the Australian public had very little involvement. The planning process for airports, in most cases, was an "isolated event" outside of the surrounding urban environment. In conjunction, urban and regional planning also ignored airports to a large degree, both in practice and in the literature. Where airports eventually created negative impacts due to environmental issues such as noise – the planning process remained disjointed, and issue specific.

The impacts of privatization

The mid-1980s saw fundamental policy changes towards ownership in countries around the world.[12] Governments faced enormous pressure from tax payers to control deficits. State funding for airports was out of favour and airports were considered a 'mature' industry with little development potential.[13] The perceived drain on public resources motivated some national governments to undertake a variety of strategies to minimise loss and seek a return on decades of unfulfilled public investment.

The privatization process in Australia occurred in the wake of increasing: air traffic, costs to manage airport infrastructure, and public reliance on flying. For example, in Australia (1995-2005), domestic, regional and international air traffic increased by annual averages of 4.6%, 4.1% and 5.9% respectively.[14] In addition, while only 0.1% of international freight, by weight, was transported by air in Australia in 2003/04, it had a value of $AUD65.5b, representing 26.4% of total freight value.[15] International tourists, whose expenditures are major contributors to regional economics, typically arrive by air and the presence of an airport is recognised as fundamental for the realisation of regional tourism and economic potential.[16] Over the next decade, the number of international visitors to Australia is estimated to grow at 5.6% per annum, to reach around 10 million per annum.[17]

This sort of growth and its implications for support services and city regions ultimately lies behind the rising importance of Australian airports as an urban phenomenon. Increasingly, airports represent a phalanx of considerations, both intentional and causational, when their impacts on economies, populations, trade, tourism, employment, industry are considered.

Within this increased growth for airports, the Australian privatisation process occurred. The deregulation of the airline industry proceeded in parallel, and so the management of major airports also underwent a revolution. From 1996 FAC airports were put to tender in a two phase process under the provisions of the new *Airports Act 1996*, and

the Federal Government netted billions of dollars in the sale of airport leaseholds. Despite the Asian economic crisis at the time, the price earnings ratios for Australian airports were high because of limited opportunities to purchase international airports in the Asia Pacific region, the high degree of corporate autonomy bestowed, and the significant geographic monopoly power involved.[18] Airport operators purchased a wide range of development rights with no restriction on land uses other than compliance with the *Airports Act 1996*. As already noted, the government sales team marketed the investment potential and opportunity for revenue from property development, car parking and commercial initiatives.

The introduction of commercial objectives by airport operators was considered an efficient way to maximise revenue, improve customer service and quality standards, while reducing risk and dependence on aeronautical revenue alone.[19] Initially much of the commercialism was focussed on the airport terminal, providing an array of shopping facilities. More recently an emphasis has been placed on a full exploitation of the airport site and further diversification of business, with an expansion of airport-linked development in the vicinity.

In Australia, two key issues changed in the public's perception with the privatisation process: the ownership of the airports by large corporations, some of which had no aviation background, and the management of airport lands for non-aviation purposes. The corporate structure of new owners varied across the capital city airports and consisted of international consortiums with a wide range of shareholders.[20] As Hooper et al. note, the sale of the airports was underpinned by at least three factors: the unprecedented opportunity to buy international airports within the Pacific Region, the degree of local monopoly power that the airports traditionally had under the Airports Act, and the expectations of future, land side commercial development. All of these factors provided a very different view of how public infrastructure should be managed – and how the benefits should be distributed. The privatisation of Australian airports was primarily an opportunity to unburden the nation from public sector funding of airport development, yet it has resulted in airport operators wanting highest returns on their investment, and they have been quick to outline expectations for the capitalisation of their land assets in the legislatively required master planning process. Airport corporations recognise that they cannot survive by landing planes, and need to diversify their commercial interests as means of ensuring profitability. Revenue from non-aeronautical sources earns airports from 60-70% of their revenues in commercial retail development, car parks, restaurants and hotels.[21] Hence airports are increasingly recognised as general urban activity centres providing retail and commercial spaces for aviation and air transport industries, in addition to businesses and services that have limited direct reliance on air transport or aviation at all. As a result they become local area economic generators and catalysts of investment above and beyond their transport role.

Recent commercial developments at airports have been a source of conflict within airport regions along with more longstanding concerns about noise, traffic and loss of environmental amenity, often sparked by rounds of airport expansion. In essence, the

non aviation uses are perceived as a commercial challenge to the economic activity in the surrounding area, and the traffic generated may put addition pressure on local road infrastructure. State, territory and local governments are ultimately responsible for making and implementing land use planning strategies, frameworks and decisions in their jurisdictions, but in the Australian context, they find that their powers do not extend over the new airport owners. The capacity of airport-lessee companies to provide non aviation uses on airport land was tested in the courts in Australia. It was argued in the Federal Court of Australia that non-aviation commercial development at airports, in particular the intention to develop retail shopping, 'was or will be in contravention of various provisions of the Airports Act 1996'.[22] All airport companies in Australia closely followed this court case, as it was considered a test of non-aviation airport development and the strength of the *Act* to enable such development. The feeling was that should the application succeed in limiting development, the value of Australian airports could be greatly reduced.[23] This protracted legal battle came to end when Federal Court Justice Cooper dismissed the application, finding in favour of airports in February 2005. The verdict highlighted the changing role of airports and reaffirmed the independence of airport- lessee companies to determine airport non-aviation land uses outside of surrounding municipal land use regulation.

The changing role and identity of airport owners (as maximizers of profit for shareholders) and the rights to develop land uses outside of local authority controls challenges the construct of the citizen as a customer. At one level, many Australians have not adapted to the change in the ownership regime. For example, in the 2003 Brisbane Airport Master Plan it is noted that "there is a misperception by some people that BAC is a semi-government organisation".[24] In addition, many individuals and companies have openly challenged the right of airport owners to develop non-aeronautical land uses on airport land. The Planning Institute of Australia developed a National Position Statement of "Development on Airport Land" in 2006 that challenges the right of airport owners to develop non-aviation land outside of local and state land use regulations.[25] With respect to this issue the Shopping Centre Council of Australia submitted a report to the Productivity Commission Inquiry (Review of Price Regulation of Airport Services) in 2006 stressing that airports have an "unfair advantage when developing airport land for commercial non-aviation purposes" because the Airports Act has fewer constraints compared to local government land use controls.[26]

The key question, outside of the land development issues on airport property, is "Have the privatized airports improved the public use of airports?" This question is central to the construct of citizen as customer, and it needs to be answered at a variety of levels. Smith and Huntsman argue that the role of government (and in this case privatized services) is to create incremental value for citizens in several ways: first to identify the most important sources of values to constituents, second, delivering value and worth with respect to these identified values, and last, to facilitate investment in the capital asset base of the community.[27] Thus, in the case of airport development and planning these questions need to frame the debate on the levels of how the customer *should be* satisfied and where the issues of value are created. The public interest needs to be

expanded beyond the simple service level to a broader community dialogue that is tied to issues of longer term community sustainability.

Challenges to future airport and metropolitan planning

The history of airport planning and the role of the airport in the metropolis has a direct impact on the present perceptions of how an airport "ought to operate" in the public realm. Airports in Australia remain public infrastructure, albeit, through 100 year leases which allow a considerable amount of private interest to accumulate. However, airports are only a small part of the changes that have occurred with neo-liberal reform and corporatisation. Decision-making as a product of governance was historically easy to identify. Public office administered our lives; regulated, influenced and determined our actions, yet in recent times decision-making has shifted. The neo-liberal ethic of corporatisation, privatisation and outsourcing has lead to diverse and shared decision-making by actors chosen to represent public administration, although in reality without a public service agenda. What is the appropriate role of government compared to market forces in the quickening pace of liberalisation? There is a need to further understand and evaluate institutional barriers to promote effective decisions and methods of improving cooperation. It is recognised that in understanding the changing role of airports, frameworks of cooperative governance and partnership are needed, yet these can only begin from an understanding of how influence and power is exerted in the new models of devolved decision-making.

The privatisation of Australian airports has posed several challenges to the planning community and to the regulatory bodies that traditionally planned for airport development. We argue that the challenges have resulted from much of the historical practice that has developed over the past half-century with respect to how airports are situated in the urban fabric. The new owners (lessees) of the airports across Australia have inherited a legacy of disjointed governance and an iconized public institution. On the other hand, metropolitan planning now has to embrace airport corporations that plan for profit maximization under a different planning regime. Yet the juncture of each system is connected through infrastructure requirements such as road and water links, land use compatibility issues, negative externalities both from the airport and from communities around the airport, and the synergies of economic and regional development that involves both the airport and the surrounding metropolis.

At the Commonwealth level the planning challenge is becoming apparent as revealed in the Auditor-General's Audit Report of 2007.[28] The Department of Transport and Regional Services (DOTARS) is the agency responsible for regulating airport planning and development.[29] DOTARS was also the lead agency responsible for this task under public management – where they developed master plans in concert with airports across Australia. With the privatisation of airports the role for DOTARS changed considerably – from managing the airport masterplanning process to policing the new landlord's plans. The initial Auditor General's report of 2004 reveals that there were insufficient recovery costs for DOTARS to administer the Airports Act – the additional administration costs were borne by the public.[30] By 2007 it was decided that the

recovery costs could not be reclaimed due to an initial statement made to bidders in the initial sale of the airports.[31] In addition, the challenge of administration lags between DOTARS and the lessees – as the federal agency learned its new role provided considerable challenges for both the regulator and the lessees.

At the State level, only two states in Australia have legislation that deals with airports and surrounding infrastructure. To date, Queensland and Western Australia are the only two states to have drafted specific aviation state planning policy to assist local governments in planning and development near airports. While the intention of both documents is to assist local government planning, neither approach demonstrates a true commitment to providing local government advice for integrated airport and regional land use planning.

At the local level, there is relatively little integration between airports and surrounding communities. The airport masterplan is conducted as a strategic planning exercise and continues to be isolated from local planning schemes. The privatization of airports and the rights of the airport corporations to develop airport lands, places pressure on both parties with respect to land use on the airport.

In conclusion, the privatization process in Australia has highlighted the lack of integration in airport and metropolitan planning. The transfer of development rights to private owners on 99 year leases has challenged both the public perception and the planning systems with respect to the identity and role of airports in the metropolis. Airports are an essential infrastructure requirement to urban centers and are in their own right, a driving force in the economic and social development of a city. There are challenges to all levels of planning in Australia with the integration of effective planning for airports within the city-regions.

Slums: a market problem? The real estate commercialization in slums of the Metropolitan Area of São Paulo

Nelson Baltrusis
University of São Paulo, Brazil
Catholic University of Salvador, Brazil

1 – Introduction

The issue of commercialization of informal real estate, especially within slums and informal allotments, among the low income population express one of the cruelest faces of the reproduction of the urban space process within our cities[1]. This type of transaction can be characterized as a segment of the second-hand real estate for low income market, which contributes in large scale with the structuring of the unequal metropolis, concentrating the poor within spaces with a lack of infrastructure and ideal conditions for the reproduction of a fairer city. This segment can be perceived by its diversity of housing and locations created by these populations as a surviving strategy. Perhaps the access to a precarious housing, with no security of tenure and purchased through the market mechanisms, is the most remarking characteristic of the dismounting of the Brazilian State. The provision policies based on the construction of housing blocks, which predominated until the years 1980, have been substituted for focused actions that provided the consolidation of this market of informality.

The cities of the São Paulo metropolis have been structured *"according to an urbanization and spatial segregation pattern marked by differences between the ways of space production and occupation. Among these ways are the slums, constituting informal settlements, which dynamic of land and real estate production and commercialization is shortly known".* (Abramo and Faria, 2000, p. 421).

The research on commercialization of informal real estate is recent. The theme has been already observed by researchers who worked with slums within the 1970's and 1980's decades. Souza (1980) while describing the process of urbanization of the Heliopolis' slum in São Paulo verifies that the real estate located within the intervention area were object of speculation and commercialization. Valadares (1980) describes the process and compares the real estate purchasing and selling process within slums in Rio de Janeiro. Therefore the problem of commercialization becomes evident from the middle 1980's on. The precariousness of the housing conditions around the world, particularly in the countries known as third world, caught the attention for the way the poorest that are not reached by governmental programs and even less by the formal market satisfy their housing needs.

The studies about informal real estate commercialization are born from the need of perceiving the dynamics existent within this segment, the way how is organized this system and if it can contribute for the design of housing policies fitting better to this demand needs. Recently, some works have been busy with studying this market segment, remarking the works of Abramo[2] (2001) about the commercialization process

within the slums of Rio de Janeiro. Nowadays Abramo coordinated a research about commercialization of informal real estate in five Brazilian state capitals: Rio de Janeiro, São Paulo, Porto Alegre, Recife, Florianópolis, Belém and other Latin-American cities: Bogotá, Buenos Aires and Montevideo. Baltrusis has developed his dissertation about this theme in 2000 and has followed it up in his doctor thesis, finished in 2005.

According to census data of the year 2000, the metropolitan region of São Paulo counted with 17 million inhabitants, out of which 2 million living in slums. The slumming process in the metropolitan region of São Paulo is intensified from the 1980's on. While observing the Table 1 – Growth of the number of slums and the slummed population in the city of São Paulo, we realize that the number of slums and slummed population has grown from 71.840 inhabitants in 1973 to 711.050 in 1991. Until the middle 1970's the number of slummed population was small, because the main way of urban informality was the commercialization of informal allotments and the renting of tenement houses unities in the degraded central areas. The increase of the number of slums and slummed population is due to a series of political and economical factors, as the re-democratization process, the economic recession, dismounting of the main financing organ of the housing policy: The National Bank of Housing. Facing this perspective the population with no formal employment and with no State apparatus for providing its basic need of housing has started a process of occupation of unused land on existing allotments that have generated new slums as well as have brought more density into existent slums. These occupations, spontaneous in the beginning and later on organized by social movements for housing, have guaranteed to the poor the access of a plot of land in a precarious settlement. Nowadays the main way of access of a shack in a slum happens throughout the informal market.

This work has as its objective to comprehend the importance of the commercialization process within the structuring of the urban space of the metropolitan region, as well as to characterize the functioning of the informal real estate market based on the prices of the real estate commercialized or offered during the year 2004.

2 – Methodological procedures

With the aim to comprehend the importance of the commercialization process in the structuring of the urban space and characterize the functioning of the real estate market in the slums, we have developed a survey in 16 slums located within 6 metropolitan municipalities: São Paulo, Guarulhos, Diadema, Barueri, Embu and Taboão da Serra. (See Frame I Characterization of the municipalities and slums).

This work has identified the prices of real estate offered and commercialized in the slums of these municipalities, as well as stakeholders and the dynamics of the functioning of this market. There have been studied the households of all the real estate which had indications of being on sale within a total of 454 households. We have also interviewed all the households who have purchased real estate in the slum within the last year (332), and have been interviewed all the renters as well as the technicians of city halls and leaderships of the studied slums [3].

In each municipality there have been chosen at least one slum: Barueri, Embu and Taboão had one chosen slum; in Diadema there have been chosen two; Guarulhos had four and São Paulo had eight, as the following criteria:

a) Number of housing units – 2 small ones, until 50 housing units; 2 middle sized ones, between 100 and 500 unities; and two big ones, with more than 500 unities;
b) Location – distributed around the whole city;
c) Time of existence – older and more structured slums; and more recent slums;
d) Urbanization standard and organization.

Frame I - Characterization of the studied cities and slums.	
Município	*Caracterização*
São Paulo	Among the municipalities of the metropolitan region of São Paulo, presents the largest number of slummed population: 1.160.590, according with the data of the *Centro de Estudos da Metrópole – CEM* (2000). The increase of population ratios have been decreasing during the time, although the number of slummed population have been increasing. Nowadays, it is estimated that 11% of the total city population live in slums. Usually, the slums of São Paulo present good infrastructure conditions, similar with the peripheral neighborhoods. The largest number of houses are made of bricks. However there is still a large number of slums in precarious conditions. Studied Slums: • Paraisópolis, located at Vila Andrade, South Zone, within a area of 15.000.000 sqm with 32.000 inhabitants; São Remo, in Butantã, West Zone within an area of 35.000 sqm, undefined population; • Jardim Esmeralda, Cidade Dutra, South Zone com 15.000 sqm and population of 1.700 inhabitants; • Maria Cursi, São Mateus, East Zone - I, with 1.200 inhabitants; • Nossa Senhora Aparecida, São Miguel Paulista, East Zone – II, population 12.000 inhabitants.
Guarulhos	It is the second biggest city within the metropolitan region with 1,1 million inhabitants (IBGE, 2000) with around 14%, or 152 thousand people, living in slums (PMG, 2002). The slums have been growing at an annual rate of 13,5%. Studied Slums: • São Rafael, Jd. Nova Galvão, population of approximately 6.000 inhabitants. • Santa Cecília, at the neighborhood of Bairro Santa Cecília, with approximately 400 inhabitants.

	• Presidente Dutra II – Presidente Dutra, approximately 4.000 inhabitants. • Bela Vista, in the neighborhood of same name, with approximately 1.600 inhabitants.
Diadema	The city counts with 30,7 sqkm, being 30% located in environmentally protected areas. One third of its population live in slums. Out of a total of 356 thousand inhabitants, around 120 thousand live in slums. The largest part of the slums of the city have been upgraded, because this city has been one of the firsts to act in these areas, since 1982. Studied slums: • Barão de Uruguaiana, Jardim Ruyce, area of 8.000 sqm and population of 500 inhabitants. • Vila Olinda, Taboão, area of 47.000 sqm, counts with a population of 1.600 inhabitants.
Barueri	In Barueri the closed condominiums as well as the industry can be considered as a factor of induction and consolidation of the slums. The slums appeared in the city still in the 1960´s and start its consolidation from the 1980´s on. According with data of the city hall, around 17% of the population live in slums. Studied slum: • João Rodrigues Nunes, Jd. Mutinga, approximately 400 inhabitants.
Embu	Around 80% of the city is formed by small and precarious housing units build of naked bricks, concentrataed at the eastern zone of the city. Favela pesquisada: • Jardim Silvia, Centro, aproximadamente 400 pessoas.
Taboão da Serra	Around 22% of the total of housing units can be defined as slums. Studied slum: • Irati, Vila Mafalda, area of 43.000 sqm, with 1.500 inhabitants.

2. The slums at the Metropolitan Region of São Paulo.

Within the last years the slums have been consolidated as one of the housing alternatives for the low income population. According to data of the Censo 2000, out of the 39 cities of the metropolitan region, only 20 of them have slums. The slums of the MRSP are located at the peripheral areas of the main municipality – São Paulo and neighboring cities, configuring an informality spot that grows occupying environmentally fragile areas, such as Billings and Guarapiranga water reservoirs, at the south and southeast zones, as well as the Cantareira region, at the north. We can also observe

the existence of settlements close to potential labor markets, being formal or informal and close to express roads and highways.

The data of IBGE 2000 indicate that 10,08% of the total of cities at the MRSP are located within slums. Although the most metropolitan municipalities have slums, this population is concentrated in the following cities: São Paulo, uarulhos, Osasco, Diadema, São Bernardo do Campo, Santo André, Embu, Barueri, Taboão da Serra, Jandira, entre outros.

2.1 The growth of slums in the metropolitan region of São Paulo.

The slumming process of the MRSP is recent and has been intensified during the last 30 years, and can be classified as an expression of the unequal process of social production of the space within Brazilian cities. Until the 1970´s the main way of informality in the metropolitan region of São Paulo was the clandestine allotments[4]. Observing the data of the Table 1 – Evolution of slums in São Paulo, we realize that during the 1970´s only 1,6% of the population lived in slums. Between 1970 and 1980 the slummed population grows up to 4,07% of the total and in 1991, according to Census data the slummed population arrives to 7,5%. In 2000 the Census points out to a slummed population of 932.628 inhabitants, or almost 9% of the total population of the city.

From the spatial point of view the informality expresses the economical inequality existent within the Brazilian society. The slums, added to other forms of occupation, such as the informal allotments and precarious settlements, demonstrate the 'socio-spatial vulnerability' of a great parcel of the population.

Table 1 – Evolution of slums in São Paulo

Year	Nº slums	Nº housing units	Slummed population	% of the total population
1973 [1]	542	14.650	71.840	1,06
1975 [1]	919	23.926	117.237	1,6
1980 [2]	188	71.258	335.334	4,07
1987 [3]	1749	142.674	779.000	7,53
1991 [2]	629	146.891	711.050	7,46
1991 [4]	--	196.389	891.673	9,24
1993 [5]	--	378.683	1.901.892	19,8
1996 [6]	574	176.905	749.318	7,6
2000 [2]	612	225.133	932.628	8,92
2000 [4]	--	286.954	1.160.590	11,12

4 Estimations CEM	5 Estimations FIPE	6 Counting IBGE

Fonte: data organized by Pasternak, 2004.

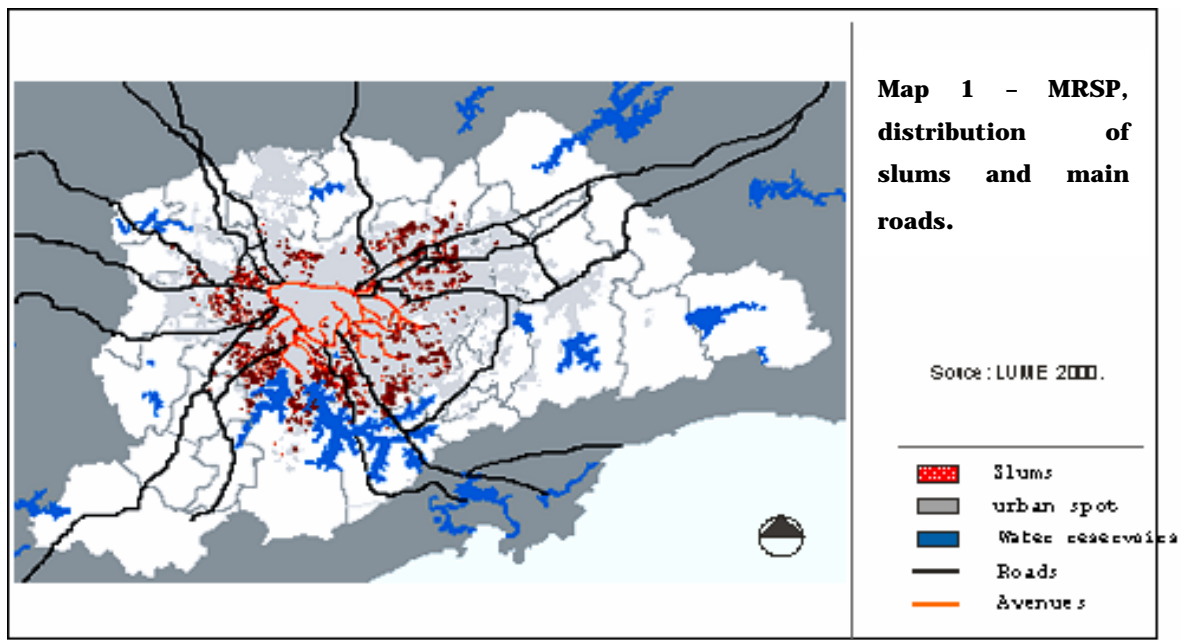
The growth of the slums transforms the design of the urban space, as well as the socio-spatial relations, creating differentiated spaces, sometimes continuous where live next to each other, even separated by walls, rich and poor. Other times separated by long distances, providing the growth a peripheral city, lacking the access of the city goods.

In this sense, Pasternak and Bógus describe the metropolitan region as a city of rings, as more peripheral being the ring, more social and spatial exclusion[5].

According to Pasternak and Baltrusis,

> (…) the poorer inhabitants are driven towards regions each time more distant, both for the main city surroundings and neighboring cities. The visible at naked eyes social polarization gets new boundaries: the poorness expands towards the whole urban fabric, while the higher classes concentrate in real richness clusters, especially at the southwest region of the capital. The other social levels are distributed within an expanded form, getting poorer towards the periphery (Pasternak & Baltrusis, 2003, p. 04).

However, Valladares and Preteceille (2000) alert that the slums, normally associated to the "typical space of concentration of urban poorness", concept common to several authors and the general media, and that cannot and should not be considered a rule, *"once that the slums do not distinguish themselves so strongly of the whole urban fabric and that the situations of extreme urban poorness are more frequent out of the slums"* (Valladares and Preteceille, 2000, p.399).

Map 1 – MRSP, distribution of slums and main roads.


Several authors, as Maricato (2001), Torres and Marques (2002), Pasternak (2003), remark that within the last decades we have lived a paradox. It has been verified a process of enhancement of the life quality of the Brazilian population. Some social indicators as the decrease of child mortality and increase of life expectation had a significant improvement. For Maricato despite this upgrade is not homogeneous for all

regions within the country, there has been during the last years "a notable and clear life improvement of all the Brazilian population" (Maricato, 2001, p.28). However this improvement was not sufficient to turn around the precariousness state in order of some social groups, living within more precarious parts of the city, obtain their full right to the access of the city goods.

Map 1 – MRSP, distribution of slums and main roads.

2.2. The space of the slums within the city

While observing the map of the MRSP we realize that the slums are concentrated in the peripheral cities next to the main city - São Paulo, towards the neighboring cities of the MRSP. In some cases, we note a tendency of conurbation of the slums from the ABCD cities with the cities of the metropolitan region of Santos.

We can also observe in the map that the roads and big connection avenues have been transformed into real axis of concentration of slums and informal settlements, contributing to the expansion of this type of housing towards the peripheral cities. This is due to the possibility of transportation and economical and income generation activities, even through informal work, that these axis provide, such as "next to the road" commerce, logistic companies, access to the center and other cities, access to middle class residential condominiums, concentration of development poles with industrial or production zones can be pointed out as relevant factors for the attractiveness of these settlements within cities cut by these roads and highways.

Other concentrating of slums element are the water spring and environmentally protected areas, characterized by the low real estate value of land due to use restrictions imposed by legislation.

3 – The dynamic of real estate market in slums of the MRSP

The option for purchasing a real estate in a slum means that the buyer will pay a large amount of financial resources. The medium price of a real estate made of bricks with two bedrooms, living room, kitchen and bathroom, with approximately 40 or 50 sqm, in a well structured and located slum in São Paulo, costs around R$ 16.000,00 a R$ 40.000,00. That means that the price per squared meter can get as high as R$ 400,00. According to Baltrusis (2000 and 2005) for similar prices we can find an apartment within the central area of the city of São Paulo. Similar results have been verified by Abramo (2000) for the slums in Rio de Janeiro. For up to R$ 20.000,00 it is possible to find real estate in buildings located at more degraded areas of the city. If the option is for purchasing a new apartment, produced by the formal market, with around 45 sqm, it is possible to find, in peripheral neighborhoods, financed real estate from the price of R$ 25.000,00 [6] on.

If the option is to rent a real estate, one can chose among several options in different locations for prices that vary, in medium, from R$80,00, for a wooden shack in a favela with precarious urbanization with one single room, up to R$225,00 for a two-stored

house with two or three bedrooms in the center of a well located slum. Barely the same prices are taken for real estate with the same characteristics in peripheral neighborhoods, so the advantage of renting a place in a slum would be exemption of taxes.

If in fact there is a set of options of the product housing for compatible prices with the ones commercialized in slums, what would bring the lowest income population to the option for a real estate in the slum? Why does a part of the poor population fulfill their need to live in informal settlements purchasing or renting their real estate in slums within the informal market?

The process of choosing a real estate obeys a series of rational factors: price, location, relative advantages etc, and other not rational ones. Abramo (2001) remarks that there is a strong indication that the location preferences –accessibility, neighborhood and lifestyle- would have a large importance within the family universe of the poor. Abramo remarks that

> *(from) the residential location (on), the poor can have differentiated access to employment and income centers, services clusters and urban commerce, public transportation, public equipments and services as well as to other accessibility factors related to the position of the slum within the hierarchy of locations in the city* (Abramo, 2001, p. 1572).

3.1 – The factors that contribute with price formation

Whenever we refer to the real estate market in slums, we mean a strategy that the poor population uses to supply their housing need. In this sense the location of a real estate plays a fundamental role in the structuring of the real estate dynamic within the slums. The location understood as proximity with employment and friends and relatives' net is an important component for the choice of a real estate, as remark authors as Abramo (2001) and Baltrusis (2000). Usually the buyers of real estate in slums chose according to economic interest, normally chose to their employment place, or to a solidariety net, where the buyer has got family, friends or cultural links with other inhabitants of the place. For Abramo *"the proximity factor of an eventual source of income and the neighboring facrtor are pointed out as reasons of location choice of urban poor"* (Abramo, 2001, p.1566).

The quality of the housing unit can also be pointed out as an element of the formation of the price. If a real housing unit on good conservation and good finishing, the tendency is that its price is higher than that one with nasty conditions and precarious finishing. When we have analyzed the medium prices of a real estate commercialized within the last year, without considering the size of plots nor the built area, it became possible to observe more clearly these two extremes: at one side the real estate in very good conservation conditions, made of bricks, that have been commercialized for medium prices of R$ 26.625,00, and at the other side, the real estate on terrible conditions for a medium price of R$ 2.900,00.

Table 02 - Conservation of the real estate X Type of finishing (medium prices)*

	Bricks with finishing	Bricks without finishing	Wood	Total
Optimum		R$ 26.625,00	--------	R$ 26.625,00
Good	R$ 12.000,00	R$ 13.843,14	--------	R$ 12.921,57
Regular	R$ 13.500,00	R$ 12.660,71	R$ 3.416,67	R$ 8.248,51
Bad	R$ 25.000,00	R$ 8.166,67	--------	R$ 16.583,34
Terrible	R$ 3.000,00	R$ 4.700,00	R$ 1.000,00	R$ 2.900,00
* not considering the size of plots nor built area. Source: Pesquisa Mercado Imobiliário Informal em Favelas da RMSP – 2002-2005				

3.1.1 – *Typology*

If the location and the structure of opportunities can be pointed out as the main attributes for the choice of a real estate in a slum, and, consequently, for the process of formation of the price within the land and real estate structure of a slum, the typology of the house, either purchased or offered, can be pointed out as a differential component. The real estate products offered can be characterized for the diversity and capacity for fulfilling the diverse needs and possibilities of income commitment of a family that intended to live in a house located at a slum.

Table 03 - Types of real estate (%)						
Type	Sellers		Buyers		Renters	
	abs	%	abs	%	abs	%
One stored house	194	55	232	70	196	62,5
Two stored house	138	39	96	29	89	28,5
Residence with commerce	16	4,5	4	1		
Apartament	06	1,5			29	09
Source: Pesquisa Mercado Imobiliário Informal em Favelas da RMSP – 2002-2005						

Frame II - Indicative of prices x Typologies

Wooden house precarious, located in area of eminent or ambiently fragile risk
R$ 1.000,00 a R$ 3.000,00

Wooden house – b located well with reform possibility
R$ 3.000,00 a R$ 5.000,00

Masonry house – well located with reform possibility
R$ 8.000,00 à R$ 15.000,00

House – well localized
R$ 15.000,00 a R$ 25.000,00

House – well localized with commerce
Mais de R$ 25.000,00

Apartment for location
R$ 250,000

For this present work effect the typology refers to the number of rooms, to the used construction material, to the quality of the construction, to the size of the plot and its implantation, among other factors that can also be considered as determining for the formation of the price. The real estate built with precarious construction materials, on top of a slab or occupying a small part of a plot, apparently have lower prices than well finished and implanted in well defined plots. Please see Frame II that indicates the prices of diverse typologies.

3.1.2 – *The infrastructure conditions.*

The access of the settlement to basic infrastructure adds values to the real estate. This access can be precarious or even informal. The simple expectation of improvement of an area can lead to the increase of the price of a real estate. Valladares has already observed that the expectation of improvement or change, and in case of Rio de Janeiro in the 1970´s, of being attended by the housing program of BNH, has increased the demand for shacks in slums, what has lead to *"the action of many people that, taking*

advantage of the situation, have built new shacks in still empty spaces, even including in their projects room for rent" (Valladares, 1978, p. 52).

Nowadays, as several authors point out, the indicators of access to infrastructure within a slum is very similar to the observed in other neighborhoods of the city. During technical visits and surveys realized in slums there have been noticed that all the visited and studied slums have access to urban infrastructure, and in some of them not all the houses have formal access to the service. In these slums, we could observe at least two categories of real estate prices: the ones which have formal access and would add more value to the final commercialized price, and the ones which access these services in an informal way and would not have this service incorporated at the final price. However, it would be necessary to research more about this theme, because apparently the houses which access informally these services could have a higher price as its owner would not pay the costs of these services.

3.1.3 – *Access to the workplace*

The transportation house-work-house factor influences in the individual choice for a real estate in a slum. Apparently there is a relation between the location of work of the households and their current house; according to the research, around 35% of the households work in the slum itself or in surrounding neighborhoods, not depending on transportation, since they realize their journey by foot or bicycle; 59% use for public transportation, out of which, 15% use more than one type of transportation; and only 6% use their own cars or motorcycle for transportation.

According to this information, we can affirm that, apart of the proximity to the work, the accessibility to public transportation or other alternatives could contribute to the formation of price. Within this logic, a slum located at a more peripheral region could concur with a more central one as long as it has a good accessibility network.

The residential mobility, both between slums and intra-slum, can be an important component for the analysis of formation of real estate prices, as well as the structuring of spaces and the relations this space establishes with the surroundings and with the city itself. It can be remarked that 48% of the inhabitants lived already in slums before purchasing the present real estate, being 35% in the same slum and other 13% came from other slums within the MRSP. The other 52% are distributed as following: 5,5% in the neighborhood itself, 41% from other neighborhoods within the city and 4,5% from other cities.

Among the renting inhabitants 66,5% used to live before in slums, being 40% in the same one, while 26,5% came from other slums. Coming from other neighborhoods there have been identified 26%, and 16% came from other cities within the MRSP; the 4,5% left either have come from the same neighborhood or from cities outside the metropolis. This indicates that the demand for real estate in slums is formed by, preferentially, people that have already lived in slums.

The proximity of relatives and friends, the employment opportunities, the protection, the escape from the violence are the most pointed out reasons for the option or permanence in the locality. What would guarantee these advantages both for buyers and sellers and renters would be a social network of protection and solidarity.

Table 04 - Buyers. Reasons for buying		
Reasons	**Abs.**	**%**
Changing city or going back to the place of origin	71	21
Location and ifrastructure	56	17
Violence	50	15

5. Final considerations

The study about the commercialization of real estate in slums of the metropolitan region of São Paulo will contribute to the comprehension of the process of choice of the poor when purchasing their real estate in slums. The found results are multiple and point out to the growth of the urban informality within popular settlements and the consolidation of the commercialization as a way of accessing land and a real estate in a slum in the Brazilian cities.

During the development of this work there have been visited nine cities of the MRSP (Barueri, Diadema, Embu, Guarulhos, Osasco, São Bernardo do Campo, São Paulo, Suzano and Taboão da Serra) for data survey about their slums, interviewing their technicians and make technical visits. Out of this universe there have been selected 14 slums in six cities: Barueri, Diadema, Embu, Guarulhos, São Paulo and Taboão da Serra, considering their urbanization and regularization level as well as their geographical position and their socio-economical characteristics.

The lack of studies about the prices of commercialization of real estate in slums of cities within the metropolitan area of São Paulo and even historical series of prices of self-built real estate in popular neighborhoods and settlements has been with no doubt an obstacle for a more precise analysis. Facing this condition there has not been possible to establish a relation between the prices within slums, or at least a few slums, with the ones of the secondary real estate market (second hand real estate) in neighborhoods and low income allotments.

Based on Baltrusis (2000) work about the informal real estate market in the slums "Paraisópolis" and "Nova Conquista" there has been adapted a group of instrumental

with the aim of soften the imperfections that the data survey would contain. In this sense, we have heard technicians from city halls, community and organized social movements' leaderships. The objective of this procedure was to rescue the memory of the process of occupation of the studied slums as well as to establish relations with the beginning of the commercialization process. In other words, this effort searched to conciliate quantitative methodology of data survey with qualitative methodologies through individual techniques – interviews. This group of information has been territorialized resulting on an important analysis matrix about preferences on residential choices inside a slum, the existent relations between the choice of a real estate and its location advantages both in relation to employment and income and to a solidarity network, which we call within this work a structure of opportunities.

If the slums have become one of the alternatives for accessing the good: housing for poor, and if it is a fact that the main way of accessing this good is through market, the comprehension of the dynamic of this market can be revealing of the existent lacks both in the structure of the market and the regulating role of the State; besides of demonstrating the deficiency of provision policies for low income.

In most part of the slums existing at the MRSP it is possible to find an "on sale" advertisement or to hear a story of someone that has recently purchased a real estate. It is also common to hear comparisons about the high prices of real estate in some slums. The informal real estate market has not only been consolidated as an answer, even if unfair, to the lack of policies and programs focused on low income, but it is the face of inefficiency of the existent programs and policies as well as of the incapability of the market to offer products more suitable with the demand. A well located real estate within a central or well structured slum can be worth R$ 16.000,00. Would not it be possible to produce real estate for prices similar to this one?

Although in order to articulate this action would be necessary the creation of provision programs that stimulates the offer of more affordable products and with quality that contribute to qualify the space of the city. Products that have the capability of attending the housing demand of the low income population. In order to make this possible it is necessary the intervention of the State, because the market simply has not yet demonstrated this capability.

The system of prices obey a hierarchy, we can say that within the informal market of housing in slums there are submarkets, with differentiated types of real estate: one type of real estate for each type of client. This hierarchy of prices is more visible due to their micro-regions subdivision.

One of the advantages of the informality would be the offer of a house to the more excluded segments of the society. The disadvantage is that this house is many times not provided of minimal living conditions and causes large onus to the city.

For the design of management instruments capable to respond to the spatial diversity of the city and lower its socio-spatial inequality there would be necessary to study this real

estate dynamic. The informal real estate market in slums or informal allotments grows up while the public power and the formal market's agents do not efficient responses to the increasing demand of the poor for land and housing.

In this sense, in order to stop the circle of informality in the city it could be designed mechanisms for enlarging the offer of land and housing creating a "popular real estate market" capable to attend the demand and avoiding future problems for the development of the city. It is worth to remark that the experiences of land regularization guarantee the land tenure, but isolated do not avoid, and should not do it, the commercialization process.

The second hand real estate market could turn out to be a market alternative for a low middle class population that, with no financing opportunities in order to obtain a formal real estate, pushes the demand for social interest housing. With the aim of contributing with the design of more efficient policies, we have been developing a new study about informal real estate commercialization with the intention of compare the existent dynamics with the slums of São Paulo and northeastern metropolis.

Room to play: public play spaces in Amsterdam

Lianne Verstrate
Eindhoven University of Technology, The Netherlands

Introduction[1]

In 1947, the first public play space in the Netherlands was created on the Bertelmanplein in Amsterdam. Previously, children's play was not provided with its own domain in the public sphere; children were playing on the streets or in semi-public playgrounds. However, this changed when the department of Urban Planning proposed the new concept of an entirely public play area, which consisted primarily of a large sandbox[2]. The city council quickly gave the green light to construct a test-case of this type of play space on the Bertelmanplein. The press and the local residents were skeptical about the success of the public sandbox; the unsupervised play spaces would surely be an unsafe and unhealthy environment for playing children.[3]

However, the test-case proved very successful and a large number of letters from enthusiastic citizens requesting a play space in their own street or neighborhood was sent to the municipality[4]. In the years to come, the various departments of Public Works worked together on the plans for public play spaces and a special committee was instated to enhance the developing process[5]. In the next thirty years, over 700 public play spaces were created throughout Amsterdam. This episode is well-documented in architectural and planning history as the success-story of architect Aldo van Eyck[6]. He was appointed by the Amsterdam department of Urban Planning to provide the designs for the public play spaces. Van Eyck's work received praise for his innovative, high-quality designs, which were said to stimulate the children's imagination and creativity. Even after Van Eyck had started his own architectural firm, he continued his work on the play spaces for the municipality of Amsterdam on a freelance basis.[7]

Instead of focusing on Van Eyck's designs, this paper ventures behind-the-scenes of the planning processes. How did these play spaces come into existence, and, more importantly, why was this specific type of play space embraced by the municipality of Amsterdam? Like in other Dutch cities, the Amsterdam playgrounds had catered to playing children's needs since the early 20th century and were very popular with the public. Yet, instead of expanding the role of the existing network of playgrounds, the municipality of Amsterdam opted to take over as main provider of play space and use this opportunity to implement a completely new type of child domain. This paper examines the concepts, events and practices underlying the Amsterdam play space plans. The case of the development of the Amsterdam play spaces allows us not only to unravel a turning point, but also to gain insight in the new role of the government and urban planners in the reproduction of public space.

The setting – play in the public domain (1900-1945)

After the Second World War, housing options in Amsterdam, and in other Dutch cities, were scarce[8]. Many families were forced to live with relatives until they were offered suitable housing, and even then the accommodation was often lacking in size. Most households did not have a garden and the balconies were too small for children's play. Therefore, children mostly played outside, on the streets, squares and sidewalks close to their home[9]. Also, Amsterdam witnessed a steady increase in the number of children, because of the post-war baby boom. In the 1950s the city's population grew mainly because of the high birthrates and in 1960, 24% of the city's residents were 0-14 years of age[10]. Photographs show the Amsterdam streets crowded with playing children. The city's police department tried to exercise some control by patrolling the streets frequently. According to a decree issued by the Traffic Committee[11] in 1942, children were prohibited from using the city's roads for their games[12]. However, accounts from people growing up on the Amsterdam streets show that the police were easily outsmarted by posting look-outs who warned when a police-officer approached[13]. Amsterdam children continued to utilize the streets as the main stage for their play until the late 1960s[14].

Besides the streets, the city's parks have always served as popular play spaces and many parents took their children for a weekend stroll in the neighborhood park. However, it is important to notice that it was forbidden to walk, let alone play, on the grass in the majority of the park in the beginning of the 20th century. In a 1930 newspaper article on Amsterdam children, the reader is given an insightful look into the state of affairs in the city's parks: "… mother's announcement, "Today, we are going to the park!" means a day of continuous reprimands and restrictive commands for our Dutch city children: 'Jantje, stay off the grass!' 'Jantje, keep your hands off those flowers!' 'Jantje, you may not play with your hoop here!' 'Jantje, walk alongside of me, and hold my hand, or you will be run over by those bicycles!' 'No, Jantje, we may not walk on the other side of the road, because then we will walk against the flow of people![15]'" Of course, children were not always accompanied by their parents, which unavoidably led to the breaking of park rules. For example, in 1916, architect P.J. Cuypers, architect of the Rijksmuseum in Amsterdam, notified the director of Public Works of "rowdy boys and girls, who use the partition-chains as swings and climb the statue of Vondel". Cuypers states that increased police patrols of the park would be a suitable solution to this problem[16]. The number of similar complaint letters remaining in the municipal archives, suggest that the Amsterdam parks were popular play spaces, despite the seemingly strict regulations.

Before the installment of public play spaces, the playground associations were the sole providers of children's play space. The first playground in the Netherlands opened its doors in 1880 in Amsterdam and was financed by wealthy citizens, concerned for the welfare of the children of the city's laborers. However, the issue of playgrounds was quickly taken over by members of the working class themselves; groups of volunteers (often with connections in labor unions) managed and maintained the playground, aided by financial support from the city council[17]. In order to play here, children's families had

to become a member by paying a yearly subscription fee. The playgrounds were closed institutions[18], fenced-off from the public domain, where children could not only play safely under supervision, but also participate in various club-activities, such as choirs and gymnastics[19].

In the 1930s, the previously flourishing Amsterdam Playground Union[20] began to encounter problems. Due to the economic crisis, the city council cut a large amount of financial support to the playgrounds[21]. Although other institutions also suffered cutbacks, the subsidies to the playgrounds were cut even further after the Second World War[22]. The municipal government seemed to withdraw slowly, yet surely, from its participation in the Amsterdam playground associations; the city council became increasingly reluctant to assist in the maintenance, planning and construction of the playgrounds. For example, news paper articles of the 1950s report how the new Playground Association Mercator received an appropriate plot from the city council, yet had to actively lobby for building permission for five years[23]. The municipal government seemed increasingly uncomfortable with the closed nature of the city's playgrounds and even debated on the possibility of making the institutions entirely public, accessible at all time of day. In post-war Amsterdam, the city council became more actively involved in the provision of play spaces, and in the process, scaled down the role of the playground associations.

A planned intervention – the General Extension Plans

After the successful test-sandbox at the Bertelmanplein in 1947, the department of Public Works devised a plan that ensured a steady increase in public play spaces over the next decade[24]. The municipality of Amsterdam felt not only accountable for the planning, funding and construction of the play spaces, but also acted as trouble-shooter and maintenance manager, without any help from unpaid volunteers. This was a remarkable change, compared to their involvement in the playground movement, and early proto-types of public play spaces.

Besides the apparent influences of the welfare state, the origins of the Amsterdam play space plans can be traced further back, to the above briefly mentioned General Extension Plans of Amsterdam[25]. In these plans, Amsterdam citizens were categorized into different age-based groups, requiring different types of housing, work and recreational facilities. Through calculating models, it was decided how the various types of spaces should be distributed throughout the city. Play spaces for children were included; children were divided into four categories and for every group, different types of recreational spaces were described[26].

In contrast with the playground movement, the Amsterdam play space plans were not an explicit attempt to educate children on the "right" morals and values[27]. Children were simply considered to be another age-group in the city that deserved their own public spaces, next to youths, adults and senior citizens. It was the task of urban planning to "supply every citizen with the opportunity to relax in the way, which suits them best"[28]. Urban planner Jakoba Mulder described the ideal city "as an urban environment where

everyone can develop themselves and live together harmoniously"[29]. If every group was given their own spaces for housing, recreation and work, a natural order would be established, thereby creating a "city of harmony"[30]. In order to achieve this ideal of urban society, the municipality of Amsterdam started to "fill in" the city's public space with user-based domains, such as soccer fields, cultural centers, allotment gardens and children's play spaces; as a result, the formerly "neutral" public domain became increasingly fragmentated.

Although the Amsterdam Extension Plans provided guidelines for the implementation of child domains, they remained vague on which specific types of play spaces should be implemented for each category. Since the plans briefly mention the city's playgrounds, an expansion of the role of the existing playground associations seems to be the suggested course of action[31]. As we have seen above, the municipal government was not amenable to this idea. Even if the playgrounds were to be "opened up" and become freely accessible, the current number of playgrounds (about forty) would have to be doubled to cater to all Amsterdam children[32]. The playgrounds required a large space with many facilities, such as play equipment, changing booths and a club house. Because of this, playgrounds were very expensive institutions and there simply was not enough open space to allow for forty more playgrounds in the city[33]. The municipality of Amsterdam was faced with the question how recreational facilities for children should be implemented in the public domain and began the search for other, more suitable, types of play space.

The search - playful experiments

The department of Public Works started experimenting and debating on different types of play space in the public domain in the 1920s. As early as 1925, the city created the first public sandbox in a park near the Artis zoo[34]. This test-case was constructed out of wood and often needed repairs and renovations. Despite its obvious problems, the department of Public Works received letters from enthusiastic citizens, who asked for more sandboxes throughout Amsterdam. A mother of three children, living at the Keizersgracht, describes the sandbox: as "the only place in the city the children can enjoy themselves completely, without my having to worry constantly."[35]
During the Second World War, a small number of similar sandboxes were created, but these were not a success. As the war progressed, the maintenance of the sandboxes became increasingly difficult; several complaint letters bear testimony to the vandalized and unsanitary state of the sandboxes[36]. Finally, between 1943 and 1945, the sandboxes were all demolished by Amsterdam citizens, in need of fuel for their stoves[37].

In the post-war years, internal communications between civil servants and various committees indicated a search for other, more durable, types of public play spaces. For example, in 1946, W.A. De Graaf, head of the Public Works department, suggested several options for semi-public playgrounds to the councilman of Public Works, Youth, Education and Sports. Children playing in a neighborhood square or park would be provided with play equipment, which could be stored away at night to prevent vandalism. All that was needed would be an open space, a shed for storage and a

number of adult volunteers to take care of the play equipment. According to this memo, the opening hours of these play spaces would exceed those of the playgrounds, so a large number of volunteers was needed in order for the play area to function properly[38].

In the same letter, De Graaf described how a number of the city's vacant lots were "conveniently surrounded by walls"[39]. In his opinion, with the addition of a door that could be locked, and a selection of play equipment, a "public" playground was easily created in these spaces. Again, he stated that a number of unpaid volunteers would be needed to open and close these playgrounds. These, and other, similar ideas were never put into practice by the city council. Interestingly, it seems that some of the plans were picked up by the struggling playground associations. For instance, a group of nuns opened the first playground in the inner-city neighborhood Jordaan in 1953. A walled-in, vacant space in the city, created during a Second World War bombardment, was easily converted into a playground; the rubble was cleared, the ground leveled and the space was provided with play equipment and an entrance door[40].

Looking back, the early plans from the municipality drew heavily on the well-known concept of the playground; unpaid volunteers would be supervising children's play and taking care of the play equipment in semi-public, often fenced-off, spaces with selected opening hours. The only difference was that these new ideas of the late 1940s, speak of government-based play spaces, only aided by volunteers. However, one of the main problems seemed to be how to incorporate children's play into a completely public space. This question reflects a changing discourse on city children and public space.

Since the Enlightenment, children were more and more looked upon as innocent and vulnerable creatures that needed to be sheltered[41]. When industrialization set in and cities expanded, the relationship between children and the urban streets became pressurized[42]. According to this discourse, city streets provided an unsuitable, immoral and unhealthy environment for children. The work of the playground associations was based on these views, and therefore strived to keep working class children off the streets by providing a "safer" and "healthier" play space, where "correct" morals could be taught through play[43].

After the Second World War, another conceptualization of city children was voiced; a number of novelists, journalists and teachers wrote about their own (pre-war) childhood[44]. According to these authors, a youth of playing on city streets teaches children important values and "prepares one for the hardships of adult life"[45]. This public discourse on the "resilient child" can be traced back to the influential works of pioneer social pedagogue Wilhelmina Bladergroen[46]. She stated that a child's ability to play was very important for its social and physical development. Bladergroen considered having accessibility to the "right" kind of play spaces and toys a child's basic right. She put children's need for adequate play spaces on the map in the Netherlands and argued strongly against spatial developments which would interfere with children's development, such as high rise buildings and the increasingly heavy urban traffic[47]. Instead of restricting her work to the academic world, Bladergroen toured the country with her message of the importance of children's play.

The Amsterdam municipality's search for a new type of play space in the public domain shows how the two discourses on city children were blended together. The play space plans were driven by the wish to provide adequate playing facilities to all Amsterdam children; play space, as put on the map by Bladergroen, had become an important issue. Also, the designs of play spaces reflected the image of the "resilient" city child; there were no fences, no regulations and no adults present to guide the children's games. Playing children were therefore free to use the space as they saw fit. However, a closer look at the planning and day-to-day management of the play spaces also reveals aspects of the "vulnerable child" conceptualization. For example, the city's department of Health Education did not allow play equipment with moving parts (such as swings and seesaws) in the unsupervised public domain for fear of children's safety[48]. Furthermore, the surface area of every play space was kept relatively small (roughly from 5 to 50 square meters), partly because of the high costs of land, but also because it would prevent older children from using the space to play soccer and other sports[49].

The play space plans - politics and bureaucrats

Once the sandbox at the Bertelmanplein proved to be successful, over 700 similar play spaces were installed in the decades to follow. The planning, construction and maintenance of all these public spaces was an immense undertaking, requiring a certain level of dedication from the municipal government. Also, the political climate and the organizational structure of the department of Public Works, were important factors contributing to the success of the play space plans.

The politics of play

In post-war Amsterdam, the labor party (PvdA) held the most seats in the municipal council. The city was, and would be for years to come, a socialist stronghold. Labor party councilman A. De Roos functioned as a spokesman and protagonist for the play space plans; he approved of the first test-case at the Bertelmanplein and later convinced the council of the need for a "ten-year play space plan"[50]. In these plans, 200.000 guilders were reserved for the installment of 15 new play spaces. When the ten-year plan expired, it was decided that a yearly budget would be attributed to the play spaces.

Interestingly, it was the catholic party (KVP) who initially objected to the installment of play spaces. The labor party was accused of trying to "set up another organization alongside of the playground associations"[51]. It is important to notice that Dutch society in the 1950s was still ideologically segregated into four columns, namely reformed Christian, roman catholic, socialist and liberal (or neutral)[52]. Every column provided its own facilities, such as schools, labor unions, newspapers, broadcasting networks and recreational organizations. The network of playground associations was built around this ideology of pillarization. Although the movement originated in "public" playgrounds, installed by members of the labor union, catholic and christian organizations were quick

to provide playgrounds for "their own children"[53]. The play space plans meant that the municipal government would provide an entirely public space, where all children could play. However, the KVP interpreted the plans of the labor party as an attempt to imprint socialist values on the city's children and a devaluation of the existing network of playgrounds.

Bureaucrats & visionaries

Amsterdam was the first city in the Netherlands to instate a department of Urban Planning. Previously, the planning of urban extensions was outsourced to architects, such as Berlage, or a joint venture of the various departments in Public Works. In 1929, a separate planning department was instated to create and carry out new extension plans for the growing city of Amsterdam. This department was headed by influential urban planner Cornelis van Eesteren, who was a member of CIAM and a professor of urban planning at the University of Delft[54]. Under his guidance, the planning division had created the previously discussed General Extension Plans and an important recreational park, the Amsterdamse Bos in the 1930s[55]. The functionalist ideas of Van Eesteren[56] strongly influenced his staff, amongst others Jakoba Mulder, who would be Van Eesterens right hand until his retirement in 1959. She was a practical urban planner, with a good eye for detail; when she watched her neighbor's daughter bake mud pies with a small amount of sand, dug up from a nearby tree, she got the idea of installing entirely public sandboxes in the city[57]. Van Eesteren approved of the plan and successfully pitched the idea to councilman De Roos.

Once the city council had approved, young architect Aldo van Eyck was approached to design the play spaces. Van Eyck embedded the play spaces in the existing urban structure, and intended to stimulate creative games with his designs for play equipment[58]. The trinity of Van Eesteren, Mulder and Van Eyck certainly enabled the implementation of more than 700 play spaces in Amsterdam, not only because of their effectiveness within the Urban Planning department, but also in relation with other municipal departments and local politics. Van Eesteren trusted Mulder's practical suggestions, just like he did when they worked on the General Extension Plans and the "Amsterdamse Bos"[59]. Also, his reputation and political skills increased the chance of approval by the city council. Finally, Van Eyck's designs were not only praised by the municipality for their innovativeness, but also for their relatively cheap costs (the main materials of the playing equipment being concrete and aluminum).

Although the department of Urban Planning had significant influence on the play space plans and their implementation, it was eventually a joint effort of all the departments within Public Works. In 1954, a special committee was set up to facilitate the planning and maintenance process of play spaces (and other recreational spaces), namely the Committee for Sports and Play Accommodations[60]. The members consisted of representatives from the various Public Works divisions, and together they made all decisions regarding the play spaces. The minutes of these meetings give present-day readers an insightful look into the considerable amount of money, manpower and time dedicated to the Amsterdam play space plans. For example, the maintenance of the

play spaces was quite comprehensive. Firstly, every play space was kept clean by the municipal cleansing department, which was also responsible for a change of sand in the sandboxes every four weeks[61]. Furthermore, two employees of the Public Works department inspected the general state of the play equipment in the city once in fourteen days[62]. The inspectors from the Amsterdam Board of Health Education also made their rounds; they frequently observed the day-to-day business on the play spaces and reported back to the Committee of Sports and Play Accommodations. These reports were not only used to evaluate the play spaces, but also to install supervisors on the most crowded play spaces during the summer months[63].

The socio-political context of the city of Amsterdam played a large part in the successful realization of the comprehensive play space plans. Also, the already existing bureaucratic structure and the strong co-operation between municipal departments facilitated the play space plans. A number of influential professionals, dedicated to the play space plans for several reasons, and a strongly socialist municipal council, perhaps searching to break away from pillarized institutions, certainly helped the implementation of these child domains along.

Planning the play spaces

Although every one of Van Eyck's designs was unique, the Amsterdam play spaces were also developed through the adoption of a number of general guidelines. As we have seen, the incorporation of recreational facilities for children in the General Extension Plans provided the first step towards the play space plans. From this document, a rule of thumb was derived, which stated that a child of age X should have to walk no more than Y meters to reach a suitable recreational area[64]. The department of Urban Planning strived for an equal distribution of play spaces, following the general rule of these premeditated calculations. On paper, these ideas look deceptively simple, yet their practical implementation into the complex reality of the city's structure would sometimes pose problems.

In the urban extensions, built from the 1950s onwards, play spaces were integrated in all plans for new neighborhoods[65]. Despite from occasional problems with housing associations or neighborhood organizations, who sporadically objected to the play spaces[66], the realization of these child domains in the Amsterdam extensions proceeded relatively easy. Small play areas were integrated into communal gardens of apartment blocks, while larger facilities were often located in the heart of the new neighborhood, in a park or on a square[67].

In the case of the existing, inner-city neighborhoods, the implementation of these child domains proved to be more difficult. The available space in these areas was minimal; during the previously described pre-war "search" for a new type of play space, internal memos of the department of public works often complained how "there is no room for play space in the older neighborhoods"[68]. The Second World War left inner-city Amsterdam with many gaps, caused by bombings, pillaging and other war-related events. These recently "opened-up" spaces were frequently converted to play spaces

by the municipality during the 1950s and 1960s[69]. Although some were placed on street corners, in alleyways or on large squares, the main spatial resources for inner-city play spaces were these vacant lots.

Considering the post-war housing shortage and the necessary rebuilding activities, this seems a remarkable turn of events; why did the municipality not use these spaces to create housing options? As we have seen before, the planning process of these child domains was a complex procedure, spreading across a large number of involved parties (committees, Public Works departments, the city council and Amsterdam citizens), which generally tends to obscure the reason why a certain play space has been located at that exact place. However, in my opinion, it is important to notice that a large number of these play spaces, located in previously vacant spaces, were intended to be a temporal solution.

The post-war rebuilding was a long and complex process, especially in a historic setting such as inner-city Amsterdam. In a number of cases, play spaces seem to have been utilized to temporarily "fill in the ugly gaps in the city"[70]; it was a relatively cheap way to clean up and enliven an urban space, until eventually construction started on the planned school, business or housing block. At that time, the play space would not become obsolete, but could easily be dismantled and moved to another spot[71]. So, although the play spaces in inner-city Amsterdam were not as neatly distributed as in new neighborhoods, their flexibility and adaptability nevertheless created a dynamic network of child domains in the public domain.

Conclusion

The ambitious plans of the Amsterdam municipality resulted in the creation of more than 700 play spaces throughout the 1950s and 1960s. Looking back on the immense scale of this undertaking, the influence of welfare state ideals shines through. Due to the large amount of children living in an urban environment and the recent conceptualization of "resilient children" with a right to adequate play space, the urgent call that "something has to be done for our children"[72] resonated in the public discourse. Before the 1950s it was the customary responsibility of civil actors, such as labor unions, charity organizations and church groups, to act upon children's needs. However, with the first outlines of the Dutch welfare state starting to take shape, the play space plans of the Amsterdam municipality provide a good example of how government officials slowly, yet surely, took over many tasks from civil society organizations[73]. Welfare state ideology[74] is clearly reflected in the fragmentation of the public domain in the 1950s and 1960s; the municipality tried to provide every Amsterdam citizen with their own spaces, thereby fragmenting the previously "open" public sphere into small user- and activity based domains.

The city of Amsterdam proved to be a good breeding ground for the early play space plans; the department of Urban Planning had laid the groundwork with the General Expansion Plans. Also, the extensive bureaucrat networks, the co-operation between municipal departments, and the flexible nature of Van Eyck's play space designs,

facilitated the efficient implementation of an intricate network of play spaces. Moreover, the capacity problems of the playground associations, combined with a predominantly socialist political climate enabled a unique move away from the strongly pillarized play ground associations and the "opening up" of children's recreational spaces.

Despite the popularity of the Amsterdam play spaces, an important question remains; did the play space plans in reality open up the urban public domain to children's play? The municipality effectively provided children with a domain of their own within the public sphere. Children were free to claim these spaces with their play at any time. Nevertheless, one could also argue that the creation of play spaces increasingly regulated children's play; these carefully planned domains, were designed to implicitly stimulate specific types of children's play (e.g. playing in a sandbox) and discourage other behavior (e.g. playing soccer)[75]. Also, it can be argued that when children gained their own little niches in the public domain, their right to claim city streets with their play was weakened[76].

Whether an empowering or restricting influence on children's place in the city, the Amsterdam play spaces are an interesting and unique chapter in urban history. Nowadays, the development of play spaces is largely outsourced to specialized companies[77]. Also, many middle-class families have moved to the suburbs, and as a result fewer children are growing up in cities. Although the post-modern Dutch city has undergone significant changes since the 1950s, aspects of the original Amsterdam play space plans are still referenced the work of contemporary architects and planners, who try to improve social cohesion of the public domain with easily accessible sandboxes and playgrounds[78].

[1] This article draws on preliminary results of my phd-research at the Eindhoven University of Technology, funded by the Netherlands Organization of Scientific Research (NWO), entitled "Children in the maelstrom of repressive tolerance". The research focuses on the question to what extent the urban public domain is (made) open for children's play throughout the 20th century. The goal is to write an alternative history of the Dutch city, in which the focus lies on the complex interplay of urbanistic regulations and spatial opportunities, in- and exclusion, and multifarious practices concerning the reproduction of space. All archival research for the case study discussed in this paper was carried out in the Municipal Archives of Amsterdam. Citations have been translated from Dutch to English by the author.

[2] The Amsterdam public play spaces, as designed by Aldo van Eyck, were open, accessible areas, with a concrete sandbox as centerpiece. Other objects such as stepping stones, hopscotch tiles, climbing frames, benches and drinking fountains were used to supplement the sandbox in various combinations and compositions. Besides the widely used Van Eyck designs, the Amsterdam municipality also implemented ten playing ponds (shallow basins where toddlers could play with water during the summer months) and a large number of roller-skate rinks and playing fields during the 1950s and 1960s.

[5] The Committee for Sports and Play Accommodations was instated in 1954. This Committee had an advisory task and tried to guide the city council's decisions concerning recreational spaces. In the case of the public play spaces, their function was expanded: every plan had to be approved by the Committee, before being put into practice. All Public Works departments were represented in its members, sometimes aided by police officials or other professionals.

6 Van Eyck's designs were considered to be innovative, since he integrated them in the existing urban structure. His play spaces became a natural part of the city, instead of a standalone domain. Also, his designs were praised for their capacity to stimulate creative games; Van Eyck tried to keep the imagery invoked by the play equipment relatively neutral, so that they could be used for a wide spectrum of activities. For example, a circular climbing frame could of course be used for climbing, but could also become a castle or a pirate ship. Covered with a sheet, the frame could also function as a hut or a house. For more information on Van Eyck and his designs see: Lefaivre, L. & Döll, H., Ground Up City: Play as a Design Tool (Rotterdam, The Netherlands, 010 Publishers, 2007); Lefaivre, L. & Tzonis, A., Aldo van Eyck Humanist Rebel: Inbetweening in a Postwar World (Rotterdam, The Netherlands, 010 Publishers, 1999); Lefaivre, L. & De Roode, I. From "Slum Clearance" to "Revitalization": planning, expertise, and moral regulation in Toronto's Regent Park

Ryan K. James
York University, Canada

Introduction

For the second time in the past six decades, the block that sits on the northeast corner of Parliament and Dundas Streets in downtown Toronto has been completely leveled. To a casual observer, there is nothing unique or especially interesting about this, since construction sites are a seemingly ubiquitous component of the contemporary Toronto landscape; but as a case study in planning history, this site yields a great deal of insight into the ways that planning – specifically with regards to its understandings of poverty, morality and expertise – has been reconstituted since the post-World War II era in Canada, and how this has reconfigured the urban environment.

This demolished block is currently being rebuilt through the first of five phases of the "Regent Park Revitalization" – a twelve-year, one-billion-dollar[1] plan to replace Canada's first large-scale public housing complex with a state-of-the-art mix of public housing, market housing, retail space and amenities. The architects of this plan describe it as an all-encompassing solution to the myriad problems with the original Regent Park, and thus an opportunity for residents to finally "live in a community much like other communities in Toronto" and to be "part of a vibrant city and a place where there is opportunity to address issues of poverty" after years of decaying buildings and social marginalization[2]. Designed through a participatory planning process and funded by public and private investment in roughly equal proportions, the plan is touted as a just and practical solution to the obsolescence of the original Regent Park which is in the best interest of residents, their neighbors, and public and private investors alike.

Ironically, the buildings that are currently being demolished in the name of "revitalization" were part of a much earlier but similarly ambitious plan to redress poverty and marginalization by drastically altering the built urban environment: the northeast corner of Parliament and Dundas was first demolished in 1948 to make room for the original Regent Park, a quintessentially modernist development designed by housing experts as a self-contained complex of exclusively public housing amongst expansive green spaces and little thoroughfare. The construction of Regent Park was intended to help alleviate the post-World-War II housing shortage in Toronto, and was especially popular with local politicians and reformers because it would replace the original[3] Cabbagetown – a neighborhood of substandard single-family dwellings that had long been labeled a criminogenic "slum" that, by its very existence, demeaned its predominantly white working class Anglophone residents[4]. Though Regent Park was intended to remedy this, it too would be labeled a degenerate slum and a planning failure within its first decade of operation; after being denigrated as such for over 40 years, it too is being demolished at the time of writing.

This paper is a critical examination of the purported goals and potential of the Regent Park revitalization. By comparing the thinking behind the original planning of Regent Park to the thinking behind the current attempt to revitalize it, I aim to illustrate how the revitalization is guided, to a significant extent, by a concern with the moral regulation of poor and working class city-dwellers (particularly those who are new Canadians and/or racialized minorities) by altering the built environment in which they live. I aim to illustrate how this concern has been modified and reconfigured from the 1950s to the present alongside the transition to a neoliberal economy in Canada, and through the partial incorporation of postmodernist urbanism within official planning policy.

Modernity, paternalism, and the first Regent Park

With a population of 2.6 million (or just over 5 million if suburbs are included), Toronto is the capital of the province of Ontario, the largest city in Canada, and has occupied a hegemonic position in the national economy since the 1930s[5]. Roughly half its population was born outside of Canada, though this was not the case until relatively recently – until multiculturalism was adopted as Canadian federal policy in 1971, Toronto had a longstanding reputation as a city that was predominantly white, Protestant, proudly British[6], and staunchly conservative[7]. The history of Regent Park spans this large-scale cultural and demographic transformation of Toronto.

Solomon illustrates how the city grew rapidly and "organically" from the late-nineteenth century through to the Great Depression with loose zoning regulations and unplanned neighborhoods[8]. The resultant urban landscape consisted of a financial core, a nearby "shantytown" inhabited by recent immigrants, and a dense "shacktown fringe" of self-built, mail-order homes occupied largely by white Anglophone workers[9]. Though turn-of-the-century Toronto saw no totalizing attempt at reordering the urban environment into something more functional, rationalized and centrally planned[10], there were certainly smaller-scale efforts in a similar vein as a moralistic elite and middle class worried that dense urban areas were hotbeds of deviance and disease – one high-ranking health official called for a complete ban on all multi-family dwellings because they allegedly fostered promiscuity, for example[11].

Much of this consternation centered around Cabbagetown, a neighborhood of small, dense blocks of row houses which, in the words of Cabbagetowner and novelist Hugh Garner, was "a sociological phenomenon[:] the largest Anglo-Saxon slum in North America"[12]. Garner's realist (and presumably semi-autobiographical) novel of Depression-era Cabbagetown depicts a lively, complex, and politically engaged community; one that fits Jane Jacobs's description of the type of "slum" that possessed its own wisdoms and potential for regeneration but was condemned by "paternalistic" planners who did not understand this[13]. As Jacobs probably would have predicted, a commission had decided that Cabbagetown must be demolished in the mid-1930s, but the process did not begin until its redevelopment was approved by a public referendum in 1946[14].

This lag-time can partially be explained by a disjuncture between the Christian aspirations of middle-class urban reformers and the Canadian political economy leading up to the Great Depression. At the federal scale, the Depression necessitated a move away from the "residual" model of social welfare, which had been premised on an idea of minimal economic intervention or support for the poor by the public sector, and toward a Keynesian focus on "social action and planning" aimed at more equitable distribution of "social goods"[15] among citizens. Meanwhile, at the local scale, the municipal governments of many of Toronto's suburbs had become financially inept through the Depression, and so at their urging, the City of Toronto amalgamated them and rationalized service provision across its newly-expanded jurisdiction[16]. This expansion, combined with the new willingness to invest public funds in the welfare of poor and working class Canadians[17] made the reformist visions of clearing slums, reducing density, and thus uplifting the moral fiber of inner-city Torontonians a great deal more practicable.

By the mid-1940s, a post-World-War-II urban housing crisis necessitated large-scale action regarding the questions of urban social policy that had been brought on by the Great Depression, while the relative popularity of left-of-center and socialist political formations among the Canadian working class at the time added an element of urgency[18]. Thus the federal government established the Central Mortgage and Housing Corporation (CMHC)[19] in 1946 to provide financing for home builders and buyers, while converting military barracks into emergency shelters for homeless families[20]. In line with the aims of reformers to reduce density and non-familial shared accommodation, the stage was now set for the sprawl of the city past its newly-annexed suburbs, as well as the simultaneous "suburbanization of the city"[21] which entailed the demolition of older and 'undesirable' neighborhoods and their replacement with single-use, insular enclaves of nuclear families and wide-open spaces.

This is precisely what happened in 1948, when Regent Park was developed at an estimated cost of $16 million funded primarily by the City of Toronto, on land cleared through the wholesale demolition of the original Cabbagetown[22]. Within a year, residents began moving into Regent Park North, the first phase of the new neighborhood, though it was not completed until 1957[23]. This phase consisted of six square blocks of roughly equal size, each vaguely demarcated by dead-end driveways and sidewalks, and containing five or six three-story apartment buildings surrounded by empty green space. By 1959, Regent Park South was completed just across the major thoroughfare of Dundas Street East; this portion of the neighborhood appeared less methodical in design, as it was spatially dominated by five hi-rise buildings at its centre, each placed at different angles and set far back from the main roads and low-rise townhouse complexes at the perimeter. As in the North, there were ample grassy expanses and dead ends. Together, Regent Park North and South constituted a 69-acre neighborhood of roughly 10,000 residents living in new, affordable, and well-equipped apartments[24].

Regent Park was developed over a decade after similar projects were first introduced in the United States[25]. Despite this initial reluctance towards large-scale public housing in

Canadian cities, Regent Park was an ambitious, well-publicized endeavor that was introduced to the Canadian public amidst a series of tall promises. For example, the 1953 National Film Board[26] documentary "Return to Oak Street" blends fictional vignettes with documentary-style reportage to tell the story of a Cabbagetown family brought to the verge of dysfunctionality by overcrowding, vermin, a lack of appliances, and a lecherous neighbor who sexually harasses the young teenage daughter of the household. Interspersed with such fictionalized vignettes is the real-life footage of an old Cabbagetown block being demolished, as the narrator triumphantly proclaims

> … Down came Oak Street. Down came the verminous walls, the unclean, unhealthy rooms. And, down came the fire hazards, the juvenile delinquency, the drunkenness, the broken marriages. And up rose something new! The nation's first large-scale public housing project, to be called, "Regent Park"[27].

Predictably, the beleaguered family finds complete redemption when they move into a clean, private, and spacious unit in the newly-constructed Regent Park.

The planning literature of the day was equally sympathetic to the Cabbagetowners, if less dramatic in expressing this. For example, Albert Rose, the longtime Dean of Social Work at the University of Toronto who played a significant role in the planning of Regent Park, devoted the first chapter of his 1958 book on the topic to the question of "whose fault" it was that so many Canadians had substandard housing (or no housing at all) in the 1940s. Rose concludes that it is "the fault of everyone" as, "for the most part, it is the community which has failed"; while those who could potentially be blamed for their own poor living conditions – that is, "the residue or 'hard core' of families who simply do not care" – "has been found to be an infinitesimal proportion" of those who apply for public housing[28].

This sympathy entailed a tendency to deny the Cabbagetowners any significant sort of agency, however. 'Slum-dwellers' were understood as incapable of the kind of calculated decision-making it takes to plan the renewal of their own neighborhood; their role in the project was reduced to that of a variable in a scientific experiment[29]. Reflecting this, Rose described how "most people originating from a "slum environment did respond very quickly to the stimulus of the new housing accommodation"[30]. Illustrating how various components of the neighborhood were reduced to a singular function and assembled methodically to produce the desired effect, an article in a 1949 trade publication on Regent Park notes that "modern, sanitary housing is the goal; parks and playgrounds, desirable as they are, beneficial as they will be, must still be a secondary consideration"[31]. As this experiment was initially deemed a success, 125 housing projects were constructed across Toronto according to a similar formula over the next three decades[32].

The architects of slum clearance in Toronto were keenly aware of their own paternalism, and knew that many 'slum-dwellers' sensed it as well. Reflecting on the apparent successes of Regent Park as of 1958, Rose admitted that though "some persons

deplore the social role of management as 'paternalism' however benevolent", this role was both necessary and desirable because "respect for the strength, authority, helpfulness and firmness of the management is of great importance in building a community in which several thousand people must learn to live together"[33]. In short, the assumption was that the onus was on ex-Cabbagetowners to escape their marginality by modifying their behavior according to the demands of a benevolently designed environment, and that management must facilitate this in ways that are helpful but definitely authoritative. Though these constructions of authority and expertise were turned upside down over the next six decades, the assumed correlation of environment and behavior has carried through.

Failure, restructuring and neglect

Despite all the enthusiasm for Regent Park exhibited by Rose in 1958, his views on the neighborhood, and on slum clearance and expert-driven planning in general would change completely within a decade. Writing in 1968, Rose explains the failures of the "simple and high-minded approach to the problem of urban revitalization" that he and his peers had implemented:

> We have constructed huge villages of the poor, disabled, and handicapped, vast collections of dependent and quasi-dependent families … who cannot provide or foster the indigenous leadership or, at least, the quantity and continuity of leadership required to build a strong neighborhood[34].

A planned community exclusively made up of public housing and vast expanses of grass had turned out to be a space of further marginalization and community fragmentation, while the expert practitioners who designed it were not as infallible as they once appeared to be. Meanwhile, the assumption that these experts had all the answers to the housing dilemmas of the day had resulted in the dismissal of any answers that may have come from the community itself.

By the time Rose had admitted it was a failure, Regent Park was typically thought of as a "slum" in popular and media discourse that was "similar in many respects to the Cabbagetown neighborhood that was destroyed to build it" – an oversized, poorly planned, criminogenic "haven of single mothers, welfare families and deviants" in the parlance of the day[35]. As a costly experiment in public housing that had been deemed a failure, Regent Park was already in a precarious position by the late 1960s; over the next four decades, its problems were compounded by the neglect and marginalization of public housing that came with the neoliberal restructuring of the Canadian economy.

Hackworth and Moriah point to three common contentions of neoliberal ideology that are particularly relevant to questions of urban planning and social policy – the primacy of the individual as the "normative center of society", that the free market is the superior means of providing for individual autonomy, and that the "interventionist state" is the

"chief impediment" to this[36]. As a place built on the assumption that what is best for both individuals and the market is a massive public investment in a neighborhood that was pre-designed to instill a sense of community and conformity in residents, Regent Park would come to be seen as an outmoded liability by various levels of government that embraced neoliberal ideology from the mid-1970s to the present. This section briefly reviews some political-economic shifts in Canada over this period as they relate to Regent Park.

It is generally agreed that, much like in the United States, neoliberalism began to gain currency in Canada following the 1973 oil-shock recession, which led to a stagnant (at times shrinking) economy in which "a larger share for labor meant less for capital, and vice versa" – in short, a "zero-sum game"[37]. This competitive situation undermined the "postwar consensus between capital and labor" that was "premised on an ever-expanding economic pie to be shared by the two"[38]; as a result, in place of measures such as social planning and the redevelopment of neighborhoods, from the mid-70s onward the dominant discourse of governance in Canada became one of cutbacks, privatization, a reliance on the voluntary sector rather than the public sector for the provision of social services, and the tendency to blame individuals rather than 'the community' for their own poverty and lack of housing"[39].

Beginning around the same time, Regent Park became further marginalized and denigrated as its population shifted – in many ways mirroring changes in the population of Toronto at large. Once a community with an overwhelming majority of white working class Anglophones, Regent Park has become an ethnically and linguistically diverse community where nearly two-thirds of the population was born outside of Canada and seventy different languages are spoken[40]. According to one report, the largest "cultural groups" in Regent Park as of 2002 were "Chinese (Mandarin and Cantonese-speaking), Vietnamese, Somali, Tamil, Hispanic, Filipino, Black and English-speaking Canadians of Western-European descent"[41].

Reflecting this diversity, Walks and Bourne have concluded from a statistical study of poverty and ethnicity in Canada that communities such as Regent Park are not "ghettos" in the American sense in that they lack the extreme racialized segregation of many neighborhoods in large US cities[42]. Still, since "racialized depictions of minority groups and criminality are enhanced when linked with certain identifiable places"[43], racist moral panics around Toronto becoming an "American city" marred by drug-related gun violence have tended to center around Regent Park[44]. These associations are particularly intense regarding assumptions of the criminality of black Regent Park residents, as exemplified by the "lengthy history of tensions between black tenants and the police, which has centered on allegations of police brutality and other forms of unfair 'racialized' policing"[45].

By the 1990s, the working class that Regent Park meant to accommodate had been further marginalized through neoliberal restructuring. "Who the poor are" had changed markedly as the working poor saw their real incomes decline to the extent that many spent such a large share of their income on rent that they depended on food banks as

much as "employable welfare recipients" did[46]. Minimum had effectively fallen by 30 per cent in the 1980s, while formerly secure industrial workers experienced mass layoffs[47]. Meanwhile, housing accommodations for the desperate have come to resemble those of the days when Regent Park was first designed – Brushett notes that the city now "reaps the seeds of Canada's late and feeble entry into the field of social housing" as abandoned warehouses and armories are sites of emergency shelter for over 32,000 Canadians each year[48].

Meanwhile, Regent Park came to be seen as an expensive and hopeless problem that no government wanted to accept responsibility for. This was exacerbated in 1993, when the newly elected Liberal federal government announced that housing for the poor would be an exclusively provincial rather than federal responsibility[49]. Within two years, the "crisis in affordable housing" this caused was "compounded" by the drastic changes made by the Mike Harris Conservative provincial government[50], which canceled any pending commitments to public housing construction, eliminated regulatory barriers on private builders, cut support for 17,000 public housing units and handed off responsibility for public housing to municipal governments which lack the taxing capabilities to adequately fund it[51]. Responsibility for Regent Park, and all other public housing projects in Toronto, was thus handed off to Toronto Community Housing (TCH) in 2002. In sum, alongside widely publicized cuts to welfare, health, and education, the Harris government was "wildly successful at undoing welfare state gains made during the previous several decades"[52]. Some scholars have noted that this was also done with a particularly moralistic vigor that aimed to reform the poor through austerity;[53] a kind of inversion of the moralism of the Keynesian era which aimed to accomplish this through the provision of affordable housing and other social supports.

Throughout these momentous changes, the built environment of Regent Park remained largely the same apart from its pronounced aging. Despite ongoing calls by residents for massive renovations, any changes made to the buildings and their surroundings were typically minor and often absurd: for example, a 1994 National Film Board documentary shows workers dismantling a particular section of fencing because it allegedly provided a place for drug dealers to sit and do business, while in front of another building, workers were installing the exact same type of fencing "for people to sit down, and for kids to tie their bikes up"[54]. Substantial change finally came in 2002, however, when Regent Park was slated to be leveled and rebuilt for many of the same reasons that Cabbagetown was condemned over 50 years prior: it was seen as a neighborhood that hopelessly leads to violence, substance abuse and community fragmentation due to its built environment. Once again, the drastic modification of this environment is being posited as a monolithic solution to these problems.

Though the built environment of Regent Park remained largely frozen in time during the momentous political and economic changes described above, many other downtown Toronto neighborhoods underwent a complete transformation. Caulfield describes the ascendancy of the corporate-service sector in the Toronto economy from the 1970s to the 1990s, and how it resulted in the growth of an affluent, white-collar workforce and an exponential rise in downtown property values[55]. Importantly, however, there is more to

the remaking of downtown Toronto than neoliberalism and corporatization: through the 1970s and 1980s, "postmodernist urbanism" became a dominant force in planning and architecture through various grassroots campaigns against the kind of cataclysmic redevelopment that created Regent Park[56] – for example, Jane Jacobs herself was instrumental in the cancellation of a plan to build a matrix of freeways across the city that would have involved the demolition of several older residential communities[57], and an attempt to demolish another neighborhood to make room for the expansion of Regent Park was blocked. The effects of this movement on planning in Toronto have included the 'preservation' of old neighborhoods (rather than their obliteration through 'urban renewal' initiatives such as the original Regent Park), the construction of new buildings aimed at mimicking the look and feel of old ones[58], and the "open/democratic planning process" that led to the creation of the St. Lawrence neighborhood, a mix of public and market housing, retail space, and community services built in the 1970s on underused industrial land[59]. This became the model to be emulated by the Regent Park revitalization roughly 30 years later.

The Regent Park revitalization: disjunctures and continuities

Though the primary purpose of the Regent Park revitalization is ostensibly the amelioration of the public housing stock of downtown Toronto, the first of the new buildings to be constructed through the plan are actually market condominium towers. Located at the corner of Parliament and Dundas streets, these condominiums constitute the first of five phases of the rebuilding process; their construction is slated for completion in 2009. When all five phases are complete, ideally sometime between 2016 and 2018, the new Regent Park will center around a six-acre park, and will consist of a mix of low-rise and high-rise buildings arranged in a way that will provide for "a container of public open space, enclosing streets, highlighting corners, defining parks and providing 'eyes on the street' increasing surveillance and safety"[60]. In all, there will be 4,500 housing units; all 2,087 public housing units of the original Regent Park will be replaced, but this time it is "assumed" that they will "be mixed with market units in as many buildings as possible"[61]. Commercial space is expected to include a bank, a grocery store, and other amenities that Regent Park currently lacks.

Of the 1,160 residents who were relocated for the phase-one demolition, 40% moved elsewhere in Regent Park, 56% moved to other nearby public housing communities in Toronto, while the remainder left Toronto public housing altogether. Toronto Community Housing (TCH) covered moving expenses and other provisions through a temporary "relocation office" that will re-open each time residents are needed to move[62]. All residents are guaranteed the right of return, but the TCH website does not address the obvious problem that residents did not have much of a choice in whether or not to relocate in the meantime; this has been portrayed in the national media as a traumatic experience for at least some of them[63].

Though the current revitalization plan echoes, to a significant extent, the original plan for Regent Park in its assumption that altering the built environment amounts to panacea for poverty and marginalization, it is purported to be a great deal different regarding the

sort of expertise and authority that are employed in bringing this about. According to the TCH website, the revitalization "has been successful to date because of a key guiding principle: community participation in all aspects of planning and implementation"[64]. The self-confessed paternalism of those who designed the original Regent Park has been turned upside down, as the residents themselves are now seen as the foremost experts on their own housing.

Despite this conscious move away from expert-driven planning, the municipal staff who coordinated the participatory planning process faced significant barriers they faced in engaging with Regent Park residents. According to a report on the process, residents are "a deeply impoverished multilingual population with a history of disappointments that has resulted in a predominant mood of mistrust and disengagement"[65]. Despite this legacy of cynicism, roughly two thousand residents agreed to provide their feedback in this latest discussion of how to change Regent Park[66]. The participation of residents was facilitated by "community animators" – mostly Regent Park residents who were hired and trained by TCH to "animate a discussion that was rooted entirely in the community"[67]. From July to December 2002, the animators asked people for their opinions on Regent Park, the idea of redevelopment, and which streets and buildings in particular they would like to see demolished or preserved. Finally, residents were shown a draft plan for redevelopment that was based on their input, and then asked for further feedback. This input was solicited through separate processes, each designed to be accessible and relevant to the major cultural/linguistic groups represented in Regent Park. After some difficulty in defining and redefining these groups[68], the planners were satisfied that were able to reach potentially 85% of the Regent Park population with linguistically specific consultation processes[69].

To briefly summarize the results of the consultation: few people wanted to keep any of the existing buildings, and few streets were identified as places where all groups felt safe. Majorities in most groups favored the conversion of dead-ends into through-streets, mixed housing, commercial space, and more community facilities[70]. According to TCH, when a plan was drawn up and presented in December 2002, it was met with "overwhelming approval" as residents "expressed strong support for the design and clearly felt a strong sense of ownership", but still "retained a healthy skepticism about the future"[71]. In sum, according to TCH's accounts of the revitalization as presented in its online reports, the revitalization is a fundamentally democratic and progressive plan that will alleviate many of the problems that Regent Park residents face.

The revitalization is in many ways an attempt to replicate the aforementioned St. Lawrence neighborhood, which, to the planners, is a failsafe way to design a community that "avoid[s] developing into either an exclusively wealthy community" on the one hand "or an area with a 'housing project' atmosphere" on the other[72]. It is also hoped that the new neighborhood will interweave and make "linkages with some of the dynamic changes taking place" in adjacent neighborhoods such as "the Cabbagetown Historical District"[73], the name of which brings together the past, present, and future of Regent Park and invokes a less inclusionary subtext to the revitalization plan.

Ironically, while the name of 'Regent Park' became increasingly maligned through these years of gentrification and economic restructuring, the name of 'Cabbagetown' – the long-gone 'slum' that was once seen as anathema to the modernity and cleanliness of Regent Park – became a hot commodity. This occurred through the complicated interplay between the initially small-scale ventures of a few property speculators, the partial adoption of some strands of postmodernist urbanism by a reformist municipal government, and the changing tastes of many members of the growing white-collar middle class through the 1970s and 1980s.

Don Vale was a low-income neighborhood of narrow streets and aging houses located just north of Regent Park that was slated for clearance and redevelopment as a high-rise rental complex in the late-1960s. Though it was never truly a part of the original Cabbagetown, the two neighborhoods were nearby and similar in many respects, and thus Don Vale was also commonly seen as a blighted downtown slum. Just as Don Vale was to be demolished, a well-to-do architect renovated twelve nineteenth century workers' cottages in the neighborhood and sold them to other privileged individuals from outside the community. This was a risky venture that soon paid off when a reformist city council, inspired by the Jacobsian critique of 'urban renewal', down-zoned the neighborhood and thus barred its impending clearance and redevelopment[74]. Over the next several years, a network of avant-garde mortgage lenders and real estate agents gradually bought up much of Don Vale and rebranded it "Cabbagetown"[75], selling the homes to an urbane section of the middle class who shunned the suburbs they were expected to move into according to the conventions of the day.

Though historically inaccurate, the 'Cabbagetown' label is now firmly entrenched and invokes connotations of a quaintly rustic but definitely urban place to live; a neighborhood that is somehow down-to-earth but definitely upscale at the same time. Houses were sold and resold several times, their values increased exponentially, and Don Vale became an example of the kind of neighborhood described by Jane Jacobs where successful 'unslumming' ironically rendered it elitist and inaccessible[76]. Today, the new Cabbagetown is socially and spatially removed[77] from the Regent Park neighborhood where its namesake once stood, its name a postmodern malapropism that has turned an anti-Irish epithet[78] into a successful marketing label. As the new Cabbagetown embodies the fetishization of the history of poverty in downtown Toronto while insulating itself from the present-day realities of this poverty, the neighborhood brings to mind Flusty's concept of "quaintification" – the rendering signs of social inequality and spatial boundaries between social strata "aesthetically pleasing"; thus rendering "security simultaneously apparent and palatable"[79].

As Caulfield has noted, Don Vale was one many old, down-market downtown Toronto neighborhoods that was spared demolition following the shift away from modernist urban planning, only to be completely transformed through gentrification in years to come[80]. It is also important to note that this gentrification tends to spread; as formerly undesirable blocks become chic and expensive, the bohemian[81] edge of the newly popular neighborhood expands to adjacent communities and beings their gentrification as well. This history of linkages between postmodernist urbanism and gentrification,

particularly in Don Vale, goes a long way to explain some of the pessimism around the Regent Park revitalization plan. During discussions at the Regent Park Film Festival in November 2007, many anti-poverty activists and some residents decried the revitalization plan as nothing more than a cynical machination on the part of politicians and developers to facilitate the gentrification of the neighborhood – comparisons to the capitalistic redevelopment of parts of Brooklyn, New York and the Cabrini-Green housing project of Chicago were made. Given the proximity of 'Cabbagetown' and the sort of misinformed nostalgia for historical poverty that contributes to its appeal, it is not unrealistic to speculate that the history of Regent Park could become similarly fetishized and marked to well-off tenants in years to come as the neighborhood is opened up and linked to surrounding communities, a process which would likely occur at the expense of the public housing stock.

There are also important connections between the neoliberal political economy and the Regent Park revitalization. After decades of neglect, the redevelopment of Regent Park can be seen as the state reasserting itself in the lives of the marginalized, in new and more "entrepreneurial" ways – for example, alongside the $1 billion reinvestment in Regent Park (over half of which is covered by private capital). TCH has also since "begun to sell part of its portfolio to fund new development, rent out space to commercial tenants, and transfer some of its properties to homeownership-based units"[82]. Despite its rhetoric of altruism, The Regent Park Revitalization is part of a broader restructuring of public housing in Toronto that involves altering levels of government spending and intervention in particular areas according to market-based logic.

Conclusion

Similar to how the original Regent Park was designed according to a thoroughly paternalistic housing policy in the 1940s that emerged through the confluence of Keynesian welfare policy and Protestant conservatism, the current neoliberal political economy and the secular individualism it valorizes have given rise to a new sort of moral regulation which aims to turn public housing residents into clean-living, productive, legitimate users of urban space. Purdy has argued that in fact the "real emphasis" of the revitalization plan "is on changing tenants themselves and not government social and economic policies that have generated problems in the project"[83]. While the systemic inequality faced by Regent Park residents is left untouched, the revitalization plan claims to solve the problems of the community by spatially mixing it with middle-class condominium owners. The unstated assumption is that these are the model citizens of the neoliberal city, and that their uprightness will hopefully rub off on public housing residents once they live side-by-side. Meanwhile, crime and violence are expected to be minimized as residents internalize the surveillance instilled by a neighborhood designed to maximize 'eyes on the street'. This reflects the "crime prevention through environmental design" (CPTED) discourse that, despite its important advances in making some urban spaces safer and more accessible, has also been described as a mechanism for social control that is practiced

by residents themselves rather than agents of the state, and thus fits well with neoliberal logic[84].

This paper has focused on the interrelated transitions from expert-driven to participatory planning and from Keynesianism and neoliberalism in Canada, through a comparison of the development and redevelopment of Regent Park in downtown Toronto. Further research in 2009 will revisit and expand on arguments made here through an historical-ethnographic study of Regent Park in the midst of its 'revitalization' – the highlight of which will be conversations with residents regarding their perceptions of the authenticity of this purported attempt to make downtown Toronto a more inclusionary and equitable place.

Notes

Partnerships for community building and governance in master planned communities: A study of Varsity Lakes at Gold Coast

Bhishna Bajracharya

Bond University, Australia
Shahed Khan
Curtin University of Technology, Australia

Introduction

A number of master planned communities have grown on the outskirts of the cities as a response to increasing demand for housing in large metropolitan regions. Unlike conventional subdivisions, master planned communities are large scale integrated housing developments with a mix of housing types, shopping and services, open spaces and recreation facilities, and employment opportunities (Ewing, 1991; Ewing, 1996; Mouldon, 1990; Schmitz and Bookout, 1998). They are often initiated by the private developers on 'greenfield' sites on the outskirts of the cities. Due to large scale nature of the development, MPCs often have a longer development period and requires long term partnerships of number of stakeholders including developer, local council, state governments and community groups (Minnery and Bajracharya, 1997).

There is a growing debate about the nature of master planned communities in Australia (Lance and Woolcock, 2003; Gwyther, 2005; Gleeson 2004; McGuirk and Dowling 2007; Costley, 2006; Bajracharya and Allison, 2008). Lance and Woolcock (2003) highlight the importance of strengthening the social networks as part of the development of master planned communities. However, Gleeson (2004) argues that current master planned communities lack genuine participation by communities and advocates the need for a participatory model of master planning. Likewise, Gwyther (2005) points out that the modern master planned estates with focus on developer-led urban design and social programs have not provided genuine ideal of community in terms of connectivity, social support and social identity. Some master planned communities have privatized governance with communal areas under community title thus excluding unfettered public access. (McGuirk and Dowling, 2007). Consistent throughout these debates is the underlying argument that the development of an active and interactive community requires effective community governance in the master planned communities (Bajracharya, Donehue and Baker, 2007).

With the declining role of local government in provision of services, developers are increasingly playing a greater role in provision of community services and community building. In the context of Australia, the developer plays an active role in private governance of master planned communities during the stage of development of master planned communities. A gap in the management of the master planned communities occurs, however, with the handing over of the management of community facilities and parks to local government and community groups once the developer exits. One of the

key questions in master planned communities in Australia is to understand how to develop effective mechanisms to transfer from private governance to local and community governance. The paper attempts to address this question by doing a case study of a master planned community in Queensland where a developer is developing a proactive model of governance which can transfer from private to community and local governance.

The paper begins with a brief review of literature on governance and master planned communities in order to provide the context to the problem. It then discusses the historic development of master planned communities in Australia with particular focus in South East Queensland. It presents a case study of Varsity Lakes, a master planned community in Gold Coast, investigating the nature of partnerships and governance in master planned communities. The paper attempts to understand the types of partnership initiatives undertaken for community building by identifying the roles of key stakeholders in the partnerships for community building and governance. The paper then discusses the model of community governance initiated by the developer and identity the key issues relating to the collaborations for community building and their implications for community governance.

As part of research methodology, the study relies on a review of relevant policy documents, a content analysis of the Varsity Lakes community website and interviews with key informant including representatives of the developer, a town planner and a community development worker from within the area.

Review of literature: community building and governance in MPCs

This section will first introduce the concept of community governance and community building to establish the context of governance in master planned communities. It will then review community building and community governance systems found in the master planned communities of USA and Queensland, Australia.

Community Building and Governance in Master planned Communities

Governance can be seen as a process employed to bring together all key stakeholders to contribute toward shared community objectives. Governance covers the spheres of partnerships, interactions debate and conflict between local citizens, organisations and local government (Evans, Joas, Sundback and Theobald, 2005). Community governance implies the power to engage in the process at grass roots level by citizens and local communities. Some of the key principles of governance are *participation, accountability, effectiveness and coherence* (European Union White paper 2001 cited in Evans, Joas, Sundback and Theobald, 2005). Community building is considered the soul work of governance and is crucial for creating social networks and connections (Vivian Hutchinson cited in Richardson, 1999). Related to the idea of community building is the concept of *social capital* advocated by Putnam (1993; 2000) who emphasised the importance of social networks for facilitating education, coordination and cooperation of the community for their mutual benefit.

Community building and governance are closely related concepts which are crucial for development of master planned communities.. Many master planned communities provide a range of community facilities and organise community events as part of the community building exercise. In many master planned communities, there is an emphasis on the provision of both hard infrastructure as well as soft programming to attract residents and develop a sense of community (Schmitz and Bookout, 1998). Some of the hard infrastructure includes parks, walking trails, exercise fitness centres, churches, town centres and established schools. Some of the soft programming elements include opportunities of interaction for parents of young children, organised programs for young children, community organiser to start up clubs and community events. The soft programming features can add value to the communities.

Governance of master planned communities in US

Master planned communities in the USA have a long history of resident community associations taking over the management of the community after the developer completes the development. Community association is a mandatory entity with membership of all property owners in the new development (Hyatt, 1998). Community association is a nonprofit corporation with its own by-laws for procedures and organization. Stabile (2000) provides a history of the development of community associations and considers it an innovation in terms of management for housing, providing communal services to residents to supplant public services from local government.

Referring to the master planned communities constructed during 1980s and 1990s, Halter (1998) reports that these community associations have, over time, evolved into service providers, providing a range of services such as those related to technology, cultural activities and liaison between businesses, councils and residents. Community website software is often developed and maintained to foster links between residents, schools and local businesses and provide a number of other functions such as setting up information points for babysitters, tutors, and support staff for local businesses.

Such community associations need to be dynamic and responsive to the changing needs of the community while protecting the rights of individual property owners (Hyatt, 1998). The need for balance between community needs and individual property rights also raises concerns about the regulation of maintenance, particularly with respect to infrastructure and community based assets, and the somewhat vexed issue of use restrictions. Some of the governance issues identified are the need for providing services that currently lie 'between' or outside of the ambit of more established governance structures, such as child care, security, affordable housing, and the care of an aging population. There are some questions regarding whether community governance should be accompanied by more professional management and volunteering programs to effectively address these issues.

There are growing criticisms of many aspects of master planned communities in the US. Blakely and Snyder (1997) criticize the rise of gated master planned communities questioning the need for and social value of gates and walls being created thus preventing the outsiders from having access to the privately governed communities. They also point out the growing opposition to these phenomena. Likewise, Mackenzie (1994) argues that the rise of homeowners association and rise of residential private government has major implication on civil liberties. Gated communities and community associations can lead to enclaves of affluence without much concern for surrounding communities. Recently Fogelson (2003) similarly critiques the use of restrictive covenants in the American cities arguing the fear of difference motivated the use of restrictive covenants by the developers. Homeowners associations were used as mechanisms for use of restrictive covenants for protection of property values but they should not micromanage the lives of residents.

Governance of master planned communities in Queensland, Australia

Unlike the US where community associations take over the management responsibilities of master planned communities after the developer has moved on, there is no established system for transferring management or governance responsibilities following the exit of the developer from master planned communities in Queensland, Australia. The overall responsibility for management of parks, open spaces transfers to the relevant local council which is often financially constrained to maintain the community infrastructure to the same levels as the developer has maintained. This often leads to a decline in standards of the community spaces such as parks in the master planned community following the developer's exit. These problems have been highlighted in some of the earlier master planned communities built in South East Queensland.

Delfin Lend Lease, one of the biggest land developers in Australia has encouraged community building in their earlier master planned communities such as Forest Lake through organisation of community events and provision of community facilities. It is primarily the responsibility of the local government, however, to manage public and community infrastructure now that the developer has completed the project.

In one of its latest MPC ventures called Varsity Lakes, the same developer is currently engaged in a serious attempt to strengthen community building by establishing a community governance entity called Varsity Lakes Community Limited (VLCL). This entity provides a community governance model whereby the community, through VLCL, will play an active role in management of the master planned community after the developer moves on. This is an interesting model with the potential for wide scale adoption among MPCs in the context of Queensland as it represents a proactive approach that seeks to move from private governance to community governance. As we will discuss later, the model being developed represents *developer-led community governance* which is a significant improvement over the earlier *developer-led private governance*. The challenge then is to convert this *developer-led community governance* into *community-led community governance* whereby local community

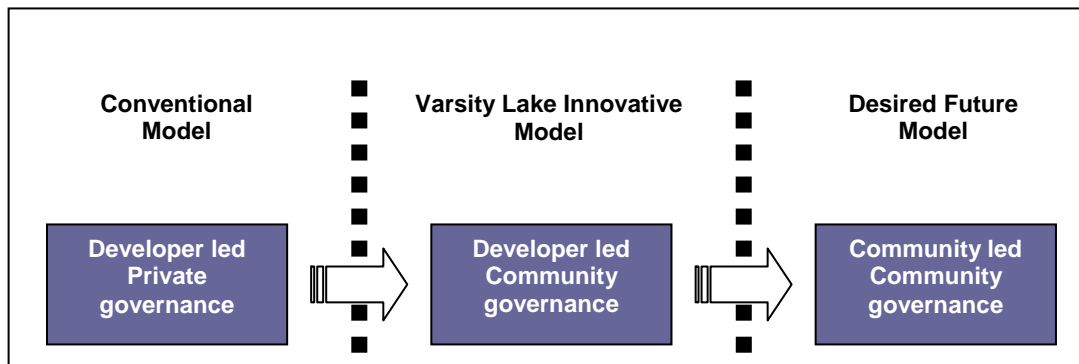
groups within the master planned community could take over its leadership after the developer exits the scene (Figure 1)


Figure 1: Evolution of the Community Governance Model

Following a brief discussion on the historic evolution of master planned communities in Australia and description of case study area of Varsity Lakes in the following section, the paper focuses on the crucial elements of a community governance model for MPCs, identifying key issues that emerge in public-private partnerships involved in community building and community governance.

Historic evolution of master planned communities in Australia

Although Freestone's book *Designing Australian Cities* (2007) provides an excellent account of the Australian planning history, there is little write-up on the historical development of master-planned communities in Australia. As Freestone has pointed out, there has been revival in *city beautiful* concept with growing interest in urban design in Australia since 1980s. New master planned communities in Australia are part of this trend with focus on green open spaces, community building and place-making. Some of the earlier master-planned communities in Australia seem to have been influenced by new town development in the UK and master-planned communities in the US. Delfin (now Delfin Lend Lease) has played an important role in the historical development of private sector driven master planned communities in Australia. Delfin is Australia's leading developer with about 20 major master planned community projects in different parts of the country. It is a land development company with its roots in South Australia, which developed one of its first master planned community of West Lakes (current population of about 6000 people) in South Australia in the 1970s (It was followed by two other master planned communities of Golden Grove and more recent Mawson Lakes in South Australia). One of the key characteristics of the West Lakes development is that the developer worked closely with the State government to build housing and other community development infrastructure within the new housing estate. In South East Queensland region, Forest Lake was one of the first developments of Delfin followed by more recent developments of Varsity Lakes in Gold Coast, Woodlands in Logan and Springfield Lakes in Ipswich. Another Delfin development called Yarrabilba (land area

of 2,000 hectares and planned population of 52,000) is being proposed near Gold Coast.

There are two distinct models of MPCs being developed by Delfin. The first type is where land is owned by another company but Delfin has the development rights for the land. Second type is where the developer owns both the land as well as the development rights. The majority of the development of Delfin is the first type (eg, Varsity Lakes, Springfield Lakes), while a few developments such as Forest Lakes is the type where the land is also owned by Delfin. There is another new type of development emerging in recent years. The proposed Ripley Valley master planned community in Ipswich has multiple land developers with the council acting as the coordinating body for the development of the master plan. It has set up a Ripley Valley Master Planning Task Force with representation from the council, development industry and community groups for this purpose.

The type of master planned communities and nature of collaboration between the developer and council have changed over time. While many of the earlier master planned communities were primarily bed room communities, some of the new ones have a greater focus on creating employment within the development as well. In terms of relationship between council and developers, the nature of collaboration has also evolved. While one of the earlier master planned communities in South east Queensland developed with informal agreements between the council and developer, some of the later MPCS have been developed under more formal infrastructure agreements and legislations. For example, in the case of Centenary development, one of the earlier MPCs which started in the 1960s in Brisbane, there was an 'informal' contract between the Brisbane city council and developer Hookers Corporation that the council will fund the infrastructure including sewerage and connecting bridge while the private developer provided the local infrastructure (this development was later bought up by a larger developer Australand in later stage). In the case of Robina, another development in the Gold Coast which started in the 1980s, the council and developer had negotiated a 'structure plan' and development agreement covering infrastructure provision. This was a contractual agreement between the two in stead of the Development Control Plan which was considered too rigid and lacking flexibility to adapt to market changes (Minnery and Bajracharya, 1998). Varsity Lakes was also initially developed according to a structure plan agreed to between the developer and Gold Coast city council. Many of the newer development such as Springfield, North Lakes were based on the Development Control Plan (DCP) and infrastructure agreements. Some MPCs have been created with special legislation as well since the size and scale of development precluded conventional approval of development. (Such as Robina Central Planning Agreement Act and Local Government (Springfield) Act)

Besides Delfin, the other major developers of master planned communities in South East Queensland are Stockland, Springfield Land Corporation, Robina Land Corporation and Investa. Stockland is developing North Lakes (for 25,000 population) in Pine Rivers north of Brisbane (this development was initially developed by Lend Lease but it later changed hands), Springfield Land Corporation is developing a 80,000

population master planned community in Ipswich (Delfin Lend Lease is responsible for development of part of residential areas called Springfield Lakes), Robina Land Corporation has developed master planned community of Robina (25,000) in Gold Coast. The proposed Ripley Valley master planned community will be the largest master planned community in Australia with a project population of about 100,000 people. Four major development companies Investa, Amex, Wingate, JMKelly Group are collaborating in this project.

The above discussion on history of master planned communities in Australia with particular focus on South East Queensland provides a useful context for discussion of the case study area of Varsity Lakes in Gold coast.

Varsity Lakes case study

Varsity Lakes is a recent master planned community, popular with empty nesters, professional couples and mature families because of its high quality built form and access to facilities and employment (Bajracharya, Morris and Cook, 2006). Development of Varsity Lakes began in 1999 and is expected to be fully developed by 2010. The master plan for Varsity Lakes encompasses total area of 343 hectares, containing a range of residential, mixed use, community and business land use It includes a defined town centre and residential precincts, focused along the foreshore of a lake and other open space.

The town centre is planned to become a cosmopolitan business hub with about 150,000m^2 of commercial space, generating an employment base for approximately 4,500 people. The town centre contains two precincts, namely Varsity Central and Market Square The Varsity Central precinct immediately adjoins a university (Bond University) and contains an office park, mix use development and education facilities. The Market Square precinct backs on to the lake and contains a range of local shopping, dining and entertainment facilities. There are also specific allotments adjacent to the town centre designated for SOHO (Small Office/Home Office) dwellings which can accommodate office or retail space on the lower floor for work-from-home professionals and small business.

Varsity Lakes contains 12 residential villages which are expected to yield a total of about 3,000 allotments and a resident population of 7,800 people. Each precinct is planned to have a special focus, based on either their proximity to the lake, town centre and golf course or alternatively based on vistas to nearby hinterland and coastal areas. The two residential villages immediately adjoining the town centre and overlooking the lake, contain medium density residential complexes and well as some mixed use development. The residential areas in other localities are planned to support more traditional low density residential development

Open space within Varsity Lakes is focused around an 80 hectares feature lake and 56 hectares of public parks and outdoor recreation areas. The network of public parks and

outdoor recreation areas includes residential neighbourhood parks, lake foreshore areas and nature reserves that are linked by 20 kilometres of pedestrian paths and bikeways.

Role of key stakeholders in partnerships for community building in MPCs

The Developer

The private developer, Delfin Lend Lease, is the single most important stakeholder driving the development of Varsity Lakes. It has an arrangement for development rights with the owner of land University of Queensland to plan and develop the land. It has developed the vision for the development and implemented much of the land development, economic and community development activities within Varsity Lakes. It has negotiated agreements with a number of stakeholders including local government (Gold Coast City Council).for the town planning approvals of development, with business groups to attract existing local and new businesses, and various building and construction companies. It has undertaken a number of community building activities such as community events, supporting a range of community groups within the master planned community. It has also initiated a community sporting facility for use by the residents and business community in the area.

Local Council

Gold Coast City Council is another important stakeholder in community building in Varsity lakes. The local councillor is actively involved in community development activities of Varsity Lakes including commitment of financial support for a Sports House within the community. The Economic Development Unit within the local council works closely with the developer to ensure Varsity Lakes can establish businesses within its area in line with the strategic economic goals of the council for the area. Local council also plays an important role in the approval of overall master plan and development applications for new buildings within the Varsity Lakes.

Resident groups:

Varsity Lakes is rapidly developing into a community of about 5500 people at this stage. There is a resident association called Varsity Lakes Progress Association which has been formed as a representative group of the local residents. Some of the objectives of the association are to identify the future needs of the community and enhancing lifestyle and safety while providing a forum for residents to raise issues and concerns. It is expected to seek to ensure maintenance of the existing quality of the development and act as a lobby group to increase the area's attractiveness to local businesses and securing the required services.

Business Groups

There are two major groups which represent business interests in Varsity Lakes. The first is the Varsity Lakes Management Association comprising of local businesses within

Varsity Lakes. It promotes local employment generation by marketing the area. It organises events and activities to raise the profile of local businesses and help generate community interest within Varsity Lakes. The other business group is the Robina Varsity Chamber of Commerce which is a wider business association representing the interests of the Robina and Varsity businesses. It aims to play a leading role in the economic development of the region by acting as a conduit to all levels of government.

State government

A number of projects have been conceived by the developer in partnership with the State government. Varsity College has been established within Varsity Lakes in partnership with the State government's education department, Education Queensland. The college houses both elementary and secondary schools. A special school for deaf children has also been planned within the community. Meanwhile, in collaboration with a leading private sector pre-primary school service provider, Varsity Lakes has established a preschool.

There is also work underway towards establishing a new transit village with new railway station, retail and housing facilities within the Varsity Lakes.

Public-private-community partnership initiatives

Sports House

The developer, in association with a private sporting company, has been organising corporate sports and recreation programs within Varsity Lakes including individual as well as team based activities. In collaboration with the local council and local community, the developer is working towards developing a community sport facility for various community and sports events in the area. A Sports House@ Varsity Lakes committee has been set up, enlisting support from the local councillor with some financial commitment from the council. . The developer also encourages the local business and sporting bodies to make capital contributions to the project. This is an example of the community, businesses and the local council coming together for community building. The planned facility is to include boat launching, community meeting spaces, and watercraft storage and fitness and recreation program. This facility is to be run by the Varsity Lakes Limited (to be discussed in further detail later).

Varsity Lakes Online

In collaboration with the local businesses and community groups, the developer has set up a community internet portal called Varsity Lakes Online, featuring information/ resources on local community and businesses.   It facilitates the booking of community/ sporting facilities and keeps residents up-to-date with latest developments.

Work towards Establishment of Community Bank

The developer has undertaken the initiative to set up a community bank for the master planned community based on the Bendigo Bank model. It has managed to secure the support of the local council members, a Federal member, local residents and business owners within the area. A twenty-member Varsity Lakes Steering Committee has been set up which seeks indicative pledge of support from the local community. The community bank model requires a percentage of bank's profit to be put back into the community for community projects, organisation and events. It is currently engaged in raising $615,000, inviting local residents and local businesses to purchase $1 shareholdings in the company.

Varsity Lakes Economic Development Strategy

The Varsity Lakes economic development strategy has its roots in the joint agreement between Gold Coast City Council and the developer to make Varsity Lakes a living and working community with targeted employment base of 4,500. In line with the city council's Pacific Innovation Corridor project that identified eight major industries, Varsity Lakes has been designated as the lead information and communication technology cluster within the city. It has also received support from the Federal government's Building Information Technology Strengths program (BITS) program, whereby an ICT incubator (inQbater) was established in Varity Lakes.

Varsity Lakes Community Limited (VLCL)

Varsity Lakes Community Limited (VLCL) is a not-for-profit company developed to take over once the developer leaves the community, marking the transition from private to community governance in the master planned community. VLCL is represented by all key stakeholder groups within Varsity Lakes. This includes residents nominated by the Varsity Lakes Progress Association, local business groups nominated by the Varsity Lakes Management Association, and educational institutions nominated by the Varsity Lakes College and Bond University. The Varsity Lake Online group and the Community Bank are also represented, The VLCL is chaired by a senior staff of the developer's company.

VLCL is designed to acts as a peak body representing the major groups. It is to act as the overarching custodian body to provide direction and support groups that may struggle occasionally. A staff member of the Gold Coast City Council sits on the committee as non-voting member. VLCL assumes the role of the owner and manager of proposed community facilities such as the Sports House.

Currently, funding for the bulk of its activities is provided by the developer. It is expected, however, that other stakeholders will gradually relieve the developers burden by contributing to the running the VLCL. It is in the process of developing a VLCL operations manual.

Key Issues on partnerships for community building and governance

<u>Identifying the roles of VLCL and Council</u>

Varsity Lakes Community Limited (VLCL) is a developer led initiative that may be classified as a community governance model which is still at a nascent stage of development. It is indeed one of the first models in Queensland where the developer of master planned community has sought to put in place a mechanism for continued community building before it leaves the scene. Unlike conventional practice in master planned communities where the developer leaves the responsibility of maintaining community services and open spaces to the local council when it withdraws, the developer has taken a positive and proactive approach of establishing community governance. In this model, the developer hands over the governance to both community (VLCL) and the local council.

In this situation, it is important to have clear understanding of the division of work between the local council and VLCL after the developer leaves. A memorandum of understanding between the two entities about their specific roles would be a good starting point to eliminate ambiguities. One concern with leaving the local maintenance to local government is that they don't have enough resources to carry out maintenance to the same standards as the developer has done. The local council can still provide the cost of basic maintenance of parks and public spaces at par with other communities. The VLCL could then provide the top-up to maintain higher quality maintenance as desired. Such an arrangement needs effective communication, coordination and a clear identification of roles of VLML and council to work efficiently and avoid duplication or mismatch of services. This may involve the services of technically qualified personnel.

<u>Leadership and Mutual Trust</u>

Currently at least two employees represent the developer on VLCL, with a senior staff of the developer holding the chair. When the project is completed the developer will withdraw its involvement in the management of day-to-day activities of Varsity lakes. There needs to be put in place a clear and transparent mechanism to identify and develop local leadership from within the community to fill the vacuum in the leadership of the VLCL. The leadership development process should commence well before the developers' departure from the development. Without a strong leadership to guide the VLCL after the developer leaves, it would be difficult to sustain community governance.

Mutual trust is an important element of community building, especially so in master planned communities with multiple stakeholders. Turf issues and self interest between different stakeholders can become a barrier to developing effective partnerships as discussed in earlier literature review and need to be handled. Turf issues may relate to perceived competition for limited resources as well as stakeholders wishing to preserve their autonomy and status and protecting their roles and interests. A number of trust

building mechanisms would need to be put in place to develop effective communication and to promote understanding of each other's roles and interests. Communication between VLCL, local council, communities outside Varsity Lakes,, business organisations and the residents have to be ongoing and frequent to avoid any build up of misunderstanding and misinformed expectations..

Strategic versus operation management

Community governance deals with long term strategic directions as well as day-to-day operations. It is not clear whether VLCL will be involved in both strategic and operational management of Varsity Lakes once the developer has withdrawn.

A master planned community in Pheonex, Verrrado has two levels of community governance – the Verrado Assembly that focuses on strategic direction setting, and the Verrado Community Association, a resident association which deals with managing day to day activities. Varsity Lakes Community limited probably plays greater role in strategic management and bringing together diverse groups of residents, businesses and education providers. The organisational structure of Varsity Lakes could be developed to include a management committee or board to handle strategic management decisions whereas the Executive Director would be responsible for operational management of the VLCL.

Stakeholder access to resources

In the case of Varsity lakes there appears to be a range of stakeholders who may wield varying degrees of power and resourcefulness. For example, the business groups and residents group may be quite differently empowered. To ensure positive and sustainable partnerships, collaboration has to be aimed for. Collaborative partnerships based on mutual trust and respect are essential to promote a cooperative investment of combined resources in terms of time, effort and funds, joint risk taking and the sharing of benefit, between a multitude of partners. Elaborate mechanisms need to be developed for sharing of power and authority and definig roles and responsibilities. This may warrant the drafting of agreements by legal experts between different partners for contributing to the community.

The Community Bank

In the case of Varsity Lakes, the developer has put in the seed money to start VLCL. To be economically sustainable, it is important for VLCL would need to generate funds in order to reimburse the developer and run it after the developer withdraws. Towards this end, the developer has initiated the establishment of a community bank within Varsity Lakes. This is a novel idea to facilitate community enterprise by pooling together community resources. The community bank venture also has the potential to provide a format for the various groups and individual residents to buy a stake in investment ventures at different scales of investment. It can also be seen as a means

to gain greater stakes of the community in the local bank by encouraging local residents and businesses to invest in the local bank.

The community bank is a franchise of Bendigo Bank which has proven to be a successful model in Australia. However, its success is mostly reported from areas of locational disadvantage such as small rural communities. Bendigo Bank model has proven to be a viable substitute to commercial banks in communities threatened by the 'dying town' syndrome because of population decline and the withdrawal of services by government agencies. As private commercial banks followed suit and closed down branch offices, the community bank has presented an option to fill in the gap commendably. However, its application in an affluent master planned community is rather new and both its potential positives and negatives need to be understood.

While the setting up of a community bank promises great potential to ensure financial viability of VLCL, there may be some issues that warrant investigation. For example, it is not clear how this would affect the location and operation of other private banks in the area. It is also possible that having institutional links with other commercial banks may affect the commitment of some businesses within the area to support for community bank.

An elitist governance model?

The Varsity Lake community governance model could be criticised as one that seeks to promote an elitist community. It seeks to ensure that the standards of maintenance and community facilities within the community are of a higher standard than what the local council can provide for in other, non-master plan, communities. There are two main aspects that need to be considered. Firstly, the financial operations need to be transparent so that the interest and investment by the community and the local council can be separately seen. The local council should be able to show that its share of investment in Varsity Lakes in cash and kind remains at par with what it spends on other communities. Secondly, the community governance would need to ensure that Varsity Lakes does not become an inward looking community. Linkages with surrounding communities within Gold Coast would need to be developed. Opportunities for other communities to access and share the facilities located within Varsity lakes, such as the school and the community sporting club need to be considered.

Conclusion

Most master planned communities in Queensland seems to be managed by governance models put in place by the developer. These *developer led initiatives generally yield a private governance model initially where the developer assumes almost total responsibility in managing and maintaining community spaces and facilities. Once the development is complete and the developer has moved on,* the governance model gives way to a *local council led governance model* as the responsibility of management of much of public spaces and community facilities become the responsibility of the local

council. However there are problems with this model as local councils don't have resources to maintain them to a same standard as the developer.

The case study of Varsity Lakes has identified another model which is an attempt to address this issue by establishing a *developer led community governance model* with establishment of a Varsity Lakes Community Limited (VLCL). While this is an improvement over conventional practice, there is still the need to further develop it and strive to transform it into a *community led community governance model. This would ensure* that the community itself can work to ensure the sustainability of the master planned community long after developer has left the place.

From the corridors of power to the community soap box: the town planning association of New South Wales in postwar Sydney

Robert Freestone

Introduction

The twentieth century was the century of planning.[1] In Australia, the years from just before world war one to the mid 1960s defined a momentous transformation in the cultural organisation of planning which shifted from the realm of progressive urban reform to institutionalisation by the state, with the key changes effected from the 1940s. The role of the citizen altered fundamentally during this period, especially that of the informed urban middle class. At first advocating and agitating for change, they urged and shaped governments into accepting new coordinative responsibilities of urban intervention. Over time they ended up as critics of planning actions by state and local authorities as the redistributive impacts of planning in practice prompted a redefinition of citizen participation toward more insurgent roles.

In Sydney, the primate capital city of the state of New South Wales (NSW), an organised town planning movement crystallised in the 1910s. Out of this awakening through to the 1940s the state response is circumscribed: tinkering with traditional local government legislation, formation of advisory committees and ad hoc initiatives in physical planning with bolder initiatives checked by the Great Depression and two world wars. But patchwork responses were ill-suited to a metropolis which had grown in population from about 500,000 to over 2.5 million from the turn of the century to the late 1960s.[2]   Post-war reconstruction fostered a climate for change nationally. The initial breakthrough in NSW was the *Local Government (Town and Country Planning) Act* 1945. Influenced by a British approach to planning, this Act enabled local authorities for the first time to prepare comprehensive zoning schemes, established a state bureaucracy for coordination and Ministerial advice, and created the machinery for the preparation of a metropolitan plan in the Abercrombie tradition. By the 1960s, however, the pressures of metropolitan growth, unresponsiveness to government imperatives, local-state conflict, and surfacing community concerns about planning's outcomes, were drivers for another round of institutional change.

One planning organisation which remarkably spans this entire period is the Town Planning Association of New South Wales (TPANSW). This Association, formed in Sydney in 1913, played an early key role in government recognition and community acceptance of the importance of town planning reforms. Through most of the interwar period it continued to actively promote the benefits of planning by advocating passage of a town planning act. The Association survived into the post-war period as a commentator on planning issues. But its historical reformist aspirations hardened into

the pursuit of reactionary and idiosyncratic causes shunned by the planning system for which it had helped prepare the groundwork.

This paper examines the place and contribution of the TPANSW in the post-war Sydney planning scene to consider the role of community organisations in planning activity. It contextualises the Association's activities in the context of its own early history as a vital force until the 1930s. Focusing on the leadership of long-time president Bertram Ford, the paper charts the activities and declining significance of a once highly credible organisation into an increasingly marginalized voice in planning discourse, unable to reconcile its old fashioned ideology to a quite different urban planning landscape.

The Town Planning Association of NSW 1913-1967

From its inception by the publisher-progressive George A Taylor, the TPANSW secured a community presence by utilising a variety of methods encapsulated in its constitution adopted following establishment of the Association at a public meeting in Sydney's Town Hall on 17 October 1913.[3] The agenda was strong on educational services such as public lectures and exhibitions, public meetings and deputations, and a constant flow of propaganda to spread the good news about town planning. The membership base was mainly middle to upper class professionals and businessmen, its leading members drawn mainly from the built environment professions and civic life.

The Association successfully juggled roles as both respected advisor and lobbyist to the state government and municipal councils. It was invited to advise on local government and state-wide planning initiatives and assist with solutions to issues such as road-widening, beautifying neighbourhoods, and designing civic centres and parklands. It received attentive consideration from other professionals with its particular planning brand and visionary zeal. As a Sydney-centric group, it was often bound up in the deliberations of Sydney City Council on issues ranging from street hoardings and fruit barrows to grander plans for a city on the rise in the mid-twentieth century.[4]

Expatriate British architect John Sulman led the fledgling Association throughout its first decade. Behind the scenes George Taylor and his wife Florence emerged as fearless but ultimately conservative ideologues.[5] Whilst the TPANSW's mission was diverse, always in its sights was the passing of town planning legislation; a matter which nonetheless continually eluded it. The Association cannot be entirely blamed for this failure. Business interests and government instability in NSW also stifled the strong political will required.

Following the resignation of Sulman in 1924 and the subsequent death of George Taylor in 1928, there was a marked change in the TPANSW's approach to its work. The subsequent succession of presidents belied organisational refreshment as the Association became more selective, reactive, myopic and conservative in its suite of planning goals. It became more aligned with commercial interests at a time when revitalisation of the city centre accompanying construction of the Sydney Harbour Bridge (opened 1932) dominated city development. Its founding membership included

those concerned with social issues, such as poor housing and the general health of the city, but they fell out of step with more dominant pro-business voices of the Association.

As its governing executive grew from the late 1920s, general membership dwindled.[6] The TPANSW continued with its propaganda, rolling out plans and ideas for a better Sydney, meeting monthly, reporting on its agendas in various journals published by Florence Taylor, notably *Building, Commonwealth Home, Construction* and *Harmony,* raising its voice amongst the pages of the Sydney newspapers and bringing its resolutions to politicians, sister professions and the community at large. But the professional respect was not sustainable as the younger and more energetic built environment professionals in Sydney organised themselves into other forums. The Association lost critical ground as a body without the essential clout to make things happen. Members continued to pat each other on the back for the good work carried out but the actual outcomes were limited.

From the mid-1930s until its demise, the TPANSW was controlled by the firm, if somewhat eccentric hand of one man – Bertram W Ford. The resolutions continued: the perennial call for town planning legislation; the need for a town planning authority; the need for government action here or there. These pleas increasingly fell on deaf ears. "Some consider us fools, whilst others think we are mad. Despite of this, we persistently carry on"[7]. Political deputations, once a standard method of pleading a cause, were often met with refusal. The Association's preoccupations drifted more and more to place-specific civic improvement schemes, either volunteered or invited by the odd local council. By the 1940s even these planning opportunities had largely dried up and the Association was reduced to reactive commentaries from Ford. By the 1950s the TPANSW seemed distant and divorced from the pressing issues of the day, notably metropolitan planning. Drained of funds, energy, members and professional expertise, the Association was able to achieve little in its waning years. It disappeared with Ford's death in 1967.

Bertram Ford

Throughout the 1950s and 1960s the main voice of the TPANSW was Bertram Willoughby Ford. Rarely is any other member mentioned publicly, except when there is an occasional press notice of office bearers, awards or a funeral.[8] Born in 1880, Ford trained as an architect, beginning a career in 1905 noteworthy for his eclectic designs of small banks in rural NSW.[9] As a member of the Institute of Architects when the TPANSW formed, Ford attended some of its earliest public lectures, but became unfinancial in the Great Depression. [10]The first official mention of Ford's formal connection with the TPANSW is 1922 when he was listed as a founding member of a suburban sub-branch.[11] He appeared as a Councillor and Secretary in 1931. He became president in 1935.

Not all of Ford's appearances in the media related to town planning. Indeed, from 1925 to 1931 he was a sports journalist with the *Sydney Morning Herald* and followed the lawn tennis circuit.[12] Ford's public interest preoccupations miscellaneously ranged from

basic wage increases and their effect on the building trade, painting the Sydney Harbour Bridge in 'old gold' paint, abolition of the upper house of parliament, and feeding 'hungry kookas'.[13] As a virtual one-man band, certainly by the late 1950s, his style was eccentric and emboldened. Under his pen, the tone and content of the Association's annual reports became erratic and often bizarre, alternating between gushing prose, tortured angst and sheer anger.[14] Like all presidents before him, a self-assured and confident Ford was blunt and to the point when it came to offering an opinion – all the TPANSW had to offer by the 1950s. At heart he held a deeply conservative stance which limited and skewed his reading of the issues. His political affiliation was the United Australia Party, a forerunner of today's Liberal Party on the political right.[15]

The Ideology of action

When Ford assumed leadership, a deep ambivalence in the TPANSW's mission was already apparent. On the one hand its historical mandate was to spread the word and elevate community understanding as to planning's desirability. On the other hand it began to assume the role of a polite, protest group, contesting government's action when considered not in the public interest. The Association seemingly sought change for the better through creative public policy, but it endorsed a small government philosophy routinely buffeted by what it saw as heavy-handed government action. Town planning was a fine goal when it stood for visions such as suburban parkland and civic design. It proved more problematical when it infringed on private property rights and business profits.

Recurring issues from the 1930s included replanning Macquarie Street, extending Martin Place, the future of Circular Quay, and contesting alienation of parklands, particularly showpieces like Sydney's Domain. While the Association often spoke out against loss of open space, it was not overly concerned about demolition of historic heritage buildings in the interests of 'progress'. When the National Trust protested the state government's demolition of historic St Malo in suburban Hunters Hill in the late 1950s, Ford's position was that the Trust "should pay attention to more worthy matters".[16] In his final report, Ford presented thoughts on topics as disparate as increased fares on the Manly Ferry to a claim that the Association was instrumental in the lifting of Olympic champion Dawn Fraser's overseas swimming ban. Blasting the state government for failing to listen to his ministrations, Ford also announced that it was time for the Association to "go it alone" in tackling the rising toll of human life in road accidents. He named his crusade "Knights of the Road" with his knights guided by principles including assisting pedestrians across the road.[17]

Larger contemporary questions of town planning were frequently ignored. The Association's annual reports provide little insight into the extraordinary changes in the organisation of planning in the post-war period. These had seemingly little impact on its activities. It could be that Ford was piqued by his and the Association's exclusion from the corridors of power. In his annual review for the year ending 1946, he protested the state government's 'insult' in omitting him from the influential new Town and Country

Planning Advisory Committee which provided high level ministerial advice from 1945 to 1963.[18] He perhaps transcended such grounds for grievance by directing his energies towards issues emanating more directly from his personal interests.

The overall agenda followed the same conservative anti-socialist line which the Taylors stood for.[19] And it did not help matters that NSW was under a left-of-politics Labor Government rule from 1941 to 1965. In 1943 Ford wrote to Prime Minister John Curtin suggesting he look towards his own state of Western Australia and direct all states to do good deeds in planning and housing. Ford highlighted the "invaluable work" done in the west by its town planning commissioner and former TPANSW president David Davidson. He believed it was timely for all Australians to have the best possible housing at the lowest affordable price.[20] Concerned about housing shortages in a post-war world, the TPANSW devoted several pages to the issue in its 1942-43 annual report. But at the end of the war Ford's bipartisan commitment to the post-war political consensus, which established a foundation for planning and housing legislation, had fractured. He reverted to barbs, childish stories and poetry to express his disappointment and outrage at the work of the Commonwealth Housing Commission, widely considered a landmark in national urban policy, as a 'communistic' operation.[21]

Ford became regularly outspoken in his criticism of government expenditure, with no shortage of targets: the Sydney Opera House[22], the Cahill Expressway[23], and general waste and inefficiency, especially in regard to planning schemes. Following the report of a study tour made by a delegation of City of Sydney Councillors to North America, Ford declared in the press that it was "utterly stupid" and full of "fatuous findings".[24]

The TPANSW's stance on two of the most significant planning institutions of the 1940s was highly problematic and akin to anti-planning. From its formation through the early 1940s, the Association had promoted town planning legislation for NSW. In 1935 Ford felt that "our goal is in sight"[25] but another decade passed before assent of the *Local Government (Town and Country Planning) Amendment Act*.[26] But he railed against the government for not including the Association in the deliberations leading up to the drafting of the bill. He spoke disdainfully of the Premier and the Minister for Local Government for refusing "to meet us or to hear our representations in connection with it", and far from welcoming the legislation, he decried it as "a cynical betrayal of a great movement".[27]

Similarly, Ford was troubled by the formation of Sydney's pioneering metropolitan strategic planning authority – the Cumberland County Council. Ford was initially sceptical about what it could achieve without the technical expertise and knowledge of town planners.[28] When it produced its landmark metropolitan blueprint after three years, he aligned the TPANSW with real estate and other critics in blasting an expensive, heavy-handed and unsound plan that would stifle development.[29] Life member Florence Taylor weighed in with similar sentiments: it encompassed "all the idealistic considerations" but threatened "possessions and property ... without any regard for goodwill or sentiment".[30]

For whom the bell tolls

These stances condemned the TPANSW to a peripheral position on matters of planning importance. But there was one quirky and final issue in which the Association at the end of its lifespan appears to have had some positive influence: the reinstatement of the clock tower on Sydney's General Post Office (GPO). This had been deconstructed at the start of the world war two as a potential target for an air attack by the enemy. The commonwealth government (which ran postal and communications services) removed the tower and placed it, stone by stone, along with the clock and bells, into storage for the duration of the war with a promise of restoration when it was over.[31]

Sydneysiders held the government to its promise. Ford was early off the mark to declare his interest. His annual report in late 1946 reported "representations to the Post-Master General" and a guarantee of imminent reinstatement.[32] Over ten years later, no clock tower adorned the GPO. Why the delay? Had the disassembled structure been misplaced; was it beyond repair and re-erection; was it aesthetically displeasing considering changing attitudes towards architectural features; was it considered structurally unsound; or too much of a financial burden? Various explanations were canvassed as Ford and others agitated for its return to the city skyline. His passion for the tower extended to speeches in Sydney's Domain (a popular venue to preach one's particular brand of politics, philosophy or religion) demanding its resurrection.[33]

Letters to the Prime Minister, federal members of parliament, and repeated pleas published in the press carried little weight up until 1960 at which time the "Sydney Spectator" section of *The Sydney Morning Herald* appealed to the 'old Sydney-Melbourne city rivalry' and chided Sydney politicians "to stand up for their own city in Federal Cabinet … If a similar Melbourne landmark had been removed in 1942, it would have been back long ago". By this time the City of Sydney Council had jumped on board in favour of the tower's restoration with a qualification that if that scenario was not possible, it would request a "new tower".[34]

Ford dispatched at least eight telegrams to Prime Minister RG Menzies who, according to Ford, initially guaranteed the tower would be back in place in 1953.[35] The saga finally came to an end in April 1962 as Menzies declared "I am happy to tell my Sydney friends that although it is said you cannot put the clock back, we are prepared to do so with all reasonable speed". Contracts were signed and the work began a year later. By Anzac Day 1964, the clock tower's chimes rang out for the dawn service at the Martin Place Cenotaph.[36] In his final annual report, Ford jubilantly pronounced that the culmination of years of hard work on the part of the Association was its "supreme effort" and "finest hour". An image of him in the report standing on a soap box preaching to a few stray souls on a free speech Sunday is a telling metaphor of a marginalised association which had once helped shape the city's modern town planning agenda.

Other Voices in the Planning Landscape

Even by the late 1940s the TPANSW had completed a metamorphosis into a reactionary organisation as often as not standing against planning as constituting a constructively critical and informed independent voice. In 1949 Chief County Planner Sidney Luker observed that "This Association is discredited in the eyes of most professional planners in this state, in spite of the fact that many years ago it had a membership of prominent professional men".[37] This reduced influence which happened on Ford's watch can be explained by at least three major circumstances.

Plus ça change …

Although a singular achievement in surviving for over half a century, the Association never fundamentally altered its structure or *modus operandi*. There was no name change or even a dispute about the name it held from 1913. Despite the fact that there were changes in membership and leadership, there were no significant constitutional or directional changes throughout its life. It failed to keep pace with the evolution of planning theory and practice. As the world changed, the TPANSW remained static and hence was sidelined more and more in planning matters in Sydney. To view its records and hear the Association's repeated laments and its unchanging methodical approach to its organisation and operations offers one explanation for its being out of step with the planning community. Its response to failure was, surprisingly, continuity. No significant transformation or reconceptualisation of its role, methods and standing ever took place. In effect, it atrophied away from a genuine social movement capable of external reinvigoration towards a small private club and onto a personal hobbyhorse.[38]

Professionalisation of planning

The culture of planning even in the early 1940s was not radically different to the 1910s when the TPANSW was founded. There were few professional planners; planning practice was mainly a sideline for interested architects, engineers and surveyors. Nationally, only a handful in government service enjoyed professional recognition. In Sydney there was just one individual, occupying the City of Sydney Council's Town Planning Assistant position created in 1938.[39] World War Two marked a watershed as it dawned on politicians at all levels of government that the methodical organisation which underpinned the successful war effort should be applied to a raft of peacetime needs. Post-war reconstruction ideology highlighted not only the importance of proper housing for returned soldiers but correction and prevention of broader urban ills.

While architects, surveyors and engineers reactivated interest in planning discourse within their own professional realms in the 1940s, the need for a new integrative and coordinative discipline was acknowledged. Trained planners had to lead the way. In NSW, the passage of the 1945 planning act enabling preparation of statutory planning schemes was the critical catalyst sparking the growth of the new profession.[40] This irrevocably changed the climate in which the proudly amateur TPANSW operated, terminally diminishing its self-proclaimed authority and public standing.

The attrition had begun in the 1930s with the formation of the pioneering Town and Country Planning Institute of New South Wales, a forerunner of the Australian Planning Institute (now PIA – Planning Institute of Australia) organised federally in 1951.[41] Ironically, the first moves toward a professionalisation had originated within the TPANSW itself. It was mooted in 1929 by former president Dr J.S. Purdy that either a branch of the British Town Planning Institute or an Australian Town Planning Institute should be established. He believed that the Association's membership could be merged into the new Institute. A committee was appointed to investigate drafting a constitution for "further consideration".[42] Within a month it reported that formation of a NSW Town Planning Institute was timely.[43]

Soon afterward, the great Wall Street crash was felt around the globe and the idea lapsed. But in 1934 it was revived when the Town and Country Planning Institute of New South Wales (TCPINSW) was formed. A.J. Brown resigned as the President of the TPANSW on 31 May to take up the post of president of the rival organisation in acrimonious circumstances.[44] The TPANSW lost its last vestiges of professional support as the TCPINSW quickly gathered credibility by assembling a strong professional membership which included planners, architects and engineers, similar to the original make-up of the early TPANSW. One of the TCPINSW's presidents, Leslie Wilkinson, suggested a proper reply to anyone asking "who is a town planner?" would be the reply: "A member of the Town and Country Planning Institute".[45]

Rise of rival organisations

A third factor which saw the relative significance of the TPANSW slip further was the rise of other non-government organisations pursuing specific issues which sliced from the broad portfolio inherited by the Association. Such rival and indeed spin-off bodies progressively diminished the TPANSW's role as a community voice in broadly environmental matters.

The TPANSW had the field to itself for many years, and was very selective in partnering other bodies in reform causes. An early alliance was with the Parks and Playground Movement (PPM). Open space and parks presented an early and enduring concern of the TPANSW. From its first meeting in 1913, the Parks and Playground Committee boasted an ambitious agenda. Diligently they were to "report on street tree planting" and where "additional parks, reserves, or playgrounds" were required.[46] Most of the TPANSW's successes were in the tree planting arena, and selected members were also invited by local governments to report on the state of open space and parklands. As an "offshoot" of the TPANSW in the early 1930s, the PPM targeted the issue more vigorously.[47] It worked primarily towards increasing the amount of city and suburban parklands while also protesting further alienation of parks and reserves threatened by both public and private development.[48] TPANSW member CEW Bean, journalist and official war historian, was prominent in the PPM. Another affiliation from 1937 came from Ford supporting a partnership with 'concerned citizens' groups such as the Circular Quay Association (focused on the re-planning of the Quay at Sydney Harbour), the NSW Chamber of Commerce and the Haymarket Central Square Broadway Association

in establishment of the City of Sydney Progress Association in 1937.[49] At the same there were knockbacks; for example, a request from the Australian Forestry League seeking affiliation with the TPANSW in the early 1920s was refused as it "would not benefit the [Association] in any way".[50]

A major dent to the TPANSW's monopoly of community planning advocacy and action had come in the early 1920s with the short-lived Sydney Regional Plan Convention (SRPC).[51] As the name implies, its chief concern was "to outline a practical and comprehensive plan for future development; as distinct from piecemeal and unrelated improvements.[52] A metropolitan plan was an early aim of the TPANSW and GA Taylor sought subscriptions to the cause, but it was not vigorously pursued and jostled with sundry other problems on the Association's agenda.[53] Although TPANSW members sat on the Convention, the Association disagreed with its directions and methods. George Taylor drew a critical comparison between the SRPC and the TPANSW. While casting aspersions on some SRPC members as having emphatically "as little idea of town planning as of common sense", he stressed that the TPANSW was the better choice as it has "kept the public alive" in regard to the greater town planning movement.[54] Florence Taylor was equally adamant that the SRPC offered members "little or nothing … to do: unlike the TPANSW wherein "every member is useful in that he or she constitutes so much 'backing' to the council that appears to do all the work".[55]

While the TPANSW stuck to its guns, clearly it was not a lone voice instructing fellow citizens on the virtues of town planning. Other organisations worked to secure healthier housing, ensure family welfare, and protect and conserve historic buildings. On social justice issues and the family at home, the Progressive Housewives' Association commenced its operations in 1946. Within a few years it became the New Housewives Association and thereafter the Union of Australian Women. These housewives' associations advocated that the home and all its comforts were an essential aspect of 'everyday life and proper organisation'. Wartime circumstances particular galvanised its concerns and the more obvious shortages of food and housing were high on a "declaration of war" list.[56]

Countless local progress associations throughout Sydney and its suburbs also made their presence heard by appealing to local councils for support in their protestations and urgings for civic improvements and new amenities. In a rare show of organisational initiative, the TPANSW engineered formal affiliations with some of these parochial associations to arrest declining membership and thinning financial support.[57]

Arising from the need to provide protection for "the natural charms of the Municipality", the Tree Lovers' Civic League of Ku-ring-gai formed in 1927 at the home of Mrs. Annie Wyatt. This organisation was initially dedicated to the distribution of seeds and planting trees.[58] By the late 1930s, Mrs.Wyatt and her colleagues extended their interest beyond trees to the destruction of Sydney's historic buildings now under threat from redevelopment. This desecration paved the way for the founding of the National Trust in 1947 which soon became the most credible voice for conservation issues in planning in the 1950s.[59]

Formation of the Cumberland County Council with a professional planning staff meant that Sydney led the nation in having a statutory planning organisation with a local government constituency attending to local concerns, arguably a reason why there was not the same planning activism in the 1950s as other states.[60] Nevertheless, concerns with its activities and those of the state government at the outset over issues of land acquisition developed from the outset.[61] By the early 1960s a rival body was mooted as a signal to government for less negative regulation and more enlightened vision.[62]

The TPANSW's critique of metropolitan planning was mainly ideological and was less substantive than the activities of more localised and specialised protest groups. An early example was opposition to the proposed oil refinery at Kurnell at the entrance to Botany Bay. This significant protest provided some indication of the environmental coalitions to come. Member groups of the Kurnell Oil Refinery Protest Committee included the Forestry Advisory Committee, Wildlife Preservation Society, Mountain Trails Club of NSW, National Parks and Primitive Areas Council, Federation of Bushwalkers, Sydney Bush Walkers, Tree Lovers Civic League, Progressive Housewives Association, and the NSW Womens Justice Association.[63]

From the late 1960s resident action groups sprang up wherever planning and redevelopment endangered amenity, flora and fauna, and urban character.[64] Such groups constituted a new form of informed and activist environmental protest vastly different from the ideological rhetoric of the latter-day TPANSW. Professional bodies were slower to show dissent but Milo Dunphy's Environment Sub-Committee of the Royal Australian Institute of Architects led the way from 1963.[65] In the same decade, a new Civic Design Society at the University of NSW marked a renaissance in community concern for better urban design.[66] Although leading the way in community agitation over planning issues decades earlier, the TPANSW's long decline into the 1960s was accompanied by a sea-change in the rise of new forms of environmental activism.

Conclusion

In 1958, an interested citizen wrote to the *Sydney Morning Herald* alarmed at the poor state of town planning in Sydney. He raised concerns about "lack of depth in professional organisations" plus "apathy on the part of the general public – businessmen and educational bodies alike". He pleaded for change and offered a solution – revive the existing town planning association "which has been fading into oblivion for years".[67] Several years later in the twilight of that oblivion in his final report Bertram Ford looked to the future as he mourned the deaths of many of his planning colleagues and expressed the will to "hand the torch to those who follow, but right now there is much to be done, and most of us are good for at least another twenty years or so".[68] It was not to be. On 15 September 1967, Ford died of cardiac failure at the age of 87. No further meetings of the Town Planning Association took place as honorary secretary R.M. Duncan, the last remaining member, closed the books.

It was an inglorious end for a once vigorous voluntary association which had helped

shape the city's modern town planning agenda in the 1910s. But since the 1940s, the TPANSW had become almost an irrelevance in policy debates with its sole achievement being a role in the restoration of the GPO Clock Tower in Sydney's CBD.

In the history of post-war planning in Sydney, the activities of the Town Planning Association of New South Wales ultimately constitute an intriguing footnote.
It wants to be a story of pioneering community involvement in the planning process but is derailed by conservative political ideology and personal eccentricity.
The real machinations and contestations of major planning narratives of metropolitan and central city planning, housing and urban development lay elsewhere.

Foreign specialists, republican ideology and urban government (Buenos Aires, 1810-1830)

Graciela Favelukes
University of Buenos Aires, Argentina

A quick glance at a contemporary plan of Buenos Aires suggests that its layout shows a strong influence of its foundational plan. In fact, the apparent continuity of the geometrical pattern conceals many deep changes that took place along time with regard to urban form, and especially the regular grid. As it will be seen, those changes affected not only the ideas about the form the city should have, but also the methods adopted to control its growth, both from a legal and practical point of view.

Buenos Aires, like hundreds of Spanish towns in the continent, was founded according to a plan based on square units. The gradual occupation of the foundational area, and its subsequent growth, challenged the geometrical principles that were the support of the spatial and legal order of the city. The very process of correcting the alterations of the foundational patterns affected and changed the regular ideals on which this order rested as well. This paper addresses the complexity of an urban design that, maybe because of its very simplicity and long-term success, has become almost self-evident. I intend to shed light on how, behind forms apparently identical, there have been at stake very different ways of thinking and operating upon the city.

We will examine here the changes that took place regarding urban planning in Buenos Aires during the first decades of the XIX century, after the revolution and independence wars. During those years, the issues at stake comprised, along with the more general aspects of the construction of a new state, those regarding the adequacy of the city to its new status. Among other aspects, the necessary reforms for adapting the city to the grand destiny dreamed by its rulers focused in its form. This presentation highlights the shift that led from an idea of urban form based on the square block, to another one, based on a reticular grid that eventually gave up geometrical perfection.

Technical devices, professional methods and government institutions played a central part in this process. They were, in fact, of primary importance in the complex paths that were taken in order to solve the conflicts involved in the definition of urban order.

Buenos Aires was founded in 1580. The original distribution of the city comprised a rectangle formed of 15 per 9 rows of square blocks, measuring 140 *varas* in each side, facing the Río de la Plata. At the center of the long side of the rectangle, adjacent to the coast, was the Plaza Mayor. From this starting point, the city began to grow steadily during the XVIII century, thanks to the improving commercial activities and especially to the promotion of the city to the status of capital of the viceroyalty of the Río de la Plata in 1776, under the Bourbon administration. Along this period, the original layout was almost completely occupied, and a sustained expansion towards the rural periphery began. As I have shown in previous works, the process of extension of the city introduced several problems, as the rigid checkerboard was transgressed through new

occupation. Following the legal principles, the local authorities tried to recover the foundational gridiron, with only relative success (Favelukes, 2008).

Independence form Spain introduced several debates concerning the city. Not only the question of the capital city of the new territories, a controversial issue that took long decades to settle. More relevant to our problem, Buenos Aires undertook the reforms that would enable to transform it into a great city. Among the concerns of the ruling groups was the necessary improvement of the city, badly affected by the revolutionary decade, . This is the setting in which the above mentioned transformation of the urban layout began to take shape.

Part of this subject has been thoroughly studied. The origins of the gridiron or checkerboard plan have been a major concern in the literature about the American urban tradition (de Terán, 1989; de Paula *et. alt.*, 1999; Nicolini, 1997; Reps, 1965; Benévolo, 1978), considering a variety of sources for what has been called the "classic model" of the colonial Spanish city in America (Hardoy, 1991). There exist also many studies about the different solutions adopted in the foundation of towns from the XVI to the XIX century, as those by John Reps for North America, Manuel Guarda for Chile and, at a larger scale, those of Jorge Hardoy or Leonardo Benévolo. Instead, we intend to examine more thoroughly one stage along the sequence in which the gridiron continued to organize the city plan beyond the foundational moment, in order to begin to understand the non linear processes that kept changing the regular layout with time. This development took place not through a homogeneous extension of regularity, but instead through the loss of order and its many times difficult and even bargained recovery or adaptation.

We will analyze these crossroads form the point of view of the construction of technical departments and the definition of instruments that would permit an improved urban control, in which the relationship between foreign specialists and the government became relevant. Several issues were at stake. On the one hand, the form of the city and its fabric was the arena in which the frontiers between public and private were to be defined. On the other hand, that definition required a state administration endowed with technical and regulatory resources which would make possible the formation of a team of specialists with the ability to control the material construction of the city. In other words, relationships were at stake between the public and the private, between the technical and the political realms.

These problems are the subject of a renewed urban history, which articulates approaches to other fields. Among the latter, history of cartography emphasizes both the symbolic and ideological aspects of the maps and their instrumental role in the construction of the social modern order (Harley, 1997; Edson, 2001). This conceptual program has been applied –among other subjects- to the close relationship between cartography and the construction of the modern state (Buisseret,1992 and 1998; Alliès, 1980). Furthermore, history of science relates the formation of professions and technical media to the formation of state institutions, both in the territorial and urban scale (Picon, 1992, 2003; Harouel,1993; Fortier,1980; Novick, 2003). Besides, a political history

traversed by the cultural turn enlightens the significant relationships that linked political and cultural changes, particularly with regard to the political revolutions and the formation of the modern republics (Halperín Donghi, 1979; Chiaramonte, 1997; Ternavasio, 2002). In Latin America, this approach transformed the accepted views about the changes occurred in the first half of the XIX century, through the emphasis on forms of sociability, political practices and the formation of a public sphere (Sábato, 1999; Gonzalez Bernaldo,1991, 2000), aspects related to the much debated public-private question (Habermas, 1980).

This wide range of problems converges in the history of the cities. The literature brings in the possibility, and the convenience of bringing together in the analysis the processes of state construction, the transformation of the societies of the old regime into modern societies, cultural activities, and technical devices –as in the case of urban cartography, that makes possible to relate these analytical dimensions to the local and concrete practices of the construction of the city. This perspective makes possible to consider from a new angle the dilemmas of a time when the ways of thinking or operating on the city changed.

To the secular problem concerning the government of urban growth, the emancipation added the need to drive and ensure the hierarchising of the capital city, imagined as a beacon of progress and as an "Athens of the Plata". But Buenos Aires was far from those ideals, presenting a dirty and untidy aspect, with unobserved urban regulations, authorities unable both to reinforce the law and to propose and apply the legal body that would make possible to reach the "happiness of the people". With regard to the above-mentioned problems, this work sets a threefold objective. First, to relate technical practices, political ideas and urban form, in relation to the formation of the modern public and private. Secondly, to show that regularity of the urban layout is not a non-historical, almost "natural" constant; instead, I want to stress that urban regularity is a device that changes together with the political and cultural transformations that affect both the society and the city. In face of this, I propose that the achievement of the regular pattern, either checkered or reticular grid, is as much related to the changing ideas about social and urban order as it is to the technical devices which led the way to the separation of the once intertwined morphological and legal realms, and to the abandonment of the checkerboard in favor of a more dynamic and neutral pattern, made possible by the new geometries introduced by foreign professionals.

Within this framework, I examine next the paths that led to the incorporation to the government of the city of the new techniques introduced in the Río de la Plata by the newly arrived European professionals, and their role in the formation of official technical departments and other institutions. It is thus possible to shed new light on how the methods of polytechnic extraction, which were incorporated to the day to day technical practices, transformed the current methods applied to fabric regularization, thus introducing a rupture in the Spanish layout of the city, the consequences of which became clearly visible during the further metropolitan growth of Buenos Aires that began in the last decades of the XIX century.

Public offices

By the 1820s the revolution was over, independence consolidated and war with Spain concluded. After the turmoil of internal struggles, the defeat of Buenos Aires by the troops of the other provinces of the Confederation promoted an inward turn of the exercise of power in a province that resigned, for some time, to lead the destiny of the former and already fragmented viceroyalty. At this point the construction of a new legal and administrative organization started, aimed at the upraising of the local society towards the destiny of grandeur sought by their leaders.

The above-mentioned project, on the one hand, arose from the progressive incorporation by the urban elite of the modernizing conceptions of society and the individual, as analyzed by a renewed political history that contributes to improve our interpretation of the urban changes of that period (Guerra, 1992; Lempérière, 1998; González Bernaldo, 2000). Accordingly, corporations and their privileges needed to be eliminated in order to establish a new citizenship based on a modern individual free of estamental belongings. This fracture seemed more plausible in a region in which, it was thought, division in *castas* was looser than in other regions.

These ideas were at the core of the rivadavian[1] republican ideology. To achieve these aims required a series of changes and reorganizations that, impossible to undertake during the revolutionary decade, were within reach of the new provincial government that arose from the political crisis in 1820.

The large administrative and legal reform undertaken by the new political leadership implied an advance in the creation of the state, through the modification and creation of institutions (Ozlak, 1999). The optimism of the ruling groups and their publicists laid on those reforms the warranty of the illustrated and modernizing ideal with regard to social change that was identified with the changing of the city.

The objectives were clear: to put into order, to regulate, to regularize in order to eradicate the irrationality imposed to the people by the Spanish "tyrant". The means: to promote administrative and technical rationality, and to secure a regularity that would allow, in the eyes of their promoters, to switch from a reality perceived as both conflictive and contradictory to another reality marked by a rational and regular order. This ambition is clearly expressed in the idea stating that by changing the city one should be able to change society. This change would take place by gradually imposing rationality, both in the way of space regulation and in the order imposed on a wide range of processes having the city as privileged setting, from the proper arrangement of the administrative apparatus and general economic processes to the regulation of infrastructure and services.

Material regularity and procedure rationality were both sides of the same coin. The study of this regular-rational impulse –applied not only to urbanism- has flourished in the last decades, mainly in French and Italian historiography (Moracchiello and Teyssot,

1980, 1983; Tafuri, 1980; Malverti and Pinon, 1997; Raymond, 1984). The rationalizing effect of the technical procedures, and of the bureaucratic and legal bodies, studied for France by Antoine Picón (1992), has been examined for Buenos Aires by Fernando Aliata (2006), who showed how the idea of regularity presided the rivadavian urban and political program. Even though it is true that this equation was already present during the Bourbon stage, the meaning of its terms changed including new connotations and went on developing through new institutions and technical frameworks (Favelukes, 2008).

To reach a new regular and rational society required the abolition of the corporations and privileges of the Ancién Regime, as the suppression of the Cabildo and the Consulate of Buenos Aires. The consequent centralization required the creation of new administrative institutions, reform that took place during the decade first years as a new bureaucratic structure was devised, in order to promote both social and material regularity.

At first, the practical government of the city was assigned to the Police, introduced during the Bourbon period, organized shortly after as a Police Department. The new institution included both what was called "high police" concerned with crime repression, and the "low police" in charge of sanitation, population, road system, work and supply (Favelukes, 2007). This police was also in charge of the applications for building alignment and construction[2].

The objective of the authorities and the illustrated groups was the formation of a true administration –which took many features of the French model, of its organization, rational spirit and technical procedures. The new public offices introduced a reorganization of activities, reformulation of objectives and renewed methods. Thus, two new government positions were created in1821: Hydraulic Engineer and Architect Engineer[3]; the latter shortly after enlarged to a department of Architect-Engineers[4], in charge of the projects and works undertaken by the government, and of the normative and technical aspects of the road system, sanitation and building control[5]. The functions of this Department gradually increased, as it was assigned with the topographic works and the redaction of regulations referring to width of streets and roads in the capital city[6]. Eventually, it was divided in 1824, in a position of City Architect and a Topography Commission, in charge of the topography and surveying of the whole province, including its capital city[7].

The duties of this commission –a consultative commission at the beginning- were to assemble data for the province's topographic plan, approve the measurements of the plots of land, certify the capabilities of surveyors in the province, give examinations to new candidates and provide them the corresponding directions, and keep a graphic and written record of the surveys performed in the province[8]. The *Instructions to surveyors* appeared as result of the commission's work in 1825; this legal and technical piece established not only the methods to be applied, but also defined the ways to achieve a proper education in the matter. These minor professionals should adjust their practice to

that unified and state-controlled methodology regarding the supervision and arrangement of land property[9].

The ephemeral national unification, between 1826 and 1828 led –under president Rivadavia- to the creation of the Engineer-Architects and the Topography and Statistics Department, both of national operation, the objective of which were to expand the advancements performed in the city during the earlier years to the whole nation. At the end of this brief national government, the Engineer-Architects Department was again replaced by a Province Engineer, a position held first by Juan Pons and later by Carlo Zucchi, until the suppression of the position in 1836, and the transference of its functions to the Topographic Department, which lasted, even though at a decreasing level of activity, until its reorganization in the 1850s[10].

In that increasing bureaucratic organization, the new technical offices should make possible a higher rationalization in the resources and conduction of public affairs. Regulations were a key component of the republican program and show the faith that was put on rational procedures and the means thought to make them possible. Specialists were expected to make use of their observation, foresight and organization abilities to serve the government, which put its trust in the knowledge and capabilities of these specialists. It was thought that the technical specialist was the person able to forecast situations before they took place, in the same way that the geometry used in their plans and projects, that allow to draw before building, made possible to transform things in order to produce "a regular, comfortable and proportionate whole"[11]

In short, that process of institutional reformulation contributed to modernize the Spanish traditional police, depriving it of the road and construction control, which was assigned to the new offices –a process shown by Pedro Fraile (1997) in a larger scale- that incorporated the newly arrived specialists endowed of the technical resources that would introduce a new rationality into the exercise of the local authority. At the same time, these technical offices were a resonance box for political debates and were indeed factories for producing legal and technical devices, which served the setting up of the professional ranks required by the ambitious republican program, and provided the government with the plan of urban transformations that would make possible to achieve the dream of the great capital city.

Professionals

The institutional program ran into several difficulties, such as the scarcity of qualified specialists committed to the republican cause. This led to the call for European professionals, who slowly but persistently started to arrive in Buenos Aires from the time of the revolution onwards. In many cases, they were individuals from different countries in search of new opportunities. In others, they were political emigrants who had joined the Napoleon armies and who, after their defeat and the restoration of the monarchy could not return to Spain. The South American political process looked promising into their eyes, a place of both professional and ideological opportunities.

These engineers populated the technical offices, promoting improved methods for the conduction of affaires, considered as useful tools for social modernization. With their contribution, technical methods started to shift from the extant military engineering to the wider and more advanced field of the polytechnic specialties, preferred for their mastering of a rational science that was better fitted to provide the necessary universal methods and procedures.

The first decades of the century witnessed the convergence of the abilities of the few military engineers who stayed in Buenos Aires after the emancipation and of those arriving because of political reasons –as in the cases of Felipe Senillosa, José Cramer or José María Romero. Many of them were military men as well, but mastered the new mathematical and geometrical knowledge systematized in the French polytechnic model, which they put forward to serve the political cause both from the administration and from their influence on journalism and in their teaching activities, aimed at the formation of the republican youth.

The case of Felipe Senillosa is perhaps the most emblematic. Although of Spanish origin and studies at the Alcalá Military Academy, he became prisoner of the French and finished his studies of engineering in that country, and later served as military engineer in the French forces. After Napoleon's defeat he accepted the offer made to him in London by the revolutionary envoys Belgrano, Rivadavia and Sarratea, who attracted him with the possibilities he could have in the Rio de la Plata. Senillosa arrived in Buenos Aires in 1815, and performed numerous activities. He was a publisher akin to the rivadavian ideas, and put special emphasis on education of the youth that needed to be trained to occupy positions in the new government, doing so both in his public writings and teaching. He took this line of action at first in the School of Mathematics and in the University founded in 1819, and later from the technical positions he held[12]. It is known that José de Arenales and José María Romero took his lessons in geometry, lectured on the basis of the Lacroix, Monge and Durand treatises. Diffusion of these methods by teaching, but above all by means of practice in the Commission and the Topographical Department gradually promoted the ideas and practices linked to the French Polytechnic School among the local professionals, as may be noticed in the case of José María Romero. Romero was also a Spaniard, and arrived in Buenos Aires in 1815 after serving in the Napoleon Army. After having worked at the Cabildo, he held different positions in successive technical offices.

But those offices were more than a mere bureaucratic space. They were part of a network devoted to the formation of local professionals. Thus, places of work were also sites to propagate new knowledge, becoming a phase of practical formation for university students and acting as examination board for the accreditation of surveyors who were already working in the region. Aspirants applying to that profession were given an examination on "the physics-mathematical part taught at the University in the second period of Philosophy, as equally on the elements of Descriptive Geometry". It was intended in this way that even the lower rank of professionals –a fundamental piece to establish an efficient system with regard to the ownership of the private and public land- would adjust their professional practice to the most advanced criteria available, i.e.

the descriptive geometry formulated by Gaspard Monge in 1802 at the Ecole Polytechnique, now taught in Buenos Aires by Senillosa. Thus, together with the higher education in the University, the concrete, practical duties performed in the Topographical Department were responsible of the gradually spreading of the new knowledge and ways of working.

The Department was also commended to organize a document repository that would make possible to gather the topographical knowledge about the territory of the province, collecting the existing plans and forming a written and graphical record of all the surveys performed in the city and the countryside. Therefore, the Department should also be the practical arm of the government with regard to the territorial and urban policies and, moreover, the systematizing instance of the province territorial and geographical knowledge[13].

Summarizing, even though, at the beginning of the 1820s, the notion of lower police was still valid as the idea of minute government of the city, and the police still carried out some practical tasks, the formation of technical departments opened a process that aimed at concentrating the territorial conduction and at operating on the basis of a sort of knowledge that became a reference to all the others involved in urban affairs, even including the very superior authority, who believed to see in their rational abilities of foresight and synthesis the necessary basis of the territorial and urban government.

Methods

A printed topographic plan of the city of Buenos Aires was published in 1822 drawn by the military engineer Felipe Bertrés at the request of the local Chief of Police (Fig. 1). The sheet depicts a city with a rectangular shape comprising a surface of 15 by 27 blocks –almost all of them squares. Despite its small format this printed plan displayed a wide range of issues: project of street rectification and opening, widening of the city limits, division in both electoral and police districts, new street nomenclature, plan of building numeration. The latter was not included in the plan, instead, it was explained in a text that should have accompanied the plan, but was not published and is preserved as a manuscript.

Comparison of this document with the manuscript plan performed five years earlier by the also military engineer José María Manso, reveals a surprising difference, since the latter shows a much more extended city, in which the checkered layout is a reality only in the central sector, that appears surrounded by a highly irregular peripheral zone (Fig. 2). The Bertrés plan ignores that periphery by what we might call "trimming" the central area, thus generating a geometrical and regular image, which is far from matching the current situation of the city.

The authorities aimed to solve and rationalize the interior distribution of the city, especially in those suburbs depicted in the Manso plan where the gridiron order had been lost. The expression that synthesized this aspiration was to "regularize the city": to bring order into the activities, avoid abuse and disobedience, and, especially to recover

the geometry of the urban layout. This geometry, which had once been seen as the embodiment of the colonial social order, was visualized now as a warranty of an ordered society according to the new republican principles that related the political and public order to the checkered plan. Regular order, and specifically the checkerboard layout, also should act as the material and legal warranty for the determination of the much needed spatial and legal frontiers between public and private realms.

The ruling group trusted that by applying rational methods it would become possible to achieve positive results about issues in which the previous Spanish authorities had been somewhat unsuccessful. According to the general principle that in order to act it is necessary to know first, the government ordered in 1824 the City Architect Engineer José María Romero the tracing of a plan of the "suburbs" (Aliata, 2006). Upon its results it would be possible to evaluate the ways at hand for the correction of the spatial distortions and also to extend the regular grid into the periphery. As will be seen, the performance of this plan and its final failure, were the take off for the adoption of new ways to solve the complex dynamics of the modern urban growth.

The limits adopted in the 1822 Bertrés plan, had defined that inner, closed and ordered city, within which it was thought possible to rectify and align the streets according to the traditional eleven *varas* width established in the foundation. When Romero had to define the area to be surveyed, he had to revise that harmonious limit, and to redefine it exclusively according to the criterion of building consolidation. This resulted in a highly irregular line, as can be seen in the plan drawn by the Architect Engineer (Fig. 3).

Pragmatically, Romero claimed in the line project he submitted to the government, that it was not possible to establish a demarcation line having a regular shape –as that proposed in the Bertrés plan- due to the already present building distribution. He stated that the new line should only serve to delimitate the consolidated sector where substantial changes would not be made, from the unpopulated sector subjected to survey where deep modifications were thought imperative[14]. The decree approving the proposal suppressed the rectangular figure adopted scarcely two years earlier, and replaced it by a completely irregular demarcation line that highlights the first fracture in the classic geometrical tradition that had imagined until then the city as a closed and harmonic body.

Even though the survey was never concluded, its partial results were determinant. The extant preparatory sheets for the plan still allow to see, along with the methods used at the time, the way in which the actual field work led to the abandonment of the gridiron dream. The sheets show, with a high degree of detail and according to precise conventional codes, the occupation state of the sector, the delimitation between plots made of adobe walls, fences and ditches –even the most precarious housing made of mud and straw[15]. In agreement with contemporary testimonies, irregularities become more important as grows the distance to the oldest sector of the city.

The most interesting feature of this work consists of the superimposition on the built fabric of a grid of lines which depicted the extension of the central and original gridiron

into the suburbs[16] (Fig. 4). This technique allowed to visualize right away –as still does- the degree of deviation of the actual occupation with reference to that ideal tracing. The solid evidence of this test was undeniable: it was impossible to force the gridiron into the periphery. Not only because that would imply, in many cases, the total elimination of numerous buildings, but also because, even when suspicious or not trustworthy, most of the dwellers could show some sort of titles of those plots of land.

Never before had such degree of certainty as to the level of deviation had been achieved. Although previously known, the repeated norms seemed to assume that, if applied, it would be possible to repair the irregularity and to recover the lost order.

Romero's survey made clear how impossible that was, by making visible and legible a much worse reality than that known by experience and the previous plans, mainly that of José María Manso (1817). Interruption of the work in 1825 was related to the verification it allowed, that contributed to the collapse of the secular identification between order, regularity and checkerboard persistence, which had defined the lines of action of the previous authorities. The unfinished plan clearly identifies the frustrations of the regularity of Enlightment, of its confidence in the intrinsic strength of the norm and the rational order, when the overwhelming contrast between reality and the *Indias* geometrical model, recovered and given a new meaning by illuminism, became undeniable. Paradoxically, the project of social change that the ruling sector had identified with spatial change, at first attempted through a relentless recuperation of the original features and roots of the gridiron –the anachronism of which, evidently, this sector was not conscious- led to the crisis of the geometrical model.

But, simultaneously with the decay of that kind of geometrical conception, another technical solution was being developed to solve the problems of the spatial and legal order of the property in the whole city, which shows the introduction of new geometrical methods –which coexisted for some time with those already under use. Those crucial years demonstrated that the latter had no chance of succeeding; in the meantime a different, new solution was incipiently being developed.

The 1824 decree, which had set the new and irregular demarcation line, established also a new device to determine the streets width and to establish the alignment of the building fronts: it was decided to define all measurements with reference to a "central line" of the street. This line should be used as reference to separate the fronts by a distance of five and a half, seven or eight *varas*, according to the desired width[17] (Fig. 5).

This new method points out to a really important series of transformations in the handling of project, and in the ways of graphically controlling and shaping space, which should be identified as tributary to the impulse to the new geometry introduced by the foreign professionals, especially Senillosa, which was spreading through the University studies and academies. Until that time, the only tools and principles of geometrical configuration had been, first those measurement units based on the foundational *quadra*[18], and secondly the definition of street and road widths. If the deviation of a

quadra occurred, the problem appeared since it could not be established at which side the displacement of the buildings should be forced; considering especially that those irregularities were not isolated buildings breaking a line materialized in the rest of that block and the adjacent ones, but were instead repeated deviations which made impossible to recognize the required dimension and direction (Fig. 6).

The "centric line" arrived to solve all of these problems in only one step. Now a tool was available which made possible to settle these conflicting points. In face of the failure of the regular alignment based upon the beauty and perfection of the geometrical figures[19], this was the only operational method which remained available to achieve an effective control and fabric rectification, even though it implied to abandon the perfect geometrical figures. By 1826 it was already accepted the possibility of a street not having perfectly parallel sides; on the basis of the higher objective of never narrowing the existing widths and not even with the objective of making a street straight and even, it was established to "uniform the delineation of a square by equal distances, taken perpendicularly on the axis that will be determined by the two central points of its two openings, at the ends of such square, *being imperative to take the middle point when those two openings are not equal*"[20]. This is the system that was used when the extension of the foundational layout was discontinued; system that led to the formation in the outer sector of what Aliata has described as a reticule.

The method finally devised shows the prevailing tendency in the technical offices at that time, when practical administration techniques were shifting from the ideological meanings they held during the revolution to their identification with a single ideology: that of technique as a neutral instrument at the service of the state, and of the specialists as neutral arms of that state.

This neutral role became possible with this technically and geometrically based solution, which started to be used at that time and made possible the transition of a control system based on rigid and static principles, inherent to the principle of the perfect figures, to other system based too on a geometrical principle, but which made possible to dynamically solve a city growth that would no longer be impaired or fixed, and neither morphologically or ideologically led. Finally, exercise of authority over the city was oriented to impose rationality and regularity by means of a pragmatic, abstract and neutral technique which took the place of the optimistic speech of the initial stages, when changing space was thought as a way to change society.

Concluding remarks

It is possible to assert that this particular shift in the traditional ways of ruling space through classical geometry was not just the effect of a shift in the ideas of the local elite, but really the result of the undesired but inescapable evidence of the administrative and political advantages of a technical, allegedly neutral device. That is, not an ideological change, but its forced abandonment in face of the evidence of a reality that emerged, not through discourses, but through the practices of cartography and survey.

The new offices that were established in the process of state construction, the introduction of new techniques by the foreign professionals, and their application to ensure urban order, highlight one particular moment of change in the long regular tradition in Buenos Aires. Particular, because it brought forth the possibility of abandoning the squared pattern, yet keeping a regular order.

A few decades later, debates on the patterns necessary for the extension of the city, could easily dismiss the checkerboard option. Regularity was imperative, but it did not necessarily require the traditional grid made of squares. Through the more dynamic descriptive geometry, it became possible to extend the city following the existing roads, adapt urban fabric to topography, respect existing plots and buildings, and solve land subdivision without appealing to classic geometrical figures. Undoubtedly, later applications of the grid used the old layout. But its connections to the classical tradition were completely lost by then. What once had been a close identification between transcendence, geometry and social order, became a device for an entirely new political and cultural program, that of the construction of modern citizenship.

Finally, the methods we have examined –that from other perspectives might seem of minor significance- would eventually make possible to settle urban order during the crucial early years of the republic, and reveal themselves as a turning point in the modernizing of urban planning. As stated at the beginning of this article, it can certainly be said that the grid observed in contemporary plans of Buenos Aires carries along the Spanish heritage. But we have just reviewed important changes in the grid that took place at later moments. Behind that grid, then, lays a long history of regularity, of which we have analyzed here a momentous transformation.

Gated communities in SPMA: a new pattern of urban segregation?

M. Camila L. D'Ottaviano
Universidade Sao Francisco, Brazil

Gated communities

Gated communities constitute an urban phenomenon that is currently spreading through every Brazilian metropolis, as well as a topic which is being increasingly studied by Latin American specialists.

Terminology can vary according to the country or region: *gated communities* in the United States, *condominios* in Chile, *countries* in Argentina and *loteamentos fechados* or *condomínios fechados* in Brazil. These are all names for the closed residential areas which are spreading throughout almost every major western city, defined by Blakely and Snyder as "*residential areas with restricted access, where the public spaces were usually privatized*". (1995:2)

Marcuse (2002) had already pointed out that closed and segregated residential neighborhoods are not a recent form of urban of living. The existence of ghettos, citadels or enclaves can be seen throughout our history (for example, the Jewish ghettos in Venice during the 16th century).

In the Latin American context of developing countries, security is pointed to as being the central problem which gives rise to the choice of this type of residence.
In the United States, spatial segregation is usually accepted as part of an assertion of social and ethnic identities. Anglo-American Protestant culture seems to more easily accept social and spatial segregation. This is not true for Latin America. A civic culture of social integration is manifested in a socially mixed physical environment. According to Sabatini (1998) this widespread social mingling could be linked to the Catholic cultural ethos and the phenomenon of a cultural *mestizo*, or melting pot.

Latin culture defends the idea that sociability between different people can lead to greater social tolerance. The public space is thought to be the right place for socializing. The privatization of public space is thus a major issue facing gated communities in Latin American countries.

Svampa in Argentina (1994) and Ribeiro in Brazil (1997) point to rising social inequalities and social exclusion as the consequences of economic globalization, the restructuring of social relations, crisis of the State crisis, deindustrialization and growing urban insecurity.[1]

Spatial segregation patterns in São Paulo's metropolitan area

During the 1970s, the first closed settlements[2] were established on the west side of the metropolitan region. These new closed communities seemed to be a solution to the

growing problem of urban violence. These communities consisted of horizontal gated areas, located on large tracts, in suburban regions. The first was called "Alphaville" and was located in Barueri, a city in the São Paulo metro area's north-western suburbs. New horizontal gated communities began to be established in suburban cities such as Barueri, Santana do Parnaíba and Cotia, all of them originating new areas of metropolitan sprawl. These communities were established mostly in the poor and sparsely populated south and west regions

Gated communities have historically been associated with large suburban areas, upper class housing (homes with at least three bedrooms and two bathrooms), and vast expanses of green and collective leisure areas.

Gated communities, which were initially located in suburban areas and populated by the upper classes, at present are serving other social classes and have new and distinct characteristics (size and location, home sizes, collective area services, etc). An initial desire for comfort was replaced by a need for security and an attempt to gain status (Pasternak and Bogus 2003).

> "*At that moment, the appeal - more than the security of living in a gated area - had to do with the comfort of living in a place where several urban needs were met without having to cross large distances and without transportation problems. This residential solution spread to other urban areas, and vertical gated communities became a living solution for the upper class population, which, due to the increase in urban violence, began to search for new ways of living that were comfortable and safe, located in the city's higher-class areas.*"[3] (Pasternak and Bogus, 2003:12)

To understand the growing proliferation of gated communities in São Paulo and other Brazilian cities, the issue of security cannot be the only consideration, the "*status*" of living in this kind of residence must also be considered.

According to Pasternak and Bogus "*there is also the search for status (…); in contemporary society people are distinguished by their consumer capacity, as a dimension that involves projects and life style.*" (2003:13)

According to Caldeira, (2000:211) during the 20th century social segregation was expressed in three different manners within the urban space of São Paulo.
The first lasted from the end of the 19th century to the 1940s, producing a concentrated city divided into different social groups compressed in a small urban area and segregated by residence types.

The second urban form, the center-suburban type, prevailed as a form of city development from the 1940s to the 1980s. During this period different social groups were divided by great geographic distances: the middle and upper classes were concentrated in central areas with good infrastructure and the lower-income classes moved to distant suburban areas which were impoverished.

During the last fifteen years, a new urban form has been configured and is now changing the city and its regional metropolitan configuration. When comparing the *rich center* X *poor suburbia* pattern, recent changes are creating spaces where different social groups are sometimes very close to each other but separated by walls and security technologies. These groups have no social contact and do not use the same public areas. This is what Caldeira calls "*fortified enclaves.*" These are privatized spaces for living, working, leisure activities and consumption. They are closed and controlled spaces for people who don't want to divide public spaces with the poor, marginalized or even homeless inhabitants of the city.

In much the same way as Caldeira analyzes São Paulo, Sabatini (1999) advocates a change in residential segregation patterns for Santiago, Chile, from a macro scale to a micro scale, from a center-suburbia to a "fractal" model.

Gated communities are meant to be secure and comfortable residential areas where the quality of life is better and there is social homogeneity. They consist of neighbourhoods closed off by walls, barriers, fences and gates. They are designed with the intention of providing security to their residents and preventing invasion by non-residents, through the use of security devices (guards, doors, barriers, alarms and cameras).

Since the 1980s, there has been a noticeable increase in the number of gated communities within São Paulo's Metropolitan Area. In 1994, the "*Lei de Vilas*" (Vilas Law) enabled the indiscriminate installation of small gated communities within every residential area of the city of São Paulo.

Gated communities in São Paulo's metropolitan area

A walk around some of the areas of the city of São Paulo, and even around some of the other cities in the metropolitan area, allows to see that there is noticeable evidence of an increase in the number of new residential gated communities and communities under construction.

Research of the databases at the Embraesp (Brazilian Company of Asset Studies - Empresa Brasileira de Estudos de Patrimônio) of all residential construction in the São Paulo Metropolitan Area (SPMA) since 1985 shows a notable increase of this kind of neighborhood.

Noteworthy first and foremost is that gated residential communities only began to be built after 1992. Since 1992, SPMA has concentrated a total of 1140[4] new horizontal gated communities. These communities are not homogeneous and efforts are needed to analyze their specialties.

Analysis of the following tables and maps makes it possible to understand important issues about São Paulo's residential gated communities.

The first communities were constructed in 1992. In the first three years, from 1992 to 1994, there was less construction (4, 17 and 12 respectively). Between 1995 and 1999, construction of new communities increased; but it was only after 2000 that the number of gated residential communities became significant in the context of the SPMA.
In Table 1, there is a noticeable increase in gated horizontal communities among the total numbers for real estate construction since 1985. If in 1992 gated communities represented only 2% all housing built, in 2004 they represented 35% of all residential construction. Although gated communities have become more and more important since 2001 in the metropolitan real estate market, in 2005 their overall construction decreased substantially (from 236 in 2004 to 87 in 2005).

A large part of the 1140 communities built (65%) were built between 2001 and 2004. It is worthwhile to look at the location of these communities: 83% of them are in the capital (the city of São Paulo). Half of all of the gated communities' residential units are within the capital. This large concentration can be seen in Table 2 and also on all of the following maps.

The SPMA is made up of a group of 39 municipalities. Table 2 shows all of the metropolitan cities possessing gated residential communities. From a total of 39 cities, only 19 have gated communities. Even among these only seven cities have more than 10 gated communities. Of a total of 1,140 communities, 949 (83%) are within the city of São Paulo.

According to Brazil's 2000 Census, the city of São Paulo held 58% of the metropolitan population. The concentration of residential construction in the city is compatible with a concentrated demand and also indicates that the capital is leading in real estate investments. This concentration shows that even with recent urban sprawl the capital is still the center of the metropolitan residential real estate market.

To analyze the residential typology of the gated communities we will use the number of bedrooms and the number of bathrooms of residential units.

An analysis of the number of bedrooms in all of the gated communities built shows a major concentration of 3 bedroom units (40.3%), followed by 2 bedroom units (37.5%). Homes with 4 bedrooms total 21.8%. Homes with 1 bedroom (only three) and 5 bedrooms (only one) are insignificant.

Table 3 shows the distribution of community construction by number of bedrooms per year. Until 1998 the number of bedrooms was not very representative. Since 1999, units with two and three bedrooms have made up the bulk of gated community housing. Two bedroom units were more representative between 2000 and 2001. Since 2003, with 3 bedroom units have been on the rise.

MAP 3 shows the construction according to the number of bedrooms. Houses with two (green) and three (blue) bedrooms are dispersed among all areas. However, three bedroom units are especially concentrated around the central district of the capital. On

the other hand, four (pink) bedroom units are quite concentrated in the southwest region of the city.

Of the 249 total units with four bedrooms, 202 are located in the southwest region of São Paulo, especially in the Santo Amaro, Brooklin, Morumbi and Alto da Boa Vista neighborhoods; 10 are in the north zone (Tremembé), 9 in the west zone (Mooca and Lapa), 4 in the east zone (Vila Carrão), 12 in Cotia, 8 in Guarulhos, 3 in Alphaville (Barueri), 2 in São Caetano do Sul and 1 in São Bernardo do Campo.

Out of 1,140 launches, 33.7% have only one bathroom and 40.8% have two bathrooms. Units that have three or more bathrooms represent only 25.5% of the total. Until 1998, the number of bathrooms was not an important characteristic. Since 1999, one and two bathroom units were predominant. Since 2003, units with 2 bathrooms became more representative, concentrating a larger number of gated community units.

Units with only one bathroom represent almost half (49.6%) of the total. Units with two bathrooms account for 37.1% of the total, while units with three or more bathrooms represent only 13.3%.

Map 8 shows construction according to the number of bathrooms per unit. Units with only one (orange) bathroom are located mostly in the northern, eastern and extreme western regions of the capital and in several other municipalities. Units with two bathrooms (green) are dispersed among all areas of the capital and other municipalities, while those with three (blue) bathrooms are dispersed, yet slightly concentrated in the southwest region of the capital.

The units with four (pink) bathrooms are extremely concentrated in the capital's southwest region. Of the total of 138 four bathroom units, 7 are in Cotia, 1 in Alphaville, 1 in Guarulhos, 5 in São Paulo's north zone, 1 in the east zone, and the remaining 123 are in the southwest region of the capital. This area concentrates a highly-educated population with high levels of income.

In order to identify the main residential typology in São Paulo's Metropolitan Area, an analysis comparing the number of bedrooms and the number of bathrooms was done. Table 4 shows the units rates according to quantity of bathrooms and bedrooms. Units with 2 bedrooms and 1 bathrooms (medium standard) represent almost half of the total, concentrating 43.7% of all units built. Housing units with three bedrooms and two bathrooms (low pattern) represent 29.2% of total. Finally, units with four bedrooms and four bathrooms (high pattern) concentrate 5.9% of the total.

Usually residential units have more bedrooms than bathrooms. Only those units aimed at high income classes, containing four bedrooms, have the same number of bathrooms.

Maps 5 (2 bedrooms and 1 bathroom), 6 (3 bedrooms and 2 bathrooms) and 7 (4 bedrooms and 4 bathrooms) show the location of the three major typologies in the SPMA.

Gated horizontal communities with 2 bedroom and 1 bathroom units (Map 5) are mostly concentrated in the east zone of the city of São Paulo and other suburban areas (north and west) and among some other municipalities, such as Guarulhos, Mogi das Cruzes, São Bernardo do Campo and Cotia.

As shown by Map 6, 3 bedroom and 2 bathroom units are concentrated in the east and north regions, around the expanded central area and in the extreme western region of the capital. The presence of this type of gated community in the other municipalities of the metropolitan region is almost the same as the low-cost housing.

Map 7 shows that almost all of the units with 4 bedrooms and 4 bathrooms (92%) are located exclusively in the southwest area of the city of São Paulo. Of all 138 releases, only 4 are located in the north zone, 2 in the east zone and 2 in the the extreme western zone of the capital in addition to 1 in Guarulhos, 1 in Barueri and 1 in Cotia.

Preliminary conclusions

In the period between 1992 and 1995, 1,140 new horizontal gated residential communities were built in São Paulo's Metropolitan Region. The amount of communities built is impressive, especially in 2003 and 2004, when 437 new gated communities were released.

From the perspective of the metropolis, the city of São Paulo concentrates 83.2% of all construction. São Paulo and the other 18 municipalities of the SPMA (about half) also have gated residential communities. The maps with the location of metropolitan gated communities show that the municipalities situated in the most suburban areas (north, south, east and west) of the metropolis are the ones that are not targeted by this specific real estate market.

In the city of São Paulo, the "Lei de Vilas" (Vilas Law)[5] was passed in 1994, enabling indiscriminate installation of small gated communities (in the old "village" style) in every residential area of the city. This can explain the high concentration of gated communities in São Paulo's municipal area.

These "villa" areas sprawled into all municipal areas, including the city's east zone, which is usually thought of as a low-income neighborhood.

In the east zone very small gated communities can be found, with small residential units, usually with no more than two bedrooms and one bathroom.

On the other hand, there are also some high-income gated communities in the east zone of the city of São Paulo although it is historically recognized as a low-income neighborhood.

The conclusion to be drawn is that residential gated communities can no longer be associated with suburban areas, upper class housing or large tracts of urban land.

Two questions need to be underscored: with the sprawl of gated communities at least inside São Paulo's municipal area, do the gated communities represent the fractal segregation model highlighted by several authors?

And, regarding low-income gated communities: can the homeowner of these small residential units afford the price of the security apparatus usually associated to gated communities?

---

[1] As noted by Castells and Mollenkopf (*Dual City* – 1991) social fragmentation leads to urban fragmentation. See also Friedmann 1997 and Sassen 1996.

[2] In Brazil we have two different kinds of gated residential areas: closed settlements (a regular settlement closed off by walls after the lots were sold) and gated communities (residential areas that include already constructed homes).

[3] This text refers to the establishment of the first vertical gated community in São Paulo in 1973 – Condomínio *Ilhas do Sul*, in Alto de Pinheiros.

[4] All data about gated communities in the São Paulo Metropolitan Area is from the databases on enterprises from the EMBRAESP (Brazilian Company for Asset Study).

[5] Law n. 11.605 from July 12, 1994. "Art 1- Paragraph – The horizontal residential complex type R3-03 is constituted by isolated habitational units, grouped, townhouse or superposed, in gated communities, located in areas that admit their residential use. / Art. 2 - The horizontal residential complex type R3-03 can only be established in lots or tracts with an area equal to or lesser than 15,000 m²."

'Skin-deep' Making and planning culture in two New Zealand urban settings

Elizabeth Aitken Rose
The University of Auckland, New Zealand

Introduction

'Culture' and its blood relative 'creativity' are much in vogue in today's policy discourses. They are acclaimed as the new drivers of economic prosperity; catalysts of social wellbeing and reconciliation; botox for urban wastelands, yet pivotal to sustainability; and the essence of an exciting, perhaps terrifying, post-modern, post-industrial era. Both terms are applied with a lissom and luxuriant optimism to everything from works of exceptional talent through to the quotidian atmospherics of the workplace or the street; and used with so much abandon that some may now consider them hackneyed, debased and devoid of useful meaning. As Tusa observes of 'creativity' (and this might easily be extended to include 'culture'):

> Stripped of any special significance by a generation of bureaucrats, civil servants, managers and politicians, lazily used as political margarine to spread approvingly and inclusively over any activity with a non-material element to it, the word 'creative' has almost become unusable[1].

Culture, rhetorically at least, has moved from New Zealand's policy margins over the last ten years, encouraged by a more receptive political climate and influenced by overseas fashions and advice from consultants on the international culture/creativity circuit[2]. This has been reflected in the revision of institutional frameworks, notably at the local level where culture is specifically identified as one of the interlinked constituents of sustainability, now the paramount purpose of local government - to be fostered through the promotion of cultural, social, economic and environmental wellbeing. Interest in urban affairs and design has also grown at all levels of governance, with connections drawn between cultural dynamism, quality of life, and civic prestige.

After a review of the evolving orthodoxies of urban cultural policy, which posit an important role for local governments in the identification and mobilisation of cultural assets and capacities, this paper aims to explore the degree to which this shift has substantively changed attitudes and practices in selected New Zealand cities. In particular, it examines how cultural enterprise is (or is not) nurtured and enhanced through local government planning and policy initiatives and processes. It does this through the methodology of two historical case studies, drawing on archival and policy documentation, along with interviews with stakeholders. The first focuses on the revival of a heritage townscape in Napier[3] and the second on the development a creative arts-based event in Nelson[4]. Arguably both provide insights into the *realpolitik* of cultural policy and practice in the New Zealand urban context - and perhaps elsewhere.

'The cultural turn'

Most works on culture – and many on creativity – begin with an attempt to unpick etymology and show how concepts underpinning the terminology have evolved in conjunction with shifting currents in the history of ideas and popular usage. Over the twentieth century the usage of culture (and creativity) moved from Eurocentric romanticised, idealised and evaluative conceptions of human perfection and civility or, in the case of creativity, the production of something without precedence - usually connected to an especially gifted individual - to looser all-encompassing conceptions deemed to be more democratic and egalitarian. The "omnibus conception"[5] of culture draws on anthropological definitions as "ways of living", reflective not only of enlightened advancement and elite, often abstruse art forms, but also of everything "material, intellectual and spiritual"[6] held in common by a particular human group. Culture was also "ordinary" and found in the "known meanings and directions" of tradition conferred through socialisation and heredity; and in "new observations and meanings"[7] produced through discovery and ingenuity.

Arguably cities are a fusion of culture and creativity congealed and inscribed; stages for the drama of social life; and crucibles of human ingenuity; and 'great' cities, according to Hall, are those led with vision and flexibility, where cosmopolitan ways of living flourish in an atmosphere that ignites the "sacred flame of the human intelligence and the human imagination"[8] Today, however, it is also argued that culture is their business mainstay. Goods and services are increasingly imbued with symbolic and aesthetic values; and cultural products and ambiences are appreciated as significant sources of wealth and competitive advantage[9]. Central to this is the perceived dynamism and potential of the creative industries - agglomerative enterprises that commercially develop and profit from individual creativity such as screen and music production, architecture and design, performing arts, digital media, fashion, advertising etc. Furthermore, there appears to be a correlation between quality, vivacious, edgy places and congregations of creative professionals[10]; and cultural producers, particularly artists, have been identified as important agents in urban regeneration and re-imaging[11]. Cultural tourism is a rapidly expanding niche market, with affluent travellers seeking unique and authentic experiences of people and place through savour of the arts, heritage, architecture, festivals, food and ethnic lifestyles etc.[12]

Rather than as a public subsidy sump, culture was re-forged in the 1980s as a strategic economic development instrument. Policy stances (often involving partnerships between levels of government and the private sector) have favoured cultural consumption, or cultural production, or a hybrid of the two[13]. Outmoded and rundown townscapes have been refashioned into 'consumption landscapes' featuring iconic architecture, new or refurbished cultural infrastructure, funky downtown apartments, and 'festival markets' - to attract more investment, skilled workers, tourists and shoppers. Sustainable cultural businesses have been nurtured through networking, workspaces, venture capital, business support, copyright protection etc. The British consultancy Comedia has taken a leading role in promoting a more holistic and integrated agenda

emphasising the revitalisation of the public realm, social inclusion and wellbeing, along with employment and wealth generation where economic development is combined with urban design, community cultural development, transportation and retailing policies etc.[14] 'Creativity' is championed in 'creative city' methodologies aimed at replicating 'creative milieux' through cultural quarters, clusters, altered mind-sets and institutional innovation[15].

The 'creative city' is recent mutation of the 'cultural planning' concept, endorsed by Comedia and others as an innovative, strategic, collaborative, place-based, democratic process for marshalling cultural resources (tangible and intangible, traditional and emerging) to tackle the complex problems of globalisation, suburbanisation, sustainability and social schism. The term is loosely employed but generally implies the assimilation of cultural perspectives into mainstream local government policymaking, where the cultural field is framed in all embracing, interconnected "omnibus" terms[16]. It is advocated as an enriching, reflexive, ethical and even radical alternative to current planning practice, which in Young's view, at least, is "in the throes of a paralysing identity crisis…shrinking…at the very time culture is expanding." [17]

New Zealand's 'cultural turn'

Cultural policy was traditionally deemed a central government responsibility in New Zealand until relatively recently and, with the exception of education, little more than a nicety extended to high arts patronage and heritage conservation (delivered through autonomous crown entities established mid-twentieth century and thereafter poorly resourced). Although culture was not considered a mainstream local government concern there was an implicit understanding that facility provision was a local responsibility and many local authorities invested in libraries (generally their most substantial expenditure), community halls and museums -financed through rates and fund-raising. Although a few of the larger urban authorities began to appreciate the economic benefits of culture towards the turn of the twenty-first century – notably New Zealand's capital Wellington - the prevailing mentality saw culture not as an asset, but as welfare; and cultural planning, where it existed, was largely geared to facility management[18].

The stature of culture altered when the current Labour Government came to power in 1999 and the Prime Minister symbolically assumed of the role of Minister of Culture and Heritage, restructuring the portfolio around national identity, artistic excellence and economic development goals. In 2002 the Government identified the creative industries as one of three key national economic growth sectors targeted for special assistance. Culture was made an explicit local government concern in the Local Government Act 2002, which gave councils greater policy discretion generally and obliged them, in partnership with central government, business, voluntary agencies and individuals, to promote sustainable development through integrated strategic ten-year Long-Term Council Community Plans (LTCCPs) based around an agreed set of 'community outcomes' developed through local consultation. The statute is not prescriptive – the constitution of culture is a matter for the community to decide - but guidance provided

by national agencies favours a comprehensive definition. First generation LTCCPs were produced in 2006. A review of a selection revealed that most councils equated cultural wellbeing with the unique character of their localities and sought to establish competitive advantage through branding; few successfully integrated the four domains of wellbeing; or demonstrated consistent linked engagement with other levels of government and outside agencies.

The New Zealand Historic Places Trust (NZHPT) is the national body primarily responsible for the identification and retention of physical heritage, but local authorities play a critical role in heritage protection through environmental planning processes laid down in the Resource Management Act 1991 (RMA)[19]. This empowers councils to draw up local registers of heritage buildings and places, and regulate to ensure their qualities are preserved.

The following case studies illustrate the evolving relationship between local government and cultural enterprise in two provincial cities embedded in regions recognised for fine landscape, abundant produce and clement weather - attractive to tourists and retirees. The first case exemplifies the 'traditional' dimension of William's cultural conception, and the second the 'new' and ingenious.

The Napier Art Deco Trust

The force 7.8 Hawke's Bay Earthquake of 1931 is New Zealand's worst territorial disaster[20] and the city of Napier's master creation narrative. Whilst catastrophic at the time in terms of life and property (fire destroyed the central business district in a matter of hours), seventy-six years later it is regarded as having beneficially delivered a unique opportunity to rebuild where "the faults of the past could be avoided", along with four-thousand acres of uplifted estuarine land for town expansion[21].

Most of the central business district was rebuilt within two years of the earthquake, notwithstanding the economic privations of the Great Depression and laissez-faire political climate. Although these circumstances inhibited the realisation of more radical visions and urban reforms, the 'New Napier' was notable for its modern 'Art Deco' architecture, waterfront beautification and suburban extensions:

> …government, professionals and individuals…went far beyond the need to provide basic shelter or commercial accommodation…to create out of adversity something of great beauty, which has survived as a heritage of distinctive value and as a site of national and international significance[22].

Napier's Deco is, in fact, an eclectic mix of modern architectural styles and influences, given an antipodean twist through the use of vernacular materials and indigenous motifs. The four local firms, 'Napier Associated Architects', who collaborated to rebuild the town, favoured this mix. 'Art Deco' also conformed to national building codes promulgated after the earthquake (reinforced concrete, integral minimalist decoration and height restraint). It was relatively inexpensive and appealed to the Depression - and

disaster - jaded popular imagination for its progressive optimism and 'Roaring Twenties' associations. That it survived to achieve "national and international significance" can largely be attributed to the passionate tirelessness of Napier's Art Deco Trust and - initially - to the discerning eyes of outsiders.

What charms one generation is habitually shunned by the next. Deco buildings were being demolished from the 1960s to make way for tower blocks, the new symbol of urban advancement and prosperity. At the time there was slender interest in the preservation of the mundane, utilitarian, or recent past. Apocryphally Napier's special qualities were first noticed in the early eighties by a group of European experts who switched attention from the imposing colonial mansions on Napier Hill, to gaze down upon the concrete town and pronounce it the real "treasure"[23]. It was remarkable, not for singular buildings, but for the stylistic coherence of the townscape and idiosyncratic interpretations of an international architectural movement.

This prompted the Ministry of Works and Development[24] to commission a catalogue on Napier's Art Deco to raise awareness and encourage the community to preserve its 'unique' architecture[25]. In 1983 the Hawke's Bay Museum & Art Gallery mounted a photographic exhibition based on the catalogue, extending it to include images from the nearby town of Hastings, which had also been reconstructed following the earthquake, predominantly in the Spanish Mission style. Following the demolition of another outstanding Deco building, a small number of cultural enthusiasts formed the Art Deco Group to promote preservation by educating the public and local government about the value of its heritage, not only for its intrinsic historical and aesthetic values, but also its significance as a tourist asset. It produced an Art Deco Walk leaflet and premiered *Newest City on the Globe,* a surrealist television documentary made by New Zealand writer Peter Wells. This attracted substantial public interest and was seen as:

> …a watershed for the group, and of course for heritage preservation in Napier – the city that always thought it had no heritage. It inspired the members of the Art Deco Group to commit for the long haul because they could see that here was a once-in a life-time opportunity to put their city not just on the map but on the globe, but also a ground swell of popular support that would make the task much easier to achieve[26].

The Group organised guided walks, unsuccessfully opposed another demolition, developed Deco merchandise (sold in the Museum shop), sponsored architectural publications, and networked with art deco societies abroad. The NZHPT designated an area with the highest concentration of quality Deco buildings a Heritage Precinct in 1985. This provided statutory recognition of the quarter's significance, but protection was only accorded to individual buildings scheduled in the NZHPT register. Whilst Napier City had the power to act independently, it merely replicated the NZHPT list in its plan at the time. The NZHPT designation did prompt the Council, however, to conduct a study of the inner city in 1986. Art Deco Group submissions argued, inter alia, that a building inventory be made and measures introduced to encourage sympathetic

development, along with restoration and maintenance assistance. The response was disappointing[27].

The Group was incorporated as the Art Deco Trust in 1987 under the presidency of Museum Director Robert McGregor. Its objectives prioritised the promotion of Art Deco tourism, maintaining the commercial viability of the buildings, establishing a register of buildings and public education[28]. In 1988 it initiated annual Art Deco Awards and held an 'Art Deco Weekend' in 1989. From small beginnings designed to generate civic pride, fun and an understanding that Art Deco was more than old buildings, this weekend event (now biannual) has grown into a major tourist attraction for the city and region. With the assistance of students and some Council support, the Trust prepared an inventory of Napier's Deco Buildings[29] and collaborated with the Council on a design guide. In 1992, after preparing a business plan, the Trust secured NZ$54,000 from Council to appoint McGregor as a full-time paid director and establish its own premises (including a shop). The Trust continues to receive this sum from the Council. In Council rhetoric, a "grant", in Trust rhetoric "a payment from the Napier City Council in return for the Trust's promotional, tourism and preservation services to the City"[30]. In 2007 this constituted 11% of the Trust's income, with 29% coming from retail sales and 24% guided walks. Twenty-three thousand people took guided walks in 2006/7[31]. The guides continue to be trained volunteers. Over the years the Trust has produced or encouraged a substantial literature on local history and architecture, and provides guidance to developers and building owners' renovation and maintenance. It now employs a staff of five including a full-time events co-ordinator and in 2005/6 its turnover was NZ$1.6million[32]. In 2006 it commissioned an independent consultant to undertake a local economic impact study which estimated Art Deco tourism had a direct economic impact of NZ$11million and NZ$23million counting indirect[33]. In 2007 the Government nominated the Deco Precinct to UNESCO as a potential World Heritage Site.

Although Napier now brands itself the 'Art Deco City', Council has been slow to develop policy safeguards, at least in the view of the Trust, which has relied on public persuasion, believing statutory planning mechanisms provide limited protection at best[34]. Napier's District Plan (proposed in 2000 and operative in 2007) acknowledged the Deco Quarter in the local planning framework for the first time, but special regulations apply only to signage, and individual listed buildings (requiring consents for alteration or demolition). The Art Deco Trust believes that the signage regulations are not enforced. A senior planner confirmed this, attributing it to resource shortages and a failure of political will (when put to the test), but thought it an advance that "rules were in place"[35]. The Council has also introduced special development controls for a suburban Deco neighbourhood, provides modest painting grants for building owners, and funded a part-time 'Deco Ambassador' out of the city promotions budget. Despite the collapse of resolve over signage, Council officers consider that heritage is a political priority, particularly given the World Heritage nomination. Heritage consultants completed a study of the precinct in 2005 that is expected to provide a basis for a review of District Plan heritage provisions described as "a gradual evolving process"[36]. The ad hoc heritage listing of earlier years has been replaced with a formal process. Every building in the precinct is now being researched, graded according to significance, and

registered if appropriate. The LTCCP[37] lists nine Community Outcomes. "Communities that value and promote their unique culture and heritage"[38]is last on a prioritized list with health and safety (considered environmental wellbeings) at the top and social and cultural wellbeings (collapsed together) at the bottom. Art Deco heritage is identified as a key cultural and tourism asset, and an environmental issue in a strategic priority to offer citizens and visitors lifestyle opportunities. Elsewhere it is nominated as a national and international point of difference, with Council support for the Art Deco Trust, restoration incentives, education and funding to improve signage mentioned as key initiatives. It is left to an obscure cultural policy, prepared by a consultant for Council's community development division, to define cultural wellbeing[39]. While this covers "leisure, cultural heritage, contemporary arts practice, cultural diversity, built in environment and creative industries"[40] the policy is restricted to art (largely public art) and heritage, where working with the Art Deco Trust is an ongoing priority.

Gradualism and pusillanimous enforcement frustrate the Trust. Like many of the implementation partners nominated in the aforementioned cultural policy, it seemed unaware of the policy's existence and cynically dismissed it as another "cut and paste" council document[41]. Despite the Trust's 'partnership' role, there is little ongoing interaction. Meetings are rare and letters go unanswered. It finds Council officers conservative, bureaucratic and incapable of being entrepreneurial. Although Art Deco weekends generate local 'buzz' and income, and are politically celebrated as a community event, the Trust continues to carry the risk and is obliged to pay for many council services such as traffic management plans. Undoubtedly there is some ambiguity and tension in the multiple roles of the Trust: as heritage activist, 'partner', preserver and tourist service provider. It does, however, have the advantage of focussed purpose and its achievements are considerable, reflecting shrewd and tenacious leadership backed by a high level of volunteerism. In twenty years it has reconfigured Napier's identity, developed viable tourist ventures, and engendered civic pride. Whilst the City Council may now have the same objectives, policy development has been reactive, sluggish and remains fragmented and uneven in implementation. It is constrained, according a city councillor, by its broad remit, lack of finance (there is a local resistance to rate increases) and statute (planning legislation deemed a particularly "blunt instrument")[42]. It remains to be seen whether the City can develop a robust protection framework capable of withstanding the vicissitudes of fashion and the market. In the eyes of another outsider, British travel writer Duncan Fallowell, it still has far to go:

> This art deco thing – they are not taking it seriously. They think conservation is a matter of printing brochures…the iconic Gaiety de Luxe Cinema…all that remains is the outdoor Moorish balcony with a round-headed window; the rest has been chopped up into a café, a model railway exhibition and a Two Dollar Shop[43].

The Nelson World of WearableArt

From Art Deco Napier, attention now turns to the WearableArt of Nelson. Described as a "No 8 wire story of creativity"[44], the Montana World of WearableArt™ (WOW) Awards

began as a one-off fundraiser for a rural art gallery co-operative near Nelson in 1987. Held in a tent, it attracted two hundred people, and sponsorship of NZ$1,000 from a local café owner[45]. Twenty-one years later WOW is staged annually over a season of ten shows in an auditorium on the waterfront in New Zealand's capital Wellington. Audiences are now around thirty-five thousand and the event attracts sponsorship from prominent national and international corporations, as well as government agencies. Mini-shows have been held abroad and the event is touted as reflecting "the colour and personality of New Zealand…into the 21st century"[46].

The event continues to be directed by its creator, sculptor Suzie Moncrieff, and managed by a private company, which superseded the non-profit incorporated society of earlier years. With a permanent staff of six women (including Moncrieff and her sister) the company is still Nelson-based in offices and an art department in the 'World of WearableArt and Classic Cars Museum' complex[47]. This improbable combination was a multi-million dollar joint venture between WOW and a Nelson family food-processing business, which largely financed the project and provided the cars[48]. The museum showcases WOW's historical collection, attracts fifty thousand visitors a year[49] and when it opened in 2001 appeared to dispel local fears that WOW "would outgrow its Nelson roots …Something unique to Nelson has been made secure"[50].

Wearable art, per se, is not unique to Nelson. It has its origins in the artistic adornment of human body and ritual, both cultural universals. Wearable art (artwear or body art) as an artistic genre has a less certain pedigree and sceptics doubt that it is an art-form at all: "'wearable art'" is a double misnomer since the stuff on display is neither wearable nor art"[51]. Leventon[52] traces it back to nineteenth century English Arts and Crafts and the American sixties counterculture movement when female artists used it to confront the patriarchal dictates of fashion, mass production, consumerism, and the art establishment. She sees it as an "art of materials and processes" existing "at the intersection between art, craft and fashion. It is of all three, but wholly owned by none of them"[53]. WOW claims that its 'WearableArt' is unique in that it not only "takes art of the wall", but "out of static display"[54]. It combines visual and performance art in a competitive, choreographed theatrical spectacle involving dance, music and sophisticated lighting effects. Although dismissed by the local high arts establishment as pandering to popular taste and the media as "evidence of a culture rendering itself impotent"[55], it became a major tourist attraction and focus of civic pride in Nelson before it 'out grew its roots' and left for Wellington in 2005.

Moncrieff's philosophy is inclusive. She argued Feeney missed the point by failing to distinguish between the artistic merit of the garments and the "unashamedly" populist show in which they were presented[56]. WOW blurs boundaries of: art, craft and fashion; professionalism and amateurism; the eternal and the ephemeral. The competition is open to anyone and while many of the entries come from artists and designers a professional background is not essential. The company has worked in partnership with tertiary institutes and secondary schools recognising "they are the nursery of new and cutting-edge art"[57]. The event now attracts entries from overseas designers, with a third of the garments in the last show coming from abroad[58]. Garments must be 'wearable'

and a certain size, but can be constructed from any material or technique and do not have to be serious, practical or commercially viable[59]. The event is themed in categories around the awards (over $NZ100,000, substantial by New Zealand standards) and throughout its Nelson period relied on a high level of voluntary support – models, dancers, dressers, ushers, makeup artists, sound technicians etc. - were recruited from the community. Forty percent of a crew of four hundred and fifty were paid in 2004[60]. The competition gives the artists media exposure and, according to WOW's[61] publicity, has launched numerous successful creative careers.

The character, growth and success of WOW owed much to the cultural traditions, mentalities, enthusiasm and ownership of the people of Nelson[62]. It became a flagship event, stimulating associated activities such as the Council backed Arts Festival (initiated in 1995) and contributing directly and indirectly to the development of regional tourism and creative industries.

The decision to move to Wellington was triggered by a 2003 economic impact report, done by independent consultants commissioned by WOW drawing on funding from central government's economic development agency. This showed the event brought in NZ$6.5million and nine thousand visitors (seventy-eight per cent of whom said they would follow the show elsewhere) into the region, with retailers receiving forty-three percent of the benefit, and restaurants and cafés twenty-four percent[63]. WOW claimed it did not intend to shift at this time, but the consultants advised it to seek an alternative location if it wished to grow and subsequently brokered a confidential five-year deal with the Wellington City Council, providing financial support for a venue, marketing and awards; paid out of the City's NZ$1.5million event-development fund (a fighting fund set up after the city failed to secure several sporting events)[64]. The City agreed (claiming this was unrelated to the WOW deal) to spend NZ$6.9million to upgrade its waterfront events centre[65]. At this time Hervey says WOW received NZ$40,000 from the Nelson City Council, NZ$37,000 of which went back to the Council for the rental on the Trafalgar Centre, the basketball stadium used to stage the event since 1990. In addition Nelson made a one-off payment to upgrade seating following pressure from WOW, but rejected requests for other facility improvements or for financing an economic impact assessment. The Tasman District Council (the other administrative and geographically larger rural authority in the region) offered no support on the basis that commercial or tourist activities were not core business[66] although its LTCCP counts tourism as one of four leading economic sectors in the region and its website insists that it has one of the largest regional counts of professional artists that, along with lifestyle, create the area's distinction[67].

WOW acknowledges that the support it received from Nelson City was invaluable in its early phase. From the outset, however, it was treated as a community service, rather than as a viable economic prospect. WOW is reticent about whether it was perceived as a women's business pandering to women's interests and consequently marginalised. Anecdotally, however, allusions were made to the patronising chauvinism Moncrieff received from local politicians, with mayor Peter Malone (1980-1992) reportedly dismissing an early WOW development proposal with "Girlie, I think the best thing you

can do is leave town"[68]. There is an enduring frustration that the Nelson Council persistently saw the contribution it made as a donation rather than an economic investment and leverage opportunity[69]. Both Nelson and Tasman did not consider it their role to support a commercial operation and the City would annually inspect WOW's books to ascertain that it was making no more than a modest profit: "council did not want us to make money, so at the end of the day we were a private company that was being told by the city that they didn't really want us to be too profitable"[70]. When the company proudly presented the results of the impact study to Nelson City Council, the response was indifferent and after a fifteen-minute discussion, councillors moved on to discuss the Santa Parade[71]. Tasman's mayor publicly stated that he did not regret refusing to fund the event, despite its contribution of NZ$1.5million to his district in the previous year[72]. The impact study consultancy's recommendation that the councils fund a purpose built venue "for the goose that laid the golden egg" was rejected in spite of a history of local agitation for improvements in the region's cultural infrastructure generally. WOW was adamant that it did not want to enter into a bidding war once the decision was made, but said that had the region's councils backed a three-year national advertising campaign proposed in late 2002 it would have felt morally bound to stay in the area.

The decision to 'finally leave town' was personally hard according to Moncrieff, but she (and Nelson's mayor at the time) likened it to a teenager growing up and leaving home[73]. Apart from facilities and funding, Wellington offered synergies with the nation's premier arts institutions; robust transport and tourism infrastructure; and potential to move the event further into the international arena (parallels are drawn with Cirque du Soleil).

There is a sense too that WOW thought the community had taken the teenager for granted:

> …(it was a) "comfortable old slipper"…``cash cow'' for many of the city's businesses...``Nelsonians have done very, very well out of WearableArt… (WOW) have just managed to make ends meet"[74].

This complacency was shaken by the economic impact results and more particularly news of the move, which was ardently debated in the press. While some citizens saw it as inevitable, others questioned the ability of the event to maintain its special character in a larger commercial environment. Some saw it as an opportunity to promote Nelson in a new market; others counted the potential loss to Nelson's retailing and tourism businesses[75]. The local Member of Parliament lambasted the councils for their lack of vision and cohesion:

> We have lost an icon event that gave Nelson life and vitality and which created millions in economic activity... Its loss strikes at the heart of who we are and what we aspire to be… Those who accept this decision as an inevitable consequence of WOW's growth are small-minded. These people accept Nelson as a sleepy hollow and a provincial backwater. They lack vision for the sort of place Nelson should aspire to be in this new century…Our councils are guilty of short-

sightedness…The WOW fiasco… highlights the weakness of our fragmented council structure…Our local councils have been incredibly naive about the competition for hosting such sporting and cultural events…Our sporting and cultural venues are a disgrace for a region of our size. Progress continues to be stalled by the inherent parochialism of our two council structures[76].

A year later the community was ruing the loss of "a world-class event that put the hippie and retirement community on the map"[77], with retailers and restaurateurs reporting a dramatic decline in turnover[78]. In the aftermath of the move Nelson City voted NZ$55,000 for an events manager, agreed to upgrade the Trafalgar Centre, and more recently budgeted NZ$200,000 for an events strategy, although this is meeting resistance from retirees who consider it luxury[79]. The Nelson LTCCP does not define cultural wellbeing, but recreation, arts, crafts, heritage, festivals, lifestyle and a unique identity contribute to "A fun, creative culture", one of its six 'Community Outcomes' and cultural funding is now couched as economic strategy[80]. The plan later signals the need to define that "unique identity".

Wellington, by contrast, has branded itself "Creative Wellington- Innovation Capital", and "New Zealand's arts and cultural capital." Inspired by Richard Florida, it aims to "attract smart, innovative people and creative, forward-looking enterprise"[81]. Its LTCCP identifies tourism, major events such as WOW (estimated to inject NZ$8million into the local economy), and the creative industries as economic drivers[82]. Hervey[83] speaks of it as an "affirming environment", where "culture and attitude" are as important as financial support. Wellington, unlike Nelson-Tasman, is prepared to invest public funds in supporting commercial ventures, believing that successful businesses are aligned with successful cities. In addition to finance and venue, the Council provides free of charge services such as permit processing, security etc. WOW now makes a profit and is more professionalized. It still relies on some voluntary support (everyone on stage is paid) and continues to work in partnership with tertiary institutes in Nelson and Wellington. The Company maintains its Nelson roots remain - museum visitors outnumber those attending the show - but it now considers itself a truly Wellington event, despite the forebodings of Nelsonians who considered it imbued with the spirit of the region and unlikely to excite sophisticated, cynical, commercial Wellingtonians[84]. Hervey pays particular tribute to the vision and courage of Wellington's mayor and council, who have defied the conventions of traditional local government and rate-payer resistance to engage in commerce and who see civic purpose as more than roads, parks and rubbish collections.

Conclusion

This paper aimed to evaluate how the 'cultural turn' observed in international urban policy over the last two to three decades – and in New Zealand over the past decade – has influenced planning and practice in the smaller worlds of two provincial New Zealand cities. It shows that while culture may have moved to the policy foreshore in national intent, it remains stranded in the policy backwaters of the cities under scrutiny. Irrespective of the prominence now given to the promotion of 'cultural wellbeing' in the

statutory framework and of the value placed on culture by those communities, as articulated in their Community Outcomes, there appears to be limited appreciation of its multifaceted strategic possibilities; confusion over the meaning and ambit of the concept itself; and little evidence that it is being assimilated into mainstream thinking and activity. Rather, culture is randomly or reactively incorporated into discordant policy agendas. Community initiatives are often stalled in process or stymied by perceived impecuniousness, parochialism, and fragmented structures. The appropriate role of these local governments in cultural leadership and facilitation remains ambiguous and a welfarist/service delivery impetus endures. Consequently initiatives unique to the locality and demonstrably able to deliver benefits to the local economy, civic identity and social felicity were inadequately resourced and safeguarded. In Nelson this contributed to the loss of a significant asset to another city; meanwhile Napier's asset remains susceptible to market forces and reliant, in part, on the steely fervour and longevity of a community trust.

The requirement that culture be an explicit concern of New Zealand local government is still in its infancy, as indeed is long-term strategic planning at the local level. Both obligations call for major changes in orientation and aspiration and even in Britain, where the 'cultural turn' is arguably more entrenched and glittering, a recent study remarked that:

> …despite the importance of culture in people's everyday lives…At local authority level, culture has neither established itself independently as an unquestioned good…nor has everyone been persuaded that culture has a vital role to play in the delivery of other mainstream council services[85].

Furthermore, New Zealanders (especially those of European descent) have been slow to appreciate that they, and the places in which they dwell, have distinctive cultures. In both the cases discussed, acknowledgment was built through lengthy, intrepid advocacy on the part of committed individuals and assisted by the recognition of outsiders. It is also possible that a more cultural orientation in some New Zealand city settings is compromised by a lingering anti-urban and anti-intellectual ethos.

The Wellington City Council is testament, however, to the notion that local bureaucracies can be creative, take risks, and demonstrate flexibility and leadership (in the style promoted by Landry). Wellington City had the will to seize an opportunity and enhance it with imaginative policy support. The 'culture' of governance itself is undoubtedly a potent factor in the realisation of original and successful policy outcomes – and cultural outcomes in William's "material, intellectual and spiritual" sense. It may also be the 'culture' of genius locus. Wellington is a relatively wealthy, well-educated community, endowed with the nation's premier high cultural organisations and an internationally acclaimed film studio. Over the last fifteen years it has forged a truly urban identity and worked to make that distinctive. Of the all the local authorities alluded to in this paper, it has best embraced cultural policy as an integrated strategic tool, albeit conspicuously in economic development – not required of New Zealand's local governments prior to the 2002 statute, but one unconventionally pursued by

Wellington's leaders with ferocious vigilance from nineteen-nineties in response to economic decline arising from public service restructuring and corporate exodus. As with cities overseas, Wellington looked to culture as a post-industrial anodyne. It not only seized, but created opportunities for culture to flourish through tourism initiatives, public art, creative industry clusters, subsidised workspaces and incubators.

Cultures are complex, liquid and unpredictable. They are made and remade by people living together in particular environments, not by public bureaucracies, and cultural planning may even be inherently a contradiction in terms. That said local councils –and their own cultures - play a vital role in establishing the ambience and infrastructure (hard and soft) that encourages local culture - in all its spontaneity, diversity and purpose - to evolve and thrive; or conversely, to stagnate.

Guiding Considerations of Public Interest in Conflicts about Development in Coastal and Marine Environments

Johanna Rosier
Massey University, United States

Introduction

Planners have partially justified their existence as a discipline by claiming that the planning discipline is one that determines consensus about definition of the common good or public interest. Plans are justified with some certainty that they are prepared by planning practitioners and would 'protect' or serve public interest[1]. Some think that planners have abandoned public interest ideals. For example, Phillip Adams in condemning planners wrote:

> It's 'public' that has become a dirty word – as in public health, public transport, public education and public broadcasting. Public as in public space, public spirited and, God forbid, public as in public ownership. The public sector is being flushed down the public toilet.[2]"

Others argue that while one of the *raisons d'être* of planning is to protect the public interest, this notion of public interest is contested terrain especially in pluralist societies such as Australia and is defined through a range of democratic processes including reviews of government decisions[3]. The shift to performance based planning in some planning systems[4] and the need for developers to meet qualitative and quantitative performance based criteria, has also resulted in decreased public participation and restricted scope for "third-party" appeals against planning decisions. In fact, a lot of small planning and building proposals are "self assessable" in all Australian planning systems, totally excluding third party involvement in the development assessment decision.

The reality of contemporary planning is that we need to rethink our interpretation of the concept and determine new ways in which planners may protect or consider public interest issues, especially in coastal and marine environments where public and private interests need to be served while achieving sustainable development. That requires a re-examination of public interest as a planning concept. In addition, it is also necessary to examine associated concepts applied in thinking about management of coastal environments, including conflict resolution, and planning values such as 'equity', 'justice' and 'effectiveness'.

Planners and managers are also expected to use collaborative approaches, enabling all voices to be heard in the decision-making process. Environmental Conflict Resolution (ECR) is an important tool in the planner's toolbox facilitating the resolution of conflict and different views about sustainability of proposals; and conflicting attitudes to natural resource management where people need to continue living together in a community and share natural resources – as in many of our coastal communities. In addition, the

planning discipline's values of 'justice' and 'equity' need to be explicitly expressed in decision making processes, rather than a narrow focus on 'efficiency' or 'effectiveness'. This is particularly relevant when considering environmental policy decision making in relation to publicly owned natural resources, as noted by Raymond (2003) who believes that "efficiency" has become the single dominant standard to judge the quality of decision-making because policymakers increasingly see public resources in utilitarian terms[5].

The ultimate aim in bringing these bodies of literature together is to derive a set of principles, ensuring that substantive ecological, economic and social planning issues are taken into account in the application of ECR techniques to resolve conflict or differing views about the appropriateness of development or use of natural resources in coastal and marine environments. The principles form part of a wider research study, in which the principles and indicators of good practice are used to assess whether public interest ideals are represented in analysing the effectiveness of conflict resolution processes in disputes about coastal and marine resources.

Attributing achievement of substantive outcomes

One of the key issues in deciding whether substantive outcomes like public interest are achieved is the problem of defining what the results should look like! Both Reade[6] and Taylor[7] believe that planning practice is hampered by vague, imprecise and ambiguous terminology, making it difficult to attribute observed "effects" on the ground, or 'outcomes' to particular planning policies.

A number of theorists (Forrester 1987[8]; Sager 1994[9]; Storper 2001[10]; Yiftachel et al 2001[11]) also believe that there is a tendency in the planning discipline to serve the stronger interests of the powerful elite, thus limiting the capacity of planners to achieve desired community outcomes. Those community outcomes are described variously as "urban places" building, community-building and institution building. Therefore, the planning emphasis on serving the elite also obstructs facilitative planning and achievement of distributive justice. The effect of this dominance on economic planning results is also exacerbated by problems in communication and process.

In assessing the appropriateness of development in coastal or marine environments, it is not just important to get the process right, it is also crucial to determine the degree to which substantive planning outcomes (e.g. protection of natural landscapes or ecological processes) are achieved in any conflict resolution process undertaken in the process of deciding applications for coastal development. Indicators to measure effectiveness of substantive planning outcomes need to be informed by literature about the use of planning instruments to achieve planning objectives, concepts related to 'public interest', the application of the 'public trust doctrine' in the coastal environment and achieving justice – a difficult concept to "operationalize" in plans, especially in relation to balancing the 'interests' of all the parties.

Procedural justice is generally seen as an important value of the planning discipline. In the past, planning proceduralists generally believed that justice is achieved if the planning process is inclusive and fair, and if the appropriate techniques are used to generate and evaluate planning options[12]. However, procedural justice is not the only form of justice identified by theorists as being important in developing better decision-making and planning. Campbell refers to a second dimension of justice:

> *"…procedural understanding of justice is not on its own an adequate basis for the situated ethical judgements required of the planning activity. In this I am echoing Paul Ricoeur's conception of ethical intention and, for that matter, practical wisdom, as aiming `at the "good life" with and for others, in just institutions'…[Ricoeur 1996,152] It should be clear that this is not a concern with value in an economic sense."[13]*

Campbell (2002) also rejects the idea that procedural justice is achieved by being the impartial expert planner constraining individuals to reason as `disinterested interests' to achieve a `fair' decision through consensus. She advocates that planners should celebrate the idea of `togetherness in difference' and accept the broader notion of justice as defined above because it would clarify the various planning roles in society at a time when the discipline seems to be confused about what interests (i.e. a developer's interests or community's interests) are served by planners. Most importantly it would suggest a reprioritising of the concepts of 'responsibility' or 'duty' over that of rights – consistent with views of theorists concerned with protection of the commons. This body of theory also relates to debates about distributive justice and is an important consideration if the sustainable management of coastal and marine waters is to be achieved, and the needs of future generations considered.

Distributive justice forms another element in any application of the social learning paradigm[14] the main planning paradigm in which greater public participation was encouraged through greater emphasis on fairer process and improved opportunities for public involvement. It was thought that this improved involvement in the decision-making process would result in reduction of NIMBYISM[15] and better acceptance of decisions.

Public Interest defined

Not all planners agree that the concept 'public interest' is still relevant. Moroni (2004) provides several arguments as to why public interest may be discounted as a relevant planning concept[16], but concludes that the concept is still relevant and planners need to reconstruct their interpretation of public interest, enabling planners to deal with issues realistically without having to invent another term. Campbell and Marshall (2002) and Grant (2005) separate out substantive considerations of public interest (e.g. protection of historic buildings) for which there are a range of subjective judgements about the value of such places and the idea of having "something at stake"[17] either as an individual (e.g. a house) or as a group (some facility). The values at stake may also be amenity or environmental values. Voogd (2001) notes that, for public interest to be

conceptualised as a planning value, there needs to be collective identification of a 'social dilemma' – a situation in which an individual's actions prejudice the provision or maintenance of a 'common good' or 'public interest'. Alternatively, the situation may be one in which a common good may only be maintained at considerable costs to individuals.[18]

Campbell and Marshall differentiate between rights based and dialogical approaches to conceptualising public interest which is important in thinking about which ECR techniques may be appropriately applied when managing conflict in a planning process. Communicative planners[19] generally advocate a rights-based approach to interpreting public interest, derived from Rawls's theory of justice[20], which stands within the tradition of liberal philosophy. This philosophy requires that "*we acknowledge the subjectiveness of values and assume that individuals should be free to pursue their own conceptions of the good life, constrained only to the extent that in doing so they do not prevent other from doing likewise*".[21] According to Rawls's theory of justice, citizens have shared perceptions of justice even though they may be deeply divided over defining good, mainly because they have similar moral values and agree to advance the same primary goods – same rights, liberties and opportunities as well as certain all purpose means such as income and wealth[22]. This shared perception of justice enables people to share "overlapping consensus" in making some decisions for the community. A significant problem for communicative planning is that the process of arriving at principles of justice is not derived collectively as preferred in Habermas's theory of communicative action. The implications are that a rights-based approach to defining public interest would not need to acknowledge that not all citizens have equal ability to make use of formal rights enshrined in law.

The dialogical approach to defining public interest focuses on arriving at consensus and agreement based on procedural norms and rules which are agreed in advance by the parties. This is relatively compatible with the collaborative approach to planning. The idea is that the use of open dialogue encourages the emergence of shared solutions because *new forms of knowledge and understandings are uncovered*.[23] Alexander (2002) notes that interactive processes need to weigh various decision considerations which often involve competing interests, conflicting rights or incompatible values. Therefore, he argues that, it is impossible to consider process alone, in any planning debate, without examination of the disputed substantive matters.

Alexander (2002) further argues that once substantive matters are dealt with in a plan or policy that is approved after public consultation, those substantive public interest elements should no longer be litigated (e.g. through approval of individual development applications)[24]. Matters to be considered in thinking about public interest include the size of the plan area of influence, degree to which community values are homogeneous (this also relates back to complexity of the planning issue), the degree to which plan-making process has been captured by dominant interests in the community and the weighting of each relevant consideration when planning options are assessed.

In the coastal management literature, debates about conflict focus on the acceptability of facilitating competing activities in coastal and marine environments, and the need to achieve justice in both outcome and process matters. Because the seabed, coastal water and air are generally not privately owned, NIMBY concerns may be different because the investment being protected is not personal, but community based investments. For example, concerns may revolve around loss of fishery stocks, loss of shellfish harvesting areas, reduction in water quality preventing recreation, or loss of safe anchorages for yachts. In addition, one aim of investment protection is to provide resources for future generations of the community as a whole.

In the environmental context, it is sometimes difficult to define "public interest", especially where there are a number of private and public interests, many of which could be non-financial. Courts also have difficulty grappling with the idea of "intrinsic values" of particular environments and who should represent intrinsic values. The *number* of people concerned does not establish public interest, but is one factor to be considered[25].

Environmental groups seeking to represent environmental values and become a party to a legal conflict about specific types of development and desired environmental outcomes, also face the hurdle of proving they should be accepted as having a legitimate role in defending "public" or "special" environmental interests (e.g. a species or preservation of a particular environment - such as wetlands). In assessing whether a group has standing to argue their position in the Court, Judge Sackville, of the Federal Court of Australia, provides useful criteria in that a group needs to have one or more of the characteristics as summarised below:

- The group involves genuinely held convictions and has special interest that goes beyond that of ordinary members of the public; group may demonstrate interest in the preservation of a particular environment;
- The group has status as the peak environmental organisation in the region;
- The group has undertaken studies in the area which is the subject of the dispute; it is respected by the Commonwealth as a significant and responsible organisation – evidenced by the receipt of financial grants from the Commonwealth Department of the Environment;
- The group is recognised by a state government in the form of membership on advisory committees is evidence of a groups legitimacy;
- The group undertakes or coordinates projects or conferences, reflecting its status as a respected and responsible group[26].

Judge Sackville noted that groups need to argue substantive issues. Allegations of non-compliance with administrative procedures, participation in an initial environmental impact assessment process, and "*preservation of the environment*" as an organisational goal is **not** sufficient to establish a group's standing in the Court.

Further problems arise if environmental groups seek government funding to support their court appeal. Boer[27] lists additional broad capabilities needed by environmental groups who seek public funding for appeals in the "public interest" including the need to contribute in terms of finances, expertise and effort in obtaining evidence and preparing material for the Court. Consideration could also be given to the extent to which an environment group can formulate an environmental problem as a legal issue.

The coast, public interest and the Public Trust Doctrine

Debates about public interest issues on private land are complicated by the debate about what constitutes the rights that are traditionally associated with freehold or leased property. For example, in most planning systems, if public actions reduce normal rights associated with private ownership, the 'public' may pay compensation. However, in coastal and marine environments, the assumption is that the foreshore and seabed and the waters above are held in trust by the State for the benefit of the public. In the United States of America (U.S.A.), this is called the 'Public Trust Doctrine'. In other countries colonised by the English, Spanish, and Dutch, the terms vary. Van Dyke (1992)[28] urges coastal managers to consider the public nature of the oceans (including foreshore, seabed and water column along with other natural resources) when providing guidance for management. He notes that:

> *"The public trust doctrine should, in nations where it applies, govern decisions in order to protect the interests of the whole community and the interests of intergenerational equity. This doctrine requires that conflicts be resolved in favour of keeping oceans whole and protecting the interests of the public of today and in the future. Managing resources as commons should be preferred over privatising such resources. If private developments are allowed, the public should receive financial benefits from such developments."*

Generally speaking the public has a right to use the coastal waters for a variety of recognised public uses – originally identified in Roman times as navigation, bathing, fishing, and activities such as repairing nets, mooring /maintaining boats, building jetties and placing cargo[29]. Remaining private activities may be limited by the 'public' through the use of laws, government policy or local by-laws. So there is considerable flexibility within and between countries in the interpretation of the original Roman doctrine.

However, the marine environment is difficult to administer. People have expectations about "free" use of the marine environment that have been passed down through generations – expectations which may be difficult to meet as there is more competition for marine space. In recent years, there has been considerable depletion of marine resources as documented by many authors[30]. As technology has enabled new industries to be established in the marine environment, people are referring to it as the new "agricultural frontier" and new industries require certainty about the long term use of particular space (Norse 2005). Frontier mentality is a phrase coined because of the sudden rush to harvest marine resources[31]. Given its difference to terrestrial environments, highly valued attributes of marine environment are often difficult to

identify, including changing patterns of how the marine "commons" are managed, the uncertainty about adverse effects spatially of long-term leasing of ocean space and the potential magnitude of the adverse environmental effects of large mariculture or aquaculture – especially given the State's inability to enforce fishery regulations and quotas at a distance.

Partnerships have been formed between user-groups (e.g. fishers) and government, excluding public interest organisations because rights have only been given to those who exploit resources. Norse believes that environmental groups who have championed conservation of marine diversity have relatively weak public support, and until public support broadens, such groups will not have a mandate to argue for more sustainable systems of resource exploitation in the marine environment.

In recent years, a number of management models have been generated to manage coastal and marine systems. Multiple use "zoning" applied in the marine environment has failed where agencies lack the political capacity to exclude powerful user groups[32]. However, zoning preserves agency options for future allocation decisions, with all parties being given relatively equal rights of access. But incompatible uses are not necessarily separated as in land-based zoning models. Norse's (2005) critique of zoning is that it is based on the presumption that all marine ecosystems and users are heterogeneous – another unsustainable proposition[33].

Integrated coastal zone management (ICZM) principles have been established in several jurisdictions[34] attempting to guide analysis of public interest rights in the coastal marine area. Issues debated include rights of users of the surface of non-navigable waters and a variety of effects on:

- Common property of natural and artificial changes (i.e. erosion and accretion) to lands in the marine environment;
- Treaties signed with indigenous people – particularly if related to particular areas of coast;
- Effects of over harvesting common property marine resources such as shellfish; and,
- Different modes of public access (visual, walking, vehicular, boating) to and along the coast (ecological affects and potential conflict between various users) where one activity precludes another from using the same space.

Regional ocean governance (ROG) models have been developed in the USA to provide for the voluntary establishment of "regional ocean councils" under the umbrella provided by the National Ocean Council. ROGS develop regional goals and set priorities in managing regional issues and facilitate research and information which meets the needs of managers and support ecosystem based decisions[35].

There is a concern that existing law and legal principles influencing interpretation of the law may not provide for future uses not yet anticipated by government[36]. Also the law has not provided adequate solutions for conflicts between various public trust

interests[37]. There is considerable confusion about the interpretation of legal provisions, once use and development debates move offshore into the marine environment deemed to be common property. For example, in California, planning for ports and harbour development now requires accommodation of increased conflict associated with accommodating public interest - perceived by industry to be "new" conflict associated with the introduction of environmental regulation.

> *'Ports which prior to the 1970s would think in terms of dredging and filling several thousand acres of wetland, now must think in significantly reduced scale often involving less than a hundred acres[38].'*

Ports have incurred extra costs in planning and engineering design, increased environmental expert advice and increased investment in environmental mitigation costs. Boschken (1982) believes that the West Coast ports had been more successful in managing uncertainty, complexity and conflict because they were growing and attracted the type of personnel who have used new technology to improve productivity, forged partnerships with key environmental groups and have taken advice in hiring respected local environmental experts who could anticipate the concerns of review agencies and community groups.

Many of the conflicts and issues of resource depletion have been exacerbated by the rapid growth in aquaculture over the last 10 years. This industry requires that areas of the foreshore or seabed and coastal waters are managed as private property for industrial purposes for up to 35 years with possible consequential adverse effects which are not internalised by the aquaculture producers. However, there are a number of competing claims on coastal resources including: coastal defences and infrastructure such as roads, bridges and ports; aggregate extraction; fishing, mari-culture and aquaculture; discharge of pollutants and stormwater effluent; generation of wave/wind energy and conservation of species and ecologically significant areas using marine reserves and protection tools.

Any collaborative approach to managing the various private interests in the coastal marine area is made more difficult by the lack of information about the effects of people's activities in coastal waters, and where information is available it is often controlled by sectoral groups (e.g. fishing industry). Research by Steel et al (2005)[39] suggests that planners should not make assumptions about the knowledge of people entering debates and participating in dispute resolution processes. Steele et al (2005 demonstrate that there is a considerable lack of understanding by USA citizens about the nature of coastal and ocean habitats, and that in lower socio-economic groups the lack of knowledge is even more critical because these groups rely on the mass media (television, newspapers and radio) for their knowledge of coastal and ocean policy issues. While USA coastal residents seem to be slightly more aware of coastal issues, they were also more knowledgeable about non-coastal issues.

Dealing with an angry public: characterization of environmental conflict

Although people have become more educated about environmental issues, planners have not been able to halt continued degradation of environmental resources, especially in the coastal and marine environments, with increasing potential for marine ecosystem collapses (Chapin et al 2000).[40] Difficulties in identifying the adverse environmental effects of specific activities and combinations of people's actions mean that management of communication about environmental matters often translates into management of conflicting views. Conflict about environmental decision making in recent years has fundamentally changed human society in many ways. Scientists have faced increased challenges; new disciplines have been created (i.e. conservation biology) and public involvement in environmental decision making has increased at all levels of government – increasing the potential for environmental conflict.

Conflicts may be analysed from a variety of perspectives. Experts often perceive conflict as being generated from the gap between the knowledgeable and the ignorant. This perspective increases the power of experts and those with funds to hire expertise.[41] Lach (1996) acknowledges that environmental decision-making is carried out in an environment influenced by politics, science and economics and believes that conflict arises when '*those who benefit from the status quo are challenged by those who seek change*'.[42]   In this perspective, uncertainty of knowledge, stakeholder interests and values are acknowledged. Uncertainty of knowledge is emphasised by Innes and Booher (1999) who believe that decision-making in complex environments requires an acceptance that a trial and error approach is needed in environmental decision-making.

The degree to which the public interest has been explicitly considered in environmental disputes is also an important issue. Comino (1996) notes that groups advocating for the environment in environmental conflicts need to have considerable fortitude and resources to demonstrate that they have the right and capacity to use litigation if their concerns are not considered in environmental decision-making[43].   Burgess and Burgess (1994) reinforce this view by emphasising that having an alternative such as litigation increases a group's power in the process of conflict resolution. In many cases, environmental groups have power having demonstrated their capacity for litigation by fighting and winning a number of cases - forcing developers to consider mediation as an alternative. Burgess and Burgess believe that:

> " *open acknowledgement of the inevitable and appropriate role of power contests in these (environmental) conflicts is important. By acknowledging the inherent limits of mediation and consensus-building in altering power relationships, mediators will help advance the prestige of the environmental mediation field by reducing the number of instances in which mediation is oversold by people claiming that the field may deliver more than it actually can.*"[44]

There are a considerable number of situations in which the public are angry about an individual planning issue because they feel hurt, misled or threatened.   Susskind and Field[45] acknowledge there are situations in which values collide and resolution is difficult because people feel their beliefs are being ridiculed or ignored - with significant implications for their identity and ideas about what they hold dear. Suskind and Field identified these as "intractable conflicts", which need to be de-escalated before resolution is possible.[46]   They suggest that planners proceed with four basic principles in mind:

1. *'Fairness in process and substance matters, especially where there have been past inequities.*

2. *Discussion around the design and implementation of controversial developments requires meaningful input from all stakeholders.*

3. *A community must be left substantially better off if it is expected to "host" a development.*

4. *Decision-makers (including citizens as stated in Principle 2) should have access to the best technical advice available, but technicians should not make what are essentially political decisions.'[47]*

Campbell (2003) attributes intractable conflict to fundamental differences in world views, values and beliefs between the parties – the principle characteristic of most environmental disputes. Campbell warns that to understand these conflicts and the degree of intractability, it is necessary to understand the ontology of each stakeholder group – that is the description of the frame through which the groups perceives the dispute and the range of problem-solving techniques to which they may be open[48]. Campbell (2003) argues the following factors may be used to judge the degree to which a conflict is likely to be intractable:

- Fundamental or deep rooted moral conflict.
- Fundamental value differences between the parties.
- Fundamental conflict about world views, values, principles or societal structures.
- Length of time the conflict has persisted.
- Severe power imbalances between disputing parties.
- Potential for coercion or escalation to violence.
- Rigidity of positions, high level of authority.
- Strongly held beliefs or positions.
- Complexity of issues, interlocking issues.
- High stakes distributional issues.
- Pecking order conflicts or one-upmanship.
- Threats to parties' individual or collective identities.
- Frames held by participants.

Obviously, there is more likelihood of intractable conflict if there are a number of factors evident in a dispute. Such intractability places significant demands on the skills and

insightfulness of the mediator or planner working with the parties. It could also be argued that conflict resolution processes may not be appropriate at all if many factors are present in the dispute.

Campbell then advocates a system of conflict resolution design - once a conflict is identified it is important to take three important steps in *characterizing* the conflict:

1. Diagnose the dispute by preparing a conflict map showing all positions;
2. Identify conflict overlays – where superficial matters overlay complex subsurface issues.
3. Reduce surface issues so that core issues may be addressed.[49]

Once the conflict is characterised, it is important to have criteria to judge how effectively the intractable dispute is managed to conclusion. D'Estree et al (2003) believes that in addition to the normal process factors, outcomes may also be categorised as outcome related – consensus, public acknowledgement of outcome, quality of outcome (effectiveness and efficiency, equity, environmental sustainability and public acceptability), and relationship quality. A good outcome would improve or transform relationships and enhance community capacity to draw on collective resources[50]. Criteria to judge change also include communicative measures according to d'Estee. She includes measures such as a shared system of understanding, recognising similarities, developing friendships and deeper intimacy.

Choosing disputes to which ECR techniques may be applied and those disputes which are better left to litigation is also advocated by O'Leary and Husar (2002). They suggest that an assessment of possible settlement options should be done before a mediation strategy is accepted. Identification of barriers at an earlier stage ensures public trust in the conflict resolution process. Examples of cases which may be more effectively addressed through litigation include dealing with a recalcitrant polluter, and where lawyers are unwilling to participate in ECR techniques because they believe they cannot advocate strongly enough for their clients[51].

Another range of factors measuring success of conflict resolution are suggested by Dukes (2004), who also acknowledges that ECR may not be the only solution to an environmental conflict[52]. Those factors include settlement rates - difficult to measure without asking participants to judge whether another method may have been more successful. Dukes also examines evidence of change in participants relationships by factors such as "reduction in conflict and hostility", "improved relations" and "cognitive and effective shift in behaviour". The satisfaction of participants is also discussed by Dukes, but there is no acknowledgement that long term monitoring of participant satisfaction is important in environmental disputes, given the need to measure environmental sustainability of the agreement.

Dukes (2004) expresses the need for further research which examines the effectiveness of facilitated meetings and mediation conducted by agency officials as third parties instead of qualified mediators. In these situations, he suggests that qualified mediators

are only brought in where they bring added value to a complex environmental dispute. According to Dukes, this area of conflict resolution is increasing rapidly with little review of its effectiveness, or the effectiveness of officers who cannot be *neutral* third parties. In the USA, government departments are now required to have conflict resolution processes such as this in place. The need for research about the effectiveness of agency conflict resolution processes is supported by Emerson, et al (2004)[53], who also identify some of the difficulties for researchers in finding data to answer some of the questions identified by Dukes.

The situations in which ECR techniques and mediation in particular may not be appropriate are examined in detail by Horn (2005). For example, mediation may not be the most effective method to deal with a dispute in which more than one group claims to represent public interest and future generations are not satisfactorily considered. Because the mediation process is generally carried out under a confidentiality agreement (a basic tenet of mediation), the transparency associated with being accountable for environmental decision-making may be compromised[54]. She also questions the degree to which mediators may be neutral in an environmental conflict given they need to comply with policies and regulation in complex legislation and environmental plans.

Principles to guide ECR processes

Planning in coastal and marine environments has a strong public interest component that needs to taken into account when negotiating desired environmental outcomes with community groups and industry, who may have competing interests in the use of marine, natural and physical resources. The literature suggests that there will be different views about what constitutes the public interest, which may be an element in any conflict. The general principles draw on interim conclusions of the various reviews to focus attention on key matters. They provide guidance about how to judge best practice in the application of ECR techniques in coastal and marine environmental conflicts. This guidance is useful in what is often a very messy planning context with poor data, many parties (coastal planner or manager, agency officials, industry sector, developer and submitters (often representing conflicting communities of interest), politicians, and the "neutral" third party or mediator.

Principles may categorised in terms of the nature of the conflict; the particular context - location and the intrinsic ecological, economic and sociological values which make up the substantive "public interest" and could be threatened by activities; the parties to the environmental conflict, their rights and interests; power relationships (agencies, industry sectors, environmental groups and indigenous people); the third "neutral" party; and monitoring

Nature of the Conflict

1. It is important to determine which ECR techniques through to litigation should be used in resolving conflict about public interest in the coastal environment. This will

be influenced by the expectations of the parties involved and the institutional context for decision-making process.

2. Decide whether the environmental conflict is intractable – indicated by the presence of any or a number of the following factors:

   - Fundamental or deep rooted moral conflict.
   - Fundamental value differences between the parties.
   - Fundamental conflict about world views, values, principles or societal structures.
   - Length of time the conflict has persisted.
   - Severe power imbalances between disputing parties.
   - Potential for coercion or escalation to violence.
   - Rigidity of positions, high level of authority.
   - Strongly held beliefs or positions.
   - Complexity of issues, interlocking issues.
   - High stakes distributional issues.
   - Pecking order conflicts or one-upmanship.
   - Threats to parties' individual or collective identities.
   - Frames held by participants.

3. De-escalation of an intractable conflict is important before ECR techniques may be applied. Following questions are a useful check to decide whether de-escalation is possible:
   - *Is there fairness in process and substance matters, especially where there have been past inequities?*
   - *Will discussion around the design and implementation of controversial developments result in meaningful input from all stakeholders?*
   - *Will the coastal community be left substantially better off if it is expected to "host" the specific offshore development and associated land-based infrastructure?*

4. Decision-makers (including citizens as stated in Principle 2) should have access to the best technical advice available, but (planning) technicians should not make what are essentially political decisions.

The Environmental Context

5. In managing the coastal and marine environments, agencies need to consider the ocean as a global commons which is also to be used by future generations. This should preclude activities which unsustainably exploit ocean resources and long term commitment of marine space for private activities – especially if adverse effects of use and development are irreversible. All current interests need to be mapped using three dimensions, because some interests change throughout the water column.

Parties to the Conflict

6. A non-government group advocating public interest values in the coastal environment should be able to justify their involvement using the some or all of the following criteria:
   - The group involves genuinely held convictions and has special interest that goes beyond that of ordinary members of the public. For example it may demonstrate interest in the preservation of a particular environment.
   - The group has status as the peak environmental organisation in the region.
   - The group has undertaken studies in the area which is the subject of the dispute. It is respected by the government as a significant and responsible organisation – possible evidenced by the receipt of financial grants to achieve their purpose.
   - The group is recognised by a state government in the form of membership on advisory committees is evidence of a groups legitimacy.
   - The group undertakes or coordinates projects or conferences reflecting its status as a respected and responsible group.
   - If the group seeks public funding for appeals in the "public interest" , it needs evidence that it can contribute in terms of finances, expertise and effort in obtaining evidence and preparing material for the Court.

7. Planners should identify specific areas in coastal waters, where application of ECR techniques may transform a conflict into a situation in which new relationships can develop and the parties involved move beyond a case-by case resolution of individual conflicts (e.g. a new understanding between marine farmers and yachting organisation about management of sheltered bays in a region). Issues to be considered include the question: *What kind of change is realistic?* Planners also need to be aware of the processes by which changes in individuals translate into improvement of inter-group relations.

8. Councils should provide resources and support for community groups seeking to participate in longer resource consent processes.
   Some funding agreements may last more than 2 years if the issues require more ongoing scientific analysis and environmental monitoring. Extra support may avoid group 'burnout'. Provisions need to be publicly accountable.

Power Relationships

9. Power relationships need to be explicitly considered in the implementation of the coastal plans, in plan implementation and in application of processes like ECR. Trust in the planning system is compromised if power relationships are ignored.

10. Planners need to be conscious of the need to consider the potential for bias in favour of current stakeholders who may already have an investment in the marine environment (e.g. jetties, infrastructure, and aquaculture industry).

Distributional justice (not just procedural justice) is an important element of decision-making in the coastal and marine environment, because of the strong public interest in the long term protection of marine, natural and physical resources, and inter-generational concerns;

The Third "neutral" Party

11. Decision-making authorities managing coastal and marine environments, should have provide clear policies to their staff about the use of "third-party neutrals" in ECR, training of internal staff or politicians who perform this function, and criteria to assess the suitability of independent third-party neutrals and the circumstances which give rise to their use in pre-hearing meetings.
    For example, independent third-party neutrals should be used when the Decision-making authority (i.e. a Port) is both an applicant and decision-making authority, and when issues are complex with a large number of submitters.

Monitoring

12. On-going monitoring of environmental conflict resolution outcomes and processes in achieving overall sustainable management of the coastal and marine environment is important if the capacity of people to participate constructively in coastal planning is to be enhanced over time.

Conclusions

The principles need to be general and applicable in a wide range of different planning office cultures. While community issues in managing human activities in the coastal and marine environment vary dramatically in western countries, because of the nature of the land and seascapes and climate, the principles may be applied in different legal regimes and planning contexts because they build on theory and general experience, rather than on historical experiences in each national context.

[16] Moroni, S. pages 153-159 2004 Towards a Reconstruction of the Public Interest Criterion. *Planning Theory*. 3:151-171. The first justification for the non-existence of public interest as a criterion for planning is that it does not exist as a fact. The interests of individuals and groups is so varied that it is impossible to say that there are interests held in common. Secondly, Public interest does not exist as an extra-individual value. In this interpretation, individuals are perceived as the only moral identity which should be taken into account in making decisions about public matters. Claims by groups, communities and structures have no legitimate (ethical) claims about planning outcomes. Moroni's third justification is that the public interest does not exist as an overriding substantive value because we have to accept strong value plurism. There is inevitably going to be conflict because of diversity of values in regard to all matters.

Rawls distinguishes five kinds of primary goods that are fundamental to social life and rest on the political conception of a person being free and equal, endowed with moral powers and capable of being a cooperating member of society. The five primary goods are paraphrased as:

1. The basic rights and liberties - freedom of thought and liberty of conscience. These rights and liberties are essential institutional conditions required for the adequate development and full and informed exercise of the two moral powers.
2. Freedom of movement and free choice of occupation against a background of diverse opportunities.
3. Powers and prerogative of offices and positions of authority and responsibility
4. Income and Wealth, understood as all-purpose means generally needed to achieve a wide range of ends whatever they may be.
5. The social bases of self-respect, understood as those aspects of basic institutions normally essential if citizens are to have a lively sense of their worth as persons and be able to advance their ends with self confidence.

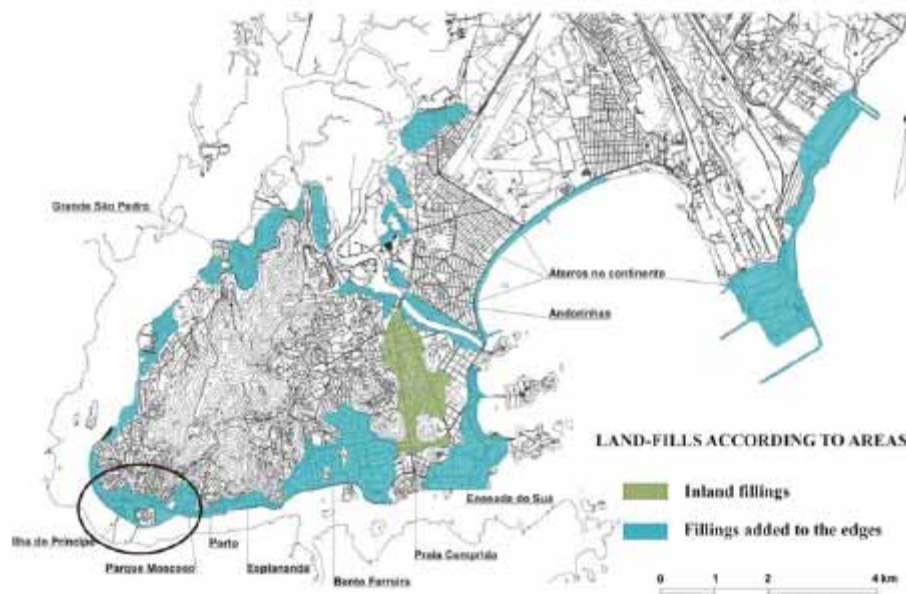
Prince Island's development: noble intentions, poor results

José Francisco Bernardino Freitas
University of Espírito Santos, Brazil

Introduction

The occupation and the urban growth in the municipality of Vitória are the result of a succession of landfills which have interfered in its territorial conformation since colonial times. Several studies, carried out since 1999, have examined the landfill areas within the administrative boundaries of the capital city of Espírito Santo State in order to identify alterations, repercussions in physical and socio-economic terms, in particular of the Island of Vitória[1]. The main sources used in this study consist of the Government Messages and Reports, presented to the legislative both at a local and a state level. Sources were further enlarged to include an inventory developed at a national level involving specialists of eight universities, as well as its original sources[2]. Figure 1 shows the proportions of the landfill areas and allows comparison between the total of the municipal area and the area of the Island of Vitória itself. The region that includes Prince Island is indicated at the bottom-left corner[3].

Some other pieces of research have succeeded, each one focusing on single areas, with the help of undergraduate scholarship-research students. Their outcomes indicate that the official reasons to justify land-fillings have always been related to the modernization of the city. Up to the 1950s, the main purposes were sanitation and accessibility; it was in that decade, however, that the government started claiming the need of territorial expansion[4].

Figure 1 - Land-fill areas in the municipality of Vitória.


This research examines a landfill area in which the whole process lasted from the 1920s up to the 1980s from implementation to final stage, including its urbanization. In order to discuss the contradiction between political determination in carrying out the landfills and the proposals to make them materialize[5], this research also analyzes the succession of landfills within Prince Island's region and its countless urbanization proposals. Particular emphasis is given on the proposal made by the Argentinean naturalized Brazilian town planner Lorenza Adina Mera, for two main reasons. Firstly, for the important role she played in the national scenario at that time, guided by her beliefs and attitude towards planning and, secondly, by the virtues of her own plan, together with the reasons that might have led the government of the state of Espírito Santo to commission her for the task.

It is important to note that while research on landfills in Vitória has made considerable progress, the study about Adina Mera and her achievements constitute work in process. Nevertheless, the outcomes of both investigations combined are worth publishing as an original piece of investigation and a means to further reflection on the subject.
In addition, this study clearly demonstrates the long period of time - between the beginning of landfill works and the end of the urbanization - as a result of the government's intermittent alterations in intentions. Such an attitude made the irregular occupation of the site easier, leading to its current conformation, which well expresses the whole examined process. Furthermore, this study exposes an uncertainty that resulted both in financial and political onus to the government, far beyond the quality, nature and type of the island's current occupation. These arguments suggest that it might have been a government strategy to always invite prominent people, in order to plan that region as a marketing resource, overshadowing its uncertainties.

Prince Island: landfills and urbanization projects

The article *Revolução Urbanística em Vitória*, in Revista Capixaba (July 1968, no.17) describes the region of Prince Island as follows: *"Prince Island has always been one of the ugliest areas of Vitória, a region of extreme poverty, where never-avoided invasions helped to breed agglomeration without any urban planning or hygiene. To add more misery to such a picture, slum dwellings spread, while the rubbish along the island's boundaries produced sites capable of supporting extra shelter"*[6].

Nevertheless, such an image reveals deep contrast to the original intentions of the government. The examined documents point out that land-filling and urbanization happened in a number of intermittent phases. The foundation stone was laid in 1926 by Washington Luís Pereira de Sousa, the country's president at that time, and the initial intervention was concluded in 1928, with the assembling of the first bridge linking the Island of Vitória to the continent.

The bridge to the continent and the expansion towards the eastern side of Prince Island.

The first reference to landfill in Prince Island's region found in government reports relates to this bridge to the continent and it is part of the expanding activities of the Port

of Vitória[7]. The 1926 Report stated that "*the works of the rock wall along the bay, the sanitation pier and landfills to link the southern to the northern part of the canal ha[d] already made considerable progress, what allow[ed] to assemble the parts of the so-called Six Bridges, also named Florentino Avidos in 1928*[8]". At the same time as the government established a contract to carry out the works for the Port of Vitória, the *Societé de Construction du Port de Bahia* was commissioned for Prince Island's contour pier works "*of the stake-boards type, the landfill of the fringe marshy areas and mangroves, as well as the opening of streets in the existing and added land*"[9].

The 1929 Report emphasized that these works would not represent any onus to the State, so the *Societé* had to obtain its own financial resources and get revenue from the selling of the new land. The state would be responsible for the paving of the streets and sidewalks, the support walls, the rain-drainage, and the provision of water and sewage, stating that "*Vitória w[ould] be provided with a wide area for building in a picturesque and easy-access place*"[10]. Such an aspiration was expressed in an article issued in 1929 by the magazine Vida Capixaba, focusing on the benefits of Prince Island's marshes and mangrove landfills. The government envisaged a new neighborhood for the city as part of the Plan for Urban Gentrification and Remodeling of the Capital to be prepared by the well-known architect-engineer Saldanha da Gama[11].

Since then, up to the end of 1930, references to landfill interventions in the region were scarce in government reports. Investments were restricted to complementary or minor works, representing a gap of almost 10 years of unsubstantial works in the region. During that period, the state government moved its attention to the links between the capital city and the countryside, with investments in road and rail infrastructure[12]. It was only in 1939 that landfills were considered again, but only in a few streets of Prince Island. No emphasis was given to the region as government directed its attention to the so-called Novo Arrabalde, an area situated in the opposite direction to the city[13].

According to Rangel (s. d.), in 1917 - more than 10 years before the first landfill - a project already indicated the transference of a public hospital, then located on a small hill in the surroundings of Prince Island. This indication was considered again in the 1931's Urbanization Plan for Vitória, proposed by Henrique de Novaes[14]. Figure 2 presents an overview of Prince Island in 1936 and shows the few number of landfills accomplished up to that year.

Figure 2 General view of Prince Island in 1936.

It is important to point out that neither of the plans expressed intentions has materialized up to the present date. In spite of all plans, only minor works were carried out in the region from 1930 up to 1943[15]. Up to the 1950s, little change occurred in this situation. Actions, and, in turn, investments of the following government were directed to the beaches in the northeastern part of the Island of Vitória. Santos Neves promoted an extensive landfill adjacent to the Port, aiming at extending the commercial area of Vitória up to the so-called Esplanada da Capixaba, almost disregarding plans, efforts and investments that had been previously carried out in the area of Prince Island. Along with Esplanada da Capixaba, Santos Neves's plans were oriented to the lands in the opposite direction. His landfill proposals involved the opening of an access from Saint John's Fortress (Forte São João) towards Bento Ferreira region (also object of extensive landfills during the 1960s), on the way to Novo Arrabalde, which had already begun to consolidate[16].

These facts show that it was not for the lack of financial resources that Prince Island and its region were mostly forgotten for about 30 years allowing irregular occupation. The government reserved only "good intentions" for the region. Nevertheless, as the initial quote of this paper indicated, small land-filling did not cease. This was done by individuals and groups taking advantage of the opportunity to make room for their irregular housing.

In 1957 the local government issued a law establishing the procedures to conclude the works and the limits of the land-filling from the area situated between Florentino Avidos Bridge and Smith Harbor[17]. According to that law, the new area gained in the bay was to be divided in plots and sold in public auction. However, all necessary works continued unfinished and, with an uncertain future, up to 1960. The 1961 Report describes the provision of federal government resources to deepen the access canal to the Port of

Vitória. This made the landfill to the eastern part of the island viable, so it joined Prince Island to the Island of Vitória. The local government aspiration was once more, the "*beautification of the capital city*" together with the gaining of land "*needed for its growth*"[18]. This was the first response to the law issued in 1957, and the way to make the landfill viable was only through federal investments in the Port of Vitória.

It is worth pointing out that it took more than 30 years for the conclusion of the land-filling, but its urbanization was still uncertain. Figure 3 presents an overview of Prince Island in the early 1960s with the landfill concluded, but not yet urbanized. In this respect, the Port (i.e. federal government resources) was responsible for the conclusion of the land-filling, but the embellishment of the city did not materialize.

Regarding this, in the year of 1967, Governor Christiano Dias Lopes Filho, finding nothing "*picturesque*" in the situation of residents in the region, set up a work-group to elaborate studies aiming at the urbanization of Prince Island itself and its surroundings, including their landfills, with the hope of "*new-quality spaces, in the city center*"[19]. Again, the solution was to use the waste obtained to deepen the access canal to the port.

The picture outlined above reveals that, almost a decade after Prince Island had been incorporated to the Island of Vitória, the situation of the region was not assured at all, although it was not for the lack of financial resources, good intentions, ideas, plans or projects.

At that time, among the urbanization plans that had been produced, no reference was found in government reports to a particular one. Our investigations up to present have not been able to find out the reasons for such an omission. As contradictory as it may appear, it was commissioned by the Administration of the Port of Vitória[20] and encompassed a great deal of virtues. These related facts make it an intriguing piece of investigation.

The Argentinean-Brazilian urban planner Adina Mera and her proposal

At this stage, it is important to present some information about the plan itself and the planner commissioned to produce it as related to the government's intentions. Meticulously designed by Adina Mera, it was oriented to the urbanization of the landfill area to the eastern part of Prince Island, including the Island itself. She presented it in 1962 to the Administration of the Port of Vitória. So far the only document found (and the only source of investigation) is the written report for the project and refers to a set of drawings, tables, sketches and maps not accessible yet[21].

Apparently, any information about Adina Mera and her work does not seem to be of much consideration since no published study has been identified. In an attempt to enlarge the sources, I carried out a set of interviews either with Miss Mera's professional peers or her personal friends[22]. Some additional information about her has been identified from the archives of The Regional Council of Engineering, Architecture and Agronomy - Section of the Rio de Janeiro State - CREA/RJ and the Institute of Architects of Brazil - Section of the Espírito Santo State - IAB/ES[23].

Lorenza Adina Mera was born in 1927 somewhere in Patagonia, Argentina[24]. Her fascination for the so-called first world led her to Paris where she took a postgraduate course[25]. Given her tall slim and elegant figure, together with the help of a close Parisian friend, she was able to support herself with some modeling work. By the late 1940s she came to know Ms. Henda Freire at the Argentinean House of the *citè universitaire* in Paris, where both lived. At that time, she developed meningitis and was advised to avoid the severe Parisian winter temperatures. Maria do Carmo Schwab points out this event as the main reason for her coming to Brazil around 1951, when once again she worked as a model. Four years later she was able to finish her post-graduate course in Urbanism at the National Architecture School of the University of Brazil [Escola Nacional de Arquitetura da Universidade do Brasil], nowadays Federal University of Rio de Janeiro. According to CREA-RJ's archives, she was granted the title in January 1956.

Interestingly, Mera was taking some disciplines at the undergraduate course in Architecture and at same time doing her post-graduation in Urbanism. One of the subjects she did with Maria do Carmo Schwab was Brazilian Architecture, which she knew very little, according to Schwab, but on which she would became an expert some years later. Schwab, Fernandes and Azevedo believe she took some disciplines at the Undergraduate Architecture Course to revalidate her first degree, in accordance to Brazilian regulations. Detailed information about Mera's First Degree is still unclear, but the important fact is that she gained legal permission to work as an Urban Planner registered at CREA/RJ.

Mera fitted well into the elite of Rio de Janeiro. Oliveira and Nicolaeff, in their contextualization about that time, remind us that the ruling elite of the capital (DC) was much the same in professional, cultural, social, economic and political terms. Mera had a very good professional relationship with Helio Modesto, a well-known carioca architect with strong political and professional contacts[26]. She had the opportunity to be introduced to and work with Burle Marx, Afonso Eduardo Reidy, and some planners in the circle of Lucio Costa and Oscar Niemeyer.

All interviewers agreed that her adaptability was a great virtue[27]. Her characteristic of deep commitment was ideally suited to her choice of urban planning at that moment. Metropolitanization was top of the agenda so she joined a team responsible for the study that led to the creation of Metropolitan Regions in the country[28]. Those facts emphasized her versatility and competence, also expressed in the articles she wrote for IBAM's Magazine for Municipal Affairs [Revista de Administração Municipal - RAM][29]. During her professional life she was actively involved with architects and the Institute of the Architects of Brazil - Regional of Rio de Janeiro State - IAB/RJ. Her contribution and participation were so intense that she reached a position as a member of the Higher Council at a national level.

In October 1976, a commission formed by five regional representatives indicated by the Higher Council produced a document expressing IAB's ideas about the urban policy in

Brazil; Mera was among them as a representative of IAB/RJ. The document stated that *"[t]he people's active and direct participation [wa]s paramount to processes of elaboration and implementation of an urban policy. [...] Only the power and the inherent pressure of public opinion and support, well organized and informed, w[ould] assure a process of reform, of our urban reality, even if it [were] partial"*[30].

In his interview, Santos overstates that Mera was one of the "*arms*" of the SAGMACS[31] group in Rio de Janeiro, primarily formed by a staff led by the Dominican French priest Joseph Lebret to apply the principles and methods of the movement known as Economy and Humanism. In Brazil, the group, initially from São Paulo, included some important professionals who in 1956 developed a plan for the urban agglomeration of the capital city[32]. SAGMACS came to influence a generation of professionals of the social sciences all over the country, such as Helio Modesto, Francisco Whitaker Ferreira and Antonio Bezerra Baltar, Mera's close friends, with whom she kept in contact for many years and shared her experiences, ideas and ideals.

At a time when decisions and know-how were centralized, the group believed the locals understood their realities - needs and problems - better than outsiders. However, they did not have the technical resources to deal with them adequately and make their realities prosper[33]. Consequently the group identified a need for widespread knowledge and decentralizing actions. The SAGMACS' report for São Paulo, for instance, recognized the Urban Department of Municipality as the best qualified to carry out the Master Plan with its own professionals. In this respect SAGMACS would only be in charge of general recommendations to the municipality[34]. The ideas expressed by Francisco Whitaker Ferreira, who always expressed strong commitment to the Economy and Humanism movement, constitute one of the pillars of the Course on Methodology and Projects for Urban Development - CEMUAM[35].

Ferreira's book of 1966 set up a series of guidelines devoted to the organization of the territory based on updated social and economic demands. That was necessary to strictly organize activities for human needs, aiming at higher standards of living of the population involved. His definition of development followed the movement's commitments[36]. Ferreira classified living conditions into nine fundamental groups: housing, education, health, leisure, transportation, consumption of goods and services, work and income, communication, and environment. The quality, availability or provision of these conditions can be evaluated according to three levels: the basic, fundamental or essential for human living; the comfort or commodity level in which living conditions are made easier, and the overwhelming or conquering level, that improves mankind's cultural and social activities and skills. The author also identified a set of seven variables of the territory: separation, polarization, localization of uses, system of uses, land occupation density, road structure, and composition of built elements.

After having defined these conditions and variables, he proposed a cross tabulation among them and variables could be evaluated by a Table of Conditions and Interferences. Ferreira presented three levels of interference: essential, intermediary and desirable, which, once completed, would allow a comprehensive assessment of

living conditions, leading to a hierarchy of needs. Along with the evaluated levels, this process would indicate possible solutions. This book is of seminal importance for CEMUAM's methodological approach.

Mera shared the same point of view and supported it in a publication in 1965, an IBAM's Technical Sheet, which specified much the same as Ferreira's proposed living conditions regarding the provision of urban facilities[37]. She was convinced that municipalities that acquired technical knowledge were more qualified to design their own plans than outsiders[38].

At this stage, it is worth noting that local authorities in Brazil have always had administrative autonomy but scarce financial resources to fully exercise it. The state and federal government were in charge of most financial and technical support, and there was a Department for Municipal Affairs to assist local government. The situation remained unchanged from the 1940s up to the constitutional revision in the 1980s.

It was in this scenario that CEMUAM was conceived. The course was designed for professionals from public or private institutions with actions towards local development like municipalities, state secretaries or councils of planning and inland affairs, institutions for municipal assistance, as well as courses, regional and federal institutions oriented to urban development at a local level. Its objectives were to prepare personnel to integrate or to be in constant contact with local planning teams of small and medium sized cities. The focus was on development regarding local authority, resources and needs for better management in all aspects of municipal administration, such as urban services and infrastructure, administrative, financial or legal issues.

Any course candidates should be formally recommended by an institution as indicated above. In addition, the candidates had to sign a Commitment Term as an agreement to apply the acquired knowledge at the institution, after their period of training[39]. CEMUAM was an eight-month full-time course, five months in Rio at IBAM and three months in a previously selected Brazilian municipality within a given region. During the first five months, the students would get in contact with the methodology itself, the municipalities' problems and possibilities, as well as with their group. There was specific training for team work with the aim of incorporating local personnel.

During the first five months field work was prepared and data on local reality started to be approached. A list of life conditions and possible infrastructure and service was prepared to be checked along the period of field work. A three-week pilot was also developed to test the methodology, its steps and the group's general attitudes. Referring to the groups, it was important that they should assume a didactic approach in sharing their knowledge with the locals, employees in particular and, if possible, the population.

CEMUAM started to form professionals in 1965. Mera coordinated the course up to 1976, issuing six editions along that period. Then she came to the conclusion that it was a finished work and found no purpose in continuing such training. Azevedo points out

the one of the reasons for her decision relates to the fact that the course did not fully achieve one of its main goals - the training of professionals to work for the local government. She would often complain that many ex-CEMUAM students' - the *cemuars* - took the course as a bridge for Master and Doctorate degrees. A *cemuar*, was (and still is) understood as a select group of professionals with guaranteed competence and valuable expertise. Contradictory to Mera's pursuit, such an excellence resulted in distorting her original intention.

IBAM did not share Mera's conviction and invited a close friend of hers, a former student of the course, to coordinate its eighth edition in 1978. From 1978 onwards eleven editions of the course were made once a year until the last one in 1988. It was the same year when a new revised constitution was approved and established a financial reform in the three levels of power - country, state and municipalities, making the latter more independent in financial terms. Resources were directed to the local government and states were forced to extinguish their technical assistance departments. CEMUAM, primarily financed by state and federal governments, could not survive. Along seventeen editions CEMUAM qualified not only Brazilians but also other Latin American professionals, totaling over 350 urban planners.

Soon after leaving CEMUAM in 1977, Mera abandoned her work as an urban planner; she grew disillusioned with her profession. Most interviewers argued that after giving up planning, she would fiercely avoid any conversation involving the matter. In 1981 she left the city of Rio de Janeiro to raise goats on a farm in the mountains nearby. At that time, she had already developed cancer. She returned to Argentina, possibly expecting to be closer to a sister, her only relative, but she became disenchanted with the whole situation she found in her home country, and returned to Brazil. The business at the farm was not doing well; the goat breeding declined and she died not long after, in December 1984.

In 1994, IAB/RJ issued the *Adina Mera Award for Projects in Low-income Housing* to celebrate the 10th anniversary of her death, in recognition of her passion and contribution to the class of city planners. Her passion was also revealed in many poems she wrote, either praising or censuring some aspect of the city, but always dedicating them to a professional friend, who she believed would support or contest her thoughts[40].

At this point it is important to comment on Mera's proposal for Prince Island as it may reflect many of her professional beliefs and attitudes as discussed above[41].

To obtain information for her proposal to Prince Island, Mera made contact with the Federal University of Espírito Santo and organized a survey carried out by the students of Sociology ("the course in architecture did not exist in Vitória", as her architect friend Schwab points out). The research took into account not only local and immediate problems but it was broadened to contemplate possible consequences of the urban growth that could affect her proposal. It started with a detailed diagnosis of the urban agglomeration as a regional center, as well as of the ability of the city to influence its surroundings and how to supply the demands of urban infrastructure and services. She

produced a series of nine maps to illustrate the various aspects of her research. Each map analyzed a specific topic which led to some accounts or scenarios addressing to a set of options or distinct proposals. The proposals were later detailed in another set of drawings of seven maps[42].

The initial set of nine maps included detailed investigation, comprising land-usage according to neighborhoods; potential consumption of the population; distribution of the population according to territorial and socio-economic characteristics; provision of electricity (public and private), telephone; water, sewage and surface drainage; food availability; pedestrian and motorized accessibility (transportation and traffic); and fishery, to define a preliminary zoning. A study about the population growth and its effects on the availability of urban facilities led to a series of propositions that were beyond the requirements of the original commissioning. However, it was in line with the planner's vision and was of paramount importance for the success of the urbanization of the region.

Mera presented her proposals with the aid of the seven land-use maps. The proposals included a new bus station, a commercial and produce center, institutional areas, fishery facilities, and areas for ship repairing (considering the expanding activities of the Port). In addition, it considered recreational activities (open green spaces and squares) for pedestrian areas. All facilities were structured for adequate access into and out the Island of Vitória. Other proposals involving urban accessibility in general terms for the municipality comprised private, mass and trucking transportation with the definition of parking areas for each of them, all based on a hierarchy of the road system map that helped subdivide the previously defined blocks into smaller plots.

She proceeded by defining the necessary phases for the execution of the public works from first to last to be implemented. She also set conditions in the cases of demolition and replacement of irregular dwellings in the region, along with guidelines and pre-requisites for any necessary property acquisitions by the government in the interest of the society, to assure viability of the proposals.

In spite of all these considerations, Mera's detailed and careful urbanization plan by itself would not be enough to change the fate of Prince Island. In the following years the region continued to expand by land-filling, for which the government kept on committing nothing but "good intentions".

The expansion to the western part of Prince Island.

The analysis of the expansion process towards the western part of Prince Island falls beyond the scope of this paper. Some words can demonstrate that the situation did not experience much change.

In 1967, with the help of the Port of Vitória, among other institutions, a new proposal for land-filling was made. Guanabara Company for Technical Consultancy in Urban Affairs, [Empresa Técnica de Urbanismo e Consultoria da Guanabara] was commissioned to

study the technical and economic viability of the proposal. The Port of Vitória was to be in charge of the work as it had the experience in similar land-filling.

It was when the land-filling "*reclaimed*" the marshy areas of the western part of the Island. The reclaimed area was more than three times the area of the land-filled completed some twenty years before, along Esplanada da Capixaba, adjacent to the Port of Vitória[43]. The project was carried out by a group of preeminent engineers and an architect, taking into consideration the use of this land along the same lines indicated in Mera's proposal. However, this time they focused more on accessibility aspects of the region and the city[44]. It is possible that the fact of Mera's proposals had not been implemented could exacerbate such an emphasis on accessibility. In other words, if Mera's proposals were taken into consideration that emphasis might not have happened.

To sum up, reiterating the government's "good intentions" of integrating the new acquired land to the urban area of Vitória, again it projected the same purposes suggested by Mera, based on the provision of the same sort of urban facilities and equipment she projected. The government, yet again, justified its position on the basis that a "*progressive urbanization project would ensure radical transformation of the area's complexion bringing a new dimension to the State's metropolitan center*"[45].

In this respect the government authorized the start of the work to implement the new project[46]. The efforts were not sufficient and in 1971 the government continued to persevere. In 1972, to make it possible the construction of the new bus station, 60 families were resettled along the northwestern fringe of Maciço Central in the Island of Vitória[47] and in 1973 the government decided to remove and relocate the 326 irregular dwellings[48]. As already argued, during the 1950s land-fills were oriented towards the northeastern part of the Island of Vitória. Then, government shifted, once more, to another direction and concentrated investments in the western part of Prince Island[49].

In 1976, a report by COMDUSA stated that "*the project for Prince Island w[ould] provide the Capital with an area of 150.000 square meters and its conclusion [was] dependent upon the location of the access of the so-called Second Bridge*"[50]. By the late 1970s, the region was still used to dispose rubbish and solid fill, turning into a place "*where a favela was growing bit by bit, lacking minimal conditions for living*"[51]. The same report argued that the studies which initially dealt with the uses to be given to the land-fill "*evolved*" [sic] according to the new uses envisaged to the place. The government continued on and on promoting and changing the purposes for that area from 1969 up to the 1980s. COMDUSA, whose primary activity was to undertake the public works for sanitation and urbanization of those areas, was not able to conclude the necessary land-filling of the marshy areas.

It is worth noting that in this extensive period of time, the studies always "*evolved*" with regards to new or updated definitions and changes in intentions to the sites. The project for the construction of the Second Bridge was presented in 1977 and the land-filling support started and finished in 1979. At the beginning of 1980, from the Second Bridge

towards the western part of the Island of Vitória, the land-filling reaching the region of Santo Antonio was only 35 percent concluded[52].

The local newspaper *A Tribuna* (April, 29 1980) pointed out that an approximate 200-square-meter area was to be urbanized. A public bidding was published and the submissions for the execution of the work were to be judged the following month. The article also detailed that the bidding was for the work of a retaining wall, land-filling and paving[53].

Concluding remarks

The facts presented point out that since 1929 many land-fills have been added to the edges of Prince Island and, as they succeeded, the purposes for their utilization changed while irregular occupation was taking place. The unstable policies, along with the disposal of waste material and solid fill, did not contribute to its occupation as desired by governments.

Nowadays the residential part of the Island constitutes an area lacking appropriate urban infrastructure and public spaces. Despite the absence of high-rise buildings, it has high occupation of the plots and scarce public spaces which make it a high-density area both in population and in construction terms as well. Figure 4 is a detail of Figure 1 and reveals the morphology of Prince Island's residential area and its surroundings, nearly four times the original island. This figure also illustrates the streets length and design, as well as the positions of the buildings inside the plots.

Figure 4 Prince Island and surroundings.

The occupation, quality of constructions and public spaces of the land-fill region present characteristics that are far beyond the investments that were made. Irregular occupations succeeded and remained, resulting from both a lack of implementation by the government and an excess of these plans. The excess was due to long periods of

627

changing intentions and indecisions by the government regarding its urbanization. Such situation, in a way, kept the residential area isolated within the Island to the added area as well as to the city as a whole. This is related to access, provision of infrastructure and services, and especially to "indecisions" or changes in the orientation of the desired growth for the city, whose land-fills proposals have never been clear by government.

As an additional argument, it is possible to assume that the government, in its "good intentions" towards the area, has always commissioned important professionals (Mera included) in order to produce skilful and adequate solutions for the site. If the governments really demonstrated good intentions for the area, they showed uncertainties about its development. In this respect, commissioning might have worked as a way of appeasing society - the elites in particular, by expressing commitment to the development of the region. If this is taken as true, the proposed plans can be seen more as marketing than commitment.

Adina Mera's efforts would never be able to change the situation in spite of her meticulous examination and propositions. Apparently, the State Government was unsure about the area itself and about the growth of the city as well.

The facts presented in this study highlight a sound contribution from Mera, not only in terms of planning and teaching, but also for the political role she played, promoting the necessary changes towards a more consistent and effective definition of an urban policy to meet the highest social ideals.

One wonders how a person that used to write odes to the city could abandon it. The fact is that she did not live long enough to find out what happened a few years later, and the evidence presented as follows, in one way or another, indicates victory for Mera's ideas and ideals.

Fernandes argues that in 1988 the "right to the city" was eventually recognized as a collective right, with the promulgation of the Federal Constitution, which established the autonomy of municipal government in legal, political and financial terms, to an extent that Brazilian Federalism has been considered one of the most decentralized in the world[54].

In addition, the Federal Law no. 10.257, entitled "*City Statute*", was enacted in 2001 to regulate the original chapter on urban policy introduced by the Federal Constitution of 1988, after an intense negotiation process that lasted over 30 years. Fernandes claims that the Constitution not only recognized Lefebvre's "right to the city" in Brazil but also "confirmed and widened the fundamental legal-political role of municipalities in the formulation of directives for urban planning, as well as in conducting the process of urban development and management".

He follows by adding: "Moreover, the City Statute indicated several processes for municipalities to integrate urban planning, legislation and management so as to democratize the local decision-making process and thus legitimize a new, socially

oriented urban-legal order. Several mechanisms were recognized to ensure the effective participation of citizens and associations in urban planning and management: audiences, consultations, the creation of councils, reports of environmental and neighbourhood impact, popular initiative for the proposal of urban laws, public litigation and, above all, the practices of the participatory budgeting process"[55].

These pieces of evidence show that Mera's ideals definitively started taking shape. Those technicians who did not return to the local government after training, and disappointed her by following an academic career, by taking their masters and doctorates, ironically may have defined that shape even more. Today, many *cemuars* may well constitute a legion of university lecturers and professors, who have formed generations of Architects and Planners whose minds and hearts will perpetuate some of Mera's ideas.

---

[1] The Federal Republic of Brazil includes 26 States, totaling 5.563 Municipalities and one Federal District (DC). The state of Espírito Santo, of which Vitória is the capital city, is one of the smallest states in Brazil. Vitória is some 600 hundred kilometers north of Rio de Janeiro city. The municipal government is the unit of local government and it comprises rural and urban areas. The municipality of Vitória is an exception among most municipalities of the country. It is 100% urban and includes the Island of Vitória, some smaller islands and a mainland, totaling 81 square kilometers. The built-up area of the island represents about one third of the land surface. The remaining area consists of a mountain, Maciço Central, surrounded by marsh areas and mangroves. The total population of the municipality amounts to some 350.000 inhabitants. Other four cities that surround the capital city form a continuous urban area (conurbation) that shelter**s** more the 1.500.000 people, according to the latest official projection for 2004, based on the 2000 census. See: http://www.ibge.gov.br/home/ and also http://www.ibge.gov.br/cidadesat/default.php [accessed in March 17th 2008].

[2] Such an inventory is published in Leme, M. C. da S. (Org.). **Urbanismo no Brasil 1895 – 1965**. (São Paulo, Studio Nobel, FAUUSP, FUPAM, 1999), and later included in the CD-Rom **urbanismo.br,** and is also available though the web address: www.urbanismobr.org.br.

[3] Figure 1 (and Figure 4 presented later) uses as a base the 2005 Map of the Municipality provided by Prefeitura Municipal de Vitória. These figures have been produced based on old maps, drawings, photographs as well as descriptions from a variety of sources. As such, they constitute a graphic representation of the land-fills obtained for approximation, not intending to be geographically accurate.

[5] The research focusing on the landfills and urbanization projects of Prince Island started in July 2007 and it is still in progress. It has been designed to take two years in order to cover the whole period between 1920 and 1980. The difficulties faced, as well as the obtained results so far, suggest that complementary research might be necessary.

[8] Nowadays, Florentino Avidos Bridge is also called Five Bridges because it is made of five metallic sections linking Prince Island to the continent. Formerly, the sixth section used to link Prince Island to the Island of Vitória. Today this section is called Dry Bridge (Ponte Seca) because it is over the landfill area that extended the territory of Prince Island to the Island of Vitória. It started being built in 1926 but it was aspired since 1910, when the government issued Decree number 7.994 on May 12th. For further details see: Espírito Santo. [22] Interviews carried out from December 2007 to February 2008 include personal and professional friends from Vitória and Rio de Janeiro as follows: 1) Freire, Henda da Rocha, Mera's personal friend and one of the persons that knew her prior to her arrival to Brazil. The interview was carried out and recorded in Rio

de Janeiro on February 1st 2008. This interview also had the participation of Azevedo, Marlice Nazareth Soares de, another personal and professional Architect friend and former student of Mera. 2) Schwab, Maria do Carmo, Architect and personal friend of Mera during Schwab's Undergraduate Course in Architecture in Rio de Janeiro while Mera followed her Postgraduate degree in Urban Planning. Interview: carried out on the 19th of December, 2007 in Vitória. 3) Interviews carried out (and not recorded) at the Brazilian Institute for Municipal Administration [IBAM - Instituto Brasileiro de Administração Municipal] in Rio de Janeiro with Business Administrator Pinto, Mara D. Biasi Ferrari and, Architect and Urban Planner Santos, Alexandre Carlos Albuquerque, in turn Consultant for Special Projects and, Economic and Social Development Director, both professional peers for a short period of time (January, 31st 2008). 4) Nicolaeff, Alex, Architect and professional peer (Rio de Janeiro, February, 6th 2008); 5) Fernandes, Almir, Architect and Urban Planner professional peer (Rio de Janeiro, 7th February 2008); 6) Oliveira, Aloysio Müller de, Lawyer and close personal friend from the 1950s up to mid-1970s (Rio de Janeiro, February, 19th 2008). Transcriptions of these interviews are still in progress and when completed will be submitted to the interviewers for approval to make them available in the Brazilian National Library.

[23] CREA - Conselho Regional de Engenharia, Arquitetura e Agronomia is the institution that regulates professional's activities, from which one has to obtain a permit to work as an Urban Planner. The President of the Institute of Architects of Brazil - Section of the Espírito Santo State - IAB/ES, Repsold, Gregório produced an *Introduction* attached to Mera's proposal for Prince Island, to illustrate her professional activities in the State at the time she died in 1984. The compilation was to support a Local Councilor [Vereador] to propose a *post-mortem* tribute to be approved by the Municipal Legislative in recognition to her professional activities in the State of Espirito Santo. Such an introduction was also based on interviews.

[24] Place of birth stated in CREA-RJ files is Port Nest, a possible misspelling for Port Brest (Patagonia, Argentina). This is still to be clarified.

[25] Her undergraduate background is unclear. An Argentinean newsletter of 2004 recognizes her as the first female industrial engineer of the country in 1944. Further details in the following link accessed in March 17th 2008. http://biblioteca.iapg.org.ar/iapg/ArchivosAdjuntos/Petrotecnia/2004-6/NovedadesEmp.pdf. Bom Retiro: permanence of urban fabric and movement of foreigners

Sarah Feldman
University of São Paulo, Brazil

Introduction

Up to the end of the nineteenth century, the most densely urbanized area in the city of São Paulo remained surrounded by a "belt of chácaras" (agricultural-production and weekend-leisure areas). With the development of coffee plantations and construction of the railway operated by the São Paulo (Brazilian) Railway Company Ltd., those green areas underwent an intense urbanization process, giving rise to a group of districts that were (re)structured, shaped, and transformed with the participation of different groups of foreigners. The social and spatial paths of those foreigners and the strategies of material and symbolic appropriation of those districts are not dissociable, at each moment, from the changes in the economic political and social context of Brazil and the immigrants' countries of origin.

The development of those districts are in consonance with the development and the transformations of the traditional downtown area of the city of São Paulo. Since its origin, the downtown area was structured beyond the paradigm of the Central Business Districts (CBDs) characterized by the density of activities considered central – retail trade, private services, leisure areas – excluding public administration activities, public services, and central administration of the productive sector[1]. The São Paulo downtown area didn't follow this model because it incorporated not only retail trade, leisure and services areas, but also a comprehensive group of institutions and facilities of extra-local importance such as wholesale trade, governmental bodies, schools, etc., in addition to dwellings. The districts surrounding the downtown area were developed as its extension, by the dissemination of administrative activities, by the arrangement of business centers closely connected to industrial production and specialized service centers, and by the presence of diversified groups of residents. One can also include those districts in the category of central districts expressing the ambiguity that characterizes them – neither a district (neighborhood) nor a downtown area[2]. Their daily activities are not restricted to the neighbors but incorporate an experience in line with the metropolitan life that starts to be created in São Paulo in the first half of the twentieth century.

Central districts are continually rebuilt, not necessarily through the logic of demolition that dominate the production and reproduction of urban space in São Paulo, but through the permanence of their physical structures, requiring an understanding of the economic processes operating in the city beyond the real-property capitals, as well an understanding of the territory appropriation strategies that are combined to make possible the coexistence of diversified groups and similar universes of social representation.

Foreigners are fundamental for the understanding of physical, demographic, economic and social transformation processes, as well as cultural standards and consumption habits existing in the city of São Paulo. By the end of the nineteenth century, from the time slave labor was replaced by salaried work, Brazil attracted large numbers of immigrants. It is estimated that 75% of immigrants arriving in the country from 1850 to 1950 were Portuguese, Spanish, and Italians. From the almost 4 million immigrants that came to Brazil from 1890 to 1930, around 60% remained in the State of São Paulo, working in agricultural and industrial activities. Those immigrants participated in such activities as industrialists and front-line workers. (Oliveira, 2001; Hall, 2004:121.) In 1936, more than 8500 factories in the state São Paulo employed more than 250,000 workers.More than 4500 of those factories belonged to Brazilians, 2,248 to Italians, 579 to Portuguese, 309 to Syrians, 150 to Germans, 76 to Japanese, 53 to Austrians, 24 to English, 22 to French, 12 to Americans, 4 to Canadians and 310 to people coming from other countries.[3] In the city of São Paulo, in 1893, about 55% of residents were foreigners and in 1934, 67% were foreigners or foreigners' descendants.

Although foreigners are present in many central districts of São Paulo, in Bom Retiro the permanence/passage of immigrants takes a particular configuration. Each group establishes not only labor but also residential relationships with the district, and in this double insertion each group builds social, cultural, political, and religious institutions. Foreigners get settled in what is already built and existing, considering that the district has few moments of physical renewal. It is a district where "tenants" change successively, and each group imprints its material and symbolic marks making the district an overlapping of identities.

This paper analyzes the process that promotes the consolidation of Bom Retiro as a garment district as the basis of the particular form by which the relations between spatial and social processes are drawn in the district, the importance of foreigners in this process and the relations between this process and the development of downtown area and central districts in São Paulo.

Bom Retiro: the successive movement of foreigners

By the end of the XIXth century and the first decades of the XXth century, foreigners who arrived in São Paulo came with contracts that included boat tickets, railroad transfers and work at coffee plantations. Those who remained in the capital city or returned from the farms sought housing and work in industrial districts located close to the railroad stations and the downtown area. Bom Retiro was one of those districts. However, the presence of foreigners preceded the urbanization outbreak . The engineers who participated in the opening of the railroad acquired *chácaras* that were used as meeting places of the English community then settled in São Paulo. That was the case of Chácara Dulley, owned by Charles Dimmit Dulley that sheltered an elite club, the São Paulo Athletic Club, where the first football games took place in the city. São Paulo's first public garden – the Botanic Garden – opened in 1825 in one of the boundaries of the future Bom Retiro district – close to river Tietê and adjacent to the downtown area – may be considered an initial mark for the establishment of those

chácaras used as a weekend retreat for the elites, delimiting a leisure area between urban and rural territories[4].

The first urban activities emerged with the opening of the railway in 1867. At a first moment, workshops and construction materials warehouses were installed close to the rails to meet the needs of the company and of its employees – the first category of significant salaried workers. One of the pioneers in the urbanization process of the area that will become the Bom Retiro district, was Mr. Manfred Méier, an Alsace Jew: he bought large tracts of land close to the railroad line, opened streets, divided them into lots ready to receive constructions and installed the city's first large brick factory – *Olaria Manfred*. The English also participated in this process, subdividing their *chácaras* into several building lots[5].

With coffee traveling through the São Paulo Railway, the connection between the capital city and the port of Santos became the major trading axis of what Singer (1968) calls "king product of Brazilian exports". From 1890 to 1900, São Paulo sheltered a significant financial market, with national and foreign banks, wholesale trade consisting mainly in importers, retail-trade stores, hotels, liberal professional offices, farm-owner homes, factories and workers' homes. (Saes, 2004). Along with the soundly insertion in the great coffee business the city's population grew fast: 28,000 in 1860, 65,000 in 1890, and 240,000 in 1900.

That dynamic caused an impact on Bom Retiro's occupation process. In the first years of the XXth century, the urban structure was already clearly defined through the streets connecting the two extremities of the district : the Railway Station and the Tietê river. The main street was called Rua dos Imigrantes (Immigrants Street). In 1882, the first hostel where immigrants who arrived in the port of Santos, traveled through the mountains by the trains of the São Paulo Railway and got off at the Estação da Luz were temporarily sheltered, was built in the district.[6]From 1870 to 1890, many Portuguese settled in the district and from 1900 to 1940, Italians prevailed. Up to 1940 the Portuguese formed the second group of immigrants in São Paulo, totaling almost 15,000 in 1893 and almost 65,000 in 1920. In 1893, Italians totaled 34% of residents; at the start of the twentieth century Italians accounted for 50% of immigrants, and continued as the largest foreign group in the city up to 1940.

Jews started occupying the district in the 1920s. At the end of the XIXth century Jews came from North Africa, Alsace, France, etc. to several regions in the country, but the largest groups of immigrant Jews arrived from 1916 to 1920, during the World War I and the Russian revolution; in the 1930s, when unemployment problems were worsened with the economic crisis of 1929 that reached Europe, and later with anti-Semitism and Nazi persecution and after World War II. Therefore, the first group consisted in Russian Jews coming from the breakdown of the Czarist empire; the second consisted in Polish Jews, mainly from small towns or villages, ant the third consisted in Oriental Jews. The census identified 17,219 Jews in 1940, and 22,808 in 1950, in São Paulo. (Truzzi, 2001; Hall, 2004:144).

Greeks, Armenians and Syrians also lived in the Bom Retiro district throughout the twentieth century. The largest group of Greeks arrives in Brazil in the 1960s – about 80,000. São Paulo received the largest number of Greeks, and a significant number of them settled in Bom Retiro. Since the 1960s Koreans started to settle in the district and, in the last two decades, Bolivians started to arrive.

In this movement of foreigners who arrive and leave the district, the element of permanence to be determined is the working universe that was built in the district combining productive and commercial activities. Although, as several authors stated, Bom Retiro integrated together with other central districts the first group of workers' districts in the capital city[7], since its early occupation a tendency to small and medium-size autonomous businesses was outlined. A study about industrial activities in the State of São Paulo of the early twentieth century shows this   profile of the district:

> "There was also a large number of shoemaker stores, woodworker facilities, pasta, grease, oil, and writing-ink factories, foundries, dyeing and cleaning establishments, shoe factories, clothing and hat manufacturing facilities, that operated in workshops, in warehouse backyards, in sum: in places not seen by the public. The number of small woodworker facilities where sometimes only one man works (...) and of liquor and pasta (vulgarly known as "*macaroni*") factories, is incalculable (Bandeira Jr., 1901: 30)

Those autonomous businesses were somewhat connected to some type of specialization of immigrant groups. The Portuguese participated in manufacturing activities, but a large portion of them opened small and medium-size businesses, mainly in the food industry. Small grocery stores, butchers, greengrocery markets, cellars and bars installed in their homes. They sold food products also as door-to-door salesmen and street-market traders, eventually operating in the wholesale trade business, beyond the boundaries of Bom Retiro. (Hall, op.cit:133)

Italians accounted for the largest salaried labor group of the factories installed at the end of the XIXth century, and also developed other activities in the district: shoemaking shops, woodworker facilities, pasta factories, shoe factories, hat factories, tailors, bakeries, operating in the backyards of warehouses proliferated in workshops-often invisible in the landscape, in addition to backyard workshops that remained midway between commerce and industry. (Truzzi, op. cit.:4)

Unlike Italians, Jews did not come to work as salaried workers. They worked initially as door-to-door salesmen on the streets of the downtown area and in the district itself. Later they established their own businesses, in the clothing segment, making and trading ready-to-wear clothing. Greeks also worked in the clothes manufacturing segment and progressively in the textile industry. As from the 1960s, Koreans took over a large number of businesses and more recently Bolivians have been winning space in the district.

That business trend got strength in the Bom Retiro district as from the end of the 1920s when started a differentiated cycle that was completed in the mid-1940s. In that period a material and economic basis was organized, on which Bom Retiro got consolidated as a ready-to-wear clothing industry and trade center. Along almost two decades, occurred the process of installation of small manufacturing industries and of establishments selling clothes, threads, machines, etc. - establishments of all elements that support clothes production and the marketing.

This process consubstantiated the particular way whereby the relations between the spatial and social process happened in the district: the permanence of the urban fabric – here understood as the physical basis and the social fabric, as well as the continuous movement of arrival and exit of immigrants. Another trend that characterizes the district since the beginning was reinforced – the proximity between homes and workplaces. The home/production/ sale combination managed by the foreigners drew the central district profile of Bom Retiro – as a district containing the ambiguity that functional specialization annuls.

It was the location of Bom Retiro – the close proximity to the railway station combined with the access to the downtown area and other districts – that enabled the industrial activities to be combined with the commercial activities. A series of public improvements accomplished around 1900 got the conditions to this situation attribute. For several decades, the railroad constituted an obstacle to access the downtown area from Bom Retiro, although it was close to it. The construction of a viaduct and the opening of an underpass to cross over and beyond the railway encouraged the growth of commercial activities   along with the industrial production. Bom Retiro was enabled, from this moment on , to overcome the condition of an enclave and to become an integral part of the city.

Bom Retiro: the foreigners and the successive building of a working universe

From the end of the XIXth century to the end of the 1920s the textile industry expanded in Brazil to meet the domestic demand resulting from the increased population growth – especially from the lower-income classes. The fabrics to meet the demand from medium- and high-income classes were not yet manufactured in Brazil, as well as those for personal use. In addition, ready-to-wear clothing for the elites as well the fabrics used by tailors were also imported. The production was made in fabric and thread factories located in different points of the national territory, and the contribution of Italians to the textile industry was essential. The City of São Paulo concentrated large factories, some of them with more than one thousand employees, and almost 1,500 among more than 2,000 establishments all over the country belonging to Italians were located in São Paulo. (Carone, 2001:100-106)

One of the largest factories of the city – Fiação e Tecidos Anhaia Fabril – was located in Bom Retiro in the end of the XIXth century, close to the railway, but the district was not characterized as the favorite location for threading and weaving factories. Although very

relevant, because they determined to a great extent the district's urban functions, such type of factories did not predominate in the area. The trade businesses opened in the district, as from the second decade of the twentieth century, were closely linked to the manufacturing industry and structured according to the new modality of sales introduced at that time in Brazil – selling directly from the factory to consumers. In such combination, the manufacturer was also the trader whose workshop was an annex of the store, or vice-versa. (Maleronka, 2007:44)

Clothing factories were introduced in São Paulo as from 1870, and most were located in the city's downtown area. From the beginning, in addition to the large shops of that time, with more than two hundred employees, the activity was also developed by small businesses with minimum capital – second-hand sewing machines, four or five employees, a leased room – that were set up in spaces with a lower lease amount, around the downtown area. The capital city concentrated the production to meet the demands of the State's interior: in 1920, 70 of the 74 establishments of the State of São Paulo were located in the capital city – but up to that time the making of clothes by autonomous tailors and seamstresses usually prevailed (Maleronka, op.cit:39,44)

In the process of establishing direct sales to consumers through small businesses, as from the 1920s, the role of foreigners stood out. In addition to Italians, Syrians, Lebanese and Jews will be among the major owners of ready-to-wear clothing establishments. (Knowlton, 1950:143) In the 1940s, the progress of the clothing industry and trade in São Paulo was expressed by the installation of an industrial organization in large establishments for their own supply, and by the dissemination of small businesses. In 1946, there were over 6,000 establishments, employing more than 28,000 employees. Tailors' and dressmakers' production was maintained, but it was a moment of transition. Although the "true clothing standardization existing in the United States is not yet a reality in Brazil, credit sales facilities and advertising strategies were already expanding. (Maleronka, op.cit.:45;138)

As from the end of the 1920s the ready-to-wear clothing industry and trade started in Bom Retiro, and in the next two decades such process was consolidated. In that period, the organization of a material base structured the production chain, and the marketing of the ready-to-wear clothing factories was performed predominantly by Jews, whose immigration movement intensified at that time. The dimension those activities acquired in the city is expressed in the following figures: in 1937, 25.1% of the ready-to-wear clothing manufacturers, 16% of knitwear mills, and 24% of hat and umbrella manufacturers of the capital city were located in Bom Retiro (Egídio, 1940:241)

Between 1928 and 1945, 310 manufacturers settled in the district, and those establishments not belonging to Jews were less than a dozen. The first establishments of clothing and white linen came to the district between 1924 and 1927, and were owned by Italians. As from 1928, establishments owned by Jews started to appear. The district's clothing factories produced men's and women's wear such as *manteaux*, *tailleurs*, dresses, jackets, pullovers, cloaks, men's suits, in addition to raincoats, white clothes - blouses, dressing gowns, pajamas, shirts, robes, slips, briefs, *soutiens*, bed

linen, pillowcases, and children's wear such as suits, dresses, coats. Those clothes accounted for about 80% of the installed industry's total production. The remainder factories produced accessories such as umbrellas, caps, belts, suspenders, ties, shawls, handkerchiefs, handbags, and coin carrying cases. There were establishments that performed specific works such as stitches in clothes and embroideries in towels. [8]

Almost all establishments had at most four employees, characterizing them as family concerns. For the type of merchandise they produced and sold, particularly making suits and dresses, the Jews mobilized the craft of artisans and the practice of commercial activities from their countries of origin. Polish Jews, for instance, in the 1920s characterized a population that was almost totally urban and occupationally directed to trade and several professions such as shoemaking, tailoring, and mechanics. (Knowlton,op.cit.:128; Truzzi, op.cit:5)

This universe of installed factories aggregated, in the same period, packaging factories that produced wood and cardboard boxes, factories that manufactured "buttons, buckles, latches, and so on," factories that produced machines and accessories for knitwear mills, machines for weaving and looms, establishments for machine repair and remodeling, even factories that manufacture cash registers as well as graphic shops that produced commercial prints, cards, labels, and delivery notes. In other words, the district became almost totally self-sufficient to produce and market clothing and accessories, lacking weaving and threading factories only. In 1945, there were only two fabric factories in Bom Retiro. The largest fabric production center was located in Brás, a central district close by and of easy access through Bom Retiro.

Almost all factories were located, initially, throughout José Paulino Street, former Imigrantes (Immigrants) Street, where in the beginning of the nineteenth century small businesses selling food products and belonging to Portuguese were concentrated. José Paulino was the main street providing access to the district, as from Estação da Luz, to the downtown area, and to the districts located in the Eastern zone where the weaving and threading factories were concentrated**.**

At that time a large number of licenses for remodeling the existing buildings[9] were requested to the public administration on the streets where the factories were installed. Those activities lacked demolition and were installed in the pre-existing physical structures. At the same time, in other areas of the district, apartment buildings started to replace the existing structures, denoting the incorporation of the district in the modernization process going on in the city in the 1940s and 1950s.

There was a change in the scale of real-property production throughout the 1940s in Brazil, and São Paulo concentrated a huge portion of the national private investment in new building constructions. During the war, real-property construction was intensified as a field of profitable investments in the industry, trade, and agricultural exports, and the capital incorporated was consolidated as a production agent in the urban environment.[10] High modern buildings which combined residential, commercial activities and services emerged in downtown area and in the central districts.

At the end of the fifties, the competitiveness of other areas of the city combined with changes in the legislation and with the elite´s abandonment of the traditional center of São Paulo stopped private investments in downtown area and in central districts. In spite of the bulky public investments, mainly in highways and public transportation, accomplished in the 1960´s and 1970´s, the cycle of land values depreciation that took place in the fifties didn´t step back.. The non attractiveness for the real estate capital allowed the consolidation of the enlarged territory articulating downtown area and central districts as a metropolitan center appropriated for the lower and middle classes. These conditions favored the consolidation and the permanence of Bom Retiro as a garment district. It favored, actually, the prevalence of the commercial capital in urban economy.

As well as Bom Retiro, other central districts, specialized in other kinds of business, were at that time stabilized as powerful job centers of great importance for the city´s economy. Taking into account the functional diversity as well the multiple social groups living in those territories, central districts can be considered a counter-example to the urban model reinforced in São Paulo along the XXth century: more and more segregated spaces, of which poor peripheries and rich exclusive neighborhoods are representative.

It is worth mentioning that clothing factories were disseminated all over the city of São Paulo, and some factories belonging to Jews were located in the downtown area and in other districts. The concentration of so many factories owned by Jews in the district of Bom Retiro was unique, as perhaps the organization of an installed material base encompassing all the elements of the production and sales chain in a limited territory and so strongly concentrated in one group of immigrants was unique too.

It should also be pointed out that the Jews did not make up the majority of the district's population. In 1934, 64.4% of the residents were Brazilian and 35.6% were of other nationalities, including not only Jews, but also 11% of Italians. The high level of organization of the Jewish community elucidates its outstanding presence in the district. Since the immigration process to the capital city started, the community set up institutions to provide social assistance and economic support to the insertion of Jewish immigrants in São Paulo.

In 1912, the first synagogue of São Paulo was built in Bom Retiro by the "Israeli Community of São Paulo," an organization comprising European Jews, whose purpose was to build, in addition to the synagogue, a cemetery and a school, and also to assist immigrants. During World War I the community founded the "Society of Israeli Ladies," for the purposes of collecting donations, promoting means to assist needy families and provide medical assistance, and the "EZRA – Israeli Society of Friends of the Poor," that welcomed the several immigrants coming from Poland, Rumania, Russia, Hungary, and Lithuania during the wartime. In 1922, immigrants mainly from Eastern Europe founded the first school in São Paulo to offer elementary school education together with Jewish teaching – Colégio Renascença, that also provided professional courses for youngsters

and adults, courses for immigrants recently arrived from Europe who sought their insertion in the labor market. [11](Veltman, 1996)

In other words, the community built a network to help the newcomers, with the support of both the Jews living in São Paulo who already were part of the industrial elite and of international organizations.[12] Such network played a fundamental role in the insertion of Jews in significant industry and trade activities, through the creation, in 1928, of the Sociedade Cooperativa de Crédito Popular do Bom Retiro (Cooperative Society for Popular Credit in Bom Retiro). That society operated as a Loans Bank to immigrants, providing credit with favorable terms and without the guarantees required by other banks.

The presence of Jews in the district was also expressed through educational, social and cultural, religious, and political institutions. In the 1920s, the Jewish culture started to be disseminated through theater plays and movie pictures, and the first Jewish newspaper started to circulate. Different groups of political movements prevailed in the district, mobilizing old and young Jews to engage in leftist movements in favor of the State of Israel and the Communist party in Brazil.

In the 1950s, the Jews started to leave Bom Retiro. At that time, Jewish schools, clubs, and jewish institutions started to be created in other districts. A census conducted in 1968 showed that 30% of the Jews lived in Bom Retiro, but other districts already concentrated an equal percentage of Jews. The survey also showed the high residential mobility of Jews and their occupational profile continued to prevail in trade and industry activities – more than 70%. (Veltman, op.cit.:100)

Jews progressively left Bom Retiro in line with the insertion of Koreans in the district, as from 1960, designing a process of transference of commercial capital. The latter, at first, used the district as a workplace and lived in the so-called "Vila Coreana," (Korean Village) in the district of Liberdade, traditionally occupied by Orientals. They worked as door-to-door salesmen and engaged in sewing activities at the factories. They gradually acquired the businesses from the Jews, occupied the houses in the district, and created their churches, schools, and institutions. To undergo this passage, they also organized an immigrant-supporting structure through a kind of consortium to provide the required financial funds – the "Kyes." (Truzzi, op.cit.:10)

In general, those processes are observed through the reproduction of generations by family community ties. What occurs in Bom Retiro is the appropriation by a group of immigrants – Koreans – of the material and economic basis installed by another group of immigrants – Jews. The completion of the existing production and sales structure permitted that, even without any tradition in the field of clothes manufacturing, Koreans keep and develop the economic activity in the district, rebuilding and conforming the working universe to the structural changes of a global economy. It is this transfer process among organized groups of immigrants that shapes the uniqueness of the district's social and spatial relations, that enables Bom Retiro to combine processes of

permanence and mutations and to be recognized sometimes as a district of Italians, sometimes times as a district of Jews, sometimes as a district of Koreans.

Public transport planning in Pakistan: an historical perspective

Imran Muhammad
Massey University, New Zealand
Ayesha Sadia
International Pacific College, New Zealand

1   Introduction

This paper highlights the core problem of the continuing failure of Pakistani cities to develop and manage their public transport systems in such a way as to provide a high level of mobility, equity and environmental sustainability. For at least sixty years public transport policy makers have formulated many different policies for public transport development in Pakistan. These policies make little sense in the presence of an extensive suburban railways infrastructure and high density mixed land use in urban areas.

The purpose of this paper is to provide an historical overview of public transport policy in Pakistan, from the British India period through to recent years, as viewed through the public transport planning literature. This paper outlines the discussion of public transport planning in Pakistan by reviewing (1) current literature and data (2) the history of public transport planning and policy and (3) listing the number of factors overlooked in the development of public transport in Pakistan. The data presented have been collected mainly through policy documents and published scholarly articles. The paper concludes with discussion on the importance of governance, capacity building and urban planning in providing adequate, efficient and effective public transport in Pakistan.

2   Public Transport Planning and Policy – Literature Review

The significance of public transport for urban mobility varies in South Asian cities. Traditionally, South Asian cities are characterized by high population and employment density, mixed land use patterns, short trip length and high share of non-motorized transport (Thomson, 1977; Tiwari, 2002; Imran and Low, 2003; Badami, 2005; Singh, 2005; Imran, 2006; Haider and Badami, 2007; Imran and Low, 2007). However, these characteristics have been changing by spatial structure which consists of medium to low density housing schemes, built at the edge of the city. Usually these housing schemes are designed for the middle to high income groups and only be accessible by public transport and private vehicles: either cars or motorcycles. Therefore, the share of public transport and private vehicles trips are growing at the cost of non-motorised trips in South Asian cities.

Table 1 shows the percentage of total trips made on different modes of transport in Indian and Pakistani cities. The data shows a large share of public transport trips in Indian cities as compared to trips made on private vehicles. On the other hand, the share private vehicles trips are higher in Pakistani cities as compared to public transport trips. One of reason behind the differences in Indian and Pakistani cities is the services

of rail based public transport in Mumbai, Kolkata and the recent opening and ongoing expansion of the Delhi metro. In contrast, Pakistani cities are served by bus or wagon (minibus)-based public transport which provides a very low level of service and comfort. In fact, Pakistani cities entered the 20th century with an urban tram system and suburban railway system. One hundred year later, either these systems were shut down or nearly to shut down. The expansion of Pakistani cities has increased the trip length for most urban residents which make walking and cycling less feasible than before, encouraging a continuously shift from non-motorized to motorized modes. In the presence of low level of public transport services, middle and higher income people lived in larger cities preferred private vehicles either motorcycle or car to travel. There is argument that public transport trips are declining or static with the popular demand or aspiration for private vehicles. An alternative view is that the lack of investment in public transport and ill considered replacement of trams and trains with diesel buses has accelerate the move away from public transport. The historical narratives presented by Imran (2006) support to this alternative view.

TABLE 1

Modal Split in South Asian Cities

Cities	Total Trips (in percentage)		
	Private Transport	Public Transport	Non-motorised Transport
Lahore*	24	16	60
Karachi**	27	23	50
Delhi***	18	40	42
Mumbai***	18	60	22
Kolkata***	5	78	17

Source: Lahore (TEPA and JICA, 1992); Karachi (Malik, 2004); Indian cities (World Bank, 2002)

Numerous factors have contributed to the upward trend of private vehicle use and the declining or static role of public transport in most cities. The most important factor is continuous investment on roads which left few or no funds for public transport provision in most cities of the developing world. For example, Howe (1996) has reported how the heavy investment in roads in Bangladesh has become threat to their social and natural environment. Badami (2005) mentioned that urban transport policy in India has been biased in favour of private transport modes. Imran and Low (2007) reported how scare resources in Pakistani cities are deployed in road development at the expense of public transport and non-motorised transport. They found that road investment policies are not result of any industrial development in Pakistan nor did the private vehicles come to Pakistani cities after WWII happened in developed world countries. But these policies mainly developed due to involvement of the international development institutions and their consultants which favoured roads instead of inherited railway which passed through most of the cities. He concluded that heavy investment on roads left no money for public transport in Pakistani cities.

Tiwari (2002) and Pucher *et al.* (2004) are in the favour of privatization of public transport services to generate funds to operate efficient bus services and to reduce

government subsidies Tiwari (2002) found that large scale privatisation of buses in New Delhi increased a capacity of public transport. Pucher *et al.* (2004) reported that the privately run services in Indian cities have higher productivity, lower costs, and higher revenues per bus km of service. They concluded that privatization does have potential to improve efficiency, but it must be accompanied by institutional capacity building which make ensure an integrated network of public transport services. This suggestion is very difficult to implement quickly because there is a long way to overcome institutional disco-ordination, lack of human, technical and financial capacity among transport organisations in the developing countries (Vasconcellos, 1997; Kah 2001). Even the countries in Europe and Australia, which have well-established institutions, the privatization and deregulation of the public transport has been a significant factor behind the decline in patronage and services (Cervero, 1998; Mees, 2005).

Beside financial factor, there are a number of other factors that have been suggested as having an influence on the level of success of public transport systems. These include, car ownership, traffic volume, parking policies, fuel cost, travel choices and capacity, urban density, urban sprawl, public transport network planning, public transport mode attractiveness and perception and governance (Cervero, 1998; Vuchic, 1999; Newman and Kenworthy, 2000: Mees, 2000; Cox, 2003; Whitelegg and Haq, 2003; Litman, 2004; Kennedy *et al.*, 2005). An investigation into how and to what extent these factors are contributing in the development and implementation of public transport planning and policies in Pakistani cities will be discuss in next section.

3 Public Transport Planning and Policy in Pakistani Cities – Historical Overview

This section will view the public transport planning and policies in Pakistan in a historical context. The discussion has separated the historical overview into three time frames; British India period (up to 1947), 1947-1990 and 1991 onward. Firstly such an analysis provides a picture of public transport development during British India. Then it is important to document public transport policies and development after independence from British India in 1947 because the period since then represents and symbolises the aspirations of the newly independent country. The discussion from 1991 onwards is particularly concerned to explore how public transport policy is accommodated within a sustainable development context. Overall, this section will disclose the history of public transport planning viewed through government transport planning and policy documents and published scholarly papers.

3.1 Public transport in British India

The history of public transport development in British India must start from the development of the Indian railway system. In 1853, the first passenger train started from Howrah to Hoogly (currently in India) (Indian Railway Fan Club (IRFC) website). The region that would later become Pakistan was connected by railway in 1861, by building the section between Karachi and Kotri (ibid). Up to 1865, the important cities of the now existing Pakistan were connected by the railway to the rest of the country (ibid). The railway network in Pakistan was extended to the Afghanistan border and up to Zahidan,

Iran, in 1878 and 1918 respectively (see Fig. 1). In total, British India had an extensive network of railways of 41,000 miles in 1944; of this total 8,070 miles was in the area of Pakistan (Vakil, 1944: 187).

In addition to the intercity railway development and operation, the British government introduced urban public transport services (Qadeer, 1983). The Karachi Tramways Act was passed in 1884 and the first steam tramway was opened for operation in 1885 along with the horse-drawn tram (ibid). Subsequently, these trams were converted to petrol engine trams in 1908. Despite this development, the tonga (horse-drawn carriages) were the only means of public transport in Pakistani cities until the late 19th century (Stalley, 1972).

These urban tramways and inter-city railways were supported by buses providing feeder services (Vakil, 1944). Like Karachi, the city of Lahore was connected with the railway network (see Fig. 2 and 3) and in 1904 the locomotive workshops were established there to fulfill the needs of the extensive railway network (ibid). Additionally, new and wider roads were constructed in Lahore (Goulding, 1924) and bus based public transport was initiated to connect the major civic and government buildings located on the Mall Road (Rudduck, 1965). During the 1920s, British elites built and settled in Model Town on the outskirts of Lahore (Glover, 1999). Model town was not only designed on the principles of Ebenezer Howard's garden city but was also managed by Howard's envisioned Model Town Co-operative Society (ibid). The Model Town Co-operative Society had not only developed their own municipal services but also initiated a bus based public transport service which connected the town to the rest of Lahore (Glover 1999; Russell and Anjum, 1997). Overall, these public transport facilities altered the face of transport system in Pakistani cities.

Irrespective of the debate about the positive or negative aspects of public transport on the economic and social system of British India, Thorner (1955) believed that independence in 1947 provided an opportunity for Pakistan and India to formulate new public transport policy which could be designed according to the newly independent countries' needs which were different from their colonial obligations.

3.2   Public transport in Pakistan - 1947 to 1991

In 1947, the railways constituted the most valuable capital asset of the country and were the single inter-city public transport mode (Hasan, 1998). At that time, Pakistan Railway (North Western Railway) carried the largest amount of passengers in Pakistan (Govt. of Pakistan, National Planning Board, 1957: 487). The First Five Year Plan (1955-60) acknowledged this fact and stated:

> The backbone of [West] Pakistan's transport system is a broad-gauge railway network. It is a system of main lines, one in each of five parallel river valleys, interlinked and stretching from the coast to Afghanistan and India's frontiers (Govt. of Pakistan, National Planning Board, (NPB) 1957: 485).

However, the plan proposed that 'in [West] Pakistan a powerful railway system and growing road transport system operate side by side and should complement each other' (ibid: 485). Accordingly, 70 per cent of the total land transport investment was made for Pakistan Railway (North Western Railway) as compared to 30 per cent for road transport during the plan period of 1955-60 (ibid: figure extracted from Table 7, 510). The Road Transport Board was set up to coordinate the rail and road networks with a inter-city passenger ratio of 75 and 25 per cent in the favour of railway (ibid: 506). It is important to note here that although resources were allocated in the favour of the railways, the plan proposed that the ratio of road to railway would increase to 25:75 as compared to 10:90 in 1947. Moreover this plan did not propose any extension of the railway network. On the other hand 1800 miles of new roads were planned to be constructed along with the improvement of 2000 miles of existing roads (ibid: 46).

In urban areas, motorised traffic was very limited until 1947 (Qadeer, 1983). For example, in the city of Lahore, homes, work places, bazaars (commercial areas) and community places were located in a mixed land use pattern within a short distance. Therefore, walking was the largest mode of transport followed by tonga (horse-drawn carriage) (ibid). In spite of this fact, Omni Bus was operated in the city of Lahore and Karachi, while tramway provided services in Karachi only (ibid). The Omni Bus (public transport) service has been a public monopoly from the beginning of its inception and expanded both in organization and resources over time. On the other hand, the tramway in Karachi was abolished in the early 1970s.

In 1951, the Motor Vehicle Act 1939 was amended and the Road Transport Board was established in Punjab. The main function of the 'Punjab Road Transport Board' was to provide efficient, adequate, economical and coordinated public transport services in the province. In 1957, the '(West) Pakistan Road Transport Board' was established according to the recommendation of the First Five Year Plan (1955-60). Accordingly, the 'Karachi Road Transport Corporation' (KRTC) was created in 1959 to be responsible to run bus based urban public transport in Karachi.

The Second Five Year Plan (1960-65) became the first planning document in Pakistan in which the roads sector was given priority over railways by being allocated more financial resources (Govt. of Pakistan, Planning Commission, (PC), 1960). The perception behind this act was stated in the plan as: 'Road transport is particularly suited to the conditions and requirements of Pakistan (p. 303) … the motor vehicle is more adaptable than the railways to varying degrees of traffic intensity and permits a greater degree of speed and efficiency in haulage over short distance (p.304) … there is close relationship between the volume of transport and the level of economic activity because each depends upon the other' (p. 277). Under these beliefs, the Second Five Year Plan (1960-65) had initiated a new era of road construction in Pakistan.

The large cities of Pakistan were also inclined towards the construction of new roads and implementing road based public transport. The Second Five Year Plan allocated considerable money to the '[West] Pakistan Road Transport Board' to introduce 500

new buses in its fleet for inter-city public transport (ibid: 305). For urban transport, money was allocated to the 'Karachi Road Transport Corporation' (KRTC) for building up a fleet of 1200 buses, procuring 700 vehicles in addition to the 500 obtained in the First Plan period (ibid: 306). The Second Plan took an initiative to encourage the private sector to come forward and run road based public transport. The reason behind this initiative was the rapid population growth which resulted in a corresponding growth in the demand for public transport. Originally, the public sector had a monopoly on public transport in Pakistani cities. After the encouragement of private sector policy, private wagons started their operations along assigned routes to fulfill the growing demand for public transport. Initially, their services were reliable, fast and comfortable, but they eventually became crowded and unsafe. Although many regulations existed and many promises were made over time, the situation has not yet been improved.

Moreover, the Second Five Year Plan (1960-65) supported the inclusion of the 'Karachi Circular Railway (KCR)' as the first (and last to date) rail based urban public transport project in Pakistan (Govt. of Pakistan, Planning Commission, 1960). The KCR was planned to serve the whole of Karachi including the periphery of the city. It was projected as a regular, cheap and efficient transport for the residents of Karachi (ibid: 287). Later, some sections of the KCR were built. This service was very successful in the first 15 years, however, it started to decline due to lack of investment in the infrastructure. In city of Lahore, the Master Plan for Greater Lahore proposed a mass transit system in the form of a 'circular railway' in 1965 to connect existing railway which passes through the city (Govt. of Punjab, 1973). However, the recommendations concerning the circular railway as a mass transit system did not catch the attention of decision makers.

In the early 1970s, public transport was deregulated; this allowed the private sector to compete with public-owned bus services (Govt. of Pakistan, Planning Commission, 1978). However, it was observed that public-owned bus services were given priority over private operators in the allocation of routes. In 1977, the 'Punjab Road Transport Corporation' (PRTC) and ''Punjab Urban Transport Corporation' (PUTC) were established in the province of Punjab (LDA and World Bank/IDA, 1980). The functions of the PRTC and PUTC were to provide an efficient, adequate, economical and properly coordinated system of road based inter-city and urban public transport services respectively. PUTC was also responsible to provide bus stands, develop amenities, purchase, manufacture, maintain and repair buses and other related services in urban areas. Later PUTC developed its own maintenance and body building workshops, central stores, offices and a central transport training institute. Although public-owned Omni Buses were merged into PUTC, it had always been short of buses due to a lack of investment by the government and international organisations. To fulfill this deficiency, PUTC and the Volvo International Development Corporation completed a study for the 'Model Urban Transport System' in Lahore (Volvo, 1980). The PUTC-Volvo Model Transportation System project comprised transport planning, organizational restructuring, capacity building and the provision of vehicles. This study identified different issues for an efficient bus based public transport network in Lahore. It recommended a continuation of the mixed public and private bus system. As a result of

this study, 350 Volvo buses were gifted by the Swedish Government to Lahore. These buses were added to the fleet of PUTC.

Although Omni Buses was merged with PUTC and the Volvo buses were introduced, the PUTC did not expanded its fleet as required to cope with the enlarged system of routes and growing demand in Lahore. Therefore, PUTC tried to attract private sector by starting a 'Leased Buses' scheme on specific routes run and managed by the private sector (LDA, 1997). However, all these efforts were not successful over time and gradually the PUTC bus services declined. Due to lack of investment, new buses were not purchased after 1989. Therefore, the public-owned bus system in Lahore managed by PUTC collapsed after being operational for a couple of years. Finally, the government disbanded the PUTC in 1998.

3.3   Public transport in Pakistan – 1991 onward

a) Public transport in the National Transport Policy, 1991

In 1991, a draft 'National Transport Policy' was published by the National Transport Research Centre (NTRC). This policy suggested the adoption of a bus based public transport system, as compared to a rail based mass transit system, as the preferred urban transport model in the metropolitan cities of Pakistan (Govt. of Pakistan, NTRC, 1991). This approach may have been adopted due the lack of finance available from the World Bank to implement a rail based mass transit system. However, at the same time, heavy and light rail based public transport was proposed in Lahore by the technical and financial assistance of JICA (TEPA and JICA, 1992).

The NTRC transport policy also proposed that government responsibility should be limited to low income groups by providing a sufficient number of subsidised public transport services (Govt. of Pakistan, NTRC, 1991). It was argued that the introduction of low quality public transport in urban areas would convey a negative image of government-owned transportation, ultimately discouraging the efforts towards promoting public transport. This policy also proposed that the government should encourage the private sector to provide efficient and high quality public transport services for the middle class of society. Several steps were proposed to encourage the involvement of the private sector including soft loans from the banks, reduction of custom duty, and tax incentives for the importation of vehicle spare parts.

b) Public transport in the Prime Minister's Public Transport Scheme, 1991

In 1991, 'The Prime Minister's Incentives Scheme to Revamp the Public Transport Scheme' was initiated by the Nawaz Sharf's government (Govt. of Pakistan, Ministry of Communication, 1991). This policy included incentive packages to import taxes, buses and mini-buses for an efficient public transport system. The incentive packages included duty free imports of taxi-cabs, buses and mini-buses, loan arrangements from the banks at 15 per cent annual interest rate and special registration numbers for new public

transport. This policy was implemented and the public transport fleet was up-graded.. However, the policy was changed after the Nawaz government lost office.

c) Public transport in the National Conservation Strategy (Agenda 21), 1992

The National Conservation Strategy (NCS) was the first comprehensive strategy to provide a framework for addressing the specific environmental concerns of Pakistan (Govt. of Pakistan, EUAD and IUCN, 1992). The Transport sectors received very little attention in the NCS. The strategy recognised the wider ecological consequences of transport use, and particular attention was paid to energy and air pollution problems. However, the emphasis was clearly on technical solutions to solve environmental problems associated with improving the energy efficiency of motor vehicles. Although the roles of public transport and non-motorised transport in reducing the impact on the environment were acknowledged, at the same time, fuel efficient cars were promoted by providing incentives in the form of tax and customs duty relief.

d) Public transport through community based Welfare Organization

In 1990s, two cities of Punjab province (Faisalabad and Lahore) made an innovative experiment to run public transport services by creating NGOs in collaboration with local private operators (Anjum, and Russell; 1997; LDA, 1997). Accordingly, the Faisalabad Urban Transport Society (FUTS) was created in 1994 followed by the Lahore Transport System (LTS) in 1997. The FUTS and LTS were registered with the provincial Social Welfare Department with funding arranged from private operators. These NGOs were regulated by the law of social companies and administrated by a governing body. The governing body typically comprised concerned government officers, community representatives, transporters and bus owners.

This model was developed on the basis of public-private-community participation to provide efficient public transport services in the city of Faisalabad and Lahore. These NGOs generated their funds through the private sector, renting existing infrastructure facilities and setting higher fares. The most interesting features of these NGOs were the setting of their own fares (without approval of the government) and enforcement. Initially this experiment (especially in the case of FUTS) was successful in providing efficient, reliable and decent public transport services by incorporating private and community sectors in the decision making process. However, lack of investment by the private and public sector in inducting new vehicles made this venture unsuccessful.

e) The People's Train and Awami (People's) Bus Train Projects

In 1996, under the Prime Minister's (Benazir Bhutto) Development Programme for big cities, a mass transit project was started in the city of Rawalpindi and Islamabad. This system was based on a rail-road mixed mode which contained an urban rail link between Rawalpindi and Islamabad connected with feeder coasters (small buses) in Islamabad. The main objective of this service was to reduce peak hour traffic

congestion, reduce air pollution and make use of existing railway infrastructure (Govt. of Pakistan, NTRC 1996: 3).

Initially, the train service was designed for 6000-8000 commuters per day. Therefore, only three train services at the frequency of 1.5 hour in morning peak and three train services at the frequency of 3 hour in afternoon peak was started. However, after three month of operation, these services were reduced to four train's services per day. Finally, this rail-road mass transit system was shut down due to heavy financial lost. The main reasons behind its failure is an inadequate service planning which includes absence of feeder buses in Rawalpindi, very low frequency, lack of information about timetabling, lack of amenities on railway stations and relatively higher fare without anytime saving (ibid: 8). Additionally, this train service caused traffic jams on the level crossing roads in Rawalpindi.

A similar kind of project Awami (People's) Bus Train was started in 1989 by the Benazir's first government in Karachi, Rawalpindi and Islamabad (Govt. of Pakistan, NTRC 1991). In this project, the National Transport Research Centre (NTRC) has designed and developed a Bus Train (prime mover plus three trailers) using old discarded buses to provide high capacity bus services on peak hour. The Awami Bus Train provided services on the main corridor having sufficient road width. Initially, this project was started in Karachi and after one year of operation, the Bus Train was shifted to Rawalpindi and Islamabad. The Bus Train has for the first time introduced an imaginary 'bus lane' on the extreme left of the road. It was estimated that Bus Train attracted a large number of commuter in Rawalpindi and Islamabad from 1991 to 1993. This service has utilized 45 per cent of its capacity and recovered 68 per cent of its cost from fare in two years of operation (Govt. of Pakistan, NTRC 1996: 19). However, this service was also shut down due to lack of interest from the government in providing public transport services.

f) Public transport in the National Integrated Transport Policy, 1998

In 1998, the Ministry of Communications gave the mandate to the Chartered Institute of Transport (now Chartered Institute of Logistic and Transport - CILT) for preparing a draft 'National Integrated Transport Policy' (CILT, 1998). This policy emphasized land use and transport integration in order to reduce the need to travel and to maximise the accessibility of public transport. However, the policy also suggested a 'zoning plan' for different land uses with reservation of land for future urban transport infrastructure. It is now widely accepted that land use planning based on separated zones will generate more travel and reduce the viability of public transport.

g) Public transport in the Transport Sector Development Initiative (TSDI), 1999

The Transport Sector Development Initiative (TSDI) was a joint effort between the Government of Pakistan, international development institutions (especially the World Bank) and the private sector to collectively develop a comprehensive transportation policy (TSDI, 2001). The TSDI policies were heavily framed by a perception that

privatisation and de-regulation of public transport would bring about more efficient and cost effective transport. In relation to privatisation, the document states, 'each mode should be developed according to the guidance of market forces … the private sector should be encouraged to play its part in public transport … a common platform of public and private sector should be established to discuss issues regarding different modes of transport … existing laws and tax duties should be modified in favour of privatisation' (ibid). It is noted that the emphasis on privatisation has been found in all transport documents prepared with the collaboration of international development institutions. Later, these policies and recommendations were reproduced by the NTRC transport policy in 2001.

h) Public transport in the National Transport Strategy, 1999

In 1999, the National Transport Strategy was developed by the Small and Medium Enterprise Development Authority (SMEDA), under the Federal Ministry of Industries and Production (Govt. of Pakistan, SMEDA, 1999). In the presence of different transport ministries, the SMEDA national transport strategy showed the Nawaz government's intention to attract private investment to the road transport sector. This strategy was approved quickly by the federal government in 1999. It should be noted here that all other transport documents were draft policy documents and not formally approved by the government.

Although the strategy is called the 'National Transport Strategy', it merely focused on the introduction of buses as the mode of urban public transport. Therefore, an institutional reform package for government organisations which enabled them to attract private investment in bus based urban public transport was proposed. Accordingly, a franchise system of bus operation was introduced to run bus based public transport. Therefore, favourable policies, tax incentives and regulations were formulated to attract the private sector to invest in the franchise system of public transport. Government also encouraged commercial institutions and banks to cooperate with private investors to help the franchise system succeed.

At the same time, a SMEDA type of a bus based public transport policy on a franchise basis was introduced by the provincial (Punjab) Transport Department with the help of the World Bank (Meakin, 1998), The goal was to phase out the aged public transport vehicles by introducing a regulated bus system owned and operated by the corporate private sector on the basis of route franchises (Govt. of Punjab, 1998). The main role of government was the regulation of services while operational aspects were left to the private sector. Under this new policy, the government provided a package of incentives to attract private investment. These incentives consisted of a subsidy on the interest of loans, exemption of customs duty on the import of CNG and diesel buses, and subsidised lease of the depots. In response to this policy, corporate private sectors introduced new buses on dedicated routes in various cities of Punjab. The policy was widely appreciated by public transport users due to the improved quality of public transport. Initially, this policy made a significant difference in the quality of public transport but started to decline due to lack of investment by the private sector. Over

time, it was realized that the lack of institutional capacity in the government meant that it was not able to play an effective role in attracting private investment and managing and solving conflicts of franchised bus operations. As a result, the public transport franchising operations in the cities of Rawalpindi and Islamabad were wound up in early 2000.

i) Public transport policies in 2000s

In 2000s, the federal 'Planning Commission' prepared a draft 'Transport Policy' through an in-house process (Govt. of Pakistan, Planning Commission, 2000). This document also presented a bus based public transport system as the transport solution for metropolitan cities in Pakistan. The policy was the first to propose reserving special bus lanes at grade or grade-separated road infrastructure. The policy encouraged revitalisation of the KCR as an urban rail line; the KCR, had been abandoned in the late 1990s. This policy also encouraged the private sector to operate public transport.

The Ten Year Perspective Development Plan and a Medium Term Development Framework (MTDF) were prepared by the Planning Commission to be implemented between 2001 and 2011. The MTDF stated that the 'development of an efficient public transport system primarily based on buses needs to be linked to mass transit systems, with light rail as an option,' (Govt. of Pakistan, Planning Commission, 2005: Urban Development and Housing, 8). However, no money has yet been allocated for the recommended public transport system.

The latest effort to formulate a National Transport Policy was initiated at the end of 2003, through technical assistance from the Asian Development Bank (ADB and Govt. of Pakistan, NTRC, 2003). Stage one of the assistance appeared in the form of a report, 'Assessment of Critical Current Transport Sector Needs,' prepared by international consultants, appointed by the ADB. However, this document was silent on the assessment and development of public transport in Pakistani cities. Stage two of the technical assistance, which will mainly contain sub-sector policy statements, has not yet been started.

In early 2000, the Integrated Master Plan (2001-2021) was prepared in Lahore to guide future development (LDA, 2004a). Like all previous Master Plans prepared for Lahore, this plan favoured the urban road network and ignored the potential of developing public transport. Accordingly, the first five year programme for transportation development in Lahore proposed to include 94.8 per cent of funding for road development, management and maintenance and only 5.2 per cent for a public transport terminal (LDA, 2004a: 21-7). Clearly the plan is a 'road development plan', not, as it is called a 'comprehensive transport plan.'

In 2005, the Government of the Punjab, Transport Department, commissioned MVA Asia Ltd (international consultants) to develop a network for a mass transit system (Govt. of Punjab, Transport Department, 2006). The study recommended a rail based four-line network called the Lahore Rapid Mass Transit System (LRMTS). This rail

system was proposed on the assumption that air-conditioned franchised buses introduced in the past became successful due to the rising income of the growing population. Therefore, people were willing to pay for a better service. However, no evidence was provided in support of this argument.

In 2005, the Government of Punjab prepared a 'Medium Term Development Framework' to be implemented in 2006 to 2009. Under this framework, urban development policy objectives encompassed the establishment of an 'Urban Commission' for preparing a comprehensive urban policy. It was proposed that a 'Provincial Urban Transport Policy' (PUTP) would be developed to guide the future 'Comprehensive Urban Transport Strategy' for Lahore. This strategy will be a part of the proposed Lahore 'City Development Strategy' which would be prepared with the technical and financial assistance of 'Cities Alliance'. The Alliance supported cities in preparing city development strategies that 'link the process by which local stakeholders define their vision for their city and its economic growth, environmental and poverty reduction objectives, with clear priorities for actions and investments' (Cities Alliance, 2006: 1). The strategy would be implemented by the proposed Punjab Large Cities Development Policy Loan (DPL), with technical and financial assistance from the World Bank (World Bank, 2006). The objective of the proposed DPL project complement city development strategy to promote economic growth in the major cities of Punjab. This growth would be achieved through metropolitan level strategic planning, integrated infrastructure investment programmes and efficient urban service delivery. The improvement of urban transport is one of the key areas in the project.

In summary of this historical review, it was shown that a number of policy documents were produced at the national, provincial and local level which addressed public transport directly or indirectly in Pakistan. These policy documents consistently affirmed the need for the development of public transport. Reasons why this development has not happened will be discussed in the next section.

4   Discussion – Why Did All Public Transport Policies in Pakistan Fail?

The review of public transport planning and policy in Pakistan has provided a fascinating example of the ways in which policy paradigms have developed historically, have been gradually changed, and then maintained over time. Despite the unquestionable benefits that public transport planning and policy can bring to Pakistan, there have been many shortcomings in the development and implementation of public transport policy. The primary purpose of this section is to discuss those concerns that were largely overlooked in the development of public transport policies in Pakistan.

4.1   Overstating the role of the private sector in public transport

From the beginning, there was an issue with investing, managing and operating public transport in Pakistani cities. Historically, the provincial governments in Pakistan have owned and operated inter-city and urban public transport services. However, over the years, the government, according to the guidelines of the World Bank, advocated to

encourage the private sector in operating public transport. The decline of state-owned public transport services created a vacuum which was filled by private operators in accordance with these guidelines. Initially, the market was open to private operators in parallel with public-owned public transport. However, the availability of public transport has not grown at the same rate as the population in Pakistani cities (Sohail *et al.*, 2006). Therefore, a large numbers of small private operators, operating Toyota 18-seater, Mazda 25-seater and Suzuki 12-seater buses were permitted to fulfil this gap in a fragmented way (LDA, 1997). Mees (2000) argued that an improvement of 'service quality' and the 'integration' of public transport were needed for making public transport successful. It has been observed that an average headway for small private public transport in Lahore was only 4 minutes while maximum and minimum headways observed were 8 and 1 minutes respectively (LDA, 1997). However, the improved headway has not provided the best 'service quality' which was also managed in a fragmented manner. As a result, a chaotic mass of individually owned small vehicles operated on urban areas, competing for road space. Over time, the public sector became regulators for the private operation of public transport.

Karachi Strategic Development 2020 proposed to revive and extend the Karachi Circular Railway, construction of the BRT and introduction of the LRT (CDGK, 2007). But all these plans were conditional on investment by the private sector. The Punjab government also initiated bus-franchising schemes which offered exclusive rights to private transport operators on selected routes. The public transport operators in turn guaranteed a minimum quality of services on a higher fare structure decided by mutual agreement. However, after operating for few years franchised services in many cities were closed down due to a lack of investment from the private sector and the inability of the public sector to resolve conflicts which arose from this initiative. Now individually owned small vehicle based public transport is back in the city of Rawalpindi.

In the early 1990s, a change occurred in relations between the private sector and the government. TSDI and SMEDA transport policies were developed to promote these stronger public-private relations. The government wanted more involvement by the private sector in the development and operation of public transport. The introduction of franchised public transport in different cities of Punjab province is an example of these relationships. Recently, the World Bank and ADB supported the development of the BRT system in Pakistani cities. These organisations always advocate the involvement (in term of policy making, investment and running public transport) by the private sector. It is important to note here that it has been the private sector which invested in and ran public transport services in Pakistan since the early 1960s. Even now, 20,000 privately-owned buses and minibuses provide public transport services to the people of Karachi (CDGK, 2007). On the other hand, public sector finance has been devoted to roads only. Over the last few decades, government has constructed 46 flyovers, 12 interchange and one underpass in Karachi (CDGK, 2007: Map 25). In contrast, government always looks to the private sector for investment in public transport. International development organisations have always supported and even provided finance for roads. But such support is absent for the development of adequate public transport.

4.2 Lack of capacity among public transport organisations

Kennedy *et al.*, (2005) in their article 'the four pillars of sustainable urban transportation' reviewed the factors contributing to best practice in urban transport. They concluded that adequate finance, infrastructure and urban planning are important for public transport planning but the critical requirement is effective 'governance'. Effective governance included appropriate organisations with the necessary powers, skills, finance and responsibilities for public transport planning. These characteristics of governance were not present in public transport organisations in Pakistan. These organisations have a long history of deficiency in professional, administrative and financial capacity to manage public transport service planning (Imran, 2006; Haider and Badami, 2007).

The federal government has never denied the importance of public transport in Pakistani cities. However, the government shifted the responsibility for public transport to provincial governments in early 1960s. On the other hand, the federal government shared the responsibility for road building with the provinces where the cost of the project was beyond the capacity of the provincial and local governments. As the provincial and local transport institutional capacity was obviously lacking in the Pakistani context, either the federal government provided finance for building roads, or the federal government built roads on their own account. In contrast, the federal government has neither provided finance for the operation of adequate public transport in urban areas, nor operated by themselves or improved the capacity of the provincial transport authorities. However, a federal government helped provincial governments transfer the operational responsibility for public transport to the private sector. In the absence of human resources, coordination, research and financial capacity of public transport institutions in Punjab, public transport has now become fully the prerogative of the private sector. The incomplete routes, high fares, fewer than needed buses, gender discrimination and even the absence of buses in some places are common in the urban areas of Pakistan.

Kah (2001) found through his study of privatisation of urban transport in Sub-Saharan Africa that privatization was ineffective if a strong governance structure was not put in place, He explained that the privatization of public transport became extremely chaotic in the absence of a properly coordinated and regulatory institutional mechanism, as in Senegal and Gambia. Therefore, he concluded that the government has a significant role to play in defining policy, developing a national level coordination and local level implementation, accessing adequate investment and building technical and professional capacity for public transport. This situation was not present in Pakistani cities, therefore, all policies for deregulation and privatisation failed over time. For example, Haider and Badami (2007) reported that recent franchised bus operations in the cities of Islamabad and Rawalpindi were eventually closed down by the private operators due to lack of capacity in the public sector to resolve conflicts. In fact, no one knows how long franchised bus services in Lahore lasted because the institutional capacity of the provincial Transport Department to support it was not strengthened. The government

and the World Bank have simply ignored this reality and have never tried to develop a capacity for the public transport organisations.

Despite the lack of capacity among public transport organisations, Pakistan has a long history of appropriate organisations with necessary skills and funding for road development. For example, the National Highway Authority (NHA) at federal level and the Communication and Works (C&W) department at provincial level are efficient, well-managed public organisations with dedicated funding and strong professional culture. However there is a lack of equally competent organisations in public transport planning. This deficiency is apparent in the poor service quality of public transport in Pakistani cities. In 1977, this problem was realised and a single authority, 'Punjab Urban Transport Corporation', was created to manage public transport in the province of Punjab parallel with the road organisations. The creation of a public transport corporation in Punjab contained the potential to break the path of road building dominance in transport policy. But it did not last long enough due to the unavailability of dedicated funds and a lack of interest from the government to improve its professional capacity. Therefore, it did not make an enduring impact.

Currently, overall responsibility for road development lies with the provincial C&W departments, while public transport coordinating, planning, and monitoring lies with the Department of Transport (DoT). On the other hand, land use planning responsibilities are with the local government (City District Governments). Beside this disintegration, transport (mainly public transport) and land use development are more market driven, as per the guidelines of the World Bank, than they were in the past. A long history of the investment of the private sector in public transport provision has already been shown as a saga of failed experiments. Even if the private sector is willing to invest more, there is a lack of professional and management capacity among counter public organisations to make public transport successful. Therefore, a fully capable public sector to mange public transport planning and integration of transport and land use planning does not exist at present. For that reason, it seems imperative that an effective 'governance' system run by a new dynamic public transport organisation at metropolitan level is important along with dedicated financial, professional and technical capacity for managing public transport.

4.3   Negligence in the development of high capacity public transport

The review of public transport policies showed how a new paradigm of road development emerged, despite the existence of an inherited railway network as an alternative for inter-city passenger transport. In contrast with inter-city transport, the policies for urban transport development were more complex in nature. The previous section demonstrated initial efforts on the establishment of both road based and rail based public transport networks in the major cities of Pakistan.

The development of rail and road based public transport in Pakistani cities highlighted the initial emphasis of the government in national development plans, although such projects were also pursued alongside major road construction initiatives. Traditional

transport planning approaches combined road projects with public transport projects. Cervero (1998), Vuchic (1999) and Newman and Kenworthy (2000) argued that investment in public transport would be combined with disinvestment in road development. Investment in both modes of transport would only make private transport successful. This is evident in the case of Pakistan where some sections of the 'Circular Railway' in Karachi were built, operated and then shut down. Similarly, no serious effort was made to implement the proposal of the Circular Railway in Lahore. Although, JICA took the initiative in the early 1990s to propose a LRT project in Lahore, this initiative was not implemented. On the other hand, a number of high speed grade separated road projects were implemented in all the cities of Pakistan.

The current public transport system in Pakistani cities consists of buses and wagons. The government authorities, in the light of World Bank guidelines, tried to improve bus systems rather than take the initiative in rail based public transport due to the flexibility and lower cost of bus transport However, Hass-Klau et al. (2003) believes that the high cost and inflexibility associated with a rail based mode of travel gives it a high profile as a symbol of political commitment and financial security for public transport. Initially, it was declared that railways should be a back-bone of public transport in Pakistan. But this policy did not last long enough due to the unavailability of finance for railway development. If the demand for public transport in Pakistan would be estimated, only rail based public transport would have the potential to carry large numbers of passengers with higher speeds and smooth rides. The most significant potential of rail over buses is its influence on urban land by enhancing development activity around rail lines and stations. Fortunately, all Pakistani cities have an infrastructure of railways inherited from British rule. Therefore, rail based public transport can play a catalytic role in the urban development and regeneration of Pakistani cities.

In short, Pakistani cities should not be persuaded that the growth of public transport can be managed primarily by improvements to the bus systems. Both the bus network and the rail systems are simultaneously required in Pakistan. However, the future success of public transport depends on the management of the different roles of each mode in an integrated system.

4.4   Failure to utilize high density, mixed land use patterns

Newman and Kenworthy (2000) is the leading advocate of the 'higher density' mixed land use development for the success of a public transport system. They presented a picture of a future sustainable city as high density land use, called 'urban villages' served by rail based public transport. Fortunately, the requirement of high density mixed land use is historically present in almost all cities of Pakistan. For example, 80 per cent of the population in Lahore resides within a seven km radius of the city and comprised an average density of 150 to 250 persons per hectare (LDA 2004b). Luckily, the rail track in Lahore passes through these areas. However, no serious effort has been made to use high density mixed land use and rail infrastructure for the development of rail based public transport. In contrast, a large amount of money has been invested to build

flyovers or underpasses to cross existing railway tracks in Lahore, Karachi, Faisalabad and Rawalpindi.

Urban Resource Centre (URC) (2001) found that the problems of public transport in Karachi were caused by its urban development policies. These policies were prepared to segregate different land use into a zone allocated for them served by a public transport system. Accordingly, lower and middle income people were settled into the cheap land available in the periphery of the city. On the other hand, neither jobs were located near to low income population nor was a public transport system developed. Similar policies were adopted in other cities of Pakistan.

The fundamental message of Mitchell and Rapkin (1954) was that a transport proposal should not be evaluated only on transport criteria, but also on land use, social and environmental grounds. It seems that these criteria have been overlooked in the provision and development of public transport. Otherwise, the land use pattern in Pakistani cities requires rail based public transport due to its potential to transport large numbers of people quickly, reliably, comfortably and safely in high density areas. Therefore, it is concluded that organisations in Pakistan need to develop public transport policies that take into consideration the high density mixed land use pattern of its cities.

In summary, all policies to provide adequate and reliable public transport in Pakistani cities have failed badly in the presence of continuous demand, high density mixed land use patterns and a long history of private sector involvement in the provision of public transport. Still passengers routinely hang out from doors and windows (see Figure 4) on unreliable, unsafe and inconvenient modes of public transport (Imran, 2006; Haider and Badami, 2007). The continuous decline in the quality of public transport means that it has now become the mode of transport for those who have no alternative such as car, rickshaw and motorcycle.

5   Conclusion and Future Research

The purpose of this paper was to provide a historical overview of public transport policy to identify factors responsible for the failure of the development of an efficient public transport system in Pakistan. Accordingly, overstating the role of the private sector, lack of capacity among public transport organisations, negligence in the development of high capacity public transport and failure to utilise existing land use patterns for the development of reliable and efficient public transport have been identified as major factors.

The essence of the historical review is that once a policy path for road based public transport and the involvement of private sector had been taken, subsequent policies and institutional arrangements supported the adopted policies and obstructed changes in policy. It has been found that public transport was operated by the public sector, semi-public sector (corporations), de-regulated private sectors (privatisation with fare regulation), a combination of public-private-community sector, and franchised private

sector organisations (privatization with fare deregulation). The review of public transport in Pakistan clearly showed that public transport planning became unsuccessful due to inadequacies in overall governance, unavailability of finance for public transport and lack of urban planning.

In Pakistan, transport planning has traditionally been divided between roads organisations and public transport organisations. The road organisations have a full hierarchy and capacity while the public transport organisations mainly existed at the provincial level. In the public transport area a sophisticated institutional culture is lacking due to low financial capacity, shortage of human resources, and a lack of professional and management skills necessary to facilitate the development of public transport. It has been found that public transport organisations rely only on the private sector for operation and investment. Therefore, a strong and unambiguous commitment for the development of public transport organisations at metropolitan level along with a capacity building programme is required for the development of public transport services. Overall, our discussion concludes the importance of governance, capacity building including investment, and urban planning to provide adequate, efficient and effective public transport in the country.

Does these characteristics are present in the local success story of public transport development in the Pakistani city of Wah Cantt. Wah Cantt, a small industrial and educational town with a population of over 150,000 inhabitants has become successful in the development of a high frequency, affordable, equitable and adequate public transport system for their residents. The authors believe that the only models suitable for Pakistani cities are ones that have been locally designed to solve the public transport problems of the majority of their people. Therefore, future research will explore Wah Cantt as a model for generating lessons for other cities in Pakistan.

When public planning entities stop planning, who addresses the public interest? A review of the Flint River Corridor Alliance and its capacity to represent the public interest

Lynette K. Boswell
University of Maryland, United States

The success of the 1909 Plan of Chicago encouraged the planning profession across the U.S. to take an aggressive role in planning cities, controlling rapid growth, and addressing development in the built environment. Almost a century later, these once prosperous and growing post-industrial cities now grapple with decreasing populations and diminishing public resources.   Cities are greatly impacted by the loss of prominent industrial jobs. This economic restructuring translates into moribund housing markets and little growth within shrinking cities, particularly cities in the Midwest.

Consequently, changes in declining cities create smaller operating budgets, and many planning departments are left ill-equipped to deal with urban shrinkage; therefore losing their value to public officials and their authority to plan. Some cities planners retained their legitimacy by focusing on rebuilding and enhancing cities' assets, such as waterways and neighborhood institutions. Other cities such as Flint Michigan devolved of their planning departments and restructured community funding into other departments, speculating little use for city sponsored planning efforts. As a result, planners in these cities have become inactive, taking on the roles of zoning administrators or public facilities managers as they leave neighborhoods to fend for themselves. Due to limited public planning, the planning functions in struggling cities have transitioned from a purely public responsibility to the involvement of quasi-public and private institutions.

In an attempt to fill the void left by planning offices, cities' neighborhood hospitals, universities, and other non-profit organizations, have commissioned master plans and physical studies to address their investments and private interests. Many plans contain overlapping goals and objectives, are bounded around the same geographic locations, but remain uncoordinated. Therefore, are quasi-public and private entities appropriate in representing public interest; or are their organizational and private interests the overriding forces shaping aging, post-industrial cities? More specifically, with varying viewpoints and interests, can private coalitions and stakeholders serve the public with little city governance involvement? These groups contain the same concerns to address the public realm but are they the appropriate representatives in implementing and monitoring city-wide efforts?

In view of an absent planning department and uncoordinated development plans in distressed cities, this paper will focus on the city of Flint, Michigan, and review the planning efforts of the Flint River Corridor Alliance. Whereas many cities experiencing limited resources and substantial fiscal changes tend to have planning commissions or its local government lead reinvestment initiatives, Flint Michigan's Alliance is an

example of an organization composed of private, quasi-public and non-profit stakeholders involved in planning efforts with limited assistance from the city planning department. Serving as a coalition of varying invested interests around the redevelopment of the Flint River waterway, this paper will question if the Alliance is the appropriate agent to address the wider public interest. It will further question, in response to limited public-planning efforts, if there is a good concept of public interest which allows the Alliance to represent all appropriate groups? Even more, how does this concept or process materialize from theory into practice?

The first section of this paper will review the City of Flint's Corridor Alliance as a case study, and discuss its mission, structure, and challenges. The second section will provide a theoretical framework to define the phrase "the public interest" and its conceptions, through the review of predominate conceptions of the public interest process. The last section will question if the Alliance, under theorist's definitions and conceptions of public interest, can truly address the public's interest. If not, this section will devise a good conception of the public interest which allows the Alliance as a quasi-public organization to fairly and effectively serve the public's interest.

The Flint River Corridor Alliance

Flint, Michigan, as a quintessential declining, post-industrial city, has experienced significant population loss and economic stagnation after its major industry uprooted in 1970. By 1990, Flint Michigan was classified as a weak market city; a term attributed to the city because of its significant population losses which has resulted in economic and social decline. The displacement of critical industrial jobs by General Motors was a major impacting factor which has led to the cities' ebbed aftermath. Residents have left the city in search of employment, abandoning neighborhoods which have decreased the city's tax base and clientele to service commercial districts. Substantial budgetary problems in the city have been followed by financial and administrative constraints within the municipal government, forcing a reduction in city department's staff and services, or discontinuance of city departments altogether.

The Department of Community Development was one city department completely dismantled during economic changes in the city. As the city of Flint experienced financial woes, the city was placed under receivership to be administered and operated by the county government. When a new mayor was placed in the office, the mayor saw little value in the department and terminated it. A consultant replaced the planning staff, working on a case-by-case basis to complete mundane planning tasks for the city, such as application reviews and associated services. With no economic development office to fulfill or administer city development projects, local funding such as the Community Development Block Grants and HOME programs were re-integrated into the city's operating budget and other departments. This action left the city, which has a population of 125,000, without a planning staff. The city's last Master plan was completed in 1963 when the city population was more than half of its existing size (Mallach, 2003); therefore the city had little direction for its significantly smaller populations, high vacancies and under-utilized infrastructure.

Lacking capacity from city hall, the Genesee County Land Bank Authority (GCLBA), a quasi public organization became central to development in the city and its slow transformation. The GCLBA serves as one of the few organizations with the authority to address economic and community development in the City. GCLBA manages more than 700 tax foreclosed properties, which are homes and/or buildings left behind during Flint's massive population exodus. The organization's control of a large proportion of abandoned properties, gives the GCLBA authority and the ability to serve as a vital stakeholder in redevelopment initiatives in the city. With fewer jobs and properties mounting on the organizations' tax rolls, the GCLBA decided to target a particular area with a significant concentration of vacant tax-foreclosed properties. The Flint River Corridor was chosen, to create an impact and return properties back to viable uses. This area not only contained a significant amount of tax foreclosed properties owned by the organization, but also presented opportunities of gaining additional support and resources from other influential stakeholders and interest groups located within the corridor boundaries, thus furthering the GCLBA efforts.

Largely comprised of residential properties, the Flint River Corridor contained scattered institutional and industrial facilities, and property owners, which includes: Kettering University, the University of Michigan-Flint, GM/Delphi and Hurley Medical Center. These stakeholders joined together with GCLBA to combat issues along the Corridor and support wider efforts. The boundary of the site enlarges based on the groups' interests, but not according to any written bylaws or rules. For example, the University of Michigan Flint was interested in incorporating the Hamilton Dam, a central waterway, into the Corridor boundary therefore the Dam was included and the site expanded.

The coordination of interests around the Corridor led to an evolving group which developed the Flint River Corridor Strategy. With the assistance of an international planning and architecture firm, the Strategy incorporated existing plans developed by other institutions and neighborhoods groups: The Cultural Center Plan, the City's Uptown Plan, and The University of Michigan Flint Plan. Other neighborhood plans existed but were excluded from the final strategy because, as stated by a GCLBA planner, the plans were outdated, less professional and created by smaller neighborhood organizations. Collaboration around the Flint River Corridor Strategy, and the ability of the GCLBA to secure state and local funding to implement the Strategy, attracted more interests from city-wide organizations, businesses and institutions to join the initiative. Thus the Flint River Alliance was created to further the coordinating efforts.

The Alliance mission

Created on September of 2005, the Flint River Corridor Alliance (FRCA) was developed around the Flint River Corridor Strategy. The mission of the Alliance is to "use [d]…combined influence and resources --- to restore and develop the Flint River Corridor, transforming the Corridor from a distressed waterway to a natural resource which is an asset to the community and a national example of urban river restoration (FRCA Plan, 2006)." The purpose of the organization is to bring varying interests and

stakeholders around the preservation and improvement of the Flint River and its surrounding neighborhoods. The Alliance focuses on three priority areas: economic development and neighborhood revitalization, recreation and culture, and environmental quality and infrastructure. Community and institutional initiatives and projects proposed along the Corridor are facilitated and monitored by the Alliance. The Alliance also provides grantsmanship and public awareness to further activities which increases river access, provides environmental improvement and fosters economic development. Overall, the goal of the Alliance is all encompassing. The Alliance serves as an advocacy group of property owners and interested parties concerned with preserving and supporting community efforts. Such service exemplifies environmental, economic, and social opportunities and benefits for the improvement of the Flint River and its surrounding neighborhoods. The Alliance, as a coalition working in the city's stead, provides the momentum groups need to realize neighborhood oriented projects and planning studies.

The Alliance structure

During a 7-month process, the Alliance developed a mission statement, identified defining priorities, and began to determine a leadership structure to guide its efforts. This process included meetings with neighborhood groups, developing work plans, and the launching of its membership. Work plans were developed to further the implementation of existing plans developed by neighborhood groups and neighborhood institutions. The major plans include the Flint River District Strategy, initially developed by vested groups; the Flint River Trail, a regional trail system developed by a local conservation organization; and the improvements of the Riverbank Park and Hamilton Dam. Additional plans and development projects include: Carriage Town Neighborhood Plan, I-475 Neighborhood Plan, City Parks and Recreation Plan, Pending Façade grants, Genesee County Infrastructure plans, Mass Transportation Authority plans, Mott Block Project, Stone Street Project, and the Durant Hotel Project. Each existing plan brings a cadre of interest groups, neighborhood groups and local organizations under one umbrella to serve within a coalition structure.

The Alliance structure is composed of: Alliance membership, individuals who pay annual dues (ranging from $250 to $1,000) and met two to four times a year; Steering Committee, individuals who chose to meet monthly; volunteers, individuals who served as co-conveners and administrative support; and Priority Area Advisory Committee, a smaller groups of individuals which addressed priority areas. The groups with the higher membership dues and major land owners are acknowledged as having more influence and benefits, though the Alliance asserts the level of support will not impact decision-making and any contributing groups will have an equal vote on the Steering Committee.

The Priority Area Advisory Committee is composed of large corridor landholders, made up of institutions, local government and appropriate government agencies or organizations associated to the priority area. Tasks associated with this committee are broken down as such: economic development and neighborhood revitalization,

recreation and culture and environmental quality and infrastructure. Projects and work plans address the implementation of the Flint River District Strategy, and the redevelopment of the Flint River Trail, Riverbank Park, and Hamilton Dam.

The Alliance retains authority to endorse or support a project. Under the endorsement concept the Alliance has no legal rights, liability, or power as a group to say what will ultimately happen on a land, but provides funding and resource support for initiatives. For example, when the Alliance endorsed the GCLBA in acquiring GM property, the GCLBA had to take the responsibility of obtaining grants to pay for the property maintenance, and research legal and environmental assessment fees associated with the application. Another example of membership support was the ability of a congressional representative member of the Alliance to assist in the U.S. House of Representatives passing in Congress, the new Water Resource Development Act (WRDA). This act led to funding for the Hamilton Dam, and a request of $7 million for its repair, rehabilitation or replacement. Support efforts among members allow the Alliance to coordinate and provide intangible resources around particular issues.

Challenges within the Alliance

The Alliance is not unique when compared to other advocacy organizations working to improve cities.   Neither does its structure differ drastically from organizations operating in post-industrial cities left with years of disinvestment, vacant industrial structures and abandonment around major waterways and environmental sites. Flint, Michigan is synonymous to cities like Baltimore, Maryland; Buffalo, New York; and Cleveland, Ohio; which have all developed revitalization planning efforts to reverse or forestall rapid decline by focusing on their waterfront, a major city asset. The redevelopment of land around and in proximity to waterways provides opportunities for cities to reverse blight left by industrial sites and create much needed public spaces and conservation sites for residents left behind. The defining element which makes the Alliance different is that in most cities, this initiative of cleaning up brownfield sites --- characterized by vacant industrial structures and disinvestment--- and waterfront reclamation is generally city led or spearheaded by a governmental entity. The benefits of city and governmental sponsored initiatives place local re-investment projects in an advantageous position to receive direct city funding and support. Central city involvement also provides neutral leadership, affording a governmental agency the ability to oversee and monitor organizations and their diverse interests. For community groups where the city is not an instrumental player, the endeavor usually contains smaller boundaries or is more specific to a particular location. However, the Alliance endeavor is at a larger scale and focuses on a significant section of the city with numerous challenges, presenting a gamut of complications among differing groups and projects.

Therefore, the prevailing challenge for the Alliance is the detached role played by the City of Flint in the organization. City officials attend the Alliance meetings but provide little support or may represent other local organizations, leaving the city absent from involvement in the Alliance initiatives. The city's lack of involvement and support of the Alliances' endeavors presents challenges when the organization attempts to secure

funding or advance projects. Uncoordinated efforts are also common, as the city and the Alliance's different plans along the Corridor, for major roadways or neighborhood redevelopment, differ. Though the Alliance is able to avoid burdensome bureaucracy, the process would be more transparent with the city's presence; and the Alliance would not be forced to continually search for unbiased and neutral leadership among their current membership.

Another challenge is uniting numerous plans and stakeholders into one unified group, with central overarching, and accomplishable goals. As a coalition form of power, defined by Stoker as "actors not seeking to dominate but rather to bargain on the basis of their respective autonomous basis of strength (1995, pg. 62)", the Alliance represents interests groups, ranging from influential institutions such as the University of Michigan-Flint and Hurley Hospital to smaller neighborhood associations, made up of neighborhood residents. Within this coalition structure, there is an exchange of bargaining with others of similar goals and complementary resources; however this arrangement is relatively unstable due to continual changes of roles and leadership within the organization and its evolving structure. With little city support the Alliance must attempt to evaluate the implementation and development plans of numerous organizations, which separately contains a host of organizations, neighborhood groups and local groups, and even governmental organizations, combining them into a cohesive whole.

The benefits of the partnership within the Alliance is one defined by Briggs (2003, pg.5) as a marriage based on the need to "produce together" because the absence of other actors would mean products (investment projects) would not be produced or not nearly as well (sub par) without the existence of the partnership. Key stakeholders hold expectations; some have more credibility and capacity than others. The coalition structure consists of issues related to trust, risk, and rewards. In this structure, groups are able to bring "money, material, expertise, reputation, relationships (Briggs, 2003, pg. 6)" and other assets to the table to achieve a common goal. There is an exchange of ideas, divided responsibilities, collaboration, leveraging of resources, and more importantly, varying voices. However, this varying representation of groups leads to other challenges.   The Alliance acknowledges though all votes are counted among their different stakeholders, not all votes are equal. Some interests are given more power than others. Within the Alliance, organizations or individual members contributing $5,000 or more are given the ability to impact decision within the Advisory board, while others are only allowed to provide input during annual meetings or work groups (FRCA Steering Committee Meeting Minutes, 2007). The lack of equal representation among the groups leaves smaller grass-root and neighborhood associations, unable to funnel their input through the process.

Additionally, some members recognized that these affected groups were not present at the bargaining table. When outside grassroots organizations expressed an interest in joining the Advisory Committee, a GCLBA planner concluded, the Advisory Board did not serve as a link to the community therefore it was essential to provide additional community-related advisory committees. To address this request, Alliance members

suggested only those active on work groups should have first choice for invitees to the various committees. Therefore, the level of involvement by grass-root groups in the coalition's process is still not clear. If grass-root groups are excluded from the Alliance Advisory committee, then neighborhood residents typically represented by grass-root groups are left out the planning process. Based on the valued given to groups, it is important to question if within a coalition structure, grass-root organizations will effectively represent a portion of the public interest, or be limited by their lack of resources and less powerful stance.

With numerous and diverse groups representation, limited city presence, and unequal legitimacy among coalition members, is it possible that the Alliance has the capacity to represent the public interest?

"Public interest" defined

The term "interest" is given utility by Campbell and Marshall (2002) as pertaining to two meaning. First, Campbell and Marshall (2002, pg.169) premise the term "interest" as "a concern with or attention to something". With consideration to the public aspect, its meaning is associated with "having something at stake (Pitkin in Campbell and Marshall (2002, pg.169))". Campbell and Marshall (2002; 227) further assert that the "interest" is not individualistic, but addresses "everyone's wishes and desires." Meyerson and Banfield (1955, pg. 322) define public interest as a concept, which "serves the ends of the whole public rather than those of some sector of the public." Benditt (1975, pg.306) applies a collective conception to the public interest, by asserting "an act or policy is in the public interest not because it is in the interest of Smith, of Jones, or Brown, etc., but because it promotes an interest of the public, i.e., an interest of anyone who is a member of the public."

Douglas (1980) adds to this discussion by observing that the public interest refers to "benefits which apply, more or less equally, to all." These benefits are "indivisible and therefore shared (Douglas, 1980, pg.110)." Walter Lippman in Douglas (1980, pg. 114) provides a more democratic definition in stating the public interest is "what is really good for the whole people" and even more, "what is really good for the whole people as interpreted by the people." However he also disclaims that people would choose the public interest "if they saw clearly, thought rationally, acted disinterestedly and benevolently." This disclaimer is difficult to assume within a coalition structure, in which individuals are attached representatives of their respective organizations.

Public interest definitions are best demonstrated through theoretical conceptions of public interest, which presents a framework of how groups or individuals interact in a group like setting. This framework observes whether groups act based on self interest or for the "happiness of the community (Benditt, 1973, pg.294)." Public interest conceptions further indicate whether groups interact with a focus on an equal and fair process or to achieve a specific goal.

Conceptions and approaches to the public interest

Generally, the public interest conceptual approaches among planning theorists are based on two main factors: the first, how it relates to a democratic process or principle, and second, how it expresses the interests of people involved in the planning process (Howe, 1992, pg. 234). The democratic process focuses on outcome over procedure and vice versa. To determine what is in the public interest and if all relevant groups are being served, a group either concentrates on a defining outcome, or is process oriented. The expressed interest of people involved in the collaboration, refers to whether a subjective or objective perspective is taken. More specifically, it specifies whether the individual is capable of determining their interest or an authoritarian intermediary is needed to determine the 'true' interest of the public. The subjective view is expressed "if the individual is expected to be the only judge of what is in his or her interest (Howe, 1992, pg. 233)", while the objective argues "a person can be wrong about what he or she defines as his or her interest (Howe, 1992, pg. 233)." Campbell and Marshall (2002) assert the interest base of a group or process is another important element in conceptualizing public interest. The interest base identifies the varying roles of actors and how groups interact; whether as individualist, collective or group/stakeholders. These elements are understood in review of three common public interest approaches which include: utilitarianism, unitary, and dialogical.

The utilitarian concept is defined as an individualist, subjective and outcome oriented approach (Campbell and Marshal, 2002). The happiness and pleasure of the individual is the measure of value. This concept asserts that the individual knows what is in their interest. However, if within the group there are common ends (results), then value is not attached simply because there is a common interest among the group. Being outcome focused, this approach gives attention to the 'ends' the individual holds important or causes them the greatest utility. Furthermore, this concept attempts to make a connection between the private utility of the individual and the public interest by leaning towards an "individual's pursuit of private pleasure that is consonant with the collective good as represented by the general welfare (Campbell and Marshall, 2002, pg 175)." Therefore "the happiness of the community" is considered important and though gains and losses are based on individual's utilities, and it is assumes everyone's utility is given equal merit. "One man's gain is as good as another's and utility is indiscrimate for satisfactory of ends (Campbell and Marshall, 2002, pg 175)". Therefore, the acts and policies which represent the public interest are determined by "the greatest happiness of the greatest number (Benditt, 1973)" of those who constitute the public interest.

The second commonly discussed concept of public interest is unitary. This concept posits there is a single set of 'ends' which is equally relevant to all members of the public. It is collective but objective, asserting there is an "observer" or outside decision maker to serve as an expert, because people don't truly know what is good for them. The observer compensates for differences assuming individuals may have mistaken their interests. This concept, similar to the utilitarian concept, is focused on outcomes. The 'ends' leads to "collective values and principles which transcend private interest and their summation (Campbell and Marshall, 2002, pg. 177)." Therefore, individuals

may collectively understand their public interest but require a non-bias observer to equalize or interpret diverse interest among groups.

The last concept, the dialogical approach differs drastically from the unitary and utilitarian approach. This approach is procedural based and inter-subjective, involving groups or stakeholders coming together to achieve a consensus or agreement on an issue. This approach is more characteristic of the Alliance public interest structure. There is an "open dialogue encouraging the emergence of shared solutions" and "interests are always plural, attached and subjective (Campbell and Marshall, 2002, pg.170)." This conception posits that "only the individual can know what his or her interests are (Alexander, 2002; 233)." The approach is defined as "an interactive process among concerned stakeholders and affected parties (Alexander, 2002; 233)." There are "political conflicts, bargaining and compromise between particular sectoral and private interests (2002; 233)". Furthermore, there are procedural norms and rules in this process, at which there is a "participatory forms of democracy but in the context of institutional structures which seek to avoid agonistic clashes of self-interest (Campbell and Marshall, 2002, pg. 180)".

Conceptions of public interest and re-evaluating the Alliance's structure

Within the dialogical, inter-subjective concept of the public interest, it is unclear that the Alliance is able to truly serve the public interests. In review of the dialogical approach, there are numerous limitations and assumptions which produce non-pragmatic concepts in addressing the Alliance's challenges. The approach assumes value neutrality; and a shared and open dialogue among diverse stakeholders, in which norms and rules are continually being developed to support and address issues presented by coalition members.   Even more, there is no overarching superior dictating or monitoring the fairness of this collaboration to ensure all parties are given equal opportunity to impact the outcome.

However, a more pragmatic assessment of the organization provides an image in which Alliance groups represent "themselves as individuals (FRCA Steering Committee Meeting Minutes, 2007)" or their respective organizations.   All groups within the Alliance, affected by public policy, do not have the option to be political or engage in the bargaining process. Neighborhood and grass-root groups are excluded from the Alliance Advisory committee--- key decision makers in the process, creating an unequal balance of powers among the more powerful and influential stakeholders. Furthermore, the focus on process within the Alliance structure creates limitations in providing a good public interest concept. The Alliance represents Healy's (1997) collaborative planning process, in which members interact together "future seeking" and not yet "future defining". The organization functions on the basis of combining influences and resources to revitalize the Flint River area with little conception of a definitive end. The groups "...agree on what to do next, on how to start out and travel along for while (Healey in Howe, 1992, pg. 235)", but are not really sure of where the process will take them. There are no objective end results for the group efforts or the area under concern. Additionally, the focus on the process and not outcomes produces undefined or measureable "ends". This makes it difficult to determine if all groups'

utilities are given equal value or if lesser valued groups have the power to sway final outcomes.

A good concept of public interest for the Alliance

At present, the Alliance's concern for the future is delegating tasks and producing reports to progress its efforts, formalizing by-laws and rules, and identifying project leaders. However, the inadequate nature of the dialogical approach presents a paramount need to focus on the structure of the organization and devise a more inclusive public interest concept. Would a more unitary or utilitarian concept fill in the gaps left in the dialogical approach? The utilitarian and unitary concepts focus on individual self-interests, assuming competing ends are compromised for the common good, and that the compromise of individual interests is done in such a way as to "create the greatest total of end satisfaction (Benditt, 1973, pg. 8)." It further assumes that while groups are different, there is a collective or individual summation of a whole.

Maybe a good public interest concept should be a hybrid of all three concepts; the unitary, utilitarian and dialogical concepts? This conception would assume that value neutrality is impossible to achieve within a coalition setting (Klosterman, 1978), and give effort to address varying voices which infers more than the presence of groups but espouses the influence and legitimacy of less powerful groups impacting collective decisions. Even more, this hybrid conception acknowledges that "goods" held by unequal groups can be bargained away in attempting to satisfy the "whole" (Howe, 1992), therefore, there is a focus on defining the "ends" or outcome, instead of focusing on a fair process which may not be a determinate of inclusion and empowerment of grass root groups. An outcome focused structure ensures that less valued groups are given power which funnels through the process to sway end results. And lastly, within a group of competing interests, this concept of public interest considers an outside 'observer' to monitor the fairness of the outcome.

Addressing representation of groups' "voice"

To provide a fair concept of public interest among the Alliance, the issue of unequal voice and distribution of power based on resources must be addressed. Currently, the strategic plan states the level of support will not affect access to decision-making and any contributing group will have a vote on the steering committee. However, it also asserts that members paying higher dues and major property owners may come to expect more influence or benefits; inferring the Alliance is aware of inequalities in the decision-making process. The climate of the Alliance committees may be "votes are counted but resources divide (Rokkin in Stone 1993; 8)", and therefore those with more are given added leveraging power. What remains is the issue of whether significant contributors should be given equal share of power with smaller neighborhood organizations and their residents, since the latter group tends to contribute less but bears the brunt of any neighborhood redevelopment decisions.

The issue of voice provokes an important discussion concerning a good concept of public interest as some theorists are satisfied with the notion that marginalized groups

should be present 'at the table' and they equate these groups presence to an equal voice. However, in review of the Alliance propensity to cater to property owners and significant contributors, of which grass-root groups are not, is their presence 'at the table' a sufficient representation of the public interest? Even more, what does it mean to be present 'at the table' during the decision-making process? Does it mean marginalize or smaller groups are given an equal voice to express their opinion regardless of its contribution size, property ownership or constrained limited resources? Moreover, having a voice or presence alone may be futile in this group's ability to sway decisions or muster support behind their cause. Stone (1993) posits that in group settings, those with more resources have superior opportunities to rally support to their cause and those with few resources have a lesser voice translating into smaller opportunities to push particular projects. Stone states that these resources may not be material, but include "skills, ability to inspire, organizational capacity, technical expertise, or other intangible factors (Stone, 1993, pg. 11)" all creating a divide among groups.

The term voice in the discussion of public interest must be given more clarity, the voices of marginalized and underrepresented groups, as well as groups with less power who are positioned 'at the table', are not given the same value as more powerful ones. Even more, the less valued groups who have little power to negotiate during the decision-making process are the most important stakeholders, representing those most affected by the decisions, policies or end results. Institutions and business stakeholders are concerned with financial returns but residents are left to deal with direct, negative or positive social and economic impacts of the neighborhood. The Alliance's agenda, to serve the public interest, must not just bring grass-root groups to the table but give them value and influence to impact final decisions. To empower less powerful groups, a plural planning process should be given more attention by the Alliance. The Alliance must create a "means for accommodating their (grass-root or less powerful groups) interests"; and provide incentives for other influential groups to participate in a more collaborative environment. The Alliance must ensure that groups are not ignored due to lack of power or inability to produce updated, professional, and technical savvy documents. This process must be inclusive, where outcomes go beyond "permitting citizens to be heard (Davidoff, 1965; 212)", but allows otherwise powerless groups the opportunity to be involved in the development of *their* communities.

Focusing on outcome

The involvement and added weight of the less powerful in the final plan encourages coalition groups to be more focused on outcomes and not the overarching process. As mentioned, the Alliance represents a dialogical structure in which there is collaboration and negotiation among differing views with the focus on creating a fair process. However, how does one know if the process is fair when there is no realization of the final outcome which can be tested or measured based on desired and identifiable 'ends'? Relying on the process allows groups to negate from making a definitive stance on an outcome. All appropriate and affected parties are given formal rights and access to negotiations, but unable to effect public action. Moreover, minimal focus on outcomes creates few chances to test if the process was fair. Outcome focus concepts

provide focuses on rules developed in the initial stages and are assessed to ensure objectives are achieved in the final stages. The execution of actionable, all inclusive outcomes validates efforts of the collective group. Without outcomes, which is concluded on by the majority of the group, the group's value is significantly diminished.

Representation of the neutral "watchdog"

In the face of limited or infrequent city representation within the Alliance, there is a need for a value neutral intermediary which takes on the responsibility of making sure all appropriate groups are represented and contributes equally to decision outcomes. Groups with little capacity and resources must be given the opportunity to act as "communicatively competent (Dryzek, 1982)" individuals, involved in the negotiation process. Serving as a "watchdog," this detached and paid staff member primary role will be to serve the public interest, and assume ethnical obligations to the community, a position commonly held by planners. Since the Alliance is not a public agency, I believe this intermediary should be responsive and responsible to public values, ensuring all groups and individual interests are being addressed.

Equally important, the outside observer would retain the technical skills needed to assist less proficient and knowledgeable groups in presenting and articulating their cases. As a detached person, holding no personal interest or responsibility to any constituency or organization, the intermediary can take an unbiased position, ensuring all advocacy groups, are present during discussions and are given the necessary legitimacy and power. This represents the hybrid unitary, utilitarian, and dialogical concepts, which infer that individuals understand their own interests but there is an 'outside' observer ensuring a level of fairness and equality amongst differing interests. However, assumptions shouldn't be made that the 'watchdog' will serve as a completely detached and neutral party with no personal agenda in advising and guiding the coalition.

Conclusions

There are many reasons why the Alliance may be unsuccessful in accomplishing its feat, or representing a good concept of public interest. These reasons maybe the results of too many groups 'at the table' vying for support and legitimacy; or perhaps the goals for the Alliance are too broad, and the Flint River Corridor site focus is too large, thus large presenting numerous conflicting issues. In addition, the Alliance's limited options to supplement the cities' role to equalize varying self-interested organization within the coalition, may be a hindrance to the Alliance's success. Consequentially, the environment fostered within the Alliance group serves the members who financially impact the Advisory Board through higher dues and are thus incapable of representing the public's interest. This imbalance is a combination of a self-interested incredulous mentality amongst members, the absence of a planning department who can adequately represent public and non-profit organizations, and the aforementioned financial disparities amongst participating Alliance members.

Beyond coordinating efforts around a central goal within a coalition structure, a good public interest concept must empower the less powerful, open opportunities for new

interests, ways of thinking, and provide new voices. A good public interest concept incorporates equitable dealings amongst Alliance members, creates a transparent process which affords heavier weight on outcomes, and provides an external leadership entity held accountable to a higher public-minded governing body with the expressed intent of reaching an unbiased solution.

Gregori Warchavchik, designer, builder, developer: São Paulo, 1939-1954

José Tavares Correia de Lira
University of São Paulo, Brazil

Gregori Warchavchik's name is closely connected to the introduction of New Architecture in Brazil.[1] Born in 1896, in Odessa, during the former tzarist Empire, and being a member of a Jewish middle class family, his education was determined by Beaux-Art architectural references. He started studying architecture in 1912, at the *Odessa Art School*, a 19th century institution, which became in those years a sort of converging point for most of Ukranian avant-garde artistic youth. After having emmigrated to Italy, in 1918, he finished the architecture special course at the Roman *Fine Arts Institute* in 1920. After graduating, he worked in several Roman and Florentine offices, some of them very important in the academic world, such as Marcello Piacentini's and Vincenzo Fasolo's, and others related to the growing official and speculative housing commissions in post-war Italy. With such a cultural and professional background, he moved to Brazil in 1923, hired by the biggest building company at that period in Brazil, the *Santos Building Company*, which belonged to engineer Roberto Simonsen, the main disseminator of taylorism in the country. In 1925, he started getting involved with the avant-garde circle in São Paulo, soon becoming 'the' architect of Brazilian Modernism and one of the main figures in the national avant-garde scene. Thus, he wrote in 1925 the first manifesto dedicated to modern architecture, and got actively involved in every polemic event associated with the modern movement since then. He planned and built, between 1927 and 1932, both in São Paulo and Rio de Janeiro, the first 2 modernist houses in Brazil.[2] In 1929, during his visit to South America, Le Corbusier invited him to represent the continent at the *International Congresses of Modern Architecture*, and as such he would send to the third Congress, held in Brussels, an important paper dedicated to the development of modern architecture in the region.[3]
Gregori Warchavchik. 1. House in Pacaembu, São Paulo, 1929/1930. 2. Group of houses in Vila Mariana, São Paulo, 1928/1930. Built to be rented in areas owned by his wife, Mina Klabin, and her family. Source: School of Architecture and Urbanism, USP.

Although he had taken part in the main diffusion programmes of the modern movement in Brazil, playing a special role on the renewal of the architecture academic and artistic systems, from the mid-1930s onwards he practically disappeared from the professional scene, including the international one. In 1934, in a letter addressed to Siegfried Giedion regarding the CIAMs, Warchavchik would insist on the indication of other Brazilian architects as members of the *International Committee for the Resolution of Problems Concerning Contemporary Architecture* (*CIRPAC*). Obstacles regarding design practice, demanding from the architects in Brazil a closer approach to civil construction, seemed to have caused him some distress.[4] And while some European architects – such as Giedion, Karl Moser, Walter Gropius, Alberto Sartoris, Van Eesteren, Victor Bourgeois, Simon Syrkus, among others – would write him on the evolution of *CIAM*, asking for local engagement, Warchavchik would keep on complaining about problems concerning design practice and the lack of professional organisation in the country.[5]

One could possibly envisage in his attitude a sort of retreat regarding the international modern movement, precisely when it started to articulate a new regional strategy in Brazil through the group of young architects gathered in Rio de Janeiro after Le Corbusier's second visit to the country in 1936. It is true that in 1937 the names of Warchavchik and Lucio Costa still featured in the list of delegates from Brazil – what did not imply their physical presence – in the *5th International Congress of Modern Architecture*, in Paris. But with the interruption of the CIAM activities during the Second World War, the Brazilian group reorganized after 1945, under Oscar Niemeyer's leadership, would be entirely composed by professionals from Rio.[6]

The purpose of this article is to illuminate this period of relative isolation of the architect from the modern movement mainstream in Brazil, between 1939 and 1954, when the tremendous urban and real estate development in São Paulo has driven him away from the aesthetic avant-garde positions. My intention is to explore some wider changes in the means of production and consumption of architecture in São Paulo. His work activity is thus followed in order to show the gaps between design, technics and building developments and the rise of new clienteles and real estate interests. My idea is to grasp some aspects of the ongoing urban transformations through the modernization of the architectural and building culture.

I start with a brief account of the local architectural practice and building tendencies during the 1930s. The second section focuses on his project for the São Paulo City Hall in 1939 in order to understand his return to practice through a reflection upon the urban aesthetics of the public space. The third part relates his first experiences with private vertical structures in the city center and the moves towards traditional architecture as a response to the changing clientele in São Paulo. The fourth part explores the impact of these new agencies, characteristic of the local milieu, in the architect's moves among academic, organicist, and modernist references. If the project of the Automobile Club (1948) is indicative of the unstable economy of creation and taste, the high-rise apartment buildings analysed in the fifth section refers to some of the main changes going on in the urban landscape and the real estate processes in São Paulo by the end of the 1940s and beginning of the 50s. The final section focuses on

the role played by the architect entrepreneur in the popularization of modern architecture within the private planning activity and the completely formed real estate market in São Paulo by the mid-fifties.

1. Avant-garde short-circuits within the urban explosion

If we take into account his professional curriculum since 1933, Warchavchik seems to have isolated himself. Between 1934 and 1937 he did not sign a single project and until the end of that decade his projects would be actually rare and often irrelevant. His return to practice at the end of the 1930s was, on the one hand, increasingly connected to a private clientele reclaiming traditional styles – including the requests related to the administration of the enormous urban land stock belonging to his wife Mina Klabin and her family, an important industrial clan from São Paulo. And on the other hand, to public orders, in São Paulo also affected by the sumptuous architectural scheme of conservative modernization going on in Brazil.

In fact, even with the incorporation of technical and economic improvements in contemporary business related to building, engineering and urbanism, the truth is that nearly every architectural work produced in São Paulo until the beginning of the 1940s, including Warchavchik's ones, in many senses drew back from the aesthetic innovations proposed in his former works. The client's will, the fickleness of style, and the constructive timidity seemed to govern the field of practice and within the massive residential market continued to prevail picturesque styles such as Neo-colonial, Mission, Tudor, Normand, or Art Déco[7]. The latter, as a matter of fact, assumed as no other an essential role in verticalizing the city centre, as a way of conciliating traditional aesthetic values, ornamental economy and conventional construction with speculative intentions. As for the official buildings, rationalization was often interpreted in terms of classical vastness, resulting most of the time in a grandiloquent architecture. Inspired by a modernized neoclassicism, much fashionable during World War II, this "constitutionalist" inclination could also be appreciated through impressive private buildings of the new rising social forces in São Paulo, such as the headquarter of Matarazzo Industries (1935), planned by Severo and Villares, and advised by Marcelo Piancentini himself, Mussolini's first architect. Despite the fact that this group of buildings stood out against the eclectic landscape of the old coffee capital, only very few architectural examples would engage on the Modernist tendencies.

To some extent, all this is related to the fact that the architectural activity in São Paulo – then associated with that of the builder, both in small and big companies – had given little importance to design imagination. Usually directed by capitalists, engineers, and big corporations (in charge of the main official and private construction), as well as smaller companies (in which the association between architects and engineers became an imperative), the design activity could neither avoid representative purposes coming from the government and the elite, nor commercial requirements for reducing costs and intensifying profit.[8] Furthermore, all this was happening in a period of sudden expansion of the civil construction sector in the city – producing over a million square meters in 1937, and reaching by 1940 more than a million and a half square meters, that is 5.6 buildings per hour.[9] Warchavchik worked in that kind of context during the 1930s. It is

possible that through his own office, with a personally trained team and suppliers, he would have faced greater problems with his competitors if he would not compromise to such parameters.

2. A classical face for the City Hall (1939)

By contributing with breaking up the hegemony of big construction companies over the governmental orders, public competitions became important design laboratories. That was the case, in 1939, at the competition for the São Paulo city hall, established by urbanist Francisco Prestes Maia, then mayor of the state capital, designated by the dictatorial government of Getúlio Vargas in 1938. In 1930, inside the *Plan of Avenues* designed by Prestes Maia himself, the city hall still did not possess a proper building. In the urban plan, Maia proposed a new site for the building, at Bandeira square, developing the idea of a monumental ensemble, inspired by North-American neoclassic skyscraper, symmetrically disposed on the vertex of the Y street system driving the traffic from the centre towards South and West borders of the city.

Successive city administrations along the 1930s ignored any solution for the problem as well as every previous effort of urban planning. Nevertheless, when Prestes Maia became mayor in 1938, the competition was finally established. According to the edict published in February 1939, the building should be placed between the top of Carmo hill and Sé square. The plan should include the administration headquarters, with all government departments and their associated offices, as well as the office and auditorium for the Culture City Secretariat. In May 1939, plans and models of twelve preselected drafts were exhibited at the Municipal Theatre, while the decision on the competition was publicised.[10] Mayor Prestes Maia was very persuasive in his speech for the press:

> *'We received 12 projects, half of them coming from Rio and the other half from here (...) One can attest that this is the harshest test taken so far by our architects. Difficulties came mainly from the fact that the very interesting place is located in an irregular area, what discouraged many competitors, but also from the immensity of the building, estimated for an amount of 30,000 Contos,and the necessity of matching the general aspect with numerous points of view.'* [11]

The press cover as well as the public visiting to the exhibition was enormous.[12]
The jury[13] awarded the second prize to project named "Civic Square", designed by Gregori Warchavchik and Vilanova Artigas. For an acute analyst of the competition[14], the project represented a:

> 'great conception in every aspect: architectural, urbanistic, and utilitarian. But if we take a closer look at the architectural one, we notice a certain lack of height regarding the main body, what makes it look like a factory. But one could say that this lowering down is deliberate, in order to avoid, through volume, the obliteration of the courthouse at the right side of the building, allowing a bigger contrast in comparison to the hundred-meter *"campanille"* storing the municipal archive and upholding the classical clock of the *"hôtels de ville"*. (…) The project clearly predicts an amazing solution for the problem of the Sé Square. (…) It proposes its transformation through the suppression of a block (the one where Santa Helena building is located), turning it into a "civic square" of notable proportions.' [15]

The enthusiasm devoted to the project Warchavchik had developed with his partner João Batista Vilanova Artigas – a young architect-engineer who had recently graduated from the Polytechnic School of São Paulo – was certainly in accordance with the architects' lucidity facing the situation and the proposed programme, attentive to the inevitable urbanistic, representative, and functional implications of the theme, as well as to the monumental tendency regarding public architecture in São Paulo. Avoiding a conception of the building as an isolated block, their project proposed to combine both Sé and Clóvis Beviláquia squares, by demolishing the block in which Santa Helena building was placed, in order to create a single central empty space around which the new city hall, the courthouse and the cathedral would compose a sort of coherent frame, comprising underneath it a central bus station and a car park, letting all free space available for public use.

Urban model of the Sé Square, before the suppression the central block: the proposed city hall at the center with the remaining Courthouse and Sé Cathedral at the right. Source: Ferraz, 1965.

The preoccupations with modifying the organization of blocks, with the definition of accesses, the use of topography, the control over height patterns, and the multiplication of diagonal relations, evoked Camillo Sitte's lessons (1843-1903). His influence in Italian urbanism through Giovanonni and in Piacentini, who had been facing since 1927 the delicate question of ancient urban centres within regulating plans[16], might have reached their ex-pupil Warchavchik. While in Rome, Warchavchik had collaborated with Piacentini in his course on urban aesthetics. However, if Piacentinian classicism appears in the rational modinature and the traditional colonnade which connects the building with the public square, its settling in the townscape is designed through more complex symmetric relations, producing an entirely active urban group, capable of structuring the biparted volume in a more coherent and articulate manner. The lowering of the perpendicular block corresponding to the Culture Secretariat at the back, the tower of the municipal archive disposed out of the axe, and the occupation of the different levels of terrain for the distribution of functions, establish with the surroundings a relationship much less hierarchic than the classical one. In any case, if on the one hand the project seemed actually distant from the dominant eclectic tendency and the fascist modern classicism, on the other hand, it could not be identified with the alleged 'currently dominant school of projects from Rio'[17], equally represented in the contest.

The truth is that none of the drafts seemed to have convinced the jury. According to the official report none of them had solved entirely the problem proposed[18] and nothing was built. In 1946 the idea was renewed by the organization of another competition for a different setting. Warchavchik's plan was again very well evaluated by critics as clever as Geraldo Ferraz and Anhaia Mello, and yet the competition was once more abandoned. For that reason, Warchavchik would years later blame it on the city administration, refering to an unreasonable combination between the narrow conceptions of the official technical border, and the sense of monumentality required by the theme.[19] According to him, only a new competition 'receptive for the big world architecture of our time' could avoid provincialism and local meanness.[20]

3. Liberal practice and the new clientele (1939-1943)

The fact that Warchavchik took part in those public competitions undoubtedly helped him to recover his place in the local building market after half a decade of isolation. It also attests of a significant turning point in his career, both in aesthetic and economic terms. That can be perceived, for instance, through the construction of a middle-class single-family house made in 1938 for the company Melhoramentos Gopouva, owner of the areas bordering the recently released Rebouças Avenue, then in process of allotment. For those areas, that company would also sponsor other residential projects by local renowned architects, as part of its campaign for promoting the area.

Warchavchik's first works in height at the city centre are also from that period. From 1938, for instance, are some apartment building studies designed for some of his wife's own land in Campos Elísios. They represent, perhaps, one of his first steps towards an

approach to the skyscraper, in a period still marked by the dense European like block of rental properties, exploring the maximum height allowed by the city's building code, six-floor tall in that area.[21] Some of these schemes anticipate the Barão de Limeira Building, erected in 1939 at Barão de Limeira street. It is true that the first drawings for this series convey an attempt for breaking the limits of the individual lot scale towards pattern solutions at the urban façades. The plans certainly reveal some evolution from the single-family house to the kitchnet and one-room apartments. But the lack of consideration over the block level would keep him, even in the final solution, from breaking with the uncomfortable separation between front and back apartments, as well as with the inconvenient ventilation trenches and circulation structures commonly used in the traditional two-floor houses.
Gregori Warchavchik. 1. Studies for apartment buildings in Campos Eliseos, São Paulo, 1938. 2. Barão de Limeira Building, São Paulo, 1939. Source: School of Architecture and Urbanism at the University of São Paulo, FAU-USP.

Perhaps the options were limited by the very conditions of his small liberal office, which had just started to work with larger scale agencies in a moment when real estate business was monopolized by big building companies and co-financed building strategies had not yet been popularized in the city. It is possible, though, that the final plan for the Barão de Limeira's building corresponded to a first step towards a greater investment in that area. Anyway, it attests the architect's maturity in face of new typological and urban requirements and the variety of architectural references available. The basic plan followed contemporary parameters of economic construction[22]. It divides the floor in two apartments and recedes the kitchnets to the back, at one side of the lateral borders of the area, ensuring thus good conditions of light, air, and a reduced confinement feeling in the laundry area, due to the suppression of the maid's room.

The vertical structure in the historical city centre also introduced relevant formal and functional innovations. Visual exploration of the reinforced concrete at the white and salient window sills, skewing in a tortuous way, as well as the Le Corbusier's *fenêtre en*

longueur, shaded by projecting roll-up wooden blinds and terraces with awnings, denotes a certain attention to the architecture and engineering contemporarily produced in Rio. It also seems to echo the advanced construction in the city, with the use of reinforced concrete allowing the development of free plans and façades. This was one of the most published Warchavchik's projects, and it was eventually awarded as the best apartment building constructed in São Paulo in 1939-1940, at the first competition of façades organized by mayor Prestes Maia in order to stimulate builders, architects, and engineers to 'fight against architectural mediocrity and anarchy, which have contributed to make our city uglier.' [23]

The innovations achieved at the Barão de Limeira building were certainly connected to the fact that it was made for his wife. But the fact is that most of his works at that period, including a significant part of the Klabin's orders, tended to move away from the previous experimentalism, usually financed by aristocratic patronage or avant-garde artists. A research for a kind of monumentality can be clearly found at the plan for the Santos Municipal Stadium (1942) and the modernized façade of Leoncio Perez's office building, built in the same town in 1943. Despite the fact that they did not contribute to the development of the programmes or constructive systems adopted, one can there perceive his effort in harmonizing historicist tradition in a scenographic image of American-style modernity, with its colonnades and monumental balconies, large edges, mannerist windows, and perfectly ordered plan. His hesitation between classic and picturesque models had certainly guaranteed him some commercial prestige, and eventually some design achievements. But there is no doubt that his range of authority became much more narrow within the new technical and social division of labor.

In fact, Warchavchik's return to traditional architecture, between the end of 1930s and the beginning of 1940s, along with more consistent works he would create until the end of his life in 1972, do not convey a nostalgic attitude or a simple swap of form and style. Instead it seems to reveal the changes in the habits of producing and consuming architecture in São Paulo. At least as regarding the gaps between the new property interests and stylistic demands of the ascending clientele, to which the architect would eventually respond either complacently or in an absent-minded way.

Clients had been changing along the years, with the stronger presence of a first generation of immigrant descendents born in Brazil. They got involved in multiple activities, mainly urban, but also rural, and were highly mobile.[24] This new urban elite also marked its presence in society through a sort of architectural ascending ritual. With the big crisis in the coffee export economy, aristocratic orders, at least in Warchavchik's office, became scarcer and scarcer. As Klabin's property strategies went on, a vast market was developed in connection with the new elite, consisting of industrials, businessmen, bankers, property investors and liberal professionals. Most of his clients were of Italian, Spanish, German, Lebanese, Sirian, North-American and Jewish ascendance: Crespi, Matarazzo, Burchard, Dannermann, Jafet, Maluf, Assad, Salim, Greber, Nielsen, Herz, Vallejos, Lenci, Perez, Zuppo, Lafer, Cherkassky, Bartchevsky, Bloch, Regensteiner, Abramsom. With the new clientele, and the expansion of new

means of construction, patterns of financing and real estate agents and budgets, the architect's role in the field of production had completely changed.

4. São Paulo and the Brazilian Modern Architecture (1943-1948)

These changes were particularly visible in São Paulo. They clearly differed, for instance, from what was going on in Rio de Janeiro since mid-thirties. The contrast was evident at the design exhibition organized by the *1st Brazilian Congress of Architects*, held in São Paulo in 1945.[25] In comparison to the innovative and daring architecture coming from Rio, the one produced in São Paulo seemed, for the visiting public, old fashioned. Even the city mayor, Prestes Maia – who by no means was an enthusiast of the modern movement, but on the contrary sponsored a certain return to classic style in public building – recognized the inferiority of contemporary architecture in São Paulo.[26]

Differently from Rio, the teaching of architecture in São Paulo derived from a Polytechnic tradition. The building market was growing much more explosively at that time while public agencies would keep on avoiding modern architecture until the 1950s.[27] It seemed to happen there something similar to what had occurred in the US during the major period of industrialization: the social mobility of the new urban elite, proud of its wealthy and unsure of its future, although deeply engaged in the changing processes of modernization, led many generations of the most talented artists to a state of isolation. Frank Lloyd Wright's loss of vitality after the first World War[28] could possibly be compared to Warchavchik's break with the avant-garde research by the end of the 1930s. It seemed as though the radical changes taking place in the world of symbolic exchanges in São Paulo had led many avant-garde artists to lose the track of the time and retreat from their own achievements in previous years in search of permanent values. This phenomenon was certainly not limited to São Paulo, but in Rio, at least in architecture, modern art concepts were acting on a much more experimental basis.

Everywhere, experiences developed by the relatively large group of architects graduated and/or working in Rio became emblematic of this new period open to modernity in Brazil. The results had been shown at the MoMA Exhibition called 'Brazil Builds' in 1943[29], as well as in most of the architectural periodicals all over the world [30]. Since the end of World War II, many professionals educated in Rio moved South and North of the country, eager to put in practice the new acquired principles. São Paulo was not an exception in that process: around the end of the war, experienced professionals graduated in Rio, as Eduardo Corona, Abelardo de Souza and Hélio Duarte, established in the city and played an important role at the local School of Architecture and Urbanism of the University of São Paulo, created in 1948 from architecture department of the Polytechnic School.

In São Paulo, the new architectural generation looked at the Cariocan School with fascination, commonly seen as a healthy expression of national modernization.[31] The work in Rio became the mirror in which paulistan architects started to recognize themselves as taking part in the contemporary production and escape from the academic styles.[32] In São Paulo, the break with experimentalism found its epitome in the

inflexion taken recently by Warchavchik's work. There is no doubt that his works from the 1940s, specially the single-family houses for the well-to-do, lost strength and in many occasions conformed to the extravagances of clients ascending and falling in the socio-economic strata.

Some of Warchavchik's projects of the period testify, though, a reconnection with the modern production, both in the country and abroad. Either in the sea-side houses planned in Guarujá for wealthy paulistan and neo-Brazilian clients, or in the apartment buildings that began to multiply with the expansion of the property market in São Paulo, or else in the elite clubs planned in the city, one can notice the increasing interest of the local clientele for modern architecture. The architect's hesitation between organicism and the so called Brazilian style is a good hint on the changes to come in the local architectural field.

A work is particularly relevant concerning his connexion with Rio: the plan for the São Paulo Automobile Club, from 1948. It is one of Warchavchik's first projects for the most central area of the city, heavily occupied and in quick process of vertical growth. It is also the first of a series of plans for clubs that he would design and build in the city, specially in residential neighbourhoods, and the only one of strongly urban nature. Placed at the extreme South of Basílio da Gama street, the building was located in an area submitted to a violent reurbanizing process, causing huge destruction and altering the height pattern of the surroundings.[33] Warchavchik's planning conception is clearly based both in the new allocations and urban tracing and outline for the area.

The eight-storey structure would be built in a way that guaranteed the access to the public space. Studies reveal, however, the uncertainty concerning aesthetic parameters as well as commercial injunctions. The existence of two alternative versions of the plan, equally developed and incompatible in style, retraces the weight of traditional taste and of official paulistan architecture. On one version, we see the typical neo-classic skyscraper, with its solid base and a main body elongated by the vertical disposition of windows and columns and the figurative crown. On the other version, we find a highly disciplined modern project, in impressive harmony with the local appropriation of corbusierian procedures of free-plan, free-facade, *brise-soleil*, running-windows and roof-garden, present in recent constructions in Rio.

Gregori Warchavchik. Automobile Club, São Paulo, 1948. 1. Site plan. 2. Modernist version. 3. Classic one. Source: FAU-USP

It is true that from the functional and structural point of view both projects are sorted out in similar manners, but the hesitation between Prestes Maia's and Oscar Niemeyer's styles conveys the way Warchavchik placed himself at that point of his career. On the one hand, he would approach the celebrated architecture from Rio, ingeniously assembling some of the modern architectural canons. On the other hand, he would adopt either a Corbusierian approach or a Piacentinian one, with as much serenity as detachment.

5. Skyscrapers and property values (1948-1954)

It does not seem strange that during those years, Warchavchik's work once again called editors's and architects's attention, becoming, along with Rino Levi, Bernard Rudofsky and Lina Bo Bardi, one of the few architects from São Paulo appearing in international magazines interested in modern Brazilian architecture.[34] But if the proximity with architects from Rio seemed to have provided him with some editorial prestige, the fact is that his insertion in the professional field was now mostly mediated by the market. This condition somehow kept him distant from the architecture independent courses recently created in the city, as well as from the representational institutions and the cultural and political engagement of local professionals against formalism (increasingly associated with the Cariocan School along the 1950s) and commercialism.

While the local avant-garde tended to align itself with the new social, economic and technical agenda lead by modern public policies in São Paulo, Warchavchik's architecture seemed to get closer to the empiricist approach of the US New Architecture in favour of human scale and daily life patterns. If he would never abandon a clearly conservative clientele, the contact with modern North-American production was responsible for a whole series of strongly organicist projects. Particularly visible in the beach houses, but also in the paulistan elite neighbourhoods, in the modern dwellings derived from Prairie schemes, his design attitude seemed more suitable to the frivolous life style of a consolidating bourgeoisie (at the same time, more urban, more

Americanized, and more casual) and to the conditions of a modern and diverse civil construction and property market in São Paulo.

As a matter of fact, this attitude was openly assumed by a whole group of younger professionals acting in the city. Most of them graduated from *Mackenzie Engineering School*, at the end of the 1930s, where the reference to North-American architecture flourished after the Second World War as a mean of compensating the gaps between modern compromise and market opportunities. Richard Neutra, at that time, published two articles about Warchavchik's recent work in *Progressive Architecture* (released in May and October 1946). It is also symptomatic that in 1948, right after the Austrian architect's first visited Brazil, his book *Architecture of social concern in countries of mild climate* was published in the country with a foreword written by Gregori Warchavchik himself.[35]

As the architectural progress in Rio became more and more obvious, particularities in São Paulo architecture increased. For the art critic Lourival Gomes Machado, professor at the *Department of Philosophy* at the *University of São Paulo*, since 1938, and since 1952 at the *School of Architecture*, there was a main contrast between the emerging group from São Paulo and the established one from Rio: an authentic look was being created in São Paulo, very different from the polemics led by the first modernists. One should notice the silent and essential role played by experienced foreign professionals acting in the city, as well as the growing exchange with modern North-American production.[36]

In fact, even though US references were well spread amongst paulistans since the end of World War II, European professionals with a modern background and relatively trained in their own countries had been arriving in the city since the end of the 1930s. That was the case of the Tcheck Bernard Rudofsky, the Italian Danielle Calabi, the Polish Lucyan Korngold or the Hungarian Zoltan Dudus. Fleeing from the war, many others would be later seduced by new Brazilian architecture: Italians like Lina Bo Bardi and Giancarlo Palanti, German Franz Heep, and Hungarians Francisco Beck and Eugênio Szilágyi. Despite the fact that the majority of these professionals got involved in specific professional or cultural networks, their activities contributed to the reopening of the paulistan architectural scene for the contemporary debates within the field.

Since the 1940s, the city's vertical growth, with the correlated real estate's value strategies, produced a clear change in the local apartment building design patterns in the state capital, many of them planned by foreigners. With World War II, the emergency of new financial circuits regarding space production motivated the development of the real estate activity due to the investment of gains obtained in industry, trade and agricultural export sectors. Between the 1940s and the 1950s, the population in São Paulo grew from 1.3 million to 2.7 million people. In spite of the expansion towards suburban and peripheral areas, the compression of the city centre became conspicuous.[37] During that period, significant credit sources appeared, as in most bigger cities around the country, from capitalization companies, savings banks, and insuring enterprises.[38]

From the point of view of social housing, the stability of rental fees, guaranteed by the 1942 Law of Tenancy, reduced capital inversion in the construction sector and amplified even more the housing crisis within the city. From the point of view of property market, it represented an important stimulus for speculating with property values, through verticalization of the city centre and its close surroundings, and the production of bigger apartments for middle and upper classes and rental ones for the popular market.[39] If the high cost of land contributed to the urbanizing process of peripheral areas through informal construction and irregularity, it also intensified the use of urban land all over the place. In that process, the character of the skyscrapers also changed, expanding to the residential market, as the height of constructions followed the consolidation of elevator industries in the country and the new urban regulations.[40]

At that moment, neighbourhoods as Higienópolis and Consolação suffered the radical transformation of their traditional silhouettes. The small palaces and bungalows were mostly turned into denser and more vertical skylines. Nevertheless the character of occupation by a wealthier population was preserved. The zoning of the city after 1947 operated as a discriminatory method, which proved to be a crucial element in the protection of property values of the noble neighbourhoods located in the western part of the city. By acting basically with two different devices, the use and volume of construction, the laws adopted in those neighbourhoods kept the same strategy used in São Paulo since the beginning of the century, which guaranteed height limits proportionally to the width of the street.[41] It was around that time that real estate incorporation, the merging among property holders, building companies and commercial agents, led by financial capital, became common in the city.[42]

In 1948, Warchavchik planned for industrial Roberto Simonsen a ten-storey apartment building for wealthy people at the corner of Aureliano Coutinho and Marquês de Itu streets, in Higienópolis. Conceived in a moment of great changes in that neighbourhood, this project connects with the inversion in the dominant process of vertical growth. Despite the fact that it was not actually built, the drawings reveal a close link with the model adopted later in that neighbourhood, due to laws favouring an elite settling: a couple of blocks strictly residential, isolated in the terrain, set upon the exposed columns of a recessed ground floor, connected to public space through generous gardens, squares, ramps and concrete canopies. The Moreira Salles

apartment building is another attempt to face the problem of residential vertical structures in busy areas of the expanded city centre. Built in 1951, at São Luiz Avenue, in a moment when this noble boulevard, isolated and quiet, was becoming a busy road, it takes was integrated in one of the most exuberant vertical silhouettes from that period. The history of the enterprise was recently summarized:

> 'In November 1942, Walter Moreira Salles, Octávio Lotufo and Edgard Richter acquired from Lúcia Assumpção do Amaral the terrain at São Luiz Street [...] The association of [banker and diplomat] Walter Moreira Salles with the two others, who possessed the construction company Richter & Lotufo, broke and in January 1951 a request arrived in the city hall for the approval of the project of an apartment building signed by Gregori Warchavchik, to be constructed in the lots number 101 to 115 by the Building Company Severo & Villares. Walter and João Moreira Salles appeared as owners with eight other people, certainly the buyers of the apartments to be made. The construction work did not start before 1952, for in that month the construction company was still asking for alignment licence.'[43]

The architect's role, until then acting as a sort of mediator between the building and the financing activities, has clearly changed into a much more vulnerable position. In search of stability, the bank starts to absorb the land ownership and the contractor's roles while the big building company substitutes the engineering company in the enterprise. Acquisition of land, hiring of the project and work, construction financing, property commercialization: in the venture one can recognize the classical mode of real estate incorporation as an extension of the financial capital. It is significant that it had become evident in the production of a skyscraper. As Tafuri remarked, in its original intent of projecting itself outside the city, as a 'single and anarchic event', the skyscraper dramatized, as a tribute, the unstable balance between the independence of the isolated structure produced in a corporative way, and the organization of the collective capital producing the city: a sort of 'an island of balanced speculation.'[44]

But the case also shows the limits of the financial capital to control the risks of such an investment into real estate: part of the costs were raised by previously negotiating some of the apartments, while the hiring of the architect and the building company seem to be made in different basis. As other buildings constructed there, the Moreira Salles symbolizes the starting point of the association between high incorporation and advanced property speculation in the centre of São Paulo, a process which reveals the fundamental contradiction between the moment of the spatial fix income and the moment of financial capital organized around it.[45]

Just as the others, the building followed the rules of the city's *Construction Code*, stipulating the total use of the land, according to the width of the streets, and side retreats after a certain height, that is, 2.5 meters from the twelfth-floor on, what explains the scheduled shape of the nineteen-storey tower. The main access to the ground-floor created an internal winding path crossing the whole block towards Basílio da Gama street, bringing together the front and the back of the building and saving some space for shops on the side-walk.

6. The architect-entrepreneur and the private planning (1945-1954)

Warchavchik's insertion in the property market would become clearer on larger scale projects, specially on those made for massive consumption in less valuable areas. The example of the plan presented in 1945 for a model neighbourhood unit in the city is particularly emblematic. Associating his previous experiences in building dwellings for rent, this 'first big project directed to solve popular housing crisis' differed not only by its size, but also by its urban conception. An article in a newspaper from Rio described it:

> 'Warchavchik's project consists of a complete plan, a proper neighbourhood, composed of twelve to eighteen-floor buildings, apart smaller ones, forming a residential unit with all resources: a smaller city inside the city, as Warchavchik says. That unit, with approximately six thousand apartments, supporting a population of some thirty thousand people, will comprise a hospital, a nursery, a cinema theatre, a school, a club, a pharmacy, a church, some shops and markets, everything inhabitants will need to not having to go further than five hundred meters away from their homes. The model working-city emerging from this current project was rationally studied in every detail, long and consciously. It will occupy a large area measuring 14.5 hectares. Its location was determined by the industrial pole in São Paulo, at Mooca, crossing Pedro I Avenue. (...) The plan intended, thus, to immediately concentrate the working population in the margins of the urban outskirts where factories and workshops are placed. As we all know, it is the lack of

connection between their houses and the factories that causes traffic problems, waste of time, lack of rest, long hours spent with transportation that could be better used for recreation and education.'[46]

Taking into account aspects of urban location, extension, circulation between dwellings and working places, the project was well motivated by the principles of housing and centrality proposed by the *CIAM* meetings after the World War II. Those themes had been enthusiastically discussed in the *I Brazilian Congress of Architects*, occurred in São Paulo in January 1945. It also coincides with the advent of a new concern with popular housing and the formulation of political responses and plans for the problem, which involved architects, such as Afonso Eduardo Reidy, Carlos Frederico Ferreira, Atílio Corrêa Lima, Francisco Bologna, Marcelo Roberto, Eduardo Kneese deMello, Oscar Niemeyer etc.[47]
Gregori Warchavchik. 1. Sketch for 'Cidadinha', São Paulo, 1945, Source: *O Jornal*, Rio de Janeiro, 22/7/1945. 2. Design for a neighbourhood unit commissioned by Germaine Lucie Burchard, Ipiranga, São Paulo, 1951-1954, Source: FAU-USP.

As an 'individual contribution' to facing the problem of overpopulation, Warchavchik's radial plan aimed at the growth of urban densities and the functional divisions of space with the creation of a collective activity centre.[48] Buildings with different heights and shapes should be disposed in the centre of large blocks, having among them gardens with areas for recreation and sport. Directed to a poorer population, the enterprise predicted apartments measuring an average of 50 square meters, with facilities and modern furniture, including the possibility of employing pre-fabricated methods in order to reduce investment costs and renting prices.

As conceived, the idea was never developed into a more detailed project. However, at the beginning of the 1950s, a plan required to Warchavchik by Baroness Germaine Lucie Burchard, heir of the largest amount of land in the city, for an area at Ipiranga, send us back to the original plan. Several solutions were presented, with different grouping of buildings, various sorts of individual cells and plans for common spaces.

The period coincides with the creation of Warchavchik's own construction company, in 1952, in association with engineers Walter Neumann and Mauris Ilia Klabin Warchavchik, his son. The company's statute assured their responsibility for 'civil architectural and engineering works in general, and for industry and trade related to building activity.'[49] Leaving behind the avant-garde architectural profile, and not being

restrained to the independent activity of liberal practice, the architect would then become an entrepreneur of the civil construction sector.

In that new context, the office's activity increased enormously, not always favouring the quality of design. Matters of maximizing property values and financial profits seemed to have become the basic requirements of the planning activity. Even when the architect's presence was remarkable, as in the apartment buildings Santa Margarida and Cícero Prado, both designed in 1954. Built for Aníbal Ribeiro de Lima, Warchavchik's usual client, the Santa Margarida building is a private investment which explores the central location of the double faced terrain through the division of the ensemble in two 13-floor independent buildings, with 78 apartments of different sizes. As for the Cícero Prado building, also built in the expanded centre, at Rio Branco Avenue, by the company Warchavchik-Neumann, perfectly describes the attempt of finding a compromise between property and visual values. The massive ensemble of the three residential blocks stand on a horizontal base occupying the whole extension of the lot.

The massive scale of the complex with nearly 150 apartments, the volumetric fragmentation of the ensemble, and the huge blind walls turned towards the exterior, certainly reflect the expectations concerning the growth and densification of the area, then in process of getting empty. And if the bulky aspect of the building was counterbalanced by the aerodynamic line of the reinforced concrete balconies, with its decorated window-sills and suspended gardens, this kitsch use of the avant-garde[50] seemed to speak of a certain popularization of high cultural references, or a massive consumption of the modern architectural image.

7. Conclusion

It is not hard to understand why along the whole process here presented, Warchavchik's work had lost its ground-breaking enthusiasm. And yet, the course of his career tells us much about the situation of the architectural field in São Paulo and the contradictions peculiar to the Brazilian process of modernization, at once progressive and conservative, subordinate and complementary, peripheral, differential and revealing of the professional inscription in the logics of capitalist development. Examined in detail, it reveals the inevitable urban, social and economic mediations of architectural work. These material mediations might be perceived in three different ways: a) through the variations of the architect's status, from pupil to employee, from a liberal professional to manager and entrepreneur; b) through the way clients engage and instigate the directions of style; and c) amongst certain forms of real estate investment, landed, rentist, corporative and/or 'incorporative'.

Therefore, the restrictions imposed to Warchavchik, as a market oriented architect, by the circle of professionals claiming to be the true and new agents of national and progressive avant-garde do not seem to be fair enough. For the inflections his work took, from the moment it engaged the urban reality of real estate, brings to light one of the distinctive features of the modern project: the ideological functioning of a design more and more connected to the city as a productive structure[51]. In other words, the ideologies of the plan or the fractures of the avant-garde poetics without utopian remains.
