**The Genesis of Yokohama's
Strategic Planning
Environment: Reflecting on
the Contribution of Akira
Tamura and His Work**

Profile of Akira Tamura – Yokohama City Planner

Chihiro Tamura (Akira Tamura Memorial - A Town Planning Research Initiative NPO)

This essay is a profile of Prof. Akira Tamura (1926-2010), one of the great city planners of post-war Japan, and a brief study of his accomplishments in Yokohama.

The meaning of the term 'city planner' is somewhat vague, but in post-war Japan officers of the central government. Because the City Planning Act 1919 was not amended as part of the post-war legislative overhaul, the power of the central government remained very strong. This centralised system was well-suited to post-war reconstruction, but did not assist in addressing questions of urban planning which arose with the rapid economic growth from the 1960s onwards.

With the expansion of the Greater Tokyo Area, the population of Yokohama grew rapidly, and its land use was disorganised. The pollution and the lack of infrastructure reached a critical point. Ichio Asukata, elected in 1963 as the new socialist mayor, had to solve these issues. He devised a citizen-centric plan for Yokohama, then approached the planning office at which Tamura was working for assistance.

Tamura had studied at the architectural department at Tokyo University and majored in city planning. After graduation he first worked for the central government, but soon quit due to feeling uneasy about the elitism and sectionalism of the national bureaucracy. Having decided to pursue a career as a city planner as his vocation, Tamura studied in the Law Faculty of Tokyo University to learn a more comprehensive approach to city planning.

Tamura proposed to Asukata a new concept for Yokohama as Japan's "international management centre", rather than a mere satellite to Tokyo. In order to realise the concept, he recommended that six projects be implemented: the redevelopment of the urban central area, the reclamation in the Kanazawa seaside area, the building of the Kohoku New Town, a municipal subway system, highways and the Yokohama Bay Bridge.

According to him, the completion of the six projects would be very costly, but would succeed if Yokohama sought the involvement of both the central government and private developers in the projects.

Tamura was invited to work at the city government and worked in the taskforce under the direction of the mayor. He became the chief planner of city administration; not only striving to realise the six projects, but also introducing guidance to control the development and management of 'urban design'.

As Asukata left the city in 1979, Tamura worked for Yokohama for about a decade. However, his planning vision was inherited by the officers who had been educated by him. Moreover, Tamura's accomplishments have encouraged many planners and officers in other local governments.

After he wrote his Ph.D. thesis on the local development exaction system, Tamura left Yokohama, and lectured on urban policy as a professor. He also authored twenty books and lectured to enlighten the public on city planning issues.

In short Tamura was a leader and pioneer in the field of city planning as an officer of local government, whose achievements are comparable to Daniel Burnham in Chicago in the late nineteenth century.

THE ADOPTION AND ABOLITION OF THE LOCAL DEVELOPMENT EXACTION SYSTEM BY THE CITY OF YOKOHAMA

Toshio Taguchi (Akira Tamura Memorial-A Town Planning Research Initiative NPO)

This thesis intends to explore the rationale behind the adoption and abolition of Yokohama's local development exaction system ("LDE system"). LDE systems were independently and locally formulated by local governments in response to challenges they faced across Japan, and the city of Yokohama provides a leading example of a functional LDE system pursuant to which land developers were required to donate land for public use as a condition of their receiving development approval from the city government. In the mid-1960s, as Japan accelerated towards a period of high economic growth, the central government promoted the implementation of new housing developments by the private sector. These housing developments required unprecedented expenditure by local governments in order to build public infrastructure both inside and outside those development areas. At that time, Japan lacked strong national laws on the control of land use, and the city of Yokohama was uniquely vulnerable to the adverse consequences of unplanned housing developments caused by the huge influx of population from neighbouring Tokyo. In 1968 Ichio Asukata, the then socialist mayor, invited Akira Tamura, a young city planner, to the city administration to solve the town planning issues Yokohama was faced with. Japan's new Town Planning Act of 1968 did not contain provisions authorising the exaction of land. Therefore, Yokohama became the first big city to adopt an LDE system in 1968. Before its formal adoption, the city government had successfully reached an agreement with the Tokyu railway company about its duty to donate land to the public as a condition of its housing developments. Following this example, Tamura extended this concept of reaching agreements to exact public land donations across Yokohama. The terms of land-use exactions were recorded in bilateral agreements prior to development permission being granted. From its inception, the LDE system was used as an administrative guideline which ran the risk of legal challenge by affected developers. Although several lawsuits were filed, most verdicts were favourable towards local governments. However, as the economic situation deteriorated in the early 1990s, the Supreme Court issued verdicts finding in favour of housing developers. After Asukata's term in office, a succession of conservative mayors narrowed and reduced the obligations imposed under the LDE system and finally ended its use in 2004. Nevertheless, using the LDE system, the city government had acquired 307 hectares of public land by the end of the 1993 fiscal year, which was used to accommodate 150 public schools, accounting for 60% of all municipal schools opened between 1968 - 1993. The idea of development exactions persisted for nearly forty years, despite the central government issuing administrative orders to local governments instructing that they not make excessive demands of developers. Tamura wrote his doctoral thesis on this subject in 1981. Since then, no study assessing its aftermath and final abolition has occurred. This study is intended to present some idea of how local initiatives can be implemented independently by local governments in a highly constrained fiscal environment without any support from the central government.

The status and use of soft law in local governments' management of urban development: restructuring the logical framework of administrative guidance on impact fees for housing development in 1970s Japan

Kenji Asakawa (Institute for Global Environmental Strategies, City Taskforce)

The rapid housing development that accompanied the high economic growth starting in 1960s Japan forced local governments to incur significant expenses for investment in public infrastructure. Therefore, many local governments established guidance on impact fees in relation to housing developments, which significantly relieved some of the financial burden on local governments in connection with these developments. However, the lack of binding force behind these guidelines also caused tension between local governments' demands and non-compliant developers. Accordingly, most local governments refrained from implementing such guidelines, perceiving them negatively as stopgap measures to an issue that required the enactment of alternative laws and regulations. However, since both laws and regulations (hard law) and guidance (soft law) prescribe social norms, irrespective of its binding force, hard laws are unnecessary if soft law successfully elicits voluntary cooperation between parties. Moreover, soft law is somewhat superior to hard law in terms of its ability to build solid consensus without binding force. One of the lessons from the Yokohama's experience of using soft law for urban development management is how to achieve such a solid consensus without the availability of legal coercion. From the viewpoint of law and economics, the economic interests of developers of complying with the guidance, that local governments are able to have an impact on, can include: (1) direct and subjective benefits from compliance shared only between the local government and the developers, (2) long-term benefits (if prioritised by the developer), and (3) indirect benefits that may be accrued by demonstrating their compliance with the guidance. In the case of Yokohama, the guidance worked effectively mainly because the administration enhanced (1) intentionally in a favourable environment for (2) although it did not take measures for (3). The developers would therefore recognise the value of such compliance to gain greater profit from higher sales of their residential land. Rapidly growing cities in developing countries face the same dilemma as Japanese local governments did in the past, and they also have similar difficulties in collecting impact fees for public infrastructure investment. Soft law may be a more appropriate solution than legislation, especially in developing countries where the rule of law is weak, since they have greater difficulty developing and enforcing laws when compared to Japanese local governments that have experienced high economic growth. Therefore lessons learned from Japanese local governments, especially the Japanese experience of using soft law for urban development management, including how to achieve such a solid consensus without the availability of legal coercion, could contribute to more effective practice of using impact fees to solve this dilemma in developing countries.

A study of unorthodox town making by Akira Tamura: the transmission of Tamura's vision to younger generations

Atsuhiko Aoki (The University of Tokyo)

The purpose of this study is to clarify how Akira Tamura's "town making" vision was passed down to and utilised by younger generations. Although the Japanese urban planning legislation regulating the control of urban space is largely based on modern Western city planning, its practical application has a strongly centralised and business-centred character (Watanabe 2001: 139). At the same time, however, there is a lack of political and social support for central government-led planning, and the principle of "architectural freedom" in urban spaces leaves planning to the forces of laissez faire market principles. Against this background, a unique contrivance for the control of urban spaces called "town making" emerged at the level of Japanese local government entirely independent from amendments to individual urban planning and building standards laws. According to Koizumi Hideki, an urban engineer, the essence of "town making" is "to create a relationship / framework among citizens and local communities that controls the market instead of the central government" (Koizumi 2001: 236).

As shown in the preceding paper, Akira Tamura talked about urban planning in easy-to-understand terms and attracted a great deal of interest in town making through his books. However, he was not a theorist of urban planning, but instead built his own town making theory through responding to the needs and circumstances of Yokohama city. Akira Tamura's town making theory opened the subject of town making to a wider range of people. Therefore, the question to be asked is, given his fluid and responsive approach, (1) what are the features of Akira Tamura's town making that were passed on and (2) how can they be applied by future town planners? In this paper, I focus on the mutual exchanges between Tamura and members of the study group on town making in Yokohama as a case study to solve these questions.

My conclusion from this study is that Tamura was able to create an approach that made town making universal and inclusive through losing his position at the Asukata-led city government (1963-78). His legacy was not to change the appearance of the city by modifying the built environment, but to think about how individuals should respond to dynamic and fluctuating urban changes. Hence, for those wishing to adopt and continue Tamura's vision, the important question is not what Tamura did, but what Tamura would do. In other words, they should approach problems in town making by internalising Tamura's approach to town making. Consultation with stakeholders and the exchange of views among those who take part in town making is indispensable for that purpose. Too often successful cases of urban planning are praised and standardised. However, from the perspective of Tamura's town making, it is not necessarily desirable to adopt a standardised approach to certain problems. Rather, it is essential to control urban space by creating a relationship / framework among citizens and distinct communities that takes a flexible, "no-fixed-form" approach of the kind adopted by Tamura.

PROFILE OF AKIRA TAMURA---Yokohama City Planner

Chihiro Tamura

*PhD in Chemistry, Akira Tamura Memorial - A Town Planning Research Initiative NPO,
ctamura@chive.ocn.ne.jp*

This essay is a profile of Akira Tamura (1926-2010), and an attempt to locate him in the contemporary history of city planning in Japan. In the 1960s Yokohama faced various urban problems accompanying its rapid economic growth. Ichio Asukata, elected in 1963 as the new socialist mayor, tried to solve them through the local government in an era when the central government's power remained strong. Asukata then met Tamura, who was working for a local planning office, and asked for his assistance. Tamura proposed to Asukata a new concept for Yokohama as Japan's 'international management centre', and the implementation of the Six Spine Projects, including the Minato Mirai 21 development. Asukata decided to invite Tamura to join the city government. Tamura worked for Yokohama city for over a decade, and his planning vision was inherited by the city's officers. Moreover, his accomplishments have encouraged many planners and officers in other local governments. Tamura later lectured on urban policy at university, authored eleven books, and travelled to educate the public on city planning (or 'machi-zukuri'). In short, Tamura was a leader and pioneer in the field of city planning as an officer of local government.

Keywords: city planning, machi-zukuri, Yokohama

1. The Purpose of this Essay

This essay is to profile Akira Tamura (1926-2010), one of the great city planners of post-war Japan, and conduct a brief study of his accomplishments in Yokohama.

His influence on Yokohama's city planning remains powerful to this day. The 'Six Spine Projects', including 'Minato Mirai 21 (the redevelopment in the central portside area of Yokohama for the twenty-first century)', which he planned as a consultant in the mid-1960s and then worked on as a city officer from 1968 to 1981, have been central to Yokohama's development for the last half century since their inception. In 2000, the Architectural Institute of Japan (AIJ) awarded Tamura its Grand Prize for 'the establishment of a theory or technique and its implementation in city planning' (AIJ 2000), which was done in connection with Yokohama. Tamura is the only practical planner in the field of city planning issues to have won the AIJ's Grand Prize, and other recipients have all been academics or architects, such as Kenzo Tange.

Since the middle of the nineteenth century, Japan had been undergoing rapid modernisation, but priority was usually placed on military and industrial development. The system of city planning was 'top-down' from the national government, and this was reflected by the City Planning Act 1919 remaining basically untouched until 1969 in Japan. Local planning originated from central bureaucrats and was approved by the Secretary of State without public participation. While such a centralised system might have been well-suited to immediate post-war physical reconstruction, it became clear that it did not assist in addressing questions of city planning which arose with the rapid economic growth from the 1960s onwards.

With the expansion of the Greater Tokyo Area (Tokyo and its three neighboring prefectures), the population of Yokohama grew rapidly (almost doubling in a decade), and its land use was disorganised. Environmental pollution and the lack of infrastructure reached a critical point. Ichio Asukata, elected in 1963 as the new socialist mayor, had to solve these issues. He devised a citizen-centric plan for Yokohama, then approached the planning offices at which Tamura was working for assistance.

Tamura proposed the 'Six Spine Projects', which were interconnected to develop and maintain the economy and citizens' lives in Yokohama, and advised the city to establish a new organisation called the "Planning and Coordination Section" (which later became the "Planning and Coordination Bureau"), because local organisations were divided by engineering field, which had resulted in sectionalism. Tamura was invited to Yokohama city in 1967, and quickly rose to become chief of the new section. However, even after Asukata and Tamura left Yokohama, the Six Spine Projects were continued by the successive mayors and the local officers, who understood that those projects were necessary for Yokohama.

Tamura went on to become a professor at Hosei University and lectured on urban policy at the Faculty of Law. He also travelled around Japan and contributed to educating the public on city planning issues until his death.

The purpose of this essay is to describe and evaluate Tamura's accomplishments in city planning. Although he is well-known by Japanese planners, there are few studies on his accomplishments as city planner at this stage. Perhaps it is too early to evaluate his contribution as only eight years has passed since his death, but in this IPHS Yokohama conference in 2018, we will try to review his work.

2. Early Life

Akira Tamura was born on 25 July 1926 in Tokyo as the third eldest son in his family, both of his parents being Christians of the non-church movement (Tamura 2009, p. 5). This movement was led by Kanzo Uchimura, an influential thinker in modern Japan and a well-known pacifist of the Russo-Japanese war era.

The Tamura family was not particularly wealthy, but was a typically cultured middle-class Tokyo family before the war.

As a child, he attended a primary school attached to the Aoyama Normal School (now a primary school attached to the Tokyo Teacher's University) and proceeded to the Municipal First Junior High School (now Hibiya High School), both of which remain prestigious schools in Tokyo. Tamura went to school by train, and visited a great

number of places reflecting his broad interests. Such experiences contributed to him becoming an active boy who liked railways, tourism, and geography.

However, he did not advance to the First Higher School (the premier high school in Japan for the elite before the war) in Tokyo, but instead went to Shizuoka Higher School, which took a few hours by train from Tokyo in 1944. He later explained this as because he 'liked to live outside Tokyo to broaden his horizons' (Tamura 2009, p. 130).

The war ended the following year and Tamura entered Tokyo University. He selected the Department of Architecture in the Faculty of Engineering, because architecture might be regarded as a broad field, encompassing arts and social science, rather than other engineering departments.

His graduation thesis was titled 'A Study of the Change of Structure in a Big City'. He joined the office of young Associate Kenzo Tange, who went on to become a world-famous architect. However, as Tange wished to be a master designer like Le Corbusier, Tamura did not totally align with his teacher's vision, whereas Takashi Asada, a staff member in Tange's office at that time, had a greater influence on Tamura. Asada was seven years older than Tamura, and also aimed to be a city planner.

At the time of writing his graduation thesis, Tamura had the goal of becoming a city planner, and it was natural that he would become a bureaucrat in the central government in order to achieve this. He decided to take the examination to become an advanced level of central bureaucrat, and passed it, becoming an administrative official.

Tamura first entered the Ministry of Transportation in 1950. However, he left fifteen months later and was then transferred to other several other ministries, although he also quit each of them 'less than two weeks later' (Tamura 2009, p. 234) because 'I felt uneasy about the elitism and sectionalism of the central bureaucracy' (ibid.).

In addition, Tamura attended the Faculty of Law, Tokyo University, while working as a national bureaucrat. This was because he considered knowledge of law would be necessary to city planning, and he succeeded in attaining a Bachelor of Laws. Then, after giving up the idea of working as a central bureaucrat, he decided to work for a leading life insurance firm, which was headquartered in Osaka.

As real estate was regarded as a good investment when the Japanese economy was recovering in the 1950s, the life insurance firm needed a specialist for real estate development. From this perspective, Tamura seemed eminently qualified because he had majored in both law and architecture. Tamura enjoyed a stable life for nine years, and married his wife Makiko, who was from the same Christian non-church movement.

However, he was not satisfied with his life as a salaried worker. When he was engaged, Tamura told his fiancée that he would leave the firm if he were given the chance (Suzuki 2016, p. 9). He wondered whether there would be a vocation for him elsewhere. He believed his then work in estate development only benefitted his firm, and was not what he wanted to do with his life. He visited Tange, his former teacher, to consult about his future.

Tange advised Tamura to visit Takashi Asada, Tamura's former superior, because he had just opened a consultancy office on city planning (ibid. p. 11).

Tamura visited Asada's office, but could not immediately decide whether to join the consultancy. He began working as a part-time member of staff, coming to Tokyo every weekend (Tamura 2014, p. 4). In January, 1963, Akira Tamura finally decided to leave his life insurance firm, and came back Tokyo to enter 'the Environmental Development Center', Asada's planning office.

In those days the private profession of city planner did not exist in Japan. Although Asada had just opened a planning office, its financial prospects were quite dim. City planning was regarded as the work of central bureaucrats, or a utopian designer such as 'the planning of the Tokyo Bay 1960', which Tange had just released.

It was at that time that Ichio Asukata, elected in 1963 as the new socialist mayor of Yokohama, approached Asada's office to ask for assistance.

3. An Adviser to the Socialist Mayor

The 18th International Planning History Society Conference - Yokohama, July 2018

In the 1960s, the Japanese economy was enjoying high economic growth, which was mainly driven by the heavy/chemical industrialisation and its growth rate continuing to rise by more than 10% annually. In 1968, Japan's Gross National Product (GNP) had come to be ranked the second in the world (Cabinet Office, 2018).

However, that economic growth brought with it urban problems common to big cities. For example, Yokohama, one of the main central cities in the Greater Tokyo Area, faced serious issues: rapid population growth, public pollution and traffic issues.

The population of Yokohama grew from 951,187 in 1950 to 1,788,915 in 1965 (Yokohama city 2010, p. 4), and most new migrants settled in the inland countryside districts. The Japan Housing Corporation and private developers built many new towns, but this led to financial difficulties for the local governments as it was their role to supply the necessary infrastructure such as roads, parks, waterworks, drainage, and schools.

Yokohama also had other problems, such as public pollution. There was a coastal heavy industrial zone (the '*Keihin Industrial Zone*') running along the Tokyo Bay in Yokohama. Those industries discharged significant volumes of waste water and exhaust, causing complex environment problems, although the industries were the cornerstone of the local economy.

The original identity of Yokohama as a port had also been changing. As Yokohama was the biggest port in Japan before the war, it was an international exchange centre for trade and people. Moreover, as the distribution system changed after the war, Yokohama's superiority as an international port had been in decline, although the increasing container loading and unloading caused traffic jams in the city.

It was against this background that Ichio Asukata, a socialist politician from Yokohama well known as a pacifist advocating a "nonalignment policy" for Japan, won the mayoral election in 1963. Asukata's solution to the urban problems was that local government should have the power to devise citizen-centric city planning by itself. Asukata's interest in city planning differentiated him from other Japanese socialists of the era. This was why Asukata went on to win the mayoral election a further four times, and was supported by even conservatives in the city council (Endo, T. 2016, pp. 34-35).

Asukata consulted with Narumi, his young political adviser, and decided to approach Asada to help him with his vision for city planning. Asada agreed and nominated Tamura to be in charge, because Tamura was the premier planner in his office. Coincidentally, Tamura had recently moved into a state-owned residential building near Yamashita Park in Yokohama.

Tamura met Asukata for the first time on a ship sailing around the Yokohama Bay to study the port situation, and they were very much impressed by each other. "Mr. Asukata was a frank man and looked easy to talk to", Tamura recalled (Suzuki 2016, p. 12); and "Tamura pointed out the townscape of the port, and I agreed with his opinion" wrote the mayor later (Asukata 1987, p. 55).

Asukata, Asada, Narumi, and Tamura had several meetings, and decided upon the new concept of Yokohama as Japan's 'international management centre'. Tamura consolidated and evaluated their plans in 'the Report for the Basic Study for the Yokohama's Future Planning' (1964).

According to the report, Yokohama had three faces: a port city, an industrial city and a residential city. These were Yokohama's three identities, which presented key issues in city planning.

The Six Spine Projects were proposed in the report, because the practical forms of the projects had to be implemented as promises to the citizens. There were in fact originally seven projects, but these were reduced to six as two could be consolidated after a careful review within the city government. Thus the Six Spine Projects were proposed to the City Council in February 1965, namely: the redevelopment central harbourside area (later named the '*Minato Mirai Project*'), Kanazawa reclaimed land, Kohoku New Town, highways, underground subway lines, and the Yokohama Bay Bridge across the Yokohama port.

Asukata also tasked Tamura with preparing a pamphlet to report to the citizens, because the mayor wanted to propose the Six Spine Projects to citizens directly, elicit their opinions carefully, and promise to implement the projects. "The pamphlet should be written in a manner that it can be understood by citizens quite easily", Asukata asked Tamura (Tamura 2006, p. 60). The pamphlet was written by Tamura and it took the title 'The City-Making of Yokohama' (1965).

Asukata thought that it was necessary to establish a new section in charge of the Six Spine Projects in the city government, because the projects would require coordination across several bureaus and sections. It was a task force, under the mayor directly, to plan a city and coordinate the various concerned bureaus to implement the projects. About thirty young staff from the various bureaus came to work in this section which was named the "Planning and Coordinating Section". Moreover, Asukata thought this section needed a new leader as a professional city planner, and invited Tamura to be a key figure in the section. Tamura accepted this position and later became section chief. Moreover, when the section was extended to become a bureau, he became its head in the 1970s.

Tamura's war as a city planner/officer in Yokohama for thirteen years had just begun.

4. 'Tamura's War'

Later Tamura wrote about his work in Yokohama in two books, 'Making Yokohama City'(1982) and 'Akira Tamura's War: towards a citizen's government' (2006). In both books, Tamura wrote that his first challenge in Yokohama city was the conflict with the national bureaucracy over the highway route in 1968.

It was planned that the metropolitan highways would be extended from Tokyo to Yokohama at the time, and an overhead route was planned to pass across the center of the city without public inquiry. It was clear that the associated interchange would damage the visual amenity of the port and reduce park area. As Asukata knew the situation, he asked Tamura to negotiate with the central government to change the plan. Tamura visited the Ministry of Construction to meet relevant bureaucrats, including the assistant secretary of the Ministry, and eventually succeeded in having the plan changed. The highway's structure was changed from an overhead highway to one that was half subterranean, and the new interchange was relocated.

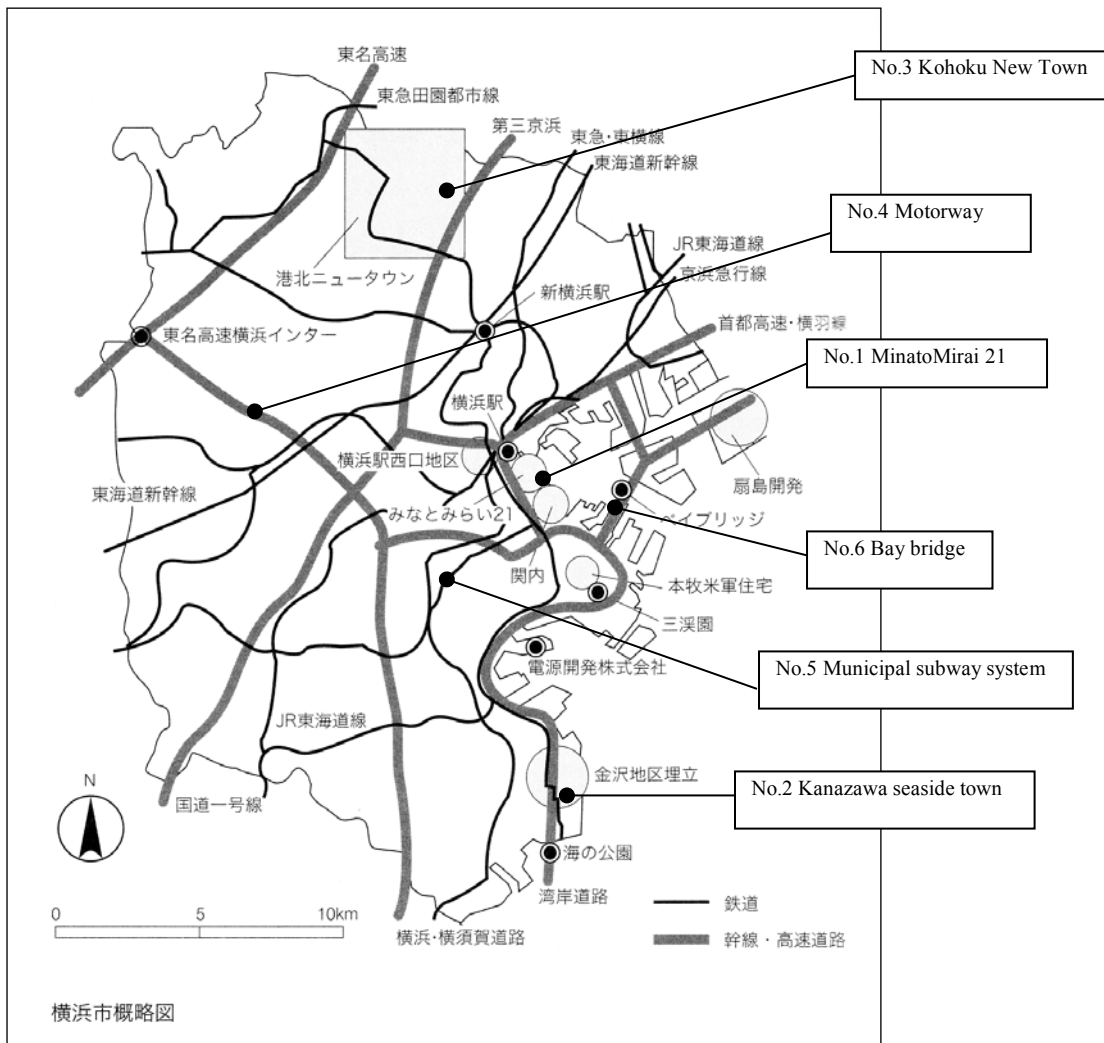

Figure 2: Map of Yokohama and the location of “Six Spine Projects” and the other projects. Base map source: Tamura, Akira. *Making Yokohama city planning work with Tamura*, Gakugei publisher, 2006, page 17

Tamura tackled another problem: the return of development profits from residential development to the local government. Although this was not facilitated by the City Planning Act as it then was, Tamura studied planning laws on betterment levies in advanced nations and even domestic examples. He began by negotiating with the Tokyu Railway Company, a large private developer in Japan, which was developing ‘garden cities’ (although they were mainly residential towns intended to envelop the new railway to the centre of Tokyo) in the north of Yokohama. Tamura successfully persuaded Tokyu to compensate the city for the costs of infrastructure, because good infrastructure was necessary to realise ‘garden cities’ envisioned.

After this success, Tamura extended this concept to an administrative guideline seeking legal agreements to make contributions of land or pay betterment levies prior to development permission being granted. Although some claimed it could be against the law as it then was and there were some lawsuits were filed, most verdicts were favourable towards local governments. The “Local Development Exaction System” continued to be used in Yokohama city until 2004, even under conservative mayors.

Throughout his work, Tamura kept in mind the education of young staff in the Planning and Coordination Section. For example, a large drawing board was put in the centre of the room to encourage staff to meet and stay abreast of what colleagues were doing. He also published a ‘Quarterly Magazine’ to share information about planning and implementation across all officers in the Yokohama city. Moreover, Tamura established the first ‘urban design team’ within a local government in Japan (Kuniyoshi 2015).

He regarded these things as his ‘war’ in his books, which was fought not only against opponents outside of government, but also against internal colleagues in the city government.

However, for Yokohama it goes without saying that his biggest task was the Six Spine Projects, and above all, the central portside urban redevelopment.

As the former central portside district of Yokohama was damaged by air-raid attacks during the war, and most facilities had been condemned by the American army until the early 1950s, its restoration appeared to be an impossible task.

On the other hand, the area around Yokohama station had been restored quickly as the new centre of Yokohama, because of its railway accessibility. As the old and new centres were quite akin to each other, it was hoped that a consolidated and continuous centre could be established, however the space was interrupted the dockyard owned by Mitsubishi Heavy Industries, Ltd.

Asukata and Tamura considered this the most important task among the Six Spine Projects for Yokohama. They visited Mitsubishi to ask for the removal of the dockyard, and showed them the new Kanazawa reclaimed land as a relocation site. Mitsubishi was interested in the city’s proposal, and Mitsubishi Estate Company, the biggest developer in Japan that belonged to the same financial clique, shortly began negotiations with the city.

Yokohama city and Mitsubishi reached an agreement on the removal of the shipyard in 1978. Tamura left Yokohama a few years after this, but the Minato Mirai 21 project went on; the redeveloped area expanded to 186 hectares by combining the neighbouring railway yard, the port areas, and newly reclaimed land. Although the present landscape of the Minato Mirai 21 district is not necessarily the same as the original plan by Tamura, the basic concept has not been changed (Taguchi 2016).

The other five projects were also commenced, and they were almost all completed by the end of the twentieth century.

When Tamura proposed the Six Spine Projects, many people were worried that Yokohama city did not have sufficient funds to complete them. However, Tamura always responded frankly by saying that city government did not intend to build only by itself, but that it would invite other sectors, including the public sector such as Japan Housing Corporation, and the private sector, such as Mitsubishi Estate Co. or Tokyu Railway Company Co., to be involved. It was important that Yokohama city take leadership in these projects, Tamura said (Tamura 2006, p. 60).

Half a century has now passed since Tamura proposed the Six Spine Projects. They have mostly been completed, and some of them have evolved, such as the extension of the subway route. However, it is noteworthy that the Six Spine Projects were able to survive and be implemented by the four mayors following Asukata, none of them being socialists. Moreover, the basic structure of the Six Spine Projects remained unchanged.

This stands in contrast to developments by other local governments along the Tokyo Bay spanning the ‘bubble’ era of the 1980s. Some of them were totally abandoned due to debt, and others remain financial millstones around the necks of local governments. The difference between those projects and Yokohama are the planning policy behind them, and the experience of the officers implementing them.

5. Later Days and Conclusion

Asukata won a fourth term in the election in 1975, and the following year Yokohama city reached an agreement with Mitsubishi on the removal of the shipyard. Everything seemed to be going well, but when the Japanese Socialist Party was decisively defeated in the election in the House of Councillors in 1977, Asukata’s city government was marked to come to a sudden end. The socialists asked Asukata to become the new chairman of the party, and he agreed to leave Yokohama city.

Michikazu Saigo, the successor to Asukata, won the mayoral election backed by both conservatives and socialists in 1978. However, his background was as a central bureaucrat of the ‘Ministry of Internal Affairs’ during the war, and he had an essentially conservative approach. He removed Tamura from his practical duties, and appointed him to a leisurely post.

Saigo also transferred responsibility for the Six Spine Projects from the Planning and Coordination Bureau to other related bureaus, such as the Urban Planning Bureau and the Port Authority. The power of the Planning and Coordination Bureau was reduced, and it was soon annexed by the Finance Bureau. It seems fair to speculate that Saigo accepted the importance of the Six Spine Projects, but thought that they should not belong to a particular individual, such as Tamura.

Instead of remaining idle, Tamura set out to write his Ph. D thesis on the “Local Development Exaction System”, and after obtaining his doctorate, he became a professor of the Faculty of Law of Hosei University. He lectured on urban policy, which he continued to do for fifteen years. His lectures were based on his practical experience in Yokohama, which made a strong impression on his students (Endo, H.).

Moreover, he launched a campaign to increase public awareness regarding city planning by writing books, including ‘Town-Making in Concept’ (1987) and ‘Town-Making in Practice (1995)’. In total, he wrote eleven books during his fifteen years at Hosei University.

From this time, Tamura used the term ‘Town-Making (*Machi-zukuri*)’ instead of ‘city planning’, because the latter sounds somewhat ‘top-down’ from the national bureaucracy, whereas the former conveys the idea of ‘grassroots’ activity by citizens. He also explained that ‘town’ has a more human scale than ‘city’. It was pointed out that Tamura was one of the first academics to begin using the term ‘*Machi-zukuri*’ before it became widespread (Watanabe 2011).

Tamura progressed his education of the public by going on a ‘pilgrimage’ all over Japan, lecturing citizens and local officers. For academics, attendance at such social events is usually the job of members of city planning committees and so on, but Tamura gave priority to citizens directly. Tamura himself supervised study groups on Town-Making in both Tokyo and Yokohama, consisting of citizens and local officers. Moreover, he was engaged in the foundation of the Japan Association of Local Government Policy Studies, which presents the Tamura Akira Award every year.

Tamura died at the age of 84, on 25 January 2010, with his wife at his side in a rest home in Izu, Atagawa district, Shizuoka prefecture. His life was filled with the pleasure he derived from city planning (or town-making) and his wife suggested that his faith in Christianity had a strong influence on him (M. Tamura 2012, p. 10).

In summary, we can tentatively understand Tamura’s achievements in Yokohama’s town planning in terms of three key aspects that drove a paradigm shift in local governance and planning. First, he pioneered the establishment of local initiatives and independent stance. Second, he promoted integrated methods of planning

which utilised all potentially available resources drawn from a variety of stakeholders. Finally, he emphasised the education and development of younger workers and assigned them important jobs that would encourage them to become responsible town planners and managers. Objective and scientific research activities concerned with Tamura's achievements have only been commenced by our organization and other scholarly work is planned to continue for several years to come. Besides his work in Yokohama, Tamura contributed to local Machi-zukuri groups and other local governments around Japan. We hope that we will be able to provide a full account and understanding of Tamura's legacy in this field in the near future.

From the nineteenth to the twentieth century big cities faced urban problems in western countries, and the local planners navigated the challenges of planning cities. Considering Tamura's achievement in Yokohama's city planning, he ranks among the pioneering planners and officers, such as Daniel Burnham in Chicago, in the modern city planning history of Japan.

No potential conflict of interest was reported by the author.

Notes on contributor

Chihiro Tamura was the youngest brother of Akira Tamura. He worked as a director of a pharmaceutical laboratory. After retirement, he wanted to study more about human societies as well as the structure of towns and cities where people lived. He studied at a private school, which Akira had established, for about ten years. As Akira's planning activities for Yokohama city were vivid and unique in Japan, after his death many people interested in his field wanted to study more about his ideas or philosophy. Chihiro established this NPO Research Initiative to propagate Akira's vision and ideas.

THE ADOPTION AND ABOLITION OF THE LOCAL DEVELOPMENT EXACTION SYSTEM BY THE CITY OF YOKOHAMA

Toshio Taguchi

*PhD in Town Planning, Akira Tamura Memorial - A Town Planning Research Initiative NPO,
taggame@jcom.home.ne.jp*

This thesis intends to explore the rationale behind the adoption and abolition of Yokohama's local development exaction system ("LDE system"). LDE systems were independently and locally formulated by local governments in response to challenges they faced across Japan, and Yokohama provides a leading example of a functional LDE system pursuant to which land developers were required to donate land for public use as a condition of their receiving development approval from the city government. Ichio Asukata, the socialist mayor at the time of the LDE system's introduction, invited Akira Tamura, a planner, to the city administration to solve the town planning issues. Japan's new Town Planning Act of 1968 did not contain provisions authorising the exaction of land. Therefore, Yokohama became the first large city to adopt an LDE system in 1968. The LDE system was used as an administrative guideline which ran the risk of legal challenge by affected developers. After Asukata's term in office, a succession of conservative mayors narrowed and reduced the obligations imposed under the LDE system and finally ended its use in 2004. This study presents some idea of how local initiatives can be implemented independently by local governments in a highly constrained fiscal environment without any support from the central government.

Keywords: Development agreements by developers, Autonomy of local governments and their initiatives, Planning and coordination by planners within city administration

1. Pre-history of the Local Development Exaction system

1-1. Position of Thesis

The objective of this thesis is to aggregate and critically evaluate the evolution of the local development exaction system ("LDE system"), which was for a time widely implemented across Japan by local governments¹ as a means of negotiating with private housing developers. Development exaction refers to the donation of land for community facilities and/or the payment of impact fees to establish the infrastructure necessary to support that development. At the time of its conception, municipalities were severely affected by their lack of development control powers and were experiencing financial hardship due to the inappropriate allocation of planning powers² and financial resources from the central government³.

The LDE system was unusual in the context of post-war Japan,⁴ because it was established without endorsement from central government.⁵ The nature of the relationship between local municipalities and central government is disputable: it is officially regarded as an equal partnership, but regarded by many as deeply hierarchical. The legislative process by the central government tends to be delayed and often fails to respond to the needs of local municipalities in a timely manner. This situation, in turn, leads local municipalities to react to urban problems to accommodate citizen's needs even when they lack the necessary legal or financial power vested in them.⁶ This kind of citizen-centred governance taken by administrations is referred to herein as "local initiatives". On one hand, Japanese local governments must act within the national legal framework and obey orders issued from the central government. However, as this framework often contains its own loopholes, some local governments have used their own initiative to find or create some means outside the national legal framework in order to secure and advance citizens' welfare.

The city of Yokohama in the vicinity of the Tokyo metropolitan area is one such example, having been greatly affected by unplanned housing developments. Ichio Asukata, the incoming socialist mayor who had defeated the conservative candidate only narrowly in 1963,⁷ outlined a plan to tackle urban problems and resolve them for citizens, although he could not receive any support from the central government because of his socialist

background.⁸ Asukata named this reformist type of approach “local initiatives without consent [given from the central government]”, which represented a new approach to conducting local administration. Asukata wanted to cultivate a new citizens’ movement from a local up to national level. To achieve this, he needed an able planner with professional integrity, and persuaded Akira Tamura,⁹ a renowned town planner, to join the Yokohama city planning administration in order to implement citizen-centred town planning.¹⁰

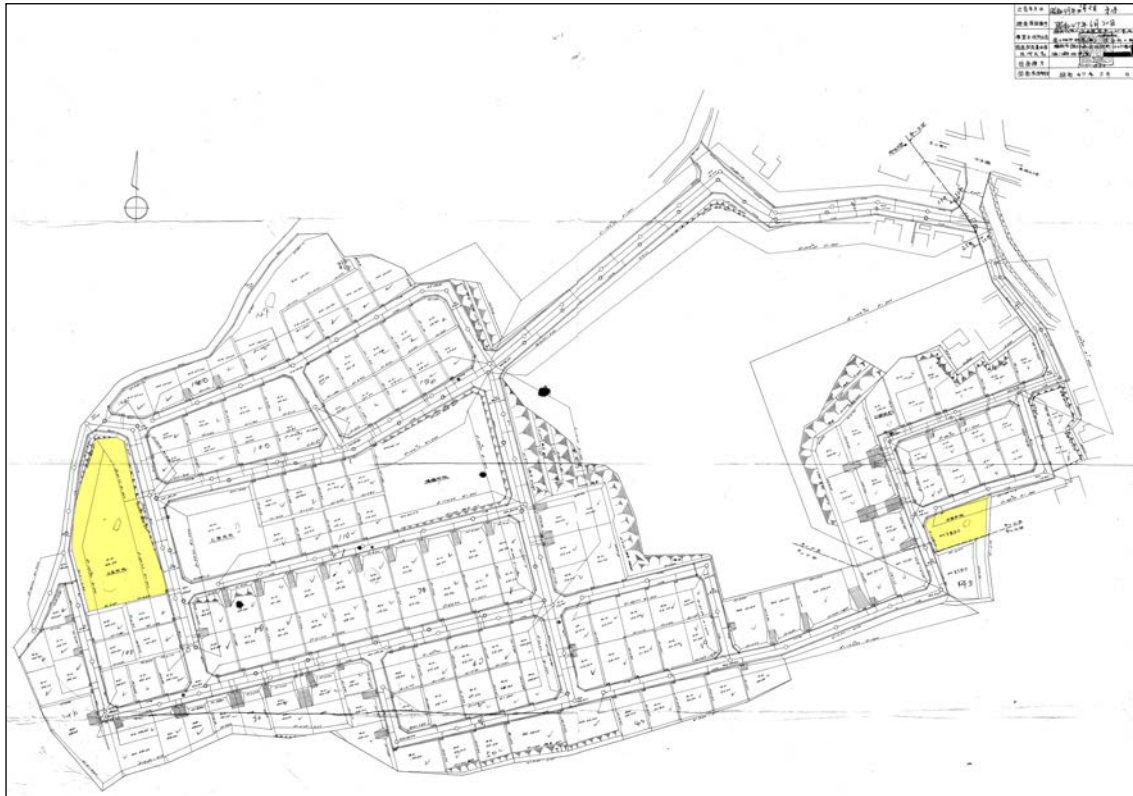

Figure 1: Site map of new housing development at Sakaigi-cho (3.7 hectares of site, planning permission obtained in 1971), Hodogaya ward, Yokohama, with a municipal nursery school on the left, situated on land obtained for community facilities from the developer by LDE system. Source: public information disclosure from the Bureau of Building Control, City of Yokohama

As Yokohama was one of a few specially designated large cities, it was vested with the legal power to permit development applications according to the Town Planning Law 1968,¹¹ an amended version of the 1919 law.¹² Against this background, when negotiating with developers in connection with their development applications, the city administration avoided giving the impression that development exactions would be sought as a legal precondition to making a formal application for development permission. Instead, the city made its own internal rules known to developers as the LDE system. Rather than demanding exactions as part of legal procedures, the city negotiated with developers to reach development agreements, in other words seeking “exactions by agreement”. As precedents to this new form of development agreement, the city signed a unique contract to protect the environment with energy companies which had sought permission to transfer land back to its original land owner, the city of Yokohama, in accordance with a basic agreement signed by both parties, but had to accept a measure to reduce pollutants generated from their power plants in order to exercise their right under the basic agreement. The city had also reached an exaction agreement with Tokyu Railway Company on its enormous housing development in a suburb of Yokohama. From the middle of the 1960s, LDE systems began being introduced all over Japan as a kind of symbol of local initiatives.¹³

Among research papers concerned with LDE systems around Japan, Akira Tamura, who formulated Yokohama’s LDE system in 1968 and managed its operation as the head of the city’s planning office for the next ten years in Yokohama, went on to publish his Ph.D thesis on the subject at Tokyo University. However, apart from Tamura’s work, no other scholars have conducted objective or evidence-based research¹⁴ on Yokohama’s LDE system. Whenever the city administration wishes to establish an important policy, it usually had to formulate a policy-decision paper called a “Municipal policy formulation paper”: the draft is prepared by a junior officer and must later be signed by concerned senior officials and finally the mayor. These policy papers are preserved in

perpetuity by the Public Documents Preservation By-law and are available to the public through the Municipal Information Disclosure By-law. Supplementary documents are frequently appended to these papers, explaining the detailed background and the reasons surrounding the issue under discussion. I have also conducted interviews with concerned retired senior officials¹⁵ of Yokohama city in order to locate appropriate official documents by using their comments as guidelines for document hunting.

1-2. Housing development by Tokyu Railway Company and its development exaction agreement

A huge housing development proposal by Tokyu Railway Company (“TRC”)¹⁶ in suburban Yokohama prompted a move to consider development exactions by local municipalities. Keita Goto, president of TRC, had returned to his old company after a short period of public exile from his official position that had been terminated in 1951.¹⁷ Goto made a new proposal for a housing development in the southwest of the Tokyo region,¹⁸ which covered a large suburban area of Yokohama.

Goto’s proposal was to construct a large-scale housing development along the newly extended railway line connecting Tokyu’s existing line with a station on the Odakyu railway line in the middle of Kanagawa prefecture, which ran through Yokohama. Then the Capital Metropolitan Redevelopment Law was enacted in 1956 by the central government. A new planning control measure to designate the suburban area as a green belt encircling the built-up areas was conceived in order to restrict unplanned expansion of Tokyo. Beyond the green belt, satellite cities with new housing developments were also allowed. It soon became clear that Goto’s proposal fell entirely within the restricted green belt area running between 15 kilometres and 25 kilometres in radius from central Tokyo. In response, Goto prepared a counter-proposal to build a new town on the southwest along the Tama River, which divides Tokyo and Kanagawa. He also proposed a toll motorway plan¹⁹ along which a new housing development was envisaged in parallel with the new railway line. As a result, Goto’s challenge finally succeeded, in that the central government allowed an exception for development within the green belt area, which was a planned housing development within a one kilometre in radius from the nearest train station. In 1960, Goto received official permission to construct his new railway line from Mizonoguchi to Chuurinkan that he had originally applied for. Goto and his company began construction of the new town for a planned 300,000 residents on 2,000 hectares of land, mostly within the city area of Yokohama.

One of the most significant community issues arising from the TRC development was the provision of schools, since they would be necessary facilities for the new residents. According to the Basic Act on Education, all municipalities are responsible for providing opportunities for all residents’ pupils to attend compulsory education at primary and secondary schools. Asukata, the mayor of Yokohama, expressed strong reservations at the negotiations with TRC about telling new residents that the city would not accept new enrolments for existing schools, which had no room to accept new pupils.²⁰ At the 1968 meeting between Asukata and Noboru Goto, son of Keita Goto and the new president of TRC, an agreement was reached to provide the land for nine schools. Asukata wanted to utilise TRC’s model of development exactions to apply all over Yokohama.

2. Genesis of Local Development Exaction system as an independent planning tool by local government

2-1. Fight on five issues by Asukata and Tamura

Despite a rapid population increase accommodated by new housing developments, the new tax revenue accompanying it did not match the costs required to respond by installing new community facilities and infrastructure. During the period from the late 1960s until the mid-1970s, the population of Yokohama was increasing by one hundred thousand annually.²¹ From 1968 until 1973 the increase in the number of pupils was similarly enormous in number: seventy thousand primary students and twenty thousand junior high students annually, which required an additional 47 primary schools and 15 junior high schools to be constructed. As the annual municipal budget²² of 1974 was 253.4 billion yen with 45.6 billion yen allocated for educational expenses, seventy percent of educational expenditure was used purely to construct educational facilities. In 1972 Asukata and Tamura²³ pledged to fight on “five issues caused by the rapid population increase”: environmental pollution, refuse dumping, traffic management, water resource, and exaction of public land. As such, the city had to respond by constructing basic amenities.²⁴

2-2. Designation of urbanised and non-urbanised areas by the newly revised Town Planning Law

According to the Town Planning Act 1968, town planning districts²⁵ are divided into two categories: urbanised areas, in which development is promoted, and non-urbanised areas, in which development is halted for more than a decade. If and when an applicant wants to develop land, he/she has to apply concerned local administration for permission to start development activities. Within urbanised areas, any development of more than 0.1 hectares in size is controlled. Although development in non-urbanised areas is generally prohibited, there is an exemption whereby well-planned housing developments that are larger than 20 hectares can be allowed.

The policy towards the use of the urbanised area designation, according to the advisory report to the Yokohama city planning committee in 1970 supervised by Tamura, reads: "Local administration is required to assume a large burden of political and administrative responsibility when making plans for urban facilities and infrastructure. Therefore, it would not be appropriate to expand urbanised areas too much without any possibility of accomplishing the necessary infrastructure within ten years. An area that is capable of being urbanised in the future should be preserved as a non-urbanised area for a while and then gradually be urbanised with planned development". Within non-urbanised areas, development is as a general rule not permitted for a period and is only possible subject to onerous controls, the report noting: "The notion of having non-urbanised areas has not only the restrictive goal to limit sprawl developments but also the positive goal of preserving these areas for future planned large-scale developments". Even areas affected by unplanned developments should be designated and preserved as non-urbanised areas until specific measures such as land readjustment schemes could be implemented in the future. The final proposal by the Yokohama city planning committee concluded that there would be 12,640 hectares designated non-urbanised area in size, accounting for 30.3% of the whole city area, which, through final negotiations with concerned bodies, was reduced to 10,673 hectares, being 25.6% of whole city area.²⁶ This ensured that, when granting planning permission to change these zones to urbanised areas for the initiation of development in the future, the city could demand greater public contributions from developers, such as the preservation of extra open space for the use of public in addition to the normal requirements under the LDE system.²⁷

3. Process of adoption and abolition of LDE system in Yokohama

3-1. Adoption in 1968 and abolition in 2004

According to the LDE system as adopted in 1968, development is defined as any kind of modification over its land in terms of shape and/or topography for the purpose of construction, and all development, irrespective of its size, is required to follow the LDE system. Exaction of land for public uses is the main theme of the LDE system and falls into two categories: exactions to fulfil a "park obligation" and a "community obligation". Roads, sewerage, drainage, and flood ponds constructed by the developer are transferred to the municipality. Public developers are required to donate land for parks equivalent to more than 4% of its development area, and private developers more than 3%, not less than 150 square meters in size. Land provided to house community facilities must be more than 5% of the whole development area, and the price paid to the developer, albeit only a nominal fee, is fixed at 3,000 yen per square meter for land within that 5%. If and when construction of public utilities outside the development area is necessary, additional construction should be done by the concerned developer.

After a 1972 revision, "development" subject to the LDE system was classified as anything exceeding 0.1 hectares. Density controls were introduced: assuming there would be 4.0 residents per freestanding house, and 3.5 residents per apartment unit. The park obligation was strengthened to require an allocation of at least 3 square meters per planned resident (applicable when this would deliver more than the existing 3% -- 4% exaction), and the community obligation was enlarged to require an additional exaction of .5% of the development area for every 30 residents per hectare (5% of the development area up to 150 residents per hectare)."

After Asukata's departure in 1978, ten years after the LDE system's introduction, a new mayor, Michikazu Saigo, assumed office. He had started his career at the old Ministry of Interior before the war and became the Administrative Deputy Minister of Ministry of Home Affairs after the war. Some provisions of the LDE system were changed in 1980: developments of less than 0.3 hectares, if and when they could not provide a full-sized park of 150 square meters in size, could instead donate the land exacted to fulfil the park obligation to its land for community facilities. Moreover, the community obligation was changed so that, if and when a developer did

not have available land for community use on its development site, the developer could instead purchase part of the land owned by a municipally affiliated land corporation which was legally authorized to buy land in advance for future municipal unspecified uses by a fund borrowing from the banks on normal market interest rates, not from municipal tax revenue, and then sell the land to the city at a nominal fee. Although this method was practical financially, the nexus between development sites and the land targeted by exaction obligations became unclear. In 1984, Saigo made a further fundamental modification to the structure of the LDE system. Any development of less than 0.3 hectares in size and with fewer than a hundred planned residents was allowed to donate 34,000 yen per resident to the Yokohama Municipal Green Foundation²⁸ in lieu of park land. This change caused a further weakening of the nexus between exaction and development sites, because expenses contributed by developers would be used for forest preservation at a different site.

Figure 2: Chart of fluctuation of residential developments since 1984 by total development permitted area. Gross area in hectares of residential development permitted each year by the city of Yokohama. Source: Data from Yokohama’s municipal architectural department, which was in charge of development permission, began being properly recorded and preserved after 1984 to a standard usable for detailed research work.

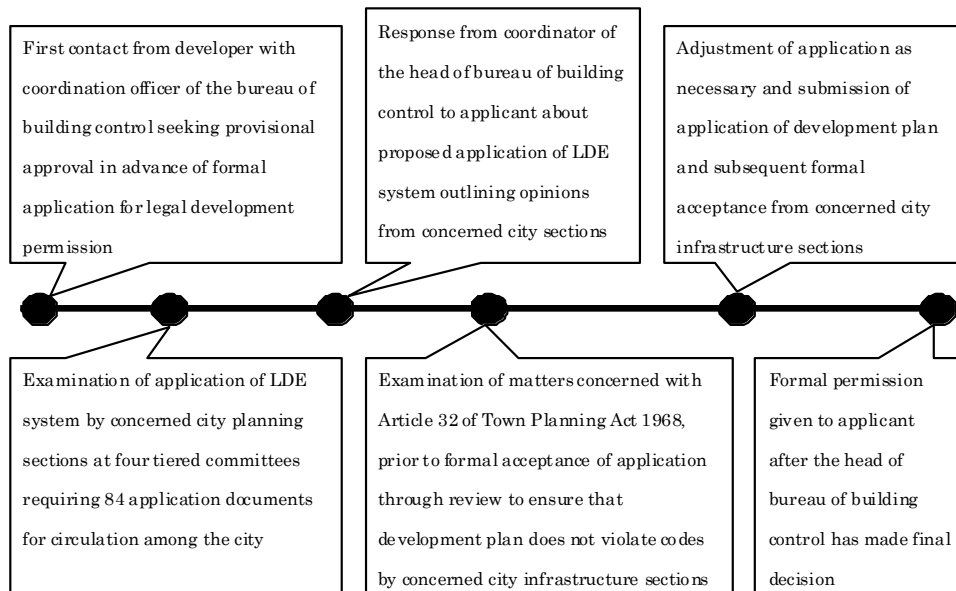

Figure 3: Flow of LDE system application and subsequent formal planning permission

Saigo died in 1990 during his term as mayor. Hidenobu Takahide, his successor, was born in Hokkaido and had become the Administrative Deputy Minister of Ministry of Construction after a career as a technocrat in the civil engineering field. However, the Ministry of Construction was a vanguard against the LDE system. In 1995, Takahide set up a special committee to review the LDE system. The committee determined that the objective of

providing school sites by exaction would be terminated despite praising the impact of the LDE system on the city budget. Regarding the park obligation, it was relaxed to require donation of less than 6% of the whole development area, whereas it had previously been calculated as more than 3% of whole area or 3 square meters per planned resident (whichever was larger).

LDE system of Yokohama	1968	1972	1980	1984	1995	2004
	Adoption	First revision	Second revision	Third revision	Fourth revision	Final revision/abolition
	Mayor Ichio Asukata	Mayor Ichio Asukata	Mayor Michikazu Saigo	Mayor Michikazu Saigo	Mayor Hidenobu Takahide	Mayor Hiroshi Nakata
Developments affected by LDE system (by size)	All residential and non-residential developments	Larger than 0.1 hectares and planned population density of more than 150 people per hectare	Larger than 0.1 hectares and planned population density of more than 150 people per hectare	Larger than 0.1 hectares and planned population density of more than 150 people per hectare	Larger than 0.3 hectares, no planned density metric	LDE system abolished, new city by-law restricting only technical matters without land exaction obligations
Required land contribution for parks ("park obligation") applicable to urbanised and non-urbanised areas	More than 4% of development area for public developers or 3% for private developers, minimum contribution of 150m ² (if calculation would otherwise amount to less)	Revised to add density restriction: more than 3m ² per person and more than 3% for private developer (4% for public developer) of development area, minimum contribution of 150m ² (if calculation would otherwise amount to less)	Any development less than 0.3 hectares can combine its community obligation land into a park lot of 150m ² or planting space in lieu	In the case of a development area less than 0.3 hectares, where there are more than 100 planned residents it triggers the park obligation, where there are less than 100 residents a donation to the city forest fund of 34,000 yen per planned resident can be made. If the park obligation amounts to less than 300m ² of a development area less than 0.3 hectares, payment to city forest fund should be made in lieu of land contribution	Only applied to housing developments, where the maximum contribution would be less than 6% of development area, donation to city forest fund not required. If park obligation area less than 150m ² , developer may contribute planted space or plaza in lieu of park	Within requirements of the Town Planning Act 1968, where a park would amount to more than 150m ² on a development area from 0.3 to 5 hectares. A development of less than 0.3ha requires planted space which is owned by the private owner, and is not a public park
Required land contribution for community facilities ("community obligation") applicable to urbanised and non-urbanised areas	More than 5% of development area, minimum contribution of 150m ² (if calculation would otherwise amount to less)	Housing development up to 150 residents per hectare provides 5% of development area, if planned density exceeds 30 residents per hectare, add 0.5%. Non-residential developments required to contribute 2% of development area. If this would amount to less than 150m ² , supplement to contribute a minimum of 150m ²	If community obligation less than 150m ² , land for community facilities can be used for park land	Non-residential developments contributing to progress of entrepreneurship can be exempted. Maximum land for community facilities can be used for community uses such as garbage depots or bicycle stands: 300m ² for less than 0.3ha of development area, 250m ² for 0.3-0.4ha, 200m ² for 0.4-0.5ha, 150m ² for more than 0.5ha. Within non-urbanised areas enterprise and/or educational-cultural developments can be exempted from park and community obligations	Community obligation to be applied to developments of more than 1 hectare, 3% of development area for residential developments only. Community obligation land not to be used for other substitute uses originated from outside development area	Community obligation to be applied to developments of more than 3 hectares and/or 500 unit apartment housing developments, and to be negotiated with city treasury bureau by a standard of 3% of development area and a land price of 25,000yen per m ²
Other infrastructure installation obligations	Roads, sewerage, flood water ponds within the development site and beyond the site if necessary are built by the developer	As shown on the left	As shown on the left	As shown on the left	As shown on the left	As shown on the left

Figure 4: Chronological list of amendments of local development exaction system

The original vision of the LDE system was fatally undermined and it was tailored to follow the minimum standards of the national town planning law. Land donations for community facilities were reduced to require land donations only for housing developments more than one hectare in size, and equivalent only to 3% of its whole site. Takahide effectively began the process of dismantling the LDE system. At the same time, the central government decided on a new deregulation policy in 1995, the Ministry of Construction issuing a notification commenting that it was the sole responsibility of local governments to provide community facilities on any developments less than 20 hectares in size.

Hiroshi Nakata, a relatively young and liberal politician having been educated at the Matsushita Institute of Government and Management, and who had resigned as a member of the Diet, defeated Takahide at mayoral election in 2002. Although Japan was facing economic stagnation, Nakata made an irrational decision to abolish the LDE system. A new development control by-law strictly based on the national Town Planning Act was introduced in 2004, which effectively replaced Yokohama's LDE system. The development control by-law enacted by the municipal assembly merely set standards as to the technological aspects of construction, and did not contain provision for exaction.

3-2. Evaluation of the LDE system

By the end of the 1993 fiscal year, the total amount of land exacted for community facilities was 307 hectares since the inception of the LDE system in 1968, of which 210 hectares had been used for municipal primary and secondary schools.²⁹ It had provided the sites for 150 schools, which accounted for 60% of the 258 total municipal schools opened in Yokohama since 1968. This shows how important the LDE system was to the provision of educational facilities in Yokohama city.

A further 65 hectares of exacted land was used for other community facilities: nursery schools, local fire stations, and citizen-use facilities, which complied with the original objectives set by the LDE system. However, the remaining 30 hectares was used for resettlement caused by public infrastructure projects which had nothing to do with the original development and its exaction, which posed a problem from a viewpoint of having no direct nexus between the development exaction and the eventual use the land was put to. The value of land acquired to build community facilities from the inception of the LDE system had amounted to 384.6 billion yen by the end of 1993.³⁰

3-3. Integrated planning and coordination method

In 1968, the city of Yokohama established a Supreme Coordination Committee of Urban Issues, whose chairman was mayor Asukata, and which was supported and administered by Tamura of the Planning and Coordination Bureau (“PACB”).³¹ At the committee many subjects concerned with city administration were discussed: the acquisition of public-use land on a large scale, and the policy regarding large-scale developments. The PACB directed by Tamura³² was a special piece of administrative machinery to coordinate sections of city administration horizontally in order to consolidate them into a unified local administration.³³

The effectiveness of the LDE system is attributable to Tamura implementing other control measures in tandem with the LDE system and using them in an integrated way. Designation of urbanised and non-urbanised areas as a tool of development control was strategically carried out. In 1973, the school planning section of the municipal educational committee formulated a “Guideline for apartment housing development” which was used to prevent new housing developments being initiated in areas with a limited capacity of public schools. They designated areas of high primary school enrolment which postponed new housing developments for a period and introduced a prerequisite to obtain permission from the school planning section.

Another innovative control measure introduced by Tamura was a “Special zoning code restricting volume of residential use”, a tactic used to set a limit residential use as a ratio of commercial and/or business districts.³⁴ The Japanese zoning code at a national level defines possible uses in each zone, but an owner of land can use the whole of its property for residential use even in the middle of a commercial and/or business district. After Tamura left office, his restrictive zoning code was immediately abolished and consequently high-rise residential towers started to appear in the middle of Yokohama’s central business district.

3-4. Mounting pressure for relaxation and abolition from the central government

Among lawsuits regarding LDE systems are two widely known cases between local applicants and the Musashino city government: the first law suit³⁵ demanded that Musashino city refund the exaction fees negotiated for an educational facility from an owner/developer of apartment housing, and the second lawsuit³⁶ demanded that Musashino city supply tap water to apartment housing built by a local developer. Musashino city

lost both cases because the court characterised the actions of the municipality as a forced donation, and that its threat to stop the supply of water was not usual exaction by agreement, and moreover an excessive use of administrative force. These verdicts in turn meant that local governments became overly timid in their use of LDE systems.

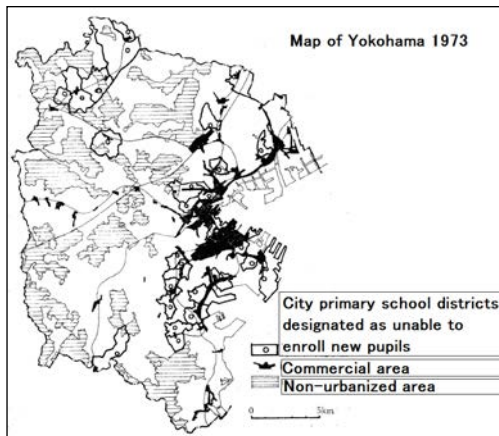

Figure 6: City primary school districts designated as unable to enroll new pupils and non-urbanised areas in the city of Yokohama as of February 1973. Source: Atsushi Naito, *Activity volume v. Facility volume-Challenge to special zoning restricting volume of residential use*, Bibliography 7)

Pressure from the central government to relax or abolish the LDE system gradually increased. Orders issued from both the ministries of construction and home affairs demanded that local governments using LDE mechanisms for exaction be more transparent with developers and citizens alike. It took several decades until the final abolition of the LDE system, since the central government could not prepare other effective measures to control developments in lieu of the LDE system. Finally, in 2003 the Ministry of Internal Affairs³⁷ and the Ministry of Construction and Transport³⁸ issued an ultimatum to local governments to review LDE system as soon as possible, which reflected that developers' tolerance for exaction had been declining due to a sharp decline in land prices. This order brought about the end of LDE systems all over Japan, including in Yokohama.

4. Conclusion

Although the majority of Japanese local governments lost their confidence in local initiatives using the LDE system, some other countries³⁹ still retain similar systems to the Japanese LDE and even Japan has an extraordinary exception still operating in downtown Tokyo. Many high-rise residential towers began to appear in water-front area of Tokyo's Koto ward, where the construction of business and commercial developments accelerated to make it a sub-centre of the Tokyo Metropolis. There soon emerged a shortage of school facilities for pupils of high-rise towers. Koto ward is such a high density area that it lacks suitable school sites. In 2002, the ward government enacted its own by-law which requires housing developers to attend negotiations, and at the same time made an LDE system which requires developers to pay 1.25 million yen per residential unit as an impact fee for community facilities. Until now, no objection has been raised by the central government.

Disproportionality in terms of population demographics exist in Yokohama⁴⁰ between districts neighbouring Tokyo and those further away from Tokyo. When, in 2016, it became necessary in Kohoku district (one of Yokohama's outlying areas) to build a new primary school,⁴¹ municipal expenses were allocated. This budget consisted mainly of municipal tax revenue, with nothing derived from local exaction fees.⁴²

Asukata and Tamura framed the LDE system as a new planning tool correlating to environmental impact fees. To this day, there is no national regulation providing for development exactions. Even if local administration needs support from the central government in order to fund infrastructure related to development, there are no reliable channels to obtain such support. It can be said that there are two kinds of responses to this situation: one is to react independently and courageously to local issues, and the other is to wait for help patiently. The happiness of citizens is greatly dependent upon these reactions. Therefore, it is significant that Asukata and Tamura independently formulated a local response which lasted for almost forty years despite incessant demands

for reform from the central government. Their achievement is worthy of significant praise both from planners and citizens alike.

Acknowledgements

Firstly I would like to express my great debt to the city officials, both present and retired, from whom I received help and assistance in the course of searching for relevant information. I also greatly appreciate the valuable advice given from my friends in our research NPO. Regarding the editing of my English, Timothy Gray provided great support for me by reviewing this paper both linguistically and logically.

Disclosure Statement

No potential conflict of interest was reported by the author.

Notes on contributor

Toshio Taguchi (b. 1952) is an independent scholar working with his research peers in order to aggregate historical data about the modern town planning of Yokohama and provide young scholars and citizens access to archival information. He studied Urban Design in England and met Akira Tamura, an eminent urban planner who remodelled Yokohama. During his early career as a municipal urban designer, he co-organized a voluntary study group of young city government workers. He believes a progressive and inquisitive approach by workers is a necessity when creating independent local initiatives in the course of town-making.

Endnotes

¹ Before Yokohama, both the cities of Kawasaki and Kawanishi had LDE systems, by 1975, they had expanded to 796 municipalities, and reached their zenith of popularity in 1997, when 1,598 municipalities had such systems, accounting for 50% of all municipalities in Japan. Source: The Ministry of Construction, *Yearly statistics of 1997*.

² In general terms, pre-war Japan lagged far behind its Western counterparts in relation to town planning, although it tried very hard to catch up as part of a drive for modernisation. Masao Kanbe, a professor of Kyoto Imperial University, proposed early in 1912 a new land tax legislation based on the English “Betterment” system. The UK’s Housing and Town Planning Act, a world first, was enacted in 1909, which speaks to the public consciousness of town planning issues at that time. However, Kanbe could not get approval for reform from members of the imperial assembly. Instead of that legislation, a form of “user pays” was introduced into the Japanese Town Planning Act 1919. To this day, Article 75 of the Town Planning Law 1968 allows for a form of “user pays” land use, as in principle a beneficiary of land development may be required to pay, namely: “if a person receives a substantial benefit from a public town planning project, central government, prefecture governments and municipalities are vested with the power to require the beneficiary to meet a part of the project costs according to scale of the benefit it receives”. This provision can be used to require property owners in the vicinity of an infrastructure construction site who expect to realise a great benefit from the construction of infrastructure to pay an appropriate portion of its cost. An equivalent provision had existed in Article 6 of the Town Planning Act 1919 which shared the same rationale with its English counterpart in the Housing and Town Planning Act 1909. Japan had applied this provision to a local project in the Osaka construction of the Midosuji boulevard and underground train system in the 1920s by mayor Hajime Seki. The city of Osaka charged landowners along the boulevard for the improvement, however it took decades to recover the costs and left a shortfall in the betterment revenue. Despite the availability of this special provision, land prices in Japan do not reflect the progress of local infrastructure. A housing development that lacks appropriate infrastructure in its vicinity can even be permitted according to the basic building code, with the construction of infrastructure expected to catch up. Due to a lack of public awareness towards environmental improvement, benefits produced by public projects have never been properly assessed.

³ From the post-war reconstruction through Japan’s initial stage of high economic expansion, its central government had promoted housing developments for middle class households in the form of single houses built by private developers and collective housing constructed by public developers. Therefore, the central government was loathe to encourage development controls which would have the effect of tightening the regulatory framework around housing developments.

⁴ The LDE system was a special concept adopted by local governments as an independent local procedure in the absence of central government regulation. The idea was conceived by local leaders, i.e., especially mayors of municipalities in the suburbs of major cities, in order to respond to an influx of new residents and the accompanying need to provide community facilities and infrastructure.

⁵ When Tamura was subsequently summoned to a meeting in 1968 by a high-ranking official of the Ministry of Construction who saw introduction of LDE system an affront that went well beyond the national legal framework, Tamura responded that provisions introduced through the LDE system should have been authorised by national policy and regulations and, for the time being until central government could address those issues, the local government would respond to those issues on behalf of the national government. Tamura conveyed a strong independent stance of local government despite central government opposition.

⁶ The central government introduced a new local tax in 1969 by amending the Local Tax Law, namely “housing development tax”, which has never been used by any local government at all. This tax can theoretically be applied to an area designated by the municipality only within an “urbanised area”. Exaction for installation of new infrastructure at new housing developments is limited to roads of less than 12 meters in width, drainage except for public sewage systems, and parks or pedestrian courts of less than 0.5 hectares. The applicable tax rate is to be fixed by municipal by-law according to degree of benefit. When implementing the tax system, a municipality is required to notify the Minister of Home Affairs for accreditation. This tax seems extremely rigid, which perhaps accounts for its poor (non-existent) uptake in comparison to the LDE system.

⁷ Japan was an undemocratic and overly centralised country prior to World War II. Local political and administrative systems were established according to the doctrines fixated on empire-building, which underlie Japan’s initiation of expansionist warfare and the reason it could not be stopped before widespread devastation occurred. The Ministry of Interior was a stronghold of ruling bureaucrats governing local administration, infrastructure construction, policing, welfare, and the Shinto national religion. All prefectural governors and major municipal mayors were appointed by this Ministry from a shortlist of its top elites, and never elected by citizens. Therefore, the American occupation forces decided to dismantle this organisation with a firm determination to create a democratic Japan. Democracy and decentralisation became two keywords for post-war Japan. Political proponents of socialist ideas appeared after the war from outlaw status during and before the war, though only the first government in the immediate wake of the war, when defeated Japan was in turmoil, was led by a socialist. Old conservatives tried to secure their stronghold against the political actions of socialists. Against this background, Asukata came to local politics in Yokohama city after a career in the national legislature, with a belief that he could change Japan through local government in Yokohama as a mayor together with local people.

⁸ When accepting democracy into defeated Japan, the central government chose a cabinet system in order to sustain its imperial family as head of state. On the other hand, local government is managed directly by the elected mayor. Although local politicians are also directly elected by citizens, local administration is generally directed by the leadership of the mayor. However, mayoral candidates tend to be appointed and funded by a relatively small group of conservative older politicians. This means that post-war local assemblies were neither active for citizens nor progressive in terms of new ideas. Despite the strong conservatism of the political and business community, local autonomy was formally authorised in the new constitution. However, the local administrative system continued to be seen as a branch of the central government, because local politicians proclaimed the importance of close relationships with the central government.

⁹ Tamura was a person who understood perfectly the structure of national ministries and their motivations, and also their limitations, because he had worked for a ministry after his graduation from university. He then moved to the real estate section of the Nihon life insurance corporation which gave him a clear perspective on real estate business and a developer's logic. Another remarkable aspect of Tamura's career was that in 1963 he joined the first private planning consultancy in Japan that had been established by Takashi Asada, producer of the Metabolism Group and manager of the globally renowned architect Kenzo Tange. His well-known consultancy experiences included contributing to several large-scale projects across Japan commissioned from national agencies or local governments. His approach to planning displayed a strong desire for a wider perspective on society, and was never parochial or limited exclusively to the needs of just a local area, but combined ideas from drawn from other countries. When thinking locally, Tamura acted at the same time globally.

¹⁰ In 1964 Asukata requested that Tamura, as an able town planner belonged to a planning consultancy office, propose a comprehensive plan to remodel the urban structure of Yokohama known as the "Six Spine Projects". Based on that work, Asukata had come to trust Tamura, and in 1968 he offered Tamura a post within city management to let him expand his role as the chief planner rather than just as a consultant outside the city's machinery. In 1973, Tamura as chief planner proposed the concept of municipal general hospitals based on private-public partnership: the city bought sites for planned general hospitals and subsidised part of the construction fees for private medical institutions that ran hospitals public use.

¹¹ The Town Planning Act was fundamentally revised in 1968 as a consequence of the advisory report in 1967 of the Land Control Committee of the Construction Ministry.

¹² Nothing had changed in the town planning system of Japan since the pre-war era. The antiquated and overly centralised Town Planning Law enacted in 1919, that had preceded the 1923 Great Kanto Earthquake, continued to be used even after the war. This law was finally and fundamentally revised in 1968 to initiate development control measures and also introduce democratic processes into law enforcement. This came nearly fifty years after the enactment of the law in 1919 and more than twenty three years after the war.

¹³ Eventually, during the early 2000s most LDE systems were abolished because of mounting pressure from the central government. Although Yokohama was a leading example of a successful LDE system, Yokohama's LDE system was likewise abolished in 2004.

¹⁴ In approaching this research, I assumed that to conduct meaningful research on the process of decision making at local municipalities would be difficult, both because of a lack of evidence available and because public servants must obey codes of conduct that prohibit them from speaking about confidential information which they have come to know in the course of their duties.

¹⁵ Although nearly 40 years have passed since Tamura left the city in 1981, many such retired city officials still boast of old stories and their achievements, however these anecdotes are not suitable materials for an objective and scientific research approach when conducting historical analysis of LDE system of Yokohama.

¹⁶ The mother company of TRC was "the Garden City Company" established in 1918 by Eiichi Shibusawa, an eminent Japanese economist. The Garden City Company intended to build the a residential area in Tokyo's hinterlands modelled after Letchworth in Hertfordshire, and in 1923 started development in the current Denenchofu area, which has become one of Japan's most luxurious housing estates.

¹⁷ Local politics and administration went largely unchanged and did not adapt quickly to the American model of democracy. An embargo order (that had been issued in 1946 and 1947 by the Japanese government on the advice of the Allied occupation forces) on hiring persons who had been at the top tier of political and economic communities in the public services, who were regarded as having taken part in the war, ended several years earlier than anticipated. This was because either a shortage of able leaders or the start of Korean War necessitated their return to public service.

¹⁸ Once the restriction on immigration to the Tokyo area after the war was lifted in 1949, the greater Tokyo region started to expand.

¹⁹ The toll motorway project had relatively low construction and maintenance costs compared to the railway system, and was later directly implemented by the central government as the current "Daisan Keihin motorway."

²⁰ TRC initially responded with the view that given that the municipality provided public educational facilities, it would have its residents' pupils go to private schools owned by TRC.

²¹ An overall trend of housing development in Yokohama from 1968 until 2014 can be identified in the data regarding housing plots increase on municipal real-estate tax index. The housing plots within Yokohama city greatly increased from 10,705 hectares of 1968 when LDE system introduced until 15,397 hectares of 1978 when Asukata left the mayor's office. Throughout Michikazu Saigo's time, mayor after Asukata, the rate of housing plots increase gradually levelled out until Saigo died in 1990, Hidenobu Takahide succeeded the mayor's office. Since the latter half of Takahide's term until Hiroshi Nakata decided to abolish the LDE system, the housing development was stable in trend.

²² It may be useful to consider the trends in annual budgets, population figures of Yokohama city and the national economic yearly growth rates: 33 billion yen budget and 1.59 million population when Asukata first elected in 1963, 365 billion yen budget and 2.69 million population when he left the city in 1978, 994 billion yen budget and 3.19 million population in the last year of Mayor Saigo's term in 1989, and 1 trillion and 377 billion yen and 3.46 million population in the last year of Mayor Takahide. Finally, Yokohama had a 1 trillion 345 billion yen budget serving a population of 3.65 million population in the last year of Mayor Nakata's term in 2008. The economic growth annual rate was 9.1% from 1956 to 1973, 4.2% from 1974 to 1990, 0.9% from 1991 to 2012.

²³ A unique aspect of Asukata's approach to resource management was to extensively utilise the concept of private-public partnerships. Tamura explained that public expenditure should mainly be limited to being used for basic community necessities and that other major investment should be managed largely by private financial power with support from the city. As such, the LDE system should be viewed as a kind of private-public partnership activity. The dire financial position of the municipality was remedied by revenue raised through local development exactions. Although Asukata was a leading figure in the Japan Socialist Party, his use of public-private partnerships went far beyond their strict socialist doctrine.

²⁴ In 1973, Tamura as chief planner proposed the concept of municipal general hospitals based on private-public partnership: the city bought sites for planned general hospitals and subsidised part of the construction fees for private medical institutions that ran hospitals for public use.

²⁵ According to the Town Planning Act 1968, town planning districts are designated as the areas which have to be planned, developed, and preserved as a unified entity.

²⁶ It was widely said among the central government and business community, who did not share a desire to preserve the natural environment for citizens, that the whole of Yokohama should have been designated as an urbanised area due to its proximity to Tokyo and its high market value as a residential area.

²⁷ A good example of housing development in a non-urbanised area can be observed in one done by the Keihinkyuko railway company: Kamariya housing development in Kanazawa ward of Yokohama, only 26% of the whole area of 275 hectares, was changed into urbanised area, being developed for housing of 20,000 planned residents, and the rest of which remained as a non-urbanised area, and was used for

public facilities and parks. Its planning permission was initially obtained in 1973 then suspended because of company's economic difficulties until 1978 when it was again permitted by the city.

Source <http://www.keikyuu.co.jp/information/history/chronology/06.html>

²⁸ This foundation was set up in 1984 as an affiliated organization of the city with the objectives of community planting, forest preservation, and promotion of greenery awareness by citizens. As of 2001, it had received a total amount of 1.3 billion yen donated by developers.

²⁹ According to the city of Yokohama, "the Municipal policy formulation paper signed by the mayor regarding the LDE system in 1995."

³⁰ Although a monetary calculation did not appear in the policy paper in 1995, the amount of municipal benefit can be calculated by comparison with the 87.3 billion yen by the end of 1980 which was shown on the other municipal policy formulation paper in 1980 by the city of Yokohama. It is therefore assumed that through exactions, the city benefited by approximately 500 billion yen in total between 1968 and 2004 when the LDE system was finally abolished.

³¹ By the first review of the LDE system of 1972, the development control standing committee ("DCSC") administered by the Planning and Coordination Bureau, directed by Tamura, and development control executive committee ("DCEC") administered by development control section of Architectural Bureau had been established. The DCSC was in charge of large-scale and important development application which needed an executive decision from wider perspective of city administration, and the DCEC as concerned with regular applications.

³² The Planning and Coordination Section had initially been set up by mayor Asukata when Tamura entered the city administration. Although Tamura was the right person to become the head of the Bureau, Asukata placed a well-trained bureaucrat as its head and Tamura as the deputy head. Three years later, when the Planning and Coordination Section was expanded into the Bureau, Tamura became its head.

³³ Tamura named this style of management "independent integration."

³⁴ Although Yokohama has a long history as a trading port opened in 1859, Tokyo has always been the centre of Japan in terms of commercial and/or business activities. Yokohama is mainly used as a residential satellite to Tokyo, even if it has industrial and business districts of a limited size.

³⁵ In 1978 an owner of apartment housing sued the city of Musashino demanding the return of an educational impact fee already paid amounting to 15 million yen. The owner was concerned over the payment of the impact fee since the city abolished the system of impact fee immediately after he/she had paid it. The Supreme Court decided in 1993 that impact fees were not illegal so long as they were paid by agreement, however an impact fee being required as a prerequisite for administrative process of concerned development was deemed an illegal administrative act. Then the Supreme Court returned the case to the Tokyo District Court and two parties, the city of Musashino and the owner of apartment housing, settled the case by paying 23 million yen from the city to the owner. Source: The city of Musashino, *Hundred years' history of Musashino city*, pp. 1029-1038, 2011

³⁶ In 1978 Yamaki Construction Company, headquartered in Musashino city, sued the city of Musashino which had refused to supply municipal tap water to the apartment building which Yamaki had constructed and owned, because Yamaki had progressed the construction without gaining approval from its surrounding residents, which was a prerequisite of Musashino city's LDE system. The Supreme Court determined in 1989 that the refusal to supply municipal tap water was a last resort for the municipality as a measure to compel a concerned developer to obey the rule of LDE system, though the tap water was a basic necessity for residents of apartment housing and therefore the municipality had a responsibility to supply the water to any developments when requested to do. The final verdict was that the mayor of the city forfeited a penalty payment. Source: The city of Musashino, *Hundred years' history of Musashino city*, pp. 1029-1038, 2011

³⁷ The Ministry of Home Affairs was in charge of local government governance, having been allocated much of the responsibility of the enormously powerful pre-war Ministry of Interior.

³⁸ In 2001 as part of reorganization of national ministries, the Ministry of Construction and the Ministry of Transport were consolidated into the Ministry of Construction and Transport.

³⁹ Since early 1980s in the United States lawsuits between local governments and private developers in terms of development exactions have occurred frequently. When giving permission to developers, local governments have required a wide range of exaction such as impact fees for construction of infrastructure and appropriate layout of planned buildings including installation of footpaths or parks on the planned site. State governments gradually began to support local governments' independent efforts through passing State Enabling Acts for development agreements and impact fees. The fundamentals of these Acts derive from police power vested on States as an inherent duty to guard welfare and security of state people. On lawsuits in state and/or federal supreme courts, nexus, a strong relationship between causes and results is always essential. It should be noted that when the central government of Japan tightened pressure to local governments concerning LDE systems, they used rhetoric to justify relaxation of LDE systems by demanding the elimination of obstacles of non-tariff barriers from the U.S. federal government. However, both federal and state governments have supported local municipalities in terms of housing development control. Regarding the case of England, the Community Infrastructure Levy ("CIL") came into force on 6 April 2010 through the Community Infrastructure Levy Regulations 2010, which is a planning charge introduced by the Planning Act 2008 as a tool for local authorities in England and Wales to help deliver infrastructure to support the development of their area. New housing developments which create net additional floor space of 100 square metres or more, or create a new dwelling, are potentially liable for the levy. This new levy was agreed parliament and introduced finally after a long history of trial and error on betterment recapture, following the Uthwatt committee of compensation and betterment in 1942. England had a well-thought rationale for its betterment concept even before Uthwatt, when the Housing and Town Planning Act 1909 proclaimed that local authorities may claim one-half of the increase in value of any property which is increased in value as a result of a town planning scheme. Local authorities in England could exercise discretionary planning power when bargaining with developers for community contributions such as the construction of community facilities or infrastructure. This kind of procedure had been long criticised by developers and land owners, therefore a new development planning regime was needed. The introduction of CIL has increased the certainty of development and was welcomed by developers, however there is a view concerned about the reduction of planning powers of local planning authorities.

⁴⁰ It is estimated that Yokohama city's population will continue to increase until 2019.

⁴¹ A new municipal primary school, for the purpose to sub-divide large enrolment of existing Hiyoshidai primary school in Kohoku ward, is now under construction and will be completed in 2020. This was caused by a large housing development of 5.6 hectares in site and the developer has sold the school site of 9,700 square meters to the city. The city spends 8.3 billion yen for acquisition of land and construction fee with the central government grant of only 760 million yen included.

⁴² There will be no financial allowance left for the reconstruction of existing urban infrastructure, because the social security expenses such as pensions have continued to expand exponentially.

The status and use of soft law in local governments' management of urban development: Restructuring the logical framework of administrative guidance on impact fees for housing development in 1970s Japan

Kenji Asakawa

JD, Institute for Global Environmental Strategies (IGES), asakawa@iges.or.jp

This research aims to analyse the use of administrative guidance such as the local development exaction system for collecting impact fees from developers in connection with housing developments from the viewpoint of “soft law”, as a collection of nonbinding social norms in Japan. It takes a brief look at the history of Japanese administrative guidance on impact fees from 1960s to 1990s, to identify how it contributed to public infrastructure development as a form of soft law in Yokohama. Furthermore, it considers the situation now faced by rapidly growing cities in developing countries and what they may learn facing a similar dilemma to that which confronted Japanese local governments in the past. Finally, it recommends more effective soft law for the management of urban development by cities in developing countries, and identifies challenges, some of which Yokohama experienced and others which it did not, which are likely to arise in developing countries wishing to make use of soft law such as local development exaction systems.

Keywords: soft law, local governments in Japan, urban development management, administrative guidance on impact fees, planning legacy and heritage

Research objectives and introduction: Why local governments needed administrative guidance on impact fees for housing developments yet refrained from using them

This research aims to analyse the rationale behind Japanese local government use and abolition of administrative guidance such as the local development exaction system for collecting impact fees from developers in connection with housing developments in 1960s and 1970s then consider whether similar guidance could be used to address public infrastructure development issues in major cities of developing countries, using Japan's experience in the 1960s and 1970s as a precedent. Insofar as an analogy may be drawn, this research intends to consider how such guidance could work more effectively than it did in Yokohama, which remains one of the model cases of implementing such guidance successfully from the viewpoint of “soft law”, as a collection of nonbinding social norms.

The rapid housing development that accompanied Japan's high economic growth starting in the 1960s primarily advanced in areas adjacent to major cities. This forced local governments, which were legally responsible for the construction and maintenance of public infrastructure, to incur significant expenses investing in such infrastructure. This included space-intensive projects, such as public schools for compulsory education consisting of elementary and junior high schools, and urban parks, which are required to be built both in proportion to the number of school children by the School Education Act, and the dimensions of the housing development in new housing areas, respectively. However, local governments' budgets could not accommodate the sharp increase of expenditure that accompanied such rapid population growth and housing development, since their additional revenue, especially that levied as local inhabitant tax from new residents, would not become available until the housing development for those new residents had been completed and those residents had moved in. In addition, although local governments sought a land value capture method to fund investment in public infrastructure, land readjustment could only provide rather small-scale spaces such as for roads, but was not sufficiently robust to secure space for large-scale infrastructure of the type mentioned above. Miki¹ analysed that the “benefit principle” system under Urban Planning Act could be utilised only for building sewerage because it was difficult to place a concrete value on the benefits realised from other public infrastructure. In order to levy additional local taxation, local governments are legally required to obtain permission from central government for tax not stipulated in the Local Autonomy Act. Furthermore, local governments were required to permit urban development according to the laws imposed by the central government, and Usui² said that they did not have any discretion to take the local situation into consideration when granting development permission. Therefore, many local governments established so-called “administrative guidance” including a local development exaction system (hereinafter called the “LDE system”) to require contributions of land in connection with housing developments, which relieved a significant portion of the financial burden on local governments that would otherwise be caused by these developments.

LDE systems typically stipulated the scope of their applicability and standards setting out the required dimensions of land to be provided for public infrastructure, as in Yokohama (see Table 1). Although it did not have legally binding force on developers, most local governments were able to obtain developers' voluntary compliance and have them contribute a portion of their developed land for free or at a nominal³ price. Developers' willingness to contribute should be seen against the prevailing economic circumstances in which a rapid increase in land prices meant developers could afford to comply, and their early compliance could facilitate cooperation of local governments, especially in the 12 major cities entitled to permit urban development in the early 1970s.

Applicability	All housing development projects*
Land required to be contributed for parks	Equal to or greater than 4% (for a public developer) or 3% (for a private developer) of development area without compensation
Land required to be contributed for public schools for compulsory education	Equal or more than 5% of development area with compensation for their costs, excluding their loss of income

*: From 1972, this was applicable to housing developments with an area equal to or greater than 0.1 ha.

Table 1: The administrative guidance of Yokohama concerning its LDE system in relation to housing development (excerpt). *Chosa Kiho (Quarterly Journal of Policy Studies) (in Japanese)*. [City of Yokohama, 1968] 75-78.

The city of Yokohama was the first major city to establish such administrative guidance since it had been rapidly populated by a large number of commuters to Tokyo, which imposed a severe financial burden for public infrastructure development. As a result, about 60% of land used for public schools for compulsory education, equal to land for 150 schools, was procured and 1.9 times the statutory minimum size of park land was secured from developers during the 25 years up to 1995 as calculated by Toshihiro and Sato⁴ and Taguchi⁵. As Yokohama's success was observed by other local governments, approximately 99% of local governments in Tokyo, 70% of local governments in Japan's three largest urban areas and 46% of all local governments nationwide had established similar guidance by 1996. (see Figure 1)

Figure 1: Share of local governments establishing administrative guidance on impact fees for housing developments and population growth. *National census*. [Ministry of Internal Affairs and Communications, 1995], *Takuchi Kaihatsu Yoko no Minaoshi no Pointo (How to revise administrative guidance on impact fees for housing development) (in Japanese)*. [Ministry of Construction, 1997], 8.

However, the lack of binding force behind these guidelines also caused tension between local governments' demands and non-compliant developers. Furthermore, some non-compliant developers brought lawsuits against the local governments to confirm the lack of binding force of the guidance and/or claiming compensation. A few

small and mid-sized local governments lost such cases, as in *Yamaki Kensetsu Kabushiki Kaisha v. the City of Musashino*, [Tokyo Dist. Ct. 1975], since they could not control permits for urban development and abused their discretion to refuse non-compliant developers' requests for access to water supply and/or sewerage infrastructure. Those cases due to local governments' abuse of their discretion using administrative guidance became a source of social criticism and were blamed for raising land prices, and the Ministry of Construction issued 11 official circulars notes from 1982 to 1996 requesting that local governments refrain from imposing their LDE systems on developers. In addition, public demand for housing developments had been moderated by the slow-down in economic growth from the late 1970s, shifting the focus of local governments from "restraining" to "inducing" housing development in order to generate needed revenue from local tax by increasing their local populations. Accordingly, the majority of local governments refrained from implementing such guidelines, perceiving them negatively as stopgap measures to an issue that required the enactment of alternative laws and regulations at a national level, as evaluated by Ministry of Construction⁶.

Re-evaluating administrative guidance by restructuring the logical framework as soft law: How the city of Yokohama implemented it successfully

Even without legal binding force, administrative guidance (soft law) in Japan is considered a social norm in the same manner as laws and regulations (hard law) are, in terms of their common intent to serve the public welfare. The defining characteristic of soft law is a tool to lead people in a specific direction intended by the social norm maker. Therefore hard law is unnecessary where soft law can successfully elicit voluntary cooperation between parties. Moreover, soft law is somewhat superior to hard law in terms of its ability to build solid consensus without binding force, and its flexibility in establishing procedures to address various cases and accommodate changes in the market involving parties. Because of the abovementioned advantages, local governments were able to use administrative guidance to contribute to urban development control through the soft law of the LDE system. Therefore, administrative guidance should be perceived more positively as an effective policy tool.

From the viewpoint of law and economics, a party's obedience of a social norm is understood as based on maximising its own interests, and whether those interests will best be served by compliance with or non-compliance with that norm, considering the benefits and consequences of each option, as explained by Tyler⁷. Regarding the factors considered when one assesses whether to comply with a social norm, Iida⁸ identified sanctions, the necessity of the norm in question and individual morality as major factors that affect parties' decisions regarding the above, and sanctions are one of the most significant factors affecting parties' decision making. Sanctions can be categorised into two types: (1) those imposed by an authority, such as penalties, and which may be accompanied by hard law, and (2) those imposed by society, such as damage to reputation, which may be accompanied by soft law as well as hard law. In terms of this classification, administrative guidance may be regarded as soft law accompanied by sanctions imposed by society, such as the reputational effect⁹.

Yokohama's administrative guidance applied to developers can be considered a model case of an LDE system in terms of eliciting voluntary compliance, which is considered one of the most critical challenges for utilising administrative guidance as soft law. The following discussion addresses why Yokohama was successful.

As mentioned above, it is important to increase the impact on a party's interests in complying with the norm, including the detriment caused by violation, to lend credibility to soft law. According to Fujita and Matsumura¹⁰, the interests consist of the following three types: (1) direct and subjective benefits from compliance shared only between the local government and the developers, (2) long-term benefits (if prioritised by the developer), and (3) indirect benefits that may be accrued by demonstrating their compliance with the guidance.

Regarding (1) subjective benefits, since most developers in Yokohama are private companies, they will comply with guidance where compliance aligns with their economic interests. The economic interests of developers were served by the following in the case of Yokohama. Land in Yokohama had a higher scarcity value for housing development since as Tamura¹¹ said the Yokohama administration allowed a comparatively smaller area for development, approximately only 75% of the whole administrative area, compared to the area in Kawasaki, which is an adjacent city to Yokohama and has topographical characteristics similar to Yokohama, which opened approximately 88%. This enhanced the attractiveness of Yokohama, especially to commuters who continued to work in Tokyo, and created a strong incentive for developers to build housing in Yokohama. Furthermore, since the city of Yokohama was vested with the authority to issue land development permits as one of the government-designated major cities, that fact encouraged developers to comply with the guidance as early as possible in order to swiftly obtain land development permission. In addition, the guidance strengthened the bargaining power of the city of Yokohama by integrating the departments in charge of public infrastructure that normally negotiated individually with developers, since the guidance concerned various sections of public infrastructure, which helped the Planning and Coordination Bureau work as a central authority under the strong leadership of Dr Akira Tamura.

Therefore, the city of Yokohama offered (1) subjective benefits to developers to facilitate voluntary compliance with their guidance as a result.

The (2) priority given to long-term benefits applies to developers who prioritise long-term benefit over short-term gain, and attracts developers seeking long-term benefits through their compliance with norms. Fujita and Matsumura¹² identified the factors that affect the impact of (2) on a party's interests, such as the size of the group or party affected by the norm, as well as its type and degree of homogeneity. In the case of Yokohama, since housing development to be subject to the administrative guidance is predominantly promoted by railway company seeking transit-oriented development which could provide long-term benefits more than the other kind of housing development, the number of major developers prioritising long-term benefits was relatively few, and this factor increased the homogeneity of developers. The public, especially potential buyers of housing real estate, could easily identify each developer individually and this enhanced (3) the reputation effect, discussed below. This meant that developers tended to follow the leading developer, Tokyu Corporation, which fully complied with the administrative guidance since it had been derived from agreement between Tokyu Corporation and the city of Yokohama. Therefore, although the city of Yokohama might have utilised the homogeneity of developers in order to facilitate their voluntary compliance with the norms that the leading developer had already accepted, the feature of homogeneity among parties is not one within the control of a local government, and the city of Yokohama had no power to increase a developers' preference for (2).

Regarding (3) indirect benefits that may be attracted by developers demonstrating their compliance with the guidance, Fujita and Matsumura¹³ explained (3) indirect benefits can be accessed by information about a vendor which can be conveyed only indirectly by demonstrating the differences between vendors to consumers. In the case of administrative guidance, a developer's compliance would indicate that the accompanying public infrastructure has been properly built, and accordingly, the quality of the residential land is guaranteed to an extent, indicating that land meeting the specifications of administrative guidance may be of a higher standard, or that a compliant developer may be expected to develop land for comfortable living. The local government could signal the above to the general public, and the developer would therefore realise value through such compliance by gaining a greater profit from higher sales of their residential land. In addition, as the guidance set specifications on more essential public infrastructure for living, non-compliance with those specifications would cause larger loss due to reputational effects. Although the city of Yokohama at one stage intended to place a notice in a newspaper indicating that an area developed by Tokyu Corporation would not have an elementary school if Tokyu Corporation refused to obey their guidance as Tamura reminisced,¹⁴ they did not take measures to credit compliant developers. Local government might be able to further enhance developers' compliance with administrative guidance if they demonstrated a positive endorsement for compliant developers, such as an accreditation system for housing land meeting the specifications of their guidance.

Applicability to growing cities in developing countries: Implications of LDE systems

Local governments are responsible for providing various kinds of public services. Although the types of services supplied by local governments varies, local governments in Indonesia and Vietnam are responsible for the same kinds of services as those in Japan (see table 1). However, only small budgets are allocated for the services in local governments, for example, local governments in Indonesia spend less than 1/60th of the average expenditure in Japan (see table 2). Considering the decentralisation of authority in developing countries tends to assign local governments to deliver public services at their cost without taxation allocated from central government, many local governments in developing countries cannot afford to supply sufficient public services for rapidly developed housing areas at their own expense, though grants from central government to local governments partly fill the gap, as analysed by Kimura¹⁵.

Country	Planning	Basic education	Basic social welfare	Basic health service	Water supply	Electricity supply	Public transport	Business development support
<u>Japan</u>	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes
China	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes
India	Yes	Yes	No	Yes	Yes	No	Yes	Yes
<u>Indonesia</u>	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes
Malaysia	Yes	No	No	No	Yes	No	Yes	Yes
Philippines	Yes	No	Yes	Yes	Yes	No	No	Yes
Thailand	Yes	Yes	Yes	No	Yes	No	Yes	Yes
<u>Vietnam</u>	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes

Table 1 Service delivered by local governments in the Asia-Pacific region, *Decentralization and Local Democracy in the World: First Global Report* by United Cities and Local Governments 2008. World Bank Publications. (Cities, U., & Governments, L. 2008) 67.

Country	Total public expenditure a) as % of GDP b) € per capita	Local public expenditure (local and meso level only) a) % of GDP b) € per capita	Ratio of local public expenses/total public expenses	Tax shares + general grants as % of the total LM income	Local tax revenues (=tax revenues subject to a local tax power) as % of total LM income
Japan	a) 22.9% b) 7,243	a) 12.3% b) 3,903	53.6%	69%	34%
Indonesia	a) 19% b) 189	a) 6% b) 62	33%	70%	<10%
Vietnam	a) 24% b) n/a	a) 11% b) n/a	48%	44%	24%

Table 2 Relative size of local governments' expenditure and income in the Asia-Pacific region, *Decentralization and Local Democracy in the World: First Global Report* by United Cities and Local Governments 2008. World Bank Publications. (Cities, U., & Governments, L. 2008) 68.

Furthermore, it is unrealistic for local governments in developing countries to establish additional local tax independently from central government. In Indonesia and the Philippines, since the variety of the local tax is limited/controlled by national law, they do not have any discretion to establish additional types of local tax. In those circumstances, they cannot increase revenue from the current taxation settings. Therefore, in order to raise revenue they would be greatly assisted by a voluntary LDE system based on soft law, such as the administrative guidance adopted in Japan.

Since soft law can bring certain incentives for land developers even in developing countries, and economic incentives are of major benefit to developers, developing countries may wish to consider the feasibility and effectiveness of a similar LDE system to that implemented by the Yokohama administration, by considering the incentives of (1), (2) and (3) above. Local governments in developing countries could increase the benefits offered to developers under (1), especially those which are vested with the right to issue land development permits as in Yokohama. However, a major part of housing land in developing countries' major cities tends to be developed by foreign developers who decrease the homogeneity of developers and could reduce (2) as a result. However, local governments could learn from Yokohama's experience by making greater use of the reputational benefits such as those in (3) if they successfully launched a labelling and/or certification system that recognised compliant developers.

The way forward: Concluding remarks

Rapidly growing cities in developing countries face a similar dilemma to that experienced by Japanese local governments in the past, and they may likewise be expected to have difficulties in raising capital for public infrastructure investment. This research has considered key taxation and public spending settings in a small number of developing countries for the purpose of exploring whether Japanese local government use of soft law could act as a kind of model. Nevertheless, successful application of soft law in developing countries will require further analysis of enabling environment of those countries for such a soft law, including their differences from Japan, in order to ensure that the implementation of LDE systems can be successful. Subject to that additional analysis, soft law of LDE systems may be a more appropriate solution than legislation, especially in developing countries where the rule of law is weak, since they have greater difficulty developing and enforcing laws when compared to Japanese local governments that have experienced high economic growth. Therefore lessons learned from Japanese local governments, especially the Japanese experience of using soft law for urban development management, including how to achieve such a solid consensus without the availability of legal coercion, could contribute to more effective practice of using impact fees to solve this dilemma in developing countries.

However, local governments in developing countries making use of soft law such as LDE systems would face the other challenges outlined below, some of which Yokohama experienced and others which it did not, but are likely to arise in developing countries.

As Uga¹⁶ identified, Japan's experience was that administrative guidance incentivised¹⁷ developers to scale down the size of their land developments in order to avoid requirements of the guidance that specified minimum sizes in determining its scope of applicability including in Yokohama. Since those local governments never found a satisfactory solution to that issue, it remains one of the big challenges accompanying the use of administrative guidance. In addition, there are the other issues that are faced commonly by local governments in developing countries, such as the governance and institutional capacity of the local governments.

Regarding governance capacity, local governments' direct collection of impact fees from developers would engender a risk of bureaucratic corruption, such as bribery. All taxes, including local taxes, are generally collected by central government, and this provides a safeguard against corruption in local governments that tend to have lower capacity in terms of governance than central government.

Regarding institutional capacity, the city of Yokohama invited professionals to organise the Planning and Coordination Bureau as a central authority for implementing administrative guidance, including Dr Akira Tamura, head of the Bureau, who was directly invited by the Yokohama city mayor of that time, Ichio Asukata. In addition to having their bargaining power boosted by the guidance and institutional reform to establish the Bureau, competent professionals working as tough negotiators brought continued success to their application of their guidance. Since local governments in developing countries still face many issues due to their varying individual capacities, successful application of such guidance would seem more challenging in developing countries.

Soft law can contribute to fundraising for public infrastructure, just as the LDE system did in many Japanese local governments, including Yokohama. As discussed above, it has certain advantages and should be considered as an alternative to legislation from central government. If local governments in developing countries are able to strengthen their capacity sufficiently to implement such administrative guidance, they can learn from the experience in Japan generally, and especially the model provided by Yokohama.

Acknowledgements

I appreciate the input of Dr Toshio Taguchi and the other members of the Akira Tamura Memorial-A Town Planning Research Initiative NPO, who provided me numerous suggestions and feedback on this research topic. I noticed significant improvements in this research through dialogue with members in the last several months. In addition, Mr. Timothy Gray played a key role as proof reader by reviewing this paper with expertise as a professional legal editor.

A study of unorthodox town making by Akira Tamura: the transmission of Tamura's vision to younger generations

Atsuhiko AOKI*

* Member of Akira Tamura Memorial-A Town Planning Research Initiative NPO, Graduate student of the Graduate School of Humanities and Sociology of the University of Tokyo.

a.aoki1021@gmail.com

This thesis intends to assess how Akira Tamura's "Town making" vision has been passed down to and utilised by younger generations, focusing on the experiences of a study group in which Tamura's successors have utilised his vision. Tamura promoted the group as an informal place to convey and understand the essence of town making, and insisted on the importance of flexibility in consideration of stakeholders. This thesis sets out to answer the following questions: (1) what are the key features of Akira Tamura's town making that have been passed on, and (2) how can they be applied by town planners now and in the future? In preparation for writing this thesis, I conducted semi-structured interviews of 4 former Yokohama public officials and referred to documents in the "Akira Tamura archives" of Yokohama city's historical library. This case study demonstrates that Tamura aimed not only to improve the law and revise the planning system itself, but to imbue urban planning with greater fluidity.

Keywords: Development with consideration of stakeholders, Town making and local governance, Planning and coordination within city administration

Introduction

The purpose of this study is to assess how Akira Tamura's "town making" vision has been passed down to and utilised by younger generations. Although the Japanese urban planning legislation regulating the control of urban space is largely based on modern Western city planning, its practical application has a strongly centralised and business-centred character.¹ At the same time, however, there is a lack of political will and social support for central government-led planning, and the principle of "architectural freedom" in urban spaces leaves planning to the forces of *laissez-faire* market capitalism. Against this background, a unique contrivance for the control of urban spaces called "town making" emerged at the level of Japanese local government entirely independent from the amendments to individual urban planning and building standards laws. According to Koizumi Hideki, an urban engineer, the essence of town making is "to create a relationship/framework among citizens and local communities that controls the market instead of the central government doing so"²

As shown in the paper presented by Chihiro Tamura and Toshio Taguchi, Akira Tamura talked about urban planning in easy-to-understand terms and attracted a great deal of interest in town making through his books. In past studies, Tamura has been referred to as just one of the respected intellectuals behind the Asukata-led Yokohama city government (1963-1978) and his actual work and how it impacted on local governments across Japan has not been reviewed.³ However recent studies, which have corresponded to the increasing popularity of town making in Japan, have begun to assess Tamura as a pioneer who understood city planning in the context of local governance issues.⁴

I do not believe Tamura's town making was intended as a theory for controlling built environments. Tamura was not originally a theorist of urban planning but instead built his own town making theory through responding to the needs and circumstances of Yokohama city. As urban engineer Shunichi Watanabe has aptly said, those who try to define "town making" are "basically practitioners—not theorists—who abstract their unique experience to their definition" and "their definition is inductive and lacks deductive discussion based on theory or discipline".⁵ Nevertheless, Akira Tamura's town making theory opened the subject of town making to a wider range of people, which in turn led to a plurality of understandings, making it difficult to precisely define the impact of town making on Japanese urban planning.

Therefore, the question to be asked is, given his fluid and responsive approach, (1) what are the features of Akira Tamura's town making that have been passed on and (2) how can they be applied by future town planners? In this paper, I focus on the mutual exchanges between Tamura and members of the study group on town making in Yokohama as a case study to solve these questions.

Figure 1: Portrait of Akira Tamura

Approach and Data

To conduct this study, I referred to documents in the “Akira Tamura archives” of Yokohama city’s historical library. The data in the archives are preserved in order to remember Tamura’s work. His family offered those documents to the city historical library. Prior to using those documents, I obtained their permission.

I also conducted semi-structured interviews of 4 former Yokohama public officials. All survey respondents were male and started their careers during the Asukata-led city government period (1963-78). The main questions asked respondents to (1) describe their relationship with Tamura, (2) their points of view regarding Tamura’s “town making”. I adapted the actual questions to correspond with the job descriptions and length of service as appropriate. These surveys were conducted on the understanding that their names would be anonymised, in order to elicit frankness and honesty in their responses.

Fluctuation in Tamura’s town making—The practice in Yokohama

Akira Tamura once said:

Urban design became a hot topic in architectural journalism in the early 1960s. However, it ignored the social relationships which are comprised of many stakeholders. In the late 1960s, there were few people who disputed the importance of urban design. However, one objective I had in entering Yokohama city was to make urban design possible in practice.⁶

The city of Yokohama in the late of 1960s existed in an era when urban policies addressing issues related to post-war reconstruction and high economic growth were a top priority of the Asukata-led Yokohama city government. The city government framed their city policy as “Making a city in which everyone would want to live” and had to find new ways to combat the problems caused by drastic industrialisation and urbanisation. Under these circumstances, Yokohama’s Six Spine Projects were launched, mainly by the Planning and Coordination Bureau (“PCAB”) led by Akira Tamura, as an advisor to Asukata. A key advantage of the PCAB was that it made the urban development required for the Six Spine Projects possible by coordinating each of the departments of the city office prescribed in the centralised city planning related laws and regulations. The motif underlying the approach had already been described as a lack of “comprehensiveness” in urban planning in the 1960s. For example, Tange Kenzo had the following criticism:

I do not find any vision for the future in the legal system for urban planning in Japan. It is quite out-of-date. Furthermore, the laws related to urban planning have lost comprehensiveness, lost sight of the system,

reflecting the sectionalism of the government agencies. Hence, urban planning has lost its substance and become just an ideological consolation.⁷

Various discussions being brought into the public domain through vehicles such as the “urban design movement” made the issue of how to ensure urban planning was a more comprehensive process into a lively subject in architectural journalism. Tamura was also actively involved in these discussions. In 1965, Tamura criticised Japanese architects who could only draw “pictures” of urban design:

The problem of urban design has been taken up keenly among architects. They have argued that it is important for architects to commit to further urban planning. But in the majority of the projects, they have only been able to draw pictures of ideal urban planning⁸

Interestingly, in the mid-1960s, Tamura was focused mainly on the physical environment of the city: His views regarding the “coordination” of the actors which were positioned at the centre of the discussion of the town planning had not yet solidified. Tamura said:

Who can solve the urban issues? Politicians, economists, sociologists, lawyers, bureaucrats are given their respective roles and it is necessary that they develop solutions to it. However ultimately, the city is an object constructed by iron and concrete. Thus an important role should be given to the new age urban planner — the general planner.⁹

It seems clear that Tamura envisioned not just that multiple stakeholders would participate in solving urban problems, but also that he foresaw urban planners having more comprehensive skillsets. In short, it appears that Tamura believed in the determinism of physical structures. This is in contrast with his views after he committed to Yokohama. Tamura later described his views in the pamphlet of the PCAB as follows:

Urban planning, as with architecture, deals with space and environment, and plans are shown in the form of pictures and figures. But urban planning is used to change the space and urban environment, and never to realise the picture itself. And if it is merely realised, it is likely that it will have caused problems in the process. Urban planning is not necessarily just about building objects.¹⁰

As can be seen concisely here, Tamura emphasised the importance of flexibility, not just building. In other words, what was important for Tamura was not to improve the law and revise the planning system itself, but to carry out urban planning fluidly. For that purpose, it was necessary to “create relationships and frameworks among stakeholders”. It goes without saying that such changes were made in his practice in relation to Yokohama city. That is, the objective of creating of relationships and frameworks among stakeholders is not only to improve the physical environment of the city but also to capture the city from a comprehensive point of view, and to facilitate collaboration between stakeholders for better development. He also emphasised that the involvement of the local administration is beneficial. My interviews asked the question of how far his flexible theory could be utilised, but for the accommodation by the Asukata-led city government. Naoyuki Kuniyoshi, belonging to the PCAB’s design team, said:

In the 70’s, I felt that the members of the design team of the PCAB didn’t recognise ourselves as members of a government office but as challengers for new age city planning. Thus we didn’t have a long-term vision. I thought it was our job to challenge the city office of Yokohama as much as possible in terms of urban design... While there are some people who criticise Tamura, there are also a lot of people who stand for his work as well. It was an era when various people were professionally maturing under him... But after mayor Asukata left Yokohama, we had no choice but to work more conservatively as an organisation within the agency. So we had to make another strategy for that period. If we had continued to act in the same way as we had before, we would only have been ignored.¹¹

The Asukata-led city government provided a place for experimental urban development. As a result of the end of Asukata-led city government, the establishment of a formal organisation in the city government (the PCAB) also meant a loss of flexibility and pragmatism. However, it is also true that there were staff members who showed enthusiasm and support for cultivating a new approach to urban development that included the practical implementation of a flexible organisation that characterised the approach of the Asukata-led city government and Tamura’s urban design. What did those people learn and inherit from Tamura? I will address this next.

Inheritance of Tamura’s point of view—From the perspective of activities of “Machi-Ken”

One interviewee, who served Yokohama city before Akira Tamura left Yokohama city, had believed that there was no place for Japanese municipalities to practice urban planning as he thought it ought to be practised, and hence he was impressed by Tamura’s urban design, and decided to become involved himself in the planning of Yokohama city.

Originally, I did not think that there was anyone doing such work in Japan, well, I wondered what was good in Japanese urban design. I was looking in Japan for the innovation in local governance seen in the UK at the time... so I was so excited when I saw that Tamura was actually doing something new. It was awesome. It was on that basis that I decided to enter the Yokohama city government too.¹²

In his case, he was originally interested in urban design, and he made the decision to join the Yokohama city government because he saw that such innovative practices could be done even in Japanese municipalities. There were also other staff members who were impressed by Tamura's thought processes and design practice in the development of Yokohama city after entering the city government. Another interviewee, who is a convenor of the "town making research society" (known as "Machi-Ken", and hereinafter referred to by this name), described Tamura's personality as follows.

Mr. Tamura embodied a kind of civic value which I don't myself possess. That is, he was cognisant of how to manage the common interests of various stakeholders, not just of individual or specific interests.¹³

By this, we can see that the key elements of Tamura's town planning were the skilled management of diverse actors, and the refusal to be bound by the determinism of physical structures. Tamura retired in Yokohama in 1982, but in 1980 he received a request from a young member and became an advisor to Machi-Ken. It was an informal study group and a place of interaction between workers, companies, and researchers. Tamura's views towards the activities of Machi-Ken were stated ten years after its founding, when recalled as follows.

"Machi-Ken"... It neither wanted to have expertise nor project anything outside, it had no contracts or officials. It was merely a voluntary study group for inner members of city governments. Also, all the members were very young and comprised a modest study group. To me, as I was retiring, my concern was not only for people who were already in management positions, but also for those who were furthering their expertise in urban development.¹⁴

Tamura seems to have participated quite enthusiastically in the group's activities. Another interviewee, who was a former Yokohama municipal official and a member of the research group, reflected as follows.

Mr. Tamura attended more than 90% of the activities of "Machi-Ken". Enthusiastic, wasn't he? Although he sometimes couldn't attend as he needed to go abroad for business trips, he mostly came and listened to the presentations by young group members, and gave advice to them.¹⁵

Another organiser of the research group, said:

There were plenty of city government departments facing problems, so we contacted the department and requested that the chief or section chief make a presentation about them to the study group. Presentations took about an hour and then discussion lasted about an hour... afterwards we went for a drink. Of course Mr. Tamura came with us. He summarised the presentation of the day and gave advice within 10 to 15 minutes. He spoke very quickly. Come to think of it, attending that study group was my greatest source of knowledge about city planning during my lifetime.¹⁶

To summarise the characteristics of Machi-Ken above, (1) it was a place for young city government workers to share their respective problems, (2) Tamura left it to its autonomous operation by its members, and served as a consolidator, (3) the study group itself functioned as a mediator between city government employees and outsiders. An official of the Building Bureau who was participating in Machi-Ken, described the significance of the study group as follows.

Our common understanding was that every aspect of urban development and town planning had to be approached from a broad perspective. It was important for us to expand our network through the study group, and to improve our individual skills for work... We wanted to secure new participants to expand the network. Therefore, we decided to invite new recruits as well as trying not to use technical terms to make it easy for newcomers to understand our approach to urban development. It was a way to build awareness among those interested in town planning. Indeed, it was a place to cooperate and coordinate.¹⁷

The main axis of Machi-Ken was to acquire broad knowledge on town making. At the same time, however it was a place to expand the network for young city government workers who did not have substantial authority in the city government apparatus. Through the study group, they acquired know-how to implement their own flexible planning style. Of course, there were deviations in terms of how much incentive the participants had to attend, and the research group itself did not have concrete abilities. It depended entirely on the individual skills and consciousness of its members.

Year	Main areas of study	Year	Main areas of study
1980	Overview of town making Assessing the region of Yokohama Participation in the Japan Design convention How to develop the seafront area holistically Recycling industrial waste	1985	about the impact of information technology Considering stakeholders when planning
1981	General planning in Yokohama Expressways in Yokohama Industrial structure Museums and cultural administration What is town making? Green master plan	1986	Department stores and development Town making and restaurants Urban designs now
1982	Participation in The Regional Congress of Local Authorities for Development of Human Settlements in Asia and the Pacific The institution of land use A new transportation system Spatial extent and authenticity Focus on the MM21 area	1987	Is it possible to attract overseas university students? 1985	Local government in Asia Railways, roads and airports	1990	Housing, environment and the community Machi-Ken 10 year anniversary forum

Figure 2: The activities of Machi-Ken (1980-90).

However, Tamura promoted the group as an informal place as a place to convey the essence of town making, and kept insisting on the importance of flexibility in the interests of stakeholders. This informal place of discussion itself had great significance. Tamura’s town making theory was reinforced and developed through these discussions, and they have formed the basis for practices followed by younger generations. Whilst it is not a very difficult task to set up projects itself, the question is always who would benefit from the project being considered? Tamura’s approach urges attention to seeking consensus. Therefore, Tamura insisted on the necessity of flexibility at all times. Another of the members of Machi-Ken looks back on the practice of Tamura as follows.

Previously, I thought of urban design as altering the physical environment such as by making plazas or creating blueprints for malls. But, well, afterwards, I got to know how much Tamura had discussed with people in the field and how much he had struggled in the city government office. And then finally I came to understand, “Oh this is what urban design actually is.”¹⁸

The essence of Tamura’s town making which developed from the determinism of physical structures to encouraging the participation of and responding to stakeholders has undoubtedly been transmitted to younger generations. At the same time, however, the problems of Yokohama city could no longer be dealt with in the same manner as during the era of the Six Spine Projects in the Asukata-led city government. In Japan, the local government’s planning documents reflect a change in mood that caused planning staff to “rush into planning and make grand promises that are not possible to deliver upon. This has been pointed out as a problem facing Japanese municipalities. This would not be consistent with Tamura’s intention for town making. With reference to Tamura’s practice, the people who gathered at Machi-Ken thought about their town making and would consider pragmatically how ingenious ideas could be possible in the face of real constraints. Rather than adhering strictly to urban planning instructions given by the government, it was important for them to think flexibly with reference to Tamura’s town making.

From the activities of Machi-Ken, a new type of administrative staff who “do not just carry out policy as a matter of budget execution and desk work, but are adept in policy and legal affairs, and actively go outside the government office to discuss matters flexibly with citizens and business operators”¹⁹ has also arisen. One of the administrative staff states as follows.

I went to meet everyone who was involved in the redevelopment project one by one, listening to various stories and talking about how to transfer that person’s rights altogether. Sometimes drink together. By doing so, we can have a heart-to-heart talk about development.²⁰

However, the current approach to municipal town planning does not necessarily have an appropriate distance sense with citizens. He says as follows.

If a single mistake occurs, then the government becomes extremely concerned that it will spread to the project as a whole. So when you do town making, the distance between government and stakeholders is too far. If you want to improve problems affecting them, then you must enter their world and talk more.²¹

In Japan, when the development of an area is carried out, residents do not necessarily establish the goals and rules for collaboration. Therefore, it is necessary to listen to the interests of actors such as local residents, companies and government, and to coordinate collaborative goals and rules for the various actors. There is now a demand for local government that can act within such agreed requirements and can make remarks in a “way sensitive to residents’ concerns”²² as pointed out by urban sociologist Naoki Yoshihara. Responsiveness to residents’ needs cannot be established only by regulation by individual laws and regulations and municipalities’ planning in advance. Municipalities are formal organisations, and being overly flexible may lead to disorder. But working to create a city certainly requires a great deal of fluidity. Therefore, it is important to secure as much flexibility as possible in the institutional design. Also in the future, it is important to actively consider how to conduct town making by consensus.

Figure 3: Machi-Ken members on a study trip to Taiwan.

Conclusion

My conclusion from this study is that Tamura was able to create a signature approach that made town making universal and inclusive through losing his position at the Asukata-led city government (1963-78). His legacy was not to change the appearance of Yokohama city merely by modifying the built environment, but to think about how individuals should respond to dynamic and fluctuating urban changes. Hence, for those wishing to adopt and continue Tamura's vision, the important question is not what Tamura did, but what Tamura would do.

In other words, they should approach problems in town making by internalising Tamura's approach to town making. Consultation with stakeholders and the exchange of views among those who take part in town making is indispensable for that purpose. Too often successful cases of urban planning are praised and standardised. However, from the perspective of Tamura's town making, it is not necessarily desirable to adopt a standardised approach to certain problems. Rather, it is essential to control urban space by creating a relationship/framework among citizens and distinct communities that takes a flexible, "no-fixed-form" approach of the kind adopted by Tamura.

**A Glocal Approach to Urban
Design: MAKI Fumihiko, Group
Form and East-West Dialogue**

Where East meets West in Maki's Concept of Collective Form and Urban Design

Ellen Shoshkes (Portland State University)

This paper forms part of a panel examining the cross-cultural exchanges that inspired Japanese architect MAKI Fumihiko's concept of Group Form, and its further evolution as a "glocal" (global and local) approach to humanistic urban design through the work of Maki's students and collaborators.

Both my paper and the panel examine two inter-related and under-studied research questions: the role of Japanese urbanism and urbanists in the transnational exchange of urban planning and design ideas in the twentieth century, particularly in the emergence of urban design as an academic field and professional practice. There is a growing body of research on the influence of Western ideas on modern planning theory and practice in Japan. Much less understood is how the transnational exchange of ideas generated the co-evolution of modern urban planning and design praxis in Japan and the West.

My paper situates Group Form in the larger context of the creative dialogue between Eastern and Western civilization that has been a powerful force in world history, giving rise to the European Renaissance, and to modernist social and artistic movements before World War I. It is widely acknowledged that the opening of Japan to the West in 1868 served as a "mid-wife" for modernism in the West. It is now understood that this was an interactive process involving the co-evolution of utopian modernism in Japan (among other places) and the West. An important conduit for this interactive process was the rise of transnational scholarly communities concerned with urbanism. The evolution of a synthesis of a set of comparable Eastern and Western social-aesthetic ideals formed an important thread in the line of planning thought pioneered by Patrick Geddes. After World War II, the renewal and intensification of East West exchange, notably between Japan and the West, sparked the further evolution of this dynamic synthesis within the new field of urban design that is established at Harvard in the late 1950s, and the inter-related Ekistics movement, led by Greek planner Constantinos Doxiadis.

My paper illuminates this broad theme by focusing on the relationship between Maki Fumihiko and the British planner, educator, and editor Jaqueline Tyrwhitt, from the 1950s through the 1970s. I examine how discourse on Group Form, urban design and ekistics evolved interactively in the context of exchanges within transnational scholarly communities based in Harvard-MIT, Tokyo University and the Graduate School of Ekistics, in Athens.

The findings of this research point to the significance of Tyrwhitt and Maki as intermediaries for the creative dialogue between Japan and the West that inspired the further development of modern utopian realism in urban design and ekistics. This research also opens a transnational perspective on planning history, requiring a dual focus on global and local approaches.

Fumihiko Maki and the Asian Planning and Architectural Collaboration (APAC)

Koon Wee (The University of Hong Kong)

Maki's investigations in group form were an effort to reconcile the homogenizing tendencies of modernization and the imperative to preserve qualities of local places and regions. Maki continued this investigation once he returned to Japan in 1965, through meetings with a group of young modernist architects from different regions in Asia, including William S.W. Lim, Sumet Jumsai, Tao Ho, Charles Correa, and Koichi and Catharine Nagashima. They all knew Jaqueline Tyrwhitt, who encouraged them to form the Asian Planning and Architectural Collaboration (APAC)

This paper examines the work of this group in the context of rapid urban development, intensified density, decolonization and a search for national identity.

Josep Lluís Sert, Fumihiko Maki, and Urban Design

Eric Mumford (Washington University in St Louis)

How did the architect Fumihiko Maki (1928-) develop his approach to urban design in the early 1960s? This paper examines Maki's education, theoretical writings, and early design practice to answer this question. Born in Tokyo, Maki had studied with Kenzo Tange at the University of Tokyo, graduating in 1952, before briefly attending the Cranbrook Academy of Art near Detroit, at time when it was still unusual for a Japanese student to be allowed to study in the United States. After a year of study at the Harvard Graduate School of Design (GSD) with the Spanish architect Josep Lluís Sert (1902-83) in 1953-54, then the Dean there, Maki worked briefly for SOM-New York and for Town Planning Associates. The latter was Sert's New York firm that he had founded in the 1940s with Paul Lester Wiener. Maki then went on to teach design at Washington University in St. Louis (1956-62) and then at the GSD (1962-65)

During this same period, Sert founded the professional discipline of what he called "urban design" at the First Harvard Urban Design conference in 1956, just as CIAM (International Congresses of Modern Architecture), the group of which he was then the President, was ending.

Both Sert and Maki emphasized the importance of designing for pedestrian urban spaces within the conditions of postwar urbanization, which was increasingly auto-centered. As he later explained in his *Investigations in Collective Form* (1964, with Jerry Goldberg), Maki's approach, which he called "Group Form," was intended to respond to the new scale of large infrastructure-related development with open-ended patterns of buildings organized around movement systems. These buildings would retain a consistent image, even as they could be modified or replaced over time. Maki's concepts then influenced Sert's work for academic institutions in the Boston area, such as the Peabody Terrace Married Student Housing complex at Harvard University (1963)

After 1967, Maki then began to apply his ideas to his successful practice in Japan, which continues to the present. This paper examines some of these built outcomes by Sert and by Maki that illustrate their design approaches, which differed radically from much mainstream urban development of the time and later.

Metabolism architects and urban planning and design in Yokohama

Nobuharu Suzuki (Yokohama City University)

Architect / Planner Takashi Asada (1921-1990) was the honorary chairman of the Metabolism Group organized for the World Design Conference in 1960. He proposed '6 Major Projects' as future vision of Yokohama City in 1965 together with Planner Tamura Akira (1926-2010), who joined Yokohama City in 1968 and led the urban planning division. Among the metabolism architects, Fumihiko Maki (1928-) and Masato Otaka (1923-2010) participated in large-scale projects such as Kanazawa Seaside Town and Minato Mirai 21 as well as individual their building projects. This paper examines these projects they involved and influence of metabolism and urban design in 1960's.

Rethinking the Recovery and Resettlement After Disasters

The Role of Residential Buyouts in Post-Disaster Housing Recovery Support: A Comparison of Recent Cases from Japan and the United States

Elizabeth Maly (Tohoku University), Tamiyo Kondo (Kobe University), Michiko Banba (University of Hyogo) and Kanako Iuchi (Tohoku University)

Government purchase of residential property in disaster risk areas is a part of official post-disaster housing recovery support for homeowners in both Japan and the United States. The role of these residential buyouts has become more significant in both countries after recent disasters--the 2011 Great East Japan Earthquake and tsunami in Japan and 2012 Superstorm Sandy in the United States. In both countries, the use of residential buyouts is premised on a similar goal: reducing the impact and damage from future disasters by acquiring properties in hazardous areas.

However, implementation of these policies differs significantly.

In Japan, the acquisition of residential land occurs primarily as part of Collective Relocation for Disaster Mitigation (CRDM) projects, used to move residents from disaster-affected communities to safer locations. CRDM projects include measures to both: 1) acquire land in designated hazardous/affected areas where redevelopment is forbidden; and 2) provide new residential land in safer areas. Although not all affected households participate in both parts, the idea of the project is to move community members collectively. In the United States, where all land buyouts are voluntary and eminent domain is not used to force owners to sell, residential properties are acquired individually. Unlike in Japan, U.S. homeowners participate independently in buyout programs. Without measures to support finding new houses, receiving funds for their property is the end of the buyout program for residents, who then move away on their own.

This paper will discuss the historical context of the use of post-disaster residential buyouts in Japan and the U.S., and trace the application and evolution of these projects in recent disasters. In Japan, CRDM projects were used in the recovery after the 2004 Chuetsu Earthquake, which struck a rural mountainous area in Niigata Prefecture. However, after the Great East Japan Earthquake in 2011, CRDM became one of the main recovery support programs used by municipalities along the Tohoku coast. In the United States, while residential buyouts have been used for several decades as part of the Hazard Mitigation Grant Program, these projects are primarily implemented in areas affected by river floods, not coastal areas. After Hurricane Katrina in 2005, residential buyouts were used as part of the Road Home program supporting housing recovery in the city of New Orleans. Open to any affected homeowner, Road Home led to scattered buyouts throughout the city. After 2012 Superstorm Sandy, various types of residential buyout projects were used by New York State and New York City. These included "enhanced buyouts" which tried to target collective buyouts in certain areas, as well as an "acquisition for redevelopment" option available to homeowners with heavily damaged homes in the flood risk area. Considering the ongoing situation of recovery areas in Tohoku and New York, this paper will explore the various implications of residential buyouts for affected households' recovery and community recovery.

Outcomes of community-based relocating recovery as regards to recovery planning theory from post-disaster recovery to pre-disaster planning - Lessons from Miyagi seashore village

Taro Ichiko (Tokyo Metropolitan University)

1. Introduction

Japan is one of distinguished hazardous countries. That is, therefore planning technology and city planners have played an important role in long-term recovery. In other words, experiences of past disaster recovery in Japan, especially on the Great Hanshin-Awaji Earthquake (1995) and the Chuetsu Earthquake (2004), have provided important knowledge for the recovery planning of tsunami-affected areas in the Great East Japan Earthquake (2011).

At the same time, planning research aftermath of the East Japan Earthquake is also to be developed based on those past case studies.

This paper presents 3 research issues that have been discussed in Japan's recovery planning experience. And then, through a case study by an action research style in Kesenuma, those issues will be considered. It would be found the needs and roles for the planning occupation and notable knowledge.

2. Three issues for long-term recovery of communities

- (1) leadership by local community leaders and empowerment for people who undertake the recovery
- (2) mitigation for future risk and restoring living landscape which were loved and suit for those local life
- (3) planning approach by a local-community and predetermined harmony approach by each victims' activities

3. An action research in Kesenuma

The case study is about a semi-agricultural and fishing village in Kesenuma City, Miyagi Prefecture. The big tsunami destroyed all of houses that 100% of houses were certified the totally collapsed. After about one year from the tsunami, a prefecture office designated the village as a disaster hazard area which is prohibited housing reconstruction. As a result of this, surviving people were forced to relocate for housing recovery. Through evacuee support by voluntary organizations, external planning experts and an architect could be made reliance upon surviving people. An organization established with survivors and those experts and dedicated in a relocating recovery project.

From this case study, we would like to consider the following points;

- 1) Creating an organization that combines leadership and individuality
- 2) Proposing balanced hazard mitigation program respecting to the intention to return to the original tsunami hazard area.
- 3) Empowerment and space design methodology for relocating neighborhood space

4. Conclusion and discussion

I was involved in this case both as a city planner and as a disaster researcher. And then, the role of the planning would be discussed in accordance with both practical planning efforts and the planning theory for long-term recovery of communities.

Sense of dwelling in disaster relocation: social housings and community organizations after the earthquake in 2011 Japan

Izumi Kuroishi (Aoyama Gakuin University)

This study examines two cases of people's displacement in Kesenuma and Rikuzen Takada cities in Japan during the last 6 years from the earthquake in 2011 in order to inquire the factors of the sense of dwelling in disaster relocation. By examining how the relocations of houses impact on people's identity, what kind of social issues arose in the process, and how designing houses integrated with their community planning is essential to create a sense of belongings, it aims to explain how the idea of disaster relocation and social housing system should be reframed to adjust to the contemporary social issues.

In the earthquake and tsunami in 2011, huge number of houses were destroyed; more than ten thousand houses in Kesenuma and four thousand in Rikuzen Takada were destroyed. The Ministry of National Land and Infrastructure and the local municipalities decided a model recovery process of housing as follow: relocate refugees to urgent shelters, then to temporary prefabricated houses, and finally prepare two types of housing support; one is developing hinterland area for their reconstruction of houses, and another is constructing mass concrete or small detached public housing. In order to join to a development of the hinterland, refugees had to form a group, and often were consulted by professional planners and NPOs. Even though the government proposed policies incorporating with resident-oriented methodologies, and constructed many public high rise housings, relocation of refugees from temporary shelter to public housing are still facing problems, and suggesting further difficulties in municipal financial management after the governmental support ends. Japanese social housing and area planning systems in disaster area clearly show their need to be conceptually reconstructed.

The cases in Kesenuma show that the lack of consideration about refugees' sense of communities in their relocation, and the differences of lifestyles between new houses and local traditional ones caused serious problems for refugees. The case in Sumita town of Rikuzen Takada shows opposite; the strong community bond between people from shelters to temporary houses, and the authentic designs of temporary houses helped their settling significantly. On the other hand, in both cities, many of the reconstruction of new towns in hinterland by group of people face with difficulties in financial and community issues.

By comparing these cases, I will explain how people keep striving to maintain their normal lifestyle and local identity, and how it is essential to create mechanisms to sustain and help their reconstruction of community and public space in each stage of their relocations. Particularly, the concept of institutional strict control of social housing needs to be reexamined to allow residents to feel the house of their own. In the era of displacement due to disasters, we need to reconsider the idea of house as the locus for people's identity and to reframe the idea of social housing and urban planning comprehensively and in process-oriented manner.

Characteristics of Institutions of Spatial Planning for Recovery after 3.11

Kubota Aya (The University of Tokyo)

Focusing on spatial planning, the paper deals with institutions for recovery utilized in the disaster area of the Great East Japan Earthquake on March eleventh of 2011. The purpose is to make issues clear for the next disaster. Institutions are described into three groups: 1) established ones between after the World War II and before 2011, 2) enacted as permanent systems after 2011, 3) temporary legislations after 2011. The feature of the first group is bureaucratic initiative with emphasis on public projects, especially civil engineering works by preventing individual voluntary activities. Because being criticized at each recovery occasion, these institutions had been revised many times before 2011 towards enhancement of citizen, including victims, participation and decentralization of authority. Such trends were perceived among enactments after 2011. However, they do not work well actually. Why? As the scale of the Earthquake and Tsunami only come once every thousand years, the damage of 3.11 is unparalleled in the planning history of Japan. The era and the place have been already in the shrinking. The property of the disaster area is very unique and far from ones supposed by the institutor of spatial planning. In the pre-modern age, the territory of each village was naturally decided by concrete jobs to maintain their field and lives. In Japan, those settlements were merged into bigger autonomies on several times. As a result, the planning law is not designed for each settlement. We should recognize the meaning of frequency, degeneracy, territorial range and realities when we consider the future of the disaster area. In addition, the pollution of radioactive is too severe for the national government, local municipalities, local residents and professionals to behave in a desirable way. There should be different recovery methods but we fail to create an effective system at this point. What we can do at disaster sites are to build banking structures, roads, streets, public houses, building lots and sea walls physically. But we are not sure whether those new artificial lands will become a living environment or not. Spatial planners have responsibility to design a physical place which will function as habitat in the near future. How can we establish a new set of institutions for recovery? Following the emergency term immediately after the disaster, local residents, and municipalities should share the understanding of the situations with the support by the national government and professionals. Then they discuss what are resources and risks of their area based on its characteristics and what is the future image of their own territory. After those discussions, some local residents may try their own ideas which make the physical new environment to their own home town. Through investigations, the questions for future recovery planning are as follows: how we can generate value through spaces, how we should set a unit of recovery and connect each other in a wider region, and how we can change the mode from the emergency to the ordinary.

Intentions and transition of inhabitants in Fukushima

Sayu Yamaguchi (Japan Women's University) and Satoko Shinohara (Japan Women's University)

The Eastern Japan Great Earthquake of March 11, 2011 had magnitude (Mw) of 9.0. It was a scale of an earthquake that modern Japan had never experienced before. However, this great earthquake did not just cause damage by collapsing buildings like the Great Hanshin Earthquake. The great tsunami that occurred in the Tohoku coastal area and other areas as well as the accident at the Fukushima Daiichi Nuclear Power Plant also caused unpredicted secondary and tertiary damage, making it an unprecedented situation. As a result of this disaster, prolonged evacuation orders were issued to wide areas, and even six years after the earthquake, there are people who still live in temporary houses because they cannot go back where they used to live.

This paper focuses on Katsuo-mura, Futaba-gun, Fukushima Prefecture and aims to grasp how the dwellings and family structures changed since the Eastern Japan Great Earthquake as well as the reason for these changes. It also aims to clarify what kind of dwelling the people of that place want to live in in the future in order to present valuable information for disaster control measures. For this study, a questionnaire was administered to all the people who used to be residents of Katsuo-mura, Futaba-gun, Fukushima Prefecture located in the distance of about 30 kilometers from the Fukushima Daiichi Nuclear Power Plant before the earthquake. At the time of this investigation, they lived in Miharu-machi, Tamura-gun, Fukushima Prefecture, about 20 kilometers to the inland area from Katsuo-mura, and an order to return to their village, Katsuo-mura, had not been issued yet.

As a result, a family structure such as young generations in their 40's or below living separately for external social reasons like work, entering a school of a higher grade, etc. was found. Originally there were many multi-generation families such as three-generation households and four-generation households in Katsuo-mura. However, after the earthquake, these families changed to small families, and as a result, the number of elderly couple and single households has increased. Asked about their wishes for the future, they expressed their wishes to return to their original large families, but they replied that their households would stay small, unchanged, with their families scattered in the future too. A small number of households increased their members. Those cases were cases in which a spouse started to live together after marriage or a new baby was born.

Intentions as to the future location of their dwellings differ by the age of the members of the household or the areas under the evacuation orders. Many young people want to move to a convenient area without relying on the existing community, but many elderly people want to go back to their original village. Therefore, it was clarified that social contact is a factor to promote migration. It was clarified that many residents want to have a privately-owned house but that there is a small number of people who want to move to a convenient area and choose other types of dwelling.

The Role of Residential Buyouts in Post-Disaster Housing Recovery Support: A Comparison of Recent Cases from Japan and the United States

After recent disasters in Japan and the United States, government acquisition of residential land has played a larger and increasing role within and in relation to housing recovery support programs. With different historical, legal, and governance contexts, residential buyouts are shaped by the respective policies of each country. Framed by earlier precedents, this paper explains the development and implementation of residential buyout programs used after recent disasters: the 2011 Great East Japan Earthquake and tsunami in Japan and 2012 Superstorm Sandy in New York City and New York State in the United States. Through a comparison of roles of buyout in relationship to other aspects of post-disaster housing reconstruction and recovery support, some similarities are identified in the challenges of implementation, as well as uniquely different issues faced by the affected communities and households in each case.

Keywords: buyouts, land acquisition, housing recover, Great East Japan Earthquake, Superstorm Sandy.

Introduction

Residential buyouts have played significant roles in post-disaster housing recovery programs after recent disasters in Japan and the United States. Both countries had pre-existing programs for acquiring private residential land for disaster mitigation, and precedents for their use in post-disaster recovery. After the 2011 Great East Japan Earthquake (GEJE) in Japan, residential buyouts are being implemented on an unprecedented scale in collective relocation projects in municipalities throughout the tsunami-affected coastal region. After 2012 Superstorm Sandy in the US, various types of residential buyouts were included in housing recovery programs of affected jurisdictions, with unprecedented use in coastal areas.

Within respective disaster recovery policy contexts, this paper compares recent residential buyouts after the 2011 Great East Japan Earthquake and 2012 Superstorm Sandy in New York City and New York State. Situating these case within land and housing reconstruction policies, it explains the development and implementation of buyout programs and considers their varied impacts. After introducing relevant legal framework, precedents, and post-disaster housing recovery programs, the buyout programs are compared based on the following three aspects: 1) goals for mitigation and/or housing recovery; 2) what is included in the buyouts, including the relationship to land as well as housing; and 3) impacts on recovery projects and affected communities.

Although both cases include goals of disaster mitigation and recovery support, legal frameworks, precedents, and relationship to housing reconstruction programs vary significantly. In the U.S., where housing recovery programs focus on support for private property reconstruction, residential buyouts are foremost a property transaction; government purchase of land is one option to support homeowners' recovery. In Japan, where housing recovery policies avoid providing compensation for private property focusing instead on investment for public benefit, buyouts are a conceived as part of a community level project. U.S. buyouts are a stand-alone program; in Japan they are one part of a set of programs dealing with former land and provision of land in new residential areas. In both countries, residential buyout programs with the stated purpose of pre-disaster mitigation are in fact used post-disaster to support recovery projects.

Background of residential buyout programs in Japan

On March 11, 2011, the Great East Japan Earthquake caused massive devastation along Japan's Tohoku coast. Following national government guidelines, local municipalities implement recovery plans with housing reconstruction projects including relocation, support for reconstruction of new private housing areas and public housing. Since the 1995 Hanshin Awaji Earthquake in Kobe, where there was almost no support for private reconstruction, more subsidies have been made available for private reconstruction. However, Japan's approach

to recovery focuses on investment in public infrastructure and community facilities, guided by an underlying principle of even distribution of public support. Whereas direct government investment in the construction of private housing is minimal, government programs provide residential lots. Buyouts in Japan have a dual focus on former/hazardous land and new/safer residential land. The legal basis to justify land acquisition and support for relocation is designation of land as hazardous. Then the government can purchase it and provide new land for relocation. Using Article 39 of Japan's 1950 Building Standards Law,¹ local governments can designate an area as hazardous, which prohibits any future residential use. While intended to promote mitigation by pre-disaster relocation, this law has primarily been utilized reactively – post-disaster – to relocate residents from damaged areas.²

Along with the designation of hazardous land, there are two primary residential relocation programs: one supports groups of residents to relocate collectively, the other the relocation of individual households. The Collective Relocation for Disaster Prevention program was established in 1972, and has been primarily used to relocate residents from isolated areas to safer, more convenient locations.³ For individual households the Relocation of Housing from Hazardous Cliffs program is designed to move individual households at risk of landslide away from steep hillside areas.⁴ Because slope failure risk is localized in small areas, this program supports the relocation of individual households' instead of groups. More flexible without requiring community consensus, it has been used more often than collective relocation programs.⁵

Recent evolution of the use of residential buyouts in Japan

After the 2004 Chuetsu Earthquake, which struck a rural mountainous area in Niigata Prefecture, already facing aging and population decline, Collective Relocation projects were used with provision of public housing to move residents from former mountainous areas to new residential areas in more convenient locations. There is also a precedent for the use of Collective Relocation after a tsunami in 1983, when residents in Okushiri Island in Hokkaido were relocated to higher land away from the sea.

After the Great East Japan Earthquake (GEJE) and tsunami, the national government prepared a menu of 40 types of recovery projects that would be fully funded, including the construction of public housing, land readjustment, and collective relocation. Local municipalities chose which of these projects to include in their town's recovery plan. Collective Relocation was one of the main programs selected by a large number of municipalities, with a total of 321 Collective Relocation projects used by municipalities in Iwate, Miyagi and Fukushima Prefectures.⁶ With up to a third of tsunami-affected land area designated as hazardous,^{7,8} the use of collective relocation and buyouts on this scale has created several challenges for the future of affected communities.

With a strong singular focus on creating new housing sites in high-land areas, there is a lack of flexibility or holistic consideration to support other residents who choose not to join the programs, or to address the physical environment that results. Some choose to stay and repair their houses on site (although hazard zones forbid new construction, repairing and living in existing structures is allowed), resulting in a patchwork of houses and empty lots; others find new land and rebuild on their own outside of government project areas, which can also negatively impact the built environment with low density sprawl.⁹

Although there have been collective relocation projects for disaster prevention purposes in Japan since the early 1970s, past projects focused on relocating people away from remote/hazardous areas, with no need to plan for reuse of acquired lands. After the GEJE, municipalities are left to manage vast amounts of land, with a significant financial burden, and, with depopulation and an aging society, to deal with a lack of demand for a use that would financially justify redevelopment.¹⁰

Whereas former communities included a dense mix of commercial and residential uses, Collective Relocation projects are limited to creating residential land. In a society with an already rapidly aging population, the massive investment in infrastructure to create relocation areas away from city centers and services raises serious questions for long-term sustainability.

The United States land use and housing reconstruction policy context for buyouts

Compared to residential buyouts and relocation projects after the GEJE in Japan, buyouts in the United States have a smaller role, with a different history and relationship to national policies, programs, and federal funding for hazard mitigation and recovery. Residential buyouts after Hurricane Katrina in 2005 and Superstorm Sandy in 2012 had different goals for mitigation and housing recovery and different relationships to federal mitigation programs.

Flood insurance and disaster mitigation

The National Flood Insurance Program (NFIP) plays a key role for determining land use control and flood mitigation in the U.S. Although 90% of U.S. disasters involve flooding, private insurance companies usually exclude floods because of their catastrophic and unpredictable damage,¹¹ resulting in increased costs of government-provided disaster assistance--compensation of loss of private property--in proportion to the number of uninsured homeowners. After several increasingly damaging hurricane and flood disasters, the 1968 National Flood Insurance Act created the NFIP, aiming to reduce flood losses: shifting government spending from disaster assistance to mitigation.¹² On the condition that local governments passed floodplain ordinances, the NFIP provided low-cost government-backed flood insurance to local homeowners; a 1973 NFIP revision required purchase of flood insurance for any federally backed loan. The Act also led to a vast flood-mapping effort; local governments were promised technical information to help them “steer development away from” floodplains.¹³ FEMA creates these flood maps, but the maps do not directly allow or forbid construction. Based on the mapped flood zone, local governments can require certain construction types and elevations; flood insurance premiums are also reduced based on the elevation height.

With subsidized low premiums and multiple large payouts, the NFIP was fiscally unsustainable and deeply in debt after Hurricane Katrina. In response, there was an attempt to modify the program through the Biggert-Waters bill, which would increase premiums over time. Coinciding with post-Sandy housing recovery, the timing of planned implementation of these reforms (especially rising premiums) and significant impacts for affected residents led to strong push-back. Although subsequent legislation slowed the planned increases, rising flood insurance premiums add a significant challenge for residents rebuilding after Sandy.

Hazard mitigation in the US

Administered by the Federal Emergency Management Association (FEMA), the Hazard Mitigation Grant Program (HMGP) is the primary source for federal grants for disaster mitigation, including purchasing land to reduce disaster risk. The HMGP was established by the 1988 Stafford Act,¹⁴ the main law governing disaster response and recovery in the United States, which authorized post-disaster mitigation efforts including acquisition of damaged properties to discourage rebuilding in hazardous areas.¹⁵ After the Great Midwest Flood of 1993, the most damaging flood disaster in U.S. history,¹⁶ the Stafford Act was amended to increase support for relocation projects targeting flood-prone properties, requiring the removal of structures and designation of acquired land in “perpetuity for a use compatible with open space, recreational, or wetlands management.”¹⁷ The HMGP was used for the first time for large-scale buyouts after the Great Midwest Flood, reducing the number of structures in the floodplain by 14,000-20,000.¹⁸ As all US buyouts, participation in HMGP buyouts is voluntary; HMGP requires 100% of homeowners in a designated buyout area agree to participate and forbids redevelopment of acquired land. HMGP can fund 75% of the cost for land acquisition; the other 25% can come from local government funds or recovery funding such as Community Development Block-Grants for Disaster Recovery (CDBG-DR).

Housing recovery programs in the U.S. after Hurricane Katrina and Superstorm Sandy

In recent years Community Development Block Grants for Disaster Recovery (CDBG-DR) from the Department of Housing and Urban Development (HUD) have been the main support for post-disaster housing reconstruction in the United States. These funds are allocated to affected (usually State level) jurisdictions based on detailed recovery projects specified in their Action Plans. As block grants, CDBG-DR funds allow flexibility for jurisdictions to design their own housing reconstruction programs. In late August 2005, Hurricane Katrina caused massive damage in the U.S. Gulf Coast region, including storm surge devastation in Mississippi and long-term and devastating flooding in the City of New Orleans in Louisiana; 80% of New Orleans flooded after levees failed.¹⁹ The largest residential damage in US history, more than 1 million houses were damaged in the region, and 134,000 in New Orleans alone.²⁰

Usually CDBG-DR “funds are used explicitly for repairs or reconstruction” in a rehabilitation model,²¹ but both Louisiana and Mississippi were granted waivers to use a compensation model that “disburses funds directly to homeowners for damages suffered regardless of whether they intend to rebuild”²² for their CDBG-DR-funded programs. While homeowners in both states could receive up to \$150,000 (depending on housing value, damage, and other support received), Mississippi’s program was a simpler compensation program. Louisiana’s program combined compensation and rehabilitation support, and attempts (later revised) to combine CDBG-DR and HMGP funding.²³

Called the Road Home, Louisiana’s CDBG-DR-funded housing recovery program included 3 options for homeowners: 1) rebuild on site; 2) sell and stay in Louisiana; or 3) sell and move outside the state. To encourage homeowners to stay in Louisiana, only 60% of market value was provided for option 3. Road Home had a large buyout component; however, these buyouts were not guided by hazard mitigation principals. Any damaged residential property within the city was eligible and future use was not restricted. Properties were acquired from

scattered sites throughout the city, resulting in a checkerboard pattern of empty lots and a challenge for the City to manage their redevelopment.

In October 2012, Superstorm Sandy caused severe housing damage along the east coast of the United States. Although the words “buyout” and “acquisition” are almost equivalent, in post-Sandy recovery they refer to 2 types of projects. In “buyouts” land is purchased for higher pre-storm values; redevelopment is forbidden. In “acquisitions” land is purchased for lower post-storm values²⁴ and redevelopment allowed.²⁵ Funded by CBDG-DR grants, New York City’s ‘Build it Back’ housing recovery program and New York State’s “New York Rising” housing recovery program both included options for housing repairs, rebuilding, elevation, and property acquisition. These property acquisition programs give an option for homeowners who do not want to rebuild; the use of the acquired property is not limited. In fact, Build it Back called this pathway “Acquisition for Redevelopment” and envisioned the redevelopment of acquired properties by New York City; properties acquired through New York State’s acquisition programs are sold at public auction.

With an early commitment to returning some areas to nature, New York State created and managed a separate HMGP-funded buyout program preserving properties as open space. A 10% bonus was available in areas targeted for “enhanced buyouts,” with an additional 5% bonus for homeowners who relocated within the county.²⁶ As a result of pro-active organizing by local residents, three communities in Staten Island were successfully selected as enhanced buyout areas. In Fox Beach, the first buyout community, the majority of properties were purchased and houses demolished and after several years the land is visibly returning to a natural state similar to the surrounding marshes.

Comparison of recent buyouts

Key differences and similarities between residential buyouts in Japan after the GEJE and U.S. after Superstorm Sandy can be clarified by considering three aspects: 1) goals for mitigation and/or housing recovery; 2) what is included in the buyouts with what relationship to land; and 3) impacts on recovery projects and affected communities.

1. What are the goals for buyouts in terms of both mitigation and household recovery support?

Both Japan and US buyout programs promote disaster mitigation through managed retreat, although acquisition projects in New York and the earlier Road Home were not for hazard mitigation, but homeowners’ recovery support. In Tohoku, the mitigation goal of buyouts is to move housing away from coastal areas, reducing future tsunami damage. The option to sell their land also financially supports residents’ recovery, including for rebuilding housing. New York State buyouts, as in Staten Island, aim to preserve a natural/ buffer zone. Other acquisition programs allow redevelopment instead of preserving open space; these are available to homeowners in the overall flood zone but are not clustered, resulting in scattered sites whose redevelopment will depend on the strength of the local property market. In all cases in Japan and the U.S., buyouts can also be seen as a type of government support compensating homeowners for damaged property. For acquisition projects in New York and properties purchased through Road Home, the goal was not hazard mitigation, but support for homeowners’ recovery.

2) What is included in buyout programs, and with what relationship to land?

Residential buyouts relate to the intersection of policies dealing with housing damage and reconstruction, as well as compensation and provision of land. Residential buyouts in Tohoku are one part of a set of multiple recovery projects within a large-scale implementation of relocation including: (government) designating former land as hazardous; (residents) having the option to sell this land to the government; (government) preparing new residential land areas in higher areas; and (residents) having the option to rebuild on these new lots. In contrast, buyouts in the United States are complete after one transaction--the purchase of privately owned land by the government. Although in the Road Home or enhanced buyouts in New York State, incentives are provided to homeowners to relocate in the state, there is no system to support residents’ finding their next house.

In Japan, buyouts are part of relocation programs which must both secure and prepare new residential lots for residents to rebuild on, and then manage the large amount of publicly-owned land acquired. In the U.S., where government does not strongly control land use, buyouts can result in scattered empty lots; the difficulty of managing (reselling or redeveloping) these lots varies based on local property markets.

3) What is impact of buyouts on the recovery process and post-disaster housing reconstruction?

In Japan, where land targeted for buyouts is designated hazardous and residential construction forbidden, there is stronger control and ability of the government to implement buyout programs. While goals of moving housing away from the coast can be achieved, it is questionable if massive infrastructure investments to carry out these projects are supporting a sustainable long-term future. In the US, although efforts are made to acquire land

strategically to create buffer zones, as buyout programs are voluntary lower density checkerboard land use patterns may result.

Regardless of location, buyouts have a clear benefit for individual households who want to move and can sell their former property above market rate. However, some homeowners are not eligible for the buyout programs because of their property's location or mortgage situation. For places like New York City, residents are unable to afford to buy another comparable house on today's market with the money from a buyout.

Unlike in Japan, where massive land areas have been designated hazardous and targeted for buyouts, buyout programs in the U.S. are restricted to limited areas, depending on political will as several levels of government (state, county, city); after Superstorm Sandy, there are communities who wanted but were not able to get a buyout, as well as counties where this option was not offered.

There are also residents in Tohoku communities who wanted to rebuild in place, but were forbidden to do so after collective relocation was selected. The time needed to implement rebuilding programs led many people to drop out of government programs, rebuild on their own and/or move away. Affected communities face the challenge of forming new communities, whereas in the U.S. residents are scattered.

Conclusion

The character of buyout projects in Japan and the U.S. is quite different. With strong government control in Japan, buyouts are implemented across large areas and connected to large scale creation of new settlements in highland areas. However, the strong focus on relocation projects targeting new areas has led to a lack of integration with other non-project areas. In areas struggling to maintain their population, the time required to complete large-scale projects completely alters the physical landscape and contributes to people's choices not to return. In the U.S., there is less government control to implement large-scale buyouts. Individual household decisions shape the results in buyout target areas, leading to scattered, empty lots. Although recent implementation of residential buyouts represents the divergent nature of housing recovery support in Japan and the U.S., both cases demonstrate limits of buyouts as a contribution to housing reconstruction programs. Looking at these two cases, significant questions arise about the use of buyouts as part of housing recovery; in both the U.S. and the Japanese context, buyout programs require significant improvement if they are to function as a successful support for housing reconstruction of affected people on a large scale.

Sense of dwelling in disaster relocation: temporary and public recovery housings after the 2011 earthquake in Japan

Izumi Kuroishi, Ph.D.*

**Professor of the School of Cultural and Creative Studies, Aoyama Gakuin University*

This study examines people's displacement in Kesenuma and Rikuzentakata cities in Japan during the last 6 years from the earthquake in 2011 in order to inquire the factors of the sense of dwelling in disaster relocation. By examining how the relocations of houses impact on people's identity, what kind of social issues arose in the process, and how designing houses integrated with their community planning is essential to create a sense of belongings, it aims to explain how the idea of disaster relocation and social housing system should be reframed to adjust to the contemporary social issues. By comparing cases, I will explain how people keep striving to maintain their normal lifestyle, and how it is essential to create smooth integration between private and public space, and to help their own subjective engagement in the reconstruction of community in each stage of their relocations. In the era of displacement due to disasters, we need to reconsider the idea of house as the locus for people's identity and to reframe the idea of social housing and urban planning comprehensively and in process-oriented manner.

Key words: East Japan Great Earthquake, relocation, temporary housing, public recovery housing, lifestyle, sense of dwelling

Introduction

Seven years after the East Japan Great Earthquake, more than 13,500 people in the damaged areas are still living in temporary housing(kasetsu). After the disaster, the Japanese government proposed the initial funding to build thirty thousand temporary housing in two months, decided a basic strategy for refugees' relocation from a shelter(hinanjo) to a temporary housing, to a public recovery housing(fukkou kouei juutaku) or to a collective town development (shudan iten takuchi), which method were to be designed by each local municipalities. Meanwhile, not only for the scale of the damage but also for the long relocation process, many refugees could not recover their sense of dwelling, which a German philosopher Martin Heidegger suggested as the foundation of man's sense of being. From a larger and social perspective, disaster refugees have been continuously relocated throughout global history. Overall, relocation requires a large restructuring of the urban space, and generates social separation between peoples by disrupting their communal bond.

Even though the knowledges and methods gained through the Hanshin Great Earthquake contributed significantly to the 2011 disaster recovery planning in designing the process of the relocation of refugees with social systems to support their community formation, as the local cultural condition was so different in the northern part of Japan that the habitual issues of housing; socio-cultural and psychological issues and the interrelationship between the special condition and social systems, were hardly examined academically. The relocation and reconstruction of houses after 2011 was a critical turning point, indicating that dwelling and urban planning should be examined with a more social viewpoint.

Therefore, this study aims to examine the internal psychological problems faced by people relocated after the disaster and the impact of these changes on surrounding areas. To this end, we interviewed refugees and their local supporting groups. By referring to the people's voices, this study assesses the issues in architectural and urban planning and management that must be examined for reconstructing the refugees' everyday private sphere, their relationships with surrounding neighboring society, and other social systems that sustain their sense of dwelling.¹

Post-disaster reconstruction

The high disaster magnitude of the Eastern Japan Great Earthquake necessitated a rapid, large scale migration from the evacuation site of the residents to the temporary housing. In Kesenuma City, at least 26,124 houses and 9,500 households were affected by the disaster. Temporary housing provided 3,504 units for 8,288 people, and 4,737 people were allocated to provisional temporary construction for renting private rental housing. In 2015, the number of temporarily housed residents decreased to 7,137, and the collective town planning developed 895 blocks (98%) at 45 sites at the end of 2015. Disaster public housing supplies provided 1,986 houses (92.8%) in 27 districts, completed at the end of 2015. In Rikuzentakado City, Iwate prefecture, the disaster affected 3,368 houses (99.5% of all households), and 2,148 houses were supplied to 51 temporary housing sites. Five hundred and sixty seven units were voluntarily rebuilt from the summer of 2011. Building disaster public construction of 989 houses, and collective town development of 562 houses were completed by March of 2014. Although the temporary housing aggregate started from 2016, 3913 residents are still accommodated in them.²

The governmental and local institutional support systems for this large-scale migration needed continuous readjustment to the changing recovery process. Even though they have recognized the necessity to maintain the existing community in relocating refugees from evacuation shelter to temporary housing, in the places with huge damage, it was necessarily to prioritize the protection of the weak people apart from their original location. In the relocation from temporary housing to public recovery housing, there were difficulties to explain the people about the future lifestyle. Most obvious problem was the difference of the way of housing in these regions from that of urban areas, in which the Japanese housing bureau has established its public housing system. Before the disaster, 87% of residents lived in detached houses, and only a minority resided in mass housing. After the disaster, 62% of the displaced residents wanted to rebuild detached houses, but 34% were prevented from realizing their wishes by economic difficulties. The residents claimed a lack of support for them. Also, in the area lacking the flat undamaged land, most of the public recovery housing have to be built in mass collective style, and on the other hand, the maintenance of the social support for the housings located in remote areas became problematic.

Review of existing studies and research methods

Many architectural planning and technology studies have analyzed the number of needed construction, function and structural durability of temporary housing, and urban planning studies have examined the community space problems in temporary housing villages. However, owing to refugees' traumatic experience of a disaster, it has been extremely difficult to examine their memories of their lost houses and lifestyles, and their psychological experiences during the relocation process. Thus, most of the disaster relocation studies have conducted historical examination of past tsunamis and larger-scale urban policies and planning. Instead, scholars of regional sociology and welfare studies conducted interviews and on-site research actively. The architectural study of temporary housing livability has been difficult for the same reason. Until the report by Reiou Kimura, the author of the present study found no urban planning and regional studies investigating how the relocation of housing influences the existing community and urban structure. Kimura conducted interviews of refugees in the prefectures of Iwate, Miyagi and Fukushima to find most of them relocated more than three times, and felt negative impact on their psychological, health and economic condition, relationship with neighbors, and family's unification.³

Even in the above research, spatial issues, such as the residents' habit and behavioral experiences of their interiors and landscapes, are rarely addressed. However, historical studies by Kon Wajiro and Nishiyama Uzo investigated the lifestyles and behaviors in transforming housing conditions between the 1910s and 1950s, including the period of Kanto Great Earthquake and World War II, using detailed surveys and qualitative plan analysis. The former was based on ethnography and interviews, and the latter adapted statistical typological analysis aiming for a more scientific result. At the risk of compromising scientific relevance, this study takes the former approach. Specifically, it analyzes the sense of dwelling from a small number of interviews. The sense of dwelling comprises the

psychological aspects of the making, memory, and belonging, which is formulated between the sense of privacy and community.

Given the progressive nature of the relocation problem in the afflicted areas, an objective theoretical analysis on the personal and social group situation remains impossible. Therefore, this thesis is limited to the analysis and consideration of research materials. The research mainly reconsiders the implications of disaster relocation and regional transformation through interviews and surveys conducted at four temporary house villages: three in Kesennuma City and one in Sumita Town. The Kesennuma City villages include the Komaba Koen area, with 62 temporary houses built in the city, Senmaya area, with 228 temporary houses built outside the city, and the Niitsuki area with 22 temporary houses built inside the city. The three Sumita Town sites contain different numbers of wooden detached houses (13, 17 and 63). We also conducted surveys and interviews at two public recovery housing sites, one in Kesennuma, the other in Rikuzentakata. (Fig. 1)

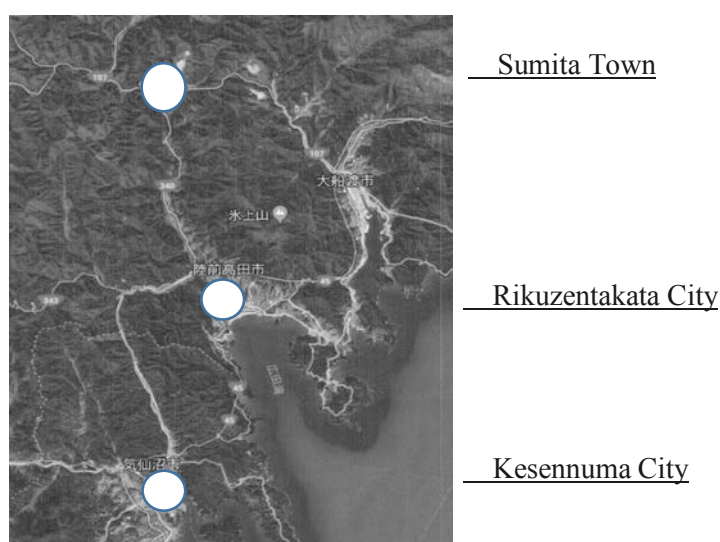

Fig.1. Locations of the interviewed area based on Google map

When interviewing the residents of temporary housing and recovery public housings, we also interviewed the social workers and the collaborators with whom we have previously conducted workshops in disaster areas. To examine their private histories and psychological issues, we informed the targeted residents of our project’s objectives, namely, to reexamine the relocation system and the designs of temporary and public housings. For each one- hour hearing, we prepared questions that probed the characteristics of the lost houses, family structures, previous and current jobs, the neighborhood relationships of each resident, the relocation process from emergency shelter to current house, the period spent in each stage, the planning of the lost house, temporary housing and recovery public housing, and the good and problematic points of each house. We also queried the residents’ reasons for choosing their current house, the most important element of their current house, their communication processes with neighbors in their current house, and how they conceptualize their future houses. The eligible subjects were 10 people in Sumita villages and 15 people in Kesennuma city. Among these, we interviewed 9 people living in two public recovery public housings, and 18 people living in temporary housing. (Table 1)

Temporary housing		Recovery public housing

Interview Examination: Five issues regarding relocation and changes of lifestyle

In order to analyze the changes of living condition through relocation after the tsunami, it is necessarily to examine the three cases separately: from evacuation shelter to temporary housing, temporary housing to public recovery housing, and to self reconstructed housing. For this study aims to examine the basic psychological aspects of housing design, it focuses to the former two cases. There are also two types of public recovery housing: mass and detached, but at the stage of this research, detached housing were not completed in both cities. Thus, this study only examines the mass public recovery housing.

Through the interviews, we identified five processes and problems in the post-disaster relocation patterns of the residents. First, many of the residents experienced problems with their relatives. They initially moved from the evacuation shelter to their relatives' homes, but this situation proved burdensome for both sides in the long term.

The second problem was progressive household separation of the family, imposed by the limited size of the temporary housing and public recovery housing and the location of schools and workplaces. In the damaged area, the household and family system have traditionally consisted of multiple generations. The changes affected these traditional lifestyles.

Third, the limited housing functionality of temporary housing and public recovery housing affected the settlement of residents who operated fishing and in-house commercial businesses before the disaster. Such residents lost their economic independence and communication potentials.

Fourth, owing to the continuity of the communities in evacuation shelter and temporary housing complexes, residents tended to settle easily with many acquaintances and relatives, and often created new communities. In addition, as Sumita town employed an organization that encourages connection among the residents of temporary housing and their existing neighborhood through daily activities. Therefore, the good relationships among the temporary housing residents are easily extendible to the surrounding neighborhood.

Fifth, residents occupying temporary housing in peripheral location are affected by transportation problems. For example, in the former Senmaya temporary housing complex was located away from the town center. Consequently, people without a car reported difficulties in getting to work, hospitals and shops, and needed public support. On the contrary, residents occupying Komaba Koen temporary housing located near the center of the city, were able to build positive relationships with the neighborhood from the beginning.

These five relocation issues can result from three themes; the livability of the spatial character and function of the house, community formations, and relationship with the neighborhood environment. Thus, in the following section, it examines how these three themes relate to the sense of dwelling in temporary housing and public recovery housing, with their residents' voices.

Relocation to temporary housing: its livability and architectural design ⁴

The architectural character and site planning of the temporary housing affected the residents' psychology and lifestyles.⁵ Prefectures constructed temporary housing in accordance with the Disaster Relief Act issued in 1947, sourcing their expenses from the national treasury. Conventionally, members of the standard building group of the Prefabricated Building Association sign an agreement with the prefectures. Because of the enormous number of needed houses after the 2011 disaster, the Ministry of Land, Infrastructure and Transport requested temporary housing from other members of the Prefabricated Building Association, the affiliated association of the Japan Federation of Home Production Organizations, and the Japan Wooden Housing Industry Association. In the Iwate, Miyagi and Fukushima prefectures, scholars and architects experimentally selected local companies to utilize the local resources and create jobs for displaced residents. However, the Prefabricated Building Association's standard building group provided approximately five times more supplies than the other groups, exerting an overwhelming influence on the residents' conditions.⁶

Primarily, temporary housing is constructed on the vacant sites, such as public and state-owned land, and land on which agreement is concluded. Temporary housing mainly aims for the rapid construction of large quantities, so after consultation with each local government, the standard and basic quality specifications satisfying the size, basic budget, and mechanical performance are determined within a short time. The problems depend on the location, local environment and management systems of the temporary housing, and on residents' adaptation to the local lifestyle. All of our interviewees reported problems with storage, bathing, dew condensation around the windows, and mold. Related problems included lack of underfloor ventilation, moisture at the base portion, and gaps around the entrance. Moreover, during summer, heat dissipated from the roof remained in the room. These inadequacies, imposed by insufficient insulation performance, become a heavy burden for refugees who cannot maintain the expense of air conditioners. The condition of temporary housing is also negatively affected by noises. Temporary housing is usually designed in a long terrace-house style, which lacks bulkhead thickness. Consequently, neighboring house noise is transmitted by the steel structural materials.

Most of the refugees had previously live in detached wooden house, so were psychologically distressed by the impairment of their pre-disaster comfort and privacy. Space limitation preclude the maintainance of traditional lifestyle in temporary housing. In the prefabricated temporary housing, the living-room space serves multiple functions, operating as a dining room, a bedroom, and a Butsuma (alter room) with a size of 6 tatami mats. Visiting family cannot stay, and communication with neighbors is prevented by the insufficient entrance space.

These problems of housing performance are directly connected to the residents' habit of living. In the research titled *Housing Revitalization Research in the farming, mountain and fishing areas of Northern part of Japan*, researchers presented two prototypes of house plan: hall and corridor types.⁷ In our current research about the residents' lost houses, these historical types are still remaining in more than half cases, and others are their variations. (Fig.2) Their entrances and kitchens are big enough to have visitors and semi-public activities connecting the resident with local community. The minimum size of temporary housing cannot afford such lifestyle and social relationship.

Fig.2 Typologies of historical local houses, refugees' lost houses and recovery temporary housings based on the interviews with refugees and the

The role of self-construction in “owning” a temporary house

As temporary housing is constructed and operated as a short term rentals, it is unavailable for later renovations. Thus, the space is not easily fitted to individual needs. Particularly in prefabricated mass housing, as the damages caused by nailing are hardly fixed, residents cannot even put a calender on the wall. Our interviews and researches clarified that if residents could alter the space, they would gain a stronger sense of ownership.

In the temporary housing of Sumita, increasing numbers of residents self-constructed the above-mentioned ceiling back-storage, and one resident ingeniously constructed small storage and shelves (Fig. 3). This resident expressed much attachment to his temporary home and a reluctance to leave it. Alterations have extended from interior spaces to the exterior; for instance, entrances have been decorated with flower arrangements, and intermediate areas have been connected with neighboring houses. In the Sumita housing, all units possess a flexible dividing wall, and the layout is freely adaptable to multiple functions, while the entrance and kitchen are relatively large. As the housing plans in this area were traditionally flexible, with tatami mats and sliding shoji, the Sumita temporary

housing appears more suited to the residents' lifestyle than the fixed plane configuration, which allocates an area per number of people.

Fig.3

Spaces and methods for formalizing a sense of community

In the parallel arrangement of mass produced prefabricated temporary housing, the meeting place is often set near the site entrance, and each row of terraced houses faces the back side of another row of terraced houses. This arrangement leaves no space for residents' interactions and communications. To the contrary, in the temporary housing village of Sumita Town, most of the intermediate space between the detached houses is used for purposes such as laundry, tool storage, and planting shelves. Moreover, the large entrance space of each house has facilitated the connection between the inside and outside spaces, like the historical house types, helping residents to communicate with their neighbors. Within the community, such usage of the intermediate space and entrance area has created a warm atmosphere that is shared by everyone. The houses are angled to match the irregular shape of the site, and a small shared space occasionally appears between the buildings. Moreover, as vacant houses in Sumita Town can be utilized as communal meeting places, they provide spaces for daily casual communications. These cases show that the creation of a community space largely depends on the design of entrances, arrangement and management of housing blocks.

Temporary housings are often located on isolated sites, with limited access to social services and mobility through public transportation. In large-scale temporary housing villages such as the Senmaya high-school temporary housing, residents are supported by Kesenuma City, and self-govern their association activities and watching. However, community activities in the temporary housing village are inaccessible to many households, such as single households, and are not usually joined by residents in the surrounding area.

Relocation from temporary to public recovery housing

The impact of relocating from temporary housing to public recovery housings also consists of issues of architectural design, owning relationship and community formation. The housings investigated in the present study contain more than three floors of reinforced concrete. They were built in a single-

corridor arrangement consistent with the prototype public housing in postwar Japan, prioritizing the sunshine direction and ensuring efficient circulation. Thus the problems faced by refugees when relocating from the temporary to public housing excluded the environmental issues of humidity and insulation. Most of the residents had never resided in mass housing, but were satisfied with aspects of the physical environment, such as the sound and heat insulation. However, the high privacy imposed by concrete walls and steel entrance doors tends to isolate the tenants, and residents reported numerous concerns with their neighbors and anxiety about the community. In contrast, there were few complaints on the structure of the temporary housing. Some rooms are divided by concrete walls, others are connected by sliding shoji. This spatial structure is more easily adapted by residents than prefabricated temporary housing.

However, most of the elderly residents expressed their problems in adjusting to the modern lifestyle expected in the public recovery mass housing. They dine on carpets around low tables rather than on chairs around desks. The modern style of eating and sitting in the combined kitchen and dining space is incompatible with the traditional lifestyle. Also, residents on the higher floors perceive the distance from the ground as a separation from society, because their original ground-level houses were closely connected to the surrounding natural and social environment. Even though the official management regulation prohibited self-construction in those houses, residents invented simple renovation methods to domesticate the space. One couple who moved from temporary housing to recovery public housing in Kesenuma reported an inability to settle in their temporary house, but after moving to the public recovery housing and constructing their religious alters of Buddhism and Shintoism, they regarded the house as their own.

Particularly for elderly people, the living qualities of disaster-recovery housing were considered to be closely related to community formation and management methods. Many of our elderly interviewees favored the smaller-scale communities in their previous temporary housing over their current situation in the disaster-recovery public housing. As mentioned above, when discussing the multiple stages and arrangement of community spaces in temporary housings, the community space in the housing complex serves two functions. First, it connects the private internal area with the social external area; second, it provides a social gathering space. When interviewed, the residents in Nango public housing suggested three levels of networks—groups of 3–5 units, horizontal networks on each floor, and vertical networks between the floors—to prevent the isolation of elder residents. Transitions and combinations of different levels of community space are especially important in disaster-recovery housing, because the steel doors create rigid barriers. Methods that expose the atmosphere of the rooms to external corridors are probably required. Such methods would facilitate the creation of a daily gathering space for residents of closely neighboring houses, and a public community space with high accessibility and visibility on a flowline to the ground floor.

Concluding remarks: disaster relocation of housing and urban/regional planning

A disaster destroys the affected area, but recovery buildings such as temporary houses and disaster public housing alter the landscape and social conditions of the area. Consequently, the construction has changed the entire landscape and infrastructure of the area. Also, whereas the construction of disaster public housing is financially supported by the country, its subsequent maintenance is handed to the local municipalities, and forms a significant part of their budgetary responsibility. Therefore, a new flexible management method, enabling a long-term change of community, is urgently required.

After examining the impact of relocation on the refugees' sense of dwelling, we recognized that social and psychological issues are closely interconnected with the physical constructions of the housing units. The research findings emphasize the need for continuing the refugees' habitual lifestyle, such as their living and societal customs, considering their regional needs. In addition, given the aging

population, forming relationships among the housing, the neighboring community, and the municipal social and communication services is more important at each stage of the relocation process than in normal times. Engagement in renovating the living space and creating community spaces can significantly assist refugees in recovering their sense of owning the place. In many instances, the refugees effectively created multiple-layered relationships between their private dwellings and the public/community space, which further elevated their sense of belonging. After post-disaster relocation, the most important problems were isolation from the existing regional space and networks, and the local society, which is closely connected to above issues of belonging. As a French philosopher Pierre Bourdeau claims, a house is a social medium connecting people with surrounding society through his engagement, restructuring the system of public housing, and the relationship between the refugees and their local society should be reconsidered.

The Great East Japan Earthquake was a scale of an earthquake that modern Japan had never experienced before. As a result of this disaster, prolonged evacuation orders were issued to wide areas, and even six years after the earthquake, there are people who still live in temporary houses because they cannot go back to the place where they used to live. This paper focuses on Katsurao Village, Fukushima Prefecture and aims to grasp how the dwellings and family structures changed since the Great East Japan Earthquake as well as the reason for these changes. Intentions as to the future location of their dwellings differ by the age of the members of the household or the areas under the evacuation orders. Young generations do not depend on the existing community, and they wish either to go back to their own old village or move to a more convenient place. It was clarified that many residents want to have a privately-owned house but that there is a small number of people who want to move to a convenient area and choose other types of dwelling.

Keywords: The Great East Japan Earthquake, Family type, Dwellings

1. Purpose of research

Wide-scale disasters have been significantly affecting people's homes. This means not only changes of homes but also changes of family units living in homes. Such changes include active ones brought about by families' intentions and also passive ones due to changes of life environment. Changes of homes have been updated by reviews of fire/quake-resistance standards. However, there are few efforts to capture changes of family units to use the findings in future disaster countermeasures.

The Great East Japan Earthquake, which occurred on March 11, 2011, was as massive as magnitude (Mw) 9.0 that modern Japan had never experienced. This huge earthquake is called an unprecedented disaster because it brought about not only damage of buildings due to collapse like those seen after the Great Hanshin-Awaji Earthquake (Note 1) but also unexpected secondary and tertiary damages due to a post-quake massive tsunami hitting the coast of Tohoku region and the nuclear disaster at the Fukushima Daiichi Nuclear Power Station. In response to the nuclear disaster, the government issued a long-term evacuation order to wide regions in Fukushima Prefecture. Even today, seven years after the earthquake disaster, residents who had lived in high-radiation areas cannot return to their hometowns since the evacuation order has not been lifted yet. As temporary houses are basically to provide houses immediately after disasters, the tenancy period is two years in principle. In the two years, the government planned to construct restoration public housing and establish housing subsidy systems. Even now, however, about 3,400 temporary houses are still in use due to reasons such as delays in decisions of construction policies and complexity of supply systems. (Note 2)

In previous research, Tominaga's paper ¹⁾ clarifies the process of evacuation by arranging how evacuees have chosen evacuation sites and temporary housing, the reasons and how to acquire the housing information. Also, TSUKUDA's paper ²⁾ reports the tendency of intention to what evacuees are desired for restoration public housing. However, there are no papers reporting in detail the changes in family structure (increase or decrease in family composition), which is a feature of this research.

In this paper, we take up Katsurao Village, Futaba District, Fukushima Prefecture in order to find how houses and family forms changed after the earthquake disaster and the reasons for the changes and also demonstrate what houses people wish to live in. I hope it'll be a meaningful linkage to the recovery processes or future of the town, such as the number of new house planned, or their housing or related support that would be useful based on the understanding of peoples' future intentions related to housing.

2. Post-quake damage in Fukushima Prefecture

The damage from the earthquake disaster was serious especially in the three prefectures: Iwate, Miyagi, and Fukushima. Looking at Table 1, Miyagi Prefecture saw the most serious human/building damages. The number of missing and dead surpassed 10,000. And the number of completely destroyed house was 82,889 in Miyagi. The reason is that due to its wide low-lying area, Miyagi had a large flooded area caused by the tsunami and a large population within the area as compared to other prefectures. In contrast, Fukushima saw less damage from the tsunami unlike other prefectures. For example, the number of missing and dead was less than 2,000. And the number of completely destroyed house was 21,167 in Fukushima. That said, residents had to evacuate due to the nuclear disaster and contamination of radiation at the Fukushima Daiichi Nuclear Power Station located on the coast of Okuma Town, Futaba District, Fukushima Prefecture. As such, while there were less human/building damages as compared to other prefectures, the number of evacuees within and outside Fukushima Prefecture is as large as 53,960 which is an unusual situation. (Figure 1)

In response to the nuclear disaster, the government set evacuation order areas in 12 municipalities within Fukushima Prefecture immediately after the earthquake disaster. By April 2017, the government reviewed the evacuation order areas 25 times in all. As a result, the three types of areas: difficult-to-return zone, restricted residence zone, and zone in preparation for the lifting of the evacuation order are currently set in seven municipalities. In the difficult-to-return zone, which has the tightest restrictions, annual integral dose may not fall below 20 mSv in five years. This is likely to restrict people from living in the zone for a long period. As such, earthquake disaster reconstruction in Fukushima is expected to be extended for a long period of time as compared to other two prefectures.

Table 1: Status of human casualties and building damage: Author based on data released by Emergency Disaster Security Headquarters, Metropolitan Police Department.

Damage type / Prefecture	Human damage		Building damage		
	Death	Missing	Completely destroyed house	Partially destroyed house	Flood*
Fukushima	1,606	210	21,167	72,947	1,339
Miyagi	9,537	1,308	82,889	155,107	7,796
Iwate	4,673	1,149	18,370	6,558	6

*Figure of inundations above/below floor level

Figure 1: Status of evacuees (in / outside prefecture): Author based on data released by Reconstruction Agency, June 18, 2013.

3. Outline of Katsurao Village and process of evacuation

Katsurao Village is located about 20-30 km northwest of the Fukushima Daiichi Nuclear Power Station. (Figure 2) Its population was 1,531 in 2010 right before the earthquake disaster, which is the smallest one among 12 municipalities that suffered damage from the nuclear disaster. The village boasted its rich nature, where the main industry was the primary industry including the cultivation of leaf tobacco and rice and stock raising.

On March 11, 2011, the day of the earthquake disaster, declaration of a nuclear emergency situation was issued after the earthquake disaster occurred. On the next day, the evacuation order was issued to people within a radius of 20 km from the nuclear power station, which designated an eastern part of Katsurao Village as an evacuation zone. At first, Katsurao Village was going to accept evacuees from other towns and villages closer to the nuclear power station. Seeing the worsening situation of the nuclear disaster, however, the village office decided to make

all the residents evacuate from the evening of March 14. Many residents evacuated staying at various places like gymnastic halls, hotels, and houses of relatives or acquaintances. In June, the village office constructed temporary houses in Miharu Town, Tamura District, Fukushima Prefecture and also opened a branch of the village office there in July. At this point of time, of 1,524 evacuees, 913 evacuees (59.9%) lived in temporary houses in Fukushima Prefecture, 446 evacuees (29.3%) lived in prefecture-rented houses in the prefecture, 34 evacuees (2.2%) voluntarily evacuated within the prefecture, and 133 evacuees (8.7%) evacuated outside the prefecture. In April 2016, about five years later, the village office resumed all the operations at the main office in Katsurao Village. On June 12, the designation of the restricted residence zones and zones in preparation for the lifting of the evacuation order was lifted within Katsurao Village. However, Noyuki District, Katsurao Village is still designated as a difficult-to-return zone. As the present investigation was conducted in March 2015, we were unable to know until when the evacuation order lasts at that time.

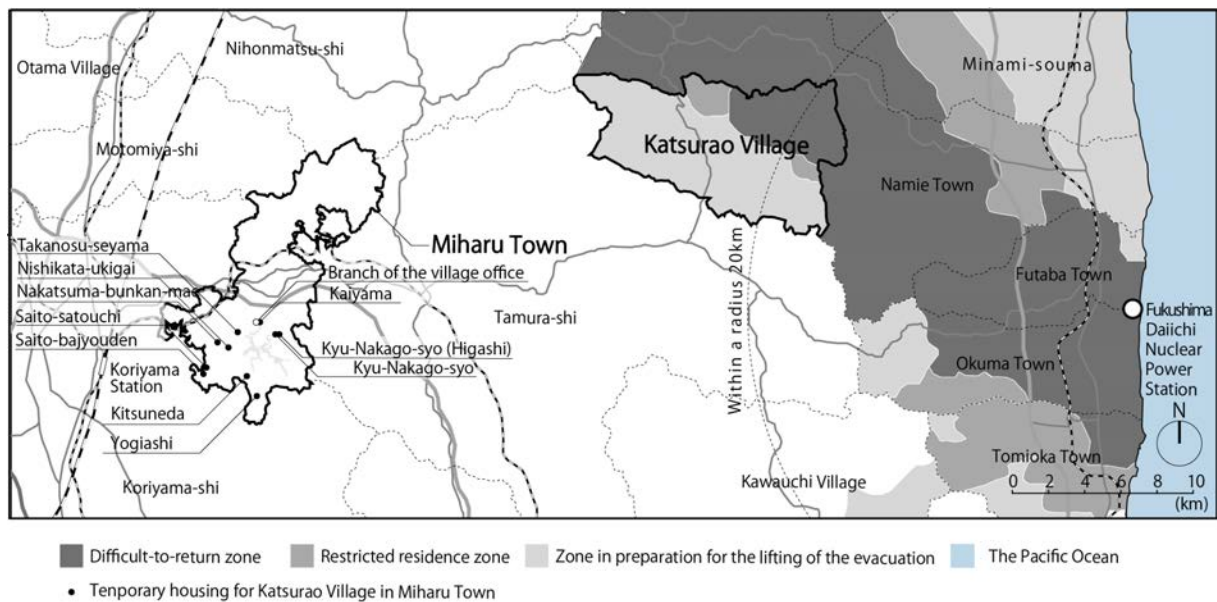

Figure 2: Map of Katsurao Village and Miharu Town, Fukushima Daiichi Nuclear Power Station: Author based on 1) Conceptual diagram of evacuateon direction area since 5th Sep. 2015 released by Fukushima Prefecture , 2) *The Great East Japan Earthquake record book in Katsurao Village* [Katsurao Village, 2015]

4. Outline of investigation

We conducted a questionnaire investigation of houses and household compositions of 456 households whose residence certificates were maintained by the Katsurao Village Office. Among 456 households who distributed questionnaires, 97 households responded, and the response rate was 21.3%. Questionnaires were manually distributed by village office staffs to 390 households living in the temporary housing complex in Miharu Town. For other 66 investigation objects, questionnaires were enclosed with copies of a monthly village letterzine. In the questionnaires, we asked how household members and house forms changed after the earthquake disaster and with whom and where respondents would like to live in the future. We distributed one questionnaire to each household and asked each respondents to give the attributes of the household members as a representative of them so that we can acquire information of all the residents by households.

This is a inventory of questionnaire (extract) below.

A. About your house and living before the earthquake

1) -What parts of district did you live in Katsurao Village?

-The area was difficult-to-return zone or restricted residence zone or zone in preparation for the lifting?

2) What kind of house did you live? (owned detached house / rented detached house / owned apartment / rented apartment / share house / facility for the elderly / the other)

- 3) Whom did you live with? How many people each? (spouse / daughter / son / child's spouse / grandchild / father / mother / grandfather / grandmother / sibling / sibling's spouse / the other (relative or pet))
- 4) What kind of relationship were you with your neighbors? (I didn't know well / just say hello to each other / have a conversation outside / have a conversation in the house / give a present for each other / do something together (work or hobby) / take part in some events together / help each other when you are in trouble) *multiple answers allowed.
- 5) Do you have attachment to Katsurao Village? And why?

B. About your house and living now

- 1) What kind of house do you live now? (temporary housing / detached housing provided by the local government / apartment provide by the local government / owned detached house / rented detached house / owned apartment / rented apartment / the other)
- 2) Whom did you live with now? Please write each parson's information (relationship, age, sex, occupation) in the table.
- 3) If there is a parson who had lived with you before the earthquake and separate now, please write his/her information (relationship, age, sex, occupation, what kind of house does he/she live, where he/she live)
- 4) Has anything changed in your family since you moved current house?
- 5) What kind of relationship are you with your neighbors now? (I know who is live in neighborhood next door / I know who is live in the same building / I know who is live in the same area / just say hello to each other / have a conversation outside / have a conversation in the house / give a present for each other / do something together (work or hobby) / take part in some events together / help each other when you are in trouble) *multiple answers allowed.

C. About your house and living in the future

- 1) What kind of house do you want to live in the future? (owned detached house / rented detached house / owned apartment / rented apartment / share house / facility for the elderly / the other)
- 2) Whom do you want to live with in the future? How many people each? (spouse / daughter / son / child's spouse / grandchild / father / mother / grandfather / grandmother / sibling / sibling's spouse / the other (relative or pet))
- 3) Where do you want to live in the future? And please write the reason.

5. Results

5-1. Changes of age groups since earthquake disaster

The respondents and their household members both had a male-to-female ratio of nearly 50%. Their current ages spread over multiple generations between age 0 and 90s, of which age groups 60s to 80s account for about 60%.

Looking at how age-specific headcounts changed after the earthquake disaster(Figure 3) , all the age groups showed lower headcounts. Particularly, young age groups of 40s or younger showed significant decreases: about 40-60% decreases. Meanwhile, age groups of 60s or older showed just approx. 10% decreases. The reason why the number of persons with unknown ages was as large as 89 before the disaster is that many respondents failed to fill out questionnaires with their ages. However, we were able to guess rough age groups on the basis of their names. (Figure 4) As a result, 45% of them were daughters, sons, and their spouses and 16% were grandchildren and great-grandchildren, which exceeded in all half of the persons with unknown ages. As such, actual decreases in the headcounts of the young age groups must have been greater.

Figure 3: Changes in population by generation

Figure 4: Breakdown of "Unknown" in Figure 3

5-2. Characteristics of changes of family compositions

The graph below shows changes of family compositions after the disaster (Figure 5).

Looking at pre-quake family compositions, there were 18 households of a married couple and an unmarried child(ren), 29 three-generation households, and eight four-generation households while there were four one-person households and 21 married-couple households. That is, there were more multi-generation households than single-generation households. Looking at pre-quake age compositions by family compositions, one-person households and married-couple households had great percentages of elderly persons in their 60-80s. Households of a married couple and an unmarried child(ren), three-generation households, and four-generation households had wide age distributions between children under 10 and 90s. Age groups of 20s or younger belonged only to these three family forms. Speaking of significant changes of family compositions, one-person households increased from four to 16; married-couple households increased from 21 to 36; three-generation households decreased from 29 to six; and eight four-generation households all disappeared.

This indicates that Katsurao Village had been an area with many large families such as three-generation households and four-generation households and young generations had been included in such large families. However, such families were split after the disaster and, as a result, one-person households and married-couple households increased, resulting in small family sizes.

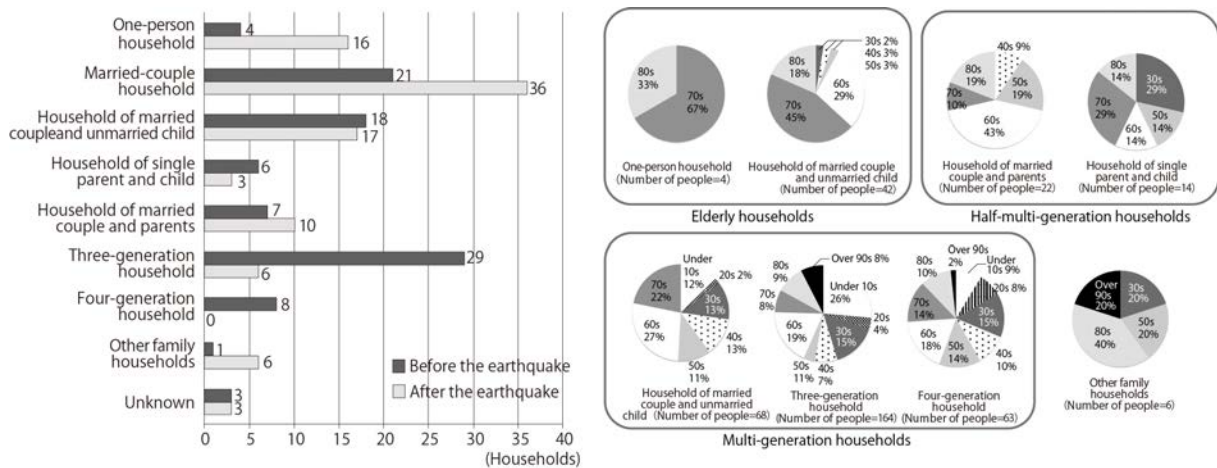

Figure 5: (Left) Changes in family type. (Right) Ratio of age and family type before disaster.

5-3. Characteristics of family compositions in terms of changes

Table 2 shows changes of family size and their intentions for the future. The vertical axis indicates changes of family size and their intentions for future changes. The horizontal axis indicates pre-quake family forms. Table 3 shows excerpts from free descriptions of changes.

Table 2: Changes in family type [pre-quake and current, current and the future]

Changing about the family size		Family type of Pre-quake (Number of people, %)									Subtotal	Total
The past changes from pre-quake to the present		One-person household	Married-couple household	Household of married couple and unmarried child	Household of single parent and child	Household of married couple and parents	Three-generation household	Four-generation household	Other family households	Unknown		
intention for future change												
No change	No change	4	10	4	1	1	0	1	0	0	21 (25.6%)	30 (36.6%)

(40s, Female, III) 	
	<ul style="list-style-type: none"> My son's wife and children moved to an apartment house in Aizuwakamatsu provided by the local government. The two grandchildren come and see us on weekdays. My son visits the Miharu temporary house on weekdays. (60s, Male, III) 	
	Expand	<ul style="list-style-type: none"> We evacuated to the current house and my daughter then started to live with us due to job relocation. So, we were mentally supported and encouraged by her when we were depressed. (60s, Female, F)

[Household type legends]

One-person household : T Household of married couple and unmarried child : K Three-generation household : III Other family households : S
 Married-couple household : F Household of single parent and child : O Four-generation household : IV Unknown : (No described)

A. Households with no family form change

Households with no change of family members accounted for 36.6%. Of them, respondents who chose “No change→No change,” which denotes an intention to make no change to their family compositions, accounted for the highest proportion: 26%. All pre-quake one-person households chose this answer. Besides, about half of pre-quake married-couple households chose this answer. That is, pre-quake small families less changed their family forms and also intended not to change them in the future.

Although their free descriptions were short as there was no change of family compositions, some respondents stated that they now have less family interaction and the elderly's dementia got worse, which suggested changes of quality of life.

B. Households whose sizes decreased

Households that respondents their family sizes decreased accounted for 58.5%, i.e., about 60%. About half of them: 28% intended to make no change to their family compositions. On the other hand, 25.7% intended to expand their family sizes. This percentage is the sum of 3.7% answering “Expand (larger than pre-quake family),” 12.2% answering “Expand (return to pre-quake family),” and 9.8% answering “Expand (smaller than pre-quake family).” As such, households whose sizes decreased broadly have two intentions: to make no change to their household sizes and to expand them.

Katsurao Village had relatively many three-generation households. In the present investigation, likewise, about 30% (29 households) of pre-quake households were three-generation households. Many of these three-generation households belonged to answer categories indicating shrinkage of household sizes. Eleven households chose “Shrink→No change,” which means that family members remain separate after household sizes decreased. This answer was the most common one. Six households chose the second most common answer: “Shrink→Expand (return to pre-quake family).”

Their free descriptions are divided into the following two types: ① Household sizes decrease due to the elderly’s disease or death as seen in the respondents: “My mother living in the temporary house is moving to a care facility due to an accident (Male, 60s, household of single parent and child)” and “My mother died (Male, 60s, household of married couple and unmarried child)” and ② Young families live separately for migration as seen in the respondents: “My son, his wife, and child moved to another prefecture (70s, three-generation household)” and “I live separately due to my child’s college education.” Reasons for living separately contained many social ones such as education and work. Besides, there was an respondent saying that an evacuee started to live separately in another temporary house after getting into trouble with others at the former temporary house. This indicates difficult human relationships at temporary houses.

C. Households whose sizes increased

The number of households that respondents their household sizes increased was just three out of all the households. Their free descriptions tell us that a child living separately started to live with parents temporarily for a work reason.

Besides, there were a few households answering that their household sizes will increase compared to pre-quake sizes despite how their household sizes changed until now. Such households chose any of these three respondents: “No change→Expand,” “Shrink→Expand (larger than pre-quake family),” and “Expand→No change.” Looking at the breakdown, many of households choosing “No change→Expand” and “Shrink→Expand (larger than pre-quake family)” were households of over 50s couple or those living with their parents or child(ren) and, in such households increase the family size with their child(ren) and their spouse, grandchild(ren). Households choosing “Expand→No change” all had a new child(ren) after the disaster. (Note 3)

6. Where evacuees want to live in the future

As respondents to the question “Where do you want to move and live in the future?” “Area of past residence” and “Convenient area” both accounted for 28%, followed by “Area where many acquaintances live” (8%), “Area to which people who had lived in same town moved together” (7%), and “Area close to relative’s home” (6%), totaling up to 21%. Thus, we found that respondents had the following three intentions in nearly equal proportions: returning to Katsurao Village where they lived before the disaster; obtaining a new convenient house; and maintaining human connections with village people, relatives, and acquaintances.

“Other” respondents included ones saying area does not matter as long as the nuclear disaster does not affect life and many respondents wanting a normal life as seen in the actual respondents “Area 30 km away from the nuclear power station because I want to get away from the village (Male, 69yo, unemployed)” and “Any place is OK if I can lead a normal life (Male, 45yo, self-employed).”

According to 5-2, in this survey, the age composed of households was characterized. Households with “One-person household” and “Married-couple household” are large elderly. And “Household of married couple and unmarried child” , “Three-generation household” and “Four-generation household” were multi-generations including the young generation. Focusing attention on the family composition in Figure 6, there are many people who wish for a “Married-couple household” for “Area of past residence”, and “Household of married couple and unmarried child” prefer “Area of past residence” and “Convenient area” are almost the same number There. “Three generations household” have many households desiring “convenient area”. Because of this, many elderly households want to return home to the familiar Katsurao village, and young households tend to select convenient areas for more social activities.

We also analyzed their intentions by pre-quake areas. When we conducted an investigation in 2015, Katsurao Village had three types of evacuation order areas. Noyuki District, which is located at the northeast end of the village, was designated as a difficult-to-return zone; Iwakado District and a part of Hiroyachi District, which are next to Noyuki District, were designated as a restricted residence zone; and the rest was designated as a zone in preparation for the lifting of the evacuation order. As for the respondents: "Return to area of past residence," Noyuki, a difficult-to-return zone, showed a small proportion of such respondents and the same holds for Hiroyachi and Iwakado, a restricted residence zone. This demonstrates that where evacuees would like to live in the future depends on the severity of an evacuation order area.

Before the disaster, owned detached houses accounted for 98% of all houses and almost all residents therefore lived in such houses. As for future houses, 74% of respondents wished owned detached houses and the rest 24% chose other house types: rental detached houses and condominium complex, etc.

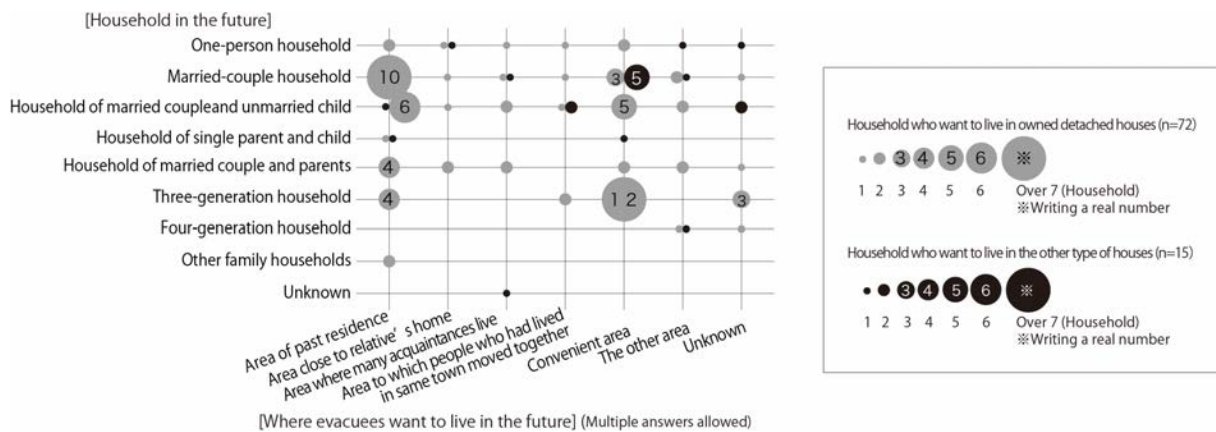

Figure 6: Desired housing type [family type × area]

7. Conclusion

Investigating changes of household forms and future resident areas demonstrated part of disaster victims' actual life.

After the earthquake disaster, particularly young generations up to 40s moved outside the village. This led to decrease of households that had been commonly found in Katsurao Village, i.e., households of three or more generations and households of a married couple and their unmarried child(ren). Besides, we found from increases of one-person households and married-couple households that large households with elderly members split into small households by generations.

One-person households made up of many elderly members and households made up of fewer members such as married-couple households less changed their household compositions and also intended not to change them in the future. Many of such households also hoped to return to their familiar place, Katsurao Village.

We found that where evacuees want to live in the future depends on household members' ages and evacuation order zones where they lived before the disaster. Households with young generations basically hoped to return to the village or move to a convenient area without depending on existing communities such as relatives, acquaintances, and people from the same town. Young generations are associated with many social external factors such as work and college education. These factors seem to promote migration. We also found that such factors cause three-generation households to live separately. As is the case with young households, many of households with elderly generations hoped to return to the village or move to a convenient area. They also intended to move to another place counting on their familiar persons such as their relatives, acquaintances, and people from the same town.

Before the disaster, almost all the residents in Katsurao Village lived in their owned detached houses and many of them hoped to live in owned detached houses in the future. However, a few married-couple households hoped to live in houses other than owned detached houses in a convenient area outside the village in the future.

Many people had to temporarily face changes of household compositions due to preparations to receive evacuees and restrictions on temporary houses. After that, prolonged life as evacuees started to change their individual situations. As a result, they were often no longer necessary to restore pre-quake household compositions. This is because individuals have close relations with environments associated with life stages such as education, marriage, and childbirth, which causes generations in large families to split.

Machizukuri and Participatory Planning

Re-generating vitality by participation? - A theoretical analysis on participation and vitality in urban regeneration process

Cinco Hsinko Yu (Delft University of Technology)

This study examines the relationship between public participation and urban vitality. It will employ a theoretical analysis particularly in urban regeneration projects. The broader goals of the study are: 1) What are the institutional characteristics of public participation (PP)? Particularly in urban regeneration projects (URS)? And; 2) What is the theoretical characteristics for urban vitality (UV) and the potential while UV present in URS projects?

It is gradually accepted that planning is neither 'what planners do' nor 'what the planning system decides to do'. Predominantly, in planning practice and planning theory, the argument of public participation is much more fundamental, it is concerning how to make the practice of planning more inclusive and democratic. However, while the planners come across questions in their mind while they are practicing planning process such as: 'How does the character of participatory planning influence the spatial quality'. These common-asked questions need to be solved. Although there is extensive research, has been devoted to developing, assessing and numerous critiques have been made to investigate various tools to make participation more meaningful, the relationship between public participation and spatial quality is still nebulous. To have an operational idea of spatial quality, the idea of urban vitality is applied, the research will later investigate the theoretical character of urban vitality, as a while implementing public participation within the process of urban regeneration project. In the literature of urban vitality, the questions such as 'what is good urban form' and 'what makes or does not make lively urban life' are intensively argued by scholars from diverse perspectives. Nevertheless, with different meanings in different contexts, the concept of urban vitality has become vague, and not yet been defined through research. Henceforward, approaches from diverse professional fields and from the inter-disciplinary perspective should take account of all the factors across the different political system and social-cultural values.

To sum up, the research will attempt to investigate the relationship between participatory planning and urban vitality in urban regeneration process, and to have a better operational definition.

The Four "I"s as Key Concepts in a Re-examination of "Machizukuri" as an Intrinsically Vital Element in Urban Planning for the Post-Urbanization Period - A Methodological Consideration of the Concept of "Machizukuri"

Keiichi Kobayashi (Tohoku University of Art and Design)

"Machizukuri" is a key concept in Japanese urban planning and more than sixty years has passed since the word first came into use. Recently, the word has become so widely used that its meaning is rendered quite vague or ambiguous. This paper intends 1) to rethink the meaning of "machizukuri" and 2) to evaluate ways it can help to address contemporary urban planning issues.

Rethinking the meaning requires a reassessment of the static definitions of the word, which, although mainly intended to distinguish "machizukuri" from statutory urban planning, have resulted in an exclusive character. Since there are only a few isolated examples of successful "machizukuri" in practice, the term remains rooted in idealism. In order to resolve this contradiction, I will examine the dynamics between "machizukuri" and statutory urban planning.

Historically it can be seen that the role of "machizukuri" has been to compensate for areas of incompleteness in the hastily established Japanese urban planning system. The co-existence of "machizukuri" goes right back to the beginning of the statutory urban planning system that was based on the City Planning Law of 1968. Instances of "machizukuri" have managed to develop alongside various phases of planning such as the adjustment process between macro and micro scales, conservation processes in historic or built-up areas, quality control systems, comprehensive management systems for urban planning, and the promotion system for urban functionality.

Furthermore, as there is a reciprocal process of institutionalization between "machizukuri" and statutory planning, it has proved to be an important means of helping solve local planning issues through incrementalism, in contrast to statutory planning's rationalism. That is to say, "machizukuri" has performed as the inspiring avant-garde of a progressive urban planning system in which highly motivated participants collaborate to create a constructive arena.

An examination of the potential of "machizukuri" requires a review of the contemporary situation at the beginning of the post-urbanization period. It can be seen that the ability of planning to reform present conditions is decreasing, which means that we have a responsibility to explore various types of "machizukuri" in seeking ends and means through an incrementalism approach.

This paper pays attention to "vitalization" as a predominant issue in contemporary urban society, and argues that incrementalism is a necessary condition for sustaining the vitalization process. As a result, intentionality, meaning subjectivity in doing something, innovative value creation, and integrity of regional development have emerged as key concepts. Combined with incrementalism as a precondition, I conclude with referring to these as the four "I"s, constituting core concepts for urban planning in the coming period.

The Inclusive Planning Strategy of Divided Nicosia through Home for Cooperation: A Building bridging People for Peace-Building

Huriye Gürdallı (Near East University)

Certain locations in a city have a stronger foundation for cooperative and comprehensive autonomy for the establishment of an urban accommodation through their socio-spatial qualities. They have the capacity and ability to exert independent effects on post-conflict areas more than the vulnerable urban plans and state-level negotiations. Post-conflict divided cities and societies symbolizes a daring experiment when planning is taken into account as a tool of reproduction of space. Urban plans prepared by international agencies, policy makers and private contractors, restorations of buildings have been implemented with limited success unless the role of civil initiative and NGOs are considered within the planning processes. The effect of the community-led initiative can be unpredictable and effective more than the planned. The spatial order in Nicosia, the buildings belonging to Lusignan, Venetian, Ottoman and British Colonial periods, historical city walls, streets ending by barricades, market area along the Green Line on both sides and the squares where significant meeting towards reunification were held yield its overarching socio-spatial experience. The Buffer Zone that physically and socially partitions Nicosia as a United Nations (UN) controlled area between Turkish and Greek Cypriots is at the focus of the communal polarization. Nicosia Master Plan formulated by the professionals from both communities had been able to resist against the protracted political deadlock by producing and implementing projects for the revitalisation of the capital city. The Buffer Zone, reputed as the Dead Zone had been at the focus of this bridging projects at urban and architectural scales. The socio-spatial transformation of the area as a co-product of formally planned and informally interpreted processes made planning experience along the divide of Nicosia unique and valuable among the planning histories of post-conflict divided cities. The Home for Cooperation (H4C) has been a symbol that blurred the lines of the border to become a shared space for Cypriots. The understanding of the ongoing experience through NMP, NVP and H4C may yield understanding for the peace building policies in the post-conflict divided cities. Scrutinization of this planning history made clear that social and cultural aspects of planning are the complementary parts and crucial components of spatial planning and transformation. This paper explores the policy towards comprehensive planning that are being proposed in post-conflict cities that include the collaboration of both parties, the cooperation taken by professionals from both communities before the political consensus is reached. The analysis focuses on the complementary role of the community-led initiative to draw attention to the involvement of cultural and social interaction of the citizens with the help of visual and verbal records centred on activities carried in H4C within the context of divisiveness.

The Four "I"s as Key Concepts in a Re-examination of "Machizukuri" as an Intrinsically Vital Element in Urban Planning for the Post-Urbanization Period

- A Methodological Consideration of the Concept of "Machizukuri"

Keiichi Kobayashi

* *Dr. of Eng., Tohoku University of Art and Design, kobayashi.keiichi@aga.tuad.ac.jp*

This paper discusses the word "machizukuri" and the versatility of its meaning through examining the interplay between "machizukuri" and statutory urban planning over the past sixty years. By tracing the history of the Japanese urban planning system, it can be seen that one role of "machizukuri" has been to compensate for areas of incompleteness in urban planning. As there has also been an institutionalisation process from "machizukuri" to statutory urban planning, the primary role of "machizukuri" has been to provide a constructive arena for collaboration on efforts to improve regional conditions. As "vitalization" has become the definitive issue for urban planning in the post urbanization period, the four "I"s, incrementalism, intentionality, innovative value creation and integrality of regional development, have been abstracted as necessary conditions for a revised and more readily applicable version of "machizukuri."

Keywords: incrementalism, intentionality, innovation, integrality, planning methodology

1. Introduction - the aim of this discussion

"Machizukuri" is a key concept in Japanese urban planning and over sixty years has passed since the word first came into use. The meaning of the word has become diffuse and, as André Sorensen (2002) has stated, "the variety is so great that it is arguable that the term has become a rather vague catch-all that serves more to confuse than to clarify" [1]. The word has come into popular use because of its positive connotations, but denotes no more than any non-specific attempt to improve regional conditions.

At this turning point in urban planning, it is natural to revisit the term and make a critique of its substance; i) what it is, ii) what kind of progression it has taken, iii) what kinds of issues and potential it has. Notwithstanding the opinions noted practitioners and scholars have already expressed with their definitions and historical views, we still require further methodological deliberations and definitions more appropriate to the realities of this period. Professor Shun-ichi Watanabe is a forerunner of this theme and proposed normative dimensions to define the concept based on analyses of prominent planners' definitions [2].

In this paper, I would like to approach the theme through an interpretation based upon the history of city planning institutions in Japan and my own practical experiences [3]. This approach will lead to a conclusion different from preceding explanations. My discussion looks at the reasons why the meaning of the word "machizukuri" has altered over time and why it has become so generalised that it is frequently used to justify any application. I also intend to identify conditions for a practicable "machizukuri" that can be applied to contemporary urban requirements.

2. A review: current trends and a general definition of "Machizukuri"

2-1. Currents and periods

It can be confirmed that the year in which the word "machizukuri" first appeared goes back to 1947, just after WWII [4]. Shun-ichi Watanabe found original uses of the word "machizukuri" in a sampling of journals of various genres concerned with urban matters published between 1945 and 1959. The instances fall within six different domains related to i) a movement for social welfare, ii) democratisation, iii) social organization, iv) administrative merger movement, v) urban planning society, and vi) social science. This shows that the word began to be used simultaneously in random contexts and with a variety of meanings [5].

Professor Shigeru Sato, one of the great promoters of “machizukuri,” wrote a history analysing ideological relationships and influences from abroad, and distinguished three phases in the development of “machizukuri.” He described the first generation, from the 1970’s to the mid-1980’s, as a rising period when the ideology became more distinct; the second generation, from those days until the Great Hanshin Earthquake of 1995, as a period of various practical trials when diverse themes were attempted one after another; and, recently, the third generation, as a period of networks forming to achieve a system of regional management [6]. His historical view is persuasive as it reflects the top runners’ issues in each period. Historical observations of its application and experience over time help us to understand the more tenable types of “machizukuri.”

2-2. Definitions

Professor Shigeru Sato’s clear view of history is the obverse of his explicit definition of “machizukuri.” He defined it as a sustainable movement, i) based on the resources of a region and its society, ii) diverse subjects cooperate in the creation of its networks, iii) incrementally improving the living environment, iv) enhancing the vitality and attractiveness of the town, and v) increasing the quality of life [7].

Professor Yukio Nishimura, also one of the leading authorities of “machizukuri,” interpreted it as a movement encouraging inhabitants to rebuild local communities and commons by overcoming social impoverishment trends caused by modern land-ownership systems. He attached greater importance to practical action than outlining definitions and pointed to confidence, amateurism and voluntarism as prerequisites for promoting “machizukuri” [8].

Although these definitions seem rather idealized, they are persuasive because they represent our perception of the concept of "machizukuri" which has mainly been influenced by successful "machizukuri" movements. The point at issue in these definitions is that they are selective and exclude various incomplete trials.

In order to widen the tolerance, Professor Shun-ichi Watanabe reviewed definitions of "machizukuri," found commonalities among them, and produced a framework for reference that included six variable dimensions, which are: i) actor, ii) activity field, iii) motivation, iv) place, v) time/age, and vi) method, (abstracted from Akira Tamura and Shigeru Sato). In addition, the wide and the narrow (abstracted from the work of Uzo Nishiyama and Akira Sawamura) are variables in each dimension [2].

Though the framework offers practical definitions and is more inclusive of vast trials, the result is still inevitably static since, as with preceding definitions, his purpose was to distinguish "machizukuri" from “non-machizukuri,” especially from statutory urban planning.

Generally speaking, such static definitions are useful for encouraging the understanding of "machizukuri" as a specific movement in history. However, if the goal is to move forward with a new version of “machizukuri” by aggregating various contemporary trials, we must take a different approach to interpreting the substance of the concept or the movement.

3. Pragmatic features and meaning of “machizukuri”

3-1. The contradictory definition of “machizukuri” as anti-urban planning

It must be reasonable that Professor Nishimura attached greater importance to practical action than outlining definitions, as I can recognize speculative definition will be inevitable to be so idealistic, which tone wither us to have an enterprise of “machizukuri,” rather than to be universally applicable.

In part, this is a result of the fact that "machizukuri" started in reaction to urban planning and therefore we need to define it in comparison with or in contrast to urban planning. Shigeru Sato's and Shun-ichi Watanabe's definitions both intended to make a distinction between "machizukuri" and urban planning.

This could turn into pressure to differentiate between "machizukuri" and urban planning, although Yukio Nishimura asserted the need for a practical combination. We can also follow the logic that "machizukuri" may be regarded as elemental urban planning thinking. Both have a common foundation, so planners and academic specialists are able to shift their focus towards practicable “machizukuri” applications.

A constructive redefinition of terms will enable us to better control the direction. We must rethink the relations among the sets of words, as “machizukuri” and "statutory urban planning" are subsets of “urban planning” which is the population set. These subsets are disjointed, since the “machizukuri” subset is a complementary set of “statutory urban planning.”

Viewed from a wider perspective that embraces both "machizukuri" and "statutory urban planning," it is possible to understand the dynamism in Japanese "urban planning."

3-2. Defects of statutory urban planning highlighted in each period.

In order to substantiate the above and to gain a broadly systematic understanding of the varied forms of "machizukuri," it seems advisable to enumerate some of the noticeable deficiencies in the statutory urban planning system. Japan experienced rapid urbanization after WWII and the City Planning Law of 1968 was hurriedly established for the expansion of urban areas. Many failures came about due to discrepancies between the statutory urban planning system and conditions in actual cities, including:

i) The lack of an adjustment process between macro and micro scales.

It was natural for the statutory urban planning system to take a rational approach in providing necessary infrastructure and development areas according to estimates of demand. Based on the act of 1968, road networks and land use were laid out rationally, giving consideration to land conditions and the efficiency of the total system. However, even though this was rational on a macro scale, it could not guarantee rationality on a micro scale. Planning has to be communicative in order to establish workable agreements in each district. At the time, there was no feedback process from the district plan to the master plan. Additionally, planners were probably not able to anticipate how infrastructure and land regulations would impact and change each district's environment, including daily life for residents. In places where environmental problems became intolerable, "machizukuri" was prompted [9].

ii) The lack of a conservation process in historic or built-up areas

At its start in 1968, the urban planning system did not have enough tools or procedures for conserving historic districts, even though it was defined as a comprehensive process of adjustment, development and conservation. Positive local governments and communities initiated trials to conserve historic districts even before the establishment of the national conservation system, as the institution of Preservation Districts for Groups of Traditional Buildings (PDGTB) was not established until 1975 by an amendment to the Law for the Protection of Cultural Properties and the City Planning Law. Such local actions have been called historical "machizukuri" [10].

In spite of the fact that the PDGTB system has been applied in over one hundred designated districts [11], we are still making efforts to conserve various local historical elements that, although not protected by law, are necessary for maintaining the historicity of our daily life space.

iii) The lack of a quality control system in forming urban space

Except for density, what was controlled by the 1968 plan was not the quality but the quantity of urban space and its function. It became apparent that a method of quality control covering all types of districts was necessary to improve city amenities. In Japan, there is usually no height control in urban areas, density control is loose, and building roof shape, colour and design are free. The Townscape Law (Keikan-hou), promulgated in 2004, was expected to be the legal backbone of aesthetic control and conservation in our daily life space. But, as it has become apparent that public endorsement is necessary in order to strengthen or enforce regulation, steady efforts to improve our environments by various implementations arrived at by consensus (called "keikan machizukuri,") are expected [12].

iv) The lack of a comprehensive local government management system for urban planning

The master plan for municipalities was established in 1992 through amendments to the City Planning Law and was intended to act as a countermeasure to the Japanese Asset Price Bubble of the mid-1980's to 1991 [13]. It is quite curious that the master plan came decades after the promulgation of the 1968 City Planning Law. Without a master plan, what can justify or guarantee the efficiency of urban planning?

Prototype master plans had already been tried out in the Toyama City (1966) and Yamagata City (1968) model planning projects. However, until 1992, apart from ministerial guidelines, we did not have the legal institution of a master plan, and local governments were not obligated to clarify their intentions nor inform or consult with citizens [14].

The series of urban design projects in Yokohama City in the 1970's, led by Mr. Akira Tamura, Chief of the Planning and Coordination Department of the city from 1968, showed a clear intent on the part of the local

government as well as some resistance to guidance from the national government. These resulted in improvements to public space and the image of the city, and became famous as Yokohama City's "machizukuri [15]."

v) The lack of a promotion system for urban functionality

As implementations of the 1968 urban planning system comprise project, regulation and guidance, it is apparent that the system functions within a physical construction process. However, the vitalization of cities, especially the commercial function of downtown areas, turned into a major urban challenge in 1990's Japan. Until that time, small and medium-sized retail stores had been safeguarded by law, but pressure from the U.S. and neo-liberalistic social trends provoked a policy change in 1998. Urban planning was expected to protect and boost commercial functions in such areas, however this has still not proved successful. Without any specific means, commercial managers and landowners have had to take action themselves by referencing management theory, in order to change conditions gradually [16]. This incremental approach to promoting commercial functions in downtown areas is also called "machizukuri."

3-3. Dynamism of the concepts

In all of the above categories, we can recognize a process of institutionalisation, meaning that when impromptu "machizukuri" was initiated in resistance to institutions, the next step was the provision from the national government of a subsidiary framework for model projects or new implementations. Local governments then made efforts to adapt the revised framework to their model projects. This process resulted in the establishment of a new institution due to enforced compliance with the amended laws.

In this dynamic between the two sets, "machizukuri" and "statutory urban planning," the later set would assimilate the former. In consequence, static definitions of "machizukuri" were destined to have limited validity.

This process also brings to the fore the antagonistic relationship between incrementalism and rationalism in planning. I am using these two words as defined by Allan G. Feldt on the clarity of ends and means [17]. Incrementalism is the type of planning we should take when ends and means are not clarified. This also happens to be the normal way of doing things, referred to as "muddling through" by Lindblom [18]. "Machizukuri" must adopt incrementalism as its inherent methodology in struggling with planning issues. In contrast, statutory planning cannot help but adopt rationalism as ends and means must be defined, even if only to satisfy appearances for the official position.

Therefore we can regard "machizukuri" as the inspiring avant-garde of a progressive urban planning system in which highly motivated residents and citizens, productive scholars and planners, flexible minded administrators and others collaborate to create a constructive arena. "Machizukuri" may also be regarded as a consequence of the incompleteness of the hastily-started Japanese urban planning system that was set up to manage rapid urban growth in the post war period.

This structural outline explains why the word "machizukuri" is easily used, even by developers. In so far as we are able to take a realistic look at a region, including its communities, we have to be sensitive to its individuality, which obliges us to feel our way forward cautiously through a process of exploration. In this sense, enterprising planning projects always have a feature of "machizukuri."

Therefore, opposition to the incrementalism of "machizukuri" is not rationalism but methodism, which relies heavily on established institutions and loses any passionate interest in solving local planning issues since it is out of touch with the reality of the region.

This turns out to be the main theme of our discussion. What are the core concepts that promote action-research, practical reasoning and flexible construction in planning? Distinct from methodism, these have typically been demonstrated through "machizukuri." The compelling inheritance of "machizukuri" will shape the most appropriate and applicable approaches to the trials of the coming period.

4. Planning conditions at the beginning of the post-urbanization period

The urban planning system in Japan developed as described above, however, from 2008, the Japanese national population began to decrease [19]. At the same time, while there seems to have been a decline in serious disagreement over urban planning, expectations for urban planning also seem to have faded. Due to the decrease in demand for construction, there is a lessened expectation of the ability of planning to reform present conditions.

Under such circumstances, vitalization has come to be a dominant theme for many local cities and municipal master plans show some hope for "machizukuri," meaning positive collective action from residents, landowners and local businesses towards implementation. Nonetheless, it is unrealistic to expect "machizukuri" movements to arise spontaneously.

We have to pay more attention to the concept of vitalization. The increasing decline of commercial functions in downtown areas and increasing numbers of vacant lots and houses on a citywide scale are complex issues reflecting macro scale dynamics. Therefore, in confronting these issues on smaller urban and district scales, rather than wistfully looking back to more manageable times, we have to distinguish viable goals as well as effective means. Furthermore, the concept of vitality is not only concerned with objective conditions, but also with the subjectivity that is formed through interaction between subject and object.

It is apparent that urban planning implementations, until now formulated for urbanization, have limited validity. At the very least, we have to become receptive to new actions and new ways of thinking, recognizing evolved market mechanisms and informational networks, as contemporary society is a more loose integration of autonomous individuals than society in earlier decades.

If we planners sincerely seek to address evolving issues of vitalization under such conditions, it must be with a new type of "machizukuri," that resists the methodism which hangs on in traditional statutory urban planning. Now, I have to ask what the new "machizukuri" will inherit from the implementations of "machizukuri" to date.

5. Four "I"s as substantial concepts inherited from "machizukuri"

5-1. Incrementalism

As already noted, "machizukuri" actions necessarily call for incrementalism. This diverges fundamentally from statutory urban planning that often slides into methodism out of which systems then derive their rationalism.

Incrementalism means to advance with heuristics, i.e., experimentation in searching for ends and means. It also means concern with knowledge construction in an on-going process through which participants can discover, become aware, understand, investigate, react and produce while determining courses of action.

Adopting incrementalism also means flexibility in making the most of the nexus of participants' actions. If productive chains are formed as a consequence of constructive action, it can be called "machizukuri."

5-2. Intentionality

In order to do anything while searching for the ends and means, there must be a subject, whether an individual or a group and, at the same time, the subject must be motivated or willing to do something [20].

At this exploratory stage, relations between the subject and the town are not yet clear and the question is open as to whether the intention is to do something for the town, in the town or with the town. Intentionality in this situation is a type of willingness from which springs the power source for a continuing process of trial and error in discovering relationships within the surroundings. As a result, this drive for interrelation promotes "machizukuri."

The intentionality needs to be reciprocal and not something imposed from any direction. Ideally, this mutual intentionality will encourage each participant to contribute according to their various positions, professions, interests and so on, bringing out their best efforts to make the most of their place.

Planners, including the municipal planning bureau, will naturally tend to investigate the underlying structure and construct a persuasive vision closely according the region, as this would be the approach of rationalism. Even so, if their plans are projected hypotheses or tools with the potential of contributing to the region, they will still support incrementalism. Naturally, there is room for further study on ways of proposing hypothetical ideas or plans to the community in order to foster wider intentionality.

5-3. Innovative value creation

Even though one might assume that any "machizukuri" project would be supported by discrete trials, one of the necessary conditions for the successful development of a "machizukuri" movement is value creation. Any kind of value, economic, social, cultural, environmental, psychological, aesthetic, or other will have a positive influence. Without value creation, the movement cannot be sustained. I would like to use the word "innovative" to encompass "creative," "productive," "constructive" and other conditions to reorganize knowledge structures.

These days, innovation is recognized to be a main driver of productivity and an indispensable factor in economic growth.

Concerning urban planning in this post-urbanization period, as demand for and investment in urban development diminishes; other channels to vitalize local economies or improve the quality of life and environment are required. As the unit of each urban project becomes smaller, we have to make more of each project by stimulating the creation of ripple effects and/or leading collaborative actions [21].

5-4. Integrality of regional development

The concept of integrality I would like to discuss here is a feature of development. As the development unit shrinks, the importance of devising sequences of smaller knock-on developments increases. Assuming that the notion of a region is intrinsic wholeness, following the regional organic theory, a development achieved in some part will influence other parts. I would like to call this integrality of regional development.

It is a long-established custom of architecture to think about mutual relationships between building and urban planning. For example, Professor Sachio Ohtani discussed the responsibility of architectural design to reflect urban conditions, and possibilities of the reverse [22]. More recently, the progressive young architect Masataka Baba and his associates have effected practical collaborations between real estate agent, architect, graphic designer and others to bring about effective progress in vitalizing districts [23].

We have tended to regard spatial, historical and cultural knowledge as the basis for our understanding about the region to be formed. However, such thinking assumes a rationalism by which relations between these constitute the object's context. Rather, as we contribute features to the subjective power of invention, we may find many suggestions for innovations from the spatial (in part or whole), temporal (past and present) and phaseal (economic, social, cultural, environmental and other) relations in order to accomplish the development as a whole.

6. Conclusion

Through this brief review of the history of Japanese urban planning since 1968, I have attempted a reinterpretation of the relationship between "machizukuri" and statutory urban planning, both subsets of urban planning, and the dynamics of the relationship between these that have resulted in the evolution of the urban planning system.

The Japanese statutory urban planning system had its inchoate start in 1968 driven by urgent necessity. For the system to adjust to altered realities, an enterprising and exploratory approach to unprecedented urban issues was necessary, and this became known as "machizukuri."

As the statutory systems were designed to perform under a rationalistic approach, passive municipalities were neither able to make much of the system nor add original devices towards an effective response to changing realities, and they therefore fell easily into methodism. Compounding this misalignment, urban conditions began to change with the onset of the post-urbanization period.

Under such circumstances, it is worth emphasising the recognisable concepts of urban planning that have been distinctly demonstrated in various types of "machizukuri" whose four basic concepts, the four "I"s, are set out here. These may not be limited to four, and the methods and tools developed in these "machizukuri" movements also constitute our planning inheritance, so the discussion is open.

At the very least, we are confronting unprecedented conditions. In order to maximise realities, it is surely helpful to reconfirm the methods or principles we adopt in formulating planning decisions appropriate to each region within its own individual and dynamic conditions.

Acknowledgements

I would like to express my gratitude to Prof. Shun-ichi Watanabe for graciously providing his research papers at my request. I also would like to thank Ms. Patricia MacLeod for her valuable assistance in finalising my English text.

Public Parks in East Asia

Contingency and Opportunity: The First Century of Hong Kong's Public Parks

Johnathan Farris (Youngstown State University)

The port city and British colony of Hong Kong had from its inception been characterized by a capitalist ethic and by dense settlement on land hemmed in between hills and sea. In these circumstances, preserving public land for general recreation was rarely prioritized as a primary government goal. Yet in Hong Kong's first century (the 1840s to the 1940s) several public parks came into being with distinct purposes in mind, while other spaces of public recreation were compromised. The history of these parks reveals no overall scheme, but responses to a series of contingencies, each shaped by moments when public interest necessitated preserving open spaces and fostering green spaces for recreation. This paper will harness government records, newspaper articles, travel accounts, and period images to address the informal and contingent way that Hong Kong acquired its early public parks and gardens. After a brief introduction to Hong Kong's development, the paper will turn to the six purpose-built parks of the colony's first hundred years. The development of the Botanical and Zoological Gardens, Hong Kong's oldest public park will introduce how dialogue about public space commenced in the colony. The diverse reasons behind and shaping of Statue Square, the city of Victoria's ceremonial center will follow. Blake Garden, built as an outcome of hygienic measures following a plague outbreak, will follow, and then rounding up the island parks will be the compromised West End Park. Like West End Park, the first attempt at a park on the Kowloon Peninsula, West End Park, was unsuccessful in keeping its original boundaries. George V Memorial Park in Kowloon, the last pre-Second World War park will conclude the discussion. Issues of investment, proximity, and use will be demonstrated as playing key roles in determining the resilience of these spaces. The paper will conclude with brief thoughts of why Hong Kong's early parks were successful and resilient, or ended in a much diminished and compromised state.

Planning a National Park in Lower Yangtze Delta, China -- Taking the 1929 Taihu National Park Plan by Mr. Chen Zhi as a Case

Tianjie Zhang (Tianjin University(Associate Professor)) and Kailai Wang (Tianjin University(Post-graduate))

National Park is an area of countryside, or occasionally sea or fresh water, protected by the state for the enjoyment of the general public or the preservation of wildlife. It not only protects the original state of natural ecology, historical and cultural heritage and natural geomorphology, but also promotes the development of ecotourism industry. The concept of national park planning can be traced back to 1872, when The United States established the Yellowstone National Park as the first in the world. Subsequently in 1916, National Park Service was set up for administration and maintenance. In Asia, Japan was one of the earliest country implementing the planning ideas of national parks. National Park Law was promulgated in 1931, and the first batch of national parks were designated in 1934. The concept of National Parks was also introduced into China. The 1929 Taihu National Park plan by Japan-educated forester and landscape architect Mr. Chen Zhi is the earliest experiment in China. The plan provided detailed suggestions and long-dated insights for the tourism development and ecological protection of the Taihu Lake River Basin.

This paper focuses on the Taihu National Park plan by Mr. Chen Zhi, and analyzes the planning concepts and principles, and uncovers the origins and localizations against the background of National Parks' worldwide spread and diversified practices. Firstly, the research will examine Chen's planning texts. Chen firstly elaborated on the importance of national park construction. Based on the indigenous conditions, Chen made a comprehensive consideration of the landscape pattern and landscape resources at the Taihu Lake River Basin. He brought forward the idea of building scenic forests (fengjinglin) according to his professional knowledge and practice. Besides, Chen also drafted the detailed traffic system and the measures to win public support, which he thought indispensable for the construction.

Secondly, via first-hand archives and documents, the research will examine the education and working experiences of Chen Zhi, a reputed and leading forest scientist and landscape architect in China. In 1919-1922, he ever studied afforestation and gardening in Tokyo Imperial University, under the supervision of Seiroku Honda, the father of Japanese parks. The paper will elucidate the connections among Chen's professional education in Tokyo, the development of National Parks in Japan and further worldwide, and Chen's Taihu Plan in China.

Thirdly, via Taihu Plan, this study will further explore the continuities and changes of traditional Chinese gardening ideas at a regional scale. Then it will compare the long history of Taihu with the national park plan.

Chen's Taihu Plan has made significant influences on the later generations. Via this case study at Lower Yangtze Delta, China, the paper intends to contribute to understanding of National Park planning legacy at worldwide.

The Public Park in Japan: a hybrid landscape form – The contribution of the French school of landscape, in the case of the Yamashita park-

Yoko Mizuma (Research laboratory of the National School of Landscape of Versailles-Marseille)

Subsequent to the 1868 Meiji revolution, the opening of the country was a time of great change in urban planning and in the art of the garden in Japan. Under influences from the West, the layout of towns and the model of the Japanese garden were both diversified and this development was reinforced and accelerated by a new element in the urban space, introduced from abroad, the « public park ».

Two schools of landscaping were pioneers in this trend: the Seiroku Honda school, established at the Imperial University in Tokyo, and the Hayato Fukuba school based in the Shinjuku Gyoen Imperial Garden. The two founders did not share the same philosophy of landscaping: the former was founded on forestry and on town and country planning, inspired by theories developed in Germany, and the latter was based on examples of horticulture and garden design from France: the treatise by Edouard André, “General Treatise on the Composition of Parks and Gardens” (*Traité général de la composition des parcs et jardins*), published in 1879, in particular, exerted a clear influence.

In the present thesis, I will defend the hypothesis that a new type of space appeared: the public park, evolving from the principle achievements of the two schools during the opening up of the country in 1868 and until the 1930s. Using the “comparatist” method, I retrace the traditions of garden design in Japan and in France informed by the study of projects for public parks and gardens in France during the Second Empire, where the French school of landscaping flourished (Parc des Buttes-Chaumont, Parc Montsouris), and I analyse the characteristics of the parks and gardens laid out by the two pioneer landscape gardeners and their followers (Shinjuku Gyoen, Hibiya Park, Hamachō)

I also research the training for landscape gardening and the formats used for transfer of knowledge among horticulturalists.

My research covers both historical and practical aspects. I use the methods of the historian for the consultation of archives and for documentary research; the methods of a landscape gardener for the techniques of surveying and the interpretation of projects. Analysing both French and Japanese parks from various thematic standpoints (paths, planting, water features, project management and layout), I demonstrate the influence of the French school of landscaping on the development of the public park in Japan. I reserve an important place to iconography and to graphics analysis, often hitherto unpublished. Finally, my thesis presents new elements concerning the effects in Japan, in this largely unexplored domain, of the art of gardening in its relation to the public park.

Contingency and Opportunity: The First Century of Hong Kong's Public Parks

Johnathan A. Farris, Ph.D.

Asst. Professor, Youngstown State University, jfarris01@ysu.edu

The port city and British colony of Hong Kong had from its inception been characterized by a capitalist ethic and by dense settlement on land hemmed in between hills and sea. Preserving public land for general recreation was rarely prioritized as a primary government goal. Yet in Hong Kong's first century (the 1840s to the 1940s) several public parks came into being and were resilient, while others were compromised. The history of these parks reveals no overall scheme, but responses to contingencies, each shaped by moments when public interest necessitated preserving open spaces and fostering green spaces for recreation.

Keywords: Public Parks, Public Gardens, Hong Kong, multicultural spaces, colonial environments

Introduction

The port city and British colony of Hong Kong had from its inception been characterized by a capitalist ethic and by dense settlement on land hemmed in between hills and sea.¹ Preserving public land for general recreation was rarely prioritized as a primary government goal. Yet within Hong Kong's first century (the 1842 to 1941) several public parks came into being with distinct purposes, while other spaces of public recreation were side-lined or never developed. This essay stands as the initial scholarly attempt to consider Hong Kong's early parks collectively. The history of these parks reveals no overall scheme, but responses to a series of contingencies, each shaped by moments when official and public interest necessitated preserving open spaces and fostering green environments for recreation.

Hong Kong grew in three phases, first with the awarding of Hong Kong Island to the British in 1842, then with the addition of the Kowloon Peninsula in 1860, and finally with the leasing of the New Territories in 1898. Thus, the origin of Hong Kong's urban development and its densest core is what was traditionally the city of Victoria on Hong Kong Island. The island is mountainous, and the initial urban expansion was therefore along the coastline. Subsequently, the addition of Kowloon also saw the densest development occur in orderly blocks on the flat part of the peninsula, leaving only the most uneven ground undeveloped. Only with the addition of the New Territories was development of somewhat relaxed density possible. Initially the city developed from a governmental core in the districts now known as Central and Admiralty to dense commercial development in Sheung Wan and the West and working class and industrial settlement further to the East. The premium placed on land has always confined the possibilities of leaving open space within the city.

The Botanic Garden

The first public park in Hong Kong, the Botanic Garden (also called the Public Garden and later the Hong Kong Zoological and Botanical Gardens), occupies a sloped site that was otherwise difficult to develop (fig. 1). Although a garden had been proposed as early as 1848, its establishment had been sanctioned in 1856, construction commenced in 1860, and it was finally opened to the public in 1864.² Stretching immediately south from Government House (the Governor's official dwelling) up the slope towards an older government officer's barracks, the site took considerable effort to develop, but the backing of the project seems to have developed in part from its proximity to gubernatorial power, as a reaction to the city's rapid expansion to over one hundred and twenty thousand inhabitants, and from its proximity to the roads ascending the Mid-Levels.³ The Botanic Garden's boundaries were well-marked (its original granite gate posts still survive), and investments with varying degrees of permanence were quickly installed. These included a variety of plantings, in terms of ornamentals in beds, shrubs and trees. In 1866, the Parsee community donated a band pavilion, which below the roofline still exists in its original state.⁴ In 1867, a fountain was commissioned and later installed as a grand centrepiece on the formal terrace below the garden's more elevated picturesque winding paths (fig. 2).⁵ Beds of ornamental plants in the "Gardenesque" manner of John Claudius Loudon et al. were installed around the terraces.⁶ By the early 1870s, when Charles Ford (probably the most important figure in early Hong Kong Park construction) took the superintendent post, garden development was under full swing, with the addition of an orchid house, the importation of exotic plants from all over the empire, the expansion of the staff,

Figure 1: Detail of the Botanic Gardens (here labeled Public Gardens) in the 1914 Directory & Chronicle for China, Japan, Korea, Indochina, Straits Settlements, Malay States, Siam, India, Borneo, the Philippines & c. (map insert of Hong Kong). The original part of the gardens is directly to the southwest of Government House, and the 1870s expansion is to the northwest of them, across Albany Road.

Figure 2: Late 19th or early 20th century photo of the fountain that was the centerpiece of the formal terrace of the Botanic Gardens (albumen print, author's collection). This was a much-publicized improvement (even being reported in the Illustrated London News in 1867). It typified the improvements which could make Hong Kong parks resilient public spaces.

the labelling of plants with both scientific and Chinese names, and the expansion of the garden across Albany Road to Glenealy.⁷ As a site of beauty, learning, and entertainment (brass bands made frequent use of the pavilion throughout the late 19th and early 20th centuries), the Botanic Garden attracted great numbers of visitors, to the extent that in 1903 charging attendance on some days to allow less crowded visits was attempted, but rapidly abandoned.⁸ The Botanic Garden was added to the list of great attractions in Hong Kong, and it is the only park that routinely figured in Victorian and early 20th century travel accounts and guidebooks.⁹ Heavy investment both by the government and the local community led to this site being one of the most visited and celebrated parks. This combined with defined boundaries, clearly visible amenities, and proximity to prestigious neighbourhoods led to the space becoming inviolable and permanently part of Hong Kong identity.

Statue Square

Statue Square (originally dubbed Royal Square, but with its current name in popular use since the early 1920s) became the next major public space to be planned (fig. 3). The square was part of a creation of a large swath of land in the city center, Praya Land Reclamation Scheme of 1889.¹⁰ The scheme for this green space had largely been anchored by a neoclassical pavilion housing a bronze statue of Queen Victoria, erected in honor of her Diamond Jubilee in 1897. Because the reclamation was funded by companies which fronted the old harbor front and that still held harbor rights, the formation of the square necessitated substantial negotiation between the colony's government and the Hong Kong and Shanghai Banking Company, which held the new lots adjacent the city's own (which were in front of the old city hall building).¹¹ In 1901, a settlement between the government and HSBC guaranteed "the site should remain open space for all time," as Sir Thomas Jackson, the bank's chief manager wrote.¹² Probably due to continued new construction of both public and private buildings around the square's perimeter, the completion of the landscape plan did not occur until 1910.¹³ The perimeter of the square was soon lined with important governmental and private buildings in addition to City Hall and HSBC, including the Post Office, the Law Courts, and the Hong Kong Club, making the site the city's new forum. The square acquired its newer moniker with a gradual accumulation of statues from its inception into the Inter-War years. This began with the addition of a statue of the Duke of Connaught in 1902.¹⁴ Subsequently, images of King Edward VII, Queen Alexandra, King George V, and Queen Mary were added, as well as (facing HSBC) Sir Thomas Jackson. After the First World War, the Cenotaph, a veteran's memorial in front of the Hong Kong Club, and on HSBC's side of the square a monument to the sacrifice of the bank's own sacrificed volunteers, were also erected, both unveiled in 1923.¹⁵

Statue Square was not as much a place of public leisure as it was a center of patriotic and ceremonial performance of the colony's membership in the British Empire. Many early photos reveal that the grass, shrubs, and palms that once filled the square were cordoned off from public habitation by iron fencing between stone piers (except for the part around the Cenotaph, considered sacrosanct because of its memorial functions anyway). Indeed, the space was rarely remarked upon in travel accounts, and when it was the results were not necessarily positive. The great assemblage of bronze caused travel writer Mrs. Cecil Chesterton to remark in 1933, "The harbor...is confronted by the most dreadfully undistinguished statues of our late dear Queen, King Edward, his consort, and various hideous bits and scraps of repellent masonry."¹⁶ The second half of the 20th century would be less dedicated with the goals of memorializing empire than its original planners. The Japanese occupation laid waste to the square, and the subsequent opportunities for redesign revolved around a combination of adaptations to new transportation infrastructure and greater public usage for passive recreation. The proximity of this space to both governmental and commercial power, its role in celebrating Hong Kong identity, and early seemingly inviolable legal agreements between the public and private sectors have led to its great resilience.

Blake Garden

Further west on Hong Kong Island, Blake Garden resulted from a public health crisis. In Tai Ping Shan district, once highly congested and occupied by Chinese of modest means, the site for the park was cleared by demolitions that reacted to an outbreak of bubonic plague in the district in 1894. Not until 1903, however, was the space specifically reserved as a public garden, and in 1904 it was given its name after the immediately previous governor.¹⁷ Although no direct link is readily apparent between new sanitary regulations in the city and the design of the park itself, discussion of the park was very much surrounded by a broader discussion of the health value of "external air."¹⁸ In 1904 it was "modeled as a garden, turfed, and partially planted."¹⁹ It was finally opened on August 22nd, 1905.²⁰ A

Figure 3: Statue Square, probably during the first decade of the 20th century when construction was still going on around its peripheries (postcard published by M. Sternberg of Hong Kong, author's collection). The formal arrangement of the square, with the greenspaces cordoned off from public access by railings, was more a place for celebration of empire than leisurely occupation.

Figure 4: Blake Garden, mislabeled as West End Park (early 20th c. postcard published by K.M. & Co., author's collection). There is no evidence West End Park ever had structures in it during the early 20th century, but Blake Garden's pavilions are well documented. The topography and pavilion match Blake Garden as described in the 1922 1:600 topographical map of the neighborhood. Investment in the park's ornamental qualities by both the Botanic and Forestry Department and the local Chinese community insured the park's resilience.

Figure 5: West End Park (early 20th c. postcard published by K.M. & Co., author's collection). The fact that the photographer found nothing but a path, foliage, and steeply sloping topography to record hints at why this site was used as an illegal dumping ground for builder's waste and viewed as a place the government could compromise by reassigning portions of it to the neighbouring St. Stephen's Girls School. Subtle planted green space and neighbourhood investment alone was not as defensible as clearly bounded sites with obvious improvements.

summer house was erected in the garden almost immediately afterwards, funded by donations from Chinese residents in the neighbourhood, and another one was added to the park in 1914.²¹ It is unknown which appears in a mislabelled early 20th century postcard (fig. 4). The 1922 Department of Works survey map of the district shows two pavilions in the northwest corner of the park and another small building in the southeast corner. Early 20th century government reports routinely noted heavy use of Blake Garden by the local residents, and in 1924, there was an additional note that "Increasingly large numbers of visitors now make use of this garden and some difficulty has been experienced with large gangs of youths, who for some time played organized football matches to the great discomfort of the regular and more orderly visitors."²² This predicts the post-war transformation of a great segment of this park into sport facilities. Blake Garden combined governmental hygienic goals with local investment and high usage to prove a resilient public space, that survives today stretching to its original boundaries, albeit with a later 20th century shift in function from passive to active recreation.

West End Park

Various factors compromised another of Hong Kong's early parks, West End Park (fig. 5), a fragment of which still occupies a steeply sloping site above the Sai Ying Pun district of the island. This park came about as the central part of the city was developing suburbs into this area. A 1902 government report reveals that the area was originally set aside in 1898 as part of the Department of Works' redistribution of soil as it extended roads into the area, and with the funding of local residents, the Botanical Departments planting of the area.²³ Maintenance of the park was then left up to the Botanical Department although no additional money was appropriated for that purpose.²⁴ This foreshadows the difficulties the park would face. The only additional expenditure beyond ordinary planting and maintenance (mostly of trees and shrubs) listed for the park before the Second World War was the leveling of a portion of the topography to allow for a playground.²⁵ One of the challenges faced from the park's inception through at least the 1920s was the illegal dumping of building debris.²⁶ The Botanical Department considered it a low priority, noting the park was "little used" in 1906 and referring to it as a "so-called park" in 1908.²⁷ These likely contributed to the willingness to re-allocate West End Park's land in 1916, 1920, and 1926, apparently mostly to surrounding educational institutions

(particularly St. Stephen's Girls College).²⁸ An anonymous 1924 newspaper editorial stated, "I can assure you, Sir, that West End Park is a source of great pleasure to the residents of this district. We count it our lone beauty spot, but authorities seem to have forgotten it..."²⁹ With this history in mind, the observation today that the remaining land which survives still as West End Park is on the most steeply sloping face of the site and difficult to develop for other purposes. The history of West End Park reveals how without dense surrounding habitation, proximity to the prestigious and powerful, intense usage, or structural investment, public parks could fall prey to official convenience and competition from surrounding interests.

King's Park

Even though the Kowloon district had become densely populated by the turn of the century, inclusion of public parks in its development seemed largely an afterthought. Orderly blocks of development marched uninterrupted the tip of the peninsula northward along the flatter west side of the peninsula, which was expanded by new reclamation over time, while shipbuilding and maintenance facilities dominated the east coast of the peninsula. In the center, however, stretched an undeveloped and rather topographically uneven plot of land of around seventy acres, which had been used by the British military as a shooting range. In 1899, Charles Ford, who had been the superintendent of the Botanic Gardens since 1871 and subsequently of the Botanical and Forestry Department, proposed this area be developed as a public park, and it acquired the title of King's Park as a dedication upon the coronation of Edward VII.³⁰ The park was ceremonially opened on August 6, 1902, by Lieutenant Governor Gascoigne and his wife with the planting of a camphor tree, but nothing else was done immediately for the laying out of the grounds.³¹

Already in 1904 (the year after Charles Ford's retirement), however, the plans for this area as an ornamental park began to unravel, as the plan to combine "accommodation for games with a certain level of landscape effect" for the southwestern part of the park had already been compromised by demands for sport fields.³² The Botanical and Forestry Department made continuous attempts to plant the park (presumably around the periphery on the hill occupying the northern end of the park) from the 1900s through the early 1920s, but they were met with challenges from plant theft and the grazing of goats and cattle, indicating that locals did not understand the intended function of the park, and perhaps that its boundaries were not clearly delineated.³³ The final transfer of King's Park into a primarily an area dedicated to sport rather than passive recreation is noted in 1924, "This area has now been laid out by Public Works Department as a sports ground and all flowering trees have been lifted and removed..."³⁴ The government had devised a scheme to lease the lands of the park to private clubs (thereby presumably relieving themselves of the burden of maintenance) by 1925.³⁵ July 1935 topographical maps reveal that the entire southern end of the park had by that point been allocated to the sports facilities of the Y.M.C.A, the Club de Recreio, the Kowloon Indian Tennis Club, the Filipino Club, the Netherland Club, the German Club, the China Light and Power Recreation Club, the Royal Navy Recreation Club, and the Central British School. The northern end of the park, which was undeveloped at this stage, in the later 20th century filled with government and other high-rise residences, leaving only a hill with a water reservoir and a playground area unoccupied. The lack of a distinctive, cordoned-off identity for King's Park led to vulnerability which allowed it to initially be unrecognized by locals and then to be colonized by private (and indeed sometimes other public) interests.

King George V Memorial Park

The last of Hong Kong's public parks of the city's first century was King George V Memorial Park on Kowloon. This park was indirectly a result of the national memorial proposed in 1936 for the recently deceased King in the United Kingdom in the form of the construction, funded through public donations, of playing fields across the country.³⁶ The Governor's executive council, in view of the unlikelihood of finding enough donations to carrying out such large scale works in Hong Kong due to the Depression, promoted instead the idea that they should solicit donations for two public parks (one on the Island and one on Kowloon) with children's playgrounds. The park proposed for the Island would occupy the gardens and yet standing wing of the Civil Hospital and it was not constructed before the Japanese Occupation. The work on the Kowloon side, however, did commence on a rocky site at the junction of Canton and Jordan Roads (although initially the Government was also soliciting suggestions for alternative sites).³⁷ Relieving urban congestion by creating sites of "recreative and hygienic value" was a primary motive behind the choice of both sites.³⁸ Maps from earlier in the century reveal that the Kowloon George V Park occupied in fact a site adjacent where there had early been oil storage tanks. These had been cleared by the mid-1930s, but the Governor's speech (delivered by his administrator) for the opening of the park referred to its previous state as "a dusty, stony wilderness, an eyesore to the passer-by and a home of vagabonds."³⁹ In its 1941 form, designed by Palmer & Turner (then Hong Kong's most prominent architectural firm), this park covered 94,000 square feet and featured a Chinese style gate with bronze doors and a bronze plaque of the king, lawn, seats, and a children's

playground.⁴⁰ The park was characterized as “something done for the greater happiness of the ordinary citizen,” and as having local Chinese from the neighborhood as its primary future users.⁴¹ Within six months, the Japanese occupation would change the way the city functioned, and all parks were under threat in the deprivations which followed. To judge by the post-war redesign and expansion of King George V Park, however, the place was well chosen to suit local needs. The parks survival seemed guaranteed by intense local investment, a substantial on-site monument (the gate), and regular and intensive use.

Conclusion

This survey has examined four largely intact and two compromised parks from Hong Kong’s first century. What it has revealed is that clearly defined boundaries, notable congestion relief, shared community and government investment, visible attractive improvements, and emblems of shared identity (whether that be in terms of articulated Chinese location or imagined Imperial community) all contributed to park resilience. Vague boundaries, lack of construction, or vulnerability to competing private interests could, on the other hand, compromise parks. These are meaningful lessons both to future protectors of public green space in Hong Kong (where it remains threatened by development, as reflected in recent debates about the use of country parks for housing construction) and also to park planners globally.

⁶ Loudon and other garden designers of the second quarter of the 19th century introduced the idea that within the previous tradition of naturalistic English garden design, geometric beds with specimen flowers and other plants should be reintroduced. Following this design strategy, the Botanic Gardens, although partially set within an organic plan, contained discrete formally designed beds that displayed botanical specimens.

Planning a National Park in Lower Yangtze Delta, China -- Taking the 1929 Taihu National Park Plan by Mr. Chen Zhi as a Case

Tianjie ZHANG*, Kailai WANG**

*Associate Professor, Tianjin University, arch_tj@126.com

**Postgraduate, Tianjin University, 296464724@qq.com

Chen Zhi(陈植)'s *National Taihu Lake Park* published in 1929, is the first planning of our country's national park. This article attempts to analyze the beautification and recreation of Chen Zhi's conception. The author starts with the development of the national park at that time and the practice experience of Chen Zhi, combing the Taihu Lake(太湖) watershed's natural and social conditions. What's more, the author interprets the planning text of Taihu Lake from four aspects, including landscape resources, traffic system, supporting facilities, and construction of scenic forests. Based on this, this article analyzes Chen Zhi's considerations of drawing lessons from abroad and integrating them into the local culture, pursues the relevance of its design concept with America and Japan, and presents the spread of national park's concept in our country in the same period.

Key Words: National Park, National Taihu Lake Park, Chen Zhi, Design Considerations

The national park is a land or water conservation area protected by the country, which is for people's recreation or wildlife survival. It plays an important role in cultural heritage and natural environment protection. China's earliest national park planning was in 1929. Commissioned by the ministry of agriculture and mining, Chen Zhi(陈植) planned the Taihu Lake(太湖), which has an area of 36,000 hectares between Jiangsu(江苏) and Zhejiang(浙江) provinces, as "National Park".

This planning is a relatively systematic and comprehensive design of national park. It is a modern case with historical values in the development of China's national parks. This article attempts to interpret this plan in the context of the society at that time, analyzes its considerations of drawing lessons from abroad and integrating them into the local culture, and pursues the relevance of its design concept with America and Japan.

Figure 1 Design Text Structure of *National Taihu Lake Park*

Number	Name of chapters	Main contents
1	Preface	Construction status, definition, nature, development purpose and benefits of national park
2	Park style	Taihu Lake has a large scale, including four parts and seven regions
3	Park landscape	Taihu Lake is rich in landscape resources, including two Dongting mountains, Maji Mountain; Wu River, Wuxian County, Wuxi, Wujin, Yixing, Changxing, and Wuxing that surround the lake
4	Required transportation system for development	Land traffic, water traffic and electrical traffic should be considered in the construction of park
5	Required corollary equipment for development	The construction of the park requires supporting facilities, including restaurants, hotels, swimming pools, electric lights, botanical gardens, zoos, sports grounds, parking lots, signs, museums, pavilions, benches, bridges and sentries

6	Construction of scenic forests	The national park's tree design should focus on scenic forests and street trees
7	Conclusion	Have a firm determination to implement, remove the barrier of lake bandits, contact relevant departments, and complete the construction of the National Taihu Lake Park with concerted efforts of central and local governments

1. Development Status of National Park

The construction of national parks can be traced back to 1872 when the United States established the world's earliest Yellowstone National Park. In the initial stage of development, representatives of the eastern America's intellectuals including artists, explorers and litterateurs came to realize that the Western Development had posed a threat to the original natural environment in the west. In addition, railway companies have found the potential value of using western landscape as tourism resources. Therefore, the idealists who protected the nature and the pragmatists who emphasized the development of tourism joined hands to urge the Congress to protect the peculiar landscape of the west, thus establishing the national park system. The exploration of the United States provides a reference for Chen Zhi's design of China's national parks. Following the United States, Canada, Australia and New Zealand established their national parks[2] respectively in 1885, 1879 and 1887. Basically at the same time, the concept of national park was introduced into Japan. The development of Japanese national park continued to 1930 (the design of Chen Zhi's Taihu Lake National Park was completed) after going through two stages of concept discussion and scale construction. In the early years of concept discussion, Japanese geographers and new mountaineering enthusiasts began to protect the "natural landscape of Japan", while railway experts hoped to stimulate the development of railway and tourism industry to earn foreign exchanges through the establishment of national parks. The stage of scale construction began after the enactment of the National Park Law in 1931. Since then, 12 national parks (Figure 1) were established between 1934 and 1936, and most of them were located in remote areas such as mountain areas or seaside. Nikko designated as the imperial park (帝国公园 teikoku kōen) in 1911.

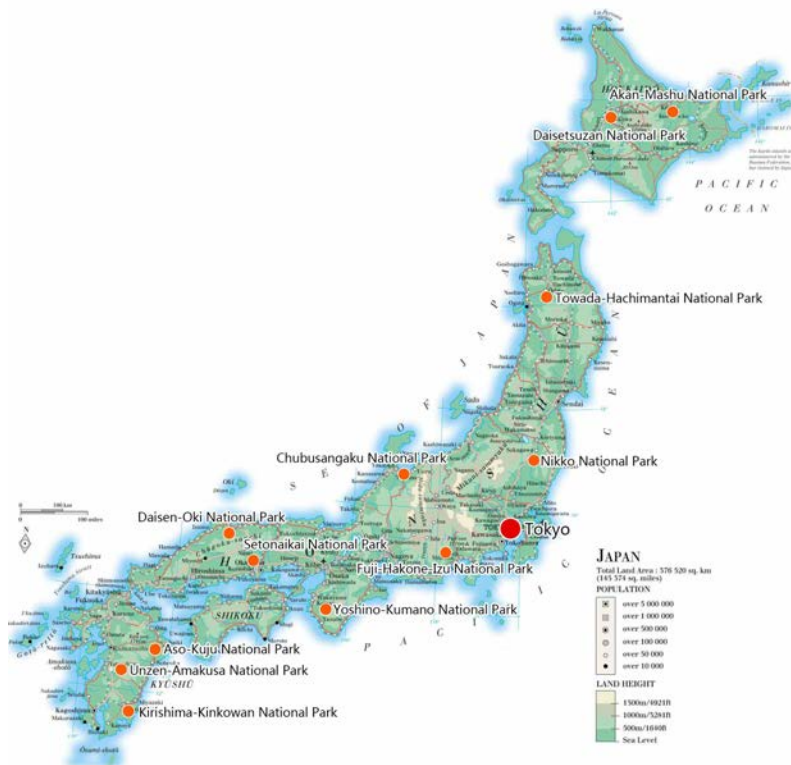

Figure 1 Distribution diagram of Japan's first batch of national parks, 1931 (Repainted by the author from Japanese elevation map)

In the 1920s, Chen Zhi learned the concept of national parks in the United States and Japan. In his *Conspectus of Landscape Making* written in 1928, the first part combed the history of gardening in China, the West and Japan. The history of western gardening alone mentioned the United States, and emphasized that there were much development and utilization of its large-scale parks. The part of Japanese gardening particularly emphasized that "the father of the Japanese National Park", Tamura Tsuyoshi (田村刚 Tiancun Gang), had played an important role. He pointed out in the book, "Dr. Tamura Tsuyoshi has made great efforts to promote the construction of the national park and to write books concerning the gardening (Figure 2)." Tamura Tsuyoshi put forward that natural park was set up for national health care and visits of overseas tourists. Based on natural resources in Japan, he emphasized the importance of Japan's mountains, lakes and hot springs, and puts forward specific requirements for location, scale and matching facilities.

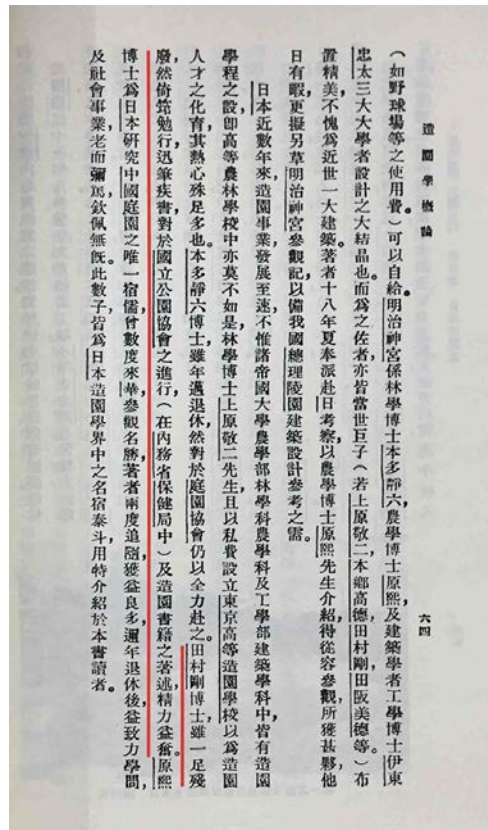

Figure 2 Chen Zhi's comments on Tian Cungang, 1935 (Cited from *Conspectus of Landscape Making*)

2. Professional Education of Chen Zhi

Chen Zhi was born in the intellectual family in 1899. At the strict request of his father, he went to private school at the age of 7, and he received a good humanistic tradition from childhood. After graduating from the first high school in Chongming in 1914, he was admitted to Forestry Department of Jiangsu provincial first agricultural school because of his excellent grades. The agricultural school was established and developed in 1913 under the guidance of Huang Yanpei, director of the Education Department of Jiangsu Province, who advocated pragmatism and vigorously developed industry. From 1919 to 1922, Chen Zhi entered the Tokyo Imperial College's Department for Agriculture, specializing in forestry and gardening. This department was the largest and most complete agricultural college in Japan at that time (Figure 3, Figure 4). Chen Zhi's courses included agriculture, forestry, forest utilization, horticulture, plants, animals, economics, agricultural engineering, farm internships and so on. His mentor was the famous Japanese landscape architect Honda Seiroku (本多静六 Benduo Jingliu), known as the "Father of the Japanese Park" and the "Father of Japanese Forestry." He was also a special member of the National Park Organizing Committee. In 1919, at the same time when Chen Zhi was admitted into the school, Tamura Tsuyoshi, the "Father of the National Park of Japan," also entered the Department for Agriculture as a lecturer, providing Chen Zhi with the possibility to understand the concept of national parks.

Figure 3 Aerial view of Tokyo Imperial College's Agriculture and Forestry Academy, 1926 (Cited from <http://www.a.u-tokyo.ac.jp/history/>)

Figure 4 Forest farm of Tokyo Imperial College's Agriculture and Forestry Academy, 1920 (Cited from <http://www.a.u-tokyo.ac.jp/history/>)

After returning to China in 1922, when the National Taihu Lake Park was designed, Chen Zhi served as a teacher in Jiangsu's first agricultural school, and the technical director and field director of the Jiangsu Education Group Public Forest (later renamed as Jiangsu Education Forest). Moreover, he put himself into the construction of practical projects like the Zhenjiang Zhaosheng Park. (now known as Jin Boxian Park). Many of Chen Zhi's achievements directly or indirectly reflect his concept of gardening, and laid the foundation for planning the national park. Chen Zhi had his own understanding of the national park. In terms of definition, Chen Zhi believed that: "The national park is characterized by the interest of the people, and its cause is to preserve and develop the landscape. The purpose of the national park is to protect historical and scientific materials from being destroyed. Besides, it has complete facilities for public recreation." In terms of importance, he concluded: "With lush forests, various security roles can be achieved; with frequent traffic, the local economy can be promoted, and robberies can be avoided; with a prosperous business, land values can be increased and various professions can be promoted such as farm, industry and commerce; in terms of environmental relations, its influence is huge" This not only focuses on the landscape space, but also pays more attention to the planning perspective of economic or model level, which responds to the development of Japanese national parks' original intention.

3. The History and Present Situation of the Taihu Lake Watershed

The Taihu Lake watershed has been known for its beautiful landscape since ancient times. In the Jiajing period of the Ming Dynasty, Wang Wen, a famous hermit, once engraved on the Hushan song tablet to praise the charming scenery of Taihu Lake. In addition, he also created *A Picture Describing the Returning to the Baojie Mountain* (Figure 5), showing the beauty of thatched cottages, fisherman's tillage, and the swaying of flat boats around Tortoise Head Garden. In 1924, after visiting the Taihu Lake, Guo Moruo wrote in the *Drifting Trilogy-Purgatory*: "The sun is going to fall. The seventy-two peaks on the lake are sometimes dark blue, sometimes light purple, and sometimes are hung over by the white vague mist. Half of the golden light from the west sky turns the lake into orange." This is also a high praise for the beauty of Taihu Lake.

Figure 5 *A Picture Describing the Returning to the Baojie Mountain*, Ming Dynasty (It is now a collection of the Palace Museum, provided by Huang Xiao)

By the middle of the 20th century, the *Taihu Lake Landscape Line* contained precious images during the period of the Republic of China (Figure 6). It vividly displayed the overall scene of the Taihu Lake's thousands of flat boats and the brilliance of light and shadow. In addition, it described the distinctive scenery of Tortoise Head Garden and Maji Mountain separately. Most of these photos have the cultural landscape intentions such as pavilions, terraces, boats, etc. At that time, people have naturally combined the beautification of landscape with the tourists' recreation, and have regarded both of them as an important part of the "landscape" of Taihu Lake.

Lots of sailboats are competing across Taihu Lake fiercely

Jichang Garden in Huishan

Figure 6 Landscapes of Taihu Lake Basin(Quoted from reference [6])

4. National Taihu Lake Park

Based on superior natural and social conditions, Chen Zhi completed the planning of the National Taihu Park. At that time, people had already recognized the scenery of Taihu Lake that combined nature with the man-made. Chen Zhi had accepted a certain concept of national park. Therefore, on the one hand his design took the beautification of the Taihu Lake landscape into consideration, and on the other hand, he maximized its recreational functions from the perspective of park development and construction. Chen Zhi inspected the landscape resources of the Taihu Lake Basin in detail and conceived the development and construction of the park in terms of traffic, supporting facilities and the construction of scenic forests.

4.1 Remarks on Landscape Resources

Chen Zhi's commentary on landscape resources starts with the existing natural and artificial landscapes, taking into account the landscape's beautification and utilization potential, as well as the consideration of recreational facilities.

On the macro structure, Chen Zhi described the grand scene of the Taihu Lake region and elaborated the landscape pattern of Taihu Lake. Maji Mountain and Dongting Mountain are the skeletons of the region. Dagong, Xiaogong, Qianshan, Shaoshan and other natural landscapes are embedded therein. It also summarizes the four forms of lakes, islands, plains, and mountains in the Taihu Lake region. On the landscape of the Middle View, Chen Zhi discussed the landscapes by dividing them into two parts--landscapes in the lake and landscapes around the lake. In the lake, the three islands of Dongshan, Xishan and Majishan were introduced in detail (Figure 7). There are cultural landscapes such as the Ancient Snow Temple and Tsz Wan Temple in Dongshan. Swimming pools and bathing areas can be built in Xishan Mountain. Maji Mountain needs protection owing to

severe deforestation. Around the lake, Chen Zhi divided the landscapes into 7 regions, namely Wujiang, Wuxian, Wuxi, Wujin, Yixing, Changxing and Wuxing.

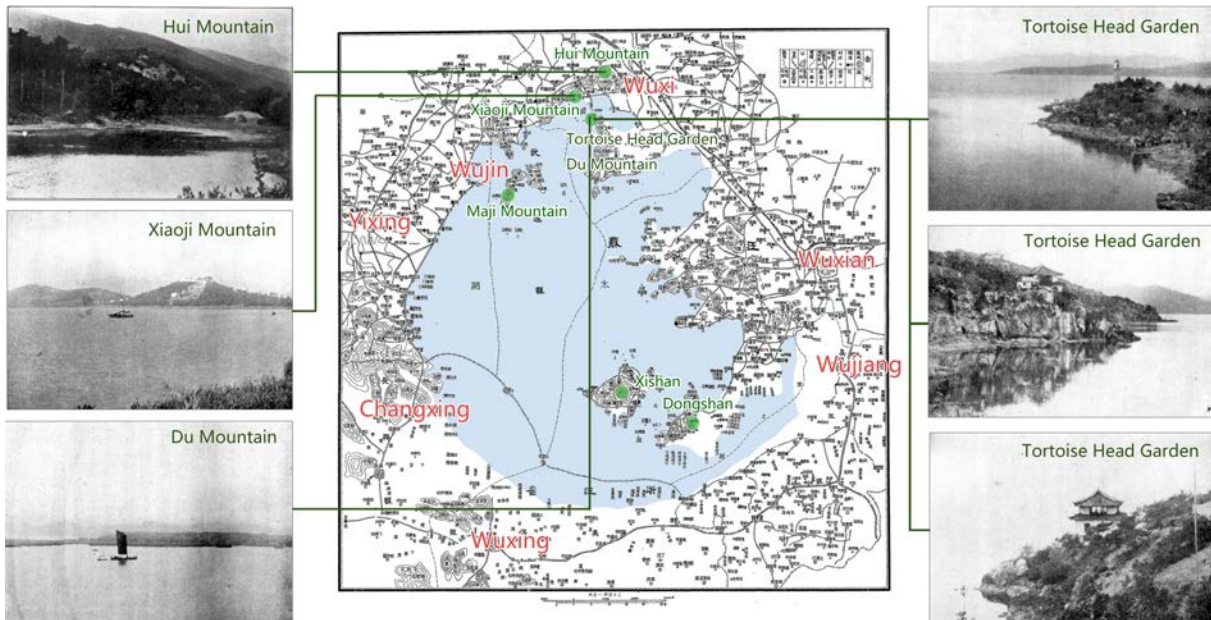

Figure 7 Chen Zhi's photographs and plans of the Taihu Lake Basin (redesigned from reference [5])

Chen Zhi's understanding of the landscape is also an environmental aesthetics concept that inherits Chinese traditional concepts. It integrates nature and the man-made. Text and photographs in the design text confirm this. Natural mountains, lakes, springs, islands, rock formations, and the view of the eagle flowing in the sky and the fish leaping in the water are what Chen Zhi pays attention to. Artificial temples, pavilions and terraces, and farming and fishing are also things he wants to beautify. In response to people's needs, Chen Zhi conceives two areas suitable for bathing in Wuxi and Xishan to provide recreational activities outside sightseeing. However, Chen Zhi's use of the lake does have some limitations. In the Theory of Cities and Parks, there are explanations for the use of water. For the use of waterscapes such as Xuanwu Lake, Daming Lake, and West Lake, natural tourism is still the main theme. Occasionally, activities such as swimming, fishing, and cruises are mentioned. Contents of dredging and water management etc. need to be deepened later.

4.2 Transportation System Planning

On the basis of exploring landscape resources, Chen Zhi takes into account the realization of the recreational functions of the national park, which requires a convenient transportation system in the Taihu Lake Basin. Chen Zhi has designed the traffic system from three aspects of water transportation, land transportation and electrical transportation. In terms of land transportation, Chen Zhi takes the Huanhu Road and Huanshan Road into consideration and emphasizes that "in a small area, we should intentionally twist the road to attract people, so as to extend the time; and in a large area, the width of the road should be wide, and cars should be driven straight. Time is the principle." There are detailed considerations for the width and type of the road. In terms of water transportation, Chen Shi emphasizes the necessity of water transport in light of the current state of national parks. "This park is centered on Taihu Lake, and its watersheds are numerous, so if we would like to have a glimpse of the lake...and get a view from all over the mountains, we will need boats. Otherwise, it will be difficult to get things done." The configuration of steamboats, sailboats, and melon boats has been planned in detail. In the area of electrical transportation, telephone and telegram should be set up to make the information more timely. The supporting facilities for this type of communication facilities are incorporated into the transportation system by Chen Zhi. The design of the three above mentioned aspects not only focus on the time, but also meet the needs of development for a period in the future.

4.3 Perfection of the Supporting Facilitates

In addition to transportation, the supporting facilities of the park are indispensable for the realization of recreational activities. Chen Zhi emphasizes that Taihu Park should be built with restaurants, hotels, swimming pools, electric lights, botanical gardens, zoos, playgrounds, parking lots, signs, museums, pavilions, benches, bridges, and guard posts. The design of Taihu Park mainly has two characteristics:

The first point is the design of tourist-oriented considerations, including the number of facilities, their forms, and even their production methods and operating channels. In the design of the swimming pool, the needs of different groups are also taken into account and several women's swimming pools should be built. The second point is to fully understand the significance of national parks for scientific research. In the construction of many ancillary facilities, services for scientific research should be mentioned. For example, in the construction of the museum, it is said that "for the purpose of academic research, all the materials in the hospital are concentrated." It can be said that Chen Zhi's consideration of the significance of the construction of the national park is very profound, considering future scientific research needs. Of course, there are also imperfections. In terms of the number of supporting facilities, he emphasizes that "more and better" and does not give a suitable reference range.

4.4 Construction of Landscape Forest

Regarding the beautification of the landscape, Chen Zhi also relies on his professional advantages to separate the construction of scenic forests (including scenic forests and street trees) into a chapter. He believes that the scenic forest should regard "beauty" as the main purpose, and "regard reconciling colors as the top priority." The scenic forest, also known as Fuchirin (风致林 Feng Zhilin) [4], is a term used in agriculture and forestry in Japan. The Japan scenic forest is a protected forest that is set up to protect the historical sites and natural landscapes of shrines and temples. Tamura set up a research room for scenic forest planning in 1920 and emphasized that landscape forests are an important factor in the landscape. It not only has a unique aesthetic feeling, but also sets off the background of the main theme of the landscape. It plays an important role in the aesthetic and ecological aspects. [16]. This idea is once again given direct feedback in Chen Zhi's planning of the national park.

As for the planting of landscape forests, Chen Zhi considers it from the perspective of tree species and operations. In terms of tree species, he believes that the Taihu Lake basin is "very suitable for the planting of various warm-banded trees." He also emphasizes the use of native plants. In terms of operations, it may not be too much because of space limitations. As for the planting of street trees, Chen Zhi also specifically mentions tree species, such as poplar, weeping willow, acacia, and so on. In terms of operations, there are also detailed regulations on the planting modulus of street trees. In consideration of the large number of trees required, Chen Zhi believes that there should be a large number of nurseries in need to prepare for the need.

5. Summary and Suggestions

This Taihu Lake project is a representative of the international communication of the national park concept, and is the embodiment of the concept's initial dissemination in China. Chen Zhi's National Taihu Park design has three major breakthroughs:

First of all, he fully realizes that the purpose of the establishment of the national park is to protect the economy and to protect natural human resources, emphasizes the recreation and beautification of the landscape, and innovatively puts forward the significance of the national park for scientific research. Second, he plans the National Taihu Lake Park in detail, changing the method of protection from a passive one to a positive one, and he hopes that people will have more chances to be close to nature and to study nature. Third, Chen Zhi combines the background advantages of his professional agricultural and forestry knowledge and his landscape architecture knowledge, introducing the concept of scenic forests into China, and plans and designs agricultural and forestry special projects for national parks.

After years of development, certain achievements have been made in the protection and development of the Taihu Lake Basin. In July 2016, the Overall Planning of Taihu Lake Scenic Area (2001-2030) was approved by the State Council and was replied by the Ministry of Housing and Urban Development. The Taihu Lake Scenic Area has ushered in new developments. This is a modern response to the idea of Chen Zhi's National Taihu Lake Park. The Taihu Lake landscape will be continued in the new round of construction.

Rethinking of Japan's Oversea Concession

What did Eiyo Ishikawa look at in Chinese and Korean cities under Japanese rule and occupation in the 1930s?

Naoto Nakajima (The University of Tokyo)

Japan conquered a significant part of East Asia in the first half of the twentieth century. It is said that this resulted in the so-called occupation planning being implemented in a one-way imposition of Japanese-style urban planning. Researchers in Japan and other countries have been interested in plans and planning systems made by the Japanese, who were pursuing a purely professional ideal and pioneering approaches in colonial cities as an experimental field. However, there has been little interest regarding the subtleties of feeling and the inner struggles of Japanese planners in the literature (let alone of local planners). In particular, there has been no discussion of how Japanese planners were influenced by the East Asian cities they conquered. What did they look at there? We argue that colonial/occupation urban planning was a kind of interactive process between planner mindsets and urban realities.

Eiyo Ishikawa (1893-1955) was a leading urban planner in pre-war and post-war Japan. In addition to being engaged in important planning projects including suburban land readjustment projects in Nagoya, Kanto regional planning, and Tokyo reconstruction planning, he wrote many influential books and unique articles on urban planning.

Ishikawa published his travels—while attending conferences and inspecting cities under Japanese occupation in the 1930s—of Korea, China, and Manchukuo. In his travel articles, he showed his curiosity and respect for local customs and traditions as well as sympathy for peoples who had been conquered. He wrote that Japanese urban planning had to learn from Manchurian local amusement and shopping districts, and he criticized tasteless Japanese colonial planning.

In 1938, Ishikawa stayed for four months in Shanghai making the Great Shanghai Construction Plan with other planners and engineers at the Japanese army's request. During his stay, he frequently visited local theatres and cafes, enjoying Chinese dramas and music, which seemed to be the essence of urbanity for him. He eventually insisted on adopting Chinese-style recreation areas into the Great Shanghai Construction Plan. Mainly through the rediscovery of Ishikawa's experiences recorded in his publications, we can shed new light on colonial/occupation urban planning.

Comparative Study about the City Planning Systems in Taiwan (for the Years 1895-1945) and Korea (for the Years 1912-1945) under Japanese Rule

Yasushi Goto (Yokohama Municipal Government)

This study compared the city planning systems in Taiwan (for the years 1895–1945) and Korea (for the years 1912–1945) under the Japanese rule. In Japan, the City Planning Act and the Urban Area Building Act were independent of each other. However, the Taiwan City Planning Order and the Korea Urban Area Planning Order included not only urban planning but also building construction control. These orders were continuously used by the Republic of Korea or the Republic of China after World War II. Existing researches have elucidated that these orders were more advanced than Japanese City Planning Act. The author's research has derived completely different conclusions. The reason why both urban planning and building control was included in one order was only to simplify the procedure for formulating orders. Taiwan City Planning Order and Korea Urban Area Planning Order had been created from Japanese City Planning Act and Urban Area Building Act as its transplant, rather than being developed independently. Therefore, the planning orders of those colonies had the same basic structure. Urban Improvement Programs in the early years of the colonized era of Taipei and Seoul had conformed to systematic street Improvement plans of that time. However, the features of those plans were significantly different. Taipei's plan to improve the environment had restricted the private right for land and controlled not only street improvement but also the sewage and building constructions. Seoul's program was executed as part of the national road construction. It was merely road construction in urban areas and had not restricted the private right for land; sewage and building constructions were not considered. Therefore, in general, the introduction of the Taiwan City Planning Order and the Korea Urban Area Planning Order standardized urban planning systems between Taiwan and Korea. The Korea Urban Area Planning Order and the Taiwan City Planning Order were drafted after Japanese City Planning Act, which reflected Japanese operational experience. In the comparison between statements of the planning laws and the orders at the time of enactment, the planning orders of those colonies may appear more advanced than those of Japan. However, since Japanese planning laws have also been revised, there was no substantial difference between its planning laws and the planning orders of those colonies at the same time. It is reasonable to see that the planning laws and orders had been improved as a group rather than being regarded as a simple binary confrontation between advanced colonial planning orders and old-fashioned Japanese planning laws. Case studies of modern city planning in Japan, Korea, and Taiwan serve to be valuable experiences to each other.

Yukaku (red-light district) and city planning in Japanese colonial cities in Taiwan, 1895-1945

Masaya Sammonji (The University of Tokyo)

In 1895, Taiwan (Formosa) was ceded to Japan by the Qing dynasty. At the earliest period of the Japanese rule, a crowd of Japanese prostitutes immigrated to Taiwan, which opened an era when sex industry of both Japanese and locals appeared broadly in the cities. Then, aiming to solve sanitary and security issues, Japanese colonial government started to set “kashizashiki designated area (also called yukaku simply)” in each city in 1896, and allowed prostitutes to do their business only inside the area. Although these designations were set only in part of cities, they based on the various situations of the cities at the time and provided the rough location planning of colonial cities far earlier than other well-studied urban policies or plannings, such as the “city improvement plannings (shiku-kaisei)” started in 1900, constructions of shrines, and so on. Thus, in this context, these designations can be considered as the earliest “silent” planning of the Japanese colonial cities.

After that, some yukakus moved to another location in the cities once or more, in response to city growth and progress of the “city improvement planning” . In this way, the transition of the location of yukakus, which can be called “silent” city facilities, was influenced by the shape of cities or various city plannings, and also influenced them at the same time.

This study aims to find a new meaning of the transition of yukakus’ location in Japanese colonial cities in Taiwan, in terms of planning theory. It will provide a new perspective for the planning history of Japanese colonial cities.

Japanese Emperor’s Visualization Facility ——The Construction of Yamato Park in Tianjin former Japanese Concession

Yuan Sun (Beijing Jiaotong University)

In the 18th- 19th centuries, it was the era of the concept of "Nation-state" in European countries. In the process of Nation-state construction, governments of various countries created public buildings and parks to shape the country's image and form an imagination Community. With the establishment of the concession, this form of expression has also been brought to Japan, China, Korea and other Asian countries, affecting the urban form of Asian countries with a "civilization" standard. As the political and cultural center of the Japanese concession, Yamato Park’ s regional architecture and spatial forms are not only closely related to the background of its time, but also serve as a system for governing and governing its overseas nationals and forming a common imagination with the home country. This article analyzes the early planning, gardening style, architectural style, public activities and other aspects of the Yamato Park area, and analyzes the formation background of the modern mixed urban landscape in Tianjin.

Comparative Study about the City Planning Systems in Taiwan (for the Years 1895–1945) and Korea (for the Years 1912–1945) under Japanese Rule

GOTO, Yasushi*

* Dr.Eng., Yokohama Municipal Government, BXM04554@nifty.ne.jp

Some existing studies have argued that the City Planning Orders of Japanese colonies were more advanced than the City Planning Act of Japan. The grounds are the integration of building control and city planning, the open-space district and their continued use by the Republic of Korea and the Republic of China after World War II. However, urban planning and building control were included in one system only to simplify the procedure for formulating orders. Furthermore, the Republics of both Korea and China continued using them for a comprehensive policy and an emergency evacuation, not because of order evaluation. Korea Urban Area Planning Order of 1934 and Taiwan City Planning Order of 1936 were created from the City Planning Act of 1919 and the Urban Area Building Act of 1919, reflecting the operational experience of Japan. These acts and orders have been improved as a group. Case studies of modern city planning in Japan, Korea and Taiwan are valuable references to each other.

Keywords: Taipei, Seoul, Taiwan, Korea, Colony

1. Introduction

This study compares the city planning systems in Taiwan (for the years 1895–1945) and Korea (for the years 1912–1945) under the Japanese rule. In Japan, the City Planning Act and the Urban Area Building Act formulated in 1919 were independent of each other. However, the Taiwan City Planning Order (1936) and the Korea Urban Area Planning Order (1934) included both urban planning and building construction control. These orders were maintained by the Republic of Korea and the Republic of China after World War II. Previous researches have elucidated that these orders had more merit and were more advanced than Japan's City Planning Act.

Regarding Japanese colonial city planning, the studies of Son¹ and Huang² on Korea and Taiwan, respectively, are well known. They were studied mainly as part of the city planning history of their own countries. Therefore, these studies rarely mentioned the relationship between the Japanese city planning laws and the colonial orders, or the relationship between the colonial orders each other. Several Japanese researchers considered the city planning of Korea and Taiwan as derivations from Japan's systems.

Koshizawa wrote that 'In the colonies of Japan, the relationship between city planning administration and building control administration was closer than those in Japan, both the Korea Urban Area Planning Order of 1934 and the Taiwan City Planning Order of 1936 included building control, and their urban regulation methods were more advanced than those of Japan'³. Here, the urban regulation methods refer to the integration itself of building control and city planning, and the open-space district which analysed by Ishida. Ishida evaluated the colonial orders as more advanced system based on the existence of the open-space district, and said 'City planning bureaucrats who could not realize ideals in Japan may have tried to realize their dreams in colonial city planning'⁴. Koshizawa also stated that 'The Republic of Korea and the Republic of China had used these orders until the 1960s. However, both of the governments separately devised city planning law and building law. They abandoned the merits of the orders'.

Goto analysed the drafting process of the Korea Urban Area Planning Order (1934)⁵ and the Taiwan City Planning Order (1936)⁶ and identified the Urban Improvement Programs previously adopted in Seoul and Taipei⁷. The present work re-examines these topics in light of new studies by Goto. Specifically, the differences in the Urban Improvement Program between Seoul and Taipei, the drafting process of the orders and the reasons for including building control, establishing the open-space district and the continued use of the orders by the Republic of Korea and Republic of China are revealed.

The arguments in this paper based upon historical materials including administrative documents, newspapers and magazines. *Keijō nippō* and *Maeil sinbo* were considered agency papers of the Government-General of Korea. *Taiwan nichinichi shinpō* was considered agency paper of the Government-General of Taiwan.

2. Taipei Urban Improvement Program

2-1. Taipei Urban Improvement Plans

The Government-General of Taiwan promulgated⁸ the Taipei Urban Improvement Plan Committee Regulations on 29 April 1897 and announced⁹ the plan of streets and parks inside Taipei's wall as a first Urban Improvement Plan (Figure 1) on 23 August 1900. In addition, the Government-General of Taiwan promulgated the No. 30 Order on 21 November 1899¹⁰ to ban the building houses on the urban facility sites designated by the Urban Improvement Plan. On 23 August 1905, the Government-General of Taiwan extended¹¹ the area of the Urban Improvement Plan (Figure 2) to the whole old city.

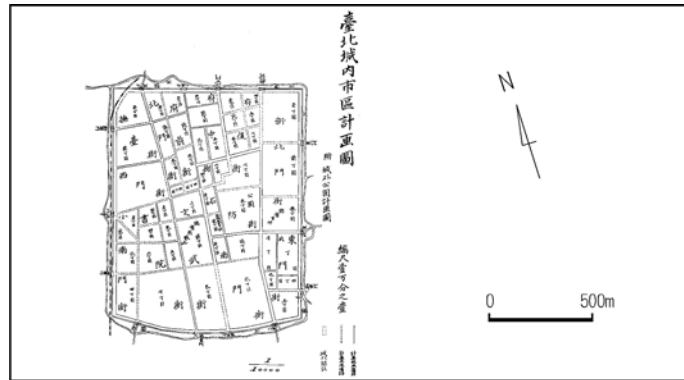

Figure 1: *Taipei Urban Improvement Plan of 1900* (Taipei Prefecture Notification No. 64, 23 August 1900).

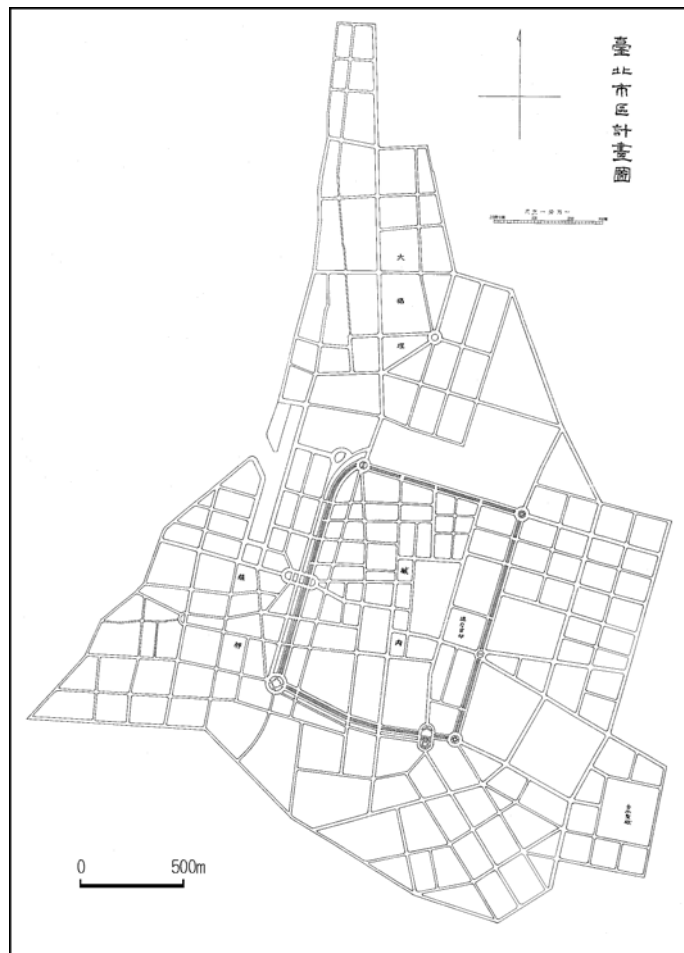

Figure 2: *Taipei Urban Improvement Plan of 1905* (Taipei Prefecture Notification No. 200, 7 October 1905).

2-2. Building Order, Water Supply and Sewerage

The Government-General of Taiwan established building specifications¹² with the Taiwan House Building Regulations (No. 14 Order of the Governor-General) released on 12 August 1900. In the Taipei Urban Improvement Plan Area, each building plan had to include arcades along the streets in accordance with No. 31 Order¹³ of Taipei Prefecture (1900).

The Taiwan Sewage Regulation (No. 6 Order of the Governor-General, 1899) was extended to the area of the Urban Improvement Plan by No. 9 Order¹⁴ of Taipei Prefecture (1909). The Taipei Water Supply Regulation (No. 8 Order of the Governor-General Office, 1909) was also applied to the Urban Improvement Plan Area¹⁵, and The Urban Improvement Plan integrated diverse urban construction methods¹⁶.

2-3. Purpose of Taipei Urban Improvement Plans

The Taipei Urban Improvement Plan Committee Regulations of 1897 defined the purpose of the Urban Improvement Plan as a formation of urban area blocks and completion of sanitation facilities. *Taiwan nichinichi shinpō*¹⁷ reported on the Urban Improvement Plan of 1905, 'The blocks in the Urban Improvement Plan were designed to be shifted from the north-south axis as a result of consideration of sunlight and wind direction'. The Government-General of Taiwan planned streets and sewers together to efficiently design the sewage system¹⁸.

Gotō Shinpei, the Chief of Home Affairs of Government-General of Taiwan, established the Taipei Urban Improvement Plan Committee and supervised it as Chairman. He thought of sanitary facilities as the substitute for religion in an effective colonial rule. Taipei Urban Improvement Plan included many sanitary environmental improvement measures because of his thoughts¹⁹.

3. Seoul Urban Improvement Program

3-1. The Streets Selected for Improvement in Seoul

On 6 November 1912, the Government-General of Korea announced²⁰ The Streets Selected for Improvement in Seoul (Figure 3) and started the improvement process. The selection of the streets was greatly revised²¹ in June 1919 (Figure 4). There was no rationale for that, but the Governor-General of Korea implemented the street improvement program in accordance with the Road Regulation of 1915 (No. 42 Order of the Governor-General Office of 1915)²². Furthermore, The Streets Selected for Improvement did not restrict the private rights on the sites where streets had been planned. The Notification Act was merely a schedule for street construction, as neither administrative action nor private rights on the sites were controlled, and the planning illustration was only reference information.

Figure 3: *The Streets Selected for Improvement in Seoul* (Government-General of Korea Notification No. 78, 6 November 1912).

3-2. Building Order, Water Supply and Sewerage

The Urban Building Regulation (No. 11 Order of the Governor-General Office of 1913) established building specifications²³. The buildings had to connect with roads, although The Streets Selected for Improvement was not included. The Government-General of Korea based the sewer system of Seoul on existing small-scale rivers. The Streets Selected for Improvement and the Sewerage Plan were not integrated. The Government-General of Korea bought and expanded the water facilities constructed by American businessmen²⁴ in Seoul, without relating them to The Streets Selected for Improvement.

Compared with the Taipei case, the urban improvement in Seoul did not incorporate The Streets Selected for Improvement with the maintenance of other urban facilities.

3-3. Purpose of The Streets Selected for Improvement

The Streets Selected for Improvement did not integrate water supply, sewers and buildings. It was limited to the maintenance of the streets and considered only as the road improvement of the urban area. It included the roads of Seoul's urban area previously renovated by the Government-General of Korea as part of the national highway maintenance. In other words, The Streets Selected for Improvement was the national highway maintenance plan for Seoul's urban area. The Government-General of Korea emphasised the maintenance of the national highway because of the colonial governance plan designed by Itō Hirobumi, the Japanese Residents-General of Korea. He considered road renovation as a prerequisite for promoting agriculture²⁵.

Figure 4: *The Streets Selected for Improvement in Seoul* (Government-General of Korea Notification No. 173, 25 June 1919).

4. The Drafting Process of the City Planning Orders

4-1. Background of the Korea Urban Area Planning Order of 1934

Son²⁶ explained that the Korea Urban Area Planning Order (No. 18 Order of the Governor-General of 1934)²⁷ was enacted because Rajin had to be systematically constructed as a base port city on the economic transportation route between Japan and Manchuria. However, *Keijō nippō's* article²⁸ shows that the drafting process had begun before the designation of Rajin. Furthermore, Goto's study²⁹, based on the urban planning survey report by the Government-General of Korea³⁰ and the lecture record of Naoki³¹, concluded that the primary purpose of the Korea Urban Area Planning Order of 1934 was to create substitute sites for public works in suburbs of Seoul by land readjustment. Shinba, Kōhei, Director of the civil engineering department of the Government-General of Korea in 1938, mentioned some differences between the Korea Urban Area Planning Order of 1934 and the laws of Japan, such as integration of city planning and building control, emphasis on urban expansion and creation of new urban areas³². The open-space district was institutionalised with an amendment in 1940³³. The Urban Area Plan of Seoul was announced³⁴ on 26 March 1936 (Figure 5).

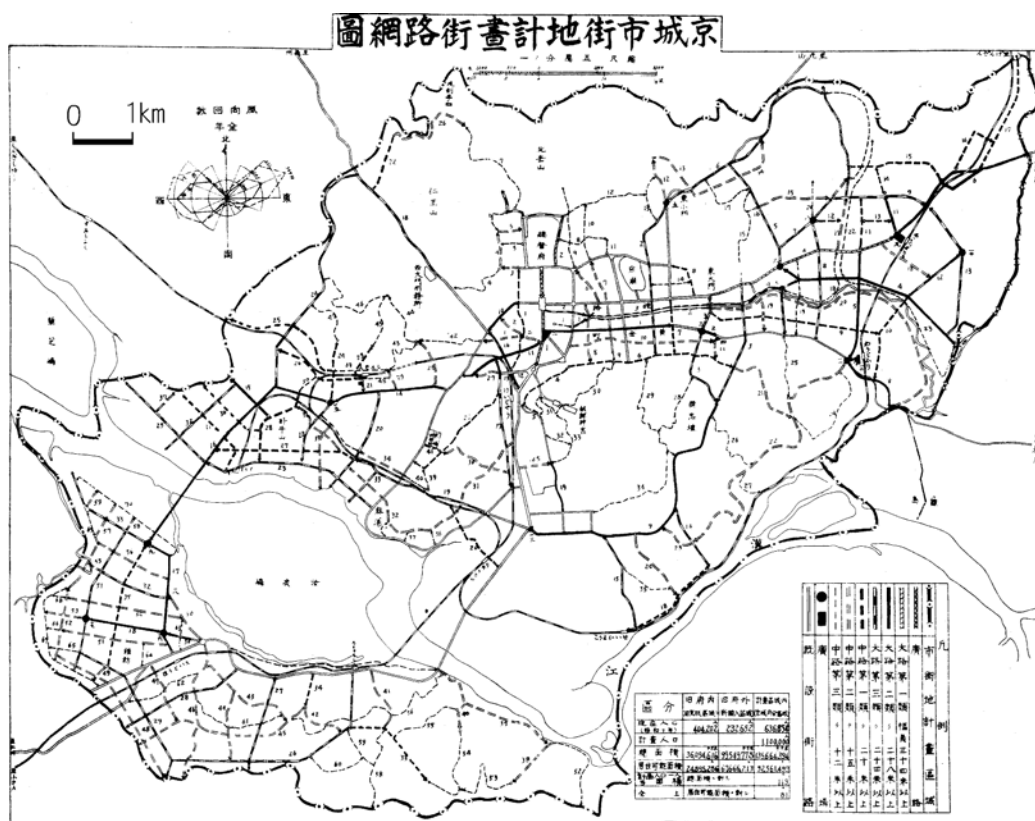

Figure 5: Urban Area Plan of Seoul of 1936 (Government-General of Korea Notification No. 180, 26 March 1936).

4-2. Establishment History of the Taiwan City Planning Order of 1936

The Government-General of Taiwan formulated the Greater Taipei Urban Improvement Plan on 7 March 1932³⁵ (Figure 6) to cope with the expansion of urban areas. However, no city planning order was enacted because of the contradictions in the legal system of Taiwan and unrelated to the technical aspects of city planning³⁶. The Taiwan City Planning Order of 1936 (No. 2 Order of the Governor-General of 1936)³⁷ differed from the City Planning Act and the Urban Area Building Act by introducing special use districts, provisions reflecting climate differences, etc.³⁸.

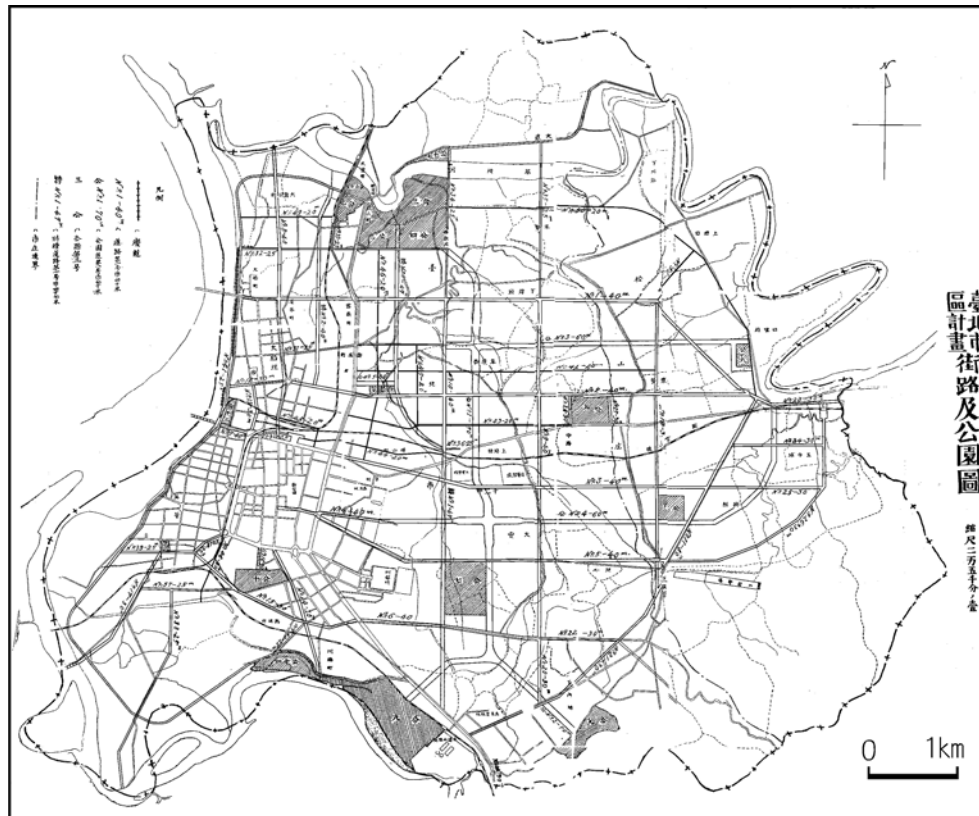

Figure 6: *Greater Taipei Urban Improvement Plan of 1932* (Taipei Prefecture Notification No. 54, 3 March 1932).

4-3. Mutual Inheritance Relationships and Differences between the City Planning Orders

Ushijima Syōzō, Director General of the Government-General of Korea, explained³⁹ that the draft of the Korea Urban Area Planning Order of 1934 was based on the City Planning Act (1919), the Urban Area Building Act (1919) and the Special City Planning Act (1923). Ogawa Hirokichi, entrusted by the Government-General of Taiwan, stated⁴⁰ that the parental laws of the Taiwan City Planning Order of 1936 were the City Planning Act (1919), the Urban Area Building Act (1919) and the Korea Urban Area Planning Order (1934). These orders were formulated according to previous laws and orders, which originated from the City Planning Act (1919) and the Urban Area Building Act (1919).

As mentioned above, the Korea Urban Area Planning Order (1934) differed from the City Planning Act (1919) by emphasising the creation of new urban areas. According to Ushijima, the application area of the City Planning Act was restricted to the cities, towns and villages designated by the Minister of Home Affairs, whereas the Korea Urban Area Planning Order was applicable wherever the Governor-General of Korea considered necessary.

When enacted, the application areas of the City Planning Act (1919) and the Urban Area Building Act (1919) were determined by Imperial ordinance, but the Japanese government revised it and transferred the decision authority to the Minister of Home Affairs. The City Planning Act was revised on 28 March 1933⁴¹, and the Urban Area Building Act on 6 April 1934⁴². In this way, when the Korea Urban Area Planning Order was promulgated on 1934, there was practically no difference about deciding the applicable area between Japan's laws and the Korean order. By comparing the planning laws and the orders at the time of enactment, the orders of the Japanese colonies may appear more advanced than those of Japan. However, since Japan's planning laws have also been revised in a second time, there was no substantial difference between the laws and the orders in the 1930s.

The City Planning Act (1933), the Korea Urban Area Planning Order (1934) and the Taiwan City Planning Order (1936) had the same approach in determining city planning, subjects for planning, land regulation methods, private rights restriction of the site and so on⁴³ (Table 1). The laws of Japan and the colonial orders shared the basic structure not because each colony developed independently its own plan but because the city planning system of Japan was transferred to the colonies. The city planning systems of Korea and Taiwan were standardised by the orders.

		Japan	Korea	Taiwan
System of laws and Orders	City planning	City Planning Act	Korea Urban Area Planning Order	Taiwan City Planning Order
	Building control	Urban Area Building Act		
Applicable place	City planning	(4/4/1919) Cities designated by the Imperial ordinance (Article 2) (28/3/1933) Towns and villages designated by the Minister of Home Affairs, and All cities (Article 2)	Not limited	Not limited
	Building control	(4/4/1919) Cities designated by the Imperial ordinance (Article 23) (6/4/1934) Areas designated by the Minister of Home Affairs (Article 23)		
Subjects for city planning		(4/4/1919) Important facilities to maintain public well-being or to promote welfare (Article 1 of the City Planning Act) Use districts are determined as the urban facilities (Article 10 of the City Planning Act)	(20/6/1934) Important facilities necessary for the creation or improvement of urban areas (Article 1) Use districts are determined as the urban facilities (Article 25)	(27/8/1936) Important facilities necessary for the creation or improvement of urban areas (Article 1) Use districts are determined as the urban facilities (Article 18)
Determining city planning		(4/4/1919) The Minister of Home Affairs decides on city plans after hearing the opinions of the municipalities concerned and upon the deliberation of the City Planning Councils (Article 3 of the City Planning Act)	(20/6/1934) The Governor-general decides on urban area plans after hearing the opinions of the municipalities concerned (Article 2) (18/12/1940) The Governor-general decides on urban area plans after hearing the opinions of the municipalities concerned and Korea Urban Area Planning Councils (Article 2)	(27/8/1936) The Governor-general decides on city plans after hearing the opinions of Taiwan City Planning Councils (Article 2)
Alteration of the shape and quality of land and building of buildings in areas of city planning facilities		(4/4/1919) Permission from the local governors is needed after the approval of city planning projects (Article 11 of the City Planning Act) (30/3/1940) Permission from the local governors is needed after the determining of open-space as city planning facilities (Article 11-2 of the City Planning Act)	(20/6/1934) Permission from the local governors is needed after the approval of urban area planning projects (Article 10) (18/12/1940) Permission from the local governors is needed after the determining of urban area planning facilities (Article 10)	(27/8/1936) Permission from the local governors is needed after the determining of city planning facilities (Article 9)
Use districts		(4/4/1919) Residential district, Commercial district, Industrial district, Special district within industrial area (Article 1 of the Urban Area Building Act) (28/3/1938) Addition of Exclusive commercial district, Exclusive industrial district (Article 2,4 of the Urban Area Building Act)	(20/6/1934) Residential district, Commercial district, Industrial district, Special district within industrial area (Article 18) (18/12/1940) Addition of Open-space district, Mixed use district and Special use districts, Abolition of Special district within industrial area (Article 15,19-3)	(27/8/1936) Residential district, Commercial district, Industrial district, Special use district (Article 21)

5. Advanced Regulation Methods

5-1. City Planning Orders including Building Control

The Japanese Urban Area Building Act of 1919 was independent from the City Planning Act of the same year, but the colonial city planning orders included building control. The Korea Urban Area Planning Order of 1934 was the first one to do it. Furthermore, the Government-General of Korea tried to set up a new division under the Governor-General's Secretariat to unify the Home Affairs Bureau and the Police Bureau along with the enforcement of the Korea Urban Area Planning Order (1934)⁴⁴. The integration of building control and city planning in the colonial city planning orders was considered as a symbol of advanced features; however, the newspapers under the influence of The Government-General reported different facts. On 8 April 1933, *Maeil sinbo* reported that 'The Home Affairs Bureau and the Police Bureau agreed on the integration of the orders that they had studied'⁴⁵. On the same day, *Keijō nippō* reported that 'the orders will be integrated from the viewpoint of

speeding up deliberation of legislation and simplifying administrative procedures at the time of application⁴⁶. The integration of city planning orders and building orders aimed at speeding up deliberations on legal proposals and simplifying administrative procedures, rather than embodying idealism about city planning.

On 1 August 1934, the Government-General of Korea enforced⁴⁷ only the city planning part of the Korea Urban Area Planning Order and waited until 20 September 1935 to actuate also the building control part⁴⁸.

The order was enforced in stages because the Home Affairs Bureau and the Police Bureau drafted the enforcement regulations separately for each part under their jurisdiction. At that time, they were not yet unified in the new division.

5-2. The Open-Space District

The Urban Area Building Act of 1919 established four types of use districts, including residential district, commercial district and industrial district. At the time of enactment, the orders of Korea and Taiwan had the same use districts.

The open-space district, introduced in the Korean order of 1940, did not allow use other than agriculture, forestry and fisheries, shrines, parks, etc., to suppress the expansion of urban areas and secure the green belt. The Taiwan City Planning Order of 1936 assumed one of the special use districts designated inside the residential area⁴⁹, but it was not realised.

The contemporary Japanese law did not contemplate the open-space district; hence, the colonial city planning orders have been considered advanced. The open-space district was introduced for the first time in the Japanese sphere of power with the Town and Country Planning Act in Manchukuo of 1936. The Policy and Purpose for Setting Open-Space District of 1936 formulated by the Government of Manchukuo stated that 'It is ideal to secure open space by site acquisition and to ease land use restrictions. However, it is difficult due to lack of resources'⁵⁰. The open-space district was created just as a compromise.

In 1940, the City Planning Act of Japan institutionalised the open space⁵¹ as an urban facility. Matsumura Mitsuma, Director of City Planning Bureau of the Ministry of Home Affairs, explained that the open space was recognised as an urban facility rather than as a use district 'Because it is necessary to secure open space promptly by urban planning project'⁵². Thus, the seemingly advanced concepts found in the colonial orders were not necessarily advanced.

6. Continued Use of the Orders by the Republic of Korea and Republic of China

6-1. Republic of Korea

The Japanese rule of Korea ended with the defeat of Japan in World War II. United States Army Military Government in Korea announced The Ordinance Number 21 on 2 November 1945, which maintained the orders of the Governor-General from the Japanese occupation era, including the Korea Urban Area Planning Order of 1934⁵³. The Constitution of the Republic of Korea enacted on 12 July 1948 included Article 100, which preserved the effects of existing laws and orders. The legislation development by the Republic of Korea was delayed because of the Korean war and the coups. The Civil Law was promulgated on 22 February 1958⁵⁴, and the Commercial Law on 20 January 1962⁵⁵. Korea continued to use the Korea Urban Area Planning Order of 1934 after independence because it took time to formulate new laws and not because of the high consideration of the existing order.

6-2. Republic of China

Following the Cairo Declaration in 1943, the Republic of China reviewed the governance plan to obtain Taiwan and formulated the Taiwan Takeover Program on 14 March 1945⁵⁶. The Fifth Subsection of the program proclaimed the temporary validity of the laws and the orders of the Japanese reign era that did not contradict the Three Principles of the People or the laws of the Republic of China. The Governor Office of Taiwan Province, constituted on 3 November 1945, confirmed that the Fifth Substitution of the Taiwan Takeover Program was effective⁵⁷. The Governor Office of Taiwan Province confirmed the effectiveness of 236 laws, including the Taiwan City Planning Order of 1936, with Decree No. 36283 on 24 October 1946⁵⁸. The continued validity of some orders of the Japanese age was a comprehensive prescribed policy for the stability of society and the protection of residents' interests. The Taiwan City Planning Order of 1936 was included because it did not conflict

with the laws of the Republic of China or Three Principles of the People and not because the order itself was appreciated.

7. Conclusion

This study compared the city planning systems of Taiwan and Korea under the Japanese rule. In the early years of Japanese colonisation, the Urban Improvement Programs of Taipei and Seoul had conformed to the systematic Street Improvement Plans of the time. However, those plans significantly differed from each other. Taipei's plan had restricted the private rights on the selected sites and included the control of the sewage and the building constructions. Seoul's program was merely part of the national road construction in urban areas, with no restriction of the private rights, and did not consider sewage and building constructions. Therefore, the successive introduction of the Taiwan City Planning Order of 1936 and the Korea Urban Area Planning Order of 1934 standardised the urban planning systems between the two colonies. These orders were drafted after Japan's City Planning Act of 1919 and reflected its operational experience.

Urban planning and building control were both included in one order only to simplify the formulating procedure. The Taiwan City Planning Order of 1936 and the Korea Urban Area Planning Order of 1934 were based on Japan's City Planning Act of 1919 and Urban Area Building Act of 1919 and did not develop independently. Therefore, these colonial planning orders shared the same basic structure.

When considering the laws and the orders at the time of enactment, the colonial planning orders may appear more advanced than Japan's laws. However, since Japan's planning laws were successively revised, it slightly differed from the colonial orders in the end. Furthermore, the colonial orders were not so advanced as previously thought. They were improved as a group and not evaluated as advanced planning orders with respect to the old-fashioned Japanese laws. Case studies of modern city planning in Japan, Korea and Taiwan are valuable references to each other.

Yukaku (red-light district) and city planning in Japanese colonial cities in Taiwan, 1895-1945

SAMMONJI Masaya*

* *PhD Student, Urban Design Laboratory, The University of Tokyo, 3@ud.t.u-tokyo.ac.jp*

In 1895, Taiwan (Formosa) was ceded to Japan by the Qing dynasty. In the earliest period of the Japanese rule, a crowd of Japanese prostitutes immigrated to Taiwan, which opened an era when sex industry of both Japanese and locals appeared broadly in the cities. Then, aiming to solve sanitary and security issues, Japanese colonial government started to set “kashizashiki designated area (also called yukaku area simply)” in each city in 1896, and allowed prostitutes to do their business only inside the area. It also provided the rough location planning of colonial cities far earlier than other well-studied urban policies or plannings, such as the “city improvement plannings (shiku-kaisei)” started in 1900 and so on. Thus, in this context, these designations can be considered as the earliest “silent” planning of the Japanese colonial cities. After that, some yukakus moved to another location in the cities once or more, in response to city growth and progress of the “city improvement planning”. This study found that there were yukakus in 16 cities of colonial Taiwan in total, and the meanings and grounds of each location changed in response to the progress of urban planning or urban developing.

Keywords: Yukaku, Red-light district, City planning, Japanese colonial city, Taiwan.

1. Introduction

Jinja (神社 shrine) and yukaku (遊廓 red-light district) have been recognized as “symbols” of Japanese colonial cities by some researchers¹, because they were set in the earliest period of Japanese colonial era and characterized Japanese colonial cities with some special functions. Thus, it is very important to focus on these things in order to understand the history of Japanese colonial cities in a variety of aspects, including history of urban planning. Aoi’s research² focused on shrines in the colonial cities of Japan, but there has been no research on relationship between yukaku and city planning yet.

This study aims to find a new meaning of the transition of yukakus’ location in Japanese colonial cities in Taiwan and it has several novelties: it (1) focused on the yukaku’s location in the city, (2) targeted yukakus in all cities of Taiwan and (3) analysed them in terms of urban planning theory.

In this paper, the followings are reported:

- (1) Yukaku’s location in each city and its transition.
- (2) Relationship between yukaku’s location and urban planning and its transition.

It will provide a new perspective and understanding for the planning history of Japanese colonial cities.

2. Methods and materials

In this study, the following materials were investigated; various historical documents such as official documents of the Governor-General of Taiwan (臺灣總督府報), books / newspapers / magazines at the time, city planning maps (市區改正計畫圖) / fire insurance special map (火災保險特殊地圖) and so on.

This paper basically uses original terms and their Japanese pronunciations about the name of cities etc.; such as Taihoku (Taipei 臺北), Takao (Kaohsiung 高雄), ken (prefecture 縣), shu (country 州), shi (city 市) and so on.

3. Policies about urban planning / yukaku in Japanese colonial era

Through the Japanese colonial era, there were some changes in the policies about urban planning. According to Huang(2006)³, these policies were divided into three types. First is in the very early time, such as 1895-1900, called “shiku-kaisei (city improvement 市區改正)” period. In this period, the Governor-General of Taiwan (Taiwan Sotokufu 臺灣總督府) mainly focused only on improvement of water systems and roads, and didn’t consider overall city planning. Then, after 1900, “shiku-keikaku (city planning 市區計畫)” was appointed in some cities, and planners started aiming to make a whole and comprehensive planning on each city. Finally, “Taiwan

Urban Planning Act (Taiwan Toshi-keikaku-rei 臺灣都市計畫令)” was established in 1936, which provided modern and integrated urban planning system in colonial Taiwan.

In terms on yukakus, a crowd of Japanese prostitutes immigrated to Taiwan in the earliest period of the Japanese rule, which opened an era when sex industry of both the Japanese and the locals appeared broadly in the cities. Then, aiming to solve sanitary and security issues, most of local governments started to set “kashizashiki designated area (貸座敷指定地 also called yukaku 遊廓 or yukaku area 遊廓地 simply)” in each city in 1896, and allowed prostitutes to do their business only inside the area. Although these yukaku areas were designated only in part of each city, they based on the various situations of the cities at the time and provided the rough location planning of colonial cities far earlier than other well-studied urban policies or plannings, such as the “city improvement plannings (shiku-kaisei 市區改正)” started in 1900, constructions of governmental buildings, and so on. In the example in Taihoku-ken (臺北縣), the very first local government’s order (kenrei 縣令) in 1896 was about this yukaku. It’s very notable because it’s far earlier than the implementation of any of city plannings. Then, the governmental order about yukaku was established for whole Taiwan in 1906.

According to Zhang(2008)⁴, contents of the order included the followings:

- (1) introduced license system of prostitutes’ business by local government.
- (2) introduced registration system of the prostitutes.
- (3) prohibited business of prostitutes outside yukaku area.
- (4) prohibited prostitutes to go outside yukaku area.
- (5) gave the Governor-General of Taiwan (臺灣總督府) the power to approve designating and redesignating of yukaku area.
- (6) made periodic medical examination compulsory.

Among them, (5) is quite important in the context of the relationship between urban planning and yukaku. In order to designate or relocate yukaku area, local government had to get an approval by the Governor-General of Taiwan. This rule made the yukaku’s location align with urban planning policies.

4. Location of yukakus in colonial Taiwan

Figure 1: *Yukakus in colonial Taiwan*. Edited by author and based on [台中市, 台中市概況(1936), frontispiece.].

The 18th International Planning History Society Conference - Yokohama, July 2018

As a result of comprehensive investigation into historical documents such as public documents⁵ and newspapers⁶, it turned out that yukaku existed in 16 cities of colonial Taiwan in total.

At the same time, the change of the location of all cities was revealed in detail. Yukakus in 7 cities moved to another location in each city once or more, in response to city growth and progress of the “city improvement planning (市區改正計畫)”. Case examples of some cities are shown below. For example, in Tainan, yukakus moved to the reclaimed land in 1912 (yukaku for Japanese) and 1917 (yukaku for locals).

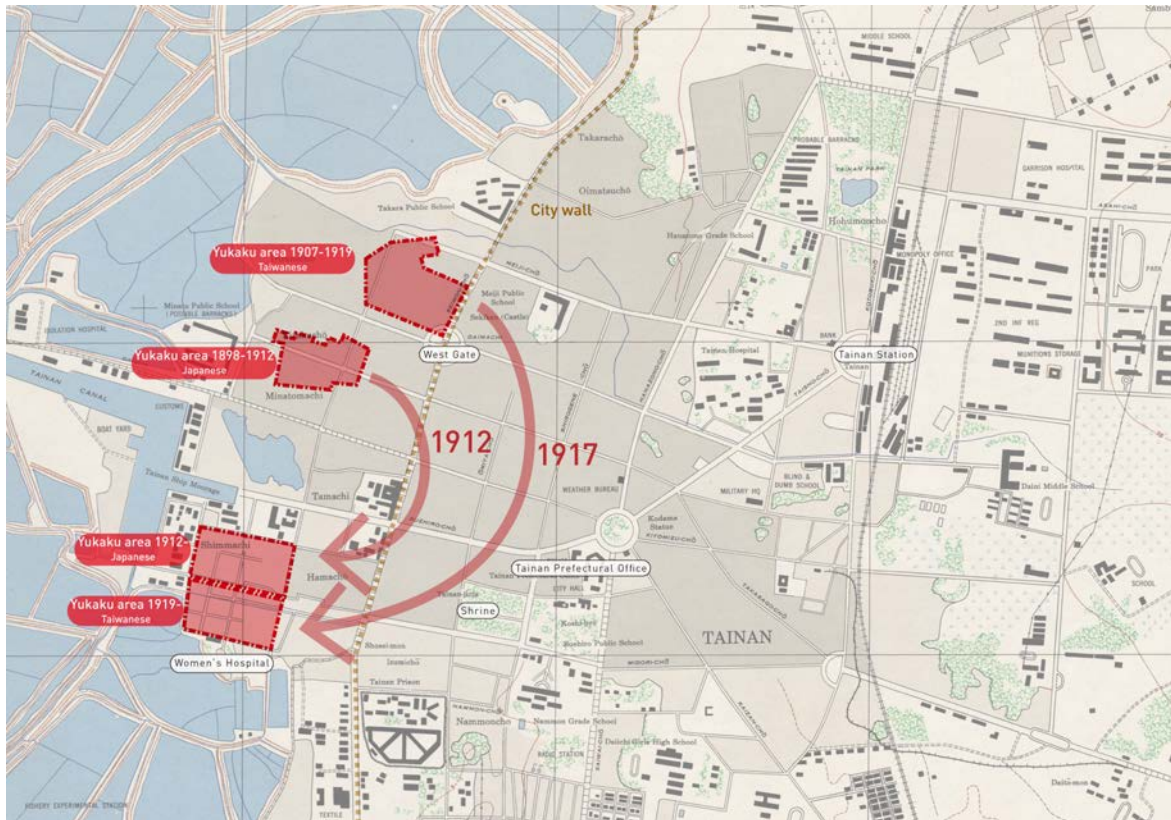

Figure 2: *Changes of the location of yukakus in Tainan.* Edited by author and based on [U.S. Army Map Service, *Formosa City Plans*, (1944-1945).].

Figure 3: *Picture of Takao Yukaku*, 鞠園文史工作室 <http://www.5819375.idv.tw> (Accessed December 23, 2017)

The 18th International Planning History Society Conference - Yokohama, July 2018

Taking all areas before and after the relocation into consideration, kashizashiki designated areas (yukaku areas) amounted to 34 in total. All of yukaku areas are listed below.

City	Kashizashiki designated area	Year of designation	Year of undesignation
Kiirun 基隆	Tenryoko 田寮港	1896	—
	Gyokudencho 2 玉田町二丁目※	N/A (after 1922)	
Tansui 淡水	Shinseki-gai 新厝街	1896	—
Taihoku 台北	Banka 艋舺	1896	—
	Daitotei 大稻埕※	N/A (after 1922)	—
	Banka South 萬華南※	N/A (after 1922)	—
Giran 宜蘭	Giran-gai 宜蘭街全体	1901	—

	Hoshio 埔仔尾	1906	—
Karenko 花蓮港	Fukusumi 福住	1910	—

Table 1: List of kashizashiki designated areas (yukaku areas) in colonial Taiwan. ※ represents “de facto” yukaku area of local Taiwanese. * represents yukaku area of local Taiwanese. × represents yukaku area that was only designated and didn’t have real businesses inside. Romanized pronunciation of the names of each area can be not accurate.

5. Discussion

From the point of view about relationship with city structure, the location of each kashizashiki-designated area (yukaku area) can be classified into following 4 types:

- (A) whole designation type: whole area of the existing urban area was designated as yukaku area.
- (B) centre designation type: central area of the existing urban area was designated as yukaku area.
- (C) margin designation type: marginal area of the existing urban area was designated as yukaku area.
- (D) suburb designation type: an area outside the existing urban area was designated as yukaku area.

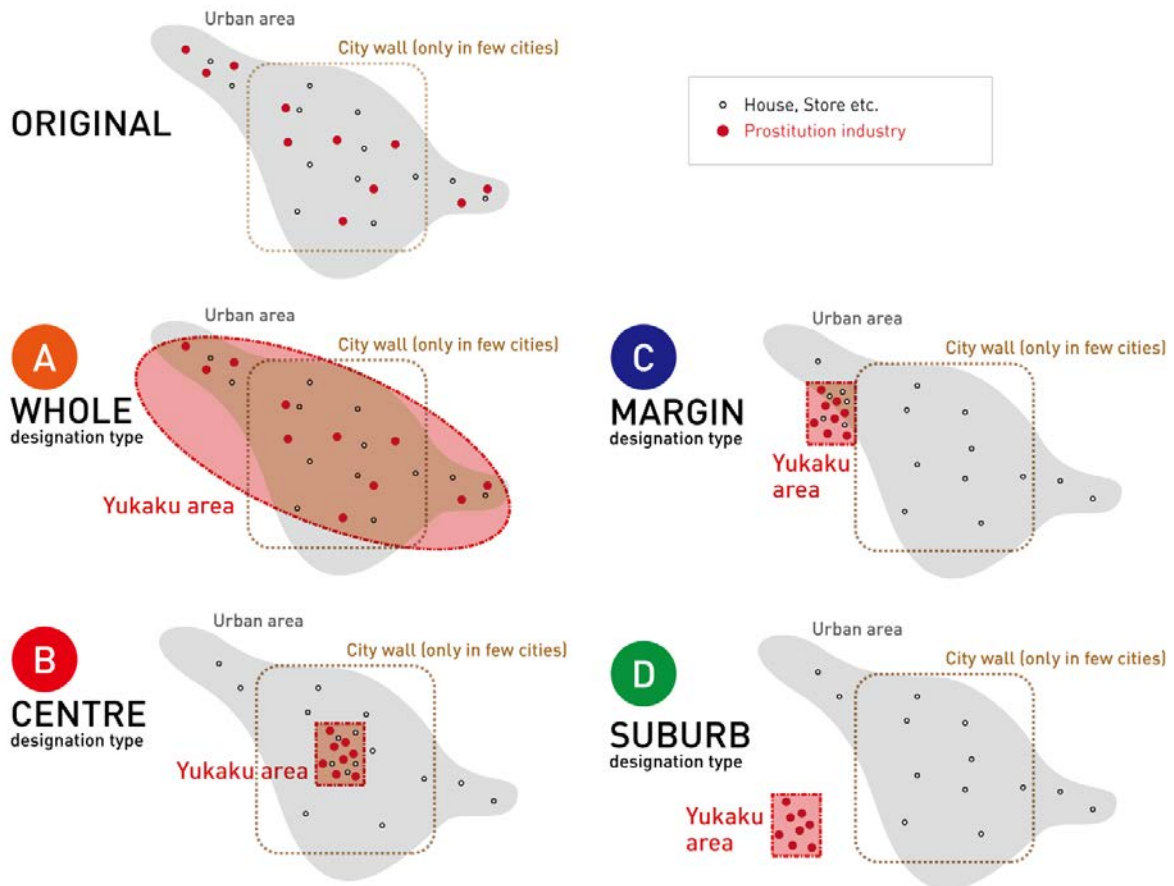

Figure 4: The location patterns of each kashizashiki designated area (yukaku area).

Based on this classification, we classified all of the yukaku areas. The results of classification are shown in Table 2.

City	Kashizashiki designated area	Location type
Kiirun 基隆	Tenryoko 田寮港	(D) SUBURB DESIGNATION TYPE
	Gyokudencho 2 玉田町二丁目※	(B) CENTRE DESIGNATION TYPE
Tansui 淡水	Shinseki-gai 新厝街	(C) MARGIN DESIGNATION TYPE
Taihoku 台北	Banka 艋舺	(C) MARGIN DESIGNATION TYPE
	Daitotei 大稻埕※	(B) CENTRE DESIGNATION TYPE
	Banka South 萬華南※	(C) MARGIN DESIGNATION TYPE
Giran 宜蘭	Giran-gai 宜蘭街全体	(A) WHOLE DESIGNATION TYPE

	Minsoibo-sho 民壯圍堡庄×	(D) SUBURB DESIGNATION TYPE
Shinchiku 新竹	Nammon-gai 南門外	(C) MARGIN DESIGNATION TYPE
	Kyakuga 客雅×	(D) SUBURB DESIGNATION TYPE
	Kousharo 後車路※	(B) CENTRE DESIGNATION TYPE
Byouritsu 苗栗	Naima 內麻	Not clear
	Koshitei 坑仔低 etc.	(B) CENTRE DESIGNATION TYPE
	626-659 Byouritsu 苗栗626-659	Not clear
Taichu 台中	Tokiwa-cho 常磐町	(B) CENTRE DESIGNATION TYPE
	Hatsune-cho 初音町	(D) SUBURB DESIGNATION TYPE
Rokko 鹿港	Hokuto-gai 北頭街	(C) MARGIN DESIGNATION TYPE
Shoka 彰化	Seimon 西門	(B) CENTRE DESIGNATION TYPE
	Nammon Shinchi 南門新地※	(D) SUBURB DESIGNATION TYPE
Toroku 斗六	Toroku-gai 斗六街	(C) MARGIN DESIGNATION TYPE
Kagi 嘉義	Kitamon-gai 北門外×	(D) SUBURB DESIGNATION TYPE
	Nishimon-gai 西門外	(D) SUBURB DESIGNATION TYPE
Tainan 台南	Nansei-gai 南勢街 etc.	(C) MARGIN DESIGNATION TYPE
	Motosotomasokogai 元外媽祖港街 etc.*	(C) MARGIN DESIGNATION TYPE
	Shinmachi 1 新町一丁目	(D) SUBURB DESIGNATION TYPE
	Shinmachi 2 新町二丁目*	(D) SUBURB DESIGNATION TYPE
Takao 打狗 (高雄)	Kigo-gai 旗後街一円	(A) WHOLE DESIGNATION TYPE
	Sakaemachi 榮町	(D) SUBURB DESIGNATION TYPE
Hozan 鳳山	Kaboko-gai 火防口街 etc.	(B) CENTRE DESIGNATION TYPE
	Shinjo-kosho 新庄仔庄×	(D) SUBURB DESIGNATION TYPE
Mako 媽宮 (馬公)	Kunaimachi/Minamimachi 宮內町・南町	(B) CENTRE DESIGNATION TYPE
	Jonai 城內	(A) WHOLE DESIGNATION TYPE
	Hoshio 埔仔尾	(D) SUBURB DESIGNATION TYPE
Karenko 花蓮港	Fukusumi 福住	(D) SUBURB DESIGNATION TYPE

Table 2: *The location patterns of each kashizashiki designated area.* ※ represents “de facto” yukaku area of local Taiwanese. * represents yukaku area of local Taiwanese. × represents yukaku area that was only designated and didn’t have real businesses inside.

The transition of the location of yukaku area is shown in Figure 5 and 6. According to this figure, we can find that more than 7 yukaku areas had changed from (A) whole designation type, (B) centre designation type or (C) margin designation type into (D) suburb designation type. In the cases of Kiirun (Keelung 基隆), Kagi (Chiayi 嘉義), Karenko (Hualian 花蓮港), yukakus were located in the suburbs ((D) suburb designation type) since first yukaku area in each city was designated. Yukaku areas in only four cities did not move to the suburbs.

This means that most of yukaku areas gradually moved to the suburbs during the colonial era of Taiwan.

In (D) type, yukaku areas were located near the border of the grid-patterned street network of city improvement plannings (shiku-kaisei-keikaku 市區改正計畫).

Figure 5: The transition of location patterns of each kashizashiki designated area (yukaku area).

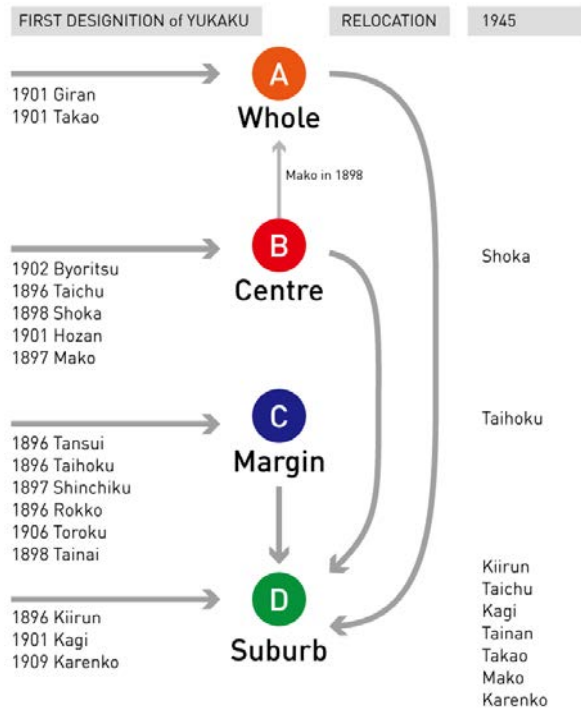

Figure 6: The transition diagram of location patterns of each kashizashiki designated area (yukaku area).

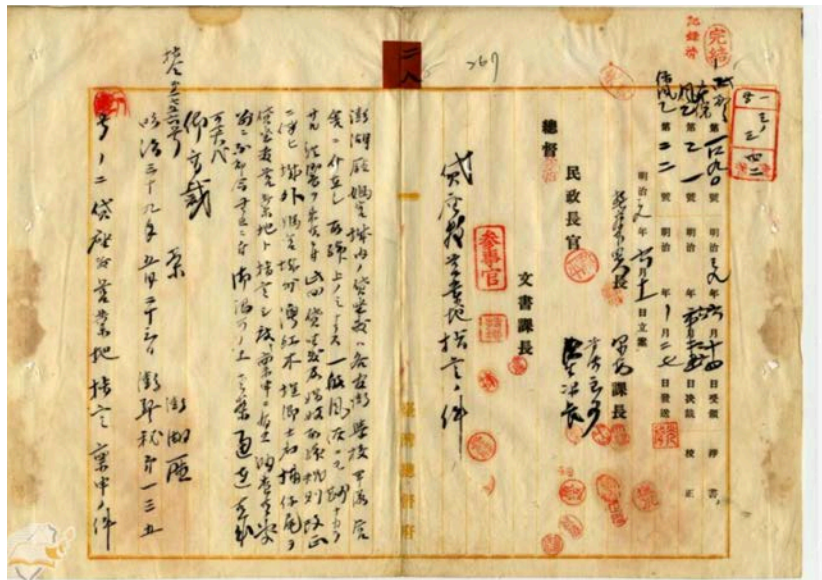

Figure 7: The official paper about relocation of Mako Yukaku area 「澎湖廳告示第四十二號貸座敷營業地域改正ノ件」 (1906年7月11日), 《臺灣總督府檔案》, 國史館臺灣文獻館, 典藏號:00001187088X003.

The reasons for designating of the kashizashiki-designated areas (yukaku areas) were partly found in the official documents such as the Governor-General of Taiwan (臺灣總督府報). The reasons can be largely divided into two; “in order to control prostitution businesses” and “in order to improve the reason for urban planning.”

As a reason for prostitution control, the most emphasized reason is “temporary” in case of (A) whole designation type, (B) centre designation type or (C) margin designation type. For example, the reasons such as “to control prostitutions temporary” were found on the official paper. In contrast, in case of (D) suburb designation type, it seems that the colonial government tried to positively isolate yukaku areas from city centre. For example, the sentence such as “to refrain from society” were written on the official paper.

As a reason for urban planning, negative reasons were conspicuous in case of (A) whole designation type, (B) centre designation type or (C) margin designation type. For example, “dangerousness of attack of bandits”, “lack of land where yukaku can be put” etc.

However, in case of (D) suburb designation type, more positive reasons were written on the official paper: such as “good potential of transportation”, “good landscape”, “scenic beauty”, “compatible with city planning” and so on. These reasons included viewpoint of urban design or landscape design and we can find yukaku’s location of (D) suburb designation type had intendment in the context of urban planning.

Especially, in the case of Tainan (Tainan 台南) and Takao (Kaohsiung 高雄), the local government and the land leveling forming company attracted a kashizasaki designated area (yukaku area) to their new land. From this point of view, it can be said that the designation of the yukaku area could be considered as a measure to expand the urban area or the “driving force” of urban development.

In these case, the grid pattern of roads inside yukaku followed the grid pattern of whole city, but rivers and green spaces were made and used as boundary of yukaku. (Figure 8) Compared to Japan, inner space of yukaku was not so characteristic.

Figure 8: *Sakaemachi Yukaku area in Takao*. Edited by author and based on 都市製図社, 臺灣火災保險特殊地図, 1930.

Moreover, both Japanese and Taiwanese residents joined the discussion about relocation of yukaku on the newspapers or magazines, such as “Taiwan Nichinichi Shimpō”.

6. Conclusions

In conclusion, the following was clarified.

- (1) Yukaku was a symbol of the Japanese colonial city.
- (2) Yukaku in Taiwan gradually began to be located in the suburbs so that it can be aligned with urban planning. The repeated transition of the location of yukakus was influenced by the shape of cities or various city plans, and also influenced them at the same time. The designation of some yukakus was considered as an effective “measure” to expand and develop the urban area. Later, in 1936, the designation of yukaku areas was included in the urban planning system by law⁷.
- (3) In most cases in Taiwan, the grid pattern of roads inside yukaku followed the grid pattern of the whole city, because planning of the whole city was prior to the designation of yukaku’s location. Inner space of yukaku was not so characteristic as Japan’s yukaku. Only rivers and green spaces were used as boundaries of yukaku.

Moreover, this study would be possible to obtain meaningful suggestions on countermeasures against urban problems that are occurring inside cities now, such as private prosecution problems in Asian countries.

However, this study scoped only colonial Taiwan and has its limitation on this point. Further studies on the other countries or areas (such as Korea, Manchuria and so on) are needed in order to illustrate the planning history of Japanese colonial cities before 1945.

Astute Planners: How Urban Villagers in Guangzhou Converted Their Neighborhood into an African Market

Guangzhi Huang (SUNY at Buffalo)

Since the late 1970s, the Guangzhou Municipal Government had been transforming the Northern Suburb to accommodate foreigners who came for the annual Trade Fair and invested in the city. Sensing the business potential brought by the increasing foot traffic, farmers of Dengfeng Village in the area, who were losing their farm land to the government rapidly, pooled together their money in the 1980s to build three hotels to capitalize on the growing number of visitors. At the meantime, individual farmers also began rebuilding and enlarging their houses into apartment buildings to accommodate the influx of rural migrants as a result of China's economic reforms. When large numbers of Africans began coming to Guangzhou searching for exportable Chinese goods in the late 1990s, the low-cost rental houses and hotels of the Village provided affordable options for these cash-strapped global traders. In the 2000s, to take full advantage of this sudden increase in population and demand for Chinese products, the Village authority opened up two shopping malls, while villagers began to turn the first floors of their apartment buildings into retail stores, all catering specifically to African customers. These in turn attracted unlicensed vendors and hawkers to come and fill up any space where they could sell their products. This paper examines the Dengfeng's transformation in the past three decades and how it evolved into a diverse global market with little state input. Dengfeng's history provides an interesting contrast to the more common story of urbanization in China, which tends to focus on land dispossession by the state. The success of the Dengfeng market, which has made renewal projects significantly more difficult, has at least enabled its residents and businesses to maintain a precarious limbo.

Urban Ordinaries - Vernacular Landscapes as Places of Diversity, Difference and Displacement

Heide Imai (Hosei University, GIS)

In most cities, public bodies are concerned with social, economical, cultural and political integration of marginal urban areas. One of the main strategies to achieve this purpose is to consider culture as one of the main engines of great urban transformations to support the realization of different scale urban renewal projects. As these occur in form of new urban entertainment, economic and cultural clusters in both central and marginal urban areas, a re-evaluation of cities cultural heritage and vernacular landscape is necessary. One of the reason is that in the context of radical urban transformation, new urban inequalities emerge which have to be approached and studied making use of methodological innovation. This paper will focus on the urbanity and everyday practices of in/exclusion of vernacular urban places that are especially the subject of effects of globalization and rising inequalities. As a first issue, this paper aims to understand everyday practices of in/exclusion and the changing role of the everyday dwellers. Secondly, the paper aims to reflect critically on the commodification of the vernacular urban places to understand how the branding of cultural heritage is affecting everyday practices, existing inequalities and the urban identity of each dweller. Finally, different forms of contestations are discussed, as different people consider different vernacular urban places to be worthy of a meaningful place in the fast transforming city.

To do so, the paper will focus on the role and meaning of the urban alleyways of contemporary Tokyo seeking to go behind the façade of the urban landscape to re-contextualise these forgotten yet necessary, marginal yet present places of everyday life. Marginalised through the emergence of new forms of housing and public spaces, re-appropriated by different fields, and re-invented by the contemporary urban design discourse, the social meaning attached to the alleyway is being re-interpreted by individuals, subcultures and new social movements. To portray the life cycle of an urban form being rediscovered, commodified and lost as physical space, the research will make use of historical references, urban narratives, graphic reinterpretations and exemplary study cases, to finally disclose questions of the alleyway's future, its new actors and its new possibilities, closing with a critical statement: extraordinary cities are made of ordinary places which need to be included in the global planning process.

The Paradox of Community Planning in Shanghai Quyang New Village: providing better service space in a formally micro-rayon in three decades

Li Hou (Tongji University), Guanning Zhao (Urban Planning & Design Institute of Shenzhen), Jihuan Li (Tongji University), Xin Kai (Shanghai Tongji Urban Planning & Design Institute), Xufeng Qiu (Tongji University) and Kaiping Zhang (Tongji University)

Recently, a variety of community planning discourses are booming in many Chinese cities, rhetorically and practically, especially in those cities with strong planning tradition and active planners' professional society. However, improving physical environment via state-led public institutions and resources are still the most common model. While planning theories and methodologies evolved since the 1960s in the western context to put more focus on the social and political optimization process of a community, it seems difficult, or even questionable, to comply with these well-intentioned initiatives in China without an awareness of the contextual differences.

This paper will examine Quyang New Village, a residential micro-rayon built in the 1980s in Shanghai, on its gradual changes and challenges as a residential district planned and built in a top-down manner. The original plan put up a relatively static picture of the socialist community, therefore installed a simple hierarchy of basic public services in the middle of the housing block, and restricted the land use as pure residential. Entering the 1990s, along with the economic restructuring and a set of urban reforms, the community has grown more and more diverse, and the residents' demand for both better services and new job opportunities grew rapidly. New commercial space had emerged on ground level residential units along the streets. For more than ten years, this informal business was allowed or even encouraged, which had formed a unique urbanism in the area. The paper will introduce the Village's recent conflicts regarding the forced clean-up campaign on illegal retail space along the streets and the planners' failed attempts to save them through more participatory approach. The future of more community-oriented approaches to planning practice in China remains unclear. However, the paper would like to interpret such paradox of community planning and explore possible ways of improvements under current situation.

THE BATTLE FOR OIL IN THE DUTCH EAST INDIES Plaju, the pearl in the crown of the Bataafsche Petroleum Maatschappij in the turmoil of the 1940s

Ben De Vries (Cultural Heritage Agency of the Netherlands / Rijksdienst voor het cultureel Erfgoed (RCE/OCW))

Oilfields can easily turn into battlefields. This happened more than once in the colony of the Dutch East Indies (Indonesia) in the 1940s, where Japanese, Dutch, Allied and Indonesian forces fought fierce battles over the control of the local oil facilities. With good reasons, because in those days the Netherlands East Indies was one of the world's biggest oil exporters.

It all started in Telaga Said I, in northern Sumatra, in the Mid-1880s, where the first oil was discovered in the thick jungle. Shortly afterwards, in the Mid-1890s, in the swampy south of Sumatra oil of a better quality was found. As a result, nearby Palembang, an ancient city with harbour facilities, quickly mushroomed into a vibrant oil industry city, and the small kampong Pladjoe (Plaju), about eight kilometers further along the River Moesi (Musi), became a spider in an enormous petroleum infrastructure. The Koninklijke Nederlandsche Maatschappij tot Exploitatie van Petroleumbronnen in Nederlands-Indië (1890) formed in 1907 a subsidiary named the Bataafsche Petroleum Maatschappij (BPM/Shell) and built at Pladjoe the largest, most productive and modern refinery of Southeast Asia of its time. The scale of operations grew over time and the BPM planned a comprehensive company town with administration buildings, refineries and jetties for mooring tankers, pipelines, (rail) roads, and designed living quarters for its employees along a rectangular grid, including modern bungalows with shady gardens, shops, schools, sports fields and a church etc. Eventually, the BPM and the municipality of Palembang as the main oil actors created together a petroleumscape : a coherent network of spaces around the physical and financial flows and interests of petroleum in the urban environment.

These times of prosperity and peace all suddenly came to an end when war and revolution broke out in the colony of the Dutch East Indies in the 1940s. As a result, the oil empire of the BPM was at risk. Based on both archival research and secondary sources, this paper elaborates on how the BPM spatially and economically planned its huge industrial oil-footprint at Pladjoe and safeguarded these oil facilities against all kinds of brutal intrusions and destructions during the Pacific War (1942-1945) and Indonesia's struggle for independence (1945-1949). Remarkably, in reaching this goal and in their effort to restore the pre-war situation of peace and prosperity, the BPM's captains of industry, Dutch Army commanders and politicians in the government seats of both Batavia and The Hague worked closely together. Constantly using oil as an economical weapon.

Production First, Livelihood Second: the Life and Death of Worker-Peasant Villages in a Chinese Oil Field

Li Hou (Tongji University)

This paper examines the formation of an alternative industrial landscape and its everyday "urbanism" in China during the 1960s and the 1970s, following the Great Famine and the discovery of oil in the Northeast, formerly Manchurian region. The Daqing Oil Field, a much publicized model of industrialization in the Maoist era, had not only provided China with energy independency, but also contributed to the rise and fall of a settlement model labelled as "integration of urban and rural", "integration of industry and agriculture" - the widespread worker-peasant villages on the mining districts. Daqing had maintained its housing standards that were similar to those of the local peasants, where decentralized villages composed of identical mud houses were indicative of an equal society, a new way of "industrialization without urbanization". Those two decades under the Daqing Model witnessed the emergence of numerous mining districts and factory complexes that statistically were not counted as cities and whose population were engaged in more than just mining and manufacturing. The state's industrialization strategies were translated into unique spatial patterns and built forms that have not only shaped the development path of the country but also integrated the lives and life choices of the common people with the fate and choices of the consolidating socialist State.

This paper attempts to fulfil the scholarly task of reconstructing the social experience of the Maoist past to be genuinely comprehensive, dynamic, and subtle. It depicts socialist industrialism as a system of socioeconomic rules which had been taking dynamic forms in a specific place.

The Daqing Oil Cluster: From petroleum hub to sustainable future

Penglin Zhu (Delft University of Technology)

Since the mid-20th century, the Chinese government in collaboration with various governmental petroleum authorities, first with the Ministry of Petroleum and later with national firms, has transformed the built environment on multiple levels. Through creating interrelated infrastructures and production sites, installing refineries and petrochemical industries, constructing dedicated oil ports, building workers' housing and educational, health or leisure facilities, they effectively created a palimpsestic petroleumscape (Hein, 2016)

While historians of architecture, urbanism, and planning have explored the diachronic changes of territory and people's everyday life individually in the region of the oil field or in the port cities, they have not studied the relationship between diverse oil-related installations and have not explored the urban resilience and sustainable development after the Oil Campaign. Meanwhile, the Chinese petrochemical energy experts have ignored the importance of spatial reality when they are imagining the sustainable future. The paper uses the concept of Oil Cluster which is one agglomerate spatial entity of the regional oil infrastructure and facilities. It attempts to explore the diachronic transformations of architecture and the built environment since the late-1970s of the Daqing-Dalian oil cluster. It examines whether the planning idea after the Oil Campaign considered the urban resilience and sustainable development as key factors. And if yes, how the plans implemented these ideas?

Relating to collections of historical document, this paper classifies the documents into several categories, governmental documents of planning strategy, plans from the local design bureau, historical maps, and photos, respectively. It intends to use discourse analysis to analyse the governmental documents. Moreover, it observes the plans from the design bureau, verifying in which manner and to what extent the plans have considered the planning strategy. Furthermore, it compares the plans and maps to examine how they have been implemented. The research will cover in 3 time spans:

- First, it investigates how urban and rural resilience has been approached by the oil authority and local elites in the period of after the Oil Campaign to the early-1990s. Specifically, it studies the evolving processes of specific urban and rural forms in the Daqing Oil Cluster after the later-1970s through representations such as maps, plans, and photos.
- Second, analyzing the recent innovations in urban planning and design which aims at sustainability, the paper speculates the future development in architecture and the built environment in the coming fossil era. To be more exact, it investigates how the Bohai Strategy has shaped current planning ideas and their implementation by analyzing the official documents from the State Oceanic Administration, the provincial documents on urban plan, and the local urban plans after 2002.
- Lastly, this research considers the recent OBOR Initiative as a potent agent influencing the built environment in the Northern China. It explores how Daqing Oil Cluster participates in the trading network of the New Marine Time Silk Road, and how it might use this opportunity to build urban resilience. Specifically, it examines how the Daqing Oil Cluster will use policy and planning to join of the OBOR Initiative from the official documents the Initiative, the provincial and local announcements, and the recent plan by the local design bureau.

In conclusion, this paper attempts to look into the relationship between national policies, oil, urbanization and industrialization, urban resilience, and sustainable development. Through this case study, the paper aims to analyze the historical development and future trajectory of architecture and the built environment in Chinese oil-industrial cities. Moreover, it offers a useful opportunity to comprehend how the CCP has been guiding the modernization process in China.

THE BATTLE FOR OIL IN THE DUTCH EAST INDIES: PLADJOE, THE PEARL IN THE CROWN OF THE BATAAFSCHE PETROLEUM MAATSCHAPPIJ (SHELL), IN THE TURMOIL OF THE 1940s

Ben de Vries MA

Cultural Heritage Agency of the Netherlands

Email: b.de.vries@cultureelerfgoed.nl

Abstract

Oilfields can easily turn into battlefields. This happened more than once in the colony of the Dutch East Indies (Indonesia) in the 1940s, where Japanese, Dutch, Allied and Indonesian forces fought fierce battles over the control of the local oil facilities. With good reasons, because in those days the Netherlands East Indies was one of the world's biggest oil exporters.

It all started in Telaga Said I, in northern Sumatra, in the Mid-1880s, where the first oil was discovered in the thick jungle. Shortly afterwards, in the Mid-1890s, in the swampy south of Sumatra oil of a better quality was found. As a result, nearby Palembang, an ancient city with harbour facilities, quickly mushroomed into a vibrant oil industry city, and the small kampoeng Pladjoeⁱ (Plaju), about eight kilometers further along the River Moesi (Musi), became a spider in an enormous petroleum infrastructure. The *Koninklijke Nederlandsche Maatschappij tot Exploitatie van Petroleumbronnen in Nederlands-Indië* (1890) formed in 1907 a subsidiary named the *Bataafsche Petroleum Maatschappij* (BPM/Shell) and built at Pladjoe the largest, most productive and modern refinery of Southeast Asia of its time. The scale of operations grew over time and the BPM planned a comprehensive company town with administration buildings, refineries and jetties for mooring tankers, pipelines, (rail) roads, and designed living quarters for its employees along a rectangular grid, including modern bungalows with shady gardens, shops, schools, sports fields and a church etc. Eventually, the BPM and the municipality of Palembang as the main oil actors created together a *petroleumscape*ⁱⁱ: a coherent network of spaces around the psychical and financial flows and interests of petroleum in the urban environment.

These times of prosperity and peace all suddenly came to an end when war and revolution broke out in the colony of the Dutch East Indies in the 1940s. As a result, the oil empire of the BPM was at risk. Based on both archival research and secondary sources, this paper elaborates on how the BPM spatially and economically planned its huge industrial oil-footprint at Pladjoe and safeguarded these oil facilities against all kinds of brutal intrusions and destructions during the Pacific War (1942-1945) and Indonesia's struggle for independence (1945-1949). Remarkably, in reaching this goal and in their effort to restore the pre-war situation of peace and prosperity, the BPM's captains of industry, Dutch Army commanders and politicians in the government seats of both Batavia and The Hague worked closely together. Constantly using oil as an economical weapon.

Introduction

At the beginning of the oil production in the Dutch East Indies stood the Dutch farmer's son Aeilko Jans Zijlker, who went to the Indies to find his luck after an unhappy love. Zijlker, administrator of the *East-Sumatra Tobacco Company*, discovered oil in North Sumatra. It was a kind of oil seep, still of rather poor quality. After negotiations over royalties with the owner, the Sultan of Langkat, Zijlker in 1883 got the concession of the area and the permission to drill.ⁱⁱⁱ After quickly assessing its potential, the Dutch King William III gave the company the name the *Koninklijke Nederlandsche Maatschappij tot Exploitatie van Petroleumbronnen in Nederlands-Indië*.^{iv} This freestanding company was officially established on 16 June 1890 with a financial back up of about 360.000 dollars.^v Due to this amazing success, Zijlker was sent out to do some more pioneering exploration and drilling around his *oil kampoeng*, but his luck was not eternal as he suddenly died in December of the same year. Nevertheless, this site would eventually become the birthplace of one of the biggest multinationals of the world today: the Royal Dutch/Shell Group.

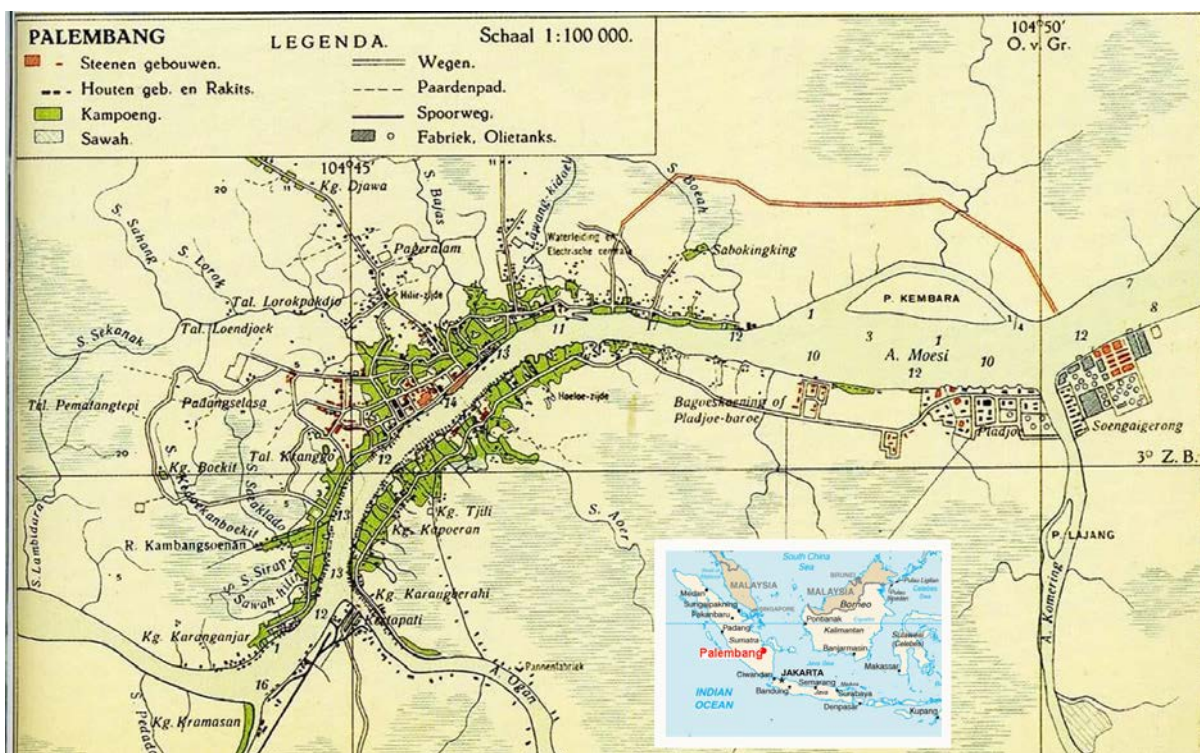

Figure 1. General map, oriented to the northwest, of Palembang and environs, in 1938, with Kartapati (left / down), Pladjoe and Soengei Gerong (right/middle), and Bagoes Koenig (middle). Source: *Comprehensive atlas of the Netherlands East Indies*.

Pladjoe: the pearl in the crown of the BPM

When oil was found in the southern parts of Sumatra, it was the experienced Jan Willem IJerman, head of the *Moeara Enim Petroleum Maatschappij*, who stepped in first and invested near the ancient city of Palembang, the capital of the province South Sumatra.^{vi} Palembang, an important exporter of pepper and tin, was a major river transport hub, strategically located along the Malacca Straits and nearby Singapore and Batavia. All around the world at that time, oil production and transportation relied on water.^{vii} From Palembang harbour to the open waters of the Bangka Straits was about 50 miles. The waterfront city stretched along both sides of the 750 kilometers long muddy River Moesi (Figure 1). The main economic and political parts of town, like the Kraton,

the former sultanates' fortified palace and its surroundings, were lying on the eastern bank, called the Ilir or Hilir ('downstream'). At the western riverbank, called the Oeloe ('upstream') or Hoeloe (Ulu), about eight kilometers from the centre of Palembang, IJzerman established an oil refinery in 1897. At that time, this place was nothing more than a small kampoeng carrying the local name Pladjoe. There was no overland transport between the city centre and Pladjoe, as there were no bridges yet. People had to take the regular ferry. Hence, Pladjoe was lying across the river in relative isolation geographically and was transformed steadily into a well-organized western

enclave; a symbol of modernity and European might.^{viii}

Figure 2. Bungalow in Pladjoe of a BPM-employee, around 1947. Source: Mieke Huijsman-Engelberts.

The facility had been built by the BPM in 1907 on the west bank of the mouth of the tributary Komerling and produced marketable secondary

products which could be efficiently transported by oil tankers from the refinery's jetty to Java, Singapore, United States or Japan. The refinery received crude oil from the rich oil fields of Talang Djimar, Praboe Moelih and Moeara Enim.^{ix} Half of the Indies' oil production was produced in this refinery, especially aviation crude, and it supplied mostly the Airforce in the Pacific.

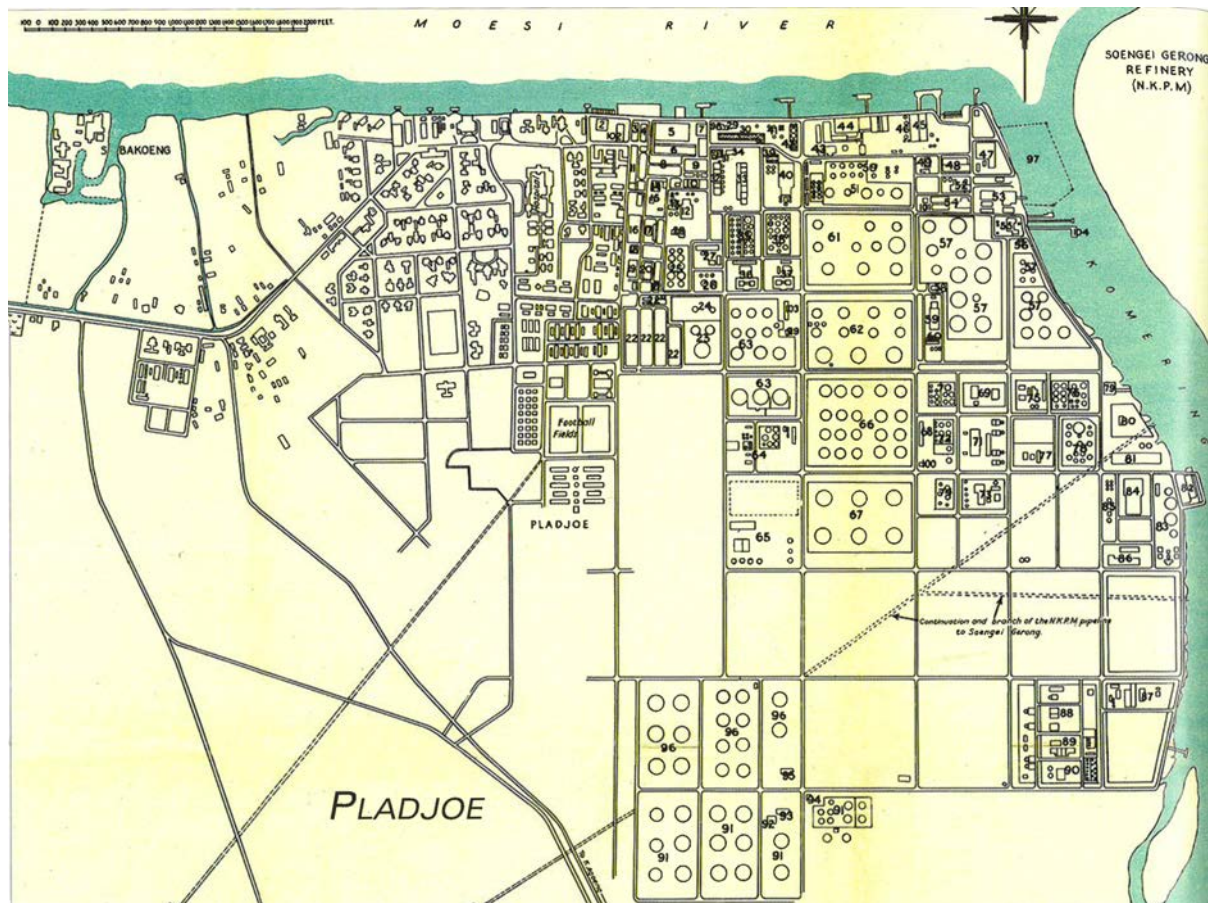

Figure 3. Sports field Pladjoe compound is still in use, now as volleyball field, 2015. Source: Author.

Right next to the spread-out production refinery of in total about 1,500 x 2,000 meters, the BPM created on the west side an ancillary petroleumscapes by building a compact compound with houses for its staff, employees and workers (Figure 2). Most of these stand-alone villas were grouped in blocks of eight or

ten and were almost identical in colonial design, depending on the rank of the employee.^x The European employees' houses were situated along palm-bordered avenues and impeccable manicured lawns, suited for private cars to arrive. Constantly, this area was extended to the south and southwest. The streets had no names, only numbers. The address was for example: 'House 122'. The compound with its almost rectangular grid plan of about 500 x 1,000 meters was fully equipped with all kinds of facilities. The BPM had its own administration building, hospital, hotel, shop and pasar, bakery, European primary school including library, church, clubhouse, 'soos' with cinema and theatre, sporting fields for hockey and tennis, and of course, a swimming pool.^{xi} To this very day, one can see the green and spacious compounds and enjoy the striking tropical modernity of the

architecture, despite the fact that some colonial buildings are dilapidated (Figure 3). Most of the original buildings are still in (the same) function.

Figure 4. Pladjoe-complex, July 1945. The living quarters are on the west side. Map was based on BPM maps of 1936 and 1940. The reference shows only the technical installations. Source: *Comprehensive atlas of the Nederlands East Indies*.

Outside these white-collar communities of gloriously shaded streets and lots, the urban space of the colonial society was more differentiated, divided by multi-ethnic differences and from race-to-class-segregated. In the company town Pladjoe lived about 250 European and 4,500 local Asian workers.^{xiii} Europeans were also accommodated in another BPM housing complex called Bagoes Koenig (or Pladjoe-baroe: new Pladjoe), a little west from Pladjoe (Figure 4).

In order to facilitate the steadily growing petroleum industry and to improve the rather low standard of living, the municipality of Palembang started to construct new ancillary structures and assets, like asphalted public roads, railways, ports and airfields. Above all, the municipal Traffic Commission implemented a new town plan in 1935 designed by the Dutch architect Thomas Karsten.

Land was reclaimed from rivers and new public housing, inland transport systems, a ring road and several bridges over the Moesi were built, including the Wilhelmina Bridge (1939) over the Ogan River, replacing the river ferry. This arch bridge connected both oil refineries from the eastern to the western bank, where the new Kartapati railway station (1939), and the coal harbour, were located. On a regular basis ocean steamers navigated the river in the late 1920s. Meanwhile, the new and continuously extending oil (rubber and coal) industry led to the rapid influx of newcomers and a subsequent population increase.^{xiii} Also in Palembang a 'European' quarter was built, called Talang Semut.

As such, the booming oil industry not only had an enormous influence on the socioeconomic structure of the city, but on the whole region as well. More than thirty-five oil-mining concessions in the area needed a complete network of iron pipelines in order to connect hundreds of drill towers, oil pumps and storage tanks, subsequently transforming the urban spatial landscape. In addition, the BPM built a road network, a vivid symbol of modernization, and forty-two schools throughout the southern province before the Pacific War.^{xiv} Such an extended petroleumscape with various oil actors required multiple headquarters for administration and supervision, like in Batavia, designed in a modernistic colonial style in 1938 by the Dutch architect Thomas Nix. Above all, a network of BPM-fuel stations was extended all over Sumatra. According to a BPM-roadmap of 1929 there were in total 185 fuel stations strategically positioned on the island; including 71 in the South Sumatra region; two in Palembang, one in Pladjoe and one in Djambi.

Monopoly of mighty BPM

Further north, around the Residence of Djambi in Central Sumatra, the oilfields and small distillation companies of Tempino, Kenali Asam, Badjoebang, Betoeng and Mangoendjadja were situated. The fields were owned by the *Nederlands Indische Aardolie Maatschappij* (NIAM), a public-private partnership between the BPM and the Dutch East Indies government, set up in 1921. This joint venture was an economic novelty. It was the first time the government became an actor through shares in the Sumatran oil-industry.

The actual refining process did not take place in Djambi, but in Pladjoe instead.^{xv} Starting in 1935, oil was transported from Tempino to Pladjoe through a pipeline over a distance of 270 kilometers through hilly country covered by dense forests, along ricefields, intersecting many watercourses. In 1938 Djambi had about 14 per cent of the total East Indies' production in their hands.^{xvi} In addition, and partly with NIAM's support, some roads and an airport were built in 1933 and the city was linked to a railroad. In 1936 a road was opened between Palembang and Padang by way of Djambi.

Naturally, the BPM feared the increasing competition from the American *Standard Vacuum Oil Co.* (henceforth *Stanvac*), working through an affiliate: the *Nederlandsche Koninklijke Petroleum Maatschappij* (NKPM). Although the Dutch Indies government tried to keep foreign oil companies outside the colony through the Mining Act, the Stanvac struggled to compete with the BPM. So, they started in 1912 to operate their own refinery at Soengei Gerong, directly opposite Pladjoe, on the east side of the River Komerang.^{xvii} It developed into the second largest oil facility in the Asian region, receiving 3,500 barrels of crude per day by pipelines from the fields of Talang Akar.^{xviii} The plant at Soengei Gerong really challenged BPM's control of the global flows of oil as a strategically asset. In 1930, another serious rival emerged on stage: *Caltex*. They also worked through a subsidiary, called the *Netherlandsch Pacific Petroleum Maatschappij Company* (NPPM), and secured extensive exploration concessions in Central Sumatra and on the Riau-islands.^{xix}

In sum, the BPM had quite a strong position in the Dutch East Indies managing large export refineries and controlling an enormous distribution network spread over the Archipelago.^{xx} Around 1930, the BPM owned 85 per cent of the oil production, but in the end of the 1930s this percentage went down to 55 per cent due to the heavy oil competition with Stanvac, which owned already 30 per cent of the promising oil market. In 1938, oil and related products determined an output value of 23.6 per cent of the total export, a value of about 190 million dollars. The six million tons of oil produced yearly in the Netherlands Indies accounted for only 2.7 per cent of the world's total.^{xxi} Hence, the Dutch economy depended heavily on the revenues of the oil resources coming from its crown colony.

Epic battle for oil

For both Batavia and The Hague it was vital to keep a watchful eye on the emergence of Japan. In case of a war, The Netherlands, as one of the smaller European powers, was not able to defend its territory in Europe or its colossal colonial empire overseas. Silently, it trusted in the British military protection. After the German victory over the neutral Netherlands in May 1940, Japan stepped up pressure by sending two missions to Batavia demanding a bigger share of the East Indies' oil export.^{xxii} Without doubt, oil was the main quest of the armies of Japanese emperor and the reason for the invasion of the Dutch East Indies. Obviously, oil was vital for their war machine, but Japan had almost no experience and expertise in this branche. The weakness of her war potential lay chiefly in the fact that Japan's home production of natural and synthetic oil amounted to only some 10 per cent of her annual requirements. Of her oil imports in 1939, about 53 per cent came from the United States, 38 per cent from the East Indies and nine per cent from other countries.^{xxiii} Somehow, Japan had to ensure means of replenishing her storage tanks.^{xxiv} Tokyo needed yearly at least 7,9 million tons of oil to win their Greater East Asia War.^{xxv} Sumatra could deliver 5,3 million, so for a long drawn-out conflict the Sumatran oil was crucial (Figure 5). Therefore Japanese troops were instructed to put the most important oil centers in their hands quickly, without any loss or destruction (Figure 6). At the same time, Dutch troops were instructed to destroy the oil facilities before Japanese troops could get in. Authorities in Batavia had boasted that they had 500,000 tons of oil in storage in Palembang and that if the Japanese forces should start a river-ascending operation, they would

release 10,000 ton of oil per day into the Moesi and burn up the convoy coming up the river.^{xxvi} The Dutch colony was in peril.^{xxvii}

Meanwhile, after the fall of France, Japan occupied Air and Naval bases in French Indochina. Immediately, the American President Roosevelt announced in August 1941 the embargo on the export of oil, including a freeze of all bank transfers. Great Britain and the Dutch government in exile in London followed with the same measures instantly.^{xxviii} On 8 December, a day after the attack on the American Navy fleet in Pearl Harbor, Batavia declared war on Japan. One month later, on 11 January 1942, the Japanese Navy conquered the oil-island Tarakan and the oil centre Balikpapan on Borneo. One month later, on 14 February, at the time that the invincible British fortress in Singapore was about to fall, a Japanese invasion fleet of about 10,000 men was sailing toward South Sumatra. Their operational plan was to attack the oil refineries at Pladjoe and Soengei Gerong and seize the superior airdrome Talang Betoetoe near Palembang, where temporarily American B-17 Flying Fortress bombers were stationed.^{xxix} In order to secure these sites and halt the frustrating scorched-earth policy, Japan flew in almost 600 men of the 1st Paratroop Raiding Group by complete surprise.^{xxx}

Figure 6. Japan's need for Palembang's oil. Source: Johan Fabricius, *Brandende Aarde*.

To defend Palembang, there were about 2,000 Dutch troops, plus reinforcements of Australian units and British anti-aircraft sections. The Territorial Command of the Royal Netherlands Indies Army (KNIL) under Lieutenant Colonel L.N.W. Vogelesang, wanted to wait as long as possible before destructing the refineries. Influenced by the oil companies only a limited destruction was planned, keeping the main installation in tact.^{xxxi} Suddenly, in the middle of the night of 15 February, he received the order from Batavia that his military units had to demolish the refinery, at last. In the rush, the huge tanks with oil products were not damaged at all, neither the refinery. After this half-hearted action, they hastily retreated and quietly slipped away in the darkness.^{xxxii} Pladjoe was soon completely in Japanese

hands and they managed to put out the fire in the boilers, shut valves, turned cranks and disarm most of the demolition charges placed in the complex by the Dutch before they were driven out.^{xxxiii} From now on Pladjoe was called 'refinery no. 1' and managed by Nihon Sekiyu ('Nippon Oil').

The refinery of Soengei Gerong, on the contrary, was successfully defended by Dutch troops. After the order of Vogelesang, military units deliberately destroyed 80 per cent of the refinery, including the oil tanks, using a time-delayed demolition charge.^{xxxiv} Nevertheless, the damage done to the refineries and machineries were easily fixed by a group of Japanese drilling crewmen and oil-engineers, resuming the production after six months.^{xxxv}

Japanese occupation

At the start of the Japanese occupation the oilfields in Palembang fell directly under control of the Japanese military. They made use of about 150 oil-employees who were forced to work for them for almost one year, but later were sent to prisoner's camps. The Japanese could therefore only rely on the local oil personnel and they were hardly capable of maintaining the modern machineries.^{xxxvi} During the war this led to a considerable lack of investments and oil was unprofessionally distracted from the oilfields. As a result, the production went down drastically, as the annual reports of the 'Koninklijke' pointed out.

At the end of the Pacific War, massive Allied bombardments started on Palembang. First, the attack by American B-29s in August 1944 was launched, but with negligible effect. Plans were adapted and in January 1945 a more precise series of British air strikes was undertaken on the Japanese held twin refineries that were supplying at that time half their oil and three quarters of their aviation spirit. Next to these 'Palembang Raids' that diminished the oil production, Japanese oil tankers were attacked which had a tremendous effect on the capacity of transportation of oil to Japan. These collective Allied efforts made Japan's war machine eventually come to a halt.^{xxxvii}

Re-capturing the oil facilities

During the Japanese occupation, the Indonesian nationalist movement had gained in power. Nationalist leaders, pressed by fanatic Indonesian youth (*pemuda*), seized the opportunity created by the unexpected Japanese capitulation. Watched by the still unbeaten Japanese troops in Indonesia of over 250,000 men, Achmad Soekarno proclaimed the independent Republic of Indonesia unilaterally, on 17 August 1945, two days after the Japanese surrender. This revolutionary action prevented that the oil installations automatically fell back in Dutch hands. Especially the British supreme command, led by Sir Philip Christison, realized that the Indonesian people were fighting for their cause and issued a statement that implied a *de facto* recognition of the Republic.

Meanwhile, the situation on the oilfields was complicated. Upon request of the Allied forces the refineries at Pladjoe and Soengei Gerong were temporarily put under supervision of Japanese soldiers in September 1945. The Imperial Japanese Army had to occupy these oil installations, including the nearby oilfields and stop the oil production immediately. All the other oilfields in South Sumatra were taken over by the Indonesian forces. On sight, Indonesian (oil) freedom fighters (*lasjkar minyak*) quickly founded their own semi-militarized oil labour unit: *Persatoean Pagawai Minyak (PPM)*. This initiative came from Dr. Adnan Gani and Dr. Mohammad Isa, who both had a prominent seat in the regional government of the Republic in Palembang.^{xxxviii}

The CEO of the 'Koninklijke', Dr. Barthold van Hasselt, was watching the nationalist developments with displeased eyes. He was eager to start the reconstruction of the refineries and make money, like in the old days.^{xxxix} Therefore, he tried to convince the British and Dutch military command of the enormous interests that were involved in the oil business.^{xl} In his opinion the Japanese troops should be replaced by British troops. These were not available, because the spearhead of the military operation was on Java. The British were not inclined to help out the BPM.^{xli}

Then something remarkable happened. Dr. Gani, Governor of South Sumatra, proposed that the BPM itself should take over the Japanese control at the oil centers as quickly as possible.^{xlii} He really wanted two things in return. First, the BPM had to pay interests over the profits to the Republic.^{xliii} Secondly, all the Indonesian workers that were occupying the refineries at that moment should be hired by the BPM and paid in kind with

food, textiles and household items.^{xliv} A profitable oil deal, because through this peaceful consultation and smart oil diplomacy, at the end of September 1946, the Republic gained the international recognition they urgently needed, and the BPM succeeded in taking control again of their most valuable oil installations without any intervention of neither the Dutch government nor the Army.^{xlv} As a bonus, the ‘trade-soldier’ Gani hoped to consolidate his political base and improve his own economic position.^{xlvi}

Nevertheless, truce and peace were apparent. The situation escalated in the end of October after an inflammatory speech by the Republican General Soedirman. The Republican revolt was reverted and led on New Year’s Day 1947 to heavy bombing of Palembang by combined Dutch units of Navy and Airforce. This punitive strike was undertaken without any notice or warning, causing many civilian losses and it left the city in ruins.^{xlvii} After this ‘Battle of Five Days and Five Nights’ Republican troops were forced to withdraw in a radius of twenty kilometers around the petroleum city. Subsequently, their political leaders fled and joined the radical camp in the Djambi area.

Operation Product

Since the landings of Dutch troops in March 1946, the progressive Dutch Lieutenant Governor-General Hubertus van Mook in Batavia and several politicians from the then cabinet Beel in The Hague became more susceptible to the oil interest in South Sumatra, and they were increasingly inclined to intervene. The First Dutch Offensive (‘Eerste Politionele Actie’) soon followed in July 1947 and throned the appropriate name *Operation Product*. The main goal was to occupy the vital economic areas as soon as possible and restart the main companies. Moreover, there was plenty of work for the tens of thousands of people in the overcrowded areas. So they hoped in this way that an important recruitment basis for the Indonesian freedom fighters would disappear.

The Dutch Y-Brigade led by the hotheaded Colonel Frits Mollinger had to occupy the key oil centers around Palembang. From a military and economic point of view the invasion was a success. Mid-August a substantial recovery of the oil production was realized and the refineries received oil again from the oilfields and worked its way up to 2,5 million barrels per day.^{xlviii} The Second Dutch Offensive in December 1948 had hardly any effect on the oilproduction at Pladjoe. This crown jewel of the BPM turned at full speed. Ironically, the Dutch military successes were a pyrrhic victory, because they caused US support to shift to the Republic and forced the Dutch to negotiate the transfer of sovereignty to Indonesia. Interestingly, during both military operations small units of BPM-technicians closely followed the Dutch forces in order to reboot oil extraction in the recaptured areas.^{xlix}

Oil-diplomacy

The management of the BPM, amongst them Johan Frederik van Diermen, the headstrong administrator of Pladjoe, was exploring the possibilities to regain control of the oilfields near Djambi. In a secret report addressed to Prime Minister Louis Beel, the BPM did not show support of a military action against Djambi for fear of damage and sabotage to the oil installations. Instead, the BPM paid 5,000 dollars to Republican security forces of the oilfields and installations near Djambi, in order to prevent destruction.¹ The BPM pragmatically went even one step further and started in May 1948 direct negotiations with the moderate leaders, and ‘oil barons’, Isa, Gani and Pattiasina, who had fled to Djambi after the earlier battle around Palembang. As a result of these ‘peace talks’, the vital oil concessions fell back into the mother’s womb. The BPM staff was very relieved, but Van Diermen’s conduct led to great outrage with the headquarters of the ‘Koninklijke’ in The Hague and with

the staff of Stanvac, as they were not informed at all.^{li} This wasn't for the first time; it happened before with the Gani-deal at Pladjoe. The Minister on Overseas Territories, Lubbertus Götzen, informed the Prime Minister rightaway and told him that '*Van Diermen could not care less who has the authority, if only he gets oil*'.^{liii}

Directly after the landing of Dutch paratroopers on 29 December 1948 and again on 5 January 1949, rebels caused severe damage to the NIAM-oilfields near Rengat and Air Molek. The BPM staff had forecasted this sabotage in many conversations with Dutch politicians.^{liiii} However, both the BPM and Dutch politicians were in favor of recapturing this important oil center.^{liv} Not at least, because the American oil company Cowie & Co INC was eager to buy local concessions from the Republic for one million dollars.^{lv} During the military action small technical units of the BPM operated again as 'advanced parties' in the slipstream of the Dutch troops and were able to minimize the damage and start repairing works.^{lvi} Mid-1949 crude oil was being piped again at pre-war production level.

Conclusion

This history shows how the south Sumatran city of Palembang industrialized and urbanized enormously due to the booming oil industry of the BPM, and how the lay-out of the company town Pladjoe grew bigger and bigger by ambitious planning of the BPM. Also this paper shows what was at stake for the BPM in the political turmoil of the 1940s, what was lost, regained and kept for the future. As for Japan, Palembang and the refineries in Pladjoe, was a coveted military prize. Remarkably, in their effort to safeguard the oil business and restore the pre-war situation of peace and prosperity, BPM's captains of industry, Dutch Army commanders and politicians in both Batavia and The Hague worked closely together. Constantly using oil as an economical weapon.

With the advent of the Indonesian independence in December 1949 the balance was drawn up. It was clear that the BPM failed to arrange business according to the pre-war situation. Pladjoe and its infrastructure was indeed saved from total destruction, but Djambi was regained only in 1949 and the refinery in Pangkalan Brandan, the origin of the Royal Dutch Shell, was lost forever due to fierce local resistance in Atjeh. Despite this outcome, the post-war oil production would eventually triple, compared to the pre-war average situation.^{lvii}

Besides, in the beginning of the 1950s the urgency for road renovation and construction in Palembang was more apparent than ever, especially in the Ulu area, which was heavily damaged during the war and revolution. Therefore the municipality implemented in 1950 a reconstruction plan, designed by Dutch architect H. Lüning.

Furthermore, in the Mid-1950s when postcolonial Indonesia was under the spell of anti-Dutch sentiments, Jakarta did *not* nationalize the BPM, but declared the company indispensable for their national economy, instead.^{lviii} Finally, in December 1965, when the local political situation was rather unstable, the 'Koninklijke'/Shell pulled out by selling all the rights in exploration and production for 110 million dollars to the Indonesian state owned oil company Pertamina.^{lix} Again a smart oil-deal, but Shell would return soon.

Daqing Oil Cluster: From petroleum hub to sustainable future

Penglin Zhu*

* *PhD Candidate, Chair of History of Urban Planning and Architecture, Faculty of Architecture and the Built Environment, TU Delft, P.Zhu@Tudelft.nl*

Since the mid-20th century, the Chinese government in collaboration with various governmental petroleum authorities, first with the Ministry of Petroleum and later with state-owned companies, has transformed the built environment on multiple levels, creating interrelated infrastructures and production sites, installing refineries and petrochemical industries, constructing dedicated oil ports, building workers' housing and educational, health or leisure facilities, effectively creating a palimpsestic petroleumscape.¹ The development of Daqing oil field can be the best representor showing the how the Chinese government shaped the built environment and people's lifestyle. Urban form in Daqing has changed extensively after the Chinese Economic Reform in early-1980s when the national policy shifted to complete and optimize the infrastructure and civic facilities. The recent national policies of the *OBOR Initiative*, which aims at balancing the economic sustainability and environmental preservation and *Revitalizing the Old Industrial Bases* in China have helped develop Daqing at the regional scale. Moreover, these national plans aim at balancing two potentially conflicting objectives: economic development and ecological sustainability. This paper explores in which manner the national policies and local spatial plans of Daqing have transform Daqing from the old oil mining district to the domestic oil hub, then to a sustainable oil cluster.

Keywords: oil, regional planning, urban planning, ecological and economic sustainable,

Introduction

Daqing, the most influential Chinese oil city, is an intriguing case to study in which manner the particular Chinese top-down planning system has influenced the urban transformation of the Chinese oil-based cities. As a city built for the national demands for oil, the built environment and lifestyle in Daqing was intertwined closely with the consecutive political shifts. In early-1960s, the central government highly praised the industrial rural form and low-cost living shelters of Daqing, promoting them as the domestic models for the other cities to learn. Specifically, the Architecture Society of China even organized a national conference to learn the experience of the urban form and architecture of Daqing and promote to the national wide.² However, the national planning patterns of 'working first, living second' and 'building extremely low-cost' housing were widely criticised by the national leader in 1980s when the Chinese Economic Reform started. The political propaganda of 'building a beautiful Daqing' is thus a by-product of the politic shift which can be seen as the guideline for the Daqing Municipality and local design bureau to complete the civic infrastructure and facilities. Between 1980-2000, Daqing was slowly transforming from the old oil mining districts to a domestic oil hub. The current OBOR Initiative, which aims to balance two opposing terms of economic development and environmental preservation, is influencing the current policies and plans for Daqing. It has conceived the future development of Daqing into the regional scale, bringing more economic and technological resources to archive the two terms. The national government have issued several economic plans to coordinate the local development such as the *Thirteenth-Five Year Plan for Revitalizing the Old Industrial Bases in Northeast China*.³ Can the Chinese government meaningfully balance the opposing terms of economic and ecologic sustainability in the oil mining cities?

The paper intends to enrich the current research field of the urban history of Daqing. Hou Li, a prominent Chinese urban historian, has studied the lifestyle and the built environment between 1960s to early 1980s,⁴ however, she has not explored the urban changes since 1990s, specifically, after 2004 when the central government issued the national policy of 'scientific development'. It was a national policy for the sustainable development. Moreover, scholars as He Li, a Chinese human geographer, has studied the current urban problems in the post reforming period, however, has not studied the relationship between diverse oil installations.⁵

The paper examines in which degree the national policies and local spatial plans have transformed Daqing Oil Cluster from the old oil mining districts to the domestic oil hub, moreover, in which manner the national policies

and plans have imagined Daqing from the domestic oil hub to the sustainable oil cluster. First, the paper explores how the national spatial strategies shaped the Daqing from the mining districts into a domestic oil hub of multiple oil industries and technology innovations. Second, it examines whether and how the national strategies and local spatial plans have formed a concept of the oil cluster, which brings regional oil infrastructure and various oil-related installations into one agglomerative spatial entity. The last, it investigates how the national and local plans have addressed the notion of ecological sustainability.

Planning processes in the Daqing Oil Hub: Urban centralization and industrial transformation

The national policies, strategies and economic plans, such as *Building a beautiful Daqing* and *Precaution for the industrial transformation*, were national intervene to transform Daqing from the oil mining district to the domestic oil hub after the Chinese Economic Reform. The *Building a beautiful Daqing*,⁶ announced by the former Chinese leader Xiaoping Deng in 1978, aimed to complete infrastructure construction, build more civic facilities including cinema, museum, shopping centre etc. to optimize the people everyday life experience. The *Precaution for the industrial transformation*,⁷ conceived by the former Chinese President Zemin Jiang in 1990, aimed to establish new industries in Daqing for the coming production decline of the oil industry. Therefore, the urban plans in 1990s were made generally for two consecutive purposes, better living environment and industrial transformation. Together with the local planning bureau and planning bureau of the Heilongjiang Province, Daqing municipality issued 3 comprehensive urban plans of Daqing to transform Daqing from the oil mining districts to a domestic oil hub.

Urban centralization was the main planning principle after early 1980s, which was made by the local design bureau to reflect the national strategy shifts of *Building a beautiful Daqing*. Since 1960, the infrastructure and facilities of Daqing were planned on the principle of 'Working first, Living Second'. The form of the oil industrial facilities, living settlements decentralized in the vast oil field. For instance, the residences were constructed in compact areas alongside the roads to the oil extraction sites. According to the yearbook of the Daqing Planning Bureau, the living condition and decentralized urban and rural form were barriers to attract and host the human resources. Therefore, the second comprehensive urban plan proposed to centralize the compositions and infrastructure in the oil field and highlighted the idea of 'core city'. Specifically, Ranghulu District was planned as the cultural, economic, and administrative centre for the oil field. The idea of 'core city' was a start point of the transitions, and it was updated to a new concept of the 'main district' in the Third Comprehensive Urban Planning in 1996 (Figure 1). The Third Comprehensive Urban Plan conceived the tri-town structure to accelerate the urban centralization for the first time. The tri-town refers to three districts West City District, East City District, and Sartu District respectively.

Figure 1 The Third Comprehensive Urban Planning of Daqing (1998-2010), Resource, Daqing Library

The Daqing Oil Field and city started the industrial transformation since early 1990s when the central government issued the developing strategy of Daqing to multiple oil industries and innovative technology industry in mid-1990s. The central government proclaimed the local municipality of Daqing to 'take precautions' of the probable

oil decline, though Daqing still produced a large amount of oil in 1990s. The idea of reforming the local industries soon reflected in the comprehensive urban planning of Daqing. The tri-town system, which has been the major spatial structure to date, has defined the main function of each districts. Among the three districts, East District has been conceived to host the technology innovation zone, while West City District has been planned as the site to facilitate multiple oil industries, Sartu District was the cultural, administrative, and commercial centre. Daqing City started construction of Daqing Hi-Tech Industrial Development Zone on April 10, 1992 which was approved as a National Hi-tech Industrial Development Zone on November 9th the same year. The overall planning area of the development area is 30.65 square kilometres, which consists of the main area and three chemical parks of Hongwei, Xinghua and Linyuan. After several years of development and construction, the development zone has now developed an area of 6.8 square kilometres, a total construction area of 1.68 million square meters, a total of 450 units.

However, the transformation from the oil mining districts to the domestic oil hubs was a slow progress to the particular local planning system that both the municipality and state-owned oil companies were both institutions for the urban development. Before the Chinese Economic Reform, the Ministry of the Petroleum Industry was in charge of the planning processes between early-1960 to later 1970s. Though there was not a comprehensive urban planning in this period, the construction plans were easy to make and build due to the national strategy of 'industry first, living second', which refers to a decentralized semi-urban semi-rural form. The Daqing Municipality, established in 1980 in light of the Chinese Economic Reform, thus far, has been the local institution to make urban plans. However, the municipality can only plan for the infrastructures and facilities outside the oil fields while the Petroleum Administrative Bureau of Daqing was responsible for the planning in the oil fields. They were individual institutions which affiliated to different higher administrators. The Daqing municipality was under the supervision of the Heilongjiang Provincial government and the Petroleum Administrative Bureau was under the supervision of the state-owned PetroChina Company. According to the locals, there has been a gap between these two in the planning processes. For instance, the local municipality and local design bureau conceive the infrastructure and facilities in the comprehensive plans of Daqing, however, the petroleum administrative bureau can postpone or modify the plan when they implement the projects in the area under their control, as an example the West City District.

The local municipality and local urban planning bureau, thus far, have put lots of efforts to coordinate the urban development in the west city district (administrated by the petroleum office). First, the local municipality and local planning bureau tried to highlight their institutional legacy in the planning processes. In 1996, the local municipality organized numerous propaganda which highlighted the importance of the municipality in order to coordinate the construction in the whole city. According to the 1996 yearbook of Daqing, such action was relatively successful. Second, together with the petroleum administration bureau, the Daqing municipality revised the Master Plan of the West City District in 2005. Specifically, it proposed the road adjustment planning, private science and technological centre, and transformation control planning of the West Passenger Station.

Daqing has been urging to balance the economic and ecological development since early-2000. As a double-edged industry, the oil industry is one hand sustaining the domestic economic growth, at the other, it is one of the major pollutions to the environment. The traditional oil field and the city have been facing the problem of environmental degradation for decades since early 2000s. After 50 years intensive oil extraction, the environment problem is severe. Both the national strategies and local spatial ignored the importance of the ecological sustainability until early 2000. The first, second, and third comprehensive urban plans of Daqing did not address the environmental issue as planning priority. The plans focused more on the economic development and industry reforming.

Daqing Oil Cluster: Economic sustainability and environmental preservation

The current national policies, strategies, and plans considers the future development of Daqing into the regional scale, such as the *Plan for Revitalizing the Old Industrial Bases in Northeast China* issued by the National Development and Reform Commission in 2014,⁸ which aims to reactive the industries in the northeast China, and the *One Belt One Road (OBOR) Initiative*⁹ proclaimed by the national government since 2013, which aims to invest some of 1 trillion dollars to build a new Silk Road of trade routines,¹⁰ specifically, the construction of railways, pipelines, oil storages, and massive infrastructure, moreover a joint cooperation of the green technology development. As one node industrial city involved in these national strategies, the future development of Daqing has been tightening with the national developing strategies of regional scale. Together with the national development and Reform Commission and Ministry of Housing and Urban-Rural Development, provincial governments of Jilin and Heilongjiang issued the Plan of Ha Chang City Group Development in 2015 (Figure 2).¹¹ It aims to archive the infrastructure interconnection, industrial coordinated development, co-construction of the

Figure 2 HaChang City Group Pattern, Resource, Plan of Ha Chang City Group Development

environment, and explore new urban forms for the main grain-producing areas. Daqing has been conceived as the core city in the plan which facilitates three industrial bases, petroleum/petrochemical industrial bases, equipment manufactory base, and the new material industrial base. The regional scale goes beyond the traditional provincial and local administrative divisions, can help us to understand the circulations of the oil flow have redrawn the urban form, architectural composition, and landscape. It is the appropriate scale for the research of oil industry development since the infrastructure of the Chinese oil hub has been planned and implemented to serve a region. Meanwhile, it is a potential tool to look at the manner which the national government has tried efforts to balance the two opposing terms of economic sustainability and environmental preservation, studying in which manner and to what extent the national government, local municipality, and local planning bureau have addressed the notions of economic and ecological sustainability, though the national policies and strategies have not spelled out the specific concept of the oil cluster.

Figure 3 Planning of China-Europe Railway Route, Resource, The Plan for China-Europe Railway Express

The paper conceives the regional spatial concept of the Daqing Oil Cluster, which includes the Daqing Oil field and the Daqing city, the oil-related infrastructure and facilities in the Northeast China, as the spatial reality carrying the national terms of balancing the economic sustainability and environmental preservation. The concept of the Daqing Oil Cluster is based on Carola Hein's concept of *palimpsestic Petroleumscape*,¹² which brings not only the built environment and architecture, but the representations and social meanings to the research of the oil as well. Therefore, the oil cluster brings all the oil-related installations into one specific spatial concept which includes the oil exploiting and extracting installations, the national strategic oil storages and the oil dedicated port as well. In the northeast China, the port of Dalian can be seen as a remote, but important part of the Daqing oil cluster. The port Dalian has long been the portal to the hinterlands in the northeast China. It is seen as the key shipping and commercial centre in northeast China in the OBOR Initiative. The infrastructure constructions carried by the OBOR Initiative are mutual advantages for both Daqing and Dalian. In the OBOR Initiative, Dalian port is

the start point of the China-Mongolia-Russia-EU Economic Corridor while Daqing is one of the industrial nodes alongside the plan for China-Europe Railway Express, issued by the national development and reform commission and China Railway Corporation in 2016 (Figure 3).¹³ And the oil products and Volvo cars produced in Daqing have already entered the market through the railway.¹⁴ Meanwhile, as one of the largest oil importing port in the world, the importing oil from Dalian port can also connect to the refining factory in Daqing. Second, Dalian is a potential example to share the experience of reforming in economy and industrial for Daqing. As a national strategical port city, Dalian has been in the frontline of reforming and urban planning to facilitate the foreign investors. However, Daqing is relative conservative comparing to Dalian, as a traditional oil strategic city with high political concern. It has been facing the threaten of oil decline and environmental pollution for decade, moreover, is at the point of balancing the objectives of economy and environment.

The construction of the oil industry is still one of the major goals of industries constructions in the Daqing Oil Cluster. *The Plan of Ha Long City Group Development* has proposed to build an important national reserve base for oil, natural gas, and coal. It aims to enhance the operation management and dispatch adjustment of oil and gas, moreover, improve the cross-regional energy security mechanism. Specifically, it has proposed numerous pipeline constructions including the Daqing-Jinxi crude oil pipeline (Daqing-Tieling section), Sino-Russian crude oil pipeline second-line project and the Sino-Russian-East natural gas pipeline, and the Dalian LNG and Shaan-Jing-Shen-Chang pipeline connection project.¹⁵ Moreover, it proposes to accelerate the construction of Daqing's 10-million-ton oil refining and million-ton ethylene projects, develop ethylene and downstream products in depth, focus on the development of synthetic resins, synthetic rubber, synthetic fibbers, and organic chemical materials. Though the oil industrial still acts as the leading industry, the *Plan of Ha Long City Group Development* has proposed various programs of industrial reforming, highlighting the importance of the economic sustainability. First, it proposes to build cooperation of equipment manufacturing in five cities, Harbin, Daqing, Qiqihar, Changchun, and Siping respectively. The manufacturing including CNC machine tools, agricultural machinery equipment, petrochemical equipment, photovoltaic and new energy equipment. Second, it has conceived Daqing as production centre of the spare parts of vehicle, moreover, a new developing centre of new energy vehicles and plug-in hybrid vehicles.

Figure 4 The Forth Comprehensive Urban Planning of Daqing (2002-2020), Resource, Daqing Construction Bureau

To balance the economic development, the fourth and fifth comprehensive urban plans in Daqing has set priorities for environmental sustainability. The national economic plan of *the eleventh five-year plan (2006-2010)*, which highlighted the sustainable development in various aspects including economy and ecology, was the first time addressing the importance of the environment sustainability. The local spatial plans soon reflected to the national strategies that the Forth Comprehensive Urban Planning of Daqing (2002-2020) highlighted the environmental preservation as one of the planning principles in for the first time (Figure 4). Comparing to the third plan, the forth

plan was as a distinct step forward of trying efforts to archive ecological sustainability. By the end of 2004, 20 ecological parks and 1400 hectares of urban green land were implemented in the oil field. Moreover, the sewage treatment program in numerous lakes were completed which solved the traditional problems of ponding. The environmental protection and ecological sustainability became the major social concern in the *Twelfth Five-Year Plan for urban and Rural construction of Daqing (2011-2015)*.¹⁶ It conceived more detailed plans for each district in Daqing, comparing to the eleventh five-year plan. *The Twelfth Five-Year Plan for the Construction of Ecological Civilization in Daqing* proposed three aspects, identifying the ecological zone, developing the ecological industry, developing low-carbon industries and clean energy production base. Specifically, identifying the ecological zone refers to protecting wetland, nature reserves, and forest parks, building agricultural and animal husbandry production and green food base. Developing the ecological industry refers to developing ecological industry and green petroleum and petrochemical base. The last, developing low-carbon industries and clean energy production base refers to develop industries of the wind energy, geothermal energy, and biomass energy. According to the local condition, these three energies resources are substantial in Daqing.

Conclusion

Examining the spatial impacts of the national strategies, the paper first examines the planning ideas of the domestic oil hub between 1980s-2000 in which to assess the implementation of the urban plans in Daqing. It argues that the transformation from the oil mining district was slow due to the two institutions in the planning processes. Moreover, the plans between 1980s-2000 only focused on economic development ignoring the importance of the environmental preservation in the plans. Second, the paper posits the concept of the regional oil cluster as a space in which to assess the implementation of the ongoing OBOR Initiative. It argues that the Daqing Oil Cluster is the appropriate planning scale for the national policies and strategies to archive the economic and environmental sustainability. At last, the environment issue will be the major concern of the future planning. Though the local municipalities and planning bureau have tried efforts to improve the ecology system in consecutive plans, the ecological sustainability is still one of the crucial problem in Daqing due to the oil industry. Lots of human resources and financial support are necessary parts to implement the plans. Thus, whether and to what extend the local municipality have implemented these plans will be an intriguing question for the further research.

Oil's Quiet on the Western Front: Planning the Persian Corridor

Stephen Ramos (University of Georgia)

Oil determined the outcome of the First World War, and logistics determined that of the Second. World War II produced geographies of oil and logistics based on established colonial and trade networks. The German threat to the Russian Western front required collaboration between U.S. and British military engineers to move equipment through the "Persian Corridor" to reach Stalin's army. The project required port and egress road construction to the Soviet Zone, tenfold capacity increase of the Trans-Iranian Railway to Tehran, and construction and operation of aircraft and truck assembly plants. The best-developed port was on the island of Abadan, which was reserved for British oil shipment, so alternative Persian ports, particularly Khorramshahr and Bandar Shahpur, had to be expanded. Though Persia was considered part of the agreed-upon British sphere of political influence due to their established oil interests, the need to build transportation infrastructure for military equipment movement forced Churchill to agree to the U.S. military's command of the eastern Persian route.

While many historians claim that World War II had little impact on the Gulf region, the paper considers the wartime Lend/Lease collaboration as a critical juncture that would link the role of oil speculation, discovery, and logistics to future spatial development, territorial definition, urbanization, and sovereignty in the region. An urbanization typology—strongly influenced by post-war British and U.S. interests in the region for oil speculation—began in Kuwait in the 1950's and moved southward to influence neighboring states as they too discovered oil.

Within the Global Petroleumscape framework, the paper considers ways in which global oil networks and their generative spatial configurations moved in and out of national and transnational trade and security networks. The British and U.S. civilian engineering firms recruited for wartime logistics infrastructure projects in the Gulf region were then essential to the post-war oil extraction and trade infrastructure, and its associate urbanism.

The Persian Corridor case provides a rich example of the intersection of war, geography, infrastructure, planning, and geopolitics as a complex field of interwoven within the intrigue of competing international oil interests and networks.

The Global Petroleumscape, Spatial and Represented: A Tool for Understanding Planning Practice

Carola Hein (Delft University of Technology)

This panel explores the ways in which corporate and public actors have inserted the physical and financial flows of petroleum into the built environment. It focuses on the ways in which the forces of private land purchase, speculation, and construction have interacted with public spatial planning, policy, and regulation, and explores how petroleum actors have guided the development of urban and rural areas around the world. It argues that the spatial presence of petroleum structures and the close collaboration of relevant actors has created path dependencies that reinforce the petroleumscape and shape planning practice. It identifies different layers—both visible and invisible, physical and depicted—that combine into a palimpsestic global petroleumscape. Extraction, refining, transformation, and consumption of petroleum have made an extensive impact on seas, landscapes, cities, and buildings. Oil drilling equipment, refineries, storage tanks, pipelines, dedicated road and rail infrastructure, and gas stations serve the physical flows of oil in industrial areas as well as everyday life. Headquarters, research facilities, housing, cinemas, and leisure facilities are linked to the financial streams of oil. All stand as material witnesses to the invasiveness of petroleum, but some of them are much more subtly connected to petroleum flows—international schools that serve oil expatriate's children, for example, are less visible than refineries. In most instances, oil companies have not been planning agents per se, but they have often collaborated with public governments in charge of spatial planning; as a result, the flows and the interests related to petroleum and their representation have influenced public planning practice, directly and indirectly, in response to the changing urban environment. It further posits that the everyday use, representation, and mostly positive appreciation of petroleum-related structures among citizens of different classes, races, cultures, genders, and ages has created a feedback loop or an energy culture that helps maintain the buildings and urban forms needed for physical and financial oil flows and celebrates oil as a heroic cultural agent – thus leading societies to consume more oil. Following a general analysis of the concept of the petroleumscape, this panel discusses global examples. In appreciating the power and extent of oil can we engage with the complex challenges of sustainable design and policymaking, develop heritage concepts, and imagine future built environments beyond oil.

Shaping Ahvaz' transnational oil modernity; at the crossroads of oil flows and international planning exchanges

Rezvan Sarkhosh (Delft University of Technology)

Through the lens of flows of petroleum, a key commodity of the 20th century, to revisit local urban histories, this paper contributes to the growing literature on transnational and cross-cultural urbanism. It argues that oil created a unique network of international stakeholders (British, German, and American), from various disciplines and professions (engineering, architecture and urban planning) who collaborated to build modern industrial cities adjacent to Iranian oil fields, much of which were found in previously uninhabited areas. Focussing on the development of the southern city of Ahvaz between 1908 and the start of the Iran-Iraq war in 1980, this paper explores how catering to the different facets of the oil industry (oil extraction, transformation, administration, infrastructure and retail), created a cosmopolitan built environment composed of a variety of architectural styles and urban planning approaches. The diverse actors who co-shaped Iran's oil cities also impacted people's lifestyles through new spatial arrangements. These international actors transformed and localized the global flows of ideas and created native processes of modernization. Albeit their good intentions, many of these actors failed to respond to the needs of the people on the ground and thereby contributed to creating social gaps among different strata of the society. Cosmopolitanism in architecture was thusly limited to styles and forms, rather than a truly just and democratic cosmopolitan society.

Localizing Transnational Architectural and Urban Ideas in Iran's Oil boom Era

Mohamad Sedighi (Delft University of Technology) and Elmira Jafari (Delft University of Technology)

Since the aftermath of the Second World War, the flow of oil and its consumption solidified the complex global network. This network facilitated the exchange of new urban ideas and construction technologies between oil consuming and oil-producing countries. This process was accelerated from the mid-1960s when a tremendous increase in oil consumption in the West put the Middle-Eastern oil-rich countries at the cross-section of international political/economic influences. As the second largest oil exporter in the world, the Shah of Iran, Mohamad Reza Pahlavi, became an influential role player in this context. Aiming to fuel his ambitious modernization project in Tehran, the Shah constructed oil refineries in the capital and involved American experts in the expansion of oil-related facilities in Tehran. This also led to an unprecedented rise in local consumption of petroleum for the industrialization of the city. This process of rapid industrialization was coupled with the urban development of Tehran attracting various international architecture and planning firms, such as Victor Gruen Associates, Kenzo Tange, and Llewelyn Davies. As a result, a series of projects were planned and implemented such as the Comprehensive Plan of Tehran (1966-69), the residential neighborhood of ASP (1970-72), Shahestan Pahlavi (1965-75), all flowing the architectural language of the so-called international style, regardless of local culture and context. As a reaction to this situation, a group of leading Iranian architects including Nader Ardalan, Hoshang Seyhun, and Naser Badie, in collaboration with Iran's Ministry of Housing and Urban Development, organised the first Iran International Congress of Architects (IICA) in 1970 held in Isfahan, to discuss the interaction of tradition and technology. Funded by Iran's National Oil Company and supported by Empress Farah Diba, the 1970 IICA attracted many of the leading architects of that time such as Louis Kahn, Paul Rodolph, Buckminster Fuller, Oswald Mathias Ungers and Jose Luis Sert.

By focusing on the architectural discussions provided in the 1970 IICA and on intellectual trends from the late-1960s to the early-1970s in Iran, this paper aims to unravel to what extent the oil-led geopolitics facilitated a paradigm shift from employing international to local architectural models. Consequently, this paper argues that while the flows of oil and its economic and political impacts on the urban development of Tehran set a basis for importing transnational ideas to Iran, it also stimulated local architects to forester a regionalist discourse in architecture and urban planning.

“Shaping Ahwaz' transnational oil modernity; at the crossroads of oil flows and international planning exchanges”

Author's Name: Rezvan Sarkhosh. *

(*PhD, Department of Architecture, chair of History and Urban Planning, TU Delft. Rose.Sarkhosh@tudelft.nl).

Through the lens of flows of petroleum, a key commodity of the 20th century, to revisit local urban histories, this paper contributes to the growing literature on transnational and cross-cultural urbanism. It argues that oil created a unique network of international stakeholders (British, German, and American), from various disciplines and professions (engineering, architecture and urban planning) who collaborated to build modern industrial cities adjacent to Iranian oil fields, much of which were found in previously uninhabited areas. Focussing on the development of the southern city of Ahwaz between 1908 and the start of the Iran-Iraq war in 1980, this paper explores how catering to the different facets of the oil industry (oil extraction, transformation, administration, infrastructure and retail), created a cosmopolitan built environment composed of a variety of architectural styles and urban planning approaches. The diverse actors who co-shaped Iran's oil cities also impacted people's lifestyles through new spatial arrangements. These international actors transformed and localized the global flows of ideas and created native processes of modernization. Albeit their good intentions, many of these actors failed to respond to the needs of the people on the ground and thereby contributed to creating social gaps among different strata of the society. Cosmopolitanism in architecture was thusly limited to styles and forms, rather than a truly just and democratic cosmopolitan society.

Keywords: transnational urban and architectural history, multicultural urban planning, cross-cultural exchanges of architectural experts, global flows of architectural ideas, global petroliumscape, ethics of urban cosmopolitanism, Ahwaz.

Introduction

The promise of the oil's wealth brought flows of international powers, people, knowledge, technologies, and cultures with diverse motivations and skills to the Iranian oil fields from 1908, when the British explorer - William Knox d'Arcy – first explored oil in Southern Iran . Under the leadership of Iranian, British, Germans, and American officials, stakeholders, engineers and architects, multiple cities emerged or developed in the oil cluster of “Khuzestan”; detached but interconnected cities were created with connections to the capitals in national and international levels (Tehran, London, etc). The Oil Companies in charge of the extraction, transportation, refining and exportation of petroleum for the international market needed extensive urban infrastructures, set up elements of the global petroliumscape, as defined by urban historian Carola Hein.¹ Connected through oil flows, these cities were part of a global system; people employed in the oil industry, lived in imported architectural spaces and practiced foreign lifestyles. Architecture and urban planning became tools in the hands of foreign companies to both shape the land for extraction and reining of oil and to accommodate, control, supervise and socialize their staff. These colonial cities could be a good trial to experiment the modernity in Western urban practices and lifestyles examining in process of modernization of the city and the society.²

Among these new born or transformed cities, “Ahwaz”, combined with Karun--the only navigable river to the Persian Gulf in Iran--located in between of the oil fields (MIS) and oil refinery and port (Abadan), was part of

the Iranian oil industry since the early pioneer days.³ International actors' intervention in Ahwaz reached far beyond the industrial infrastructures engaging all layers of the petroleumscape. Ahwaz had a profound relationship with global flows during its history of transformation, development and modernization which promoted the city to the modern capital of Iranian oil fields with a strong role as a mediator and negotiator for Iran in international contexts.

Focusing on the case study of Ahwaz, this paper will shed light on a lesser known aspect of interrelationship of architecture, urban planning and international flows. It combines the history of modern architecture in the developing world with geopolitical considerations. National and international actors in different political and economic periods in Iran, manifested different steps of modernity in Ahwaz through urban transformations. This can be seen in production of modern architectural and construction types (industrial, administrative, residential, ancillary), urban forms (infrastructures, neighbourhoods), lifestyles, engineering and etc. This paper explores consecutive transnational actors and their role in the creation of different periods of development in the city between 1908, the oil exploration in Iran, and 1980 when the Iran-Iraq war made an important outbreak in oil fields urban life⁴.

Urban development of Ahwaz;

First stage (1908-1926); Fast Building for Oil Industry

Responding to initial needs of the oil industry and its employees, the first urban form of Ahwaz reflected a fast decision making far from thinking for future social issues. Influenced by the previous experiences of United Kingdom in other colonial cities, Ahwaz was designed based on the job hierarchy. The city was classified into social classes and contained various types of housings for workers, employees and manager's in separated neighbourhoods or company towns.⁵ The first and oldest buildings built by APOC in Ahwaz –except managers' houses- were merely simple and functional as row houses for the workers lined in narrow streets, almost in vernacular styles, construction types and materials. (“Kut-Abdollah” and “Khorramkushk”).⁶

Second stage (1926-1941); Growth of Urban facilities and infrastructures

In 1926, with the ascent of the Pahlavi in Iran, Reza Shah who identified the geopolitical significance and resource wealth of oil made Ahwaz the capital of Khuzestan. This shows the reason for taking new steps in the development of the city's built environment. Turning the black gold income to the country, he made a new concession⁷ with APOC in 1933 regarding more benefits for the Iranian government. Improving Iranian workers' life conditions, the Oil Company made an effort to break social gaps and created more urban facilities.⁸ Subsequently, Iran's financial budget multiplied twenty two times from oil revenues. This new income played an important role in encouraging the Shah to invite foreign stakeholders to participate in the industrialization and modernization of the country. In order to decrease the power of Britain and Russia on national, political and economic levels, Reza Shah was particularly interested to have relations with Germany

and the United States.⁹ Trans-Iranian railroad was a main project of national infrastructures which began by one American company¹⁰ in the south and three German companies¹¹ in north of Iran.¹² This variation of actors resulted in two types of architectural styles in 95 railway station buildings. In the south, the American-built infrastructures were designed according to traditional and vernacular architecture of the middle east, while, in the North, Germans had a tendency to make modern forms devoid of any historic references.¹³

In 1929, the railway, reached Ahwaz by the Americans and became one of the main effective features in shaping the urban form of Ahwaz. It also determined the direction of its urban growth by passing the railway through the city.¹⁴ The line functioned not only as a fast way to transport, but also as a symbol of modernization.¹⁵ The American involvements in Ahwaz involved construction of new housings for staffs,¹⁶ "Karun" railways station, engine depots, Wheel shop building, as well as new paved roads and bridges on Karun.¹⁷ In 1933, an accident to the royal train on the inaugural day resulted in the transformation of contractors from the American and the German companies to a Swedish–Danish consortium,¹⁸ which cooperated with construction companies from the Great Britain, Italy, Belgium and Czechoslovakia, named "KAMPSAX." This collaborative effort was concluded in 1938.¹⁹ This transformation of the actors is the main reason behind the changing of architectural styles of railway's buildings of Ahwaz. Railway leaders' housings²⁰ and "Railways' club", belong to the time after opening of railways and probably are built by KAMPSAX since they are designed considerably more modern compared to the other buildings of railways.

In 1930's, the Oil Company competing with the other nationalities' interactions to the area, had realized the importance of advertising itself through architectural and urban projects in order to grow stronger roots in the oil fields. It developed a sizeable oil community in Ahwaz supplying its staffs for housing, along with the usual amenities such as stores and hospital, transport centres, ancillary buildings (educational, religious, entertainment and leisure), and infrastructures as fast main-line car service, airport, pump houses.²¹ Finally apart from being a major traffic junction, Ahwaz also became the midway depot for the pipeline construction and a major distribution centre for oil products.²² As mentioned before in the new contract of 1933, the demands for building urban facilities for the Iranian workers were particularly pressed the by Iranian government from the oil company. The architect who received this great responsibility was the British architect James Wilson, who had started his work with APOC since 1926, but in the 30s the volume of Wilson's works increased from single residential houses to massive constructions. In terms of architectural styles, he tried to use modern style while he was also impressed by vernacular architecture, materials and forms and conceptually used them in his works. With combination of vernacular elements to the extrovert type of buildings having open faces to the streets (instead of introvert traditional types), he created magnificent architectural facades in Ahwaz. In terms of large-scale urban planning issues, one of the main tasks that Wilson accomplished was transforming the structures of company towns. Before that the company towns had very basic, compact and functional patterns.²³ Wilson transformed them to more spacious ones by importing the concept of the "Garden City" of Ebenezer Howard." Howard's ideas were implemented in the Great Britain in late 30s and were concurrently introduced to other parts of the work where the Brits had economic and political control.²⁴ Green spaces, health, light and air were the main characters for planning new urban spaces in the company towns of Ahwaz combining with grid streets and easy access to every neighbourhood based on the need of control of urban spaces by the company.²⁵

By 1939, Persia become the world's fourth largest oil-producing country and still had a strong tendency to collaborate with Germany to launch its modernization projects.²⁶ For British Government, which was eager to keep their influence in Persia as the dominant great power, the great fear was the access of Germany to the Iranian oilfields. Following the increasing German involvement in Iran as their oil-source pilot in the Middle East.²⁷ (at the time of the outbreak of World War II, about 1200 German workers were engaged in business in the country),²⁸ in 1941 the Anglo–Russian invaded Iran and eventually the facilities built by Germans as railway, bridges, etc. beside the Iranian oil were used by Britain to help the Soviet Union and caused their victory in World War II. At this time, the existence of railway bridge turned Ahwaz to the principal built-up area of the oil fields.²⁹ Finally the Soviet Union forced Reza Shah to eliminated all Germans from Iran³⁰ and also leave the power to his son, Mohammad-Reza Shah. After Germans, once again the British built spaces achieved the opportunity of being improved and developed in the oil fields.

Third stage (1941-1951); Development of Ahwaz by AIOC as a Base for Oil Fields³¹

In 1947 the production rate was doubled that of 1939 and AIOC had recognized that M.I.S.³² was not the most suitable location for fields management and headquarters organizations and started to transit the headquarter from M.I.S. to Ahwaz regarding its water connection to Abadan and also its railway connection to Khorramshahr and Shahpur port. Because of the demand of pressing development, stores, workshops, repair services for mechanical transport, construction and maintenance plants were expanded in Ahwaz.

Figure 3: The process of Purchasing Lands in Ahwaz By AIOC from Iranian government 1948-1949, (in these chorological maps, the red lands means which have already been bought and the green lands means which are about to be bought). Source: BP Archive. Archref: 68939.

At this time nationalism and democracy gained a lot of values in Iran. Iranian politics, against Brits, insisted on improvement for Iranian worker's living conditions who were suffering from low wages, poor houses and facilities while the best situations belonged to British employees³³ AIOC, in order to not losing its beneficial position in the oil fields, tried to improve the oil cities conditions but their actions were too late. The Iranian oil minister Mossaddegh, officially nationalized oil in 1951 and later the oil properties and infrastructures were also declared nationalized.³⁴

Fourth stage (1951-1959); Oil Nationalization

With the formation of the "National Iranian Oil Company; NIOC in 1951" an entirely new situation arose in Iran. NIOC had the tremendous responsibility of all the southern oil industry, providing for the fast-growing internal demands. NIOC employed more than fifty thousand professional staff and labourers. The difficulties for the country for the halting of its oil income between 1951 and 1953, resulting in the infrastructural decay and economic downturn of the all oil cities, including Ahwaz.³⁵

In 1954 an agreement was signed between the Iranian Government and the NIOC as well as eight major foreign companies in the global Oil Consortium (five American Companies with a 40% interest; the British Petroleum Company limited with 40%; one Dutch Company with 14% and one French Company with 6%).³⁶ These numbers indicate why Americans became increasingly interested in Iran's oil fields, in parallel to their British counterparts. With the conclusion of the Oil Consortium, the country's income of oil increased nearly four times, and the idea of carrying out a development program for Ahwaz as the headquarter city gained importance. Urban transformations in Ahwaz began with the support of the Iranian oil managers. This was a national approach that continued alongside cooperation with foreign experts. Among development projects implemented in Ahwaz, plans in the various fields of housing, agriculture, communications, industries, social and public utilities, health and education had been most impressive.³⁷ Ownership of some lands that belonged to the oil company transformed for the workers to build houses for themselves.³⁸ In some neighbourhoods as Bagh-Moin and Amanieh in 50s a lot of magnificent residential villas had been built which reveal the development of culture and social taste for architecture in the city.

Because of the large part of British Petroleum in the Consortium of 1954, Ahwaz partly continued to be developed by the influence of the British actors but jointly with Iranian actors; the British architect James Wilson, continued his job in association with the prominent Iranian architect, Farmanfarmayan.³⁹

Parallel to the Brits and the Iranians, through the geopolitical oil interests of the Americans in the Iranian oil fields, Ahwaz crossed the threshold of global modern lifestyles and made huge differences to the period of British power. At that time, the welfare in oil company cities was much more than any other big city in the

country even the capital. The introduction of American culture which believed in better life conditions for workers made labour work better rising their motivations. Becoming the main agent of modernization, American design firms got involved in the expansion of Iranian cities, which led to the export of American Architecture to Iran.⁴⁰ In this regard, there are some documents revealing that “Doxiadis”⁴¹ who had developed a strong track record of work on planning and housing in Iran⁴² had schematic work on Ahwaz. (He had first visited Iran in 1957, to work with the Khuzestan Development Service, a regional development agency which was set up to develop the oil-rich region of Khuzestan⁴³).

Fifth stage (1959-1980); Oil Exploration and Operation in Ahwaz

In January 1959 one of the largest oilfields in Iran was found on Ahwaz’s doorstep and from 1962 onwards, Ahwaz began to yield its great hoard of oil. The city soon became the major central producer of the oil fields and prospered as a result of this new found wealth. The “Iranian Oil Exploration and producing Company” (IOEPC) increased the scope and importance of its activities in Ahwaz by bringing to the town nearly all functions previously located elsewhere; it brought into public view activities which for too long had been hidden away on remote oil fields. Finally, Ahwaz became the only Fields’ Headquarters for transport, engineering, maintenance and construction.

In the 1960s, the oil community became integrated into a rapidly developing city and possessed diversified industries and facilities (as university, hospital, etc). It planned to make oil company employees as permanent residents.⁴⁴ To provide for this, the city had become the centre of “Home ownership scheme” by “Iranian Oil Participants Limited” established on a pilot basis from 1958. It was the “Welfare Concept” of the Western societies to help company’s men to own their home and to pay for it from their monthly earnings.⁴⁵ The company regarding social aspect of the city, aimed to have result in satisfied and dependent employees with real roots in the community. For expending on this scheme in 1966⁴⁶ the company provided financial⁴⁷ and technical requirements to design and construct a variety of houses on freehold lands. Local enterprise made over 90% of the required materials and local contractors provided the labours. It was planned to design various types of houses to try to avoid mass-housing appearance which lack the sense of space in the city. In this theme, characteristic designs to outfit private lands, or renovations of old buildings had also been undertaken.⁴⁸

Figure 4-7 :Home ownership scheme by Iranian Oil Participants Limited, 1961, Source: BP Archive

Various inter-related industries were expanding still further and every industry started to expand its own zone in the city, containing industrial, official and residential facilities; in the north of the city, the lands were owned by the Oil Company, metal industry was located in the east; Army headquarters were in the west and Water and Electricity company was located in the south which is a good example with a specific design for company towns in combining the idea of the Garden city with a geometrical magnificent pattern in its urban planning.

Figure 10: Right: Water and electricity Company town in Ahwaz, source : Google earth. & Figure 11 & 12; middle and left: oil company mass housing projects, 1970s. Courtesy of the Iranian Oil Museum Archives.

The main Company Town was the “New Site” neighbourhood holding new headquarters of the “Iranian Oil Exploration and Producing Company”. The headquarter building was built as a representative tool to expose the power of the oil company, so it was designed in the most modern type of architecture of its time and pushed the process of modernization in architecture of the city. Moreover the whole neighbourhood continued its expansion by large modern residential and recreational areas, a new well-established emergency hospital, staff clinic, club, sports facilities, schools and cinemas to facilitate the modern urban design of the neighbourhood.

Figure 8: National Company of South oil fields in Ahwaz Source: Iranian Oil Museum Archives

In this period, Individual Iranian architects as “Kamran Diba” and “Farmanfarmayan” or “Nader Ardalan” tried to define Iranian modernity and re-read traditional concepts in a modern way.⁴⁹ They were inspired by the principles of organization and typology of traditional Iranian cities and the use of local material adjusted to the climate. This architectural and urban trend was based on localizing the process of modernization in Iranian cities. Thinking of climate and vernacular culture and trying to combine modern and traditional elements in low-cost housings (new towns) were signs of vernacular modernism shaped in the early 1950s and continued until the 1970s in Ahwaz. One good example in the city of Ahwaz is the expansion plan for Jondi-Shapur University in 1968⁵⁰ designed as a clear reference and an iconic modern embodiment of traditional Iranian architecture.⁵¹

Figure 9: Jondi-Shapur University Ahwaz. (1968-1978)

In 1967 the first comprehensive plan for the city of Ahwaz was developed by the Iranian architect and urban planner, "Ali Adibi". However, because of finding oil in planned areas, his urban plan was not implemented at the end.⁵² In 70s, transferring the role of oil exporting port from Abadan to Mahshahr and Shahupur for their larger capacities for arriving larger ships, Abadan lost its previous value and Ahwaz took the role of Abadan to be the most important mediator and dealer to the developed countries. Many high quality homes for managers and offices were built in the city containing 2000 residential houses in 1974 in the lands that belonged to the oil company after oil nationalization.⁵³ The fact of having no more valid comprehensive plan for the city expansion, responding to increasing population of company's employees, in a conflicted method of development to what explained above, unplanned suburbs grew and the city expanded in a disharmonic way. In order to deal with unplanned expansions of the city, the government supported planning of poor residential areas as "Chaharsad-dastgah" and "Kuy-sepidar" inspired by global modern mass housing trends which resulted in unsuccessful living areas in the city. Continuously low-cost housings for labours were built at the Ahwaz suburbs of "Zaitoun" and "Behrooz" in the following years.⁵⁴ All of these separated zones were contributed to various global exchanges which resulted a city bearing the scars of unplanned growth.

The developments of the city in 70s with new urban plans indicated a welcome break with the past; on the one hand, in 1975 Iran announced the creation of new towns in Ahwaz for which Skidmore, Owings & Merrill of Chicago were hired to conduct the planning;⁵⁵ and on the other hand, with financial support of the oil company and under the leadership of Iran's Prime minister of oil, Dr Eghbal,⁵⁶ once again Ali Adibi started to design a new comprehensive plan for the city between 1975-77. The role of urban plans in Ahwaz had grown with a gradual shift in emphasis from gardens for the private sphere to an increasingly public function. New factories located far away from residential areas and often surrounded by newly planted trees and shrubs. These urban planners had a significant role in making the city more ideal for living with socio-cultural developments. The local authorities were improving the appearance of the city, laying out new landscape projects as parks and gardens, rebuilding the river frontage.⁵⁷

Conclusion

In the centre of the Iranian oil cluster, the advent of diverse global alliances (British, German, American) were closely tied to Iran's political, economic, and cultural connections created a unique international network of stakeholders, officials, experts, engineers, architects and urban planners for urban and architectural transformation. The question of how providing to the different facets of the oil industry (oil extraction, transformation, administration, infrastructure and retail), had impacts on planning the city to convert it to a multicultural modern city in the border of various global flows, and their resultant cross-cultural exchanges is the main focus of this research. Since the discovery and the drilling of oil, the modern urban texture in Ahwaz is full of architectural and urban narratives which have been created by international actors and global flows. Transforming from a rural community to a modern city in less than a century caused a unique and complicated urban growth which is important for the global history of modern architecture and urban planning. The oil actors have co-shaped not only the built environment but also people's lifestyles through oil-related buildings, urban projects and their representations. Exploring the transnational urbanism of Ahwaz, this study revealed myriad cross-cultural exchanges between national and international actors. The arrival of the various actors transformed and localized the global flow of architectural knowledge and created native processes that are informative for the field.

Acknowledgements

The author is very grateful to professor Carola Hein, professor and head in chair of History of Architecture and Urban Planning at Delft University of Technology. Professor Hein is the promoter of author's PhD theses. This paper has been initially inspired by her research on global Petroleumscape and then revised by her appreciated comments. The author also wishes to deeply thank Dr. Pamela Karimi, associate professor in University of Massachusetts, for her valuable guidance in the research process and editing this paper. There are also great thanks to the staff of "BP Archive" and "Iranian Oil Museum" for kindly sharing their valuable archives to the author.

10 Planning Modern Shanghai and Tianjin

The Urban Change in Modern Shanghai Descript by Maps, 1840s-1930s

Gao Xi (Tongji University) and Peng Nu (TONGJI UNIVERSITY)

The urban change in modern Shanghai is a complex process which fused a lot of reasons in many ways. It is also the most important window to understand the urban modernization in china coastal city. This paper described the process of urban modernization in modern Shanghai according the analysis of the map of modern shanghai urban renewal. It separated to three parts. The first part, from river to sea, new and old existed together. Following the port opening, the old Chengxiang area and the new settlements area dramatic existed together. The second part, from street to the road. The new city views in settlements influenced the old town. The administrative department initiated the original change in Chengxiang area concentrate on building roads. And the influence from old land shape to the settlement' s road plan was different in British and French settlement. The third part, port areas and the city. With the city development, the bund function changed. And the relationship of Shiliupu dock and Chengxiang area was intimate. The general city structure、 road structure、 relations of port and city area, as the marks of city changing which can be seen from the maps published in this period.

Planning Greater Shanghai: 1927—2017

Richard Hu (University of Canberra)

This article offers a complete narrative of modern planning in Shanghai. It started from 1927 when the Nationalist Government established Shanghai Special Municipality and started preparing the first modern plan in Shanghai and China, to 2017 when a new plan “Shanghai 2040” was submitted for the State Council’ s approval. It bridges two historic divisions that have hindered the writing of Shanghai’ s planning history: the division between the Nationalist Government and the Communist Government in 1949, and the division between a planned economy and a market economy in 1978. Thus it structures Shanghai’ s modern planning in three broad periods – the Nationalist period (1927-1949), the planned economy period (1949—1978), and the market economy period (1978-2016) - with sub-periods within each of them. The article outlines the master plan documents, making process and approach, and political, economical and social contexts. By doing so, it summarises the thematic continuity and change in the plans, and identifies the endogenous and exogenous factors that contributed to the formation of the planning themes. It further critically reviews the latest plan “Shanghai 2040” that sets a vision of Shanghai as an excellent global city. The article concludes with a few observations on the macro-history of planning Shanghai. First, planning Shanghai has been a national strategy, the Nationalist Government and the Communist Government alike, constituting an important component in China’ s nation building. Second, planning Shanghai has been highly political and ideological, subject to strong political wills and pushed by political leaders at the time. Third, planning Shanghai has been heavily influenced by international planning diffusion, from the West first, and the Soviet Union then, and the developed world again in recent decades. Fourth, planning Shanghai approach remains top-down, elitist, rational, and expert-centric, with public consultation and participation insufficient or tokenism. Lastly, planning Shanghai tools remain highly physical, technical, design-based, and infrastructure and land use-controlled, which prioritise economic growth far ahead of environmental and social concerns.

The Griffin Plan for Shanghai, 1904-1906

James Weirick (The University of New South Wales)

An event in Yokohama in January 1906 – the accidental death of the Chinese trade commissioner to Japan, Huang Kaijia 黄开甲 (1860-1906)– seems to have ended one of the most intriguing city planning ventures of the early modern era. Two years previously, as Imperial Vice Commissioner to the St Louis Exposition, Huang Kaijia was almost certainly the ‘delegate from the Chinese government’ who commissioned the design of a ‘new city at Shanghai’ from the American architect and landscape architect Walter Burley Griffin (1876-1937)

This paper reviews the testimony emanating from Griffin and his colleagues on which the claim for a Shanghai city plan from 1904-1906 is based; the modernising impulses in Shanghai at the time; and the broader context of ‘New China’ reforms initiated by the Qing Dynasty in the first decade of the twentieth century. From the available descriptions, the following details of the proposal can be established. First, the project was a Chinese initiative, not a ‘colonial’ venture associated with the Foreign Settlements. Second, the proposal involved ‘a modern city on a new site’ located ‘a few miles’ from the traditional walled city. Third, the project was conceived as an alternative to the ‘narrow streets, swarming tenements and insanitary areas’ of the ‘old city’ – and, indeed, included the proposal to ‘abandon the old city.’ Fourth, Griffin ‘drew the plans for the new Shanghai in detail.’ Based on archival research, critical review of contemporary newspaper accounts and recent scholarship on the ‘tradition vs modernity’ debate in Chinese historiography, the paper seeks to address the question, what does the fragmentary evidence of the ‘Griffin Plan for Shanghai’ tell us about innovation and change in urban thinking before the Chinese revolution of 1911; the continuity of ideas across the revolutionary divide; and the distinctive fusion of modernity and poetic power in the successor to the Shanghai scheme in the Griffin oeuvre, the winning entry in the Australian Federal Capital competition of 1911-1912.

Why not Bund, but Victoria Road; Water level – the landscape of concessions in Tianjin (Tientsin)

Yichen Liu (Toyohashi University of Technology)

Background

In Asian’ s modern history, many European and American powerful countries have created many concessions there, especially in China. The most typical ones were Shanghai’ s combined concessions and Tianjin’ s nine individual concessions. Concessions were often built by the sea or river because they relied heavily on water for transportation. The most well-known sample was Shanghai’s common concession. Tall foreign commercial facilities were facing Huangpu River, which have created a beautiful landscape. However, in Tianjin, business, commercial facilities did not face Haihe River, instead they face inland - Victoria Road.

Purpose

The aim of this paper is to explore the reasons behind the fact that Concessions commercial facilities in Tianjin were built facing Victoria Road instead of Haihe river. This paper is to focus on the hypotheses that in Tianjin, commercial facilities such as the Western Bank did face Haihe River in the early days of the settlement of the British Concession when the majority of transportation was on Haihe river. However, due to the deteriorating of Haihe River the transportation on water declined, the main means of transportation was no longer on the river, it shifted from ships to trains and cars on the road.

In 1900, the boxer rebellion (義和團運動) in Tianjin had caused damages to many buildings in the concession which speed up the change. During the boxer rebellion many business facilities were destroyed and new opportunities presented themselves. The boxer rebellion damaged many buildings and commercial facilities, due to all the above factors many foreign firms decided to either renovate or build complete new buildings for their business. As we have discussed the main transportation had shifted from water to road, business facing Victoria road instead of facing Haihe river would bring many benefits to the business. As a result, the well -known buildings and commercial centers in Tianjin can be found facing Victoria road, unlike those in Shanghai facing the water forming the bund.

Conclusion

Transportation’ s shift from water’ road represented the advance of modernism. In many countries, this process took a long time, while in Tianjin it happened suddenly because of the deteriorating of Haihe River and the Boxer Rebellion. It also created the need and the opportunity for a port to be built at estuary where Haihe joins Bohai sea. Taku Port was established as a result.

The Urban Change in Modern Shanghai Descript by Urban Maps, 1840s-1930s

Abstract

The urban change in modern Shanghai is a complex process which fused a lot of reasons in many ways. It is also the most important window to understand the urban modernization in china coastal city. This paper described the process of urban modernization in modern Shanghai according the analysis of the map of modern shanghai urban renewal. It separated to three parts. The first part, from river to sea, new and old existed together. Following the port opening, the old Chengxiang area and the new settlements area dramatic existed together. The second part, from street to the road. The new city views in settlements influenced the old town. The administrative department initiated the original change in Chengxiang area concentrate on building roads. And the influence from old land shape to the settlement's road plan was different in British and French settlement. The third part, port areas and the city. With the city development, the bund function changed. And the relationship of Shiliupu dock and Chengxiang area was intimate. The general city structure, road structure, relations of port and city area, as the marks of city changing which can be seen from the maps published in this period.

Keywords: *Modernization of Shanghai, Map, Road plan, Settlement, Chengxiang, Port*

The urban development in modern Shanghai is complex. Integrating the influences and effects from the various aspects, the urban spatial pattern with a sense of collage is formed. Due to the different backgrounds of designers, the urban maps of Shanghai in this period have different on the drawing styles, spatial scopes, and contents. As the most intuitive and effective pictures for responding a city, the urban maps truly reflect the development of urban space in the modernization of modern Shanghai, and even the gradual formation of its structure layout.

There are many research on the city maps of modern Shanghai, which are not limited to the urban planning history. For example, Chong Zhong discussed issues such as the map drawing level, the development of the printing industry, and the role of maps in social life, etc. From the perspective of planning history, Baihao Li, et al, outlined the several stages of the urban development in Shanghai from 1843 to 1949 from the formation of modern Shanghai and combining with the maps and historical events. Qian Sun discussed the urban construction of the public concession and the French Concession from the perspective of system and norms, as well as the effect of the urban planning by the Shanghai municipal government on its urban form after 1927. There also are some most recent research, such as the "Shanghai City Map Integration" by Xun Sun and Chong Zhong published in August 2017. This book is about a complete and systematic compilation of the Shanghai maps from 1504 to 1949, and some map information in this paper is derived from this book.

In this paper, it selects five types of Shanghai maps from the beginning of the establishment of the concession in Shanghai in 1843 to the enemy-occupation in 1937 as the important evidence for the modernization of Shanghai. 1. In the late Qing dynasty, there were freehand-painted intentional maps that painted with Chinese traditional map-making methods. 2. In the early period of concession, designers designed the practical local mapping maps and the first full actual surveyed maps. 3. At the beginning of the 20th century, during the period of accomplished basic urban construction in the concession, the authorities of the Public Concession and the French Concession make the road planning maps and the cadastral maps for urban development. 4. At the end of the 19th century, influenced by the Western survey maps, the Chinese modern publishing group painted the actual survey map of Shanghai, which was first painted by the Chinese. 5. In the 1920s, after the establishment of the Shanghai special city by the national government, the planning map of roadway system for the Shanghai special city was drawn.

The analysis and comparison of these maps drawn by different groups and representatives of regimes visually illustrate the changes in the urban structure of modern Shanghai. The inner core of the city was constantly moving out of the estuary, from the city developing along the river to the city developing toward the port; the dual compatible urban form was produced due to the coexistence of the traditional feudal towns and the modern cities

in the concessions; the narrow, curved streets and lanes in the traditional towns have slowly transformed into the modern urban street systems suitable for automobile traffic; Relying on the development of the port, in the urban structure, modern Shanghai was transformed from the integration of port and city to the separation of port and city.

1.From the river to the sea, the old and the new exist side by side

Like any other modern port cities, Shanghai is a port city transformed by the modernization of urban planning brought by opening ports and establishing settlement. After Opium War in the late Qing Dynasty, British settlement began to be established in November 1843. By 1849, the United States and France built settlements in the Hongkou region and the old town north adjacent areas respectively. With the colonization development of cities rented by the Western countries, Shanghai has changed from a traditional town to a prosperous modern city. The city center has also been transformed from Chengxiang area with traditional town into a rented Bund-centered area. Changes in the city center has also been identified in the subsequent urban development. Shanghai also formed the situation that the old town and the settlements, the old traditional town and the new modern city exist side by side, respectively governed by Tao-tai, the local administration organization of Qing government and municipal council independently built and organized by settlement. In 1850s and 1860s, it can be seen that the old and the new exists side by side from the map of old urban area and settlements. Administrative division continued until 1945 and the division on the spatial form was still clearly discernible.

It can be seen from the map of Shanghai county authored by Zhao Zhihe made in 1851 Fig.1. The map of old urban area were appeared in the local chronicles in the form of freewill drawing without pursuit of accuracy of the dimensions. It mainly covered the government offices, ancestral halls, public temples, city walls, gates, rivers, bridges, etc. The drawing method of "flange city wall" is adopted. There is no drawings for roads. The description of landmark buildings are in the

Figure 1 :Zhao Zhihe. *The Map of Shanghai County*. 1851 [日.山下和正藏]

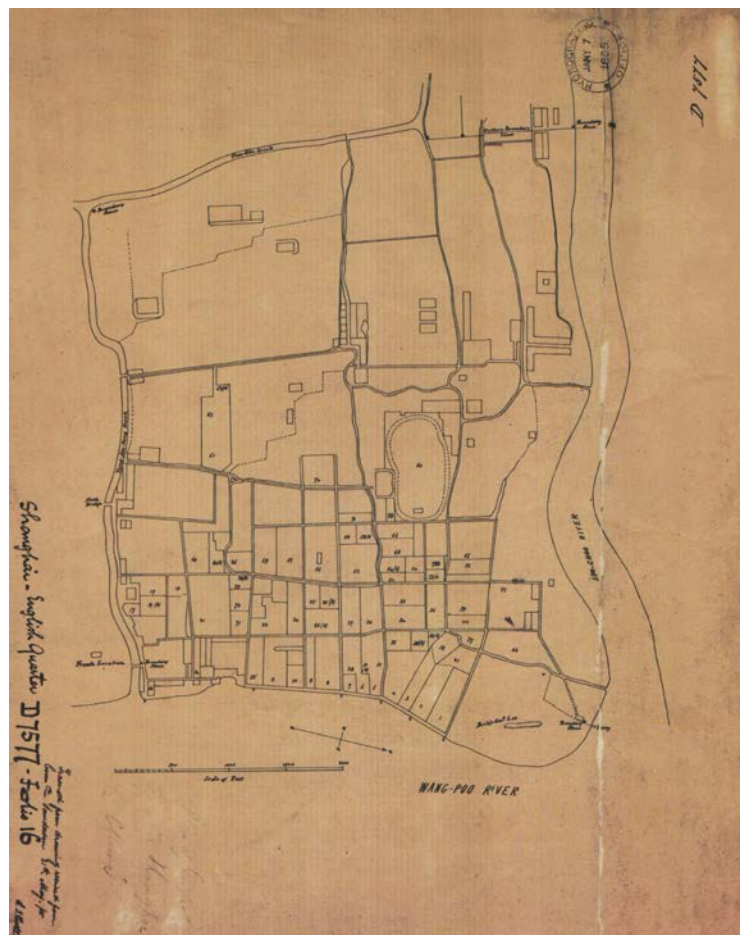

Figure 2: Commander Sanderson.*Shanghai English Quarter*.1851-1852[United Kindom Hydrographic Office]

form of symbols and names inside the frame. At the same time, it can be seen from Shanghai-English Quarter made from 1851 to 1852 Fig.2, the full figure of contemporary British settlement in Shanghai has already adopted the method of actual measurement drawing, in which the scale and compass have appeared. The main features of the map are roads, plots and its serial numbers. It is already in the same form as an modern actual measured map.

The situation that old urban area and settlements exist side by side can be seen from the map of City, Settlements and Environs in Shanghai in 1861. Fig.3 This map is considered to be the pioneer Shanghai map fully manifested integral old urban area and leased areas in the existing actual measured Western maps.¹ The map are mainly marked with information about roads and waterways, as well as British and French fortifications against the Taiping Heavenly Kingdom. Part of old urban area is surrounded by water and city walls and the internal road structure is influenced by the topography and waterways. The road structure in the settlement is more square and the street blocks are more regular.

Figure 3 :City, Settlement And Environs of Shanghai.1860-1861.[The National Archives, United Kingdom]

2.From street to the road

2.1 British settlement roads controlled by old roads and topography shape

It can be seen from the map of City, Settlements and Environs in Shanghai in 1861, Fig.3 that the road structure in settlements is largely different from the road structure of Chengxiang area with twists and turns, multi-small road and guillotine road. In 1845, British settlement's first consul, George Balfourⁱ agreed with Shanghai Taotai about The Shanghai Land Regulationsⁱⁱ which began to contain provisions on roads. The Shanghai Land Regulations stipulated the network of nine roads. Before Shanghai opened, there were six east-west towards river avenues, three east-west beach roads and two north-south passages between Chengxiang area and Wusong River. The Shanghai Land Regulations in 1845 does not need the expropriation procedure for private lands because of the public attribute of the original road, so the newly stipulated settlement road takes the original road system as the foundation of the road structure. But land regulation

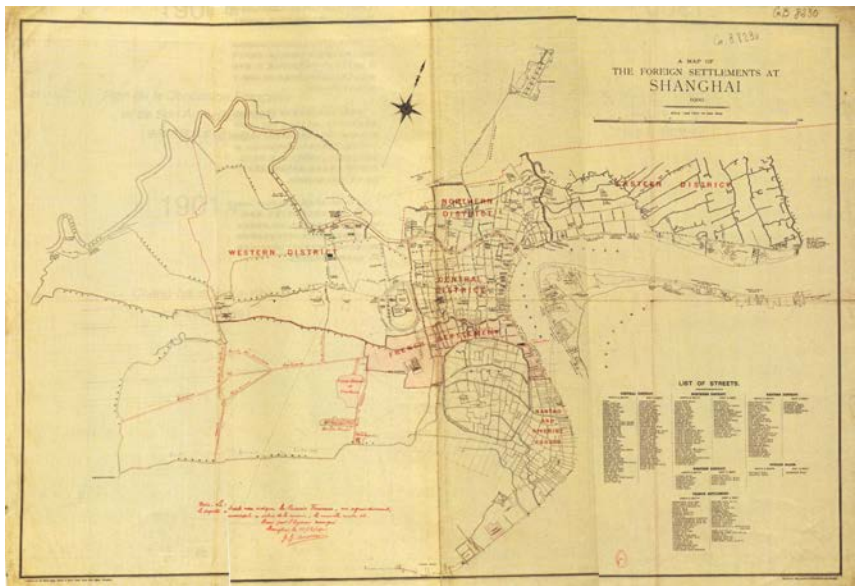

Figure 4:A Map of The Foreign Settlement at Shanghai,1900.[The National Librararys of France]

ⁱ George Balfour, British settlement's first consul .He arrived in Shanghai on 8 November 1843 aboard the steamer Medusa, and immediately began discussions with the ranking local Chinese official, the Taotai , on the opening of foreign trade and the site of a foreign settlement. He left the post of Shanghai consul in 1846, and was replaced by Rutherford Alcock.

ⁱⁱ The Shanghai Land Regulations,1845,which was the basis of the establishment of british settlement. It stipulates the geographical scope of the settlement and provides the legal basis for establishing the self-governing council.It also make great contribut to the urban plan of Shanghai.

rebuilds the old roads and defines road grades. "The width of the roads along the Huangpu River (now the Zhongshandongyi Road) and the Tasheng Old Road (today's Jiujiang Road) is" 2.5 Zhangs (about 8.33 meters) measured by the Customs". Other converted roads and new roads are all 2 Zhangs(about 6.67 meters).² In addition, the plot of the small road is also divided in accordance with plot edge of the original lands. Because of the dense water network from Chengxiang area to the Wusong River, the settlement continues the old road and the natural form of the land to build roads. But the shape of road is seems about 150-200 meters in grid shape regular and just like the result of top-down road planning.

2.2 Planning awareness for road structure in French settlement

Compared with the road structures in the British and French settlement, the road structure of French settlement presents a more regular feature. Different from the road construction method followed the original road and private land boundary in British settlement, the city management agency of the French settlement has more planning consciousness on the design of the road structure. In particular, it is reflected in the out-of-boundary road plan in the French settlement expansion area after 1900. Tri-junction is an important motif in Baroque city. In the Map of the Foreign Settlements at Shanghai in 1900 Fig4, J.J.Chollotⁱⁱⁱ's mark shows that the straight and wide Paui Brunat Road(today's Huaihai Road) and the intersecting Liou ka Za Road(today's Donghu Road) and Big Grave Road(today's Fenyang Road) formed a three-way junction. In the 1901 map of Chang-hai et Zi-Ka-Wei Fig.5, we can see the comparison between the straight standard planning roads and the original natural, small land division line. There is a difference between the urban form of the three-fork intersection planned in the French settlement expansion area and that of the three-fork junction of the Baroque city. The three-fork intersection in Baroque city is built from a dense building facade into a square of the city. Because of the shortage of the building construction, the restriction of the retreat of the building and the practice of the boulevard, the space form of the city square can not be formed in the three-fork intersection of the French settlement expansion area.

By 1914, the French settlement had expanded to Xujiahui. The council also made a detailed road plan to fill the roads in the expanded area. Adopt the grid of roads to fill the street plots, more suitable for the interests of real estate developers. Further implementation of Baroque road planning at some public road nodes: such as design a triangular urban garden at Boissezon Road(today's Fuxing West Road) and Alfred Road(today's Wulumuqi Road) and Joffre Road(today's Huaihai Road) and the

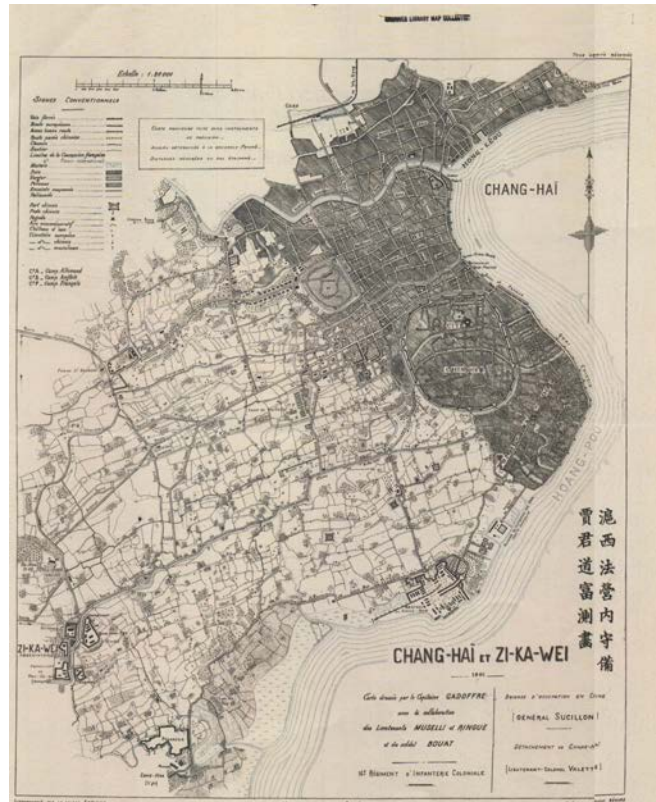

Figure 5:Gadoffre.*Chang-hai et ZI-KA-WEI*.1901.[Earth Science Library and Map Collections,Stanford University]

radiation plaza at three important junctions.³ Fig.6 The urban situation of this road design is still preserved.

2.3 Road reconstruction of streets and alleys in Chengxiang area

After 1850s, influenced by the actual-measured map drawn by westerners in the early modern times, the map drawing in our country also changed greatly and formed a series of actual survey map activities based on the Complete Map in Shanghai Chengxiang Area and Settlements. Fig.7 It lasted until the end of the 19th century and also reflected the road of urban construction in 1895 after the city's earliest municipal organization-the establishment of the Nanshi Road Bureau.

Traditional Chinese cities and towns are characterized by street space, but most of the streets are narrow, unsuitable for automobile traffic and lack of drainage lighting and other infrastructure. In order to transform the present situation, the main task of the Shanghai Nanshi Road Engineering Bureau established in 1895 is to transform the streets and build the roads.⁴ Formed the modern urban reconstruction activities dominated by the demolition of city walls, the filling of rivers, the building of roads, the construction of docks and the construction of bridges.

Comparing Complete Map of Shanghai Chengxiang Area and Settlements painted by Xu Yucang in Qing Dynasty in 1884, Dian Shi Zhai amendment^{iv}, and Chengxiang part in Shanghai Nanshi map in 1914 Fig.8, we can see the change of urban space caused by these urban renovation activities. From 1912 to 1914, the north and south walls were demolished successively and a round-the-city road was built on the original city foundation, namely, Fahuaminguo road (now Renmin Road) and Zhonghua Road. A series of creeks have also been levelled into roads. History in this period is also described in the map of Shanghai Nanshi Area in 1914 Fig.9: "management in Nanshi area pays attention to the gradual reconstruction of traffic roads over the years. It is difficult to record all those expanded roads, and those who build roads with silt creams, such as those who build roads in the Central District, such as the Black Bridge Bang in the Central District, the Fu you Road, the Park Bang, the Ning River Road, the Pavilion Bridge Bang, the Yunliang River Bang, the Penglai Road, the Penglai River Bang, the Pure Land Road, and the Shou Shu Bang are the Shangwen Road`` The northern half of the city has been filled in by

*the county administration, and the southern half of the city will continue to be built. The old city will be rebuilt and city appear to flourish. "*⁵

The spatial form of the traditional towns in Shanghai where houses are built first and then the streets and lanes. The traffic pattern of traditional towns in the south of the Yangtze River are river system. Chengxiang have formed a road-oriented urban structure after the municipal departments have learned the urban development model in settlements building roads before house construction and promoted the modern city development of Shanghai.

2.4 The pioneer road planning in modern Shanghai

Mr. Sun Zhongshan first put forward the "Great Shanghai Construction Plan" in the General Plan of China in 1922, which was targeted to build Shanghai into an international commercial harbor city as the largest port in the East. ⁵ After the establishment of Shanghai Special City in 1927, municipal council of national government proposed the "Great Shanghai Plan". As the Chinese's earliest and most complete urban planning in Shanghai, it was the imitating stage for western urban planning in modern times.

The Great Shanghai Plan incorporated the functional zoning and rapid transit ideas in contemporary western urban theory. In the regional zoning plan of downtown Shanghai, the central district of Shanghai is divided into five functional areas: administrative district, industrial zone, commercial port district, commercial district and residential area. It can be seen from the map of the road system in Shanghai center 1932 **Fig.10**, central area uses a radial and circular network of main roads and the composition of buildings in the city center, making roads "like starlight, while city downtown occupies the center of the road obtaining the tendency to control the overall situation." ⁶ The road emphasizes the layout of geometry, organized by diagonal lines and small grids to emphasize central axisymmetry. The urban space in the central region demonstrates the mixture of Baroque centralized space and modernism functional partitions. The

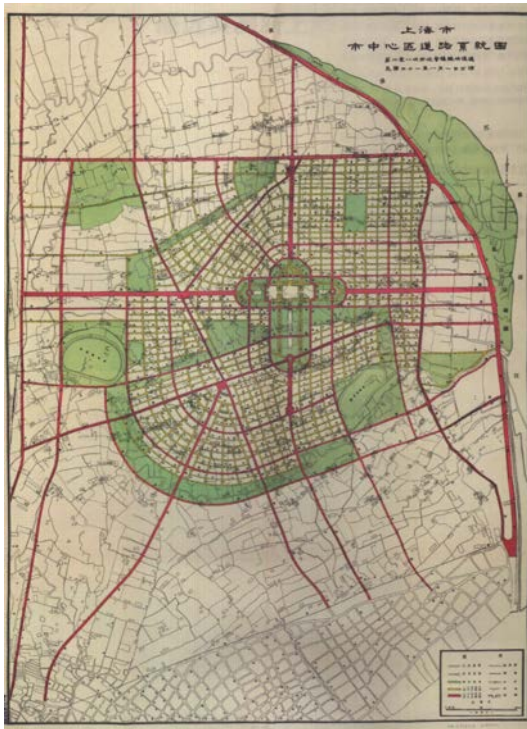

Figure 10: Shanghai Municipality Bureau. *Map of Road System in Shanghai Center. 1932.* [China National Library]

administrative buildings in the central district adopted the Chinese traditional architectural style in Shanghai carrying the meaning of national rejuvenation and transcending the concession as well at that time.

We can see the relationship between the new city center and the city existed before in the map of main road system in Shanghai special city 1929. **Fig.11** The National Government hopes to develop a new urban center on the "virgin land" of northeast of the city. Therefore, in order to avoid the restriction of the private ownership of land to the urban development, the national government first relegated the

⁵ Great Shanghai Construction Plan. Carry on the world commercial port plan proposed by Sun Zhongshan, nationalist government put forward Great Shanghai Construction Plan. Construct new city center at Jiangwan. But the construction was broke by Japanese army invasion in 1937.

undeveloped land to the public as the reserve land for urban construction. Therefore, the roads of the Great Shanghai Plan can not be affected by the trace of the original land shapes and it is a completely new state which is not subject to any restriction. Due to the Japanese occupation of Shanghai in 1937, the "Great Shanghai Plan" could not continue. However, the construction of road network in the central area has been partially formed and presented in the urban form of Shanghai today.

3. Port areas and cities

3.1 Port area is urban area

During the decades since port opening, the settlement has developed concentrated on the the Bund. The Bund is an undeveloped marsh before port opening. During Qing Dynasty of Kangxi Emperor period in 1683, there was a map depicting the geography of overall Shanghai in Shanghai county annuals. Fig.12 It can be seen that the area near the Huangpu River in the north of Yang Kang Pang area was the location of the Bund," *Along with Huangpu river, there are many old shipyards and wooden shops, followed by rice fields, cotton fields and a small village farther back.*" *"Most of the ground is wet and uninhabitable."*⁷ But the land is in good condition as a port and easy to load and unload cargo. Therefore, as the representative of the British settlement, Bund has become a specialized port for foreigners because of the prosperity of trade and developed rapidly. Because of their proximity to the port, businessmen were willing to live along with the river and their shops. As a result, their live and business activities were concentrated in the Bund area. In 1853, the map of Shanghai and its suburbs Fig.13 clearly demonstrates the site of foreign port area (Bund) and the local port area at eastern Chengxiang. The main buildings in the British settlement are concentrated in the area near the Bund Pier, to the west part which is becoming rarer and dominated by churchyard、 graves and so on.

At the beginning of the establishment of the Bund, the early road construction of the British settlement also indicated a close relationship with the port. In 1855, Ground Plan of the Foreign Settlement at Shanghai-North of the Yang Kang Pang Canal Fig.14 demonstrates that street block scale of the road near the port side is smaller than that far from the port side and indicated east-west strip pointing to the port in the direction. *"The field becomes fine smooth after governing vehicle and roads. Ports along with Huangpu River, are implanted with large wooden stump, extended through the iron chain to more than ten miles with broad of several Zhang (about 3.3meter). Therefore, the port is exactly*

Figure 12:Shanghai County Annals. A Map Depicting the Geography of Overall Shanghai.1683[Shanghai Library]

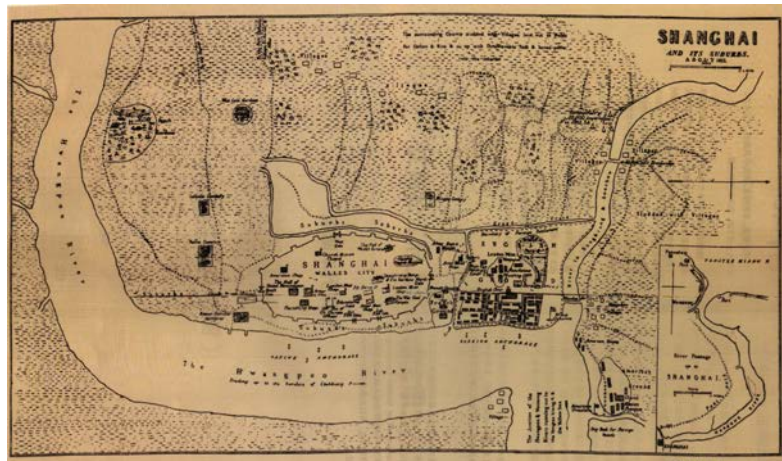

Figure 13:Shanghai and Its Suburbs,About 1853[The History of Shanghai,George Lanning]

suitable for the ship..."⁸ The main roads from the south to the north leads to a port at the end, which is convenient for loading and unloading cargo. The shops and business firms are located in the streets near the port, and the prosperity of the port brings the thriving of the city trade mixed with the port area.

3.2 Separation of urban areas in port areas

At the beginning of the port, sailboats were used as merchant ships. After the rising of ships, the silt in Huangpu River made it difficult for large vessels to enter the port. Although the dredging bureau carried out dredging operations, the port conditions on the Bund became more and more severe. The transfer of the port became a matter of course. The

Hongkou area north of Wusong River became the American settlement in 1848 and became the northern section of the public settlement after merging of the British and American settlements in 1863. The condition of river in this area is wider and deeper than the Bund and more suitable for ship merchant port. Comparing with the China East Coast, Wusong River, Shanghai Harbor in 1866 and 1889 Fig.15 respectively, there were only a few warehouses and other buildings in Hongkou area in 1866, while the docks, streets and buildings had developed on a large scale by 1889.

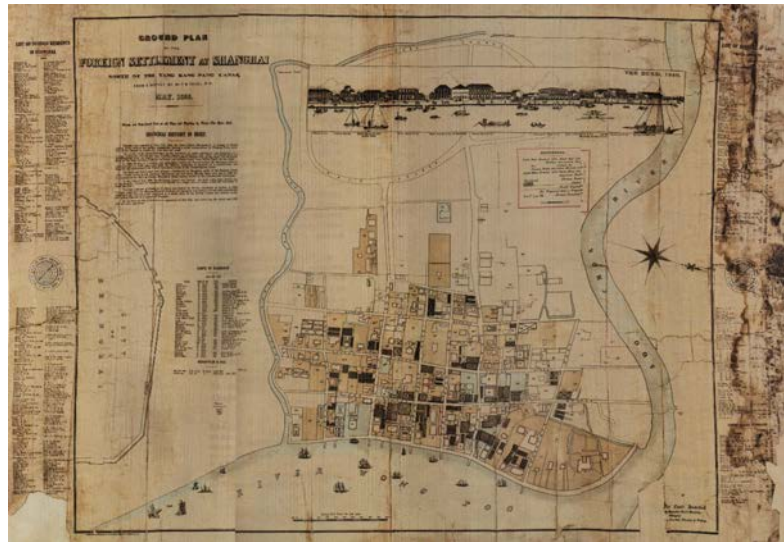

Figure 14: F.B.Youel.*Ground Plan of the Foreign Settlement at Shanghai-North of the Yang Kang Pang Canal.1855*[Shanghai Library]

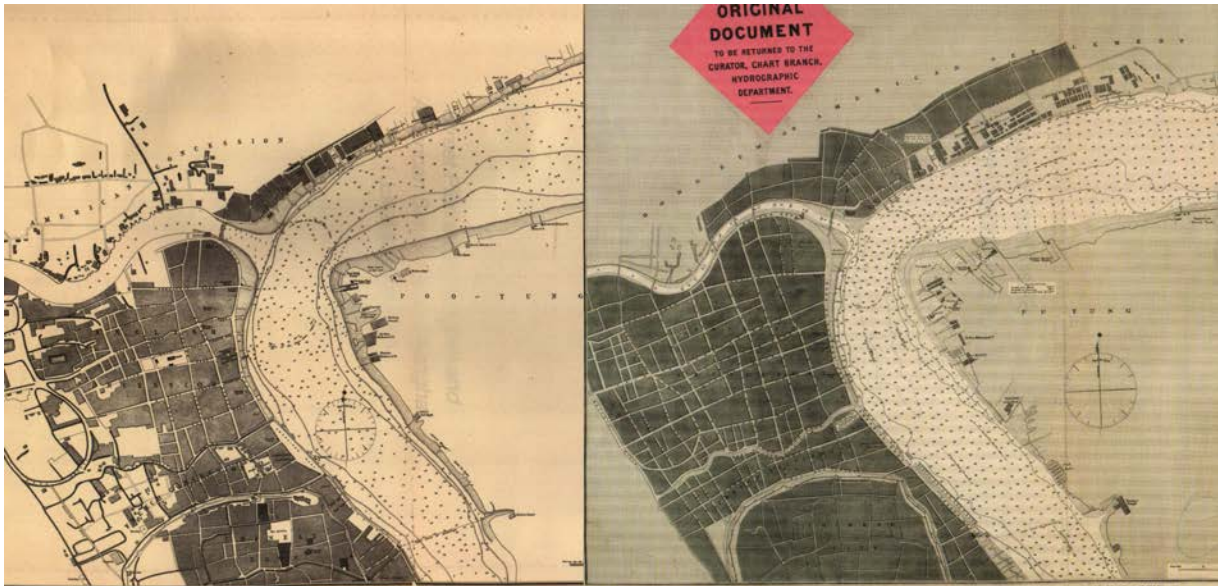

Figure 15: *Comparison of the China East Coast, Wusong River, Shanghai Harbor in 1866 and 1889*[British Hydrographic Bureau]

With the development of transportation and commerce, the land price in the Bund is rising rapidly. The commercial tycoons choosing to lives and works here became dissatisfied with the noise and chaos of port area. In 1869, Edward Cunningham,^{vi} the director of municipal council in of British settlement proposed that the port should be developed away from the Bund and put forward that "*the Bund is the only place where residents can absorb fresh air from the Huangpu River when they walk slowly at dusk as well as the only place with an open view in the concession. The Bund of the British concession is the eyes and heart of Shanghai* ".⁹ This proposal

^{vi} Edward Cunningham, the director of municipal council in of British settlement from 1868-1869. Proposed the function changing of the bund.

changed the history of the Bund and established the position of developing the Bund as a financial and commercial center, while the port area moved outward.

3.3 Chengxiang area and port area

Figure 16: Qiu Yufu, Xu Yucang. *Part of Map of Settlements and Chengxiang Area. 1875*[China National Library]

Before the opening of the port, Shanghai was China's largest domestic trade port. The Shiliupu docks on the east side of Chengxiang area was very prosperous. But such a historical ancient port lost the opportunity for development in the face of the coexistence of the old and new port areas, and greatly fell behind the development of the settlements area together with Chengxiang. From the overall map of the settlements and Chengxiang area in Shanghai in 1875 **Fig.16**, we can see dense docks on the east side of Chengxiang area along the

bank line of Huangpu river. There were a street to the urban area behind each dock. The street construction here is obviously port orientation.¹⁰ But these docks are small in scale, backward in construction and still traditional wharves, facilities are far behind that of the settlement docks. Moreover, the hinterland between the east wall of Chengxiang area and Huangpu River is too narrow, and the poor street conditions also restrict the development of the port modernization. After the establishment of Nanshi District Road Bureau, efforts were also made to renovate the port area. Fill the trenches, demolish the walls, build roads to expand the hinterland of the port area, and manage and renovate the wharf. However, on account of specific situation of old area and old port mixed and the excessive absorption of business opportunities by settlements, modernization stagnated.

Summary

The urban modernization of Shanghai is a complicated process. It can be roughly divided into three parts: the modernization of the Shanghai county seat, the development of the settlement area and the urban planning and construction of Shanghai after the establishment of the National Government. The development of settlements plays an important role in it. In this period, the map made by various administrative agencies and civil society has become an important image material for studying the modernization of Shanghai city.

Meanwhile, in this paper, it also has some new discoveries in the comparative analysis of Shanghai maps. There was a huge difference in the form of Shanghai maps drawn by the Chinese and by Westerners in middle of the 19th century, while such difference is also reflected in the differences in spatial characteristics of traditional Chinese towns and newly-built concession cities. There were differences between the road shape features of the treatment of the original sites between the public concession and the French Concession, and the differences also affected the road reconstruction in the old city area. By comparing the maps in different periods in the public concession, it can be seen that the port area gradually migrated to the sea in the urban space.

This paper takes the modern urban map of Shanghai as the research object. From several aspects such as the old and new—coexistence of Chengxiang areas and settlement in urban structures, the transformation and road modification of the streets and lanes in Chengxiang area, the formation of the street structure of the British and the French settlement, the road planning of the National Government on the new Shanghai center, changes in the relationship between the port and the urban area in the urban modernization, strive to illustrate the changes in the modern urban spatial structure and the development of modernization in Shanghai.

The Griffin Plan for Shanghai, 1904-1906

James Weirick*

*Faculty of Built Environment, University of New South Wales, email address: j.weirick@unsw.edu.au

Abstract: An event in Yokohama in January 1906 – the accidental death of the Chinese trade commissioner to Japan, Huang Kaijia 黄开甲 (1860-1906)– seems to have ended one of the most intriguing city planning ventures of the early modern era. Two years previously, as Imperial Vice Commissioner to the St Louis Exposition, Huang Kaijia was almost certainly the ‘delegate from the Chinese government’ who commissioned the design of a ‘new city at Shanghai’ from the American architect and landscape architect Walter Burley Griffin (1876-1937). This paper reviews the testimony emanating from Griffin and his colleagues on which the claim for a Shanghai city plan from 1904-1906 is based; the modernising impulses in Shanghai at the time; and the broader context of ‘New China’ reforms initiated by the Qing Dynasty in the first decade of the twentieth century. From the available descriptions, the following details of the proposal can be established. First, the project was a Chinese initiative, not a ‘colonial’ venture associated with the Foreign Settlements. Second, the proposal involved ‘a modern city on a new site’ located ‘a few miles’ from the traditional walled city. Third, the project was conceived as an alternative to the ‘narrow streets, swarming tenements and insanitary areas’ of the ‘old city’ – and, indeed, included the proposal to ‘abandon the old city.’ Fourth, Griffin ‘drew the plans for the new Shanghai in detail.’ Based on archival research, critical review of contemporary newspaper accounts and recent scholarship on the ‘tradition vs modernity’ debate in Chinese historiography, the paper seeks to address the question, what does the fragmentary evidence of the ‘Griffin Plan for Shanghai’ tell us about innovation and change in urban thinking before the Chinese revolution of 1911; the continuity of ideas across the revolutionary divide; and the distinctive fusion of modernity and poetic power in the successor to the Shanghai scheme in the Griffin *oeuvre*, the winning entry in the Australian Federal Capital competition of 1911-1912.

Keywords: urban visions, cross cultural exchange, city planning, Shanghai

Introduction

An event in Yokohama in January 1906 – the accidental death of the Chinese trade commissioner to Japan, Huang Kaijia 黄开甲 (1860-1906)¹ – seems to have ended one of the most intriguing city planning ventures of the early modern era. Two years previously, as Imperial Vice Commissioner to the St Louis Exposition, Huang Kaijia was almost certainly the ‘delegate from the Chinese government’ who commissioned the design of a ‘new city at Shanghai’ from the American architect and landscape architect Walter Burley Griffin (1876-1937).

This paper reviews the testimony emanating from Griffin and his colleagues on which the claim for a Shanghai city plan from 1904-1906 is based; the modernising impulses in Shanghai at the time; and the broader context of ‘New China’ reforms initiated by the Qing Dynasty in the first decade of the twentieth century. Based on archival research, critical review of contemporary newspaper accounts and recent scholarship on the ‘tradition vs modernity’ debate in Chinese historiography, the paper seeks to address the question, what does the fragmentary evidence of the ‘Griffin Plan for Shanghai’ tell us about innovation and change in urban thinking before the Chinese revolution of 1911; the continuity of ideas across the revolutionary divide; and the distinctive fusion of modernity and poetic power in the successor to the Shanghai scheme, the Griffin Plan for Canberra.

The ‘Shanghai testimony’

When Griffin achieved fame as winner of the international competition for the Australian Federal Capital in 1912, a feature article in the *New York Times* reported that ‘his only other experience in planning a city’:

. . . was when he drew plans for the rebuilding of Shanghai, China, which, a few years ago, it was proposed to rebuild a few miles from its present site, with its narrow streets, swarming tenements, and insanitary areas. Mr. Griffin drew the plans for the new Shanghai in detail, but the scheme was abandoned.²

The 18th International Planning History Society Conference - Yokohama, July 2018

To date, the plans have not been found – however, another article on Griffin’s success in the Canberra competition, published in *Engineering News* (New York), provides more details of the Shanghai commission:

Walter B. Griffin... also prepared a design for a new city at Shanghai, China, a few years ago, when it was proposed to establish a modern city on a new site, and to abandon the old city, which is largely an insanitary collection of native huts. The delegate from the Chinese government to the St. Louis Exhibition had plans prepared by Mr. Griffin, but owing to the death of the delegate on his return to China nothing was done toward carrying them out.³ tell us

The Australian writers – and Progressive Era activists – Miles Franklin (1879-1954) and Alice Henry (1857-1943), then resident in Chicago, interviewed Griffin in June 1912 and submitted an article to the *Daily Telegraph* in Sydney which adds further details of the Shanghai project in relation to the ‘Federal Capital prize’:

It may be interesting to note that this is not the first foreign city designed by Mr Griffin. The Chinese Commissioner to the St Louis Exposition, authorised by his government to obtain a design for the rebuilding of Shanghai on a site somewhat removed from the present one, accepted the plans submitted by Mr Griffin. Owing, however, to the death of the Commissioner, and a change in the Government, this undertaking is still in abeyance.⁴

In 1933, correcting the draft of a thesis on his life and work by University of Sydney architecture student Nancy Price, Griffin amended and authorised the following statement, which given its provenance can be considered an autobiographical note:

In 1906, following the St Louis World Exposition, there came through the medium of the Imperial Delegation, a possibility for a development involving the replanning of the Chinese city of Shanghai. Designs were prepared by him, but the whole project came to naught through the untimely death of the interested delegate on his return to China.⁵

Griffin’s wife, the brilliant architect and delineator Marion Mahony Griffin (1871-1961) – co-author of the Griffin Plan for Canberra and his colleague in the office of Frank Lloyd Wright in the 1904-1906 years – provided recollections of the Shanghai project in relation to Griffin’s early work in her memoir of their life together, written in the late 1940s:

Shortly after graduation he laid down a town plan for a city to be built in China for a Chinese client who unfortunately died before the work could be initiated. The underlying principles were clearly established here – the laws of distribution and occupation. This was Griffin’s first plan of a whole Municipality.⁶

Another colleague from Wright’s office in the 1904-1906 period, Chicago architect Francis Barry Byrne (1883-1967), who took over the Griffins’ American practice when they left for Australia in 1914, provided a somewhat similar recollection in a conversation with historian Mark Peisch in 1953:

Byrne said that c.1910 there was a project to move the city of Shanghai to a new site. Griffin submitted plans for the project but no record of these exist.⁷

Peisch went on to describe the Shanghai project as ‘an obscure and intriguing episode in Griffin’s career as a planner.’⁸ To this day, no plans have been found.

Although the timing and tenor of the various accounts, their mix of consistencies and inconsistencies, and the lack of any documentary evidence in support of the Griffin claim, must raise doubts about the Shanghai project,⁹ circumstantial evidence does support the possibility that the claim is correct.

The ‘Chinese client’

The 1904 Louisiana Purchase Exposition in St Louis, Missouri was the first occasion that China was officially represented at a World’s Fair. The Chinese Pavilion, an elaborately decorated courtyard complex in late Qing style, was prominently sited near the eastern entrance to the Fair grounds. The large Chinese delegation was led by Prince Pu Lun 溥倫 (1874-1927), nephew of the Emperor and considered at the time to be heir to the throne.¹⁰ The key figure behind the Chinese presence in St Louis, however, was the Imperial Vice Commissioner, Huang Kaijia, who as a young man had been educated in the United States. There can be little doubt that Huang Kaijia is the

The 18th International Planning History Society Conference - Yokohama, July 2018

‘delegate from the Chinese government’ who is purported to have had Griffin prepare plans for a ‘modern city on a new site’ at Shanghai.

In 1904, Walter Burley Griffin was a key member of Frank Lloyd Wright’s Studio in Oak Park, Chicago with some measure of freedom to undertake independent commissions.¹¹ Descriptions of daily life in the Wright Studio, recorded in the letters of draftsman Charles E. White jr., capture the enthusiastic response of Wright and his colleagues to the St Louis Fair.¹² For Griffin, the Fair undoubtedly provided lessons in the art of city building. As an ensemble, the major pavilions were deliberately designed to outclass the scale and magnificence of the Chicago Fair of 1893; their arrangement on a radial plan was considered an innovation in terms of City Beautiful principles; and the streets, terraces and public parks of the urban scene were infused with the practical realities of the City Efficient: mass transit, electric lights, modern sanitation.¹³ However, the design of the Fair was by no means an unqualified success – the expansion of the program to fill a 1200-acre site, double the size of the Chicago Fair, created an overwhelming spectacle. The vast array of Beaux Arts buildings, set among colonnades, fountains, cascades and statuary, confused the classical ideal with bombast and excess. The smaller state and national pavilions, designed to attract attention, were generally considered ‘pomposities or curiosities.’¹⁴

The symbolic purpose of the Fair was to celebrate the centennial of the ‘Louisiana Purchase’ – the acquisition’ by the United States, of the French territories stretching from the Mississippi to the Rockies, negotiated by treaty during the presidency of Thomas Jefferson. Territorial expansion and national identity, material progress and the ‘march of civilisation’ were thus the *sine qua non* of the event, promoted in direct and subliminal ways.¹⁵ In this context, the Chinese Pavilion was a curious presentation of deep culture and elaborate artifacts, contained within a single-storey courtyard building, which was claimed to be a replica of Prince Pu Lun’s summer residence in Beijing, ‘gorgeous in scarlet, gold, ebony and blue.’¹⁶ Set behind a symbolic *pailou* gateway, the pavilion, partially built by American workmen and partially by Chinese artisans, appears to have been a conflation of Chinese motifs, rather than a replica of a significant Qing dynasty building.¹⁷ In its combination of timber screens, inlays, carvings and lattice work with somewhat awkwardly resolved roof forms and massing, the pavilion evoked more the superficial exoticism of Chinoiserie than the tectonics and symbolism of traditional Chinese architecture. In effect, the exhibit expressed the uneasy relationship of the late Qing regime to the modern world: a deeply traditional society seeking engagement with the west on its own terms, at the same time wracked with internal tensions and inconsistencies.

The conservative East Coast journal, *American Architect & Building News* dismissed the Chinese pavilion with the comment, ‘China is still clinging to the past in her exhibit of a summer palace of a nobleman,’¹⁸ but to the progressive architects of Chicago, sympathetic to the spirit and forms of non-western architecture, it was undoubtedly fascinating, and almost certainly prompted the initial contact between Walter Burley Griffin and Huang Kaijia. The treasures in the Chinese Pavilion restricted access to individuals presenting a card, or small groups and it could have been in this context, that Griffin as a visitor to the Fair, met Huang Kaijia.¹⁹ There is another possibility – the American architect for the pavilion, Charles H. Deitering was a classmate of Marion Mahony at MIT in the 1890s,²⁰ it could have been through Deitering that Griffin had the opportunity to meet Huang Kaijia. How the contact led to the commission to design a ‘modern city’ for Shanghai, and whether the commission had any basis in reality, are not known. Huang Kaijia was a protégé of the leading moderniser in Shanghai, the industrialist Sheng Xuanhuai 盛宣懷 (1844-1916), a powerful force in the Qing Dynasty’s ‘self-strengthening’ (*zhiqiang*) movement in the nineteenth century. His many official posts included Director-General of the Imperial Railway Administration, where Huang Kaijia served as Secretary in the 1890s.²¹

As a boy of 12, Huang Kaijia had been selected to study in the United States as a member of the ‘Chinese Educational Mission’, an experiment initiated during the reign of Emperor Tongzhi 同治帝 (1856-1875), which sent annual contingents of thirty students to the United States for a period of fifteen years to gain a western technical education, then return to China as experts in the service of the Imperial Government.²² The experiment was cut short in 1881, when its promoters lost influence at the Qing court and the students, then numbering over a hundred, were recalled. Huang Kaijia, who attended middle school and high school in Hartford, Connecticut, had just completed his sophomore year at Yale. He returned to Shanghai. As he later recalled, his American experience cost him twenty years of struggle ‘to make a breach in the wall of Chinese conservatism’²³ but with many other classmates from the Chinese Educational Mission, he gained the patronage of Sheng Xuanhuai and involvement in the first telegraph and railway ventures in China. He subsequently entered the diplomatic service and was a member of the Chinese embassy to the coronation of King Edward VII in 1902; served as Vice Commissioner to the St Louis Fair in 1903-1905; and as a Trade Commissioner to the United States later in 1905.²⁴

Indeed, he made three trips to the United States in the period 1903-1905, June 1903 to January 1904 overseeing construction of the Chinese Pavilion at St Louis; April 1904 to January 1905, touring the United States with Prince Pu Lun until June 1904 and carrying out his official duties at St Louis until the New Year.²⁵ He subsequently returned in August 1905 as a Trade Commissioner concerned with the rights of Chinese merchants and students to enter the United States under controversial provisions of the US immigration laws, and a boycott of American goods by Shanghai merchants these had induced.²⁶ He returned to China in October 1905. The details of his death are recorded in the alumni archives at Yale:

After reaching China he suffered from nervous exhaustion and spent three months in a hospital in Peking, going thence by advice of his physician to a health resort in Japan for the winter months. His death was due to a distressing accident. On the morning of January 24 he entered a bath room where there was a charcoal stove with a kettle of hot water. Overcome by the charcoal fumes, he fell against the stove, overturning it and being badly burned from the shoulders to the knees by the water and coals. Though found immediately and given the best medical attendance, he was unable to stand the shock and died at the Yokohama General Hospital, after twenty hours of intense suffering.²⁷

This sequence of events supports the many statements emanating from Griffin and his colleagues that nothing was done towards carrying out the plan for Shanghai 'owing to the death of the delegate on his return to China.'

The dates of Huang Kaijia's sojourns in the US suggest that if the 'Shanghai testimony' is correct, Griffin embarked on his first venture in city planning sometime between April 1904 and October 1905. Griffin left Wright's office to establish his independent practice in the second week of January 1906,²⁸ it is possible he entertained hopes for the Shanghai project at that time²⁹, only to learn of Huang Kaijia's death within a month.³⁰

Modernising impulses in Shanghai in the period 1904-1906 were certainly consonant with preparation of a city plan. In 1905 the population of Shanghai had passed one million, with approximately half in the Chinese city and half in the foreign enclaves,³¹ the British-dominated International Settlement and the French Concession. The International Settlement had long been administered by its own civic entity, the Shanghai Municipal Council, established in 1854.³² In 1905 the Chinese city – dating from 1074³³ – was the first in China to achieve municipal self-rule with an alliance of local gentry and merchants granted authority by the Qing Dynasty to establish the Shanghai City Council.³⁴ This notable shift in governance may have some bearing on the commission Griffin received to prepare a plan for 'a modern city on a new site.' As Mark Elvin has commented, 'the Shanghai City Council was an impressive attempt by a still cohesive and self-confident traditional Chinese social order to adapt itself to modern Western ideals of democracy and of organizational and technological efficiency . . . the influence of the modern West was apparent in almost every aspect of the Council's work.'³⁵ The links between the modernizing impulse in Shanghai; the formation of the Shanghai City Council; the presence of a Shanghai-based, American-educated envoy at the St Louis Fair; the 'model city' ambitions of the exposition; an enthusiastic young American with 'model city' ideas; and a city plan for Shanghai may be tenuous, but they are certainly plausible.

Huang Kaijia was one of the 'earnest reformers' of the city.³⁶ As Secretary of the Imperial Railway Administration, he was involved in the first sustained railway venture, construction in 1898 of a line from the Zhabei district of Shanghai on the northern outskirts of the International Settlement twelve miles north to a deep-water port at Wusong on the Yangzi River (this replaced a line built by the British without permission, notoriously dismantled in 1877³⁷). There is a newspaper account of Huang Kaijia accompanying Sheng Xuanhuai and the Managing Director of the railway Zhu Baokui on an inspection of the line a day before its official opening.³⁸ Zhu Baokui 朱宝奎 (1862-1925) was another member of the Chinese Educational Mission who had studied in the United States, he subsequently served as Managing-Director of the Shanghai-Nanjing Railway in its planning phase, 1903-1905 with two other members of the Chinese Educational Mission (CEM) on its board, Liang Dunyan 梁敦彦 (1858-1924) and Tang Rongjun 唐荣俊 (the latter became General-Manager of Jardine Mathieson, the formidable British trading company). A fourth member of the CEM, Zhong Wenyao 钟文耀 (1861-1945) took over as Managing-Director of the Shanghai-Nanjing Railway on the opening of the first section to Nanxiang in November 1905 as it extended up the valley of the Yangzi. Liang Dunyan, Zhong Wenyao and Huang Kaijia had been hosted by the same family in Hartford, Connecticut and were classmates throughout their US education from middle school and high school in Hartford to Yale. In the 1903-1905 period, the CEM network extended into the centre of provincial power with Liang Dunyan on the staff of Zhang Zhidong 张之洞 (1837-1909), Viceroy of Liangjiang Province at Nanjing, whose dictum – "Chinese learning for fundamental principles and Western learning for practical application" – proclaimed in his 1898 reformist treatise *Exhortation to Study*, struck the keynote for the era. The

CEM network also included Liang Pixu 梁丕旭 (1864-1917) – Sir Chentung Liang Cheng – Chinese Ambassador to the United States, 1903-1907.³⁹ The strength and influence of this inter-connected group,⁴⁰ together with Huang Kaijia's connections to the Manchu Court at Beijing evidenced by his Imperial appointments, provide support to the proposition that Huang Kaijia was 'authorised by his government to obtain a design for the rebuilding of Shanghai on a site somewhat removed from the present one.'⁴¹

The Griffin Plan

The physical form of Griffin's Shanghai Plan is not known, but from the available descriptions, the following details of the proposal can be established. First, the project was a Chinese initiative, not a 'colonial' venture associated with the Foreign Settlements. Second, the proposal involved 'a modern city on a new site' located 'a few miles' from the traditional walled city. Third, the project was conceived as an alternative to the 'narrow streets, swarming tenements and insanitary areas' of the 'old city' – and, indeed, included the proposal to 'abandon the old city.' Fourth, Griffin 'drew the plans for the new Shanghai in detail.'⁴² Fifth, as Marion Griffin recalled, 'the underlying principles were clearly established here – the laws of distribution and occupation,'⁴³ in other words, the integration of transport and land use: the site for the new city was almost certainly linked to the new rail lines extending west to Nanjing or north to Wusong from North Station at Shanghai, most likely the latter, with a tramway connection from the West Gate of the Old City to North Station through the International Settlement, planned since the 1890s, under construction in 1904.⁴⁴

Although the detailed plans have been lost, the descriptions of Griffin's Shanghai scheme are infused with progressive notions of modernity and urban reform. In this, they are consistent with accounts of the emergence of a 'New China' in the first decade of the twentieth century – a period of change that followed reforms mandated by the Qing Court in the aftermath of the Boxer Rebellion.⁴⁵ The vision of a new Shanghai implied by the Griffin plan, suggests the desire to develop a stronger and more assertive Chinese city to challenge the power and influence of the Foreign Settlements. At the same time, the failure to pursue the idea, interpreted structurally, rather than as an outcome of contingency and chance, can be seen as an expression of the 'agonism' that Theodore Hutters has argued, lies at the centre of the modernising impulse in the last years of the Qing dynasty – a 'discourse of anxiety' in which receptivity to new ideas was met by 'a countervailing tendency to shut off alternatives even as they were being advanced . . . because most of the new ideas . . . either did in fact come or were taken as having come to China from the modern West.' The combination of dynamic change and a 'pervasive sense of impasse' was grounded in:

the fear that adapting too easily to alien ways would result in irreparable damage to the very set of institutions that reform was designed to save – that is, a Chinese culture whose continuity as a unified whole could be traced back thousands of years The period . . . is thus fraught with an anxiety growing out of a central paradox . . . a paradox virtually unique to East Asia in the modern world wherein a nation was obliged, under an indigenous government, to so extensively modify its culture to save it, that questions inevitably arose as to whether the resulting entity was that which was intended to be saved in the first place.⁴⁶

The long-accepted view that 'traditionalism' in turn-of-the-century China was replaced by nationalism, with all its emotive power and explosive content,⁴⁷ is challenged by Hutters in a critical study of Chinese literature and intellectual currents in the years 1895-1919. This study draws upon the work of Prasenjit Duara to define Chinese discourse across the revolutionary divide as a movement which claimed both 'descent and dissent from past cultural practices' – a movement whose inner tension was its defining characteristic.⁴⁸ The paradox of 'at once identifying with and resisting the past', which characterized late nineteenth and early twentieth century China, meant that 'the need to establish a new nation . . . made the need to cherish that nation's history and traditions all the more insistent, even as they simultaneously needed to be denied.'⁴⁹

The Griffin plan for Shanghai, predicated on abandoning the old city, and building a 'modern city on a new site' clearly denied Chinese history and traditions – whether it demonstrated any 'Chinese' tendencies cannot be conclusively established. The origins of the Griffin project in the heady atmosphere of the St Louis Fair, at the height of the City Beautiful movement – and at a time when Chinese traditions of city building were little known in the West⁵⁰ – suggest that the scheme was an exercise in American 'civic art'. At the same time, the creative fusion of exotic motifs in Griffin's architecture, strongly evident in his earliest civic projects and fully developed by the time of the Canberra plan,⁵¹ together with the subtle power of his landscape ideas,⁵² suggest that the scheme

could have demonstrated an imaginative engagement with 'Chinese' principles of site planning and architectural expression.⁵³

The Legacy

The tumult and dislocation which overwhelmed China in the years following the 1911 Revolution have long been represented as a break between the cultural world of the late Qing and early Republican periods. Recent scholarship, however, has searched for evidence of continuity in the Chinese experience,⁵⁴ and in the practical realm of city planning, the possibility that the Griffin Plan was not lost in 1905, but survived to inform planning proposals for Shanghai in the 1920s must be considered.

The Greater Shanghai Plan, initiated by the re-constituted 'Special Municipality' of Shanghai in 1927-1929, featured an impressive new town and civic centre, located on a new site at Jiangwan, north-east of the existing city, linked by rail and road connections to the deep-water port at Wusong. The tantalizing question is whether this move to establish 'a modern city on a new site' drew upon Griffin's ideas of 1905 in any way. The siting, scale and strategic significance of the 'Greater Shanghai Plan' demonstrate a remarkable grasp of city planning principles in terms of transportation and land use, civic presence and symbolic power.⁵⁵ The 'city beautiful' aspects of the scheme, organised around a cross-axial alignment of ceremonial spaces; the central significance of the 'civic centre'; the geometric array of urban districts, combining streets and blocks in grid and radial patterns; the inflection of the street pattern with respect to the subtle topographic relief and river systems of the deltaic landscape; the integration of parks, park systems and greenbelts; the separation of industrial and residential districts; the efficient alignment of railways and arterial roads, interconnecting the new and old city, the port and the larger metropolitan region – reflect ideas developed in many city plans of the era. The 1911 Griffin Plan for Canberra, however, was a 'new city' plan in which these ideas appeared with clear and compelling force. Did Griffin's Shanghai Plan of 1905 contain similar ideas? Despite the death of its advocate, Huang Kaijia in 1906 and the collapse of the Qing Dynasty in 1911/1912, did this plan survive in the archives of the Shanghai municipal authorities to inform the city planning initiatives of the late 1920s?

Regardless of the fate of Griffin's Shanghai Plan, the origin of the commission at the St Louis Fair of 1904 indicates that the notion of a 'modern' city was at least considered during the last years of the Qing Dynasty, and represents a significant departure from the cosmological tradition of walled city formation, which had distinguished Chinese spatial strategies for millennia.⁵⁶ This approach to city building, with its basis in the legitimation of imperial power, had been manifest as recently as the 1880s with the establishment of the walled city of Taipei as the prefectural capital of Taiwan.⁵⁷ However, the 'modern' dimension of twentieth century city planning – rational land-use, efficient transportation, advanced municipal engineering and infrastructure, regularised land parcels and land tenure, unbounded possibilities for expansion – did not foreclose the possibility of a symbolic, 'cosmological' dimension to urban life, and the belief that a harmonious society has some correspondence with harmonious patterns of city space. Griffin's Canberra Plan is redolent with these associations.⁵⁸ The question raised by his earlier planning proposals for Shanghai is whether the challenge of designing a city in China contributed to Griffin's spatial symbolism, in which the physical location of functions and land uses transcend utilitarian concerns to yield a deep sense of 'rightness' and inner purpose, so that in the flux of everyday life, civic ideals are fused with concrete experience.⁵⁹ In Griffin's Canberra scheme, the rational distribution of city functions was combined with a set of design strategies – the parallel alignment of government buildings, the pagoda-like form of the crowning ceremonial structure, the mandala patterns of the various centres, the axial alignments on surrounding mountains, the balanced irregularity of 'naturalistic' landscape, the still presence of the central lake – to evoke the timeless qualities of an ancient capital.⁶⁰

In the absence of Griffin's detailed plans for a New Shanghai, the fusion of 'tradition' and 'modernity' in his 'New China' project can only be inferred from his other work, beginning with his adaptations of Japanese architecture around 1900,⁶¹ and culminating in 1911 with the imaginative architectural proposals for Canberra, developed in association with his wife, Marion Mahony Griffin. In the drawings submitted for the Australian Federal Capital competition, the temple-like ensemble of ceremonial courtyard buildings, arrayed in the Canberra landscape, demonstrate a fascinating synthesis of architectural traditions and new constructional systems at the scale of the modern city.⁶²

Conclusion

The funeral of Huang Kaijia was held ‘at the deceased’s residence’, Bluff no.184 in the Yamate District, Yokohama on 14 February 1906, his memorial tablet inscribed with the words ‘revered by his sovereign as a loyal servant.’⁶³ In Shanghai, the *North China Herald* eulogised ‘a man of sterling integrity and probity,’ noting with regret that ‘his brilliant talents, from which so much was hoped to push on the progress and enlightenment of his country . . . have, alas! been lost China.’ Western notions of progress and enlightenment nevertheless stood in contrast to deep Chinese traditions, memorably captured in descriptions of Huang Kaijia’s position in the hierarchy of the Qing Dynasty: ‘Metropolitan Officer of the 4th grade, with the brevet 2nd rank red button and peacock’s feather.’⁶⁴ Whether this servant of the emperor had the rank and network connections to push forward plans for ‘a new city at Shanghai’ will never be known, certainly with his death, no more than the barest traces of the scheme managed to survive.

Whether real or ideal, the Griffin Plan for Shanghai of 1904-1906 stands as the first attempt to design a ‘modern city’ for China. The project remains a mystery in its physical details, but as an idea it resonates with creative tension between modern and traditional approaches to city building, and thereby occupies an imaginative space in twentieth century urbanism. This is the imaginative space defined by Prasenjit Duara, which at once claims ‘descent and dissent from past cultural practices’ – an historical condition whose inner tension is its defining characteristic.⁶⁵ For an object lesson in this approach, we need look no further than the mysterious fusion of rationality and poetic power in the successor to the Shanghai scheme, the Griffin Plan for Canberra \ as presented in the original competition drawings of 1911: ink-and-watercolour on linen, emblazoned with gold, culminating in the magnificent perspective from the heights of Mount Ainslie drawn by Marion Mahony across three horizontal panels – designed to unfold like a Chinese screen.

- ⁵⁰ Boerschmann, 'Chinese architecture and its relation to Chinese culture,' was the first significant English-language account of Chinese city formation. Although it carries dates of 1911 and 1912, it was not released until January 1913, see: *Washington Herald*, 11 January 1913, 8. Contrary to Proudfoot, *Secret Plan of Canberra*, 62-63 and Kögel, *Grand Documentation*, 33 this paper could not have influenced the Griffins' entry in the Australian Federal Capital competition, which was prepared September-December 1911.
- ⁵¹ For example, the Clark Memorial Fountain, Grinnell, Iowa, 1910; the project for a State Fair Exhibition Building for the Universal Portland Cement Company, 1911; and the architectural elements of the Griffin entry in the Australian Federal Capital Competition, 1911-1912 – Kruty, *Walter Burley Griffin: architectural models of projects and demolished buildings*, 22-26; Vernon, *A Vision Splendid*.
- ⁵² Griffin's knowledge of *feng shui* has been inferred from 'water' and 'mountain' relationships in the Canberra Plan, most provocatively in Proudfoot, *Secret Plan of Canberra*, 19-21, 56-65 – but to date, no documentary evidence has been found to support this assertion.
- ⁵³ A further dimension to Griffin's 'Chinese' interests is provided by his later involvement with leading members of the Chinese community in Melbourne, Australia which resulted in a number of significant commissions, most notably the Chinese Nationalist Club in Little Bourke Street (1921); the Cheong and Moon Houses, Castlecrag, NSW (1921-1922); and the Blue Hills garden suburb, East Croydon, Victoria (1921). The architectural projects, in particular, indicate Griffin's attempt to suggest 'difference' through the deployment of imaginative geometric elements, rather than direct borrowing of Chinese motifs, Turnbull & Navaretti. *The Griffins in Australia and India*, 176-177, 182-183, 188.

GUHP***

Postwar Urban Reconstruction in China, 1938 - 1958

Toby Lincoln (University of Leicester)

This paper outlines my next major research project. It explains how urban reconstruction in China during and after World War II (WWII) laid the foundation for the country to become the world's largest urban society. In focusing on the war as a transformative period in the development of China's cities, instead of the Communist Revolution, it writes the country into the global history of urban change throughout the 20th century. The paper focuses on what ideas on urban planning were circulating in China throughout the 1940s, and the extent to which the Nationalist Government was able to implement them. Before the outbreak of war with Japan, planners and architects had written about many of the ideas that were fashionable in global planning circles, including garden cities and zoning. During and after the war, they developed their ideas to respond to such issues as aerial bombardment and the need for urban reconstruction. In doing so, they also referenced international experiences from Germany, Japan, the UK and the USSR among other countries. Just as importantly, throughout the wartime period, the Nationalist Government was building up an administrative and legal apparatus to manage the reconstruction and expansion of cities. Officials at central and local government attempted to put into practice some of the latest global ideas on urban change, which were then circulating around China. Despite the difficulties of WWII and the civil war that followed it, urban reconstruction in the 1940s formed the foundation for the development of socialist cities after 1949.

Building a Socialist Industrial City: Factory, City, and Countryside in Mao's China

Koji Hirata (Stanford University)

This paper examines how industrial enterprises and ordinary people participated in construction of cities in the early years of the People's Republic of China. Much of the past scholarly literature on urban planning in the early PRC focused solely on the state bureaucracy. By contrast, I focus on how urban-planning policies were implemented at the ground level, by focusing on the case of Anshan—a major industrial city in Manchuria (Northeast China) that had previously been constructed as a Japanese colonial city prior to 1945. To examine the urban construction of Anshan, I draw upon a wide range of newly available sources, including local newspapers, official municipal histories, and confidential government reports. This paper begins with a brief overview of the establishment of the PRC city-planning bureaucracy, which is followed by a discussion of the process and outcomes of urban construction. The paper then discusses the population movement to Anshan from the countryside, and how this contributed to issues of housing shortages in the city.

Altogether, this reexamination of the Chinese urban political economy demonstrates that local-level negotiations among various actors, including lower-level officials, enterprise managers, and even migrant workers, lay at the heart of urban-construction policies in Mao-era China, even during the period usually characterized by centralization of power. Firstly, far from being monolithic, policy implementation in the early PRC city was radically fractured among different enterprises and local government offices. The enterprises and government offices constructed housing buildings, roads, and factories according to their own plans as opposed to those of the city government. Secondly, partly because of the city government's lack of centralized power, the city's physical infrastructures were transformed more gradually than the city officials had planned, and the city's landscape in the end remained only moderately changed from that of the period under Japanese colonial rule. Thirdly, the city government lacked the kind of centralized power necessary to predict and control people's daily activities and movements. While the city government failed to build sufficient urban infrastructure, it also failed to foresee and control migration into the city. Combined with slow development of the city's urban infrastructure, the resulting population explosion brought about a range of crises, from disposal of human waste and urban crimes to, most seriously, a shortage of housing.

From Shinto Shrines to Martyr Temples and others: 'Religious' Space, Rituals and their shifting political Symbolism as Enunciation of Power(s) in Taiwan since the Post-war Era

Liza Wing Man Kam (Georg-August-Universität Göttingen, Max-Planck Institute for Study of Religious and Ethnic Diversity)

First it was ceded to Japan in 1895-1945, then it became the island of retreat for the Chinese Nationalists (Kuomintang, or KMT) in 1949 after the Civil War of China. Currently it is the first polity in the Chinese world who is 'allegedly (one of the) most successful cases of democratic transition in East Asia' (Chu and Huang 2010)

In the last two centuries, Taiwan has gone through several shifts on political paradigm and ideologies before, during and after Japanese colonisation.

Shintoism was the 'state religion' in Japan, and by 1937, 120,000 Shinto Shrines had been built in the country. Departing from being centres of worship, these Shrines also serve as sites of enunciating political power as well as icons to facilitate identity formation (Tsai, 2001, 2015)

As Taiwan became the 'extended territory' of Japan, Shinto Shrines were built nationwide in Taiwan as icons enunciating colonial power in political, religious and cultural terms. The colonial authority made use of Shinto Shrines as religious spaces but simultaneously asserted the additional political, military, authority and 'enlightenment' layers of symbolism to further iconise Shinto Shrines. They acted as symbolic 'surveillance' and 'reminder' (Tsai, 2001) of concepts such as the 'greatness' of, and the loyalty to the Japanese Empire in the quotidian existence of the colonised populace. In the later stage of the colonial period, Shinto Shrines became the most significant spatial and material symbolism under the Kōminka policy. Shrines in different forms penetrated into every single household of the colonised. According to Tsai (2001), 'some were built by Japanese expatriates to safe-guard their business on the colonised island, some were solely icons of political power-- regardless of the original intentions of constructing such Shinto Shrines, once they appeared in the setting of Taiwan who did not belong to the same religious framework as the Japanese, it became inevitable that such architectural prototype is always associated to be the icon representing the colonial power.'

Departing from analysing the Shinto Shrines as colonial architectural/ spatial icons, this paper studies the evolved/ evolving roles of these shrines in the context of post-colonial Taiwan, as well as the liturgical and non-religious activities hosted in them 1. As the various political symbolisms; 2. As the tools and driving forces to gather/mobilise populaces and; 3. With their performative effects examined, hence how it affects the process of identity formation, in parallel with the historical timeline which marks the several political paradigm shifts in the Taiwanese society since the colonial era.

12 Planning History in Modern China

Spatial History: Policy Interventions, Uneven Development, and Rescaling in the Beijing-Tianjin-Hebei Region, China, 1962–2017

Yi-Qun Zhang (School of Architecture and Urban Planning, Nanjing University)

With the emergence of social issues such as "Beijing Folding," China's regional inequality has recently received increasing attention. As a typical case, it remains key question to understand the development process in Beijing and its surrounding areas. This paper aims to show the evolution of policy intervention and spatial development in the Beijing-Tianjin-Hebei region, also known as Jing-Jin-Ji region, from a historical perspective, to reveal the internal dynamics and mechanism of regional uneven development in a highly centralized environment, and to explain the role of policy intervention in reterritorialization.

According to the traditional location theory, Beijing is the geographical core of the Beijing-Tianjin-Hebei region and therefore should serve as a regional center. However, entering the era of globalization, Beijing became a typical Global City-region, which has attracted more global and national-scale flows from a multi-scalar perspective, and there is no close geographical connection between Beijing and the surrounding areas. In the meantime, through the orchestrated arrangement under continuous policy intervention, over-concentration of capital is triggered, which further aggravates regional uneven development.

On the basis of comprehensively reviewing the progress of related research on spatially-targeted intervention, this paper selects data from industrial and commercial enterprises across the nation from 1977 to 2017 to make a historical interpretation of the development of the industrial structure and policy intervention in the Beijing-Tianjin-Hebei (Jing-Jin-Ji, JJJ) region, revealing the features of regional industry evolution, and elaborated the role and spatial effects of policy intervention in regional development.

The study's findings suggest that: 1) Under the authoritarian regime, spatially-targeted intervention is the result of state space selectivity, and the stickiness of policies and institutions attached to geographical space is the key point to understand unbalanced development of cities and regions; 2) The evolutionary process of industries in the Beijing-Tianjin-Hebei region presents cyclical fluctuations and has a coupling and interaction relationship with regional policies. 3) The realization of collaborative governance in the Beijing-Tianjin-Hebei region relies on the easing of rights and the reconstruction of the scalar relationship, and the establishment of multi-level governance system.

Dilemma Between Density and Living Quality: The Urban Planning History of Sinan Road District Before and After 1949

Kaiyi Zhu (Delft University of Technology)

The saturation of urban construction in contemporary Chinese metropolises has forced planners to face the inevitable strategy of optimizing housing stock. Whereas several Chinese big cities are revealing their flourish, old urban properties have suffered from damage and collapse, caused by a lack of maintenance and rough occupancy. Improvement of quality of dwellers' lives has consequently gone hand in hand with the transformation of existing historic buildings. This paper investigates the unique urban planning history and demographic changes in Sinan Road (also named as Rue Massenet) District of Shanghai and the socioeconomic impacts on local inhabitants' living quality led by formal and informal planning dynamics.

The story of modernism in Shanghai originated in 1840s when the first foreign merchants and missionaries settled. Sinan Road District was formed during the expansion of French Concession. As a result of the shifting socioeconomic atmosphere, quondam houses, which were built for middle and upper classes, have been residence for diverse inhabitants, from aliens to important members of the government, from prominent tycoons to ordinary labourers and even low-income groups. Sinan Road District has gone through two phases of urbanization, within which both population structure and urban morphology of the district have undergone apparent changes. In the first stage before 1949, when the district was still under the influence of concession period, this district maintained the style and features as an upscale community. This identity and status positioning of Sinan Road District was designated and planned by the French Concession Bureau (Conseil D'Administration Municipale de la Concession Française de Changhai in French and 公董局 in Chinese) in the early twentieth century. After 1949, housing shortage has become a long-standing issue as a result of labour tide. Local government split upscale houses in French Concession and assigned them to multiple migrant workers in order to reduce the pressure on urban housing. Occupancy from low-income groups has significantly changed standards of local living quality. Therefore, in the second stage of urbanization after 1978, living conditions in historic districts have accordingly become complicated and intractable to conduct. In this case, heritage approaches, such as demolition, urban renewal, adaptive reuse, renovation, have emerged in endlessly. However, urban transformation in historic areas has been marketing selection dominated by capital. Although heritage approaches have gradually demonstrated the erstwhile prosperity in Sinan Road to the public, reminiscences and relevant population have almost vanished. Tentative conclusions indicate that multiple inhabitants' behaviour and habits have decisive influence on the qualitative changes of inhabitants' lives; moreover, governors' plans and capitalists' contribution are crucial remedies in the transforming process of an urban area but cannot determine the final direction of a certain urban transformation when it comes to the essence of lives; most importantly, the fight for stabilization between density and quality is a time-consuming perseverance, requiring cooperation between various stakeholders. In general, investigating the underlying changing goals and ambitions, stakeholders' attitudes, planning strategies for urban transformation in historic districts is needed.

An Investigation on the External Passage Development and Spatial Structure Transformation of Modern Kunming from a Southeast Asian Perspective, 1885-1945

Tianjie Zhang (Tianjin University, Associate Professor) and Yuqi Zhang (Tianjin University, Postgraduate student)

From a regional perspective of Southeast Asia, the paper focuses on Kunming, the capital city of Yunnan Province in southwest China, on the border with Burma, Laos and Vietnam. The research elucidates the planning ideas and construction process of international external passages, via both land and air, and explores their influences on Kunming's spatial structures from 1885 to 1945. Historically, Kunming was the cradle of the ancient Southern Silk Road and the Tea Horse Road. As an important node city in China's southwest frontier, Kunming has been the gateway between China and Southeast Asian countries for economic and political connections.

The paper examines the land and air route planning, construction process and transport volumes of the passages between Kunming and Southeast Asian countries. It identifies the impetus of passage construction increase, such as Kunming's self-opening as a treaty port and strategic retreat in late 1930s, which further accelerated Kunming's modernization and affected regional economic structure. The passages between Kunming and Vietnam were mainly supported by the Yunnan-Vietnam Railway, together spread French Colonial influences. The Yunnan-Burma Railway, the Burma Road, the Ledo Road and the Hump Air Route were established in succession. These external passages became the arteries of economic transportation. Kunming became an important node of the Southwest China-Vietnam and Southwest China-Burma-India economic corridors. Kunming developed into an international economic center in early 1940s.

Accordingly, the paper, via archives research, field works and in-deep interviews, reveals the changing characteristics of Kunming's spatial structures influenced by these external passages. To certain degree, the external passages accelerated Kunming's urban growth along the traffic lines. The city center shifted to the Station area, where industrial and commercial developments also congregated. New industrial zones were planned to the east and north of the old city, where new passages brought more convenient transportations. The internal road network plan also emphasized the connection with new railway station and bus stations.

Besides, the research elucidates the planning practices, traces their theoretical origins, and uncovers their indigenous considerations.

Certain key figures and their planning thoughts will be analyzed in details. The first Kunming mayor Zhang Weihuan was ever educated in Tokyo Imperial University from 1919 to 1921. During his mayorship in 1920s, he visited Japan several times to investigate municipal construction and administration. Other technocrats like Ding Jishi, Tang Ying who drafted the metropolitan plan respectively in 1939 and 1942, ever studied in Germany. Contextualized in the worldwide communications of modern city planning ideas, the paper will reveal the diverse and dynamic planning interactions in Kunming from a regional perspective of Southeast Asia.

McPublic Spaces: McDonald's appropriation of the everyday place in Hong Kong

Diego Caro (The University of Hong Kong)

The pressure of high property prices in Hong Kong forces a great percentage of people to live and work under poor conditions; this fact, combined with the lack of effective open public spaces in the city, has empowered for decades the rise of places of consumption as an extension of domestic and professional realms. In the 1970s, a large process of appropriation and interiorization of the "public" by multinational corporations was initiated, primarily through shopping malls. In this context, McDonald's has played a crucial role in the integration of everyday activities into spaces of consumerism in Hong Kong since the opening of its first outlet in the city in 1975. The aim of this paper is to analyse the role of McDonald's restaurant design in Hong Kong in the production of everyday places where the production of social space happens under the constraints of the market's spectacle and speculations.

There are currently 244 McDonald's strategically distributed in the most populated areas of Hong Kong, of which 116 are opened 24hours. Its access appears hardly restricted; users range from families with children, to high school students, construction workers, domestic helpers or groups of elderly people. Moreover, Hong Kong and Mainland China McDonald's have been known in recent years for letting homeless people, referred as "McRefugees", sleep in their restaurants, or high school students overstay while playing videogames. McDonald's outlets in Hong Kong have evolved from the original aesthetics of the company with a colourful postmodern cafeteria look, to the newest concept "Next", internationally released in Hong Kong in 2015, with a bold design, neat materiality, touch screens and open layout. Throughout this process, its restaurant design and policies have evolved by appropriating the rhythms of the city and its citizens.

Whereas Hong Kong's city escape is commonly perceived as the product of top down strategies carried out by "coalitions" between public institutions and private corporations, McDonald's offers a case study of informal activities influencing the way a global enterprise develops. Its new "Next" concept might be seen as an attempt to anticipate informality. Two opposing ideas underlie this "open look": the aim to homogenize customers through the sanitation of the space, versus the provision of neutral spaces to allow for the occurrence of heterogeneity. The presence of the screen as an intermediary between the restaurant and its customers empowers a dichotomy between an impersonal fast food service and current paradigms that aim to prioritize people and food.

Dilemma Between Density and Quality: The Demographic History of Sinan Road Area

Zhu Kaiyi *

* PhD Candidate, Department of Architecture, K.Zhu-1@tudelft.nl

This paper investigates the unique urban planning history and demographic changes in Sinan Road (also named as Rue Massenet) Area of Shanghai and the socioeconomic impacts on local inhabitants' living quality led by formal and informal planning dynamics. Examining both tangible and intangible characteristics of this area under five different historical phases, this paper indicates that population density and urban quality cannot always be positively or negatively related. Urban quality can reach the maximum value when area population of concentrated density stays in an ideal state, although, as a result of the qualitative variates, such state (peak value) is in suspense. Through analysing the overarching strategic plan of different periods, it also argues that urban quality is not merely dominated by or directly related to density but more by the population's social demands and their initial interaction with a specific area, active or passive involvement.

Keywords: population density, Sinan Road area, historic district, social demands, urban transformation, living quality

Introduction

The saturation of urban construction in contemporary Chinese metropolises has forced planners to face the inevitable strategy of optimizing housing stock. As a city where urban heritage practices happen frequently, municipal construction and housing departments of Shanghai jointly issued a series of implementation opinions in 1999, to improve and monitor pilot preservation and reconstruction projects of historic buildings and blocks of this city. This turning point has brought a more comprehensive platform of expression in the context of market economy, while enabling multiple values of urban heritage to be fully discovered by varied stakeholders in a new era. Sinan Road area is an important component of Hengshan-Fuxing Historic Area, which was designated as one of the twelve *Areas with Historical Cultural Features* (历史文化风貌区) in 2003 by Shanghai municipality. This paper examines formal and informal urban transformation in Sinan Road area throughout the history, investigating the dilemma between population density and space experiencing quality within this area.

Sinan Road was initially built in 1914 from farmlands and ponds and named after Jules Massenet as Rue Massenet Road. Reaching Huaihai Middle Road (Xiafei Road) on the north and Taikang Road (Jiaxiyi Road) to the south, it is one of the most distinctive roads in the Shanghai French Concession with its richness in historical and cultural features. The whole historic area was largely developed between the 1910s and 1930s. Interested in the integrity of its legacies and the diversity of architectural features, scholars analyse regarding this area have revealed under the following points: Shao Yong and Ruan Yisan focus on the utilization and redevelopment criteria of urban heritage protection by considering their public and social interest, and besides, flexibility in the formulation of heritage protection policies and operational mechanisms by local government in the background of market economy¹; Mou Zhenyu's study of land use and development process of modern Shanghai²; in Wei Min's research, from the perspective of urban planning, the thesis discusses the main objects and approaches in heritage protection practice under the principle of integrated conservation, with proposing specific proposals for forward progress³. Nevertheless, the inadequacy of research is that the most previous studies are always tending to split the past and present status of Sinan Road area, without connecting different stages of development as whole and exploring its changes as a consistent social issue. Therefore, taking density and quality as two key elements which have been consistently interacted throughout the history of area development, in addition to the study of a general history of Shanghai French Concession where the target site located as a basis, this paper explores the demographic changes and its resulting urban phenomenon in multiple historical stages for comparison; it then investigates the significance of population density and its relationship with urban quality, especially, when many architects and urban planners embraced an ethos of low density urban community.

The Necessity of Population and Density

When American socialist and activist Jean Jacobs' talks about city diversity in her book *The Death and Life of Great American Cities*, the necessity of a concentrated density and old buildings are almost equally important to

a community⁴. Although, the population of in each city is different, Asian cities, such as Shanghai and Beijing, follow a high-density mode⁵. According to urbanists' analysis of urban density and sustainability, environmentalists Peter Newman and Kenworthy indicate a negative correlation between the energy consumption and the overall population density of a city, which means that the lower population density it is, the less sustainable the city will become⁶. Conversely, architect Steffen Lehmann indicates that there is a limitation of compactness for sustainable urban liability⁷. Sustainability represented by the energy consumption is merely one of the indicator to assess urban quality of every locality, this research reveals a scientific fact that within the public's choice for production convince many things are discarded, including people⁸. There is particularity of Sinan Road; more sustainable urban features, such as vibrant urban forms, social equity, efficient infrastructure and urban greenery, could not be achieved in a stable district with a history over semi-century⁹. Under the circumstances, its significance as urban heritage should be re-examined; settling both population and liveability of Sinan Road under the demographic shift throughout history, native residents, whether at what historical phase they moved into this community, without doubts, have become one of the most representative features of the site. In this paper, it further investigates the demographic composition of native residents and their engaging approaches and degrees of involvement in Sinan historic site, to investigate people's material and spiritual needs in everyday-life. Applying this method, this paper aims to clarify population's sense of location intimacy, which is tightly associated with living quality, liveability and urban health of every specific historic district.

The Formation and Expansion of the French Concession and Two Urban transformation Phases before 1949

The story of modernism in Shanghai originated in 1840s when the first foreign merchants and missionaries settled. Before and after entering the Republic of China, although the newly appearing New Shikumen Lilong houses were equipped with basic sanitation facilities and better environment, they were still built for economical and practical purpose. Those old Lilong houses, as a result of the shifting socioeconomic atmosphere, could no longer satisfy the needs of booming nouveau riche, let alone meeting politicians' and bigwigs' living standards. Sinan Road area was formed during this era, the third expansion of French Concession (Figure 1). Before the contemporary urban transformation started in 1999, Sinan Road area had gone through five phases of urbanization, within which both population structure and urban morphology of the district had undergone apparent changes. This urban development process will be elaborated in the following content.

Figure 1. Anonym. *Extension map of the French Concession in 1920*. [Shanghai, date unknown]

Stared in 1914, the French Concession authorities took advantage of the third expansion to create a core zone intentionally. Under such circumstances, in order to ensure the purity of European residents of the region and its thriving and prosperous, the French Concession Bureau issued a series of related orders. It was clearly stipulated by the bureau that only houses constructed with European features was allowed in the expanding area, with elaborate description of architectural details. In addition, each community was equipped with doorkeepers who were mainly responsible for public security and health¹⁰. According to the *Decade Report of Customs (1912-1921)*, the west part of the French Concession was the first and single unique example of Shanghai that was delicately designed by architects and planners¹¹. This west end had therefore become a place where political, economic, military, cultural, entertainment and social activities frequently happened. Although there was a structural adjustment of population composition after 1927, both housing usage conditions of every single property and surrounding public urban environment were staying in a ideally preconceived state as planned.

Turning point of urban transformation in Sinan Road area first appeared with the outbreak of the Second Sino-Japanese War. During this period, expatriates from Europe and America had withdrawn from China in succession; coincidentally, most domestic households, the politicians and bigwigs, left their properties and handed over to relatives and friends for management. Meanwhile, as a respond to warfare, famine and shortage of materials, a large number of victims flooded into the French Concession, causing a shortage of housing. In this case, with the decline of these powerful or glamorous families, a single family house in Sinan Road area was usually divided into several households, subsidizing family daily expenses. Most previous households could not return, and the main body of residents had changed from politicians and celebrities to entrepreneurs and businessmen; nevertheless, compared with communities in Luwan District, the ratio of educated population held a sharp advantage of 90 percent more than the others¹². In the second phase, Sinan Road area was still a high-end residential area in Shanghai. This paper thus claims that in the second historical phase of urban transition, in terms of living density, the increase in population had literally put pressure on varied communities in Sinan Road area; moreover, such demographic shift had not effected the overall sustainability of the area, either from the perspective of the elitism of the local population or the degree of regional environment and community vigour and vitality. The relationship between population density and urban quality in Sinan Road area had therefore reached and maintain a healthy and sustainable balance before 1949, after its establishment.

Three Urban transformation Phases in Sinan Road Area after 1949

Between 1949 and 1999, the whole Chinese society had experienced a period from turbulence to recovery and development. Global Industrialization brought the evolution of China's industry, leading growth of labours, and besides, multi-storey commercial housing more in line with market demands. In addition to the reform of political system and the change of house-ownership in the new regime, former status of historic blocks in Sinan Road area were to comply with the political demands of the era. Since 1949, urban transformation in this historic site has chronologically experienced three phases successively: starting from 1956, the urban housing renovation utilized for emerging industries under the context of a mechanism of public-private partnership; immigration of low income households to this area in the Cultural Revolution period in order to balance housing resources in various administrative districts; urban conservation practices as a respond to the rising emphasis on historic relics after the reform and opening-up policy in 1978. The latest urban transition has kept happening contemporarily.

In the third phase of urban transformation, as a result of the original architectural design, there were a number of vacant houses with large space, which were suitable for industrial offices or factory buildings. Allocated to enterprises, these delicate and large houses encountered their first adaptive reuse with rough alterative details. Strictly stipulated architectural features formulated by the old French Concession Bureau had been gradually replaced by industrial materials and coating layer, large equipment, temporary barracks and industrial waste. On the other hand, with the nationalization of historic housing, local government offered a considerable number of such houses in Sinan Road to senior intellectuals, senior officials and returned overseas Chinese celebrities as reward for working¹³. In this case, social function and the original high-end nature of this area had changed, fresh residents moved in still being with reliable socio-political and educational background, but differently, the adaption facing factories has led communities to a more civilian direction. From the perspective of the whole area, such adjustment brought diversity, even though there was doubt whether it could fully integrated into the advancement of Sinan Road area. The dramatic developing process of the Chinese society could not leave time for deliberateness and verification.

Effects of the Cultural Revolution had rapidly swept across the country, in the fourth phase between 1966 and 1976. Luwan District government split upscale houses in French Concession and assigned them to multiple migrant people from working class and poor families, in order to reduce the pressure on urban housing and

equilibrating housing resources across Shanghai. However, this measure helped the stabilization and settlement of inappropriate occupancy, changing the former standards of high living quality. The significantly growing poverty population could not afford their rents, even gas bills at the time¹⁴. Commodities consequently replaced with pits and firewood replaced with gas stoves as well. In addition to those physical alternations of architectural tangible features, intangibly, in order to respond to Mao's call for rebellion, temporal radical 'rebels' pillaged houses from former legal residents who were defined as reactionaries in the turbulent time¹⁵. With an increasing population density of poor households, disorganized reconstruction, deteriorating urban landscape and retrogressive lifestyle had largely impacted the urban health and sustainability of Sinan Road area. Such phenomenon of social disorder had no longer being a matter about adding community inclusion, diversity or complexity, and on the contrary, it had created the polarization of the population of different historical phases within the same community, causing irreversibility effects emerged several year later after the Cultural Revolution.

In the last stage of urbanization after 1978, living conditions in Sinan Road area have accordingly become complicated. Complying to government directive, heritage practices regarding historic neighbourhoods has been evolving; approaches of urban heritage transformation are varied from urban renewal and regeneration, renovation to restoration and conservation. Indeed, Sinan Road area, being one of the most outstanding historic block ever, was appointed by Shanghai administration to be one of the four pilot locations to be conserved at the moment, among all the communities in this area, Sinan Mansion was selected for a testing urban heritage approach. This mansion site, located on the south of Chongqing South Road, west of Sinan Road, south of Medicine Faculty of Shanghai Jiaotong University, north to Fuxing Middle Road, has been designated as an important part of Shanghai Hengshan-Fuxing Historic Area, containing one of the largest concentration Garden Lilong houses (Figure 2). In 1999, according to planning strategy, the project was positioned as a high-quality living and commercial leisure community with Shanghainese unique cultural and historical features. The project consists of four functional areas: Sinan Mansion hotel, characteristic boutiques, residential apartments and enterprise mansions; the total construction area is approximately 78,800 square meters, of which approximately 30,000 square meters of old buildings will be conserved. Until now, the entire project has not been completed. This seemingly tangibly ideal conservation plan whereas has also greatly reduced the local population by all residents relocation, obtaining a more efficient environment for redevelopment. Bringing Sinan Mansion area to its previous past glorious scene more or less, urban vibrancy has not been improved as expected by city reformers. Located in the most active commercial centre, Sinan Mansion has become a place where could not gather popularity (Figure 3). Relocation of native residents has indeed a certain degree of negative impact on maintaining the long-term diversity and sustainability of this space. Noticing better urban healthy quality and disappearance of regional polarization, there seems no precise boundary to identify the advantages and disadvantages of population density shrinking.

Figure 3. Anonym. *There is almost no people in the public space of Sinan Mansion area, and this place is losing its urban vibrancy.* [Shanghai, 2014]

Integrated Conservation Plan and Population Expelling

As mentioned, the Sinan Mansion area has been a pilot project under the context of urban heritage transformation. This redevelopment project was overall designed by a French architect Jean-Marie Charpentier and, German architect Wolfgang Keilholz was responsible for the restoration work of this project. Developers and urban reformers applied integrated conservation plan in Sinan Road historic areas in 1999; the measure aimed to relocate all residents is an unescapable method for three reasons. Firstly, historic houses in this area were built more than half a century ago, dark and moisture, deteriorating with less of repair, and besides, the aged facilities can no longer approach the living demands of modern society in Shanghai. Secondly, every single house has contained considerable number of households since the late 1920s, accommodating an extremely high density in each property; moreover, being a micro society with one house, conflicts and contradiction between households and households have been more complicated to solve. Thirdly, considering themselves not native residents, current dwellers have weak sense of private space maintenance and heavily damaged previous architectural details. Under the circumstances, regarding conserving historic houses in Sinan Mansion area as a matter of urgency, the developer assumed that present residents could not afford the further huge rent in a shortly coming future as a result of their existing low income level. Experienced planners' and developers' decision of relation could give no causes for much criticism, although it somehow has taken away the vitality of this community meanwhile. In 1982 and 1987, ICOMOS successively issued and approved the concept of "tangible heritage" and "intangible heritage" in the *Burra Charter* and the concept of "historic towns and urban areas" in *Washington Charter*¹⁶. Since then, protecting city inhabitants as intangible within every integrated conservation plan and urban regeneration practice has received extensive attention across the world. Finnish architect and urban conserver Juukka Jokilehto indicates that interpretations of internationally agreed charters has been deliberately utilized as an excuse rather than a guiding standard by varied politicians in their regulation formulation and stakeholders in their decision making¹⁷; nevertheless, these charters have brought a possibility for population density and multiple qualities in historic sites, with the methodology by merging tangible and intangible heritage conservation at maximum.

Conclusion

Indeed, in a broader sense, population density and urban quality cannot always be positively or negatively related. Going through the whole transforming history, taking tourists and staff members into consideration as permanent population in the present Sinan Road area, looking at the changing population composition and quality in this historic district, this analyse raises a conclusion that the population density and urban quality are roughly express in a curve pattern characteristics of concave function. In this correlation, urban quality reaches the maximum value when area population density stays in an ideal state. However, as a result of the qualitative variates, the most ideal state (peak value) is in suspense without any solution, although population quality and density in the original plan brought great praise in the 1920s. In this context, urban quality contains not only pleasant environment, delicate architectural appearance and urban landscape, but also includes the vitality, complexity and diversity of a region, and besides, the capability to maintain the healthy demographic

development and keep the balance of flexible supply and demand as facilitated foundation for marketing operation in every respect of a historic district.

In integrated urban conservation project of historic district, varied stakeholders' coordination is one of the most key elements to settle the dilemma between concentrated density and public quality. In general, administrative urban plans and capitalists' contribution are crucial remedies in the transforming process of an urban area but cannot determine the final direction of a certain urban transformation when it comes to the essence of lives. Under such basis, this paper hence argues that urban quality is not merely dominated by or directly related to density but more by the population's social demands and their initial interaction with a specific area, active or passive involvement. Multiple habitants' behaviour has decisive influence on the qualitative changes of inhabitants' lives. In the specific example of Sinan Road area, when people took initiative and in an ethical manner occupancy of the communities within, urban liveability and vibrant could improve or at least maintain in a sustainable situation; on the contrary, when appearing passive and immoral intervention, living quality faced decline. The fight for stabilization between density and quality is a time-consuming perseverance, investigating the underlying goals and ambitions, stakeholders' attitudes and motivation, planning strategies for urban transformation in historic districts are in request.

Notes on contributor

ZHU Kaiyi (1991), is a PhD candidate at TU Delft. Kaiyi obtained her Msc in Conservation of Historic Buildings at the department of Architecture and Civil Engineering of the Faculty of Engineering and Design in the University of Bath. Since October of 2016 when she started her first year of PhD studies at Chair History of Architecture and Urban Planning, Kaiyi's research and practice is related to the development of international conservation theories and urban heritage practice "in the name of conservation" located in historic residential areas of China's big cities.

Studies on External Transportation Development and Spatial Structure Transformation of Modern Kunming from a Southeast Asian Perspective, 1885-1945

Tianjie ZHANG *, Yuqi ZHANG **

* Associate Professor, School of Architecture, Tianjin University, China, arch_tj@126.com

** Postgraduate, School of Architecture, Tianjin University, China

From a regional perspective of Southeast Asia, the paper focuses on Kunming, a gateway between China and Southeast Asian countries. The research elucidates the planning ideas and construction process of external routes, via both land and air, such as Yunnan-Vietnam Railway, Yunnan-Burma Railway, Burma Road, Stilwell Road and Hump Airline in early 20th century. These external routes became the arteries of cargo transportation, and Kunming became a regional economic center and military command center during wartime. The paper further reveals the transformation of Kunming's spatial structures influenced by these external routes, which accelerated Kunming's urban growth along the traffic lines. The city center shifted to the Station area, where industrial and commercial developments also congregated. New industrial zones were planned to the east and north of the old city, where new passages brought more convenient transportations. The internal road network plan also emphasized the connection with new railway station and bus stations. The research construes the planning ideas and implementation, traces their theoretical origins, and uncovers their indigenous considerations.

1 Introduction

Kunming is the capital of Yunnan and an important city in southwest China. As the birthplace of the ancient Southern Silk Road and the ancient Tea Horse Road, the southwest is the frontier of economic and cultural exchanges between China and Southeast Asia, and also the core area for inland opening to the outside world¹. In modern times, Kunming once had a rapid development. After the Sino-French War of 1885, the French and British forces reached into Yunnan. In 1910, Kunming opened a commercial district and began its modernization. In 1937, with the full-scale outbreak of the Anti-Japanese War, the eastern coastal cities were blocked, a large number of people, factories and schools moved westward. Kunming became an important gathering place during the Anti-Japanese War. In modern times, Kunming built a number of domestic and international access roads, which had an important impact on the evolution of the regional structure of Southeast Asia and the internal spatial structure of Kunming. In combination with Southeast Asian regional perspectives, this paper attempts to explore the access construction between modern Kunming, the domestic and Southeast Asian countries and its impact on the evolution of urban spatial structures.

2 Development Background of Modern Kunming

2.1 Urban development before modern period

Kunming is surrounded by mountains on three sides and Tien Lake in the south. It was an important population gathering place in ancient times and gradually became the center of politics, military, economy and culture in Yunnan. Tuodong city, built in the Tang Dynasty (618-907 AD), formed the embryonic form of Kunming. In the Song dynasty (960-1279 AD), the area was expanded. Zhongqing City in the Yuan Dynasty expanded to the north based on the city of Song dynasty. The city of Ming Dynasty (1368-1644 AD) continued to move north and the brick city covered an area of about 3 square kilometers (Figure 1). It was prominent for political and military function. The Qing Dynasty (1644-1911 AD) inherited the Ming and formed the main axis of space from South Gate to Wuhua Mountain. Before modern times, the urban spatial structure of Kunming gathered in blocks. The urban space expanded northward due to the influence of topography. The landscape pattern of "three mountains and one lake" was continued (Figure 2). With the opening of the commercial district in 1910, Kunming began its transition to modernization.

Figure 1: Kunming in Ming and Qing Dynasty

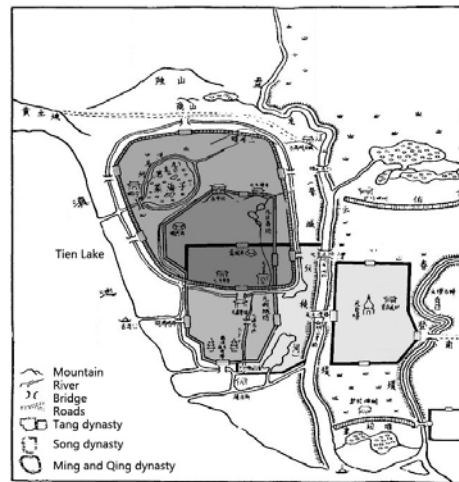

Figure 2: The changes of the city site in Kunming

2.2 Regional traffic development before modern period

The terrain of Kunming is dominated by hills and mountains. Affected by the terrain, traffic conditions before modern times were not very developed, but there were still accesses connecting inside and outside, such as the Southern Silk Road, the ancient Tea Horse Road, and Shu'an South Road. The Southern Silk Road had come into being before the Han dynasty, starting from Sichuan, went through Kunming to Myanmar and India (Figure 3). It was a business and cultural communication channel, linking Southwest China with South Asia. The Tea Horse Road was in contact with the "Great Triangle" areas of Yunnan, Sichuan and Tibet in China (Figure 4). And it extended abroad to India, Myanmar, Vietnam, Laos and Thailand. It was the important civil international trade channel and cultural communication center. Shu'an South Road was also one of the most important transportation routes in ancient times. It started from Sichuan, went through Yunnan to Vietnam. In addition, there were also some Horse Roads and water transportation routes that linked Kunming and the domestic areas such as Guizhou, Guangxi, Sichuan and Tibet. Before modern times, the main direction of communication between Kunming and the international countries was Vietnam, Myanmar, India and other Southeast Asia countries. This laid the foundation for the modern Kunming to expand its access to Vietnam, Myanmar, and India.

Figure 3: The ancient southern silk road

Figure 4: Road map of Tea Horse Road

3 Formation of External Routes in Modern Kunming

3.1 Routes between Kunming and Southeast Asian countries

3.1.1 Routes between Kunming and Vietnam

In modern times, the transportation links between Kunming and Vietnam have been significantly enhanced, and the construction of the Yunnan-Vietnam Railway has been an important support. At the end of the 19th century, the British and France saw Yunnan as an export to develop trade network in China's inland. It urgently needed a railway to connect Yunnan². Afterwards, the France obtained the Yunnan-Vietnam Railway construction right. The Yunnan-Vietnam Railway started from Kunming and stretched southwards to Vietnam (Figure 5). It was opened in 1910 and was one of the earliest international railways in China³. It formed a new pattern of modern external channels of Kunming. During the Anti-Japanese War, the Yunnan-Vietnam Railway was the traffic arteries in the early stage and assumed the most important task of transporting materials for aiding China.

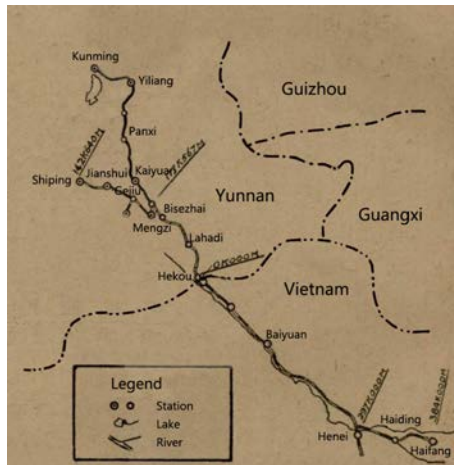

Figure 5: Road map of Yunnan-Vietnam Railway

Figure 6: Road map of the Burma road

3.1.2 Routes between Kunming and Myanmar

During the Anti-Japanese War, under the pressure of the Japanese military's blockade to southeastern coastal cities, the access between Kunming and Myanmar has been further developed. In 1937, Long Yun, Chairman of Yunnan Province, proposed to Chiang Kai-shek the "Plan for the Construction of the Yunnan-Burma Road and the Yunnan-Burma Railway"⁴. In 1938, the Burma Road opened. It travelled from Kunming to Xiaguan, Baoshan in the west, and to Bamo in Myanmar. It communicated with the inland provinces of Yunnan, Sichuan and Guangxi and the outland of Myanmar's Mandalay and Yangon (Figure 6). After the Yunnan-Vietnam Railway was cut off, the Burma Road was once the only international communication landline in the rear of Anti-Japanese War, called the lifeline⁵. The Burma Road had the second largest traffic volume, just after the Yunnan-Vietnam Railway. Although it was dominated by military transport, it was also a trading road⁶. Another route linking Burma was the Yunnan-Burma Railway which had been proposed during the late Qing Dynasty. However, due to various factors in wartime, this line only partly built.

3.1.3 Routes between Kunming and India

In 1942, Japanese invaded Myanmar and cut off the access between China and Myanmar. This provided an opportunity for the expansion of the Kunming-India access. In order to transport aid supplies, the US military opened up the Hump Airline (Figure 7). It was an air corridor from Kunming, flying over the Himalayas to reach India. It was the only transportation line that offered international assistance in the late Anti-Japanese War. There was also a road linking China and India, the Stilwell Road (Figure 8). At that time, the Yunnan-Vietnam Railway and the Burma Road were both cut off. The transportation of the Hump Airline was limited and the transportation costs were high. Therefore, the construction of the landline between China and India was necessary⁷. The Stilwell Road was built by China, America and Britain from 1942 to 1945. It started from Redo in India, went through Myanmar entered the western Yunnan and finally reached Kunming. It was the most convenient land route connecting China, India and Myanmar to the Southeast Asia.

Figure 7: Route map of the Hump Airline

Figure 8: Road map of the Stilwell Road

3.2 Domestic Routes of Kunming

In addition to international links, Kunming also strengthened its transportation links with other parts of China in modern times, which changed Yunnan's situation of accessible to foreign countries but inaccessible to domestic cities, thus formed China's southwest national defense transportation network.

As for links with other provinces, roads between Kunming and Guizhou, Sichuan, Guangxi, Nanjing were main construction projects. As important domestic railway transportation routes were cut off during the Anti-Japanese War, roads became key access to the southwest. To promote provincial roads connection in southwest and unify planning and management, the national railway department of the Ministry of Communications established southwest highway transport authority in 1938, planning to open Changsha-Guiyang-Kunming-Chongqing and other major channels⁸. The main roads completed in the early period of the Anti-Japanese War include the Yunnan - Guizhou road, Sichuan - Yunnan road, Yunnan - Guangxi road and Beijing - Yunnan road. In addition, since modern times, the caravan transportation has gradually declined. In order to restore the caravan post transportation during the Anti-Japanese War, the original post way in Yunnan was renovated, including the Sichuan and Yunnan post transportation and the Yunnan-Tibet-India post transportation. They also bore the heavy burden of transporting materials to China's war zone and played an important role in logistics support⁹. In the aspect of railway construction, railway from Yibin of Sichuan province to Kunming was planned to put up in 1937, but only part of it completed due to the war. In addition, Kunming also opened up air routes to Chongqing, Nanjing and Fuzhou.

As for links between domestic provinces, the government of Yunnan province listed road construction as one of the four most important political issues in 1928. In the same year, Yunnan provincial highway administration was founded and Kunming was designated as the center of "four main roads and eight districts" highway planing¹⁰. In this planning, the east Yunnan road connects Yunnan and Guizhou, the northeast Yunnan road connects Yunnan and Sichuan, the west Yunnan road connects western Yunnan and the south Yunnan road connects Yunnan and Guangxi.

3.3 Summary

In modern times, the access between Kunming and Vietnam, Myanmar and India gained rapid development. Especially after the outbreak of the Anti-Japanese War, the authorities attached importance to international route. With Kunming as the heart, roads and railways as the backbone, the construction of transportation networks has enabled Kunming to display an enormous advantage in the international, inter-provincial and provincial relations.

The external access constructed of Kunming leads the regional spatial structure of Yunnan (Figure 9). After the opening of the Yunnan-Vietnam Railway, it has been the most densely-connected external channel for the people, logistics, capital and information in Yunnan¹¹, forming the Yunnan-Vietnam Economic Corridor with the "Yunnan-Vietnam Railway" as the main axis and the group of towns in Southeast Yunnan. During the Anti-Japanese War, the construction of life lines such as the Burma Road, the Hump Airline and the China-India Road has enabled Kunming to become a hub city for relief supplies. The Burma Road and the China-India Road have helped to form the Yunnan-Myanmar-India Economic Corridor and the group of towns in West Yunnan. Meanwhile, the construction of the inter-provincial traffic of Xukun Railway, Yunnan-Guizhou Road, and the

provincial road network also strengthened the links between Kunming and inland China. Huge amounts of aid materials were transferred from Kunming to Sichuan, Guizhou and Guangxi through these accesses. Kunming has become a key fulcrum supporting China's wartime economy. In Yunnan, a regional spatial structure, with Kunming as the center and traditional central cities as the nodes, has come into being.

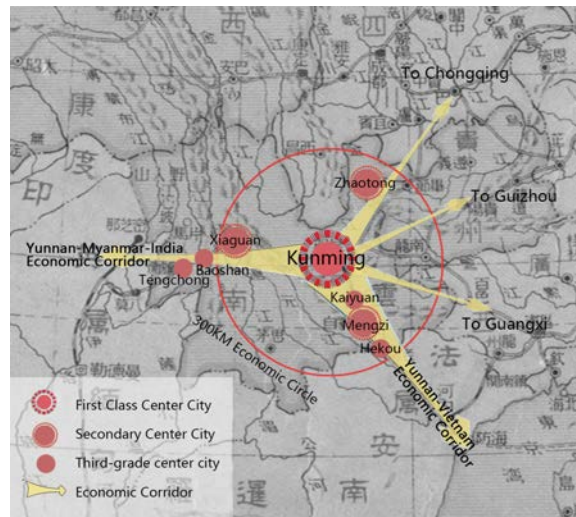

Figure 9: Diagram of modern Kunming regional spatial pattern

4 Corresponding Transformation of Kunming's Spatial Structure in Modern Period

4.1 Formation of Dual-core Structures (1910-1936)

After the opening of the Yunnan-Vietnam railway in 1910, the railway economy became an important factor in the reconstruction of the urban structure of Kunming. The commercial district centered on the Yunnan-Vietnam Railway Station, which was located outside the South Gate of Kunming (Figure 10). With the opening of the Yunnan-Vietnam Railway, Kunming's commercial trade quickly flourished¹², forming an early business district. At the same time, urban space began to expand eastwards and southwards, presenting the "dual-core" structure of Kunming's old city district, where government offices and temples are the centers, and the commercial district¹³. In terms of urban road network, unlike the old city, commercial district adopted a small-scale grid to pursue higher commercial land value.

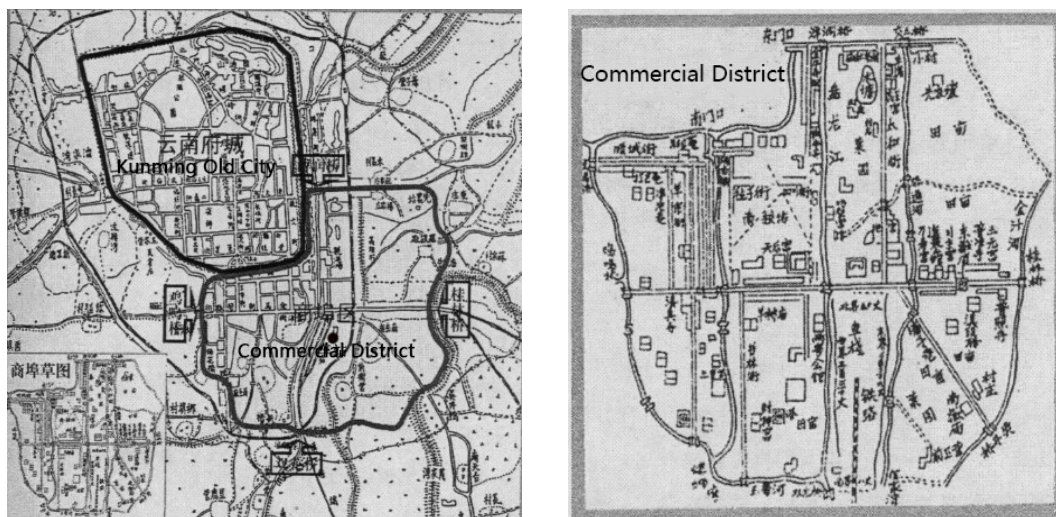

Figure 10: Location map of Kunming commercial district, 1920s

In 1922, the Kunming Municipal Public Office was established and a new urban construction plan was introduced. Its executive was Zhang Weihai, supervisor of Kunming Municipal Public Office. Zhang Weihai went to Tokyo Imperial University and the Tokyo Municipal Research Society in 1919 for learning the constitution

and the municipal administration¹⁴. The experience of studying abroad in Japan made Zhang Weihuan deeply influenced by theories such as Garden City. He proposed that in the future expansion plans, it was necessary to adopt the latest approach so that the industrial and commercial areas also included appropriate garden areas¹⁵. The plan confirmed that urban space would continue to expand to the south area and serve as an industrial and commercial area. In addition, the opening of the Yunnan-Vietnam Railway also affected the traffic network in Kunming. At this time, the railway station became an important transportation node. In order to dredge the traffic between the railway station and the old city, Zhang Weihuan drafted the demolition of the South Gate Tower and built a ring road, vigorously transforming the old streets, and letting the road connect to the train station so as to get maximize traffic utility.

In 1928, the Kunming Municipal Government was established. In order to better meet the needs of car travelling, the municipal government has vigorously rectified the traffic in the city. In 1930, it proposed the construction of Ring Road. In 1931, it proposed the "New Market Development Plan" to mainly renovate the streets. In 1935, it formulated a detailed plan for the transformation of the city roads. In 1936, it implemented the "8-Street Plan" for remodeling the streets. Before the Anti-Japanese War, Kunming had formed a new road network. In addition, there has been a marked expansion of urban space (Figure 11). Except for district 4, which were affected by the topography and developed northward, the overall urban space still extended eastwards and southwards.

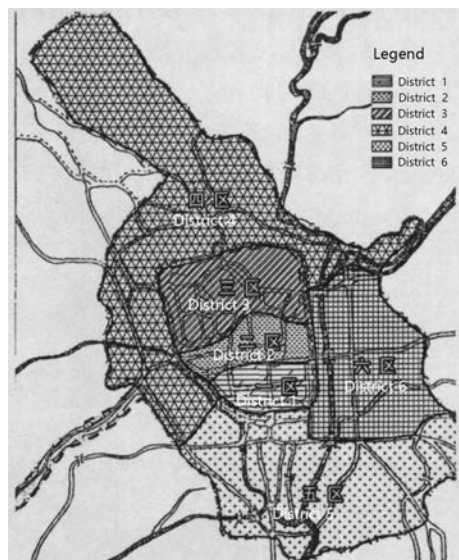

Figure 11: The urban zoning plan, 1935

4.2 Development of Concentric Zone Model (1937-1945)

During the Anti-Japanese War, China's social and economic center moved inland. With the construction of international routes and the domestic southwest road network, Kunming's urban status was even more important. It was not only the political, cultural and economic center of the Yunnan, but also a traffic hub and strategic point for domestic and foreign connection. During this period, Kunming had two important planning. The first was the "Great Kunming City Planning" in 1939. It could be regarded as the rudiment of regional planning, proposed by Ding Jishi, Director of the Kunming municipal public works who had studied in Germany. The other important planning was the "Outline of the Three-year Construction Plan of Kunming", drafted by Tang Ying in 1941. Tang Ying also studied in Germany. The concepts of Urban Zoning, Garden City, and Satellite City were introduced in the plan.

The Outline proposed a long-term plan for the scale of urban development land of 170 square kilometers. The municipal authorities also proposed that the density of urban population should not be too large. It should adopt Garden City, the evacuation development method which combined rural and city, and expand radioactively along railway lines or road to form a multi-point satellite urban system¹⁶. The Outline proposed the concept of urban zoning (Figure 12), delineating administrative areas, cultural areas, commercial areas, residential areas, industrial areas, scenic areas, cemetery areas and forestry pastoral areas. Urban zoning took into account the impact of traffic on different functional areas. For example, the industrial area was outside the city, located in the eastern and northwestern parts of the city for transportation convenience, with the Yunnan-Vietnam Railway, Yunnan-Burma Railway, Xukun Railway and the Burma Road, Yunnan-Guizhou Road outside and inner-city roads. During the

Anti-Japanese War, Kunming formed several important industrial districts (Figure 13). They formed independent groups around the city and had a convenient transportation link to the city center. The business district was located in the area around Yunnan-Sichuan station and Yunnan-Vietnam station where there were a lot of people and logistics.

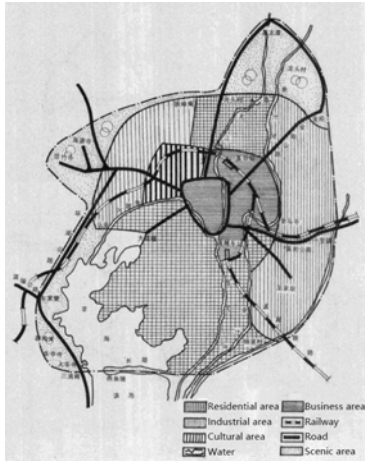

Figure 12: The zoning plan in Kunming, 1943

Figure 13: The industrial layout of Kunming during the Anti-Japanese War

In terms of traffic network, in order to meet the requirements of urban evacuation development and contact with external traffic, the “Outline” proposed the road system adopted a ring with radial structure (Figure 14). The external accesses of the Burma Road and Yunnan-Guizhou Road were radial and connected with the loops. The east ring railway and city road were also provided to connect the North Yunnan-Sichuan Railway Station and the South Yunnan-Vietnam Railway Station. In addition, from 1938 to 1942, the “Ten Street Project” was implemented to renovate the city street. In 1942, the main street design of Kunming was proposed (Figure 15) and the main roads were widened. The urban form at this stage basically formed the spatial structure of the “Concentric Zone Model”, with the circular radiation path as the skeleton¹⁷.

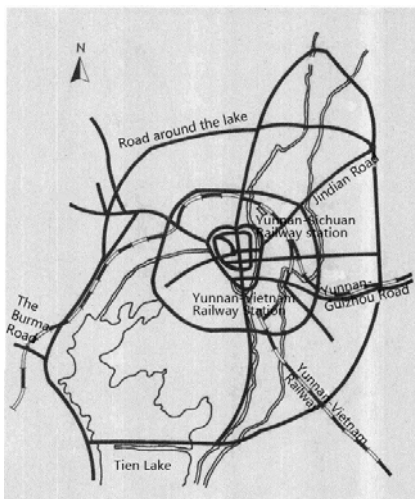

Figure 14: The planning of the main road system, 1943

4.3 Summary

Table 1: Summary of planning practice in modern Kunming

Period	1900-1921	1922-1927	1928-1936	1937-1945
Historical Development	Opening Commercial	Kunming Municipal Public Office	Kunming Municipal Government	During Anti-Japanese War

	district in 1910	was established in 1922	was established in 1928		
Construction of External Access	Yunnan-Vietnam Railway	—	Yunnan-Guizhou Road; Yunnan Road Project	The Burma Road, Yunnan-Burma Railway, the Hump Airline, the China-India Road, Xukun Railway, Southwest Road Network	
Major Plan and Planners	—	Kunming New Urban Construction Plan, Zhang Weihan (1923-1928)	Plan for New Market Development, The Kunming Municipal Government(1931)	The Great Kunming City Planning, Ding Jishi (1939)	The Outline of the Three-year Construction Plan of Kunming, Tang Ying (1941)
Planning urban area	The newly opened commercial district was located outside the South Gate.	The planned urban area was 50 square miles, and the urban area focused on the southward development.	The city continued to expand eastward and southward	Delineated with Tien Lake as the center, all counties around Tien Lake were within the scope of Kunming City	Planned the urban area a scale of four-ring 170 square kilometers
Urban road network	Small Scale Grid in commercial district	Planning radial road network in the south, keeping the chessboard road network in the north and renovating the old roads	Mainly to renovate the streets	Constructing the road around the lake linked with the urban areas, counties and areas around the lake	Ring with radial road network; the loop was connected with the external roads, and connected to railway stations
Urban Zoning	New commercial district and old city	Old Northern District, New Southern District as the Industrial and Commercial District	6 administrative districts	Making simple functional division according to the original county area	The concept of urban zoning was proposed, taking the impact of traffic into account
Major planning concept	—	Garden City, City Beautiful Movement	—	Decentralized development, the rudiment of regional planning	Urban Zoning, Garden City, Satellite City

Recalling the development of Kunming in modern times, the construction of external accesses was an important factor in promoting and influencing its development. From the end of the 19th century to 1945, Kunming's urban space generally expanded eastward and southward along the major traffic routes. The urban area expanded from 3 square kilometers to 7.8 square kilometers. The spatial structure evolved from the early lumps to dual-core structure and to the concentric zone model. The road network in the city was gradually improved to meet the needs of the automobile era. Several important external stations had a good connection with urban road networks. Urban functional zoning was also affected by external accesses.

Table 2: Urban growth of modern Kunming

Urban Built-up Area			
Period	Qing Dynasty	The 1920s	The 1940s
Historical Development	—	In 1910, the Yunnan-Vietnam railway was opened, and in the same year, it opened the commercial district.	During the Anti-Japanese War, the opening of multiple domestic and international accesses made Kunming a strategic place for the rear.
Urban Expansion	Mainly concentrated in the city	Extended eastwards and southwards	Expanded along the traffic lines
Urban Area	About 3 km ²	About 6.08 km ²	About 7.8 km ²

5 Conclusion and Discussion

Traffic is the foundation of a city's development, especially in the special period of modern times. The construction of modern external accesses in Kunming is formed under the dual thrust of foreign forces and domestic reform. It vigorously promoted the modernization of Kunming and southwest China, making Kunming a hub city of the Anti-Japanese war and a military and economic center rather than the frontier military town in early period. Kunming became the forefront of opening to the outside world in southwest China. The Kunming-centered transportation line is the material carrier of Kunming's external access and the artery of southwest economic transportation. The construction of external access has extended the scope of economic and cultural communication. It affected the spatial pattern of the entire Yunnan and southwest China. It constructed the Kunming-centered China-Vietnam economic corridor and China-Myanmar-India economic corridor, strengthened the economic interaction between Sichuan, Guizhou and Guangxi provinces. It has promoted the development of towns along the routes as well.

The period of the Anti-Japanese War is an important stage for the construction of Kunming's external accesses. It provides a direct impetus for Kunming's urban development. Kunming obtained the external power of urban development through external transportation, which supported its wartime operation, and played multiple roles in political, military and economic aspects. It profoundly affected the spatial structure of Kunming. The development of external access changed Kunming's traditional "walled city" form, expanded urban space and provided a new axis for urban growth. When the transportation is still underdeveloped, the urban spatial structure is a concentrated mass. The construction of external accesses made the urban spatial more decentralized and flexible, promote the expansion of urban space, present the embryonic form of concentric zone model and display a decentralized industry area layout. The urban space gradually expanded to the east and south, and the urban center shifted to the railway station area where the industry and commerce have been developed. The urban road network has also undergone adjustment accordingly. In addition, in the course of the construction of Kunming's external accesses, some western planning concepts have been absorbed, such as Garden City and Urban Zoning, which injected new ideas for urban planning in Kunming. It's worth noting that Kunming's reference to western planning ideas was selective and localized. For example, Zhang Weihai's understanding of Garden City was translated from Japan. The Garden City movement in Japan was developed and promoted as a high-level residential area in the suburbs of large cities¹⁸. However, Zhang's understanding of Garden City focused on the construction of material landscape environment and urban livability.

McPublic Spaces: McDonald's' appropriation of the *everyday* place in Hong Kong

Diego Caro

* MPhil, Department of Architecture, University of Hong Kong, dcaro@connect.hku.hk

This paper analyses the role of McDonald's in Hong Kong as a consumption-oriented place where the production of social space happens under the constraints of the market's spectacle and speculations. McDonald's in Hong Kong have evolved from the original aesthetics of the company, with a colorful postmodern cafeteria look, to the latest concept "Next" with a bold design, neat materiality, touch screens and open layout. Throughout this process, its restaurant design and policies have evolved by appropriating the rhythms of the city and its citizens. Whereas Hong Kong's city escape is commonly perceived as the product of top down strategies carried out by "coalitions" between public institutions and private corporations, McDonald's offers a case study of informal activities influencing the way a global enterprise develops. Its new "Next" concept might be seen as an attempt to anticipate informality. Two opposing ideas underlie this "open look": the aim to homogenize customers through the sanitation of the space, versus the provision of neutral spaces to allow for the occurrence of heterogeneity. The presence of the screen as an intermediary between the restaurant and its customers empowers a dichotomy between an impersonal fast food service and current paradigms that aim to prioritize people and food.

Keywords: cross-cultural, globalization, everyday spaces, public & private, spaces of appropriation vs spaces of domination

Introduction

The pressure of high property prices forces a great percentage of Hong Kongese to live and work under poor conditions. This fact, combined with the lack of effective open public spaces in the city, has empowered the rise of places of consumption as an extension of domestic and professional realms. In this context, McDonald's has played a crucial role in the integration of everyday activities into spaces of consumerism in Hong Kong since 1975. This interiorization and appropriation of the "public" by multinational corporations is part of a larger process in the city initiated in the 1970s, primarily in shopping malls.

Social scientists refer to public space through two main ideas: accessibility and the public sphere as a place for communal dialogue¹. In terms of accessibility, there are 244 McDonald's' restaurants strategically distributed in the most populated areas of Hong Kong of which 116 are opened 24hours². Its access appears hardly restricted; users range from families with children, to high school students, construction workers, domestic helpers or groups of elderly people. Moreover, Hong Kong and Mainland China McDonald's have been known in recent years for letting homeless people, referred as "McRefugees", sleep in their restaurants. The prefix Mc has been used over the past decades to create neologisms, often following pejorative connotations associated with McDonald's. This paper's title "McPublic" refers to contemporary spaces of consumption that make up an essential background for everyday life.

As a place for dialogue, it is particularly relevant the influence of its interior design's playful mood combined with intense branding strategies in people's behaviour and habits. McDonald's Hong Kong has evolved from its first restaurants emulating the American colorful postmodern touch of the brand in the 1970s, to the world's first McDonald's Next, a drastic new concept with a bold design, pure clean materials such as concrete, wood or steel, touch screens and open layout³. Along this process, McCafé was incorporated in Hong Kong in 1999 and, recently, healthier and Create Yourself menus have been implemented in accordance to current trends.

This study will take into consideration: users, workers, designers and the corporation, in order to understand how McDonald's has assimilated and appropriated the everyday into its capitalist consumer strategies where private and public ambiguity arises.

Public & private ambiguity

Public space and low standard living conditions

There are two key factors that contribute to the proliferation of private third places in Hong Kong as substitutes of public and domestic scopes: the characteristics of its public space and the living standards of its residences⁴.

Rampant growth and privatization of the public realm for the benefit of big corporations, have turned public spaces in the city into residual areas: narrow sidewalks, overcrowded squares or parks whose access is hindered by big infrastructures, as an example. Moreover, these spaces are often restricted and surveilled⁵. On the other hand, housing average areas and living standards in Hong Kong are remarkably low. According to Hong Kong's Government, the average living space per person in 2013 for Public Rental Housing was less than 13sqm.⁶ The dimensions in the case of informal subdivided flats can decrease down to 4.5sqm.⁷ These minimal conditions often force people to find a third space as a substitute of their living and working places.

Privatization of public space

As a consequence of its development-oriented urban dynamics, Hong Kong has relied on the private sector to provide public space provision to the city. The most common form under which these spaces are developed is POPS (Privately Owned Public Space). Originated in New York in 1960, this concept was adopted by Hong Kong Government in the 1980s due to its rapid economic growth⁸. The synergy between local state and corporate strategies in Hong Kong is particularly significant as the government is the landowner as well as the lawmaker⁹. The intentional manipulation of planning systems in order to favor big corporations has created an efficient "Bureaucratic society of controlled consumption" that shapes Hong Kong social space¹⁰.

Whereas in the case of POPS the public use of a private space is institutionalized, there are numerous cases where this boundary is ambiguous. A crucial factor that intensified this ambiguity was the upswing of the shopping mall in the 1970s in Hong Kong; this process of interiorization and privatization of public spaces meant a radical change in everyday life of space¹¹. In opposition to some negative characteristics of open public spaces such as adverse weather conditions or poor accessibility, these private spaces are safe, organized, located in strategic points of the city linked to a subway station and provide a comfortable environment. Moreover, the rise of a consumer culture brought new lifestyles and aspirations.

McDonald's in Hong Kong

Hong Kong in the 1970s

The first McDonald's, opened in Hong Kong in 1975, was located in Paterson Street, Causeway Bay. The landing of the big franchise coincided with a period of unprecedented economic and demographic growth after WWII. The city was transiting from being a second sector-based economy to a financial and high-technology industries center where shopping malls and offices were being built at a frantic rhythm¹². Fast food culture was not a new phenomenon in Hong Kong. The intense rhythm of the city, long working hours and commuting time meant that people often consumed take away food. Thousands of street food vendors delivered food day and night during the 1960s and the 1970s. The first step to the corporatization of street food was carried out by Café de Coral in 1968 by incorporating fast food into clean and nicely decorated interior spaces¹³. This company is currently one of the main competitors of McDonald's in Hong Kong with 150 outlets. In this context, McDonald's found optimal conditions to enter the local market: one year after its first restaurant, McDonald's set foot in Kowloon with a restaurant in Yau Ma Tei. In 1981, McDonald's in Kwun Tong beat the world record of daily transactions¹⁴.

In parallel to the development of shopping malls, the restaurant chain gradually transitioned from being an exotic place, especially for young people wishing to be part of a popular culture, to a common meeting point in everyday routines, where not only fast food was offered but a place to stay¹⁵. The strategy of McDonald's' first Manager in Hong Kong, Daniel Ng, was not to compete with local food restaurants but to stick to their original American menu and aesthetics. According to Watson, McDonald's also played an important role in Hong Kong by setting new standards of cleanliness, particularly in toilets, and people's discipline, such as queuing while waiting to order¹⁶. Moreover, McDonald's offered a safe space, free of triads, alcohol or cigarettes, to young people. This whole process can be considered as a "McDonalization" of Hong Kong's society in the terms used by Ritzer of "efficiency, predictability, calculability, substitution of nonhuman for human technology and control over

uncertainty”¹⁷. The international debut of the latest concept Next in Hong Kong indicates the naturalization of the brand in the city.

Hong Kongese habits

A closer look at the specificities of Hong Kong in comparison to United States suggests some important differences in people’s habits. Whereas in the United States 70% of McDonald’s sales come from drive-thru, in Hong Kong this service is not offered and its home delivery service accounts for less than 20% of its transactions in Hong Kong¹⁸. In the United States, the average eating time in fast food industries is 11 minutes and in Hong Kong 20 to 25 minutes; in addition to this, Hong Kongese often consider McDonald’s meal as a snack before eating at home¹⁹. These facts denote a social component involved in McDonald’s consumers in Hong Kong.

Ubiquity in the city

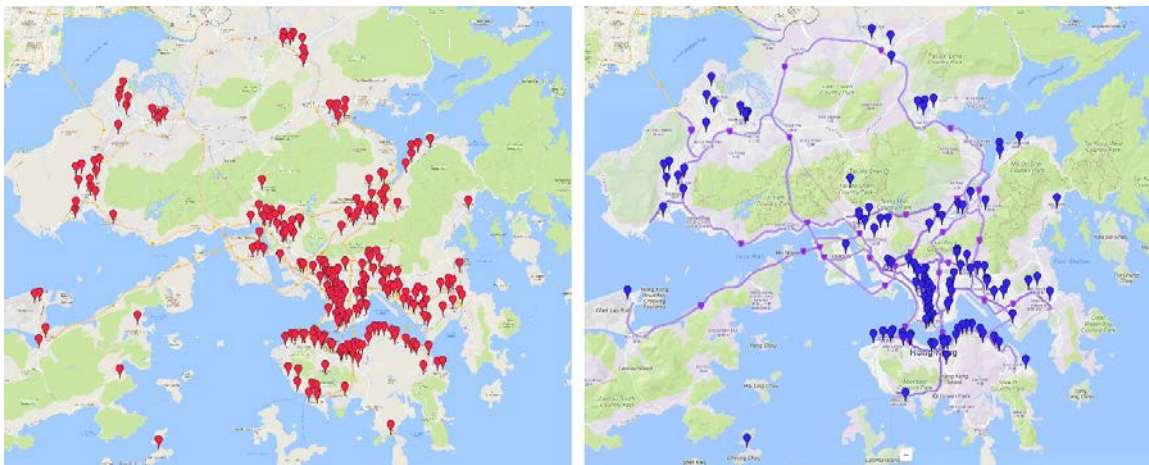

Figure 1. Caro, Diego. *Map of Mcdonald's outlets in Hong Kong. Day(red) and 24h(blue)*. [Hong Kong 2017]

There are currently 244 McDonald’s restaurants strategically distributed in Hong Kong, of which 116 are open 24 hours. There is a McDonald’s situated within a radius of 500 meters in 83 out of 91 MTR stations, and, in the proximities of the outlets, intense signage is carried out in different forms in relation to street’s typologies.

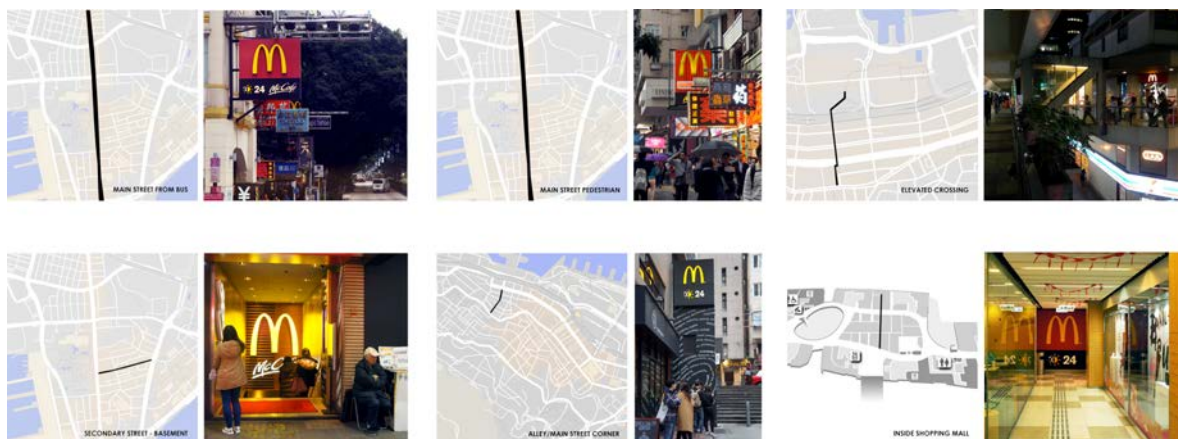

Figure 2. Caro, Diego. *Diagrams of Mcdonald's' signage in Hong Kong*. [Hong Kong: 2017]

Among its restaurants, McDonald's located in residential areas are particularly successful. In 1992, 7 out of the 10 busiest McDonald's in the world were in Hong Kong and 5 of them were located in residential areas of the city (Kowloon Bay, Tsuen Wan, Shatin, Tuen Mun and in Kwun Tong)²⁰. Moreover, the corporation is also visible in the city landscape through the sponsorship of events, charity campaigns and community services²¹.

McDonald's and Real Estate

The omnipresence of McDonald's in the city is intrinsically connected to the corporation's real estate business strategies²². McDonald's' real estate properties worldwide are worth more than \$31 billion, from which it gets more than \$5 billion revenue annually²³. This means that the corporation makes most of its profits from acquiring outlets and subletting them to its franchisees. Since its origins in Hong Kong, McDonald's has had close relationship with banks and developers. The first restaurant in the city was opened by one of the three sons of the co-founder of the Bank of East Asia. Most recently, in 2017, 80% of McDonald's China & Hong Kong shares were bought by CITIC and Carlyle groups in an attempt to set more localized directions. The first steps of the new owners were several deals with some of the most important Chinese Real Estate developers such as China Evergrande Group, China Overseas Land & Investment Ltd. or China Vanke Co., whereby McDonald's will be the first retailer to see new developments so as to decide the location for their future investments²⁴.

Notwithstanding, real estate speculation has also negatively affected McDonald's' locations in Hong Kong. High prices in rents, that in some cases tripled in the past 40 years, have forced iconic outlets like the first McDonald's in Paterson Street to relocate. The main reason behind this increase is the rampant emergence of high-end retails that respond to the increasing demand of these products by Mainland Chinese tourists according to property consultants²⁵.

McWorld: McKids, McGamers and McRefugees

Kid's loyalty programs

The McWorld alters the physical space of the city as well as its citizens²⁶. Through intense loyalty campaigns, McDonald's has targeted kids since the first appearance of Ronald McDonald in 1963. In Hong Kong, these controversial marketing strategies have had a strong impact in the way they enjoy their leisure time as well as the way they perceive leisure space in the past years. McDonald's has developed specific spatial practices focused on children, from a Toys Museum to a restaurant designed from drawings done by kids²⁷. The kids that celebrated their birthday parties in a McDonald's in the 1980s and 1990s get married nowadays in the same outlets²⁸.

Whereas the idea of kids' indoctrination suggests that McDonald's uses marketing as a mechanism of control, top down strategies, other groups of people, like McGamers or McRefugees, have played an unexpected role in McDonald's creating bottom-up informal situations that the corporation have somehow absorbed.

McGamers

Albeit originated in Japan, McGamers were probably the first big phenomenon of informal overstays taking shape inside McDonald's outlets in Hong Kong. Their presence increased dramatically after the release of PlayStation Portable (PSP) in 2005 and, particularly, the game Monster Hunter. The need of physical proximity between gamers due to Bluetooth connection, and electric outlets where people would connect several devices to a power strip, plus the possibility of enjoying an informal environment to gather and make controlled noise far from school or home, brought a vast amount of teenagers inside McDonald's.

Nowadays, whereas physical proximity is not required due to the spread of the internet, McDonald's has done a good use of the ideas acquired from McGamers by offering charging stations for mobile phones or free Wi-Fi. The recent video game phenomenon PokemonGo in 2016 was also taken advantage of by the corporation in Japan with more than 3000 restaurants in the country introducing virtual gyms in their interiors. Quickly, other companies, including Starbucks, followed this trend²⁹.

McRefugees

Hong Kong and Mainland China McDonald's have been broadly known in recent years through media for letting homeless people sleep in their restaurants³⁰. According to Homeless Outreach Population Estimation organized by City University of Hong Kong in 2015, 254 people were reported to stay overnight in fast food restaurants. In reference to McRefugees, McDonald's Hong Kong expressed in an official statement that the company welcomes all walks of life to visit their restaurants any time and that tries to be accommodating and caring to customers who overstay³¹.

McDonald's restaurant design evolution

For over 50 years, McDonald's has transited from a fast food chain in the United States focused on automobile culture with basic and cheap menus and decoration to a more sophisticated restaurant offering coffee, bakery or customized salads. The influence of external factors has played a decisive role in the evolution of its marketing strategies and restaurant design. Among them: competitors such as Starbucks or KFC, food health issues, anti-capitalistic movements, workers' protests, real estate market, new technologies or changing practices of customers. Throughout these years, two milestones have affected drastically the restaurant's interior design in Hong Kong: The incorporation of McCafé and the recent McDonald's 'Next' concept.

First restaurants

The first McDonald's' restaurants developed in the United States had a postmodern cafeteria look where the golden rings were a predominant element within a white and red background. The building became a sign, as some of the case studies shown in *Learning From Las Vegas*³². Venturi and Scott Brown themselves also designed a McDonald's in Buenavista, Florida in 1990, that can be consider as a paradigmatic example of this original trend. The first McDonald's in Hong Kong was designed in a similar fashion and just a few of this first generation of McDonald's were kept until recent years. One of them was the recently closed McDonald's in Kwun Tong that, after 30 years running, had become an icon within the neighborhood. The renovation of this McDonald's stayed on hold for many years due to urban speculation uncertainty becoming a short of vintage place³³.

McCafé

The first McCafé in Hong Kong opened in 1999 in Wing Shan McDonald's in Sheung Wan. This new service meant a crucial change in the restaurant's design and atmosphere that became more playful yet sophisticated. Warm materials were introduced as well as colorful wallpapers and furniture. Regarding the spatial distribution, semi-enclosed spaces were generated by variations in furniture elements, some of them fixed, as well as the disposition of vertical elements such as wooden louvers. Different conceptual designs for different areas of the city and for different customers. McDonald's' design catalogue in Hong Kong proposes different moods for its restaurants: Allegro, Fresh & Vibrant, Simply Modern, Living Room or Craft, among others³⁴.

Figure 3. "Minimal", "Public & Hub Metro" and "Form & Allegro" interior concepts. McDonald's. <http://www.mcdonalds.com.hk/en.html> (Accessed November 20, 2017)

This evolution can be considered as a result of the competition for the third place market with companies like Starbucks. This corporation arose dramatically and expanded internationally in the 1990s, with its first outlet opened in Hong Kong just one year after the implementation of McCafé in the city³⁵.

McDonald's NEXT

The most recent concept 'Next' was first implemented in Hong Kong in 2015³⁶. Its design was carried out by the Australian firm Landini Associates. This new restaurant's style varies considerably from the previous concept: grey is now the predominant color; wallpapers display stylized quasi architectural drawings of McDonald's classic menus; vertical partitions disappear; and light fixtures become subtle elements of space distribution offering a more open space where most of the areas are visually connected. Comfortable and homogeneous furniture, totally moveable, ranging from black fabric and metal in the case of seating elements, to concrete or wood for the tables, where some phone charging points are incorporated. Cooking spaces and McCafé open up with wide glass surfaces and stainless steel. And lastly, the implementation of touch screens where customers can order and pay their meals as a key element of this new design. The main idea behind its design is "to create memorable places of commune where people and food are the key actors"³⁷.

Figure 4. Landini Associates. *McDonald's NEXT in Admiralty*. [Hong Kong: 2015]

Case Study: Mei Foo McDonald's

The case study chosen is located in the ground level of Mound Sterling Mall in Mei Foo Sun Chuen Estate. This residential estate, built between 1968 and 1978, is one of the largest private housing developments in the world³⁸. This outlet, with a built surface of 490sqm, was first opened in 1989 and renovated into the new 'Next' design in early 2017. This McDonald's was one of the first in the world, together with Admiralty and Smithfield branches, to offer wedding ceremonies.

The research method consisted of data collection from observation in the outlet. The field work was carried out for 4 weeks in the months of November and December 2017, with a total of 4 visits. During the observations, notes were taken about customers considering 4 different factors: gender, age group, consumption and activities. Remarks in relation to the spatial distribution of users were also noted.

Figure 5. Caro, Diego. *Mei Foo McDonald's estimated floorplan*. [Hong Kong: 2017]

Several suggestions derived from the results:

McDonald's targets a greatly wide range of age groups and these are distributed along different days of the week and times of the day. During weekday mornings, groups of elderly chatting are predominant whereas, in the late afternoon, the main users are high school students doing their homework or talking while having a snack. At night, mainly middle-aged men having a drink after the workday. Another important factor is that a higher percentage of people were involved in a conversation than people using their phones, although both activities were predominant. During weekdays, a high percentage of people can be spotted working, holding job meetings or doing their homework in the case of young students. Most of these customers are regulars and live, work or study in the area.

During the observations, a remarkable percentage of the visitors overstayed or did not consume. This figure was particularly high on Sunday afternoons reaching 35%. This fact might be explained due to the working schedule of domestic helpers whose free day is, normally, on Sunday. The percentage of female visitors during that day was over 65%. During the research, 2 McRefugees were spotted. 2 women were seen in every occasion sitting and sleeping in the same location, next to the secondary access.

Figure 6. Caro, Diego. McDonald's Mei Foo. Data collection charts. October/November 2017. [Hong Kong: 2017]

Conclusions

From 1975, McDonald's has transited from being an "exotic" American brand to becoming a regular place in Hong Kongese's everyday life. Through a thoroughly studied evolution of its restaurants' design and locations, menus, advertising campaigns and community involvement, the company has managed to absorb the diversity of the city and its culture as well as to mitigate opposing forces.

McDonald's' market studies provide the corporation a great capacity to foresee and react to consumer's trends beforehand, assimilating the rhythms of the society in order to later control them. The efficiency of the private model of market research and anticipation suggests that, often, private spaces of consumption have a higher capacity to engage with society than public places. The latest restaurant concept "Next" might be seen as a step towards the appropriation, sanitation and control of informality, a McDonalization of society versus unpredictability and uncertainty. McDonald's has abandoned its original colourful look giving way to an austere design of its outlets and some of their locations have been displaced from the main spots of the city, yet its omnipresence has not been compromised; the brand has impregnated the everyday conscience of its customers. Behind the neutral appearance of its newest restaurant design, a filtered reality empowers a dichotomy between what seems to pursue current paradigms and trends that aim to prioritize food and people and an impersonal fast food service focused on maximizing profits.

13 Foreign Influence in Planning

Reception of the Città Ideale. The cultural impact of the Italian Renaissance on town planning in Poland

Maciej Motak (Cracow University of Technology)

The concept of the Ideal City, as developed in Italy during the 15th and 16th centuries, has produced a significant number of treatises with texts and drawings, which, largely speaking, are theoretical rather than applied. Although new Renaissance towns were quite a rare phenomenon both in Italy and in other countries, a number of such towns were constructed in the Polish-Lithuanian Commonwealth. Two types of new towns were built according to their basic functions: the town-and-residence compounds were prestigious family seats combined with adjacent towns, while the "economic" towns were local trading centres. The fashionable ideas and forms of the Città Ideale were adopted by those towns' founders and planners. Selected examples of Polish Renaissance towns are discussed in this paper. Apart from Zamosc (1578, designed by Bernardo Morando and often considered the most perfect Ideal City, and not only in Poland), other slightly less ideal though equally interesting town-and-residence compounds are also described: Zolkiew (1584, now Zhovkva, Ukraine) and Stanislawow (1662, now Ivano-Frankivsk, Ukraine). Three of the "economic" towns are also presented here: Glowow (1570, now Glogow Malopolski), Rawicz (1638) and Frampol (founded as late as c. 1717, although still of a purely Renaissance form).

Exporting Development Zone Planning from China to Africa: Taking JinFei Development Zone in Mauritius as a Case

Lu Zhang (Tianjin University), Tianjie Zhang (Tianjin University) and Krishna Chinasamy (Tianjin University)

The last three decades witness the establishment of over 20 Sino-African economic and trade cooperation zones, which are based on the model of China's development zones. The cooperation zones are unique areas for cross-border economic cooperation between China and African countries. They are jointly developed by both governments and large-scale enterprises mainly from China under favorable policies and conditions. Their plans and development paths are mainly formulated by Chinese planners and operators and accordingly refer to the domestic counterparts within China.

This paper selects JinFei Economic and Trade Cooperation Zone (JFET Zone) in Mauritius as a specific case. Mauritius is situated in the "golden triangle" connecting Asia, Africa and Australia. It becomes a gateway of the eastern African continent, and a crucial transportation node between Asian and African continents. Informed by its unique location, the research examines the planning and implementation of the Sino-Mauritian cooperation zone contextualized with the macro background of international economic and political collaborations, and also local micro settings. It intends to reveal the planning connection between JFET Zone and the Chinese domestic counterparts, and also the local amendments in response to indigenous conditions.

The paper examines the planning and developing pattern of China's domestic development zones. In China, the establishment of development zones can be dated back to the early 1980s. As regional growth poles, they have successfully accelerated China's urbanization. The research summarizes their development process into four stages. Currently, China's development zones are at the fourth stage, namely diversified development and transformation. Besides the obvious achievements, they inevitably have some problems at the same time, like chaotic industrial layout, space conflicts caused by rapid expansion, and environmental challenges. Although it is generally regarded as a successful Chinese experience, and is according exported overseas, including African countries.

Subsequently, the study focuses on JFET Zone, and explores its multiple motivations, detailed planning concepts and implementation process. It examines the spatial layout and industry configuration of JFET Zone, contextualized within Sino-African trade and international investment situations. Besides the opportunities and achievements, the study also discusses the difficulties and challenges. Mauritius owns a small land area, small population, and limited domestic market. Shortage of natural and human resources, a Mauritius' political and economic environment differs greatly from China. The paper uncovers the main problems and difficulties for building JFET Zone. In addition to the opinions from Chinese actors, the study further investigates the perceptions from the local government and society about JFET Zone via interviews or internet open data. It intends to present a panorama of JFET Zone based the response from both African and Chinese actors. The paper tries to evaluate the transnational exporting of Development Zone Planning from China to Mauritius and bring forward some suggestions for its sustainable localization and development.

FRENCH INFLUENCES ON BELGRADE URBAN DEVELOPMENT

Milena Vukmirovic (University of Belgrade - Faculty of Forestry) and Corinne Jaquand (ENSAPB Ecole nationale supérieure d'architecture de Paris-Belleville)

In its development, cities always looked at each other, competed and grew. However, special attention has been drawn to those most developed and they were considered to be the role models. Such parallels can also be made between Paris and Belgrade, i.e. France and Serbia. In an effort to build itself according to European standards, Serbia has looked at developed European countries, while its capital city has been urbanized and built following the example of the most developed European cities and towns. During the 1867 the City of Belgrade has adopted its first urban plan done by Emilijan Josimovic. The same year the state was officially released from the centuries-long Ottoman rule, while the second half of the 19th century in the national history is characterized by Europeanization. This period is also characterised by the cooperation with French engineers and experts in the field of infrastructure and investments. Over the course of 150 years, Paris and Belgrade have been developing in accordance with their own capabilities, historical circumstances and at each pace. However, during all these years, the influences of some Frenchmen and the city building based on the French capital city as the role model can be identified in the built tissue of Belgrade. In regards with the mentioned, this paper will present the research results of chronological mapping of the French influences on Belgrade's urban development and their kinds, the particular exchanges between Paris and Belgrade and the intensity of collaboration between two cities/countries.

A Historical Review of Foreign Ideology in Planning Practice in Vietnam

Đinh Thế Anh (Southeast University), Li Baihao (Southeast University) and Ren Xiaogeng (Southeast University)

Within 2,000 years, Vietnam was ruled by China for more than 1,000 years, was colonized by France for almost 100 years, and was divided into pro-American and pro-Soviet Union camps for more than 20 years during the world's cold war. It can be stated that Vietnam's political, social, cultural and other aspects contain deep foreign trails, the same as urban planning. Urban planning in Vietnam consists of a technical and political process. Its evolutionary phases have been highly affected by foreign influences. First of all, it drew on ancient Chinese social and natural philosophies, including planning for maintaining national political and adapting to the universe and nature; Secondly, it accepted the science and technology of France from the 19th to the 20th century, including the Vauban fortress, port-city planning, municipal engineering and management, urban expansion and remediation planning; Thirdly, in the wave of socialism in the second half of the 20th century, Vietnam had learned from the Soviet Union about planning for Industrial cities and industrial zones, planning for towns and villages network and residential units in centrally planned period; Finally, in the second half of the 20th century, in the territory south of the 17th latitude line, it imitated the US market economy concept and introduced theories such as the new city planning, the regional planning and organic growth theory. To summarize it, these thoughts and practices are not only valuable experiences and lessons for Vietnam but also serve as basis to answer questions about "local theory", "national identity" and "regional features" when facing globalization and considering the path of national modernization.

The article reviews some foreign thoughts, their practices and their influences that appeared in the history of Vietnam. With limited historical data and imperfect research foundations, these papers aim to reconstruct a clue about planning characters and planning events. Based on the source of thoughts, this article summarizes the perceived historical information and divides it into four parts: China, France, the Soviet Union and the United States, presenting in chapters while focusing on an important feature of urban planning in Vietnam, which is the superposition of multiple dimensions of urban and rural concepts, construction techniques and concept technology of different cultures in the same physical space dimension. In the conclusion, the article will analyze this feature, explains how it has been formed and what kind of influence and effect it has had on urban planning since 1986 Đổi Mới.

Reception of *Città Ideale*. Italian Renaissance cultural impact upon town planning in Poland

Maciej Motak

* Maciej Motak, PhD, DSc, Faculty of Architecture, Cracow University of Technology, mmotak@pk.edu.pl

The concept of the Ideal City, as developed in Italy during the 15th and 16th centuries, has produced a significant number of treatises with texts and drawings, which, largely speaking, are theoretical rather than applied. Although new Renaissance towns were quite a rare phenomenon both in Italy and in other countries, a number of such towns were constructed in the Polish-Lithuanian Commonwealth. Two types of new towns were built according to their basic functions: the town-and-residence compounds were prestigious family seats combined with adjacent towns, while the “economic” towns were local trading centres. The fashionable ideas and forms of the *Città Ideale* were adopted by those towns’ founders and planners. Selected examples of Polish Renaissance towns are discussed in this paper. Apart from Zamosc (1578, designed by Bernardo Morando and often considered the most perfect Ideal City, and not only in Poland), other slightly less ideal though equally interesting town-and-residence compounds are also described: Zolkiew (1584, now Zhovkva, Ukraine) and Stanislawow (1662, now Ivano-Frankivsk, Ukraine). Three of the “economic” towns are also presented here: Glowow (1570, now Glogow Malopolski), Rawicz (1638) and Frampol (founded as late as c. 1717, although still of a purely Renaissance form).

Keywords: ideal cities, Renaissance planning, Polish town planning, urban composition, cross-cultural exchange

Introduction

The well-established term Ideal City is primarily associated with the Renaissance¹, principally the Italian Renaissance since it was developed in the 15th and 16th centuries mostly in Italy (and to a lesser degree in France and Germany²). Most Ideal City concepts were drawn up, described, and published in architectural and urban treatises by Italian authors, theoreticians, and practitioners of architecture and planning. They include Leon Battista Alberti (c. 1452), Filarete (c. 1464), Francesco di Giorgio Martini (c. 1476), Leonardo da Vinci (c. 1490), Sebastiano Serlio (from 1537), Pietro Cataneo (1554, 1567), Andrea Palladio (1570), Giorgio Vasari the Younger (1598), Vincenzo Scamozzi (1615), and many others. In time, their various concepts took on the generic name of “Ideal City”, which was first used by Vasari³. While their views may have differed, there were still enough features common to their towns for them to be subsumed under this term. It should also be said that they tended to express their ideas more eloquently in their drawings than in their words.

The theory lying behind the construction of ideal cities derived largely from the humanistic ideas of the Renaissance, as expressed in the art and architecture of the period. The c. 1414 re-discovery of the treatise *De Architectura Libri Decem*, written c. 20 BCE by Marcus Vitruvius Polio, is regarded as one of its direct triggers. (It was also translated into several languages, including Italian, Spanish and French in the 16th century). Vitruvius’s works, especially Book I (Chapters 4-7), contained suggestions for the location, planning and construction of towns, and those searching for an ideal city formula attempted to apply his guidelines and also to reconstruct his missing drawings. As time went on, they also wished to master the theory behind them. However, despite general admiration for his views, there were also some who expressed cautious criticism towards them⁴.

The aim was to create a town-planning formula which would meet the residents’ needs in a full and complex way, especially with regards to their health and comfortable living standards. The towns had to possess a perfect composition, and also provide appropriate protection against external attack. Theoretical considerations produced three basic types of highly regular town plans: orthogonal (gridiron), radial, and “mixed” (combining the features of both). The characteristics of ideal town planning required the insertion of a town plan into a regular polygon; using a particular measurement module, this meant the introduction of a great number of squares and plazas; the application of axial connections and other compositional interactions; and the influence of fortification geometry on the town plan. An attempt at a holistic approach to the process of town building may also be noted, as well as a tendency towards an orderly, harmonious, balanced, symmetrical, closed and complete composition, characteristic of Renaissance art and architecture .

The practical results of this theory were limited and not immediate. Town planning was only at the beginning of its separation from the discipline of architecture⁵. The scale of physical changes to Italian cities was relatively

small, especially in the 15th century⁶. Even when they increased during the next century, it mostly took the form of re-modelling existing towns and modernising their fortification systems⁷. New towns in the already quite urbanised Italian states were rare. However, from a wider perspective, the claim that the “two centuries between 1500 and 1700 in Europe are not primarily noteworthy for new towns”⁸, is not entirely borne out vis-à-vis Poland.

Reception of Renaissance in Polish town planning

The period of the most intense search for the formula of an ideal city lasted from the end of the first half of the 15th century (Alberti) till the beginning of the 17th century (Scamozzi). This was also the time when a new formula for Polish statehood appeared. In 1386, the Kingdom of Poland, reunited after its earlier division into five duchies, was nominally united with the Grand Duchy of Lithuania, which lay to the north-east. Two centuries later, in 1569 this actually became a reality, when the two states combined to form a Commonwealth of Two Nations. The 16th century is often referred to as Poland’s Golden Age, especially with reference to its cultural and artistic life⁹. It was a state of substantial political importance in Europe. It had a successful feudal economy; it enjoyed a high level of religious freedom; and it had an idiosyncratic ‘democratic’ system, whereby representatives of the nobility (*szlachta*), sitting in a two-chamber parliament, shared power with the monarch¹⁰. Unfortunately, this favourable period in Polish and Lithuanian history came to an end during the devastating wars waged continuously in East-Central Europe between 1648 and 1673.

At the start of the 17th century, the importance and influence of the aristocracy in the Commonwealth noticeably increased. Despite its low number (several dozen rich families as opposed to several dozen thousand *szlachta* families, and a population of c. 10 million), it became the most powerful and influential social group and dominated all the other social classes: peasants, burghers, the remaining nobles, even the King himself. These aristocratic families were responsible for the creation of a number of new towns in the late 16th century and in the 17th century.

Renaissance as an architectural style emerged in Poland at the beginning of the 16th century, after being imported into court circles, largely from Florence. Knowledge about Renaissance ideas and features penetrated into Poland via books (including treatises on architecture), travel, academic studies made abroad, for example in Padua, dynastic marriages (King Sigismund I married Bona Sforza in 1518¹¹), and other sources. It may be interesting to note that the first fully regular post service started in 1558 between Krakow and Venice, after less regular services began c. 1519).

The first work of Renaissance architecture, the arcade over the contemporary late Gothic tomb in Wawel Cathedral in Krakow, then the capital, dates back to 1502. In the same year began the complex re-modelling of the Royal Castle, which was designed and overseen by Francesco Fiorentino. And 1517 saw the construction of the magnificent mausoleum in the Cathedral by Bartolomeo Berrecci, referred to as the “best example of Renaissance architecture on this side of the Alps”¹². Over the next decades, the Renaissance style became very popular with the aristocracy, nobility, and burgher and clerical circles in many towns and cities of Poland and Lithuania.

As regards town planning, the increasing domination of aristocracy at this time was reflected in the foundation of their own private towns. Until the 15th century towns had been founded by royal decree. Although generally more numerous than Renaissance projects in Italian states, new Polish urban foundations were also quite limited in certain regions because of the existence of many medieval towns, with either regular or irregular plans. Thus new towns were established in the south and east of Poland, where, with a settlement network not yet dense enough, conditions were favourable for further urbanization. Additionally, the largest aristocratic agriculture-oriented *latifundia* were to be found in this region, some of which were even equipped with their own private armies and judicial system. Between 1570 and 1670 (with one significant later exception), they built a number of new private towns, some of which reveal the impact of the ideal city theory. From the urban point of view, two major groups of new foundations may be distinguished.

The town-and-residence compounds and the “economic” towns

The Renaissance towns in the Commonwealth, most of which were founded from scratch (*in cruda radice*), fall into two basic groups according to their principal functions: town-and-residence compounds and “economic” towns. The former, founded by wealthy aristocratic families, contained an impressive residence with an adjacent town, both protected by a fortification system. However, being the works of a specific functional system and original urban form, they were relatively rare. Their founders were rich, ambitious, highly educated representatives of their social class, and their new private towns were intended, apart from other functions, to

serve as a visible sign of the importance and prestige of their families. The fashionable ideas and forms of the *Città Ideale*, which were already known to Italian urban planners, proved to be a fruitful source for them to mime. In addition to these relatively large towns, which were family seats, landowners also needed a considerable number of smaller (in terms of population rather than size) towns whose function, purely economic, was to organise trading and crafts across their vast *latifundia*. Dozens of these were established, some of which received extremely regular and well-composed plans. Some of the “economic” towns had much simpler plans and tended to be established by less wealthy noble families as part of the economic organisation of the surrounding farmlands, since the export of grain was the base of Poland’s economy at the time.

Some of the new towns, of both types, were granted plans of a Renaissance character. They followed theoretical proposals to a various degree and in some cases also featured traditional elements, typical of Medieval town planning¹³. Below are discussed six Renaissance cases: three town-and-residence compounds and three “economic” towns. Each description starts with the town’s origin and its urban form and ends with its relation to Italian Renaissance town planning. In the first group are Zamosc, Zolkiew, Stanislawow, and in the latter Glowow, Rawicz, Frampol (original names).

Town-and-residence compounds were complex structures and consisted usually of three main components: the owner’s residence (palace or castle), the town proper, a ring of fortifications¹⁴. These elements can be spatially connected in different ways, thereby defining their composition. Four subgroups may be identified and distinguished (Figure 1), each featuring a clear compositional axis which linked the palace to the city proper, the latter constructed on a regular gridiron plan, centred on a market square: simple link; compositional link (e.g. Zolkiew); closed compositional link (e.g. Zamosc and Stanislawow); free link¹⁵. Renaissance features can be seen in compounds as a whole and/or in their particular components.

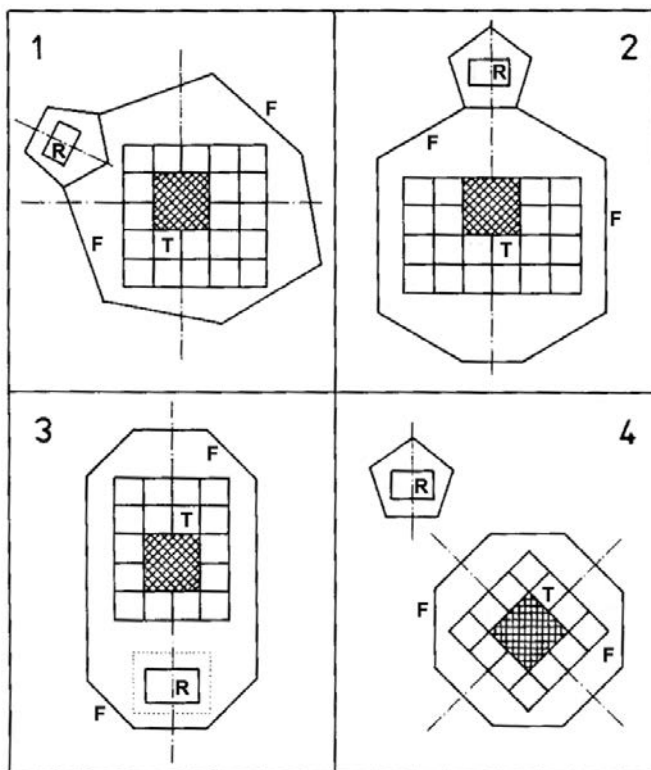

Figure 1. Schemes of the four basic types of Renaissance town-and-residence compounds: simple link (1), compositional link (2), closed compositional link (3) and free link (4). R – residence, T – town, F – fortifications. The market square area is hatched. Evaluation by Mieczysław Książek, drawing by Maciej Motak.

In the “economic” towns, there was no residence and in most of them there were no fortifications either. Due to the simplicity of most plans, their subgrouping is based on the proportion of “modern” Renaissance features versus traditional Medieval ones, rather than on the shapes of the plan. The cases under discussion date back to different years, and even centuries: Glowow was founded in the 16th century, Rawicz in the 17th and Frampol – only in the 18th, although the impact of the Renaissance impact may be noted in all three.

All six cases are illustrated with the plans of the towns as built by the 17th or 18th century (Figure 2).

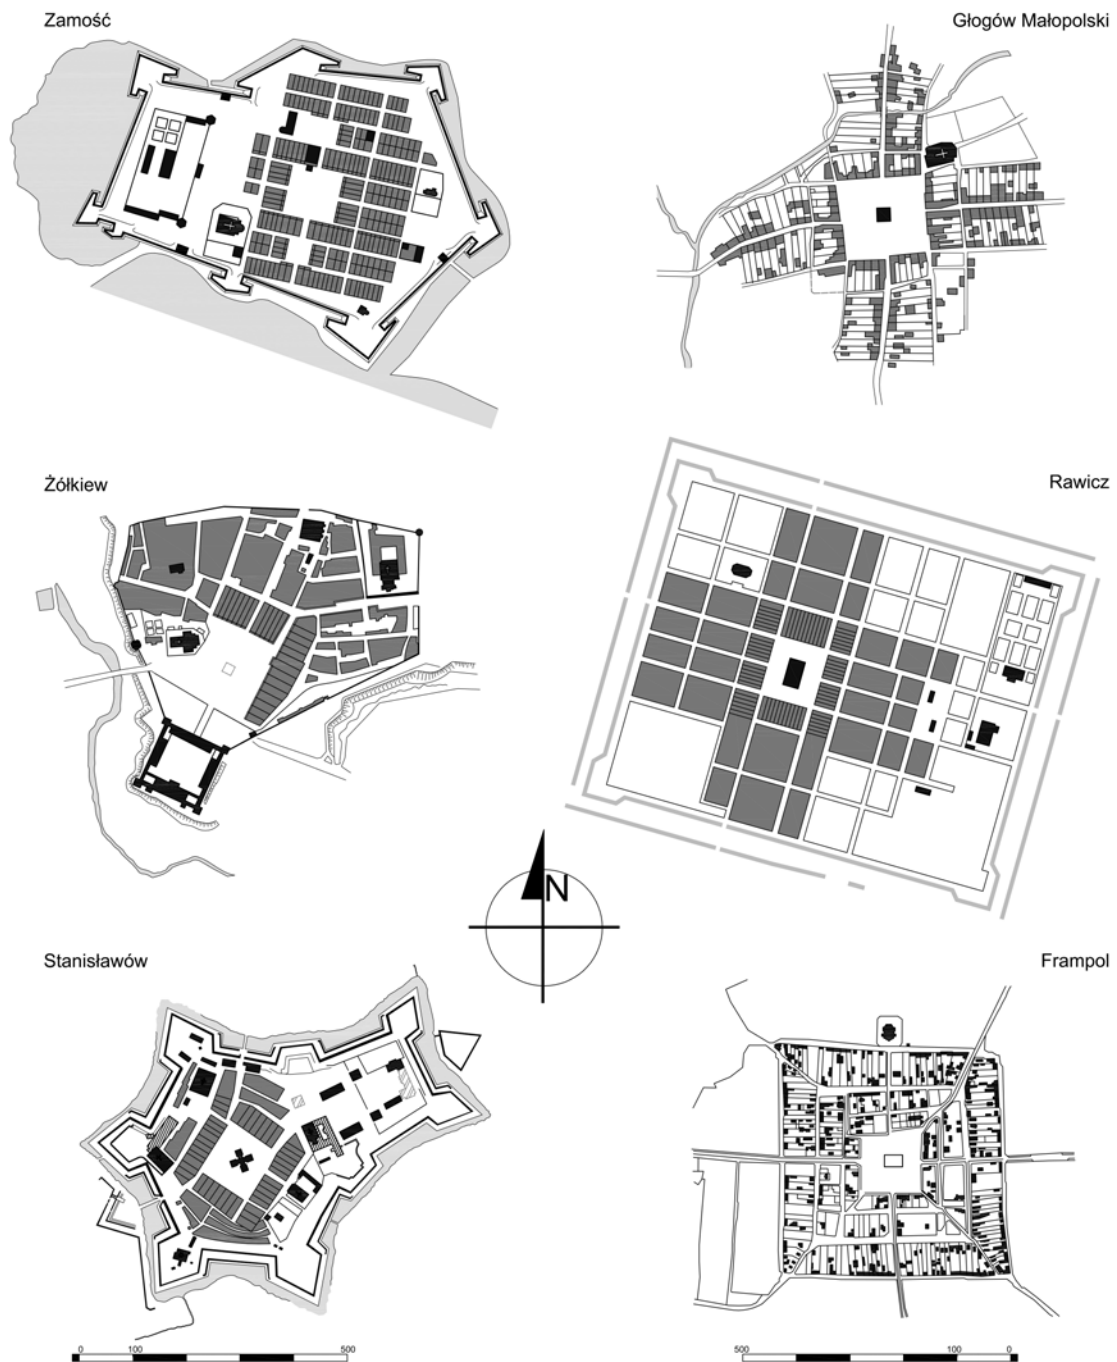

Figure 2. The schemes of the built plans of residence-and-town compounds (on the left, top to bottom: Zamosc, Zolkiew, Stanislawow) and of “economic” towns (on the right, top to bottom: Glowow, Rawicz, Frampol), as of the 18th century. Public buildings are shown in black while residential blocks – in dark grey (except for Frampol for its specific structure). Based on the and own research and the compilation of plans and maps. Evaluation by Maciej Motak, drawing by Maciej Kapolka.

Zamosc

This was one of the earliest and most perfectly planned Renaissance urban projects. The town was chartered in 1580 by Jan Zamoyski (1542-1605), Chancellor of State and Commander-in-Chief of the Army. The town proper was placed near the residence. The residence area contained the palace, back-buildings, gardens and

armory. Both the town proper and the residence were enclosed within a ring of modern bastion fortifications according to the New Italian System. The town proper was laid out within the square plan (c. 360 by 360 m) in accordance with a regular, modular orthogonal network, with the market square at its centre (also square, 100 by 100 m). Two compositional axes crossed in the very centre of the market square: the latitudinal, very gently bent, linked the market square with the residence (whose gate tower closed the vista of the street leading to it), while the longitudinal linked the ceremonial market square with two smaller, ancillary squares of everyday commercial use. The crossing point of the two axes – the town's focal point – was neither emphasised nor even marked in any way, although its presence was indisputably felt. An important feature of Zamosc is its three-dimensional composition. The centre of the town is marked by the town hall tower which stands out slightly from the northern frontage of the market square, around which there are numerous (c. 280 – by 1605) two- or three-storey burgher houses, which are in turn surrounded by large volumes of public edifices – the Academy and the temples of several faiths. The Collegiate Church, the Zamoyski palace, and the Academy (only the third in the Commonwealth) symbolise the three powers: Soul, Politics, and Science.

Figure 3. 1930s view of the Zamosc town hall as seen from under the arcades of the market square. The photograph by Adam Lenkiewicz c. 1938.

The Zamosc plan partly resembles a theoretical plan of Pietro Cataneo (1567), in which town and fortress were to be linked by the compositional axis, with the ancillary squares complementing the main square. The impact of Italian town planning theory on Zamosc is also revealed in the use of regular polygons. The quadrangle of the town proper plan was carefully placed within the pentagon of the fortifications plan, which was extended westwards to embrace the residence. The continuous arcaded passages around the market square and along other streets are another sign of Italian influence. Last but not the least, one should note the personal connection. Zamosc was designed by the architect Bernardo Morando (c. 1540-1600), who came to Poland from Padua (Padova). Jan Zamoyski probably met him while studying in Padua and in 1578 commissioned from him a project for his family seat¹⁶. Morando lived and worked in Zamosc until the end of his life and he was responsible for numerous architectural projects there: the Zamoyski palace complex, the town hall (Figure 3), the Collegiate Church, the Academy, the fortifications, and burgher townhouses including his own. After his death, local masters followed his style (Greek Catholic Church, Synagogue etc.).

Zolkiew (now: Zhovkva, Ukraine)

Owing to Zamosc's pioneering character, its large scale, and the superior quality of its town plan and architecture, it became a model to be emulated by other urban compounds with a similar functional-spatial structure. An early example is the town of Zolkiew, founded in 1594 (officially chartered in 1603) by Jan Zamoyski's closest collaborator, namely Vice-Chancellor and Deputy Commander-in-Chief, Stanislaw Zolkiewski (1547-1620). Zolkiew is of similar size, though less regular than Zamosc and was formed by three components: the Zolkiewski castle, the town proper, and a ring of somewhat obsolete walls. The compositional axis linked the castle with the market square (in the middle of which originally stood the town hall), via the high street, which led to the town gate, next to which was the synagogue. This regular, composed strip of town building was adjoined by less regular districts on the eastern and western sides, as there were already small settlements there, whose presence the founder decided to respect.

The relation of Zolkiew to the Italian Renaissance is weaker than that of Zamosc and seems to be of a more indirect character – through borrowings acquired via Zamosc. The axial composition and arcaded passages along two frontages of the market square show a definite influence, and also of note are certain symbolic connotations. The places of worship might originally have been located in accordance with a determined topographical order, and the four city gates led to the four corners of the world. Although authorship of the Zolkiew town plan remains uncertain, it now seems quite likely that he was an Italian architect working in Lviv, Paolo Il Felice¹⁷.

Stanislawow (now: Ivano-Frankivsk, Ukraine)

Stanislawow is a relatively late example of a town-and-residence compound. It was founded in 1662 by the *chorazy* (Flag-Bearer) Andrzej Potocki (c. 1630-1691), who was later to become an influential statesman. The compound consisted of three originally composed elements: the Potocki family residence (never finished), the town proper (its simple plan rotated by 45 degrees in relation to the town-residence axis) and the exceptionally regular ring of bastion fortifications of the Dutch system – hexagonal, although elongated in order to embrace the residence, and further equipped with two ravelins. The 45-degree rotation was repeated in the cross plan of the town hall, which was built in the centre of the market square, its tower symbolising the municipality and its four wings offering retail spaces. Like Zamosc, Stanislawow was one of more important fortresses in the Commonwealth.

Figure 4. Hypothetical hexagonal plan of Stanislawow c. 1670 and its further north-east elongating extension. The scale is marked in so-called short rods (above) and metres (below). Evaluation and drawing by Maciej Motak.

In Stanislawow, as in Zolkiew, one notes significant, although probably indirect, borrowings from Renaissance town planning but also, unlike Zolkiew, some over-formation characteristic at the transition period from Renaissance to Baroque urban art. Three-dimensionally, the skyline of Stanislawow is close to that of Zamosc. The residence in its planned shape was already close to the Baroque plan. The same could be noted of the

elongation of the entire compound plan. However, in its first phase Stanislawow may have received a perfectly hexagonal plan¹⁸, which was elongated after several years to include the planned palace into a ring of fortifications (Figure 4). The symbolic order of the location of the places of worship turned out to be more permanent than in Zolkiew¹⁹. The simplified plan of the town and the sophisticated plan of the fortifications seem to support the speculation that the fortification planner, Francesco Corassini of Avignon, was responsible for the whole compound²⁰.

Glowow (now: Glogow Malopolski)

The very first Polish town to receive a Renaissance form was Glowow, which was founded in 1570 in eastern Malopolska in the south of Poland. Its founder was a modest nobleman, Krzysztof Glowa (-1582), Castellan of Polaniec and also Royal Secretary, perhaps a man of more far-reaching ambition than this post would imply²¹. The town functions were mainly commerce and agriculture. The town plan was very regular, based on the square of the whole town (c. 500 by 500 m) and nearly the square of the centrally located market square (160 by 150 m), both crossed symmetrically by two compositional axes leading along streets from the market square into the four corners of the world. The town hall was built in the centre of the large market square, its volume closing the views from all four streets leading to the market square. Four ancillary squares were laid out at each corner of the market square, which were intended to be built up with public buildings (only the Parish Church was built at this time). Lots for 120 burghers' houses were laid out along the market square frontages and the four main streets.

The Glowow plan resembles to some extent certain plans by Pietro Cataneo (1554) but these did not feature a building in the market square. Closing a street with a view of a building in the square appeared in the works of Baldassare Perruzzi and Sebastiano Serlio. Ancillary squares were also typical of many Renaissance concepts. In addition, the strong emphasis of the cross composition of the two main arteries refers to the fundamental scheme of ancient Roman town planning favoured by Renaissance Italian town planners. There is some dispute as to the unsolved attribution of the Glowow plan, although it gently favours an Italian personal connection²². There is also an hypothesis that the original plan of Glowow could have been be of a radial type, but there is no convincing proof of this²³.

Rawicz

Rawicz was founded in 1638 by a local influential noble, Adam Olbracht Przyjemski (1590-1644) as town for craftsmen, in Wielkopolska, in western Poland. The town plan was enclosed within a slightly elongated rectangle, its dimensions c. 780 by 660 m. It is an orthogonal plan, with a very regular street network and an almost centrally located rectangular market square (100 by 120 m). There are three streets along each longer frontage and two streets along each shorter frontage, the elongation of the town hall plan corresponding to the elongation of the market square. The corner areas of the town were initially left unbuilt, with the intention that they be built up later. Another, smaller, square was laid out in the east of the town. Quite rarely for "economic" towns, simple fortifications were built soon around Rawicz, which developed quickly and successfully, reaching over 300 houses in the late 17th century.

In the case of Rawicz, it is quite difficult to point to direct Italian patterns. The town was probably planned by Michael Flandrin, of Flemish origin, a military engineer from Wroclaw. The founder himself had studied in Bavaria. A certain similarity of the Rawicz plan to the French town of Richelieu (1638) and presence of the French-refugee town of Erlangen, near Nuremberg in Bavaria (1684) has been noted²⁴. If correct, that would mean either a very quick transfer of the original source, or rather a reference to the later re-planning of the town. The town plan bears also a similarity to the towns laid out in accordance with the Laws of the Indies in Spanish colonies²⁵. It can be seen, apart from the regularity and scale, in the proportions of the market square. All in all, the original plan of Rawicz seems to have a lot in common with ideal city patterns, though they were probably transferred via non-Italian channels.

Frampol

Frampol was constructed in the Lublin region – the centre of Poland at the time and now eastern Poland. It was founded in 1717, or slightly later, by Marek Antoni Butler, a modest local noble. It is therefore a very late work of the Renaissance period to which it belongs stylistically and could perhaps be seen as a post-Renaissance town. It is the only Polish example of a Renaissance town whose plan is not entirely orthogonal – a so-called mixed plan, combining features of gridiron and radial plans. It uses the square-shape plan (500 by 500 m). As many as eight streets leave the centrally located market square (with the town hall built originally in the very centre) – four perpendicular from the mid-frontages and four diagonal from the corners. Three strips of buildings surround

the market square, although the innermost one was probably added in the 19th century, diminishing the oversized surface of the market square from 225 x 225 m to 140 x 140 m. The characteristic element of the most external belt of buildings, inhabited by farmers, are their private “town barns” along the town limits, beyond which there were individual narrow farmlands (Figure 5).

Figure 5. The barns lining the most external streets and town limits of Frampol. The photograph by Maciej Motak, 1994.

In Frampol there is a striking similarity to one of the most precise and mature concept projects of the ideal city, i.e., by Giorgio Vasari the Younger (1598)²⁶. Eight axes crossing one another at the very centre of both the plan and the market square with its town hall as well as the disposition of ancillary squares are definitely Vasari-like features. The town Vasari drew and described was, however, octagonal and fortified. The transfer of that pattern and the name of the author of the Frampol plan unfortunately remain unknown.

Conclusion

One must begin the conclusion with the fact that there were more towns with Renaissance features in the territories of the former Commonwealth than the six presented above. Other examples of town-and-residence compounds are Brody (1584, with the 1630s fortifications by Andrea dell’Aqua), Szarogrod Podolski (1585), Wisnicz Nowy (1616); of the “economic” towns – Oleszyce (1576), Tomaszow Lubelski (1590), an extension of Grodzisk Wielkopolski (1593).

The six towns briefly discussed above still bear – to a varied extent – the features they were bestowed with when they were founded and laid out. Since most of them have since grown in size, the Renaissance compounds discussed here now form the centres of towns of various sizes, although they have retained their original composition. This is most noticeable in the heart of each town, its market square (Figure 6). The original regular plan has helped keep the same spatial order. In addition, all six towns, both in Poland and Ukraine, enjoy a good reputation for the preservation of their urban and architectural heritage, with numerous listed buildings. The town that stands out particularly is Zamosc, a splendid example of an ideal city, recognised since 1992 as the World Heritage Site.

The cultural impact of the Italian Renaissance upon town planning in Poland has been expressed in a number of ways and has left traceable marks. In all the discussed cases there is a direct and/or indirect following of theoretical plans, as well as particular features generally present in ideal city concepts, such as regularity, symmetry, balance, and the more specific ones like the primary straight street, gridiron and enclosed space²⁷. The compositional axis, or axes, has played an important role in all cases. The main, regular, centrally located market square was usually accompanied by ancillary squares (two in Zamosc, four in Glowow, one in Rawicz, four in Frampol). The town hall was deliberately located in the middle of the market square (five cases) or in its frontage (Zamosc). In some cases (Zamosc, Stanislawow) there is a conscious three-dimensional care shown for the town skyline and volume, which goes well beyond the typical, two-dimensional planning concept. Some of the authors of the projects were Italian architects (in Zamosc, Zolkiew, perhaps Glowow) and all the authors showed a good understanding of the concept of ideal city, which they shared with those who commissioned them

– the town founders. In addition to this, Italian Renaissance influence on Polish town-planning may be noted in other fields, such as fortifications (especially of Zamosc), and in the general attention shown to harmonious and balanced urban composition.

The non-Italian influence (French, German) upon Polish Renaissance town planning cannot be missed or omitted. Moreover, some of the local Polish masters (builders, surveyors) learnt quickly from external sources and successfully implemented the principles of the new style. However, it was the Italian Renaissance that was mostly responsible for introducing the Renaissance town planning into Poland and, to a large extent, for its further development and substantial achievements. Combined with the necessary adjustments to local topography, as well as individual conditions and requirements, it resulted in a number of noteworthy Renaissance-built new towns.

Within these deliberations on cross-cultural impact, one might also recall its 20th-century obverse. The 1598 book by Giorgio Vasari the Younger was actually found, translated and edited by a Polish historian, Teresa Zarebska, in 1962.

Within 2,000 years, Vietnam was ruled by China for more than 1,000 years, was colonized by France for almost 100 years, and was divided into pro-American and pro-Soviet Union camps for more than 20 years during the world's cold war. It can be stated that Vietnam's political, social, cultural and other aspects contain deep foreign trails, the same as urban planning. The article reviews some foreign thoughts, their practices and their influences that appeared in the history of Vietnam. With limited historical data and imperfect research foundations, these papers aim to reconstruct a clue about planning characters and planning events. Based on the source of thoughts, this article summarizes the perceived historical information and divides it into four parts: China, France, the Soviet Union and the United States, presenting in chapters while focusing on an important feature of urban planning in Vietnam, which is the superposition of multiple dimensions of urban and rural concepts, construction techniques and concept technology of different cultures in the same physical space dimension. In the conclusion, the article will analyze this feature, explains how it has been formed and what kind of influence and effect it has had on urban planning since 1986 Đổi Mới.

Keywords: Planning history of Vietnam, Planning history of French colonial, Modern history in Southeast Asia cities, Modern Vietnam

1 Introduction

Vietnam is a country that has experienced many political changes during its own development. Most of these changes are related to foreign countries, as Vietnam was ruled, colonized, received a military or technical assistance, etc. Within 2,000 years, Vietnam was ruled by China for more than 1,000 years, was colonized by France for almost 100 years, and also was divided into pro-American and pro-Soviet Union camps for more than 20 years during the world's cold war.¹ It can be stated that Vietnam's political, social, cultural and other aspects contain deep foreign trails, the same as urban planning.

Urban planning in Vietnam consists of a technical and political process. Its evolutionary phases have been highly affected by foreign influences. First of all, it drew on ancient Chinese social and natural philosophies, including planning for maintaining national political and adapting to the universe and nature; Secondly, it accepted the science and technology of France from the 19th to the 20th century, including the Vauban fortress, port-city planning, municipal engineering and management, urban expansion and remediation planning; Thirdly, in the wave of socialism in the second half of the 20th century, Vietnam had learned from the Soviet Union about planning for industrial cities and industrial zones, planning for towns and villages network and residential units in centrally planned period; Finally, in the second half of the 20th century, in the territory south of the 17th latitude line, it imitated the US market economy concept and introduced theories such as the new city planning, the regional planning and organic growth theory. To summarize it, these thoughts and practices are not only valuable experiences and lessons for Vietnam but also serve as basis to answer questions about "local theory", "national identity" and "regional features" when facing globalization and considering the path of national modernization.

Therefore, the article reviews some foreign thoughts, their practices and their influences that appeared in the history of Vietnam. The research object is divided into two main parts: (1) foreign planners implement planning and construction on Vietnam's territory; (2) Vietnamese use foreign thoughts to explore and plan. With limited historical data and imperfect research foundations, these papers aim to reconstruct a clue about planning characters and planning events. Based on the source of thoughts, this article summarizes the perceived historical information and divides it into four parts: China, France, the Soviet Union and the United States, presenting in chapters while focusing on an important feature of urban planning in Vietnam, which is the superposition of multiple dimensions of urban and rural concepts, construction techniques and concept technology of different cultures in the same physical space dimension. In the conclusion, the article will analyze this feature, explains how it has been formed and what kind of influence and effect it has had on urban planning since 1986 Đổi Mới.

2 China

The ancient Chinese planning was not a pure plan or construction technique, its knowledge system spread over various aspects of the country's executive rule and management functions.² However, it cannot be said that it only belongs to the field of political management, and it also includes the ancient Chinese people's understanding of the universe and their understanding of the geographical environment in which they live.³ Of course, a short exposition cannot make it easy for us to understand this dispersive and extensive knowledge system, however, if we choose important content, it is mainly manifested in two aspects: one is planning for maintaining national politics; the other is planning for adapting to the universe and nature. Since Emperor Qin Shihuang unified China, the concept of these two aspects has profoundly affected the planning and construction practices in Vietnam with the ten-century rule.

2.1 Planning for maintaining national political

In the history of being ruled by China, Vietnam had constructed basically unchanged local political system - the system of prefectures. It is a system implemented throughout the country by QinShiHuang after the unification of the six nations and has continued throughout the feudal era. We can understand this simply: divide the country's territory into a number of "counties" with a radius of 2500km²(方圓百里;千里百縣), then combine more than 20 counties into a prefecture and establish a magistrate of prefecture, and the country's ruling system is built on all counties.⁴ We will further understand the operating mechanism of the prefecture: it will be a national territory covered by approximately 50,000 km²; The ruler builds a shire ruling city (local administrative center) at its most convenient point of transportation; The prefectures government will be about 100 kilometers away from the prefectures where it is located.⁵ In this way, when there is a riot, a thief or a disaster in any part of the prefectures, the intelligence will arrive in the hands of the ruler day and night, and the ruler can completely arrange military or administrative work to arrive in the local within 3 days. It should be emphasized that an operability of this system is very flexible, and a size and number of prefectures and counties are variable. The location arrangement of the prefecture city and the county city are also based on different geographical conditions to meet the resource supply, transportation, and military defense. However, the military system and the county system can be combined or separated. In short, as a structure of the feudal society, the prefecture-county is a plan for the preservation of national politics in terms of planning thought. In the national territory of Vietnam, the important figures for the construction and updating of the county system are the feudal rulers from the Qin, Han, and Tang dynasties, representative figures include ZhaoTuo, ShiDai and MaYuan.

ZhaoTuo of Baiyue is the first person to implement the prefectures system on the territory of Vietnam. ShiDai of the Western Han Dynasty systemized it, and MaYuan (14 BC - 49 AD) of the Eastern Han Dynasty was to further construct the system into a complete state. From 42 to 44, Ma Yuan investigated the local territory and population, adjusted administrative divisions, and built at least one prefecture city and most county cities. 《後漢書》 records the specific conditions of these tasks: "馬援奏言西於縣戶有三萬二千，遠界去庭千餘裡，請分為封溪、望海二縣，許之。援所過輒為郡縣治城郭，穿渠灌溉，以利其民" .It means that Ma Yuan has investigated 32,000 households in Xiyu County (Red River Delta Area),⁶ and the distance from the furthest boundary to the political center has exceeded the distance of more than a thousand miles (427.5 km), thus referring to the emperor that this place can be divided into two counties from the original one county (because of a large number of people, there is a demand to increase political institutions). It can be said that Ma Yuan actually formulated the vague prefecture system in Vietnam strictly in accordance with the Eastern Han standard model. Most importantly, he had done a systematic survey of the population and geography and had fully implemented the system of prefectures into a physical space.

2.2 Planning for adapting to the universe and nature

According to the above explanation, we will also find another part of planning method that parallels political planning- adaptation to nature, and its philosophy consists of three steps: First, a geographical environment survey; The second is to choose suitable habitat or political or military locations; The third is to plan living space and future development space according to laws of nature. In Vietnam, Ma Yuan in the Eastern Han Dynasty had basically completed its first step, and the remaining two steps were completed by the Tang Dynasty's military governor GaoPian (? -887) and the MingDynasty exchequer Huang Fu (1362-1440).

In 866, he was under Emperor Yizong of Tang's orders to study the geographical situation in Vietnam. He spent the last 20 years of his life and conducted a comprehensive survey of the Red River Delta region, and statistics of the 27 imperial land (帝王貴地 possible to build a political center) and 569 expensive places (血脈貴地 environment with suitable habitats) in the region are given. These surveys were recorded by later generations

in historical materials such as 《高駢安南地藁記》 (Figure 1), 《安南地理藁·高同謹撰》 (Figure 2). In the 17 years (1407-1424) of the Ming Dynasty's Huang Fu working in Vietnam, he continued his work and extended the scope of the investigation southward to the Sông Lam basin. As a minister of the Ministry of Works and the Ministry of War in feudal China, his work was recorded in detail in the Ming Dynasty historical materials such as 《安南地脉》 and 《奉使安南水程日記》. In short, Huang Ping and Huang Fu built many cities, towns and villages. In addition, he had left many references for Vietnam to build towns. Today's Hanoi is actually Gao Pian's site, and he also had formulated the initial spatial structure (political area, production area, Development Zone).

According to the 《大越史記全書》, after becoming an independent autocratic monarchy (10-19 century), the feudal rule of Vietnam took an initiative to accept and study China's planning ideology. Li Gongyun, the founding emperor of the Li Dynasty, explained these thoughts on the Transfer of the Capital.

“昔商家至盤庚五遷，周室迨成王三徙。豈三代之數君，徇於己私，妄自遷徙？.....況高王故都大羅城，宅天地區域之中，得龍蟠虎踞之勢，正南北東西之位，便江山向背之宜，其地廣而坦平，厥土高而爽塏，民居蔑昏墊之困，萬物極蕃阜之豐，遍覽越邦，斯為勝地，誠四方輻輳之要會，為萬世京師之上都” (Edict on the Transfer of the Capital).⁷

This section describes Li Gongyun's reflection on the relocation of capital by the Shang and Zhou dynasties and appreciates the ancient capital that was built. From this emperor's analysis of the situation, position, front and rear, mountains, terrain, vegetation and residential areas, it can better illustrate the ancient planning of Vietnam were deeply influenced by China.

3 France

3.1 Vauban fortress

During the Vietnam Tây Sơn civil war(1771-1802), GiaLong emperor who led the military forces of the South, in order to resist military forces of the North, entrusted the missionary Béhaine to the West to seek military assistance from Europe.⁸ Béhaine went to France in 1786 and returned to Vietnam in 1789. Due to the outbreak of the French Revolution, he failed, but he came back with military technology, including technology to build a military Vauban fortress.⁹ With the assistance of Béhaine, GiaLong emperor finished the plan of the capital of Gia Dinh in 1792. Main experts in a construction of Giadinh capital are as follows: First, Jean Baptiste Marie Dayot who was the French Navy's lieutenant, as Technical Consultant of tactics and defense; Second, Victor Olivier de Puymanel who was the director of planning and architecture, responsible for mapping and designing urban pattern; Third, Théodore Lebrun who was a French engineer, responsible for the construction and management of the project; Fouth, Trần VănHọc who was Béhaine's disciple, as the interpreter and was mainly responsible for

directing the workforce and setting up the urban roads and zoning. In addition, as the true master of the capital, the emperor put forward strict requirements on the design of feng shui and etiquette space organizations.¹⁰

In the later period of the Civil War, the Giadinh model was transplanted to various new occupation sites along with the victory of the Royal Army's advancement to the north, such as the Mỹ Tho(1792), Diên Khánh (1793), Vinh (1803) and Thanh Hóa (1804) etc (Figure 3 and 4). In 1805, the Nguyễn Dynasty unified country, the model of fortress was modeled by the state and gradually merged with the administrative divisions, eventually it evolved into a standardized city system that covered Vietnam's territory.

Fig 3: the Citadel of Diên Khánh

Fig 4: the Citadel of Vinh

3.2 Port-city planning

After the "Tianjin Treaty" (1858), in order to improve participation in the colonial movement that divides the Chinese market, on February 17, 1859, French occupied Saigon in order to meet the crossover needs of military and trade.¹¹ Taking Saigon as temporary capital, the French gradually expanded their military power and eventually annexed the territories of Vietnam, Cambodia and Laos (Historically known as French Indochina) in 1897. In the construction strategy of the Vietnam region, they set up these coastal cities as French colonial cities, including Saigon, Quy Nhon, Nha Trang, Da Nang, Hai Phong, Hanoi, etc. In this context, with the construction of a free trade port, Port-city planning technology was transplanted to Vietnam.

Taking Saigon as an example, on February 22, 1860, the governor Le Page initiated the construction of Saigon Port during the emergency period, proposing the construction of urgent projects as soon as possible, taking into account the future development of the city. He arranged the engineer's captain D'Ariès to make a plan which is "plan for new buildings" (Figure 5).¹² With the victory of the war and the thriving trade of Saigon port, Napoleon III and captains of the navy, Charner and Bonard, announced that they would permanently rule the territory of Cochinchine, delineate the "urban area" of Saigon and build it into "French's Singapore". They invited military engineer Paul Coffyn to plan and design for the city. On April 30, 1862, he proposed a plan called "Saigon 500,000 Civil Engineering Projects" (Figure 6).¹³

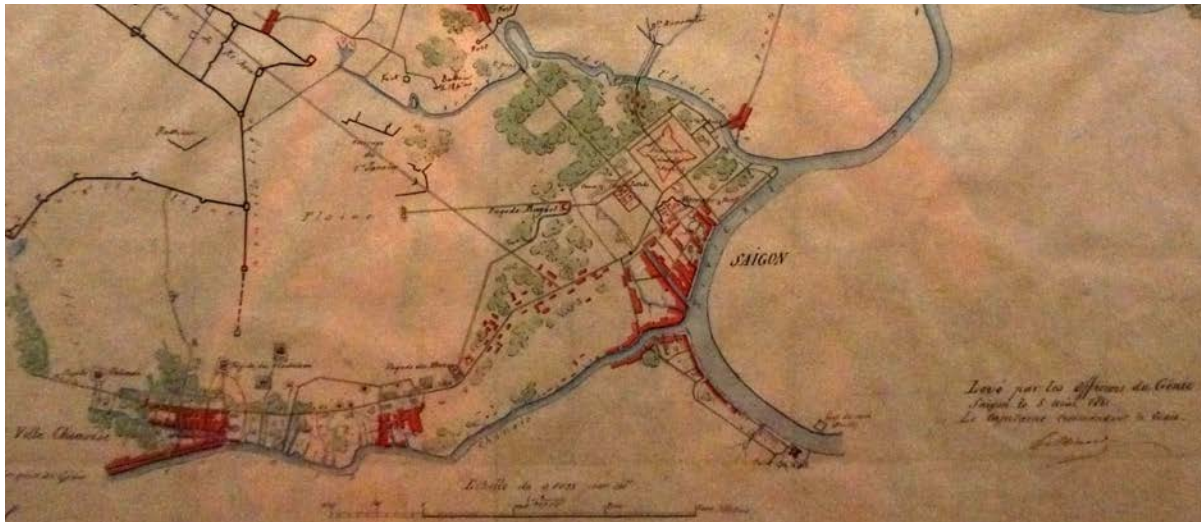

Fig 5: The construction of Saigon in 1861 under the war environment

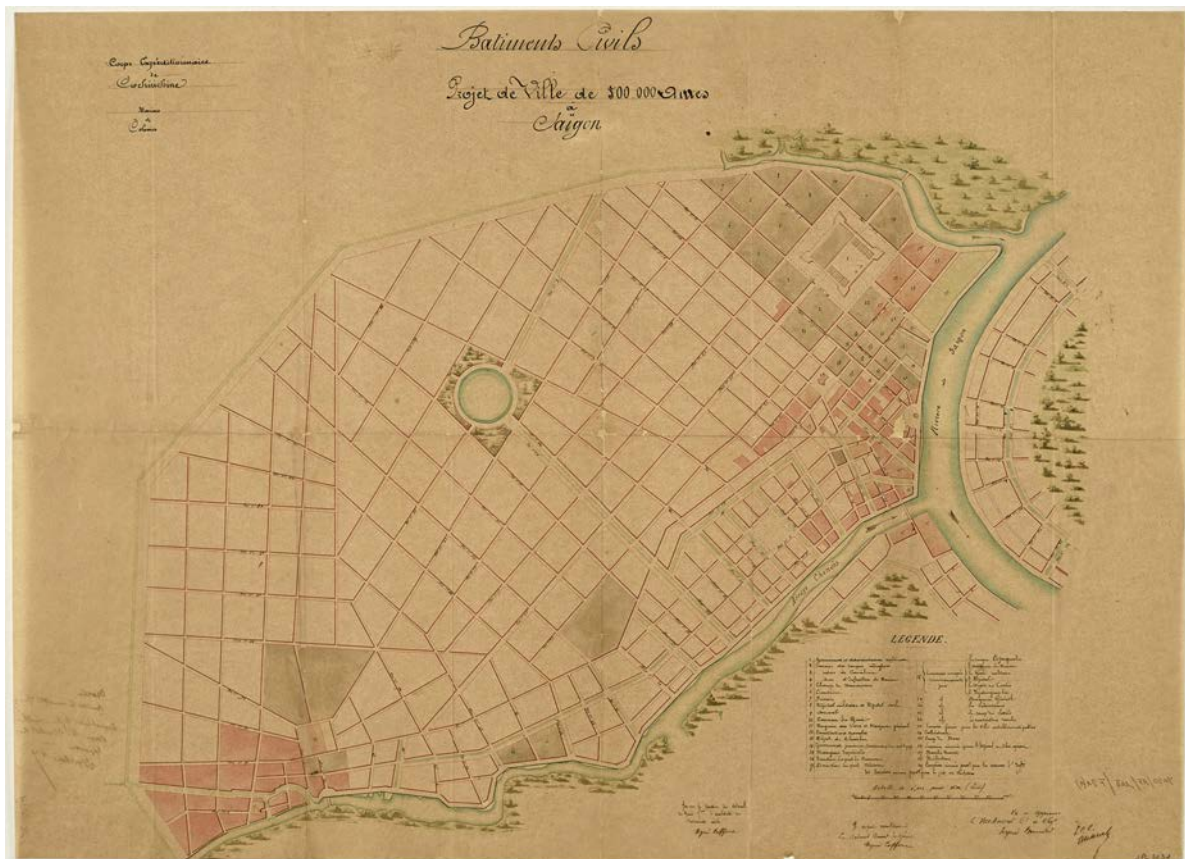

Fig 6: Paul Coffyn's "Saigon 500,000 Civil Engineering Projects"

3.3 Municipal engineering and management

The French colonial cities in Vietnam, in fact, serve Europeans (not only for the French).¹⁴ In the early days of establishing the city, their first task was to establish an official municipal system when facing multiracial citizen groups. This system will set urban operating rules and public policies for the realization of colonial economic goals.¹⁵ After 1870, most of the contents of urban planning were incorporated into the municipal system, forming the administrative techniques for the two objectives: the first one is to plan and build urban public land; the second one is set up regulations and supervision for the construction of private lands.

In Vietnam, Hanoi and Hai Phong, were colonial cities that were basically built through municipal planning. Before the official rule, the colonialists firstly established the "Commission Municipale Provisoire", and then clearly specified that the organization should take over the planning and construction of the city.¹⁶ For example, Hanoi's City Committee" started taking over urban planning and construction work in February 1888, and this agency has completed the following tasks: Firstly, formulate urban boundaries, urban suburbs and municipal development reserved areas; Secondly, count and divide urban lands into public lands and private lands(Figure 7); Thirdly, set administrative and civilian areas, and focus on the construction of administrative districts and European settlements(Figure 8).¹⁷ It can be said that the French municipal plan has a far-reaching impact on urban redevelopment in Vietnam, namely, clearly distinguishing cities and villages, standardizing public and private lands, modern transportation, sanitation, public security, fire prevention and so on, all of these contents have changed the Vietnam's understanding of cities and urban planning.

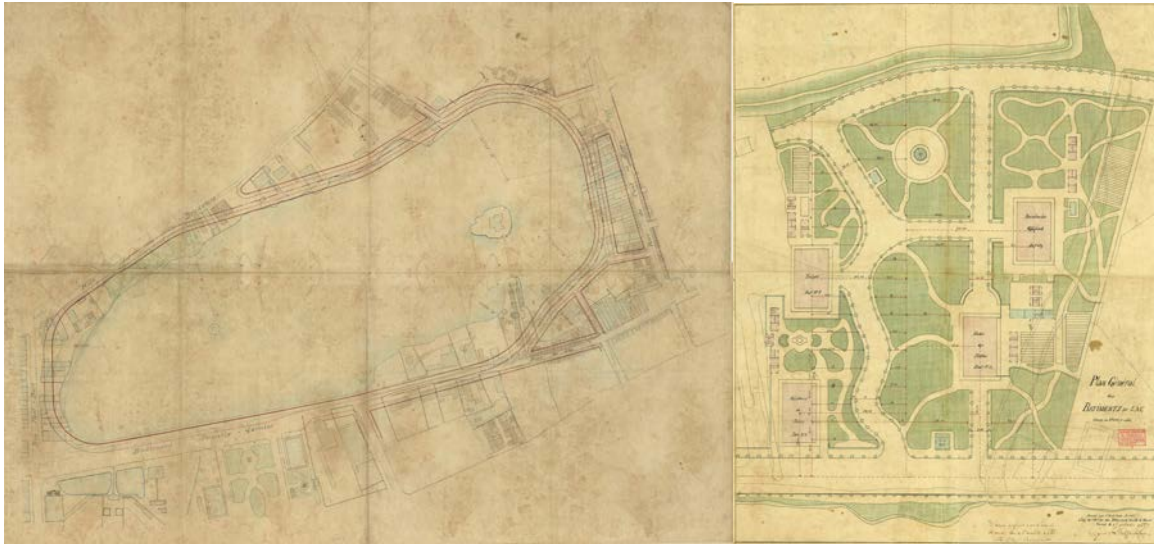

Fig 7: Road planning in Hoan Kiem Lake

Fig 8:Hanoi City Administrative Center Planning

3.4 Urban expansion and remediation planning

From 1920 to 1922, the Socialist Party Maurice Long came to Vietnam to serve as Governor. In order to response to French Cornudet Act,¹⁸ he immediately established Central Services of Urban Planning and Architecture in Hanoi and hired Ernest Hébrard, a well-known planner, to serve as director. Ernest Hébrard who was a member of SFU (société française des urbanistes) and also an architect of the Rome Prize winners, drew urban expansions for six cities with a population of 10,000 in Hanoi (Figure 9), Haiphong, Nam Định, Hue, Saigon and Phnom Penh (Cambodia) from 1920-1930 and drew optional administrative capital plan for Dalat (Figure 10) These planning programs of Hébrard emphasized sanitation, urban beautification and public space, using modern planning techniques such as land division, urban functional zoning, heritage protection and green belts. In addition, he was a pioneer in proposing locality in Vietnam, setting up "new (racial) mixed neighborhoods" and "new types of local neighborhoods" for Vietnamese residents.¹⁹ After Ernest Hébrard left Vietnam in 1930, these urban planning programs were still disputable among politicians. Although only a small part was implemented, its planning theory was gradually recognized in the latter period. French planners such as Louis Pineau, Mondet, Lagisquet, who took over Hébrard's work, gradually completed his thoughts and paid more attention to the protection of local characteristics and natural environment.

Fig 9: Hébrard's Saigon Plan (1924).

Fig 10: Hébrard's DALAT future plan (1924).

4 The Soviet Union

After the end of the first French Indochina war in 1954, Ho Chi Minh had led North Vietnam following the path of communism. On one hand, North Vietnam seek assistance from the Soviet Union and China, on the other hand, adopting a socialist approach towards development models based on the Marxist-Leninist ideology. After the agreement name “The Economic and Technical Cooperation Agreement” of the Soviet Union and North Vietnam signed in 1955, many experts from the Soviet Union and other communist countries had arrived to support Vietnam.²⁰ In the field of planning, at least ten countries had built expert groups to work in Vietnam. The main focuses in their works included a preparation for emergency war, development planning, and post-war reconstruction planning. The main objects of planning practice can be divided into three major types: planning for industrial cities and industrial zones, planning for towns and villages network, planning for Residential units.

4.1 Planning for Industrial cities and industrial zones

In 1960, planning experts from Poland, Russia, and China had arrived in North Vietnam. Piotr Zaremba(1910-1993),²¹ a professor from Poland, was the first expert who put forward a proposal of “Capital regional plan” for Hanoi. He suggested building three ring roads and one railway surrounding West Lake to transform it into a new geographical center and arranged industrial and manufacturing sites along sides these transportation projects. His proposal was complemented and completed in 1962 by a Russian architect name I.A.Antyonov. In 1973, Sergei Ivanovich Sokolov represented for the Leningrad Scientific Research Centre for Town Planning and Construction (LRCTPC) to make the planning for the region of Hanoi.²² Once again, the ideas of Piotr Zaremba was adopted to complete Hanoi-Leningrad plan which had profound impacts on the development of modern planning in Vietnam (Figure 11).

Fig 11: Hanoi-Leningrad plan

Besides of Hanoi, Poland experts also made plans for Haiphong, an industrial port city. Meanwhile, Chinese experts were working on the planning of two industrial cities, ThaiNguyen (iron and steel industry) and VietTri

(chemical industry). From 1965 to 1975, East Germany sent many experts to help planning Vinh, a manufacturing city. Romania experts assisted in planning ThaiBinh (focusing on agricultural production), North Korea assisted to plan the BacGiang industrial zone, Cuba assisted to plan the Donghoi Industrial zone, Hungary assisted in the planning of HonGai and BaiChay so on.²³ In general, these planning practices share a common feature: stressing out industrial production in order to eliminate the characteristics of the colonial economy which paid more attention to the trade. At that time the Communist party perceived trading cities as non-productive cities.

4.2 Planning for towns and villages network

Facing frequent air strikes of US army, the government of North Vietnam put forward the decentralized development model which constructed the networks of production in rural areas. Planning and constructing a network composed of multiple small towns and villages. With the help of experts from China and the Soviet Union, Two counties around Hanoi (ĐàoViên and KhoáiChâu) were designed according to this model and gradually extended to HảiHung, AnSở, QuỳnhLư, ĐôngHung, NamNinh and other places.²⁴ In this process, the planners from Bulgaria put forward new concept for whole provincial region, a dynamic planning program accord to the development stage, to guide the traditional villages to the large-scale production model and eventually become a number of modern villages. This model had laid the foundation of the modern rural planning in Vietnam.

4.3 Residential units in centrally planned period

The destruction of cities in war and the industrial development caused housing shortage, which was also a major issue for the urban construction during 1955 to 1965. This housing problem was clearly noticeable in many cities such as Hanoi, Haiphong, Vinh, Namdinh where industrial sites were concentrated. In an effort to solve this problem, the expert group from East German had proposed a planning concept for the urban center of Vinh city. The core idea is to choose a region with the most convenient traffic and transform it into a residential area which can accommodate a large-scale population (Figure 12). In addition, the experts from LRCTPC also proposed the model of neighborhood unit, as an alternative solution built in suburbs of large cities (Figure 13).²⁵

Fig 12: Residential estates QuangTrung in Vinh (2001)

Fig 13: Residential estates KimLien in Hanoi (2000)

5 The United States

In 1955, on the other side of the 17-degree line, the U.S. government with many goals and ideas began to assist South Vietnam. Besides the financial, military and food aid, Washington had assisted South Vietnam through the United States Agency for International Development (USAID) also in drawing up plans and implementing several projects. But, first of all, we must explain some of the civil wars that occurred in South Vietnam at that time.

Unlike for North Vietnam, the war situation faced by South Vietnam was not air defense, but guerrilla warfare. As a result, it caused many problems for a development of the city. In the 15 years from 1960 to 1975, most of the people in South Vietnam migrated to big cities, where they thought might find a sense of security. Under this circumstance, cities such as Saigon, NhaTrang, DaLat, VungTau, BienHoa, and other cities have ushered in an extra population that is several times greater than the original. According to statistics, from 1950 to 1975 in Saigon,

the urban population increased by 2 times.²⁶ Therefore, the handling of issues such as outsiders, refugees, crowded space and rapid and disorderly expansion has become the primary task of South Vietnam's urban planning at this time. The United States technical experts who had faced these problems before proposed two experiences for South Vietnam: one is the planning of the new city; the other is the regional planning and organic growth theory.

5.1 planning of the new city

In 1965, commissioned by USAID, Greece's Doxiadis Associates (DA)²⁷ formulated the first edition of the master plan for Saigon.²⁸ They did a thorough research on resources, climate, landforms, soil quality, internal and external financial capabilities, and even local customs, however, the plans they made were not implemented due to the wrong planning ideology. It had used the old city of Saigon as a starting point to determine the four new cities in the neighboring cities that can accommodate the migrant population, actually, it is a planning concept that makes the city develop linearly (Figure 14). This plan rigidly concentrates the traffic to the axis that runs through the center of the old city and a new city, making the connection between the old and the new very weak. DA's idea was simple: first, to plan a relatively isolated area for the inhabitants; secondly, to design a mega block on the area; finally, to develop a high-density simple housing in a huge street profile. DA believed that this approach is a good way to deal with the largest number of migrants for the least amount of public finances. However, such planning has wasted too much land resources, making the land redevelopment phase facing many obstacles, and it would also require too many government interventions.²⁹

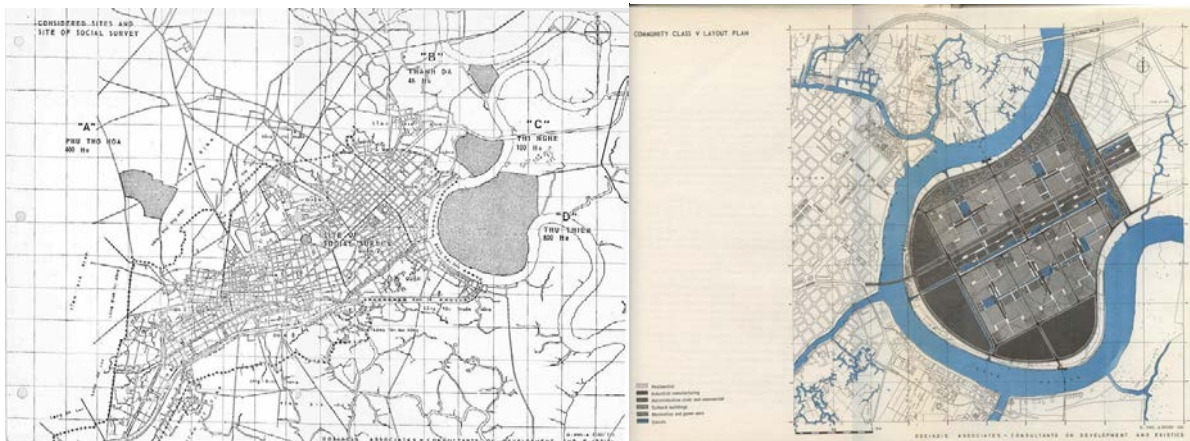

Fig 14: master plan for Saigon by Doxiadis Associates (1965). Comments: DA point to determine the four new cities in the neighboring cities: "A" PhuThoHoa 400Ha, "B" ThanhDa 46Ha, "C" ThiNghe 100Ha, "D" ThuThiem 800Ha.

Then, in 1972, USAID commissioned Wurster, Bernadi and Emmons (WBE) in San Francisco to re-plan the most important new city for Thu Thiem Peninsula.³⁰ From the viewpoint of land value potential, finances and implementation policies, WBE hoped to promote the development of an entire west side of the Saigon River area through the development of the region, and then plan Saigon to become a dual-center structure city (Figure 15). The idea of WBE was also not implementable. The plan would be more suitable for an era of development and requires broader internal and external financial capabilities. As the result, in the time of the war, most of the new arrivals were "war refugees, and WBE's plans became unrealistic.

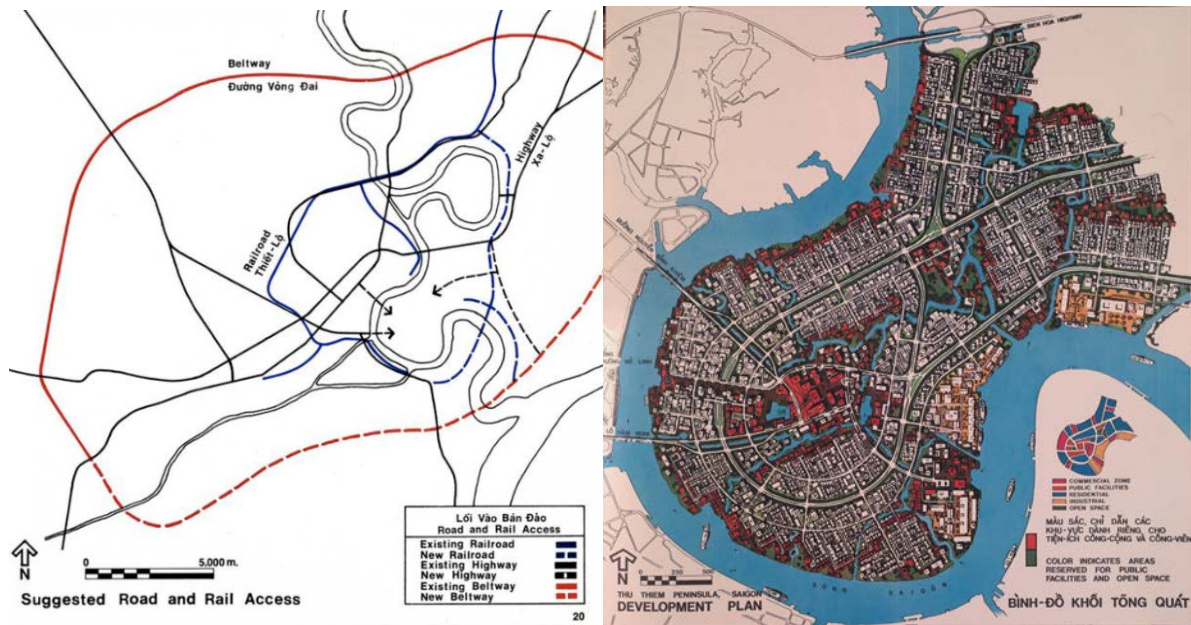

Fig 15: WBE's Saigon Plan.

5.2 Regional planning and organic growth theory

In the absence of urban planning in 1965 and 1972, USAID commissioned Frank Pavick and James Bogle, two U.S. urban research experts in 1974, to find a solution for planning problems. The two experts collaborated with the Urban Design Bureau of South Vietnam (affiliated with the Ministry of Transport and Public Works) to place urban development issues in a wider space, the Saigon Metropolitan Area, through the perspective of regional planning. They found more space for the Migrant population and also assumed several leapfrog spatial development methods. In addition, through the prediction of three factors of land development, further analysis of the actual situation of local financial capacity, and finally put forward an organic growth plan for the urban space in Saigon District(Figure 16).

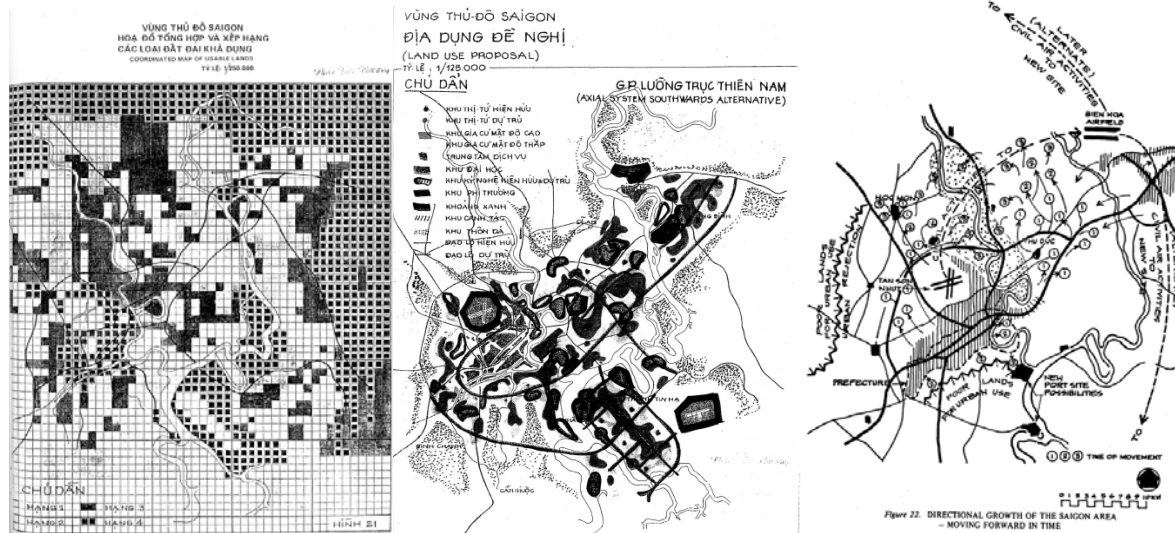

Fig 16: Frank Pavick and James bogle analysis and proposal.

6 Conclusions

From the above analysis, we can see that urban planning in Vietnam from ancient times to the present is certainly not as simple as following other countries when they ruled or receiving assistance and finding themselves when they are independent. This process can be regarded as superimposed on the same dimension by the

spatialization of multi-layered urban and rural concepts, construction technologies and concept technologies of different cultural colors. On the one hand, this superimposed effect is embodied in the physical space, presenting a city or town that is spliced by different cultural plates; On the other hand, the superposition effect has also created many fuzzy areas in the planning ideology space, especially manifested in the value of the “foreign planning” of Vietnamese rulers, planners and even the entire society. In other words, when a certain foreign planning in history is placed in front of Vietnamese policymakers, it will generally show two sides: one is modernity, superiority or humanity; the other is ruled, colonized, imperialist or unforgettable hunger. This led to Vietnam’s urban planning (including disciplines and administration) to be a kind of cross-cultural interaction since 1986, but not the incubator of a flourishing hybridity, but ambiguous, which is sometimes praised or despised when it comes to the foreign planning of their own experience. We can find the basis for the important urban planning documents of Vietnam in the past 30 years (the master plans of Hanoi, Ho Chi Minh and Hue) and the urban planning academic literature, especially in the analysis of localization, national identity, foreign, China, France, Soviet Union, United States and other related keywords.

It should be noted that the urban planning in Vietnam from ancient times to the present has rarely crowded out foreign plans, but more inclined to rely on foreign experience when facing new challenges or when there is a necessity to change its own theoretical system. Because of this, there will be two questions: the first one is “How many of the foreign plans that have been experienced have been absorbed into their own knowledge? The second one is “when facing a complex historical background and historical space, how can we see ourselves and which foreign culture system will we use for reference?” Of course, these two issues only proceed from a historical perspective, but this paper believes that it is the source of a series of theoretical and practical problems, such as “Urban Heritage”, “National Identity”, “Cultural Identity”, “Local Characteristics”, “Root Culture”, “Branding City”, “Planning Education” and “Planning Effectiveness”.

14 **Taking possession of the
history: reconstructions,
allusions and simulacra for
urban revival / Round Table**

Mon. July 16, 2018

Session 2 (2:00PM-3:45PM)

Room 9, Yokohama Port Opening Hall

Moderators:

Aleksey Krasheninnikov, Professor, Moscow Architectural Institute
Andreas Butter, Ph.D., IRS Erkner, Germany

History of urban planning has witnessed an impressive variety of reconstructions of buildings from Ancient Rome, Gothic, Baroque or Chinese styles, showing us striking comparative perspectives, cross-cultural allusions and borrowings. Every reconstruction fits into a certain political, economic and technological framework and rises questions of authenticity by the professional community and public.

Global examples of the late XX and early XXI century are the most dominating and arguable. The Frankfurt am Main center, developed in the 1950s-70s is being replaced widely by constructions claimed to be authentic of the medieval city. The Stadtschloss in Berlin where they applied a 3-D-technologie is another example on the site of the demolished 1970s Palace of the Republic. In Moscow, they have reconstructed several churches ruined in the anti-religious Soviet campaign, replacing socialist objects, changing urban plans. An upcoming past is replacing a vanished future of Modernism.

The current wave of reconstructions of architectural losses, due to different reasons or simulacra borrowed from other cultures or locations have become new epicenters of urban transformations. Sometimes, we see correct archeological reconstructions, in others – just an idea, or an image of a certain cultural time period. Urban historical allusions, have become very popular for commercial, social and cultural purposes, encouraging tourists to visit, identities to be built, or the hospitality business to flourish. Champs Elysees simulacrum in China or Disneyland parks worldwide, Las Vegas themes in the US ensure worldwide scalability of urban patterns. Reconstructions interpret history in many ways and can be more convincing than the reality at times. At times, reconstructions affect preservation practices and devalue existing landmarks.

Key words: Urban planning, reconstructions, urban simulacrum, architectural losses, urban historical allusions, cultural borrowings.

We hope to receive contributions, which would help us to understand urban trends, purposes of reconstructions and their roles in the current urban planning, seeking for the answers to the following questions:

How aesthetic, psychological and political motives interact with each other in respect to the national and local histories and who are the initiators of reconstructions?

When are reconstructions considered as a tool for the healing of urban traumas or, vice versa, causing public disagreement?

Under which circumstances could reconstructions be seen as intentional signifiers of social values of a past period and for what reason this period is chosen?

What are the economic reasons for the reconstructions or allusions: attracting tourists, customers or land valuation? How have city-images changed?

What do the newly created urban highlights effect the overall layout of human habitats?"

15 Westernization in East Asia

Guangzhou as Livable City: Its Origin, Inheritance, and Development ——from the Thirteen-hong to Its Ecological Status Quo

Yanjuan Han (School of Arch. and Urban Planning,Guangzhou University;School of Civil Eng. Wuhan University of Technology), Yue Pang (School of Arch. and Urban Planning,Guangzhou University)

Abstract: This article intends to explore the ideas and concepts that dominate the landmark versions of planning in a historical survey on the development of urban planning for the construction of Guangzhou. From the Late 17th C. to the Mid-19th C. Xiguan in Guangzhou witnessed the booming of the Thirteen-hong characterized by gardens and buildings in Western architectural styles. These characteristics constituted the architectural features and urban spatial patterns on both sides of the Pearl River, and caused the moving westward of the ancient city center to the Thirteen-hong Business District. After The Second Opium War Western merchants began their planning and construction of Shameen with Western planning techniques, which, together with the model of the Thirteen-hong, led to the urban modernization of Guangzhou urban planning. During the years from 1911 to 1948, the urban planning and construction in Guangzhou underwent a sequence of processes from simplicity to complexity, and from part to whole. There was also a process from the simple imitation of Western ideas and concepts of urban planning in Dashatou Island to the renovation of Guangzhou urban planning marked with road and park construction. This process includes the dismantle of the city walls for road construction in 1912, the prelude of modern urban planning of Guangzhou in 1914, the planning for network and city-round road and park construction in 1918, the idea of "Traffic First" in 1921, the regional studies and planning in 1923, the concept of functional division in 1932, the idea of implementing urban function division in 1920s and 1930s, and the transference from the initial techniques and measures to land management in 1937. After that there was the adoption of the "zonal cluster layout" along the Pearl River in 1984, the idea of the Planning of Urban Agglomeration of the Pearl River Delta in 1995, and the continuation of the "four land usage modes" in 2003. The idea and concept of urban planning for Guangzhou, thus derived localized from the practice of Western urban planning in the Thirteen-hong and Shameen, later underwent the municipal planning of Dashatou, the idyllic residential districts. The innovated regional green space in 2006, followed by the livable urban and rural planning in 2016, and up to the lately ecological city in 2018, all bear the marks of the early ideas and concepts realized in the Thirteen-hong, Shameen, and Dashatou. Therefore, it can be further concluded that the urban planning of Guangzhou, developed from the initial function of landscape beautification to the regulation of regional green environment of the Pearl River Delta, underwent finally a full process of imitation, learning, transformation, and innovation, resulting in an idea of green, open, and shared urban construction.

Developing New Kowloon into a Modern Suburb: Emergence of Modern Town Planning in Hong Kong (1898-1941)

Alex Ka Lok Cheung (The Chinese University of Hong Kong)

Soon after acquisition of the New Territories in 1898, the portion of it adjacent to the old territory of Hong Kong was delineated and named as "New Kowloon". New Kowloon was then the most important ground for urban expansion and practice of town planning within the colony. Given this historical background, this paper aims to trace and explain how and why New Kowloon was developed and town planning was utilised by the colonial government to develop this new district.

In this paper, it would be demonstrated that town planning was utilised to divert private investment to New Kowloon, so as to open up this district and eventually make Hong Kong a more prosperous colony. In many occasions, the colonial government depicted Kowloon as a modern suburb as compared with City of Victoria. In this developing district, sites for constructing factories and port facilities were provided. Besides, in order to accommodate the rapidly increasing population of the colony, various housing schemes were implemented. Eventually, in order to regulate the property market and living cost in the colony, the Town Planning Scheme was formulated in 1922 as a masterplan for the district. Therefore, New Kowloon was developed, in a planned manner governed by the colonial government, into the most important suburb of the city at the time.

At such, the style of governance of the Hong Kong colonial government is demonstrated. There is a general impression that, under the ideology of laissez-faire, town planning was not available in Hong Kong before the WWII, or at least limited to the minimum degree. However, this paper suggests that the colonial government actively drew up development plans in a top-down manner, so as to boost economic growth and transform the colony into a prosperous modern city in British Far East. In this way, in the context of pre-war Hong Kong, town planning was not a profession practised by professionals, but a pragmatic tool made use of by the colonial government.

The case of Nanjing. The growth and westernization of the city from the First Opium War to the Nanjing Decade

Domenica Bona (Università degli Studi Roma Tre)

With a focus on architecture and planning and direct linkages with politics and entrepreneurship, this paper investigates the spatial evolution of Nanjing in the period from the First Opium War (1842) and the Thirties, the so called Nanjing Decade. From this perspective, it suggests an alternative interpretation of the case study enlightening the participation of both foreign and local actors in the refoundative process. During that time, the foreign influence was predominant in Nanjing and led the modernization of the city, starting from the port system and its infrastructural layout as an outpost commercial hub on the Yangtze River. Indeed, after the fall of the Chinese Empire (1911), the contribution mainly of the Americans allowed the republican government of KMT to move the capital from Beijing to Nanjing and draft a modern plan for a new westernized Chinese capital. Artificers of this new stage of development were American investors, architects, and engineers flanked by Chinese colleagues educated in the West, promoters of modern ideas, advanced technologies and modernist styles. Thanks to the intertwined network of local and foreign designers, Western ideas in the field of architecture and planning could find in Nanjing a unique testing ground; moreover, the fortunate occasion of founding a new capital acted as a common aim for politicians, entrepreneurs, and designers who considered the spatial change of Nanjing as part of a wider change to realize shared ideas and wills.

Stressing the focus on the new forms and the persistent historical features defining the development of Nanjing, this paper discusses the importance of Western planning ideas into the early-modern history of the Nanjing as a relevant example of Chinese Treaty Ports legacy. To do so, this research assumes an "interpretative-maps approach". By analysing a diachronic series of maps from the Seventh Century to the 1970s, drawn by Chinese and foreign geographers, together with the masterplan proposals for the competition for the Capital Plan in 1929 and a wide range of architectural designs of the early-mid Twentieth Century, some interpretative maps show the evolution of urban patterns, the grafting of new elements and the relevant structural transformations that only partially maintain the features of the classical imperial layout. In parallel, a critical explanation of the spatial transformations is driven by comparing maps with historical accounts, critical essays on planning and the wide literature of Treaty Ports.

This work of interpretation helps in gaining a fresh approach to the Treaty Ports of China and, specifically, gives a new perspective to the colonial history of Nanjing. In fact, the Western contribution to the urban landscape goes far beyond the common experience in other cities where foreign enclaves toil to relate to the pre-existing Chinese settlements and hardly participate in a general harmonized development.

Urban governance, planning culture and colonial history in East Asia Cities (EAC)

Yu-Tzu Lin (Delft University of Technology)

Many EAC's planning institution has been shaped by their colonial past and several of their present urban challenges have colonial roots. For example, Hong Kong and Singapore follow British-style urban planning system, major urban form in Taiwan is based on Japanese planning history and Korea became a protectorate of Japan. The framework of planning institutions in EAC is mainly provided by state governments e.g. China, Korea, and Vietnam. For decreasing carbon emissions, participatory practices in urban governance and planning often play critical roles in the implementation of effective urban mitigation. The urban form of many EAC has been compact, mixed-use, and high density, but the carbon emissions in some cases is still comparatively higher than other cities with urban sprawl and low density. Most of the East Asia cities had experienced a period of rapid urban and economic growth, and some are still in rapidly urbanization. They have similar cultural background, colonial heritage, and are facing common governance and institutional limitation. Those factors increase GHG emissions not only through social norms, but also by the way of affecting urban land use.

Their limited capacities of urban planning and management to respond to mitigation needs within local climate governance is the entry point to expand solution space for urban mitigation. Planning intervention such as land use and design policies has become a critical tack to change human behaviors since the built environment affects physical activity as the institutional opportunity to address GHG emissions. Well-planned cities with good climate governance reflect efficient coordination by the way of urban planning to integrate public and private sectors at multiple geographic scales. However the planning cultures significantly across countries. Although since the 1990s, a number of countries have adopted decentralization policies that has the advantage of empowering local governments, the formal strategic spatial planning for urban development is not well provided for in local government administration. The EAC's planning system mostly belonging to top-down approach can be categorized according to the degree of autonomy and authority. These administrations often lack the power and organization to fully enforce building codes, environmental controls, and plans for built environment. Based on a literature review and documentary analyses, this paper begins by providing a brief introduction of the interrelationship between the colonial history and the planning culture in EAC; secondly, analyzes EAC's public participation in plan making with the local governments and the degree of empowerment for the stakeholders by using the democracy scores measured by Freedom House in 2016 to indicate the extent to which the urban planning process is involving the stakeholders.; thirdly elaborate the similarities of urban challenges intertwined with planning culture; and finally presents transferrable solution for common lessons facing by EAC as conclusions and suggestions.

Guangzhou as Livable City: Its Origin, Inheritance, and Development —from the Thirteen-hong to Its Ecological Status Quo

Keywords: Thirteen-hong, livable ecotype city, urban planning ideas, modern urban planning history, Guangzhou city

Introduction

Guangzhou ranked the 40th in a list of 361 world cities selected in 2016 by the Globalization and World Cities Study Group and Network (GaWC), concerning the leading ability demonstrated and the leading role played in global activities, and has become a first-tier city of the world since then.

Guangzhou has been one of the earliest modern Chinese cities where foreign trade was granted officially. During 1910's, after 1949, and 1980's, especially since the initial period of China's reform and opening up, Guangzhou has been shouldering the leading role of Chinese modernization, and has ever since become a stage for cross-cultural communication between the Western and the East.

This paper intends to analyze the inheritance and developmental ideas and techniques of city planning mentioned above in the construction of a livable ecotype city in the light of the development of the urban planning of Guangzhou.

1 The Square and Gardens in the Thirteen-hong

Guangzhou had been the only Chinese trade port for the West since 1757, with the business halls in the Thirteen-hong chartered for the service, where Western merchants were constantly seen coming and going.

In the beginning, according to Huashiyiyan, the Thirteen-hong covered only a small area as residence for the merchants coming from the United States, Britain, France, Denmark, Holland, Brazil, Portugal, Russia and some other countries.

Close to 1795, however, the area had already covered an area of 5.1 hectares, with the Thirteen-hong in the north, the Pearl River in the south, the West River in the east, and Lianxing Street in the west (now the area for Guangzhou Cultural Park).

Afterward, the Thirteen-hong underwent several recoveries from fire damages¹, and the architectural style was changed from the early Chinese architectural style to a combined Sino-European style, characterized with European colonnade.

By the end of the Qing Dynasty, the buildings in the Thirteen-hong appeared to be in a Western architectural style, mostly white and pale yellowish brown with gray tiles and red brick, arranging neatly along the Pearl River, thus forming a unique landscape along the river (Figure 1).

The trade flourishing, the Thirteen-hong Square, initially designed as a reserved buffer for the Pearl River tides, was gradually turned into the function of a temporary goods yard. Around 1842, Isaac M. Bull (1808-1884), an American merchant, designed a garden with 9 flower beds in the Square, about an area of 130 thousand square feet or 0.012 square kilometers, in front of the business buildings of the United States (Figure 2). A flagpole, surrounded with potted flowers, was set up in the central flower bed. About 2 years later, the British merchants began to build their garden connecting to the American one in front of the British buildings. In 1856, however, these buildings, together with the gardens, were all destroyed in The Second Opium War.

Fig.1 The Thirteen-hong in 1840s

Fig.2 American Garden in the Thirteen-hong
(about 1844-1845)

Now the profound impact of Thirteen-hong on the landscape and urban spatial patterns in Guangzhou

¹ Thirteen-hong: The analysis of urban development dynamic in Guangzhou at Qing Dynasty, Honglie Yang, Famous City in China, 2014 (5):54-61

can still be seen everywhere. And the Thirteen-hong area itself, still retaining the old street pattern and Sino-Western architectural style even today, is still one of the largest and most bustling commercial wholesale blocks in Guangzhou. Evidently, the gardens in Thirteen-hong have an important impact on Chinese gardening.

2 Shameen Concession – Miniature Models of Modern Western Planning

In 1859, Britain and French seized Shameen, and in two years developed the place into an island of about 0.8 square kilometers with 870 meters long and 290 meters wide.

In 1861, the British Government signed an Agreement on Shameen Concession with the Qing Dynasty. Soon the British and the French authorities began to uniform the planning and construction of the grid-shaped roads and the green environment in Shameen Concession.

There was a walking road along the embankment, with a football field and a tennis field. A British garden and a French garden were also planned (Figure 3). The concept of public landscape with gardens in the Thirteen-hong period was thus retained and developed.

The colonial urban planning mode applied in the Thirteen-hong was adopted in the construction of Shameen, and the experience and lessons learned from the construction of Thirteen-hong were applied as reference in the site selection, environment development, and garden construction in Shameen.

All of the urban planning strategies and techniques, the regular grid-type road system, the open fields and gardens, and all relevant constituents presented in Shameen construction, later became a template for the modernization of construction in Guangzhou, thus stimulating the booming urban modernization of the city.

Fig.3 Map of Shameen in 1910

3 Urban Planning Exploration in the Republic of China

In 1911, the then Republic of China, with the common aspiration of the Chinese people, started an urban revitalization, and soon the reform of modern urbanization began.

3.1 Municipal Planning of Dashatou Island

In 1912, the Guangdong Military Government implemented the modernization of public works in Guangzhou. They dismantled the city walls for road construction. By 1914, the Engineering Bureau of Dashatou was set up to plan and construct the Dashatou Island. The Dashatou Planning (figure 4) , designed by Guanying Jiang the engineer and Shengren Chen the assistant engineer, was quite a fairly complete and systematic planning developed by the Guangdong Military Government at the early stage of the Republic, even though it was still an imitation of the Western urban planning techniques.

The elevation of Dashatou was the same as that of Shameen, and the planning area was 814 mus, i.e. about 0.54 square kilometers, in which 340 mus were set aside for the embankment, roads, parks, meadows, and lanes, while about 470 mus were kept as the building area. The embankment surrounding the island was 13,050 feet long, enclosed was a regular road grid layout with 3 horizontal and 8 vertical streets. The spacious area of embankments, roads, parks, grasslands was very large, covering more than 40 percent of the island².

Fig.4 Plan Diagram of Dashatou

Evidently, the impact of design concept and planning techniques applied in the construction of Shameen is prominent in the planning of Dashatou with its flexible 4 times road width, regular road network, and the attention paid to the recreation spaces, public lawns and environmental greening. Unfortunately, for various reasons, the planning of Dashatou had not been implemented. But the planning ideas lived on, and would have a profound influence on the urban modernization of Guangzhou.

3.2 Municipal Planning of Guangzhou City

In 1918, the then Guangzhou Municipal Bureau issued the planning for road and park construction, focusing on the construction of the city-round road and network road. The location of the first park in Guangzhou was settled at the old government department (figure 5).

In 1921, Guangzhou was chartered, and the Municipal Department was founded. Implemented was the planning of urban road improvement and park construction, realizing the idea of “Traffic First” proposed by Sun Ke the mayor. Then, planned and constructed successively were a number of roads including Yuexiu North Road, Mapenggang Road, Zhusigang Road, Weixin Road, Yuexiu South Road, Wenming Road,

² Guangdong Dashatou Engineering Bureau revelation, 1914, Sun Yat-sen Library of Guangdong Province

Danan Road, Taiping Road, Dade Road, Panfu Road (Chang Road), Yuexiu Road, Gongyuan Road and Yong Han North Road (Figure 6). Five parks were also planned, including Dongshan park, Xiguan park, and Haizhu park. The official planning of urban modernization of Guangzhou was well on its way.

In order to solve the problems among regional division, population increase, resource allocation, and governance capacity, the Municipal Department had a planning to expand the urban area along the traffic lines outside the old city. In 1923, based on regional studies of the whole city, a regional planning for the proposed urban area was completed by the Works Bureau of Guangzhou Municipal Department .

Fig.5 Road Map of Guangzhou in 1918

Fig.6 Road Map of Guangzhou in 1927

The planning outgrew the original scale of the old city. Included in the proposed planning of the urban area, besides the public fields, wild fields, and transport hubs, were the considerations of natural boundaries, future population growth, distance to the district or city center, reach of the police force, expectations of usefulness, industry distribution, easiness of district division, nearness to highlands, or the rivers,.

As a result, the proposed urban area was bordered by Baiyun mountain in the north, water pond at Beidi in the southwest, Henan Huangpu in the South, the line along Xiachebei river from Dongpuxu to Shuitugang in the north. The proposed urban area was, however, too large for the economic limitations. Therefore, a smaller but more appropriate, or affordable area was confirmed (Figure 7).

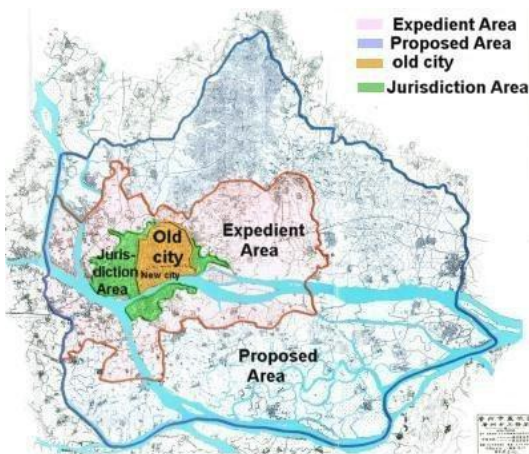

Fig.7 Demarcation of Appropriate and Proposed Areas in 1923

Fig.8 Road System Diagram in Guangzhou in 1932

In August of 1932, the then government promulgated the first urban planning scheme of Guangzhou—The Urban Design Outline of Guangzhou³. The planning divided the whole area into four functional districts: the industrial districts, the residential districts, the commercial districts, and the mixed districts.

The industrial districts were arranged along the Pearl River, including the West Village, the southeastern part of Shiweitang, Niujiaowei, Niugusha and Luochongwei.

In addition to the original commercial districts in the old city proper, the new commercial districts were located at the East of Huangsha Railway Station and Dongshan, to the west of the provincial government office, and in the northwestern part of Henan.

The residential districts fall into two categories, the beautiful exemplary residential districts and the civilian residential districts. The former ones were located in the central-northern part of Henan, the eastern part of Dongshan, Chebei, and the southeast part of Feieling Hill. The latter ones were adjacent to industrial districts, scattered around Bantang, and Fangcun in the southwestern part of the city.

The old city proper was reserved as mixed districts. Meanwhile, 10 parks in different sizes were planned in response to the emphasis in the outline of the planning on leisure places and parks for the public.

In November of 1932, the then City Government promulgated the Road System Map of Guangzhou (Figure 8). The arrangement of the road system adopted a chessboard-style layout, with five kinds of road width, namely 40m, 30m, 20m, 15m and 10m. In order to meet the needs of automobile traffic, the cross-shaped network of wide roads and large blocks were designed to be in the administrative district, while a network of narrow roads and small plots for walking are to be built in the commercial and residential districts.

For the first time in the history, the concept of functional division is introduced, with this complete and specific planning document, into the urban planning of Guangzhou. It focused on urban function division, road and infrastructure construction, and green space and parks layout. It marked the transformation of urban planning of Guangzhou from local road planning to overall urban planning.

In 1920s and 1930s, the idea of implementing urban function division in Guangzhou was accepted and applied in actions to adopt Western urban planning methods for local needs. The idea soon became an important approach to upgrade the urban environment. In harmony with the then economic conditions and government capacities, the demarcation of the appropriate and proposed areas broke the shackles of the old administrative divisions, and made it an easier work, from macro land layout to micro building control, for the then government to manage and implement unification of urban modernization.

In 1937, the Anti-Japanese War brought the urban construction of Guangzhou to a stop(Fig.9). After the war, in 1947, the then City Planning Commission of Guangzhou resumed the procedures of land division. The emphasis of urban planning of Guangzhou transferred from the initial techniques and measures to land management (Fig.10). The city was again divided, but this time, into six districts: the ordinary residential district, the rural residential district, the commercial district, the industrial district, the scenic district, and the agricultural district. The rural residential district emphasized the idea of residential environment construction.

At that time, there were 7 parks in Guangzhou. From the Road Traffic Map of Guangzhou Special City, published in 1948, it could be concluded that the procedures were an extension and realization of the design idea of urban planning draft in 1932.

³ The Outline Draft of Guangzhou's Urban Design (Document-Politics-590), 1932, Guangzhou Archives.

Fig.9 Road Map of Guangzhou in 1937

During the years from 1911 to 1948, the urban planning and construction in Guangzhou underwent a sequence of processes from simplicity to complexity, and from part to whole. There was a process from the simple imitation in Dashatou Island to the urban renovation marked with road and park construction, a process from simple road construction to overall urban traffic system, a process from scattered green lands to the overall greening system, a process from subdistrict planning to comprehensive planning of the whole city, a process from simple planning techniques to comprehensive land management, and finally, a process from simple imitation to localization.

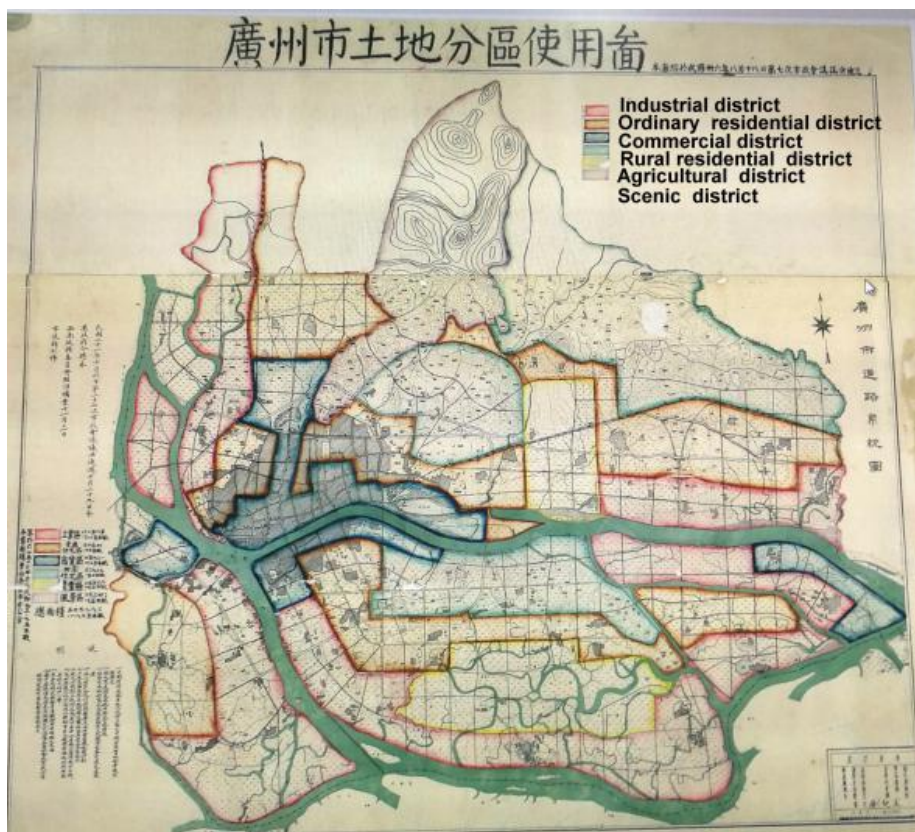

Fig.10 The Land Utilization Segmentation Map of Guangzhou in 1947

4 Planning Innovation after Reform and Opening in 1980s

On September 18, 1984, the State Council approved the City Master Plan of Guangzhou ((Fig.11)), the planning purpose of which was changed from "building Guangzhou into a socialist productive city" to "building Guangzhou into an economic center of the whole province and South China, and make it a prosperous, civilized, stable and beautiful modern socialist city" by adopting a "zonal cluster layout" along the Pearl River: the old urban area, Tianhe District and Huangpu District.

The focus of urban greening was on the downtown greening, encouraging greening in every possible patch in the old city proper. This master plan pays attention to the protection and construction of ecology and environment, but its strategies and means are not much different from those proposed by the Government of the Republic of China.

In 1995, based on the regional overall planning of Guangdong Province, the Construction Committee of Guangdong Province issued the Development Planning of Urban Agglomeration of the Pearl River Delta, proposing a conception of four modes of land use: the metropolitan district, the urban concentration district, the opening district, and the ecological sensitive district. The planning, especially the assignation of the open and ecological sensitive districts lay an emphasis on urban planning from old city reconstruction and urban expansion to co-building of urban greening and ecological protection.

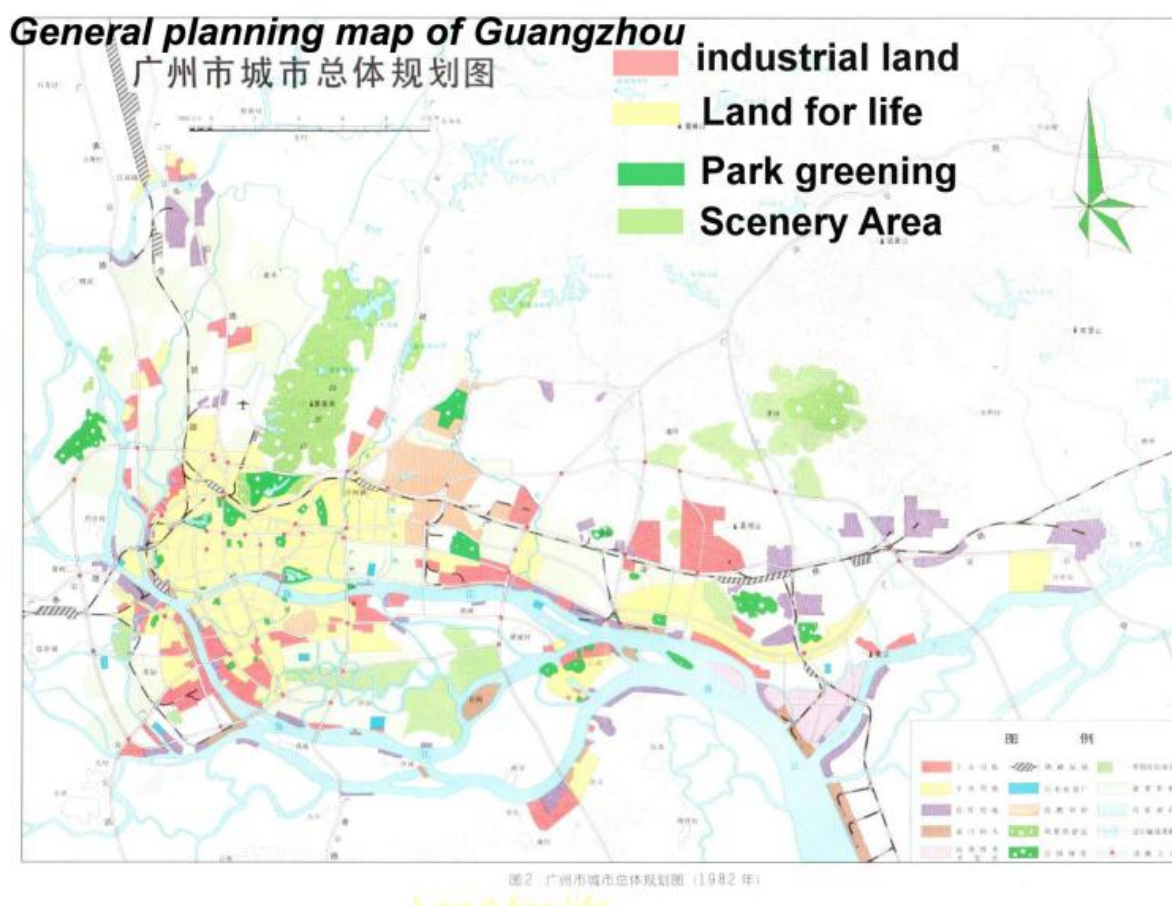

Fig.11 the General planning map of Guangzhou in 1984

In 2003, as the continuation of the “four land usage modes” advocated in 1995, The Guidelines for

Regional Green Space Planning of Guangdong Province was issued to further highlight the construction of ecotype green spaces. In 2006, the emphasis of regional green space was elevated to the legal level with the Regulations for the Implementation of Coordinated Development Planning for the Urban Agglomeration of the Pearl River Delta in Guangdong.

The planning regulations, compiled and adjusted from 1995 to 2003, all aimed at the regional planning of the Pearl River Delta. As a result, Guangzhou took the leading role in the development of the whole region, and thereby became an integral part of the Regional planning.

In 2012, a concept of planning for livable urban and rural areas was introduced and advocated in the Urban Comprehensive Planning of Guangzhou (2011-2020), proposing that the urban size should be rationally controlled with a total planning area of about 7,434 square kilometers. By the end of 2020, the urban resident population should be less than 18 million, and the construction land, less than 1,772 square kilometers, in which urban construction land less than 1559 square kilometers.

To highlight the water features of South China and construct the ecological water city, the water surface rate and drainage density of the city should also be increased to restore the ecological network of urban and rural water system, and the planning water surface rate should be 11% (Fig. 12, 13).

Fig.12 Green Space System Planning

Fig.13 Urban Road Network Planning

In Feb. 2018, the Urban Comprehensive Planning of Guangzhou (2017-2035) reinforced the vision of developing a beautiful and vigorous city of flowers in the world. Taking the Pearl River Water System as the developing path, the construction of the hub-type cyberspace structure of Guangzhou is now underway, and can be completed soon with the support of the transportation system and the ecological corridors (Fig. 14, 15).

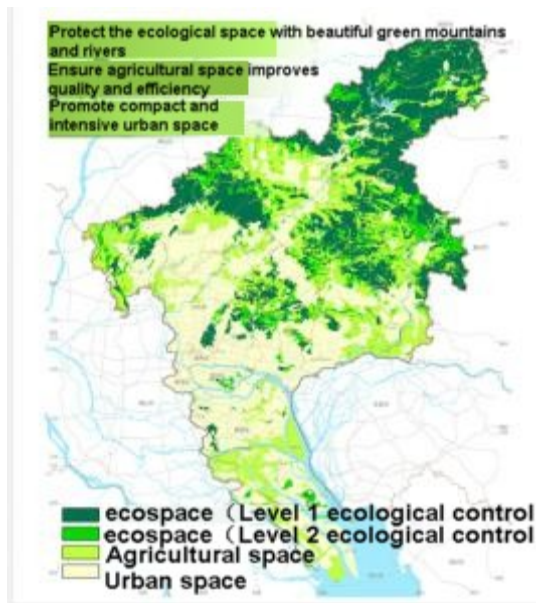

Fig.14 City Ecospace

Fig.15 Park and Recreation System of the City

5 Conclusions

Upon the survey of the planning history of Guangzhou it can be concluded that, from the few parks on the Thirteen-hong square to the overall planning of ecological Guangzhou, the urban planning of Guangzhou has witnessed the development from the district planning of Dashatou, through urban function division and the idyllic residential district, to the regional greening and livable city, which completes at last the process from imitation, study, transformation, and innovation. All these have brought to the birth of a unique concept of urban construction, a unique concept of an innovation, harmony, green, open, sharing, attractive, and distinctive ecological city of Guangzhou. It can also be concluded that the planning versions at all stages of the history of Guangzhou share something in common: assigning special districts, urban function divisions, network and ring road systems, avenues, squares, parks, and green space designs.

What can be noted is that ideas and concepts of urban planning have always changing to suit the foreseeable needs. In different developing periods, the ideas and emphases of green space construction are different. In the Thirteen-hong period, the role of green gardens was only landscaping. In the period of the Republic of China, the roles of green gardens were not only landscaping and recreation, but also an important symbol of city modernization. At the 21st century, the expansion of green lands is for the improvement of air quality and living suitability. In recent years, urban planning has paid more and more attentions to the planning and constructing regional green spaces. The construction of parks and public green spaces has become increasingly important in the prevention of the city from malignant expansion and environmental deterioration, and in the improvement of ecological environment. The development of green space has experienced a constant increase of quantity and area, and has evolved into the construction of ring green space and regional green space. Finally, this development has completed the urban ecological green space system, reflecting the development trend of urban public green space, and ecological green space planning.

Finally, it must be pointed out that the urban development discipline be observed, and insisted should be the strategy of sustainable and coordinated development in a balance among economy, society, population, environment, and natural resources. It is the common aspirations and dreams for the Chinese to

make Guangzhou into a prosperous, harmonious, ecological and livable modern city by enhancing the urban comprehensive function and improving regional radiation-driven capabilities and international influence.

16 History of Urban Conservation

The Rise of Historic Preservation in the Urban Land Use Planning System in Tokyo: Towards Heritage-led Regeneration

Jiewon Song (National University of Singapore)

The earliest approach to integrate heritage preservation into the urban land use planning system can be dated back to 1968 in New York City, which was the first city on the globe, implemented transfer of development rights (TDR) to allow the preservation of heritage properties and opened the path for urban redevelopment at the same time. Across the Atlantic Ocean, the House of Commons of the United Kingdom launched a report on “The Role of Historic Buildings in Urban Regeneration” in 2004 to review the management of the historic environment in order to promote the heritage preservation within the UK urban regeneration scheme. Their approach was, however, to control historic buildings within the planning system but without taking a TDR program into account. As was emphasized in the 2004 House of Commons Report, heritage plays a central role at the heart of contemporary urban placemaking by integrated into urban redevelopment.

In Japan, urban regeneration emerged as a part of national economic revitalization strategies when cities suffered a long-term economic downturn after experienced its infamous bubble economy. Under this scheme, heritage-led regeneration projects were put into practice from the late 1990s onward when the preservation of modern heritage took the center stage of cultural heritage administration, while the national government promoted deregulations in several sectors of the economy, including the urban and heritage sectors. Along these lines, local governments such as the Tokyo Metropolitan Government (TMG) introduced competitive development strategies to win the global intercity competition.

In 1999, the TMG officially implemented heritage-led regeneration framework within the city planning system under the national economic initiative that is known as the Important Cultural Property Special Type Specified Block System (Juyo Bunkazai Tokubetsu Gata Tokutei Gaiku Seido, 重要文化財特別型特定街区制度, STSBS). Indeed, this STSBS is a spin-off of the Specified Block System (Tokutei Gaiku Seido, 特定街区制度, SBS), which was established in 1961 and launched as the first redevelopment system aiming to create urban blocks comprised of open space and high-rise buildings in times when cities in Japan underwent rapid urbanization. However, the national and local government agencies, private developers, and corporate owners collectively acted as place-makers to shape the SBS into a mode of heritage preservation in order to prevent the demolition of modern heritage properties in the midst of strong pressures for urban changes.

Given these backgrounds, this study attempts to examine the historical development of the integration of heritage preservation into the urban land use planning system focusing on Tokyo. In doing so, it also sheds light on the economic, social and political background and the intent of the establishment of the heritage-led regeneration framework at the level of urban policy and decision-making processes that have never been spotlighted and/or clarified either in Japanese or English literature. The study, therefore, is built on multilevel data set such as stakeholder minutes of the meeting and government archives on corresponding urban redevelopment projects involved with heritage preservation in central Tokyo. This study is set in Tokyo, but it provides an insight into the origin and evolution of urban heritage preservation in Japan.

“The spirit of living continuity”? Revisiting the vision, methodologies and influence of the English Studies in Conservation (1968)

John Pendlebury (Newcastle University) and John Gold (Oxford Brookes University)

The late-1960s witnessed sustained debate about the prevailing direction of policy towards the existing built environment. With comprehensive redevelopment proceeding apace there was increasing momentum behind a nascent conservation movement that sought a less interventionist and more human-scale approach. Against this background, an initiative launched in 1966 by central and local government in partnership saw small teams of consultants commissioned to prepare analytic and advisory reports on four historic cathedral cities: Bath, Chester, Chichester and York. Their reports, published in 1968 as the *Studies in Conservation*, were intended not just to provide specific information about the physical and economic fabric of four cities, but also collectively to act as pilot studies able to indicate more generally the options available to policy-makers in the future planning and management of this genre of city.

In this paper, we make use of oral testimony, archive sources and contemporary commentaries by interested observers to identify the origins and purpose of this initiative. The opening part provides a brief overview of the background to the initiative and the way in which the case-study cities were selected. The next section analyses the various intrinsic visions offered for these cities, and comments on the methodologies proposed for achieving conservation. We then consider the reception the plans received on publication and their impact, both locally and nationally. The final section provides historiographic commentary on the significance of the *Studies in Conservation* half-a-century after their publication. Although now often conceived principally as part of a reaction to clearance-oriented urban renewal, we note that they were framed in accordance with the spirit of times in which modernist-inspired approaches were still regarded as accepted orthodoxy, identifying continuity as well as disjuncture. In light of that point, we end by situating them within the context of wider debates over the role of architecture and planning in the evolution of the city and specifically the active construction and reconstruction of the relationship between conservation and modernism that was occurring at that time.

A Voyage from “A Future for Our Past” to “Our Heritage: Where the Past Meets the Future”

Nuran Zeren Gulersoy (Istanbul Technical University Faculty of Architecture)

During the 1970s, European Council of Ministers Commission tried to continue the attempts on promoting and protecting the common architectural heritage of European Countries; A campaign was launched in 1972 to promote European Common Cultural Heritage among European Countries. As a result of the Split Conference in 1971, the year 1975 was declared as “European Heritage Year.” The Campaign for “European Heritage Year (1975)” started with a convention in 1973, Zurich-Switzerland, and used the motto: “A future for our past.” The need of an “integrated conservation” policy -which considers the results of economic and social studies along with the historical, archaeological and architectural study of the urban pattern to protect areas with historical and cultural value and the need of using monetary facilities for protection and regeneration were supported.

This year, 2018, has been designated “European Year of Cultural Heritage” by the European Union. European Culture Forum held in Milan by European Commission on 7 December 2017, launched the 2018 European Year of Cultural Heritage. The year aims to encourage more people to discover and explore Europe’ s rich and diverse cultural heritage and to reinforce a sense of belonging to a common European space. The main idea is to understand the past and to look to our future. The slogan of the year is “Our Heritage: Where the Past Meets the Future.” The Year will pursue an integrated approach to heritage and put people at the center. During the year, 10 European initiatives will focus on four main objectives: engaging people with cultural heritage, promoting its value, fostering its protection and stimulating innovation. Cultural heritage, its value to society, its contribution to the economy, its role in European cultural diplomacy, the importance of safeguarding it for the enjoyment of future generation will be promoted.

In this paper, the voyage of the cultural heritage promotion policy in Turkey will be described with the reference of the European approach, from the “1975 European Cultural Heritage Year: A Future for Our Past” to “2018 European Year of Cultural Heritage: Our Heritage, Where the Past Meets the Future.”

Heritage and urban sustainability in the context of prescriptive planning. Challenges for integrating territorial policies in Mexican cities

Gabriela Lee Alardín (Universidad Iberoamericana Ciudad de México) and Gabriela Estrada Díaz (Universidad Iberoamericana Ciudad de México)

Urban planning for Mexican cities seems to be historically dissociated from scales and aspects of planning which are widely recognized as essential to meet criteria for sustainable development. This presentation will focus on two particular issues in relation to urban planning, namely environmental considerations and cultural heritage conservation. First, a revision of how these topics have been addressed over the last few decades by government agencies at the federal, state and municipal level at territorial, urban, and local scales will show how public policies apply unto land units without an integral approach. Since the 1960s a profusion of plans were outlined for Mexican cities, aiming to articulate physical growth with social and economic development; this type of centralized urban planning was not socialized with local stakeholders, and later efforts to implicate them in the process were hindered by demographic dynamics and land use regulations. Today urban planning is led by local governments, with little social participation. On the other hand, environmental policies have long been devised by federal and state authorities considering regions or watersheds, disregarding both the dynamics of inlying cities and towns and the value of cultural landscapes, and disconnected from urban plans. Finally, urban heritage conservation policies have been a part of urban planning since the 1990s but in practice they remain insufficient to ensure the integration of the city of the past into the city of the future, thus disregarding its potential social, economic, and cultural contributions to sustainability.

Mapping planning criteria for urban heritage, the city, and its natural environment would constitute valuable input for recent initiatives in Mexico which strive to provide an integral multiscale framework for territorial and urban development, aligned with international recommendations for urban sustainable development, such as Habitat III’ s New Urban Agenda and UNESCO’ s Recommendation on the Historic Urban Landscape. This paper explores whether merging these layers of information would be possible in the Mexican planning structure, and if current practices might be modified to suit this purpose.

17 Living Heritage and Local Community

Living Heritage Conservation: from commodity-oriented renewal to culture-oriented and people-centred revival

Yiran Xu (Urbanisation and Urban Rural Planning Research Center of Jiangsu, Southeast University)

Living Heritage is characterized by 'continuity', in particular those historic places that are still a 'living' part of their community. For the tangible cultural heritages, especially the historic districts, the most important thing is to protect the texture of the old city formed hundreds of years ago, as well as the streets and alleys with friendly human scale. For the intangible cultural heritage, the treasures are actually those real life memories of the local residents as if had been integrated into their bone marrow and blood. It is gratifying to note that behaviors like forced demolition of shabby ancient houses or construction of fake antique commercial streets has gradually been abandoned these years. In China, the mainstream of living heritage conservation is shifting from commodity-oriented renewal to culture-oriented and people-centred revival, which has obviously displayed in many planning practices. The paper firstly mentioned the extension and connotation of the concept of 'cultural heritage' over the last two decades through a series of authoritative documents issued by some typical international heritage protection and research organizations. It then explores the application approaches of living heritage conservation through two conservation practices in Nanjing, China. In the first project, the author conceived a brand-new way of protecting and revealing historic streets, named 'Reflection Alley'. It treats the street as an open museum, utilizing current semi-dismantled remains, providing a stage for dialogues between history and modernity, endowing the historic legacy with a sustainable future. In the second project, a 'Five-stakeholder Platform' is set up to support the progressive revitalization of a historic district. Through in-depth community engagement, the design team have developed a three-phase planning guide helping locals to protect and repair their residences thus stimulating the vitality of community life. The paper provides solutions for the implementation of culture-oriented and people-centred revival through the interaction between tangible and intangible parts and the connections to community. The paper concludes with thoughts on the positive significance of living heritage conservation, highlight on the continuous tracking and management to achieve long term sustainability, and expectation for the further exploration on the balance between commercial interests and original continuity of community.

Between Vulnerability and Living Livelihood Culture: Reassessing small alleys as urban heritage

Daisuke Abe (Ryukoku University)

Kyoto, an ancient capital of Japan, has a grid pattern that clearly defines citizens' living form. It requires attempts and devices of how to build a neighborhood in a city. It also flexibly accepts divers way of living type making the best of existing street-block relations, which brought about several features for Kyoto. In this article, main focus will be placed on the historical value of so-called Roji, which represents tiny alleyway between houses in urban block. The combination between Roji and Machiya, a traditional townhouse mainly build during the early modern period, 2-3 stories, made of wood, usually deep and narrow, and built very close to the edge of the street, defines historic environment and tourist image of Kyoto. The buildings along the sides, eaves, and paving material determine the spatial form of Roji. These make for a unique and interesting atmosphere, which creates an identity that differentiates the Roji from alleys in general. However, in recent years, the unique spatial qualities of Roji are decreasing. There is a policy dilemma; reinforcing urban physical structure to improve vulnerability, or conserving living popular culture on tiny alleys? Therefore this article intends to discuss the following discourses. Urban morphology, as well as architecture, should be evaluated as an important urban heritage in contemporary cities, and be a target for conservation and improvement. Preservation of historic quarters in contemporary cities sometimes just results in mere protection of monumental historic building and religious architecture whose value and importance are easy for every citizen to understand. However, those historic buildings are not the only heritage that would inherit the city's context and memory to future generations. For better conservation of urban context and memory, it is important to expand the concept of urban heritage, focusing on the following two approaches: 1) to understand urban heritage as a mechanism between street-block-backyard and 2) to include build-environment mainly created in a modern and contemporary period, which could be "future heritage".

Planning and local heritage in São Paulo: Multiple views on the Bexiga neighborhood, São Paulo, Brazil

Ingrid Ambrogi (Mackenzie University), Nádia Somekh (Mackenzie University) and José Geraldo Simões Jr. (Mackenzie University)

The present work seeks to discuss the neighborhood of Bexiga, a place that exemplifies the great contradiction between a global city, such as São Paulo and one of its districts, considered as one of the city's heritage, as a result of multiple urbanistic, traditional and social historic perspectives called Bexiga.

The Bexiga neighborhood is located in a central area, close to Avenida Paulista, valued and with strong pressure of the real estate market, aiming at the densification of its territory. In contrast to this verticalization, the Bexiga neighborhood concentrates innumerable residential properties. The site began to be occupied at the end of the sixteenth century and from the end of the nineteenth century it began to be parceled out, and since then it has been home to small traders, workers, craftsmen, service providers, migrants and immigrants, artists, among other trades, in short, inhabited by a population of medium and low income, that in many cases lives in precarious conditions of health, in collective properties of rent - the slum tenements. The heritage listing of almost a thousand buildings in this area denotes its relevance and need to be preserved. However, the urban guidelines derived from the master plan of the city of São Paulo point to an opposite path, favoring the densification and renovation of this richly built heritage buildings.

This contradiction and the alternatives for its confrontation and solution will be the object of study treated by this table, composed by researchers who have been studying this neighborhood for years. The debate seeks to address similar situations also observed in other global cities.

In addition to this urban dimension, the study also addresses the culture and memory of the neighborhood, present in the daily life of the residents and in the history of their material records. In this way, the study of photographic archives and inventories of past neighborhoods will be explored, such as IGEPAC Bela Vista (carried out by the Department of Historic Patrimony of the city of São Paulo in the 1980s) and the Museum of Memory of Bexiga, the families of the neighborhood and the incentive of the Street Museum, an initiative of the architect and photographer Júlio Abe Wakahara, an event that helped bring the population closer to the history of its neighborhood.

In this way, the project uses these important records as a contribution to the heritage education process of the residents, making them aware of the inherent values of their culture and helping them in facing this public debate that is taking place regarding the future that is desired for the Bexiga neighborhood: whether preservation and patrimonial conservation, or real estate development with gentrification, or even an integrated action between cultural preservation and economic development. This is the main question that today is part of the agenda of this neighborhood and on which the present study will certainly help to point out the best ways.

What kind of future has been drawn through movements for urban design by proprietors in Ginza, Tokyo from pre-war to post-war?

Takahiro Miyashita (The University of Tokyo)

This paper revealed development of movement for urban design by local proprietors in Ginza from 1930's to 1960's. Ginza Street in Tokyo is known as one of the first modern style streets in Japan. This street has developed greatly by modern buildings and advanced urban design methods in modern times and after although it has also been suffered heavy damage twice by Great Kanto Earthquake (1923) and Great Tokyo Air Raids (1945.)

We pay attention to Ginza Street Association: a store association has been composed of proprietors in Ginza Street, and reveal development of their movement for urban design from 1930's to 1960's and find out a new historical context of Ginza.

In 1930's, Ginza Street Association started movement for "Urban beauty" of Ginza Street. They aimed for actualization of comfortable urban spaces for shoppers and beautiful townscape by Tokyo Olympics in 1940. Main themes of this movement were the removal of telegraph poles and the abolition of the tram, and they have appealed to the city government. In 1937, they planned 10-year plan for redesign of Ginza Street by themselves. However, this movement ended in failure as Japanese society had entered the war regime after 1938.

After WWII, Ginza Street Association released "Ginza reconstruction plan" in 1945. In this plan, an awareness of the issues they had shared in 1930's was succeeded though it was under the condition most buildings had been burnt down by air raids. After that, they have argued ongoingly with city government, and they achieved large-scale construction including the removal of telegraph poles and the abolition of tram in 1968. We can understand this result as the goal of their movement for a long time from pre-war.

In conclusion, this paper revealed the continuity of their movement for urban design from pre-war to post-war through paying attention to changes of the awareness of the issues and the image of spaces. Based on these facts, we can find a new historical context of Ginza different from existing historical view found through history of the building of architectures by architects in Ginza.

In addition, the organization of GSA has played a role as a place where local proprietors argued the future image of their town for a long time. It can be thought that the succession of such a platform has a great value to take over the awareness of the issues to next generation.

Living Heritage Conservation: from commodity-oriented renewal to culture-oriented and people-centred revival

XU Yiran

*Urbanisation and Urban Rural Planning Research Centre of Jiangsu, Southeast University, China,
njxuyiran@gmail.com*

Living Heritage is characterized by ‘continuity’, in particular those historic places that are still a ‘living’ part of their community. In China, the mainstream of living heritage conservation is shifting from commodity-oriented renewal to culture-oriented and people-centred revival, which has obviously displayed in many planning practices. This paper centres on the connotation of living heritage and explores its applications approaches through two conservation practices in Nanjing, China. In the first project, the author conceived a brand-new way of protecting and revealing historic streets, named ‘Reflection Alley’. It treats the street as an open museum, utilizing current semi-dismantled remains, providing a stage for dialogues between history and modernity, endowing the historic legacy with a sustainable future. In the second project, a ‘Five-stakeholder Platform’ is set up to support the progressive revitalization of a historic district. Through in-depth community engagement, the design team have developed a three-phase planning guide helping locals to protect and repair their residences thus stimulating the vitality of community life. The paper provides solutions for the implementation of culture-oriented and people-centred revival through the interaction between tangible and intangible parts and the connections to community.

Keywords: Living heritage, Heritage conservation, Historic district, Culture-Oriented, People-Centred, Community engagement.

Introduction

In China, the mainstream of living heritage conservation is shifting from commodity-oriented renewal to culture-oriented plus people-centred revival, which has obviously displayed in many planning practices. This paper will centre on the connotation of living heritage and explore its applications approaches through conservation practices. It firstly introduces the definition of living heritage and its characteristic and major elements, clarifying the relationship between tangible and intangible parts. Afterwards, the paper mentioned the extension and connotation of the concept of ‘cultural heritage’ over the last two decades through a series of authoritative documents issued by some typical international heritage protection and research organizations. Among them the shift of view in living heritage conservation practices is summarized by the author as ‘trends from commodity-oriented renewal to culture-oriented and people-centred revival’. Next, two design practices in Nanjing, the capital of Jiangsu Province, China, are taken as examples to illustrate the implementation through the interaction between tangible and intangible parts and the connections to community. Both are innovative ideas and good trials to ameliorate conventional conservation approach. The paper concludes with thoughts on the positive significance of living heritage conservation, highlight on the continuous tracking and management to achieve long term sustainability, and expectation for the further exploration on the balance between commercial interests and original continuity of community.

Living Heritage and its tangible and intangible continuity

Living Heritage is characterized by ‘continuity’, in particular those historic places that are still a ‘living’ part of their community¹. Although we do not regard any heritage as ‘dead’, some heritage sites have been occupied by new functions after touristic, economic or social transformation like ‘museumification’. Diversity, continuity and community (three key elements of heritage) are largely overlooked during the process². This kind of conventional conservation approach might indeed bring new vitality to the heritage to prevent isolation from current society, but it also means the connections between community and heritage have been suppressed or even

¹ Wijesuriya, “Living Heritage: A summary,” ICCROM, 2015.

² Wijesuriya, “Conservation in Context,” Edizioni Polistampa, 2010.

broken down to some extent³. The question that needs to be asked is whether local residents can still enjoy or benefit from the heritage places that have been converted into popular tourist attractions⁴.

Continuity does not mean invariance. It consists of several continuous elements, namely, original functions, community connections, cultural expressions and long-term care. In this context, changes are inevitable and should be embraced as a part of the continuity rather than reduction. Constant evolutions can occur to both tangible and intangible components, such as expansion of existing dwellings to better serve the growth of population, or old customs which have been altered or abandoned with the passage of a generation. Some long-term negative consequences are due to greater emphasis on the fabric and neglect of the living dimensions. From the perspective of sustainable development, the purpose of conservation is not to 'freeze them in time and space as material manifestations', but to ensure functional in the lives of communities⁵.

Tangible and intangible are a unity of opposites, so are tangible cultural heritage and intangible cultural heritage. Conventional conservation approach tends to separate them. For the former, especially the historic districts, the most important thing is to protect the texture of the old city formed hundreds of years ago, as well as the streets and alleys with friendly human scale. For the latter, the treasures are actually those real-life memories of the local residents as if had been integrated into their bone marrow and blood. In fact, communities do not compartmentalize heritage as tangible or intangible. It does not make sense to update the material space without considering human needs. Besides, without the tangible carriers like human beings, certain intangible heritages cannot be dependent and vice versa. Therefore, in this paper, the author hopes to integrate the perceived dichotomies through the interaction between tangible and intangible.

Figure 1: *A unity of opposites: tangible (cultural heritage) and intangible (cultural heritage).*

Culture-oriented and people-centred trends

As mentioned before, compared to the success in economic factors, much more attention should be paid to exploring new conservation and management approaches and decision-making processes, based on the continuity of both tangible and intangible elements, to enhance the sustainability of living heritage in communities. The author defines the shift of view in living heritage conservation practices as 'trends from commodity-oriented renewal to culture-oriented and people-centred revival'.

Over the last two decades, the extension and connotation of the concept of 'cultural heritage' have been continuously enriched internationally. In 2001, UNESCO adopted *The Universal Declaration on Cultural Diversity*⁶, on the basis of which new heritage types were emerged, such as cultural landscapes and cultural routes. In 2003, ICCROM launched a programme on Living Heritage Sites to emphasize the living dimensions of heritage sites⁷. In the same year, *The Convention for the Safeguarding of the Intangible Cultural Heritage*⁸ was adopted by UNESCO. *The Declaration on the Conservation of Historic Urban Landscapes* was announced in 2005, revised and final adopted in 2011 as a good trial to reconnect the different cultural traditions with socio-economic dynamics that are present in any contemporary city. In 2015, ICCROM developed a community participation programme for promoting '*the People-Centred Approach to Conservation*'.

The change of protection scope in China also shows the similar trends from static objects to living remains, from material elements to a combination of material and non-material elements. The emphasis on living continuity protection of historic districts is also in line with the international concept of sustainable development. Though the current understanding of 'authenticity' has not yet reached a rational attitude, the early blind pursuit of 'modernization' has been largely corrected in China. It is gratifying to note that behaviors like forced demolition

⁸ Wikipedia, "Convention for the Safeguarding of the Intangible Cultural Heritage."

of shabby ancient houses or construction of fake antique commercial streets has gradually been abandoned these years. To avoid large-scale demolition and construction, attempts have been made to explore small-scale, progressive and organic renewal approaches.

On one hand, these trends are closely related to the increasing importance of culture as a kind of soft power. Chinese President Xi Jinping delivered a report at the 19th National Congress of the Communist Party of China on Oct. 18, 2017. Xi stressed that cultural confidence represents a fundamental and profound force that sustains the development of a country and a nation. He called for a culture that is sound and people-oriented, that both promotes socialist material wellbeing and raises socialist cultural-ethical standards⁹.

Regarding to the protection of cultural heritage, Xi Jinping pointed out that, 'To meet the people's new aspirations for a better life, we must provide them with rich intellectual nourishment. We will strengthen protection and utilization of cultural relics, and better preserve and carry forward our cultural heritage.' He put forward a vision to let those treasures come alive, for instance, the cultural relics collected in the forbidden palace, the heritages displayed on the vast land, and the characters written in ancient books¹⁰.

On the other hand, the reason lies in the continuously strengthened bottom-up civil coordinating forces. The implementation of urban planning is a process of 'game and distribution' of the interests of administrative power, civil coordination and market forces¹¹. The improvement of the overall quality of citizens contributes to higher attention to public space, public life, and public events. The requirements of most people are usually found in the debate, so as to make a city dynamic and harmonious. This might also be one of the passive reasons for people-centred trend.

This trend is even more pronounced in cities with higher levels of citizen culture, one of which is Nanjing, the capital of Jiangsu Province, China. There are nearly fifty colleges and universities in Nanjing, second only to Beijing and Shanghai, together with numerous scientific research institutes and troops. Meanwhile the total population of Nanjing is far below Beijing or Shanghai. Some cutting-edge living heritage protection projects have also emerged under this circumstance in Nanjing. Two practices the author participated in are taken as examples below to illustrate how the culture-oriented and people-centred trends can be implemented through the interaction between tangible and intangible parts.

Project 1: conserve intangible heritage in a tangible way

In the 'Reflection Alley' project, our planning and design team conceived a brand new way of protecting and revealing historic streets. It treats the street as an open museum, utilizing current semi-dismantled remains to provide a stage for dialogues between history and modernity, and endows the historic legacy with a sustainable future.

Core issue of Pingshi Street

This is a conceptual design proposal for an existing historic street, 'Pingshi Street'. The site is located in the old town of Nanjing, a city recognized as one of the Four Great Ancient Capitals of China, and it is now the second largest city in the East China region¹².

As a thousand-year-old ancient street, 'Pingshi Street' is actually an alley compared to our current urban scale. In the past, the street was a fusion of culture and business, with many traditional food shops and leather workshops on both sides, most of which are two-story old wooden houses.

In general, streets are often not as 'lucky' as buildings to get a priority, considering more complex interest entanglements and higher renovation costs. For example, Ganxi's Mansion nearby, commonly known as "the ninety-nine and a half rooms" built two hundred years ago, has been restructured into a folk museum and open to the public now¹³. As time goes by, it no longer conforms to the definition of 'living heritage'. The reasons that Ganxi's Mansion can be promptly repaired include not only its great historical value and rare huge scale, but also its relatively independent ownerships and the continuous relocation of original residents.

There was a period of 'tough' time when 'Pingshi Street' underwent partial demolition in 2013, due to the difficulty to repair the wooden structures and the pressure from the rising land price of the old city centre. However, it quickly triggered a strong social debate which forced the demolition to stop.

¹⁰ China Youth Network, "Xi Jinping talked about the protection of cultural heritage."

¹¹ Southern Weekly, "Urban Construction in Nanjing Progresses in Debate."

¹² Wikipedia, "Nanjing."

¹³ People's Daily Online, "Ganxi's Mansion - The ninety-nine and a half rooms."

Afterwards, some houses were designated as sites to be protected for their historical and cultural value at the level of municipality. According to Law of the People's Republic of China on the Protection of Cultural Relics, the principle of keeping these cultural relics in their original state must be adhered to in the repairs and maintenance at the sites and in any removal involving these sites.

However, the other part of the street was still in an awkward situation. For a long time, local residents had to pass by those ruins every day. According to field surveys and interviews with locals, a core issue was raised. Is there an appropriate way to revitalize the street and meet all of the following goals at the same time?

- Keeping the cultural relics in their original state
- Displaying the historical and cultural value of the street
- Reusing the broken walls and wooden structures from the ruins
- Providing vitality for modern community life

Figure 2: Public Space Renovation Plan for Pingshi Street.

Tangible 'Reflection Alley' and intangible open museum

Therefore, the planning and design team put forward the concept of 'Reflection Alley', regarding the Pingshi Street as an open museum. No matter tangible or intangible, each historical fragment here is an exhibit. It can be as large as a courtyard or as small as a kettle. It may be a dish of traditional fried dumplings or a piece of

memory told by the elders. In other words, not only the material cultural remains are cherished, but also the memories of local residents will be recalled.

Six potential nodes in Pingshi Street were selected to further develop the detailed plan. Just like the preparation before the display, each historical fragment here went through the cleaning up, appraising and repairing process. In addition to the protection, more efforts had been made to renovate public space and stimulate community vitality. The 'reflection' idea can be perceived in the following ways:

- Transparent materials were used to complement the street interface. It helps to reproduce the original scale and texture of the historic blocks and provide containers for social activities.
- Vertical sections of the architectural structures left over from the demolition were protected by special glass covers. Some old photos of the building were hung on the wall which had an educational subtext.
- The trusses of architectural structure that remained in the site were redesigned and integrated into new communication space.
- If the street facade on one side had been missing, glass was used to reflect the appearance of the other side of the street to reshape the past image.
- To build a landmark at the street entrance reusing those old objects and discarded materials from the site.

In this project, it is the culture-oriented conservation of tangible heritage, which promotes the intangible heritage. It enables the street to 'self-describe', providing a new way of thinking for the conservation of living heritage. Pingshi Street has been revitalized by new vitality and integrated into the contemporary community.

Project 2: conserve tangible heritage in an intangible way

In the Xiaoxihu project a 'Five-stakeholder Platform' is set up to support the progressive revitalization of a historic area. Through in-depth community engagement, our planning and design team have developed a three-phase planning guide helping locals to protect and repair their residences thus stimulating the vitality of community life.

Core issue of Xiaoxihu

The project site 'Xiaoxihu' is located in the south part of Nanjing inner city. The total area is about 4.69 hectares, with 1,390 households and 2,600 people living there. The value of heritage conservation here lies in its well-preserved traditional street pattern and a large number of traditional Ming and Qing Dwelling houses.

Now the block is among the list of 22 historic townscape conservation areas in Nanjing, which was announced in *Conservation plan of Nanjing historic city, 2010-2020* by municipal government. This plan divided historic areas (selected to be protected) into three protection levels, namely, historic districts, historic townscape conservation areas and general historical areas. Xiaoxihu belongs to the middle protection level, emphasizing both authenticity and flexibility in terms of protection requirements¹⁴.

The core issue of Xiaoxihu was the contradiction between the dilapidated living conditions and the growing demand for modern life. The per capita living area was less than 12 square meters according to the statistics of 2015. Apart from the high density, another imminent dilemma was the lack of basic living facilities (toilets, bathrooms, sewer system, prevention of roof leakage, etc.). It was imperative to expand the living space intensively, improve the living conditions efficiently, and ultimately enhance the vitality of the community on the basis of inheriting historical features¹⁵.

The government had organized some investigation and concept planning work about the final vision of this area. However, those ideas were a mere scrap of paper, without practical implementation plan guiding the whole regeneration process¹⁶. Another reason for the suspension of the ideas was related to the nearby tourist attraction, 'Laomendong'. It had a similar historical background to Xiaoxihu. Driven by consumption culture, this area had undergone a thorough relocation of local residents at the cost of high demolition and reconstruction funds. This kind of commodity-oriented renewal can maximize land benefits in the short term, and meanwhile lead to the depression of the overall living atmosphere of the historic blocks. After comprehensive consideration, the government decided that the Laomendong's mode will no longer be applied to Xiaoxihu. A culture-oriented and people-centred revival approach that would not just consider the material space was waiting to be presented.

Intangible ‘Five-stakeholder Platform’

It was indicated in the guidance note (People-Centred Approaches to the Conservation of cultural heritage: Living Heritage) published by ICCROM in 2016:

Communities contain capacities and assets that outlast political or professional structures and complement specialist knowledge and skills. Where the relationship between people and heritage has been weakened or broken, a people-centred approach seeks to identify the problems and rectify them. In this context, heritage is seen as having the potential to play an active role in communities and bring benefits to people, thereby demonstrating that heritage is meaningful to society, as well as gaining society’s support for its on-going use and protection.

The crux of the controversy lied in the fact that individual residents of Xiaoxihu had not formed an organized whole to participate in the coexisting multi-stakeholders’ game with the equal rights to speak. With this in mind, the planning and design team firstly conducted in-depth interviews with 216 property units to stimulate more extensive community involvement. Outputs included a deeper understanding of the specific desire of each household to improve their living standards, as well as an ‘identity file’ with photos and requirements for each property unit. Moreover, we also unearthed some potential community leaders who were willing to speak for the interests of the residents. These above were conducive to providing residents with personalized solutions, predicting the difficulty of advancement and implementation of the follow-up demolition plan, and ultimately strongly guiding the direction of the overall conservation strategy.

Throughout the design process, there were various forms of public participation, such as public exhibitions, cognitive map graffiti events, community open days, and the establishment of social media platform public pages¹⁷. More often, the exchanges within five stakeholders’ platform were achieved through meetings. A vivid and easy-to-read ‘Five-stakeholder Platform Guidebook’ defined the rights and responsibilities of each party:

- Planning Bureau and other government functional departments are responsible for formulating and interpreting the policies and handling specific policy issues arising during the process.
- Sub-district and Community Neighbourhood Committee undertake a large number of basic tasks such as opinion collection, policy advocacy, and coordinating the specific contradictions in the process.
- The planning and design team communicates directly with the residents, proposes revival plans, answers technical questions of architectural design, and guarantees the goals and effects of the planning implementation.
- The major investor is in charge of the infrastructure construction and the disposal of public housing. Commissioned by government or residents, construction team works according to the architectural design plans.
- With the help of community autonomy organization, local residents can have equal dialogue with other stakeholders and put forward their requirements of the architectural design.

Figure 3: Public exhibition. Figure 4: Community open day. Figure 5: Cognitive map graffiti event.

Tangible construction guide

The conservation of Xiaoxihu is a continuous process of development. A three-phase, small-scale, progressive construction guide was developed for different types of functional units. In addition, the design team chose a typical site for each type of functional unit for a pilot design.

- In the first phase, most of the work will be carried out to improve people’s livelihoods. It will last for 3 to 5 years to address the issues that local residents are most concerned about, such as improving infrastructure,

¹⁷ XU Yiran, “Participatory urban design methods.”

adding toilets and kitchens, etc. The reserved and some newly added public service spaces will start renovation or construction in the form of government co-ordination. Residents can freely choose whether to accept compensation for demolition and move at any time. With reference to the style guide, residents can independently update relatively good residential units. Community autonomy organizations are still in the process of nurturing and the five-stakeholder platform has not yet been completed¹⁸.

- During the second phase, the five-stakeholder platform is established, on the basis of which all types of functional units will be built. The whole process is estimated to take 5 to 7 years. Government will mainly promote the construction of public service space and the conservation of historic buildings. Correspondingly, the renovation of general dwelling units is led by community autonomy organizations. Once a consensus has been reached among residents sharing the same house, they can seek help from the five-stakeholder platform and apply for the permit. Reaching the consensus as soon as possible gives priority to improving their dwellings.

- The third phase is expected to take another 3 to 5 years, focusing on the joint updating of the general dwelling units. The five-stakeholder platform undergoes constant adjustment and improvement while the construction and renovation of public space have ended. Inevitably, there will be some groups that do not reach consensus and will continue to negotiate abided by the principle of residents' free will and five-stakeholder consensus.

In summary, the Xiaoxihu project itself was an innovative attempt of collaborative planning, achieving a full range of social mobilization, and gaining in-depth design results and extensive social influence. The most precious intangible heritage here is the residents themselves and their lifestyle, which is the core of the conservation of living heritage. The intangible people-centred approach helps to give equal respect to different stakeholders, particularly safeguard the interests of disadvantaged communities, avoid potential conflicts, and ultimately achieve a smooth conservation of tangible heritage.

By the end of 2017, the first phase of work has made some progress in accordance with the guide. A pilot part of the municipal common ditch is under construction. Some buildings planned to become public service spaces in the future are expropriated under the premise of respecting the wishes of residents and property owners.

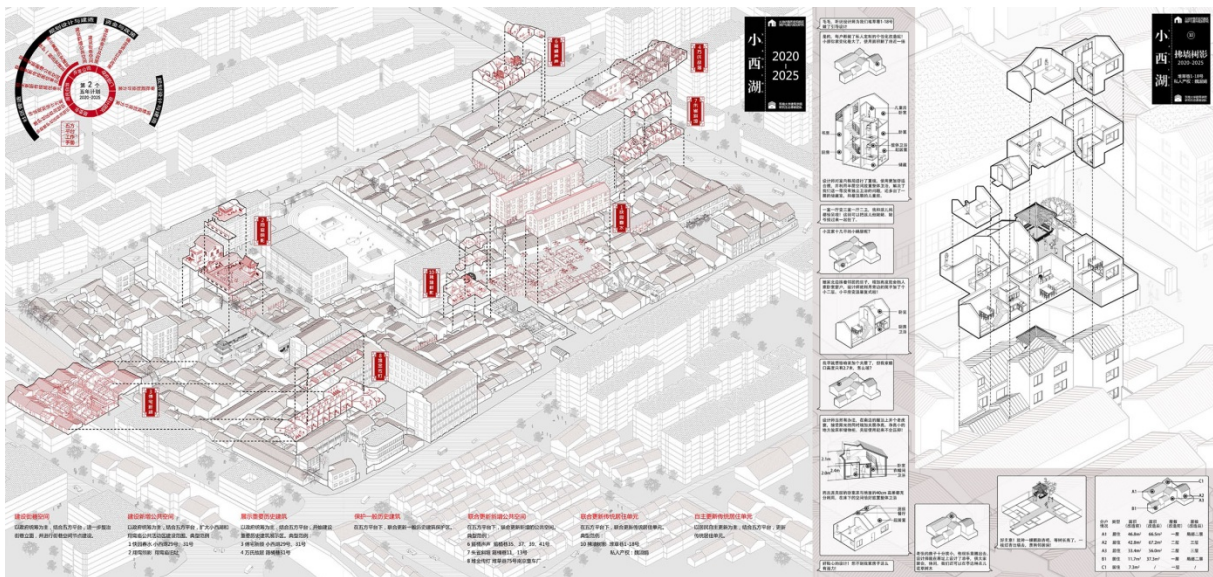

Figure 6: Construction guide for different types of functional units for Xiaoxihu.

Conclusions

Living heritage is defined as a heritage place maintains its original function and connects with community. Its essential characteristic, ‘continuity’, does not mean invariance, but is accompanied by changes in both tangible and intangible components. Over the last two decades, protection scope of ‘cultural heritage’ has been continuously enriched worldwide. UNESCO and ICCROM put more emphasize on sustainable development in terms of economic, environmental and social factors, and the living dimensions and community involvement of heritage sites, to reconnect the different cultural traditions with socio-economic dynamics that are present in any

¹⁸ ZOU Jianguo, “The inheritance and development of residential space.” essential

contemporary city. In China, especially in the cities with higher levels of citizen culture, shows the similar trends shifting from commodity-oriented renewal to culture-oriented and people-centred revival in living heritage conservation practices. There are two main reasons for these trends: the increasing importance of culture as a kind of soft power at the top-down level, and the continuously strengthened bottom-up civil coordinating forces.

From the two projects (Pingshi Street and Xiaoxihu) introduced above, one can easily perceive the gratifying progress from conventional conservation methods separating material and non-material parts, to new small-scale, progressive and organic revival approaches with tangible and intangible interactions. Whether the starting point is 'tangible' or 'intangible', the ultimate goal is to achieve long term sustainability in safeguarding heritage and its hidden culture with an empowered community engaged in decisions made for them and their heritage, which is the real motivation for advocating culture-oriented and people-centred revival in the process of protecting living heritage. The systematically approaches of living heritage can be seen in the ICCOM guidance note *People-Centred Approaches to the Conservation of cultural heritage: Living Heritage, 2016*, from which one may have a deeper understanding of living heritage.

More efforts should be placed on the continuous tracking and management of living heritage. After all, there is no end or a simple completion to maintain the vitality of community and reach the harmonious coexistence with society. Besides, the economic or commercial interests mentioned above are not unimportant as well. They are indispensable sources for the restoration work and need to be considered. In the context of this article, the emphasis is on the perception of a comparatively more noteworthy issue. In fact, how to balance economic interests and original continuity of community is also a problem that needs further exploration.

Acknowledgements

The conceptualization of this article was stimulated by the preparation for a new magazine initially called Human-habitat Heritage started in July 2017 for which the author is responsible. The author would like to thank all the respondents for their valuable input and for the materials they provided for this paper. This paper would not have been possible without the assistance from my design team members in Pingshi Street and Xiaoxihu projects. Many thanks to Prof. WANG Jianguo, academician of Chinese Academy of Engineering, my tutor in Southeast University, China, for his support and guidance at various stages of the research. Special thanks to CHEN Xiaohui, director and my tutor in Urbanisation and Urban Rural Planning Research Centre of Jiangsu, China, for her encouragement in the process of the full paper writing.

Disclosure Statement

No potential conflict of interest was reported by the author.

Notes on contributor

XU Yiran is an urban planner, urban designer and young scholar of Urbanisation and Urban Rural Planning Research Centre of Jiangsu, China. She participated in some research and projects on sustainable urban planning and design at Kungliga Tekniska Högskolan, Sweden and Technische Universität Berlin, Germany in 2014. One of her recent studies at Southeast University, China in 2017 focused on the development of participatory approaches for urban design under the new environment of network data and media. She is interested in urban form and public space quality, eco-city, and heritage conservation (the reuse practices of historic buildings and the role of stakeholders involved).

Succession of the image of the city in the movement for urban design by local proprietors in Ginza from pre-war to post-war

Takahiro Miyashita*, Naoto Nakajima**

* *Doctoral Student, Department of Urban Engineering, University of Tokyo, miyashita@ud.t.u-tokyo.ac.jp*

** *PhD, Department of Urban Engineering, University of Tokyo, naoto@ud.t.u-tokyo.ac.jp*

This paper revealed the development of the movement for urban design by local proprietors in Ginza, Tokyo from 1930's to 1960's. Ginza Street is known as one of the first modern style streets in Japan. This street has developed greatly by modern buildings and advanced urban design methods in modern times and after although it has also suffered serious damage twice by Great Kanto Earthquake (1923) and bombing in 1945. Therefore, buildings and urban space have seen repeated reconstruction and renewal until today. On the other hand, if we pay attention to local proprietors, we can understand that they have developed the movement for urban design of Ginza Street continuously and succeeded the awareness of the issues toward urban space. So this paper finds a new historical context of Ginza through the elucidation of development of their movement from viewpoints of how the awareness of the issues and the image of spaces have changed.

Keywords: Modernization of the city, History of Machizukuri, Shop-owners' Association, Ginza

1. Introduction

Ginza Street, is known as a main street of Tokyo, is one of the first modern style streets in Japan. The starting point of its modern history was the construction of "Ginza Renga-gai (Ginza Brick Town)" in 1872 (Meiji Period.) This street has developed greatly with modern buildings since that time, and scholars have studied it from various viewpoints. We can find several important previous studies in fields of planning history and architectural history. Fujimori (1982) approached the history of Ginza Street in terms of architectural history and studied the development of planning of Ginza Renga-gai by the Meiji Government¹. And he also examined changes of architectural styles a lot of architects had used in development along Ginza Street from the Meiji period to pre-war in the Showa period² (1868-1945.) Hatsuta (2004) revealed changes of urban functions and development along the street in terms of formative history of a busy street³. Okamoto (2003) documented changes of land use and land ownership in Ginza since the Edo period and considered the relationship between these changes and urban development.

Ginza Street suffered catastrophic damage three times, by fire in the Meiji period (1872), by the Great Kanto Earthquake (1923) and U.S. bombing in 1945. These disasters razed buildings to the ground. Three scholars mentioned previously regard these disasters as turning points in formative history of Ginza and indicate the extinction of urban context. In addition, they grasp a town of Ginza as the aggregate of architectures and draw history of Ginza from viewpoints of the accumulation and changes of architectural actions by various architects. Considering these studies, we can understand the historical context that Ginza Street has been developed through overcoming serious disasters and repeating reconstruction and renewal by modern architectures.

On the other hand, we can find another historical context if we pay attention to local proprietors' actions. There is a store association: "Ginza Street Association (GSA)" composed of proprietors in Ginza Street. They have been continuously involved in the urban design of Ginza Street since their establishment in 1919. Although Miyashita (2018) revealed the change of their movement⁴, the consideration on the historic significance of their movement was insufficient. So this paper paid attention to consistency of the issues, the image of spaces, and a role as a place where local proprietors argued. And we find the historical value in the elucidation of arguments on townscape they have desired and reveal development of their movement from pre-war to post-war.

2. Viewpoints of analysing and methods

GSA has tackled arguments on identities of their town, Ginza and ideal townscape they desired since the establishment of an organization. Especially, they started large-scale movement in 1930's in preparation for the 1940 Tokyo Olympics and Japan Expo. They were aiming for realization of comfortable urban space for shoppers and beautiful townscape by international events in 1940. But it became difficult to continue their actions in the war regime of Japanese society after 1938. To make matters worse, buildings along the street were burned down by air raids during WWII. Although it suffered serious damage, they restarted their movement as

Figure 1: Current Ginza Street

soon as the war terminated in 1945. And they achieved the removal of telegraph poles and the abolition of the tram in 1960's.

It is worthy of notice that the organization of GSA has played a role as a place where local proprietors argued the future image of their town for a long time. The existence such a framework enabled them to succeed the awareness of the issues toward urban space from pre-war to post-war. So this paper reveals changes of a place they have argued their town and the image of spaces shared among them. Then, based on these analyses, this paper finds a new historical context different from existing ideas based on the history of architectures in Ginza.

This paper pays attention to various internal materials kept in the office of GSA. For example, a great number of scrapbooks have been edited since 1936. We can find articles on not only their movement but also urban development in Ginza in these scrapbooks. This paper reveals historical facts on their actions through them. In addition, this paper carried out searching of major newspapers by digital archives of Yomiuri Shimbun and Asahi Shimbun as it is unclear whether all articles about GAS have been collected in these scrapbooks. We also pay attention to internal materials such as the record of proceedings of the governing body. All policies of movement have been decided in the governing body. Therefore, we understand the process of arguments inside through these texts. In addition, this paper reveals the change of external claims through petitions to the authorities and articles in bulletin of GSA.

3. Development of the movement by Ginza Street Association in 1930's

3.1. Development of the movement aimed for the Tokyo Olympics

In July 1936, it was decided that two international events: Olympic Games and Expo were going to be held in Tokyo in 1940. With this decision as a turning point, the importance of urban design in Tokyo was argued by newspapers. GSA decided to tackle movement for the removal of telegraph poles and the abolition of the tram in these situations⁵. A promotor of this movement was Koji Hosaka (The vice-president of GSA.) A newspaper article in those days reported that this movement had been started based on an awareness of the issues that these telegraph poles and overhead wires of the tram in Ginza Street made townscape ugly.

We can understand the awareness of the issues they had and the image of ideal townscape from their remarks in those days. For example, we note the "Conversation meeting on the symbol of metropolis" supported by a newspaper company on June 1st, 1936. 22 proprietors in Ginza including the president and the vice-presidents of GSA participated in this meeting and argued problems on townscape and identities of their town. At the beginning, a facilitator asked them, "Which way should Ginza Street aim at a promenade or a shopping street?" All participants answered "Ginza Street should be a promenade" for this question. An expression of

Figure 2: Ginza Street in pre-war (1936)
Source: Kyobashi Library, Tokyo

Figure 3: Buildings along the street (1934)
Source: Ginza Street Association

“promenade” was used as the image of a street with widened sidewalks, rich green, gorgeous show windows and bright neon signs. Participants stated as follows⁶.

“Show windows in Ginza are greatly inferior to that of Paris. In addition, neon signs are also inferior to that of Times Square in New York. We have to learn about usage of spaces from these cases.”

Umekichi Kosaka (Owner of a restaurant, Hibiya Matsumotorou and Taishoken)

Thus they shared the directionality that Ginza Street should aim at the image of spaces idealized Western cities. On the other hand, they also desired a Japanese style townscape. There were not many Japanese style architectures in those days though a lot of buildings had been built as reconstruction buildings after Great Kanto Earthquake in 1923. Most of these buildings adopted Western style, Historicism and Art Deco. But local proprietors didn't necessarily appreciate such a townscape.

“I agree with the idea of creating a nationalistic townscape. It must not be the imitation of Western cities. It is worthless that creating townscape that visitors from foreign countries can't recognize as Japanese city. I desire Japanese style architectures like old castles are built more.”

Yaichi Tamaki (Senior adviser of GSA)

Thus local people shared two inconsistent images of townscape. The former image of town scape idealized Western cities had been shared since construction of Ginza Renga-gai. On the other hand, the later image called “Japanese style townscape” and “nationalistic townscape” came to be shared as it was supposed that many visitors would come to Ginza from foreign countries in 1940.

3.2. Development of movement for the Tokyo Olympics (1940)

GSA submitted a petition to the mayor of Tokyo and the chair of city assembly to assert the importance of the abolition of the tram in October, 1936⁷. But a reaction from the authorities was poor as the fare of trams became the yield of taxes⁸. So GSA took noticed of Nihon Toshi-Fukei Kyokai (The Society of landscape of cities Japan) as a new partner for cooperation. Toshi-Fukei Kyokai was established by Yoshitane Tochinai (urban critic) and composed by private influential person such as journalists, professors, presidents of companies, and authors⁹. GSA decided to cooperate with this organization to advance their movement.

Two organizations named the team “Ginza judging team,” and they hold an inspection and a conversation meeting on November 24th. Participations from Toshi-Fukei Kyokai proposed the following ideas in this meeting¹⁰.

“Japanese style architectures should be rebuilt to Western style buildings as there is not the sense of unity of townscape in Ginza Street.”

“Buildings along the street should have at least 4 stories to be the unified townscape.”

“Each building should have a show window on the 1st floor.”

“Street trees should be changed from willows to ginkgoes as willows in Ginza are very scanty.”

Figure 4: Sidewalk of Ginza Street (1936)
Source: Kyobashi Library, Tokyo

Figure 5: Noise survey by Ginza prosecutor team (1936)
Source: Ginza Street Association

“Bicycles parked along the street should be removed.”

“The tram should be abolished, and GSA should donate the stylish community bus to the city government.”

“Street lights should be renewed.”

“The number of entrances of the subway should be increased.”

Though the height limit in Ginza Street was then 31m by the building regulation law, most of buildings along the street were one story or two stories except department stores. In addition, willows were growing poorly because of a decrease in ground water¹¹. Toshi-Fukei Kyokai criticized these situations harshly. In the end of this meeting, they decided to tackle the removal of telegraph poles and the abolition of the tram together. Then, based on these arguments, they hold a survey of noise pollution in Ginza Street on December 19th. The purpose of this survey was indicating the problems of the tram to society¹², and newspapers reported this survey on a large scale.

Thus GSA and Toshi-Fukei Kyokai developed movement for the realization of “Urban Beauty.” However these two organizations had different images of ideal townscape. Although local proprietors had two directions of images: modern townscape idealized Western cities and Japanese style townscape, Toshi-Fukei Kyokai criticized Japanese style architectures and willows. Especially, Yoshitane Tochikai asserted that willows weren’t suitable for street trees, and he stated, “Ginkgos are ideal trees to decorate the modern main street” in the conversation meeting mentioned before¹³. For this claim, Koji Hosaka accepted the change of street trees to ginkgoes. As proprietors had regarded willows as the symbol of “Japanese style townscape,” they accepted this claim conditional on planting historical tree species in Japan. However, this decision wasn’t carried out as conditions of willows had changed for the following year¹⁴.

3.3. Release of “Ginza remodelling plan” and the end of the movement for “Urban Beauty”

In January, 1937, GSA released a plan for redesign of urban space from medium and long-term perspectives. The plan was named “Ginza Kaizo Keikaku (Ginza remodelling plan.) The contents are as follows¹⁵.

“Create a beautiful busy street through the removal of telegraph poles and reconstruction of buildings.”

“Promote pedestrianization through the abolition of the tram and the ban of through traffic.

“Ban running of cars except the bus in a period of time with many crowds.”

“Design small parks on the street in such block, and keep atmosphere clean by lawn and shrubs.”

The contents of this plan are different from the proposals by Toshi-Fukei Kyokai in conversation meeting in December, 1936 (3.2, 1.10). But these proposals affected their movement not a little as Hosaka made referenced in introducing the rule of minimum height of buildings in the media.

In addition, GSA started negotiation with the city government on the removal of telegraph poles, and they reached an agreement in February, 1937¹⁶. Thus they finally anticipated the realization of one of the main themes.

However, these opportunities were lost as Japanese society entered the war regime after 1938. The biggest turning point was enactment of the law to ban the late-night business of stores except restaurants in 1938. This regulation led to the sluggishness of commercial activity in Ginza. In addition, neon signs were banned for the purpose of reduction of the electricity consumption in the same year. To make matters worse, the agreement to remove telegraph poles was cancelled by the Ministry of Finance for the reason of reduction of the budget in the war regime¹⁷. Thus opportunities for “Urban Beauty” were lost, and the GSA movement ended in failure.

4. Development of the movement by Ginza Street Association in post-war

4.1. Efforts in the war damage revival period

Buildings in Ginza suffered serious damage by air raids in 1945. Nevertheless GSA undertook the reconstruction of a shopping street as soon as the war terminated, and they procured timbers for temporary buildings. In addition, they submitted “Ginza reconstruction plan” to City Planning Division of the Tokyo metropolitan government in December, 1945¹⁸. The contents included ideas: the removal of telegraph poles, the abolition of the tram, the change of street trees from willows to ginkgos and the stipulating of minimum height of buildings. In this plan, the issues they had shared in 1930’s was succeeded though it was under the condition most buildings had been burnt down. In addition, ideas proposed by Toshi-Fukei Kyokai in pre-war (3.2, 1.10) were included. We can also understand that proprietors succeeded ideas they had shared as the image of ideal townscape called “promenade” in 1930’s. On the other hand, the image of Japanese style townscape called “nationalistic townscape” wasn’t expressed in this plan.

Figure 6: Sketch of buildings along Ginza Street
Source: Shogyo Toshi-bi Kyokai, *Encyclopaedia of Ginza Past and Present* (1951)

Although this magnificent plan wasn't put into practice due to supply shortages in the war damage reconstruction period, GSA achieved the improvement of street space. Although a road of Ginza Street was under the control of the Tokyo metropolitan government, they didn't have enough budgets for space design in Ginza Street¹⁹. So GSA played a role of the manager of sidewalk substantially in those days and constructed new pavement and street lights from 1949 to 1951. These street lights were selected in a design competition. The judge was Hideaki Ishikawa (the chief of construction bureau of Tokyo metropolitan government, urban designer) who had tackled movement for "Urban Beauty" with GSA as a member of Toshi-Fukei Kyokai in 1930's²⁰. We can also infer their passion to design new townscape from the fact that the design of street lights was entered in the Register of Designs.

When we pay attention to then townscape in Ginza Street, we can find show windows in most buildings though many of them were temporary buildings. Local proprietors had found the value in show windows since pre-war and giving advices on lighting and display in shops were main tasks of GSA in those days.

Figure 7: New street lights
Source: Ginza Street Association

4.2. Development of the movement for the Tokyo Olympics (1964)

In December, 1955, GSA decided to tackle movement for the abolition of the tram again²¹. This was one of main themes in "Ginza reconstruction plan," and proprietors more than 80% demanded to remove them according to a questionnaire survey for members of GSA. Although they imagined a desire to create the planting strip between roadway and sidewalk after abolishing the tram, a response of the metropolitan government was poor. The authorities claimed that the tram played important roles in terms of avoiding congestion of the passenger of other public transportation²⁰. So they invited essays and ideas on redesign of Ginza Street in prize competition to raise public interest in urban design in 1957. Experts such as Eiichi Isomura (urban sociologist) and Yoshiro Taniguchi (architect) were invited as judges, and winning works were selected from 273 works²². And Ginza Street Association released a principle of movement on June 6th, 1958. The following contents were decided based on winning works of a competition²³.

"Achieve the removal of telegraph poles and the abolition of the tram."

"Promote to build communal buildings and make the height of buildings even."

"Redesign buildings to be able to go through to back streets."

"Design show windows in each building continuously."

"Design new show windows between roadway and sidewalk."

Figure 8: Ginza Street and the tram
(1955)
Source: Ginza Street Association

In addition, they sent in a petition for the abolition of the tram in October, 1959²⁴. Although they sent a same petition again in February, 1961, the Metropolitan Assembly didn't adopt this petition²⁵. The competent authorities judged that the tram still had a big value in terms of transportation.

On the other hand, GSA developed arguments on construction of pavement on sidewalk with the competent authorities of street space, Tokyo National Highway Office. In August, 1963, they reached an agreement on carrying out of construction of new pavement by the Tokyo Olympics in 1964²⁶. Although local proprietors had a desire to use granites for pavement, they had to give up as it became difficult to dig up the road surface if it was made of granite²⁷. As a result, National Highway Office decided to pave coloured asphalt, and GSA had the decision of a colour of asphalt. Shiro Kimura (the managing committee of GSA, dress designer) selected "pigeon" (beige tones) considering colours of building and pedestrians' clothes²⁸. The construction was completed in August, 1964.

Thus the holding of the Olympics led to increase proprietors' desire for urban design same as pre-war. And they were proud that Ginza symbolized Japan. We can find description as follows in the bulletin of Ginza Street Association²⁹.

“We can't accept French style Ginza and American style Ginza. We want to invite people from the world to Ginza of Japan.”

But a viewpoint to desire traditional townscape wasn't shared among local proprietors, and they had the image of “promenade” same as “Ginza reconstruction plan” in the war damage revival period.

4.3. Arguments for large-scale construction of Ginza Street

In 1967, it was seen the epoch-making change of arguments in the metropolitan assembly. As the authorities had a lot of problems about the operation of the tram in terms of traffic congestion and financial difficulties in those days, they decided to abolish the tram in Ginza Street³⁰. GSA considered this decision as a chance to achieve the large-scale construction of Ginza Street. In addition, they had planned holding of “The Great Ginza Festival” when they heard this news. So they wanted to hold a big event using the whole street space after the realization of construction³¹. They petitioned to redesign street space to National Highway Office as soon as Tokyo metropolitan government decided to abolish the tram. As a result, National Highway Office decided to carry out the overall redesign of street space including the removal telegraph poles based on this petition³². Thus GSA had an opportunity to achieve their longtime aims, the abolition of the tram and the removal of telegraph poles at the same time.

National Highway Office had a plan to pave sidewalk using concrete blocks at first. In contrast to this plan, GSA proposed the following idea to re-use the granite paving stones of the tram³³. As National Highway Office accepted this proposal, GSA achieved their aim they had given up once four years before.

Thus GSA expressed their opinions to the authorities though the movement for urban design from pre-war. On the other hand, they didn't have a clear policy on street trees. Willows in Ginza Street were getting poor in growth under the influence of decrease in ground water and car fumes in 1960's. Arguments whether should change tree species occurred among local proprietors based on these situations. Keizo Uekusa (the managing committee of GSA) stated, “Willows can't harmonize with modern buildings though they used to harmonize with Japanese style architectures in days of old³⁴.” However, board of governors couldn't come to the decision about this argument as some members took objection to remove them. As a result, they decided to leave the choice on street trees to National Highway Office in order to make negotiation for the redesign of Ginza Street a success³⁵. Based on this offer, National Highway Office decided to remove willows and plant raphiolepis umbellata³⁶.

Source: Ginza Street Association

Figure 11: Willows in Ginza Street (1960)
Source: Ginza Street Association

Figure 9: Ginza Street after large-scale construction (1968)
Source: Ginza Street Association

Construction of Ginza Street was carried out from December, 1967, the day the tram was abolished, and it finished by the day of “Great Ginza Festival” on October 11th, 1968³⁷. The details were the removal of telegraph poles and overhead wire of the tram, the widening and paving of sidewalk, designing of new street lights, planting of new street trees, and the construction of a common duct under sidewalk. And large-scale parades and the big bargain sale on redesigned street in “Great Ginza Festival.”

5. Conclusion - A new historical context of Ginza found in the continuity of the movement by local proprietors

This paper revealed the development of the movement for urban design by local proprietors in Ginza from 1930's to 1960's. Figure 12 is a chart on the change of their movement. We can find things in common on contents of “Arguments inside of Ginza Street Association,” “Release of private plans” and “Petitions to the authorities.” If we pay attention to consistency of the issues and the image of spaces, we can understand themes of their movement were succeeded from pre-war to post-war. Especially, it's worthy of note that the contents proposed pre-war were included in “Ginza reconstruction plan” which was planned under the situation of great damage by bombing. And the steadfast repetition of these arguments had an influence on policies and constructions by the authorities in 1960's. These two policies have been carried out in various cities by administrative authorities in post-war. But they have historical meanings as the goal of continual movement by local proprietors since pre-war in this case.

GSA continued being interested in urban space of Ginza Street after 1970's. Although they had developed the movement through petitions and release of private plans by 1970's, they came to participate in the urban planning administration of Chuo Ward, Tokyo as members of “Ginza Machizukuri conference” after 1988. In addition, GSA and Chuo Ward cooperated for planning of the establishment of district plan in 1990's. Machizukuri by local people entered the new stage.

The organization of GSA has played a role as a place where local proprietors argued the future image of their town consistently for a long time. It can be thought that the succession of such a platform has a great value to take over the awareness of the issues to next generation. On the other hand, the image of spaces shared among them has changed with the times. In 1930's, they had two different images of ideal townscape: the image called “promenade” idealized Western cities and the image called “nationalistic townscape” to introduce characteristics of a Japanese town to visitors from foreign countries. But the later image vanished in post-war though they still had a pride that “Ginza was a symbolic town of Japan.” These tendencies appear conspicuously in arguments on street trees. Local proprietors found the value in willows as the symbol of “Japanese style townscape” in a period

they placed importance on the later image of spaces. But the value of willow wavered in the post-war period as they lost interest in Japanese style townscape. As a result they decided to leave the choice about street trees to National Highway Office.

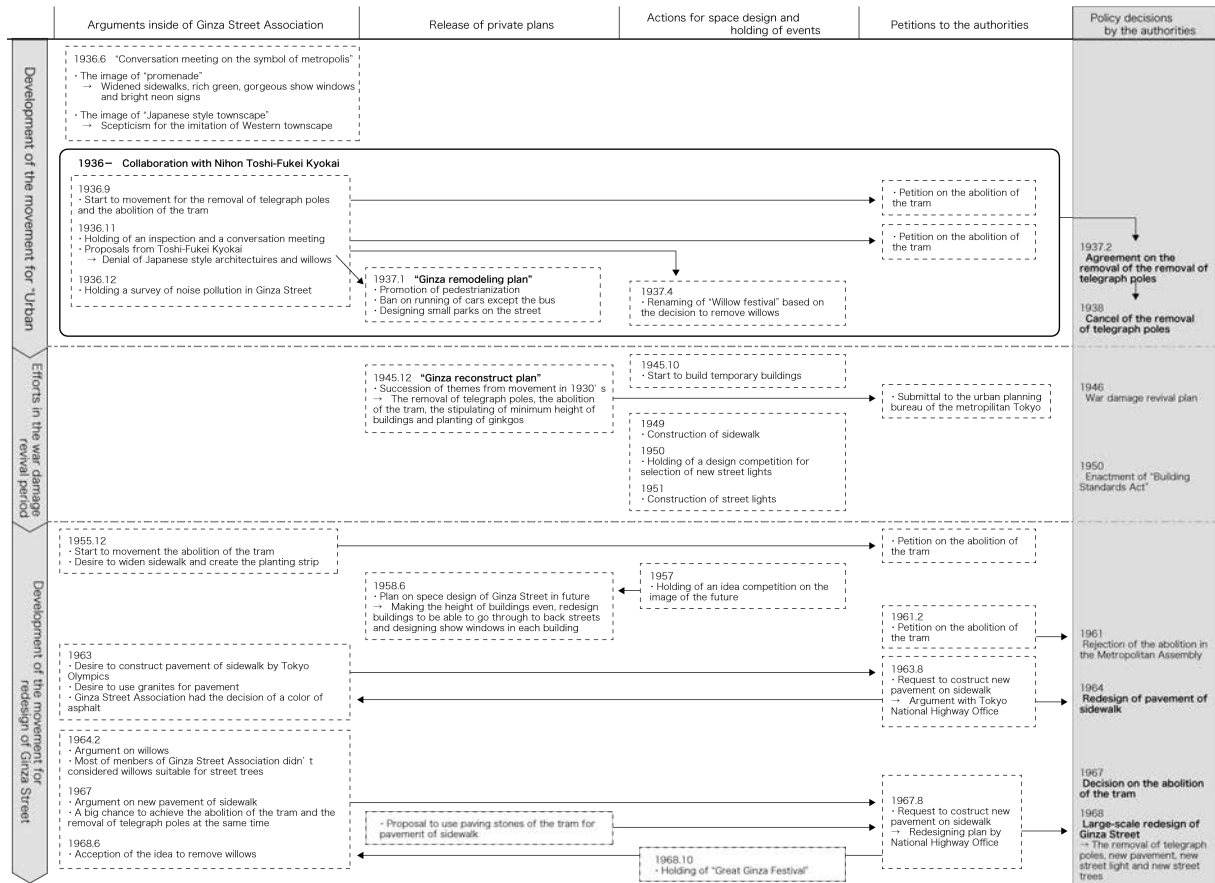

Figure 12: Development of the movement by Ginza Street Association from 1930's to 1960's

Thus this paper found a new historical context of Ginza through placing importance on the accumulation of arguments by local proprietors. This context shows us the different historical view from that of the past found through history of the building of architectures by architects in Ginza. Urban space designed by local people was definitely not many. The history of their movement hasn't paid attention as we can't find the spatial fruits easily. But this historical context shows us the accumulation of time they have attempted to create their town. Finding various historical contexts should lead to the re-recognition of the richness of time in urban space.

Planning*

18 Transportation (Railway)

Study on the Spatial Planning of the Secondary Station –Located Areas along Chinese Eastern Railway

Zhang Bocheng (School of Architecture of Harbin Institute of Technology), Zhao Zhiqing (School of Architecture of Harbin Institute of Technology) and Wang Qinglian (School of Architecture of Harbin Institute of Technology)

At the end of 19th century, Russian tsar, to expand their influence in Far East and consolidate their strategic position in Yellow Sea region in China, built a T-shaped railway penetrating Northeast China, namely Chinese Eastern Railway, which starts from Manzhouli City (in Inner Mongolia Autonomous Region) in the west, ends in Suifenhe City (in Heilongjiang Province) and reaches to Lvshunkou District (in Liaoning Province) in the north. During the railway construction (1897-1903), a large amount of areas attached to railway station-located areas had been constructed and developed constantly, which therefore facilitates the emergence of new type morphology of cluster arising from the railway in northeast China. And the towns' morphology of this period had had the profound influence on the subsequent the towns' development in northeast China. In this research, the author himself went to St. Petersburg in Russia and to check and collect files in Russian National History Archives, from which a large amount of basic files about city construction during the period of the construction of Chinese Eastern Railway have been generated; then, based on the above materials (ages and number), the research period (construction of Chinese Eastern Railway 1897-1903), objects (railway stations along the main lines of Chinese Eastern Railway:) and sample (Station Manzhouli and Suifenhe) are determined. During the sampling process, based on the scale, number and representatives of the railway stations, two secondary stations (Station Manzhouli and Suifenhe which functioned as administrative center, border business center and crucial nodes of railway service, are selected as the research samples; Thirdly, the historic planning drawings and towns' construction for two stations are translated to extract the planning information, earlier city construction, social economy development, location features, land layout, texture of street profile, street transport, buildings' texture, landscape greening and other basic elements of towns' morphology. Two towns are compared to conclude the typical structural pattern and morphology, which include the land layout, grid structure of road network, wide and flat road design, orderly towns' texture, enclosed buildings' texture and concentrated landscape greening. Ultimately, Russian style station in Suifenhe City is taken to conduct field research and empirical analysis and explicit the conservation content of historic features as well as propose the conservation ideas depending on the principles of completeness and authenticity. After hundreds of years, the Russian style stations during the Chinese Eastern Railway have developed into to the commercial centers, which dominate in the modern city. Although the features of earlier Russian style stations have been broken, these centers still demonstrate strong sense of environment and landscape as Russian style colonial city. This research intends to explore the planning content of earlier stations to restores the planning elements of earlier cities with the ultimate aim to reveal the historical landscape of the towns, which is greatly significant to the conservation of urban historical features.

From the Port to the Inland ——Jiaoji Railway and Urban Development and Spatial evolution of Modern Cities in Shandong

Bo Jiang (Shandong Jianzhu University), Qipeng Mu (Shandong Jianzhu University) and Yanyu Cui (Shandong Jianzhu University)

The research mainly focuses on the construction process of Jiaoji railway and its great influence towards the urban development and spatial evolution of modern cities in Shandong Province. The modern transportation system in Shandong, represented by Jiaoji railway as well as the trade network it built, leads directly to change of Shandong regional economic trend and the layout of Shandong economic centers. To demonstrate Jiaoqi railway' s role in the urban development of Shandong, many historical documents, such as Shandong Map in 1831, and the Map of Jianan Fu in 1898, are provided to prove the objectivity of this research. Besides, the researchers did some field surveys to the cities along Jiaoqi railway and collected some first hand data. All the documents and field survey data serve to show the scientific nature of this research. With the help of the documents and the empirical data, the research explores the changes of some cities along Jiaoqi railway. The coastal city of Qingdao, with the boost of city population and the rapid urban expansion under the influence of Jiaoqi railway, has gradually formed its own characteristic city outlay; With the banks, shops and factories built after the opening of Jiaoqi railway, the inland city of Jinan has experienced a economic resurgence and grown into the capital city of Shandong. Many self-sustaining small villages along the line of Jiaoqi railway, such as Zibo, Fangzi, Gaomi, Jiaoxian, Mingshui, Yidu, ect., have changed greatly and developed quickly due to the railway traffic. Since then, new cities of Shandong completely abandoned the traditional city layout and the economic center of Shandong is moving rapidly from the cities and towns along the canon to the cities along the railway and then to the cities along the ocean. The development of city modernization of Shandong went into a new era and the overall economic outlook has been fundamentally changed.

History matters in making Lahore sustainable

Muhammad Imran (Massey University)

Lahore, like many other South Asian cities, is facing sharp population growth and economic development coupled with increased motorisation and a deteriorating urban environment. The second-largest city of Pakistan and capital of the Punjab province, the metropolitan area, had 9.9 million people in 2010, distributed over approximately 3000 square kilometres. As a major economic centre, the city produces nearly 10 percent of national GDP. Although sustainable transport modes make over 60 percent of total trips, the city administration has been criticised by planning scholars for putting most of its recent investment into roads and low-density housing, despite severe air pollution and vulnerability to climate-change-related events.

This paper examines the contradictions and uncertainties that have characterised urban planning in Lahore in the pre and post-independence period by using a sustainable city and sustainable transport literature. This paper begins with a historical overview of urban planning in Lahore by exploring the Mughal and the British period of development and the impact of partition on the post-independence planning. The formal planning documents (Master/Structure Plans) produced from 1947 to 1990 will be reviewed to understand the current structure and transport and environmental challenges in Lahore.

The second section analyses transport and urban development policies and projects since the 1990s. The analysis shows that the status of Lahore as a 'political capital' provide the opportunity to implement the high-quality roads infrastructure (flyovers, underpasses and a ring road) and the country first ever Bus Rapid Transit (BRT) system (2013) and Metro Train project (2018) in the city. The role of charismatic and transformational leadership in implementing these mega projects is highlighted.

The final section shows how the Lahore Bus Rapid Transit (BRT) and Metro train projects can provide a 'window of opportunity' to redefine transport and housing issues and offer a transit-oriented development (TOD) solutions in Lahore. Some radical changes to land use planning and alternative funding sources are explored to examine if an integrated public transport system can be developed in Lahore to provide sustainable mobility for its residents.

ANKARA COMMUTER LINE AS THE PRODUCT AND WITNESS OF MODERN PLANNING EXPERIENCE IN TURKEY

Selin Çavdar Sert (Gaziantep University), Funda Baş Bütüner (Middle East Technical University) and Ela Alanyalı Aral (Middle East Technical University)

Evolution of commuter rail transit systems has always served a tight relationship with the development of urban planning theory and practice. Expansion of urban areas towards peripheral lands, emergence of small size industrial towns, development of specialized urban zones, massive population flow from rural to urban areas, insufficient urban services and poor living conditions of industrial cities as the urban questions of the late 19th and early 20th centuries triggered the invention of new transportation modes and technologies. Commuter rail development in Ankara, on the other hand, has a peculiar history begun with the establishment of the Republic of Turkey in 1923, as opposed to its numerous contemporaries which had emerged as the lasting effects of Industrial Revolution on cities.

In the aftermath of the World War I, quite a number of cities were established, of which some were assigned to be capital cities of new nation-states. In this period, Ankara town was also pronounced as the capital city of the newly established Republic. However, transformation of Ankara from a small Anatolian town to a modern capital city necessitated planned development and highly organized infrastructure intervention. For the establishment of the city, famous figures –namely Carl C. Lörcher and Hermann Jansen- representing the 19th century culturalist school of spatial organization were commissioned. Within this planning context, the commuter line was served as one of the major transportation infrastructures in 1925 to integrate green structures (vacant lands, recreation areas, farms and productive landscapes), emerging residential areas and city center and to introduce modern urban life to the citizens. It was recognized as a planning tool in the designation of the rural-urban continuum, urban green network, community spaces and logistic centers. Keeping in mind this history, Ankara Commuter Line and its historic components are the modern planning legacies of the early 20th century.

Covering approximately 37 kilometers distance, currently, Ankara commuter line operates between the west and east edges of the existing urban core. Besides being a passenger service delimited by urban areas, it is recognized as a planning threshold and provides great opportunity for experiencing and reaching the fragmented historic properties (historic villages and landed estates etc.) of the Republican period plans. In this respect, the aim of this study is to reveal the significance of Ankara Commuter Line as a city planning legacy by mapping its earlier development and accompanied built and landscape heritage.

Study on the Spatial Planning of the Secondary Station –Located Areas along Chinese Eastern Railway

During the Chinese Eastern Railway construction (1897-1903), a large amount of areas attached to railway station-located areas had been constructed and developed constantly, which therefore facilitates the emergence of new type morphology of cluster arising from the railway in northeast China. And the towns' morphology of this period had had the profound influence on the subsequent the towns' development in northeast China. In this research, the author himself went to St. Petersburg in Russia and to check and collect files in Russian National History Archives, from which a large amount of basic files about city construction during the period of the construction of Chinese Eastern Railway have been generated; then, based on the above materials (ages and number), the research period (construction of Chinese Eastern Railway 1897-1903), objects (railway stations along the main lines of Chinese Eastern Railway:) and sample (Station Hailar and Suifenhe)are determined; Thirdly, the historic planning drawings and towns' construction for two stations are translated to extract the planning information ,earlier city construction, social economy development , location features, land layout, texture of street profile, street transport, buildings' texture, landscape greening and other basic elements of towns' morphology. Two towns are compared to conclude the typical structural pattern and morphology. Ultimately, Russian style station in Suifenhe City is taken to conduct field research and empirical analysis and explicit the conservation content of historic features as well as propose the conservation ideas depending on the principles of completeness and authenticity. After hundreds of years, the Russian style stations during the Chinese Eastern Railway have developed into to the commercial centers, which dominate in the modern city. Although the features of earlier Russian style stations have been broken, these centers still demonstrate strong sense of environment and landscape as Russian style colonial city. This research intends to explore the planning content of earlier stations to restores the planning elements of earlier cities with the ultimate aim to reveal the historical landscape of the towns, which is greatly significant to the conservation of urban historical features.

Keywords: urban morphology, urban planning history, Chinese Eastern Railway, secondary railway station.

Introduction

At the end of 19th century, to expand the influence in the Far East and consolidate the strategic position in the Yellow Sea region of China, Russian Tsar constructed a T-shaped railway (hereinafter referred to as Chinese Eastern Railway) through northeast Chinese, which starts from Manchuria in the west, ended in Suifenhe in the east and reached to Lushun in the north (Shixuan Jin 1986,chap 1). During the construction process of Chinese Eastern Railway, the stations along the railway were divided into five types based on the railway transport service and its derived requirements. Among them, the secondary station, as the crucial node of the railway service, functioned as the collection and distribution of the materials, locomotive maintenance and railway administration management, etc(Jianhong Dong 1989, chap 3). meanwhile, the spatial planning and construction of the station-located areas were increasingly developed, which then drove the secondary station-located villages and towns to gradually become the important administrative and border trade along the railway.

Table 1 Geographical statistics of secondary stations

Station	Construction	Original	Distance from	Distance from	Location
---------	--------------	----------	---------------	---------------	----------

		name	Station Harbin	Station Manchuria	
Manzhouli	1901	Mengjiuliya	935km	—	Manzhouli City, Inner Mongolia Autonomous Region
Hailar	1901	Hulun	748km	187km	Hailar District, Hulunbuir City Inner Mongolia Autonomous Region
Boketu	1901	Buhaduo	539km	396km	Boketu Town, Yakeshi City, Inner Mongolia Autonomous Region
Qiqihar	1903	Xitun	270km	665km	Anangxi District, Qiqihar City, Heilongjiang Province
Hengdaohezi	1901	—	271km	1206km	Hengdaohezi Town, Hailin City, Heilongjiang Province
Suifenhe	1903	Pogulanqiana	548km	1418km	Suifenhe City, Heilongjiang Province

I layout of land use

Station-located areas, as the spatial node for the service of railway operation, involves many aspects of railway-related economy, culture, education and administration and others in its types of land use. The specific types include the commercial land for the service of railway transport and trade, the residential land for the living and daily life of railway staff and residents, the recreational land for leisure, medical land for rehabilitation and care and specific land for professionals (including monks, judges, translators, teachers, etc.). Different types of land use are set up to initially form the towns' function of the station-located areas, such as administration, border trade and locomotive maintenance.

As shown in Figure 1 and Figure 2, the layout of land use for two secondary station-location areas takes the railway station as the origin with the distribution along the railway lines, while constantly extending to both sides of the railway. The railway station is located in the center with the elliptical square to the south; closely to the railway station, the residential land is distributed on the west and east side of the square in front of the station, which includes staff dormitory and residential houses; the commercial land and medical land are adjacent to the residential land use, locating in the western part of the town, which include shop, hotels; the special land is scattered in the northwestern part of the town, which includes education land (schools for Russian students), houses for translators and teachers; the entertainment land is between the special land in the western part of the town, which includes clubs and parks. The newly added land for citizen's life, closely to the residential land, is distributed to the northern edge of the town.

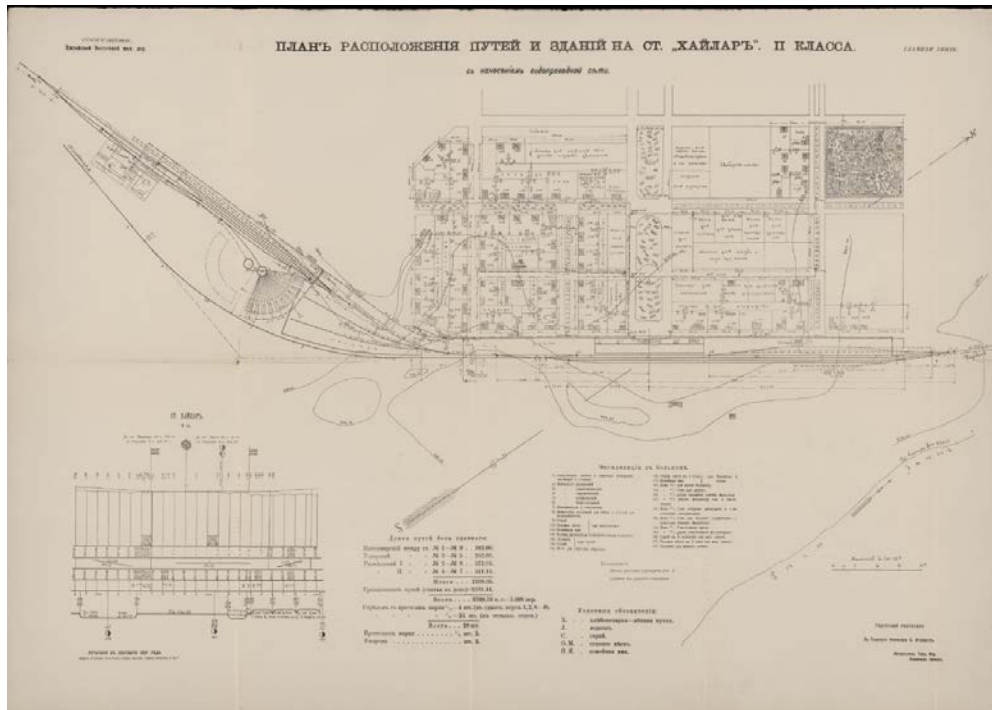

Figure 1: Ignagus . Hailar planning drawing . [Hailar,1902]

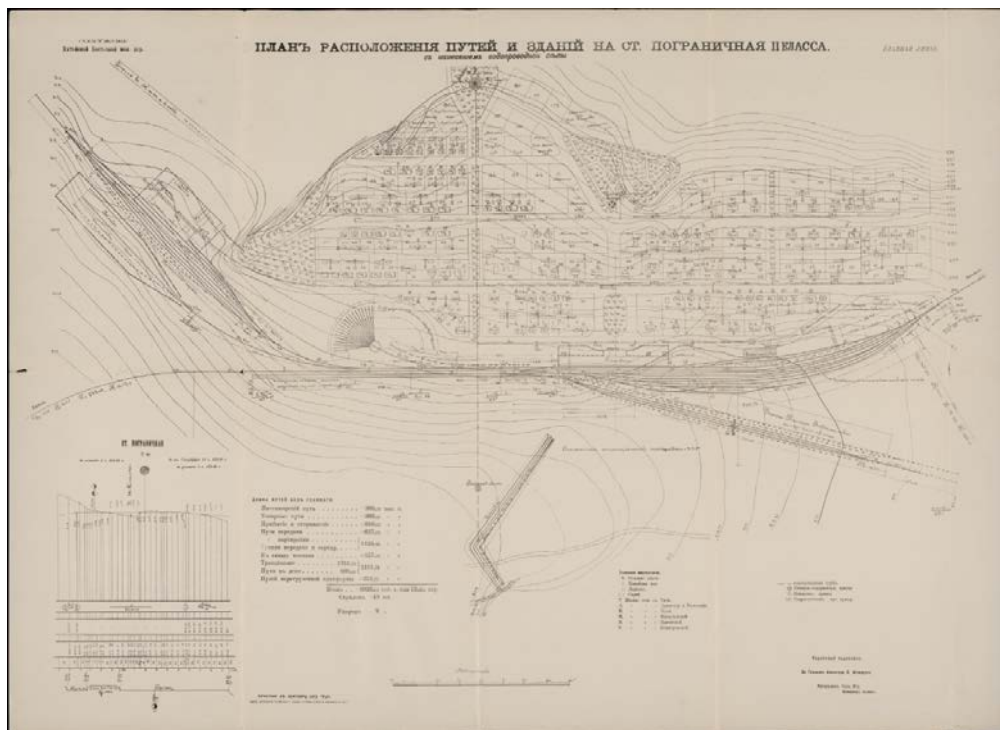

Figure 2: Ignagus . Suifenhe planning drawing . [Suifenhe,1902]

Through the comparison of each land scales and the distance away from the railway station (seen in Table 2), it's concluded that the scale of the residential land is the largest and then the commercial land; for the distance away from the railway station, the nearest is the residential land and then the commercial land. The station-location area is generally planned to service the railway operation and its required derivative services. In the plan, a large amount of residential land, squares and commercial land are set around the railway station. Additionally, the medical land is set up closely to the railway station, which is convenient to the life of railway staff and their

families; in the plan, the commercial, special and entertainment land are scattered to improve activity space and towns' vitality; on the other side, in the plan, there are also the hotels specially for Chinese, which are set at the northeastern edge of the town along with the houses for translators. A large amount of idle land is reserved for the future construction and development of the towns. As the crucial transport nodes of prosperous trades, the proportion of commercial land in station-located area is larger. In sight of the land demand from the population growth, the land for life is reserved to accommodate newly increased citizens. Large scale parks are constructed in the towns to further mitigate the environmental issues brought by the surging population(Sun Hui, 2006).

Table 2 Statistics of land use in station-located areas (sagene¹)

Land use	Station Suifenhe			Station Hailar		
	Planning area (m ²)	percentage	Distance from Station Harbin (m)	Planning area (m ²)	Percentage	Distance from Station Harbin (m)
Residential land	45000	67.37%	< 10	22500	48.70%	< 10
Commercial land	3500	5.24%	< 75	5000	10.82%	< 25
Special land	3200	4.79%	< 125	2700	5.84%	< 75
Medical land	2000	2.99%	< 150	—	—	—
Entertainment land	1100	1.65%	< 200	2500	5.41%	< 100
Idled land	12000	17.96%	—	—	—	—
Total	66800	100%	—	46200	100%	—
Remarks	Idled land is set up around the towns.			The land for life is reserved to accommodate new newly increased citizens at the north end of the towns.		

The plan of secondary station-located not only serves the railway operation, but also satisfies the derivative requirements from the operation, which include staff residence, commercial trade, entertainment, education, religion and military, etc. For the types of land use, according to the different functional demands, the land use of station-located area include commercial land, residential land, entertainment land, special land, medical land and idled land (reserved land for newly increased residents), etc. The structure layout depends on the proportion of land use and the distance from the railway station. The railway station is located at the center of the town with the square to the north; the commercial land, closely to the railway station, is distributed along both sides of the square in front of the station; the residential land, closely to commercial land, is distributed on both sides of railway station; entertainment land, distributed in the west of the town, is closely adjacent to commercial land and residential land; the special land, distributed in the west of the town, is closely adjacent to the commercial land and entertainment land; distributed at the northwestern edge of the town, medical land is closely to the residential land; the idled land (reserved land for newly increased residents) is scattered on the edges of the town.

II Road network structure and street design

Since these two secondary station-located areas were constructed on newly built area, their road networks therefore demonstrate the characteristics of overall planning. The road structure is the compact small-scale grid with straight roads. The towns with grid road network are more resilient in growth scale and direction. Meanwhile the frontage proportion could be increased to ensure the standard land subdivision, fair land purchase and lease, accessible trade flows and unified planning and management. For Station-Hailar-located areas, the distance between the roads is commonly within 125 sagene, the width of the main road is 9 sagene and 7.5 sagene for minor roads. For Station-Suifenhe-located areas, the distance between the roads is commonly within 100 sagene, the width for main roads is 10 sagene and 4 sagene for minor roads.

Through the comparison between the structures of the road network and street design for these two stations (see Table 3), it's concluded that the structure of road network , which is applied in the planning patterns of the secondary-station-located areas, the width of main roads is approximately 10 sagene and 5 sagene for the minor roads. This kind of structure could easily generate the street profile, parallel to the roads, which avoids the sharp corners at road crossings, benefits to deal with the building orientation and land lease as well as the land

¹ 1 sagene=2.134 meter

development and commercial operation. In general, the grid structure unifies the orderly layout of the towns, which is conducive to the towns' development of construction. In addition, the street design is featured as wide, flat and straight with dense road network. The distance between the roads is commonly within 100 sagene. For straight streets, nodes are connected with straight lines to further facilitates traffic and eliminate the secrets among irregular neighborhood; with the straight street, the colonists could more effectively control the city.

Table 3 Comparison of road network structure and street design for two stations (Sagene)

Station	Structure of road network	Street width		Street design
		Main street	Minor street	
Suifenhe	grid	10	4	wide, straight and flat
Hailar	grid	9	7.5	wide, straight and flat

III Town texture and landscape greening

The street profiles for two secondary station-located areas are mostly short squares with the ratio of length and width between 1:2 and 1:3. The street profile, however, for residential land ranges from short and squares to narrow and long and the ratio of length and width even reaches to 1:4. The scale of the street profile is relatively small. The planning structure has demonstrated strict geometric features, small scale of street profile and dense urban fabric. The depth of typical street profile for Station Hailar-located areas and Station Suifenhe-located areas are respectively 120 sagene and 110 sagene. The typical depth of commercial land and residential land is 50 sagene; the standard grid dominates in land division. The scale are 50 sagene ×132 sagene and 45 sagene ×115 sagene in respective. For architectural texture, the buildings are set up in double rows within the street profile and the buildings at the edge are set up closely to the four corners of the land, of which the public toilets, garbage, ice pits and sheds exist in the middle (see Figure 3). The greening in front of the station is the oval green land with the respective scale of 20 sagene×50 sagene×3 sagene and 18 sagene×38 sagene (see Figure 4); setting up in the middle of the roads, the width are respective are 5 sagene and 6 sagene; the park greening concentrates in the north of the towns, which is square and trapezoidal, with the scale of 5,041 square sagene and 4,750 square sagene (see Figure 5).

Figure 3:Ignagus . Buildings' texture. [Hailar、 Suifenhe,1902]

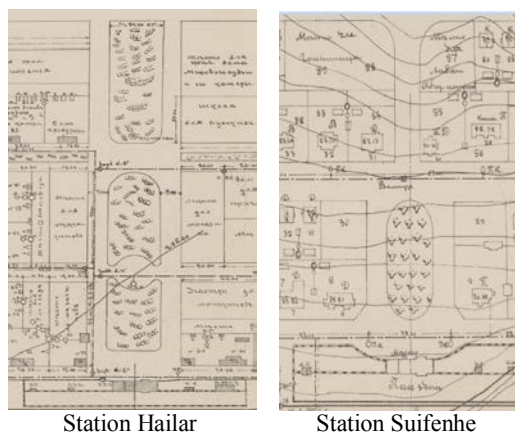

Figure 4:Ignagus . Greening in front of the station. [Hailar、 Suifenhe,1902]

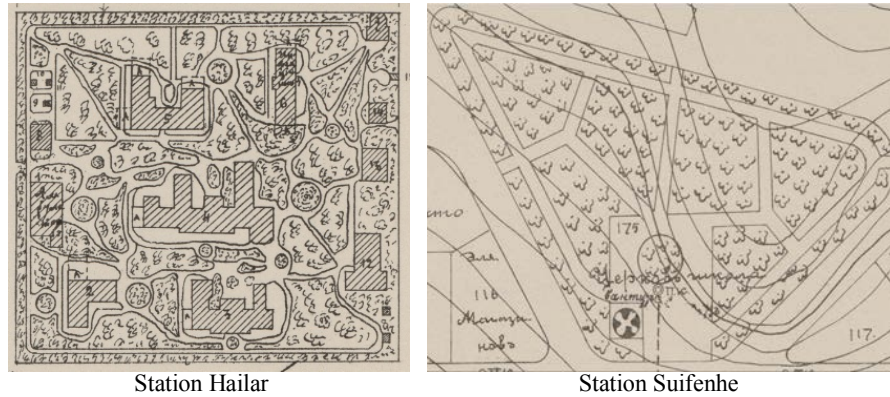

Figure 5: Ignagius . *Parks' greening*. [Hailar、 Suifenhe, 1902]

Based on the comparison of towns' texture and landscape greening (see Table 1), the depth of street profile for the secondary station-located areas is 100 sagene. And it's 50 sagene for commercial land and residential land. The standard grid dominates in land division. The land scale is 50 sagene×100 sagene, which unified the shape, orientation and scale of the land. For architectural texture, the buildings are set up in double rows within the street profile and the buildings at the edge are set up closely to the four corners of the land, of which the public toilets, garbage, ice pits and sheds exist in the middle. With this kind of layout, it's possible to obtain large inner courtyard between the dwellings to further form an ideal public space of communication, which is more concentric and conducive to the neighborhood communication as well as cold resistance and wind protection; in additional, one characteristic of this layout is to stress the street-facing interface with the vegetable garden in the inner courtyard, which endows the courtyard with the function of agricultural production. The landscape greening include greening in front of the station (oval), road greening and park greening; the road greening is set up in the middle of the roads, 5 sagene; the parks greening concentrates at the north end of the towns.

Table 4 Comparison of towns' texture for each station (Sagene)

Station	depth of street profile		plot		Building's texture	
	Typical street profile	commercial and residential land	division	scale	buildings' layout	remarks
Suifenhe	110	40	grid	45×115	double row, closely to the four corners of the land; public toilets, garbage, ice pits and sheds exist in the middle	—
Hailar	125	50	grid	50×132	set up along the edge, closely to the four corners of the land; public toilets, garbage, ice pits and sheds exist in the middle	vegetable garden in the inner courtyard

Table 5 comparison of landscape greening for each station (Sagene)

Station	Greening in front of the station	Scale	Road greening	Greening width	Parks greening	Greening area	shape
Suifenhe	oval	18×38	In the middle of the roads	6	northwest part of the town	4750	trapezoidal
Hailar	oval	20×50×2	In the middle of the roads	5	northeast of the town	5041	square

IV Summary of planning models for secondary station-located areas

Influenced by the idea of functional zoning of the secondary station-located area, the layout considers the railway station as the center and set up a large amount of oval squares and greening at the center of the towns. Public buildings, such as commerce and entertainment, are also set around the squares. The railway station,

additionally, is taken as the base to develop along the railway lines from the south to the north, in which residential land, commercial land, entertainment land, special land, medical land and military land. The land scale is dominated by the residential and commercial land. It's therefore generated that the plan focuses on the railway operation and the basic function of the station-located area is to satisfy the requirements of residence, life and business from the railway staff. The typical grid is applied by the road network of the towns. The spatial form of the square is the simple and wide station in front of the station. The street is wide, straight and flat. The depth of the typical street profile is 100 sagene and 50 for the typical depth of commercial land and residential land. The buildings are set up in double rows within the street profile and the buildings at the edge are set up closely to the four corners of the land, of which the public toilets, garbage, ice pits and sheds exist in the middle. The road greening is set up in the middle of the roads and the parks greening concentrates at the north end of the towns.

V The application in conservation of historical features-taking Suifenhe City as an example

After hundreds of years of city development and construction, the earlier station-located areas have already been submerged in the continuous expansion and reconstruction of city map. Through the comparison of original planning drawings and remote sensing of status quo, the historical boundaries of earlier Suifenhe Station-located areas is determined (see Figure 6), which is composed by Xinghong Road, Zhanqian Road, Changan Street and Jvyuan Street. Within historical boundaries, it's still clear to find out the planning characteristics of earlier secondary station-located areas, which conclude the grid road network, flat and straight street and orderly land division. However, the typical greening in front of the station and road greening is hardly reserved and the enclosed structure of the building is additionally changed. Generally speaking, the Russian style station-located areas in Suifenhe City have retained the earlier planning framework.

Figure 6 illustration of historical boundaries for Suifenhe Station-located areas

Historic buildings, as the most recognizable characteristic elements, are significantly crucial to the construction of historical features. The field research of historic building is conducted to clarify the current information of the remains within historical boundaries (see Table 6). According to the statistics, within Russian style station-located areas, there are total 26 historic buildings, among which the number of building is 2 for Japanese occupation period(1935-1945) and 24 for Russian occupation(1896-1917); most of the buildings are well preserved with less influence on authenticity. For buildings' base, more than 60% have mildew problems and some have others such as weathering, settlement, fragmentation, cracks and burial issues. 70% of the walls more or less have crack issues and less have weathering, mildew and efflorescence; the users are complex and 16 buildings is individually owned and 9 buildings is state owned. The rest one is collective ownership. In

conclusion, the number of historic building remains is less, well preserved and, however, is faced with damage such as mildew and cracks as well as lost risk; additionally since the remains is largely individual owned, the utilization and conservation of the buildings themselves are hardly regulated and consistent with the counterpart of the surrounding environment, which has caused huge damage to the historical features (see Figure 7).

Table 6 Statistics of status quo of historic buildings

Name	The former site of the Russian Consulate in Suifenhe	Current function	commerce
Address	No.111,Guanghua Road Guanghua Community, Suifenhe Town, Suifenhe City, Heilongjiang Province		
Age	1931	Façade material	Plastering
Altitude elevation(M)	456	Building' s structure	Brick and mortar
Level of cultural relics	National Key Cultural Relic Conservation Unit	Heritage type	Administrative office
Ground floor	2	Underground floor	1
Floor area(m²)	679	Construction area(m²)	1358
Ownership	Country	Using agency	Suifenhe Museum of Russian Painting Art
Damage	Base	Mildew	
	Wall	Peeling	
	Layout	Complete and authenticity	

Figure 7 Environment of historic buildings

Suifenhe City has completely preserved the earlier planning framework and part of historical buildings in Russian style station-located areas. Two historical featured areas are mainly constituted within historical boundaries: areas of single historic building and clusters of historic buildings (see Figure 8). Under preserving the earlier planning framework completely and following the principles of building authenticity and completed features(Long Shao 2016,chap 2), the existing problems from the field research are combined to put forward the following conservation ideas of historic features. In general, the earlier planning layout, the authenticity of historic buildings and consistency of surrounding environment are in full conservation while continuing their earlier function and moderately increasing new functions without destroying historic features (Jun Zhang 2017,chap 2). Another is to formulate the conservation principles and measures for conservation of historic

buildings, environmental remediation, management and exhibition, etc. On the other side, two distinct strategies are deployed for two types of historic featured areas. Since the historic features of single historic buildings area have been broken, therefore, in this area, the conservation of the buildings themselves is stressed to implement overall conservation. The conservation scope is rationally divided according to the specific circumstances, where the development and utilization should be forbidden and the proper development is permitted(Wan Yong,2011). As developing, the coordination of the overall style is also paid attention. The design of new elements should be coordinated with historic features to avoid using strange decoration materials and excessive large mass and scale; the new is coordinated with the old and the traditional buildings are coordinated with the modern buildings to form mutually coordinated features. The cultural relic conservation units and excellent historic buildings are not only in respect; new modern buildings are also arranged reasonably. New buildings obey not breaking the overall atmosphere of historic and cultural featured areas.

Figure 8 illustration of spatial distribution of historic buildings

Conclusion

After hundred years of vicissitudes and drastic changes of social and economic system, Russian style station-located areas, along Chinese Eastern Railway, still demonstrate strong adaptability with obvious location advantages. The land layout of parcel development is conducive to consolidation and expansion for goods, people and commercial trade. The spatial texture of street profile is condensed and fine and the road traffic is smooth and orderly. Although the earlier planning framework of station-located areas is reserved, a large amount of historic buildings have already been damaged more or less, and even most of them have disappeared. The historical features require urgent conservation within the station-located areas. In this research, the author strives to restore planning histories to further achieve the conservation of historic features of earlier station-located areas. However, this research is only limited to the quantitative analysis, including the collection of historical materials and the existing problems, which is insufficient in the consideration of the recognition of historical features from different groups as well as the eyes' perception on historical features and other factors.

History matters in making Lahore sustainable

Muhammad Imran*, Abid Mehmood** and Abdur Rehman Cheema***

Lahore, the second-largest city of Pakistan, is facing sharp population growth and economic development coupled with increased motorisation and a deteriorating urban environment. This is due to a long history of investment into roads and low-density suburban housing development in Lahore which increases motorisation. This paper provides a historical overview of urban planning in Lahore by shedding light on the Mughal and the British period of development followed by the post-independence planning paradigm in the city. This paper examines the contradictions and uncertainties that have characterised urban planning in Lahore in the pre and post-independence period by using a sustainable city and sustainable transport literature. The analysis shows that Lahore traditionally attracted investment in the high-quality roads infrastructure (flyovers, underpasses and a ring road) and recently in the country first ever Bus Rapid Transit (BRT) system (2013) and Metro Train project (2018) in the city. The paper argues that the Lahore BRT and Metro train projects can provide a window of opportunity to redefine transport and land use issues and offer a transit-oriented development (TOD) solutions in Lahore.

Keywords: Lahore, transport, sustainable urban development

Introduction

Lahore, the second-largest city of Pakistan and capital of the Punjab province, is facing sharp population growth and economic development coupled with increased motorisation and a deteriorating urban environment. Although over 60 per cent of total trips are made by sustainable transport modes¹, the city administration has been criticised by planning scholars for putting most of its recent investment into roads, despite severe air pollution and vulnerability to climate-change-related events such as flooding and heatwaves². Employing a sustainable city and sustainable transport framework, this paper examines the contradictions and uncertainties that have characterised transport and urban planning in Lahore in the post-independence period. The paper inquires into how Lahore got itself into its current urban planning situation, examines the implementation of Lahore's first Bus Rapid Transit (BRT) project and metro train project (the Orange line) and suggests how these projects provide opportunities for transit-oriented development (TOD) model for future urban growth. The paper begins with a historical overview of urban planning and development of Lahore since the Mughal period. This is followed by a more detailed and critical review of urban and transport planning in Lahore in the post-independence era through the lens of metropolitan strategic plans (locally called 'Master Plans'). Finally, the paper focuses on the challenges and opportunities arising from the BRT and Orange line metro projects, to establish the urgency of finding reforms in land use planning to facilitate TOD.

Pre-1947 Lahore

Lahore was a prominent centre of the Mughal Dynasty. Before the Mughals, Lahore was subjected to regular Afghan and Mongol invasions that it protected itself from by building 13 gates and a wall around the inner city. The Mughals aspired to transform the city by constructing architecturally significant buildings including Lahore Fort (1566) (see Figures 1), Shalimar Garden (1642) and Badshahi Mosque (1673).

After a brief period of Sikh rule in the first half of the nineteenth century, the British colonization of north-western India brought further changes to the architecture and culture of Lahore. The Lahore Railway Station was completed in 1861, connecting the city with major urban and regional centres. The British established prestigious educational and research institutions in Lahore (such as Government College (1861)); a modern municipal system (Municipal Committee (1862) (see Figures 2); open spaces (Lawrence Garden (1862)); and new road systems (such as Egerton Road, Davis Road etc.). The Punjab Municipal Act 1911, Punjab Town Improvement Act 1922, and Lahore Municipal Corporation Act 1941 were all used to regulate land use and the provision of infrastructure facilities in Lahore.

Figure 1 Lahore Fort (Source: Authors)

Figure 2 Lahore Metropolitan Corporation Building (Source: Authors)

The British viewed the old city (mixed land use in an organic layout) as backward and in need of modernization by separate zoning and by-laws for housing, educational and institutional buildings, and commercial activities³. Model Town, established in 1921, on the outskirts of Lahore, was laid out on 'garden city' principles with bungalow-style housing and was governed by the Cooperative Model Town Society Limited (see Figure 3). The newly built areas and major civic and government buildings in Lahore were connected through a suburban railway network, omnibuses and horse-drawn carts (tongas)⁴. These developments strengthened Lahore's status as the political, social and cultural capital of north-western India⁵. However, the chaotic, densely-populated inner city remained excluded from modern planning practices. The walled city continued with its traditional *bazar* economy⁶.

Patrick Geddes report 'Town Planning for Lahore' published in 1917 argued for conservation and improvement of the walled city of Lahore through a 'conservative surgery' approach rather than large-scale demolition in the name of slum clearance. He emphasized combining physical and social planning in development projects and proposed several 'garden villages' outside the walled city to accommodate Lahore's urban growth. The later part of the colonial period was characterized by a development planning tradition, in which state-led policies sought to co-ordinated land use with accessibility through transport and to enrich the social and economic sustainability of the city.

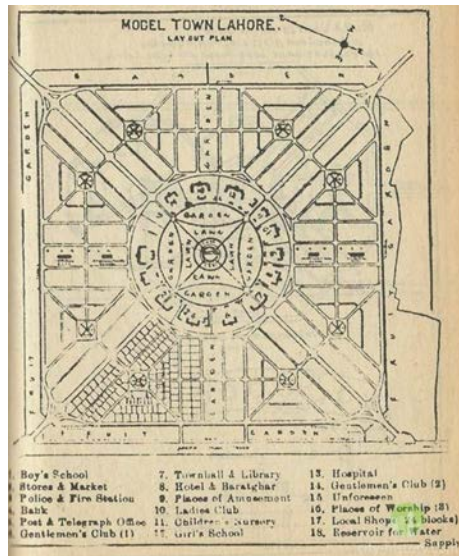

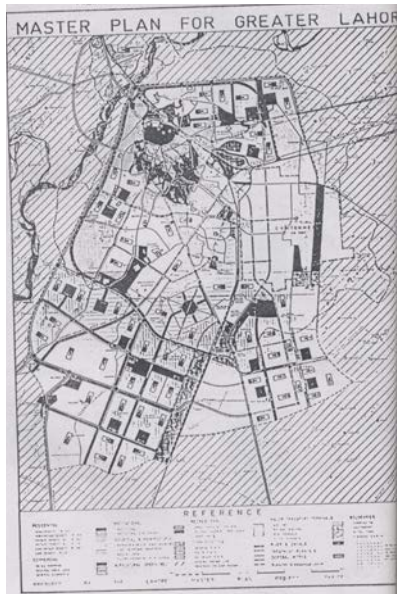

Figure 3 The Model Town, Lahore, 1927 (Source: Sir Ganga Ram Pocket Book of Engineering)

Post-1947 Lahore

Lahore suffered after the partition of British India in 1947 when 240,000 middle-class Sikh and Hindus, comprising one-third of Lahore's population, fled to India⁷. On the other hand, almost half of East Punjab's population (comprising 400,000 Muslims) moved to Lahore in a wave of reverse migration and violence. This demographic change made Lahore one of the fastest growing cities of the time. The partition also made Lahore a border city, creating a sense of insecurity not experienced before.

Pakistan joined the Colombo Plan in 1950 and made arrangements for preparing national level Five Year Plans. The second Five Year Plan (1960-65) recommended preparing master plans for 11 major cities, leading to the formulation of the first *Master Plan for Greater Lahore (1965-80)*⁸. The Master Plan project office published an interim report in 1962 followed by the Master Plan in 1965. First Master Plan proposed a three-tier hierarchy of neighbourhood, district (metropolitan) and divisional (greater district) civic centres, a 24 kilometre green belt around the city and four industrial satellite towns served by high-quality inter- and intra-city transportation projects⁹. A 'circumferential arterial road' (later named the Ring Road) was also proposed together with standards for a road hierarchy, justified as a catalyst for economic growth¹⁰. For commuter traffic, the Master Plan recommended a mass transit 'circular railway' system as a 'long-range project', arguing that the Lahore Omnibus Services would be unable to cope with the expansion of new planned neighbourhoods and satellite towns. Most of the road proposals in the first Master Plan were eventually implemented in the medium to long term, although a large part of the Ring Road has been constructed only recently. The circular railway as a mass transit system and a green belt to check urban sprawl and ribbon development did not catch the attention of decision-makers.

The Lahore Urban Development and Traffic Study (LUDTS), known locally as the Lahore Structure Plan (1980-2000), was the second strategic master plan prepared by foreign consultants and financed by the World Bank. Like the 1965 Master Plan, the 1980 Structure Plan recommended south and south-westward growth over its twenty-year life supported by high-speed roads¹¹. The main argument behind its proposals was the strong belief that a rising level of economic activity would bring low-density suburban development and a higher volume of private vehicles¹². With no statutory basis the Structure Plan remained an advisory plan for the development¹³. The *Integrated Master Plan for Lahore (2001-2021) (IMPL)* (LDA, 2004) and the (draft) *Integrated Strategic Development Plan for Lahore Region 2035 (ISDP-35)* (LDA, 2013) are the recent strategic urban development plans prepared to guide future development in the Lahore metropolitan area. In relative terms, land use planning and policy in both the IMPL and ISDP-35 maintain the status quo of accommodating future urban growth in greenfield development at the edge of the city (see Figure 4).

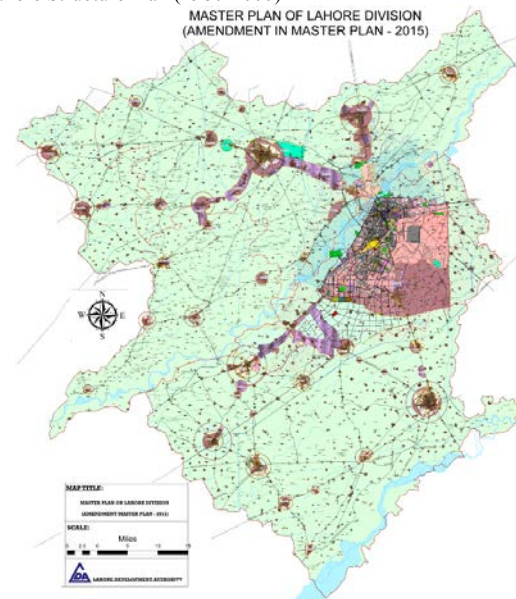

Master Plan for Greater Lahore (1965-80)

Lahore Structure Plan (1980-2000)

Integrated Master Plan for Lahore (2001-2021)

Integrated Strategic Development Plan for Lahore Region 2035

Figure 4 Various Master Plans of Lahore (Source: Document published by LDA)

All Master Plans were not fully implemented due to institutional disconnection - the absence of a comprehensive implementation framework, the absence of legal protection of the plan, a lack of systematic allocation of funding to proposed projects, out-dated zoning, building and land subdivision regulations, flawed property tax policy, the absence of programmes for urban renewal and the purchase of land for public purposes, and of incentives for private sector and institutional re-organization¹⁴. All Master Plans in Lahore have weaknesses in terms of their content, preparation process and enforcement mechanisms¹⁵. Moreover, these plans only apply to two-thirds of the total area under the jurisdiction of Lahore Development Authority (LDA) and the Lahore Metropolitan Corporation. These plans do not include land uses and bylaws in Cantonment¹⁶ or Defence Housing Authority areas even though these comprise nearly one-third of the built-up area of Lahore. Overall, Master Plans have taken a long time to prepare and then have been approved (or partially approved) reluctantly, do not apply to significant parts of the urban area and are inadequately and selectively implemented. In spite of these deficiencies, however, these plans set the direction for future urban growth for the upper-middle class and for investment in city transport. For example, the exponential growth of gated communities in urban fringe has become successful in recent decades

because they offer the growing urban middle class better security in the face of increasing street crime and terrorism¹⁷ and a prestigious a lifestyle that gives access to modern facilities and amenities, along with speculative investment. After spending four years as a Country Director for UNDP, Marc Andre Franche spoke of Pakistan's 'apartheid of opportunities' and argued that 'Pakistan will not be able to survive with gated communities where you are completely isolated from the societies, where you are creating ghettos at one end and big huge malls for the rich at the other end. It is not the kind of society you want your kids to live in'¹⁸. However, it is not only the planning mechanisms within Pakistan that favour the elite, but also international agencies such as the World Bank which continue to promote an elite-led economic growth model which exacerbates inequalities¹⁹.

Challenges to and opportunities for sustainable transformation

Despite the pro-road and pro-suburban emphasis of Master Plans in the post-Independence era, 60 per cent of the 9.6 million daily trips in Lahore still take place by sustainable transport (walking, cycling and public transport)²⁰. This is possible because 80 per cent of Lahore's population still lives in the inner and intermediate areas of the city, within an average seven kilometre radius of the centre, at average densities of 200-600 persons per hectare²¹. There is an opportunity to prepare urban development plans that show sensitivity to the socio-economic characteristics and spatial realities of Lahore and bring investment and improved quality of life to these existing high density urban areas. This section explores difficulties to date in challenging the road-based transport paradigm through case studies of Pakistan's first Bus Rapid Transit (BRT), or the Metro Bus, and of the metro, or 'Orange', train line currently under construction. We argue that these public transport investments should serve as catalysts for land development alongside the BRT corridor and around train stations as the basis for sustainable regeneration.

Bus Rapid Transit (BRT): Pakistani cities have failed to develop high-quality mass transit systems in the post-Independence era, and public transport has been provided largely by privately-owned minibuses with very low levels of service and comfort²². The main reason for this failure has been a lack of political leadership and investment in public transport to make the best use of existing high-density development²³. However, this situation changed in 2013, when the Chief Minister of Punjab, Shabaz Sharif (SS), succeeded in gaining support to complete Pakistan's first BRT in Lahore. Lahore BRT is a 27 kilometre-long corridor and is equipped with an intelligent transport system (ITS) (see Figure 5).

Figure 5 BRT in Lahore (Source: Author)

The project was completed in 2013, at the cost of approximately PKR 30 billion (US\$ 0.28 billion), raised from provincial resources. BRT has been criticized for its high construction and operational costs, the dislocation of people and businesses, its negative impact on the environment and heritage sites, the opportunity cost of education and health issues affecting the entire province, and lack of public involvement in the planning and design processes. However, some scholars have viewed the criticism of the BRT as being out of context in that it did not take into account public transport key performance indicators. BRT offers high speed (45-60 km/hour) transport during both peak and off-peak periods²⁴ and, together with a fare structure that encourages short trips, it has the potential to become a 'game-changer' for the public in Pakistani cities who have been accustomed, under the deregulated private sector to being loaded like cattle on to buses and wagons (low-quality mini-buses)²⁵. Haider²⁶

sees an essential role for public investment in public transport but proposes that the private sector should be involved in property development to subsidize the capital cost of transit projects.

The Orange Line: The successful implementation of the BRT project encouraged the Punjab Government to initiate Pakistan's first metro train, the Orange line project, in Lahore, planned to be completed in mid-2018. Like the BRT, the 27 kilometre-long railway passes through historical and compact parts of the city. Approximately 250,000 people a day will be able to travel on this train. The Orange line comprises 25.3 kilometres of elevated and 1.7 kilometres of underground sections. The total cost²⁷ of the project is estimated at over PKR 162 billion (US\$ 1.5 billion), 100 per cent financed by a Chinese 'soft' loan. The Chief Minister of Punjab has described the Orange line as the 'common man's ride', providing safe, swift and pollution-free transport. Like the BRT, the Orange line project has also been opposed by political and civil society actors who have concerns about the dislocation of people²⁸. Questions have also been raised about the transparency of land acquisition and compensation, lack of civic engagement, privacy issues and the threat of terrorism inherent in the elevated sections. The loudest opposition came from groups who had reservations about the design of the project and its potential effects on important heritage sites of Mughal and British architecture (see Figure 6). Because of these controversies, the project has been challenged in the Lahore High Court. The Orange line project was suspended in August 2016, when the Lahore High Court ordered the Punjab Government to stop construction at sites near eleven historic buildings. The court ruled that this violated a law prohibiting construction activities within 200 metres of UNESCO-listed heritage sites.

Figure 6 The Orange line construction near the Chaurburji, Lahore (Source: Pakistan Today newspaper)

The Punjab government challenged this decision in the Supreme Court (the highest court in the country), which allow construction of remaining sites after one year of hearing and on the advice of the technical committee. The government had hoped to complete this project before the 2018 general election in May. In short, a lack of communication and the adoption of a set planning process, a deficit in trust, and mismanagement - specifically, the absence of a traffic plan and resettlement issues - created confusion about both the BRT and Orange line projects among residents, businesses and professionals. We consider the lessons from these projects to provide a 'window of opportunity' for the discussion and introduction of contemporary urban planning practices and, specifically, of transit-oriented development in Lahore which will be explored in the next section.

TOD as a model for Lahore's future: Considering Lahore's long history of greenfield development, how can the BRT and the Orange line can drive a transformational shift in sustainable urban development. It is estimated that the service sector in Lahore has already grown to 42 per cent of the workforce, resulting in mass transit system demand. The BRT and Orange line projects, while imperfect, need to be built upon in support of the case for investment in high-quality public transport to reduce rising congestion under conditions of continuing population and economic growth. Proposals for transport and land use integration have been largely absent from Lahore's Master Plans to date. The current practice of reactive planning needs to be replaced by proactive planning based on TOD in newly-built public transport corridors. The recently developed Punjab Land Use Rules 2009 also allow high rise residential and office towers and Lahore has also received more investment in the retail sector than anywhere else in Pakistan in the last ten years through the building of medium and large-scale shopping malls²⁹. However, these malls are located haphazardly in the city and are mainly accessible by cars. There is a need to direct this retail investment strategically to sites accessible by the Orange line and BRT. Private developers toned

to be encouraged to invest in land development in high-quality transit corridors, particularly if the LDA assists by assembling the land.

Lahore can learn from the experience in this regard of Hong Kong and Singapore in Asia and of Curitiba, Bogota and Santiago in South America, all of which integrated high-quality public transport with land use by adopting a proactive transport and land use planning approach, sometimes called the 'transit city' model³⁰. In Lahore, it is important to develop a shared smart vision of the BRT and the Orange line corridors and to prepare an urban regeneration master plan for these corridors, followed by institutional capacity building to manage regeneration. Pakistani cities need clever preservation and creative destruction to make urban renewal happen³¹. Even high-density cities can adopt a compact city policy with 'local sensitivity' to improve the quality of life³². Likewise, we argue that a regeneration plan should incorporate a holistic place-based land use plan covering a 500-metre radius from BRT and train stations. High-density TOD along a transit corridor ultimately generates a greater number of passengers to sustain a mass transit system, and Lahore could transform Ferouzpur Road, Multan Road and GT Road into new and desirable high-density residential and commercial areas (see Figure 7).

Figure 7 The built environment alongside the Orange line (Source: Chief Minister of Punjab Facebook)

Lahore, historically an 'aspiring architectural capital' and a 'political powerhouse'³³ in the post-independence era, is well-placed to exploit its strengths to adopt TOD. The transit-city model requires the institutional capacity to adopt innovative land use approaches, rules, regulations and procurement strategies in their local context. The Punjab Mass Transit Authority (PMTA) has considerable responsibility for policy-level guidelines, regulations and procurement of public transport but, in its current form, it lacks a mechanism to collaborate with LDA and LMC, the land use planning agencies. The LDA itself has little or no experience or capacity to formulate or implement land use policy in existing built-up and brownfield areas, but high-density development is gaining momentum as powerful voices are raised against the negative consequences of sprawl. For example, the Higher Education Commission Pakistan recommended that 'in view of urban sprawl in the country, it has become imperative to establish a top-level Land Use Planning Authority at Federal Level along with parallel Provincial and District Level Authorities for land use planning and strategic development planning in the country'³⁴. There is also a proposal to pass a City and Regional Planning Act in Punjab to establish a Divisional (Regional) Planning Authority (DPA), which will be responsible for spatial planning and land use and building control. It is expected that the DPA will promote and encourage a pattern of compact and mixed land use development that is convenient to existing transportation infrastructure.

Although a region-wide planning agency is desirable to focus on the bigger-picture land use and public transport issues, there is also a need to concentrate on creating innovative mechanisms to fund the public transport network. A TOD-based urban growth model will help to develop innovative sources of funding public transport. The BRT project in Lahore was built by the Punjab government and the Orange line is under construction with the help of Chinese funds. However, the financial sustainability of these projects is in question unless new and reliable sources of funding can be found to support their operation and extension³⁵. Although it is too early to claim that the BRT and Orange line will increase property values in the future, this should be the aspiration, and there is a need to develop rules to capture these increases, brought about by public investment. Many projects around the world now use value-capture models to fund high-quality public transport systems in cities³⁶. However, land value capture is generally limited to commercial properties. We also argue for value-capture mechanisms for regeneration or

redevelopment of whole corridors supported by an urban renewal programme and micro-level land use planning approaches, using the BRT and Orange line corridors as a pilot project and starting with the development of government-owned properties. Affected people can benefit from newly refurbished apartments, and new commercial areas can be developed, taking advantage of increased patronage and providing the basis for value capture to fund future transit investment. The new regeneration plan needs to be underpinned by enhanced urban design near bus and train stations and can still be informed by Patrick Geddes's suggestions to include street layouts, plot shapes and small pocket parks to promote the social and economic interaction between residents. A successful pilot project can help to mobilise the support of civic, professional and political actors beyond traditional transport operators and property developers³⁷.

The BRT and the Orange line projects in Lahore were underpinned by political will and charismatic leadership, but professional leadership is also required. Planners have the technical knowledge to justify and chart a path towards a more sustainable city³⁸. The Pakistan Council of Architecture and Town Planners (PCATP), the Institute of Planners Pakistan (IPP), Institute of Architects of Pakistan (IAP) and the Pakistan Engineering Council (PEC) need to show professional leadership and bring the smart corridor and TOD agenda to the forefront of the development debate. The establishment of a Lahore Development Forum for the ongoing debate about future development scenarios for the city could also help to inform the next generation of civic leaders. Engaged residents, professionals and politicians have the capacity over time to influence an alternative development agenda positively. In short, the BRT and the Orange line initiatives can be seen as an opportunity to break the path dependency of roads and greenfield development providing the first steps in overhauling land use planning and transport policies to make infrastructure investments sustainable over time. A comprehensive institutional framework for integrating public transport and land use planning in Lahore is required to influence policy, funding and leadership in favour of TOD. If Lahore takes the lead in developing such a framework, then the city will be at the front of the sustainable city queue in South Asia.

Ankara Commuter Line as the Product and Witness of Modern Planning Experience in Turkey

Evolution of commuter rail transit systems has always served a tight relationship with the development of urban planning theory and practice. Commuter rail development in Ankara has a peculiar history begun with the pronouncement of Ankara as the capital city of the new regime in 1923, as opposed to its numerous contemporaries which had emerged as the lasting effects of Industrial Revolution on cities. In the earlier plans representing the culturalist school of spatial organization, Ankara commuter line was recognized as a planning tool in the designation of the rural-urban continuum, urban green network, community spaces and logistic centers. The commuter line together with adjoined uses, today, might be a remarkable case in the broad identification of the railway heritage assets as well as the complementary relationship between urban morphology and history. Besides being a mass transport service covering approximately 37 km distance, the line provides planning opportunities in consolidating the fragmented historic properties (historic villages, landed estates, industrial areas etc.) of the Republican period plans and discovering the spatial interactions generated by the railway lines. In this respect, the aim of this study is to reveal the significance of Ankara Commuter Line as a city planning legacy by mapping its earlier development and accompanied built and landscape heritages.

Keywords: City Planning Legacy, Ankara Commuter Line, Planning History, Railway Heritage

Introduction

Beyond being linear transport features, railways have always been constructive tools in the early 20th century nation-building, economic restructuring, territorial control, urban and regional development processes. Setting aside their technical features, a railway line may be recognized as the medium of a long journey that penetrates into the history of a city and society by revealing and incorporating historic assets. Within this context, this paper focuses on the commuter line of Ankara as the product and witness of the early 20th century modern planning experience.

Before World War I (WWI), the railway network crossing Ottoman Anatolia (Berlin-Istanbul, Istanbul-Bagdad) was controlled by the European empires. The railway technology, on the other hand, was imported from those western quarters; and Ottoman Empire was obliged to create tremendous budgets for the regional railway constructions. Since the railway policy of Ottoman Period was strongly dependent to territorial/regional control plans of European empires, the inlands of Ottoman Anatolia lacked of railway system which further became a strategic problem during the Turkish War of Independence. After the WWI, many newly established nations started to structure their economy in line with the progressive development ideas. The Republic of Turkey followed this path in order to remove dependent Ottoman Empire image as well as to take a place among developed Western countries as an independent and equal partner. Removal of railway imperialism was one of the targets of the young Republic in making independent national policy and economy (Figure 1). Nationalization of the railway network was equated with the success of the new regime; and institutionalization of railway constructions was recognized as a prerequisite in achieving national development and international commerce goals. The pronouncement of Ankara as the new capital was also supporting the progressive ideals of the state in a sense that the establishment of modern capital would represent the new regime and its cultural codes. Ankara, on the other hand, was offering a poor nature and insufficient infrastructure qualities in the aftermath of the War -even though it had been a prestigious and strategic node during the Turkish War of Independence owing to its central geographical location and the existence of railway and telegraph systems¹. Therefore, the establishment of the capital city and construction of the commuter line began simultaneously; and

¹ During the War, Ankara was decided to be the center of the War since the city was far enough from the hot war and close to the West. The city was also a node in the telegraph network and had the railway access to Istanbul and other war spaces (Tekeli, 1984). After the War, Republican elites were expecting that Istanbul would stay as the capital city. However, as being the prestigious center of the War, Ankara was pronounced to be the new capital city.

this process generated a commuter line which has been highly integrated with the Republican Period's industrial and landscape heritage.

Figure 1: Demiryollar [Railway] Newspaper, 1931:7. *Picture depicting the power and significance of machine age and railway construction as the sign of civilization.*

There are two early planning studies which play significant roles in the emergence of the modern urban core and rural environments of Ankara as well as the development of Ankara commuter line. Prepared by Carl C. Lörcher (1924-1925) and Hermann Jansen (1928-1937), the main features of the plans were expressing the 19th century culturalist planning approaches². The commuter line of Ankara, on the other hand, was recognized as a consolidative and generative component in these early planning approaches, since it was united with green stripes, public squares, productive landscapes (agricultural lands, landed estates, recreation areas) and small number of industrial quarters. Later planning experiences of the city between 1955 and 1980 exposed the commuter line as a barrier and transportation threshold in the designation of industrial and residential zones, shaping up the urban macroform and stratifying parallel multi-lane roads which further resulted in a sharp polarization between north and south of the line as well as the loss of the earlier planning legacies (rural-urban continuum dominated by landscape fabric, transport-landscape interaction).

Ankara commuter line, currently, depicts a territory that covers heritage assets and diverse forms of interaction as the products of modern city planning experience. Regarding the planning history of Ankara, this study intends to reveal the significance of Ankara Commuter Line as a city planning legacy by mapping its development and accompanied heritage. The conducted mapping study focuses on the early planning legacies which once produced continual landscape fabric (including heritage assets) and socio-spatial interaction, yet now are fragmented at a greater pace.

Recovering the Commuter Lines beyond Mass Transport

Keeping in mind the tight relationship between urban fabric and railway development and considering the impact of the railway development in reflecting multi-layer histories (nation-building, railway imperialism), it is possible to read planning history of a city through its railway/commuter line development. Transportation corridors, for Wilson (2002), can reflect particular events in nations' or societies' histories since these corridors may be deeply embedded in the collective memory and be recognized as "*the timeline of the country*". In this respect, commuter lines possess the associative values that blend time-space and societies in a particular context. The built and landscape fabric enfolding railway lines, on the other hand, may comprise historic assets which embellish the historic significance of these lines. In that sense, a railway journey would transform to a spatial experience that narrates and consolidates distinct fragments of urban history.

Urban history and urban morphology studies have a complementary relationship; as Moudon (1994) puts it, any morphological research can only be conducted by historical analysis; since whole and parts have undergone continuous change and transformation. Similarly, planning history of a city cannot be read without decoding and mapping the physical components of urban fabric in a certain chronology. As being physical components of urban form, the commuter lines might be significant cases in understanding the city planning histories. Beyond being massive passenger services, owing to their scale, function and linearity, as well as sequences (stations and

² According to Choay (1969), planning understanding of the late 19th century is based on two main schools of spatial organization which are progressist and culturalist. Progressist model maintains the social progress and future scenarios whereas culturalist model emphasizes urban cultural community and history in a nostalgic outlook (Choay, 1969: 31-102).

stops) and motion, diverse forms of spatial interaction and meaning have generated during their lifespans. The interactions often demonstrated by the culturalist urban planning approaches (rural landscape-railway, urban core-railway, neighborhood-railway, industry-railway, green-blue infrastructure-railway) contribute emergence of a territory that transcends the seemingly impermeable borders of the railway corridors. Since culturalist approach was characterized by compact urban form, radial ordered green structures and arteries, continual voids, low density development, strong emphasis on urban history and geomorphology; commuter lines were predominantly recognized as planning tools in the designation of the rural-urban continuum, urban green network and community spaces.

On the other hand, a commuter line itself has the capacity to construct an interactive spatiality beyond defining a strict border between urban uses. This nature of commuter lines might bring new perspectives for the development of future planning scenarios; and for Allen (1991) "Its [transport infrastructures'] primary modes of operation are; the division, allocation, and construction of surfaces; the provision of services to support future programs; and the establishment of networks for movement, communication, and exchange". However, these interactions or permeability between physical components, for Moudon (1994), cannot be represented through conventional solid-void mapping techniques.

This morphological re-structuring evolved historically also provides opportunities for the broad identification and consolidation of the railway heritage assets (station buildings, bridges, tunnels, culverts, maintenance hubs, storehouses, housing compounds, railway landscape) and accompanying heritages (industrial, landscape). The linearity and sequential feature of the railway transport brings out visual interaction with heritage sites/assets, and eventually make them legible as identical image elements of the city. Sustaining the entire commuter line as a heritage asset is an urban planning question owing to the scale, function, transformative impact of the line on the urban fabric and accompanying assets (built and continual natural properties). The railway lines have a transformative nature that generate continual spatial changes all along their neighboring environment (Bütüner, Aral, Sert; 2017b). The chronology and physical pattern of transformation are significant in understanding the spatial history of the railway and in developing future scenarios for the adjoining urban fabric. As Tatom (2006) stated, modes of interaction between transportation lines and cities are worth to discover, since they may be treated as spatial planning opportunities beyond being technical infrastructure requirements.

The other aspect concerning commuter lines is their capacity to unite opposites (De Block, 2013) both in physical and conceptual/perceptual terms. They can knit together rural and urban, natural and artificial, traditional and modern, historic and new, continual and sequential, linear and nodal. This feature of commuter lines doubtlessly motivates urban history and morphology studies to adopt new terminologies and mapping techniques in understanding the transport infrastructures.

Regarding this theoretical framework, Ankara commuter line offers a characteristic case in discussing the contribution of the 19th century modern planning approaches in creating distinct forms of built and landscape heritages, the exploration of the conceptual origins concerning railways as uniting planning tools, as well as the transformative impact of commuter lines on the landscape fabric. **It is important to note that there is not any previous study concerning the historic significance, heritage value or morphological analysis of Sincan-Kayaş Commuter Line development in Ankara. Through this study, it is also aimed that planning history studies in Turkey might gain new perspectives in understanding the tight relationship between urban history, urban morphology and commuter line development as well as in the broad identification of railway and accompanying built and landscape assets as significant modern planning heritages.**

Reading the Planning Legacy of Ankara through Commuter Line Development

Emergence of the city of Ankara and the commuter line have a peculiar and shared planning history dated back to the establishment of the Republic of Turkey in 1923. The capital city was shaped by six planning experiences³ having their impacts on the macroform, CBD, transport systems and quality of life. Regarding the approaches adopted for these planning processes and the changing growth dynamics of Ankara, the commuter line was conceptualized, utilized and transformed in distinct ways. Among them, the plans prepared by Lörcher and Jansen are the focuses of this article, since their approach on Ankara commuter line aimed to generate rural urban continuum, social meanings, visual quality and quality of life which are worth to explore. Reflecting the culturalist ideas, these two early planning experiences recognized the commuter line development predominantly as a tool for bringing social infrastructure to the city and in exposing rural-urban continuum by uniting the line with industrial areas, landed estates and green structures. By the later planning processes, the multiple functions of the commuter line were reduced into transport oriented strategies as opposed to the early planning approaches.

³ Realized between 1924-1956, the three master plans followed culturalist planning approaches. The two plans prepared between 1970-1990 had the features of structure plan, and the rest adopted strategic planning approach.

This approach further resulted in the loss of historic meaning of the line and the fragmentation of the earlier planning legacies.

Establishment of Ankara and the commuter line had a close relationship with the progressist⁴ and statist goals of the early Republican Period: realization of the exemplary urban revolution, cultural modernization, socio-economical progress embodied in the establishment of the modern capital city. Ankara as being the new administrative center would portray the spatial manifestation of the national progress. The War of Independence brought a demolished town center that had long lacked of sufficient social, cultural and physical services. The regional railway line reaching to the west edge of the town center was the only sign of civilization grasping the moorlands of Ankara. Displaying the characteristic properties of the pre-industrial city, Ankara had developed around the citadel and made up of wooden two- storey dwellings; streets had not seated on any geometric order and lacked of infrastructure. German architect Carl C. Lörcher was commissioned for the preparation of a master plan in 1923 (Cengizkan, 2006). Finalized in 1925⁵, the plan was modest and realistic which would be proposed to a newly established state that had limited post-war budget, human resources and technical knowledge.

The plan has a circular and compact macro-form supported by radial axes and baroque arrangements that associates sub-planning areas (Figure 2). The main districts, namely the historic town center *Angora* (on the north) and the new city *Çankaya* (on the north) were associated by the Station Road⁶. Starting from the railway station park, the Station Road, as its contemporaries in the Europe, was designed as the most prestigious commercial axis of the city. The main railway station and its periphery, for Lörcher (1925), should become one of the most significant image elements of Ankara. The station would be where newcomers and visitors met with the capital city and should reflect the modern cultural life in the city. For this reason, the periphery of the station was supported by commercial uses as well as parks and public squares having radial arrangements.

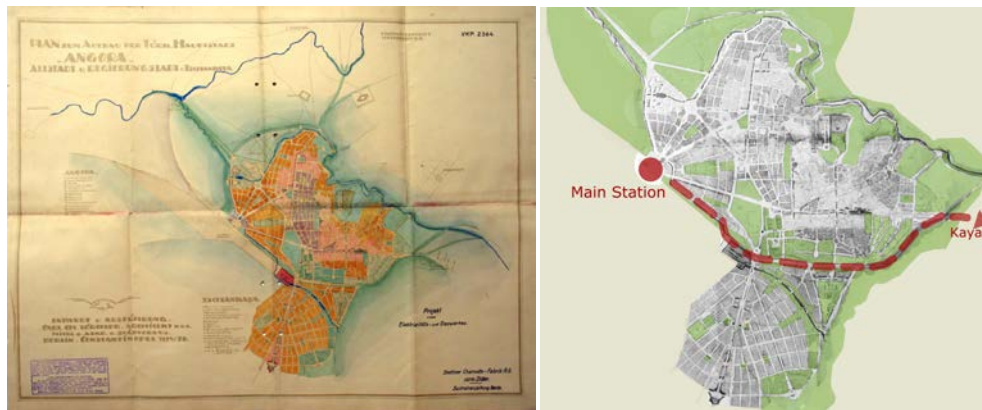

Figure 2: Carl C. Lörcher. *Ankara Master Plan dated 1925 (on the left); railway line and green network in Lörcher Plan (on the right).*

The construction of additional regional railway lines, for Lörcher (1925), would transform Ankara an important logistic node in the country and enforce its centrality within Anatolia. As a consequence, an industrial quarter was formed following the 3 km distance from the main station. Since the additional lanes of regional railway were under construction, Lörcher delimited planning study with the main station on the west (Figure 2). Regarding the feasibility limits of states' post-war economy, he did not suggest development on the flat lands of west portion (Lörcher, 1925), or not expose it as a possible development axis.

Following the establishment of Ankara-Kayaş railway line, railway excursion tours towards east were started in 1928 (Emiroğlu & Uzmay, 2013) which aimed to meet citizens with rural extensions of the city rather than providing massive transport. Dated back to the late 19th century, there have been vineyards, orchards, small size landed estates and summer houses on the route of the railway (Bütüner, Aral, Çavdar, 2017a). The excursion tours aimed to make existing green patches accessible, whereas the culturalist planning scenarios consolidated

⁴ For the founders of the Republic -Mustafa Kemal Atatürk and his comrades, being a self-sufficient nation necessitated progress in all levels and arms of economy (agriculture, industry, commerce), land democracy, science and culture.

⁵ During the planning study, Lörcher submitted two plans for the development of the historic city and the new city. The plan dated 1924 was mainly focusing on the existing urban pattern to highlight the historic and cultural potentials of the district whereas the plan dated 1925 was aiming to construct the new city and governmental quarter of the Republic. For Lörcher, Angora would reflect 'the glorious historic past of the city' whereas Çankaya would represent 'the future visions'.

⁶ Besides station and its periphery, the planning report detailedly analyzed potentials of the existing historic landmarks as well as stream network as a social infrastructure component, and proposed new road network, residential areas, public spaces, and urban services.

the patches by the addition of new green infills. The west axis, on the other hand, had different development dynamics owing to the geomorphologic outlines, soil structure, hydrology as well as spatial history of the land. In the early 1920s⁷, the railway line was the only sign of civilization grasping the moorlands of west Ankara. Moreover, marshlands extending along the Ankara Stream were enfolding the line. This physical character of the west was disrupting the modern image of the city besides being public health threat, whereas the west pole was recognized as a gate through which the regional trains approach to the city. Consequently, in 1925, quite a large size landed estate, namely *Atatürk Forest Farm*, was established in order to replace marshlands with productive and modern landscape; maintain the agricultural and industrial revolution; provide new and modern modes of recreation. Covering 52.000.000 sqm land, AFF was offering recreational and agricultural education facilities, in addition to modern agricultural and agro-industrial production. A railway station was opened in 1926 to reach the Farmland from the city center -which would also become a node for supplying raw materials as well as distributing AFF products such as beer, milk etc. to other cities. Existence of AFF and railway corridor attracted the industrial development along the commuter line, such as cement factory (1926), cartridge factory (1955), sugar factory (1962) in the following decades. The military quarters were also formed in the west portion as being other consequences of commuter line development.

At the end of the 1920s⁷ the population of Ankara increased more rapid than it was expected in 1924⁷. To obtain a new master plan, an invited planning competition was opened in 1928⁸. Among the candidates, Hermann Jansen who was also the award-winner of the Berlin Master Plan Competition was commissioned. Representing the culturalist school of spatial organization, the plan dated 1932 had a circular and compact macro-form and aimed to develop the city towards the north-south and east directions (Figure 3). The legacy of Lörcher Plan was kept except the revisions concerning the peripheral development of the Main Railway Station. Jansen's plan isolated the Main Station from the city center through placing it within an industrial corridor and removing the commercial uses around it (Günay, 1988). The construction of large arteries for motorized transportation, on the other hand, was not encouraged; even the main arteries of north-south and east-west connections were kept limited without bringing alternative roads that further caused permanent traffic congestion.

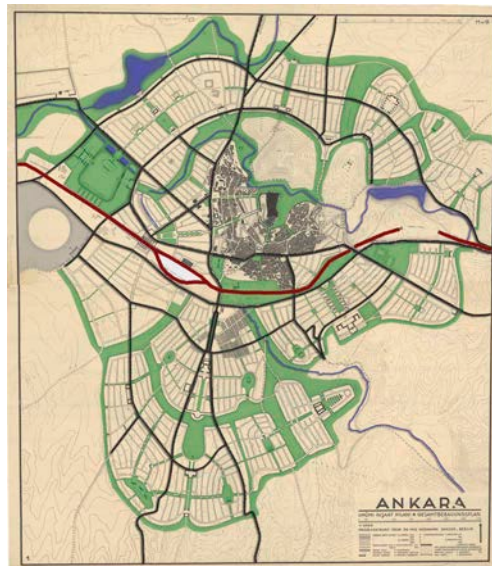

Figure 3: Hermann Jansen. *Ankara Master Plan dated 1932. The green network, railway line and main arteries comprising the outlines of the plan are emphasized in green, red and black colours.*

The green network of the plan had a high level organization⁹. The green areas as being continual-structural components of the plan, for Jansen (1937), should be accessible for all people and be offered in every

⁷ The population of Ankara was 40,000 in 1924, and Lörcher foresaw the future population of Ankara as 200,000 for twenty years since he had suggested low density development for the new city. However, the population of Ankara has already reached 75,000 in 1928, and there were not any planning experts to control the growth of the capital.

⁸ Before the competition, German planner Carl C. Lörcher was commissioned for the preparation of Ankara Master Plan in 1924 (Cengizkan, 2006). Continued until 1926, the planning study focused on reclamation of old city as well as designation of the main elements of new city without paying attention to macroform development.

⁹ Previous planning approaches, for Jansen, recognized green areas as means of beautifying the environment, while contemporary planning approach interpreted them as a 'tool for providing health and recreation facilities to modern human'. Recreation and relaxation were equated with sports and walking activities in Jansen's planning approach; modern human could relax by walking and involving in sports.

neighborhood (Figure 3). Similar to Lörcher's approach, Jansen put a strong emphasis on the continuity of green stripes¹⁰ along the commuter line, and for him "skeleton of the city should be composed of main arteries, railway line and green stripes". Moreover, these stripes were not only supporting pedestrian movement but also adding "visual quality" to the transport modes (Jansen,1937). Extending along the arteries, commuter line, and Ankara Stream green stripes should orientate people through parks, squares, private gardens or even the frontiers of the city. By this way, arteries and commuter line would provide continuity between rural landscapes and urban core (Jansen, 1937).

Together with the establishment of Atatürk's private farm and Etimesgut and Sincan Modal Villages, west of the city needed new road connections that had not been foreseen in the 1932 plan. In addition to that, continuous changes comprising density increases and speculative pressures were begun to deploy within the plan by the coactions of the local administration. For these reasons, existing plan was recovered by Jansen between 1934 and 1937¹¹. The plan dated 1937 extended the urban fabric towards west along the commuter line and opened up new lands on the north, south and east for the urban development (Figure 4). All these plan revisions led increase in the number of railway stops reaching new neighborhoods/villages, and the emergence of 'railway station and park' duo in neighborhoods as typological elements of urban plan. Culturalist school of spatial organization embraces the human scale and social interaction, therefore, even the stations and their parks were formed to produce collective spaces¹².

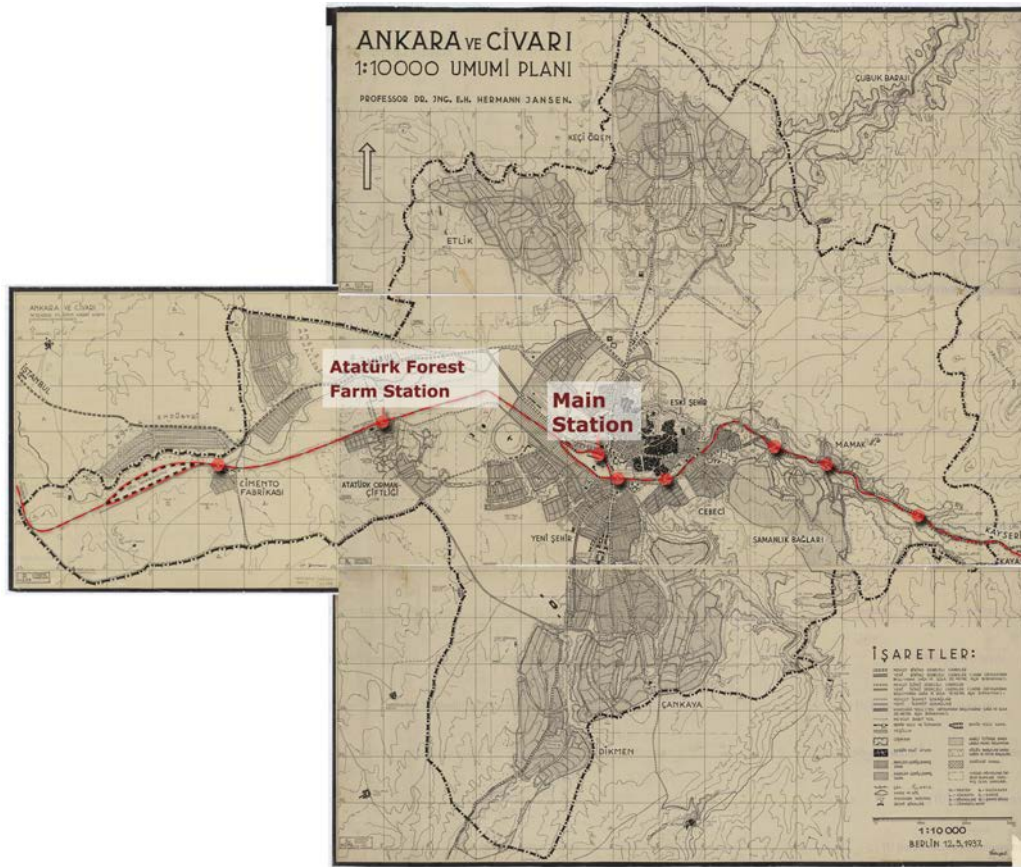

Figure 4: Hermann Jansen. 1:10000 scale Ankara Master Plan dated 1937. The commuter line and stations are emphasized in red colour.

After resignation of Jansen in 1938, speculative pressures and emerging squatter-belts have started to shape the urban form, Ankara faced with unplanned development process. Nevertheless, latter planning study dated 1956

¹⁰ The green stripes were the planted pedestrian axes following main and lateral arteries as well as commuter line (Jansen,1937).

¹¹ Jansen resigned in 1938 as a result of the weakness of the local administration against land speculation. Indeed, it was the beginning of an unplanned development period characterized by speculative pressures (Tankut,1993). The only state figure supporting the planned development was the President Atatürk (Atay, 2014). After his death in 1938, local administration remained uncontrolled.

¹² Beside numerous macro-scale impacts of railway lines, particular micro-scale interactions are also emerged between railway line and detached areas. Transport modes create collective spaces (Wall, 1999) and pointlike relationships, like stations which become the nodes of interaction in economical and social terms.

would not cope with these spontaneous growth dynamics, since the 1956 plan was utilized as a tool for approving speculative decisions rather than controlling urban development. Starting with 1960s', the continual landscape fabric along the commuter line was interrupted as a result of sprawl and emerging squatter areas. Until the 1970s', the urban development of Ankara was carried out through piecemeal plans. Following planning study, dated 1980, reflected the features of the structure plan approach and became a milestone for the removal of culturalist planning approaches. By suggesting long-term strategies, it mainly aimed to control squatter development and propose a realistic growth scenario for Ankara. By opening up new lands for urban development and service areas, a linear development scenario towards west was adopted without supplying north-south road connections. The commuter line together with Ankara Steam and AFF were recognized as a threshold, barrier and macroform generator differing from earlier planning approaches. This approach towards commuter line, however, further resulted in the social and economical polarization between north and south of the city, fragmentation of landscape reminiscent of Republican Period plans (Bütüner, Aral, Çavdar; 2017a), stratification of new boulevards parallel to the commuter line and visual and physical isolation of Ankara Stream. Following master plans sustained this tendency, consequently the interplay between the commuter line, continual landscape fabric and water structures were diminished and the station parks in the neighborhoods were shrank or disappeared. The built components of railway heritage also have not been taken into consideration, currently, many of them under the threat of demolition to sustain the urban transformation economy.

From Legacy to Future: Mapping the Railway Heritage of Ankara

Extending along 37 kilometers distance, currently, Ankara commuter line operates between the west and east edges of the existing urban core. It offers a characteristic case by setting up a territory where three infrastructures –transportation, green and water- adjoin (Bütüner, Aral, Sert; 2017b).

Being both the product and the witness of modern planning experience in Turkey, Ankara commuter line generated a continuum between rural and urban, core and periphery, and united landscape and technical infrastructures, neighborhood and social infrastructure (station parks and squares) regarding the culturalist planning ideas of the early 20th century. The landscape fabric (cultivated lands, parks, forests, and landed estates) designed along the line (Figure 5), the planned interplay between nature and infrastructure were assumed to convey visual and aesthetic impacts, make the city legible and imageable and be the community spaces of modern citizens. Even though this landscape fabric is still legible as depicted in 2013 map, its continuity along the line was interrupted, the cultivated lands and Atatürk Forest Farm was fragmented and shrank out at a greater pace starting from the 1960s'.

The built assets of Ankara commuter line constructed between 1920s' and 1940s' comprise station buildings, station parks, bridges, tunnels, culverts, maintenance ateliers, rail and locomotive hubs, storehouses, and housing compounds (Figure 5). Together with the urban development starting from 1950s' and decentralization, the logistic requirements of the line was transferred to the west and the built railway heritage assets dated back to the Early Republican Period faced with long period of abandonment until 1990s'. Currently, very few of them are registered or refunctionalized¹³. The industrial heritage accompanying the commuter line, on the other hand, was located towards west due to the existence of Atatürk Forest Farm and the density increase in urban core (Figure 6).

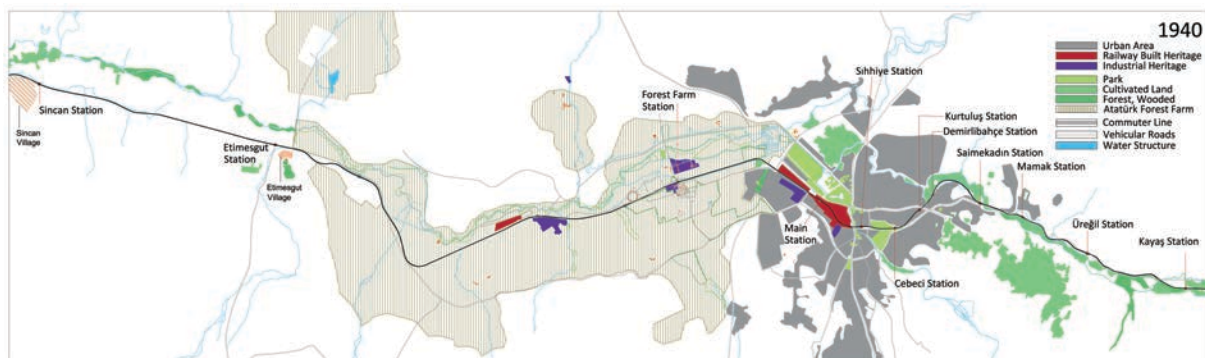

Figure 5: Rendered by the authors based on Ankara touristic map dated 1963 and Atatürk Forest Farm map dated 1960. Map showing the built and landscape heritage accompanying the Ankara Commuter Line in 1940.

¹³ The unregistered railway built assets remained at the urban core are currently under the threat of demolition.

Figure 6: Rendered by the authors based on Ankara map dated 2013. Map showing the built and landscape heritage accompanying the Ankara Commuter Line in 2013.

Conclusion

Commuter line developments, doubtlessly, bring fresh discussions on planning history studies since they may symbolize nation-building; represent urban history; emerge as modern planning heritages and city planning legacies; and often intermingle various forms of continuity (space-time continuum, urban-rural continuum) or interactions (rural-industry, infrastructure-landscape, transport-heritage etc.) owing to their scale, linearity and function. In this regard, Ankara commuter line and accompanying built and landscape heritage as the remarkable elements of urban image of Ankara symbolize several meaning sets comprising the statism and modernization in all senses and the urban revolution first experienced in Ankara.

In the aftermath of the WWI, quite a number of cities were established, of which some were assigned to be capital cities of new nation-states. In this period, Ankara town was also pronounced as the capital city of the newly established Republic. However, transformation of Ankara from a small Anatolian town to a modern capital city necessitated planned development and highly organized infrastructure intervention. For the establishment of the city, famous figures –namely Carl C. Lörcher and Hermann Jansen- representing the 19th century planning approaches were commissioned. In these early plans prepared between 1924-1937, Ankara commuter line was not only recognized as one of the major transportation infrastructures, but also as a planning tool in the designation of the rural-urban continuum, modern industrial and rural environments, logistic centers, urban green network and community spaces.

Brought by these earlier plans, currently, Ankara commuter line and adjoined built and landscape assets become the urban planning heritages of Ankara as well as the prominent remnants and the legacy of the early 20th century modern planning experience in Turkey. The line and accompanying assets clearly have historic, cultural, identity, age, aesthetic, visual, perceptive, social infrastructure and technical values. Once integrated the planned green network (landed estates, recreation areas, vacant lands), industrial areas and city center; currently, the generative potential of the line is interrupted at a greater pace. The entire assets, on the other hand, may not be valued as the outstanding examples of modern architecture or landscape, however, the emphasis here is to conserve their historic integrity, their capacity in reflecting societal history and the original ideas behind the planning approaches -which are all indispensable parts of planning historiography. Although fragmented at a greater pace, the city planning legacy of culturalist school in Ankara is still legible and might be an effective tool in recovering social amenity and city planning relationship as well as re-evaluating the potential future contributions of spatial interactions generated by the commuter line.

Regarding the history of modern planning theory and practice in particular, influenced by culturalist ideas in Europe, modern railway landscapes of Ankara also helps us to construct a modern landscape planning history evolved with and beyond planning thought and to restore the place and long forgotten significance of landscape history in planning historiography.

Institutional changes and the Shifting Power Network: Planning Wusong Port from 1898 to 1999

Hao Jiang (Tongji University) and Li Hou (Tongji University)

Located at the intersection of Yangtze river and Huangpu river, Wusong is a maritime gateway to Shanghai. The function and location of Wusong Port have experienced several changes in the twentieth century. While market condition, economic structure and physical factors have been the major determinants of change highlighted in previous studies, central and local governments are playing key roles in transforming ports and their planning.

While the western powers had tried to extend the concession to Wusong, the Qing Government made Wusong as the first trade port self-determinately in order to maintain the sovereignty in 1898, carried out a modern planning to construct a commercial port. Although it failed, it proclaimed the beginning of the modern urbanization of Wusong. In 1920, Northern Warlords Government made it a trade port the second time in order to use it as a engine of national economic development, and presented Outline of Wusong Opening Plan. During this time, the development target was to compete with Shanghai port. In 1927, Wusong became part of the Shanghai special city, the construction of Wusong port became an important factor to promote the development of Shanghai City. The construction of Wusong port has been considered comprehensively in the Greater Shanghai Plan (1929) and Greater Shanghai Plans (1946-1949)

After the founding of the People's Republic of China, Wusong port was built as an industrial port to promote the construction of Shanghai which was orientated an industrial city by the central government. This intention is also reflected in Shanghai Master Plan (1959,1986)

In this paper, the author introduces the issue of institution as a factor of considerable significance. Based on field investigation and historical geography analysis, inquiring port plans, policy documents, laws and regulations as the basic historical data, the author try to review the process of developing Wusong port in the twentieth century and analyze the dynamic mechanism of its evolution from the perspective of institutional change.

The first section of this paper provides an overview of the development trajectory of Wusong port, which focuses on its function and location changes. The second section briefly discusses the shifting power network that had historically governed the port and analyses relationship between the port and the city. The third section explores the planning of the Wusong port in different historical periods. The impact of administrative zoning adjustment is particularly mentioned, since the changes of the function of Wusong port were always accompanied by it. This article provides evidence that government-led port exploitation plays a great role in the fundamental change of Wusong port -- from a naval port, to a commercial port, to an industrial port, and finally an international cruise port.

The Land Reclamation Along the Hai-Ho River and the Birth of Modern Tianjin (1897-1937)

Rui Ma (The University of Hong Kong)

Within the early decades of the twentieth century, the so-called "hypercolony" Tianjin transformed from a traditional trade terminal to a modern city. The size of settlement expanded more than 10 times during these years which made Tianjin the second largest city in China at that time. Existing research from the perspective of planning and architecture rarely study water environment and topography of the city, and mostly see them as neglect bearer. And the research tends to treat the chaotic structure of the city as a reflection of the disorganized administration and the result of isolated planning on individual concessions. This paper will examine the important role of natural environment in the birth of modern Tianjin, compare Chinese traditional attitude to nature and modern concept of hygiene, and argue that the aquatic environment and topographic condition along the Hai-Ho River at that time limit any large-scale planning and construction to be formulated or implemented. The planning and construction of the concessions was made and carried out step by step after the reclamation of the land along the river.

A new proposal that fill pools and swamps in the hinterland with sediments pumped from the riverbed opened a new stage of land reclamation. It was a byproduct of the Hai-Ho Conservancy Commission (HHCC), a cross-administrative executive authority established in 1897, with its main task of maintaining river navigation through the means of dredging, bend cutting off, and ice breaking. For the sake of the introduction of the new method and new technology, the buildable land doubled within 30 years, which triggered the booming of planning and construction. For this special terrain condition, the general linear relationship between site selections, planning, land reclamation, and construction evolved into a complex interaction. Focusing on the concessions and native areas on the west bank of the Hai-Ho River, the paper will examine the complex relationship and the role of land reclamation in the process of the compelling construction, i.e. the birth of the modern city.

Reimagining the Metropolitan Harbors of the 1960s Through Sub-Center Creation: The Case of New York City and the New Jersey Meadows

Sevin Yildiz (Barnard College, Columbia University)

This paper focuses on the sub-center discussion of the 1960s, as it was seen in many metropolitan centers around the world. The establishment of Port Authority of New York and New Jersey, which was a joint regional governance body established in 1921, pushed both states sharing the same harbor to reconceptualize the organization in the greater metropolitan region. As the primary port facilities of the harbor migrated to Newark-Elizabeth in the 1950s, and the port facilities became a jointly run bi-state operation, a new possibility for re-centralization arose. Around the same time, the newly emerging “systems thinking” in planning theory, challenged the planners’ way of studying the components of metropolitan urban growth. The proponents of “systems thinking” called for a revisiting in the way different clusters in the metropolitan region interacted and were interconnected. They asked for a reevaluation of how land uses shape growth axes and how existing sub-regions could be better linked. The case study presented here will be New York Harbor’s relationship to a vast site called New Jersey Meadowlands, formerly known as the “most valuable real estate in the world,” in northern New Jersey. In the light of revisiting this specific moment in planning history, this paper asks the following questions: How were new sub-center ideals negotiated in New York metropolitan core, in the 1960s, and between two states, during the decade leading up to federal environmental regulations? Who were the policy and plan movers of this era in pushing for a systems approach? One of the sub-center migration sites during this period was New Jersey Meadowlands region, situated in Northern New Jersey and only 5 miles away from mid-Manhattan. The conceptual shift in the Meadowlands’ planning since the 1920s had incrementally rendered New York City less potent as an actor in a possible development scenario. However, the changing ecological imperatives of the 1960s and new policy mobilizers introduced a fresh approach, which eventually would shape planning priorities and would reconnect these fringe ecologies to the metropolis.

HISTORICAL WATERFRONT OF RIO DE JANEIRO: cartography of landfills and new rehabilitation perspectives of the port area

Fabiana Izaga (Federal University of Rio de Janeiro - Graduate Program on Urbanism) and Amanda Silveira (Federal University of Rio de Janeiro - Graduate Program on Urbanism)

This article seeks to analyse recent urban transformations and the conceptual bases that have been in force in the Urban Rehabilitation Project of Rio de Janeiro's waterfront. An attempt is made at establishing a connection between the development of the area, the evolution of the city's history, the activities carried out at the port, and its conversion to new uses. An analysis of the spatial transformations is done, especially in the 7-year (2009-16) span of the initial implementation of the ongoing 'Porto Maravilha' [Marvel Port] urban project, with the mapping of new and old urban fabric and infrastructure; bibliographical research on historiographical studies, city administration players, and technicians to unveil processes that concern urban projects as contemporary tools for land valuation. As a conclusion, we point that despite the major work recently carried out as a product of the Urban Operation Consortium Law guidelines, only 9% of the urban land stock has been negotiated, contradicting even the pessimistic forecasts of 50%. The area lacks an Integrated Urban Plan with a public policy approach, especially to foster housing as a key element for liveable neighbourhoods and a stronger connection with the green infrastructure of the Guanabara Bay ecosystem

Institutional changes and the Shifting Power Network: Planning Wusong Port from 1898 to 1999

** *Associate Professor, Tongji University, houli@tongji.edu.cn*

In this paper, the authors introduce the issue of institution as a factor of considerable significance. Based on field investigation and historical geography analysis, inquiring port plans, policy documents, laws and regulations as the basic historical data, the authors try to review the process of developing Wusong Port in the twentieth century and analyse the dynamic mechanism of its evolution from the perspective of institutional changes. The first section of this paper provides an overview of the development trajectory of Wusong Port, which focuses on its functions and locations changes. The second section briefly discusses the shifting power network that had historically governed the port and analyses relationship between the port and the city. The impact of administrative zoning adjustment is particularly mentioned, since the changes of the function of Wusong port were always accompanied by it. The third section explores the planning of the Wusong port in different historical periods. This article provides evidence that government-led port exploitation plays a great role in the fundamental change of Wusong Port -- from a naval port, to a commercial port, to an industrial port, and finally an international cruise port.

Keywords: Wusong Port, historical evolution, Port city, Management institution, Power networks

Introduction

As centres of exchange where different cultures and different environments meet, at the boundary between land and sea, port cities have long fascinated geographers, economists, sociologists and historians. (Tan, 2007) With the development of world ports, the research hotspots experienced the port city spatial relationship (Bird, 1963), the evolution of the port cities of the colonies (Taaffe E J, Morrill R L, Gould P R, 1963; Hoyle, 1968), the evolution of the hub ports and their systems (Hayuth, 1987), the port city interface (Hayuth, 1982; Hoyle, 1989), in the academic field. Since 1980s, the research on institutions of ports has become a hot topic (Amin and Thrift, 1994; Brooks 2004; Notteboom 2005; Pallis and Syriopoulos, 2007; J Wang A. Ng 2004), some scholars had begun to attribute the power of port and urban development to institutions (Jacobs and Hall Gonz les and, 2007; Healey, 2005) in recent years.

These institutions consist both of formal rules (e.g. constitutions, laws, and property rights) and informal rules (e.g. customs, traditions, or codes of conduct) that shape the actions of individuals, organizations, groups or other actors. (Daamen T A and Vries I, 2013) It is difficult to adopt a general method for institutional analysis of port cities, for China's unique national conditions and historical progress. Therefore, the authors mainly study the different policies and means adopted by the governments in the management and planning of Wusong port in different historical periods, as well as the role changes of the Port Authority in these activities.

Wusong, named after the Wusong Estuary located at the intersection of Yangtze River and the Huangpu River, has always been regarded as a treasure land for development due to its excellent traffic conditions. Early in the Guangxu period of the Qing Dynasty, it had been a port town for the transshipments of goods, with customs, railways, wharfs and post offices being built¹. Wusong had a high reputation abroad in the early twentieth century, while some foreigners had not heard about the location of Shaanxi, Gansu and other provinces, but everyone knew Wusong². However, the development of Wusong port had been very slow during a long historical period. The reasons are complex, but one reason that cannot be ignored is that its development is related to institutional changes and the shifting power network. So it is necessary to interpret its special and complex situation in a perspective of institutional changes. The Qing Government made Wusong as the first trade port self-determinately in order to maintain the sovereignty in 1898, and formulated a plan to construct a commercial port. This marks the end of its unrestrained development stage, that's why we choose this time point as the beginning of this research.

From a fishing port to an international cruise port: function transformations of Wusong Port

In this paper, Wusong Port refers to a series of wharves, berths, harbour operational zones etc established in Wusong area in history. Historically, its main functions and locations of have undergone many vicissitudes(fig.1). Its function transformations can be divided into five stages, from the fishing port, naval port, commercial port, industrial port and then to the international cruise port, almost the epitome of various types of port functions in China. (Lin Tuo and Zhang Xiugui, 2008) Its trajectory of space migration is different from the classical Any-port model, and its change process could be characterized by jumping. (Shen Li, 2013)

Before Wusong became a town, it had already been a fishing village market described as *three hotels in the ten stores and twice seafood listed on a day*. The fishing wharves were mainly distributed on both sides of the Yunzao Creek, while Wusong town expanded behind the wharves. After the Opium War, the military function of Wusong port gradually became prominent. It's closed to the urban area of Shanghai, if we lose, the safety of the city will be directly threatened. In 1870, the Qing government set the Wusong Navy Camp and built a wharf. Since then, Wusong port began to extend along the Huangpu River and the Yangtze River estuary.

In late nineteenth century, the Qing government independently opened port in Wusong to avoid Western Powers advancing into the Wusong area. Viceroy of Liangjiang Liu Kunyi take Supervisor of the Self-strengthening Army Service Department Shen Dunhe's proposal to dynamite Wusong Fort Barbette in order to facilitate business activities³. This marks a shift from a naval port to a commercial port. Wusong Port became a centre of land-and-water coordinated transport.

After the founding of the PRC, Wusong Port began the transition to an industrial port as Wusong area is regarded as an important industrial area of Shanghai. In November 1959, Shanghai Port 9th Harbour Operation Zone was established on the west side of the Huangpu River in Zhanghuabang. Shanghai Port 10th Harbour Operation Zone began to establish in 1973, and then the two harbour operation zones became the international container port of Shanghai. Starting from 1980s, Wusong International Cruise Port located in the Paotaiwan water of the Yangtze River began to be planned. It is the busiest international cruise home port for the Asia Pacific region after the completion of the construction.

Several repetitions of the establishment and revocation of Wusong administrative area

As a governing and policy tool, the status of administrative division in China is more critical than other countries. To analyse the development of Wusong port, we should pay close mention to the influence of the administrative division adjustment, which makes it be taken into consideration in the overall pattern of Shanghai, from an outpost.

In the late Qing Dynasty, Wusong Port was located in Wusong Town, while Wusong town was subordinate to Baoshan County of Taicang state, Jiangsu Province. At the beginning of Shanghai's opening port, Wusong was eyed by Western powers⁴. Wusong's administrative jurisdiction didn't belong to Shanghai, so foreign businessmen could not carry out commercial activities in Wusong area. From the 1870s, Western Powers one after another to request to open the Wusong as a commercial port and expand the scope of their concession, but the Qing government did not agree. Qing government regarded the development of Wusong port as a mean against the Shanghai concessions controlled by Western powers.

In 1927, Shanghai Special Administrative City was established. In subsequent year, Wusong was divided into a part of Shanghai city by the government of the Republic of China, which was promoted to Wusong district. Wusong Port was delimited into the overall framework of the urban development of Shanghai. Because of the existence of Wusong outpost, the connection between Wusong and Shanghai County was strengthened. In order to meet the economic need, the government of the Republic of China made a positive response to an administrative division adjustment and promoted the original administrative unit of Wusong Town, which belonged to Baoshan County, to become an administrative unit of Shanghai. (Wang Liehui,2013) More importantly, as the first mayor

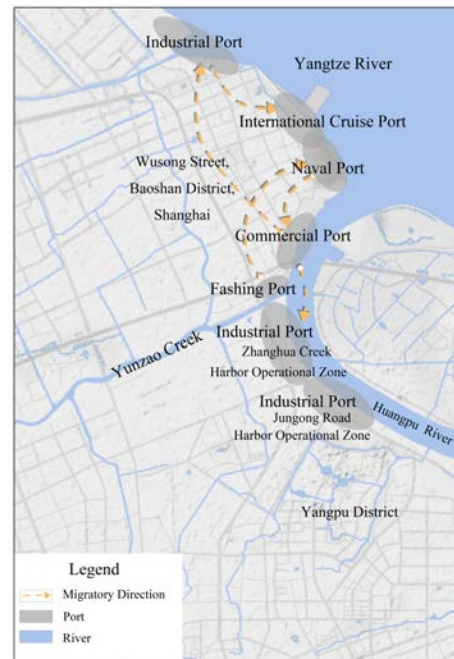

Figure 1: Changes of functions and locations of Wusong Port

of Shanghai Huang Fu proposed, to build a port at Wusong, and open up a new city between Wusong and Concession, to weaken the importance of concessions⁵.

After the founding of the PRC, Wusong District experienced establishments and revocations for three times. Three different Wusong District had three different functions, in three different areas, reflected the trend of Wusong Port's functions in the process of urbanization. The first establishment of Wusong District was helpful for the Shanghai municipal government to organize and manage the development of port and port industry. In January 1960, because of the need to build an iron and steel industrial base, the Wusong District dominated by iron and steel industry was rebuilt across the Huangpu River. In the first half of 1964, the industry under the leadership and management of Wusong district was put under the administration of the relevant industrial bureaus and companies of Shanghai, the establishment of the district system was revoked. In order to enhance the regional service for the construction of Baogang in 1978, the Shanghai Baogang Regional Office was established. Wusong District of the urban area was set up again in 1980 on the basis of the Baogang Regional Office. This laid the institutional foundation for Wusong to develop an industrial port. Wusong District was merged with Baoshan County in 1988, Wusong Port highlighted service function under the framework of coordinating the relationship between urban and rural areas, a water and land transport hub and urban comprehensive service centre.

Shifting Power Network

Wusong Port has experienced more than 100 years of developments since the first independent opening, across the three periods, the late Qing Dynasty and the Republic of China, People's Republic of China, with its management institutions changes continuously. In different historical periods, the institutions involved in port management and their management rights are different.

In the late Qing Dynasty and the early Republic of China, there was no specialized institution to manage Wusong port. The land and water area, foreign mooring area and Chinese ship mooring area of Wusong port were managed by separate institutions. Lack of specialized port management institution resulted in low administrative efficiency, and the development and construction of port were basically in a spontaneous state. According to statistics, half of Wusong wharves were donated by local businessmen. At that time, Shanghai Port was actually in the hands of the foreign port manager under the Commissioner of Customs.

After 1920s, the government of the Republic of China realized the fact that there was no specialized port management institution, which was not conducive to the planned development of Shanghai Port. In 1927, the Special Municipal Government of Shanghai decided to set up Shanghai Port Authority to conduct unified management of the port. In the next year, Wusong was divided into Shanghai. Wusong Port was placed under the management of Shanghai Port Authority. However, due to the obstruction of Shanghai customs, Shanghai Port Authority did not actually control the management of all the wharves. In fact, the Shanghai government could only manage Chinese vessels, wharves and warehouses in Nanshi Area. By the end of 1930, Shanghai Port Authority had no choice but to revoke. The dispute of port management right ended with the failure of the Chinese government. In 1937, Shanghai Customs, Police Office, Pilotage Office, Junpu Bureau, etc. were under the control of Japan after the Japanese occupation of Shanghai.

Before liberation, Wusong port had been under the control of the imperialist and bureaucratic bourgeoisie, and more than 10 units, such as Shanghai Customs, Junpu Bureau and the Political Bureau, scramble for the port and compete for each other. The semi-colonial feature was most prominent in the port management system, which was dominated by foreigners. Wharves and warehouses were decentralized, controlled by several enterprises from different countries. This had resulted in the development of Wusong stay in the ideal.

In May 1949, Shanghai was liberated. The People Government retracted all kinds of sovereignty of imperialism and illegal occupation of our country, including the ship diversion, navigation administration and channel dredging, which ended the chaos in the management of Wusong Port, which was caused by the imperialism for decades. In 1954, the jurisdiction of the port authority under the Ministry of Transport was clearly stipulated in the form of a decree after the promulgation of the Provisional Regulations of the People's Republic of China on Port Management. According to this law, it has gradually established and formed a combination of government and enterprise, and a management system of production, aviation and service units. It has played an important positive role in developing port production and strengthening port management. In order to make the port management institution to adapt to the need of development and change, the central government has made eleven changes to the administrative institution of the port authority from 1950s to 1980s. The main change is the affiliation of port, which changes periodically between the Ministry of Communications (the central government) and the local government. In 1980s, the state's port management institution has undergone major changes. In 1986, Shanghai Port has been put under the control of the local government, and the management institution of "central and local government dual leadership and local government management" was carried out.

Planning Wusong Port in the context of confrontation between China and Western Powers

The planned construction of the Wusong Port began in the late Qing Dynasty, the Qing government once open the commercial port autonomously, promoting Wusong city development. But it failed for a variety of reasons. Dr Sun Yat-sen also showed the idea of transferring the Shanghai port to the lower Huangpu River in his famous work *The International Development of China*, unfortunately, it failed again. Since then, the government of the Republic of China has also attached great importance to transfer the port to the lower Huangpu River and Wusong in the planning of the Chinese community. The government had made a lot of plans for the construction of the port, but most of them had been shelved and forgotten. It failed to carry out owing to the backward technological conditions and chaotic political situation at that time. Even if some of the schemes were executed, there was little effect.

Liu Kunyi asked the Qing government to open Wusong as a commercial port autonomously in 1898. Wusong became a trading city different from Shanghai concession and allowed foreign businessmen to conduct business there and began to plan for constructions. This made the Chinese people very optimistic about Wusong Port to be a large seaport, but it was not as expected. The purpose of the Qing government to open Wusong Port was to develop it into a port competing with Shanghai Port, but the existing Western Powers with a vested interest Shanghai was obviously unwilling to see such a situation. The opening of Wusong Port stimulated Western Powers to be more concerned about dredging the Huangpu River to improve the shipping conditions of Shanghai port, and wrote relevant clauses into 1901 Treaty ending the Boxer War. (Wu Qiang, 2016) The dredging of Huangpu River made Wusong lost the chance to compete with Shanghai concession.

After entering the Republic of China, industrial development in Wusong area provided an opportunity for Wusong to open its port second time. Early 1920s, Zhang Jian put forward the *Outline of the Wusong Opening Plan*, pointed out that the displacement of the ocean-going vessels had increased greatly, and cannot enter the Huangpu River. Wharves should be built at Wusong. Otherwise it will be detrimental to international transportation⁶. In 1927, special municipal government of Shanghai was founded. The central government believes that China's military, economic and transportation issues should focus on Shanghai⁷. But at that time, Shanghai municipal government could not complete the development of all the city of Shanghai due to the existence of the concessions, it could only focus on the development of the Chinese region, and began to formally put forward the urban planning, this is the Greater Shanghai Plan. The urban planning and construction of Shanghai had a clear political intention of starting from the founding of its municipal government. (Hou Li and Wang Yibing, 2015) The plan determined that the new commercial port is open in the south of Wusong town along the Huangpu River, a place with deep water. Pudong coastline of the Huangpu River was planned as an expansion zone of the commercial port area to completely avoid the influence of the concessions. The central government believes that once the Wusong built, wharves around the concession will be wasted⁸.

In 1937, the Japanese occupation of Shanghai attempted to turn Shanghai into a large port that plundered China's large quantity of raw materials and output commodities. In 1938, the fake revival Bureau was planning to establish a large port in Wusong to make the 10000 ton cargo ship to shore directly in the *Shanghai Urban Construction Plan* (later renamed the *Shanghai new Urban Construction Plan*). After the establishment of the Shanghai Port Consolidation Committee in September 1946, it began to discuss the formulation of the great Shanghai port construction plan. In September 1947, the Committee's work group wrote *Outline of the Construction Plan for the Port of Five Years*. At the same time, the Great Shanghai Urban Plan Committee began to attach great importance to the

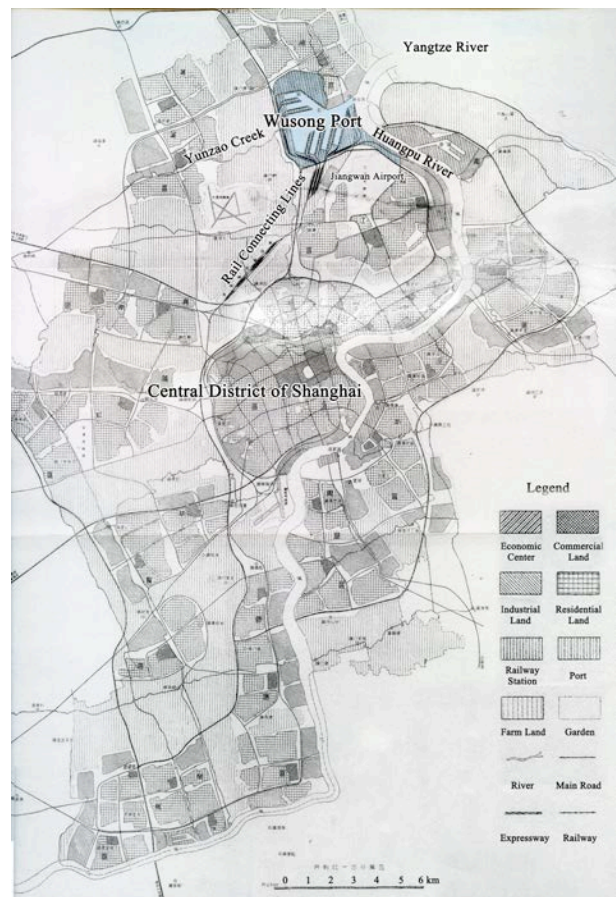

Figure 2: Port planning in the Greater Shanghai Plans: the third draft

importance of port planning, and put forward the *Preliminary Research Report on the Shanghai Port* and the *Wusong Port Plan Research Report*.

In addition to thinking that Huangpu River needs to dredge regularly to navigate, they considered that only Wusong, deep river and wide river, is the ideal position of the inner river port⁹, build a port at Wusong can avoid all the shortcomings at that time¹⁰, so the Shanghai port will gradually transfer to Wusong. In addition, Wusong port covers an area of nineteen square kilometers, with a throughput of one hundred million tons per year, some of which can be classified as free port when needed¹¹. More importantly, planners believed that the wharves of different sizes along the Huangpu River represent countless private interests, the establishment of a dig-in basin(fig.2) in Wusong was conducive to improve management efficiency. Although these plans are based on the detailed investigation of the Shanghai port maladies, and in the process of planning, it had learned from Europe's Dutch Port Region and North German Port Region and La Plata Port Region in South America, it could only be shelved at that time.

Planning Wusong Port promoted by the central and local governments

In the early days of the founding of new China, Shanghai was listed as an industrial city by the central government. In order to cooperate with the development of the city, port development of Shanghai also had strong industrial port orientation. The Wusong still serves as a port of Shanghai, in management, planning and construction¹².

In 1951, Shanghai Municipal Construction Committee compiled the “Shanghai Development Direction Map” (Draft), planned an excavated port reserve at the intersection of the Huangpu River and Yunzao Creek proposed the long-term interests. But in 1953, the Soviet expert Mukhin came to Shanghai to guide the planning of the general map of Shanghai city, he proposed to make full use of the existing facilities and the reservation of deep water shoreline and construct an ocean water and land combined port in the area of Zhanghuabang¹³. This idea was eventually implemented. In 1950s, development of Wusong Industrial Area promoted the construction of Wusong port. In Shanghai Master Plan(1959), we can clearly see the intention of Wusong port serving the Wusong Industrial Area.(fig. 3)

In order to coordinate with the policy to develop the city, reorganize and adjust the old urban industry and gradually build the satellite town in the periphery, so as to create conditions for some quay shoreline in the urban area, Shanghai Port Authority has compiled a brief report (Draft) of the Shanghai port planning (1962)¹⁴, and then the Shanghai Municipal People's Committee put forward a report on the design task book on the construction of Zhanghuabang wharf¹⁵. It planned to lay out 20 berths of 10000 tons and set up a special railway line in the port area. In 1959, the construction of Zhanghuabang wharf began. After that, Shanghai Port Authority put forward a three years' construction plan that 8 berths were built at Zhanghuabang in 1960-1962¹⁶. In 1973, the Jungong Road Harbour Operational Zone of Wusong Port was built, Wusong Port became an international container port.

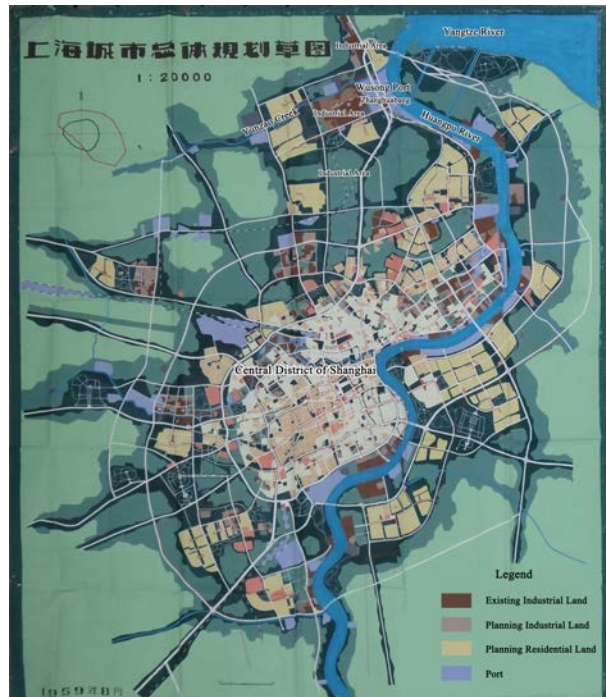

Figure 3: Draft of Shanghai Master Plan,1959

In 1973, Premier Zhou Enlai issued the call of “three years' change of the port's appearance”. The first wave of port construction in China appeared. In the same year, the State Council port construction conference proposed the requirements for the preparation of the fifth five-year plan and vision of port construction. Shanghai had set up a leading group for the construction of port with a branch named the Office of the Port Construction (also known as the Planning Office) which is affiliated with Shanghai Port Authority. In July 1974, Office of the Port Construction made a report on the ten year development plan of the port. The draft proposed the sixth five-year during the construction of the new port near Wusong Estuary. The wharf in the latest port can be operated jointly with the Zhanghuabang and Jungong Road wharves which are conducive to production scheduling¹⁷.

In 1982, Shanghai Municipal People's Government approved the location of international cruise port in Wusong area, and the length of the coastline was 330 meters. In 1987, the Ministry of Communications approved the

approval of a new international passenger and cargo berths in Wusong District. In 1986, the State Council approved the Shanghai Master Plan in which the local government proposed to actively improve the passenger transport facilities and the establishment of Wusong International Cruise Port is one of the principal measures. What's more, it pointed out the final direction of development of Shanghai port is to build new port out of the Huangpu River. Since then, Wusong ceased to be the focus of port planning.

Conclusion

In the development process of Wusong Port institution played a key role. Before liberation, Wusong had not been fully developed, with a good location conditions. The biggest reason says there was no institutional support. Although the government of the Qing Dynasty and the Republic of China have realized the importance of port construction, the driving factors of Wusong construction were more like market power without taking a tough measure to intervene.

Before liberation, Wusong Port was always in the whirlpool of various complicated political power struggles, and went up in the struggle between the old institution and the Western power. Wusong Port had always been in a weak position in competition with the traditional Shanghai port, just like the weakness in the struggle between the local government and Western Powers. The prosperity of Shanghai port is mainly based on the transportation trading system at the core of foreign enterprises. Western Powers did not want to see an uncontrolled Wusong Port and Wusong City, so they took numerous measures to crack down on the development of Wusong. The local government failed to develop Wusong Port due to various factors, but Western Powers occupy Shanghai was a major reason why Wusong Port is difficult to develop at that time.

During 1950s-1980s, the planned economy and the closed political and economic institution in China had restricted the development of Wusong Port to a certain extent. However, China's central government had constantly introduced new policies, and Shanghai's local governments had also adopted various adaptations to meet the need of development. This institution was constantly debugged, which many countries had never been tried or dare not try (Wang, 2010). Dynamic policy environment was a major factor to Wusong planning formulation and implementation.

Some scholars believe that the port management institution and the incomplete decentralization of port management right in China restrict the full utilization of port advantages. (Shi Youfu, 2003) Although the management and development of Wusong Port had been controversial between the central and local government, but when scrutinizing the planning since the founding of the People's Republic of China, it could be seen that the central and local governments had a common role in promoting the development of Wusong port without too much institutional resistance. Although the central government had issued various policy documents, the port law was promulgated until 2003, which created the system conditions for the development of Wusong port to a certain extent.

It is obvious that Wusong port has been not planned by the central government. It is formulated by Shanghai Port Authority and the relevant departments of the Shanghai local government through discussion, and then central government approved it. This is primarily due to the port development trend to market-oriented, and affected by more and more local factors, which are further reflected in the construction of Shanghai Yangshan port.

The Land Reclamation Along the Hai-Ho River and the Birth of Modern Tianjin (1897-1937)

Rui Ma*

* PhD, Department of Architecture, The University of Hong Kong. Email: ray.von.hk@gmail.com

Within the early decades of the twentieth century, the city of Tianjin transformed from a traditional trade terminal to a modern city. The size of settlement expanded more than 10 times during these years which made Tianjin the second largest city in China at that time. For the special natural environment, the topography cannot be neglected in this process. By analyzing of the aquatic environment and topographic condition along the Hai-Ho River, comparing Chinese traditional attitude to water and modern concept of hygiene, and reviewing urban development of concessions before 20th century, this paper argue that land reclamation was a vital and necessary work in building a modern city. Using archive of land filling of Hai-Ho Conservancy Commission, the paper explores the process of land reclamation along the Hai-Ho River and examines the important role of the commission, new filling method and technology in this process. It then focuses on the development of the concessions on the west bank of the river and examines how the land filling evolved in the complex relationship and played an important role.

Keywords: Hai-Ho River, modern Tianjin, Hai-Ho Conservancy Commission, land reclamation

Introduction

As an agriculture-based society, China, in its long history, saw water control a fundamental means to rule the empire. This concept, which was rooted in Chinese Confusion traditions, constructed a centralized state power that guided public works in the process of transforming water environment. The massive constructions of canals were used to support the expansion of agricultural production and to maintain the complex and subtle relationships among navigation, irrigation and flood control.¹ The Grand Canal, which connected the capital and *Jiangnan*(江南) area, was vital to the safety of purveyance. The routes of the canal altered with the locations of capital. Since the capital moved to Beijing in Yuan Dynasty, the settlement of Tianjin emerged for the sake of its location, which is the intersection of the Grand Canal and the Hai-Ho River, and played a role of trade terminal that providing transportation by canal or by sea.

In order to reduce the large amount of manpower and resources in maintaining the canal transportation system, the Beijing court tried to improve the irrigation condition in the Hai-Ho Plain to gain self-sufficient for several times. But the occasional harvests around the capital could not replace the purveyance from *Jiangnan*.² Hence, the rulers of Beijing implemented a policy called *Bao yun ji cao* (保运济漕), means the irrigation and water control had to subject to navigation of the Grand Canal. The plain, especially low-lying cities such as Tianjin, Hejian, and Baoding, had been flooded frequently.³

Within this natural environment, Tianjin and its rural area have formed particular morphological features. *Jinmen Baojia Tushuo* (津门保甲图说), which published in 1846, shows 3 features of the city form in mid-late Qing Dynasty (Figure 1).

(1) The area around the intersection of the Grand Canal and the Hai-Ho River, which was called *San cha he kou* (三岔河口), was the most densely populated area in the city. It was also the key place that plays the role of trade terminal. To the southwest of *San cha he kou* located a walled city, which had been built in 1404 in Ming Dynasty to ensure the safety of the canal transportation system. These two areas constituted the main body of the city and also occupied the biggest highland of the region. There were two ponds in the south of the walled-city, which connected with city moat and wetlands in the southern suburbs through the water gates on the wall. There were no clear boundaries between nature and man-made environment, which shows Chinese traditional philosophy of moderation and harmony.

(2) Most of the villages and buildings located along rivers. On one hand, due to the sediments brought by the rivers and perennial levee constructions, the terrain along the rivers was relatively high. On the other hand, rivers provide fish and transportation to villagers.

(3) The villages those relatively far from rivers were located on many platforms, which were surrounded by marshlands and ponds. These wetlands would become flood discharge areas when summer is coming.

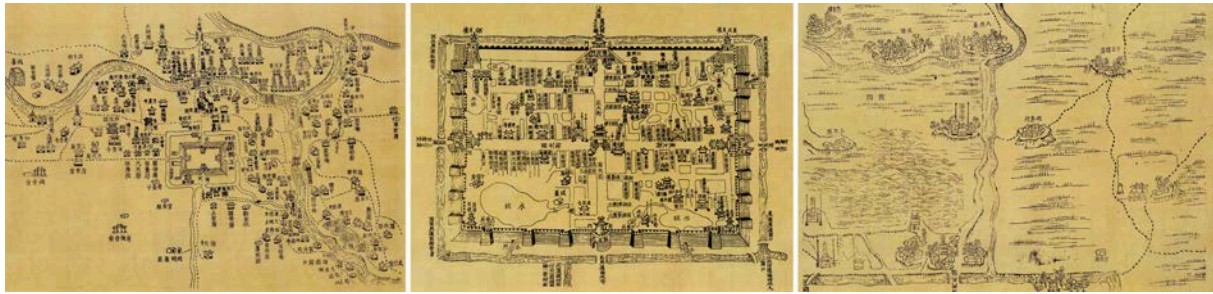

Figure 1: The urban form of Tianjin and its rural area, the walled city, and villages in southern suburbs. Portions of *Jinmen Baojia Tushuo*.

The First Opium War forced the Qing Dynasty of China to open its doors to the world. And Tianjin was opened as a treaty port after the Beijing Convention was signed in 1860. Up to 9 countries had designated concessions in Tianjin. The role of the city changed during era and the urban scale expanded unprecedentedly. Meanwhile, the human-nature relationship as described above also got a significant transformation. Existing research of urban history mentioned this course briefly while historic geography studied this from a macro perspective.⁴ But in the field of urban planning history, researchers rarely integrate water environment and topography of the city in their study. They see the transformation as neglect bearer of human activity and tend to treat the chaotic structure of the city as a reflection of the disorganized administration and the result of isolated planning on individual concessions.⁵ This paper emphasizes that natural environment and its transformation deeply engaged in the birth of modern Tianjin, and argues that the aquatic environment and topographic condition along the Hai-Ho River at that time limit any large-scale planning and construction to be formulated or implemented and the planning and construction of the concessions was made and carried out step by step after the reclamation of the land along the river.

The Designation of Concessions and their Development in the Early Years

Concession	British	U.S.	French	German	Japanese	Russian	Italian	Belgian	Austro-Hungarian
Phase 1	1860 460mu	1860 131mu	1861 360mu						
Phase 2	1897 1630mu			1895 1034mu	1896 1667 mu				
Phase 3	1902: 131mu (annex American concession) 1903: 3928 mu		1900 2300mu	1901 3200 mu	1900 400 mu	1900 5971 mu	1902 771 mu	1902 747 mu	1902 1030 mu
Total Area	6149 mu		2660 mu	4234 mu	2067 mu	5971 mu	771 mu	747 mu	1030 mu

Table 1: Three phases of the designation of concessions and their areas. Excluding illegal occupied areas.

Source: Tianjin local history editorial commission, <http://www.tjdfz.org.cn/tjtz/zjz/hdykz/index.shtml> (accessed Feb 12, 2018)

The designation of concessions in Tianjin includes 3 phases (Table 1). The first one began at the Anglo-French occupation of 1860 during the Second Opium War. British captain Charles G. Gordon cooperated with French Lieutenant de Vaisseau de Trèves investigated the areas outside the native city and selected a parcel of land at *Zi-zhu-lin* (紫竹林) on the west bank of the Hai-Ho River.⁶ The United State subsequently delineated its concession to the south of the British Concession. The Chinese defeat in China-Japan war in 1894 gave opportunities to Germany and Japan to establish their concessions in Tianjin and Great Britain to extend its concession zone. From the walled city on the north, Japanese, French, British, American, and German concessions, all adjacent to each other, occupied the west bank of the upper reaches of the Hai-Ho river. The designation of concessions got its culmination after the Boxer Rebellion in 1900. Russia, Italy, Austria-Hungary, and Belgium followed examples of Britain and France and measured land on the east bank of the river. And the existing settlements also extended their territories several blocks inland. By 1902, Tianjin had become a “fragmented city”⁷ with concessions up to 23629 mu in area, which was nearly 17 times that of the native walled city.

Although the scope was large, the topographic condition limited the development of the concessions. The riverbank area such as *Zi zhu lin* was originally less-developed area dotted with ponds, vegetable gardens, and a few huts.⁸ And the inland area was much lower, with immense shallow and swamp. An aerial view taken by the French military shows topography along the river around 1900 (Figure 2). On the east bank of the river (the site of Italian and Austria-Hungarian Concessions) stacks piles of salt, the villages inland are surrounded by a lot of

Figure 2: Terrain of Tianjin along the Hai-Ho River around 1900.

Figure 3: The construction of the original concessions in 1888 and the surrounding topography.

ponds. On the other side, where is the site of Japanese Concession and Nanshi Area, is full of boundless wetlands. Obviously, the terrain condition was not suitable to modern construction. Furthermore, the natural environment, which was against modern concept of hygiene, was considered unsanitary and threats to public health. Hence, the land, as an 1897 Japanese report depicted, need “a lot of projects to reclaim.”⁹

As soon as the concession was settled, British engineer Gordon made a grid plan with three roads parallel and four roads perpendicular to the river. The site was divided into 10 blocks and 35 pieces of land.¹⁰ This plan was undoubtedly based on the experiences and images of what a colonial city should be and had the advantage of quick rental and rapid construction. But how to deal with the muddy land was an unavoidable issue. In the prior years, the concession governments used the same methods as the Chinese did to fill land. The landowner entrusted a contractor to hire labor to dig and transport soil from land nearby. The mud was dumped on the construction site and left to dry.¹¹ But the cost of this method was high and efficiency was low. During the first 30 years, only 60% of the land had been constructed in the three original concessions. And most of them were in the British settlement (Figure 3). The condition of slow development had not improved even until all the concessions had been designated. A 1908 map shows that, the land has been built is less than a quarter of concession territories and is mainly concentrated on the west bank of the Hai-Ho River. Any construction and expansion would require parting the water from the land. The environment delayed the development of concession.¹² Meanwhile, the traditional methods, i.e. digging in nearby land, meant created a new pond while eliminating an old one. The concession governments had to prohibit digging in the concession.¹³ This dilemma only changed until the establishment of the Hai-Ho Conservancy and the introduction of new method and technology.

The Hai-Ho Conservancy Commission and the Land Reclamation Along the Hai-Ho River

The original intention of establishing a concession in Tianjin was to set a nearby base to cast influence over the capital of Qing Dynasty. After several decades of development, the city's trade status had become more prominent. The *Zi zhu lin* Port played a role to incorporate Tianjin and North China into a global market. The number of steamers that arrived at the port increased from 111 in 1861 to 688 in 1895. And the tonnage increased by almost 23 times.¹⁴ But Tianjin was not a natural port. The watercourse between the city and the sea was shallow and winding, which was not navigable to ocean-going steamers. And the course at times silted up in summer when flood brought large amount of sediment from upper reaches and distributaries. The navigation condition seriously deteriorated at the end of the 19th century.

“During the summer of 1889 the Hai-Ho was said to be more difficult to navigate than during any season since the port had been opened...”

The 18th International Planning History Society Conference - Yokohama, July 2018

... 1896 was one of the worst in the history of the port. For more than seven months steamers were unable to come to the Bund, and the outlook was so serious that not only Foreigners, but even Chinese, began to take alarm.”¹⁵

The navigation of the Hai-Ho River vitally affected the dream of making Tianjin a modern treaty port and the general welfare of the city. Both foreigners and Chinese eager to find a satisfactory solution of this “chronic local trouble.”¹⁶ Along with the suspension of canal transportation, the focus of conservancy shifted from the Grand Canal to the Hai-Ho River. In 1897, the Hai-Ho Conservancy Commission established. It was an organization that bridge Chinese government, Customs, foreign concessions, and merchants. The Commission reorganized as the Hai-Ho Conservancy Board after the Boxer Rebellion. Its main task was to improve the navigation condition of the Hai-Ho River by modern methods and technology. The Commission’s jobs contained two parts, public works and routine maintenance. The former included the rounding off of many of the bends between Tianjin and the sea, and the building of a system of locks on the distributary canals to keep as much water in the Hai-Ho River as possible. The latter included ice breaking to realize winter navigation and dredging at the mainstream of the river. In the first few years, the dredged sediment was transported and dumped in the deeper part of riverbed. But this cannot reduce the total amount of sediment in the river, which increased the risk of silting in the near future. When HHCC suffered from the inability to dispose the sediment, the concessions that gradually developed from riverbank to inland were bothered by the lack of soil for land reclamation. In 1905, Commissioner T. T. H. Ferguson, Representative of Customs, saw the opportunity and proposed to sell sediment from the river to the concessions as fill for the low-lying lands. ¹⁷

“The Commission, during 1906, proposes to dispose of all spoil dredged within a convenient distance by bringing it in boats into the Canal leading from the old University to the *Hai Kuang Ssu*(海光寺) and selling it at any place on that canal to landowners for raising or filling in purposes.”¹⁸

This proposal, later named “Hinterland Filling Scheme,” implemented firstly in the British concession. A boat carrying sediment dredged from the river navigated through the Canal to a large pond at the end of Meadows Road. About 14,000 *fang* of earth was deposited. Half of the pond was reclaimed.¹⁹ In the following year, the HHCC introduced pumping stations to replace human labor. They built floating pumping stations and directed the dredged soil to the pond through pipes. Dredging, pumping, and filling, all cooperated with each other, worked according to the amount the foreign municipal administrations reported. From 1907 to 1909, all the dredged sediment had been pumped and filled into the ponds, which were mainly in the British and French Concession. This provisional pumping station kept in working until 1910 and was replaced by new pumping plants. In the test of filling in Deutsche Niederlassungs Gesellschaft property, 130 m³ of silt was discharged into the pond in 13 minutes.²⁰ The efficiency of filling was highly increased. The annual quantity of silt that dredged and filled in the following decades was several times that of previous years.

The filling first implemented in the British and French Concession and then spread to the German, Japanese Concession, and native areas. By Japan’s invasion in 1937, the land along the upper reaches of Hai-Ho was almost accomplished. And the focus of work gradually shifted to the downstream area of Tanggu. From 1902 to 1937, the total quantity of sediment dredged in the Harbour was 4,095,440 *fang* and 96% of that was filled in hinterland (Table 2). The altitude of land raised by an average of 1 to 2 meters. The work laid the foundations of road construction and land investment in the low-lying areas and directly connected the conservancy activities with urban development.

Year	No. of fang dredged in Harbour	Quantity disposed by dumping	Quantity for filling in Tianjin	Filling Areas	Filling Methods
1902	12,000	12,000 river	--	--	--

The Evolving Relationship among Site Selections, Planning, Land Reclamation, and Construction

For the special terrain condition along the Hai-Ho River, most of the land for construction was reclaimed. And there was not an administrative authority that had power to organize urban development of all districts, the general linear relationship among site selection, planning, land reclamation, and construction evolved into a complex interaction (Figure 4). The following session will focus on the concessions on the west bank of the river and examine the complex relationship and the role of topography and land reclamation played in the process of urban development.

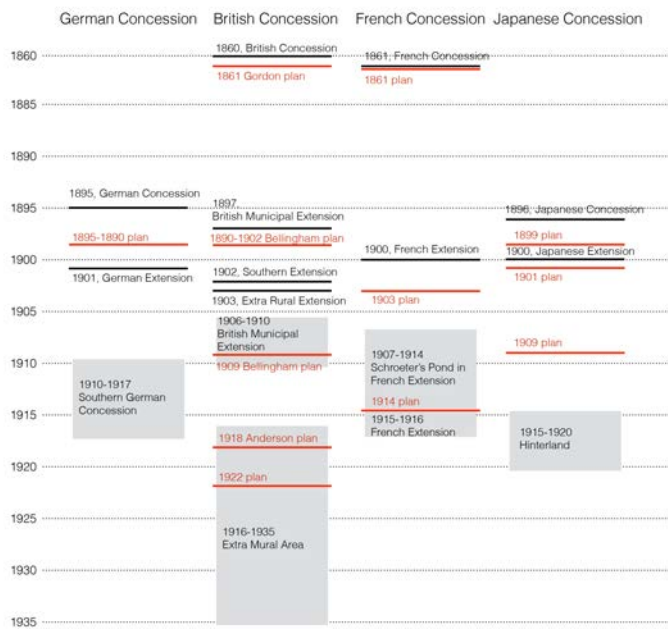

Figure 4: The complex relationship among site selection, planning, and land reclamation.

Figure 5: The terrain elements that defined the concessions boundaries.

The first mode that topography and land reclamation integrated in the process is that, the terrain defined the boundary of concession and affected its expansion. A conspicuous geographical element can be a reference for demarcation in a wilderness and also became a means for Chinese authorities to restrict the illegal expansion of the concessions. The elements in Tianjin case include the Hai-Ho River, *Haitatao* (海大道), Mud Wall Canal, and *Hai Kuang Ssu Road* (海光寺大道). *Haitatao*, which had existed from Ming Dynasty, connected the riverbank to the south of the walled city and *Taku* (大沽) by the sea. The road, together with the Hai-Ho River, defined the West-East boundaries of the original British, French, and American concessions. The Mud Wall and Mud Wall Canal were fortifications that built by General Sengge Rinchen (僧格林沁) in 1860. The Canal connected the Southern Canal and the Hai-Ho River to the south of the city. The Mud Wall Canal, as a solid element, defined the southern boundaries of the British Municipal Extension, the French Extension, and the Japanese concession for a long time. And its irregular path had profoundly affected the urban pattern of these concessions. As to the *Hai Kuang Ssu Road*, it was a means used by Chinese authorities to limit the further expansion of the concessions. It was originally a country path, and then in 1918 reconstructed into a dyke to protect the city from flood. In 1937, Mayor *Chang Tzu-chung* (张自忠) rebuilt the road and sent police to patrol to prevent the illegal cross-border constructions from Japanese and French Concessions.²¹ The scope of the concessions expanded from the river to the inland step by step. And the complex boundaries laid the foundation for a collage of urban patterns (Figure 5).

The procedure of site selections, planning, land reclamation, and construction implemented in the original concessions of Great Britain, France and Germany. Although the traditional method of filling slowed the speed of construction, the concessions all developed according to the plans that made at the time when concessions established. The filling of southern area of the German Concession followed the new method. From 1910 to 1917, about 155,400 *fang* of sediment pumped into the ponds according to the original plan.²² Urban construction started accordingly. These concessions, adjacent to each other within a limited scope, all had clear boundaries as reference to make plans. And these plans also had sufficient time to be implemented. Therefore, although belonged to different administrative authorities and developed in different time, these concessions formed a clear, well-organized and interconnected urban pattern.

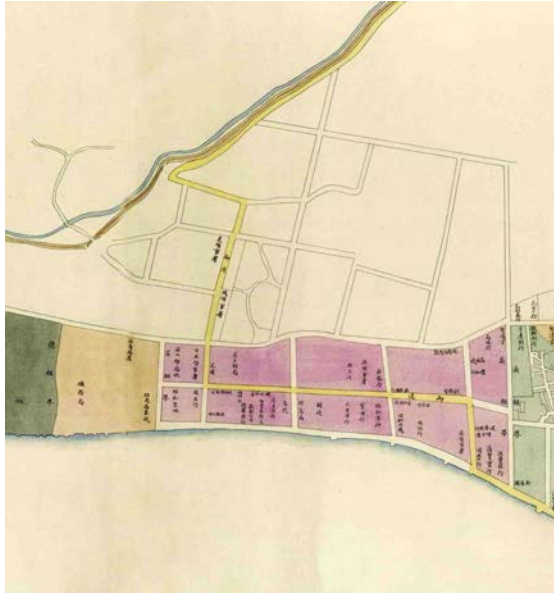

Figure 6: Map of 1895 shows the pattern in the later B.M.E.

Figure 7: Map of 1913 shows the pattern of B.M.E. and Bellingham's sketch plan for E.M.A

The third mode that topography and land reclamation integrated in urban development is that, scattered cross-border constructions deeply affected by terrain condition and these constructions then as fait accompli affected the following planning. The development of British Municipal Extension applied a typical example. The land within original British Concession had been fully developed in 1880s. Custom Commissioner Gustav von Detring led British merchants and British Municipal Council to buy land outside the concession. When the B.M.E was granted by Chinese government in 1897, half of land had been occupied and developed.²³ This kind of construction, which was dispersed and in small-scale, was not able to carry out large-scale transformation of the land. Hence, the construction of roads and buildings must follow the texture of the site, which was the most convenient way to purchase and reclaim land. The comparison of maps of 1888, 1895 and 1913 (Figure 3, Figure 6, Figure 7) shows that the road system of B.M.E. had been formed before 1895 and the structure continued the pattern of tombs, vegetable gardens, ponds, and paths depicted in the 1888 map. Researcher indicates that British Municipal Council engineer A.W.H. Bellingham made the B.M.E plan between 1890 and 1902.²⁴ Obviously, this plan was deeply affected by topographical condition and existing constructions but not followed the road system, which parallel or perpendicular to the river, of the original settlement.

The last mode, which is the most significant one, that land reclamation influence urban development is that, the original plan that based on topographic condition modified after the land had been reclaimed. Mr. Bellingham made a sketch plan for the Extra Mural Area in early 1900s. Different from his plan for B.M.E., which was made based on status quo, the E.M.A plan was an idea ahead of any actual construction. The plan, on its northeast part, continued the grid structure that of B.M.E., and gradually rotated the grid to achieve North-South orthogonality. Due to the lack of detailed topographic map of the E.M.A., it is difficult to tell if his design was based on consideration of topographic condition, like the former one did. But obviously his plan applied a possibility that break through the concession's boundaries to formulate a structure that shifted from the riverbank to hinterland. But this plan also had obvious shortcomings. The conflict between the ideal grid and irregular border created lots of triangular blocks, which were difficult to develop (Figure 7). The filling of the E.M.A. started in 1916 when the technology was mature enough to reclaim a land as large as the E.M.A. It is also hard to tell whether the

advanced technology made the B.M.C. have the ability to ignore the status quo or they just gave up the previous idea of building a city beyond the boundaries. The Council proposed a plan in 1918 and another modified one in 1922, which guided urban development of E.M.A. in the following decades.

Figure 8: Plan for French Extension, 1903.

Figure 9: Map of French Concession in 1928.

There was similar case in the French Concession. The French Municipal Council proposed a version of plan in 1903 after the French Extension granted by Chinese government. This was a compromised plan that connected existing roads in B.M.E. and roads in Japanese Concession's riverfront area. The sparse roads bypassed the big ponds in the site as much as possible (Figure 8). This plan had been overturned after the Schroeter's Pond had been filled in 1914. The new plan, with denser road network and higher developing intensity, laid the foundation for building this area into a commercial center in the future (Figure 9).

The changes in the planning of the Japanese concession are even more significant. There were more low-lying lands and marshes in the hinterland of the Japanese Concession than in the British and French ones. For this reason, the original plan proposed to transform the low-lying land near *Hai Kuang Ssu* into big ponds, which could be used to irrigate and develop fisheries. The soil dug from the ponds could be used to fill the land in other area of the concession (Figure 10).²⁵ The land reclamation focused on the riverbank area by traditional filling method in the following few years. The HHCC's new method of land filling applied possibility to reclaim the hinterland. The Japanese municipal authority modified the plan in 1909. The new plan simply extended the existing roads to the Canal and Hai Kuang Ssu with no consideration of the ponds on the site (Figure 11).

Figure 10: Original sketch plan of Japanese Concession.

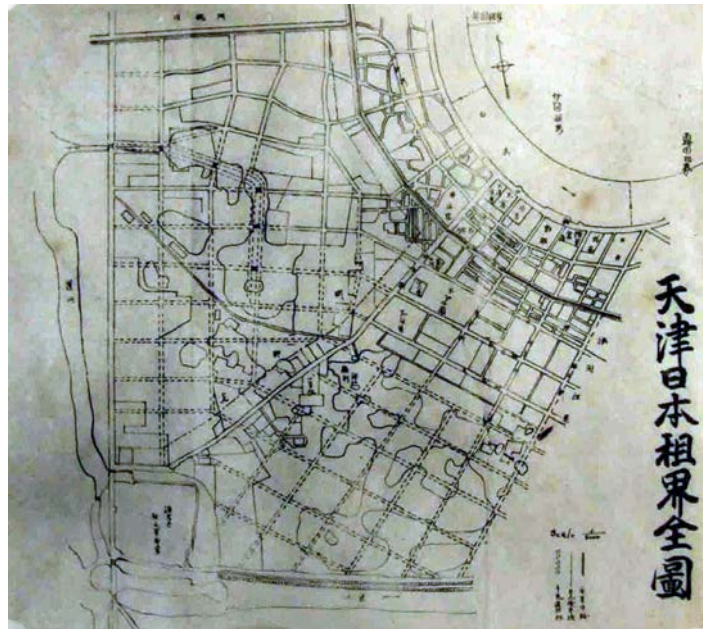

Figure 11: Map of Japanese Concession in 1928 shows the roads extended to the hinterland.

Conclusion

From 1860 to 1945, Tianjin had a history with concessions for more than 80 years. The driving force for designation and development of the concessions shifted from political deterrence to trade. For the sake of huge population poured into the city during different wars, the force then changed to real estate development. And the booming of modernization and construction occurred from that time, i.e. early decades of the 20th century. The terrain of Tianjin cannot fulfil the large-scale construction and the modern concept of hygiene. Hence, the land reclamation became precondition and foundation to the further development of the city. The establishment of HHCC and its introduction of modern method of land filling, which created lots of land, realized the need and the birth of modern Tianjin. The terrain condition of Tianjin made land reclamation a key role in the process of urban development. It significantly influenced the site selection, urban planning, and construction and produced a collage of urban patterns.

HISTORICAL WATERFRONT OF RIO DE JANEIRO: cartography of landfills and new rehabilitation perspectives of the port area

Fabiana Generoso de Izaga *

Amanda Barbosa da Silveira **

* Associate Professor at Rio de Janeiro Federal University: fabizaga@gmail.com

** Architect and Urbanist: amanda-bsilveira@hotmail.com

This article seeks to analyse recent urban transformations and the conceptual bases that have been in force in the Urban Rehabilitation Project of Rio de Janeiro's waterfront. An attempt is made at establishing a connection between the development of the area, the evolution of the city's history, the activities carried out at the port, and its conversion to new uses. An analysis of the spatial transformations is done, especially in the 7-year (2009-16) span of the initial implementation of the ongoing 'Porto Maravilha' [Marvel Port] urban project, with the mapping of new and old urban fabric and infrastructure; bibliographical research on historiographical studies, city administration players, and technicians to unveil processes that concern urban projects as contemporary tools for land valuation. As a conclusion, we point that despite the major work recently carried out as a product of the Urban Operation Consortium Law guidelines, only 9% of the urban land stock has been negotiated, contradicting even the pessimistic forecasts of 50%. The area lacks an Integrated Urban Plan with a public policy approach, especially to foster housing as a key element for liveable neighbourhoods and a stronger connection with the green infrastructure of the Guanabara Bay ecosystem.

Keywords: waterfront; landfills; cartography; urban rehabilitation; Rio de Janeiro.

Introduction

The main central area of Rio de Janeiro has seen countless changes in its 450+ years of age, and remains as an important element of centrality of the city in the 21st century. The renewed waterfront of the city, a place where several urbanistic interventions have been made, as part of the urban rehabilitation programme that was in force from 2009 to 2016, when the city hosted the 2016 Olympic and Paralympic Games is now a space fraught with a high degree of uncertainty as regards its capacity to transform the economy of the city and contribute towards the reorganisation of the inner city region, with its 12 million inhabitants. However, as a space of contact between the water and the urban domains, as discussed by Alemany and Andreatta¹, the Rio de Janeiro waterfront has its own peculiar features with many urbanistic possibilities, for its touching the historical centre of the city, and its potential to create new spaces for culture, trade, services and residences, along with its special aspects as regards the environment and the landscape.

This paper seeks to ask about the reach of the recent transformations and the bases on which the main instruments for a new development sit on, a development effort that has been operating on Rio's waterfront. We seek to establish points of intersection between the development of the area, and the evolution of the city's history as a whole, along the activities of the port and its conversion into new uses. We will undertake a discussion on the spatial transformations, considering the original implementation of port activities in that place, in 1910, in relation to the present day, especially the works done in the 7 years of the initial implementation of the ongoing 'Porto Maravilha' (PM) urban project (2009-2016). In order to carry out our analyses we rely on studies of the history of the urban evolution of the city developed by Abreu, Lamarão, Sisson, and Pereira & Izaga² along with those that deal with the aspects of cartography and the plans for the city of Rio de Janeiro documented by Andreatta and Czajkowski³. To discuss the proposals contained in the PM project we resort to an in-depth analysis of articles produced by governments, chiefly those from technicians and players related to the City administration such as Arraes & Silva and Dias⁴, relating them to research work that seeks to identify processes related to urban planning as an instrument for land valuation as argued by Sarue and Belisário⁵. Our research aims to reflect on the relationships between the new and old urban fabric and the new visions for urban development, their new methods and approaches. As a conclusion, we point that despite the major work recently

carried out as a product of the Urban Operation Consortium Law guidelines, only 9% of the urban land stock has been negotiated, contradicting even the pessimistic forecasts of 50%. The area lacks an Integrated Urban Plan with a public policy approach, especially to foster housing as a key element for liveable neighbourhoods and a stronger connection with the green infrastructure of the Guanabara Bay ecosystem. This would provide a more sustainable urban vision to the waterfront itself and also of it as an important element of a complex metropolis such as Rio de Janeiro.

Rio de Janeiro, the central area and its historical waterfront

Rio de Janeiro is a metropolis with 11,945,532 people, consisting of 21 municipalities, with 6,520,000 of them living in the main city. Its central, historical area, where the CBD - Central Business District - is located, and which contains important equipments such as the headquarters of large State-owned corporations (National Oil and Gas Company - Petrobrás; National Bank for Economic and Social Development - BNDES), still holds its relevance in the 21st century as the area that attracts the majority of urban flows, where 75% of all the jobs are found and one with the highest real estate prices. To the North from it, on the borders of the 'Baía de Guanabara' [Bay] and at the old port area, and stretching east, along its border, a new Urban Rehabilitation Project [Projeto de Reabilitação Urbana] was set up in Rio's waterfront.

An extensive list of transformations was carried out in the central area during the 20th century. New ways were opened on top of colonial urban fabric (Figs. 3 & 4) (Avenida Rio Branco [1905]; Avenida Presidente Vargas, [1944]), hills were levelled [Morro do Castelo (Hill) in 1922 leading to the appearance of the borough of Castelo], and the construction of a modern port on its North face. According to Lamarão⁶, from 1904 to 1911 the place that once had docking bays and boarding decks is transformed into a specialised port area, of exclusive use, at a time when this function reached a higher technical level in the capitalist moves towards modernisation. With the aim of attending to the requirements needed for international trade in a port operation 1.2mi square metres are added with landfills into the sea. The port area works led to the redefinition of the entire urban domain in the central part of the city, where it was seen as the basis from which an ample restructuring of the central area and of the city would take place. In a process aimed at establishing hierarchies and impose segregation, Lamarão and

Abreu⁷ argue that the city sought to overcome its colonial, slavery-dependent condition to enter a new cycle of modernisation of a markedly capitalist nature.

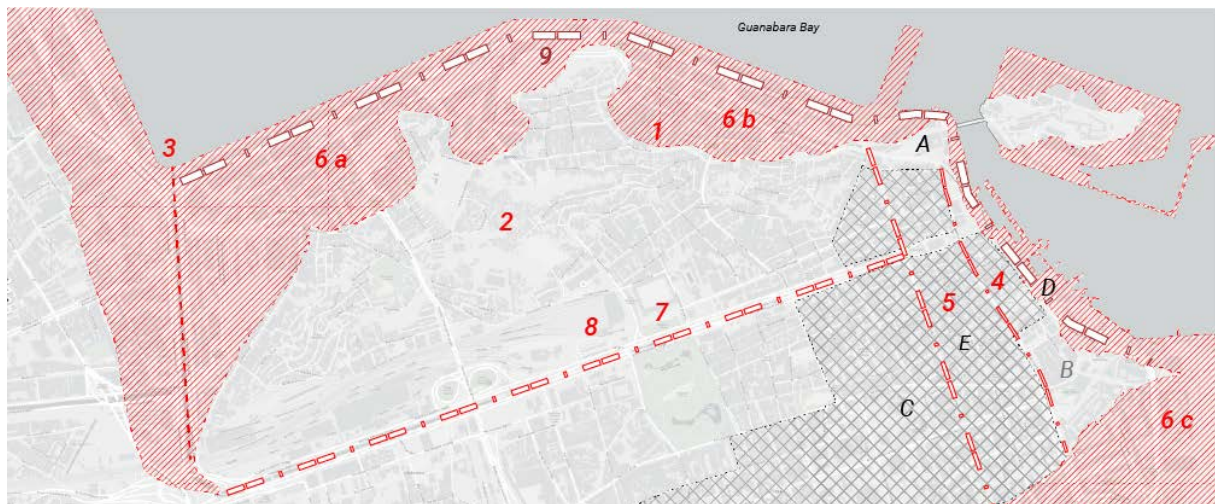

Figure 4: Main elements of the Central and Port Area in Rio de Janeiro in the late 19th and 20th centuries. Source: authors, 2018.

Key: 1 – Original coastline; 2 - Providência Hill – Where the first favela in Rio is located; 3 – “Mangue” Channel (1906) - Drainage works of marshland areas; 4 – Rua Primeiro de Março, or “Right St” [Rua Direita] – Rio's first main street (1600's); 5 - Av. Rio Branco, or Av. Central (1904-1905) opened in the colonial urban fabric (1600's); 6 – Successive Landfills. a: drainage (1904), b: port improvements(1910), c: area originated from the demolition of Morro do Castelo [Hill] (1922); 7 - Av. Presidente Vargas (1944), opened in the colonial urban fabric (1600's); 8 - Grand Central Station - Train Terminal (mid 1800's); 9 – Perimetral Flyover Viaduct. A - Saint Benedict Monastery(1590) - Benedictines; B - College of the Jesuits and Saint Sebastian Church (1567) - Jesuits, demolished along with Castelo Hill (1922); C - Saint Anthony Monastery (1608) - Franciscans; D - Old Quay (1779) - Rio's first dock; E - Rio's CBD (2018).

From the second half of the 20th century, the central area would see two cycles of redefinition of its functionalities. The one marked by the emptying of the residential areas that were re-located to the shores at the city's South End. The second one took place in the 1980s, marked by a resistance to the movements imposed by the previous cycle, which sought through heritage preservation initiatives to discontinue the processes of

deterioration that emptied the area. The reorganisation of the port logistics, with the construction of the new port of Itaguaí in 1982 would lead to a fall in the rates of use of a number of warehouses and an abandonment of a sizeable part of the old retro-port area. Still, between years 1957 and 1978 a flyover viaduct is built, named Perimeter Way [Perimetral] which aimed to clear traffic flows into and out of the Central area, but that actually further disfigures an area that already was going through a process of decay, as discussed by Izaga⁸.

The port area scenario, in the early 20th century at the time that preceded the rehabilitation works, was one where its isolation and abandonment were greatly intensified and, although it lied next to the CBD, its land was 75% owned by the Federal [Central] Government, something that hampered and slowed the possibilities of renovation. To this picture, a larger context of dispute in the network of centralities in the city of Rio de Janeiro was in effect, where the borough of Barra da Tijuca, a new settlement west of the city - planned by Brazilian architect Lucio Costa on the 1970's pushes to be a more affluent residential area, along with a network of services.

It is then that, from 2009 when the city is chosen to host the 2016 Olympic and Paralympic Games that new political movements and alignments become possible, and real opportunities for investments are seen by economic agents related to real estate and financial market, in a movement to reorganise the old port area.

The port area and the 'Porto Maravilha' (Marvel Port) Project

The debate on port areas' rehabilitation in modern cities has been presented by Hall and Castells & Borja⁹ as a typology of large urban projects that appear as instruments to face changes to the means of production of society in the late 20th century. In the old port areas, usually located in the central parts of the cities, the model used for urban renewal became attractive for new investment, to generate income, and see improvements to the infrastructure, apart from leveraging the tourist potential. Examples of waterfront rehabilitation in cities such as Baltimore (US), Barcelona (Catalunya), Rotterdam (The Netherlands), Cape Town (South Africa), Hong Kong (P.R.C.) and, in Latin America, in Buenos Aires (Argentina) have become accepted as reference cases of success by Andreatta¹⁰, albeit in different urban realities and inserted in cities of all sizes.

In Rio de Janeiro, despite the fact that an ample debate took place from the 1980s onwards, it saw proposals with little realism that disregarded players such as, for example, the 'Companhia Docas' do Rio de Janeiro [Company] to which the Brazilian Central Government had transferred in 1987 the responsibility for all cargo handling, in a concession agreement. In year 2000, the City Administration made some sporadic interventions in land that had been left free after railway infrastructure work, building there 'Cidade do Samba' [City] (space destined for Carnival artefacts and equipment construction) and a space for sports practices, named Vila Olímpica [Olympic Village], as well as some informal areas urbanisation in neighbouring boroughs, through the Favela-Bairro Programme [Slum Upgrading Programme]. And indeed, it is only when the alignment of the Central, State and City governments finally happens as they join forces to concentrate on the preparation of the city to host large international events that an effective effort to prepare a project takes place.

The city of Rio de Janeiro then launched a rehabilitation programme in the shape of a complex public and private partnership named 'Porto Maravilha' [Marvel Port], and embarked on the largest pool-based intervention of the country of a port area. In order to define the area for rehabilitation, or the AEIS - Special Urbanistic Interest Area - to the original port area is added the neighbouring boroughs, taking the total to 5mi square metres. The OUC - Urban Operation Consortium - Law that governs the 'Porto Maravilha' (pursuant to Supplementary Law no. 101/2009, from the City of Rio de Janeiro), was passed in 2009 and is the main instrument that triggered the intense transformations that would take place along the following 7 years: two new museums designed by renowned architects, the re-qualification of the public spaces along the nearly 3 kilometres of docks and surrounding areas, 2 LRT light rail tram lines totalling 28 kilometres, and the excavation work to build 3.5km of tunnels that, in connection with the infrastructure work done, that included the imploding and demolition of the 7 km-long flyover structure that ran peripheral to the docks and shoreline (Perimeter Line).

Supplementary Law No. 101/2009 altered the City's Director Plan [Plano Diretor] with the creation of specific urban policy instruments for the AEIS - Special Urbanistic Interest Area - land that changed the parameters of land use and for the granting of extra rights for construction, amongst others. From the issuing of CEPACs - Certificates for Potential Construction - which represent 'virtual land' and that correspond to approximately 4mi square metres added for construction, the operation proposes a density increase with verticalisation. The construction heights allowed in some sections (50 floors) are completely unusual and lie outside the economic scenario and Rio de Janeiro landscape. The Law also created the Port of Rio Area Development Company [Companhia de Desenvolvimento Urbano da Região do Porto do Rio (CDURP)], responsible for the management of the OUC and for the articulation between the remaining public and private bodies, along with the

New Port Utility Company (the consortium awarded the contract after a public tender procedure, consisting of construction companies), in charge of carrying out the construction work and providing the infrastructure services from 2011 to 2026.

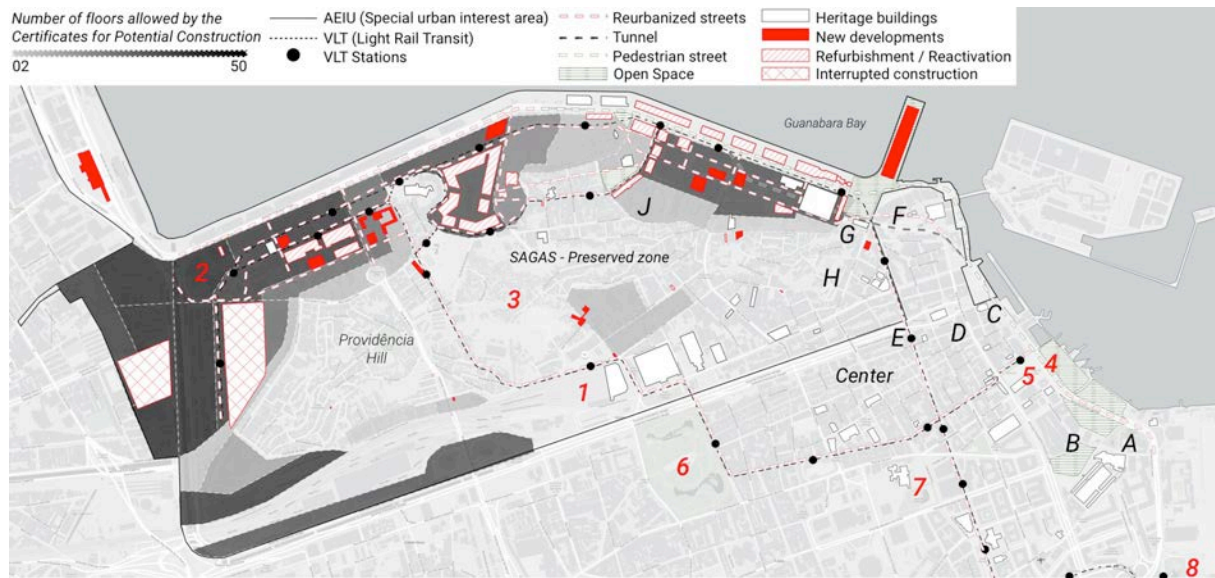

Figure 5: Part of the Central Area of Rio de Janeiro and 'Porto Maravilha (Marvel Port) Rehabilitation Project and the New Public Space Project, heritage protected buildings and new developments. Source: authors, 2018.

Key - 1 – Grand Central Station - Train Terminal (mid 1800's); 2 – Central Bus Station "NovoRio"; 3 – Providência Hill – Where the first favela in Rio is located; 4 – Water Transport Terminal: Ferry to Niteroi; 5 – 15 th of November Square: Old Largo do Paço; 6 – República Square; 7 – Carioca Square; 8 – Santos Dumont Airport; A - National Historic Museum; B – Image and Sound Museum; C – France Brasil Cultural Centre; D - Banco do Brasil Cultural Centre; E – Candelária Church; F - Saint Benedict Monastery(1590) – Benedictines; G – Mauá Square/ Rio's Art Museum/ 'A Noite' building; H – Conceição Hill; I – Mauá Pier/ Amanhã Museum; J – Fluminense Old Mill.

The CEPACs were offered in a tender procedure in one single lot on June 13, 2011 and bought by public company CAIXA – 'Caixa Econômica Federal' - the Brazilian Savings Bank for R\$3.5bi, via a fund workers contribute, namely the FGTS - Labour Guarantee Fund - which made the banking institution the biggest investor in the project. For the first time in history the FGTS funds were invested in an urban consortium-based operation. The CAIXA savings bank, which is a public bank, also undertook to covering the costs associated with the recuperation of the infrastructure and the maintenance costs of the public services for the 15 years of the contract's effectiveness and, in return, started to manage the issuing of the CEPACs and to have priority in the acquisition of the land in the region that formerly belonged to the Brazilian Federal [Central] Government.

To summarize, the structure of Supplementary Law no. 101/2009, on which the 'Porto Maravilha' OUC project is based, defines major urban and infrastructure principles, urban general guidelines, perimeters on which it has applicability, overall construction parameters and a management structure to have independency from the planning structure of the City of Rio. A list of bold objectives was later announced, grouped in four main items: infrastructure; housing; environment and culture and tourism. Where outstands the recuperation of urban infrastructure and transportation, the improvement of current housing conditions and attraction of new residents, preservation and improvement of the environment, new sidewalks squares and parks, and the creation of a new Tourist Pole for the city, with the recovery of the existing historical and cultural heritage and the new cultural, entertainment and education equipments. However, these objectives were never a part of an Integrated Urban Plan, remaining more as an umbrella to coordinate independent initiatives, not having a method to regulate their connection and fulfilment, which left them greatly unattended.

'Porto Maravilha' (Marvel Port) Project, a public policy?

The 'Porto Maravilha' OUC, as it focused on the policies for urban entrepreneurship, acted in a complex and diffuse manner as regards the initiatives aimed at a process of rehabilitation of urban spaces. The land, acquired in Stock Exchange operations, was done with taxpayers' money drawn from the FGTS fund, ending up by paying the very capital of the companies involved. The process that led to the acquisition of the property, along with the

modelling of the parameters for their use, produced a real estate valuation, which predominantly channelled the acquisition of that space to corporate use, to tourism and to entertainment industries.

Cities' construction process is riddled with recurring conflicts and tensions between public and private interests, environment and heritage, which brings the debate on the right to the city to the spot, especially when the main intervening party and agent is the public authority, which leads to the questioning of what is done, and of whom it is aimed at. In the case of the OUC it is possible to see that the official discourse overlaps that of the urban marketing, evident in the discourse of City Office for Urbanism Director Sergio Dias¹¹, which on one hand emphasizes a concern with the historical and cultural heritage of the region whilst defends a series of construction principles with another set of priorities.

In 2017 the City Office for Urbanism, Infrastructure and Housing conditioned the heritage listing of any building in the 'Porto Maravilha' area to the approval of the consortium of companies (New Port Utility Company) then granted right to carry out the renovation work of the infrastructure of the area. With the valuation of the property, as a result of the infrastructure investment done, this resolution gives even more power to the real-estate interests entertained by the pool of companies attracted to it, which then get to have the final say on what is listed and what is not.

Figure 6: Sale of certificates of additional construction potential (CEPACs).

If the OUC had the real goal of increasing the resident population in the area, based on mechanisms of tax and urban incentives, the reality would be quite different when we compare the huge number of commercial projects with the very few of a residential kind. The financial leverage that guarantees profitability to the agreements executed with the private companies comes from the use of public funds, drawn from the money paid by the taxpayer. But the land was stripped of any relevance in public policies as it is offered to private enterprises of the real-estate kind, which operate to set what the urban space will be like, as they impose their abstract order on the use of the land and prioritise the profitability of their own assets.

As regards the financial operation as a priority, the issues related to the unequal distribution of the territory are placed under the spot, particularly the themes of density and verticalisation. The benefits of dense areas such as space vitality, urban infrastructure optimisation, active mobility, linked to a reduction of the dependency on cars are not acquired in an immediate way with the verticalisation model being proposed. Moreover, it fits like a glove to corporate spaces occupation and much less to mid-sized residential units, which have most demand. Therefore, it would be the governments' role to establish measures that would better regulate processes, better shaping the occupation of the territory to allow mix of uses, and catering to the demands of the populations that live in the vicinity.

The crisis that gripped the country in 2014 had a significant effect on the real estate market that, until then, was experiencing a sizeable growth. With it, the OUC started to face hardship in the sale of its CEPACs and with it opened a breach to other operations such as, for example, the exchanging of property in its negotiations to burdened granting. Our research mapped through the now available OUC documents that whilst an optimistic forecast of the feasibility studies made by the CDURP considered that in 2017 more than 70% of its stock would have been sold, a pessimistic outlook put it at 50%. However, based on the quarterly results of CDURP¹², our research identified a figure of only 9% of the stock negotiated until 2017 (Fig. 6). In the absence of an Integrated Urban Plan and a clear set of goals engendered in public interest to be accomplished in a determined time lapse, these figures reveal a performance indicator. They evidence a distorted optimism of a real estate private project, but that used public money as the main leverage, thus making the State to bear its financial investment risks and losses. For the city, the worse loss certainly is having a void overpriced land in a central area. The empty areas acquired at low prices from the Federal Government became abstract financial assets, where the profit is reserved for the investors that have no commitment whatsoever with the construction of the place

Final Considerations on the possibilities for the future of Rio de Janeiro's Waterfront

It is quite likely that the greatest benefits had from the recent urbanisation work on the waterfront of Rio de Janeiro and from the 'Porto Maravilha' OUC, lies in the re-qualification of the public spaces and in the new continuity that was implemented between the old central area, the sea and the 'Baia de Guanabara' [Bay]. Of the public spaces contained within the OUC, we can point the Cais do Valongo [Quay] (1811-1831), old place of disembarkation and trading of African slaves, discovered during recent infrastructure work and preserved as a place of memory for Black African culture. It is however located in an inner space and its original relation of proximity with the water was lost. To the warehouses in the dock area common public cannot access. This means that there is no open public space within the OUC area on the shoreline.

To conclude, and regarding the rehabilitation of Rio de Janeiro's waterfront in the last 7 years, from its installation to the present days, it is possible to say that the urbanistic instrument of the 'Porto Maravilha' OUC, as proposed, through its guidelines, has been unable to steer the elaboration of an Integrated Urban Plan for the area and to promote the full rehabilitation of the old port area of Rio de Janeiro. With residential occupation that could attract commerce, services, and leisure, something that has not happened. Although an important section of the city's history came to attention, cultural values of the existing neighbouring boroughs have not yet been properly valued. Finally, with only 9% of the CEPAC's stock being sold we fear that the 'Porto Maravilha' OUC could become a new barrier, placed between the sea and the city. Re-directing the instruments of the OUC would provide a more sustainable urban vision not only to the waterfront itself, but also of its features, as an important element that could favour the re-organisation of a fragmented and complex metropolis such as Rio de Janeiro.

20 The Anglo Imperial City

Neoclassicism, Nationalism, and the Limits of the American Imperium in Havana, San Juan, and Manila

Joseph Hartman (University of Missouri - Kansas City)

Neoclassical formalism embodied an aesthetic response to a new U.S. dominion in the ex-colonies of Spain after the Spanish-American War of 1898. This essay will examine three civic buildings constructed in Havana, San Juan, and Manila each originally intended as seats of the legislature, and patronized by local civic leaders under the auspices of the United States during the late 1920s. The Federal style exhibited in those exemplars of Caribbean and Pacific civic architecture activated a complicated network of reproduction and simulacrum within the urbanization efforts of the American Imperium and more local assertions of nationalism and self-governance. Cuba's Capitolio, unveiled in 1929, was a near-replica of the Capitol in Washington D.C.; Puerto Rico's Capitolio, also inaugurated in 1929, employed designs nearly identical to Cuba's; and the Philippines' Legislative Building, completed in 1926 and formerly proposed as a Capitol under Daniel Burnham's unfinished 1905 plan, featured an iconic Beaux-Arts temple façade. Drawing from shared geographies and cultures, the Spanish Caribbean examples were necessarily distinct from the Legislative Building of Manila. Nonetheless, the buildings also displayed remarkable parallels in their respective histories and designs. With the support of U.S. financial and political interests, local architects trained in the United States and Europe created the design for each building (Raul Otero, Rafael Carmoega, Juan M. Arellano, among others). They employed a mixture of indigenous symbolism with "universal" signifiers of Western democracy. So too, each building exemplified, to varying degrees, typologies of quintessential North American Capitols, Statehouses, and Legislative Buildings, as seen in the porticos, copulas, rotundas, and symmetrical wings of legislative houses in Minnesota, Texas, and many other states. Unveiled within three years of one another under the administration of U.S. President Calvin Coolidge and used variously as sites for legislation and political ceremonies: The similarities in the three buildings reveal an untold history that moves beyond common narratives of monument cataloguing and Western appropriations. This essay, to that end, aims to compare and contrast the buildings within the specific historic and political contexts of Cuba, Puerto Rico, and the Philippines at the time of their inauguration in the late 1920s. This paper will argue that these replications expressed a vision of local identity negotiated around the strictures of Empire. Like contemporary works of the British Empire (Sir Edwin Lutyens' 1931 design of the Viceroy's house and urban plan of New Delhi), the neoclassic buildings incorporated symbols of local sovereignty and indigeneity. These symbols coupled with neoclassic designs allowed nationalist narratives to interrogate shared histories of imperial hegemony and Spanish colonialism. The three buildings each registered the capitalist ambitions of the United States, but also Cuban, Puerto Rican, and Filipino assertions of national identity and autonomy in the period context of the early twentieth century.

Tayabas: The First Filipino City Beautiful Plan

Ian Morley (The Chinese University of Hong Kong)

The historiography of the City Beautiful in the Philippines has, in broad terms, been dominated by two American planners, Daniel Burnham and William E. Parsons. In some ways this is to be expected: both individuals were known to have strong personalities; Burnham's monumental 1905 plans for Manila and Baguio were central to a new urban design paradigm being manufactured in the country, a planning model which replaced the Spanish colonial model based in the Law of the Indies (1573); and, Parsons from 1906 to 1914 as Consulting Architect to the Philippine Commission propagated the City Beautiful via comprehensive city plans and grand civic centre projects. But where in the Philippine City Beautiful narrative do Filipino planners fit? To date their role in the city planning picture during the American colonial era has been, at best, portrayed as minimal. However, given the author's recent uncovering of new planning works by Filipinos it is pertinent to ask if planning historiography needs to be revised?

Focusing upon one Filipino architect, Arcadio Arellano (1872-1920), this paper examines a city plan bypassed by written history. As a Filipino who from 1901 advised the American colonial government on matters associated with architectural design, Arellano in 1919 composed a city plan for Tayabas. Sponsored by a local civic organization the city plan was the first Filipino City Beautiful scheme. Consequently, in the context of its rediscovery and, thinking historically, known political transitions in the Philippines in 1916, the city plan offers a fresh opportunity to appraise how Filipinos utilized grand city planning to promote social progress in the run-up to the establishment of the Philippine Commonwealth (in 1935). Moreover themes currently non-existent in City Beautiful historiography can be brought forward as part of new planning history discourse. These include the culture of plan making, planning education, and the role of Filipino nationalism in the Philippines.

To sum up, to date only very limited attention has been given in the chronicle of the City Beautiful in the Philippines to Filipino architect-planners. Where thought has been given to Filipinos typically it focuses upon one person, Juan Arellano, and one scheme, his 1930 Iloilo city plan. Yet, as this paper will demonstrate, there is a need to reconsider the contribution of Filipinos to the development of city planning in the Philippines. The historiography of city planning in the Philippines should thus not be as one dimensional as presently is: after all by 1919, just three years after the American promise of self-rule in the future, not only were Filipinos known to be composing grand city plans, e.g. for Tayabas, but they were also responsible for all public planning projects in the country.

Canberra: An Antipodean America

Christine Ellem (Queen's College, The University of Melbourne)

Amongst the early 20th century capital city building projects of New World settler societies, Canberra remains distinct as the most fully realized, large-scale version of City Beautiful design. The Griffins' City Beautiful inspiration had travelled from Paris via Chicago to Washington DC with Burnham, and from there traced out other lines of cultural traffic as well— in Baguio, Manila, Pretoria and New Delhi. But if the City Beautiful style was the hallmark of American Imperialism, exemplified in Burnham's Washington DC redesign, heavy with the symbolism of Athenian reinvention and the cultural legitimation of a new world democracy set to expand outwards, then the Griffins' vision of Canberra used the style instead to articulate a capital for a new, independent and vigorously democratic nation-state with a self-conscious sense of mission. The geometric formalism and classicism of the City Beautiful was indigenised; put in the service of existing landforms and celebrated the aesthetics of native flora. It was, essentially, an American interpretation of Australia; as a modern, democratic nation-building project. But Canberra's final design and development reflected the ambivalence of settler capitalist identity. The affective pull of the British Commonwealth leavened much of the nationalist energy of the original design, and famously, the Griffins' model was only partly taken up. A hundred years later, Canberra's story is still largely told in narrow terms, as a parochial tale of either the boorish pragmatism of bureaucrats, or as the tragic tale of a bold national vision, failed by the incomplete nationalism of Australians themselves. Placing Canberra in the context of other capital city building projects during the period offers a better understanding of the complex overlays of imperialism, national projects and regional identities at play in new world settler societies. The story of Canberra's design and development points not to an incomplete sense of nationalism, but to unresolved and unresolvable tensions inherent within the Australian nation building project. As a settler society, Australia looked simultaneously back to Britain and beyond it. Canberra's design also fed into other lines of cultural traffic; it facilitated the cross fertilization of British and American planning projects via Lutyens plan for New Delhi, British imperialism's last gasp before Indian independence in turn appropriated the capital for its own national project. The visionaries behind Canberra's design may have been enthusiasts of an American style of independent democracy, but given the complexities of New World settler identities, they would never have the last word. Even today, Canberra as a symbol of the Australian national project remains malleable, as various Indigenous challenges to it, both authorized and unauthorised, demonstrate. Now, as always, Canberra is an ongoing conversation, between competing ideas of Australian identity and nationhood.

Tayabas: The First Filipino City Beautiful Plan

Ian Morley

Department of History, Chinese University of Hong Kong, Hong Kong SAR; ianmorley@arts.cuhk.edu.hk

The historiography of the City Beautiful in the Philippines has, in broad terms, been dominated by two American planners, Daniel Burnham and William E. Parsons. In some ways this is to be expected: both individuals were known to have strong personalities; Burnham's monumental 1905 plans for Manila and Baguio were central to a new urban design paradigm being manufactured in the country, a planning model which replaced the Spanish colonial spatial model based in the Law of the Indies (1573); and, Parsons from 1906 to 1914 as Consulting Architect to the Philippine Commission propagated the City Beautiful via comprehensive city plans and grand civic centre projects. But where in the Philippine City Beautiful narrative do Filipino planners fit? To date their role in the city planning picture during the American colonial era has been, at best, portrayed as minimal. However, given the author's recent uncovering of new planning works by Filipinos, e.g. in Tayabas and Iloilo Province, is it pertinent to ask if planning historiography needs to be revised?

Keywords: City Beautiful, the Philippines, American Colonization, Filipino architects, nationhood.

Introduction

City planning was a fundamental component of American colonial governance in the Philippines. It was used from the early-1900s to help 'uplift' and 'civilize' local society, and to additionally aid the American regime to demonstrate to Filipinos that a different cultural and political era had begun: urban designing in this political-cultural framework was used to not only remodel cities' built fabrics so that they could be 'modern', but to also turn life within them away from church-lined plazas dating from the Spanish colonial period (1565-1898). However, what is generally not known about planning activity in the country during the American colonial era was that, from 1919, it was undertaken solely by Filipinos. They, to be brief, made use of the need to alter the urban form so as to capture, and thus articulate in built form, changing social and political values in Philippine society.

The narrative of modern urban planning practice in the Philippines, or more precisely City Beautiful-inspired city planning, commenced in 1905. In that year Daniel Burnham produced two major city plans, for Manila and Baguio, and these in the following years acted as a model which Consultant Architect William E. Parsons propagated throughout the country in the form of comprehensive plans (for Cebu and Zamboanga), plus new civic districts within provincial capital cities. Yet, so as to bolster the 'uplifting' of local civilisation, from 1913 the colonial civil service was Filipinised. Incorporating Filipinos into the upper levels of the colonial bureaucracy this process of political assimilation was sped up in August 1916 when the Jones Act was passed. It declared the American objective of retreating from the Philippines in the future and, in conjunction, to recognise Philippine independence "as soon as stable government can be established therein".

Permitting Filipinos to hold key administrative positions so that they could make a greater contribution to colonial governance, Filipinization resulted in far more than the mere substitution of American civil service personnel with Filipinos. It resulted in two major governmental changes: firstly, it granted opportunity for Filipinos to, for the first time, sway the regime's capacity to reshape local life; and, secondly, it helped modify government policies more towards Filipino priorities. Certainly in the Bureau of Public Works' (BPW) Division of Architecture, the department responsible for designing public buildings, spaces and, when necessary city plans, this advancement was evident by 1919 when Juan Arellano and Tomas Mapua were appointed as Consultant Architects. Yet the first major articulation of the Filipino city planning came via a private source, a civic group based in Tayabas, which commissioned Juan Arellano's brother, Arcadio, to create a plan for the city. It was produced in 1919. Even though the plan, financed by the Club de Los 33, was never implemented it nevertheless has importance: it helps historians to rethink Filipino planning influence, which up to now, has been missing from the story of American empire, and City Beautiful; it grants new opportunity to evaluate how Filipinos utilized City Beautiful planning to promote social progress, *and* to articulate their sense of national identity in the run-up to the establishment of the Philippine Commonwealth in 1935.

Arcadio Arellano and the 1919 Tayabas Plan

Broadly understood as a pioneer of Philippine architecture little is actually known of Arcadio Arellano's urban design work. Whilst it is recognised that in 1901 he became the first Filipino to be employed by the American colonial government as an architectural advisor, what has been researched of Arellano by-and-large explains his professional activities through the medium of changing architectural forms during the American colonial era. To date little has been investigated of, for instance, his role in preparing plans for monuments to Philippine revolutionaries. Charged by the colonial government in 1915 with this task after Act No. 2494 was passed, Arellano's work from that time evidently provoked him to consider larger scale matters of environmental surveying and design. As such the planning of Tayabas in 1919 – Figure 1 - represented a logical, natural professional development. But why a plan for this small-sized city? A number of points must be appreciated. To begin with it is known that Arellano held patriotic leanings. He was related to a revolutionary hero, Deodato de la Cruz Arellano; was in the Philippine Engineering Corps during the latter stages of the 1896 Revolution; and, in 1908, he designed the Mausoleum of the Veterans of the Revolution in Manila's North Cemetery. Moreover, Tayabas was by 1919 a city with a national reputation owing to it, on one hand, having resisted the Spanish colonial forces prior, during, and after the Philippine Revolution and, on the other hand, in 1912 and 1916 its citizens helping elect Vicente Lukbán as Provincial Governor. He was a well-known protagonist for Filipino freedoms and independence.

Figure 1. The 1919 Tayabas plan by Arcadio Arellano. The river axis through the plan runs north-east to south-west.

Titled the *Plan of Improvements of the Municipality of Tayabas, Tayabas Philippine Islands Accompanied With a Descriptive Report to the Municipal Council*, Arellano's plan sought to completely alter a settlement with a history dating back to the pre-colonial period. Advancing some of the environmental design notions introduced into the Philippines by Daniel Burnham in 1905, e.g. park systems, a road layout mixing narrow streets with lengthy tree-lined boulevards, the laying out of large symmetrically-formed public spaces, etc., Arellano's concept was to expand Tayabas's Spanish colonial era grid layout in the form of a rectangle measuring about 1.9 kilometres in length by 1.3 kilometres in breadth. At the four corners of this configuration were to be sited roundabouts, surrounded by park areas, from which a number of roadways – they being positioned geometrically - dispersed into neighbouring urban districts or the surrounding countryside. Demarcating the city on its northern, southern, western, and eastern flanks with broad tree-lined boulevards, running north-south through the middle of the built environment was the Alitao River: in Arellano's planning proposal its formerly meandering banks were to be straightened and greened so as to form the Central Park. Such a feature was original to urban planning in the Philippines at that time.

Arellano's Tayabas plan incorporated a number of environmental features: a road system arranged in a grid pattern; the placing of monuments at the centre of plazas; the development of a commercial district; a civic centre; and a park system. For example, situated midway along the East Boulevard and West Boulevard were large-sized green spaces. They terminated the western and eastern ends of the principal east-west alignments in the city plan: the position of the axis in the eastern section of the city plan directly corresponded with the site of the Rizal Monument (erected in 1915 by the Club de Los 33).

A primary element of Arellano's plan was to enlarge the existing pattern of roads. The grid configuration of the Spanish settlement was preserved in the 1919 planning proposal albeit with new roadways intersecting at greater distances than existing ones so that larger blocks of land could be created. Yet one major transition was apparent. There was to now be four types of roads – see Figure 2: Type A Boulevards; Type B Avenues; Type C and Type D Streets with each having a different width and cross-section. Noticeably for types A and B, the widest roadways, they were designed as tree-lined parkways.

Figure 2. Road types in the Tayabas plan by Arcadio Arellano.

In terms of the siting of the four road types they were to be put into particular parts of Tayabas's built environment. For example, Type A boulevards were to be located on each side of the Central Park, and at the four edges of the urban sprawl. These peripheral thoroughfares thereby functioned as ring roads to enrich circulation between the different districts of the settlement. Type B avenues, of which there was to be only two in the city plan, likewise granted direct links between different quarters of the city but also provided grand vistas to prominent public buildings and spaces. The vast majority of roadways, categories C and D, had no additional role other than, it seems, permitting easy navigation throughout the urban environment. With additional regard to the Type B avenues they, of substantial length, were to connect the most important civic edifices in Tayabas, i.e. the Municipal Capitol and Municipal Group, to the business district at the opposite/southern end of the city. These roadways, Municipal Avenue and Manuel Quezon Avenue, akin to almost all roads in the city plan, were straight in form.

In keeping with early-twentieth century American logic that urban planning was an indispensable component of a progressive society, the Tayabas plan enunciated what a spatially organized and civic-minded, modern community was. Demonstrating that city planning included much more than physically arranging a built environment, Arellano's scheme promoted municipal sentiment which, in the post-Jones Act context, assisted Filipinos to disclose to their colonial masters that they were capable of successfully managing cities, and accordingly society at large. The north-south axis from the Municipal Capitol to Plaza de Tayabas – Figure 3 – was crucial in this regard. Not dominating the city plan but nevertheless helping present the existence of civic spirit the ability of citizens to see along Municipal Avenue to public edifices and the business district let them be aware of four matters: first, citizens could appreciate that public authority was being operated by elected Filipinos to protect and develop life, health, and property as part of the advancement of local civilization; second, the vista southwards along Municipal Avenue to the business district informed people of the enlargement of the local economy and the possibility of affluence hitherto unimaginable; third, to look along Municipal Avenue meant seeing buildings, monuments, and spaces belonging to a distinct people and their culture, and in this context impressive vistas along the thoroughfare helped elicit civic esteem and pride in the nation; and, finally, new monuments and existing ones served to present tangible images of Filipinos historically associated with the pursuit of self-determination which, following political developments in 1916, was guaranteed by the Americans to be forthcoming. Notably too, given the passing of new laws by the American colonial government from 1898, new civic rituals were to take place (on new public holidays in the new spaces) about the monuments dedicated to national heroes, i.e. the individuals who, pre-1898, had fought against Spanish oppression and/or helped promote Filipino civil rights at that time.

Figure 3. Plan of the axis between the Municipal Capitol and the Plaza de Tayabas.

The Broader Philippine Planning Picture, c.1916-1935

The Tayabas city plan, although not implemented, must not be seen as an isolated design proposal. Rather it must be seen as the opening act of a new planning narrative: one determined from 1919 by Filipino rather than American actors. Yet very limited research has been undertaken on city planning by Filipinos during the years between the passing of the Jones Act and the establishment of the Philippine Commonwealth. In the light of this fact the following section of the paper outlines urban design activities by Filipinos employed in the BPW. From 1919 to 1935 city planning by Filipinos took on a number of forms. These included comprehensive city planning, zoning planning, the designing of new civic districts, and the revitalizing of Spanish colonial plazas. So that an introduction to the Philippine situation at that time can be tendered focus is now put upon one major city, Iloilo, and one territory, Iloilo Province.

In historiography Juan Arellano's 1930 *Proposed Development Plan of the City of Iloilo and Vicinity* is noted as being the first city plan by a Filipino. Evidently such a 'fact' is fundamentally flawed given the author's recent uncovering of Arcadio Arellano's 1919 Tayabas scheme. Furthermore Juan Arellano's planning activity in Iloilo began in 1926, not 1930 – see Figure 4. In the 1930 plan, Arellano's 4th version of the scheme, Iloilo's built environment was characterized by its riverbank development, an urban sprawl incorporating once isolated villages, a major arterial boulevard about the suburbs, the establishment of a suburban prison, farms, and cemetery, plus a large elliptical-shaped park laid out immediately north of the Iloilo River. A civic core and exposition grounds, respectively situated north and south of the river, were also evident in the scheme. However in the original/1926 plan the banks of the waterway were left undeveloped and outlying communities not integrated into the built fabric of the municipality. Additionally the major arterial boulevard circumventing the city was absent, as was the development of land in Mandurriao, the drainage canal and park in Molo, and the train station and airport south of La Paz. The generic road layout was different as well. The 1926 plan contained a large volume of straight roads so that blocks of land could have, for the most part, four straight sides. In the 1930 plan curved roads could be seen in many districts, the large plaza near the mouth of the Iloilo River was also omitted, and where in the 1926 plan a cemetery was to be sited north of the waterway a large elliptical park could be seen in the 1930 scheme.

Figure 4. Top: The 1926 plan, and (bottom) 1930 plan for Iloilo by Juan Arellano.

With respect to Arellano's 1926 plan, three features determined the city layout. First, there was the use of land zoning. Residential Zones, for instance, were to be developed throughout the city. Second, approximately 500 metres north of the Iloilo River, there was a circular plaza (with monument). It was to be surrounded by eight symmetrically-shaped blocks of land. In proximity to the space was the Carnival Ground with green areas positioned at its western and eastern sides. From the plaza roads dispersed through three Residential Zones to the urban fringe where additional green spaces were located. Grand vistas to/from the plaza and its monument were, therefore, created. Third, south of the Iloilo River was the new civic centre. Situated about 1.5 kms to the west of the business district the civic core was organized with a major central axis. Presenting an impressive vista north to the Iloilo River and south to the Iloilo Strait the axis was accentuated by the siting of two public buildings, the Market Buildings and City Hall, and numerous green spaces along it. Surrounded on four sides by a Residential Zone four major roadways led to/from the site of the City Hall: one roadway headed west to Molo; another went east to downtown; two roads headed northwards. One of these north-bound thoroughfares went toward the cemetery, the other to the aforementioned plaza and Carnival Ground.

In the light of Juan Arellano's Iloilo scheme being comprehensive in nature, and BPW finances having to be spread amongst a large number of environmental projects throughout the Philippines – in 1929, for example, the Division of Architecture designed/constructed 319 structures - it was executed in sections. These included the laying out of the north-bound roadway from the City Hall to the Carnival Grounds, and the construction in 1933 of the City Hall. Now used by the University of the Philippines-Visayas, the City Hall was once the largest building in the Visayas Region, and has been noted as being the sole surviving architectural landmark of Arellano's city plan. With sculptures by Ricardo Monti on its front elevation, and sitting originally within a 16 hectare plot, the classically-designed building is imposing. But in spatial terms by the late-1930s, as part of the undertaking of Arellano's city plan, dozens of plazas in communities surrounding Iloilo had been revitalized - at least 14 of which had been redesigned by Juan Arellano. Significantly, these plaza renewal schemes, and similar projects in other provinces, as yet have not been acknowledged in Philippine planning historiography. So, by discussing and explaining these government-funded projects a more truthful grasp of what urban designing by Filipinos occurred, and greater cognisance of planning's value to American colonial governance can transpire.

Figure 5. The plaza renewal project for La Paz.

Between 1933 and 1935 29 Spanish colonial plazas were redesigned in Iloilo Province. No other region in the Philippines was subject to so much urban planning activity at that time. Such schemes varied in character, and could on one hand be somewhat simple in nature, e.g. laying out symmetrically-formed lawns about a centrally-placed bandstand in the plaza in La Paz – Figure 5, or laying out a tennis court, children’s playground and erecting a bandstand in proximity to the Church in Leganes, and arranging lawns about a monument in the plaza in Miagao. On the other hand, some plaza redevelopment schemes were somewhat more complex in nature, such as those in Lumbanao and Tigbauan which included the construction of a number of architectural features as well as the arranging of green spaces: in Lumbanao, for instance, the Spanish colonial era space was lined on its sides by thin green lawns into which, on the west and east sides of the plaza, were planted trees. With most of the plaza being greened/transformed into lawns for lounging or playgrounds for children, the central axes of the space were arranged to directly correspond with the grid plan of the settlement and the position of the nearby Church. For example, the central north-south axis of the plaza which corresponded with the centre of the Church, was given the same width as the roadway directly to the south of the space, which the central east-west axis which was marked by two monuments and a bandstand aligned with the locations of two nearby roadways. Thus as a citizen was to travel about the central core of Lumbanao vistas were to be formed to the new architectural features in the space, and when approaching the plaza from the south, the church’s main elevation in the background framing the view of the bandstand and green spaces about it. Evidently when approaching the plaza from either the east or west citizens were able to view the plaza and the monuments within it.

Figure 6. The plaza renewal proposal for Arevalo.

As to why plaza redevelopment projects were a fundamental of Filipino urban designing a basic grasp of the use of the spaces, and in turn reference to Filipinos architects’ appropriation of an imagined, soon-to-be self-ruling nation is necessary. Whilst some scholars of Philippine Studies have indicated that during the American colonial period Filipinos rejected Spanish heritage from a planning perspective this is not true: after the Jones Act’s passing, and the Filipinisation of the colonial bureaucracy, existing urban spaces were utilized for the first time by Filipino architect-planners to help promote a sense of nationhood. Since through their education in the US and work experience in the BPW Filipino architects had learnt that architectural and environmental reforms were central to the American modernisation of the Philippines, the renewal of spaces alongside grand city plans post-1916 provided opportunity to nationalise/decolonise local cityscapes. With respect to the architecture of Capitols and other nationally important edifices, the use of decorative pediments that referenced *La Madre Filipina* (Mother Philippines) along with native characters helped to voice in built form a fresh interpretation of the developing nation as it headed towards independence. Furthermore, these new artistic references in the setting of political evolution, were suggestive of the expanding Filipino pursuit of liberty and happiness. As such redesigned plazas provided, literally and figuratively, a setting into which Filipino architects could articulate *the new construction of their own nation, one not American but Filipino*. Moreover, as an upshot of this actuality, the postcolonial historiography that encourages the viewpoint that Filipino post-1898 sought to partition and remove their Spanish heritage, given that it was viewed as something that should not be preserved, is flawed.

Such a way of thinking is unsound. Spanish spaces were to be kept but redefined in terms of use and meaning. The historiography, in particular, draws no reference to the changing use of plazas and the redesign of plazas after Act No. 3482 was passed: the Act (dated 1928) encouraged municipalities to consider issues associated with urban environmental design, and in turn developed common bonds between people within their urban communities. Development plans associated with renewing existing plazas became a staple of BPW public works from that time and can be seen in Iloilo Province settlements that included Pavia, Arevalo, Barotac Nueva, Carles, and Pototan. As places typically ignored within historiography, akin to the aforementioned Tayabas, there is a need to re-evaluate both the context and implementation/form/meaning of city planning in the Philippines during the American colonial period. Furthermore, in this intellectual milieu, it is appropriate to ask what factors influenced the approach of the Filipino designers? Until now, in written history, the answer lies in just one factor: Filipinos who worked in the BPW had received Beaux Arts-inspired education in the US. But is this grasp of Philippine planning history so simple?

To grant a broader account of the Philippine City Beautiful there is a need to check the Filipinos' renewal of plazas after Act No. 3482. Historically, of course, plazas were the hub of Philippine communities. Within the spaces, traditionally, social and religious celebrations occurred. However, during the American colonial era, with the construction of new monuments within the spaces, and with the establishment of new public holidays as well as in 1916 the kick-starting of decolonization, urban spaces became 'nationalized'. Crucially as part of this process the erection of new monuments to national heroes became entwined with the 'progressiveness' of local culture, and the broadening social understanding of matters associated with the quest for freedoms and civil rights. Consequently, not only did the erection of a new monument help tie in the local place to the national framework, a cultural environment associated from the late-1800s with Filipino emancipation, but now it also acted as a symbol of community prosperity and civic advancement. Whereas during the Spanish colonial era urban spaces had been directly connected to the Catholic Church, and so by the 1900s seen as part of its social control over the populace, firstly after 1898 under American 'benevolent assimilation' the spaces became used for secular activities and, secondly, from 1919 they became venues to advertise the growth of the Filipino nation as it headed towards self-rule. Hence to develop a maybe elaborate, but at least well-kept plaza, was a sign of a thriving, and indeed civically alert community. Part of this articulation of progress, evidently, was tied to the BPW architects who not only reshaped the physical structure of places but also designed within them statues and bandstands: as to why bandstands became important to social progress it must not be forgot that they were where local politicians made speeches to local people on days of civic celebration. As such bandstands were platforms for local democracy to be, literally, voiced at key dates in the calendar. As a result, as indicated at first by the 1919 Tayabas plan, should Filipinos wish to show to their colonial masters their capacity to express civic pride, spatially organized environments could also present an awareness that Filipinos had come to understand what public authority was for, and what 'public good', i.e. the cornerstone of democracy, was.

Conclusion

For about half of the American colonial period city planning, of a form shaped by contemporary American practices, was undertaken solely by Filipinos. Beginning in Tayabas the process of reforming the Philippine cityscape was vital to Filipinos demonstrating their evolving sense of nationhood but also the presence of public authority in their hands, and it post-1916 being applied for the benefit of the general public. Significantly as well, much of this planning activity has not been written about in Planning History, and as an outcome the role of city planning to colonial governance is not yet fully explained nor important schemes comprehensively discussed. As such many planning projects throughout the country have not been integrated as yet into historiography. This author's research takes a small step to address this problem.

The Filipinization of the City Beautiful, as this work has presented, entailed far more than Filipinos for the first time being urban designers in their homeland. The changing nature of City Beautiful urbanism post-1916, an articulation of the colonial state realigning itself, helped to supply opportunities for Filipino national identity to be put into built form and revealed how nationalist architects working within the BPW's Division of Architecture were successful in modifying the design form of built fabrics to this end. As a consequence, two matters need recognizing: first, the role of Filipinos within the working of the American empire during the 1900s needs reiterating. To date their function has barely been acknowledged. Their role was much more than incidental. Second, the historiography of the City Beautiful, as schemes by Filipinos from 1919 show, needs to extend beyond Manila and Baguio. Many town and city plans were composed pre-1935, and such was the volume of plaza renewal schemes that they topped three figures by the early-1930s. Thus, if the US was the spiritual home of the City Beautiful then the heart of its application was, arguably, in the Philippines.

21 Urban Vision and Planning Heritage

Sir Christopher Wren's Iconic London Plan

Michael Hebbert (University College London)

Immediately after the 1666 Great Fire of London, the distinguished architect Sir Christopher Wren sought to persuade King Charles II to rebuild the devastated city according to the best principles of baroque urbanism, with wide straight streets, axial symmetry, monumental endpoints, and a waterfront integrated to the street system with open quaysides. A pictorial postage stamp of 2016 showing the architect presenting his drawing to the monarch offers one of the few representations of a town plan in philatelic history.

Several such schemes circulated in the aftermath of the Fire of London. Wren's was rejected by the Crown and the City Corporation and might have been expected to disappear into a historical footnote. But instead it was seized upon by his son and grandson as a scandal of lost opportunity. A noble vision had been 'unhappily defeated by faction', long-term design sacrificed to short-term commercial advantage. The plan became widely reproduced by print-makers and gained iconic significance, influencing street improvements in eighteenth century London, providing a symbolic focus for nineteenth century public health reformers and late-Victorian advocates of municipal autonomy. Wren's plan featured prominently in the debates around postwar reconstruction of London in the mid-twentieth century. It continued to be illustrated in published editions of Sir Patrick Abercrombie's *Town and Country Planning* as recently as the 1960s, and was invoked in the urban design controversies involving the Prince of Wales and the real estate companies behind the redevelopment of Paternoster Square around the year 2000.

My paper aims to tell for the first time the history of this iconic plan. It will trace its genesis in the Renaissance expression of mastery over urban space through geometrical principles of order, harmony and proportion, and explain its long afterlife, showing the perennial appeal, for reasons that changed over the centuries, of Wren's iconic visualization of the city as an architectural ensemble.

The paper contributes in two ways to the conference theme of 'looking at the world history of planning'. Firstly, it offers an important case study in the world history of Baroque urbanism. And secondly, it addresses a neglected episode in the history of one of the world's great harbour cities.

The Role of Post-war Reconstruction Planning in Hiroshima's Image-shift to a Peace Memorial City

Allam Alkazei (University of Tsukuba) and Kosuke Matsubara (University of Tsukuba)

In the wake of war, cities' path to recovery is hindered by a large-scale destruction which is usually combined with issues such as post-war financial difficulties, and complex property rights. During reconstruction, urban areas encounter different drivers of recovery that define the future direction of their urban development. In the case of Hiroshima, the city had an important role as a military industrial centre in Japan since the end of the nineteenth century. However, its atomic bombing during the Second World War marked an end for that era of Hiroshima's history. Therefore, the infamous atomic destruction and the need for a post-war image-shift in Hiroshima ushered the way for its reconstruction as a "Peace Memorial City". This article links the history of planning of Hiroshima with its current state in an endeavour to highlight what Hiroshima's experience could offer other to-be-rebuilt cities. Based on field and archival survey, the article aims to clarify how the reconstruction process has paved the way for the image-shift of Hiroshima to a Peace Memorial City. It argues that Hiroshima's reconstruction illustrates an example where reconstruction planning was an actor in the image transformation using memorialism as a driver of recovery.

Studies on the Relation to plan-making of Conception of Hiroshima Peace City Construction Plan after the winning of Hiroshima Peace Memorial Park Competition by Kenzo Tange

Norioki Ishimaru (Institution for Hiroshima Shoji & Area Reliving)

It was already well known that Architect Kenzo Tange (& his associate group) won the first prize of Peace Memorial Park in Hiroshima held in 1949. After the competition, Tange made a great contribution not only to realize Peace Memorial Park Design but also to make Hiroshima City Reconstruction Plan as Peace City. This paper aims to make it clear how Peace City Construction Plan in Hiroshima was planned through the several plan documents and at the same time how Kenzo Tange, had related and contributed to the plan-making of that Plan. Kenzo Tange had proposed his idea and carried the plan through Peace City Construction Plan. Tange presented unique planning concept and purpose among together Hiroshima City planners. But those almost ideas was not always admitted by city planners or administrative stuffs.

In Japan, early after the world war Second, many war damaged cities begun to plan reconstruction Plan. When Tange joined to city planning team and presented to city planning project, almost Hiroshima reconstruction plan has been already completed. Then Tange's mission was limited. At the same time, Hiroshima was enacted under new law, in 1949 "Hiroshima Peace Memorial City Construction Law", under the special system, based on New Constitution, strongly oriented by GHQ. Then, Hiroshima was favored with financial condition than other war-damaged city. Hiroshima has fairly received national properties or special assistant support. Tange's concept was changed from Peace memorial Park Plan to peace memorial city plan. For example one hundred wide road were constructed under usual construction system, but Tange intended to construct it as peace boulevard road, namely special national support.

In those days, civil engineering was major field reforming infrastructure facilities. Those plans were not landscaping design but civil engineering plan such as widening roads and parks or putting into land readjustment plan. Then architect mission was very limited. Tange made his best to broadening field. Tange's original design was sea-side park plan near Ujina and air-port plan cited Kan-non area not Yoshijima. Partially Tange's plan was accepted, but almost plans were not.

Tange was working in his house through the night together with city stuffs and his institute stuffs. And he by himself wrote and presented planning documents, then we can admit his writing letter.

At that time, Tange studied many subjects, then contributed in designing national-wide or city-wide facilities, such as Ehime Prefectural Office and big scale Olympic facilities. And he gained his abilities through the influence of many administrative stuffs or government officers.

This paper makes it clear how city plan planed by architect has meanig

Contribution of the Planning Heritage in Anatolia for a Sustainable Future

Seher Erbey (Yıldız Technical University) and Zekiye Yenen (Yıldız Technical University)

It is stated that the degradation of the ecosystem in the last century, due to human activities, has not been experienced throughout the history (Gremmen, 1997; Jenks, 1996)

The global challenges -the most important one is the climate change- has pushed all countries to think about sustainable development (UN, 2015) Hence, in last thirty years, "alternative development models" have been sought in order to prevent conflict between 'conservation' and 'development' (Recife Declaration, 1996; Çahantimur, 2007)

Sustainability is a relationship among social responsibility, environmental harmony and economic feasibility (Riddel, 2004; Moughtin, 2005; Brandon, 2005)

The most basic definition for the concept of 'sustainable development', which has been used since Cocoyoc Declaration (Redclift, 2005; WCED, 1987) is explained in Our Common Future Report by the Brundtland Commission. Accordingly, "sustainable development is such a phenomenon that meets necessities of today's generation without interfering the needs of humanity in the future".

Survivors has been connected to the "place" relevant to protection capability of that special environment of themselves and the social, economic and cultural system they produced. This is an interaction between the geography/environment and the place; than the settlement starts the production of its inhabitants.

Based on these two assumptions, a research question such as "traditional settlements has the characteristics we need for sustainable future" could be stated. Therefore, this study focuses on the planning background which has been experienced in Anatolia under the reign of Ottoman Empire. The Turks have the responsibility of managing a society who believed that new system established respecting the culture specific in Anatolia. The most basic point that Ottomans managed the society was the relationship with geography. The community, although having different origins and dynamics, produced similar "places" in a common ground like geography. Production of economic, social, political and cultural interaction and the system continued at the basis of that planning approach during the Ottoman era.

This paper studies the similarities between the urban planning approach of the Ottoman period and the sustainable planning approaches developed today. The results obtained will be evaluated under the following headings.

- Lessons learned by Turks who have migrated to Anatolia from former civilizations,
- Achievements of this accumulation in the context of universal planning approaches,
- Application of the results of this evaluation to sustainable planning.

The conclusions of this paper -strengthened by the researches of authors in Boyabat, Edirne, Bursa, Kastamonu, Bergama, Eyüp- are;

- The settlements in Anatolia take advantages of geography utmost both locating the city in early period and the development of urban pattern,
- This planning heritage is a key address for the sustainable urban life for 'model' planning approaches for the 21th. century city.

The Role of Post-war Reconstruction Planning in Hiroshima's Image-shift to a Peace Memorial City

During reconstruction, urban areas encounter different drivers of recovery that define the future direction of their urban development. In the case of Hiroshima, the city had an important role as a military industrial centre in Japan since the end of the nineteenth century. However, its atomic bombing during the Second World War marked an end for that era of Hiroshima's history. Therefore, the infamous atomic destruction and the need for a post-war image-shift in Hiroshima ushered the way for its reconstruction as a "Peace Memorial City". This article links the history of planning of Hiroshima with its current state in an endeavour to highlight what Hiroshima's experience could offer other to-be-rebuilt cities. Based on field and archival survey, the article aims to clarify how the reconstruction process has paved the way for the image-shift of Hiroshima to a Peace Memorial City. It argues that Hiroshima's reconstruction illustrates an example where reconstruction planning was an actor in the image transformation using memorialism as a driver of recovery.

Keywords: Reconstruction planning, Image-shift, Memorialism, Hiroshima.

Introduction

Since the start of this decade, there has been a rise in the number of conflict-affected areas¹. A "storm" of hostilities in many urban areas has caused a staggering amount of destruction around the world especially in the Middle East and North Africa². The conflict-prone situation and the prolonged uncertainty make the path for reconstruction undetermined and full of challenges. These facts emphasize the importance of learning from previous reconstruction experiences. A key example of post-conflict recovery is the rebuilding of Hiroshima after the atomic bombing on August 6th, 1945.

Since the end of the nineteenth century, Hiroshima has had an important role as a military, industrial, educational centre in Japan which has set the city's path towards modernization³. The industrial development in the Japanese cities at that period was accompanied with a development in the city planning domain as well through the implementation of the first planning system in 1919⁴, which later was applied in Hiroshima in July 1923⁵. The bombing of Hiroshima has marked a new era in the city's development due to the large devastation the took the lives of 140,000 of its residents by the end of 1945⁶. After its staggering destruction, Hiroshima was able not only to rebuild the damaged areas but also to reinvent itself as a peace symbol.

The article sheds the light on how reconstruction planning has shaped Hiroshima into a memorial city. It also argues that choosing *memorialism* as a driver for recovery has not only set the direction of planning during the reconstruction period but also it was used as a catalyst for recovery. After setting the theoretical background, the article examines the changes in urban form during the reconstruction period.

Drivers of recovery

Cities after conflict often follow different paths of reconstruction based on the dominant drivers guiding their recovery. Those drivers and their associated planning practices depend on the attitude of authorities towards the memory of the event (warfare, natural disaster...etc.), and the tendency towards conversation or new development as illustrated in figure 1.

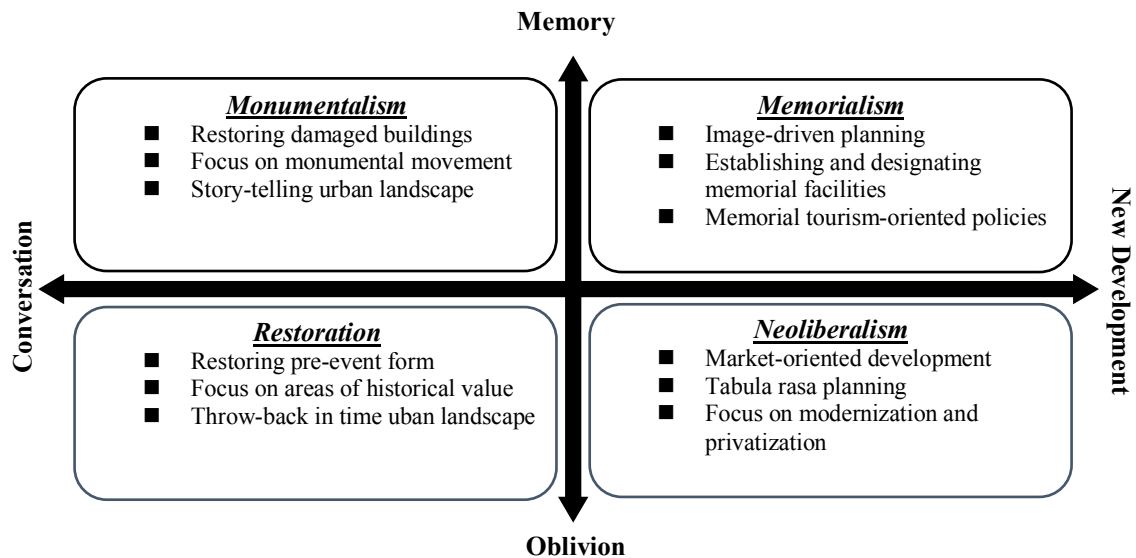

Figure 1. Drivers of recovery

Reconstruction of some post-conflict areas has been carried out with a sense of *oblivion*. An example of a recovery focusing on new development with a deliberate avoidance of the memory of the event could be seen in the redevelopment of Downtown Beirut after the Lebanese Civil War (1975-1990). The private redevelopment has followed a tabula rasa planning approach driven by market-oriented *neoliberal* policies. As a result, it marginalized state institutions and set privatized planning as the paradigm in the city centre⁷. In harmony with the context of ‘political and psychological amnesia’ following the civil war⁸, the redevelopment makes it difficult for visitors to imagine that the city centre was once a battlefield. Another example of recovery where the memory of the event was washed away by *restoration* could be seen in Old Town Warsaw after WWII. In an attempt to protect the Polish architecture from “western influences”⁹, the recovery was done in a “creative reconstruction” way which pushed back the Old Town to pre-1830 and erased the changes happening after that date because it did not suit the ruling realist socialist ideology at that time¹⁰.

On the other end of the memory spectrum, other reconstruction examples have chosen to include a reference to the event in the recovery process. The unification of Berlin illustrates a case where *monumentalism* was behind the conservation of conflict-related elements. The recovery efforts recognized the return of Berlin Wall to the city’s landscape after the memory-erasing “critical reconstruction” policies failed to express the story of change in Berlin¹¹. By doing so, the wall was used as a vessel to evoke strong images of the city’s memory and transition¹². As for Hiroshima’s reconstruction, it illustrates a memory-informed new development case of recovery. Among the 215 Japanese cities bombed during the events of WWII¹³, Hiroshima demonstrates an example of *memorialism*-driven reconstruction despite the almost “clean slate” rebuilding imposed by the massive destruction of the atomic bombing.

City’s image, brand and identity

In terms of how a city is perceived, scholars have used several terms such as the city’s image, brand, and identity. The notion of the city’s image goes back to Lynch’s seminal book *The Image of the City*. Lynch defines imageability as the ‘quality in a physical object which gives it a high probability of evoking a strong image in any given observer.’¹⁴. Scholars argued that a ‘strong and identifiable image’ has a positive influence on the satisfaction of visiting a place¹⁵. As for the city’s brand, scholars have defined city branding as ‘a set of actions aimed to improve the competitiveness of the city internationally ...’¹⁶. Finally, identity is what distinguishes a city and makes it unique, i.e. ‘the extent to which a person can recognize or recall a place as being distinct from other places’¹⁷. Scholars have also pointed out the existing interrelation between the three notions by arguing that city’s brand and identity are based on its image whether it is positive or negative¹⁸, which per se varies among the type of visitors (city residents, domestic tourists, international tourists)¹⁹. Therefore, it could be inferred that the city’s image is how it is seen by its occupants, its brand is how it presents itself, and its identity is what makes it distinguishable from other cities. Thus, the process of image-shift cannot be done by planning alone (city’s side), but it also requires a shift in how occupants perceive the changes in the urban environment (occupant’s side). Examples of image reinvention could be seen in some post-industrial western cities^{20 21}. Hiroshima’s reconstruction demonstrates a war-damaged military industrial city that reinvented itself as a symbol of peace.

Previous research

The reconstruction in Japan after the Second World War has been thoroughly discussed in the literature. Scholars have highlighted several features of reconstruction such as the continuity in central planning before and after the war²²; the project completion ratio-based evaluation of reconstruction^{23 24}; and the remaining vulnerabilities of Japanese cities to disasters despite the reconstruction²⁵. Furthermore, the infamous destruction of Hiroshima has drawn particular interest to its recovery and resulted in a large body of literature on its urban development. Scholarship has examined how reconstruction ideas were dispersed and debated in the immediate years after the bombing, and how later they all merged into one direction²⁶. Research also discussed how the architecture of reconstruction, most referred to by Kenzo Tange's Peace Memorial Park, has introduced a Japanese modernity that 'would be culturally authentic and contemporary'²⁷. Additionally, the role of transnational urbanism and how it has contributed to the reconstruction of Hiroshima were also explored in the literature regarding reconstruction advisors advocating conservation²⁸; their western inspired plans for areas in Hiroshima²⁹; and the reflection of western modernists in Tange's design of the peace memorial museum³⁰. The debate on post-war Hiroshima and reconstruction planning emphasized the importance of policy decisions in the 'construction new identity'³¹, however, it was also argued that the post-war identity per se might have created sites of 'dark tourism'³². This article elaborates on the debate on how reconstruction has changed Hiroshima's image after the bombing.

Methodology

The article is based on a literature survey of primary sources and field survey. Data collection and field survey were conducted in August 2017. Primary resources were obtained from Hiroshima City Archives, Hiroshima City Hall (Naka Ward), and Hiroshima Central Library. The article discusses the planning development of Central Hiroshima as a case study namely the area in Naka Ward located Northern of the Peace Boulevard, mainly discussing road planning and land-use change. It also clarifies the transition in planning by comparing the situation before the war (figure 2), with the current state³³.

Findings

After several reconstruction plans being set in the immediate years after the bombing, the Peace Memorial City Construction Law was promulgated in 1949 as a framework for reconstruction. The law and the later formulated Peace Memorial City Construction Plan in 1952 used *memorialism* as a vessel for the recovery which was expressed through: roads planning, land-use change, and conservation policies.

Roads planning

History of transportation planning in Hiroshima goes back to 1928 when the urban roads planning was fixed³⁴. After the bombing, reconstruction planning was based on a grid-type roads network in a consistent manner with the pre-war planning (figure 3). Since the *modus operandi* in Japanese urban planning is to carry land readjustment, plans were made in which the designated damaged territory was divided into two sectors: western sector carried out by the prefecture, and eastern sector carried out by the city.

The national government issued the Basic Policy for Reconstruction of War-damaged Areas in December 1945 to provide the guidelines for reconstruction. In terms of transportation planning, the basic policy allowed the planning of roads with 50 to 100 meters width when necessary for beautification and disaster prevention³⁵. Many damaged cities around Japan, including Hiroshima, saw this as an opportunity to plan ambitious 100-meter roads, however, later most of the plans were scaled-down or abandoned due to feasibility and financial difficulties³⁶.

The reason why Hiroshima's 100-meter road, currently known as the Peace Boulevard (figure 4), was realized lies in its symbolic value for the city³⁷. Furthermore, the road's importance comes also from a contextual necessity since it was originally a wartime plan as a firebreak for disaster prevention. This illustrates how a military project

Figure 2. Pre-war Central Hiroshima (1930)

before the bombing was turned into a symbol of peace through the reconstruction³⁸. Former mayor Shinzo Hamai has described the purpose of the plan in his memoir:

“if the central area had an East-West division, the city could be divided into twelve blocks by the rivers and empty land. Even if a major fire takes place, it could be contained within one block.”³⁹

Another important feature of the reconstruction is the influence of cross-cultural planning at that time. As other post-war reconstruction projects have fuelled the flow of international planning professionals⁴⁰, reconstruction in Hiroshima shows an example of transnational urbanism where foreign advisors have contributed to the planning. Stanley Archibald Jarvie from the British Commonwealth Forces (BCOF) was assigned as a reconstruction advisor in Hiroshima during the occupation of Japan. Jarvie proposed a plan for Hakushima district that integrated western planning concepts⁴¹. He proposed fewer blocks and wider curved paths rather than the grid-type plan proposed by the city’s plan. However, Jarvie’s proposal was not implemented since the city’s officials considered it unsuitable for a Japanese urban context^{42 43}.

Figure 3. Land readjustment plan for Central Hiroshima

Figure 4. Peace Boulevard in Hiroshima

Land-use transformation

Land-use planning was first decided in Hiroshima in 1927 then modified several times until reconstruction planning was decided in March 1949⁴⁴. The Peace Memorial City Construction Plan later integrated major changes of land-use as a part of the turn-over to a new era for the city. These changes were largely affected by the dominant movement towards memorialism. A well-known example is the transformation of Nakajima District after its devastation by the atomic bombing. The once vibrant commercial district was used to memorialize the disaster by turning it into a Peace Memorial Park.

This memorial park was also a part of a large effort to increase green spaces through reconstruction. Planning authorities in Hiroshima city and prefecture wanted to follow international standards for parks in Hiroshima⁴⁵. On the national level, the government stated in the Basic Policy for Reconstruction of War-damaged Areas that reconstruction plans are required to allocate ten per cent of the city area for green spaces⁴⁶. However, for a city such as Hiroshima where rivers constitute a vital part of the urban environment, reconstruction plans allocated green areas along the riverside as well. The plan of 1952 proposed riverbank greenbelts with a total area of 21.32 ha (13.14 in the East and 8.18 in the West)⁴⁷.

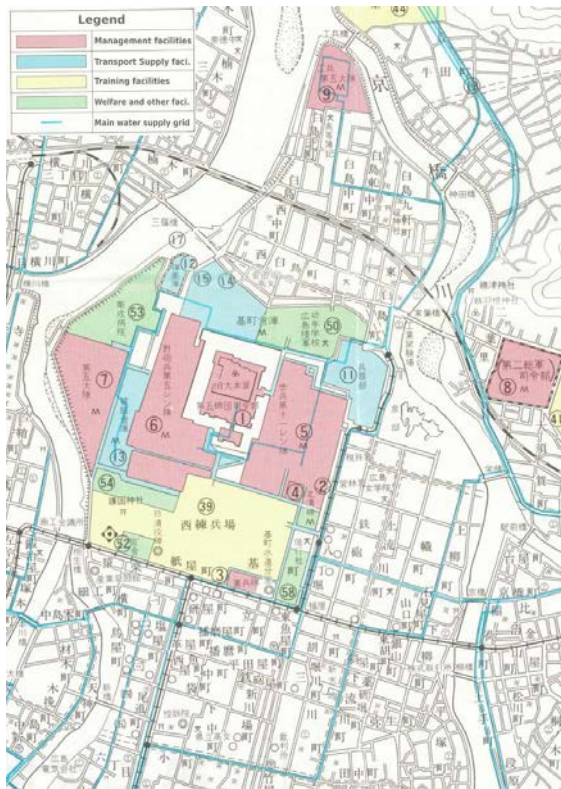

Figure 5. Military-use lands in Central Hiroshima

Figure 6. Map of Central Hiroshima in 1981

Another major example of land-use transformation could be seen in Motomachi District, a once military-use area in Central Hiroshima. The Peace Memorial City Construction Law facilitated the transfer of ownership of previously military-use lands from the national government to the city⁴⁸ (figure 5). For Hiroshima, the military lands, which constituted 9.3 per cent of the city area at that time⁴⁹, did not only have an obsolete purpose but also were unsuitable for the new image of Hiroshima as a symbol of peace. The military lands of Motomachi have kept the district “detached from ordinary citizens’ daily lives”⁵⁰. After the bombing, illegal houses built in Motomachi, and their fire-prone environment, were a long-lasting challenge for reconstruction in the city. It took reconstruction efforts up to the late 1970s to reintegrate the military lands in the district by turning them into civic facilities, parks, and public housing.

Figure 7. Former military lands in Motomachi District (left: public housing and Chuo park – right: Hiroshima Green Arena)

Early reconstruction plans designated the southern part of Motomachi district for the Chuo Park by allocating 70.48 ha of land⁵¹, but later those plans were scaled-down to clear the way for housing. Public housing was built to respond to the dire housing shortage at that time (figure 6). After demolishing the illegal housing, the construction of mid-rise public housing continued from 1956 up to 1968⁵². Later, a plan for high-rise housing was made by Masato Otaka which showed another example of cross-cultural urbanism manifested by piloti-style design and rooftop gardens⁵³. Currently, the once militarized district contains several civic facilities such as Hiroshima Central Library, Hiroshima Museum of Art, and sports facilities (figure 7). By the end of the reconstruction era,

the military character of Motomachi District has been abandoned, however, currently, the district is facing challenges such as deteriorating buildings and ageing residents⁵⁴.

A comparison was made between the current state and the pre-war urban form to shed the light on how reconstruction has ultimately changed Central Hiroshima as illustrated in figure 8⁵⁵. It could be concluded that post-war planning generally kept the original grid-type network structure while adding smaller divisions to the existing blocks. However, the areas with major transformations, namely: former Motomachi District, Nakajima District and, Peace Boulevard, have witnessed almost a complete change in use, road network, and block divisions.

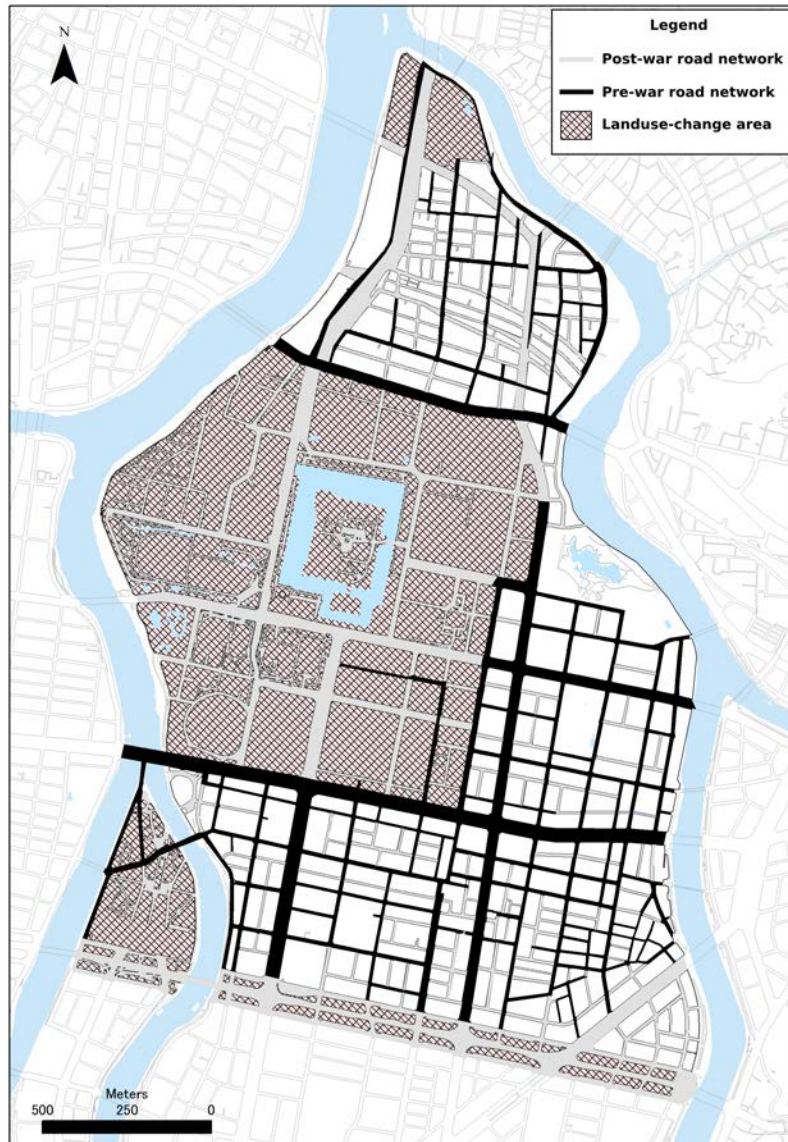

Figure 8. Changes in road network and land-use in Central Hiroshima⁵⁶

Conservation and memorialism

The vision of a memorial city was not only advocated locally but also it was pushed forward by international actors as well. At that time, the Allied Forces in the GHQ closely followed and shaped the financials of reconstruction in Japan⁵⁷, however, they provided the green light for rebuilding Hiroshima as a memorial city⁵⁸. Mayor Hamai has mentioned how Justin Williams, Chief of Legislative Division of GHQ, personally wanted to secure the approval of the GHQ when he was presented with the Peace Memorial City Construction Law proposal⁵⁹. Therefore, the foreign role in memorialism demonstrates another aspect of the international contribution in Hiroshima's recovery, which per se adds to the long existing transnational flow of planning ideas between Japan and overseas as seen in earlier times in the design of Nara and Kyoto, or in more recent examples such as the revival of Ginza in 1873⁶⁰. A key expression of the memorial vision is shown in Tange's design of the Peace Memorial Park which was not only a "major vector in cross-cultural exchange"⁶¹, but also it was a marriage of conservation and memorialism.

The calls for conservation and memorialism especially by reconstruction advisors Australian Stanley Jarvie and American John Montgomery⁶², their expression in Tange's design, and having a clear vision and a solid framework, are all factors that helped the reconstruction become a catalyst for recovery which ultimately established the city's memorial facilities among the most popular touristic sites in the country⁶³.

Figure 9. Memorial facilities in Central Hiroshima (left: Peace Memorial Park – right: Former Bank of Japan, Hiroshima branch)

Conclusion

Hiroshima's choice of memorialism as a driver of recovery was vividly materialized in reconstruction planning. Roads planning aimed to achieve objectives such as disaster prevention and symbolism while keeping pre-war planning practices. Several areas have had major land-use transformation as seen in the reintegration of military-use lands in Motomachi back into the citizens' life. Memorialism kept a reference to the memory of the bombing by establishing memorial facilities and conserving atomic monuments despite the almost clean slate reconstruction.

Transnational urbanism has had an important contribution to the reconstruction of Hiroshima. This contribution could be seen in the influence of western concepts in Tange's and Otaka's designs, getting the green light to build a memorial city from the GHQ, and the proposals of foreign reconstruction advisors. The flow of planning ideas in Hiroshima's reconstruction could arguably be described as a case of *synthetic borrowing* as demonstrated by the adoption of conservation and memorial ideas while discarding Jarvie's Hakushima plan⁶⁴.

The reconstruction of Hiroshima was able to memorialize the atomic bombing even through new development which distinguishes the way the city was rebuilt from other examples. Hiroshima's choice of memorialism has played a role as a catalyst for recovery that ultimately turned the once a militarized city into a popular touristic destination. However, some areas such as Motomachi District that went through a major transformation is currently under stagnation, and how this transformation has impacted its urban vitality is yet to be investigated.

Studies on the Relation to plan-making of Conception of Hiroshima Peace City Construction Plan after the winning of Hiroshima Peace Memorial Park Competition by Kenzo Tange

Norioki ISHIMARU*

**Doctor of Engineering, Institute of Researching Hiroshima Several and Area Reviving / nisimar5@hotmail.com*

Keywords: Hiroshima Peace Memorial City Construction Law, Hiroshima Peace City Construction Plan, Architect Kenzo Tange, Planning Document, Peace Memorial Facilities, Plan-making by Architect

The price winning proposal by Architect Kenzo Tange (and his associate group) for the Peace Memorial Park competition in Hiroshima in 1949 is well known and extensively documented. Less research exists on the planning of the Peace Memorial Park Design and the Hiroshima City Reconstruction Plan focused on the concept of the Peace City. This paper examines the process of the preparation of the Peace City Construction Plan in Hiroshima between 1949 and 1952. It analyses several planning documents and explores how Kenzo Tange contributed to the plan-making in collaboration with staff from the Hiroshima City office and other members of the business community. It argues that while parts of the plan were already set before Tange's arrival in Hiroshima, he and his staff had a large impact on select aspects of the plan. Tange proposed his unique planning concept and purpose to Hiroshima City planners and members of the business community and several of his ideas were realized. The analysis of various drafts and plans, points to specific areas where the input of Tange is visible, notably in more idealistic visions, more English wording, and also in the specification of building structures. The paper also highlights the particular impact from planning staff, notably focused on the implementation and funding of the plan. In conclusion, the paper demonstrates the need for a careful analysis of the process from vision to plan and the interaction between external architects and their visions and local planning agencies and their needs and requirements.

1. Introduction

Hiroshima was the first atomic-bombed city on August 6 1945, in the world(Fig.1). The Peace Memorial Park Competition in Hiroshima was held in 1949. Architect Kenzo Tange (& his associate group) won the first prize and the competition proposal(Fig.2) was realized with little revision shortly thereafter.

FIG. 1 ATOMIC-BOMBED AREA FROM THE SKY

After the competition, Tange contributed to the realization of Peace Memorial Park Design and the less known Hiroshima City Reconstruction Plan that promoted the idea of Hiroshima as Peace City. Tange who worked on Hiroshima Peace City Construction Plan was in close relation with Hiroshima city planners or administrative staff.

FIG. 2 FIRST PRIZE PROPOSAL BY KENZO TANGE

Numerous architectural professionals and theorists have commented on the prize-winning project by Kenzo Tange for Hiroshima Peace Memorial Park Competition. They have extensively written about the construction of Peace Memorial Park and on the design of Peace Memorial Museum. But, much less is known about the ways in which Tange collaborated with Hiroshima city staff and other stakeholders to produce and implement Hiroshima City Construction Plan that promoted the idea of Hiroshima as Peace City. This paper clarifies how the Peace City Construction Plan in

Hiroshima evolved through several plan documents and explores Tange's relation to Peace City Construction Plan.

2. Purpose, Method and Past Results of Study

In Hiroshima, there were several planning documents through the process of planning and carrying of Reconstruction Plan for War damaged Area. Examining those documents closely shows clear that a unique frame-work of plan-making was developed and functioned.

Kenzo Tange and his associates played an important role through the process of decision making and worked closely with the authorities. Then, aim of this paper is how Architect Tange was related to plan making of city planning.

Through examining of planning documents, this paper shows how several subjects guided the process of planning and implementing the Reconstruction Plan for War damaged Area. While Tange and his associates played an important role through the process, the final plan and its implementation are the result of the collaboration with local authorities and other business and architectural subjects. The purpose of this paper is to grasp the contents and meaning of the plan proposed by Tange as well as the characteristics, effect and persuasiveness of plan-making activities by Tange.

In connection with the past study concerned, there are "New History of Hiroshima/Volume of Urban Culture" (compiled by Hiroshima Municipal, published in 1983), "40 Years History after Hiroshima Bombing/Reconstruction of City"(compiled by Study Group of Researching Urban Life Hiroshima, published 1985), "Hiroshima's Path to Reconstruction"(Edited and Published by "Hiroshima for Global Peace" Plan joint Project Executive Committee, in 2015) and so on. Those referred to contents of Tange's participation in plan-making of Hiroshima Reconstruction Plan, but they did not describe concretely, but only appearing on the stage of planning process. Namely, existing document has so far ignored the role of Tange in the realization of the plans.¹ These mentioned only a little the role of Tange.

3 . Evaluation of Hiroshima Peace City Construction Planning Documents (1949-1950)

The Original Hiroshima Reconstruction Plan for War Damaged Areas legally implemented as Street Plan, Park Plan and Land Re-adjustment Area & Enterprise in October or November, 1946. The Plan named "Hiroshima Reconstruction Plan for War Damaged Area", was the same in name and form as that of other ones of war-damaged cities. In 1946, when Tange was invited as a part-time planner of Agency of War Damage Reconstruction to join the city planning team, the Hiroshima reconstruction plan had been almost completed.

This detailed knowledge of Hiroshima planning would facilitate his participation in the Peace Memorial Park Competition of 1949 and help his involvement in Peace City Construction Plan, the construction of Peace Memorial Museum and Peace Memorial Hall.

Tange's role increased when Hiroshima Peace Memorial City Construction Law as special law system was enacted by the Diet, and enforced in August 1949. This Law provided additional national funding for the rebuilding and turned Hiroshima into an exceptional case of post-war reconstruction. It also served as foundation for the establishment of the "Hiroshima Peace Memorial City Construction Plan". During the process of elaborating the final plan Tange's original concept changed from Peace Memorial Park Plan to Peace Memorial City Plan or Peace City Plan. The final outcome is effectively a combination of local

¹ See, for example, "New History of Hiroshima/Volume of Urban Culture" (compiled by Hiroshima Municipal, published in 1983), "40 Years History after Hiroshima Bombing/Reconstruction of City"(compiled by Study Group of Researching Urban Life Hiroshima, published 1985), "Hiroshima's Path to Reconstruction"(Edited and Published by "Hiroshima for Global Peace" Plan joint Project Executive Committee, in 2015

planning, existing before Tange’s arrival, and novel ideas by Tange and his group. The one-hundred-meter-wide road stands as an example. It was already under construction during the war as a fire break and projected right after the war to be constructed using the land readjustment system.² In Tange’s plan it appears as “Peace Boulevard” to be realized with special national support. Then, what is the role of Tange? There are several questions how some architect should plan city plan not but architectural design.

In May 1949, Hiroshima Peace Memorial City Construction Law as special law system was enacted by the Diet, and enforced in August that year. The planning framework in Hiroshima was exceptional and City Plan as “Hiroshima Peace Memorial City Construction Plan” was decided and realized. Tange’s original concept changed from Peace Memorial Park Plan to Peace Memorial City Plan.

The Original Hiroshima Reconstruction Plan for war damaged area was legally decided upon as Street Plan, Park Plan and Land Re-adjustment Area & Enterprise in October or November, 1946. This planning system was under the same system with other war-damaged city. The decided Plan named “Hiroshima City Reconstruction Plan”, and the name was same as other ones of war-damaged cities.

To receive national special assistance, Hiroshima City Planning Authority settled on several plans and compiled planning document(**Table 1**). The documents examined include Hiroshima Peace Memorial City Construction General Plan, Hiroshima Peace City Construction Proposal, and Hiroshima Peace Construction

TABLE 1 LIST AND BASIC DATA OF PLANNING DOCUMENTS RELATED HIROSHIMA PEACE CITY PLAN

Planning Document Number	Name of Plan	Key organization of Planning	Announcement Period of planning	Format and volume of planning document
Planning Document ①	Hiroshima Peace Memorial City Construction General Plan(proposal)	The City of Hiroshima	September 23, 1949	8 pages with main text, 23 tables, 4 figures, 37pages totally on B5-size
Planning Document ②	Hiroshima Peace Memorial City Construction Enterprise Plan	The City of Hiroshima	October 3, 1949	9 pages with main text on B5-size, 27 tables and figures on B4-size
Planning Document ③	Hiroshima Peace City Construction Proposal in 1949 version	Mayor Office of the City of Hiroshima	from February to March, 1950(inexactly)	199 pages with main text (including figures and tables) on B4-size
Planning Document ④	Hiroshima Peace City Construction tentative Proposal	Mayor Office the City of Hiroshima	April, 1950	185 pages with main text (including figures and tables) on B4-size
Planning Document ⑤	Hiroshima Peace City Construction Proposal	Mayor Office of he City of Hiroshima	April, 1950	92 pages with main text (including figures and tables) on B4-size
Planning Document ⑥	Hiroshima Peace City Construction Proposal	Mayor Office of the City of Hiroshima City	October, 1950	140 pages with main text (including figures and tables) on B4-size
Planning Document ⑦	Comments as to Hiroshima Peace Memorial City Plan	Special Committee of Hiroshima Peace Memorial Construction	August 6, 1951	Several pages

² Hein, Carola. "Hiroshima. The Atomic Bomb and Kenzo Tange'S Hiroshima Peace Center." In *Out of Ground Zero. Case Studies in Urban Reinvention*, edited by Joan Ockman, 62-83. New York, München: Temple Hoyne Buell Center for the Study of American Architecture Columbia University, Prestel, 2002; Hein, Carola. "Tange Kenzo’s Proposal for Rebuilding Hiroshima." In *Cartographic Japan: A History in Maps*, edited by Kären Wigen, Sugimoto Fumiko and Cary Karacas. Chicago: University of Chicago Press, 2016.

Tentative Proposal all of which are preserved in Hiroshima Official Archives or the Hiroshima City Library. Table 1 shows these documents in chronological order from Planning Document ① to Planning Document⑥. The first two proposals date respectively from September and October, 1949. They are followed by three proposals, and finally the Construction Plan in April and October, 1950. This analysis focuses on the role of Tange in these changes. Tange himself was working in his house through the night together with laboratory staffs and the planner from the city to write and present planning documents.

There were 6 main Planning Documents and one Committee Document. Planning Document① (the cover page is shown on Fig. 3), Planning Document ③ (Fig.4), Planning Document④ (Fig. 5), and Planning Document⑥ (Fig. 6) are entitled “Peace Memorial City Construction Plan” or “Peace City Construction Plan”.

The first Planning Document① was compiled in September, 1949 immediately after the enactment of the Hiroshima Peace Memorial City Construction Law in August, 1949. Table 2 shows the main contents of this plan. It is based on The City Planning Act, the Special City Planning Act and Peace Memorial Construction

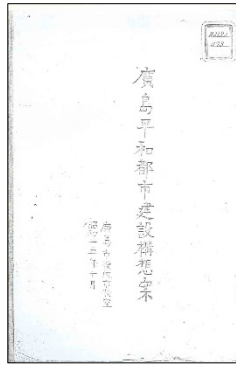

FIG. 3 COVER PAGE OF PLANNING DOCUMENT ①

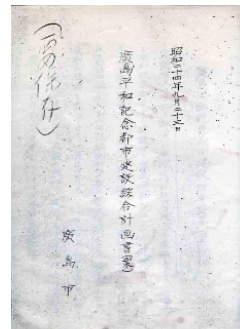

FIG. 5 COVER PAGE OF PLANNING DOCUMENT ④

FIG.6 COVER PAGE OF PLANNING DOCUMENT ⑥

TABLE 2 SUMMARY OF PLANNING DOCUMENT ①

Planning system, Ground of planning	Basic principle of planning	Main contents of planning	Remarks, and special remarkable characteristics
Necessity of Planning Document on the enactment of Hiroshima Peace Memorial Construction Law, especially in relation to Article 2	Planning Based on City Planning Act and Special City Planning Act, and especially planning of peace memorial facilities	① According to Article 1, “therefor, the plan of constructing ideal peace memorial city to answer public opinion of world human being and to contribute establishing eternal peace should be planned ② To construct Nakajima Park named Peace Memorial Park as Peace Memorial Facilities, 37000 Tsubo area in width ③ In the Park, to set up Peace Memorial Hall and Scientific memorial Hall, ④ To plan and evaluate 100-meter road as a peace memorial road which run through from east to west ⑤ To plan cultural facilities as international peace memorial city ⑥ Enterprise rough cost of total reconstruction city plan for war-damaged area estimate 2,790,000,000 yen and 1,960,000,000yen as Peace Memorial City Construction Cost in detail account, 16,000,000,000yen as peace memorial facilities ⑦ As financial plan, the project absolutely could not be realized under the regional financial project, then under national support and national land disposal this enterprise must be promoted based on Article 3 and 4 ⑧ Policy of preserving old Hiroshima Prefectural Industrial Promotion Hall so-called “Genbaku Dome” which was mentioned by Peace Memorial Facilities Plan	The very early stage plan in September, 1949 Short sentence as a whole in document Peace Memorial City Construction at this stage Concept of Preservation of Atomic Bombed Dome

Law all of which already employed the term Peace Memorial Facilities. The document contains the main elements of the later realization, such as the Peace Memorial Park, Peace Memorial Hall and Scientific Memorial Hall. More remarkably, the 100-meter-wide road was renamed Peace Memorial Road. It is very remarkable that the idea of the preserving the ruin of the Hiroshima Memorial Hall (the A-Bomb dome) was expressed. It also includes concrete thoughts about the necessarily national funding for the project. It is not clear how important the participation of Tange was at this stage.

TABLE 3 SUMMARY OF PETION FOR RECONSTRUCTION UNDER NATIONAL GOVERNMENTAL MANEGEMENT

Process of preparing the petition	Main contents of the Petition and Petition Paper	Remarkable Characteristics
Original petition for reconstruction of under government management in December, 1948 Then, the petition was collected in February, 1949, but this was not presented	<p>① In preface, it was described that Hiroshima War Damage has a historical meaning of warning toward all people, but that to construct memorial city for international peace means nearly impossible for regional condition.</p> <p>② Those are reason, "International historical meaning of the Hiroshima war damage", "Public opinion from world human being", "construction of a model modern city", "construction of tourist city Hiroshima and national-wide economy meaning", "the foundational enterprise and national meaning", "require urgent completion", and "fiscal measures." And so on.</p> <p>③ I hang up a peace commemoration institution and also concrete urban facilities, and suppose that I will prepare international cultural facilities, such as peace memorial halls (a large meeting ground, an atomic bomb data petition room, a peace tower, etc.), a fine-arts Palazzo, an athenaeum, and a scientific inquiry organization, Peace Memorial Park and into it.</p>	<p>① The expression of "public opinion of world human being" is prominent</p> <p>② The direct expression "peace memorial city construction" was not appeared</p> <p>③ The demand of Peace memorial city facilities was not placed in front of basic enterprise, but was involved among them.</p> <p>④ Especially already basic information for competition of Peace Memorial Park was hidden, and at that time it was ready for competition to comes true</p>

By the way, as to whether Planning Document① was original or not, the contents of Planning Document① is very similar to "Petition for Reconstruction under National Governmental Management" as **Table 3** shows. In this Petition Document, we can find out the name of Peace Memorial Park and Peace Memorial Hall as Peace Memorial Facilities. That is to say, the source of Peace City Construction Planning was petition for Reconstruction under National Government Management.

Although Planning Document② is almost the same with Planning Document① for appearances, there are small differences between both in their contents, as **Table 4** shows. That is to say, the biggest basic difference is the changing of the framework of planning term to five years plan. The reason of this changing is under the national government request, and as the one more reason, the total planning budget become remarkably large sum without 5 year limited term plan.

TABLE4 SUMMARY OF DIFERENCE BETWEEN PLANNING DOCUMENT① AND PLANNING DOCUMENT②

Difference panning Document ① and Planning Document ②	The Meaning and the influence
1. In Planning document ② Peace Memorial Park 257,000-Tsubo in area together Nakajima Park and Central Park is an enterprise which symbolizes to be peace city Hiroshima, it was necessary to set up here the peace memorial hall, the cenotaph, the athletic-sports field, etc. namely, Peace Memorial Park should be magnified here and contribute to global peace.	1. Tange's Hiroshima proposal was linked to the enlarging zone which is expanded from Peace Memorial Park and includes Central Park. Especially, the object of planning drawing together with Tange was Peace Park expanded area.
2. In Planning Document ① plan was the peace memorial hall and the scientific memorial hall, but in Planning Document ②, plan was the international conference hall and the atomic bomb museum, and scientific survey laboratory room, etc. in a peace memorial hall. As a monument the large arch and memorial tower to hang the bell of peace", and namely, the name of facilities were expanded.	2. The implementation design for execution of competition advanced, in Planning Document ② Peace Memorial Pavilion and scientific memorial hall was not suitable, and the name of facilities changed to International Conference Hall, Atomic Exhibition Museum, Scientific Survey Laboratory, Memorial Cenotaph,
3. In planning Document ②, a new item among the text appeared such as incidental facilities the old prefectural industrial promotion hall to be preserved.	3. Preservation of old Prefectural Industrial Promotion Hall was changed to gradually bigger theme.
4. Therefore, in Planning Document ② as the basic urgent enterprise the total amount was limited within 5 years length plan, then as the recovery program table, total cost of the proposal enterprise was summed up 5100billion yen.	4. As the fiscal plan, the cost of Peace Memorial facilities summed up to 710billion and a part of enterprise for five years will be taken into as a national budget.

TABLE 5 SUMMARY OF PLANNING DOCUMENT③

Planning System Planning Grounds	Basic Principle of Planning	Main contents of Planning(extract)	Note, special Outstanding Characteristics
Planning Organization is Mayor's room. First period of Planning work is from 1 November 1949 to 4 March 1950, and working stuff are Kenzo Tange and Takashi Asada as Tokyo University members, and Oda as an assistant engineer and Fujimoto as a director, The basis of a proposal is the same as the planning document①	The same principle as planning document①, with the unique intention	①writing clearly Article1 of Peace Memorial City Law, and running with poet of Edmond Branden(pp.1-2) ②on the preface writing both Peace Nation Construction of Declaration of Constitution and Article1 of Peace Memorial City Construction Law(pp.3-4) ③to Construct Hiroshima Peace City is the public opinion and the hope of the world people (p.6) ④on the Chapter1 adopting "Hiroshima as Peace City", describing "the idea of Peace City", "the aim of Peace and Construction", "the Reason for constructing Hiroshima as Peace City", and "the Subject of Peace City Construction"(pp.10-34) ⑤ concretely speaking, describing problem of civilization and peace with "to release atomic power", specifically discussing "How Hiroshima should be"(pp.10-18) ⑥as the reason why construct Hiroshima as Peace City, there are four reasons, one is the world historical reason and lesson, one is world public opinion that make Hiroshima the peace center in the world, one is that Hiroshima is the symbol of new Japan, and one is Hiroshima has Geographical conditions which Hiroshima can be built as new city ⑦there is a long preface sentence, before going into the contents of the main text(pp.16-31) the words and phrases of .(pp.1-31) ⑧ with word mixing English, introducing foreign examples, there is some characteristics ⑨as Peace Pavilion facilities, concretely indicates Peace Pavilion itself, Peace Arch, Cenotaph temple, Peace Square and Atomic Bombed Remains(pp.35-41) ⑩concretely speaking Peace pavilion Facilities are P3eace Pavilion itself, Peace Arch, memorial cenotaph, Peace Square and Atomic Bombed Remains ⑪by calling 100-meter road peace Peace Boulevard, the extents of Peace City Construction Plan and Peace Facilities is spread	Expression of "to release nuclear power" is outstanding Many oversea conceptions such as the poetry of the Edmund Branden and President Truman declaration, General MacArthur's message, introduction of the global peace day committee, proposal by Tamm Dealing and so on are quoted Necessity of facility is explained from the name of facility but from function or role of facility Total volume of planning document become to remarkably large size

The "Hiroshima Peace Memorial Construction General Plan"①, "Hiroshima Peace City Construction Proposal"② or the same tentative proposal till . Kenzo Tange who is an architect, and the member of the group were involved. However, the subject called the influence or effect not being necessarily clear was also left behind. Then, how Tange had participated to city planning or what was the role of Tange are the question to solve.

4. Tange's Participation

Thus, from Planning Document① and ②, the stage changed to the following Planning Document③,④), and⑤. As shown Planning Document③ in Table 5, the big conversion will be made here .

Planning Document③ of "Peace City Construction Plan" is B4-size(legal-size) in report size, 199 pages in report volume, and compiled by Mayor Room, as 1949 editions. This document was not printed in typing, but in handwriting. As Fig. 7 shows, planning period had been written down on the cover page, that is "from November 1, Showa 24(1949) to February 4, Showa 25(1950)", namely that is the first working term, and planning stuff are "Ota assistant engineer, Kanayama assistant engineer, and Fujimoto director belonging to Mayor Room". At the same time, the signature of "Kenzo Tange and Takashi Asada belonging to Tokyo University" has been written down on the upper part of the cover page (Fig. 8). Perhaps this signature was handwritten by own handwriting.

FIG.8 SIGNATURE OF KENZO TANGE AND TAKASHI ASADA

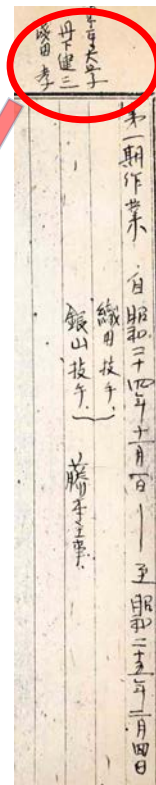

FIG. 7 A PART OF COVER PAGE OF PLANNING DOCUMENT ④

By the way, Tange sent several times his letter to Hiroshima Mayor Office Room, namely to Mayor Hamai and for example, by the letter dated on December 1, 1949, he wrote their schedule of working for plan-making from December 2. The member of working staff are Fujimoto, Oda and Kanayama. They were working at Tange's House and later their name by themselves on cover page of Planning Document above mentioned.

Then, what is the result of planning by Tange participation?

Table 6 Difference between Planning Document③ and Planning Document④

Difference between Planning Document③ and Planning Document④	The Meaning and the Influence
1. Hiroshima Peace City Construction Proposal③ express clearly the period April 1951(Syouwa26) and planning body mayor office	1. There is enough effort to settle the format.
2 On the Cover page, working and polishing is the second term, and the period is "from February 5, 1950(Syowa25) to April 2, 1950(Syowa25), and the planners are Kenzo Tange, Takashi Asada and Sachio Asada", "mayor Office Boss Iwao Nanba, Katutoshi Kato, director Chimata Fujimoto, Toshi Nakano, Kyosuke Kanayama, Yoshinori Yamada Yoshinori and Kimiaki Oda".	2. It was supposed that mayor office system must be settled down.
3. As the name of Mayor Office Boss Iwao Nanba, in the title page there ia "Declining" which reports midterm presentation".	3. At the result, there is enough system in the mayor office
4. On the middle cover page, there is 1949 ^{er} version and 1950 ^{er} version, then that is not complete revision.	4. It shows now shifting version process.
5. In the Planning Document③, many points are eliminated and revised by correct line, then, it remains the state of rough draft, but planning documents④ was made a fair copy as the united whole.	5. Now planning document has been settled down fomally,
6. In October, 1945, the speech in English of President Truman was quoted.	6. The intention to quote the long sentence was not clear.
7. Among the second half of contents after Chapter3, many are corrected or erased, are not always enough polished.	7. A fair copy had completed halfway, the latter half was not incomplete.

The remarkable tendency of Planning Document③ expressed often the philosophical ideas and using the plenty of foreign languages and foreigner's statement, that is, in the Tange's own way. Another characteristics are to adapt land use planning method which Tange Group had accumulated and to quote space image from his competition result. Those characteristics are remarkable difference from Planning Document① and Planning Document②. For example, Planning Document③ many time expressed "liberation of nuclear" (release atomic energy), as meaning of "the idea of a Peace city". Under this expression, victory of human wisdom, public opinion and hope (trust) of world humankind was connected with Peace City Construction of Hiroshima. General MacArthur's message was succeeded to the petition of Reconstruction National Enterprise. On the whole, hope of world humankind was succeeded, at the same time, new thinking and working was piled up. Moreover, new ideas were proposed such as Peace Boulevard, bridges, Peace memorial plantation, in addition to Peace Hall and Peace Park as Peace Facilities. Not only cultural facilities (an athenaeum, a science museum, an art museum, an open-air theater, a scientific facility) but recreation facilities (facilities for courtesies rest, comfort and joy, health, health, and just like athletic exercise) have also included them. Namely, by Tange Group many facilities were proposed to add under the new budge system. That is Planning Document③.

One more large difference is Park Planning. Both Nakajima Park and Central Park(Chuo-Kouen) were big park category, then, new Park Planning is Central Park(Chuo Kouen) only as big park, and another Nakajima Park was changed to Memorial Facilities category. It was not clear whether this idea was proposed under the suggestion from Tange group or from Mayor Room Staff itself. That framework was settled down at the stage of October6, 1949, then, Park Planning System was decided by Mayor Room Staff itself. Under the Park Planning System and the Memorial Facilities System, later, Tange had presented his drawings to CIAM that had held on London. Next step is from the following Planning Document③ to Planning Document④, as shown in **Table 6**, that is, the big conversion will be made here.

Acording to the letter written by Tange, "Mayor Staff were coming up to Tokyo to work planning" was reported. The working place was Tange's own house, too. The first working term work was done on December, 1949 and second working term was from February 4 to April in 1950. Then, Planning Document ③ was compiled on 1949 fiscal year and Planning Document④ was sumarized on next 1950 fiscal year.

Planning Staff are Kenzo Tange, Takashi Asada, and Sachio Otani belonging to Tokyo University, and Iwao Nanba, Kastuto Kato, Chimata Fujimoto, Toshi Nakano, Kyosuke Kanayama, Yoshinori Yamada and Kimiaki Oda belonging to Hiroshima Mayor Room. From first planning term, planning organization changed remarkably systematically (Fig.9).

Here, Tange's and Asada's signature was supposed to be written by own letter, as Fig.10 shows. Tange himself had related to Planning Document③ and wrote the report of planning, and Asada and Otani assisted Tange. Of course, city stuffs supported Tange group, as a beautifier or a rewriting performer. Although Planning Document④ was not remarkably different from Planning Document③, but there are basic differences from mutual. The Planning Document③ has remained incorrect part which must be rewritten, but Planning Document④ has been already corrected, namely a revised version. As for the main differences between Planning Document③ and Planning Document④, there is President Truman's declaration which is quoted in Document④, as it is in English.

Planning Document⑤ was planned later, and the word of "tentative" faded out, then the title of plan change to "Peace City Construction Plan". The content of this plan is not so much different from Planning Document③ or ④.

As for Planning Document⑥, main problem was succeeded from "Hiroshima as Peace city" and "the central subject of Peace City Construction Program" which was settled down on Planning Document ③ and ④. Peace facilities, with its function and area scale were succeeded from document ③,④. This Planning Document⑥ calls together Nakajima Park and Central Park Peace

Park, one hundred meter road Peace Boulevard, and established the conception of Peace Arch designed by Tange. However, English word presentation used in Planning Document③ and ④ is deleted in Planning Document⑥, namely Tange style disappear and on the contrary apply the administrative official presentation.

5. Conclusion—The Meaning and the Role of Tange’s Participation

Hiroshima Peace Memorial City Construction Plan" was formally authorized on March 31, 1952. The procedure demanded about three years after the legislation of "Peace Memorial City Construction Law" in 1949, and the plan was summarized, in this process, Hiroshima Peace Memorial City Construction Law and Tange’s Participation was chronology as Table7 show.

On the stage of Planning Document① and ②, we cannot specify to Tange's participation to Hiroshima Peace City Plan. As that period was too immediately after Peace Memorial Park Competition, it was supposed that Tange’s participation was not completed. In the view of the contents of Planning Document①,②, we cannot confirm Tange’s presentation technic such as English key words or famous expression. While, on the cover

FIG.9 A PART OF COVER PAGE OF PLANNING DOCUMENT④

FIG.10 SIGNATURE ON THE PLANNING DOCUMENT④

page of Planning Document, as the first planning term the signature of Kenzo Tange and Takashi Asada were recorded, and as the second planning term the signature of Yukio Otani's was added. On the other hand, depending on the different Tange letter, planning works at Tange's residence at that time was confirmed.

Then, what is the meaning of Tange participation to planning works?

When the some unique keywords appears in planning Document③,④, moreover main tendencies of planning appears as **Table8**, shows, many characteristics are pointed out. At first, in Document participated by Tange, many English words were used in planning document. Moreover unique expression such as "nuclear release" and "victory of human wisdom" often appeared in the city planning field. President Truman's message, General MacArthur's message, etc. was quoted, that is, with unusually governmental expression. Those expression was looked over ordinary in the architectural field, but in the field of city planning those sophisticated expression is in the seldom case.

Moreover, the logic built by Tange as "Hiroshima as Peace city" is not a simple expression, but a rhetoric one. Quoting foreign language and foreign affairs shows a tendency of high blow, and they are personal expression, not social and public expression.

TABLE 7 HIROSHIMA PEACE MEMORIAL CONSTRUCTION LAW AND TIME TABLE ON TANGE'S PARTICIPATION TO PLANNING

TABLE 8 KEYWORDS AND PLANNING TENDENCY OF PLANNING DOCUMENT③ AND PLANNING DOCUMENT④

Planning Document	Planning Document③	Planning Document④, especially difference from Document③
Keywords used in the Document	release atomic energy, victory of human wisdom, President Truman, World Peace Day, Tam Dering, Daniel Burnham, atomic period, peace pavilion, beautiful trace of old building, peace green way, boulevard, no hinged arch, two hinged arch, symbol of Japan rebirth, peace memorial nursery, child cultural center, Ujina Area sea-side park, Japanese-American pavilion, general subject of peace city construction, special district for public office, special district for education, building of Community, Atomic Bomb Statement by President	Basically the same of right advert, English keywords remarkably attached to Japanese keywords
Remarkable Planning Tendency	following land use Plan planned by as a part time planner of Reconstruction Authority of war-damage, especially idea following to special district for public office, special district for education, idea of rebuilding of community proposed by Gropius, aware of importance of Airport site, explanation of necessity of peace delegation, introduction of characteristic examples of oversea permanent bridge, to reclaim sea shore land about area 36.36ha then to establish there sea-shore park area	a quotation of Truman's president message just as a long sentence, a quotation of MacArthur Japanese message, as it is, at Hiroshima Peace Memorial Ceremony, detail description of international movement for World Peace day, maintaining the plan of peace arch

In the early years after the Second World War, many Japanese war damaged cities began to plan for reconstruction. In those days, civil engineering focused on reforming infrastructure facilities. Such plans were not geared to aesthetics, but rather focused on widening roads and creating parks through land readjustment enterprise. Those all representation were not by Tange and Asada, but if without participation of Tange and Asada, those expression came to the formal of planning document by no means. Subsequently, although the planning document ④ of a "Peace Memorial Hiroshima City Construction Law Tentative Plan" are not the planning document③ and a differentness thing fundamentally, since differences among some are found, I will observe only there (Table 6). The planning document④ was summarized with in April, 1950. If the plan by which the name of planning time and the charge ? was written in the cover also here remains and the portion is clipped, I have become as it is shown in Fig. 6. namely, -- being referred to as "from-February 5, Showa 25 to April 2, Showa 25" as the second term work and polish as shown in Fig. 7 -- as a name -- "University of Tokyo Kenzo Tange, Takashi Asada, and Sachio Otani Hiroshima mayor staff room? Iwao Nanba, Katsuto Kato, and chief Chimata Fujimoto, Nakano, and Kyusuke Kanayama I am indicated as Yoshinori Yamada and Kimiaki Oda." It turns out that Yukio Otani joined in the University of Tokyo when saying from the previous plan③, and the below section head staff increased in number also at the burgomaster room. I can respond now systematically.

On November 1, 1949 or on February 4, 1950, Hiroshima Peace City Construction Plan were published. Kenzo Tange and Takashi Asada, engineer Ota, engineer Kanayama, and director Fujimoto were working together. In April 2, 1950, Kenzo Tange, Takashi Asada, Yukio Otani, Iwao Namba, Chimata Fujimoto, Kyosuke Kanayama, Kimiaki Oda, Katsuto Kato, Toshi Nakano, and Yoshinori Yamada were working together October, 1950, Hiroshima Peace City Construction Proposal was edited. Then on March 29, 1952, city planning council committee decided regally Hiroshima Peace Memorial City Construction Program Determination.

In the planning document① and the planning document② were compiled soon after the competition. Then, Tange's participation was hard. And in the planning document③ and ④, planning term was recorded as the 1st work term and the 2nd work term, and the name of Kenzo Tange, Takashi Asada, and Yukio Otani name were also added behind. Tange and Asada were signed.

However, Tange's Participation was estimated that by using the keyword of "Peace" Tange intend to realize many plans for peace enterprise. After enacting Hiroshima Peace Memorial City Construction Law, the range, which the benefit of this law extend to, attains to the maximum level, If the word of "Peace" were used in Peace Memorial Construction Plan, the construction enterprise, was supposed, would be built by a high grant rate. Tange did not always accommodate to that condition, but to same extent he would like to utilize the condition without persuading the other war-damaged cities by proposing new planning idea.

As mentioned above, many proposals from Peace Memorial City Construction Plan to Peace City Construction Plan are set up, and finally Peace City Construction Plan authorized legally. Perhaps, Tange's did not prefer the ward of "Memorial". He understood memorial as the meaning of negative stance.

In this way, since Tange participated to land use plan decision as a part-time of War Reconstruction Authority after the war, he played an important role in Hiroshima Peace City Plan, not always winning the first prize of Peace Memorial Park Competition, but also participating to Peace City Construction Plan. However in Japan administrative plan such as city panning is planned by civil engineers not but architects planner. Especially reconstruction planning was planned for land readjustment mainly. In those days city plan was not comprehensive, and especially lack the point of view architectural of landscaping urban space. As a result, many planning ideas proposed by Tange were not ignored or carried out.

Tange's participation to Hiroshima on the whole, as shown in **Fig9**, will can be evaluated from various points of view-point, participation to Peace City Construction Plan was powerful support to the reconstruction of

Hiroshima, and especially the construction of Peace Memorial Hall and Peace Memorial Park became profitable. If Peace Memorial Park had been constructed independently, reconstruction itself extremely insufficient, supposed. Furthermore, quite a long later, the experience by some architect in Hiroshima played the role of suggestion to city planning of a Japan. Then, we must say that Tange's Participation was never meaningless.

If Tange's participation is twined around popular evaluation, many of contents of a proposal can be entitled the term "peace", and I can say that I tried to aim at realization. After peace city method enactment, I expanded the range which this law

attains to, and the tendency for "peace" to be entitled became strong noting that the method of a receptacle and many proposals were related to peace city construction in a subsidy and national property onerous payment legislation -- a law -- immediately after, when peace was entitled even by the road, I thought that I was built by a high grant rate. Although the Tange side was not necessarily flattered at it, I have not resulted till the place which shows a proposal idea so that other war devastation cities may be convinced.

As mentioned above, many planning ideas for the peace city construction after enacting Peace Memorial City Construction Law are set up, and among them, it was important that peace memorial city construction program had prepared for the legal authorized one, and that as the result Tange's participation had played the fundamental role.

In this way, since Tange participated in land use planning of Hiroshima as a part-time planner of Reconstruction Authority for War Damaged Area early after the war, he took part in the Hiroshima Reconstruction Council Committee, and had entried into and won the Peace Memorial Park Competition, and moreover has finished the positive role for Peace City Construction Plan. Especially, participation into Peace City Construction Plan resulted in powerful support at the reconstructing process of Hiroshima, and also the construction of Peace Memorial Museum or Peace Memorial Hall supported mutually.

However, how Tange's participation had given authority or power was not clear. That is, Tange's contribution to Peace City Construction Plan was not formal or official. Historically, Tange's contribution was not always evaluated

Of course, I proposed here Tange's works and the effect, but it is very difficult to estimate the power relationship which moved real history of city formation (Fig. 11). However the fact that Architect Tange had

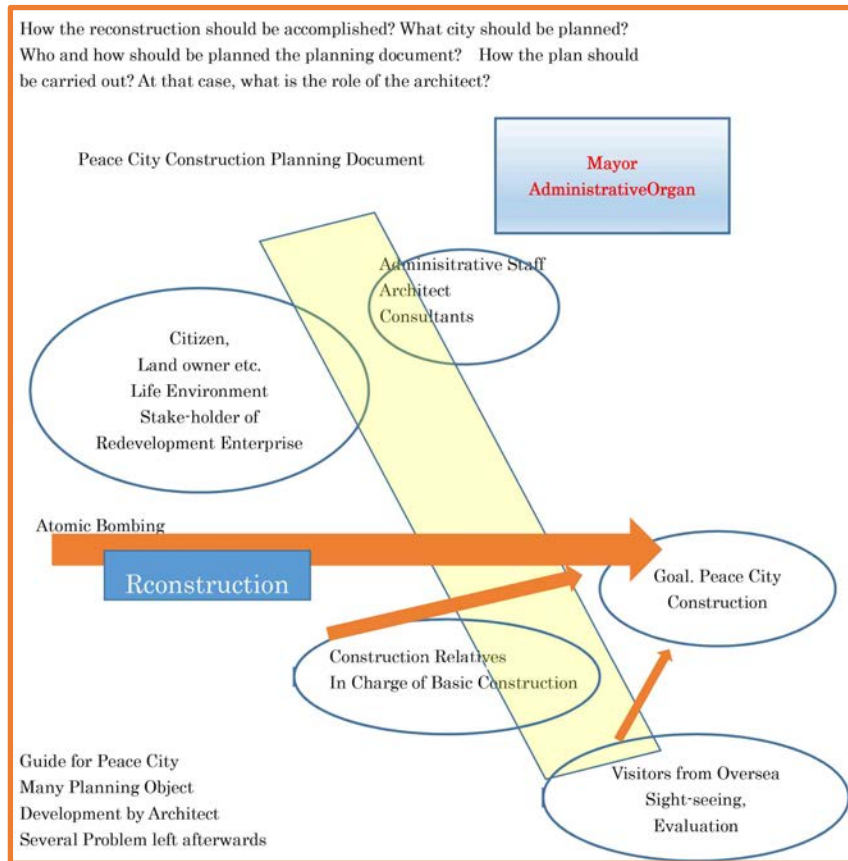

FIG.9 TANGE'S PARTICIPATION TO PEACE CITY CONSTRUCTION PLAN

The 18th International Planning History Society Conference - Yokohama, July 2018

participated Hiroshima Peace City Construction Plan was extremely important experience for post-war reconstruction planning in Japan.

In the early years after the Second World War, many Japanese war damaged cities began to plan for reconstruction. In those days, civil engineering focused on reforming infrastructure facilities. Such plans were not geared to aesthetics, but rather focused on widening roads and creating parks through land readjustment enterprise.

In the field of an architectural design, the books for promoting construction of a building centering on the plan are drawn up. The competition is materialized by using the figure of a building as a plat, and expressing and competing for it in the very most conspicuous form for collecting into books behind. On the other hand in city planning, the plan which I write in to a proposal idea, the various contents of a proposal, or an assumption budget centering on idea drawings, such as a road as what specifies city construction, and a park, and which was expressed variously is drawn up. This production of a plan is an act called planning, is a result of the business of people in connection with a proposal, and is a result.

22 Comparison of Urban Form Between Asian Cities

A Comparative Study on the Construction Mechanism of Urban Public Space in Modern Shanghai and Yokohama

Wang Yan (Tongji university), Zhou Xiangpin (Tongji university) and Zhou Teng (Tongji University)

In the 19th century, with the development of foreign trades, Shanghai and Yokohama opened to the world, became the window and bridge to introduce the European and American culture to China and Japan. Different from traditional Chinese and Japanese cities, Shanghai and Yokohama had been influenced and Intervened by the western urban planning Thoughts and practices, and then built in a very short period of time. Modern Shanghai and Yokohama both are important gateway in East Asia, the geographical environment, historical background of colonialism, the reorganization of the political system and so on are similar, so the two cities have showed some similarities in modern development and evolution . But different management systems, conceptual cognitions and political systems have also led to differences in city construction. Based on the view of public space, this paper compares the material space of modern Shanghai and Yokohama in urban form, architecture scene and park space, and tries to analyse the similarities and differences of the management system, concept cognition and political system behind public space.

Wall and Floor oriented Areal Spatial Conception and the Formation of Supergrid and Superblock Structure in Chinese and Japanese Planning

Xiaofei Chen (The University of Sydney)

The Supergrid and Superblock form is one of the most important planning structures that should be recognized in the history of East Asian planning culture. Together, they constitute a grid-and-cell urban structure that is especially evident in China and Japan, where its origins are ancient. The Supergrid is a large-scale network of wide roads that defines a series of cells or Superblocks, each containing a network of narrower streets. Despite having different names and forms in various periods of time, this structure is not well understood and mostly taken for granted in the planning of modern cities in that region without realizing its inseparable relationship to culture. My paper explores the similarities and differences of Chinese and Japanese spatial conceptions and how they influence the formation of Superblock structures in the two countries. It will first examine the visualization and expression of space: in the ideogram, calligraphy and painting, and how a similar spatial conception is further expressed and physicalized in the creation of architecture, city design, and planning in the two countries. Adapting from Ashihara' s conceptual framework of architectural space in China and Japan, related respectively to wall and floor, the second section of the study explores how various cultural predispositions influence the formation of the morphology of Superblocks and how these structures in the two countries are transformed through history. This study concludes that the Supergrid and Superblock phenomenon is rooted deeply in Eastern spatial practice and culture. It is formed under the influence of the same Eastern Areal (lateral) thinking that underpins a multidimensional spatial conception, which is common to both countries. However, different spatial demarcations that are oriented towards the 'wall' (China) and 'floor' (Japan) lead to divergent Superblock forms in the two countries. This Areal thinking appears to be the counterpart of the Western linear thinking and reflects a different inclination in spatial thinking that is strongly determinant to the formation of different types of Superblock in the modern Eastern and Western cities. This paper emphasizes the importance and persistent of culture in the formation of urban structure and how culture should feature more prominently in shaping our understanding of urban structure.

Comparative study of planning history, spatial development and sociological significance of the back alley in Yangon and Singapore

Tomoko Matsushita (The University of Tokyo), Kimiro Meguro (The University of Tokyo) and Aya Kubota (The University of Tokyo)

In the center of Yangon, Myanmar, there is a long-neglected space, even considered an eye-sore that people literally tried to hide called Back Drainage Space (BDS); long, narrow alleys typically 5m by 250m, running north-south behind city blocks in the Central Business District. This research attempts to recognize the significance and potential of the BDS as a heritage and public space, and the important future potential role in urban renewal of Yangon. This is a comparison study that identifies links and commonalities between two harbor cities of former British colonies and indicates the historical and sociological significance of the BDS to provide insights and useful suggestions towards innovative and people-centered development of the city of Yangon.

Yangon's original plan was created by a surgeon named Dr. Montgomerie in 1852 who, considering the flood prone, low-lying nature of Rangoon, included the idea of BDS to provide a sanitary living environment with proper drainage, sewage system and ventilation. These thin strips of urban space were implemented and largely remain today, although mostly closed and underutilized. However, in recent rapid urban transformation since the country was democratized in 2012, the potential of BDS as valuable public space has slowly been recognized.

Although its background and current state differs from Yangon, there is a similar space called backlane in the city of Singapore. The city was planned 30 years earlier than Rangoon in 1822 by Raffles and Dr. Montgomerie was involved in the town planning then as a secretary to the Town Committee. Backlane was not included in the initial plan, and traditional shophouses were built back to back without alleys. After years of development, by the early 1900s with growing concern for worsening living conditions in the overcrowded central area, the idea of backlane was introduced as a slum clearance policy by a public health officer Dr. Simpson who proposed to cut the back of existing buildings to create open space to gain light, ventilation and also control over the residents. Unlike Yangon, most backlanes are lost today, however studies have revealed their past sociological significance; what the space was meant for and how it served the local community. Some contemporary projects revitalizing the backlanes can also provide useful insights and suggestions on how Yangon should deal with the BDS.

Yangon and Singapore have similarities as harbor cities colonized by the British after the Industrial Revolution in south-east Asia, but this study reveals other less-known commonalities, such as the importance of the idea of sanitation, creation of BDS or backlanes and their evolution as informal socializing space for the community. The study investigates further in an attempt to find out how the two cities may have influenced each other and what Yangon can learn from the path Singapore has taken towards people-centered development in the future.

A Comparative Study on the Construction Mechanism of Urban Public Space in Modern Shanghai and Yokohama

In the 19th century, after experienced the " open port " and " port opening ", Shanghai and Yokohama opened to the world, became the important ports for Europe and the United States in East Asia. In the view of different historical geography, background and management, Shanghai and Yokohama show different development processes and characteristics. On the basis of briefing the modern urban and social background of Shanghai and Yokohama, this paper analyses the similarities and differences from the aspects of urban forms, architecture scene, park space, based on these, try to conclude the reasons from the system policy, concept cognition, and the management feedback, supposes to place the studies in a broader perspective, understands the construction mechanism of the Modern East Asian cities.

Keywords: Modern, Yokohama, Shanghai, Urban Public Space

Introduction

The book *Amherst Tour 1832* is regarded to be the earliest western record of modern Shanghai. Maclellan (1899), Montalto (1909), Lanning and Couling (1921), Fredet and Jean (1929), Pott (1928), Miller (1937), Hauser (1940) and Murphey (1953) also explained the modern Shanghai in their own aspects. Since 1930, Chinese scholars began to study modern Shanghai, Yazi Liu wrote the *Shanghai History* and the *Shanghai History Series*, Zhenchang Tang wrote the *Shanghai History* in 1988. The *Shanghai Modern Urban Studies* edited by Zhongli Zhang, made a general exposition of the modern Shanghai. Later, the sociology, economics, political scholars started to focus on modern Shanghai. As to the modern Yokohama, *The Yokohama Guide* written by Griffis and William Elliot in 1874, introduced Yokohama to the world. At the beginning of 21st century, Japanese scholars started to study Yokohama, Yuzo Kato described the Yokohama's history in *The City of Yokohama: Past and Present*. In 1997, Chinese and Japanese scholars held a joint research. Based on these research, this paper compares the material space of modern Shanghai and Yokohama in urban form, architecture scene and park space, tries to analyse the similarities and differences of the management system, concept cognition and political system behind public space.

1. Modern Shanghai and Yokohama City Development

The rise of Shanghai is due to the port open. After the First Opium War, Shanghai "opened" as one of the five ports. *The Land Regulations* (1845) wrote, "the land that located in the north of Yangjingbang, south of Lijiachang to the British businessman, for the construction of buildings and residences¹". Later, the American and French also encroached on land. After several expansions, the Shanghai International Settlement reached to 33503 Mow, the French Concession extended to Zikawei (Figure 1). In 1927, Shanghai National Government set up, the Chinese government combined the Chinese and Western style into the new town planning -- *Great Shanghai Plan*. On the eve of the founding the People's Republic of China, the *Great Shanghai Metropolitan Plan I/II/III* showed the importance of concession area in the city construction.

Fig.1 The Extended map of the Shanghai Concessions

If the “opening” transformed Shanghai from a general town that located in the empire’s border into a world-class metropolis, the Yokohama’s “opening” meant “the emerge of the city”. “Yokohama was a semi farm and fishing village. The hōgunate intended to catch up with the date of Port-Opening and stepped up the construction of the city²⁾”. In 1858, The *Treaty of Peace and Amity* stipulated the opening of the five ports. However, the Tokugawa shogunate decided that port facilities should be built in Yokohama instead. And the "customs house" was rented to the foreigners. In the early Meiji period, Yokohama developed into a prosperity modern city. In 1889, Yokohama built the city, and mainly around the port area of Kannai, Yamate and Yamashita (Figure 2). Subsequent decades, the Kanto Earthquake and US Air Raids slowed the pace of urban expansion.

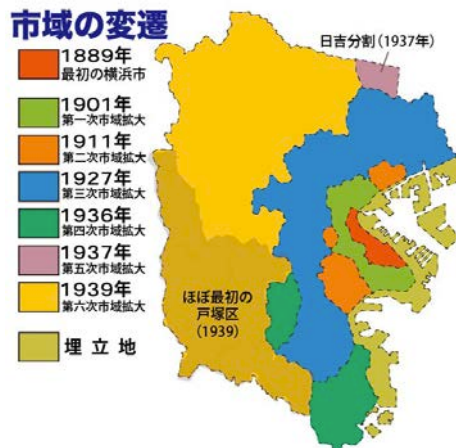

Fig.2 The Extended map of Yokohama

2. Comparison of Urban Public Space between Modern Shanghai and Yokohama

2.1 Urban Form

The concessions were the core of modern Shanghai. The construction of urban spaces was carried out around the shipping trade. The foreigners cared more about the timeliness and Functional, resulted in the collapsible layout in early concessions. From the 1960s, “building roads cross the border” was an important way for the expansion, land use continued to divide and sectorization go apparent. The International Settlement spared. The French Concession extended to zikawei. In the 1920s, the *Great Shanghai Plan*, which absorbed modern Western planning theory, used a radial and circular stitching pattern, showing a completely different urban form from the traditional Chinese town form. The impact of the *Great Shanghai Plan* on urban form had been lasting until the 1940s and even became a paradigm for the Japanese *Shanghai Metropolitan Plan* during the “Island Period”.

In order to build Yokohama into a port city, the shogunate built port facilities like roads, bridges, ports and other instalments, the Yamashita foreigner residential districts become similar to the Tokugawa town. In the early days of opening, Yokohama was bounded by the “customs house,” and the west was given to the foreigners, the east was the Yokohama village, both sides were in similar forms. The Shogunate developed a variety of land preferential policies to attract the Japanese to develop Yokohama, Kannai quickly became the Business centre. In

1889, Yokohama became a real city, the port area became the original form of Yokohama city. Later, Yokohama city expanded to 400 square kilometers.

2.2 Architecture Scene

In the early opening times, the couch-style that came from Europe to the Southeast Asia became the main style in Shanghai. At the beginning of 1860s, the foreigners began to hire some skilled architects for designing, and imported materials from overseas. The Bund was “full of gorgeous buildings”, Some of the buildings were imitated Greek temples, and some were imitation of the royal palace of Italy. In the 1920s, Chinese architects began to explore the modern architectural design in Shanghai. Although the Chinese architects mastered the western modern architecture technology and skills gradually, the design style was still subjected to conservative traditional ideology. For example, Dong Dayou used the traditional Chinese roof on the top of a Western-style building, try to build a symbol of government authority and stability (Figure 3). In the 1940s, the American modern style became the mainstream style.

Fig.3 Bird's-Eye view of the cluster along the Bund in 1930

Fig.4 National Shanghai Municipal Government Building

At the beginning, Yokohama was built in a traditional Edo style. After the opening, buildings began to appear strong western style, especially in the Yamate and Yamashita settlements, buildings were designed by foreign architects, “Renaissance”, “Gothic”, “Baroque” and other styles appeared Simultaneously. Yokohama became the source of westernization in Japan. After the Meiji Restoration (1868), the open social environment created a background for architectural development. “Imitate the western style” was prevailed in the Japanese folk³. At the end of the 19th century, the modernist architecture emerged. The native Japanese designers mastered the orthodox form of western architecture, and soon there emerged a large number of architects, such as Yamaguchi Hanroku, Tsumaki Yorinaka and so on⁴. In 1904, the Yokohama Specie Bank Ltd designed by Tsumaki Yorinaka was built in Yokohama, the building was New-Baroque style (Figure 4). Yokohama gradually became a laboratory of the modern style.

Fig.5 Yokohama Bund in front of the Grand Hotel

Fig.6 Yokohama Specie Bank Ltd

2.3 Park Space

In the 1860s, on the ground of “the public welfare”, the British Consuls set up the first park--Public Park (1868). The western modern concept of entertainment, park style and management system were introduced to China, and stimulate the transform of traditional gardens. In the late 19th century, parks extended other concession areas. The park types varied, there were community park (Quinsan Square, 1898; Wayside Park, 1911), athletic park (Public Recreation Ground, 1898, Hongkew Recreation Ground, 1909), recreation park (Jessifield Park, 1914), children's park (Tifeng Road Children's Playground, 1917, Nanyang Road Children's Playground, 1922) and many other types. The French Concession also began to build parks with the meaning of “Decorating the City” , such as Koukaza Park (1909), Verdun Park (1917) and Petain Park (1926). With the influence of the concession parks, Chinese began to make park a part in the town planning. The Chinese community set up the Military Road Memorial Park (1919), Xuehua Park (1928) and so on. The *Great Shanghai Plan* also included the park plan -- The First Park (1932).

In 1866, the foreign ministers signed the *Yokohama Settlement Renovation and Racecourse Cemetery Contract* with shogunate, and put forward the requirements of the construction of park. Until 1869 when the Japanese government gave the foreigners about 6,000 pyeong of land to build park, named Public Park (Yamate Park). In 1876, the foreigners established the “This Side and That Side Park (Yokohama Park). With the influence of the settlement park, the local private businessmen began to build commercial park, for example the sanenkaiken park. At the beginning of the 20th century, the types of Yokohama modern parks varied, including the Memorial Park - Kamonyama Park (1914) and the Children's Playground -Yokohama Children's Playground (1929). After the Kanto Earthquake, the Yokohama City Council set up Yamashita Park (1930), Motomachi Park (1930) and Kanagawa Park (1930) in the post-disaster ruins. In the 1940s, Tokiwa Park (1942), Gumyoji Park (1943), Tsunashima Park (1944) were set up as the defend green tract of land.

2.4 Comparison

Urban form

Modern Shanghai and Yokohama had excellent geographical location and port advantages, based on these opportunities, Shanghai and Yokohama absorbed a lot of capital both from home and abroad. Shanghai and Yokohama developed rapidly and became world-class port and metropolis in a very short of time. The differences between them are: 1) The builders of urban space in modern Shanghai were mainly the foreigners; and the builder of Yokohama was the Japanese government. 2) The development of modern urban space in Shanghai was achieved through the expansion of the concession for a long time; the modern Yokohama set restrictions for foreigners, and the settlements only played indirect roles in promoting the development of urban form, not the main force. (Table.1)

		Shanghai	Yokohama
Difference	Builder	Foreign Powers	Japanese Government
	Style	Western style — Chinese and Western combined	Edo style — Western style — Japanese and Western combined — Modernist style
	Main Area	Concessions	Japanese Community
Similarities	Original Position	Port Area	
	Construction Content	Roads system、Bridge	

Table.1 Comparison of Urban Forms between modern Shanghai and Yokohama

Architecture scene

Both Shanghai and Yokohama were affected by the western architectural ideology and material skills. The differences are: 1) Although Shanghai gained access to western modernism earlier than Yokohama, it did not form a definite value orientation; even Yokohama was enlightened late, the Japanese modernist architectural tendencies were clarified after the new culture movement. 2) Western designers or architecture studios monopolized the construction market of modern Shanghai for a long time, the Chinese native designers raised late, and they still pursuit the Western style more or less; However, the native Japanese architects realized the initiative early, laid the foundation for the flourishing development of Japanese architecture (Table.2).

		Shanghai	Yokohama
Difference	Style Evolution	Western style — Chinese and Western combined	Western style — Modernist style
	Designer	Western architects have been more active, native architects imitated	Western architects in the early period, native architects took the initiative later
	Value Cognition	Swing between the West and the Traditional	With the influence of Western-style get into modernism
Similarities	Western Influence	Style, technology, materials are affected by Western architecture	

Table.2 Comparison of Architectural Scene between Modern Shanghai and Yokohama

Park space

In order to meet the health and entertainment needs, Foreigners set up the Public Park in Shanghai and Yokohama. The foreign parks promoted the rise of private self-built commercial park indirectly, such as Shanghai's Zhang Shuhe Garden, Yokohama's Sanenkaiken Park. However, there were some differences: 1) The concession management department and the concession parks were the most important construction subjects and construction contents of Shanghai Modern Park; The Yokohama modern park is derived from the settlement park, but the Yokohama municipal government started to build their own park quite soon. 2) Concessions and the Chinese communities handled their own funds, while Yokohama government took charge of the constructions. 3) As to the park types, Yokohama has set up defend green tract of land because of natural and war factors, became an early sample of disaster prevention green space (Table. 3).

		Shanghai	Yokohama
Difference	Builder	Concession — folk — concessions and the Chinese community at the same time to build the park	Western style— Modernist style
	Sources of funds	The concession and the Chinese community are fragmented	Yokohama government support
	Park type	Athletic park, suburban park, children's park and so on	Defense green tract of land as park
Similarities	Origin	Public park in concession or settlement	
	Influence	Changed people's entertainment concepts, public ideas	
	Park Opening	only open to foreigners in early period	
	Status	Is the early model or source of modern park in both countries	

Table.3 Comparison of Park Space between Modern Shanghai and Yokohama

3. Comparison of Construction Mechanism of Urban Public Space between modern Shanghai and Yokohama

3.1 The Management System

On the impact of colonialism, Asian countries suffered different fates. Some of them were completely reduced to the colonies of Western countries, such as India. Some turned into a semi-colonial, such as China. Moreover, other countries like Japan, although the sovereignty of them had been undermined, they still remained independent and even developed into a powerful country⁵. The British Consul, Sir Rutherford Alcock who successively served in Shanghai and Yokohama, frankly stated, "In Shanghai, there were more expensive price of land, because construction of all of the river bank, the pier and the road were been funded by the lessee, while in Yokohama all of them are constructed by Japanese government, and the lessee of land have no those responsibilities⁶".

Department of administration

In 1845, the *Land regulation* given the principal of "Planning Together", showed that the diaspora in concession were the main body of construction, the West were also responsible for the source of funds, design and implementation, management, and maintenance of municipal construction of concession. The Chinese government abandoned the right to construct and manage the concession. After the 1880s, they even grew into independent institutions as equal as the Chinese government. Different from Shanghai, <Land regulation of the Kanagawa Port in 1860> stated, "The Japanese government need to regularly maintain urban roads and terminals and, if necessary, to build sewers⁷". It showed that the main body of the management was the kanagawa government.

Situation of administration. There were three forces of management (the Municipal of Shanghai International Settlement, Municipale de la Concession Française de Changhai and the local community), took charge of their own regions independently, which result in a local orderly but overall disorder. Differently, the foreign powers forced the Shogunate to sign the <Yokohama Residence Book>, declared the independence of the residence and establishment of the General Court in charge of the affairs of the residence. After 1866, due to lack of funds, the foreigners gave up the autonomy of residence, so the modern Yokohama was under administration of Japanese government.

Source of funds

The background of the three divisions coexistence of shanghai decided the varied source of fund for construction. Along with the increase in residents of concession, higher taxes made the management organization of the concession enhance greatly enough to be afford municipal expenditure. In contrast, Yokohama had always been controlled by the government, taxes in the residential area were completely control by the local government of kanagawa.

Local management system. There were different attitudes toward to the western management system in Shanghai and Yokohama. Since the establishment of the National Government, They kept a Top-to-Down management

system, while in Japan, the political management system was more westernized, the Yokohama government provided more development space for the public.(Table.4)

		Shanghai	Yokohama
Difference	management authority	The government has voluntarily abandoned the concession	The government insists on adhering to its own sovereignty
	Management organization	Foreign residents , the Municipal of Shanghai International Settlement , the Shanghai government	Shogunate , the kanagawa government — Foreigner Council —Yokohama Government
	The source of funds	Westerners take use of tax and china offer partly support	The shogunate government take charge of it , take advantage of high price of land
	management situation	The three individuals	The Yokohama government
	Foreign organization	the Municipal of Shanghai International Settlement , Municipale de la Concession Française de Changhai: powerful	Short-lived Foreign Council, powerless
	Impact on the local	The top-down management system	after the Meiji restoration , the political management system westernized
Similarity	Westerners autonomous	Foreign powers both had self-governing periods in the concession and residence areas	

Table.4 Comparison of The Management system between Modern Shanghai and Yokohama

3.2 The Concept of Cognitive

Utensil culture

In the early of opening, both Shanghai and Yokohama showed resistance to foreign cultures. In the 19th century, it was still in a passive state of acceptance or even relatively exclusive stage, for example, in 1881, there began to appear tap water in Shanghai, but “Chinese users were fresh, and even doubted that the water was toxic and harmful and better not to use it⁸”. It was same in Japan, they rejected request of opening port of westerners at beginning, but then they immediately showed crazy pursuits for the western culture as long as they realized it was "advanced" soon.

Spiritual culture

Similar with Utensil culture, the acceptance of spiritual culture was even slower. At the end of the 19th century, people with lofty ideals advocated learning western culture, but the management system gave the elite little voice. In contrast, after the Meiji restoration, there were more active attitudes in Japan, encouraged the people to learn and absorb advanced western utensil and culture. The Meiji government combined the concept of Western Urban Planning with the problems of their own cities, triggered an upsurge of reform, and the government and non-governmental organizations spontaneously put into practice(Table. 5).

		Shanghai	Yokohama
Difference	Utensil culture	Passive acceptance	active acceptance
	Spiritual culture	resistance	The government and the people jointly promote it, The Meiji restoration
Similarity	In the early for the foreign culture are excluded		

Table.5 Comparison of the Concept of Cognitive between modern Shanghai and Yokohama

3.3 The Policy and System

System foundation. Since the opening of the port, the land regulations can be regarded as the earliest planning document and the first new law and urban planning law in modern Shanghai. After the opening of Yokohama, the foreign consuls and the shogunate signed the *Land Regulations of Kanagawa*, which was the basis for the negotiations between the early shoguns and the aliens.

Land management.

Chinese landlords had rights to deal with foreigners directly, which indirectly offered the potentiality for expansion of the concessions. Relatively, the shogunate acquired ownership of all land of Yokohama prior to the opening of the port, and the farmers could only use land in the form of a contract, which increased the difficulties of self-expansion of the settlement. When the city of Yokohama was founded, it repossessed the reservation and acquired ownership of all the existing land.

Settlement situation.

After the Taiping Heavenly Kingdom and the Small Knife event, Chinese people flocked to the concessions, which led the settlement formation from separation of Chinese and foreigners to the mixed residence, and the Chinese people that living in the concessions became the main source of the taxes, and the forced the expansion and development of concessions. Oppositely, owing to the lack of local labor and capital, the strength of the residence had been unable to compete with the Yokohama government, which restricted the expansion of the settlement indirectly (Table.6).

		Shanghai	Yokohama
Difference	Land system	Westerners and landlords directly trade, the government does not take part	The land is owned by the government and the government and the West trade
	Settlement system	mixed residence of Chinese and foreigners	Separated residence of Japanese and foreigner
Similarity	The "Land Regulation" become the basis for the two cities to contact with foreigners		

Table.6 Comparison of The Policy and System between Modern Shanghai and Yokohama

Conclusion

Under the impact of advanced civilization, both Shanghai and Yokohama had completely finished the process of urban modernization or urban formation in a short period of time, showing a leap-style development process with characteristics of colonialism. On the basis of investigating the material form and construction mechanism of public space in modern Yokohama and Shanghai, the following conclusions are obtained: 1) The same geographical location, port resource and social background make the two cities have similarities in the external performance of urban public space. Modern urbanization processes are both derived from the foreigner settlement; Western architectural form have been the mainstream for a long period of time; Advanced materials and techniques have promoted the rapid development of architecture technology; Public Park became the early model and source of two cities and even modern parks in the two countries, changing the concept of entertainment, health, and public in the country. 2) There are difference in urban forms、architecture scene and park space between the two cities, and main performance are the builders, sources of funds, style and other aspects of rheology. 3) Different management systems, conceptual awareness and policy systems are the main causes of this discrepancy.

Notes on contributors

With a considerable research of gardens in modern china, it is possible to understand how the social and culture factors influenced the spatial pattern and garden types in modern China. Yan's research in this field, she concentrates specifically on public gardens in modern Shanghai and influences on the open space in our cities. For this paper, Zhou Teng help with the translation, and Zhou Xiangpin gave valuable advices.

A comparison of two similar types of back alley spaces: Back Drainage Space (BDS) in Yangon and Back-lane in Singapore, is conducted to find out if there are any relationships between their spatial development and lessons that can be learned from the precedent case in Singapore. Commonalities and differences of the back alley are identified by comparing the historical urban context of their formation and development in British colonial cities. The findings suggest that the back alley spaces in both cities, despite divergent circumstances and development after independence, possess common traits as interstitial space between public and private, with a unique way of spatial management based on informal, mutual agreement, which suggests some useful ideas when considering the role of these spaces in the redevelopment of Yangon in the near future.

Keywords: Back Drainage Space, British colonial city, back alley, Yangon, Singapore, urban renewal

Introduction

In the centre of Yangon, Myanmar, there is a long-neglected space, even considered an eyesore, called Back Drainage Space (BDS), dark and dingy, long and narrow in proportion, typically 5 meters wide by 250 meter long, running north-south behind entire city blocks throughout the Central Business District (CBD). A similar type of space called Back-lane, behind so-called shophouse, an architectural style of Chinese merchants commonly found in Asian countries, is creating part of the scenes in highly touristic areas in Singapore. The two cities share a background as former British colonies that flourished during the 19th to early 20th century as Southeast Asian harbours. Reflecting post-industrial revolution concerns for diseases caused by crowded urban environments, both back alleys were created for the purpose of sanitation. While BDS in Yangon are still largely intact today as originally implemented, many of Singapore's Back-lanes have been lost in the course of modernization, buried among high-rise buildings. Recognizing the potential of this under-utilized urban heritage as an important asset for the rapidly changing city of Yangon, the authors selected the two cities as targets of this study with the goal of gaining useful lessons from the precedents of back alley in Singapore that could inform the development of BDS in Yangon. As there are no previous studies on BDS and limited materials on related subjects, the authors relied on information from accounts of residents and semi-structured interviews with the local community and authorities. For Singapore's back-lanes, facts and analysis are based on literature which provided important information to support the core of this paper. First the two cities are compared in terms of their history of urban formation, development, use and sociological significance of the back alley, then commonalities and differences are identified to draw insights that may be useful in considering the urban renewal of Yangon City in the near future.

Comparison

Urban formation of Yangon: reclaiming land and the problem of sanitation

When Yangon was seized under British colonial rule in 1852 after the second Anglo-Burmese war, it was a small trading town, ruled by King Alaungpaya, with some roads and timber houses on stilts, suffering from frequent floods. Europeans who saw Yangon at that time depicted it as having poor housing, lack of proper drainage and insanitary conditions.¹ A rough sketch by Grant who visited Yangon from 1836 to 1849 shows a road leading up to the great pagoda, Shwe Dagon Pagoda, located inland and also a number of religious buildings such as an Armenian Church, a Roman Catholic Church and a few mosques near the port, indicating that the town's population was diverse before colonization.² Yangon was mostly destroyed during the war, so there were no pre-existing buildings of any value or city layout to follow.³

A medical doctor Dr. Montgomerie⁴, gave the original idea for the city's planning after coming to Yangon with the troops in 1852. Although he was not an architect or urban planner, it was common in the late 19th century for doctors and public health experts to have dominant role in the planning of colonial cities⁵ and Montgomerie was quite confident because of his experience serving as a Secretary to a Town Committee in Singapore from its beginning in 1819 to 1842 prior to coming to Yangon.⁶ He proposed a new city plan that reflected a general British philosophy of colonial urbanism with wide streets in a grid pattern which symbolized human order and was intended to encourage proper ventilation, prevent spread of fire, and reduce congestion which could cause insanitary conditions and spread of crime⁷. Based on this idea, Fraser⁸ revised and drafted the plan and Phayre⁹ accepted them for implementation.

Montgomerie was specifically concerned about the drainage system as the city suffered from frequent floods since pre-colonial times, and proposed "that down the centre of each block of buildings a narrow lane or back-drainage-space should be placed, along which a sewer should be carried to the river"¹⁰(Figure 1)." The idea was to implement fifteen-foot-wide canals and reservoirs to collect water during high tide and to use that to flush the sewers to the river once a day to keep the city free of stagnant water. The canal was never realized because of the potential of contaminating the river water significantly¹¹ however the Back Drainage Space was implemented as one can see in almost every block of the city today, years later after the problem of sanitation became a serious issue.

To construct the new city, Yangon had to reclaim much of its land, about two to three feet in height, which was largely below high-flood levels surrounded by swamps, creeks and lagoons.¹² By then all property in Yangon belonged to the government and revenue from selling city property was used to finance reclamation work. The reclamation was delayed due to a lack of funds while at the same time the city outgrew the originally planned population of 33,000, especially with the drastic increase of the Indian population recorded in the census from 15,677 in 1872, 16 % of the total population of 98,138, to 66,077 in 1881, 49 % of the total population of 134,176.¹³ Many of those who supported the growth and prosperity of Yangon were crammed into small, swampy areas and "housed under the worst possible conditions".¹⁴ Without proper systems for water supply and drainage, the city suffered from great losses caused by fire as well as high death rates due to unsanitary conditions. In 1887, a proper sewage system was finally introduced and a hydro-pneumatic system installed by the British company Messrs. Shone & Ault is still in use today, 140 years later.¹⁵ Yangon was as dense and crowded as cities in India at that time but the planning of BDS contributed to better conditions in the city. As Pearn wrote "Rangoon was fortunate in that Fraser's scheme provided some 43 per cent of open space in the form of roads and back drainage spaces, a circumstance which moderated the evil of overcrowding as known in Indian cities."¹⁶

BDS: the users' stories

Due to a lack of official documentation about BDS, the authors relied on the accounts of the residents who shared stories of their childhood that go back as early as the 1960s. Semi-structured interviews were conducted by the authors with six groups of residents including local communities and authorities¹⁷. 1988 was the year of nationwide protests and it turned out to be a turning point for the BDS as well. In the early days, the CBD was low density with low-rise buildings where most neighbours knew each other, so BDS was not only used for drainage purposes but some residents used it as a place to socialize, sit and relax, a playground for children and passageways to visit neighbours or relatives' houses (Figure 2). The city government cleaned it regularly since it is a public property and the drainage and sewage system functioned according to its designed capacity. However, after 1988, gradually the situation changed as society underwent instability following the uprising. The Yangon City Development Committee was established around this time in 1990 and a large amount of new construction was realized, many owners took the opportunity to maximize values by building high-rises up to eight stories with rentable units. As a result, an influx of new residents from around the country crowded the downtown area and residents could no longer identify their neighbours' faces. Consequently crime rate increased, and finally the ward council decided to shut the BDS for security reasons (Figure 3). When the BDS were closed, people stopped using them and started to put trash there. Some owners may not have upgraded their sewage system properly when they increased the number of units, which caused overflow and it made the BDS an even more unpleasant place. So there was a common experience of many of residents that the BDS was closed for security reasons and when it became unused, it became a 'trash alley' eventually.

Situations may differ depending on the location. There was an interesting story about a street vendor who ran his business as a tea shop in the BDS for twenty years. Because it is a public space, officially one is not allowed to use or occupy the space for any activities including washing, cooking, running a business or storing a generator.

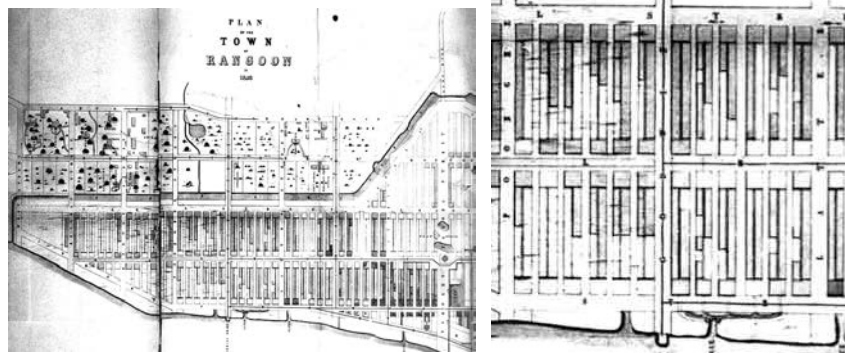

Figure 1: *Plan of the town of Rangoon in 1856 showing the grid pattern with BDS laid out in every block.* (Enlarged partial plan on the right) [London: s.n, 1856]

Figure 2 (Left): *BDS in the past with residents socializing.* [Yangon: s.n.]

Figure 3 (Right): *BDS today, closed by the fence, seen from a sidewalk.* (Photo by T. Matsushita, 2016)

Yet one occasionally finds such scenes in the BDS. There seems to be a number of informal or unofficial agreements between the users and authorities and it seems to be accepted as long as there is no harm to others; it may even benefit the neighbours by acting as a safeguard for the community.

Urban formation of Singapore: Spatial segregation and concentration

Malacca was occupied by the Portuguese in 1511 then by the Dutch in 1641. When the British came to Singapore in 1819, it was still a small fishing village, described as a dense forest with approximately twenty plantations built by the Chinese.¹⁸ Raffles¹⁹ came to negotiate with the Malay Sultan on trading rights and after the agreement was made successfully, he immediately set out for the new settlement, appointed the Town Committee in 1822 and instructed the basic land-use patterns. Raffles' idea was to make a clear separation between the government, commercial uses, Europeans, and different ethnic groups namely Arabs, Malays, Bugis, Javanese and Chinese, based on expediency and his belief that close integration of different ethnic groups may create conflict.²⁰ Many of Raffles' decisions were based on his experience in England and his knowledge of colonial India and as Edwards describes, "consideration of health, safety, and fear of native contamination all suggested proper separation of the European community from the Chinese and native quarter."²¹ Priority was given to the merchants and specific guidelines were given for building forms and materials, including shophouses which were the main type of buildings in Singapore until the 1960s.²²

Back-lanes: 'innovation in the war against disease' and its failure

The city was growing rapidly and on the surface life seemed pleasant and prosperous, especially for the Europeans and rich merchants living in suburbs, however Chinese people who made up 70 % of the population in 1901 lived in crowded, insanitary condition,²³ described by Yeoh as "subdivided tenements, makeshift cubicles and back-to-back shophouses."²⁴ Although the bottom line problem was a lack of adequate housing, instead of providing more

houses, the government focused on issues of overcrowding and lack of sanitation of those shophouses. Committee members came up with an idea to create back-lanes to bring light and air into congested dwelling areas²⁵. In 1906, a public health officer W. J. R. Simpson²⁶ was invited by the government as an 'outside and independent expert' to investigate the sanitary conditions and causes of high mortality in the city of Singapore.²⁷ Simpson pointed out the problem of those shophouses built back-to-back lacking multiple egress to allow for scavenging and drainage and recommended the creation of back lanes "not less than 15 feet, and not more than 20 feet wide for the purpose of scavenging and drainage."²⁸ Not only did he recommend stopping construction of new shophouses without back-lanes, but also demolishing rear of existing shophouses to create new back-lanes in existing neighbourhoods (Figure 4). He indicated five useful points that they: 1) facilitate drainage and scavenging; 2) add air space between the buildings; 3) prevent encroachments; 4) form alignment at the back; and 5) define the limits of the boundary of each plot.²⁹ The government considered it 'the latest spatial innovation in the war against disease (Figure 5), a spatial technique of combating 'the enemy' by using what Foucault calls 'power through transparency' or 'subjection through illumination'.³⁰ This operation would not only provide light to the residents but also to give authorities access to spaces which used to be private, hidden behind the public eye.

The law was passed and the government proposed the implementation of a total of 252 back-lanes between 1910 and 1947, mostly in Chinatown, Kampong Glam and Little India.³¹ However only 22 back-lanes were completed in 1918 and the government realized that this on-site, piecemeal solution could not solve the problem and the scheme failed, due to a number of reasons but cost being the major factor, for both compensation and construction.³² The residents also resisted this unrealistic idea forcing them to give up already tight living space while the authorities did not understand the local culture and customs in which they lived.³³ In 1927, the Singapore Improvement Trust was established to oversee various kinds of urban improvement schemes and gradually the back-lane scheme was abandoned and high-rise public housing projects eventually replaced the low-rise shophouse buildings.

Figure 6 (Right): Chong, Ho Kong, Eun, Valerie Lim Nyuk. *Back-lane as used by the residents.* [Singapore: s.n, 1992]

Back-lanes as ‘contested regions’ with informal negotiation

Although the back-lane scheme may not have been a good solution to the housing problem, a fascinating sociological phenomenon was observed as a result of implementing the scheme. Residents displayed a sense of territoriality, for example by leaving visual markers of ownership, fighting for their right to use the space as before, while a certain level of indifference was also observed as the spaces were exposed to unexpected vandalism (Figure 6). In response to various acts of ‘colonization’ by the residents, the authorities would then place visual markers such as yellow lines on the ground for parking lots or pillars at the entrance physically delineating the boundary of public and private. The residents could also display their territoriality by just giving hard stares at the ‘encroachers’ such as authorities or passers-by.³⁴ Although the back-lanes became a ‘contested region’ where residents and authorities struggled to gain control over one another, the authorities were not too fussy about how the residents used the space. The residents in Chinatown often informed each other of approaching officials to prepare themselves, while inspectors overlooked minor offenses as long as residents followed basic standards and kept the place clean.³⁵ This kind of mutually beneficial, informal deal kept them both happy and the place tidy. Aside from the territorial issue, the back-lanes possessed both qualities of public and private, an intermediate space providing quieter, slower and more intimate atmosphere compared to fast, busy and formal front streets, more enclosed with a sense of comfort and protection while not totally closed, allowing for random encounters with employees or family members who may step out for a break from their work or daily routines.

Analysis: commonalities and differences

Sanitation issue

Sanitation was a serious issue for both cities and back alleys were part of the solutions to this common issue. Both cities experienced difficulty managing increasing populations necessary to support the growing cities while providing decent housing and necessary infrastructure for them. Such problems happened in the areas where ethnic groups were living, Indians in the case of Yangon and Chinese in Singapore; their tenements were often extremely congested and insanitary with inadequate drainage systems. However, displacing those who worked in the central area to suburbs was not realistic thus such conditions were considered to be a ‘necessary evil’.³⁶

Montgomerie, though he was a surgeon, having served in the Town Committee in Singapore from the beginning of colonization in 1819 to 1842, came to Yangon in 1852. Maxim speculates that Montgomerie might have taken the waterfront design concept of Singapore and transplanted it directly to Yangon as Strand Road, considering the importance of creating visual impact at the arrival from the sea.³⁷ The authors speculate another possible linkage that Montgomerie who introduced the idea of BDS in Yangon could have been inspired after experiencing the early construction of the Chinatown in Singapore and its consequences with back-to-back shophouses in swampy areas.

Colonization of the alley, the ‘contested region’

Both alleys were used beyond their original functions, as a place of socialization or an extension of personal space as they shared a similar nature as an intermediary zone between public and private; this allowed residents to take their liberty and enjoy ‘colonizing’ the back alley. The case in Singapore showed how the residents and the authorities made an informal deal regarding the use of the space by ‘checking each other’ while the case in Yangon also revealed that a similar mechanism existed between the residents and the authorities.

Spatial segregation

When Raffles instructed the basic land allotment of Singapore, the intention was clear to segregate ethnic groups spatially to avoid conflicts while there was no indication of intended segregation in the original plan of Yangon, at least within the CBD. In Singapore, building guidelines were developed for those areas where Chinese merchants lived, and this led to the development of a specific colonial architectural style known as the shophouses.³⁸ In Yangon, spatial demarcation by ethnic groups was not directly indicated, however similar ethnic groups clustered together, creating designated areas within the city which can be recognized today, along with remaining architecture of distinctive characteristics such as row houses, Chinese temples, or mosques.³⁹

Modernization and the back alley

Looking at today’s back alleys in both cities, perhaps it is not possible to tell that one was planned and implemented from the beginning, while the other was not planned but implemented later, as a countermeasure to worsening

living conditions. Both alleys were used by residents as semi-private spaces at one point but took different paths thereafter. After the failure of the Back-lane scheme, many of the back-lanes in Singapore have disappeared together with the demolition of shophouses during the process of adapting a modern, high-rise housing scheme. However, starting in the late 1970s discussion about the conservation of historical districts began and in 1986, the Conservation Master Plan was announced and the central area became designated as a “Historic District.” Today’s Chinatown is one of the popular tourist attractions and the exotic feeling is enhanced by street cafés that are recreated to make the place feel more ‘original.’ The remaining shophouses and the attached back-lanes, though visually may be the same as before, have lost the original characteristics as a place for local people with dual functions for home and work. It has been transformed from being a place for ordinary people to a place for tourists.

Some fear that Chinatown in Singapore would eventually be reduced to a mere theme park, if not already. The big debate is whether the place should function as a residential or touristic landscape or both? Singapore Heritage Society argues that it should incorporate the residential community in order to keep the place alive and save the collective memory of the common people.⁴⁰

In Yangon, since their closure in the 1990s until recently, BDS were dirty and dangerous places, an eyesore to most people. Although many buildings were rebuilt in the 1990s, transforming the landscape drastically from low-rise to high-rise, BDS remained intact, perhaps due to the existence of the 140-year-old sewage system lying under most BDS in CBD. In Yangon one can still see the local people enjoying food from street vendors and casual tea meetings on the roadside or in the BDS, giving distinctive characters and liveliness to the place.

Conclusion

In this comparative study of the back alleys in two cities, the authors found that in both cases, despite divergent circumstances and development after independence, possess common traits as interstitial space between public and private. A unique way of spatial management based on informal, mutual agreements between residents and authorities seems to have existed in both cases, though further study with a comprehensive survey with various stakeholders is needed to verify the historical facts. The example of Singapore’s gentrified Chinatown today raised an important question, who should the place be made for? Further studies are needed to re-examine the meaning and the spatial value of the BDS and what kind of management strategy may be suitable for Yangon.

Acknowledgements

We would like to express our sincere gratitude to the residents and local authorities from Kyauktada, Lanmadaw and Pabedan Township, Myanmar students and the Social Enterprise Doh Eain for their support and cooperation in conducting interviews. The field survey was made possible by the opportunity provided by the Science and Technology Research partnership for Sustainable Development (SATREPS) program in Myanmar supported by the Japan Science and Technology Agency (JST) and Japan International Cooperation Agency (JICA).

- ¹⁷ Before conducting the semi-structured surveys, the authors conducted field surveys to understand the physical characteristics and spatial distribution of the BDS and then two questionnaire surveys with multiple choice were carried out, one in February 2017 to sixteen residents randomly selected by the authors in the neighborhood, another one in May 2017 to forty four households selected randomly from the list of residents of the 4th ward in Lanmadaw Township. Based on the experience and information acquired by these preliminary surveys, the interview questions were prepared and the authors conducted long, semi-structured interviews to a total of thirty two residents including the ward officers and parliamentary members in three Townships in the CBD namely Lanmadaw, Pabedan and Kyaukhada Township from July to August 2017. The summary and analysis of the survey is to be published in another paper due to space constraint therefore this paper illustrates main points from the findings. The subjects were selected by the community leaders, average age is fifty five years old, predominantly male, Buddhist (two females, six Muslims out of thirty two total subjects).

The application of city planning theory to industrial development in Japan – Another introduction process of garden city theory and neighborhood theory –

Shigeo Nakano (Osaka City Univ.)

The companies that operated factories were forced to deal with city planning and the housing policy integrally because providing workers with dwellings was as indispensable as developing other parts of a city infrastructure such as developing premises for factories and constructing roads. In a company town, above all, the task of constructing a company town was a major undertaking because there were scarcely any private companies that supplied workers with the large number of houses needed. In the following sections, this paper describes the history of housing policies that were closely linked with the planning of industrial cities by discussing the case of Kurabo Industries Ltd. (hereafter referred to as “Kurabo”) as a representative example of the spinning industry, and that of Hitachi, Ltd. as a representative example of heavy industry. This paper is intended to reorganize this information by adding newly unearthed facts and analyzing anew how housing measures devised by companies through the application of advanced city development theory should be positioned. The construction of company housing is important in respect to the efforts that a company makes to develop an industry and in that it has been planned integrally with city planning as development of an industrial infrastructure.

JAPANESE STUDENTS' STUDIES AT THE ÉCOLE CENTRALE DES ARTS ET MANUFACTURES IN PARIS IN THE 1870S AND ITS IMPACT ON URBAN PLANNING

Junne Kikata (Kagoshima University) and Ken Nakae (Graduate School of Engineering, Kobe University)

INTRODUCTION

In 1875, seven years after the Meiji Restoration (1868), the new government of Japan officially started dispatching students abroad with the hope of introducing advanced Western technical knowledge to the nation's development. With regard to the field of civil engineering (*doboku-kougaku*), it is a well-known fact that young elites were selected and sent to France to study at the *École Centrale des Arts et Manufactures* in Paris (hereafter ECAM) between 1876 and 1879. This study discusses the features of technical education at ECAM during that period and reconsiders its impact on the planning history of Japan through the practices of its students after their return. The main focus is on the lectures of professor *Émile Muller* (1823 ~ 1889) and the activities of his disciple *Hanroku Yamaguchi* (1858 ~ 1900)

SIGNIFICANCE OF ÉMILE MULLER'S INSTRUCTION

ECAM provided specialized courses on construction technology (including architecture and public works), which was a single, integrated course titled *Construction Civiles* in the school's foundation year of 1829. During the semester of 1877–78, when the Japanese students attended, the course *Construction Civiles* was taught by Muller as one of the divided courses along with *Travaux Publics* and *Éléments d'Architecture*. Muller is known as the architect of the workers' housing suburb of Mulhouse (*la cité ouvrière de Mulhouse*) and for his contribution to research on workers' housing. A Japanese student's hand-written notebook proves that Muller's planning concept of workers' housing was surely taught in his course. We consider that this was one of the earliest evidence of the direct introduction of planning ideas to Japan.

ECAM GRADUATES' CONTRIBUTION TO OSAKA'S INDUSTRIALIZATION

Yamaguchi pursued his internship at Muller's ceramic factory in Ivry after his graduation from ECAM. After returning to Japan, he first worked at the Ministry of Education (*Monbu-shō*), and then turned to private enterprises of industrial capital in Osaka. Yamaguchi finally drafted the plan for Osaka in 1899. It was an industrially oriented extension plan toward the New Osaka Port, which was to be supervised by his Paris colleagues: *Koi Furuichi* and *Tadao Okino*. This unrealized plan is considered to be one of the pioneering Japanese city plans, though it still requires contextualization, especially regarding the learning and practices of ECAM graduates.

DISCUSSION

It is important to recognize that in Japan's early Meiji era, Western industrialization was acquired from multiple sources (England, Holland, France, Germany, U.S., etc.) and driven by multilayered structures (public/private, central/regional, authorized/unauthorized). In the field of urban planning, the French track has not been considered to be a major and continuous part of learning although, as presented, it was surely the earliest introduction track of planning ideas and played an important part in the industrial development of Osaka, through consultations with ECAM graduates. ECAM's targeted education seems to be effective at this stage, though further discussion is needed on its historical impact with regard to its limitation.

Spatial-temporal evolution of modern urban industry in China from 1840 to 1949

Jie He (School of Architecture, Tianjin University) and Jing Liu (School of Architecture, Tianjin University)

The research team collects data of important typical factories and mines established in 1840-1949 to create a historical geographic information system (GIS) database of modern China urban industry. Purpose of this database is to support an integrated recognition on historical value of modern China urban industrial heritages. Through the GIS database, spatial statistics and analysis are operated to investigate the spatial-temporal evolution and distribution pattern of modern industry development in China. Analytical results shown that modern industrial classifications in China had been evolving and increasing gradually and affected by natural, institutional, traffic, ideological, market forces, capital, wars and other factors as a whole, while the dominant factors varied over time. In general, distribution of Chinese modern industry is in a north-to-south layout. The geographical mean centers of modern industrial development shifts from the north to the south, then to the west, and finally back to the east region during the study period. The analysis illustrates that distribution of factories and mines is in a positive spatial auto-correlation and agglomeration pattern. Among these centers, the most agglomerated cities, including Shenyang, Tianjin, Shanghai, Wuhan, Chongqing and Guangzhou, are also typical industrial cities where population gathered. The methodology and techniques applied can improve accuracy of extracting the entire spatial-temporal phenomena from abstract data and support better understanding through GIS data visualization. Furthermore, these new approaches also serve as supplement references as well as are able to testify traditional literature studies.

The application of city planning theory to industrial development in Japan

– Another introduction process of garden city and neighborhood theory –

Shigeo Nakano *

**Prof., Graduate school of human life science, Osaka City University, Ph.D. in urban and regional planning, nakano@osaka-cu.ac.jp*

The purpose of this paper is clearly the roots of garden city theory and neighborhood theory in Japanese company town, case study on Kurabo and Hitachi company housing plan. This paper is analyzing how housing measures devised by companies through the application of advanced city development theory should be positioned.

In conclusion, the historical positions of the two cases discussed in this paper in the overview of city planning history have been charted in this paper. The Kurashiki case indicates that Magosaburo Ohara developed a garden city theory from the concept of a company town like a workers' village expanded to a city as a whole. On the other hand, Yoshikazu Uchida, who introduced neighborhood theory to Katsuta. Although the two cases discussed in the paper were not authorized as official city plans, they are well established in the Japanese history of city planning as examples that involve garden city theory and neighborhood theory.

Keywords: Ohara Magosaburo, Uchida Yoshikazu, garden city, neighbourhood theory.

Introduction

“National wealth and military power” is the slogan under which Japan labored during the course of its efforts to become a modern nation. This journey started at the end of the First World War during the “special providence” period, during which Japan experienced an unprecedented economic boom—starting with the spinning industry and culminating in heavy industry—that propelled the nation down the road toward becoming an industrialized nation in the true sense of the word. Of particular note was the resulting phenomenon under which urban populations increased rapidly due to the influx of factory workers, an influx that created serious urban problems, especially in the six major cities of the time. In order to resolve these issues, the former City Planning Act was promulgated together with Urban Building Law on April 5, 1919. Along with these legal measures, Japan started implementing a housing policy that governed public housing and housing associations during the middle of the Taisho period (1912–1926) to prepare housing for factory workers. Although the City Planning Act and the housing policy intrinsically needed to proceed hand in hand, each was discussed and planned independently. As a result, Japanese city planning started without the vital issue of its fragile relationship with a government housing policy being resolved, which lead to housing shortages.

However, the companies that operated factories were forced to deal with city planning and the housing policy integrally because providing workers with dwellings was as indispensable as developing other parts of a city infrastructure such as developing premises for factories and constructing roads. In a company town, above all, the task of constructing a company town was a major undertaking because there were scarcely any private companies that supplied workers with the large number of houses needed. In the following sections, this paper describes the history of housing policies that were closely linked with the planning of industrial cities by discussing the case of Kurabo Industries Ltd. (hereafter referred to as “Kurabo”) as a representative example of the spinning industry, and that of Hitachi, Ltd. as a representative example of heavy industry.

The author has already published material detailing how Kurashiki, the home of Kurabo, innovatively introduced the garden city theory; and the case of Katsuta, where the Mito plant of Hitachi, Ltd. is located, that introduced the neighborhood theory progressively. This paper is intended to reorganize this information by adding newly unearthed facts and analyzing anew how housing measures devised by companies through the application of advanced city development theory should be positioned.

1. Garden city-type company housing constructed by Kurabo and Magosaburo Ohara

Kurabo Industries Ltd., founded on March 9, 1888, built the Kurashiki mill currently known as Kurashiki Ivy Square in 1889. The company employed female workers who lived in commutable suburban areas in its early days, but found itself suffering from a labor shortage as production increased. To remedy this, it acquired land adjacent to the mill and constructed dormitories to be used both for workplaces and living spaces in 1896. Each of the dormitories was designed to house a sizeable number of female workers in a large room. As depicted in the “Sad

Fig.1 Layout drawing of Kurabo Kurashiki factory (1928)
Collection of Kurabou memorial hall

Story of a Girl Factory Worker” (a non-fictional novel written by Wakizo Hosoi in 1925), they were defective from a sanitary point of view and, to nobody’s surprise, these insanitary conditions led to an outbreak of typhoid fever in 1906, for which the first president of Kurabo, Koshiro Ohara, was forced to take responsibility by resigning.

This was the background to Magosaburo Ohara’s inauguration as the second president of the company. He initiated a thorough makeover of the dormitories and started the construction of 76 “family-like” dormitory buildings in 1908 (Fig.1). Each one of the 76 buildings was a small dormitory consisting of four rooms, and female workers lived in each room like a family. Each building was sited parallel to the next from the viewpoint of sanitation and receiving daylight, and flowerbeds were planted between the buildings so that the female workers could enjoy gardening. Ohara calculated that the improvements made to the dormitories would pay for themselves because they would enable female workers to work for a longer period of time and because they allowed his company to develop skilled workers, which would lead to higher production efficiency, although doing so required a high initial investment to cover the high construction costs.

Toward the end of the Meiji period (1868–1912), Ohara planned to construct the Masu mill (currently Mitsui Outlet Park Kurashiki) in order to expand the company. A vast area of land adjacent to the north side of Kurashiki Station was chosen for the easy access it would provide to railway transportation, and construction was completed in 1915. At the same time, Ohara set up a human resources study group and conducted research on methods of employing workers. In those days, it was general practice to employ migrant female workers in the spinning industry. Ohara’s research made it clear that constructing company houses where workers could live with their family members would permit them to work after getting married, and enable the company to develop many more skilled workers. Responding to the research results, a company town called “garden city company housing” was planned for the Masu mill. A garden city-type company house was a small one-story house with a floor space of about 10-tsubo (33 square meters), and 440 units in 110 buildings were completed by July 1915. Each house had a vegetable garden to let residents get friendly with the soil, and was the earliest example of company housing with a vegetable garden.

What is noteworthy is why the catchphrase “garden city,” often used for suburban housing, was used for company housing. As is well known, the concept of “garden city” was advocated by Ebenezer Howard. It is a famous planning theory that spread throughout the world together with the concept of “garden suburb.” However, Howard’s garden city concept—without any modifications—was not introduced to Japan until the end of the Meiji period. “Garden City,” published by volunteers of a local bureau of the Home Ministry in 1907, was the first Japanese book to introduce the concept of “garden city.” However, this book was written by summarizing not Howard’s original book “Garden City of To-Morrow” but “Garden Cities in Theory and Practice” written by Alfred Richard Sennett. What should be noted here is the fact that the garden city imagined in Sennett’s book was an industrial village like Bournville or Port Sunlight.

A recent survey has revealed that “Garden City” was in Ohara’s library, and it is not difficult to imagine Ohara thinking about industrial cities in foreign countries with this book in his hand. Ohara organized Sunday lectures to improve the civic culture of Kurashiki, and he invited Tokiyoshi Yokoi, a professor at Tokyo Imperial University, to the 58th lecture, which was held in August 1910, and Yokoi was quick to order a copy of Howard’s book. While Howard’s garden city theory is a “measure to make a city a rural area,” Yokoi thought that it was important to import the taste of the city into rural areas.” Kosuke Tomeoka, from Takahashi City in Okayama Prefecture, was invited to the 59th lecture. Although Tomeoka is now known as the pioneer of social welfare, he worked as a part-

time employee of a local bureau of the Home Ministry when “Garden City” was published. He was extremely interested in Sennett’s book, “Garden cities in Theory and Practice”, which was listed in the bibliography, and it was he who asked the Home Ministry to order a copy of Sennett’s book.

In the manner described above, Ohara became very interested in garden city theory through books and lectures, so it was a natural consequence for him to want to apply garden city theory to his company housing. In his book “Birth of City Planning,” Shunichi Watanabe points out that garden city theorists back in those days uniformly placed emphasis on improving agriculture, and this was a very attractive planning theory for Ohara, who operated a business in the rural area of Kurashiki. Even although he mistook Sennett’s intended vision, the “garden city-type company housing” constructed together with the Masu mill is positioned as the first case in which garden city theory was materialized in Japan.

However, the policy of letting workers live in company houses with their family members was abandoned in the midst of excessive competition. In the

course of time, dormitories were repeatedly improved until they finally became very similar to standard apartments. Kazue Yakushiji, who was an architect and then an architectural adviser to Kurabo, visited young Charles Edouard Jeanneret-Gris abroad and collected information from him. Charles Edouard Jeanneret-Gris, commonly known as Le Corbusier, was a European architect and urban planner and one of the pioneers of what is now called “modern architecture.” (In fact, Yakushiji is reportedly the first Japanese to have met Corbusier.) While Ohara maintained his position of improving housing for female employees, he was not able to go against the current of the times.

Against this background, Ohara was forced to compromise on his philosophy of garden city-like company housing, but the author believes that the image created by the phrase “garden city” lived on in Kurashiki for the reasons listed below. Ohara, the person who introduced the garden city theory to Kurashiki, became involved in city planning for Kurashiki as a whole as part of the industrial development of Kurashiki during the latter half of the Taisho period (1912–1926). He was inaugurated as a member of the Road Committee and engaged in suburban development by founding his own company, and he then promoted road improvements and urban reform by donating a large sum of money. Ohara contacted Rintaro Naoki, who was then manager of the City Planning Division of Osaka, and asked him to construct an industrial city centered on Kurashiki. Naoki went abroad immediately before he addressed Kurabo’s industrial city plan and visited the First Garden City, Letchworth, officially Letchworth Garden City, in Hertfordshire, England under Howard’s guidance and was impressed with it. Naoki was contacted by Ohara immediately after he returned to Japan. The whereabouts of the design for the road plan and the written statement that Naoki submitted to the Kurashiki Council in January 1923 remain unknown, but it can well be presumed that he tried to apply what he had seen in Letchworth to Kurashiki, which was to construct an industrial village that had space for both work and life with due consideration paid to Ohara’s wishes. What the author wishes to introduce as collateral evidence for this assumption is a section in “Reading of Garden City” that summarized the lectures given by Hideaki Ishikawa (Fig.3). Ishikawa visited Kurashiki in the early days of the Showa period (1926–1989) after the series of industrial developments planned by Ohara had been completed, and he made the following comments upon comparing Kurashiki and Letchworth:

Fig.2 Layout drawing of Kurabo Masu factory (1928)

Collection of Kurabou memorial hall

“Probably, everyone involved in city planning in Japan presumed that Kurashiki should be the place to construct a garden city or city based on the garden city concept in Japan.”

“What is interesting is that Kurashiki adopted the radiation and circulation system for its road networks as Letchworth did (Actually the system in Kurashiki is better than the one in Letchworth in terms of height). Kurashiki’s city center had five radial lines that intersect each other, although it did not have 12 radial lines as Letchworth did.

Comparing the two cities solely by their maps indicates that Kurashiki’s organization is the spitting image of Letchworth, including the factory location.”

As described above, what impressed Hideaki Ishikawa—who actually visited Kurashiki and walked around the town—was the radiation- and circulation-type road network, which was similar to that in Letchworth.

Fig.3 Hideaki Ishikawa (1931) Reading of Garden city Collection of Kurashiki central library

2. Industrial development by Hitachi, Ltd. and the housing plan of Yoshikazu Uchida

Hitachi, Ltd., which became independent of Hitachi Mining in 1920, expanded its business in the northern part of Ibaraki Prefecture, starting at Hitachi and later embracing the towns of Katsuta and Takahagi, and built an industrial area referred to as the “Hitachi Kingdom” prior to the Second World War during the Showa period (1926–1989). What drove the expansion was the growing military demand during the war, and Hitachi’s industrial development was strongly promoted hand-in-hand with the national policy as represented by the new concept of industrial city planning.

Hitachi City, which is Hitachi’s home, did not place much importance on city planning prior to the war. Newspapers of the day lamented the situation that houses for workers were being constructed in a disorderly manner within the city and that road construction was one step behind. Hitachi made donations to promote civil engineering and help the construction industry remedy the lamentable infrastructure, but this failed to achieve the expected results by means of renovating the existing urban district. In light of this bitter experience in Hitachi City, Hitachi subsequently placed a stronger emphasis on city planning as a way to improve the industrial infrastructure. In 1939, a project to construct a new industrial city was planned as a national policy when the Taga plant (currently Hitachi City) was constructed anew, and a semicircular urban district was constructed thanks to a donation from Hitachi and a subsidy from the central government. Following the construction of Hitachi City, the construction of an industrial city was planned in Katsuta.

It was Yoshikazu Uchida, a professor of Tokyo Imperial University, who actually addressed the industrial city plan for Katsuta. Uchida had already drawn up several housing plans for Hitachi, Ltd. in partnership with his colleague Etsusaburo Ichimasu, and his students Eika Takayama and Yoshifumi Uchida. For Ouse and Hanayama, company districts were constructed basically as planned (Fig.4). Hitachi asked Uchida to devise a plan because it thought it was necessary to draw up an industrial plan that covered the neighborhood areas instead of a housing plan limited to company housing as it had done before.

Fig.4 Ouse company houses, Hitachi Ltd. Collection of Tokyo Metropolitan Archives, Document of Uchida Yoshikazu

In November 1939, Uchida visited Katsuta with his son Yoshifumi and completed the initial plan the following year (Fig.6). With some modifications, the plan was finalized by March 1940 (Fig.7).

According to Uchida’s recollection, he drew up the plan for Katsuta by making reference to Stadt des KdF-Wagens bei Fallersleben (currently Volkswagen’s company town of Wolfsburg, as designed by Peter Koller)(Fig.5). Comparing Katsuta’s industrial city planning with the plan drawing of KdF-Wagens reveals that these two plans share the same basic city organization, such as the arrangement of factories and stations and the double radial belt line. The design details show that planning units were set up to make it possible to construct housing areas in stages. The first housing area was designed to accommodate 10,000 people (having been increased from the original 8,000), with green areas to separate roadways from sidewalks. The plan for the arrangement of houses was partly based on a plan from Harvard University contained in “Samples of Division of Residential Lot in Foreign Countries,” which was edited by Uchida and summarized by Takayama. In short, Katsuta’s industrial city planning was created with reference to housing area planning in Western countries. In particular, in view of the fact that the idea of a planning unit and the separation of roadways and sidewalks were incorporated in the planning, it can well be imaged that Katsuta’s plan was more or less affected by the “neighboring housing theory” as advocated by Clarence Perry.

Fig.5 Peter Koller (1939) “Die Stadt des Kdf-Wagens”, “Die Kunst im Dritten Reich” vol.3 Collection of Tokyo Metropolitan Archives, Document of Uchida yoshikazu

Fig.7 The final plan of Katsuta Industrial city designed by Uchida Yoshikazu
Collection of Tokyo Metropolitan Archives, Document of Uchida Yoshikazu

Fig.8 Katsuta legal city plan of land readjustment instituted by Ibaraki city planning council
Collection of Ibaraki Prefecture Archives

Here, the trends of Uchida in neighborhood theory are organized. As is well known, he created a magnificent city and village plan by applying neighborhood theory in Datong under the colonial regime in 1938, one year before he addressed the industrial city planning of Katsuta. As Uchida introduced the details himself in “Journal of Architecture and Building Science,” he applied the neighborhood planning of Detroit—included in “Samples of Divisions of Residential Lot in Foreign Countries”—to his housing arrangement plan that laid out the configuration of the planning units. He conducted a series of research and study projects for the Housing Problem Committee of the Architecture Institute of Japan beginning in June 1939 and the Architecture Division of the Japan Life and Culture Academic Society beginning in March 1942, and made proposals on planning units by bringing together outstanding members in the field of city planning for housing planning. The author presumes that these discussions were very important in the sense that they became the original models of planning standards for war-damage reconstruction and that they became the original model of neighborhood theory because they were applied to the theory of new town development. The industrial city planning for Katsuta was not released due to various

reasons, but it can be positioned as the first example of the implementation of a residential neighborhood in Japan apart from the innovative approaches made by the GHQ. However, Uchida's industrial city planning was not realized as originally planned, and only part of the company town was constructed in accordance with block planning.

The draft of the official city plan for Katsuta was concluded by the end of 1941, indicating that it was evaluated highly as a model case of industrial city planning, despite the fact that Katsuta was not designated as a new industrial city in the first collection of the "research report of housing conditions." In Katsuta, the project started with the construction of major city streets, but the base of new city construction was the land readjustment project that was planned and decided in November 1943.

The "Map of Lot Adjustment of Area Subject to City Planning in Katsuta" (Fig.8) shows that it obviously does not agree with the industrial city plan created by Uchida. However, it shows that green areas were laid out everywhere inside the area and that planning units were set up by encircling the residential area. This was explained in a discussion by the local Ibaraki committee of city planning with the comment, "Each area is regarded as a neighborhood unit for an elementary school zone for between 8,000 and 10,000 people," indicating that a school zone was used as a neighborhood unit. The residential neighborhood for a population between 8,000 and 10,000 people is exactly the same planning unit as used in residential neighborhoods today. In addition, the comment, "The plan was to construct a garden city by encircling it with a green area comprising paddy fields and mountain forests" indicates that the city planned to encircle the garden city with a green belt as a garden city does. Thus, a city-planning map that merges garden city theory and neighborhood theory can be said to be the goal in city planning prior to the Second World War.

In Katsuta, which secured wide parks and green areas in this way, the ratio of parks to lot area is set higher than 5% and that of green spaces to lot area is set higher than 15%. These two figures were much higher than the standards set by the Home Ministry in "Guidelines on the Construction of a New Industrial City" (each of the ratios of parks and green spaces is set higher than 5%). The guidelines clearly state that an urban district should be divided into lots, each of which is about 1 square kilometer, by a wide street, water channel, banking, railway, park, green area, etc., and an elementary school and a market should be constructed to establish a neighborhood unit for the daily lives of citizens. They are probably the planning standards in which the concept of a residential neighborhood appeared for the first time, and they were set at a higher level than the planning standards for land readjustment.

As discussed above, only a small part of Uchida's industrial city plan was incorporated in the arrangement plan for a company town, and it was not reflected directly in the official city planning. Nonetheless, it can be said that the series of plans in Katsuta during the war were basically devised under the influence of a neighborhood theory.

Conclusion

Garden city theory and neighborhood theory can be said to be theories known to everyone involved in city planning. The first cases discussed in the textbooks for those who specializes city planning are Den-en-Chofu for garden city theory and Senri New Town for neighborhood theory. Both garden city theory and neighborhood theory are already well established as planning theories indispensable to the development of new towns and residential suburbs. In contrast, the innovative approaches to garden city theory and neighborhood theory in industrial cities discussed in this paper are scarcely known. This is probably because mistaken visions were implemented without any change, and because the two approaches have not been particularly well documented, and were realized only in part. However, the fact remains that industrial development by a company is not particularly significant in the history of city planning as it is intrinsically classified as an academic field for the public because city planning as industrial development by a company is considered to be an investment by a private company. The construction of company housing is important in respect to the efforts that a company makes to develop an industry and in that it has been planned integrally with city planning as development of an industrial infrastructure. This contrasts with an official city plan implemented independently of a housing policy. It deserves special mention that industrial city planning by companies introduced advanced planning theory from abroad—ahead of public city planning—in the development process. Although the two cases discussed in the paper were not authorized as official city plans, they are well established in the Japanese history of city planning as examples that involve garden city theory and neighborhood theory.

In conclusion, the historical positions of the two cases discussed in this paper in the overview of city planning history have been charted in this paper. The Kurashiki case indicates that Magosaburo Ohara developed a garden city theory from the concept of a company town like a workers' village expanded to a city as a whole, although this is only a presumption based on collateral evidence. This agrees with the acceptance process of the garden city theory in Japan. The image of an industrial village when it spread to Japan during the end of the Meiji period (1868–1912) gradually prevailed as the planning theory for residential suburbs. It was Den-en-Chofu being constructed on a full scale that made the concept of a garden city widely known. Of course, it goes without saying that garden city theory was originally a planning theory for an entire city and should not have been applied only to the development of a residential suburb. Ohara's industrial city planning, aiming to construct a city for both

work and life during the middle of the Taisho period, was not intended to construct a garden city, but it has gone down in history as constructing a city to realize the idea of offering a site for work and life, and has been evaluated as being closest to the garden city envisaged by Hideaki Ishikawa. If so, Kurashiki should be regarded as the original garden city in Japan. However, the idea of developing an entire city into a garden city did not spread substantially in Japan, and the image of developing residential suburbs full of greenery was established as a catchphrase. As a result, Ohara's approach to garden city theory fell into oblivion as a barren flower.

On the other hand, Yoshikazu Uchida, who introduced neighborhood theory to Katsuta, discussed specific figures for a residential neighborhood in the Housing Problem Committee and the Japan Life and Culture Academic Society. Goro Ito, who was a member of Uchida's study group, promoted the construction of new industrial cities in the Home Ministry and presumably drafted "Guidelines on the Construction of a New Industrial City." As a result, the concept of a residential neighborhood was incorporated into planning standards. After the end of the Second World War, the Architectural Institute of Japan submitted "Proposal on City Planning and Housing Measures in the Post-War Period" to the prime minister and the War Damage Reconstruction Institute. The Proposal talked about the control of large cities and the industrialization of local areas, and wrote about "Organizing borders between living areas by setting up a residential neighborhood" as a specific proposal. This specific proposal was taken into account for war-damage reconstruction. It is clear that the specific planning standards of war-damage reconstruction was rooted in the research on residential neighborhoods that Uchida and his colleagues conducted during the war. That is, the planning unit of a residential neighborhood was recognized as the basic standard, while the postwar period inherited the contents of city planning developed during the war. Katsuta was merely a case of applying the cases of residential neighborhood implemented by Datong City Plan, but it can be positioned as the starting line from which neighborhood theory spread and became established substantially in postwar Japan.

Japanese Students' Studies at the École Centrale des Arts et Manufactures in Paris in the 1870s and its Impact on Urban Planning

Junne Kikata*, Ken Nakae**

* *Ph.D., Department of Architecture, Kagoshima University, kikata@aae.kagoshima-u.ac.jp*

** *D. Eng., Department of Architecture, Kobe University, nakae@kobe-u.ac.jp*

Between 1876 and 1879, young Japanese elites in the field of construction were selected by the government and sent to France to study at the École Centrale des Arts et Manufactures in Paris (hereafter ÉCAM). This study discusses the features of technical education at ÉCAM during that period and reconsiders its impact on the planning history of Japan through the practices of its students after their return. It focuses on the activities of Hanroku Yamaguchi (1858-1900) who finally drafted the Plan for Ōsaka in 1899, unrealized but one of the pioneering Japanese city plans. The Plan was strongly associated with public works which was to be supervised by his Paris colleagues—Kōi Furuichi and Tadao Okino—and with his practice on industrial buildings in Ōsaka. Its distinguished feature was industry-oriented design associated with his learning in France. Moreover, this paper discusses the limitations and scope of the transmission and localization of planning ideas.

Keywords: Japan, Ōsaka, École Centrale des Arts et Manufactures, industrial village, extension plan

Introduction

It is important to recognize that in the early Meiji era (1868-1890s), Japan underwent Western industrialization influenced by multiple sources (England, Holland, France, Germany, the U.S., etc.) and this development was driven by multi-layered structures (public/private, central/regional, authorized/unauthorized). This gives rise to the question whether this involved the transmission of urban planning ideas. If yes, a selection process must have been adopted (consciously or unconsciously) since these countries had different planning traditions. Stephen Ward identified three major concerns regarding the international diffusion of planning and proposed a typology of diffusion¹. Ward identified early twentieth-century Japan's case as an example of 'undiluted borrowing'. Recognizing the context, 'the rapid modernization of Japan from the later nineteenth century, which encouraged a fairly systematic trawling of the advanced Western countries for progressive practices which could be adopted', Ward noted that 'the possibilities of conscious selection or synthesis were quite limited', and pointed that 'Japanese planners...had always looked to the West as a whole'. Although we appreciate this important recognition of the general tendency of the Japanese understanding of the West, we think that it is still important to study specific cases, especially in the early phase, and analyse the limitations of the planning and the reasons they generated historical results as summarized by Ward.

On the other hand, in our previous study, we demonstrated that the Western concept of the industrial village had been accepted in various contexts in Japan². The analysis of business travels, which increased rapidly in the 1890s, suggested that these trips enabled Japanese businesses to assimilate concepts and practical information concerning Western industrial villages. Interestingly, several related practices of industrial development emerged in Japan at the turn of the twentieth century. Simultaneously, the Garden City concept also emerged with the first publication of Ebenezer Howard's *To-morrow* in 1898. The concept of the industrial village was thus acquired from multiple sources by the private business sector on their own initiative.

Japanese Students of the École Centrale des Arts et Manufactures (ÉCAM) in Paris in the 1870s

This paper focuses on the Japanese students who studied at ÉCAM in Paris, between 1876 and 1879. The historical importance of their study is already well known, since the dispatch of Kōi Furuichi (1854-1934), Tadao Okino (1854-1921), and Hanroku Yamaguchi (1858-1900) was the first organized dispatch of students overseas by Monbu-shō (Ministry of Education) of Japan in this field, after the reformation of their scholarship policy. Moreover, because of the fame they achieved after their contribution to the development of 'Doboku Kougaku' (civil engineering/public works)³, the Japan Society of Civil Engineering conducted substantial studies on Furuichi's and Okino's works⁴. Although these studies focused on their work in specific fields, they are helpful to understand the whole picture of their learning and career.

Comparatively speaking, studies on Yamaguchi are quite fragmentary, although he is the most important person in relation to the planning as he drafted the Plan for Ōsaka in 1899. Since the 1980s, the Plan for Ōsaka has been addressed by several authors, for example, Tamaoki (1979)⁵; Miwa (1989)⁶, who tried to establish Yamaguchi as the originator of Ōsaka's planning; Hori (1992), who briefly introduced Yamaguchi as 'the first architect and planner in Japan'⁷; the Planning Bureau of Ōsaka City (1989)⁸ and Nishikawa et al. (1989)⁹, who mainly focused on street planning; and Arai and Ozawa (2014), who focused only on park planning¹⁰. The most precise understanding was obtained by Y. Ishida (2001)¹¹, who recognized the importance of Yamaguchi's learning in France and the context, Ōsaka's industrialization, but it lacks actual proof. Further, the Plan for Ōsaka drafted in 1899 has also been introduced in foreign languages¹², though, as Fouquet (2013) commented, shortage of works written in French hinders accurate discussion¹³.

One important reason for the general lack of studies on Yamaguchi is his illness and death at the young age of 42. This obviously shortened his career and limited his output (practices and writings), as well as hindered the attempts of later generations to completely understand his work. Moreover, his achievements during his illness were relatively underestimated. Another important reason for this lack is probably that some authors emphasized his status as 'the first architect in Japan'¹⁴. Although partly true, this preconception led to the fragmentation of existing studies. Yamaguchi's works on school buildings during his career at Monbushō Eizen Ka (the Construction Department of the Ministry of Education)¹⁵, and his last and most spectacular work of Hyogo Prefectural Office have been highly appreciated; however, his simple works—industrial buildings of factories in the Kansai area—have not been given enough attention. A comprehensive study on Western-style architecture in the Kansai area by J. Ishida (1996)¹⁶ placed Yamaguchi's contribution in historical context, though it also did not focus on industrial buildings such as factories.

Nevertheless, with regard to understanding the learning of Japanese students, including Yamaguchi, at ÉCAM, such works of industrial buildings are important as they more suitably reflect their learning at ÉCAM. Horiuchi's case study (2003) accurately observed and discussed the practical education in France obtained by Yamaguchi and Katsutarō Inabata, the founder of Muslin Mill Co. Ltd., and their collaboration in Ōsaka¹⁷.

Significance of Émile Muller's Teaching at ÉCAM

ÉCAM was founded in 1829. It introduced new theoretical and methodological principles of education in response to the drastic change in social and economic circumstances due to industrialization in France, particularly, the nature of building programs¹⁸. This can be briefly described as the 'invention of Industrial Sciences (Sciences Industrielles)', as the interface between basic principles and industrial practice¹⁹. In the construction field, ÉCAM provided specialized courses on construction technology (including architecture and public works), which was a single, integrated course titled 'Construction Civiles' in the school's foundation year. During the 1877-78 semester, when the Japanese students were at ÉCAM, 'Construction Civiles' was taught by Professor Émile Muller (1823-1889), along with 'Travaux Publics' taught by Antoine Boutiller (1828-1918) and 'Éléments d'Architecture' taught by René Demimuid (1835-1881).

Muller is known as the architect of the workers' housing suburb of Mulhouse (la cité ouvrière de Mulhouse). Its construction started in 1853, and it is regarded as one of the earliest examples of industry-oriented housing development in France. He is also recognized for his contribution to research on workers' housing such as *Les Habitations Ouvrières En Tous Pays: Situation En 1878, Avenir (Workers' Housing in All Countries: Situation in 1878, Future)*²⁰, co-written by Émile Cacheux, an ÉCAM graduate. This book included an international comparison of workers' housing and received an award in the world exposition of 1878. Moreover, he is known as an entrepreneur, the founder of la Grande Tuilerie d'Ivry (the Grand Tile Factory of Ivry) located in Ivry-sur-Seine in the outskirts of Paris at the Seine riverfront²¹. Importantly, Yamaguchi did his apprenticeship at Muller's factory in Ivry in 1880 after his graduation from ÉCAM. One of Yamaguchi's ÉCAM classmates, Tadao Okino, in his biographical introduction of Yamaguchi, states that 'Yamaguchi learned the methods of tile and architectural terra-cotta production under Muller's kind instruction'²².

Muller was a typical reformist engineer who was deeply committed to the social and economic issues of construction. His character is reflected in his commitment to workers' housing and his role in the increasing use of ceramic, motivated by the invention of economic but durable architectural materials to replace stone, the limited natural resource that also has faults. Moreover, he was regarded as a reformer of education at ÉCAM. In 1846, Muller was appointed as the professor of 'Construction Civiles', as the first graduate of the school. Before Muller, former professors of 'Construction Civiles', including Charles Mary (1791-1870), were all from École Polytechnique, known for its highly theoretical education. Muller was considered a model civil engineer, as imagined by ÉCAM's founders, and a social and industrial reformer²³.

Contents of Émile Muller's Course 'Construction Civiles'

The detailed educational contents of ÉCAM can be known today, thanks to the richness of the Archive of l'École Central of Arts and Manufactures²⁴. Even in Japan, we can understand it partly through Kōi Furuichi's handwritten notebook and textbooks preserved at Furuichi Bunko (Kōi Furuichi Archives) of the University of Tokyo²⁵. We consulted Furuichi's notebooks and textbooks on three courses related to construction engineering, especially on the course 'Construction Civiles' taught by Muller, and were able to understand the entire contents. 'Construction Civiles' includes fifty-two lessons, which were taught between 3 September 1877 and 11 May 1878. By referring to Furuichi's notebooks and a historical record of the school, we confirmed that Muller's course included the following contents: *étude des matériaux de construction* (study on construction materials), *charpente* (structural framework), *éléments d'architecture et historique* (architectural elements and history), *étude des locaux d'habitation et des locaux d'industriels* (housing and industrial premises), *hygiène de l'habitation* (hygiene of housing), and *direction des chantiers, devis, cahier des charges*, etc. (direction of construction site, estimation, specification documents, etc.)²⁶.

The first chapter on construction materials started by introducing the physical characteristics of stone, describing its faults, including frost damage (*gélivité*). The materials included mortar, glass, ceramic, wood, paint, plating, etc., and their physical and chemical characteristics, as well as usage, were described. The next chapter on structural framework dealt with wood, steel, and mixed structures, which were explained with examples of traditional and contemporary architecture. The chapter on architectural elements explained the architectural principle with three keywords: *de la solidité* (solidity), *de la commodité* (commodity), and *de la beauté* (beauty). About beauty, Muller stated that 'There is no law or precept to give on the subject of what constitutes beauty. The base of the art is truth'²⁷.

These contents are important when considering the impact of Muller's architectural education on the Japanese students, although regarding planning, the following chapters are more important. The chapter on housing and industrial premises dealt with the following types of facilities: warehouse, dock, spinning mill, textile mill, public bath and wash-house, hospital and hospice, housing, and workers' housing. This clearly shows that Muller's course was industry-oriented. Each building program was explained with numerical evidence, with a notification saying 'one has to consider the economic side'²⁸. Regarding housing, Muller commented that 'the history of housing... gives an idea of each period's civilization'²⁹. On workers' housing, Muller explained the rise of this issue from the 1850s; *Cité ouvrières* (Workers' City) had produced a unique impact. Muller described the impossibility of Workers' City in a big city; however, he indicated that it could achieve success in a provincial city and stated that 'the first idea is to give back the workers their own (house), and this institution acted on the moral situation of the workers'³⁰. Finally, he referred to the Workers' City of Mulhouse.

Here, we can confirm that Muller's planning concept for workers' housing was surely taught in his course. This is probably one of the earliest evidence of the direct introduction of planning ideas for workers' housing.

Influence of Émile Muller's Course on Yamaguchi's Industrial Buildings

Yamaguchi returned to work in the Kansai area in 1894 as an associate at Kuwahara Engineering Office in Ōsaka, which was an association of seven university graduates, Kouno, Fujii, Yamaguchi, Oka, and others. They specialized in architecture, railways, mining, machinery, and were the leading figures in each fields. The office looked 'like a complete advisor of the industrial world of West Japan'³¹. Eleven projects, after 1894, were listed as part of Yamaguchi's works, edited by Tadao Okino in his biographical account of Yamaguchi (**Table 1**). Among them, only Hyogo Prefectural Office is a public building; others are private office buildings or industrial buildings. This paper focuses on three factories in Ōsaka and considers the influence of Muller's course on Yamaguchi's works.

- Nihon Seitō Kabushiki Gaisha (Japan Sugar Refining Co. Ltd., completed in 1898)

The factory of Nihon Seitō was located in the north of Ōsaka on the Yodogawa riverfront. Yamaguchi designed the 1,980-square-meter factory building, constructed with steel-framed brick walls. The Period Reports of Nihon Seitō clarifies the factory construction process and the circumstances of Kuwahara Office's participation in building design, namely, Yamaguchi's participation. The company selected a refining machine for purchase based on the documents and drawings sent from Europe, and finally, when the machine was ordered, Yamaguchi designed the factory building referring to the machine drawings³². Yamaguchi had learnt factory design at ÉCAM in Muller's course and through practices outside of school. In addition, he had also learnt about machinery. The task of building this factory shows how Yamaguchi's learning suited actual practice.

Figure 1 shows the resemblance between Nihon Seitō factory building and a cross-section drawing of an existing factory building in Paris from Mullers’ educational materials (*Croquis de Cours des Constructions Civiles*). This is a visible example of the reflection of Yamaguchi’s learning in France, especially from Muller’s course, in his works.

Figure 1: Comparison between the appearance of the Nihon Seitō factory (left) and a drawing from Muller’s educational materials (right)

• Kishaseizō Kabushiki Gaisha (Locomotive Manufacturing Co. Ltd., completed in 1897)

The Kishaseizō factory was located in the west of Ōsaka on the Ajigawa riverfront, next to Nishinari Railways’ Ajigawa Station in the northwest, on 66,000 square meters of land donated by Mr Kichiemon Sumitomo. Of this, 33,000 square meters was designated for the headquarters and factory site. Yamaguchi designed the 330-square-meter main office building, a two-story brick structure, including a granite quoin, arch, and cornice. This building no longer exists, although it survived until the 1980s. It was a simple but stylish building with arched windows. Not much is known about this small building now, so we did not examine it in detail, though we think this architectural design deserves further consideration regarding the design theory taught by Muller.

• Mosulin Bōshoku Kabusiki Gaisha (Muslin Mill Co. Ltd., completed in 1900)

The Muslin Mill factory was located in the north of Ōsaka in front of a newly developed drainage canal (today's Shin Yodogawa). It was founded by Katsutarō Inabata, who was dispatched to France by the Kyoto Prefectural government and studied textile, dyeing, and applied chemistry in Lyon. A previous study by Tatsuo Horiuchi examines the significance of his career in relation to that of Yamaguchi³³. Here, we focus on buildings and their programs. Yamaguchi's Architectural Works listed in *Yamaguchi Hakushi Kenchiku Zushū* reported that Yamaguchi designed more than 13,530 square meters of one-story brick factory buildings. More exactly, there were 11659.6 square meters of brick factory buildings, and 3985.7 square meters of wooden annexes (including housing, welfare facilities); a total of 15645.3 square meters³⁴. The numbers do not match perfectly, though we proceed our discussion with the assumption that Yamaguchi coordinated all construction work³⁵.

Figure 2: Aerial view of the Muslin Mill Ōsaka Factory

Figure 3: A drawing from Muller's educational materials showing a 'filature' (textile mill)

The factory building was a typical textile mill construction taught in Muller's course (Figures 2, 3). The substantial buildings of housing and welfare facilities are of more interest. There were five two-story buildings for workers'

housing (Figure 4). Reportedly, there were more than 100 rooms of approximately 20 square meters on the ground and first floors for female workers' accommodation³⁶. These and other welfare facilities were connected by covered corridors, equipped with lavatories with hot and cold water³⁷. There were large dining rooms, 14.4 m wide and 61.2 m deep, of wooden truss structure³⁸. Moreover, there were apparently various shops and kiosks which were 'extremely convenient, as if a town is condensed here'³⁹. In addition, there was a company hospital and a cattle farm and aviary (Figure 5). Milk and eggs from the cattle farm and aviary were provided to the hospital for patients' nourishment⁴⁰.

Figure 4: Workers' housing of the Muslin Mill

Figure 5: Hospital (left), and cattle farm and aviary (right) of the Muslin Mill

These welfare facilities, responsible for the complete care of workers' life and health, were a typically paternalistic way of managing a factory. Notably, this system was developed by Inabata and Yamaguchi, both trained in France. Undoubtedly, they were both aware of the same kind of existing European practices. Yamaguchi, especially, had surely learnt how to plan workers' housing in Muller's course, although the concept of Muslin Mill's housing and welfare facilities was quite different from that of Muller's Workers' City of Mulhouse. The latter aimed to make workers' families independent by giving them land and house as a reward for their diligence, which made it innovative. As we confirmed earlier, the Japanese students, including Yamaguchi, were surely taught this in Muller's course. Conversely, Muslin Mill's facilities were almost the opposite, as they aimed at offering full patronage to the workers. These two places targeted different workers—Muslin Mill's target was only young, single female workers from the countryside—which can be considered the reason for this difference or for the rejection of the Mulhouse system in Muslin Mill. In any case, it is an important question regarding the impact of learning from Muller's course.

The Plan for Ōsaka in 1899

Regarding Ōsaka, major issues related to public works since the 1870s have been discussed; for example, the improvement of Yodogawa river, which carried large quantities of sand from an upper stream that originated in the Kyoto region. Another issue was the development of a new Ōsaka Port, historically located at the mouth of Yodogawa river, and which was facing problems due to dredge works before encountering a new challenge—the rise of Kobe Port from 1868, located in the same region and designated as a new open-port by the former Japanese government. Moreover, the flood of Yodogawa river in 1885 spurred the public authority to take concrete measures. During that period, in the 1890s, the people in charge of this matter were Kōi Furuichi, Vice President and Chief of the Engineering Affairs of the Ministry of Interior, and Tadao Okino, a specialized and experienced engineer for river improvement at the Department of Engineering. Okino proposed a river improvement plan in 1895 and implemented the new drainage canal (Shin Yodogawa) under Furuichi's approval. Around the same time, Furuichi

approved the new Ōsaka Port plan in 1894, originally proposed by Cornelis Johannes van Doorn⁴¹, with a definite amendment. Naturally, these two projects were closely related, though Furuichi and Okino's final solution was to separate and simplify them (**Figure 6**).

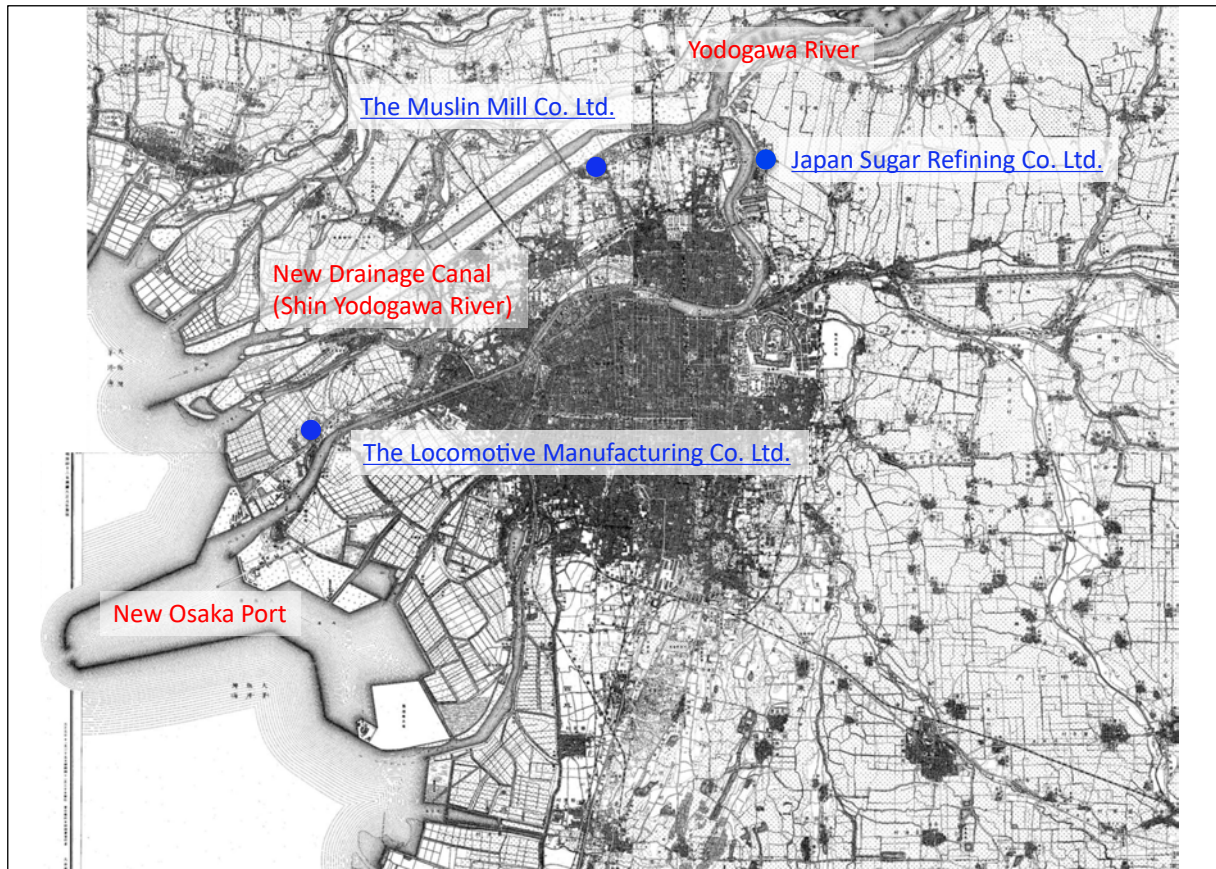

Figure 6: Geographical map of Ōsaka in 1908-1909, showing major public works and locations of Yamaguchi's factory works

We will now return to Yamaguchi's works. The three factories, Nihon Seitō, Kisha seizō, and Muslin Mill, were all located on riverfronts in the outskirts of Ōsaka, and the sites were therefore stable due to the river improvement project. Yamaguchi finally enacted the Plan for Ōsaka in 1899, starting with the new Ōsaka Port. Yamaguchi's works in Ōsaka were strongly associated with his ÉCAM classmates' public works. Original documents reveal the details of Yamaguchi's proposal for the Plan for Ōsaka⁴². Of these, 'Ōsaka Shinsetsu-shigai Sekkei Setsumei Sho (the Description of the Plan for Ōsaka)' by Yamaguchi reveals his planning concept in detail, corresponding to each proposed work—186 lines of streets, 29 areas of parks, and 17 lines of canals.

After comprehensively analysing it, we think that the most important feature of Yamaguchi's proposal is demonstrated in the composition of the planned elements, primarily the distribution of canals and land use of canal fronts (**Figure 7**). In the then newly annexed municipal area between Ajigawa and Shirinashigawa rivers, two lines of first-class canals (width 45 m) running east to west were proposed to connect both rivers. Three second-class canals (width 32.4 m), running north to south at right angles, were proposed. Supported by other second and third-class canals, also at right angles, an extended area was covered by a well-ordered canal network. All canal fronts were opened to future utilization, without locating streets directly along the canal. About the land use of canal fronts, Yamaguchi stated the following:

The canal bank is the most useful space for citizens' utilizations. First, it is necessary for the collection and distribution of freights. It is also the best site to build warehouses. Further, a gentle slope from the waterfront helps load and unload heavy and large ship cargos... Therefore, I decided not to construct streets on the canal front, but to preserve substantial space on the banks... With regard to the location, I set 50 Ken (90 m) or 100 Ken (180 m) in depth of the canal front block⁴³.

This idea shows the most important feature of Yamaguchi's planning, that is, an industry-oriented design. Moreover, we can assume the influence of the education and practical observation at ÉCAM and France, for

example, at Muller's brick factory in Ivry Port, located on the Seine riverfront, where there was a wide bank space with a gentle slope and some factory facilities at the riverfront.

Figure 7: Plan for Ōsaka in 1899 (above), and closeup of the newly annexed area (retouched by authors)

Conclusion

Our findings are as follows. 1) Yamaguchi's works were influenced by his learning at ÉCAM, especially his later works of industrial buildings in Ōsaka. 2) His Plan for Ōsaka in 1899 was strongly associated with public works conducted by his ÉCAM classmates Kōi Furuichi and Tadao Okino, and its distinctive feature was industry-oriented design. 3) Yamaguchi's design for the then newly annexed municipal area of Ōsaka resembles that of Ivry Port in the outskirts of Paris where he did his apprenticeship at Émile Muller's factory. We can assume that not only his studies in school but also such practical learning had helped develop Yamaguchi's professional conviction. However, there is still scope to further our understanding of the whole picture of ÉCAM's off-school education.

Additionally, we observed the outstanding consistency and accuracy of Yamaguchi's design from an architectural to an urban scale. Future research should consider in more detail whether this was a typical outcome of education at ÉCAM or the result of Yamaguchi's personal talent.

Moreover, a general question needs to be discussed further—how can one evaluate the impact of the Japanese ÉCAM students' learning in France on the planning history of Japan? Since Yamaguchi's Plan for Ōsaka was not realized, we should also consider its limitations. These can be divided into *external* and *internal limitations*. External limitations include historical circumstances, such as Yamaguchi's death at a young age, political atmosphere⁴⁴, and lack of social recognition for advanced planning, for example, social and economic requirements (the central government was still interested in the beautification of the townscape) and the importance of extension plan (the main concern in that period was the urban improvement plan). Internal limitations include those regarding the ideas and concepts learned from France. First, the highbrow ideas of ÉCAM, such as '*la science industrielle est une, et tout industriel doit la connaître en son entier*'⁴⁵ (*industrial science is one, and every industrialist must have its knowledge as a whole*), seemed too idealistic and were difficult to adopt in the Japanese industrial world of that period, which struggled to catch up with both imported knowledge and the reformation of traditional technology. Moreover, we could not observe a clear influence of Muller's concept of workers' housing on Yamaguchi's works in this regard. We instead identified another external limitation here—differences in the maturity of industry and labour market—and observed Yamaguchi's powerlessness or disinterest in housing reform, to which his mentor Muller devoted his career.

Acknowledgements

This study was supported by the Maeda Engineering Foundation Research Grant and JSPS KAKENHI Grant Number 15H04106. The presentation was supported by JSPS KAKENHI Grant Number 18H01617. We would like to thank Dr Naoki Hirai, for providing his precious private collection related to the Muslin Mill for our research, and Editage (www.editage.jp) and Bo Causer of Kagoshima University, for English language editing.

Disclosure Statement

No potential conflict of interest was reported by the authors.

Notes on contributors

Junne Kikata serves as a professor at Kagoshima University. He won the CPIJ Research Award in 2004, and the RECAJ Best Writing Award in 2010, for his work on the history of campus planning in Japan.

Ken Nakae serves as an associate professor at Kobe University. He won First Prize at the 19th Nisshin Kogyo Architectural Design Competition in 1993 and received a doctoral degree from Kobe University in 2009. His thesis examined the architectural design theory of Hugo Häring.

- ³⁴ *Introduction of the Muslin Mill Co. Ltd.* (a commercial pamphlet, c.1902, private collection)
- ³⁵ It is known that another architect/builder named Shōgorō Shige participated to the construction of the Muslin Mill factory (Ishida, *ibid.* 16). Yamaguchi and Shige worked together in other projects too including Kisha Seizō. Therefore the extent of Yamaguchi's participation for each projects remains to be examined further. Nevertheless, as for the Muslin Mill, there was a special background to be considered, the connection between Yamaguchi and Inabata (Horiuchi 2003, *ibid.* 17). Therefore, we assume that Yamaguchi's participation extended over the entire project, especially in the conceptual work.

⁴⁴ For example, in the academic field of Architecture, dominance of the *English School* (Fujimori 1993) led by Josiah Conder and his pupil Kingo Tatsuno had become decisive when Tatsuno assigned to the professor of Architecture of the Imperial University and the first president of Zouka Gakkai (today's Architectural Institute of Japan) in 1886. However at that moment, the dean of the School of Engineering, Imperial University was Furuichi. It is reported that there were some conflicts between Tatsuno and the School of Engineering on Tatsuno's working condition (Shimizu 2015). And in this atmosphere, a slander about Yamaguchi was presented when he appointed to the Construction Department of the Ministry of Education, saying that he was not educated as a genuine architect (by Kōzō Kawai, qtd. in Tatsutarō Nakamura, 1936).

24 Heritage and Urban Regeneration

Why has the polluted canal been conserved?: The planning history of Fugan Unga in Toyama, Japan.

Hiroyoshi Sano (Kanazawa Seiryō University)

Fugan Unga is the famous canal planned by city planner Kanichi Akashi, the excavation of the canal was completed in 1935. Now, the canal is widely known as open space of the central city of Toyama, attracting citizens and tourists. The canal was originally planned as transportation route for the surrounding factories, aimed for industrial development of Toyama city. However, the main route of transportation had changed from ships to automobiles in 1970s, and the meaning of industrial canal was gradually losing. At the same time, sewage contamination of the canal had grown into a serious problem. Therefore, the canal had been planned to fill up and develop the roads and public facilities in 1979.

5 years after, a city planner had insisted to drop the fill-up plan, and proposed the regeneration of the waterfront as the park attracting citizens and tourists. In 1997, the canal was opened as a waterfront park (Fugan Unga Kansui Koen), triggered by the proposal. This paper aims to clarify the process of change from the fill-up plan to the regeneration of the canal, and discusses why the canal was conserved through the document research and interview to the planner in charge of the regeneration plan at that time.

GREYFIELD DEVELOPMENTS: DISSONANT ASSEMBLAGE OF HERITAGE IN THE CITY

Vidhu Gandhi (Extent Heritage Pty. Ltd)

Greyfield sites have long been considered as viable built assets in urban areas providing readily available sites equipped in terms of infrastructure and amenities that can be employed to generate more liveable and much needed spaces in the centre of cities. Redevelopment of greyfield sites such as shopping malls, abandoned municipal properties, and old carparks into museums, community centres and housing demonstrates the potential of these sites. At the larger urban scale the approach toward greyfield sites involves regeneration of larger sites, blocks or entire precincts in the middle of cities that have the potential of being developed via urban infill. The role of heritage conservation in this urban renewal process is often relegated to individual greyfield sites, with the larger redevelopments especially those earmarked for housing, often perceiving heritage as a “barrier” to the overall consolidation and development processes of these larger sites in the city. This largely theoretical paper will explore differences in the approaches toward heritage and greyfield developments by examining the formation of diverse identities and sense of place that is employed and generated by the development of these places.

Drawing upon studies of regeneration of brownfield sites, the paper will demonstrate that aspects of heritage character and sense of place that are often associated with brownfields are equally applicable, and employed in individual greyfield developments. Simultaneously, the paper will explore larger greyfield developments and the market based idea of identity that is focused on, in the move away from suburban to urban living, with the intention of providing greater accessibility and the promise of greener and more sustainable environments in the centre of cities. The idea of heritage character and a sense of placemaking which builds on the idea of heritage is missing in these larger ventures. However, rather than term the former as more heritage sensitive than the latter, the paper will argue that both individual smaller scale and larger scale greyfield developments are needed in the “assemblage” of heritage places in a city. The ideas of “places as assemblage” as encompassing “the flows of everyday life; the narratives that are expressed through them; and the desires, hopes and fears that are invested in them” will be examined against the backdrop of “dissonance” in heritage so as to better understand the often conflicting ideas of heritage character and identity associated with greyfield developments.

“I’m a fan of the Ouseburn, you know”: The History of Heritage-led Regeneration in the Ouseburn Valley, Newcastle upon Tyne

Loes Veldpaus (Newcastle University) and John Pendlebury (Newcastle University)

In this paper we will discuss the history of the heritage-led and culture-led regeneration of the Ouseburn Valley, a post-industrial area located close to the city centre of Newcastle upon Tyne (UK)

The research combines semi-structured interviews with local activists and stakeholders, observations, and policy analysis. We analyse how history and sense of place come together and are connected in imaginations about the area’s future, shaping the process of urban development. We explore how the continuous process of revitalising and upgrading of the area is portrayed and framed by the various stakeholders, and how it becomes part of the history mobilised in urban regeneration.

The Ouseburn Valley is presented as the cradle of the Industrial Revolution on Tyneside and once had a significant residential population of workers. More recently Ouseburn became a leftover and marginalised area, described as isolated, forgotten, and passed by. Since the 1980s the area began to develop a community of artists and creative sector-based urban rehabilitation developed in the momentum in the 1990s. In the 2000s major development interests including volume house builders took an interest in the area until this was dissipated by the financial crisis. Post-crisis, the area is now confronted with a new wave of development.

Our interviews reveal how within this history, issues of planning legacy and heritage management are intertwined with a strong affective and long-lasting attachment to place. Great passion is shown for example, for the alternative gritty histories and the quirky atmosphere. However, not everyone mobilises the same history, as some have a great passion for the early industrialisation of the area, or for the environmental and geographical historical setting. These different pasts have both developed through and are interwoven in the various projects, plans and policies that have been developed over the past decades. Recent pasts are included in heritage narratives just as much as long gone histories.

The vision of key stakeholders is for development to respond to the character formed by the area’s industrial history as well as its ‘alternative’ pasts. Development co-exists with a continued industrial uses, such as a scrapyards and a timber yard. But there is also a focus on industrial aesthetics and materiality, bordering on the exploitation of working-class histories for the current users (young professionals, hipsters) and residents (higher socio-economic groups)

As such, we will explore how histories, memories, and nostalgia are carefully woven into the sense of place, whilst operationalized in conservation planning, in a constant balancing act between gentrification and regeneration, and we reflect on how this affects heritage management and urban governance.

A Vision for Arts Led Urban Renewal in Adelaide and the City West Campus of the University of South Australia

Christine Garnaut (University of South Australia)

Various perspectives on universities and urban renewal in the post-industrial era are considered in the international literature. These include universities’ roles as drivers of physical environmental change and of economic and social improvement; their relationships, and sometimes tensions, with immediate and wider neighbours; and the social, infrastructure, economic, cultural, educational, and local environmental sustainability benefits of a university’s presence for a city and its residents. One theme within the literature on the economic and cultural contributions of universities is their potential and actual role in the evolution and development of arts and cultural quarters. This paper considers that topic in relation to the University of South Australia’s City West campus that opened in 1997 in an area of Adelaide known as the West End. The campus was built adjacent to an emerging arts complex. Soon after UniSA announced its decision to move to the new location, the Adelaide City Council commissioned the West End Urban Development Strategy to optimise the benefits of the university’s presence in the West End. This paper introduces and reviews that strategy and a subsequent, related, initiative of the City Council and the South Australian Government to establish the West End as an arts and cultural quarter.

A Vision for Arts Led Urban Renewal in Adelaide and the City West Campus of the University of South Australia

Introduction

The diverse international literature on the post-industrial city in the last decades of the twentieth century in Europe, North America and Australia paints a complex and richly-textured picture of the particular ways in which those countries responded to a range of circumstances stemming from three broad impulses. One was industrial and economic decline that resulted amongst other outcomes in the loss of established manufacturing and commercial bases and consequently in unemployment, decentralisation, 'urban dereliction' and the 'need to find a use for land that has lost its [previous] use'.¹ These circumstances led in turn to initiatives to 're-centre'² cities, a phenomenon common in the 1980s and 1990s. A second impulse was new economic frameworks including neo-liberalist ideologies, the rise of new economies, as in Asia, and of the European Union, and deregulation and the opening up of international trade, tourist and investment markets. A third impulse was altered governance structures underpinned by neo-corporatist ideology and by neo-liberalism – the privatisation of public services and utilities, decreased government provision of public housing and increased private sector investment in that area, deregulated planning, a lack of public participation in the planning process, and the birth of urban development corporations and public-private partnerships to drive urban development projects.³

One subset of the literature on the post-industrial city investigates efforts at revitalisation as cities internationally endeavoured to find new footings and to establish and market their place locally and globally, but within shifting social, technological, political and economic conditions as well as in an increasingly competitive urban milieu. Several major strands emerge including one considering ways in which cities became 'entrepreneurial',⁴ underwent exceptional transformation as, for example, in the cases of Barcelona and Bilbao, 'reinvented themselves to attract new flows of capital investment',⁵ and rebranded, marketed and sold themselves and their distinctive profile and place qualities.

Another significant strand in the urban revitalisation literature is scholarship on regeneration through cultural planning which draws on both existing and new work on the culture of cities; on the production and consumption of design, and on their interrelationship and contributions to what Julier labels the 'culture of design';⁶ on the development of the creative city and of cultural quarters; and on design-led approaches to urban regeneration.⁷ Contributing to the last strand is yet another literature on the creative industries and design economy and their pivotal role in cultural regeneration, defined by Wansborough and Mageean as a process of 'restoring and improving the quality of urban life through the enhancement and development of the unique characteristics of a place and its people'.⁸ The contribution of universities to cultural regeneration is considered within this strand, for example by Dempsey,⁹ as is their part in a larger conversation about 'urban renewal and the university'.¹⁰ The last topic has been considered from a variety of perspectives including the opportunity not only for physical

improvement of degraded areas and their environs but also the social, economic, cultural, educational and local environmental sustainability benefits of a university's presence for a city, its residents and wider community.¹¹

This paper responds to the topic of universities and urban and cultural regeneration exploring it through a case study of the part played by the University of South Australia's City West campus in Adelaide, South Australia, to the revitalisation of the area where the campus has been purpose-built from the late 1990s. In particular, the paper introduces the West End Urban Development Strategy (1996) and a related drive for arts led urban renewal and a cultural quarter in Adelaide's West End. The discussion draws out selected outcomes and initial conclusions about the contributions of the City West campus to both initiatives.

Adelaide and its West End

Adelaide, the capital city of South Australia, was established as a colony of Britain in 1836. The selected site was located on the traditional lands of the Kaurna people of the Adelaide Plains. The physical plan was for a place laid out using the conventional grid form and divided into two sectors, each with sites allocated for public squares; parklands enveloped the whole entity. One sector was on the northern and one on the southern side of a river later named the River Torrens. The earliest settlement was in the northwest corner of the part to the north of the river. Densely populated from the outset, it quickly assumed a mixed-use character. Its geographical location contributed to the name by which it was (and is) popularly known – the West End.

Hindley Street, a key east-west vehicular and pedestrian thoroughfare in the West End, was the city's principal commercial street in the founding decades of the colony. It was bisected by Morphett Street that ran north-south and over time created a physical divide between its (Hindley Street's) western and eastern ends. Following World War Two, Hindley Street was a focal place for migrants to establish retail and café businesses. Through the 1960s and 1970s, while retaining a retail function, Hindley Street East and the section of the street immediately west of Morphett Street increasingly emerged as the city's premier entertainment and tourist destination with hotels, nightclubs, cinemas and amusement parlours being the key attractions.¹² Meanwhile, the street's western end continued to accommodate industry, entertainment, commercial and residential functions. As Hindley Street East refocused its uses, it assumed a chameleon-like guise, presenting a generally sedate side by day, but a less desirable side by night. Incidents of crime and anti-social behaviour were common.¹³

Hindley Street's reputation was further tarnished, and enhanced, as the century wore on due to diminishing investment in property maintenance and upgrades by owners most of whom were private individuals and often absentee landlords rather than resident traders, and by degradation of the public realm.¹⁴ With its image and private investment at a low point, several factors coalesced in the mid 1990s to generate a renewed vision and an urban revitalisation strategy for Hindley Street and the West End at large. The principal factor was 'the decision of the University of South Australia to build its City West Campus in the heart of the precinct.'¹⁵

The University of South Australia

The University of South Australia (UniSA) was established in 1991. A product of the era of the Unified National System (1988-1996) in Australian tertiary education, UniSA was born through the amalgamation of several existing institutions. Significant space constraints on its existing city campus forced the UniSA Council to look for accommodation alternatives and in 1993 it decided to build a brand new campus in the West End.¹⁶ The selected site was immediately west of Morphett Street and adjacent to a recently opened arts complex that utilised heritage listed buildings as well as new structures (Figure 1). The complex included the Lion Arts Centre, the Jam Factory with studios for craft practitioners and a retail outlet, the offices and gallery of the Experimental Art Foundation and two cinemas.

Figure 1: Aerial view Adelaide west c1994 showing location of UniSA City West campus, middle lower left.

A mix of privately owned warehouses, retail outlets, restaurants and public entertainment places in various physical states occupied the proposed campus site.¹⁷ Some owners elected to retain their properties so the new campus was planned around them. In February 1997 UniSA moved into eight purpose-designed buildings with the intention of expanding the campus footprint in future years, a process that continues two decades later.¹⁸ Two major streets, North Terrace, the city's cultural boulevard and the northern boundary of the central business district, and Hindley Street bounded the campus (Figure 2). Its frontage was to North Terrace. Due to security concerns, the campus was secured by gates, which were locked after hours, and gave it a 'fortress' like appearance.¹⁹

The opening of UniSA's City West campus Stage One brought approximately 5,000 additional people to the West End. Amongst them were students and staff of the Faculty of Art, Architecture and Design.²⁰ Although the Faculty's entire Visual Art academic staff and student cohort did not move to City West until the completion of Stage Two in 2005, their imminent presence would lend partial weight to the late 1990s rationale for an arts and cultural quarter in the West End. Ahead of the consolidation of Visual Arts on the City West campus, however, UniSA's Art Museum (from 2007 the Anne & Gordon Samstag Museum of Art) moved to the city from its suburban location at Underdale, about 5 kilometres west of the city centre, to a former warehouse on a site earmarked for the Stage Two development. The warehouse fronted North Terrace and was refurbished specifically for the Art Museum's use. The Museum's relocation not only 'breathed new life into its programs' but also pointed to a cultural role for UniSA, and to the opportunity for it to engage with audiences and communities beyond those traditionally associated with universities.²¹

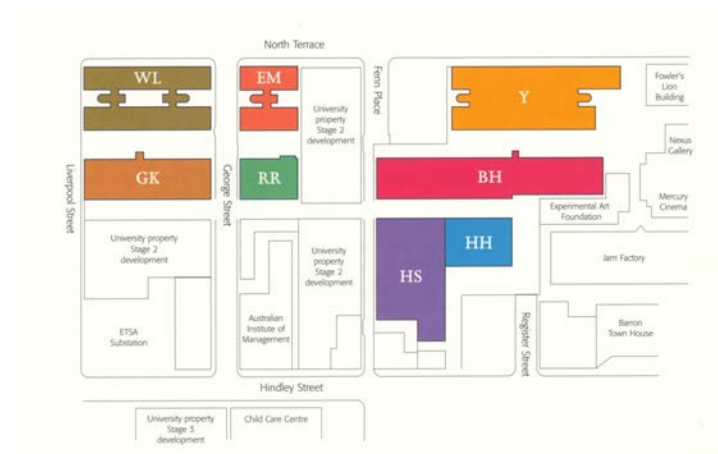

Figure 2: City West campus plan showing location of new buildings and future proposed development, the location of the existing arts complex and sites retained by private owners.

West End Urban Development Strategy

The Adelaide City Council commissioned local firm HASSELL to prepare the West End Urban Development Strategy that was finalised in 1996. Its brief was to develop a process for co-ordinating proposed and future public and private investment in the West End.²² Although the particular driver was UniSA's decision to move to the precinct, there were others. Firstly, TAFE (Technical and Further Education) Light Square, an existing neighbouring provider of tertiary education, commenced a substantial expansion of its premises and also announced that it planned to construct a new building for a Centre for the Performing Arts two blocks to the south-east of the City West site. Secondly, various state government and Adelaide City Council strategic programmes were in train as part of a larger vision, sometimes referred to as 'the "globalisation" of Adelaide',²³ to promote Adelaide to national and international business, as well as tourist, markets. One was a review of the City of Adelaide Plan that had guided Adelaide's development since 1976. Another was the Adelaide 21 Project that focused on the regeneration of the city centre and related sites like North Terrace.²⁴ One component of its vision was of Adelaide as 'The City of Creative Imagination' in which 'the creative industries' were promoted and developed, an ambition that became significant in shaping the state and local government's view of the West End of the future.²⁵ Thirdly amongst the other drivers for the West End Urban Development Strategy were 'the pressing issues within the Precinct: progressive dis-investment, poor image, declining population [and] under-developed private landholdings and the public realm'.²⁶ A related imperative was the appropriate management of social issues and behavioural problems associated mainly with the locality's places of public entertainment.

HASSELL carried out extensive consultation to produce the West End Urban Development Strategy. It identified the key agencies and stakeholders and employed surveys and workshops with specific foci and target groups as the main means to elicit information about perceptions of the West End; identify its strengths; suggest improvements; propose opportunities for its economic development; and to prepare a vision statement, and its underpinning strategies and actions, and establish key directions for the strategy's future implementation.²⁷ Representatives of UniSA were closely involved in the consultation. The Vision that emerged from the process explained, ambitiously in terms of the time frame, that:

By the year 2000, the West End Precinct, Hindley Street and its environs will have international recognition as a special area within the City. It will be recognised for its creativity, education excellence, its renewed sense of community pride and its contribution to the City's economic revitalisation. It will have achieved this through problem solving, leadership, collaboration, risk taking, investment and innovation.²⁸

To guide the Adelaide City Council in implementing the West End revitalisation Strategy, the consultants proposed an 'integrated strategic framework' based on ten broad objectives. These related to: the image of and access to the precinct; the creation of a cohesive social, business and education community; the provision of safe and affordable inner city residential accommodation; recognition of the key economic drivers for precinct revitalisation being professional development for management, application of information technology and delivery of performing and visual arts; creative approaches to precinct governance and management; the revitalisation of old buildings, removal of 'poor/obsolete development', and the introduction of new streetscapes to enhance the built environment; recognition of the history and heritage of the area in any redevelopment programmes; revitalisation being driven by local, state and federal government partnerships; and the commitment of the beneficiaries of the precinct's revitalisation to ownership of that process.²⁹ The West End Urban Development Strategy Final Report considered all of the objectives in detail providing current contextual information and setting goals, implementation strategies and priority actions for each.

The Arts and UniSA in the West End Urban Development Strategy

The Final Report was peppered with references to the UniSA City West campus along with recommendations as to how its presence could be optimised 'to maximise the benefits'³⁰ to the West End from economic, urban design, urban art, precinct image and property development perspectives. The consultants argued in part that 'The Arts and Education will be strong factors in the revitalisation of the Precinct and will complement the existing business community.'³¹ A section of the economic development discussion focused on practical ways in which that could occur. One was for a 'World Centre for Training in Performing and Visual Arts'. A set of strategies for achieving that goal centred on various proposed collaborations including a forum between the Adelaide City Council, UniSA, the proposed Centre for the Performing Arts, organisations in the existing arts complex adjacent to the City West campus, as well as appropriate existing businesses in Hindley Street and the West End. Potential indicative actions were to co-develop proposals, for example for new galleries and performance venues in the precinct, and to co-campaign for the Adelaide Festival and Adelaide Fringe offices to re-locate to the West End.

The urban art section made various mentions of the opportunity to work with the Faculty of Art, Architecture and Design to address the general absence of public art in the precinct.³² Recommendations about ways in which UniSA students could contribute included through the installation of art works at significant spots in the local streetscape and at entry points to the City West campus, murals on buildings, temporary sculpture installations, and the establishment of a permanent open air gallery via a partnership with the Art Gallery of South Australia and the Adelaide City Council.

West End Urban Development Strategy: urban renewal outcomes

The West End Urban Development Strategy was described as 'a comprehensive initiative to address social, economic and physical issues in the West End'.³³ It was well received not only by the Council but also by the state government and local community including business, individual and institutional interests represented by the Adelaide West End Association. Adelaide City Council approved it in 1996. The processes of developing and implementing the Strategy created considerable momentum not only within the City Council but also within state government departments and in the arts sector generally.

Several reports were commissioned: a crime prevention report for the West End; a tenancy plan to improve the vacancy rate (29% in 1997) on Hindley Street and to achieve a balanced mix of 'shopping, education and entertainment';³⁴ an urban design concept plan to better integrate Hindley Street East and nearby Light Square; and a strategy for accommodating people who lived in boarding and rooming houses in the West End and who may have been displaced as the precinct was redeveloped.³⁵ Amongst outcomes that flowed from the reports, the Adelaide City Council allocated significant capital works funding to effect urban design improvements including

paving, lighting and tree planting in Hindley Street and Light Square. It also instigated a West End building improvement programme in addition to its Heritage Incentive Scheme. The improvement programme led to the restoration of the façade of West's Coffee Palace, a local heritage place with significant presence on Hindley Street East (Figure 3).³⁶ Additionally, through the endeavours of the City Council's West End Strategic Taskforce, attention was directed to the management of licensed premises. The Hindley Street tenancy mix was altered and the number of tattoo and pinball parlours and motorcycle shops was reduced markedly.³⁷

Figure 3: Hindley Street East, Adelaide, South Australia c.1984. West's Coffee Palace is 19th century red brick building on left

West End arts and cultural quarter

In 1999, as the West End Urban Development Strategy was being implemented, the Adelaide City Council and South Australian Government jointly launched an Arts Led Urban Renewal initiative for the West End.³⁸ By then other government as well as privately funded new commercial and hotel accommodation projects and urban renewal schemes were underway on North Terrace neighbouring the West End and in the Riverbank (River Torrens) precinct a short walk away (Figure 4). Also, the first stage of a report for the West End Arts Co-location Project, commissioned to ascertain the demand for and capacity to accommodate artists moving in to the West End, was complete and had confirmed the availability of appropriate venues.³⁹

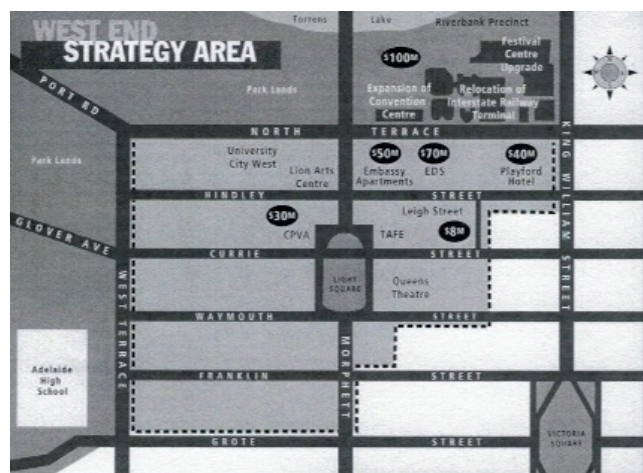

Figure 4: West End Arts Led Urban Renewal Initiative, Strategy Area, showing existing location and cost of new building development in the vicinity of the West End.

Additionally, by the time that the Arts Led Urban Renewal initiative was announced, several prominent arts related organisations and entities had moved into the West End, amongst them the Adelaide Festival and Fringe Festival offices and the Community Arts Network. The state government department Arts SA, comprising 60 staff, was poised to relocate to the restored and refurbished West's Coffee Palace. Before long, 'the largest employer of artists in the state', the Adelaide Symphony Orchestra, would take up residence, too, in rehearsal and recording studios in a former cinema.⁴⁰ The momentum for renewal was fuelled as well by Shop@rt, a program of exhibitions in the windows of vacant shops in the West End, regular festivals and an arts market and a substantial redevelopment of heritage buildings and the public realm in Leigh Street, which connected Hindley Street with major roads to its north and south.⁴¹

Pointing to the existing and growing 'critical mass' of arts-based organisations, agencies, networks and infrastructure in Hindley Street East, as well as to the presence on the western side of Morphett Street of education institutions UniSA and TAFE, and respectively their Faculty of Art, Architecture and Design and Centre for Performing Arts, the South Australian Government and the Adelaide City Council expressed their aspiration to 'create a precinct for artists' in the West End.⁴² They cited arts and cultural quarters in international cities in Europe, Canada and the United States as examples of what could be achieved.⁴³ But the arts led renewal of the West End did not occur as envisaged. By 2002, three years after the launch of the initiative, it was clear that 'momentum ... [had] ground to a halt and [in 2004] the current trend ... [was] for artists to leave the area.'⁴⁴ This situation occurred despite the survival of various existing venues for cultural activities and the opening of some new ones, cultural events continuing, and artists and designers, arts organisations and providers of tertiary education in the arts having their bases on or near Hindley Street.

Montgomery has evaluated and investigated reasons for the demise of the Arts Led Urban Renewal initiative and refers to a number of structural and policy factors. These include the type of day and night-time activities that occurred on and in the vicinity of Hindley Street and the fact that they were not perceived as 'complementary'; the street's 'less savoury' night-time image; private ownership of a significant number of premises and, despite the existence of a tenancy management plan, artists' inability to pay the prices charged by private landlords; and the absence of 'specific enterprise or development programmes for the arts and cultural industries in South Australia', and of an 'overall West End cultural development or arts programme' and consequently of marketing and audience development for the arts in the West End.⁴⁵ Regarding public investment in the arts in South Australia, in a 2007 interview Greg Mackie, local arts champion and an influential independent bookshop owner in the West End, reflected on the reality of emerging and competing challenges for government like health care, alluded to the current situation and foreshadowed a future decline, since realised, in public investment in the arts in South Australia.⁴⁶

Conclusion

This paper has explored the topic of universities and urban and cultural regeneration through a case study of the role of the University of South Australia's City West campus in the revitalisation of Adelaide's West End in the late twentieth and early twenty-first century. The paper introduced the West End Urban Development Strategy (1996) and an Arts Led Urban Renewal initiative (1999) that included a vision for an arts and cultural quarter in the West End. Following are initial conclusions about the contributions of the City West campus to these endeavours.

The South Australian Government and the Adelaide City Council regarded the substantial financial commitment of the University of South Australia in Adelaide's West End as a critical stimulus to encourage future investment in that part of the city. Their confidence in that prospect led the City Council to implement a multi-pronged urban revitalisation strategy which, among other outcomes, aimed to improve the public realm, tackle safety concerns, address the negative image of Hindley Street, and promote community collaborations and partnerships that would benefit the precinct from social, economic, educational and tourism perspectives. As a result of the strategy, various public realm improvements were achieved but shifting the image of Hindley Street was far more problematic. Indeed, more than a decade later, one commentator observed that the east end of the street was being referred to locally as a 'wild west warzone'.⁴⁷ UniSA has continued to invest in the precinct on the western side of Morphett Street. In the last decade in particular it has expanded its footprint to the south side of Hindley Street and the north side of North Terrace (Figure 5). The South Australian Government and the University of Adelaide have invested also in the City West vicinity in a bio-medical precinct that occupies an extensive area on the north side of North Terrace. These new developments have brought thousands more people to the area. They have led to the extension of an existing tram line to provide public transport to the doors of each of the major institutions and they have been a catalyst for many new businesses, mostly eateries, on Hindley Street and North Terrace.

Figure 5: North Terrace looking west from Morphett Street showing UniSA City West campus (opened 1997) left and Cancer Research Building right (opened 2018) and University of Adelaide Medical School (opened 2017), middle right. The new Royal Adelaide Hospital (not in view) (opened 2017) is to the west of the Medical School.

The location of the Faculty of Art, Architecture and Design at City West was perceived as presenting an opportunity for staff and students associated with its various programmes to engage collaboratively with arts organisations and entities located in the precinct. Such collaborations continue to flourish for example with its near neighbours including the Jam Factory. Montgomery noted that ‘The presence of so many design and arts students was seen as a significant opportunity for the growth of new creative businesses and also for smaller-scale leisure and retail.’⁴⁸ And the Faculty’s staff and students and the presence of the Art Museum were counted amongst the ‘critical mass’ that helped convince the Adelaide City Council and the South Australian Government of the viability of an arts and cultural quarter in the West End. However, in reality, in UniSA’s early years at City West, students spent the minimum time on campus. Outside of designated study commitments there was little in the way of amenities to hold them at the university or in its environs. ‘The campus was merely a functional location; a place for study, the precinct: a place to park the car. Student engagement with their surroundings was minimal’⁴⁹ Perceived and actual physical deterrents emerged, too, in relation to accessing the creative premises and activities on Hindley Street East. Although not far from them geographically, the university campus and the complex containing the Lion Arts Centre, Jam Factory and other arts organisations were (and are) separated from them by Morphett Street. A major road carrying six lanes of traffic, Morphett Street, was (and is) like ‘a wall’ preventing easy and fluid access within the precinct.⁵⁰

Recent developments at and in the environs of UniSA’s City West campus suggest that the campus has contributed to a gradual process of physical revitalisation of the West End and most especially of Hindley Street and North Terrace west of Morphett Street. Since UniSA moved to City West, staff and students associated with its Architecture, Design and Visual Arts programs have engaged in various ways with arts and cultural opportunities in the West End and wider city precincts. The recent formation of the School of Creative Industries at UniSA and its potential relocation to City West raises the possibility of establishing a substantial and diverse critical mass of creative people and associated activities in and around Hindley Street West. In time, that may give cause to revisit the idea of an arts and cultural quarter in Adelaide’s West End.

The 'socialist post-socialist': Urban planning in Hungary during the first two decades following its 1989 regime change

Daniel Kiss (ETH Zurich, Institute for Urban Design)

This paper will introduce the socialist spatial planning regime's conspicuous persistence in Hungary after 1989, and explain both its causes and effects within the framework of the rapid and excessive post-socialist decentralization of resources and authority. The paper enriches the discourse by discussing the planning regime's transformation crisis from the perspective of its persistence rather than its accelerated atomization during the post-socialist transition.

In 1968, the 'New Economic Mechanism', an all-around restructuring of the planning and commanding of the socialist economy was introduced in Hungary, reducing the role of central planning and increasing corporate autonomy. With this shift towards market socialism, the decentralization of spatial planning has also taken its first steps. This culminated in transferring the right of enacting General Urban Plans from the central government to the city councils. While the fragmentation of the political and economic systems accelerated following the fall of socialism, the modes and instruments of spatial planning proved more resilient against the transformation drive.

In the first seven years following the regime change, spatial planning regulations and instruments inherited from socialism (e.g. the 1964 Building Law and Budapest's General Urban Plan from 1988) remained in force. In this period, the large-scale state projects shaping the growth of the socialist city were replaced by innumerable small-scale space appropriations, incremental in their dimensions, and difficult to control, particularly in a climate dominated by the social imperative for deregulation and market liberalization. The inherited instruments were not only unable to fulfill their purpose amid these new conditions but also left the public hand for long without a coherent vision on how Budapest should develop. Only in 1997 was the first post-socialist General Urban Plan published, just preceding the enacting of a new Building Law later in the same year. This sequencing proved to be ill-fated, since the new law was to adjust the modus operandi of settlement planning, replacing the GUP with the Settlement Structure Plan and delegating some of its tasks to district-level instruments. This lack of clarity in the division of authority and competence between different public agencies resulted in regulative loopholes, which were especially precarious in the face of the conflicts of interests between these agencies becoming more open. It was not until the mid 2000s that the instruments of urban planning were finally harmonized with the requirements of the market economy, the 1997 Building Law, and the European Union's spatial planning norms. Notwithstanding the unusually rapid systemic transformation, the adjustment of the policies and methods of urban planning to the new circumstances of the market economy and decentralized power geometry took a conspicuously long time. In this period the public hand has lost its ability to generate and keep structural changes under its full control. This, in its turn, has given private developers the overhand and, thus, resulted in a rather laissez-faire type urban development, characterized by the lack of significant top-down restructuring of the city and by the proliferation of business-dominated development projects not integrated into any grand urban design.

Planning Transition Beyond Socialism: From Poland to China and Back

Piotr Bujas (TRACE - Central European Architectural Research Think-tank), Alicja Gzowska (Uniwersytet Warszawski), Li Hou (Tongji University) and Łukasz Stanek (The University of Manchester)

This talk discusses the uneven dynamics of knowledge transfer between two socialist countries, Poland and China, in the 1950s and in the 1980s by following the trajectory of Piotr Zaremba, Polish urban and regional planner and head of the Postgraduate Course of Urban and Regional Planning for Developing Countries which opened in 1965 at the University of Technology in Szczecin (Poland). Zaremba worked in PRC as an educator, designer and consultant in two periods: during the 1950s, when the modernisation of the country was developed according to the Soviet model; and during the 1980s, thus during the controlled opening of China towards the capitalist market.

The first engagement, which included leading regional planning teams, consulting development plans and lecturing was based on specific experiences of Poland's post war reconstruction and modernisation, and its survey contributes to a more nuanced view on the circulation of international planning models in China before the Sino-Soviet split. The second engagement as an organizer and leader of courses and seminars in China, and in particular Zaremba's planning of harbour cities in the Guangdong province and special economic zones was relying on Zaremba's wide international experience, including his work as UN consultant.

By comparing both phases of Zaremba's engagement, we will argue that actors from Poland, more than transferring a specifically socialist model of development, acted as mediators between China and international planning culture, to which they themselves contributed. This mediation included the last decade of the cold war, when Polish and Chinese planners envisaged a spatial framework for the transition beyond socialism. Learning from his experience in the PRC, by the late 1980s Zaremba aimed at transferring the Chinese experience to Poland by delivering detailed plans of the special economic zone in Szczecin.

Local Adjustment with Path-dependence: the Governance Structure Shift and Spatial Responding in Chinese Third-front City since 1980s

Zhendong Luo (Nanjing university) and Biyao Zhu (Nanjing university)

To better understand urbanization and urban change, especially inner relationships between spatial phenomena and institutional factors, an urgent claim for planning historians has been reinforcing theoretical framing and more systematic comparative studies, which is also the primary task in Chinese planning history scholarship. That is to show how Chinese urbanization expresses the complex and changing relationship between a strong central government and market forces. Here is one kind of cities called Third-front city, making a pure sample to understand Chinese modern institutional design and related spatial phenomena. Such cities were first built for war-preparing in remote Midwestern China in 1960s, under compulsory power and planned arrangement from central government, which seems not a sustainable mode by general acknowledgement. Yet those cities have still went through transformation and gained follow-up development. With the perspective of historical institutionalism, we assume there exists the interaction of institutional path dependence and endogenous incremental change. This paper takes one typical of them, Shiyuan in Hubei Province for empirical study. From the Socialist planned economy stage (1960s to 1970s) to China's Reform stage (since 1980s), we mainly explore how government structural change effected the city's development outcomes as a core institutional factor, especially where planning got involved. We find that the initial institutional system dominated by central government had ensured rapid rise of Third-front city in early stage, while producing path dependence and long-term urban spatial influences. In face of transformation, general environment of modest reformation in China had provided enough buffer space for new institutions; On the other hand, despite path dependence in terms of industry pattern, finance structure, administrative power and so on, new local actors' seeking for incremental changes within original institutional framework also generated transformative effects.

Sotsgorod (Socialistic city) of Today and Tomorrow: Soviet Legacy in Common Trends and Challenges of Contemporary Urban Development and Planning in China and Russia

Fedor Kudryavtsev (Moscow Institute of Architecture) and Li Hou (Tongji University)

Urban planning of Soviet time was not just rules, documents and plans. It was a comprehensive understanding of what socialist city or "sotsgorod" is and how it should be in the future. This holistic vision was further spread around the world and had a strong impact on global urbanization. Transfer of planning standards, practices and urban forms from USSR to PRC in 50s of XX century proves ambition of "sotsgorod" as "built for the sake of the working people" to become a global alternative to any other city built before.

Comparative study on modern planning practice in Russia and China and case-study on evolution of factory town of Red East Tractor plant in Luoyang have confirmed that Soviet legacy is still relevant to contemporary urban planning and strongly influences its future in both countries. Common traits can be preliminary sort out as following:

- preserved built-up forms (Red East factory and workers housing in Luoyang, neighborhoods of Wuhan Iron and Steel group and similar patterns of Kharkov, Magnitogorsk and other Soviet cities, 5-story housing blocks in Shanghai and Moscow)
- city layouts, planned in 50s and adapted for new built-up forms and functions (Jiànxi qū district in Luoyang) or left untouched till now as in many Russian cities (Volzhsky, Elektrostal, etc)
- Soviet time planning concepts evolving to modern forms of main streets, new high-rise housing blocks, cityscape, etc. (Main thoroughfares and new peripheral high-rising housing areas in Moscow and Beijing)
- planning thinking and language, adapted to new context but basically preserved: comprehensive planning at big scale with clear functional zoning (New Moscow and Chengdu Tianfu New Area projects), terms and notions of integrated socio-economic and spatial planning (Guangzhou Eastern Bay Area project case and Soviet regional planning schemes of 70s and 80s)
- common challenges of national city system like Third front cities in China and industrial "monocities" in Russia

Given findings raise an issue of valuation of this legacy for planning theory and nowadays practice in order to elaborate adequate policy for its use, development or denial. Soviet time planning appeared to be as part of world history as well global phenomenon to be engaged into contemporary planning discourse. Components of formerly comprehensive "sotsgorod" concept should be sorted out and valued accordingly to their impact and relevance to future development. It is presumed that installation of detailed comparative research on socialist planning influence and heritage globally and between China and Russia in particular can strongly contribute to fulfillment of this task.

Local Adjustment with Path-dependence: the Governance Structure Shift and Spatial Responding in Chinese Third-front City since 1980s

A primary task of Chinese planning historians is to show how Chinese urbanization expresses the complex and changing relationship between a strong central government and market forces. Here is one kind of cities called Third-front city, making a pure sample to understand Chinese modern institutional design and related spatial phenomena. Such cities were first built for war-preparing in remote Midwestern China in 1960s, under compulsory power and planned arrangement from central government, which seems not a sustainable mode by general acknowledgement. Yet those cities have still went through transformation and gained follow-up development. With the perspective of historical institutionalism, we assume there exists the interaction of institutional path dependence and endogenous incremental change. This paper takes one typical of them, Shiyan in Hubei Province for empirical study. From the Socialist planned economy stage (1960s to 1970s) to China's Reform stage (since 1980s), we mainly explore how government structural change effected the city's development outcomes as a core institutional factor, especially where planning got involved. We find that the initial institutional system dominated by central government had ensured rapid rise of Third-front city in early stage, while producing path dependence and long-term urban spatial influences. In face of transformation, general environment of modest reformation in China had provided enough buffer space for new institutions; On the other hand, despite path dependence in terms of industry pattern, finance structure, administrative power and so on, new local actors' seeking for incremental changes within original institutional framework also generated transformative effects.

Keywords: central-local government relationship, planning history, path dependence, Third-front city

Introduction

In the common transition environment of globalization and capitalization, places with different institutional backgrounds will always make quite varied choices. This is largely due to factors such as their different stage of economic and technical development, the division of power between local, state and central governments, constitutional protections and traditions of property rights, and type of urban system, and so on¹. This inconsistency has been confirmed in the process and phenomenon of contemporary urban development, especially in some developing countries and emerging market countries, which cannot be explained by the traditional geographical location theory². Incompletely rational choices made in specific space-time scenario can have significant impact on urban space evolution, via intervention in local institutional arrangements including administrative power structure, capital accumulation mode and policy efficiency³. Therefore, taking the time dimension as one of determining factors rather than simply static labels in research about urban planning and constructions, it might help to better understand how those important historic events changed local urbanisation procedure, and how their influences had been inherited and evolved during later changes. Actually, this is also where the core value of planning history research lies, instead of just 'telling stories'⁴.

Unlike in western context, China's reformation is more like a process seeking balance in terms of both local-central government relationship and planned-market economy, changing from the status of highly centralized socialism to a compromise towards decentralization. So planning history research in China shall provide a valuable model for major socialist countries or even other developing countries. Many research with regards to Chinese urban

planning after 1949 has pointed to the influence of the Soviet Union^{5,6}, but the practice of socialist planned economy system in many places actually underwent local adjustment, which generated corresponding institutional legacies that played key roles in Chinese reform and opening up, which then set an example as institutional transition of pragmatism and gradualism⁷. There have been studies on the evolution of urban planning against the background of China's transition from a planned economy to a market economy, most of which pointed out a fact that Chinese urban planning is path dependent due to its strong government-dominated political origin^{8,9,10,11,12}.

Indeed, the planning history of most Chinese cities contains complex historical background factors from home and abroad, and this adds difficulties to distinguishing real endogenous institutional innovations to explain 'purely Chinese model'. Luckily there is a special kind of Chinese modern cities called 'the Third-front city', built for war-preparing during the Third-front Constructions from 1960s to 1970s, making an ideal example for analysing Chinese special process and characteristics of planning evolution¹³. Those cities locate in inland area far away from national boundaries, and were mostly accompanied by the constructions of the Republic's large industrial plants at that time, especially in fields as iron and steel, petrochemical, machinery, transportation equipment and army defence. Some cities even developed from deserted land to big or medium sized cities¹⁴. The main question here is, early establishment of Third-front city largely benefited from the compulsory power and strictly planned arrangement of central government, which seems not a sustainable mode for a city's development by normal sense from a market economy view. Yet such city mostly went through the follow-up reform and opening up after 1980s with their own ways. Why and how?

To cope with this question, related concepts of historical institutionalism (HI) are introduced in the next section (especially the concept 'path dependence'), while a logical framework is provided to interpret how governance transition and spatial evolution interact with each other in the Third-front city. The following two parts of this paper are for empirical study with one typical Third-front city, Shiyan in Hubei Province. The third section tells about the specific governance structure in Shiyan under circumstances of planned economy and 'the Third-front Constructions', along with its spatial effects on urban planning. The fourth section then explores how Shiyan's governance structure react to the nation's overall institutional transition during Reform Period after 1980s, paying key attention to some prominent path dependence factors and the ways new governance actors managed to live with them.

Characteristic of institution-space interaction in the Third-front city: from view of historical institutionalism

Interpret urban planning history by institution

The theory of historical institutionalism branches from new institutional economics. It stands up for the very viewpoint that both institutional stasis and change matter in urban political dynamics. As a typical capitalist economic landscape, cities are strongly geospatial dependent. Urban phenomenon are shaped by multiple actors' interaction in social relations, behaviour patterns and policy process, which are always generated from specific historical conditions¹⁵. Since the design of institution can be seen as resource allocation based on power relationship, planning history then can be told as a history of institution-building under urban political coalitions of different scales and levels. Urban property capital, its quality, liquidity, risk structure, and profit margins are all shaped by place-specific compromises with regard to who pays for what; which risks are socialized; how infrastructure is delivered, paid for, and maintained; and how public services are provided. Particularly important is the specification of the rules that apply to new capital investment in urban space, and the distribution of the costs and benefits of such investment, which are reflected by local industrial arrangement, fiscal arrangement, spatial strategy and so on.

'Path dependence' is the core idea in historical institutionalism. In a particular local historical process, some external critical junctures marked by major historical events will always contribute to specific institutional choices, and at the same time certain form of political coalitions in favor of this newly-set institutional framework. Yet change does occur after that, while some institutions are harder to change than others and that such differences in openness to and patterns of change can have profound impacts on urban outcomes¹⁶. On condition of that, later institutional adjustment tends to adopt an incremental and moderate way rather than a radical change, with consent to the validity of existing institutional framework. Thus urban transition in real situation often presents as an evolving procedure with constantly feedbacks or adjustments between institutional design and spatial outcomes.

Special central-local relationship as the core of path dependence in Third-front City

As 'important legacy' of Chinese urban planning and construction during the planned economy, the value of Third-front cities has been emphasized by many planning history researchers in China^{17,18,19}. Some have further managed to dig the institutional roots behind those cities planning characteristics^{20,21}, but there is still lack of exploration towards the subsequent functions of path dependence factors in reform period (also known as 'post Third-front Constructions' period). This can be partly attributed to the limitation of theoretical perspective which used to regard institutions as controlled variables, so that we could only discuss the planned economy and the market-oriented reform separately. Now the application of historical institutionalism might help a lot to break through such limitation.

Urban space is moreover a political expression²², that is, the way politics acts on urban development is through arrangements for land and its overlying spatial structures by urban governance actors (who have power rights and benefit from urban space)²³. Our discussion about the Third-front city follows this theoretical logic as well. Despite that in Soviet-style socialist planned economy, individual is reduced to a passive and minimal state and private property rights are abolished²⁴. Although resources are allocated by plans, or more accurately by bureaucrats, they nonetheless need to be controlled by some organizations that then put them into consumption or production. That is, there are still de facto property rights, which inevitably give rise to property interests. These property interests may be held by a factory, a school or even a government agency. In a Third-front city as Shiyang, such organization compound took the shape of 'the Third-front enterprise'. However, it was actually not an enterprise in the real sense, but a vertical dispatch department set up by the central government for the construction of large industrial bases at local. Therefore, 'the Third-front enterprise' had got dual role as an industrial entity and both a local government agency, which made it the central knot between governments of different levels and between government- enterprises. This had then led to multifaceted intertwined status of central-local government relationship in the Third-front cities, making a starting point for path dependence (Fig.1).

Planned economy period: the ‘enclave’ of central government and the formation of path dependence

Chinese central government had been investing enthusiastically towards Third-front cities from 1964 to late 1970s. At this period, Third-front cities were essentially more like the implementation bases of the “Comprehensive Plan for Regional Industrial Construction”²⁵, and therefore were set up completely surrounding the state’s production units, with needed labour force and their living facilities, which totally was ‘the socialist style’. The City of Shiyuan was selected then as the location of Chinese second automobile factory, one of SPUs. This implementation changed Shiyuan from a remote deep-hill village to a large-scale specialized industrial city.

‘State-owned enterprises(SOE)’ as the foundation of exotic specialized industries

Once located in some place, large-scale industrial projects will have profound impacts in terms of investment return, industrial chains and bringing other sub-sectors²⁶. During the Third-front Constructions, industrial projects launched basically shared the above characteristic of significant positive externality, which was further magnified by the State’s centralized and monopolistic investment. For example, Chinese second automobile factory (referred to as ‘the SOE’ here), which was a military-oriented enterprise directly subordinated to the State Council’s machinery industry authority, providing products nation-wide, was totally ‘airborne’ to Shiyuan when there was no modern industrial departments. Under the state’s strict supervision and support towards the whole operation process including production and sales, capital withdrawal, and financial flow, the SOE achieved dramatic development and became the absolute pillar industry of Shiyuan. This process brought profound influence toward Shiyuan from two perspectives. On one hand, the SOE in Shiyuan restricted local economic development. The profit of the SOE went directly to the central government, leaving the local of Shiyuan in a dilemma of lacking financial income from its profit. In the meanwhile, Shiyuan also had difficulties to adopt other industries since the pillar industry had dominant impact on local economy. On the other hand, the SOE lay industrial foundation for Shiyuan. Under the strong promotion of relevant national policies, the SOE had received fully support from the entire country for raw material, personnel, technology, and other aspects. The complete industrial chain and national leading technology had provided Shiyuan the potential and opportunity of becoming an ‘automobile city’.

Administrative structure: close connection with central government and integrated leadership by the local and the SOE

Third-front cities like Shiyuan at first did not have much political resources except for exploitable land, due to their weak linkage with capital city and other cities in the same province. When the SOE settled in Shiyuan, a strong linkage between the local and central government had been created robustly. In order to form a streamlined administrative structure between local and the central government, a unique administrative system had been introduced. The technical and administrative leader of the SOE also undertook the position of the party and governance leader of the Shiyuan city. Under this administrative system, central government provided more direct guidance and support towards the city development via the SOE. For example, the leader sought tens of million funds directly from the central government specifically for the setting up of local education, health care, culture, sports, public security, fire protection, residents’ committees, the People's Armed Forces, real estate, telecommunication, and warfare, which boost local development dramatically. In addition, since the leader was granted rights of both city and SOE construction, he could arrange local personnel and industry more efficiently. One manifest practice was encouraging family members of SOE staff to participate in local production industry cooperating with the Second automobile factory, and in other service and commercial work unit. By this means, the special administrative system created a self-sufficient society by providing products and services for the producer group, which succeeded in intensive use of local resources and providing stable life quality for residents at the same time.

Spatial Effect: fragmented land use pattern based on industrial clusters

The decade from 1973 to 1982 was the crucial developing period for Shiyuan. During this decade, the State Ministry of Finance allocated 47.1 million Yuan in the fundamental urban infrastructure construction for Shiyuan. Under this circumstance, Shiyuan benefited from the vast investment in rapid urban expansion, while was constrained strictly in the urban development pattern planned by central government at the same time. For air defence considerations, central government set 23 sub-factories of the SOE scattered in 8-10 mountain valleys with a total spatial range of approximately 10-22 km connected by massive mountain roads, bridges, and railway lines²⁷. This industrial spatial

distribution affected the spatial pattern of urban region profoundly. At planned economy era in China, residential area and supporting living facilities were in coordinate with production sectors to provide sufficient services under the guidance of a rigid rule. Shiyang's residential area and facilities therefore followed the pattern of industrial cluster land use, and formed a fragmented urban pattern with 8 separating functional clusters separately every 3-5km. Under this basic urban development pattern, hospitals, primary and secondary schools, other service facilities, and warehousing and freight yard land were all set by time in 8 clusters respectively (Fig.2). Later industries settlement was also attracted adjacent to original clusters, which enhanced this scattered pattern. Although this fragmented spatial pattern was not economic rationality, it still developed smoothly relying on the leaning financial support by central government.

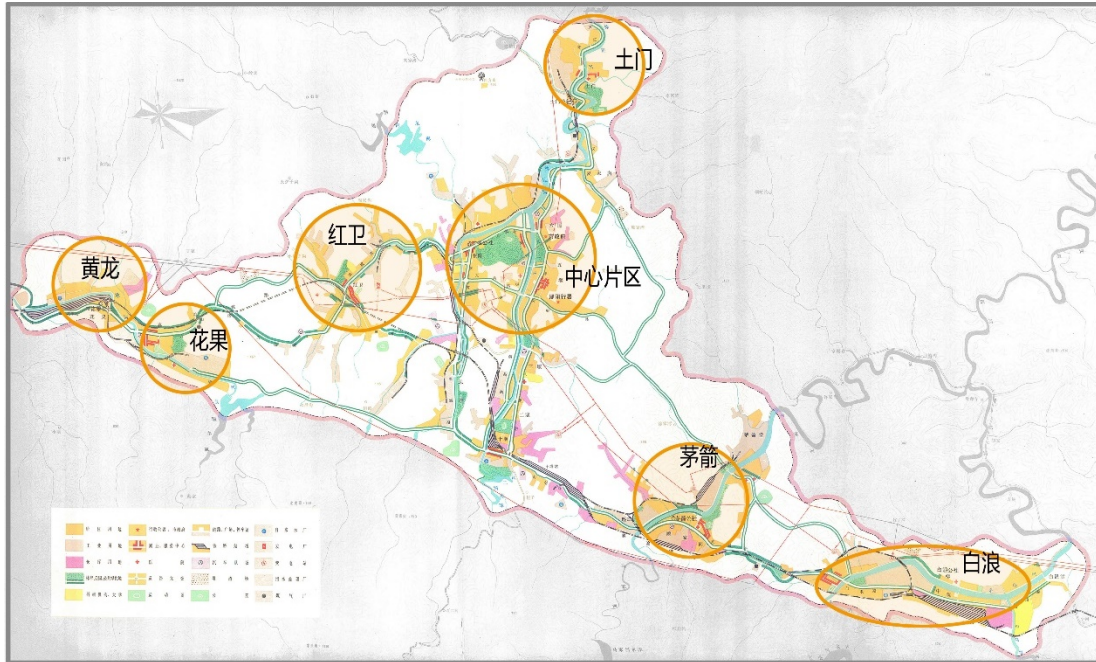

Figure 2: Urban structural plan organized for the priority of each factory

Reform period: 'the return of local authorities' and their compromise to path dependence

Overall institutional environment change in China began from the early 1980s with decentralization as its fundamental characteristics²⁸, both in administrative and economical territories²⁹. Local government was a pure local branch of the state in the planned economy, but in the market economy it would enjoy much higher degree of local autonomy and have many more functions. In the meantime, thanks to the termination of the wartime planned economic policy, the nation's investments for Third-front industry projects had been cut down greatly. As a natural result, Third-front cities were not that tightly bound to the central government, then 'the return of local authorities' in governance system became a must to ensure those cities' succeeding development. But in fact, Third-front cities mostly witnessed a situation where local actors showed inertial dependence towards central government via the existence of 'Third-front Enterprises', while making some incremental institutional adjustments within the original governance framework. This in a sense provided enough buffer zone for the Third-front city to go through transition steadily, as things went in Shiyang.

Sustained overflow effect and political say by the Third-front Enterprise

The special system design of integrating local city with enterprise in Shiyang ended in 1982, and local government of Shiyang officially established. The Chinese Second automobile factory was no longer an all-round dispatched agency responsible for Shiyang City, beginning to show more market-oriented interest demands itself. Yet as the nation's important assets still, Chinese Second automobile factory could consistently get indirect support from the central government in many ways like produce orders, technical help or brand building. This was the very economic overflow effect local city needed, so the Second automobile factory and its related industries had taken dominance in Shiyang's production system for a long time (Tab. 1). Above that, benefited from administrative resources accumulated during the planned economy, Shiyang had remained some political privileges in negotiating

²⁸ LUO Zhendong. *Metropolitan Development in China* (Beijing: China Architecture & Building Press, 2007).

²⁹ LI Yanyi. *Central-Local Relationships and Local Governance Revolution in China* (People's Forum, 2014).

with the central government. Even a lot of early local government members were former leaders of the Second automobile factory. They helped seek for several important projects for Shiyang city, including the Automotive Industry College set up by National Ministry of Education, talent introduction policy towards nation-wide, and convenience in international trade, which were quite rare for inland cities like Shiyang.

		<i>Number of enterprises</i>	<i>Output value</i>	<i>Fixed assets value</i>

Table 1: Enterprises of automobile industries in Shiyang (2008) .

Local government's struggle in interweaving administrative and property relationship

In the state owned assets system of China, the rights of property and income are attributed to governments by levels. During the former planned economy, to facilitate the central government's control on the Second automobile factory, the administrative level of Shiyang had actually been promoted higher than the province level. When it came to the reform period, some mismatches had popped up then: the financial income of the Second automobile factory belonged to the central and the Hubei Province government; the part of local collective enterprises belonged to the Yunyang Region (approximately the range of Shiyang Metropolitan Area nowadays); thus the city of Shiyang could only rely on little revenue from agriculture and business departments, which made it hard for the local government of Shiyang to organize the city's planning and constructions. By 1990s, the gap in public services grew larger and larger between the Second automobile factory system-inside and the local. Faced with this problem, the local government actively took advantage of institutional legacies by the Third-front Constructions and made a policy towards sharing public service responsibilities between government and enterprise. The specific practice is that, the Second automobile factory first organized a 'Shiyang management department', embodying all those non-business affairs and public services such as infrastructure, energy supply, education, medical care, accommodation, entertainment and so on; According to later operating conditions, these functional units could be passed to corresponding administrative sections, or seek asset merging with local enterprise actors.

Spatial adjustments: tiny change with regards to original urban spatial pattern

Not only the governance structure, also in spatial planning, the needs of automobile industries had been put in first consideration in the reform Shiyang. In spite of the awareness that the scattered pattern in a long range was kind of wasting, the pattern was still continued in later planning drafts, with tiny advices of combining adjacent production clusters into comparative multi-functional zones (Fig.3). In addition, to ensure a steady level of infrastructure facilitating, local government had also made the decision of joint sponsor in major facilities construction, which actually enlarged the scope of Second automobile factory in local Shiyang.

Figure 3: Urban structure of three main clusters put up during reform period.

Conclusion and Discussion

For Third-front cities, the special central-local relationship plays the core role of path dependence in its comprehensive institution system towards urban development. Especially the creation of giant-scale 'SOE' as Chinese typical doing after 1949, has proved the view that 'Once the political alliance is combined with a large enough asset owner group, it can effectively prevent the formation of another alternative alliance'.

Just as in Shiyan, the initial institutional system dominated by central government had ensured rapid rise of Third-front city in early stage, while producing path dependence and long-term urban spatial influences. In face of transformation, general environment of modest reformation in China had provided enough buffer space for new institutions; On the other hand, despite path dependence in terms of industry pattern, finance structure, administrative power and so on, new local actors' seeking for incremental changes within original institutional framework also generated transformative effects. Thus, the beings of Third-front cities, which seemed incompatible with market economy, have made their own way to strive the conflict in Chinese overall transition environment.

The geospatial dependence and institutional path dependence of urban phenomenon are in constant interaction. Only by taking historical institutional legacy seriously and figuring out how it functions among urban governance, can we come up with better ideas to help the local make effective adaptive response towards common transition.

26 Critical Junctures of Institutional Transformation: Developing theory and cases in planning history

Is the land finance system a fiscal expediency? Tracing the process China establishes the underlying institution for contemporary city planning

Nannan Xu (The University of British Columbia)

Why could China be able to urbanize with a more sufficient provision of infrastructures and less informal developments comparing to other developing countries? I argue that the reason is that the Chinese state successfully captured land value increase in the urbanization process with which needed infrastructures were funded.

How could the Chinese state capture the land value increase? It was not only because of the state landownership as a legacy of the communist revolution, but also of the institutional reforms of land management in the real estate marketization era. This paper examines with a historical institutionalist approach the 1998 revision of the Land Management Act. Taking it as a case of critical junctures, I present how the party state made land value increase accumulate towards the public fund. In the constant institutional reform process, the period that individual local officials and rural collective leaders transfer public-owned land use rights with depreciated values for personal gain, which I call the 'wild 90s', gradually terminated in the beginning of 21st century.

This paper concludes with three points: first, the land value capture institution, widely known as 'land finance (tudi caizheng)', was conventionally explained away as an expediency to the 1994 fiscal reform which substantially reduced local governments' tax income. However, the so-called land finance only became a significant source of income after 2002. An expediency should not take such a period to formulate. This research provides an alternative explanation to the formation of land finance, that the land value capture institution was a nationwide intentional arrangement of the 1998 revision of Land Management Act, instead of an expediency to fill local fiscal gap.

The second point is that the growth-machine or urban-entrepreneurialism model developed in the western neoliberal context demands three adaptations in the Chinese case. First, the power relation within it is different from that of the western cases. The state dominates. Second, the logic of coalition changes since the 1990s. Initially, local officials easily ended up with sacrificing the state interests for personal gain, but later they must work in a more institutionalized environment. The motivation of engaging with investors was shaped to be more towards raising money for infrastructure development and economic growth, which were evaluated as political achievements. The third adaptation is to take into consideration of the role of the central party state. They have always been playing the hegemonic role of the ultimate maker of the rules of game. The third point is to advocate for an expanded scope of the Chinese planning history, which has always focused on just one of the multiple 'plannings' in China: the urban and rural planning, or Chengxiang gui Hua. One has to at least understand the land management institution to see a whole picture. Aimed at broadening the scope, I intentionally examine one important critical juncture in the development of land management institution. As the multiple planning institutions have been merged into one central-government agency in March 2018, an integrated approach to their histories becomes more practically meaningful.

Land Readjustment in Denpasar, Indonesia: Critical Junctures, Effects on Land Governance and the Spatial Distribution of Land Prices

Felipe Francisco De Souza (The University of Tokyo)

After the World War II, and after the coming decades where colonialism and colonial processes came to an end, a whole new space for the diffusion of ideas and models took place and international cooperation agencies became the main drivers to support the developing world in turning new projects into reality. Among different ideas and models, land readjustment has been practiced and transferred for more than 100 years, and the last decades witnessed an unprecedented interest on such urban planning instrument. Its adaptation and implementation processes replace old approaches and precedes significant changes inside planning cultures. Critical junctures – briefly defined as a period of rupture which is hypothesized to product legacies – therefore is relevant when (1) reviewing the historical reconfiguration when Indonesia started urban land readjustment projects in Denpasar city, back 1980s, and (2) reviewing how that long-term implementation and incremental revision of the instrument – mainly supported by the Japan International Cooperation Agency – shaped the local planning system and city's environment after 30 years. In order to contribute with the understanding of potential legacies, the present paper reviews the South District of Denpasar and 4 projects to evaluate changes in land prices, comparing variation throughout time, inside and outside land readjustment project areas. When addressing how land readjustment has shaped the urban environment of Denpasar at the regional scale, most specifically, the research intends to find expressive valuation of land prices in existing land readjustment projects, comparing with areas that were urbanized without using the instrument, performing such analysis through the econometric model of "difference-in-differences." Some initial findings suggest, from the results of difference-in-differences, that land readjustment has shaped the urban environment of Denpasar by reflecting socio-economic disparities especially when comparing inside and outside project areas. Such disparities seem to be a problem because (i) the government is subsidizing these projects without cost recovery land and (ii) the government is not increasingly and properly collecting property taxes from these areas to redistribute to the society as a whole (like the Japanese government does)

The paper ends listing the research limitations and looks into a proper theoretical framework on critical junctures in order to understand the research outcomes.

How does urban legislative reform shape planning education and practice? The Institutional Agency of the 74th Amendment to the Indian Constitution

Azhar Tyabji (The University of British Columbia)

The landmark 74th Amendment to the Constitution of India (1993), which sought to devolve urban decision-making from federal and state governments to local authorities (‘panchayats’ and municipalities), is well-documented as a critical, historical juncture in the postcolonial story of Indian urban governance. But a qualitative accounting of its specific effect on planning pedagogy and practice following India’s new economic openness to Foreign Direct Investment and global competition in 1992 might raise intriguing questions to do with causality and correlation. Could we view urban legislation as the embodiment of agency, as in Latour and Appadurai’s reckoning, with a contingent ‘thingness’ that produces social consequences, giving rise to new institutions in turn? Assuming an historical-institutionalist approach, this paper argues that the genealogical trajectory to early-1990s urban legislative reform in India represents a kind of institution in and of itself, profoundly shaping planning education in the mid-1990s, and consequently forms of planning practice that have since come to define the ‘new normal’ characterized by a market neoliberalisation of knowledge production and its application to urban planning in India, albeit with profoundly moral consequences. Drawing from select narrative interviews with planning practitioners who were witness to legislative advances leading up to and after the 1993 ruling, the paper begins by speculatively setting the historical precedents to such legislation against an emergent Asian/Tiger encounter with neoliberal urbanization in the late 1980s/early 1990s (with China as one of several comparative foils)

The paper then sketches legislative impacts on planning education and practice in India, exploring the proposition that markedly-new advancements in legislation empowered new state and private planning ‘actors’ in the 1990s, driven by moral logics of the market that seemed newly at odds with the State’s hitherto-welfarist thinking. The paper reflects, in conclusion, on the methodological challenges and opportunities specific to situating legislation-as-an-institution within the overall logic of historical institutionalism, and more broadly the historical problematic of charting the moral consequences to neoliberal schools of planning thought in India.

Forks in the road: Theory and method of critical juncture analysis in planning history

Andre Sorensen (University of Toronto)

Social, political, and economic change sometimes occurs during periods of major change in which previously relatively stable structures are replaced with new approaches. Historical institutionalists refer to these turning points as critical junctures. Critical junctures are usually defined as periods of significant change which tend to occur in distinct ways in different jurisdictions, and which have enduring legacies. The suggestion is not that all change occurs in this way, as processes of incremental revision and evolution are also important. But if critical junctures sometimes produce enduring legacies, then these periods are an important topic for research and theory-building. Planning history offers many examples of such relatively short periods of significant change that produced distinct and lasting outcomes in different jurisdictions.

The study of critical junctures has been a major theme of comparative historical analysis and historical institutionalism for a quarter century, and a significant literature on critical junctures has developed in recent decades. This research has contributed to the development of robust conceptual frameworks detailing the structure and implications of such change processes, as well as the development of associated research methods, particularly for comparative historical analysis, that are valuable for planning history research. It seems clear also that planning and local governance processes experience some distinctive types of critical juncture, compared to national governance processes, such as during post-disaster recovery, major infrastructure investments, or new planning laws or mandates imposed by senior levels of government.

This paper reviews recent research in this area and develops a conceptual framework and typology of critical junctures relevant to planning and urban governance.

27 The Routledge Handbook of Planning History / Round Table

Tue. July 17, 2018

Session 6 (2:45PM-4:30PM)

Lecture Hall, Yokohama Port Opening Hall

Moderator:

Carola Hein, Professor, Delft University of Technology, The Netherlands

Participants:

John Gold, Margaret Gold, Andre Sorensen, Dirk Schubert, Stephen Ward, Clement Orillard and Stephen Ramos

Planning history is a discipline with diverse terminology, multiple interpretations and manifold applications through space and over time and the methodological and theoretical approaches towards planning history reflect that. The Handbook of Planning History starts with the assumption that planning is a flexible system rather than a fixed one. Taking a networked, cross-cultural, balanced approach, and writing from different vantage points, the Handbook explores spatial traditions and cultural landscapes. This session brings together nine authors from the handbook to present their work and to reflect on the next steps of writing planning history for the future. It first explores the development, state and goals of planning history, highlighting diverse global approaches. It then investigates the reasons for pursuing such historical investigation both in regard to past and future practice of planning and finally provides indications as to the ways in which planning history may work in the future before outlining the overall concept of the Handbook.

The authors have respectively written or contributed to the following chapters:

1. Planning History and Theory: Institutions, Comparison, and Temporal Processes, André Sorensen
2. Global Systems Foundations of the Discipline: Colonial, Post-Colonial and Other Power Structures, Robert Home
3. The Ancient Past in the Urban Present: The Use of Early Models in Urban Design, Michael E. Smith, Carola Hein
4. Urbanisme, Urbanismo, Urbanistica: Latin European Urbanism, Javier Monclús, Carmen Díez Medina
5. Planning Latin American Cities, Maria Cristina da Silva Leme, Vera Lucia Motta Rezende
6. Translating the Idioms of Japanese Planning, Carola Hein
7. Ports and Urban Waterfronts, Dirk Schubert
8. Urban Segments and Event Spaces: World' s Fairs and Olympic Sites, John R. Gold, Margaret M. Gold
9. Global Suburbanization in Planning History, André Sorensen
10. Opposition, Participation, and Community Driven Planning Histories, Dirk Schubert

28 Colonial Planning in Asian Cities

History, Development and Hereafter: Planning Legacies Within the Walled City, Manila.

Claudia Isabelle Montero (The Chinese University of Hong Kong)

The quest to look for a new capital of 'New Spain' prompted the founding of a fortified city in Manila in 1571. Intramuros, which means 'within the walls', represents the beginning of planned Spanish colonial urbanism in the Philippines. For over 330 years Intramuros operated as the military, political and religious center of the Spanish colony in Southeast Asia. Developed in accordance with the Laws of the Indies (1573), Intramuros reflected the Spanish vision of an ideal urban form. However, The Intramuros' plan is distinct when compared to other Spanish colonies e.g. those in Latin America. Notwithstanding the arrival of Americans in 1898, and in 1905 City Beautiful pioneer Daniel Burnham putting forward a comprehensive city plan for Manila in which the old Spanish walls and fortified city were to be retained, thus with reference to the urban form of Manila today this paper attempts to appraise the correlation between the historical institutional planning factors and Philippine capital city's present-day status and development. Consequently, this proposal for conference aims to present the planning legacies of Intramuros, e.g. how and why it has become part of contemporary heritage discourse in Manila. Fundamentally, the paper deals with one major question: where, in the setting of Philippine heritage studies, does planning history fit? Moreover, why has the Intramuros become seen by the heritage community to articulate (in space) Filipino cultural identity when to be brief, its origins and development are Spanish, and not in any way Filipino?

Portuguese Colonial Momentum and Political Inertia: the Macao Inner Harbour Improvement Project Deadlock (1884-1919)

Regina Campinho (University of Coimbra/University of Lorraine)

In October 1919, the Governor of Macao received a formal complaint from Canton concerning the ongoing work on the Inner Harbour Improvement Project, on the grounds that reclamation was being made in Chinese waters. The unusually menacing tone of this complaint, as well as advice by his Hong Kong counterpart to suspend the dredging work, led the Governor to adjourn construction until a diplomatic solution could be found. By mid-1920 it was clear that the young and politically unstable Portuguese and Chinese Republics, the latter moreover deeply troubled by its southern provinces' separatist movements, together with the not-so-subtle British interest in the underdevelopment of Macao's harbour, wouldn't be able to reach an understanding regarding the Portuguese land and maritime borders, bringing the Inner Harbour Improvement Project to a most inglorious end. In 1922, work resumed on Macao's ocean front, far from the disputed water limits, to carry out a wholly different seaport project to be run by an international company under British influence.

This swift resolution to a forty year deadlock was providential to solve Macao's harbour accessibility problem. The wake-up call had come in 1881, with the first reports on the rise of the riverbed which was starting to prevent larger vessels to penetrate the channels leading to the Inner Harbour. At this rate, Macao would become inaccessible to seaborne trade, which struck a chord with the Portuguese imperial pride in the settlement's pre-Opium War reputation as the prime connecting entrepôt between China and the world. From 1884 to 1915, ten projects to update harbour capacity were presented by Portuguese engineers, either on central government special commissions or working in Macao's Public Works Department, aiming to turn the province from a "silting backwater" serving a supporting role in regional trade into a prosperous colony of an internationally preponderant modern Empire.

Portuguese central government had been striving to build the colonial edifice in old self-governing Macao since the 1850s by overthrowing the practice of a "divided sovereignty" established between Portuguese and Chinese local authorities in the mid-sixteenth century, and by taking control, restructuring and expanding the urban territory, mostly with the help of private Chinese initiative, capital and workforce. Increasing colonial grasp, however, eventually meant that all major projects must be backed by central government. Unfortunately, the Empire's finances didn't match its ambition and, when it came to the Inner Harbour Improvement, project after project was denied funding until full shutdown in 1919.

In this paper, examining three of these projects and the reasons they failed to materialize, we will discuss the paradox of turn-of-the-century Macao in which the colonial momentum, responsible for a notable urban renewal period in an initial "laissez-faire" stage, as well as the deployment of an array of progressive engineers, by being fundamentally at odds with the reality of the province's part in regional geopolitics, later ended up stifling that same development dynamics, perhaps irreparably, by subjecting the improvement of Macao's core infrastructure to Lisbon's endemic political indecision and lack of resources.

Urban forms at intersection of Imperialism and Colonialism: a perspective on Beirut

Nadine Hindi (Notre Dame University - Lebanon)

Towards the end of the 19th century and the WWI geopolitical aftermath, Beirut presents a case along the Eastern Mediterranean at the intersection of two major colonial powers, the Ottoman Imperialism and French Colonialism. Dissociated from the province of Damascus in 1888, Beirut was elevated to the rank of provincial capital of Wilâya, the geographical borders of which spanned the equivalent of four actual countries. Following this administrative upgrade Beirut benefited from the Tanzimat reforms and the Sultan Abdul Hamid II jubilee in 1901. This paper will highlight the implementations of these political moments on urban forms and the urban landmarks for the ruler's glory. Under the French mandate, Beirut role shifted from being provincial capital of a Wilâya part of the Ottoman Empire, to being capital of a Republic country with newly defined borders. Preceding the French Colonialism, Sultan Abdul Hamid II envisioned Westernizing some of the Ottoman Empire cities to the image of the European urban model. Alternately, the French were very enthusiastic to modernize Beirut, their prime image in the Levant. At this moment, Beirut's urban fate was at the intersection of two visions of Westernization, the late Ottoman Imperialism and the early French Colonialism. An attempt to better understand the urban implications of this turn of century intersection, will be achieved by highlighting urban forms continuities and ruptures as a methodology observed in the broader geo-political context. It is a chance to reflect on the modes of borrowing Western urban forms and examining the blurred boundaries of their planning, juxtaposition or imposition on an existing urban order. It will as well unfold in a parallel mode how each colonial power approached and applied different urban practices on their occupied territories.

From Colonial to Neoliberal: Urban planning in postcolonial Malaysia

Nurul Azlan (Delft University of Technology)

This paper argues that contemporary neoliberal planning practices in Malaysia demonstrate that there is no real break from its colonial past, since both share the similar endeavour of maximising capital through the spaces they create and destroy. Even though they may seem contradictory since the colonial ideology was based on extraction, while neoliberal planning prioritises growth, the growth that neoliberal planning produces functions and results on a similar logic of extraction as the colonial ideology. Neoliberal planning is defined as the state taking a proactive role in introducing market principles through various levels of planning reforms, which it then reinforces through repressive mechanisms available to it as a state (Baeten, 2018: 105)

Ironically, at times, under guises of heritage, the very architectural legacy of the colonial period is used to justify neoliberal planning decisions, since historical sites are viewed as a golden goose.

In this paper, I will trace the how urban planning has developed in Malaysia since the British colonial period to the present. I will particularly focus on the moment when the state, thirty years after Independence, retreated from its role to provide public service, either through privatisation of institutions, or by incentivising public service to foster growth. I will argue that this policy has shaped the urban environment into one concerned with control and surveillance, parallel to the spatial condition of the colonial period. At times, colonial spatial forms are even recreated, capitalising on nostalgia to produce spaces of consumption and leisure. Finally, I will demonstrate how notions of democracy such as freedom of expression, are reduced in Malaysia through the use of economic growth as an excuse. The paper concludes by systematically drawing the parallels between the colonial and the neoliberal, which is not only limited to abstract notions of operations and ambitions, but also how more tangible colonial legacies are utilised to enforce the neoliberal, indicating a continuity and compatibility between the two ideologies.

Portuguese Colonial Momentum and Political Inertia: the Macao Inner Harbour Improvement Project Deadlock (1884-1919)

Regina Campinho*

** PhD candidate at the Institute for Interdisciplinary Research, University of Coimbra, Portugal, and at the History of Contemporary Architecture Research Center, University of Lorraine, France
regina.da.luz.campinho@gmail.com*

From 1884 to 1915, ten projects to update Macao harbour capacity and equipment were presented by Portuguese engineers, aiming to turn the province from a “silting backwater” serving a supporting role in regional trade into a prosperous colony of an internationally preponderant modern Empire. Portuguese central government had been striving to build the colonial edifice in old self-governing Macao since the 1850s by taking control, restructuring and expanding the urban territory. Unfortunately, the Empire’s finances didn’t match its ambition and, when it came to the Inner Harbour Improvement, project after project was denied funding until full shutdown in 1919. In this paper, studying these projects and the reasons they failed to materialize, we will discuss the paradox of turn-of-the-century Macao in which the colonial momentum, responsible for a notable urban renewal period in an initial “laissez-faire” stage, as well as the deployment of an array of progressive engineers, by being fundamentally at odds with the reality of the province’s part in regional geopolitics, later ended up stifling that same development dynamics, perhaps irreparably, by subjecting the improvement of Macao’s core infrastructure to Lisbon’s endemic political indecisions and lack of resources.

Keywords: colonial urban planning, Portuguese Empire, Macao Inner Harbour.

Introduction

In October 1919, the Governor of Macao received a formal complaint from Canton concerning the ongoing work on the Inner Harbour Improvement Project, on the grounds that reclamation was being made in Chinese waters. The unusually menacing tone of this complaint, as well as advice by his Hong Kong counterpart to suspend the dredging work, led the Governor to adjourn construction until a diplomatic solution could be found. By mid-1920 it was clear that the young and politically unstable Portuguese and Chinese Republics, the latter moreover deeply troubled by its southern provinces’ separatist movements, together with the not-so-subtle British interest in the underdevelopment of Macao’s harbour, wouldn’t be able to reach an understanding regarding the Portuguese land and maritime borders, bringing the Inner Harbour Improvement Project to a most inglorious end. In 1922, work resumed on Macao’s ocean front, far from the disputed water limits, to carry out a wholly different seaport project to be run by an international company under British influence.

This swift resolution to a forty year deadlock was providential to solve Macao’s harbour accessibility problem. The wake-up call had come in 1881, with the first reports on the rise of the riverbed which was starting to prevent larger vessels to penetrate the channels leading to the Inner Harbour. At this rate, Macao would soon become inaccessible to seaborne trade, which evidently struck a chord with the Portuguese imperial pride in the settlement’s pre-Opium War reputation as the prime connecting entrepôt between China and the world. From 1884 to 1915, ten projects to update harbour capacity and equipment were presented by Portuguese engineers, either on central government special commissions or working in Macao’s Public Works Department, aiming to turn the province from a “silting backwater” serving a supporting role in regional trade into a prosperous colony of an internationally preponderant modern Empire.

Portuguese central government had been striving to build the colonial edifice in old self-governing Macao since the 1850s by overthrowing the practice of a “divided sovereignty” established between Portuguese and Chinese local authorities in the mid-sixteenth century, and by taking control, restructuring and expanding the urban territory, mostly with the help of private Chinese initiative, capital and workforce. Increasing colonial grasp, however, eventually meant that all major projects must be backed by central government. Unfortunately, the Empire’s finances didn’t match its ambition and, when it came to the Inner Harbour Improvement, project after project was denied funding until full shutdown in 1919.

In this paper, examining three of these projects and the reasons they failed to materialize, we will discuss the paradox of turn-of-the-century Macao in which the colonial momentum, responsible for a notable urban renewal period in an initial “laissez-faire” stage, as well as the deployment of an array of progressive engineers, by being fundamentally at odds with the reality of the province’s part in regional geopolitics, later ended up stifling that same development dynamics, perhaps irreparably, by subjecting the improvement of Macao’s core infrastructure to Lisbon’s endemic political indecision and lack of resources.

This discussion is part of a broader study on Portuguese overseas action and administration in 19th century and early 20th century’s so-called “age of imperialism”¹ and its burgeoning “world urban system”². It focuses on the evolution of Macao’s urban landscape during this period, particularly through the analysis of government-sponsored urban interventions, with the purpose of interpreting how the city’s changing built environment both represented and conditioned the province’s economic, social and political dynamics. While in line with recent post-colonial urban studies³, the purpose of this study is, however, less to give an insight on “modernization in the colonial context”⁴ but rather to reflect on the globalizing impact of modernization at the imperial scale, where metropolitan and overseas territories are intertwined and subjected to a similar and concomitant transformation process, stemming from the advancement and expansion of industrial science and technology.

Colonial momentum

Captain of the Port Demétrio Cinatti’s 1881 report on how the river siltation was affecting trade⁵ is generally considered to have been the turning point for the “port issue” in public opinion. Commissioned by the Overseas State Department, it accounted for the progression of the sedimentation phenomenon and its causes, predicting that by the 1900s the port of Macao would reach critically low water levels and probably face shutdown. He recommended the implementation of a moderate-scale dredging programme designed to open up sea and river channels liberating access to the piers and existing docks. To accommodate the silt product from the dredging works, he proposed that it be put to use in a new reclamation scheme in the northern part of the peninsula, narrowing the riverbed, consequently improving river flow and reducing sedimentation, while simultaneously creating new land for agriculture.

Cinatti’s report, later picked up by the Macanese press in a sort of nationalistic campaign for the improvement of harbour conditions, had come in the wake of several contacts made by Governor Joaquim José da Graça to the Minister of Overseas Territories regarding this issue. As early as 1879, Graça was writing to Lisbon suggesting that part of the province’s contribution for the imperial common fund should remain in Macao to be reinvested in harbour improvement:

This could be the beginning of a broader scale commercial and industrial development. The commercial movement in 1880 was roughly of twenty-four million *patacas*, and this year it will most probably be even bigger, judging from the last five months. The Inner Harbour is obstructed in such a way that the steamboats docked at the piers get stuck in the mud, even those that barely demand 6 feet of water. Now, cleaning up the harbour can bring two great advantages: facilitating navigation and expanding the territory. There is a bay in the river that can and must be reclaimed, for this conquered land may become excellent farmland which could result in a considerable improvement in public revenue should it be rented.⁶

By this time, work was almost completed in the latest ongoing riverfront reclamation project. With permission granted in 1877 and promoted under a concession contract by a group of mainland Chinese entrepreneurs fronted by a Macanese businessman, it also had been justified on claims of it improving public prosperity by creating new ground on which to build commercial and industrial structures, as well as public health, by eliminating an insalubrious siltation point, and even the river flow, by realigning the pier wall, thus giving the riverfront a more regular profile⁷.

As such, this 1880s pressing for an Inner Harbour Improvement Project promoted by the Portuguese Government and backed by Chinese and Macanese entrepreneurs cannot be understood outside of a colonial momentum that had been manifesting itself since the 1850s, namely in the reshaping and expanding of the urban riverfront.

Indeed, much of the post-Opium War Government reforms had had a strong land use management component, aiming at establishing Portuguese sovereignty over the Macao peninsula. Indeed, the territorial sovereignty issue as well as the blatant Chinese disinterest in the definition of any land or maritime borders would be paramount throughout the second half of the nineteenth century, particularly affecting harbour works.

The “divided sovereignty” system established since Portuguese settlement in 1557, by which both administrations coexisted and established jurisdictions each over their own subjects and affairs, became, particularly in the face of the foundation of the British Hong Kong colony, a source of violently conflicting points of view: to the Viceroy of Canton, delegate of the Qing administration in the Guangzhou province, Macao was a leased territory with no territorial waters, in which land use and construction policies remained Chinese prerogatives; to the metropolitan Portuguese Government, it needed to be more than that.

Following the 1848 eviction of the Viceroy's delegates and customs, and particularly after a great fire destroyed most of the Bazaar, Macao's most prominent Chinese district, in 1856, city ground was ready to be restructured in the colonial mold. Lacking in financial resources, however, Portuguese administration found in the prominent and well-respected local Fujian and Guangdong-born businessman, whose fortunes had thrived due to the gambling and commodity concessions system as well as coolie trade, strong allies in its urban reconstruction and expansion plan. Through consecutive reclamation projects, planned and controlled by the Portuguese Government, namely by its Public Works Department created in 1869, and thanks to Chinese capital, the Inner Harbour transformed in a period of 30 years from a muddy backyard into a (mostly) uniform city façade, welcoming vessels in brand new piers along a main avenue bordered by elegant archways (Figure 1).

As Governor Graça puts it, the 1880s in Macao were a time of prosperity and confidence. In his view, the time had come for the colony to reclaim its rightful place in the international trade routes, by making the harbour accessible, not only to the Canton and Hong Kong steamboats and other small coastal navigation, but also to the larger modern ships. Updating port capacity and facilities, improving its accessibility, and possibly gaining considerable reclaimed construction land in the same process was definitely befitting Macao's growing colonial ambition.

The Inner Harbour Improvement Projects

1. The 1884 Adolfo Loureiro Project

The silting river presented the most obvious obstacle to this project. The predicted scale of the dredging works alone meant that, this time, local Chinese capital would not be enough to see it through. Metropolitan Government backing and financing, as well engineering, was essential, at the same time legitimizing it in the eyes of the Qing administration.

At Governor Graça's request, the Overseas State Department sent Portuguese Engineer Adolfo Loureiro in a seven month mission to Macao to study harbour conditions, from which he drew his 1884 "Preliminary study for the improvement of Macao Harbour"⁸ (Figure 2). In it, the author makes a comprehensive study of the Pearl River Delta geography, tides and weather, coming to the same conclusion as Cinatti that a permanent solution would only come from the general redirection of the conflicting currents that were causing the silt to accumulate in the city's western coast, which meant realigning the river banks well beyond the Macao peninsula. Extensive dredging would follow, using the extracted silt directly to form new reclaimed land.

Figure 3 zooms-in on the reclamation area in the northern part of the peninsula, as it presents itself in Loureiro's "Preliminary study" plan. Traditionally, Macao's border was set at the northern outpost of Portas do Cerco ("doors of the rampart"), situated at the end of a narrow isthmus connecting the peninsula to the mainland. In his effort to comprehensively work on correcting the river flow, Loureiro proposed to go beyond this point and reclaim a vast area to the north in order to create a smoothly curved river bank designed to accelerate the current.

Loureiro proposed to stabilize this reclaimed land through a series of dams connecting the old and new banks. One of these would connect the isthmus to Ilha Verde ("green island"), separating the area destined for farmland to the north of the bay, from the area destined for urbanization and docks to the south. The northern area of the peninsula had long been occupied by floodplains used as rice fields, and its riverside by the Patane shipyards. Loureiro's plan was to maintain that important industry, upgrading it to a new dock complex which could also serve as refuge in the event of a typhoon. This complex would be completed with the construction of an industrial and working-class district, connected to the city by the extension of the riverside avenue up to "Portas do Cerco" road.

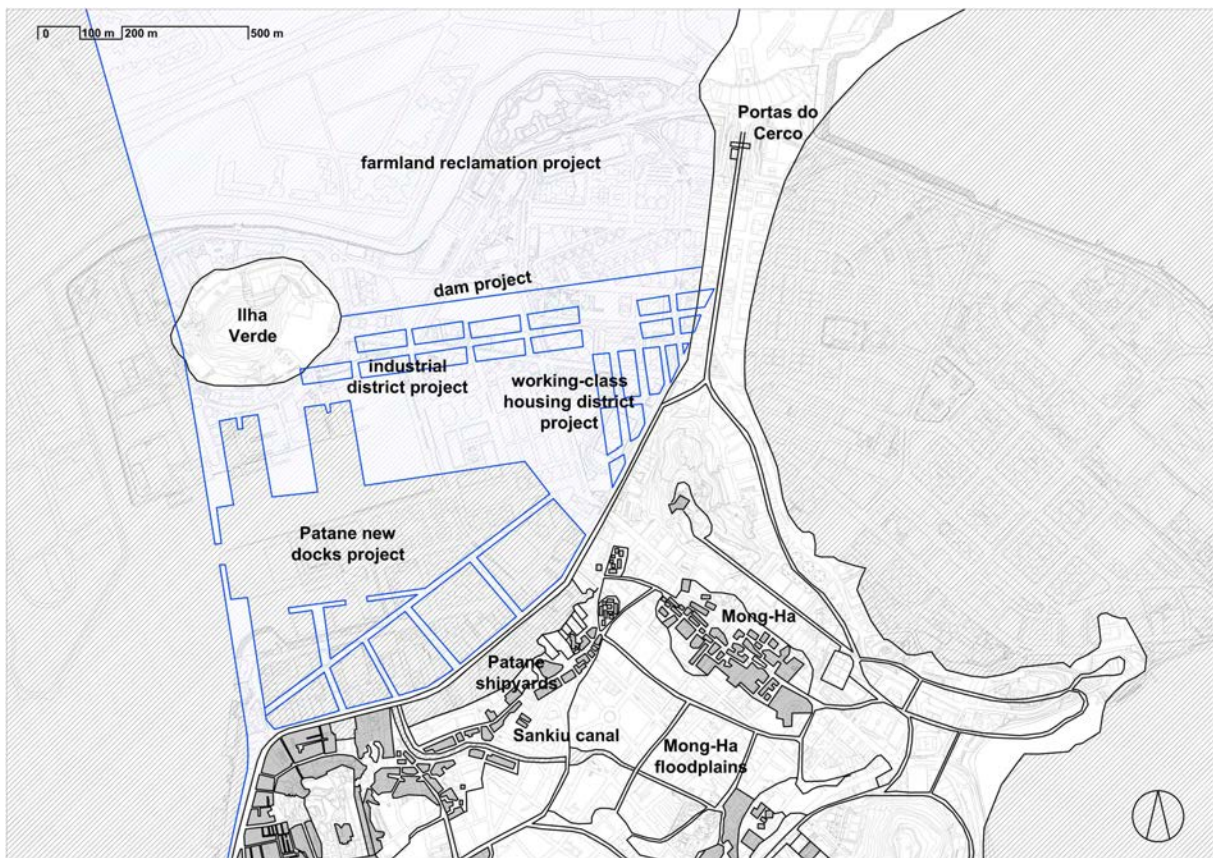

Figure 3: Zoom-in reinterpretation of Loureiro's 1884 "Preliminary study" plan (Figure 2), superimposed on Macao's 2015 cadastral map. Black: the Macao peninsula in the 1880s. Blue: Loureiro's project.

This project represented a somewhat moderate ambition for Portuguese Macao. Its aim was mainly to ameliorate the existing harbour in order to maintain, or at best slightly ameliorate, its trade dynamics. Nonetheless, it was deemed as too ambitious, too expensive, and out of touch with the province's needs. In 1886, trying to tackle the problem, Governor Firmino José da Costa appointed a special committee to study Loureiro's proposals and come up with a prioritised construction plan. Co-written by Captain of the Port Costa e Silva and Public Works Director Horta e Costa, the 1887 committee report endeavoured to tone down the "port issue":

It is undeniable that the silting problem goes back many years, having become more sensitive lately, not due to its aggravation, but because light has been shed on its effects. All the plans and ancient accounts of the province agree that the Inner Harbour was never very deep, even if it allowed entrance to ships with a larger capacity than those that access it today. In 1871, when large scale emigration [coolie trade] was done from Macao, statistics showed that 120 seagoing vessels entered the port. The movement was extraordinary then. In 1885, the same statistics show the entrance of merely 62 ships. At that time, there was great interest in coming here. Today there isn't, but we cannot truthfully claim that this decline is due to the silting of the river.⁹

The Viceroy of Canton, who had met Loureiro's demands to extend his study of the river tides onto Chinese waters with a contemptuous silence, must have manifested his disaccord regarding the projected reclamation, as the committee reported that this could not be carried out, "as it clearly affected land that didn't belong to Portugal"¹⁰. Nevertheless, the prescribed solution reprised Loureiro's idea of dredging an access channel to the Inner Harbour, using the resulting silt to construct a smaller scale docks project.

However, and apart from the 1884 concession to a group of Chinese businessmen for the construction of a single dock according to Loureiro's plan (Lam-mau dock in Figure 4), political decision dragged on. In 1889, Public Works Director Borges Cabral was still insisting on this minimum programme, appealing to the immediate acquisition of a dredger, as a sign of commitment from the Government to the success of the improvement plan:

Various attempts have been made by private initiative to undertake, partially and according to each other's convenience, parts of the reclamation works, which have not been authorized as they didn't follow Mr. Loureiro's plan. This shows how easily, when construction starts and demonstrates its value, private capitals will flow, easing the Government of its initial burden. I should add that not only the Macanese population, but the Chinese as well, accustomed as they are to the freedom that generally presides over public works in Hong Kong, regret the slow and disrupt progress of a plan on which depends the commercial and industrial development of the city and, as consequence, the well-being of its inhabitants.¹¹

The first official steps for implementing the 1887 commission's plan were taken by Governor Custódio Miguel Borja in 1890. A firm believer in the autonomy of local government, ten days after taking office he approved the project for the Ilha Verde dam (Figure 4), ordering construction to start immediately¹². In his December 1890 report, Borges Cabral summed up the general belief that the Governor's arrival would be a turning point in the Inner Harbour Improvement deadlock:

Unless we are eluded by blind optimism, we see in the commencement of these works the greatest indisputable step do give our colony a new impulse of prosperity, now with no fear of disruption. Once the Ilha Verde dam is completed, with the use of the dredged mud, vast reclamation land will necessarily follow broadening our dominions solely with the arms of peace and work.¹³

In Mai 1891, however, the Minister of Overseas Territories issued a direct telegraphed order to Governor Borja to stop any further work until a general improvement plan could be approved.¹⁴

2. The 1897 Abreu Nunes Project

The "port issue" was only picked up again in 1897 by Governor Rodrigues Galhardo and Director of Public Works Abreu Nunes, author of a revised Inner Harbour Improvement Project. As we can see in Figure 4, Abreu Nunes's propositions were still largely based in Loureiro's main ideas. The major difference lies in the greatly reduced extension of the projected farmland to the north, which Nunes limited by a new dam aligned with the Portas do Cerco border, reflecting the underlying political tensions:

The committee has chosen not to extend the new piers towards the north of Ilha Verde, having received instructions not to project any construction pertaining to the Chinese coastline. Although it shares Adolfo Loureiro's opinion that until Pac-seac the coast is still Portuguese, the fact remains that it is currently being occupied by the Chinese. It is only natural, then, that the Government would wish to maintain the status-quo.¹⁵

Another six years elapsed in discussions about which dredger to acquire and hesitations on where to start dredging, until the arrival in Macao of Governor Guedes Rebelo, a clear partisan of the Loureiro/Nunes global solution. By summer 1903, hope was rising again in public opinion that this time the Improvement Project enterprise would actually commence, which seemed to be confirmed by the Governor's dispatch to the Overseas State Department, on September 25th, of a fully updated version of the 1897 Abreu Nunes Project, to serve as the basis for an international public bid. Rebelo's governorship, however, ended abruptly after barely one year in Macao. His successor, Queirós Montenegro, decided to take a step back, considering that the approved plan would "commit the Government to immediate expenses with no guarantee of results"¹⁶. The new Governor preferred to spare the Public Works' small but sure annual budget... and buy a new dredger.

3. The 1908-1912 Castel-Branco Project

By summer 1905, the Overseas State Department had decided to send in a third party.

General Castel-Branco arrived in Macao in January 1907, serving as Overseas Public Works Inspector, in the last months of Montenegro's governorship, as new Public Works Director Miranda Guedes was starting out. Castel-Branco had a general commission to devise a General Improvement Plan for Macao, with contents ranging from potable water supply to the sewage and waste disposal systems, as well as other topics related to public hygiene and sanitation. The Inner Harbour Improvement Project was set to be the pinnacle of this would-be grand city-modernization plan.

Due to persistent health issues, however, it was only in 1912 that Castel-Branco managed to publish his own ideas concerning the port, even if Guedes and other State Department engineers had been successively commissioned to reinterpret his research in several reports since 1908.

In Figure 5 we can see that Castel-Branco's project started from Loureiro's plan, to which he added a new transformative ambition by placing the Macao railway central station in the heart of the new housing and industrial district. According to the author, only this triad of interconnected improvements would manage to change the face (and fate) of Macao: the harbour, the Macao-Canton railway, and the urban sanitation plan:

Strict obedience to this plan [he wrote] is indispensable and urgent to correct the incoherence and disorientation in the development of the city, which has already birthed much evil, threatening to give rise to severe hygienic, economic and social inconveniences. Thus will the Republic prove that our race can fructify and advance the colonies which, in current times, is of primary importance for the integrity and future prosperity of the Portuguese Motherland.¹⁷

Yet again, none of these would ever be. By April 1911, new Governor Melo Machado had already expressed his doubts about the "overly ambitious" Castel-Branco project, preferring to go ahead with a "more modest" deal he was about to break with a British dredging company. The Improvement Project was once again put on hold.

Dredging started in June 1911, putting Qing local delegates, already on edge about looming republican uprisings, on full nationalistic mode. In July, the Viceroy of Canton started raining down protests printed in the local press, stating that Portugal had no right to territorial waters and that its true purpose harbour development was surreptitiously to annex more land in the islands around the Macao peninsula. The breakout of local uprisings in October, however, probably led to a quieting down of the political contestation, as dredging seems to have proceeded as scheduled.

Governor José Carlos da Maia, arriving in June 1914, endeavored once more to take up the Castel-Branco Project, with the support of Public Works Director Faria e Maia, launching the first Patane reclamations in September 1915. One year later, however, Governor Maia was exonerated and ordered back to Lisbon, under the accusation of abuse of power. Budget was drastically cut by the metropolitan government, which led the work to a full stop in April 1917.

The very last effort to relaunch the Inner Harbour Improvement Project would be attempted by Macao-born Minister of Colonies João Tamagnini in May 1918, by separating the harbour from general Public Works management, and putting Vice-Admiral and hydrograph engineer Hugo Carvalho de Lacerda at the helm of the newly created Committee for the Improvement of Macao Harbours. Partisan of a revised Castel-Branco project, Lacerda would easily gather the support of new Governor Artur Tamagnini, the Minister's brother, to resume the reclamation work, until the full shutdown of October 1919.

Conclusion

Macao was the door through which the truth of Christianity was introduced to the Far East and the light of European science was able to radiate over this ignorant and backward portion of mankind. The germs of European Civilization, brought at the beginning to these faraway countries with the help of Portuguese trade have started to fructify abundantly. And Macao, from where the first impulse was given to this great social transformation, should it languish away little by little until complete annihilation? Surely not. Its geographical position, its numerous Chinese population and their capital, the peace, quietness and security that we enjoy, are fertile elements that could regenerate Macao and make it prosper through commerce and industry, if they are seized and directed by an administration that, forgetting the old routine, would find in the true principles of science its guiding rules.¹⁸

In our account of the Macao Inner Harbour Improvement Project forty year deadlock, we painted a picture of political inertia as a set of complex hesitations and indecisions dragging through the years. Both local and metropolitan, engaging in regional politics, but also in financial, political and social issues, it all unfolded in the global context of imperial Europe's geopolitical game of trade route domination.

Following the second half of the nineteenth century Portuguese colonial momentum, a great deal of this inertia, affecting the outcome of the Harbour as well as other grand-scale projects, was probably coming from a grave discrepancy between the positivist imagining of the colony of Macao in an equally imagined gloriously ancient Empire, as described above by the Macanese Mayor in 1883, and both realities in the context of Portuguese possessions' role in the global political and commercial networks.

As Adolfo Loureiro himself pointed out in 1895, after the First Opium War Macao had been reduced to an intermediary outpost between the interoceanic routes coming to Hong Kong and the West Pearl River Delta provinces. Nothing more, but also nothing less. Loureiro's view was that, if Portuguese imperial ambition tried to "regenerate Macao" to make it emerge from its said "languishing state", this was bound to upset not only the British but especially China: "They would start to look at us with their usual wariness, and maybe take away the advantages they grant to our harbour, as the true Chinese harbour that it is."¹⁹ The key was to embrace this role and grow from it, not try to change it.

However, in the late nineteenth century Imperial Europe's intellectual and political circles, it was commonly acknowledged that imperial powers had the duty, at home and abroad, to commit to modern enterprises like improved and connected harbours, or grand urban sanitation schemes to push forward the imagined industrial city. This impulse of nationalistic progress and modernization mostly sprang from the early-century "material improvements" philosophy promoted by French economists like Michel Chevalier²⁰, who claimed that the "true principles of science" provided unequivocal "guiding rules" for the betterment of humanity or, in this case, for the urban and social regeneration of the city, which was earnestly perceived as a civilizing mission.

This philosophy would indeed lead to important interventions in Macao, as in other metropolitan and overseas cities. Overall, though, the Portuguese Empire's meager means meant that improvement projects concerning other than the prioritized African and Indian provinces, more often than not ended up at the bottom of Public Works Departments' drawers. As engineer Lisboa Lima ironically mentioned about Timor in his 1913 report on the general lack of progress in the modernization of Portuguese imperial ports: "The State's initiative here has been little more than nothing. Any change in the betterment of the colony is of private initiative, perhaps due to the fact that Timor still isn't connected to the world, and therefore to Lisbon, by the telegraph."²¹ Maybe "a little more distance" to the overbearing metropolis would have gone a long way in keeping the 1850s colonial momentum going in Macao, allowing perhaps for a more locally consensual Harbour Improvement solution to be found.

Urban forms at intersection of Imperialism and Colonialism: a perspective on Beirut

Nadine Hindi.

PhD, Department of Architecture, FAAD - nhindi@ndu.edu.lb – Notre Dame University, NDU - Lebanon.

Towards the end of the 19th century and the WWI geopolitical aftermath, Beirut presents a case along the Eastern Mediterranean at the intersection of two major colonial powers, the Ottoman Imperialism and French Colonialism. Dissociated from the province of Damascus in 1888, Beirut was elevated to the rank of provincial capital of *Wilâya*, the geographical borders of which spanned the equivalent of four actual countries. Following this administrative upgrade Beirut benefited from the *Tanzimat* reforms and the Sultan Abdul Hamid II jubilee in 1901. This paper will highlight the implementations of these political moments on urban forms and the urban landmarks for the ruler's glory. Under the French mandate, Beirut role shifted from being provincial capital of a *Wilâya* part of the Ottoman Empire, to being capital of a Republic country with newly defined borders. Preceding the French Colonialism, Sultan Abdul Hamid II envisioned Westernizing some of the Ottoman Empire cities to the image of the European urban model. Alternately, the French were very enthusiastic to modernize Beirut, their prime image in the Levant. At this moment, Beirut's urban fate was at the intersection of two visions of Westernization, the late Ottoman Imperialism and the early French Colonialism. An attempt to better understand the urban implications of this turn of century intersection, will be achieved by highlighting urban forms continuities and ruptures as a methodology observed in the broader geo-political context. It is a chance to reflect on the modes of borrowing Western urban forms and examining the blurred boundaries of their planning, juxtaposition or imposition on an existing urban order. It will as well unfold in a parallel mode how each colonial power approached and applied different urban practices on their occupied territories.

Keywords: urban forms, colonial powers, Beirut, Westernization

Introduction

This paper will highlight Beirut's changing urban forms towards the end of the 19th century, at the intersection of Ottoman Imperial and French Colonial rules. Both ruling powers resorted to Western urban planning and practice for the improvement of cities under their rules, Beirut in this case. Preceding the French Colonialism, the Ottoman Empire envisioned Westernizing cities to the image of the European urban model. The different reasons lying behind the Ottoman will and urge for *Westernization* will be explained in this paper in the broader geo-political and administrative context of Beirut. The Imperial glory of the urban achievements didn't last long as the Ottoman Empire was fragmented and divided following the WWI geopolitical aftermath. At that turning point of history, the French ruled Lebanon and were very enthusiastic to modernize Beirut, their prime showcase in the Levant. Both the late Ottoman '*model of progress*' and the French '*mission civilisatrice*' in the Levant, Beirut being its *Vitrine du Levant*, placed Beirut among their strategic priorities¹. Accordingly, both ruling powers shared some of the urban *Westernization* features, which visibly transformed the city's landscape at the turn of the century. Applying *Tanzimat* reforms, the late Ottoman regime aimed at modernizing their major cities by *Westernizing* them. French urbanization intersected in many way this *Westernization* implications in particular at the beginning of the mandate. This paper will highlights points of convergence and divergence in the two modes of *Westernizing* for the production of city space. It will present an understanding of their urban visions and the effect of *Westernization* modes in the laying out of a Mediterranean city.

The literature on the changing geographical importance of the Eastern Mediterranean coast and the growth of cities along it has documented accurately the urban landscape of late 19th century Beirut, namely the scholar works of Hanssen (2005) and Çelik (2008). However literary works addressing the Mediterranean cities in their specific historic urban trajectory are still hesitant and thus far present an incomplete reading of the individual cities. This paper unfolds Beirut's urban transformation as a Mediterranean city, from a medieval Arabic city structure into a major port-city on the Mediterranean. The production of urban forms, their structural changes and their transformation will be approached under two main perspectives; the city as physical space and consequently as a dynamic model, and the city as part of a larger network and wider context. Observing the city as being a physical space consists of analysing the transformation of the city fabric, the evolution of the urban landscape and its

structural changes. Simultaneously, studying the city as part of a network leads to an understanding of the urban dynamics in relation to its broader geo-political context.

This paper highlights the urban forms transformations at this particular moments of history, when late Ottoman concerns about urbanism were Western-driven, followed shortly by the Westernizing practice of the French on their colonial cities. It is an opportunity to reflect on the modes of borrowing Western urban forms and to examine the blurred boundaries of their planning, overlay and imposition on an existing urban order. While the text doesn't draw primarily on the economic and socio-communal aspects, it doesn't imply by any means that they are of a lesser importance. It doesn't focus neither on the role of the political authority in imposing urban orders on occupied territories as a major indirect catalyst in shaping the city.

Contextualizing Beirut at the end of the 19th century

Beirut has been historically a city at the crossroad of different empires and played different administrative roles within different geographical boundaries and political dominations. Under the Ottoman rule, its administrative role kept on gradually rising while it was still part of the *Bilad al Sham* territories until the fall of the Ottoman Empire in the WWI aftermath. From a city under Ibrahim Pasha's rule that was annexed to the province of Damascus in 1864, it rose in the lapse of twenty-four years to become capital of *Wilaya* in 1888 (the total area of which was 30,500 km²), then capital of Greater Lebanon (Lebanon area, 10,450 km²) in 1920, as it is currently in its present-day borders. On a macro-scale, Beirut shifted from being a province within the *Bilad al Sham* territories under the Ottoman rule, into a capital within a State frontier under French rule.

Following the Sykes-Picot agreement, the Empire territories were divided into different states among Allied forces, and consequently the network of the Empire cities was modified and forced to function in a different mode, following a new geo-political context. Confined within the smaller geography of the state of Greater Lebanon, the French authority considered itself a 'mission' and a 'mandate' rather than a 'colonial' power. Earlier, when Beirut was upgraded to capital of *Wilaya*, it benefited from the *Tanzimat* reforms and the Sultan Abdul Hamid II silver jubilee in 1901, the implementations of which played the role of urban catalysts. Accordingly, Beirut became part of the network connecting the Empire's major cities. As the word *Tanzimat* mean literally 'reforms', urban reorganization, reordering and restructuring were instituted, inspired from Western urbanization concepts. Urban Westernization was thus practiced under late Ottoman rule in an ironic anticipation to the French production of urban space.

The slight overlap and intersection of these two urban moments will be tackled through this paper by presenting their effect on the city. During the early mandate period, the French continued working on the city image initiated by the Turks for the Sultan by carrying out the '*Foire-Exposition*' event of 1921. Similarly, they appropriated physically the public spaces of *Sahat* and occupied the architectural landmarks. They carried on the urban developments initiated by the Turks in the port sector and clearing of the medieval fabric of *Bayrout al-Qadima* which preceded their 'imported' urban practices. Though both powers sought Westernization in their urban design paradigm, the French character diverged substantially from the late Ottoman one. At a more advanced stage, the Mandate failed in fully implementing two successive master plans envisioned in 1932 and 1934 by French planners, respectively Danger then Delahalle.

The changing urban landscape

Several factors laid behind the rise of Beirut from a coastal medieval city into a major Port-City along the Eastern Mediterranean coast at crossroad between shipping lanes and the land routes for trade activity². This urban transformation was deeply rooted in the geo-political and administrative changes initiated during the late Ottoman period³. At that time, both Ottomans and French shared a particular interest in Beirut and worked on strategically improving the port and its surrounding area. The works on the port ran in parallel to the development of the infrastructural connections between Beirut and Damascus, a hinterland city without a seaport.

The Beirut-Damascus carriage road completed in 1863 bypassed the tortuous intramuros roads to reach the seaport and replaced the previous route that crossed *Sahat al-Burj* through *Bab al-Saraya* and *Bab el-Dabagha*. Beirut was throwing off its medieval character and moving out of its eroded walls around 1860. It grew in size along the main arteries to Damascus, Saida and Tripoli completed between 1860 and 1876. The two extramuros loose and undefined spaces at the boundaries of the medieval wall, known as *Sahls*, were urbanized gradually into *Sahat*. *Sahat al-Burj* (later to become *Sahat al-Hamidiyeh*) and *Sahat al-Sour* playing respectively the role of nodes to Damascus Tripoli and Saida. The first urban transformations started as early as 1892 with the arrival of Ismail Kemal Bey as the new *Wali* of Beirut *Wilaya*, being '*one of the leading Ottoman architectural figures in Beirut during Abdulhamid's reign*'⁴ who undertook major urban changes in the port sector. Between 1890 and 1895, a French company with local entrepreneurs undertook the port enlargement, followed in 1895 by the construction

of the 800 meters long Ottoman jetty. French authorities carried on the extension of the port between 1920 and 1929 which was strategic for the arrival of their military troops. Later on in 1934, they extended the jetty by 450 meters to mark the final change to the turn of the century Beirut waterfront landscape. The mercantile medieval port acquired a hybrid nature with the inauguration of *Orosdi Back*, the first large-scale department store along the wharf at the same year of the railway's in 1900, followed by the opening *Imperial Ottoman bank* in 1905. The advent of the coastal railway which was part of a larger rail network placed Beirut on the Muslim pilgrimage road as early as 1909 with the construction of the Beirut-Al Hijaz railroad⁵. *Locandas* and hotels multiplied along the waterfront, and the *Khan Fakhry Beh* and *Khan Antoun Beh* were different from the introverted nature of the medieval *Khan*, basically with their open ground level typology.

Urbanism transformed the port area and initiated the first piercings of big part of Souq streets in the city tortuous medieval fabric starting 1915 by the Turkish initiative⁶. The French influenced the Turkish will to modernize planning, since their presence infiltrated to Beirut since 1860, preceding their official entry to the country in 1918. They were blamed for their lack of concern for the three principles of modern urbanism, *hygiene, aesthetics and circulation*, characteristic of the French planning. Accordingly they initiated piercings the *Souq* for the purpose of ventilating the congested area. One piercing aimed at linking *Sahat al-Burj* to *Bab Idriss*, connecting the East and West sides of the city. The second piercing in the direction of the sea aimed at linking the port to the *Souq* area, ending by effectively destroying *Souk al-Fashkha*, *Souk al-Tawileh* and *al-Jamil*⁷. The rubble was used to backfill the seashore, changing the shoreline, visible in the map of 1876. Consequently, a bearing wall was constructed out of the backfill and seaside promenade of *Minet el-Husn*, which became the favourite destination for the Beirutis⁸. The French pursued the Ottoman idea of embellishment of this promenade to be named *Avenue des Français*, lined with casinos, elegant hotels, cafes and patisseries 'à la Française' and the first piece of art, le "Monument aux morts". Famous for its palm trees and wide pavement, postcards of *Avenue des Français* printed in 1925, were comparing it to *Promenade des Anglais* in Nice to promote French tourism in the *Levant*⁹. Nevertheless, *Place de l'Etoile* remains undoubtedly the proud product of this French Mandate period, following the 1932 Danger masterplan. Three concepts underlay the master plans, namely *Hygiene, Circulation and Aesthetics*, and formed the basis for the urban intervention. The destruction of parts of the *Souq* by the Turkish authorities paved the way for the final imposition of the geometrical star-shaped square on the *Bayrout al-Qadima* medieval fabric (*Figure 1*). This inspired *Haussonian* intervention disrupted radically the previous city structure¹⁰ except for the strong resistance of the Christian authorities which saved the existence of two churches. This meant that two branches of the star had to be amputated.

Figure 1: Fragmentation of the Souq structure to be replaced by *Place de l'Etoile* - Diagrammatic maps by author (extracted from author PhD dissertation, 2015)

The landscape and model of the city of Beirut were profoundly modified. The major development of the seaport drastically changed the medieval city landscape into a major Port-City. The subsequent structural changes in clearing the tortuous city fabric aimed at opening the old city in the direction of the sea, although its traces are still omnipresent. The Beirut-Damascus carriage road which bypassed the tortuous intramuros roads by running along the city periphery transformed deeply the city model. While the port became Beirut's major urban component the city dynamics shifted from the East to the West (*Figure 2*). Instead of reaching the port though via the Eastern *Bab el-Dabagha* and the tortuous narrow road, the wide and straight carriage road reached out the seaport from the West (*Figures 3 and 4*).

The changing urban image: from *Wilaya* to Capital

Ottomanization after the *Tanzimat* went beyond the production of monumental effects and landmarks in the urban space, to achieve networking through communication and transportation. Whilst the French were confined within the borders of the state of Greater Lebanon, they boosted their image through internationalizing Beirut as their prime colonial city of the Levant. Transportation and telecommunication by means of the telegraph covered what had been the Empire Arab provinces¹¹ and brought cohesion to the Ottoman Empire territory¹². Infrastructural networking was developed with the opening of the Suez Canal in 1869 which revitalized the trade routes via the East Mediterranean and played a catalyst role in the emergence of Beirut as a port-city. As distances were shortened, Beirut's links to Istanbul and Damascus were not only infrastructural but symbolical as well. In the same year, the port railway was inaugurated, five tramway lines were inaugurated for this occasion and were operating by 1907, passing through *Sahat al-Burj*. The will for planning the square was both a tribute for the Hamidian image of Sultan Abdülhamid II and a display of late Ottoman westernization. The square was then named *Sahat al-Hamidiyeh*, known also as *Menchiyeh*, where the *Petit Serail* was built in 1883 at its end and occupied by the Turkish authorities. In addition to the port, this square served as the point of departure for the historic visit of German emperor Wilhem II to the Orient in 1898.

Architectural landmarks and monuments led to the fast transformation of the Late Ottoman cities landscape. The construction of public buildings on hilltops¹³, the urbanization of main squares in central urban locations, the construction of clock-towers across the Empire were physical and symbolic products of the Ottoman Empire's authority for unification across the Empire's territories and of the will to modernize the provincial capitals. In the year that followed the *Petit Serail*, the construction of the *Grand Serail* was completed in 1884 on Beirut's hill. On the same hill, a remarkable 25 meters high Ottoman clock-tower became the highest point in Beirut. The 8-meter ornamental *Hamidiyan fountain* was inaugurated in the middle of *Sahat Assour*, as another tribute for the Hamidian image. In the urbanized squares or *Sahat*, ornamentation replaced functionality which characterized the fountains of intramuros *Sahat* where women used to meet and collect water at the *Souq* intersections.

Beirut's Ottomanized model, the “*the jewel in the crown of the Padishah*” as German emperor Wilhem II called it, became the “*Vitrine du Levant*” as the French envisioned it at the heart of their “*mission civilisatrice*” in the *Levant*¹⁴. While the late Ottoman rule showed a concern for embellishment and monumentality as a tribute to the Hamidian rule in the first place, the French worked on further promoting the city as their image. Beirut gradually became the “*Pearl of the Middle East*”, often known in the sixties as ‘*Paris of the Orient*’ or ‘*Switzerland of the Middle East*’. After the visit of the German emperor to Beirut in 1898, the ‘*Foire-Exposition*’ event of 1921 was another milestone in its urban history (Figure 5). The idea behind the exhibition was to affirm political goodwill for the newly established Greater Lebanon, and trust between France and Lebanon¹⁵, the French being aware as well, that the region was traditionally based on trade. The ‘*Foire-Exposition*’ emphasized the importance of the city by the construction of the *Pavillon de l'état de Damas* in the heart of the city in the *Place des Canons* (previously *Sahat al-Hamidiyeh*) and gave it a more ‘*cosmopolitan*’ character (Figure 6). Beirut exposed itself as the primary French colonial city of the Levant, reflecting the cultural image of the French presence. At an international level, this event marked the importance of Beirut in the hierarchy of the colonial cities.

Conclusion

The premise that it takes powerful moments of history to bring deep changes to the city¹⁶ lies at the heart of the deep formal and structural changes of Beirut's fabric. This moment of deep urban transformations at the end of the 19th century coincided with several catalysts such as the opening of Suez Canal¹⁷, the administrative upgrade of Beirut to *Wilaya* and the Ottoman will to bring urban order as per the *Tanzimat* reforms. However the most important feature was the transformation of the city as a model, and not only as an urban fabric.

Even though the production of *Westernized* urban spaces converged at some early moments of their overlapped influence, Empire and Colonial rules diverged ideologically in their approach. The primary Imperial incentive at that time was reordering state control by connecting the fragmented territories of the Ottoman Empire and creating an unprecedented infrastructural network among Arab provinces connecting to the holy cities of Al-Hijaz (Mecca and Medina), followed by the economic concern. The modernity of this approach diverged from the French Colonial concern for boosting a cultural image of civilization. This search for an image that transcended the geographic limits, might be generated from the fact that French Colonialism in the Levant had to rule over a divided fragment of the Empire territories, which became moreover separate countries. The end of WWI marked the end of the Imperial and Colonial urges for expansion over broader geographies, to be replaced since then by different forms of control.

Two premises can conclude this paper, one concerning the process of urban *Westernization* and another one concerning the creation of city image and the representation of power. It can be concluded that French *Westernization* consisted of introducing imported urban forms and applying them on an urban fabric based on *Souq* structure, thus a different process of self-regeneration based on trade. Imperial *Westernization* consisted of a concept or ideology for modernizing through regenerating the existing urban landscape. The second premise on image and representation of power presents an interesting contrast between the Empire monumentality and the Colonial representation of cultural power using the '*Foire-Exposition*' event for changing city image. The French promoted the image of Beirut as a city of culture on the international scene inasmuch as the Ottomans used the cities to honour the image of the Sultan and the Empire. The Empire achieved a coherent City-Port model in Beirut whereby the implementations of French urban concepts and forms emanating from a different cultural process, were less successful.

Though this paper doesn't cover all the necessary aspects for an urban comparative between Imperialism and Colonialism, it may serve as a starting-point for further understanding the production and transformation of Mediterranean cities. At the crossroad between East and West, Mediterranean cities are the complex outcome of several urban models juxtaposed on top of each other, under different political rules.

¹⁵ The idea is underlined as a celebration of sacrifices and a compensation for the support to General Gouraud, put forth in the following terms:
Pour saisir ainsi le sens et la portée de cette publication, il faut évoquer la Foire-Exposition de Beyrouth qui apparaîtra désormais à tous ceux, Syriens, Libanais ou Français, qui ont travaillé aux côtés du général Gouraud dans les heures militantes de 1919, 1920 et 1921, comme une consécration de la Paix gagnée après tant de sacrifices.
La Foire-Exposition de Beyrouth 1921 n'a été qu'un prologue, car dans tous les domaines des actes s'accomplissent qui s'imposent.
Mais le général Gouraud l'avait aperçu dès septembre 1920, elle a été plus, elle a donné confiance.

As documented in the conferences related to the decision to set the exhibition in, Haut Commissariat et la République Française en Syrie et au Liban, *La Syrie et le Liban en 1921. La Foire-Exposition de Beyrouth. Conférences. Liste des récompenses*. (Paris: Emile Larose Libraire-Éditeur, 1922), 2-4.

29 Transnational Planners and Engineers

Cross-Cultural Engineering: The Role of Dutch Civil Engineering in Modern Port Planning in Japan (1870s-1890s)

Kazumasa Iwamoto (Kyoto University) and Carola Hein (Delft University of Technology)

Civil engineering has shaped urban form and urban planning for centuries, but scholars have yet to focus on the exact relation between the two fields. This is particularly true for the Japanese case, where engineering has played a major role in the country's modernization and westernization since the mid-19th century. Engineers have taken a leading role in providing defenses against multiple natural hazards, developing new road, rail, and port infrastructures, or transforming waterways. Exploring the influence of Dutch Civil Engineers on the design and engineering of Japanese ports from the 1870s to 1890s, this paper proposes a first look at cross-cultural exchanges in civil engineering. Specifically, it aims to show how relate the civil engineering with the port city by using their investigative reports, design drawings and survey maps.

Following pressure from the United States and the appearance of the canon-laden, so-called black ships on its shores in 1854, Japan turned from an isolated country without international trade to a rapidly modernizing one with global connections. From the early 17th to the mid-19th century, Japan's contact to the world had been limited to the Nagasaki port where only Dutch and Chinese representatives had been allowed. To help with the modernization and to facilitate international trade, the Japanese government invited foreign experts, notably European and American practitioners, to lead this transformation. Dutch civil engineers appeared eminently suitable to develop water management projects including river systems, soil-erosion control structures and port basins, wharves and jetties. Focusing on the history of planning and construction of five case studies—the ports of Nobiru, Mikuni, Nagasaki, Misumi and Yokohama—this paper shows diverse patterns of cross-cultural engagement. In the case of Nobiru and Misumi, the Dutch engineers, Cornelis Johannes van Doorn, Johannes de Rijke, and Anthonie Thomas Lubertus Rouwenhorst Mulder attempted to design the port as well as an adjacent new town and land-side infrastructure. In both cases, the new port city project was not built in its entirety due to the typhoon and incomplete land infrastructure. Mikuni and Nagasaki struggled with sand deposition on river mouth, and the Dutch engineers, Johannes de Rijke and George Arnold Escher, proposed a new layout for the river, dredging the sea bottom and building a breakwater, allowing the two ports to revitalize. In the case of Yokohama, four foreign engineers participated in the design process. The design by Johannes de Rijke's was rated highly because of the stronger structure of the breakwater and a bigger basin. Ultimately, the design by the Henry Spencer Palmer, a British engineer, was chosen because of political reason.

The paper concludes that foreign practitioners greatly influenced Japan's civil engineering, in particular through the design of breakwaters and the practice of dredging. Those techniques were important in order to build basin, in fact, especially the technique of breakwater appeared in the textbook and spread to Japan. Even in ports, where the natural environment prevented port construction, or where land-side infrastructure was not built, the Dutch engineers had a great impact on Japanese port planning.

From the local experiences to the international scene: the birth of transnational urban planning expertise (Brazil and France, early XX century)

Angelo Bertoni (Aix Marseille Université)

This paper aims to explore the transnational circulation of planning models and ideas, focusing on the dialogue between the different actors and the transfer and exchange of the knowledge of urban planning on both sides of the Atlantic from 1900 to 1930.

The first part of the twentieth century was marked by the construction and affirmation of urban planning as a discipline, both in Europe and the Americas. At that time, European and North American cities were faced with the need to control their growth and build new relationships between urban and rural contexts. During the same period, cities of Latin America were faced with an unprecedented growth and the urban framework was in the process of being structured in several countries.

In these multiple contexts a new figure emerges: the expert. He was often an architect, trained in Europe and/or in the Americas, a member of international associations and a well-known practitioner. This actor was involved in various professional networks, both national and international: he based his practice on defining and adopting urban planning tools, in particular the plan. The expert was called by local governments, as Joseph Stübgen in Luxembourg or Donat-Alfred Agache in Rio de Janeiro, or he participated in international competitions, such as Henri Prost in Antwerp or Werner Hegemann in Buenos Aires.

During this period, theoretical knowledge of urban planning was gradually built, especially during the national and international conferences' debates. The circulation of ideas was ensured not only by the journals that emerged between 1910 and 1930, but also by an increasingly rich literature devoted to urban planning. The experts were actively involved in the circulation of knowledge and expertise in urban planning that they enriched with their personal experiences and exchanges with colleagues, often from foreign countries.

The objective of the paper will be to explore some professional trajectories between Europe and the Americas, focusing on Saturnino de Brito, Victor da Silva Freire, Edouard Imbeaux and Joseph Bouvard in a comparative perspective. They contributed, with their ideas and activity, to the introduction and adaptation in Brazil of town planning concepts, at that time debated in Europe and in the United States. Journals, conferences and town planning literature of these decades are the main sources for this research to provide a review on transnational dialogue among experts in urban issues.

From Paris to the world: the international practice of the Institut d'aménagement et d'urbanisme de la région parisienne/region d'Ile de France from the 1960s to the 1980s

Clement Orillard (Ecole d'Urbanisme de Paris / Lab'Urba, Université Paris-Est)

In 1960, the State created a new organism initially responsible for the study of the Paris Region, then quickly becoming charge with its planning: the Institut d' aménagement et d' urbanisme de la région parisienne (IAURP) renamed Institut d' aménagement et d' urbanisme de la region d' Ile de France (IAURIF) in 1976. Created as a foundation, it developed a new planning document, the Schéma directeur d'aménagement et d'urbanisme de la région de Paris (SDAURP) published in 1965. This document proposed not only a shift in the regional planning policy in terms of content, most notably the development of several new towns to anchor urban growth, but also in terms of methodology. It consisted of a schematic framework, rather than a detailed plan, that become quickly a reference for a renewal of planning tools at the national scale. It also became the basis for the Institute' s international practice as a consultant for municipal authorities and governments across the world. Between the 1960s and 1980s, the Institut worked on more than a dozen metropolitan planning documents and on numerous other planning studies, in Latin America, the Middle East, North Africa, Sub-Saharan Africa, and the Far East, working on cities from Buenos Aires to Shanghai. This consultancy took different forms. In some cases, it was only a limited evaluation of a document produced separately by local planners. Nevertheless, in other cases, it was a real process of co-production sometimes using the translation of the French expression "schema directeur" into "esquema director" for Buenos Aires or "master scheme" for El Cairo. Moreover, the worldwide demand for this expertise evolved during the decades analyzed. In 1984, the Institut partly used its international network built through this consultancy to co-organize a symposium about metropolitan planning named "Metropolis." This symposium, which gathered 31 local authorities, eventually led to the creation one year later of the Metropolis association which manages today the metropolitan section of United Cities and Local Governments. Indeed, the analysis of this consulting activity helps to map the worldwide use of French planning expertise during the second half of the 20th century in conjunction with the global development of metropolitan issues. The presentation proposed will carefully analyze the development of this international practice, focusing on metropolitan "schema directeur," to assess the complexity of the use of the Institute' s expertise. It will confront this analysis with a broader view of French expertise in terms of actors and time in order to try to map the dynamics of a "global French" planning culture. The presentation will use the first results of a research project undertaken during a sabbatical and draw upon the archives of the Institut and some interviews.

The Construction of Socialist City by East German Engineers in the Late-1950s Postwar Reconstruction of Hamhung

Hideo Tomita (Kyushu Sangyo University)

Very little is known about the hundreds of East German engineers who moved to the North Korean city of Hamhung in the late 1950s to help with urban reconstruction after the Korean War; they were known as the 'German Work Team Hamhung' . Their urgent mandate was to redesign Hamhung as a socialist city. However, research on cross-border propagation of city planning for mass demonstrations, such as from East Germany to North Korea, appears to be non-existent. Therefore, this study investigates the square and street network designed for mass demonstrations in Hamhung and evaluates it from a socialist city planning history perspective. For this study, we used materials left by Püschel at the Dessau Bauhaus Foundation, and semi-annual reports of the German Work Team Hamhung from the German Federal Archives. Regarding research methodology, Section 2 discusses changes in the organizational structure of the German Work Team Hamhung. In Section 3, we argue that the square and street network for mass demonstration was the greatest feature of the newly built socialist cities in the 1930s Soviet Union and early 1950s East Germany, and that Püschel had a special career in each country concerning urban planning. In Section 4, we highlight the similarity between the Hamhung and Ham Hing plans in the late 1950s.

The research findings are as follows: First, the basic plan of 1955 under the leadership of Konrad Püschel was relatively important. Second, there was a common social situation to build new socialist cities in the Soviet Union in the first half of the 1930s, East Germany in the first half of the 1950s, and North Korea in the latter half of the 1950s. Moreover, Hamhung's plan may have been influenced by Püschel' s experience to construct a socialist city in these three countries. Third, the city planning department arranged the 'central square' at the city centre and connected it with the street network, using which mass demonstrators could gather easily at the central square. In addition, the centre square was surrounded by high-rise public buildings as symbols of urban space.

Thus, the reconstruction plan of Hamhung as a socialist city in the latter half of the 1950s had similar characteristics to the socialist cities of the Soviet Union (early 1930s) and East Germany (early 1950s)

German architects contributed transnationally to the construction of socialist cities. In particular, in the case of Hamhung, the presence of Püschel was substantive. As mentioned above, although the East German engineers followed the concept and methodology in the aforementioned socialist states, they adapted them to the local circumstances that were ascertained by detailed preliminary survey work. Their activities highlight the unconsidered aspect of the global/worldwide spread of the concept and methodology of socialist city planning.

Cross-Cultural Engineering: The Role of Dutch Civil Engineering in Modern Port Planning in Japan (1870s-1890s)

Kazumasa Iwamoto*, Carola Hein**

** Delft University of Technology, c.m.hein@tudelft.nl

This is particularly true for the Japanese case, where civil engineering has played a major role in the country's modernization and westernization since the mid-19th century. The design and engineering of Japanese ports from the 1870s to 1890s is a case in point. This contribution explores the degree to which civil engineering engaged with port city design by studying investigative reports, design drawings and survey maps established by Dutch civil engineers in collaboration with Japanese practitioners. It identifies three types of cross-cultural engineering. 1. Building a new port: Some Dutch engineers proposed complex projects combining water management and port basins, jetties with urban form, but these were only partially implemented. 2. Improvement of Port Functions: The Japanese engineers were particularly receptive for the design of breakwaters, the practice of dredging and the construction of basins; notably the technique of breakwaters became a staple in textbook and spread through Japan. 3: Development of the Port. The engineers developed a complete vision for a new port, but diverse reasons hindered realization, including natural features that disturbed the construction of the port. These three types stand as examples of the intricacies of cross cultural engineering in engineering and planning.

Keywords: Cross-cultural Engineering, Civil Engineering, Port Planning, Dutch Engineers.

Introduction

In 2015, Misumi port, a key site of Japan's Meiji Industrial Revolution was certified as a World Heritage by UNESCO¹. Home to Iron and Steel, Shipbuilding and Coal Mining and a symbol of industrialization of Japan in the 19th century, Misumi port is an intriguing lens for the cross-cultural exchange between Japan and the West. Designed by A.T.L. Rouwenhorst Mulder, a Dutch civil engineer, the heritage of Misumi port integrates Western engineering with Japanese expertise.

Civil engineering has shaped urban form and urban planning in Japan for a long time, drawing heavily on foreign expertise since the opening up of the country after the Meiji Restoration in 1868. The country has long been threatened by multiple natural hazards and engineering traditionally provides the necessary defences. The country's rapid modernization relied on engineered infrastructures, road, rail, port and waterways. In the 19th century, Japanese civil engineers gained expertise water management from projects such as river systems, soil-erosion control structures and ports, from Dutch civil engineers². New types of construction for river improvement were particularly important for Japanese development³. Most of the foreign engineers who were employed by Japanese government as advisors, had returned to their own countries by 1900s⁴. Since some of the Japanese who went to Europe to study engineering, returned to Japan, and Japanese engineers who worked with foreign engineers, acquired engineering skills from them. It meant that by 1900s, cross-cultural engineering was active. Mulder reported that nobody had knowledge about surveying and designing in water engineering when van Doorn arrived in Japan⁵. In order to realize urban planning and development urban form in a modern port city, building the secure water area for trade and acquiring new land for urban development was necessary. This paper explores the influence of Dutch civil engineers on the design and engineering of Japanese ports from the 1870s to the 1890s, through the lens of cross-cultural exchange in civil engineering. In other words, it aims to show how Japanese civil engineers obtained the knowledge of modern engineering necessary to build modern port cities through by examining their investigative reports, design drawings and survey maps.

After the Meiji Restoration, which saw the adoption of a new calendar system in 1868, the new Japanese government wanted to create a new industrial development policy. Toshimichi Okubo, the Secretary of the Interior, presented the policy of *Fukoku Kyohei* (Rich Country, Strong Army), which aimed to improve the educational system, the military system and the tax system, and in addition, encourage new industry. In order to implement the policy, they invited engineers from all over the world, from countries such as the Netherlands, France, the United Kingdom and the United States of America.

Dobokuryo, the governmental Department of Civil Engineering, invited only Dutch engineers, six engineers and five assistant engineers in the period 1872 to 1903. They carried out several water management projects and had the achievements such as diversion Kiso three rivers, the introduction of a water level maker, erosion and flood

control in the mountain. By the 1870s, modern ports had been born around the world in cities such as London and Rotterdam⁶. Some scholars argue that the starting point for the modern Japanese port was in Yokohama in 1888⁷. However, before this, a number of Dutch civil engineers had already contributed to modern port construction. This study highlights the modern Japanese port construction designed by Dutch engineers from the 1870s to the 1890s.

More concretely, this paper aims to show the relationship with and contribution of Dutch civil engineering in the building of modern ports, by focusing on the history of planning and construction using five case studies from the ports of Nobiru, Mikuni, Nagasaki, Misumi and Yokohama. This paper shows the diverse patterns of cross-cultural engagement (Table.1). The construction of these ports can be classified into three types; 1. building a new port city, 2. improvement of port functions and 3. development of a port. In the case of building a new port city, which includes Nobiru and Misumi, the Dutch engineers, Cornelis Johannes van Doorn and Anthonie Thomas Lubertus Rouwenhorst Mulder attempted to design not only the port but also an adjacent new town and land-side infrastructure. In both cases, the new port city project was not built in its entirety due, in one case to a typhoon and in another case to an incomplete land infrastructure. In the case of the improvement of a port function, which includes Mikuni (Sakai) and Nagasaki, the engineers struggled with sand deposition at the river mouth, and the Dutch engineers, George Arnold Escher and Johannes de Rijke, proposed a new layout for the river, which required dredging the seabed and building a breakwater, thus allowing the two ports to be revitalized. In the case of the development of a port, which is Yokohama, four foreign engineers participated in the design process. The topographical requirements of Yokohama was disadvantage for building new port city. However, that disadvantage was overcome by civil engineering. In the design of Yokohama port, the design of Johannes de Rijke was rated highly because of the stronger structure of the breakwater and a larger basin. Ultimately however, the design by Henry Spencer Palmer, a British engineer, was chosen due to political reasons.

Modern Port Construction Designed by Dutch Engineers

Building a New Port City: The Case of Nobiru Port

In this chapter, each type of construction, in particular those which used Dutch engineering and perspectives, are introduced through the three examples, Nobiru, Mikuni (Sakai) and Yokohama. The first case is Nobiru. Okubo presented the policy for national prosperity and defence (Fukoku Kyohei) in which, as part of the plan to encourage new industry, it was proposed to build up a new port in the Tohoku region in the North, intended for international trade, especially with the United States of America. In order to build the new port, C.J van Doorn, the Dutch civil engineer, was assigned by the public works section in 1876. The following year, van Doorn spent six months investigating the situation and concluded that the Nobiru area was the best location for building a new port, from the perspective of the sediment deposit from the river, water depth and accessibility of a land transportation system.

In those days, when deciding the location for a port construction, topographical conditions were the most important. In the case of Nobiru, choosing a river mouth meant that water depth was shallow in general. Therefore, it was difficult for steam ships to moor at Nobiru, so in his design the port was divided into an inner port and an outer port, which created significant difficulties. Thus Masanao Matsudaira, Miyagi prefecture governor, opposed the project because Nobiru was not easily accessible for ships arriving from Matsushima bay, particularly when seas were rough, as the outer port was cut off from the inner port⁸. However, van Doorn did not change his proposal, because, he argued, other places also had some weak points. In the case of Nobiru, it was possible to overcome the problem by construction. He designed an inner port as the first stage of construction, and an outer port as the second stage of construction. The contents of the design in the first stage of construction are as follows⁹. (Fig.1)

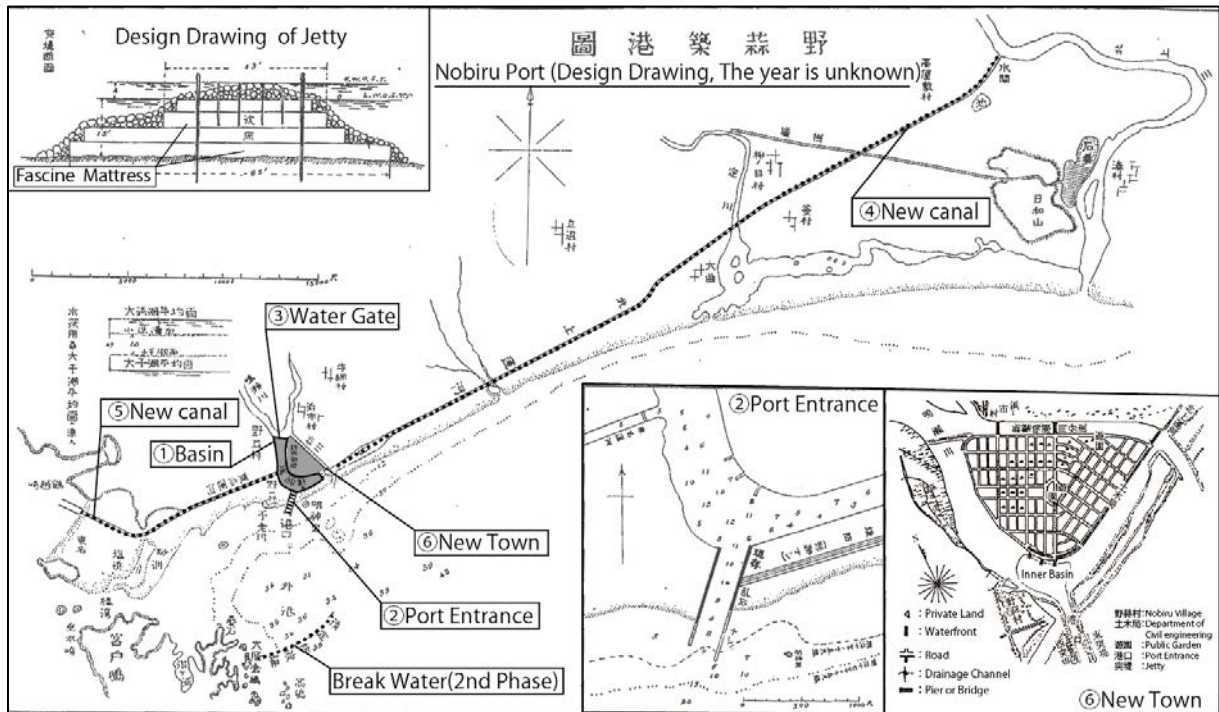

Fig.1 The Design of Nobiru Port

1. Building the basin as an inner port in the river mouth of Naruse river
2. Building the port entrance for connecting inner port and sea
3. Executing the closing and switching of Naruse river
4. Excavation of the Kitakamigawa canal between Nobiru and Kiatakamigawa
5. Excavation of the Tounan canal between Nobiru and Matsushima bay
6. Building the new town
7. Other works

In addition, the steam dredging machines, which were able to dredge 40 tons per hour, were first introduced to Japan by van Doorn¹⁰. He designed the outer port using a breakwater on the eastern edge of Miyako island and connecting it here to Nobiru port during the second stage of construction, after completing the first stage of construction.

During construction, some mistakes were made, especially in the design of the pier positioned at the port entrance, this is mainly content of the first stage construction. The piers in his design used so-called fascine mattresses, an innovation of Dutch civil engineering. The use of this structure is effective in rivers or shoals, however the coast of Nobiru was too deep. Hence the waves were stronger than in shoal areas, so the pier which used fascine mattress was destroyed by the waves. Sediment also flowed to the inner port unexpectedly. The construction started in 1878 and was completed in 1882 and incurred increased construction cost. In 1881, the new town, which was around 1.1 million square meters and build using land reclamation, was also almost completed; in this town, there were irrigation channels, streets, waterways for tugboats, bridges and dikes. Fig 1 shows newly planned urban area, which has grid street networks, three piers to connect new town and inner basin and some public gardens. The branch office of the governmental department of civil engineering, is located along the waterway. In addition, administrative offices of Miyagi prefecture and some commercial offices had already moved to the new town. From previous research, this town planning was designed by van Doorn¹¹. Thus, Dutch civil engineer's works in Japan was not only civil engineering, and they who have the skill of land reclamation and water control, have been requested to make the new town plan.

Only two years after completion, the pier was destroyed by a typhoon. Van Doorn had already returned to the Netherlands in 1882. Following the destruction of the pier A.T.L Rouwenhorst Mulder and other engineers investigated and made a plan for the restoration of Nobiru port. Mulder concluded that rather than restoring Nobiru, the port should be relocated to Onagawa bay because of the high cost of restoration and the need to alter the design. In the other words, he highlighted van Doorn's design errors, in particular the poor selection of location. Following

Mulder's report, the Japanese government decided to stop the port construction. Subsequently, everything was removed from the new town in Nobiru; nowadays, there is only a pine forest.

Improvement of Port Functions: The Case of Mikuni (Sakai) Port

Mikuni port was the first completed modern port project, designed by the Dutch engineers, Johannis de Rijke and George Arnold Escher. In the early modern times, Mikuni port had an important role as a national trade port, because it was located on the route of the Kitamae-Bune, the national trade ship¹². Mikuni town has been shaped along the Kuzuryu river since early modern times. By 1870s, the function of Mikuni port decreased due to sediment deposit from the Kuzuryu river. In other words, it led to a crisis of an abolished port from sediment deposit at the river mouth. In 1875, the people living in Mikuni town, applied to the Japanese government through Fukui prefecture to make improvement to the port. At first, the Japanese government assigned Escher to the task of designing the improvement of the Mikuni port. He started to survey and design from 1876, after which he submitted a report. According to his report, the contents of his design were building the arc breakwater for gravel run-out from the Kuzuryu river and making a basin with an average water depth of three meters within the arc breakwater. He also mentioned the structure of the arc breakwater, which should be made using fascine mattresses and stones, and the length of this was 470 meters¹³. In addition, wooden pier was designed on the arc breakwater.

After completing the design, Escher's contract with the Japanese government was terminated and he returned to the Netherlands, and de Rijke was assigned to Mikuni port project by the Japanese government. While working on the project, he changed the design because of a miscalculation in budget made by Escher and the structure of arc breakwater was weak to withstand the Japanese waves. De Rijke proposed a new design that consisted of five layers of fascine mattresses and wooden piles which were bounded by an iron chain. He also added the four spur dikes in his design. As a result of the changes in the design, construction costs tripled, meaning that the financial load on the inhabitants increased. In 1880, without the agreement of de Rijke, Mikuni port opened to trade in the middle of construction, in order to start earning the construction cost back. In 1881, part of the arc breakwater was destroyed by the strong ocean wave, making it impossible for the construction to be managed by Mikuni town and Fukui prefecture. Afterwards, the Japanese government appointed de Rijke and Japanese civil engineers to lead the construction. This project was finally completed in 1885, by which time the total construction cost had increased 7.5 times compared with Escher's original calculation. While underway, several visitors came to the site to learn about the method of this construction.

In the meantime, due to the improvement the port function as a result of the Dutch engineering, many national trade ships visited Mikuni port, however a railway was built to Mikuni town in 1911. Moreover, with an average water depth of three meters, Mikuni port was not able to accommodate big steam ships, hence most passengers and freight were carried by train¹⁴. Finally, the function of Mikuni port was changed from trade port to fishing port¹⁵. In 2003, the breakwater in Mikuni port was declared as a national important cultural property due to the excellent construction method and used Dutch engineering.

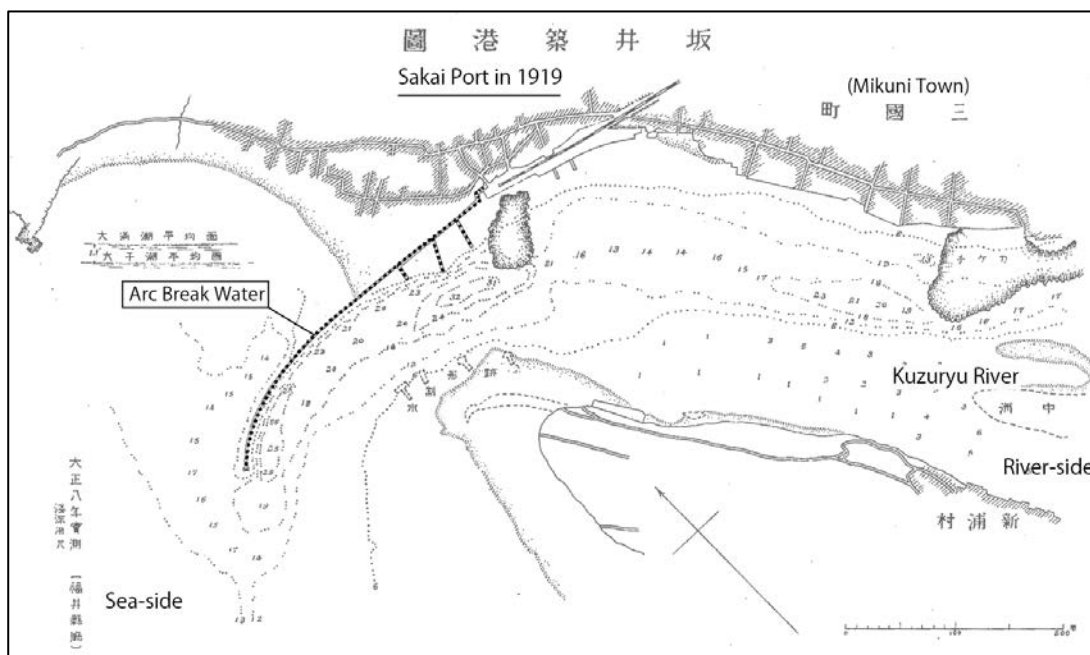

Fig.2 The Survey Drawing of Mikuni (Sakai) Port

Development of the Port: The Case of Yokohama Port

After the opening of Yokohama port in 1859, four foreign engineers participated in the design process. In general, in order to build new port, designer have to research the topographical features of potential locations, looking for a place with a suitable cove and hill, features which are important for providing protection from the wind and waves. However, Yokohama didn't meet those requirements¹⁶. In fact, when strong winds blew, it was impossible to unload goods from trade ships to the port¹⁷, making it unattractive to merchants. The Japanese government was afraid of the influence that the foreigners might have on the local people and so they tried to isolate them¹⁸. By the 1870s, some infrastructures had been built systematically in Yokohama, such as wide street between the foreign settlement and Japanese district as a means of fire spread prevention, and western style garden was also there¹⁹ (Fig.3).

In the 1870s, van Doorn, a Dutch engineer, and Brunton, a British engineer, attempted to design the new port. Both of their designs were rejected by the Japanese government because of the absence of a survey and budgetary deficit. In 1872, the first railway connection in Japan, was built from Tokyo to Yokohama, the reason for creating this route, Japanese government aimed to establish a logistics network between the port city and capital²⁰. In the 1880s, the United States of America made reparations to Japan for the Shimonoseki Campaign. By using this money, it was possible to start to work on new port project again. At the same time, two other foreign engineers started work on the design. Kanagawa Prefecture invited Henry Spencer Palmer, a British military engineer, to the

new port project. He designed two wharves in Yokohama port, but de Rijke dissented in his plan and designed two large breakwaters to surround Yokohama port. Finally, the Foreign Office awarded the new port design to Palmer, while de Rijke was awarded the same plan by the Department of the Interior.

In 1888, three engineers, Koi Furuichi, Gisaburo Tanabe and A.T.L. Rouwenhorst Mulder, examined the two plans and according to their reports the contents of the designs were almost the identical. In fact, in both designs, Yokohama port was surrounded by two breakwaters, training dikes were to be built for the Katabira and Ooka rivers, and a pier was planned in inner harbor. The principal issue was the structure of the breakwater, especially the degree of difficulty of work and maintenance, repair and strength. In Palmer's design, the lower part of the breakwater was built in bagged concrete, and the upper part was concrete. In contrast, in de Rijke's design, the lower part of the breakwater was built with fascine mattresses, and the upper part consisted of gravel and sand and so on. Table 2 shows the opinions of the two Japanese engineers, Koi Furuichi and Gisaburo Tanabe. Especially on soft ground, when the breakwater is damaged, they indicate that Palmer's design is harder to repair than de Rijke's in terms of technique. Mulder also speaks highly of de Rijke's design, of using the fascine mattress in the breakwater, while he contradicts Palmer's design. In Mulder's report, he argued that the fascine mattress is able to adapt to any form on the seabed, that it functions long-term, has been used elsewhere in the world in place such as in Rotterdam, and that there are many suitable materials for the fascine mattress. On the other hand, Mulder mentioned that Palmer's survey result was initially incorrect, and his design was at risk of subsidence on soft ground. Finally, in case of adapting Palmer's design, Mulder believed that construction costs would exceed Palmer's calculation. This meant a budget deficit, hence he objected. For quite a while, Mulder had argued for the construction of a new port in Tokyo²¹. Therefore, as an additional remark, Mulder mentioned that proceeding with Tokyo port was a better option than improving Yokohama port due to the fact that there was plenty of land in Tokyo which was suitable for development²².

In 1889, the Japanese government ignored these opinions and decided to adopt Palmer's design (Fig3). From previous research it appears that this decision was part of a diplomatic effort aimed at the revision of an unequal treaty with the United Kingdom. However, as was expected, the breakwaters were destroyed during building work²³. After completion, the secure water area had been acquired by the building of two breakwaters, urban development continued on the hinterland and on the reclaimed land.

The influence of Dutch civil engineering on the Japanese port design

Through exploring these projects, this paper shows some examples of Dutch engineering in Japanese port construction, in particular, the design of breakwaters and the practice of dredging. In the construction of Nobiru port, van Doorn introduced Dutch steam dredging machines and used the fascine mattress to build a breakwater. In those days, most Japanese ports were located at a river mouth, therefore, dredging was necessary to maintain the function of the port. The Dutch steam dredging machines made it possible to establish and maintain the necessary water depth. Escher also introduced the fascine mattress for building the breakwater at the first modern port in Mikuni. The fascine mattress was able to adapt to slow flowing parts of the river²⁴ (Fig.4). Therefore, Japanese civil engineers used it mainly in river construction, and nowadays the fascine mattress is considered a "Japanese traditional technique"²⁵. Understandably, it is possible to use it in the port, but only for shelving the bottom. In the case of Nobiru, the water was deeper and the waves stronger. Building a breakwater in these conditions became technically possible after 1955²⁶. However, through the case of Nobiru and Mikuni, Japanese civil engineers studied and gained the knowledge of how to build an artificial basin. Grasping this concept has been very significant for Japanese port history.

In the case of Yokohama, there were two design plans, and finally the big issue was remained. In spite of the fact that some civil engineers recommended Rijke's plan for its feasibility and technical strength, Palmer's design was chosen. It is worth mentioning that the sloping-type breakwater which de Rijke designed is structurally weaker than Palmer's composite-type breakwater. However, the problem was that Japan was not able to make high quality concrete yet. Even nowadays, it is still necessary to take into consideration whether or not the materials that are used in construction are able to be prepared easily. In fact, Palmer's breakwater failed while under construction because of low quality concrete²⁷. On the other hand, there was an abundance of high quality materials available in Japan for the construction of the fascine mattress. It is pointed out that the fascine mattress was also effective in the construction of Yokohama port²⁸.

In Japanese technical book, fascine and fascine mattress appeared as progressive and useful technic in 1889²⁹. In this book, it was stated that the fascine could be used for breakwater, the base of embankment, improvement of rivers, spur dike, dam, sand control and the base of road on wetland soil. The fascine mattress provides water purification, so it can be useful for keeping the water clean and as the spawning ground for fishes and shellfishes³⁰. This means that this function is beneficial for an aquatic environmental up until now. The fascine mattress was

Fig.4 The Section of the Breakwater with Fascine Mattress

also used into Rotterdam port³¹ and in the Maas river in the 19th century, in the project named “Nieu Waterweg (New Water Street)”. The purpose of this project was also to make a new water way for the large ships. The point to note that Dutch civil engineers exported their modern techniques in those days to Japan. Thus, Japan obtained the modern techniques of water management through cross-cultural engineering.

Conclusion

After the opening up of the country, Japan had to adapt to international trade with the world through the building modern port. However, Japan did not possess the engineering capability to build a modern port, and so it invited Dutch civil engineers to contribute to river and port water management. As a result, they produced excellent results in river improvement projects, but on the other hand, in port projects, they were not able to build modern ports such as Yokohama port where continued to develop to the present day. However, Dutch contribution, in particular by teaching the use of the fascine mattress technique for breakwaters and in importing steam dredging machines, has been very significant for the construction of basins and the maintenance of modern port function. Through these engineering techniques, Japan was able to obtain the knowledge of how to realize the basin in the modern port for the first time.

Cross-cultural engineering was not successful in terms of importing a full system of planning and engineering. However, select technologies have been adopted, to the point where they are actually perceived as being Japanese. Exchange with foreign engineers allowed Japanese engineers to grow into their own.

Notes on contributors

Kazumasa Iwamoto is a PhD candidate in department of Civil Engineering, Kyoto University. His research topic are cross-cultural engineering and port planning through the lens of civil engineering. He has worked at TU Delft as a guest researcher, supported by MEXT, from February 2017 to March 2018. His research explores how civil engineering influence urban development and urban planning.

Carola Hein, is Professor and Head of the History of Architecture and Urban Planning, TU Delft.

The Construction of a Socialist City by East German Engineers in the Late 1950s: Post-war Reconstruction of Hamhung

Hideo Tomita*

* *Dr. Eng., Faculty of Architecture and Civil Engineering, Kyushu Sangyo University, tomi@ip.kyusan-u.ac.jp*

In the late 1950s, hundreds of East German engineers moved to the North Korean city of Hamhung to help with urban reconstruction after the Korean War; they were known as the ‘German Work Team Hamhung’. However, research on cross-border propagation of city planning for mass demonstrations appears to be non-existent. Therefore, this study investigates the square and street network designed for mass demonstrations in Hamhung and evaluates it from a socialist city planning history perspective. The research findings revealed the following: The reconstruction plan of Hamhung as a socialist city in the latter half of the 1950s had characteristics similar to the socialist cities of the Soviet Union (early 1930s) and East Germany (early 1950s). German architects contributed transnationally to the construction of socialist cities. In particular, in the case of Hamhung, the presence of Konrad Püschel was substantive. As mentioned above, although the East German engineers followed the concept and methodology in the aforementioned socialist states, they adapted them to the local circumstances that were ascertained by detailed preliminary survey work. Their activities represent the unconsidered aspect of the global/worldwide spread of the concept and methodology of socialist city planning.

Keywords: Post-war Reconstruction, East German Engineers, 1950s, Socialist City Planning, Hamhung

1. Introduction

1.1 Post-war Reconstruction of Hamhung

In the latter half of the 1950s, hundreds of East German engineers moved to the North Korean city of Hamhung to help with urban reconstruction of war damage from the Korean War. Owing to the cooperative relationship between socialist nations, they moved to an unfamiliar world at the request of the East German government. They were known as the ‘German Work Team Hamhung’ (Deutsche Arbeitsgruppe Hamhung) and were under the control of the organization Baustab Korea (Berlin) within the Ministry of Trade (Ministerium für Außenhandel und Innerdeutschen Handel).

Konrad Püschel (1907–1997) led the city planning department for the German Work Team, beginning in 1955. After studying at the Bauhaus, he moved to the USSR together with Hannes Meyer as a member of the Bauhaus Brigade in 1931. He was involved in the new socialist city construction of the Soviet city of Orsk. He began working for the Academy of Architecture and Fine Arts at Weimar in East Germany in 1948 and was later engaged in the post-war reconstruction of Hamhung.

Hamhung, the second largest city in North Korea, located on the northern coast of the Korean Peninsula, has long been the central city in this region. During the late 1920s, with the completion of hydroelectric plants in the northern mountains, industries developed rapidly in the coastal city of Hungnam, on the outskirts of Hamhung. Later, nearly 80%–90% of Hamhung was destroyed during the three continuous years of the Korean War, between June 1950 and July 1953. In August 1953, after the armistice, the Central Committee of the Workers’ Party of Korea plenum took up the issue of post-war reconstruction, and a three-stage reconstruction plan was unveiled for actions from 1953 to 1961.

1.2 Previous Research and Study Objective

Regarding the influence of East Germany on North Korea, Frank (1996) described the outline of the central square in post-war reconstruction city plans and highlighted the influence of the Stalinallee in Berlin (now the Karl-Marx-Allee) on Püschel’s plan¹. Shin (2017), who served as an interpreter for German Work Team Hamhung at the time, noted that the urban development principle of the East Germany as strictly applied to Hamhung².

About the influence of the USSR on East Germany, the book ‘Ostkreuz’ (1999) explains East German post-war city planning ideas and their relation to Soviet city planning.³ Wakeman (2014) examined residential complex projects in the post-war reconstruction of East Germany since the 1950s and pointed to their transnational background.⁴ In addition, Kim and Jung (2017) evaluated the micro-district theory regarding the post-war reconstruction of North Korean cities in the context of socialist nations.⁵

However, research on cross-border propagation of city planning for mass demonstrations, such as from East Germany to North Korea, appears to be non-existent. Therefore, this study investigates the square and street network designed for mass demonstrations in Hamhung and evaluates it from a socialist city planning history perspective. For this study, we used materials left by Püschel at the Dessau Bauhaus Foundation and semi-annual reports of the German Work Team Hamhung from the German Federal Archives.

The study is organised as follows: Regarding research methodology, Section 2 discusses changes in the organizational structure of German Work Team Hamhung, and clarifies the position of urban planning department in the organization and achievements of Püschel, who has intermittently been a leader. In Section 3, we evince that the square and street network for mass demonstration was the greatest feature of the newly built socialist cities in the 1930s Soviet Union and early 1950s East Germany, and Püschel had a special career in each country concerning urban planning. In Section 4, we highlight the similarity between the Hamhung and Ham Hing plans in the late 1950s.

2. Organization of ‘German Work Team Hamhung’

2.1 History of Organization

German Work Team Hamhung, under the control of Baustab Korea (Berlin), submitted a report every six months to the Director of Baustab Korea. Among them, documents on organizational planning of staff members were also included (Figure 1). These materials have not been examined in previous studies and are highly useful. Specifically, the organizational structure was confirmed every six months from the second half of 1956 to the second half of 1960. From 1961 to 1962, one type of organization chart was also confirmed; however, since this organization chart was not available for every year, it was excluded from this study. These materials revealed constant changes in the organizational structure and number of experts. These changes are considered to reflect the situation at each stage of the reconstruction project.

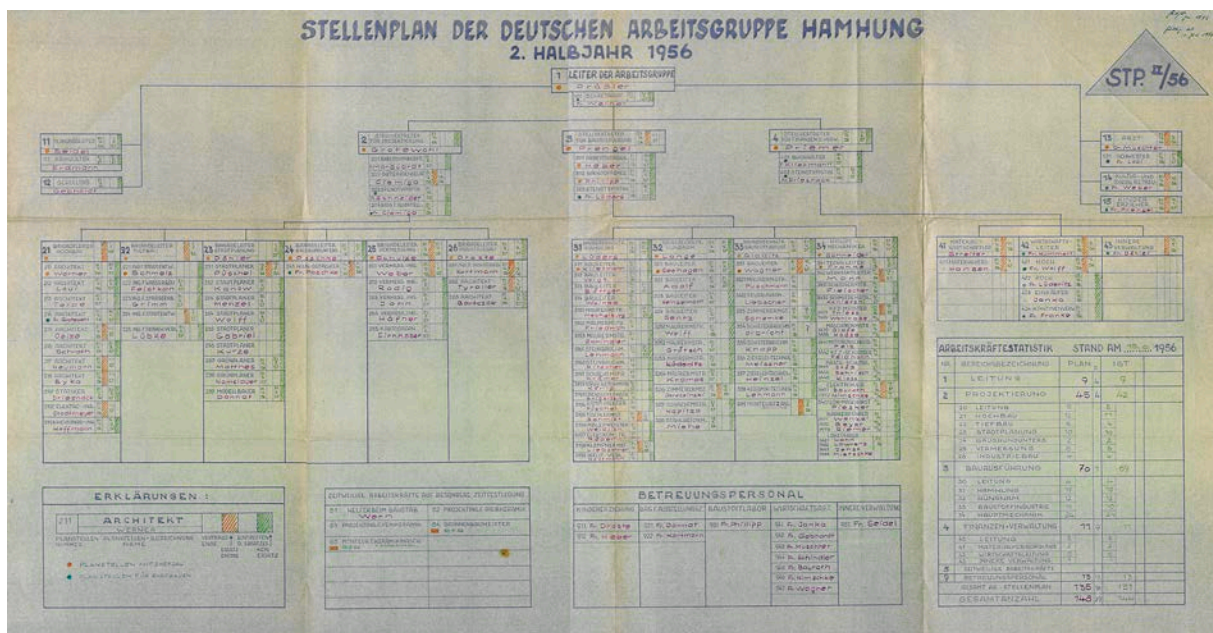

Figure 1: Organizational plan of the German Work Team Hamhung (1956)

In the latter half of 1956, the organization comprised a total of 148 members (135 experts).⁶ The leadership department (9 experts, same as below) included three sub-departments: planning (45), building and construction department (70), and administration and finance (11). In addition, a caretaker department (13) comprising the

experts' spouses was established. Despite a gradual decrease in the number of members, the organizational structure itself did not change until 1957.⁷ From 1958, the departments were abolished and reorganised into six teams: namely (1) the measurement and building site survey teams of the planning department were integrated with the urban planning team and renamed as the urban planning and measurement team.⁸ (2) As the scale of the building construction department was reduced, the department was downgraded to a team, and the construction machinery team became independent.

During the second half of 1958, the city planning and measurement team and underground construction team were integrated and reorganised into four teams.⁹ However, the integration was dissolved in the first half of 1959. In 1959, the industrial building team and the building construction team were reorganised into five teams.¹⁰

Table 1 presents the changes in the planned number of experts every six months, which has not been clarified in previous studies. As for the 1955 year without the material, Püschel described that nearly 175 experts participated in 1955.¹¹

Thus, the most experts were dispatched in 1955 at the beginning of the post-war reconstruction project; in 1958, their number was reduced to 40 experts, whereas in 1960, the number reached 60 experts.

Table 1: The planned number of experts within German Work Team Hamhung

Year	First half of the year	Second half of the year
1956	-	135
1957	100	87
1958	43	35
1959	44	53
1960	65	67

2.2 Change in Urban Planning Team

Table 2 presents the stipulated number of city planners (Stadtplaner) within German Work Team Hamhung. In the second half of 1956 and first half of 1957, the urban planning team comprised one team with ten experts. Under one team leader, there were a total of ten experts, including six city planners, two green planners, and one model maker. However, in the second half of 1957, it decreased to one city planner under one team leader.

The main framework of the post-war city planning of Hamhung was completed in 1955. According to the autobiography of Püschel, the first leader of the city planning team, the city planning team had only three experts in March 1956. Thus, during this period, there were only two experts, Püschel and Peter Doehler, in urban planning. The city planning department was headed by three prominent leaders at different time periods: Püschel (from April 1955 to December 1955 and from September 1957 to December 1958), Peter Doehler (from December 1955 to February 1957), and Erich Ressel (February 1957 to September 1957).¹²

Based on these analyses, it can be inferred that the city planning team was in the following situation: First, in 1955, the framework of the reconstruction city plan was established under the leadership of Püschel. Second, the number of city planning experts dramatically increased under the leadership of Doehler in 1956, who intensively stuffed the plans with details. Finally, in the second half of 1957, the city planning was almost completed; therefore, it can be considered that there were only one or two experts in charge of city planning. In other words, the basic plan of 1955, under the leader of Püschel, was relatively important.

Table 2: The stipulated number of city planner within German Work Team Hamhung

Year	First half of the year	Second half of the year
1956	-	6
1957	6	1
1958	1	1
1959	2	2
1960	1	1

3. Konrad Püschel's Career and Socialist City Planning in the USSR (Early 1930s) and East Germany (Early 1950s)

Püschel planned the socialist city of Hamhung with a square and a street network for mass demonstration in the latter half of the 1950s. This feature was most emphasised in the construction of socialist cities in Moscow in the early 1930s and East Germany in the early 1950s, such as Berlin and Leipzig. In reality, German architects designed and constructed socialist cities in the 1930s in the USSR, which became the model for East Germany's post-war reconstruction in the early 1950s. Püschel also experienced the construction of socialist cities in these two countries in his career. This section explains the networks of streets and central squares designed specifically to accommodate mass demonstrations in the USSR in the 1930s and in East Germany in the 1950s.

Püschel was concerned with city planning in the USSR in the early 1930s. From 1930 onward, the city of Moscow held annual design competitions for festivals in urban spaces, especially mass ceremonies and demonstrations to commemorate the Russian Revolution. Competitions for the development and reconstruction of greater Moscow (1931-32) are popular examples. For the competition, Ernst May and Hannes Meyer proposed the same idea for a mass demonstration space: First, ring road A would be widened to incorporate a green zone in which massed demonstrators would march through for revolution or May Day celebrations. Second, significant architecture would be placed at the heart of the city to accommodate mass demonstrations. In particular, Meyer proposed widening Red Square and incorporated skyscrapers in his plan.¹³

The basic reconstruction plan for Hamhung was determined in 1955. To explain the origin of Hamhung's plan, we will note some typical features of East German post-war reconstruction in the early 1950s, including concern for urban space, the setting of demonstration routes, and demonstration squares with symbolic high-rise buildings. The post-war reconstruction in 1950s East Germany was conducted simultaneously with its reconstruction as socialist cities. The following seven cities were important socialist cities in East Germany at that time: Stalinstadt (now Eisenhüttenstadt) – newly constructed as East Germany's first socialist city, Hoyerswerda – a new town built as the second socialist city, East Berlin, Dresden, Leipzig, Rostock, and Magdeburg – that respected existing urban structure and functioned as socialist cities, were included. The first two new cities were constructed near the Poland border. The plans of the socialist cities in East Germany were modelled on Soviet socialist cities and featured residential complexes, demonstration routes, and demonstration squares with high-rise buildings. These features were well organized with each other. They were furnished in newly constructed cities. In existing large East German cities, these socialist features were incorporated based on analyses of the city's structure. For example, in East Berlin, the newly designed wide street Stalinallee was part of the demonstration route. Through that route, mass demonstrators were expected to gather in the square at the former royal palace site in the centre of Berlin. The establishment of a high-rise building was planned beside the square. There were similar plans in other large East German cities such as Dresden, Leipzig, and Magdeburg.

Thus, a common social situation existed in order to build new socialist cities in the Soviet Union in the first half of the 1930s, in East Germany in the first half of the 1950s, and in North Korea in the latter half of the 1950s.

These features were also observed in the post-war reconstruction of Hamhung in North Korea as executed by East German architects in the late 1950s. The next Section discusses Hamhung's plan, explaining that it shared fundamental concepts with East German city layouts.

4. Square and Street Network for Mass Demonstrations in Hamhung

The city planning department arranged the central square at the city centre and connected it with a street network, through which mass demonstrators could gather easily at the central square. In addition, the central square was surrounded by high-rise public buildings as symbols of urban space.

4. 1. Street Network for Mass Demonstrations

In 1937, the Empire of Japan drew up a city plan for Hamhung, including new main roads and a railway station. In the early stages, the East German architects created a city plan based on the Japanese grid-based city planning (Püschel, 1959).¹⁴ However, they finally rejected this plan and produced a reconstruction plan, characterised by three gently curved radial streets, a demonstration street, and a central square at their intersection (Figure 2). The grid-based city plan was primarily rejected because of Püschel's in-depth understanding of the city form in the Korean Peninsula.¹⁵ He used a method to thoroughly investigate the planning area before city planning. It is believed that the survey results revealed gently curving radial streets that organically connected with the existing urban structure. His city planning methodology at Hamhung was completed in the following three stages: (1) Investigation of the structural characteristics of the planning area, (2) new ordering of planned space based on structural value, and (3) completion of the entire plan of post-war reconstruction of Hamhung. This methodology

was written in a report summarizing Püschel's work at Hamhung in January 1959, when he completed the city planning.

Wilhelm Pieck street and Kim Il-sung street followed the city's historical main streets. Market street and transport street, two of the three radial streets, were also based on historical roads. However, the central axis street, one of the three radial streets, was newly designed to be the new axis of the socialist city. Five-storey apartments with pitched roofs were arranged on both sides.

All these streets are connected to the Central Square (in particular Demonstration square) located at the centre of the city. Püschel described Central Square as follows.

'It (the Central Square) will be a gathering place, which calls the residents of Hamhung to rallies and demonstrations, which unites them to joyful play and dance, giving them rest and joy'.¹⁶

For a political event that involved the entire city, people gathered at the Central Square through these streets. Thus, a street network for mass demonstrations was formed around the central square.

Figure 2: Central Area of Hamhung by the city planning department of the German Work Team, October 1959

4. 2. The Central Square with High-rise Public Buildings

Püschel designed the central square as a symbol of urban space based on three considerations: first, the square's relationship with the street network; second, the construction of a twelve-storey high-rise public building (the 'central building') next to the central square (Figure 3); and third, the position of the podium relative to the demonstration street and central building.

Using this street network, mass demonstrators could gather easily at the central square. Püschel wrote as follows: 'Wide inner-city streets touch the central square. Parallel to the central building, a demonstration street leads from the sport stadium via an industrial area culture park to the podium'.¹⁷

The 'central building' contained many public facilities and organisations: the main provincial offices, party and mass organisations, city administration facilities, a main post office, city library, and provincial culture centre. Demonstrators would gather at the square in front of the central building.

The podium for the mass demonstration was arranged on the south of the square to light the speakers from behind (Figure 4). Moreover, as evident from the drawing, 'the main building gives the demonstration a dignified background from the viewpoint of podium'.¹⁸

In fact, the characteristics of Hamhung's city planning in the latter half of the 1950s were similar features seen in the reconstruction city planning in East Germany in the early 1950s. In the Stalinallee competition at East Berlin in 1951, high-rise apartments were also arranged parallel to the street. Gently curved radial streets were also seen in the design of Stalinstadt in 1951, which was built as the first socialist city in East Germany, now Eisenhüttenstadt. In East Berlin, high-rise public building projects set beside the central square were seen from 1950 onward. The building design changed from decorative in the early 1950s to non-decorative in the late 1950s, a reflection of criticism against Stalinism. Parallel to those in East Germany, the design of Hamhung's central building was also non-decorative.

Figure 3: Central Building next to the Central Square

Figure 4: Demonstration route and podium

5. Conclusion

Thus, the reconstruction plan of Hamhung as a socialist city in the latter half of the 1950s had characteristics similar to the socialist cities of Soviet Union in the early 1930s and East Germany in the early 1950s.

As highlighted in Section 3, German architects influenced the reconstruction plan as a socialist city in Moscow in the early 1930s. Thus, German architects contributed transnationally to the construction of socialist cities. In particular, in the case of Hamhung, the presence of Püschel was substantive. In fact, Püschel engaged in the practice and study of socialist city planning in the 1930s USSR and 1950s East Germany, which were very advanced in terms of socialist city planning. In both the nations, streets networks and squares were very important features.

As previously mentioned, although the East German engineers followed the concept and methodology in the aforementioned socialist states, they adapted them to the local circumstances that were ascertained by detailed preliminary survey work. Their activities evince the unconsidered aspect of the global/worldwide spread of the concept and methodology of socialist city planning.

30 Zoning, Regulation and Guideline

Port of Resistance: The Role of Activism in Shaping Zoning Ordinances at the John F. Kennedy International Airport

Cequyna Moore (Cequyna Moore Planning Consultants)

When one thinks of a port city, harbors teeming with majestic schooners, longshoremen, and docks filled with wooden barrels come to mind. Although maritime ports continue to shape the lives of the port city, the airport has become the vehicle for high value goods that are shipped globally (www.boeing.com)

Idlewild Airport, now the John F. Kennedy International Airport, opened on the marshes of Jamaica Bay in 1948. During its opening year, 222,620 passengers, 4,580 tons of air cargo, and 1,150 tons of mail traveled through the John F. Kennedy International Airport. Today, those numbers have increased exponentially: 53,254,533 passengers, 1,343,683 tons of air cargo, and 89,162 tons of mail travel through the airport (www.panynj.gov)

During the course of nearly seventy years of existence, the airport has become one of the world's leading cargo centers. According to industry analysis, the airport is ranked seventh in the United States in regard to total air cargo handled and is ranked nineteenth worldwide (www.nyedc.com)

What role does community activism play in the shaping of ordinances and how does race and class factor into favorable outcomes for the host communities. As the influence of the airport grew, so did the environmental impacts that affect quality of life, including but not limited to, noise and air pollution, increased traffic, and the development of off-site cargo facilities. Traditionally, planning policies near the airport limited the height of buildings in order to facilitate the safe landing of aircraft. However, issues such as air and noise pollution adversely affect the neighborhoods that are located in the direct vicinity of the airport (Bednarek, 2016)

Through interviews and archival research this paper will discuss the history of Springfield Gardens, Rosedale, Laurelton, South Ozone Park, Ozone Park, Howard Beach and the Rockaway; New York City neighborhoods located in the immediate vicinity of the John F. Kennedy International Airport, and grassroots activism and legal action that influenced zoning changes near the airport. This paper can serve as a case study and resource for communities in rapidly developing areas that are balancing quality of life issues with infrastructure needs.

The Chinesization of American Zoning in the 1980s: From Shanghai Hongqiao Experiment to Wenzhou Old Town Renewal

Yun Shen (Shanghai Tongji Urban Planning and Design Institute) and Li Hou (Tongji University)

The most instrumental reform in Chinese urban planning system during the market reform in the 1980s is the introduction of so-called “regulatory detailed planning” (in Chinese pinyin, kong gui), an adaptive form of American zoning in Chinese cities. For the first three decades of People's Republic of China, based on the soviet model, master planning was considered a core instrument to arrange land use and spatial layout of cities, while detailed planning was made for direct implementation of specific projects, to “materialize” the national economic plans. Beginning from the early 1980s, with the introduction of foreign direct investment and land reform, a more regulatory approach was introduced. It borrowed the control indexes such as floor area ratio (FAR), building density, height limits from American zoning into the traditional detailed plan-making system. However, the authors argue that, regulatory detailed planning is not the simple imitation of American zoning, Chinese urban planners have selectively borrowed tools and indexes from zoning to fit in the institutional context.

The birth and later wide application of regulatory detailed planning began with local experiments, in which Shanghai and Wenzhou (a merchant town in Zhejiang Province) have had a pioneering impact. Based on archival research, mapping and interviews, this article traces the planning and development process of Shanghai Hongqiao and Wenzhou old town, and explores the original process of transplantation and localization of American zoning in Chinese cities. The experiment of introducing regulatory detailed planning showed the different process of land reform in different cities. Due to the different hierarchical status of cities in the country, local culture, the involvement of social groups and many other factors, there are also great differences in the sources of funding, investment and modes of cooperation for the construction and reconstruction between the two cities, as well as the roles and functions of the planning policies. As a show window opening to the outside world representing Shanghai, Hongqiao New Area has been selectively developed in cooperation with large foreign corporations (i.e. listed on Fortune Global 500) The redevelopment of Wenzhou old town, on the other hand, has been depended more on small-scale private capital, overseas Chinese businessmen, joint ventured with local state-owned enterprises. Nevertheless, the experiments on planning by the two municipalities were for the same purpose— seeking new sources of capital to finance urban construction.

This article argues that the introduction of regulatory detailed planning serves as a technical tool, which is rather a continuation of its past, to materialize the development goals of the cities. It has been instrumental for the governments marketing its development goals to the global market, and has provided a platform to negotiate with the private sectors, rather than representing public intervention and regulation in the US. The frequent adjustment of planning control indexes, especially FAR during the development process, reflects the testing of market acceptance and the maximizing development benefits. A new urban development control system in Chinese cities has ever since begun to establish.

Urban planning codes and urban form, a review of the Brazilian case

Luiz Carvalho Filho (Delft University of Technology)

This paper is part of an ongoing study that examines segregation patterns in urban spaces, and moreover, the influence of urban planning and 'planning by codes' in the relationship between urban form and segregation in the Brazilian City. The broader context for the study is the effect of rapid urbanisation on the spatial and social conditions in cities.

Some aspects of the recent urbanisation in Brazilian cities has been consistently described by the use of images such as 'gated city', 'anti-urban typologies', or 'the city of walls'. (Caldeira, 1996a, 1996b, 2000; Figueiredo, 2012; Netto, 2017) Such images reflect a narrative of loss (Arefi, 1999) regarding the connection between places and people. They reflect a particular pattern of segregation in cities, what is sometimes described as 'anti-urban'. As cities continue to transform following this anti-urban model, the risks of exacerbating social and spatial divides increases and possible progressive responses are made very difficult. Segregation in this context follows a new logic, no longer a mere opposition centre-periphery but a hybrid and intertwined set of "...architectural typologies, spaces and transportation systems that favour a few ways of life over all others." (Figueiredo, 2012, p. 1)

This paper is divided into two parts. First there is a description of the urban form that has been associated in previous studies with segregation in the Brazilian context. The second part explores how planning codes respond, react or even contribute to the emergence of anti-urban form.

Findings suggest that the 'planning by codes' approach has resulted in the standardisation of the city landscape, the disruption of the qualities associated with public life and increased social-spatial segregation. (Gehl Institute, 2017)

This paper describes the impact of the current planning regime and the general model of planning primarily via zoning and normative instruments on the relationship between urban form and segregation in the Brazilian city. Bernardo Secchi has emphasised the importance of investigating such processes.

'What changes down the history of the city is much more the regulatory sense and role of each device rather than the catalogue of devices, and it is through this regulating action that the city becomes a machine for social integration or exclusion as the case may be (Boano & Astolfo, 2015)

The initial phases of the research (Carvalho Filho & van Nes, 2017a, 2017b) revealed significant relations between the spatial parameters regulated on planning instruments and the emergence of several typologies of urban environments. One of these types, building with blind plinths, resonates characteristics of the anti-urban typology described in the literature (Caldeira, 1996b; Figueiredo, 2012)

Correlating in time the changes in parameters present in the planning codes with the emergence and spread of this typology demonstrates that the methodological approach of the research can identify relations not so evident currently between planning, urban form and public life.

The Chinesenization of American Zoning in the 1980s: From Shanghai Hongqiao Experiment to Wenzhou Old Town Renewal

Yun Shen*, Li Hou **

* *Shanghai Tongji Urban Planning and Design Institute, shenyun-tj@qq.com*

** *Tongji University, houli@tongji.edu.cn*

The most instrumental reform in Chinese urban planning system during the market reform in the 1980s is the introduction of so-called “regulatory detailed planning” (in Chinese pinyin, kong gui), an adaptive form of American zoning in Chinese cities. However, this episode of the reform hasn’t been closely examined from a historic and critical perspective so far. Based on archival research, mapping and interviews, this article traces the planning and development process of Shanghai Hongqiao New District and Wenzhou old town, and explores the original process of transplantation and localization of American zoning in Chinese cities. By comparing the planning and construction explorations of the two cities, we will argue that although it learned much from zoning techniques, especially the control indexes, the regulatory detailed planning is more to be a platform for local government to negotiate with the foreign businessmen and other private sectors, rather than representing public intervention and regulation in the US, and served as a technical tool to materialize the development goals of Chinese cities.

Keywords: planning history, zoning, Reform and Opening Up, Shanghai Hongqiao, Wenzhou old town renewal

Introduction

For the first three decades of People’s Republic of China, based on the soviet model, master planning was considered a core instrument to arrange land use and spatial layout of cities, while detailed planning was made for direct implementation of specific projects, to “materialize” the national economic plans. Beginning from the early 1980s, with the introduction of foreign direct investment and land reform, a more regulatory approach was introduced. It borrowed the control indexes such as floor area ratio (FAR), building density, height limits from American zoning into the traditional detailed plan-making system. Regulatory detailed planning is not the simple imitation of American zoning, Chinese urban planners have selectively borrowed tools and indexes from zoning to fit in the institutional context.

Regulatory detailed planning was conceived in the planned economy system and developed in the market economy period. Fundamentally, it is not only a technical tool for the government to manage urban land and space effectively, but also a social product under the political and economic system in a particular historical period. After its evolution of more than thirty years, regulatory detailed planning has become the core of Chinese urban planning and management system nowadays. The introduction and evolution of regulatory detailed planning are widely recorded and discussed in Chinese planning history, however, there still lack of an in-depth review with certain historical distance.

The birth and later wide application of regulatory detailed planning began with local experiments in which Shanghai and Wenzhou (a merchant town in Zhejiang Province) have had a pioneering impact. This article traces the planning and development process of Shanghai Hongqiao and Wenzhou old town. Due to the different hierarchical status of cities in the country, local culture, the involvement of social groups and many other factors, there are great differences in the sources of funding, investment and modes of cooperation for the construction and reconstruction between the two cities, as well as the roles and functions of the planning policies. As a show window opening to the outside world representing Shanghai, Hongqiao New District Area has been selectively developed in cooperation with large foreign corporations. The redevelopment of Wenzhou old town, on the other hand, has been depended more on small-scale private capital, overseas Chinese businessmen, joint ventured with local state-owned enterprises. Nevertheless, the experiments on planning by the two municipalities were for the same purpose— seeking new sources of capital to finance urban construction.

Shanghai Hongqiao New District Planning

Shanghai is one of the pioneer cities to carry out the urban planning reform in the beginning of 1980's reform and opening up. Shanghai used to be the largest trading financial centre in the Far East and the largest industrial and commercial city in China in modern times. It was also one of the most important industrial and technology bases, and the largest port and trade centre since the foundation of PRC. However, after ten years of Cultural Revolution, the economy and society in Shanghai were badly damaged. In order to develop the economy under the reform and opening policy, Shanghai government vigorously attracted foreign investment and carried out the experiment of land reform. Under the new policy, the traditional urban planning formulation also needed to change. Hongqiao New District¹ was chosen to be a pilot plot by Shanghai government to introduce foreign capital, and the new planning innovation experiment was carried out as well. Hongqiao New District Planning realized the transformation from “placing the buildings” to index control and it is considered the first experiment of regulatory detailed planning.

At the beginning of opening up, in order to expand foreign communications and attract foreign investment, Shanghai government decided to develop a “micro-district” for foreign consulates tourist hotels and international trade centre. They chose a 0.65 square kilometres site which located between the city centre and Hongqiao airport (Figure 1). There were farmlands, rural houses, several factories in that area, the municipal infrastructure were very weak (Figure 2).

Figure 1: Location of Hongqiao New District

Figure 2: Old Scene of Hongqiao New District in 1970s

According to the requirements of the relevant government departments, Shanghai Urban Planning Bureau made several rounds of detailed planning which focused on functional distribution and architectural form during 1979-1983(Figure 3&4). Retaining the thought during the planned economy period, urban planning was considered the “deepening and concrete” of planned economy, the planning institute just materialized the government plans.

Figure 3: Detailed Planning in 1980

Figure 4: Detailed Planning in 1983

In 1984, Shanghai was listed as one of the 14 coastal cities² “opening up” to the world. The Mayor Wang Daohan declared that:“ Hongqiao New District Planning has been made, the land will be provided this year”³. Then many foreign businessmen especially overseas Chinese (including Hong Kong, Macao and Taiwan compatriots) began to contact and show great interest in this area. In order to promote Hongqiao New District better, Shanghai urban planning institute adopted the international practice, completed Hongqiao New District detail planning-site layout(Figure 5).

In 1980, American female Architects Association⁴ visited China, introducing the land zoning of United States for the first time. According to the atticle written by the Office of the Chinese Architecture Society, the female

architects introduced the zoning in New York. The use of each land was formulated and specific requirements for the volume, style, greening and density of the building were put forward. Those buildings which complied with the regulations would be encouraged, and those violated the regulations would be referred to the court. Female architects called this law a "carrot and stick" approach to planning management. It aroused the interest and attention of Chinese architects at that time.

Before the formulate of the site layout planning, Shanghai Urban Planning Bureau had began to sample the land use and construction capacity in different periods in Shanghai, referred to architecture and planning regulations before and after the liberation, collected planning and architecture laws of American, Japan, H.K. to make Shanghai Technical Regulations on Land Use Management (上海市土地使用管理技术规定). Land classification, building density, building height and other control requirements were included. This site layout planning extracted eight control indexes⁵ from this Management. The index data of FAR, building density were calculated depending on the previous detailed planning. This planning adopted the internationally acceptable planning technique and broke the traditional form of detailed planning.

Overall, the new form planning referred to the land use division and index system of the American zoning, and was expressed in the form of similar zoning maps. One of the main contents of the zoning——zoning ordinance, were more absorbed in the technical regulations. On the basis of traditional detailed planning, this new plan added zoning maps and indexes, its basic research, municipal support and transportation of the detailed planning still remained. Although the index datas were the “translation” of detailed planning to a large extent, it was still a great breakthrough at that time.

The essential feature of zoning is law, the land use, building height, density and so on specified in zoning could not be easily changed. While regulatory planning was only a general technical document of the planning department then. It did not have legal status, so the indexes were easily modified for a variety of reasons.

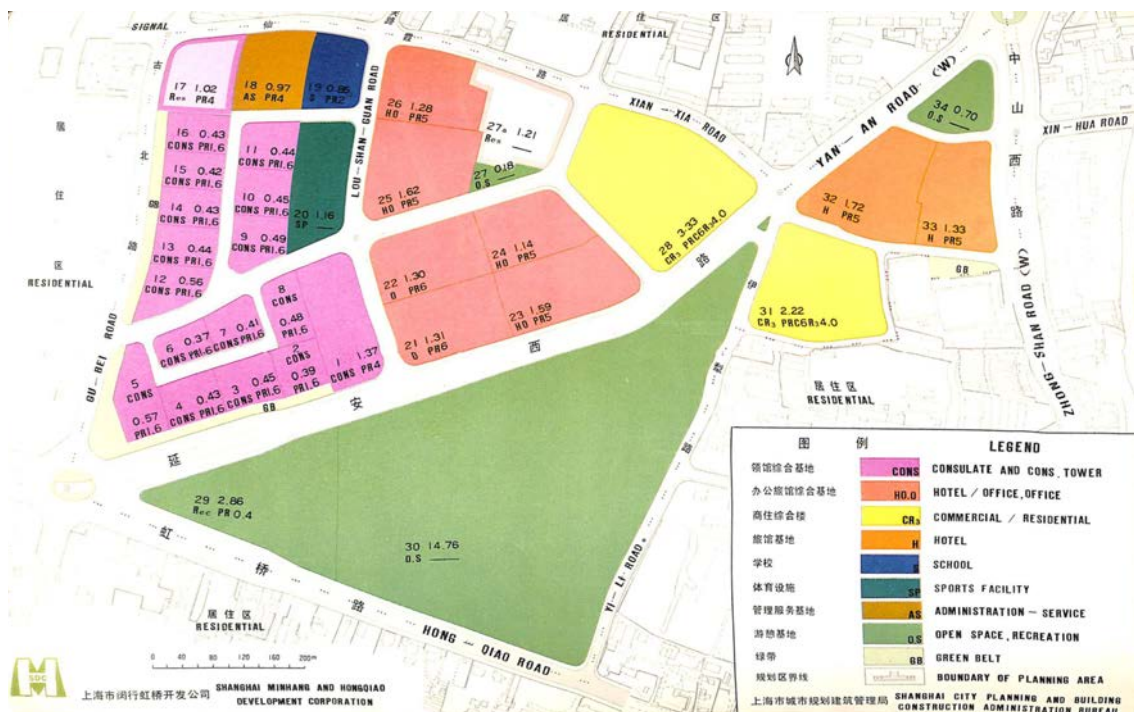

Figure 5: Shanghai Hongqiao New District Detail Planning-Site Layout, 1984

The change of the traditional planning made it easier for foreigners to understand the developing conditions of Hongqiao New District. In the late 1970s and early 1980s, the reform and opening up policy in China had just launched, government's rules and regulations were not perfect. Initially, there were only several foreign businessmen showed interest in this area, most of which were overseas Chinese and Hong Kong compatriots. Shanghai government preferred to cooperate with large foreign corporations. Take the first foreign capital project Hongqiao Hotel for example, the government agreed to cooperate with Yi Shen Industrial Corporation (伊沈实业公司)⁶ in 1979 because of Cyrus S. Eaton's abundant capital and international reputation. After a long controversy about design and cost, Cyrus S. Eaton withdrew, and then Shanghai government refused to continue cooperation with Shen Jianbai after consideration. The hotel were invested by Shanghai Municipal Tourism Administration. Before 1984, although several corporations had intention to invest, no substantive progress was made.

In 1984, Shanghai became one of the 14 coastal cities with preferential policies and measures, the new planning followed international practices of Hongqiao New District was released, and Shanghai Minhang and Hongqiao Development Co. (上海闵行虹桥开发公司)⁷ was established to organize operation of Hongqiao New district. All of these actions accelerated the pace of attracting foreign direct investments. Pacific Hotel⁸, Yongtze Hotel⁹ and New Hongqiao Mansion¹⁰ were the first joint venture projects(Figure 6&7). The planning could be easy to understand by foreigners and became the basis of negotiation.

Figure 6: Panorama of Hongqiao in 1984

Figure 7: Panorama of Hongqiao in 1987

In order to reduce risk, land readjustment and subdivision were made according to foreign developers demands, FAR of the plots chosen by foreign investors were mostly increased. In 1986, Shanghai decided to choose a plot in Hongqiao as a pilot of Land Lease. In 1988, plot 26 was called for bids at both home and abroad. The planning requirements of plot 26 were adjusted because of the bidding. The main control indexes of planning were accepted into the bid document and contract. With the deepening of land reform and Deng Xiaoping's South Tour Speech¹¹ in 1992, more and more foreign direct investments were introduced, leading to extensive modification of control indexes. the FAR and building heights of many plots were increased (Figure 8). Sino-foreign joint ventures and foreign-owned enterprises are in the majority of all the development companies (Figure 9).The foreign investment mainly came from H.K., Japan and America.

Figure 8: Far changes from 1984 to the present

Figure 9: distribution of different developers

To make a brief summary, the birth of regulatory detailed planning was to adapt to the demand of opening up, make it easier for foreigners to understand the development conditions. Although it ostensibly learned from America zoning, the planning purpose was to facilitate the city development rather than maintain public interests. The planning served as a plat for Chinese government and foreign corporations to negotiate. When the Land Lease Policy came into power since 1986, the regulatory detailed planning essential basis for land lease. However, it's worth noting that the adjustment of the control indexes were the result of negotiation between government and foreign businessmen to a large extent.

Wenzhou Old Town Renewal Regulatory Planning

Wenzhou is a city with a history of more than 1600 years, however, due to several historical reasons, there was very little investment in Wenzhou from Chinese central government since its founding in 1949. The old town located in the Midwest of Wenzhou (Figure 10) and covered an area of about 8.9 square kilometres in 1980s. The infrastructure and housing construction of the whole old town were seriously lagged behind before the reform and opening up. The progress of the old town renewal was slow in early 1980s because of the less investment from the central government and the city's development policy which focused on developing

new area. Wenzhou was one of the highest population density areas in China at that time, with old houses, crowded traffic and poor infrastructure (Figure 11). At that time, the rapid development of Wenzhou's small commodity economy had enhanced the masses' economic power and they had the ability to reconstruct the old town.

Figure 10: Location of the Old Town

Figure 11: A Bird's Eye View of the Old Town

In 1984, Wenzhou also became one of the 14 coastal cities, however, the poor infrastructure and construction of the old town couldn't keep pace with the opening up and economic development. Then Wenzhou government decided to focus on old town renewal, starting with Renmin Road reconstruction. In 1987, Wenzhou Planning Bureau made the Middle and West Renmin Road¹² Detailed Planning (Figure 12). The government considered it as a "test area" for real estate development. They expected that the reconstruction of Renmin road would attract social funds to make ends meet. Although people's market awareness were raising at that time, the planning form was still traditional, which focused on architectural forms, function and traffic.

Figure 12: Middle and West Renmin Road Detailed Planning, 1987

With the development of commodity economy and serious problems of the old town, the Wenzhou planning department believed that the original planning management methods could not cope with the complicated construction and management of the old town. In 1988, Wenzhou Urban Planning Bureau began to formulate the full-coverage Old Town Renewal Regulatory Planning¹³ based on the master plan.

Since the Hongqiao New District Planning made in 1984 and gained attention after the National Conference on urban planning and design held in Lanzhou in 1986, Guilin, Shenzhen, Guangzhou and other cities also carried out experiments and made many efforts to explore the contents, expressions and control indexes of regulatory detailed planning. Ding Junqing, who participated in this planning, recalled that they learned much from American zoning and Shanghai experience, and also referred to the planning experientments in Guangzhou, Suzhou, Beijing, Hangzhou, and Nanjing etc. The Old Town Renewal Regulatory Planning integrated both the theory and technology of various regulatory detailed planning firstly and got promoted nationwide.

Instead of considering the building layout of every plot, this planning payed more attention on the whole city's integrated control. The planning could be divided into two phases: the first phase was the old town renewal regulatory planning; the second phase was the 11 blocks regulatory detailed planning which was made on basis of the first phase and was the main content of the whole planning¹⁴. The first phase was the deepening of Wenzhou Master Plan made in 1986. In order to realize the goal of reducing population and building density of the master plan, this planning reduced residential land and increased commercial and traffic land (Figure 13). Unlike the control indexes calculated on basis of detailed planning in Hongqiao New District, the determination

of FAR and other control indexe in Wenzhou old town were more complicated. Take FAR for example, the planners first forecast the total population to calculate the average FAR, and then determined the FAR of 50 areas (Figure 14), then furthermore calculated the FAR of 287 plots (Figure 15), finally they made the final adjustment according to real estate development benefits.

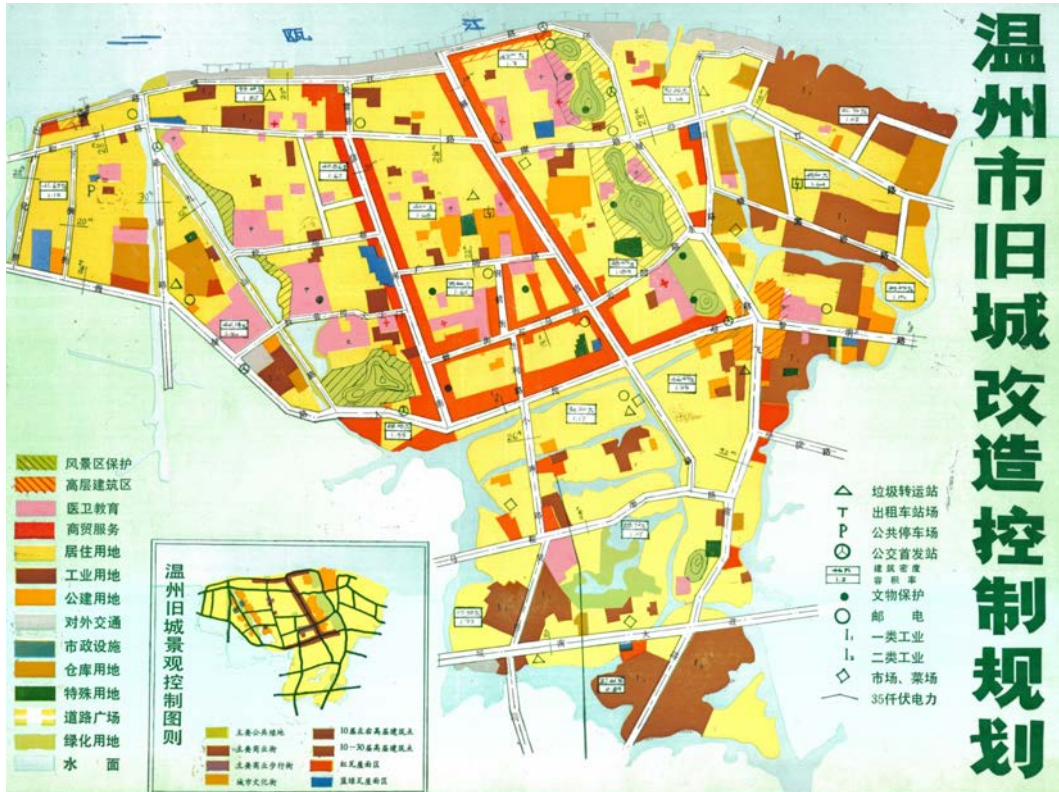

Figure 13: Land Use Planning of Wenzhou Old Town, 1988

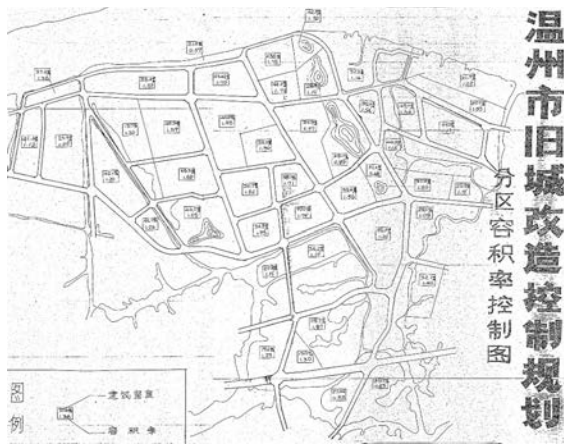

Figure 14: FAR of 50 areas, 1988

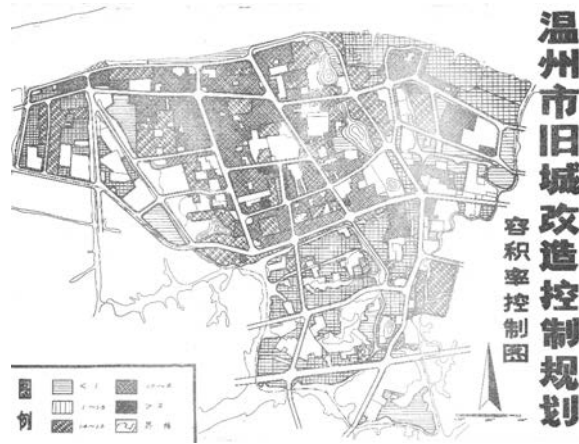

Figure 15: FAR of 287 plots, 1988

The 11 blocks regulatory detailed planning emphasized the comprehensive indexes, including land use, building density, FAR, building height, etc to achieve the quantitative control (Figure 16). Extra building density, FAR, building height along the street were added into the control indexes of residential land to improve the efficiency of land use (Table 1). The planning contents of the Renmin Road detailed planning were translated into control indexes of the 11 blocks regulatory detailed planning.

Figure 16: Zoning map of Wuma Block (a part), 1988

Land use (C)	FAR	Land use (R)	building density	FAR	building height
	building height		building density along the street	FAR along the street	building height along the street

Table 1: control indexes of commercial land and residential land

Besides the planning texts and zoning maps, the planning bureau also made Wenzhou Old Town Renewal Planning Management (trial) (温州市旧城区改造规划管理试行办法) and Wenzhou Old Town Land Use and Construction Management Technical Regulations (温州市旧城土地使用和建设管理技术规定) as the final planning outcomes. These two regulations were approved by the municipal government with the planning texts and maps. The model of Wenzhou regulatory detailed planning formulation was promoted throughout the country after the “regulatory detailed planning seminar”¹⁵ held by the national Ministry of Construction in 1991.

Compared with Hongqiao New District Planning, the content and form of Wenzhou Old Town Renewal Regulatory Planning were closer to zoning. First of all, Wenzhou realized the full coverage planning of the old town, while zoning also generally controlled the land development of the whole city. Secondly, Wenzhou closely combined the regulations with the planning, which was more similar to the main contents of zoning. The difference was that the legislation of zoning was following the principle of bottom-up, considering more about the will of local residents, and it was a comprehensive reflection of the local interests in the city; on the contrary, Wenzhou Old Town Renewal Regulatory Planning was not the will of the local residents, it was considered by the planners and local government from the overall situation, and took into account the overall needs of the city.

The reason why Wenzhou old town renewal regulatory planning got promoted is not simply for the advancement and integrity of the planning techniques, but also owe to its important effect in promoting the reconstruction of the old town. Renmin Road reconstruction was the pilot project of the whole old town, the local government proposed to push the housing commercialization to make ends meet. It chose several real estate companies¹⁶ for the contract through public bidding. Residents lived along the street would be relocated at the original place after the reconstruction. The government also set up Renmin Road Reconstruction Headquarter (人民路改建工程指挥部) to organize and coordinate the whole reconstruction project. Some planners from urban planning bureau joined the headquarter simultaneously.

In the process of renewal, several high-rise buildings constructions delayed because of the fund shortage. At that time, the national land use reform had been full swing, and the central and local government launched a series of policies to attract taiwan compatriots and other foreign capital. Since 1990, several taiwanese businessmen showed interest in the Renmin Road reconstruction and established joint ventures with local real estate

companies to conduct the construction. Then more and more joint ventures were established to develop high-rise buildings along Renmin Road. The old town renewal regulatory planning played an important role in providing development requirements and calculating the land price. The reconstruction were funded by the residents and development companies. The government obtained 30 million by leasing land from 1989 to 1992. The renewal of Renmin Road provided a great experience for the comprehensive renewal of the whole old town.

Figure 17: Scene of Renmin Road in 1992

Figure 18: Scene of Renmin Road in 2004

The old town renewal were in full swing since Deng Xiaoping's South Tour Speech in 1992. High-rise buildings were widely constructed along the main streets, especially on main intersections. They were mostly developed by joint venture real estate enterprises established by overseas Chinese of Wenzhou (Figure 19). During the development process, the FAR of many plots were increased after the negotiations. For example, the original FAR of the Global Mansion plot was 1.8, while it actually reached up to 4.9.

Figure 19: main distribution of different developers from 1980 to 1998.

The Wenzhou old town renewal regulatory detailed planning was considered the summarization and aggregation of various regulatory detailed planning experiments at that time. This planning strengthened the leading role of urban planning department in the old town renewal process. It played an important role in land leasing, land price calculation, and guiding the further planning, and also played an active role in the development and negotiation. However, the negotiations between the developers and the government often led to the modification of the planning, which aimed to maximize the interests of the two sides. The flexible regulatory detailed planning had become a tool for the local government to negotiate with the developers for the common interest to a certain extent.

Comparison and Conclusion

Here is a simple comparison of the two Chinese zoning experiments. In terms of the planning formulation, Shanghai Hongqiao New District borrowed eight control indexes from American zoning and referred the previous architecture regulations, and then “translated” the detailed planning. Wenzhou learned more experience from other cities especially Shanghai besides zoning, and emphasized the control indexes along the main streets. Both of the two experiments reformed the traditional forms of detailed planning, focused more on control indexes rather than architectural layout and emphasized economic measurement. The two plans also remained some traditional detailed planning contents and showed obvious Chinese planning characteristics.

Shanghai and Wenzhou carried out construction under the guidance of regulatory detailed planning. The similarities of the two cities were that the local government transformed from a constructor to a rule maker and city manager. Unified development institutions were established to organize the whole construction. As a show window opening to the outside world representing Shanghai, Hongqiao New District has been selectively developed in cooperation with large foreign corporations, especially those listed on Fortune Global 500. The Shanghai government would like to take Hongqiao New District as a catalyst to promote investment and opening up, and to further promote the prosperity of Shanghai economy. The foreign businessmen who came to invest also took the investment in Hongqiao New District as a springboard to enter the Chinese market. The redevelopment of Wenzhou old town, on the other hand, has been depended more on small-scale private capital, overseas Chinese businessmen, joint ventured with local state-owned enterprises. The Wenzhou government implemented the old town renewal in order more for improving the city environment and raising the living standard. The formulation and adjustment of the planning mainly focused on the feasibility of the development and considered whether it could make a profit. Most of the overseas Chinese businessmen who invested the old town renewal put their own interests first. Nevertheless, the planning experiments of the two cities were for the same purpose—seeking new sources of capital to finance urban construction.

In conclusion, the introduction of regulatory detailed planning serves as a technical tool rather than a continuation of its past, to materialize the development goals of the cities. It has been instrumental for the governments marketing its development goals to the global market, and has provided a platform to negotiate with the private sectors, rather than representing public intervention and regulation in the US. The frequent adjustment of planning control indexes, especially FAR during the development process, reflects the testing of market acceptance and the maximizing development benefits. A new urban development control system in Chinese cities has ever since begun to establish.

⁴ From April 6 to 27 in 1980, at the invitation of Chinese Architecture Society, fifteen people from the delegation of the Chinese research group of American female Architects Association conducted a visit and academic exchange in Beijing, Shanghai, Suzhou and Guangzhou. Fifteen members of the delegation, Linda Simmons, Hu marg, Ai Dezhi and Cauchy, made several academic reports. The main contents included urban planning, residential building design, interior decoration and materials, zoning was introduced in detail.

⁵ Land use, area, building setback, building area density (floor area ratio), building density, building height, entry and exit location, garage parking area.

⁶ The company incorporated in Bermuda, Cyrus S. Eaton was the chairman, Shen Jianbai was the president.

⁷ This company re-established a joint venture called "Shanghai Hongqiao United Development Co. Ltd. (上海虹桥联合发展有限公司)" in 1985.

⁸ The first Sino foreign joint venture construction project in Hongqiao New District. It was invested by Shanghai Minhang and Hongqiao Development Co. Ltd., Shanghai Traveling Company and Japan Green Wood Construction Co. Ltd.

⁹ It was invested by Shanghai Minhang and Hongqiao Development Co. Ltd., Shanghai New Asia Limited by Share Ltd Hongkong Yun Ke International Investment Co., Ltd. and King-pai Co. Ltd.

¹⁰ The first comprehensive office building in Hongqiao. It was invested by Shanghai Minhang and Hongqiao Development Co. Ltd. and Bank of China (Hong Kong and Macao).

¹¹ From January 18 to February 21 in 1992, Deng Xiaoping visited Wuchang, Shenzhen, Zhuhai, Shanghai and other places, made a series of important speeches, known as the South talk. These speeches reiterated the necessity and importance of deepening reform and opening up and accelerating development. Deng Xiaoping's South Tour Speech marked the second wave of China's reform and opening up, which played a key role in promoting China's economic reform and social progress in 1990s.

¹² Renmin Road was a transportation, life and business main road across Wenzhou. In 1985, Wenzhou Planning Bureau made the East Renmin Road detailed planning, however, only three projects completed because of fund shortage. In the face of the development of the individual economy in Wenzhou, the public construction enthusiasm was very high, and the main traffic road in the city has widened except the Middle and West Renmin Road. The government chose it as the key point of the old town renewal, and combined with the East Renmin Road reconstruction project which had been stopped before.

¹³ Yang Xiuzhu was the deputy director of the planning bureau and served as the technical leader. The other staffs included Gao Yunguang, Yang Weifeng, Lou Shifan and other 41 people, composed of local urban planning technicians and managers.

¹⁴ Gao Yunguang (1990).

¹⁵ In 1991, the national Ministry of Construction held the "regulatory detailed planning seminar" in Wenzhou, Yang Xiuzhu reported the compilation and implementation of the old town renewal planning in Wenzhou. The representatives of Shanghai, Guangzhou and Zhuozhou introduced the compiling of their regulatory detailed planning respectively at the meeting. The practice of Wenzhou had been highly valued and recognized.

¹⁶ The real estate companies were emerging in Wenzhou since 1984, and the earliest real estate companies were funded by the government related institutes.

Greening the Megacity: A Critical/Historical Appraisal of Jakarta's Planning for Sustainability

Christopher Silver (University of Florida)

Since Indonesia's independence in 1950, a continuous series of comprehensive plans, donor funded studies and program, and government policies related to Jakarta's development have aimed at environmental conditions – that is “greening” -- in the emerging megacity. The most important recent policy pronouncement, Law 26/2007, set a long term (20 year) target of at least 30% of urban land maintained in green open space. In 1911, the Ministry of Public Works launched a voluntary program to accelerate attention to the environmental component of sustainability to complement the traditional emphasis of Indonesian cities largely on promoting economic development, and typically at the expense of remaining green spaces. Moreover, Indonesia has sought technical support for this initiative from the Asian Development Bank through a program entitled, “Green Cities: A Sustainable Urban Future in Indonesia.” Does Indonesia's new initiatives represent a departure from previously proposed but ultimately failed effort to realize livable, ecologically-sustainable cities or “green cities” program or is it mere rhetoric that does not advance these objectives? Whether it is rhetoric or substantive policy changes, the post-Suharto-era has seen witnessed a “green movement” and “green discourses” that represent a new type of “collaboration among experts, clusters of communities and the city government” not possible under the previous authoritarian regime.

By examining the longer legacy of “green cities” planning in Jakarta, beginning with environmental initiatives in the pre-democratic era, it is possible to assess what changes contributed to the scope of the current green movement. One part of the longstanding green agenda was maintaining green open space – the “Garden in the City” -- to ensure that the challenges of urbanization in a tropical climate with an extended “rainy season” would provide the means to handle storm water removal and spaces for recharging the ground water system. Related to this was protection for and hopefully upgrading the quality of surface water in Jakarta's vast river system covering much of the urbanizing area. Another component of greening deals with provision of sufficient infrastructure to provide adequate clean water and removal of waste water to ensure environmental qualities. And related to provision of sanitary infrastructure was the need to improve services to the vast array of population residing in the maze of kampungs that made up the bulk of Jakarta's residential settlements. Finally, it is useful to assess strategies to expand green areas through land reclamation, especially along the Jakarta waterfront, as well as within the satellite cities that accommodated the demand for new middle and upper income housing through land development practices more akin to western models than the traditional form of Jakarta and other Asian cities. Attention will also be given to related “greening” topics such as energy provision and consumption, handling air pollution and solid waste and the impact of transportation on land use. This examination of environmental planning in Jakarta since the 1950s will seek to draw connections between past planning, policy and programmatic initiatives and the present multi-pronged movement to “Go Green” and its potential to produce more livable environs.

Mitigating urban heat island effect in built environment by integrating spatial planning measures: A study in Taoyuan

Yu-Tzu Lin (Department of Urbanism, Delft University of Technology) and Chih-Yu Lee (Department of Urban Planning and Disaster Management, Ming Chuan University)

Heat waves take their toll on human health and residents' quality of life in cities. Due to the accelerated urban heat island (UHI) effect, the dense urban areas of Taipei Metropolitan Area are experiencing increasing heat stress in summers. The introduction of vegetated green and blue infrastructure at city - scale curbs O₂ levels. The integrated mitigation and adaptation strategies to limit the effects of climate change and greenhouse gas emissions are crucial to achieve sustainable cities. With Taoyuan's case study, this paper analyses the causes of the temperature change due to the rapid population growth and the impact of anthropic activities. Based on the concept of multi-functionality, we raise a holistic planning strategy according to local climate conditions, built environment, and urban form to integrate ecosystem functions and public health promotion. The strategies, divided into four aspects: green transportation system, solar energy design, wind belt design, and green and blue infrastructure (GBI) design, target to increase urban resilience to climate change, improving the coping, adaptive and mitigation capacities within dense urban area by employing holistic viewpoint. Especially integrating green infrastructures, as rain gardens or green roofs, will be an effective tool to mitigate heat stress, mitigating greenhouse gas emissions and furthering the establishment of resilient cities. Since this study is confined by the downscale data of local wind belt, we apply 3D modeling and the architecture model to enhance the feasibility of the strategies and to offer a possible urban landscape instead of a direct simulation to measure the temperature difference. It concludes by suggesting a way for planning a crisp Eco-city to mitigate urban heat effect and to optimize the potential for green infrastructure benefits is needed. Besides, for the possible implementation of the holistic strategies in the future, we supplement the conclusion by amendments for planning- and designing-related regulation revision, such as Building Technique Regulation, Regulations for the Periodical Overall Review of Urban Planning. Considering that the bottom - up initiatives can improve critical environmental and ecological conditions in dense urban areas more efficiently, how to include community efforts into planning practice in the case study will be the lesson for future research.

A Brief History of Planning for Climate Change Adaptation on the Gold Coast, Australia

Michael Howes (Griffith University) and Aysin Dedekorkut-Howes (Griffith University).

With over half a million people, the Gold Coast is currently the sixth largest city in Australia and one of the most rapidly developing urban areas in the country. Unfortunately it is also highly vulnerable to the impacts of climate change and has been hard hit by storms, flooding, heatwaves, and droughts over several decades. These kinds of impacts were forecast by both national and international risk assessments (including the Intergovernmental panel on Climate Change). Australia has a hierarchical three tiered governing system that encompasses one national (Commonwealth) government, six states (including Queensland) plus two territories, and 565 local councils. Elections occur every 3-4 years for each level, with government periodically swinging between a centre-right coalition of the Liberal-National parties and the centre-left Labor party. In the period 2007-2012 all levels of Australian government had started to take the first steps in addressing the challenges posed by the need to adapt to the impacts of climate change. The shift to centre-right governments 2012-15 saw many policies and plans reversed due to the combined effects of: gaps in the three tiered system of government; the ideology of the parties in power; powerful economic interests; electoral politics; fears of legal liability; and, the unique features of the Gold Coast. Since 2015 there has been a divergence between the different levels of government, with state-based Labor governments such as Queensland moving back into the climate change adaptation space. The science is clear: climate change is happening, the impacts are serious, and low-lying coastal settlements like the Gold Coast are highly vulnerable to its effects. The constant policy and planning reversals over the last decade, however, have made consistent long-term planning and investment in building resilience very difficult. Coastal settlements such as the Gold Coast simply cannot afford to continue this roller coaster ride much longer and their plight has major implications for the ability of democracy to address wicked problems like climate change.

Landscape architecture and environmentalism in the expansion era for Australian universities: The work of Bruce Mackenzie and Associates

Andrew Saniga (The University of Melbourne)

The 1960s and 1970s were an era of expansion of the tertiary education sector internationally with entirely new universities developed at an unprecedented pace. In the Australian context, the quintessential start-up suburban campus was usually set within a greenfield site - typically on post-agricultural land at the fringe of rapidly expanding suburbia. An effective role for landscape architecture often materialised from symbiotic relationships between architects, engineers, planners, horticulturalists, and others. A significant driver in shaping and enacting a clear vision for a distinctive quality of campus landscape came internal to university administration. Communities consisting of academic staff, administrative staff, and other interested and talented practitioners have been found to be crucial in defining a niche for landscape architects in campus design, marking a significant moment in the recognition and due regard that would be paid to a small but influential profession on the Australian scene. This paper records the themes that define the distinctive nature of the Australian condition. Focusing on campus designs by Bruce Mackenzie and Associates (BMA), the paper provides a preliminary assessment of the roles and influence of people, organisations, and events in the creation of the modern campus in Australia. It concludes that the most effective results were achieved when the landscape architect was engaged at the formative stages of campus development and had broad support inclusive of collaboration with other consultants and with university administrators and on-ground staff. A significant ingredient for success in achieving innovative results was found to be the existence within the university of communities of interested and engaged people with joint aims and ambitions for the creation of high quality campus landscapes, often in line with a culture of environmentalism. Such communities often go unheralded yet without their involvement the establishment of campus landscapes that celebrated the conservation of Australian indigenous plants and forms may not have been as readily achieved.

Water Landscape Changes and Place Perception in University Campus History: A Spatial Humanities Perspective

Jie He (School of Architecture, Tianjin University), Meng Yuan (School of Architecture, Tianjin University) and Wei Lei (School of Architecture, Tianjin University)

‘Spatial humanities’ is defined as “an explicit recognition of the reciprocal influence of geographic and constructed space on culture and society”. It “fuses traditional focus on nuance, voice, experience, text, and image with the systematic modeling and virtual reality, and links time, space, and culture dynamically” by Prof. David Bodenhamer (2011)

In the proposed research paper, the research team will introduce a project of investigating both how people’s physical daily activities and sense of place changed during the past 30 to 40 years in the Weijin Road Campus of Tianjin University, where the water landscape changed tremendously because of the rapid urbanization and campus development.

The Weijin Road Campus used to be full of ponds and lakes where are parts of a large-scale suburban wetlands network in the southwest of Tianjin built-up regions. But now this region shrank and already be enclosed by urban scopes. The Campus is a typical epitome of such urbanization and water landscape change in Tianjin. The research team integrates historical archives and oral history in a GIS database to reflect both physical and emotional changes. For the physical landscape changes, historical maps, historical aerial and satellite photos, and university planning and construction archives are overlaid to digitize water surfaces and building layouts of different stages of the campus development. This dataset serves as a base map for analysis and visualization. Meanwhile, in order to reconstruct place with people’s memories and experiences, and drew memory maps, emotion maps, and preference maps to visual that how the location, events, behavior and motivation interweave together, historical activities and place perception are derived from records by interviewing current and retired faculties, alumni, and other residents living in the campus in different ages, while current activities are gathered by site observation, route tracing and hotspot analysis.

Comparing the current and historical activity and emotional data, spatial analyses has shown that preferred campus pedestrian and gathering/resting places switches southward from a loop surrounding one lake to a more complicated water landscape integrating lakes, plaza, gardens, outdoor facilities, and functional buildings. And there’s a positive relationship between the participation and protection consciousness of landscape. The more people participate in the place, the stronger protection consciousness they have. The proposed study has tested the potential of digitizing non-structural historical records and analyzing the data spatially, as well as visualizing it to support historical interpretation.

Study on the Protection of Village Cultural Space in the Attractive landscape Area of Liupan Mountain, China

Fei Wang (School of Architecture of Southeast University; Lanzhou University of Technology), Bai Hao Li (School of Architecture of Southeast University) and Qijun Jiang (Gansu Institute of Political Science and Law School of Art Design)

This paper takes the village art and culture space in Liupan Mountain attractive landscape area as the research object. Based on local current situation, the writer sorted out several factors which lead to the formulation of art and cultural space. Methods like historical research and local field investigation were adopted to analysis the characteristics of the object from several aspects include diversity, farming, space openness, etc. The research shows that Liupan Mountain attractive landscape area is a multi-ethnic blended region, which also a reason for its prosperous economic and artistic cultures in the past time. In addition, affected by traditional farming culture, the object displays a deep integration and harmonious development of the Cultivation Culture, Frontier Culture, Buddhist Culture, Taoism Culture, Drama Culture, etc. The results lead to a conclusion that Liupan Mountain attractive landscape area should not be simply defined as "National Park" or "Attractive Tourism Area". Based on this conclusion, this paper proposed three principles: Respecting local traditional folk culture, modern science and old nature from the perspective of villiage artistic and cultural connotation; integrating the concept of "Harmony between Man and Nature" with modern development and update spirit; promoting the historical and artistic values of regional ethnic culture, classifying and adjusting measures to protect this kind of art and culture space according to local conditions. What needs to be emphasized is the concept of nature in this paper should not be limited in the traditional scope like natural scenery and geographical space. The four methods: respecting nature, maintaining the survival and development of native culture, inheriting the art and cultural space still exist in local traditional villages, and exploring new methods and policies for the movement of cultural regeneration of the village are have practical significance for the development of the village art and cultural space in attractive landscape area.

NATURE CONSERVATION PLANING APPROACH IN THE URBAN EPOCH

Balin Koyunoglu (ISTANBUL TECHNICAL UNIVERSITY) and Nuran Zeren Guler soy (ISTANBUL TECHNICAL UNIVERSITY)

When looking at the projections of 2050, the world will be urbanized. This emerging urbanization trend alters nature conservation processes. Today process is not only conserving natural sites but also sustain natural heritage in urban content. Nature is an important aspect of the contemporary city structure. Natural sites satisfy social needs and increase ecological awareness in urban societies. To that extent – in the face of increasing urbanization – nature conservation planning serve as urban planning substrate. Today, nature conservation is developed from site protection into planning systems especially in urban planning processes. Therefore, nature conservation planning history shifted from initial classical individualistic approach to inclusive ecological approach. In the 18th century, the aim was to conserve natural resources and protect valuable landscapes. In the 19th century, the focus was protection of ecosystems, biodiversity, and wildlife in natural sites and monumentalize the sites with its scenic wonders. In the 20th century, nature conservation planning became a networking discipline. Preventing fragmentation of natural sites was the intention of comprehensive and inclusive planning attempts. The concept and methodology of nature conservation planning have been evolved over centuries because the attitude on preserving and sustaining natural heritage have been changed respectively. From the Stockholm Declaration (1972) to the Rio Declaration (1992) nature conservation became a form of global partnership and gained national, regional and international recognition. At last, as the cities continue to grow and the pressure of urbanization on natural sites increases, the emerging issue became to sustain natural sites in urban fabric. As a result of this momentum, IUCN (2014) remarked current concept and methodology of nature conservation planning in the Urban Protected Area Guidelines. This study aims to constitute a literature review on history of nature conservation planning together with international declarations and recommendations determining tendencies of the time and shifting points. Methodological alternations from protection islands and buffer zones (1980) to no-take boundary design (2014) on nature conservation in the planning history will be examined comparatively. After structuring theoretical background, contemporary nature conservation planning implementations in urban areas will be assessed with innovative planning applications (such as Helsinki Green Fingers and East London Green Grid)

Landscape architecture and environmentalism in the expansion era for Australian universities: the work of Bruce Mackenzie and Associates

Andrew Saniga

Associate Professor Landscape Architecture, Planning and Urbanism, Melbourne School of Design, The University of Melbourne, ajsaniga@unimelb.edu.au

The 1960s and 1970s were an era of expansion of the tertiary education sector internationally with entirely new universities developed at an unprecedented pace. In the Australian context, the quintessential start-up suburban campus was usually set within a greenfield site - typically on post-agricultural land at the fringe of rapidly expanding suburbia. An effective role for landscape architecture often materialised from symbiotic relationships between architects, engineers, planners, horticulturalists, and others. A significant driver in shaping and enacting a clear vision for a distinctive quality of campus landscape came internal to university administration. Keywords: landscape architecture, environmentalism, Australian campuses, Bruce Mackenzie and Associates.

Introduction

This paper considers the emergence of the profession of landscape architecture in Australia in the context of a period of expansion in University campuses in the post-World War Two years. Australia followed the UK, North America and Europe, making deliberate attempts to expand the infrastructure of tertiary education. The Australian Federal Government received advice from the Murray Committee in 1957 to the effect that Australian universities were woefully unable to accommodate teaching staff and students across all manner of requirements,¹ the result of which saw the rate of new building construction double.² Total university enrolments between 1958 and 1960 grew 30% with a predicted total enrolment of over 95,000 by 1966, a clear indication of the changed attitudes towards the value of tertiary education.³ Simultaneous with new university expansion, technical and training colleges were being transformed into colleges of advanced education as a result of the Martin Committee Report in 1964, and later into universities during the Dawkins era of the late 1980s.⁴

Amidst all this change, the Australian Universities Commission (established 1959) believed that the newer universities of the 1960s had a greater capacity for expansion because they were generally located on large suburban sites.⁵ Capital grants predominantly went toward buildings,⁶ perhaps with the assumption that landscape and environmental quality would follow. However, campuses did in fact require careful site planning, an endeavour defined by North American Kevin Lynch as ‘...a design problem that lies on the boundaries between architecture, engineering, city planning, and landscape architecture.’⁷ To this ‘design problem’ could also be added socio-political contexts, including university communities and more broadly, the burgeoning environmental movement, that potentially added to the design challenge. How then did the Australian profession of landscape architecture contribute?

This paper briefly introduces the context within which the profession engaged in campus work. It will briefly discuss three contemporary campus sites that at earlier stages received landscape architectural input from the practice of Bruce Mackenzie and Associates (BMA): the University of Technology Sydney (UTS) commencing c. 1970; the University of Wollongong (UoW) from 1976 to 1987; and, the Australian Defence Force Academy (ADFA) in Canberra commencing 1981.⁸ It will pay particular attention to the UTS and the UoW for the effectiveness in manifesting BMA's design ethos in distinctive ways.

Campus landscapes in the context of an emerging profession.

The Australian profession of landscape architecture emerged in the 1960s from an array of associated disciplines – architects, planners, foresters, environmental activists and even academics. Their application to the profession remains a complex path to chart, with different motivations, interests, formal training etc.⁹ Institutionalisation under the Australian Institute of Landscape Architects (AILA) in 1966 provided a formal instrument for recognition among competing professions and bureaucracies. The AILA attempted to define a role for the practitioner, drafting membership criteria, standards of practice, and education policies. However, as sociologist Andrew Abbott has argued, it is competition for work and inter-professional relations that creates a system of professions that in turn defines a profession,¹⁰ more so than its independent steps towards institutionalisation. The complex ways in which professional territory is won, and lost, and the environments in which this occurs, Abbott argues, form a critical part of the history of any profession.

Campus landscapes received only oblique reference within the discourses of the AILA's first two conferences. At the 1969 conference held at the University of Melbourne, Richard Downing noted somewhat disparagingly of the grounds of the University of Melbourne: '...you may, of course, wonder whether we have any respect for our environment at all.'¹¹ George Seddon's analysis of the 'The Quality of Our Landscape,'¹² gave anecdotes pertaining to the campus of the University of Western Australia (UWA), its design, mismanagement, and even high art, and praised in particular the planting of the Sunken Garden. Landscape architects Lindsay Pryor, Peter Spooner and Bruce Mackenzie all presented papers at the 1969 conference, but none made mention of their campus design commissions, notwithstanding the fact that in the published proceedings Pryor's paper was illustrated with his landscape design work for La Trobe University.¹³ The 1971 conference, held in association with the Australian Conservation Foundation, was overwhelmingly concerned with conservation of urban and natural environments, yet campuses, many of which had seen dramatic success and failures in terms of environmental impact, were not included in any critical analysis.¹⁴ Despite these scratchy beginnings, campus design work from the late 1950s through the 1960s and 70s was indeed a significant professional pursuit: all the individuals cited above (and more) had been involved in planning, designing and managing Australian campuses.

As early as 1946, Pryor pioneered a role for landscape architecture within the campus of the Australian National University in Canberra. He then went on to complete commissions for numerous campuses across the eastern states and territories¹⁵ and recruited landscape architect Richard Clough, formally an employee of the National Capital Development Commission in Canberra and second president of the AILA from 1969-71. In the context of hectic site work operations typical of the period, their methods could best be described as pragmatic and direct, advising on plant species selection, preparing planting plans, and completing on-site inspections. Roles for private practitioners were pioneered in highly idiosyncratic ways. At Monash University in Clayton, no less than six landscape architects took up professional roles between 1958 and 1971, their variable successes largely the product of Monash's highly opinionated academic community, keen to shape the campus landscape to their own tastes.¹⁶ George Seddon, who was not formally a landscape architect, too had involvement in designing campus landscapes via engagement with the Grounds Committee of the UWA through which he had direct access to the University gardener and others.

A further distinction needs to be made for academics who were also landscape architects and subsequently completed landscape design on-campus. In the mid-1960s, Peter Spooner completed the 'Broadwalk' around the time he began teaching at the University of New South Wales (UNSW in Sydney). In a different mode again, in 1974 during a period of rapid growth, the UWA was among the earliest in Australia to appoint a full-time University Landscape Architect in Jean Verschuer,¹⁷ setting a precedent that lasted through to 1987 at that institution. The diverse ways in which landscape architects impacted on the Australian campus was partly a product of the newness of the profession and its unchartered professional territory at that time.

Interdependent realms of environmental idealism: Bruce Mackenzie and Associates (BMA).

The early trials and tribulations of landscape architects in campus development also occurred at a time of a global environmental movements. In Australia, formulations of environmental consciousness often mixed notions of

The 18th International Planning History Society Conference - Yokohama, July 2018

national identity and Australian indigenous landscapes, resulting in unusual alliances across groups with different philosophical and political backgrounds.¹⁸ Some within university communities identified campus landscapes as ideal theatres in which to explore Australian indigenous themes thus enabling landscape architects Bruce Mackenzie and Associates (BMA) to build a reputation. Bruce Mackenzie (born 1932) is one of Australia's most notable landscape architects and founder of the profession. In 1967, BMA were pioneering environmental design engendering Australian indigenous themes at sites such as Peacock Point (later Illoura Reserve) on Sydney Harbour, work that as recently as 2016 has been lauded by the AILA as among the 'top ten' landscapes to be produced between 1966 and 2000.¹⁹

In BMA's monograph, *Design With Landscape*,²⁰ Mackenzie explained the three campus projects the firm completed: the UTS, UoW and the ADFA. Around the time that BMA were designing UTS and UoW, Mackenzie described his own design ethos as 'idealistic purism of purpose,'²¹ meaning a bias toward Australian plants over non-Australian plants. Nationhood underpinned his thinking: 'The indigenous environment of this young nation, I believe, offers a vast potential for establishing a tradition almost totally dictated by its natural and distinctive qualities.'²² Mackenzie's pursuit of indigenous landscapes permeated BMA's campus work thus serving as important cases for gauging the firm's effectiveness.

The UTS and UoW are comparable as early 1970s to late 1980s projects, whereas the formative period for ADFA came in the 1980s. The ADFA and UTS were both new campuses on undeveloped sites, and consisted of stands of indigenous plants and pre-existing landforms. In contrast, the UoW was built upon earlier campuses developed as part of Wollongong College and Wollongong Teachers College dating from the early 1960s. These sites had been cleared agricultural land but directly abutted on the eastern boundary the Mt Keira escarpment, an area of steep land with indigenous forests, from which drainage channels that passed into the UoW site originated. Along these drainage channels were isolated specimens of indigenous trees, including a small number of fig trees, the original specimens of which ultimately did not survive building development but were replaced. In the context of the three campus's pre-existing site conditions it is interesting to note the resultant shape, form and character of the landscapes that eventuated.

At the ADFA, the site's pre-existing savannah woodland was identified as an important feature of the site by landscape architect Catherin Bull and Professor of Botany Lindsay Pryor,²³ yet Mackenzie admitted that:

...[its] retention was not to be, as the random nature of the woodland had little chance of surviving the patterning and finished levels of complex buildings, a concourse, sports fields, parade ground, roads and car parks. Only a few of the original trees survived.²⁴

Figure 1: Two very different outcomes on the one campus site. [left] Attempted reconstruction of savannah woodland (2018); and, Figure 2, [right] the highly manicured parade ground and Claret Ash planting (2018). The Australian Defence Force Academy [UNSW], Canberra, by Bruce Mackenzie and Associates.

Notwithstanding BMA's attempts to reinstate vegetation in car parks and on the outer perimeters of the ADFA campus (see Figure 1), the defining plant species of the core part of the campus (see Figure 2) was the non-Australian tree, Claret Ash (*Fraxinus raywoodii*). This choice was a compromise in response to the cooler climate of Canberra and the argument that with deciduous trees more winter sunlight would be permitted to internal spaces. However, Mackenzie later perceived the result to be conflicting in appearance and that 'a less reverent approach to Canberra's standards would be applied, and limit the cold-climate trees to only the most critical winter time places.'²⁵

The design of ADFA was led by large design and coordination teams predominantly consisting of architects and planners²⁶ with BMA's involvement commencing almost a decade after planning had commenced. Roger Johnson, who served on ADFA's Planning Co-ordination Team, praised Mackenzie's role²⁷ yet by BMA's own admission their effectiveness in advancing an environmental agenda was less certain. In this sense, the UTS and the UoW remain the more notable of BMA's commissions largely because of a more long-standing and intrinsic role.

The formulation of legacies: the UTS and the UoW.

The outcomes at the UTS and UoW stand in stark contrast to the ADFA. At the UTS (formerly known as William Balmain Teachers' College and later the Kuring-gai College of Advanced Education), BMA worked closely with project architect David Donald Turner from the NSW Government Architects Office. Turner was known to be sensitive to Australian indigenous landscapes. The site had significant vegetation and rock platforms of Hawkesbury Sandstone, qualities praised from the outset by landscape architect Allan Correy²⁸ from the Landscape Section of the New South Wales Public Works Department. Correy was one of the few landscape architects of the period who became involved in conservation debates and environmental activism²⁹ and thus aided the assembly of a unified voice for protecting the site's pre-existing qualities at the design and planning stages.

The UTS campus layout was highly compact so as to avoid impacts across the site. BMA innovatively regenerated landscapes adjacent to buildings and car parks, developing landscape plans that designated areas of indigenous plants to be protected whilst also specifying 'native seed broadcasting' to be completed by campus staff.³⁰ This essentially entailed mechanical slashing of natural heath vegetation, the stockpiling of the residue, and the subsequent re-application of this residue to bare earth so that seeds contained within could propagate distinctive reproductions of the original landscape of indigenous plant communities.³¹

Planting solely Australian native plants and working with existing natural features, BMA's plan annotations indicate the intention to achieve an appearance of naturalness: specifying planting locations at 'random centres';³² to 'clean back to bare rock wherever possible'³³ and seamlessly integrate constructed elements, like steps and walls, into natural grades (see Figures 3 and 4); and, to micro-manage the site's ongoing regeneration. In a letter to the Principal of the college, Mackenzie explained that on a recent visit to the site in 1975 he had observed '...Willow trees, Pampas Grass, and Cotoneaster...[they] can only exist in conflict with the basic theme and strength of the natural indigenous character...Could they be removed?'³⁴ Despite the Principal's preference for non-Australian plants (roses for example) and his initial hesitation over BMA's embrace of the indigenous landscape, Mackenzie claimed that over time that same principal became proud of the resultant Australian theme.³⁵

If the UTS demonstrated concerted effort at protecting and enhancing a site's pre-existing indigenous qualities, the UoW's legacy can be defined as reclaiming an indigenous landscape completely erased. In 1976 when BMA began their commission, the UoW had as early as 1973³⁶ a community of like-minded and enlightened people, notably, mathematician and UoW senior academic, Keith Tognetti.³⁷ The interested community had support from the top in Vice-Chancellor Designate Dr L. M. Birt and Estate Manager John Bell (both commencing 1973). Together they formed a multi-dimensional force at various levels of management³⁸ committed to reconstructing semblances of an indigenous landscape. Birt's personal commitment was bolstered by the fact that he lived on a property in the hills above the campus and had a garden of impressive eucalypt trees and Australian plants.³⁹

The UoW's Academic Senate saw the need to build the new University's academic stature comparative with Sydney universities and believed that a campus of distinctive environmental quality would be a competitive tool in recruiting students and staff.⁴⁰ With Birt's support, Bell enabled this to pass: he initiated the production of a Development Plan in 1974 which was completed by a team of both in-house staff and consultants of national reputation in campus development;⁴¹ he aided the establishment of a Buildings and Grounds Committee (commencing 1 January 1975) which facilitated the production of key guidelines for pedestrianisation, a ring-road configuration⁴² with car parking, the use of Australian native plants, cohesion in brick paving, and, the masking of existing buildings with trees;⁴³ he helped secure and defend⁴⁴ substantial funding for landscape,⁴⁵ and importantly, he appreciated the site's resources, like its creek lines, supporting protection because they 'provided an attractive natural feature of the landscape'.⁴⁶

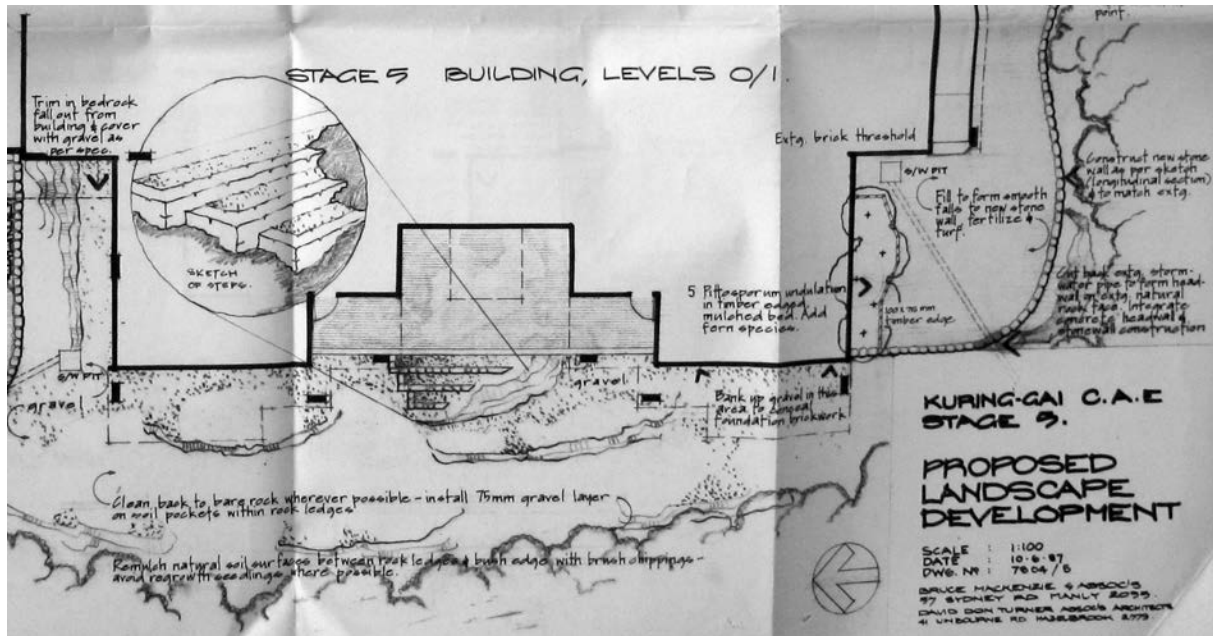

Figure 3: [top] Bruce Mackenzie and Associates, 'Kuring-Gai C.A.E Stage 5 Proposed Landscape Development', Drawing No. 7804/8, 10 June 1987; Figure 4 [bottom]: The UTS campus, 2016.

Bell's procurement in 1975 of landscape supervisor Leon Fuller and his second-in-command Bob Beattie would prove a decisive move. Leon Fuller's influence is widely regarded as a critical moment, and despite the fact that his six-year tenure was relatively short, he inculcated a landscape tradition from which others, including his successors David Walker and Martin Bramston, benefitted. Fuller was prepared to embrace an intensive planting program dedicated to indigenous plants of the Mt Keira escarpment and their propagation and use on-site to the order of 60% of all planting in his time.⁴⁷ Many of these plantings represent the earliest use of the local rainforest trees in designed landscapes. His subsequent publication on the native plants of the Wollongong region the 'Illawarra',⁴⁸ *Wollongong's Native Trees*, has been lauded in the local media as 'the definitive reference book on the region's diverse native trees.'⁴⁹ Fuller believed Bell's 'Development Plan' of December 1976 which included provisions for 'The Built Environment' and 'Landscaping'⁵⁰ was a formal instrument that expressed and gave credence to the indigenous plant theme and a degree of artistic licence.⁵¹

The 18th International Planning History Society Conference - Yokohama, July 2018

At the time [1975/6] a number of people at the university, mainly academics, felt strongly about using native plants. Dr Keith Tognetti (a mathematician at the university) was one of them. Their plan was to create a natural forest around the buildings and I believed in that vision. I could see it in my head. I had this clear picture of what it would be like.⁵²

The contribution of BMA needs to be appreciated against this backdrop of the University's in-house activities. BMA's early work included the design of car parks using Australian native plants, and in 1979, the completion of the duck pond amidst Fuller's emerging plantations after four years of intensive activity. The pond's design included vertically-placed logs as partial edging, creating an organically aligned wall⁵³ (see Figure 5). BMA contributed to the University master plan of 1987 led by architects and planners Graham, Bell and Bowman.⁵⁴ The landscape principles proposed mostly Australian indigenous species with plants indigenous to Wollongong region selectively used dependent upon suitability. A consistent plant palette was balanced with distinctive treatments for corridors, boundaries, paved areas, and, the remaining creek channel where recreational opportunities were to be provided.⁵⁵ The construction of UoW's campus landscape during the 1980s and 90s was to an in-house value in excess of \$30 million⁵⁶ and included an extensive redevelopment designed by Ian Brammer Landscape Architects for a water course and ponds (including The McKinnon Pond) that dramatically redefined an area once dominated by car park and playing fields.⁵⁷

The road to transformation of the UoW campus was not always a smooth one and the post-Birt era has had critics. For example, Vice-Chancellor Kenneth McKinnon reputedly had a relatively autocratic manner whilst overseeing a period of growth and development from the 1980s yet he nonetheless delivered a vision for landscape albeit whilst 'disbanding' previously engaged committees of management and restricting the influence of senior academics.⁵⁸ However, successive management regimes have been overwhelmingly committed to maintaining UoW's high environmental quality, ensuring adequate funds were allocated for maintenance and new landscapes, particularly post-construction of new buildings. It does appear that opinions have varied with regard to the kinds of forms that a reconstructed indigenous landscape should take within a university campus environment. The design ethos of Landscape Supervisor Martin Bramston (1984-circa 2012) from the mid-1980s onwards emphasised the 'presentation' of the campus as a park-like setting (see Figure 6) befitting a sense of order and control⁵⁹ that to an extent was different to the 1970s bid to reconstruct vignettes of natural Illawarra forest in relatively wilder states. Thus, diverging approaches may have resulted in differing views of ultimate success.⁶⁰ Regardless, the legacies of the 1970s seem all-pervasive: the current landscape guidelines include statements like: 'Plants should be 100% Australian native with approximately 50% of these being local to the Illawarra Escarpment and coastal plain.'⁶¹

Figure 5: [left] The duck pond at the University of Wollongong in 2018; Figure 6 [right]: A view of planting near Central Square, the University of Wollongong in 2018.

Conclusion

The relatively young Australian profession of landscape architecture made distinctive yet sporadic claims to the design and planning of university campuses over a two decade period from the 1960s to the 1980s. In this context, the commissions of BMA figure prominently. Examples of BMA's most effective work at the UTS and UoW begin to indicate some of the ingredients for success: consistent and ongoing involvement of one landscape consultant commencing from the early stages of development; close professional associations with architects, engineers, and planners of both in-house staff and external consultants; representation on design panels, management committees and the like; and perhaps most significantly, being able to capitalise on the joint and prolonged efforts by communities of university staff and other people all of whom had vested and common interests in attaining high quality campus environments. The significance of a broad commitment of people at multiple levels can often go unheeded. For example, the UoW's current masterplanners, MGS Architects, record the legacy of Fuller's work and Mackenzie's designs but the broader group in the academic and management community like Keith Tognetti, Kenneth Ausburn, John Steinke, Martin Bramston and many others are overlooked.⁶² Campuses are complex sites where the physical environment potentially develops in ways highly distinctive in response to the particular communities who inhabit them. It is the existence of such communities that make campuses unique environments and ideal arenas for the study of professions, shedding light on the complex negotiations that occur in the bid to develop a shared resource. Globally, the ongoing evolution of campus landscapes within increasingly urbanised centres presents critical opportunities for comparative analysis across a diverse and wide-ranging international scene.

⁴⁶ Bell et al., *The University of Wollongong Development Plan*, 12. In summary: a 1970 masterplan by planners Laurie and Heath Pty Ltd proposed that a creek that ran through the site needed to be diverted in order to allow Stage 2 of the main library to be constructed and that this be achieved by piping the creek underground some 100 metres to the east. This drew criticism and objection to the extent that a decision was made to divert the creek but not to contain it within a concrete pipe. Despite the concern for the appearance of the reconfigured creek, its shift in position had an unforeseen detrimental impact: two large fig trees that predated urbanisation by hundreds of years and had survived the early years of the campus's development were purportedly killed as a result of their water supply being impacted. ⁵² Leon Fuller quoted by Duffy, "Field of dreams", 8.

⁵³ The duck pond in the central square was built in 1978/9 amid controversy: many felt the price tag of around \$80,000 was too high and that funds should have instead spent on improving education, the university's prime task. Student activism arose in a bid to bring about a decision whereby such funds would be spent procuring a new professorial position in History and Philosophy of Science, hence the protestors slogans 'F... the ducks, we want HPS.' Hartgerink, *Regional Icon Global Achiever*, 28; see also: Duffy, "Field of dreams", 8. This wall has subsequently been replaced due to deterioration of the timber over time but its reconstructed state bears strong resemblance with the original.

⁵⁴ See: Graham, Bell and Bowman, *Stage 1 Site Services Development Plan The University of Wollongong*, October 1987. This masterplan materialised in the form of a 'site services' document because the lead consultants, were sensitive to the fact that the then Vice-Chancellor, Ken McKinnon (1982-94) did not value bureaucratic entanglement or 'voluminous master plans' (Terry Graham, personal communication with Andrew Saniga, 9 March 2018).

Nature Conservation Planning Approach in The Urban Epoch

Balin Koyunoglu*, Nuran Zeren Gulersoy**

* *Ph.D. Candidate, Istanbul Technical University, Graduate School of Science, Engineering and Technology, Urban and Regional Planning Department, balinozcan@gmail.com*

** *Prof. Dr., Istanbul Technical University, Department of Urban and Regional Planning, gulersoy@itu.edu.tr*

This study explores the nature conservation planning in the urban context, an emerging issue in the process of striking a balance between natural heritage conservation and urbanization demands, by focusing on two cases: Breda City Plan in the Netherlands and Beykoz Riva Integrated Environmental Protection and Development Plan. Breda City Plan is analyzed as a reflection of a deep-rooted tradition that is sensitive to nature while Riva Beykoz Plan is analyzed as a unique example within Turkey in that regard. These cases see the development of an integrated rainwater management system by the enhancement of existing ecosystems and green urban spaces and by their connection to the adjacent protected natural areas. This study explores whether the recent implementations of nature conservation in Breda and Beykoz Riva meet IUCN guidelines for urban areas. These cases are analyzed with the IUCN Urban Protected Area Guidelines which adopts current concept and methodology of nature conservation planning in urban areas. As a result of their analysis, it is observed that they both meet the guideline criteria.

Keywords: nature conservation, urban protected areas, planning history

Introduction

According to the projections of 2050, it is evident that the world will be increasingly urbanized¹. This emerging urbanization trend has already started to alter the approaches to nature conservation and will continue to do so. Current approaches intend not only to conserve natural areas but also to sustain natural heritage in urban settings. Natural areas meet social needs and increase ecological awareness in urban societies. Thus, nature is an essential aspect of the contemporary city structure. To that regard, nature conservation planning serves as a substructure for urban planning.

An initial attempt at integrating natural areas in the urban spatial organization was made at the Third World Parks Congress in 1982². The subject of the conference was the shift in understanding of natural areas which were no longer “set aside” but casted as “components of sustainable development” in the urban pattern³. Meanwhile, the buffer zone concept was developed into a broader systematic technique called impact zone. This was followed by a zone of interaction and multi-objective land allocations. When it came to the 2000’s, no-zoning approaches started to emerge. Today, there are several models such as no-take boundary design or morphological spatial pattern analysis that consider natural areas in relation to their surroundings, especially in urban areas⁴.

This study aims to provide a literature review on the history of nature conservation planning in an urban context, exploring the issue together with international declarations and recommendations that have determined the tendencies of their time, leading to shifts in understanding. After structuring theoretical background, selected case studies will be assessed according to the Urban Protected Areas Guidelines, one of the recent nature conservation guideline focusing on urban areas. These case studies are Breda City Plan, Breda Netherlands and Beykoz, Riva Valley Integrated Environmental Protection and Development Plan, Istanbul Turkey. By providing an analysis of these cases, this study intends to find out whether the contemporary nature conservation planning implementations are compatible with the IUCN Urban Protected Area Guidelines.

The concept and methodology of nature conservation planning have been evolved over centuries due to the transformation of the attitude with regard to the preservation and sustainment of natural heritage. From the Stockholm Declaration⁵ to the Rio Declaration⁶ nature conservation became a form of global partnership, gaining national, regional and international recognition. As cities increasingly grew in time and the pressure of urbanization on natural areas increased, sustaining natural areas in the urban fabric became a key issue. As a result, International Union for Conservation of Nature adopted the current notion and methodology of nature conservation planning in the Urban Protected Area Guidelines in 2014⁷.

Consequently, the classical individualistic approach that was adopted earlier left its place to a more inclusive one. In the eighteenth century, the aim of nature conservation planning was to preserve the natural resources and protect valuable landscapes. In the nineteenth century, the focus was to protect the physical environment, sustaining the

variety of wildlife in natural areas and monumentalizing the sites with its scenic wonders. In the twentieth century, nature conservation planning became a networking discipline. In that regard, preventing fragmentation of natural sites was prioritized in the course of comprehensive and inclusive planning attempts. The following part of the study explores how the history of nature conservation planning in urban areas developed.

Alterations in the Process of Nature Conservation Planning in Urban Areas

Between 3 and 5 thousand years ago, a sophisticated urban culture emerged in Anatolia and Mesopotamia with the development of ancient cities⁸. Those cities provided the basis for systematic initiatives to be taken in urban environments. Management of productive land, irrigation, and understanding of solar system were developed and systematized, paving the way for the establishment of analytic and comprehensive relations between human and nature. As a result, natural areas were either removed from the city centers or kept at the outskirts of cities. Until the twenty-first century, cities were assumed to present a stark contrast with nature or the natural⁹. It is common knowledge that having been cultivated and invented by the hand of humans, cities were understood to stand in opposition to the wilderness. They were often described as separate from what might be considered the “natural world”.

However, today’s understanding of urban culture demonstrates a difference from the past by focusing on the notion of urban socio-nature. Socio-nature does not contrast the concepts of nature and humans but unites them by referring to them as a single concept¹⁰. In that regard, according to socio-nature, there is nothing inherently unnatural about cities. Cities are man-made environments that are integral to a broader ecological system. Hence, the previously presumed dichotomy between city and nature is rejected. For a long period, urban studies have ignored the physical nature of cities, emphasizing the social aspects rather than the ecological. However, cities can also be defined as a prism of social, economic, ecologic and cultural powers.

In the nineteenth century, there was an explicit urban park movement. Landscape architects such as Frederick Law Olmsted have left a permanent legacy in cities as a part of this movement¹¹. Urban parks used to be large open green areas that were located at the edge of a city, following the ideal of the pastoral landscape with buildings subordinate to the overall landscape. These large landscaped parks were supposed to mimic nature¹². However, they were not supposed to be as wild as nature. Urban parks were required to be in between the wildness of pure nature and civilized nature of a city. Since that movement emerged, urban parks such as the Central Park have been developed not only for their social and economic opportunities but also their aesthetic appeal. Prosperous cities are aware of the fact that nature is an essential element in creating the high-quality environment.

In the mid-twentieth century, environmental groups tackled with series of issues on nature, city and social powers. These attempts were aimed to raise public awareness about environmental degradation. With public support, they tried to secure the conservation of natural resources, preservation of wilderness areas and biodiversity in urban environments. This modern environmental movement was triggered by local, national and international non-governmental organizations. Beginning with a concern about air and water pollution, this movement grew in time to address other concerns pertaining to all landscapes and human activities. As a part of this movement, Abel Wolman introduced the notion of the metabolism of cities¹³. According to Wolman, the city is accepted as an ecological system with a quantifiable amount of environmental inputs such as energy and water and outputs such as heat, pollution, garbage, and noise. Maintaining a balance between inputs and outputs constitutes a self-sustained city.

In the late twentieth century, the context of sustainability in cities was expanded with the Stockholm Declaration and established respectively with the World Charter for Nature¹⁴, the Brundtland Report¹⁵ following the Rio Declaration¹⁶. The Brundtland Report emphasizes the necessity of combining human actions, ambitions, needs, and attempts with the environment in order to achieve sustainability in the long term¹⁷. With the Rio Declaration, sustainable cities became a developing topic, especially for planning discipline. In the same declaration, environmental protection was stated as an internal part of the development processes in the cities. The declaration addressed the issue of harmony with nature which is crucial for a healthy and productive life in urban environments. Herbert Girardet defines the sustainable city as “a city that works so well that all its citizens can meet their own needs without endangering the well-being of the natural world or the living conditions of other people, now or in the future”¹⁸. According to Girardet’s definition, the sustainable city requires the implementation of environmental-friendly standards, management objectives, and priorities equally for all the citizens.

These discussions on sustainability have raised the issues of environmental quality in urban areas. Questions of environmental quality immediately bring up the issues about social exclusion as the worst environmental conditions are imposed on the most marginal-lower-income urban areas. Disasters are also considered as a matter of social exclusion. They affect poor cities or poor parts of cities more than affluent ones. Due to the existence of economic inequity and social justice, hazards easily turn into disasters. At the beginning of the twenty-first century, Lawrence J. Vale and Thomas J. Campanella used the term “resilience” to determine a city’s ability to survive a

The 18th International Planning History Society Conference - Yokohama, July 2018

disaster, underlining four stages for recovery. These stages are an emergency response, restoration, replacement and reconstruction and development reconstruction¹⁹.

All these distinct yet connected ideas about nature conservation underline the importance of the existence and sustainability of natural areas within cities. Today, natural areas in the urban fabric are utilized to sustain, resist, and contribute to the creation of socially inclusive and healthier cities. Best management practices in nature conservation increase the quality of life in cities.

Though the conservation and protection of natural areas in cities gained importance, threats against nature did not subside but showed an increase. As a result, United Nations commissioned International Union for Conservation of Nature (IUCN) as a permanent observer in 1999²⁰. Today, IUCN has the most significant network and database for nature conservation. In 2003, United Nations Protected Sites List, which was first initiated in 1962, was officially established by IUCN and UNEP-WCMC²¹. Together with the list, protected sites categorization and management strategies are decided. With this momentum in 2014, IUCN remarked current concept and methodology of nature conservation in the Urban Protected Area Guidelines (UPAG)²². Even though the guidelines refer to urban protected areas, it draws the framework of management and enhancement of natural areas in an urban environment.

According to IUCN definition, urban protected areas are natural areas situated in or at the edge of large population centers²³. They do not include conventional urban parks with lawns, flowerbeds and sports fields²⁴. They are wilder forms of nature in the urban fabric²⁵, such as groves. There are numerous actors in charge of these areas including government, decision-makers, media, opinion leaders, and critical educational and cultural institutions. Urban sprawl and intensification of urban development are external threats. These areas are affected by crime, vandalism, littering, dumping, and light / noised pollution and subject to urban edge effects as more frequent and severe fires or the introduction of invasive alien plant species.

PEOPLE
provide access for all
engender a local sense of ownership
take advantage of volunteers and support groups
communicate carefully and use a range of communication technologies
demonstrate, facilitate and promote good environmental behaviour
demonstrate, facilitate and promote the health benefits of contact with nature and of good eating habits
prevent littering
prevent and prosecute a crime against people and property.
reduce human-wildlife interaction and conflict
control poaching
control invasive species of animals and plants
INSTITUTIONS
cooperate with agencies that have shared or adjoining jurisdictions
cooperate with institutions that have complementary missions
cast a wide net of advocates and allies
cooperate with universities in training managers for urban protected areas
learn from others' experience with collaboration
IMPROVING URBAN PROTECTED AREAS
promote and defend urban protected areas
work to make urban protected areas national and global conservation priorities
create and expand urban protected areas
promote rules and organisational cultures that respect the differences between urban and more remote protected areas
recognise that political skills are critical to the success
seek funding from a wide range of sources
take advantage of international organisations and exchanges
improve urban protected areas through research and evaluation

Table 1: Principles are stated in the IUCN UPAG.²⁶

To sustain natural areas in cities, UPAG laid down certain principles. IUCN states that these principles are relevant to urban protected areas or any open green areas in or at the edge of large population centers²⁷. In Table 1, the

principles are grouped in four categories to simplify the complexity of UPAG. They include suggestions to increase social relations with natural areas, cooperation among institutions, improvement of urban protected areas as well as a recommendation for future implementations.

These principles constitute the main aspects of sustaining natural areas in an urban environment. In order to create natural conservation in city-scale high-populated areas, IUCN recommends a network planning approach to integrate natural areas into other land-uses to increase human contact with nature²⁸. Thus, natural and built areas need to become components of a whole system harmoniously. The UPAG remarks this concept and methodology by providing access to all, increasing awareness, promoting connections to natural areas and helping infusion nature into the built environment. In the scope of this study, these remarks of the UPAG is analyzed in two cases.

Nature Conservation Planning Approaches in Case Studies of Breda and Beykoz, Istanbul

Two different case studies have been selected to discuss UPAG principles. The first case is Breda City Plan in the Netherlands. The second one is the Beykoz Riva Integrated Environmental Protection and Development Plan in Istanbul, Turkey. The city of Breda has historic urban context with water presence^{29, 30, 31}. Riva also has a historic settlement pattern including agricultural and forest areas^{32, 33, 34, 35}. Both cases are at the edge of the water bodies and face a flood risk due to several rivers. The City of Breda and Beykoz have a similar population with 324,812 and 247.284 inhabitants respectively^{36,37}. These two-medium size post-industrial settlements are both under the pressure of rapid urban development and share an environmentalist stance.

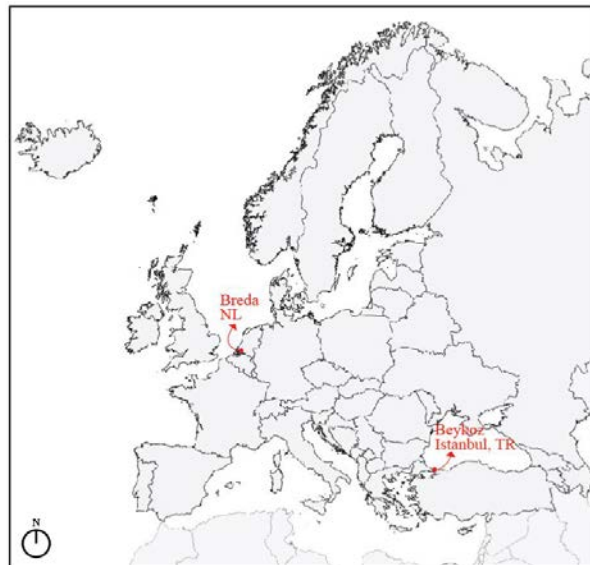

Figure 1. Location of Breda Netherlands and Beykoz Istanbul Turkey on the Europe Map

The city of Breda is located in the province of North Brabant in the southern part of the Netherlands. Breda has been pursuing sustainable urban development for thirty years in order to distinguish itself from its neighbors Rotterdam and Amsterdam³⁸. Implementations in Breda focuses on the combination of planning attractive green spaces with sustainable risk management for flooding. Urban development approaches in Breda have environmentally friendly and socially sensitive aspects. In that regard, the city establishes a forest plantation near to a local highway to compensate for carbon dioxide emission and to increase awareness about global climate change. Housing development projects (Chassé Park or Westerpark) prioritize the connection among nature, city, and agriculture. First, the green areas within the city are connected to one another, then this web of connection is tied to a larger project, called the Green Fingers, which includes a regional scale³⁹. Breda is also adjacent to the NP De Biesbosch which is protected nature reserve and the largest freshwater tidal area in Europe⁴⁰. The reason for analyzing Breda City Plan in the scope of the UPAG is to comprehend whether a traditionally successful nature-sensitive implementation will also adopt the principles.

The district of Beykoz is located in the north of the Anatolian side of the Bosphorus in the Istanbul metropolitan area. The Municipality of Beykoz is distressed by the regular flooding of Riva River. Therefore, the integrated protection and development of the Riva river and Riva valley in Beykoz are initiated by Beykoz Municipality in collaboration with a Dutch-based planning firm⁴¹ and local stakeholders. Within this framework, flood risk management and sustainable water strategy were developed together with the revitalization of the agricultural area. This project also includes the ecological and recreational development of the Riva river basin. In that regard, the construction of a new city marina, acceleration of urban development, and tourism industry are proposed. This

sustainable approach allows Beykoz to conserve its natural values and continue to be the green lung of Istanbul. This project site also includes a nature protection site (Polonezköy Nature Park) that is integrated to the development plan⁴². Beykoz Riva Integrated Environmental Protection and Development Plan is assessed according to UPAG in order to understand whether the guiding principles of UPAG support this one of the first implementations in Istanbul.

The assessment Breda and the Riva Beykoz urban plans according to IUCN's UPAG demonstrates that both implementations are in line with most of the principles (Table 2). In Breda City Plan, an existing green network of natural areas is enhanced to increase recreational activities in the urban context. The plan is carried out in cooperation with various institutions with the aim of developing an environment-friendly transportation system and creating economic opportunities. Dwellers were included in the planning and decision-making processes, and they continue to be a part of communications with the authorities for future processes.

The Riva Beykoz development plan also expands the use of public open spaces, and enhances the connection among populations, increasing access to social benefit. The development plan proposes solutions to the problem of canalization of water bodies, improving environmental quality for river basin and increasing agricultural production. It also emphasizes cultural heritage sites and increases awareness with regard to urban identity. Breda City Plan aims to improve biodiversity in an urban area and make it more durable together with green infrastructure implementation in the natural areas. It is a successful project carried out with a sensibility to protect nature in the urban context. In contrast, nature conservation has not become a key concept in urban planning in Turkey. Riva Beykoz development plan is one of the first attempts at creating an integrated environmental protection plan focusing on a river basin in an urban context. Even though these cases represent different backgrounds in terms of nature conservation, they both meet criteria of IUCN UPAG that adopt the current concept and methodology of nature conservation planning in urban areas.

Conclusion

As cities continue to grow, nature retreats and people lose contact with nature in urban areas. Therefore, not only the protection of natural areas but also the creation of new spaces for the development of nature within the urban fabric attain crucial importance. The existence of nature in urban areas is vital for influencing, encouraging and assisting societies to conserve the integrity and diversity of nature. In addition, it ensures that any use of natural resources must be equitable and ecologically sustainable. Natural areas facilitate the connection between people and nature. Cities are where most people live, where wealth is concentrated and where communications and the media are centered. According to IUCN, political leaders are under pressure to hear what their electors have to say to them⁴³. In that regard, restoring the severed ties of urban people with nature might be possible if they are to demand from political leaders that nature conservation must be a priority.

“Earth will be protected only if urban people care about nature where they live”⁴⁴.

Considering the change in the approaches to nature conservation as the cases of Breda and Riva Beykoz demonstrate, it is possible to conclude that social needs of city dwellers can only be met and an ecological awareness among them can only be raised by enhancing the connection between nature and urban societies. As it is indicated by IUCN UPAG, today the emphasis is not only on protection of natural areas but also on the sustainment of natural heritage by increasing durability and improving life quality in urban settings. Therefore, conservation of nature is an important aspect of the contemporary city structure.

33 Water and City

Interaction between Water and City: Historical Legacy and Transformation of The City of Ji'ning

Lu Guo (Tsinghua University)

Ji'ning, located in the southwest of Shandong province of China, is a famous historic city with a long history and deep cultural accumulation. In Ming and Qing Dynasties (1368-1912), it was an important commercial city along Beijing-Hangzhou Grand Canal. However, in recent decades, large-scale industrial production and coal mining have been carried out in Ji'ning region, resulting in serious environmental problems, and the cultural characteristics of the city, which was gradually accumulated in the long history, are becoming increasingly blurred. It is necessary to study the historical legacy of Ji'ning in a scientific way, to excavate its characteristics and mechanism, and furthermore to learn from the legacy and explore the way of urban transformation and development.

Firstly, the historical context of the city development of Ji'ning would be teased out to excavate its driving force, including 3 steps: (1) Prehistoric Period: the primitive settlements were developed depending on the rich natural water system; (2) Lu Cultural Period (from Pre-Qin Period to Song Dynasty, 11th century BC to 13th century AD): the artificial water system had been developed gradually providing better conditions for urban development; (3) Canal Cultural Period (From Yuan to Qing Dynasty, 13th to 19th century): The Beijing-Hangzhou Grand Canal was completed promoting the development and prosperity of the region. It could be declared that the main driving force of the development of Ji'ning city in history is the interaction between city and water, the development of the water system had promoted the development of the city.

Secondly, the mechanism of the interaction between city and water would be excavated with Canal Cultural Period as an example. It could be demonstrated that a multilevel regional whole with the canal as the core had been created through the interaction of water and city, including 3 spatial scales: (1) Enrichment and development of urban and rural system; (2) Expansion and evolution of urban form; (3) Integration and change of streets and buildings.

Based on the study on the driving force and mechanism of urban development, the enlightenment from the historical legacy to the sustainable future of the contemporary city could be achieved. First, attention should be paid to the interaction between city and water, from the perspective of solving the contradiction between city and water, the comprehensive means of ecological governance and landscape modeling could be applied to improve the damaged natural environment and restore the benign interaction between human and water. Second, the regional space should be treated as a whole, a multi-scale creation of regions, cities, urban areas, streets and buildings should be carried out rather than simple city planning.

Modern Regional Development in Japan: From the Kiso River Improvement Project to City Planning of Gifu

Yoshifumi Demura (Gifu University)

Japanese modern local cities were formed by the system of urban planning which became full scale in the 20th century, controlling the urbanizing area. However, looking to the outside of the city planning system, it is obvious that the cities exist on the result of previous infrastructure developments, such as traffic lines including water transportation, the drainage systems, land improvement, disaster prevention, food supply, and energy supply. For example, Japanese great rivers were initially modified by Dutch engineers far before establishing urban infrastructures.

In order to describe the circumstances and conditions of the establishment of modern city, the transformation of causal relationship between the regional infrastructure system and the urban planning should be described. In this research process, international comparison studies must be effective, for some regional improvements in the East were carried out by technology transmitted from the West, and the insights into urban planning in the East were also influenced by the world wide stream. This research focuses on one typical example for this, the case around a local city, Gifu, Japan. The objective is to describe the aspect that the region gradually modernized in the process from the river improvement project to the urban planning in the urban area.

The sequence of projects was as following. The initial situation of downstream parts of the Kiso, Nagara, and Ibi rivers after the Meiji Restoration was the state of collective Wa-Jyu which were areas surrounded by embankment in meshed river flow. Johannis De Rijke, one of hired Dutch engineers, found out the problem of sediment flowed out of the mountainous area and planned to modify the flows letting the sand flow out to the sea. This river improvement project was from 1887 to 1911. After this project, land improvement of agricultural fields on watershed area of upper stream parts was required. This wide spread project needed to overcome conflicts between individual societies rooted of each Wa-Jyu. Then people organized new overwhelming society and constructed huge drainage system from 1926 to 1934. Gifu city situated in the upper stream of this area was about to make a system of city planning at that time, to overcome general urban drainage and environmental pollution problems derived from new factories. The drastic solution planned by the Gifu city engineer was construction of separate sewer system using the drainage system already formed by that time, from 1934 to 1943.

In this long process (1887-1943), there was not the comprehensive vision in the initial stage. The final system was formed as the consequence of emergence in the process that the social relationships among various positions reach equilibrium. The vast vision of De Rijke, perspective of the prefectural technicians, and guidance to the collaboration of the interior ministry bureaucracy, which were derived from Western or Westernized engineering, stimulated people to cooperate and share the wider scale of foundation system which was a new equilibrium among wider society. The urban planning began on the bases of vast regional system created in that way.

The river and the park: infrastructure in urban planning. Santiago de Chile at the beginning of the 20th century

Fernando Pérez-Oyarzun (Pontificia Universidad Católica de Chile)

The paper highlights the role of infrastructure in urban planning. It poses the question about virtuous associations of infrastructure and public space. Does infrastructure reduce its meaning to technical and functional dimensions, or could trigger wider and positive impacts upon the urban fabric? Examining a case study of the early 20th century, the paper suggests the possibility to conceive infrastructural projects as promoters of urban quality. The case study is Parque Forestal (Forestal Park) area in Santiago de Chile, whose origin is tightly associated with the canalization of the Mapocho River. The Park makes part of a wider modernization process. It provided the city with a new public space, allowed the creation of a renovated residential neighbourhood, and set a tendency for urban expansion and future public spaces.

Mapocho embankments were used as common pasture fields during colonial times. Local authorities had built a series of protecting walls, known as Tajamares, to prevent the floods caused by dramatic changes in the river flow. Along them, urban promenades, adorned with trees, were settled. At the end of the 19th century the area had turned into an abandoned periphery, serving, in part, as waste deposit. The river course appeared as a wide area of a variable size that eventually reached more than 200 meters width.

Benjamin Vicuña Mackenna, Intendant of the city, proposed to canalize the river and to take advantage of the liberated land, in 1872. The idea was to plant a park and build a residential area in the terrains gained to the river. The canalization was part of a wider plan, which included other infrastructure projects as well as green spaces. Vicuña Mackenna was fully aware about the economic implications of this huge project and, therefore, about the need of getting the maximum urban profit from it.

The river would be actually canalized fifteen years later, following the project of the engineer Valentín Martínez. After some public discussions, Vicuña Mackenna's proposal of planting a park and developing a residential area was implemented. The park was a key space for the centennial of the independence celebrations occurred in 1910. A new fine arts museum and a number of monuments to celebrate the occasion were installed there. The residential area was conceived as a kind of garden city, fully innovative for the urban standards of those years.

The Forestal Park transformation represents a very significant effort of the early 20th century, in order to combine infrastructure modernization and urban quality. It gave birth to one of the most appreciated areas in the city. This can be attributed to the virtuous combination of the river, the park and the residences. Other parks have emerged along the river in the following years. This tendency, inaugurated by Forestal Park, could become a green backbone for the whole city. One could expect that the highways also built along the river could have exhibited the same concern about public space, but it hasn't been always the case.

Interaction between Water and City: Historical Legacy and Transformation of The City of Ji'ning

Lu Guo*,

* Assistant Professor, School of Architecture, Tsinghua University, Beijing, China, guo_lu@126.com

Ji'ning is a famous historic city with a long history and deep cultural accumulation in Shandong Province, China, which was facing serious environmental problems and cultural crisis due to large-scale industrial production and coal mining in recent decades. It is necessary to study the historical legacy of Ji'ning in a scientific way, to excavate its context and characteristics, and furthermore to learn from the legacy and explore the way of urban transformation and development. Firstly, the historical context of the city development of Ji'ning is teased out to excavate its driving force. Secondly, the mechanism of the interaction between city and water is excavated with Canal Cultural Period as an example. Based on this, the enlightenment from the historical legacy to the sustainable future of the contemporary city is declared as a conclusion.

Keywords: Legacy, Transformation, Sustainable future, Water, the Grand Canal

Introduction

The city of Ji'ning is located in the southwest of Shandong Province, China. Governing 2 administrative districts, 2 functional areas, 2 county-level cities and 7 counties, it covers an area of 11,187 square kilometers with the population of 8,354,400. The "Ji'ning" discussed in this paper refers to Rencheng District where the administrative center locates, which is also the site of ancient Ji'ning County. Rencheng District covers an area of 651 square kilometers with the population of 1,010 thousand and it's the core region of the city of Ji'ning (Figure 1). People have lived in Ji'ning since Paleolithic period. (Figure 1) After the opening of the Grand Canal in the Yuan Dynasty (1271-1368), it has been an industrial and commercial city with prosperous economy and social culture because of the unique position as the center point of the canal. Ji'ning is a city with long history and profound civilization accumulation. However, in recent decades, a large-scale of industrial production and coal mining have been conducted in Ji'ning, which cause severe problems such as environment pollution and aging industry. The regional cultural characteristic that is accumulated and formed in history is blurred gradually and the urban development is facing the transformation. In 2014, the whole application for world inheritance of the Grand Canal got a success. The value of Ji'ning's history and culture, on the one hand, has been fully affirmed and highlighted. On the other hand, higher requirements have been raised in terms of legacy protection and transformational development of city. That inspires us to study further the historical legacy of Ji'ning with scientific methods to explore the historical context and analyze the characteristics of the development of the city. Based on this, we could get further reference from historical legacy for the development of modern city and then explore the path of city's transformational development.

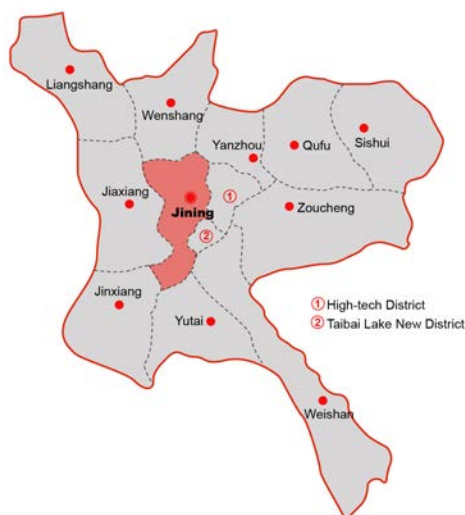

Figure 1 Location of Ji'ning and administrative division of the city of Ji'ning

The urban development historical context of Ji'ning: motivated by interaction between city and water

The history of urban development of Ji'ning could be divided into four stages broadly: prehistoric culture period, Lu culture period (Western Zhou to Song Dynasty, about 11th century BC - 13th century AD), Canal culture period (Yuan Dynasty to Qing Dynasty, about 13th century - 19th century) and Industrial civilization Period (20th century-). People have lived in Ji'ning since Palaeolithic period. A large number of early settlement sites had been founded in Ji'ning and surrounding areas, including several cultural types including Beixin, Dawenkou, Longshan and Yueshi. Tales of several legendary tribal leaders and sovereigns such as Chiyou[蚩尤], Shaohao[少昊] and Great Yu[大禹] are also spread widely nowadays in that region. Started early, the culture there was prosperous and highly diverse. Ji'ning was Rencheng State in the Pre-Qin Period. After the unification of China in Qin Dynasty (221-207BC) this area was divided into Rencheng County and Kangfu County. That was kept basically until the Southern Song Dynasty (1127-1279). During this period the main functions of Ji'ning was politics and military. It was an important part of Lu Cultural Region that took Qufu as the core. Respecting Confucianism, valuing rite and observing order were highly appreciated. After Yuan Dynasty (1271-1368), with the opening of the Grand Canal, Ji'ning, as the center point of the Grand Canal, entered its meridian period of urban development. The commercial economy was more and more flourishing, "The goods and money from Yangtze River and Huaihe River areas are all gathered there". The social culture became richer and more diverse, "Different culture from different regions is converged", "People don't depend on the agricultural production but commodity. They speculate and earn money"¹. The regional culture was converted into Canal culture which was open and attached great importance to commodity from Lu culture which was plain and respected agriculture. The modern Ji'ning is a traditional industrial city depending on resource exploitation. The industrial culture has been the main body of regional culture. The industrial and mining enterprises are everywhere and lead the urban development.

From further analysis of the driving power of urban development and evolution in each stage, we can find that the interaction between water and city is the main driving power going through the whole process of the history of urban development. The interaction between water and city forms a multilevel regional space as a whole. Since the ancient times, Ji'ning has been a region with serried water network. In early stage of regional development, people took advantage of the natural water resources simply for agricultural production and everyday life; then artificial water system came on stage gradually and large-scale water projects were built; in modern times, coal mining has caused large-scale subsidence waters. The natural landscape changes continuously. The human settlement is also in the process of gradual development: the earliest primitive settlements developed into a political and military center of a region, and then became a prosperous commercial city. Now it's a traditional industrial city which is in the process of transformation. The urban space, with the interaction between people and water, is gradually formed and developed throughout the long history.

(1) Prehistoric culture: well- developed natural water system system and emergence of original settlements

The archaeological survey and research show that the southwest of Lu where Ji'ning locates was a region with alternated rivers and lakes and thick forests from ancient times². The ancient people took advantage of the rich production and living resources provided by natural environment. They farmed and inhabited there, and also hunted for animals and fish. The early settlements sites distribute widely in Ji'ning, including Sigudui site, Chengziya site, Fenghuangtai site, Shihai site, Pipashan site, Yihe site and Danggudui site. These sites belonged to several different historical period and cultural types, such as Longshan and Dawenkou.

(2) Lu culture (Pre-Chin—Song Dynasty): artificial water system involved and development of the city

Though, there were always a great numbers of rivers and lakes in Ji'ning and the water resource was rich throughout the history, the water system changed greatly in different historical periods influenced by Yellow River. In Spring and Autumn Period(770-476 BC), people tried gradually to make the human power involved in natural environment and communicated the natural water system with artificial canals. For example, In 483BC, King Fuchai of Wu (reigned 495-473 BC) excavated canal to communicate Jihe River and Yihe River³; in 12th year of Yonghe in Eastern Jin Dynasty (356), Xun Xian (322-359) excavated the Guanghe River⁴; in 4th year of Taihe in Eastern Jin Dynasty (369), General Huan Wen(312-373) excavated the Huangong Ditch⁵; in 4th year of Kaihuang in Sui Dynasty (581AD), the Fengyan Ditch was excavated⁶. (Figure 2)

The artificial canals improved the convenience of water transport of this region and the advantage of geographical location of Ji'ning had also been enhanced. In 'Note on the Wall of Rencheng County's Hall' of Li

Bai(701-762), it is recorded that “There are 11 counties in the area of Lu. Among them Rencheng is the most strategically important section.”⁷The city developed gradually with the political and military function.

(3) Canal culture (Yuan Dynasty—Qing Dynasty): the opening of the Grand Canal and the prosperity of the whole region

From the Yuan Dynasty, along with the excavating of the Grand Canal, a series of relevant large-scale water projects were pushed, which made the rivers and lakes as well as the terrain of the whole region changed greatly. In 20th year of Zhiyuan in Yuan Dynasty (1283AD), the Jizhou River was excavated; in 26th year of Zhiyuan (1289AD), the Huitong river was excavated. The two rivers were further dredged during the period of Yongle in Ming Dynasty(1403-1424).

The opening of the Grand Canal made Ji'ning an important node on north-south communicating artery of China. Ji'ning was located at the center point of the Grand Canal, from where “one could reach Yangtze River and Huaihe River areas in south and Zhanghe River and Wei Area in north. The land and water communications gather here, which makes it a very important region”⁸. In 4th year of Xuande of Ming Dynasty (1429), the court raised the tax of 33 counties to increase the income of the central government. They were mostly well-known industrial and commercial cities with prosperous economy, such as Suzhou, Yangzhou and Yingtian(Nanjing), and Ji'ning was one of them, which indicates that Ji'ning was already one of the important economic centers of the whole country⁹. From the Yuan Dynasty, the commercial economy of Ji'ning rised rapidly and the whole region was very prosperous. However, in the 5th year of Xianfeng in Qing Dynasty (1855), the Yellow River moved northwards and grabbed the waterway of Daqing River into sea. The Grand Canal was cut off and Ji'ning was declined gradually. (Figure 2)

(4) Industrial civilization (modern times): surrounding land subsidence and the limitation to regional development

Since 1950s, Ji'ning has been an important coal base in China. Long-term coal mining caused dozens of environment problems, the most severe one of which was the large-area land subsidence. Until 2010, the area of land subsidence in the City of Ji'ning is about 23,500 ha, which accounts for 2.1% of the total land area.¹⁰ It is preliminary estimated that the collapsed area will be over 270,000 ha in 2050, which accounts for about 24% of the total land area and 50% of the cultivated area.¹¹ The urban construction land of Ji'ning will be surrounded by large-area water formed by land subsidence. (Figure 2)

The coal minning industry had accelerated the economic development of Ji'ning, but also caused serious problems: the water pollution spreads; the communication facilities and the infrastructure of water and transportation are damaged; a great amount of farming land and construction land is eroded. All of these problems threaten the regional ecological security and restrict the urban development greatly.

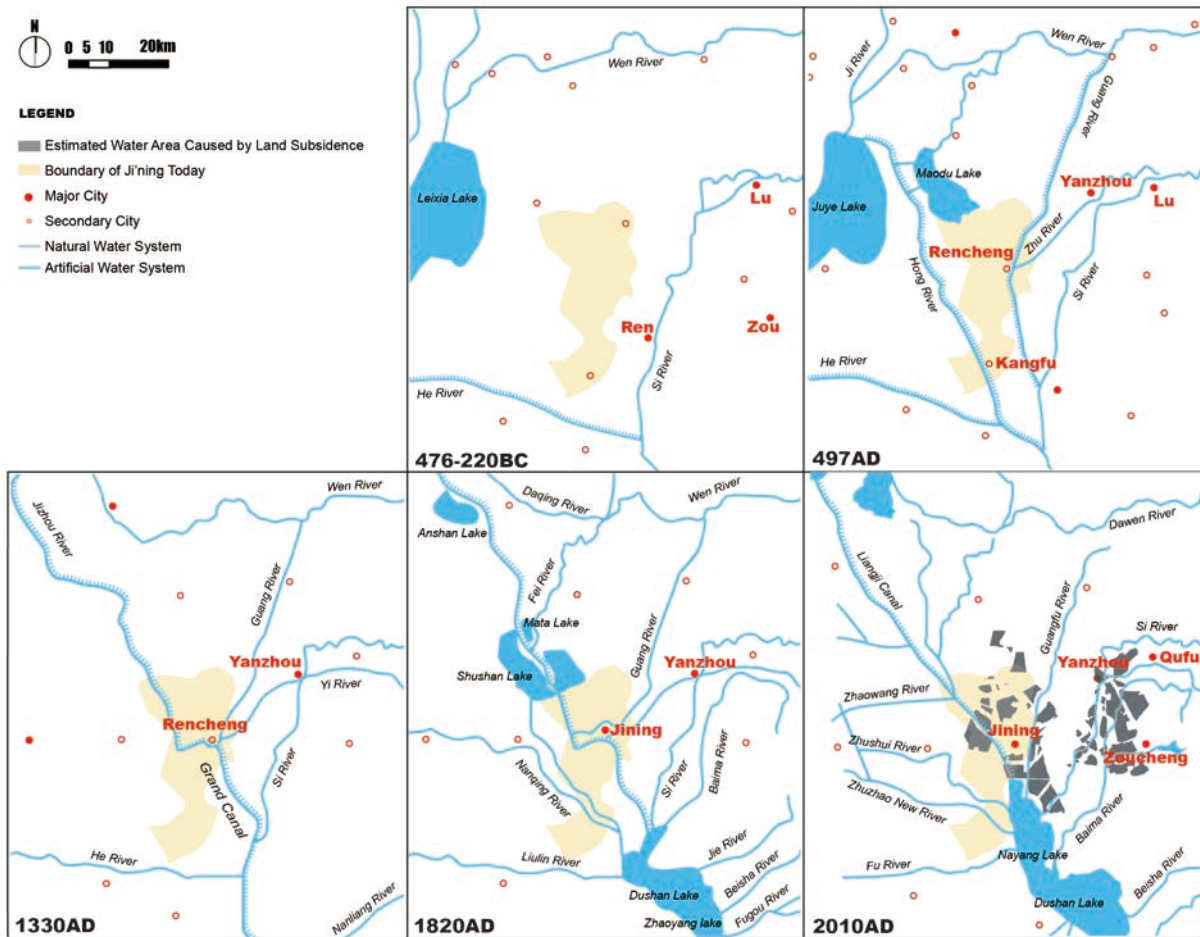

Figure 2. Evolution of the water system of Ji'ning area

Typical characteristic of Ji'ning's historical and cultural legacy: multilevel region with the canal as the core

Ji'ning has formed a series of colorful cultural landscapes in different historical periods. The canal culture period from Yuan to Qing Dynasty was the peak period of urban development, which shaped the main characteristics of the historical and cultural legacy of Ji'ning city. Through the analysis of this historical cross section, the mechanism of the interaction between the city and water can be deeply excavated, and the characteristics of the history and culture of Ji'ning city can be better understood. The excavation of the canal is the modification of the natural environment by man power, based on which, the urban and rural system, urban form, streets and buildings produced a full range of evolution and formed a multilevel region with the canal as the core.

(1)Enrichment and development of urban and rural system

The excavation of the Grand Canal had driven the formation and development of the urban and rural system in Ji'ning and surrounding areas.
