On the one hand, the Grand Canal promoted comprehensive development of cities, towns and villages. Convenient water transportation promoted the prosperity of regional commercial economy. The original town scale expanded rapidly and the population increased. Nanyang, a town to the south of Ji'ning had become “a large town of over 3,000 families” from “a tiny town of 12 families”¹². A large number of emerging commercial towns had sprung up on the basis of water-gates and docks, such as Liulin Water-gate, Tongji Water-gate. They had all become small settlements “with hundreds of families”¹³. At the same time, since the Ming Dynasty (1368-1644), in the need for grain transportation and canal management, the government stationed troops in the Ji'ning area and set up Tuntian, i.e. open up wasteland and grow food grain, which gradually evolved into towns and villages later and became new elements of the regional urban and rural system. (Figure 3)

On the other hand, the canal linked these towns and villages to an organic network. As a transport artery, the canal connected towns alongside to be a transportation and economic community; at the same time, the

governance of the canal, such as the management of springs and the dredging of the channels, also required the overall cooperation among cities, towns and villages in the region to complete¹⁴, which strengthened the communication and connection among them.

Figure 3. Ji'ning and the towns along the canal in Qing Dynasty

(2) The expansion and evolution of urban form

The excavation of the canal also led to the evolution and change of the urban form of Ji'ning.

On the one hand, the city crossed the limitation of city wall and water system around and approached the direction of the Grand Canal. The docks and water-gates had become the gathering point of business and manufacture in surrounding areas. Guanxiang Areas [the neighborhood outside the city gate] developed rapidly. The Tianjing Water-gate and Zaicheng Water-gate to the south of Ji'ning were extremely important, which accelerated the Southern Guanxiang Area to be a newly developed area in a short time that was prosperous in business, comprehensively functional and culture flourishing. Other Guanxiang Areas developed in different degree according to the different space relationships with canal water-gates. (Figure 4, 5)

On the other hand, driven by aggregation effect of docks and water-gates, the function and form of the city also changed on the original basis. In the south of the city, "All kinds of goods gather here and travelling traders come and go". The economy was developed and industry and commerce were gathered. In southwest of the city, "There are many people who imitate the Pear Garden"¹⁵ and "gamble together". The habitants were almostly businessmen and craftsmen since the Grand Canal passing through this area. In northeast, most people were soldiers because the commanding agency of Ji'ning Guard in Ming Dynasty, "many people living there like drinking". The northwest was far from the canal and got the least effect, and was a sparsely populated area.¹⁶

Figure 5. Space form of Ji'ning city in the republic of China (1927)

(3)The intigration and change of streets and buildings

The opening of canal brought the economic development and cultural communication. It also drove the change of city streets and construction.

On the one hand, the forms and functions of city streets were affected by the canal. The Grand Canal crossed the city and the street space and water were tightly integrated. Until now, there are still many streets named after bridges, docks and river ports, like Yuehebei [Cross Canal North] Road, Shunhemenwai [Along the Canal and Outside of the Gate] Street, Hewan [River Bend] Street. At the same time, the commercial development relying on grain transportation formed unique along-canal streets with specific industries, like Zhugan [Bamboo Pole] Lane, Guozi [Dessert] Lane and Pifang [Cobbler Workshop] Street.

On the other hand, due to the cultural and technical communication brought by the Grand Canal, the buildings of Ji'ning were fitted with southern characteristic on the foundation of traditional northern architectural style. Temples stand facing the canal and houses were constructed along the water, which are the typical forms of the buildings in the Yangtze River delta. At the same time, these buildings were stable and thick which was the nature of the northern architecture. Though the shops mostly have Yingshan [flush gable] roof which was

common in the North, the wind-window loft style buildings, which were the typical southern style, were also not unusual on streets. (Figure 6)

Figure 6. The traditional commercial street: Bamboo Lane

Conclusions: The inspiration to modern transformation development from historical legacy

On the basis of the study of urban development driving force and functional mechanism, we can get the inspiration to modern transformation and development from historical legacy.

First of all, historical legacy is the cultural base for the survival and development of the city, the reasonably and effectively protection of which is the first step for transformation development. On the one hand, as a cultural city with long history, the historical legacy of Ji'ning is not only indicated in Canal culture, Prehistoric culture and Lu culture had also left rich heritage. All of them formed the complete process of city development. We should extend the range of legacy protection and take consideration of the cultural legacy various historical periods as a whole. Meanwhile, Canal culture is the peak of Ji'ning historical culture and it has very important value, which was reflected in the multilevel whole region with canal as the core. Therefore, the protection of the canal legacy should not be limited to the canal only, but expanded to the integrated system of city and natural environment. The legacy protection, water system governance as well as the city environment improvement and optimization could be combined as comprehensive strategy.

At the same time, the mechanism and characteristic of Ji'ning urban development in history are rooted in the region. They are the fruits of wisdom accumulation for hundreds of years and still have enlightening significance to transformation development nowadays. On the one hand, the development of Ji'ning in history was driven by the interaction between water and city. We still have to pay attention to the relationship between water and city. Starting with solving the contradiction between people and water, different methods such as ecological management and landscape shaping could be applied comprehensively to improve the destroyed natural environment and restore the positive interaction between people and water. On this basis, industry upgrading and culture development could be promoted and the urban development would be pushed into a reasonable developing circuit again. On the other hand, the interaction between water and city not only had an effect on the two sides along the canal or within the city wall, but also influenced both the urban and rural area and created a multilevel region as a whole. In the modern times, since the city construction scale is becoming larger and larger, it is even more important to view the regional space as a whole. The approaches of transformation development of Ji'ning should not be limited in the planning and construction of city, but be extended to the comprehensive creations in the region, the multi-scale and multilevel planning and constructions of the region, city, city districts, streets and buildings should be considered as a whole to improve the quality of inhabitant environment completely.

Modern Regional Development in Japan: From the Kiso River Improvement Project to the City Planning of Gifu

Yoshifumi Demura*

* *Gifu University, demu@gifu-u.ac.jp*

Although modern Japanese cities are the products of an urban planning system, this system is itself rooted in the histories of towns and provincial areas, that had previously grown in the context of local economic needs and resources. However, in the early stages of urbanisation, the new infrastructure derived from the West did not necessarily complement the existing local urban environment. This was eventually reconciled by a series of infrastructure development projects, which were presented to local city planners for feedback. This study focuses on a typical example of this process in Gifu, Japan; it presents a description of the steps by which the region was gradually modernised by means of a river improvement project that led to the implementation of urban planning.

Keywords: sewage system in city planning, river improvement project, Johannis De Rijke, waterschappen, modern technocrat, irrigation/drainage improvement project, industrial contamination.

Introduction

Modern Japanese cities are the products of an urban planning system that reached its pinnacle in the 20th century, when the urbanisation process was controlled. However, the operation of this system is rooted in the histories of individual towns and provincial areas, that had previously developed in the context of local economic needs and resources as reported by Asano¹, Nakano² or Demura³. Indeed, cities develop on the foundations of the extant infrastructure, such as roads, water transportation networks, drainage systems, food and energy resources, and land improvement and disaster prevention programmes in the larger region in which they are situated. Benevolo⁴ examined prominent examples of urban infrastructures, and Suzuki⁵'s reach encompassed water infrastructure as the basis of town formation. Tomory⁶ demonstrated that the development of the sanitation industry in London represented continuity of economic and technological progress, leading to the formation of the urban infrastructure.

In the field of hydrology, a new interdisciplinary discipline combining technical hydrology and sociology, has explored the co-evolution and self-organisation of people in the landscape (Sivapalan et al.⁷, and Seidl et al.⁸). Such linked approaches are also useful to examine themes related to planning history. It is important to investigate relationships between the growing regional infrastructure system and the urban planning process to understand the circumstances and conditions under which modern cities were established. For example, Arts et al.⁹ presented a perspective separating different types of work, such as that of 'builders and planners'. As a subject that is arguably interdisciplinary like Art's study, the present study focuses on water management, which involves not only water and sewage in the context of city planning, but also irrigation and drainage in agriculture, soil erosion prevention, flood control, and water transportation as civil engineering application, in addition to other industries such as fishing, hydropower generation, and landscape creation.

Recently Vitiello¹⁰ summarised studies that focused on planners' involvement in shaping critical infrastructure. According to his perspective, the sewers of Paris in the 1830s, New York's Croton water system that opened 1842, and the first major social and sanitary survey by Edwin Chadwick illustrate the concrete procedure for new water and waste systems. Vitiello also noted that a new cadre of municipal and consulting engineers designed urban infrastructure. He also noted that innovations in infrastructure technology often spread between cities bureaucratic route, and that infrastructure occupied a prominent position in the work of late 19th century and early 20th century planners. However, those studies tended to concentrate on urban areas as a reasonable consequence of their objectives to understand urban planning systems.

Several studies on critical regional infrastructure beyond the boundary of the urban area have been carried out by scholars in other fields, such as civil engineering and the industrial economy. Tasaki¹¹ focused on urban developments and their surrounding agricultural areas in modern Japan, and particularly on the difference between urban and rural economics, for example in terms of land prices, to explain the migration of populations to cities. Wilson¹² discussed the formation of Christchurch as an example of long-term drainage and sewage development, situated in that case on a vast swamp outside an urban area. Hoeksema¹³ clarified how land area changed historically in the Netherlands through large-scale flood protection and land reclamation, including a description of management methods. Vast landscapes such as these are beyond the conventional urban area, and may be more

familiar in the context of regional planning, as a development of city planning. Such examples may be incorporated into this study as it seeks to understand the substructure of early city planning.

It is well known in the field of civil engineering that Japan's great rivers were modified by Dutch engineers many years before the urban infrastructure was constructed. Foreign engineers did not simply apply pre-existing techniques; instead, they developed new techniques while working with local engineers at the construction site (JSCE¹⁴). Moreover, local engineers also contributed their own techniques to this creative process. These modern river modification methods, which directly or indirectly support urban operations, were intended to support huge structures and generally have considerable impact. Therefore, it is not surprising that an entirely new structure would reflect and support local land-use patterns. However, at the beginning of urbanisation, the new river modification methods did not necessarily support the existing local urban environment. Indeed, studies on modern Japan's civil engineering history mentioned cities only in passing (Ohkuma¹⁵). These differing interests were eventually reconciled when a series of infrastructure development projects, initially derived from the West, were presented to local city planners for feedback. It is especially important to understand this process, as it became the prototype of the current urban planning system.

This study focuses on a typical example of this process in Gifu, Japan; it presents a description of the steps by which the region was gradually modernised by means of a river improvement project that led to the implementation of urban planning.

Early Gifu City Planning and Sanitation

The first city planning law was enacted in Gifu in 1923. Several roads extending out from the city centre and zones for residence, commerce, and industry were planned (Figure 1). The original purpose of this plan was the creation of conditions that would promote construction of industrial factories (Demura¹⁶). It was assumed that a rail network and abundant subterranean water would encourage the textile industry to build factories near the city centre.

Nevertheless, the early goals of Gifu city planning changed dramatically. Led by Mayor Kunimatsu Matsuo, who held office from 1925 to 1946, the land devoted to industrial development decreased by about 16% (from 557 ha to 470 ha), and that devoted to residential development increased by about 57% (from 1,095 ha to 1,718 ha). The new main agenda was to use local environmental resources to create favourable conditions for housing and tourism. The reasons behind this shift in the priorities of Gifu City were the decline of the textile industry after the great depression of 1920; the new concept of a 'Tourism City', a goal that conflicting actors could share; and the Mayor's commitment to public health, hygiene, and the construction of healthy residential areas. Regarding the latter, he insisted that 'drinking water, toilets, and bathtubs'¹⁷ were necessary to prevent 'the fall of Gifu City' due to lack of sanitation, which leads to high mortality rates among infants. During the Matsuo administration, the Gifu City planning agenda included water supply projects and sewer facilities.

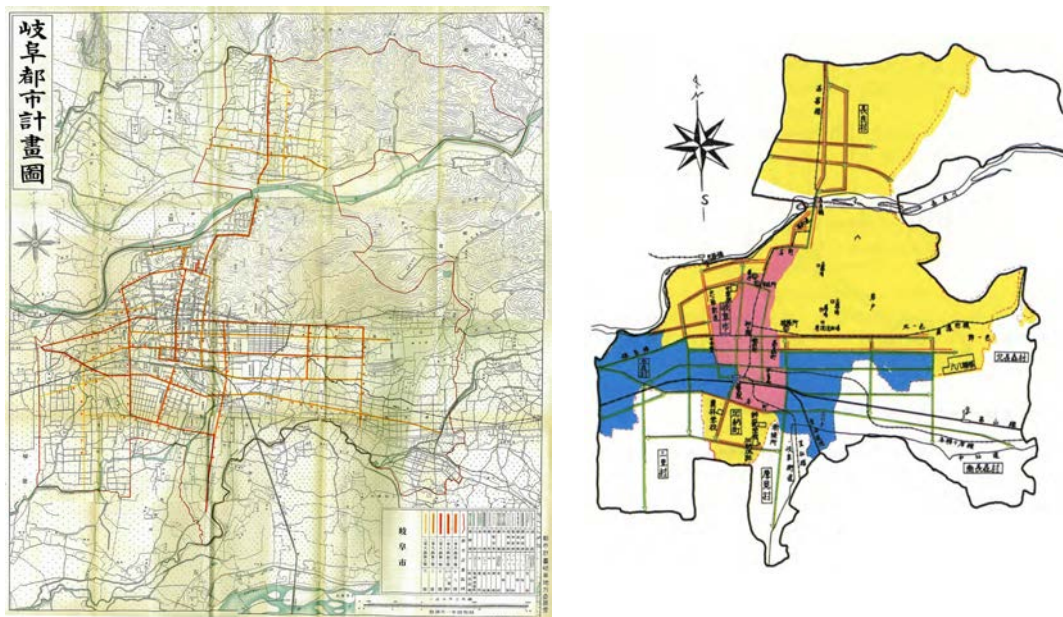

Figure 1: The Gifu City Planning Committee's *Street Network Plan of Gifu City*, issued in 1926 (left) and *Land Use Zones of Gifu City*, issued in 1927 (right). In the righthand figure, red, yellow, and blue areas indicate commercial zones, residential zones, and industrial zones, respectively.

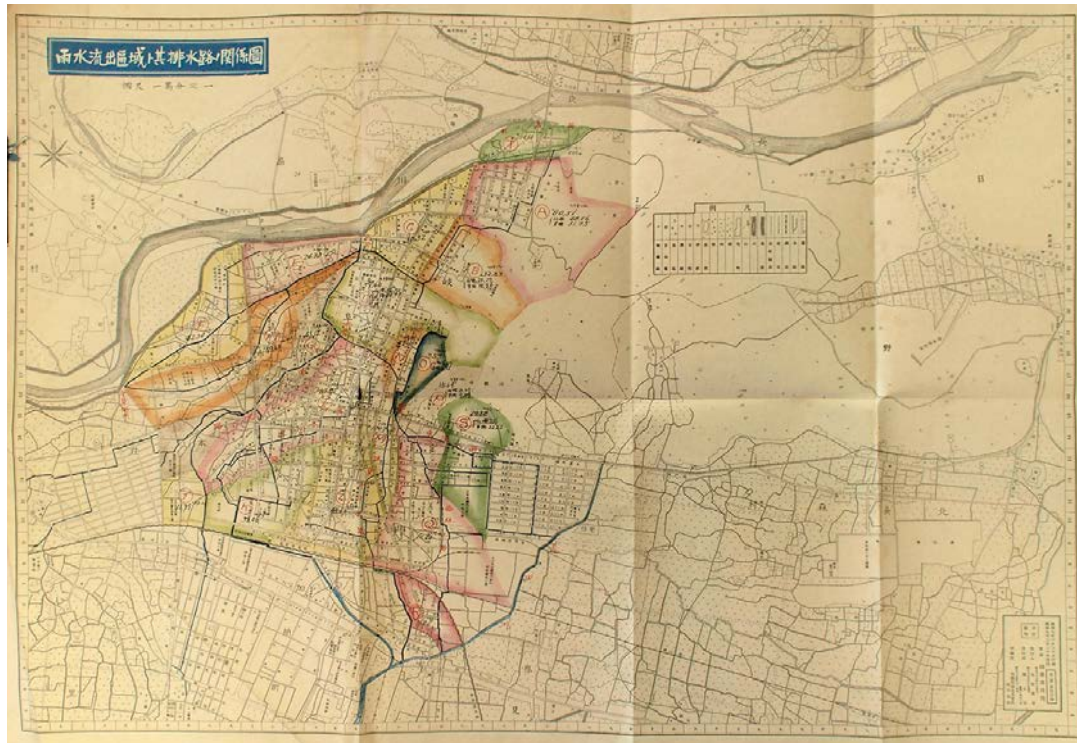

Figure 2: *The Relationship between Drainage Districts and Drainage Channels*. The same drawing was attached to a document submitted by the Home Ministry entitled *Map of the City Planning Sewage System: Drainage Districts*, together with another map, *The Sewage Plan and Trunk Pipes*. [included in Abe Nikko Kogyo Co., Ltd.]

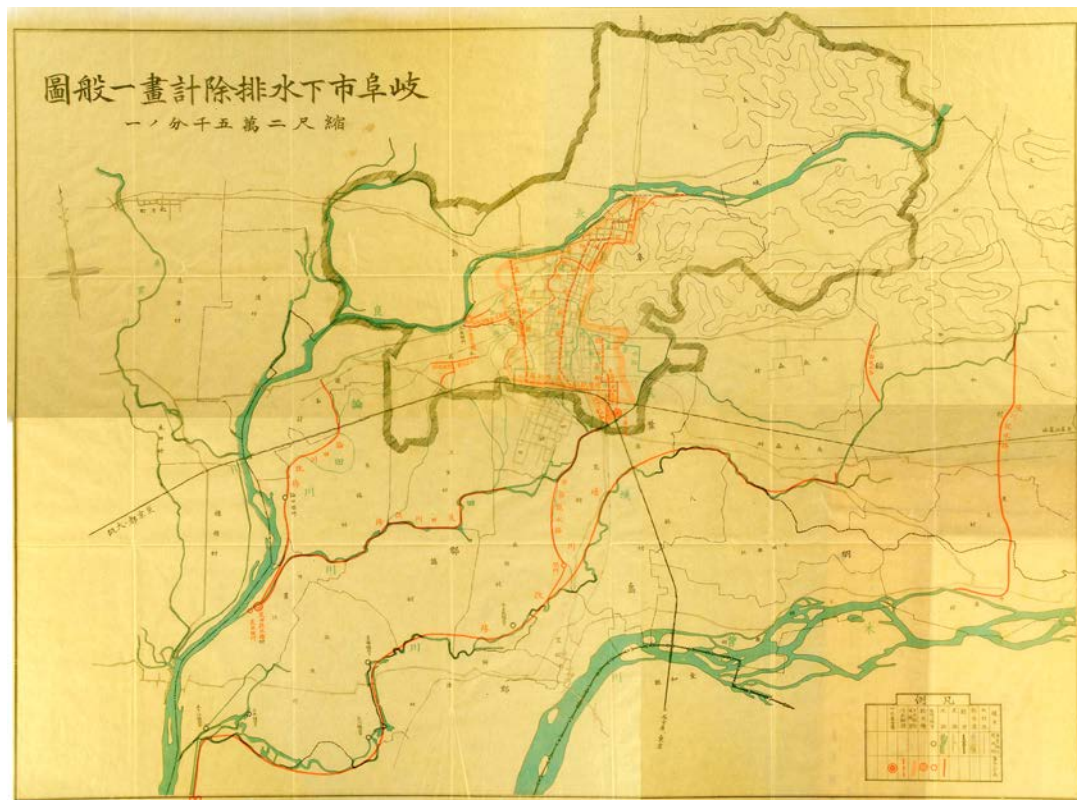

Figure 3: Genzaburo Abe. *General Map of the Gifu City Sewage System*. The area demarcated in Figure 2 is included in the centre of this large map. The boundary of the city is delineated by the grey hatched line. [Gifu City, 1935]

The sewage system was an especially huge project for the Gifu municipality. The cost of the initial plan was estimated to be 6 million yen in 1925, when the annual general budget of Gifu City was about 1 million yen. This system combined wastewater and rainwater in a large-diameter pipe¹⁸. However, the project could not be started due to insufficient funding and lack of technical ability. Then, in 1928, Mayor Matsuo announced a new plan at the Municipal Assembly in March: an unprecedented separate sewage system in which the sewage pipe was separate from the rainwater flow¹⁹. Improvements in the street gutters that collect rainwater and connect to trunk watercourses would start during the next budget year, decreasing costs.

At the same time, the mayor employed an expert engineer, Genzaburo Abe, who had been engaged in water supply construction in other areas, such as Maebashi and Takaoka. For the next 5 years, Abe was engaged to design and construct the water supply system using the subsoil water of the Nagara River as his first carrier in Gifu; at the same time, he studied and surveyed the location of the sewage system and insisted it would be possible to construct a complete, separate sewage system using existing water channels. Abe completed the design of the separate sewage system in 1932 for a cost of 2.5 million yen. His confident explanation of the project, which rested on his enthusiasm and engineering skill, facilitated its passage through the Municipal Assembly in August 1933 despite considerable opposition. The Home Minister endorsed this plan as an official Gifu City Planning project in January, 1934, and the sewage system was constructed between 1934 and 1943.

The plan that Abe and Gifu City Planning Committee submitted to the Home Ministry was drawn for a restricted area within the designated City Planning Area of 1923, as it conformed to the then-current norms, as Figure 2 shows. However, in practice, the actual plan was drawn differently. Figure 3 shows that the area went far beyond the boundary designated for city planning; indeed, the system for urban sewage was constructed as if it were situated in a huge water system. This raised questions regarding the planning of this urban water system and whether any blueprints could be found from the time before City Planning began.

Outline of the Kiso River Improvement –Johannis De Rijke’s Idea

Gifu City is situated on the alluvial fan in the middle stream of the Nagara River, which was originally twinned with the flow of the Kiso and Ibi rivers. The downstream portions of the Kiso, Nagara, and Ibi rivers had been characterised by collective polders, areas surrounded by dikes in called Wajuu, during the Meiji Restoration (from 1867) (Figure 4). At that time, the town of Gifu was situated on relatively high ground within a broad field formed by polders that stretched 50 km to the sea. The most urgent problem facing the early Meiji government involved the transition from a feudal society to a new social, economic, and political structure. Indeed, it had to develop secure transportation routes for local industries and agricultural policies to prevent disasters such as floods. That is, the major rivers, including the Kiso River, which had been allowed to flow freely during the previous feudal epoch to discourage people from travelling, had to be safely controlled. The government tried to use Western technology to achieve this goal, hiring foreign engineers as no domestic engineer had managed such a major project.

Johannis De Rijke, one of the Dutch engineers hired for this purpose, investigated the Kiso River system in 1878 and 1879 and determined that sediment flowed out of the mountainous area. He reported to the government that the networked flows had to be organised into single streams to carry the large quantities of sand contained by the river water into offshore areas. At the same time, he argued that the supply of sand from the mountainous areas should be reduced by means of planting, management, and installation of dams on small streams²⁰. Another of his reports insisted on the need to crack down on deforestation, which was a severe criticism of the then dominant Japanese tendency to act without considering consequences²¹.

According to these reports, the government immediately began to construct sabo-dams, as soil-erosion control works, in the valleys that were the source of the Kiso River²², based on designs created by De Rijke and six Japanese engineers in 1884. The river-improvement project in the lower streams, carried out from 1887 to 1911, was designed to prevent flooding, drain the fields within dikes, and improve shipping routes (Figure 4). De Rijke’s vision of these projects, which included the entire basin of the Kiso River, went far beyond the aspirations of local residents, who had known only polders.

In 1891, De Rijke announced his understanding of the main causes of flooding in Japan: the deforestation of river water sources, the frailty of the sluices separating the water used for irrigation from the river flow, the failure of high-water protection methods, the lack of knowledge of local people, and the delays in making repairs after damage. He criticised people who waited passively for the government to draw on the public budget to respond, contrasting this pattern to the Dutch tradition of ‘waterschappen’, whereby landed individuals were responsible for flood control and drainage. Even after the river improvement work began, De Rijke continued to promote public organisation and cooperation²³.

The enactment of the Water Utilization Association (WUA) Law in 1908 allowed for the establishment of an association that could provide the financial basis for project development and maintenance. In 1909, the completely

revised version of the Land Arrangement Law centred on land improvement, including irrigation and drainage systems. Both policies were strongly promoted to improve agricultural productivity²⁴. By 1911, many WUAs had been established in the area downstream of Gifu City. Although these were similar to the organisations proposed by De Rijke, each WUA had deep roots in the Wajuu community, rendering cooperation among them difficult (except for purposes of petitioning the government), leading to isolation.

Figure 4: *Kiso Nagara Ibi. Three Rivers Improvement Plan* (1900). North is to the left side; the rivers flow from left to right on this map. Gifu City is shown in the upper left corner. This map was drawn in 1/50,000 scale, based on the large map of Johannis De Rijke in 1/10,000. [housed in the Gifu Prefectural Historical Museum]

Overcoming the Scale of Wajuu – Union Integration

The drainage system was a primary problem even after completion of the Kiso River improvements in 1911. In Wajuu, polders in streams with an approximate bed slope of 1/5,000 reduced drainage efficiency, especially when the water surface of the river rose higher than the protected areas surrounded by dikes at the time of a flood. People living near polders downstream of Gifu expected the improvement project to improve the drainage in the upstream area of the Kiso River. However, the Kiso River Upstream Improvement Project did not include such improvements when it began in 1921. On the other hand, Kanichi Maekawa²⁵, a director of the Nagoya Civil Branch Office of the Home Ministry informed the aggrieved counties that, because the Home Ministry intended to improve the polders, they should discontinue their traditional practices and overcome the barriers between the people in the counties and the polders.

In December of 1924, Iwao Kira, the engineer at the Gifu Prefectural office, issued a comprehensive plan, which was framed as ‘a personal proposal’²⁶ (Figure 5). Kira designed a system with new irrigation trunk channels and clearly distinguished drainage trunk channels that efficiently exchanged water within a wide area regardless of the traditional boundary of the Wajuu. This plan reduced the amount of water from the Sakai River, which had caused flooding as a result of collecting water from the hilly land, by constructing a discharge channel directly from the upper stream of the Sakai River to the Kiso River. He also modified the route of the Sakai River so that it could serve as the drainage trunk for the whole area and discharge its flow into the Nagara River at one downstream location. In terms of the irrigation channel, as all the water was taken from the Kiso River, an almost entirely new system that did not depend on the existing system involving the Nagara River had to be constructed.

Kira’s plan proposed an approach to ‘overcoming the barriers between counties and polders’, which helped to expand the perspective of local people. Isamu Ohno, Director of Inaba County, agreed to the plan and gathered together neighbouring WUAs in January 1925. Although the design was declined by the technocrats of the Home Ministry and the Agriculture and Forest Ministry, Kira was able to improve the plan by the following year under the guidance of these technocrats to use conventional means to move water from the Nagara River, use existing water channels, and reorganise the system in a way that went beyond the purview of the small associations, to foster cooperation among the affected areas. At the same time, the affected people and organisations in the area on the left bank of the Nagara River organised a new, larger union in June of 1925. Finally, in January of 1926, Ohno and Matsuo, who had just been elected Mayor of Gifu City, established the Gifu City Inaba County

Irrigation/Drainage Water Utilization Association (Gifu/Inaba WUA), which included 25 towns and a city with five associations, to cover the entire area affected by this system²⁷.

Figure 5: Akira Kira. *Irrigation/Drainage Trunk Channel Improvement Plan for the Area between the Kiso and Nagara Rivers* (1924). Blue and red lines indicate irrigation and drainage channels respectively. The streams are of Nagara River (upper) and of Kiso River (lower). The upper hatched area is downtown Gifu City. [Ohno, 1933]

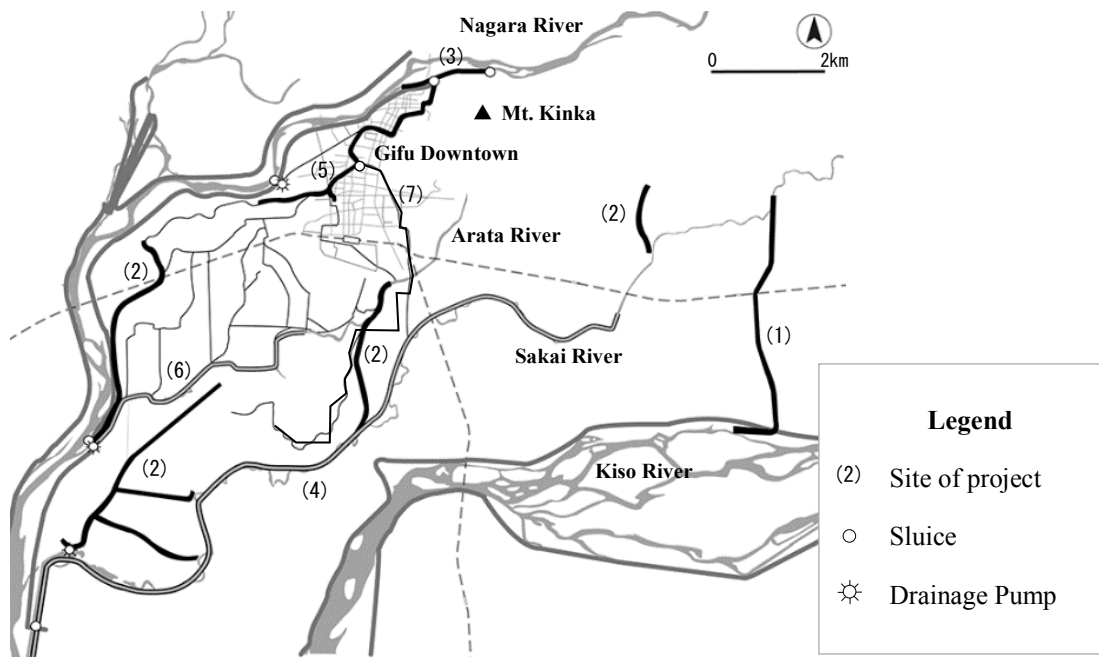

Figure 6: The series of water system improvement projects being conducted around Gifu City and the downstream area. This clarifies Figure 3.

Table 1: The series of water system improvement projects being conducted around Gifu City and the downstream area. The monetary unit is Yen in total expenses, government subsidy, prefectural subsidy, and local contribution columns. (A) and (H) are the subsidies provided by the Agriculture and Forest Ministry and the Home Ministry, respectively. This table was included in a previous study. [Demura, 2017]

Period	Project Name	Objective	Contents	Expenses	Sub. by Gov.	Sub. by Pre.	Local
(1) 1926-1931	Sakai River Drainage Improvement Project (the first stage)	Drainage Improvement	Discharge channel	1,100,000	(A) 400,000 (H) 200,000	250,000	250,000
(2) 1928-1933	The Second Stage of Sakai River Drainage Improvement Project	Drainage Improvement	Drainage Pump · Drainage Channel · Sluice	1,180,000	(A) 590,000	177,000	413,000
(3) 1931-1933	Replacement Project of Chusetsu Water Channel	Irrigation Improvement	Irrigation Channel · Sluice	251,500	under the direct control of the Home Ministry		
(4) 1932-1933	Sakai River Improvement Project	Tributary Improvement	Channel · Shorter Flow	567,000	(H) 283,500	155,925	127,575
(5) 1932-1934	Chusetsu Water Channel Improvement Project	Irrigation Improvement	Irrigation Channel	135,000	(A) 67,500	20,250	47,250
(6) 1933-1934	Arata River Improvement Project	Tributary Improvement	Channel	82,000	(H) 41,000	29,038	11,962
(7) 1935-1937	Shobo Temple Water Channel Improvement Project	Drainage Improvement	Irrigation Channel	160,000	(A) 80,000	24,000	56,000

The water system improvement projects in this area were reasonable and functional. Their results are presented in Figure 6, and Table 1 outlines the schedule and budget for each part of the project. The scale of the entire project and the discharge channel from the area upstream of the Sakai River were the same as in Kira's plan. This system first removed the excess water using the discharge channel, calculated the capacity of the drainage downstream, distributed the necessary water, and drained into the Nagara River by the mechanical force of pumps at its most downstream points. This series of construction projects was based on an understanding of the function of drainage; the irrigation plan (mainly (3), (5) and (7) in Figure 6) was not clearly outlined in the plan at the first stage of implementation. That is, intentionally or otherwise, the blueprint for the vast water-management plan for the urban water supply and drainage system in upstream areas had not yet been completed. According to the shared flexible blueprint, appropriate irrigation arrangements could be planned after the drastic improvements designed to protect against flood damage due to drainage failure had been achieved.

Conflict and Cooperation between Rural areas and the Town

Following the initial urbanisation plan, many industrial factories were built just outside the Gifu City area after World War I (Figure 7). These factories were involved mainly in textile manufacturing, including spinning, dyeing, and scouring. Although they were built just after enactment of a law regulating factories in Japan, the factories discharged their wastewater directly into the nearest water channels. This soon caused water pollution in the area downstream of the Arata River, and 'clear water changed into black water, even animals could not drink, fish disappeared except for a few which were too foul to eat'. The Fishery Society and Arata River Sluice WUA started to take action in 1923, negotiating with the prefectural government and other governmental agencies for the regulation of factory wastewater.

In June 1928, the Arata River Sluice WUA invited Shozo Toda, a Kyoto University professor of hygiene, to perform a detailed investigation of the discharge practices of factories insofar as they affected the Arata River. In September, Toda presented the results to the relevant actors, including members of the police and prefectural government officials; workers at the Agricultural Experiment Station; WUAs; industrial, civil, and sanitary engineers; village, town, and county leaders; and Mayor Matsuo of Gifu City. Toda proposed a two-pronged plan: the first initiative involved a regulation requiring cooperation from factories, and the second involved improving the water-related infrastructure in a vast area that extended to downstream areas of the Arata River²⁸.

The second part entailed additional construction to ensure a stable and sufficient volume of water. However, the intake of the 'Chusetsu Water Channel' and the only watercourse reaching the urban area from the Nagara River was almost non-functional at this time because, due to the Kiso River Improvement Project, the surface of the Nagara River became too low to flow into the channel without intervention.

In April 1930, the Gifu/Inaba WUA decided to improve the irrigation system by replacing the intake sluice of the Chusetsu Water Channel. The leaders of the municipalities and various WUAs that belonged to the Gifu/Inaba WUA reached agreement over the share that would be accorded to each municipality if the improvement project

were approved by the prefectural government as a public works project²⁹. According to this agreement, Gifu City was given the largest share, 65.8 %. (Figure 8) The aggressiveness with which Gifu City officials pursued their interests seems to have stemmed from their intention to reduce the pollution caused by industrial wastewater, as Toda had suggested. However, they should have aimed for more.

The final version of the project to improve the Chusetsu Water Channel consisted of two parts (Figure 9). The first was to widen and partially reorganise existing downstream irrigation courses; half of this project was subsidised by the Ministry of Agriculture and Forestry. The second part was to replace the intake sluice and the connection to the existing system; this proceeded as a part of the Kiso River Upstream Improvement Project, directly controlled by the Ministry of Home Affairs, which had provided compensation to the area that had suffered from the drawdown of the Nagara River. The objectives of both parts required the dilution of the industrial effluent and the need to consider the resulting surplus water; the amount of effluent from each factory was measured to determine the volume of water that would travel downstream.

The main portion of the upper part of this system was devoted to the control of flooding at the entrance to the main sluice, which was situated before water from Nagara River was taken up. This system enabled the movement of abundant water for the dilution of industrial pollution, in addition to satisfying the demands from agriculture. Additionally, the irrigation water could be stopped by the main sluice when it rained heavily; the system was also designed to collect rainwater efficiently using the capacity reserved for irrigation water. The improvements to this irrigation system were completed in May 1934.

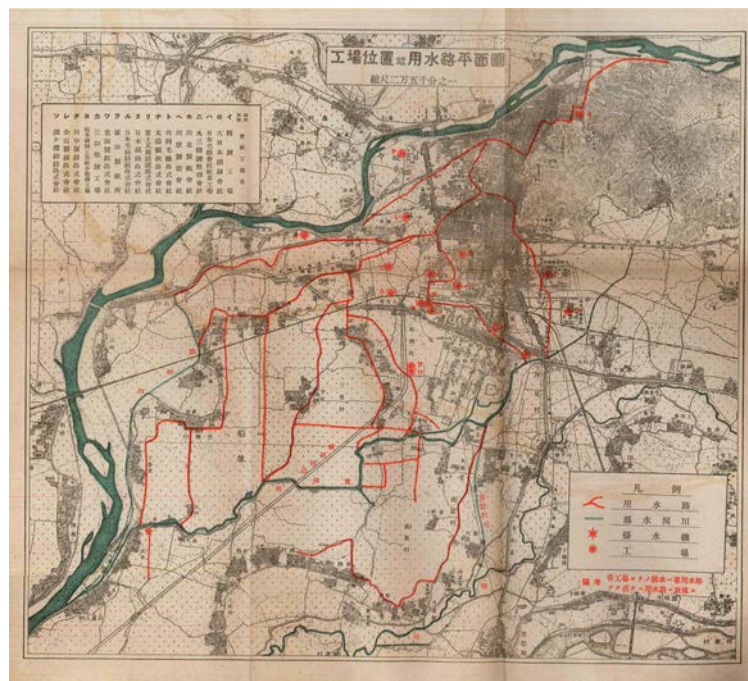

Figure 7: Arata River Sluice Water Utility Association, *Irrigation Channels and Location of Factories*. Red circles are the sites of factories, which show a strong correlation with the water course. Their location also correlates with the planned arrangement of streets, as can be seen by reference to Figure 1. [Arata River Sluice WUA, 1938]

Figure 8: Share of Contributions for the Chusetsu Water Channel Improvement. The municipal leaders reached an agreement regarding the distribution of the budget on 18 June, 1930, on the assumption that the project would be approved by the prefectural government as a public works project. [Ohno, 1933]

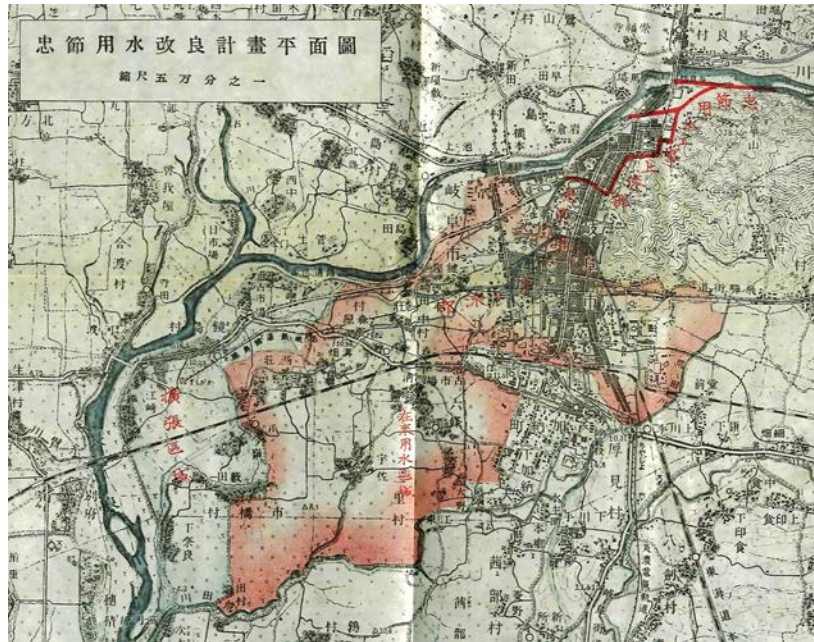

Figure 9: *Plan for Improving the Chusetsu Water Channel*. This map is drawn to a scale of 1:50,000. Red bold lines in the upper part of the figure indicate part of the Kiso River Upstream Improvement Project (denoted by as (3) in Table 1). The faint blue line indicates the lower part of the project, subsidised by the Ministry of Agriculture and Forestry (denoted by as (5) in Table 1). [Ohno, 1933]

Conclusion

Kunimatsu Matsuo articulated his concept of a separate sewage system in early 1928. He knew it was possible to establish a drainage system located downstream of the urban area because, as a mayor of Gifu City, he occupied a central position in the Gifu/Inaba WUA, founded in 1926. The engineer, Genzaburo Abe, performed research in preparation for the design of the sewage system. Matsuo was also among the most important founders of the Chusetsu Water Channel Improvement Project in 1930. At that time, it is likely that Matsuo and Abe clarified the plan for urban drainage. They would have noticed that the ability to manage rainwater could be secured, even in heavy rain, if the inflow from the Nagara River could occasionally be stopped. Moreover, the amount of water was reduced by the collection of the industrial wastewater from each factory outlet pipe. Finally, the aforementioned comprehensive vision of all the systems emerged. (Figure 10)

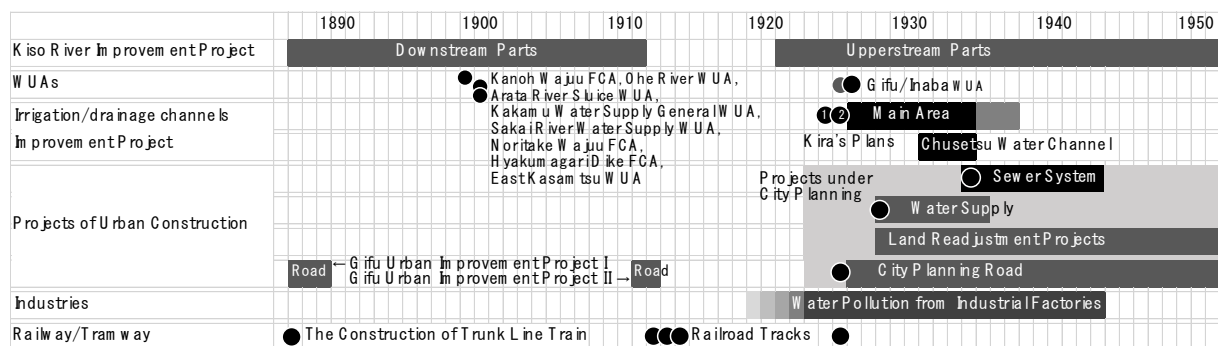

Figure 10: Modern Construction Projects in Gifu and its Downstream Area in Chronological Order. Gifu Urban Improvement Project I, and II are beyond the scope of this paper to describe; these were urban construction projects in downtown Gifu City initiated by townspeople based on a business strategy. For more information, see Demura 2012 and 2015.

The early city planning in Gifu involved a remodelling project aimed at establishing a healthy, liveable city that would complement the extant infrastructure, which had been developed based on an economic strategy. Indeed, a highly organised, modern infrastructure was needed. It was clear that the last city planner who brought sophisticated skills to these projects, which were based on the ambitious vision of Mayor Matsuo, was Genzaburo

Abe³⁰. However, they had only just finished the long process of improving the vast water system that had started in 1887. Initially, there was no comprehensive plan, and the final system emerged from the social relationships among various actors, perhaps ensuing from a new equilibrium. The vast vision was elaborated by De Rijke, the prefectural engineer Kira contributed his systematic perspective, and the technocrats of the Ministry of Home Affairs cooperated with those of the Ministry of Agriculture and Forestry to provide guidance derived from Western or Westernised engineering practices. These efforts facilitated cooperation among relevant actors, all of whom benefited from the large scale of the system; this system brought a new state of equilibrium to the wider society, and the urban planning discussed here was constituted on the vast infrastructure system that was developed for this area.

The expansion of technological and social frameworks should be more or less homogeneous across cities in Japan, and in any country whose modern history is founded on the legacy of a previous epoch that had to create a framework to resolve inherent problems. Generally, the boundaries between rural and urban areas were contested as cities started to expand. In the case of Gifu, urban construction and regional improvement had started in late 19th century. Subsequently, the process of creating a water system to serve both urban and rural areas functioned simultaneously as the process for applying modern engineering methods from the West to the local environment. The focused examination of a typical city conducted herein found that an expanded framework that considered the construction of water infrastructure amid the upheaval in linked domains, such as inter-Waju or urban-rural relations, resembled regional planning, which historically was distinct from city planning. Fluvial systems may be a relevant topic for cities located on fluvial fans, and their relevance to regional planning should be pursued as a new perspective on planning history.

- ¹⁸ Although the engineers were aware of the (then) popular system in which the sewage pipe was separated from the rainwater flow, they considered this system to be uneconomical. After outlining the advantages and disadvantages of both approaches in 'The History of Water Supply' (1927), the local authorities insisted that a separate system was inappropriate for Japanese cities because it cost almost twice as much as the combined system, and they would have to construct both pipes from scratch. Indeed, a separate system was constructed in only a small part of Tokyo, Shimonoseki, and Qingdao (under Japanese rule at this time). (The three cities mentioned were not able to build complete systems, but only limited systems; a complete system had not been built in Japan at this time.) - ²⁶ The epoch after World War I was characterised by food shortages and occasional heavy floods, and the Cabinet, which was supported by rural landowners, strongly promoted efforts to increase food production by improving irrigation, drainage, and flood control measures. The Emergency Water Control Committee, formed in 1921, developed the National Flood Control Plan, which proposed improvements in agricultural water use, in addition to raising the subsidy rate of the National Treasury. Communications regarding river administration matters concerned with water management were divided into river issues, under the directive of the Home Ministry, and irrigation/drainage, under the Ministry of Agriculture and Forestry. This national effort led directly to the unprecedented 50% subsidy for the Irrigation/Drainage Trunk Channel Improvement Project, issued by the Food Director in 1923, which affected 500 cho-bu (495.9 ha) of agricultural land. This plan, which was developed by Kira, was designed to distribute the subsidy. (Yoshifumi Demura: *Repair Work at the Branches of Kisogawa River and Land Improvements - the Process of Building Cooperation to Acquire a Modern Water System -*, Journal of Japan Society of Civil Engineers, Ser. D2, JSPS, 73(1), 54-62, 2017; see also Tokai Agricultural Administration, *The History of Kisogawa Basin Agricultural Water Use*, Nagoya, 1980).
- ²⁷ The petitions to the Home Ministry organised by a committee of the Gifu/Inaba WUA finally led to the development of a clear plan that requested the Diet to allot another unprecedented 50% subsidy to the Repair Work Project at the tributaries of the Kiso River in 1928. Added to the Irrigation/Drainage Trunk Channel Improvement Project, this area received a substantial budgetary allocation and became widely known due to its dependence on the authority of both the Agriculture and Forestry Ministry and the Home Ministry (Demura, 2017).

34 Transformation and Management of Urban Communities

The Characteristics and Changes in Residential-Industrial Mixed Buildings in the Taito Leather Industrial District in Tokyo

Megumi Hamada (The University of Tokyo), Naoto Nakajima (The University of Tokyo) and Yukio Nishimura (The University of Tokyo)

In recent years, the urban area in Tokyo is facing the issue of disaster prevention, particularly in areas having a high wood density. The recent developments in the existing urban industry are destroying the local community network and its spatial characteristics, and weakening the local industries due to the change in industrial structure. So, there is a need to discuss that how to renew the existing urban area while simultaneously creating a sustainable urban and local industry space.

The present study aimed to examine the special characteristics of leather industry establishments in the area and grasp the trend of the present Residential-Industrial mixed-use spaces in Tokyo. By discussing the results based on the historical industrial transition, we intend to extract the inherited essence in the renewal process of urban Residential-Industrial mixed-use areas depending on the popular will.

Located near the big consumption area, the leather industry is a sustainable industry as it uses the by-product of meats consumed by urban people. The target area, Northern Taito Ward, is an area where the leather industry was established during the early modern times, which were dominated by the wholesale and secondary processing industry on a family scale. Individual buildings in which residence and workshop functions are combined are a popular style in this area.

We analyzed the architectural characteristics of 155 leather industry buildings on site. Based on the results of the field survey, we created four building types for analysis.

A1 Wooden and low-rise buildings built as residence and workshop functions that are combined in the ratio of 1:1.

A2 Non-wooden and low-rise buildings rebuilt as residence and workshop functions that are combined in the ratio of 1:1.

A3 Non-wooden and middle- to high-rise buildings rebuilt as residence and workshop functions that are combined in a ratio of multiple:1.

B1 Non-wooden and middle- to high-rise buildings rebuilt for workshop functions only.

It was found that A2 type building style is the most popular style in this area. In part, some tenants enter the low-rise part of apartment houses (A3)

Both are Residential-Industrial mixed-use buildings, which have been renewed keeping the industrial and community networks at the ground level.

In addition, there is a trend of separating the access flow lines to each residence and workshop functions by making different entrances in A2/A3 type buildings.

The results of the field survey indicated that one part of the buildings in the target area has been spontaneously and personally renewed to non-wooden buildings on the assumption of Residential-Industrial mixed-use. Whether a building is rebuilt under Residential-Industrial mixed or separated style is related to the position of the establishment in the leather industrial structure. In the case of Residential-Industrial mixed renewed buildings, there is a spatial expression that shows the divergence of distance between job and housing, as they are still in the same building.

Study on the Comparative Analysis on the Process of Consensus-Making in Area Councils in France

Kumi Eguchi (Kyushu University) and Shota Tokunaga (Kyushu University)

In Japan, nowadays bottom-up styled participative urban planning through intermediate organizations more and more becomes in trend. The trend started by the Law Concerning the Promotion of Specific Non-Profit Organization Activities in 1998 after the evaluation of the activities of groups of inhabitants in the Great Hanshin Awaji Earthquake in 1995. Also the Landscape Act of 2004 permitted them to concern the management of the landscape plan if they are nominated as the landscape management organization. However, only 6 NPOs are nominated in Tokyo, Ibaraki, Nara, Tottori and Shimane today. In France, these intermediate organizations of the inhabitants are designated as the Area Councils (Conseil de quartier: CQ) by the Law of the Democracy of Proximity (loi relative à la démocratie de proximité) of 2002. They are based on the history of groups of inhabitants formed since 1920s' in Grenoble. They are obliged to be instituted in the communes with more than 80,000 populations. This is defined by the 23rd article of the law as in the communes with more than 80,000 inhabitants, the municipal council fixes the every area, which constitute the commune. Municipal council fixes their composition and the functional mode. The Area Councils are able to be consulted by the Mayor and are able to give him or her the propositions about the every question concerning the area from the point view of the city politics. This system deserves the attention in the trend of the decentralization and local deterioration. However, we have not had the sufficient studies yet even in France. We think that we are able to have the efficient suggestion for Japan for the democracy of proximity. This study aims to clarify the contemporary situation, effectiveness and political process of the Area Councils to have the suggestion for Japan with the political point of view. As a research subject, we choose the Area Councils in Paris and Lyon. This is because that the 122 Area Councils in Paris have diverse activities and compositions and I have already clarified a part of their effectiveness for the urban policy. They are suggested to be the representative example. On the other hand, the City of Lyon has 36 Area Councils and they have 7 concertations for the consensus-making of the ZAC projects. As a research method, our research team visits each municipal council, has interview and collect the documents and proceedings. As a result, I clarified the concrete situation of the area councils and analyzed the examples as follows. The Area Council of the 11th ward in Paris is freely composed by all people residing, studying or exercising a professional or associative activity. It works as the consulting council for the great project such as Truillot Garden and Breguet block. For the conclusion, the Area Councils in France have strong impact and certain effectiveness on the participative urban planning which Japan need to refer to.

Transformation of Urban Communities from Within: Inhabitants' Role in Urban Planning of Shanghai After 1998

Kaiyi Zhu (Delft University of Technology)

Inhabitants living in historic neighborhoods seldom have subjective initiative within urban transformation as a result of their selfness generated from the Chinese sociocultural tradition. Urban planning in China has been government behavior since the end of feudal dynasties. Moreover, most planning strategies proposed by government under the unique housing and land ownership in China largely reflect the hierarchy and centralization of local authorities. Since the commercialization of housing in 1998, conflicts between residents and government have increasingly prominent and intensified. This paper investigates inhabitants' participation, attitudes, appealingness within multiple urban transformation in historic Lilong neighborhoods (also known as Shanghai Alleyway House) of Shanghai, and their impacts on shifting urban forms in and around each specific neighborhoods. Thereinto, considering the bottom-up project of urban renewal in Number 210 of Taikang Road (also known as Tianzi Fang) as an unwonted example dominated by inhabitants, this research mainly looks at the changing role and effects of residents in such urban transformation after 1998. It also explores residents' reaction in other Lilong neighborhoods, which are situated in different administrative districts with varied economic, cultural, demographic and educational conditions, such as Chunyang Li and Ruikang Li in Hongkou District. Through a methodology of comparative study, it first investigates the flexibility of inhabitants' participation in urban planning of historic neighborhoods of Shanghai and their changing roles; it then examines reasons that make inhabitants' participation ineffective in most urban transformation cases. Urban transformation in historic neighborhoods located in different places of Shanghai are facing an unbalanced development as a consequence of varied economic growth rates. Between the end of the Twentieth Century and the beginning of the Twenty-first Century, historic neighborhoods in Huangpu District have largely transformed. Number 210 in Taikang Road is the production of the game among different stakeholders. There are many stakeholders who have appeared at different stages throughout the transformation; local residents and famous artists were indeed major stakeholders who first participated in this urban renewal project in 2002. Since 2017, as a result of the Shanghai government's strategical plan, repair and renovation works of historic dwellings in Hongkou District have been in full swing. However, according to pilot interviews during investigation in Chunyang Li and Ruikang Li, residents do not pay close attention to urban planning in their living areas, nor willing to face urban transformation; moreover, some inhabitants even drew emotions of contradictory, though they are suffering low living conditions. Tentative conclusions indicate that transformation in historic urban communities from within is rare in China, and the reasons could be that residents' subjective initiative has been low and negative, although legislative frameworks and political situations can bring in boundedness within residents' practices; furthermore, as a result of the residents' mistrust and resistance to the local authorities, cooperation between them has been complicated and challenging. Inhabitants, as a principle part of integration in every specific historic neighborhood, it is essential to explore and promote their positive participation during urban transformation.

Temporary dwellings as successful informal suburban development: the case of Sydney 1945 to 1960

Nicola Pullan (The University of New South Wales)

The occupation of temporary or makeshift dwellings when there is a shortage of affordable housing is a global phenomenon. Until recently, the vast majority of urban planning literature has tended to convey that this type of informal urbanism existed only in the global south. However, a number of scholarly and popular publications on suburbanisation have indicated that informal urbanism in the form of makeshift housing on purchased residential land has had a presence in many countries in the global north throughout the twentieth century, the best-documented exemplars being the construction of self-help housing situated on the outskirts of newly-industrialising cities in France and Canada during the inter-war period and as makeshift seasonal accommodation in the UK. Comparable studies indicate that similar dwellings emerged as unapproved housing in suburban extensions to the capital cities of Greece and Portugal during the 1950s and 1960s, and persist today as the ever-expanding colonia settlements of the US-Mexico border region. Occasional references to temporary dwellings in the Australian housing literature indicate that informal urban development existed at a significant scale on the fringes of most towns and cities in Australia during the two decades immediately following world war two, however this form of suburbanisation has not yet been investigated in any detail. Drawing on documents from government departments and interviews with residents, this paper surveys the phenomenon as it played out between 1945 and 1960 in the outer suburbs of metropolitan Sydney. The research highlights the existence of a distinctive Australian story and compares this with the circumstances which surrounded the international instances of informal housing mentioned previously. The paper concludes by suggesting that, contrasting with the previously-mentioned instances of informal urbanism which occurred during the early twentieth-century, the unprecedented social, political and economic contexts which prevailed in post-war Sydney enabled otherwise un-financial households to acquire un-serviced land in areas without public infrastructure and to construct makeshift dwellings that were within their financial means, and to use the situation as a positive interim step towards successful ownership of an approved, more conventional, and permanent home.

Transformation of Urban Communities from Within: Residents' Role in Lilong's Attributive Switch Between Market-led Commodity and State-controlled Property

Kaiyi Zhu*, Carola Hein**

* *PhD Candidate, Department of Architecture, K.Zhu-1@tudelft.nl*

** *Professor, Department of Architecture, C.M.Hein@tudelft.nl*

The state has owned most historical buildings since the establishment of the People's Republic of China (PRC). Residents within are entitled to the right to use the house in the form of a lease. After entering a free trade housing market in 1988, residents in historic neighbourhoods of Shanghai have been suffering uncertainty of their identities. Residents' role, responsibilities and obligations within urban transformation, has always been in suspense and strongly affected by multiple stakeholders' decisions. Based on an analysis of the relationship between the native residents and the historic Lilong communities they are living in, this paper examines stakeholders' heritage approaches in three typical transforming project, to explore residents' mobility and behaviour within varied urban transformation and socio-economic development. Through a literature review, fieldwork and a pilot study in Xintiandi, Tianzifang and Chunyangli districts, urban transformation in historic urban communities from within is found literally rare in China. This paper argues that residents could not clarify their role by living in urban heritage, neither obtaining house-ownership to define their position nor being treated as one component of urban heritage. Government in China has been indeed the character who mediates between all stakeholders and bears the most burden.

Keywords: urban transformation, Lilong houses, historic urban communities, native residents, participation, housing policy, government, intangible heritage

Introduction

The evolution of urban community in Shanghai has almost reflected this city's history of migration. Developing from a fishing village to a marvellous metropolis, the old town of Shanghai was originally enclosed by fortified walls and surrounded by swamp, cultivated land and the Huangpu River at the east (Figure 1). Different from most traditional Chinese old towns, not planned in a square urban texture and straight roads, the urban growth has followed a more organic and natural pattern. Such spontaneous expanding status settled the inclusiveness of foreign intervention in Shanghai. Discovering this characteristic of the city, settlers from Europe and United States exploited great business opportunities from burgeoning mercantile communities, which were established as a result of social rebellions and population increase; they consequently created a real estate market in Shanghai for the first time by exposing commercial housing to international trade. Lilong houses (alleyway houses, 里弄) were indeed the products led by such marketing environment¹. The former free trade market of Lilong houses was prohibited by the state between 1949 and 1978 during the Mao era. Lilong houses in this period were not general commodities for commercial transaction, but reward or state subsidies to people allocated by administration, to meet national economic and planning strategy². The Maoist housing policy reform largely reduced the value and vitality of housing market and weakened the relationship between residents and their living places as well³.

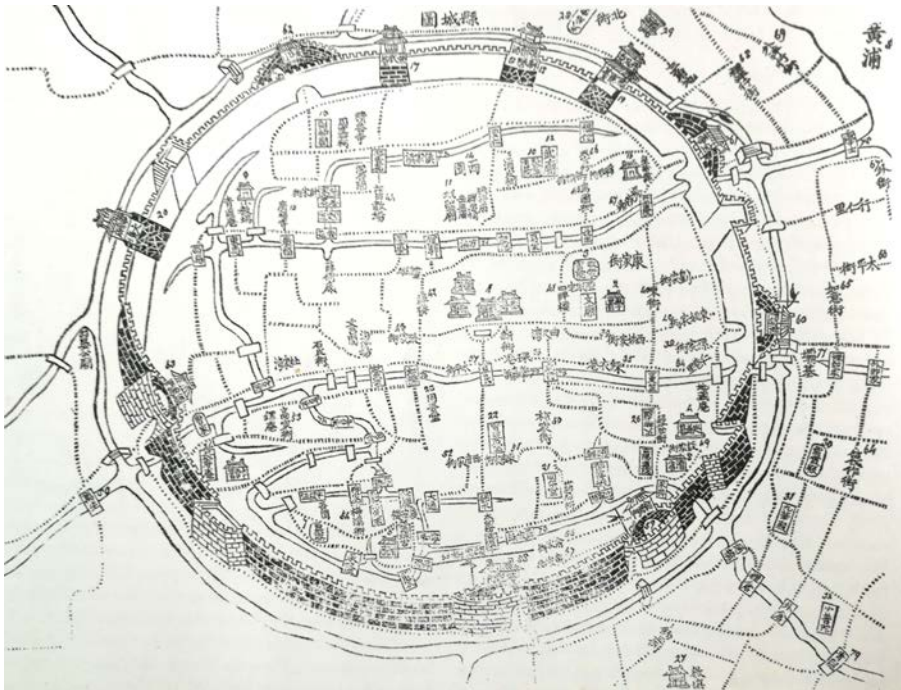

Figure 1. Unknown. General Description of Shanghai. *The walled old town of Shanghai, showing swamp, cultivated land and initial roads.* [Mission Press, 1850]

Since the state has continuously owned most historical buildings, native residents' role in historic urban communities within urban transformation is constrained within a certain range. Influenced by international tendency of housing privatization, the central government of China launched several economic measures in the late 1970s, to realize the reform and opening-up policy starting in 1978⁴. With the promulgation of the land leasing policy of Shanghai in 1988, attribute of land usage in Lilong districts has changed and faced different transforming modes⁵. For example, a considerable number of abandoned and dilapidated Lilong houses encountered with massive demolition and renovation of the city builders in the 1990s⁶. Shenjing He and Fulong Wu demonstrate that in the project of Xintiandi, urban redevelopment of historic site was led by property, to attract private sectors⁷. Furthermore, in major existing historic communities, such as Bugali and Hehefang, district-level government took the responsibility to renovate and restore architectural facilities, improving living qualities⁸. Nevertheless, including demolition, commercial redevelopment and housing renovation, this paper argues that local authorities have maintained to own and manage the construction or transaction of most Lilong houses. Considering the adding character of Lilong housing as heritage in contemporary era and their location advantages, housing policy reform after 1978 yet cannot bring these remaining urban community heritage to an open, free and fair market, in which all residents (if being householders) should take their own responsibilities and obligations for the conservation of historic architecture and urban landscape. Under the circumstances, in order to engage native residents in urban transformation of historic communities that they are living in, the intangible significance of residents' existence should be emphasized by themselves and the public simultaneously. This paper also argues that historic communities, under the long-lasting government-dominated housing market, residents could not clarify their role by living in urban heritage. These residents can neither obtain house-ownership to define their position nor be treated as one important intangible component of urban heritage.

Urban transformation has become one of the most distinct characteristics in contemporary Chinese metropolises. About 7.3 million square meters of Lilong houses in downtown area of Shanghai need to be protected and renovated⁹. In the following content, firstly, through literature review, this paper elaborates that within a short term of socio-economic development, a status of Lilong housing as state-owned property will not change; regardless of a small portion houses for commercial redevelopment, Lilong housing will continuously be a non-productive sector in most senses; therefore, local government cannot provide sustainable and sufficient funding supply for architectural renovation project with low rental income from residents¹⁰. Varied stakeholders had interpreted, implemented, appropriated and justified the concept of modern heritage and their values in the movement of urban transformation of historic Lilong communities. Under the contemporary heritage discipline within which intangible significance of heritage is repeatedly emphasized, spirit of place and native residents' memories as an important component of history have become a more attractive feature of a historic site to

investigate. Secondly, by analysing three different cases located in Taipingqiao (Xintiandi), Taikang Road (Tianzifang) and Chunyangli, this paper thus further explores that in the scope of government capabilities that cannot be reached, from what perspectives for native residents to enhance, expressing their role as one intangible component of urban heritage.

Housing Policy and Lilong Houses

Throughout the last two decades of the twentieth century, privatization of public property have obtained political inclination and increasing emphasis in many advanced societies of the world¹¹. In the United Kingdom and eastern Europe, government promoted the strategy of house ownership, to strengthen the influence of private sector in housing market; under such circumstances, a hint of the ideology of socialism in housing system faced collapse in these societies as well¹². As a socialist country, practices and political reform of housing property should launch with its speciality. Normal compounds built in the late twentieth century for working class and newly-built commercial residence in flexible housing market have completed their ownership-attribute shift from state-owned dwellings to private estate. However, despite the cancellation of the welfare housing allocation system, most Lilong houses have been owned by the state and rented at a low price. According to historical events and a regime change, Zhang Song indicates that the ownership of historic buildings is extremely complex, bringing difficulties to protection and management of Lilong houses¹³. This situation manifests that under the existing housing policy for historic urban communities in China, residents cannot be property owners, but they can take occupancy as long-term tenure and users, largely benefiting from government subsidies and preferential policy for urban heritage. This paper thus argues that these residents should seek a way out by taking maximum advantage of their identity as intangible legacy and spiritual-cultural holders. Housing policy reform of historic urban communities forward a further stage seems to be a continuous and circuitous mechanism to follow, largely creating limitation of residents' involvement and dynamic roles in urban transformation of urban heritage. In the following three Lilong transforming cases for analysis, despite strong intervention made by capitalists and local authorities, this paper explores residents' mobility and behaviour within each urban transformation; regarding the chronological order of every single project, it further discusses the interaction between multiple groups of residents' behaviours, to elaborate.

Residents and the Significance of Urban Heritage

Lilong architecture was primitively built in the foreign settlements in the nineteenth century. Two rebellions, booming population and advanced industrial techniques of that time catalysed the germination of a real estate market in Shanghai. The word "Lilong" is the representation of two Chinese characters: Li (里) stands for the concept as a neighbourhood, a block of compounds; while Long (弄), which is also named as Longtang (弄堂), means alleyways or lanes, connecting and structuring each subdivided residential compounds. Lilong house is therefore also under the name of alleyway house in translation, referring likewise the urban community lifestyle in the historical Shanghai. Lilong were built between the 1870s and the 1940s; during the seventy years, these residential quarter progressively transformed into different forms to keep with the changing population.

One thing for certain is that after the reform and opening-up policy and land leasing policy, the society or more precisely the market in Shanghai has paid more attention to commercial values of Lilong; although, their heritage values have received more concentrate in the increasing strong voice of some experts and scholars¹⁴. Based on the criteria included in *Venice Charter* (1964), published literature reveals that Wang Shaozhou and Chen Zhimin indicate the combination characteristics of Lilong houses from both western and oriental architecture¹⁵; Lu Wenda and Zhu Jiancheng claims its social significance as the beginning of modern real estate in China¹⁶; Fan Wenbin indicates the importance of Lilong neighbourhoods as one distinctive character of urban landscape in Shanghai, while Li Yanbo points its social and cultural values¹⁷. Nevertheless, as a result of the lack of research on the spirit of Lilong communities, where residents gather and create a typical lifestyle of Shanghai, dynamic residents omitted the initiative consciousness of being part of the of the heritage itself, actively integrating into urban heritage.

Shifting Ownership-attribute of Lilong Housing

Ownership-attribute shifts of Lilong can be divided into three major historical stages, from foreign commercial housing development before the foundation of the PRC, to the rising welfare system under the planned economy between 1949 and the 1980s, and to the later state-controlled market economy of commercialization and monetization.

Lilong houses were as mentioned widely built as commodities in the foreign settlement era, to form a hitherto real estate market in China. Before 1949, most commercial housing for sale and rent were constructed and owned by foreign investors, such as Shanghai Land Investment Company, Sassoon Group and Haroon Company. The early Shikumen Lilong built in the late nineteenth century maintained the Chinese traditional characteristics of *Shenzhai Dayuan* (深宅大院), a compound of connecting courtyards and surrounded by dwelling quarters¹⁸. Such expensive and upscale housing property were mostly owned by the transmigrating gentry and wealthy families in Shanghai; however, in the early twentieth century, with the decline of these powerful families, a Lilong house was usually divided into several households and becoming into a more civilian product under the circumstances. This division has raised a tremendous number of second and even third landlord of a single Shikumen Lilong property. In the continuous typological evolution, Lilong had transformed towards styles more of economization and popularization. This improvement made Lilong houses more affordable and accounting for more than three quarters of the whole residential buildings in the 1940s of Shanghai, reaching a number of two hundred thousand houses¹⁹. Lilong as commodity had been unequivocal with no doubt, establishing and accelerating Shanghai's urban transformation and capitalist accumulation.

After a recovery from Sino-Japan War in 1949, the national liberation raised an urgency for mass accommodative dwellings to shelter a burgeoning and broad working class. Meanwhile, there was no company able to manage the construction of Lilong housing. In addition, during the disorder time, a large number of local residents moved out of Shanghai and left their houses vacant or co-rent by more people; therefore, during the period of planned economy after 1949, a considerable number of Lilong houses were nationalized and offered to senior intellectuals, senior officials and returned overseas Chinese celebrities as reward. From that point on, historic residences have been state-owned property under control. Accompanied by continual housing shortage, situation had been even worse since the 1960s when the *Cultural Revolution* broke out. Encouraged by Mao's call for rebellion, temporal radical 'rebels', who contributed to abolish cultural traditions, pillaged houses from legal but persecuted residents who were defined as reactionaries in the turbulent time. Disorganized haphazard construction, deteriorating urban landscape and retrogressive lifestyle reconfigured Lilong architecture, which nature as a home was deprived and even lost, becoming conquest with no feelings of belongingness. It had been government property but without normative control. This historical production confused both the owners and users, laying complicated difficulties for the later urban transformation, especially in residents allocation and equity ownership. There was one thing for sure that Lilong's attribute as a commodity had no longer existed but been regarded as spoils or awards by the public instead.

As mentioned above, after 1988, when the central government admitted land leasing policy, foreign investment started to attach importance to the real estate market in Mainland China. This measure brought a dynamic environment in China. In the meantime, several Lilong neighbourhoods with distinctive features were initiatively listed as *officially protected monuments and sites* (文物保护单位) and *excellent historical buildings* (优秀历史建筑) of Shanghai, and besides, with an increasing number of Lilong in the list of cultural relics, the importance of such historic sites has been ever emphasized. Nevertheless, the situation that a minority of Lilong houses are private and a majority are state-owned have not changed.

Historic houses can become commodities easily due to the land leasing policy and it literally happened in 1997 within the Xintiandi Project; however, with the process of democratization and socialism and continue rising of land prices, Lilong's role as family home and government property are increasingly highlighted. In Lilong's attributive changing history of more than one hundred years, bargaining among capital, authorities and communal inhabitants are full of directivity, speculation and uncertainty. Stakeholder, who occupied more resources, usually dominated the values, functions, social roles, and even preservation status of these Lilong houses; however, and furthermore, whether it was the real estate market that was introduced during the Qing dynasty, or the Cultural Revolution that was experienced during the early days of the foundation of the People's Republic of China, or the concept of commodity economy and cultural relics conservation that have been re-emphasized since the 1980s, the contemporary Chinese society is unfamiliar with dealing with Lilong's complicated property-ownership and value scope as urban heritage. As its nature has changed from simple to multiple, from simple to complex, Lilong have been highly likely becoming an aggregate property with social and political status and value.

Whether it is a remediation of past errors or a cater to international trends, Lilong have obtained a new and additional identity as architectural heritage ever after. Among all the Chinese cities, Shanghai as a land formed by the accumulation of capital has observed an evolving process of stakeholders' heritage approaches towards Lilong architecture and neighbourhoods since 1988. The resulting production has been diverse as well; among them, the most representative cases are the commercial development Xintiandi and Jianyeli, renovated and preserved living neighbourhoods Bugaoli and Chunyangli and, the very specific bottom-up urban renewal of Tianzifang. In these urban transformation in urban historic areas of Shanghai, driven by interests or legislative

factors, residents' role has been continuously shifting, illuminating effects on dynamics of heritage approaches in varied districts.

Xintiandi: Residents' Inaction

Xintiandi project is a commercial redevelopment conducted by Hong Kong developer Shui On Group in 1997. Designed by American architects Wood and Zapata, two city blocks in the former Taipingqiao area has become the most popular and luxury shopping and entertainment hubs in Shanghai (Figure 2). Standing for "new world" in Chinese, stakeholders introduced a new lifestyle into this renamed Xintiandi project²⁰. Before Xintiandi redevelopment, there were 23 vernacular old neighbourhoods in Taipingqiao area, accompanied with seventy thousand people. Located within the conservation area of the First Communist Congress historic site, this redevelopment project should comply with certain laws and regulations of cultural relics protection. Since the limitation of targeted regulations, guidelines, orders and recommendations from local authority, seizing maximization of interests has become the major subject throughout this specific "developmental-conservation" project²¹.

Figure 2. WOOD & ZAPATA. Sketch manuscript of Wood's urban design in Taipingqiao area, and in this redeveloping process, residents could not be involved. [Shanghai, 2017]

Residents passively participated in this redevelopment. It was extremely efficient that in less than six months the relocation of 1950 households was settled, with the efforts paid by collaborating developer and Luwan District government; moreover, remove of about 3,800 households and 156 working units were achieved in merely 43 days, making room for the adjacent Taipingqiao Park²². Throughout this redeveloping process, local residents as the largest population could not voice for their own demands and rights and interests. The rapid pace of relocation allows people to associate native residents with bundled packages that can be disposed of in the form of orders and notices, without prepared negotiation. Although, inhabitants benefited larger living area and healthier living environment after the redevelopment, residents' role and function was completely ignored and overlooked. This precedent of residents' inaction has consequently brought considerable inconvenience and failure of mutual trust to later Lilong conservation and renewal. People who used to experience the traditional way of life have no longer regarded Lilong as a homeland but a bargaining chip. Marginalizing residents in this first-practical project named Xintiandi has largely declined native residents' positivity to participate in public management of Lilong, and besides, residents have few senses to take obligations as part of heritage and contribute to the sustainability of historic urban communities.

Tianzifang: Residents' Gradually Withdrawal

Learning experience and seizing a smoothly expanded commercial opportunity from their neighbour Xintiandi, a group of residents in the case of Tianzifang played their subjective initiative in regional transformation for the first time. However, as a bottom-up project of urban renewal, as a result of financial restraint and China's inherent land policy, Tianzifang has actually altered to be the production of the game among varied stakeholders.

The transforming progress of this project has gone through four stages: the original stage (before 1998), the initial stage (between 1998 and 2004), the conflict stage (between 2005 and 2007), the free transformation stage (after 2008)²³. Within this urban transformation, with arrivals of artists, retailers, developers, the local government, professionals and other stakeholders, native residents' influence on decision making within this area has become gradually less important. Since Tianzifang gained social attention in the early Twenty-first century, the evolving orientation of urban neighborhood has been no longer controlled or led by the residents. In China, it remains to be seen whether government or capitalists can dominate the urban dynamics, since most of the residents do not own Lilong property, their contribution and group aspiration can easily be replaced by authorities for national strategic significance.

Chunyangli: Residents' Repulsion and Irresponsibility

Compared with Huangpu District, geographical factors did not bring Hongkou District advantages in economic competition, but serendipitously contributed to the retention of a large number of Lilong housing. Considering cost-effective conditions, Lilong neighbourhood in Hongkou District was selected for the first practice, under the guidance of reform policy of "preservation before renovation and demolition" (named as "留改拆" in mandarin)²⁴. Among all the residential relics, Chunyang Li which was built in 1930 by the Shanghai Land Investment Company, was distinguished by holding typical Shikumen architectural features. Due to the proximity of Hongkou Port, residents in this community were mostly urban migrants, working for port trade in north bund. In this political renovation project, observing propaganda slogans and banners (Figure 3), district government applied varied method to obtain native residents' coordination for short-term moving out. However, according to pilot interviews during site investigation in Chunyangli, residents were not willing to face inconvenience brought by urban transformation, which aimed to improve basic living facilities, such as sewer lines and window frames; moreover, some inhabitants even drew emotions of contradictory. However, four months later after author's oral interviews, according to media reports, 46 households included in the first renovation practice were approaching a better living environment and public health²⁵. Another 1,135 households are waiting for similar engineering. This paper is questioning who is responsible for such large amount cost. So far, government is still the biggest stakeholder in charge of the most financial expenses.

Figure 3: Author. One of the billboard on the photo on the left is about the warning on rejection of temporary relocation, while content of the other is about renovation details to avoid moisture inside houses; photo on the right is the encouragement and for a brighter future of better living conditions. [Shanghai, 2017]

In American sociologist Harvey Molotch's urban theory, a city, or any place, is the representation of interests of elites, which is also very much in line with Henri Lefebvre's discussion on space production²⁶. In such competition between varied elites, by utilizing local government and authorities, both sides strive to induce investment growth in their own fields, sacrificing profit of the other stakeholders. Nevertheless, in Chunyangli housing renovation project, with increasing investment from local government, relationship between elites and other stakeholders seems to be becoming simple and pure. However, considering the core principle of social justice, this paper questions where should funding supply from if local government dominates and takes the most responsibility within urban heritage transformation? If most of these funds are borne by the government and

come from national taxpayers, regarding such rented Lilong houses as a type of social housing, what action and efforts for native residents with low income can make for sustainable development of urban heritage.

Conclusion

To conclude, urban transformation in historic urban communities from within is therefore rare in China. Two aspects mainly predominate residents' habitual passive attitude within urban transformation or transition of historic communities, the absolute power of administrative authorities in China and an extent sense of disengagement from urban heritage as integration. Normal residents can neither be classified as ordinary owners and daily users, nor can be considered part of the intangible cultural heritage.

Under the contemporary housing policy of urban historic dwellings, district-level government and the state in China has been indeed the character who mediates between all stakeholders and bears the most burden in urban transformation of historic communities. Residents' participation in urban transformation of their living community has constantly been low. Native residents seem to have undergone a process of transition from not having the right to participate to being unwilling to express themselves. The reasons could be that residents' subjective initiative has been negatively depressing, although the present legislative framework and regulations can bring in limitation within residents' practices; furthermore, as a result of the residents' mistrust and resistance to the local authorities, cooperation between them has been increasingly complicated and challenging. As a principle group of integration in every specific historic neighbourhood, it is essential for residents to explore and promote their positive participation during urban transformation.

Urban heritage and intangible significance of cultural relics has been overlooked in the Chinese society and heritage practice environment. Internationally, the concept of intangible cultural heritage was proposed in 1970s, when the Chinese central government started to re-emphasize the importance of protection of relics and ancient buildings. Comparatively, such concept and mainstream has evolved in Europe for more two hundred years. This paper hence argues that the Chinese society has a consistent lag and prejudice on the values of urban heritage, whether people are the general public or residents, part of historic communities. With the enhancing of Lilong's cultural and intangible significance, public-private-partnerships may contribute to solve this multidisciplinary issue in a longer further by an accumulation of urban heritage practices, discussion and reflection, but to be demonstrated though²⁷.

Temporary dwellings as successful informal suburban development: the case of Sydney 1945 to 1960

Nicola Pullan*

* *PhD student, Faculty of Built Environment, UNSW Sydney, n.pullan@unsw.edu.au*

Occupation of temporary dwellings during a shortage of affordable housing is a global phenomenon. Until recently, the majority of urban planning literature has tended to convey that this type of informal urbanism existed only in the global south. However, a number of scholarly publications have revealed that informal urbanism was present in the global north throughout the early twentieth century, surrounding newly-industrialising cities in France and Canada and as seasonal accommodation in the UK. Recent studies reveal that similar dwellings emerged with illegal suburbanisation in Greek and Portuguese cities during the mid-century, and persist today as US-Mexico borderland *colonia* settlements. References to temporary dwellings in Australian housing literature suggested that informal urban development existed at an appreciable scale on the fringes of most towns and cities in Australia following world war two. This paper surveys the phenomenon as it played out in the outer suburbs of metropolitan Sydney, highlights a distinctive Australian story, and compares this with the international instances. The paper then suggests that a combination of four unprecedented circumstances prevailing in post-war Sydney enabled temporary dwellings to be a successful form of informal suburban development that enabled economically-marginal households to achieve ownership of a conventional home.

Keywords: informal urbanism, temporary dwellings, Sydney housing, makeshift housing, post-war housing shortage.

Introduction

Urban informality has been described as instances when the actions of economic agents do not conform to established institutional rules or when the rules fail to protect their interests.¹ In this paper the term is applied to housing that does not reach institutionalised standards for urban habitations. Urban informality is a global phenomenon, however, much of the planning literature has assumed that this form of development is seemingly restricted to the global South. This assumption was highlighted by urban geographer, Richard Harris, who identified a large number of studies promoting the notion that it was the informality of urban settlement which distinguished the South from the strongly regulated urban locations of Europe and North America. He observed that, in the few instances which acknowledged the existence of informal urbanism in the global North, it was primarily understood to be a fairly recent phenomenon, comprising issues of regulatory infractions or limited to a small number of rapidly-growing, poorly-regulated locations.² However, a number of scholarly publications on suburban development have mentioned the occupation of sub-standard housing on undeveloped land in a number of the more-established countries in this region. Among these publications were a handful of accessible in-depth studies focussed on unregulated residential development surrounding rapidly-industrialising cities in Canada and France and holiday townships throughout the UK or enquired into 'unauthorized' housing in Greece and 'clandestine' residential building in Portugal.³ Brief references in the Australian housing literature, and other anecdotal evidence, indicates that similar urban informality existed on the fringes of most Australian towns and cities during the late-1940s and the 1950s. This paper presents aspects of this distinctive Australian story. The proposition explored is that the social, political and economic context which prevailed in Sydney during this era enabled temporary dwellings constructed on purchased land to be a successful phase in the suburban development of the metropolis.

This paper comprises two sections, commencing with a discussion of examples of informal development in the global North. The second section describes informal urbanism on the fringes of Sydney between 1945 and 1960, then identifies and explores four elements fundamental to its success as a housing route: emergency wartime legislation; an expanding national economy; the prior existence of prematurely-subdivided allotments; and government regulation of utility providers. This paper draws on primary sources such as state and local government records, oral accounts, contemporaneous photographs and maps, and histories of land subdivision and urban expansion. It has been developed from ongoing research into the role of temporary dwellings in facilitating access to home-ownership and builds on previous papers considering dwelling typologies, living conditions, financing, and institutional barriers to their existence.⁴

International examples of informal urban development

Widespread but by no means universal, informal urbanism has played an important role in the suburban development of expansive areas of the global North during the twentieth century, however this phenomenon is limited to a minority of texts on the suburbanisation of established cities and the subject of only a handful of in-depth studies. The texts mention the occupation of owner-built makeshift housing on purchased land on the developing fringe of a number of rapidly-industrialising North American towns and cities during the first half of the twentieth century, such as Los Angeles and Illinois, and settlements of 'clandestine' or unapproved housing on illegally subdivided rural land throughout the Mediterranean region following world war two, including Rome and Belgrade in Southern Europe, Barcelona and Castellon in Spain, and Istanbul in Turkey, however the topic is not pursued in any detail by the authors.⁵

The few accessible in-depth investigations into urban informality in Northern cities focussed on locations in Canada, England, France, Greece and Portugal. The first of these explored the makeshift shanties or partial houses which were constructed by low-income workers on newly-subdivided and un-serviced residential allotments scattered across vast tracts of vacant land surrounding Toronto between 1900 and 1939, where the existing provincial housing regulations did not apply to un-incorporated areas outside city boundaries, allowing rural land to be subdivided and sold for occupation without provision of amenities and public infrastructure.⁶ Designated 'shacktowns' by contemporary observers, these enclaves consisted of small shacks and shanties. Some comprised the rear ground-floor portion of a house, while others were made from the basement level of a future house roofed with tin sheets or tar-paper and surmounted by a small box-like structure serving as a porch.⁷ Comparable development occurred between 1918 and 1939 in the *lotissements*, a ring of un-serviced and sub-standard subdivisions surrounding Paris on which low-income purchasers constructed shanties and other 'mediocre' dwellings, later described as 'one of the most perfect examples of unorganised urban space'.⁸ As with the instances mentioned previously, local authorities did not have the power to halt subdivision nor to compel land entrepreneurs to install the amenities and infrastructure needed to ensure these rapidly growing areas reached acceptable standards for the urban density which eventuated.⁹

Figure 1. Tar-papered shacks in Earlscourt, York County, Toronto, 1916. Image: National Archives of Canada, a069935-v8.

Similarly examined were uncontrolled settlements which spread throughout the coastal and rural areas of England. Designated 'plot-lands' by local authorities and decried as rural slums by town and country planners of the day, they consisted of small allotments of undeveloped marginal land subdivided and sold principally between the wars and marketed as seasonal accommodation, although subsequent changes in housing circumstances meant many were later occupied on a permanent basis.¹⁰ Countless subdivisions were only partially settled, with dwellings contrived from old buses, trams and train carriages as well as more conventional shacks and huts, the majority without amenities or public infrastructure.¹¹

In each of these locations, authorities were confronted by sub-standard urbanisation on a vast scale, the bulk of which was situated in locations that would prove expensive to service.¹² In the UK, local town councils could not regulate housing beyond their immediate jurisdiction until national Town and Country planning legislation was enacted in 1947.¹³ However, before this date, a number of local councils and utility providers borrowed funds to provide the public works needed in 'plotland' sites and the increasingly-permanent owners were charged compulsory levies to refund the high cost of installation.¹⁴ At the same time, residents were obliged to upgrade their shacks to satisfy newly-amended housing ordinances.¹⁵ Although these expectations could be met by some owners, the legislation placed 'an impossible burden' on old people and very low-income owners, who either mobilised, with some success, against attempts to resume and demolish their dwellings or were forced into selling for land redevelopment.¹⁶

The dwellings in Toronto and Paris were occupied on a permanent basis from the beginning so remediation could not be postponed. In the districts surrounding Toronto, new municipal authorities were established during the 1920s which proceeded to impose minimum housing standards and borrow from the state to provide essential services, to be repaid through service and usage charges and a municipal tax levied on the affected households according to property valuations.¹⁷ Municipal taxes more than doubled within four years, yet revenue received from the low-value allotments could never cover the excessive cost of servicing such widely-scattered settlements.¹⁸ Harris revealed that many 'blue-collar' owner-builders had reached the limit of their resources after purchasing land and building materials, and the newly-imposed housing standards and municipal taxes, combined with a non-existent labour market after 1929, made it impossible for many marginal residents to cover their housing costs, resulting in more than 27% of taxes remaining unpaid in the following year and several municipal authorities facing bankruptcy.¹⁹ A significant number of owner-builders were forced into selling, leading Harris to conclude that the most-marginal households ended up worse off financially than if they had continued to rent accommodation within the city boundaries.²⁰ In Paris, a number of legislative measures were passed during the 1920s to ensure new subdivisions were provided with modern utilities, however these laws were ignored by land speculators.²¹ Conditions improved only after ratification of an urgent parliamentary bill in 1931, through which the French government granted short-term loans to resident syndicates for installation of essential infrastructure, repaid through a quarterly tax.²² The extra expense was unaffordable for a large number of low-income owners and the deepening economic crisis meant that many now-unemployed purchasers, up to 30% of the wage-earning population in some districts, found themselves in serious financial difficulties and either refused to pay the tax, or sold or abandoned their property.²³ With funding increasingly limited, public works slowed and living conditions stagnated until the late 1950s when entire districts were cleared and replaced with government-owned low-rent apartment blocks.²⁴

Informal housing was also constructed on illegally subdivided rural land on the outskirts of Athens and in townships on the periphery of Lisbon following World War 2.²⁵ The dwellings which surrounded Athens commenced as single multi-use rooms gradually extended in three directions as the owners could afford materials, until a two-storey courtyard house was achieved.²⁶ Hampered by ineffective and outmoded regulations, the city later annexed these unauthorized and un-serviced outlying settlements on payment of a 'special contribution' from owners, which was not necessarily expended on the needed infrastructure, and many years elapsed before reticulated water, electricity, roads and schools were available, with drainage and refuse collection following much later.²⁷ The construction and occupation of makeshift housing was also common between 1958 and 1974 in villages surrounding Lisbon, where un-serviced land was subdivided through successive lot-splits without prior approval, granted separate title and sold to low-income workers. Purchasers then built minimal houses, again without approval.²⁸ These subdivisions were initially designated 'clandestine' and tolerated as a necessary model of urban transition but a change of government in 1974 and retrospective imposition of minimum building standards meant they were re-interpreted as 'illegal'.²⁹

Figure 2. First-stage dwellings in a prematurely-developed fringe area of Athens, 1969. Image: Romanos, 1969.

The instances of informal development outlined above achieved only qualified success. Although the affordability of un-serviced allotments made ownership of a residential property available to ‘the small man’, the difficulties encountered in achieving the standard of living required for habitable structures meant constant financial problems for owners and local authorities.³⁰ The high cost of retrospective installation of utilities compromised ownership for many marginal households who were also expected to comply with newly-introduced compulsory housing standards, while the advent of the 1930s economic crisis with its concomitant widespread unemployment limited many to a basic lodging or forced them to forfeit the property and lose the money they had invested. In some cases, indebted local authorities and residents’ syndicates found themselves unable to meet loan obligations so declared bankruptcy or requested outstanding loans be written off by the state.³¹ In contrast, Lisbon’s informal urban development can be perceived to have been completely unsuccessful as official policy changed from tolerance under one authoritarian regime to criminalisation under the next, with ‘clandestine’ homes ‘illegalised’ and their owners labelled ‘unequal citizens’ or criminals, forcibly relocated to geographically-distant public housing settlements, and their houses demolished to make way for financially-motivated private development.³²

However, the use of makeshift housing as a form of urban development was more successful in certain sites in the UK and in settlements surrounding Athens. In the UK, a number of local authorities responsible for enforcing enacted housing legislation accepted informal development as an interim housing step or realised the exorbitant cost of land rehabilitation, so either relaxed their policies and allowed replacement of substandard dwellings in unsuitable locations with approved housing, or accepted staged installation of amenities combined with extension and improvement of the original dwelling. In the districts surrounding Athens, incremental expansion of the dwelling as the owner could afford it meant most houses were completed as planned, with essential services and infrastructure of an appropriate standard installed as public funds gradually became available, and the residential security gained by subsequent metropolitan annexation outweighing the burden of living in difficult conditions for many years. Nevertheless, retrospective installation of utilities and drainage or their approved alternatives still proved very expensive for the home-owner and the decision to occupy or to build without authorisation frequently meant the house was at risk of demolition.³³

Informal urban development in Sydney

Between 1945 and 1960, Australia also experienced informal urban development. In 1946, it was estimated Australia needed almost 400,000 homes, 90,000 of which were needed in Sydney, where the cumulative effects of rent control, economic instability, and wartime building restrictions had left almost a quarter of the population without adequate and affordable housing.³⁴ Public housing initiatives were unable to satisfy demand, and many households were forced to turn to an alternative solution.³⁵ However, household funds were limited, materials were strictly rationed and skilled labour was unobtainable, so the solution for thousands of families often entailed purchasing an inexpensive allotment of outer-suburban residential land and building a temporary dwelling while they worked to achieve a permanent home.³⁶ By 1952, the architect, Robin Boyd could observe that, ‘many thousands... lived in unsatisfactory accommodation: in temporary, converted army camps, in tents, in caravans, and with in-laws’ while they waited for their permanent house to be habitable.³⁷ A small number of tents and caravans were used as homes, as well as converted trams and railway cars, but a considerably larger number of

garages, shacks, huts and sheds provided accommodation, sometimes for many years. All these makeshift homes contravened recommended and legislated standards for habitable structures but continued to spread rapidly throughout the developing fringes of all towns and cities in the country and, in the vast majority of cases, were successfully replaced by, or gradually adapted and extended to become, a house that conformed to institutionalised expectations.

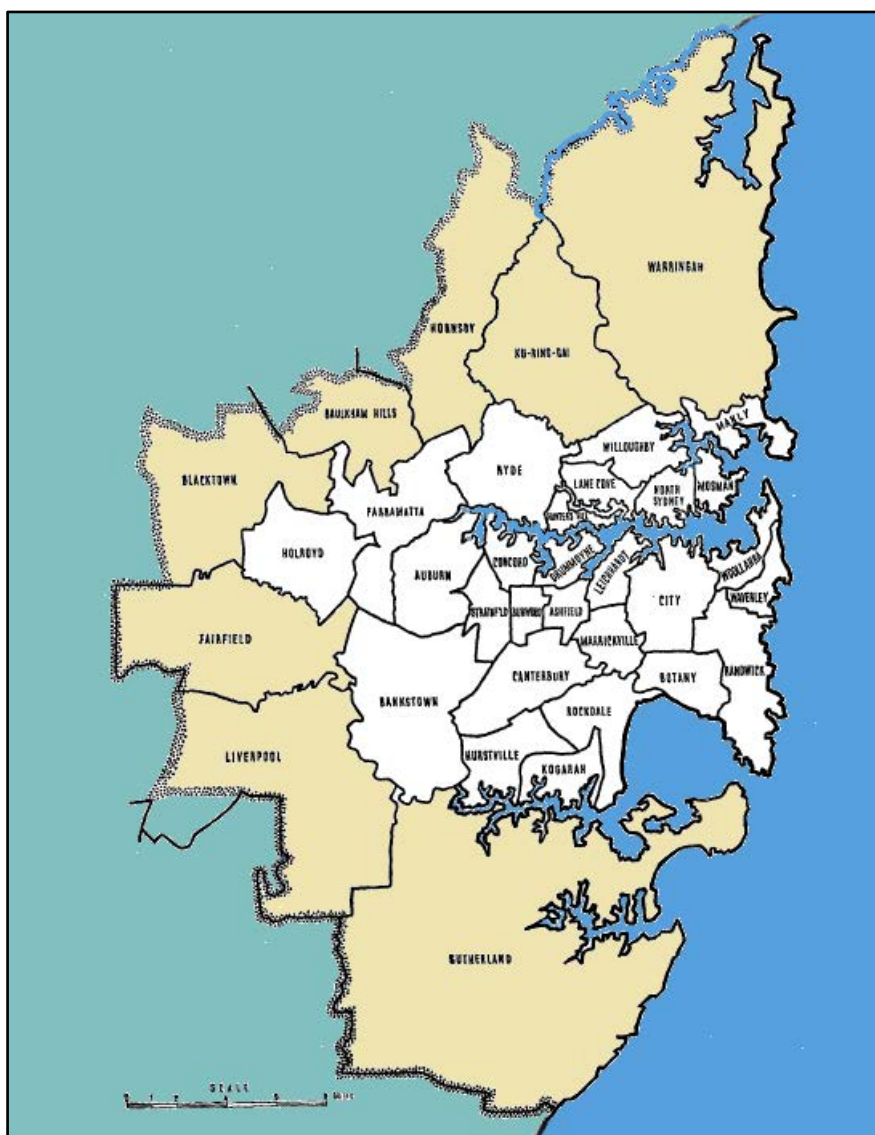

Figure 3. Local Government Areas of metropolitan Sydney, 1958, including urban areas only of the 8 fringe LGAs. Ref. Jeans and Logan, 1961, 34.

Recent research into makeshift homes in Fairfield, Hornsby and Warringah, three of the eight Local Government Areas (LGAs) on the outer fringe of Sydney, has identified more than 6,600 temporary dwellings occupied during the post-war period, the success of which as a form of urban development appears to be attributable to a number of coinciding events.³⁸ Firstly, Commonwealth legislation removed the ability of local authorities to enforce legislated minimum housing standards.³⁹ Secondly, post-war economic expansion and wartime savings provided a favourable financial climate for land purchase.⁴⁰ Thirdly, legislative changes meant many prematurely-subdivided building allotments were made available for purchase.⁴¹ Finally, the established system of public infrastructure provision reduced the financial burden of utility installation for individual households.

Commonwealth legislative actions

For the government of NSW, informal urbanism commenced with early acceptance of the Commonwealth Powers Bill 1942, a draft law proposed in December 1942 and enacted into federal law as the Commonwealth Powers Act

The 18th International Planning History Society Conference - Yokohama, July 2018

on 30 June 1943.⁴² This Bill transferred many State government concerns to the Commonwealth government until five years after the Act was passed by Parliament, including control of the production, sale, distribution and prices of all building materials and internal fixtures, now allocated entirely to military purposes, and also granted control of the sale-price of vacant land which was immediately limited to 10% above the 1942 valuation.⁴³

In NSW, elected local Councils operated with powers delegated by the State Government and so were responsible for enforcing enacted state housing legislation, including compliance with Ordinances 70 and 71 of the Local Government Act 1919 (the Act), that required housing to satisfy minimum accommodation standards before occupation was permitted.⁴⁴ The NSW Government's immediate acceptance of the Commonwealth Powers Bill meant that any houses under construction and in need of further materials or fittings were unable to be completed, and planned new housing was unable to commence. Within two weeks of NSW accepting the Bill, local councillors realised that the requirement for full compliance with the ordinance could no longer be achieved and so Councils could no longer reject owners' requests to occupy incomplete or non-complying housing.⁴⁵ By July 1943, Councils were appealing to the Department of Local Government for an amendment to the Act which would allow them to approve occupation of temporary dwellings on condition they were demolished after the war, however the Department simply agreed that 'the position which confronts Councils today with regard to the erection of small war-time dwellings is difficult', noted that demolition could leave families without shelter, and stated that any decision on the ultimate fate of temporary dwellings should therefore be left for the future.⁴⁶ With this reply, the Department effectively conceded their inability to enforce institutionalised housing standards and the opportunity opened for temporary or makeshift dwellings to become widespread. Local Councils were forced to approve construction and occupation of these dwellings, albeit with rarely-met conditions, while the living standards of the residents were brought under the supervision of increasingly-tolerant Council Health and Building Inspectors.⁴⁷

Figure 4. Two-roomed garage dwelling occupied 1950-1965, Hornsby LGA, Sydney. Image: N.Pullan 2014.

The Commonwealth Powers Bill expired in 1948 but was immediately replaced with the NSW Building Operations and Building Materials Act 1948 which retained control of building materials, but relinquished control over land prices.⁴⁸ Full delegated powers were finally re-instated in September 1952 on expiration of the 1948 NSW Act, and Ordinance 71 was simultaneously amended with Clause 86, Temporary Buildings – “Special Provision”, prohibiting the habitation of temporary structures.⁴⁹ However, for at least another decade, local authorities' attempts to re-impose control over sub-standard dwellings could only extend to pushing for rapid completion of the permanent house while continuing to ensure temporary dwellings provided adequate, if basic, accommodation.⁵⁰

The expanding post-war economy

From 1945 until 1949, the Commonwealth government also retained full control of the country's domestic and international finances, facilitating a successful transition of the Australian economy from wartime production to consumer-oriented manufacturing.⁵¹ As a result, despite inflation briefly reaching 20% in 1951-52 due to high consumer demand and increased labour costs, the period from 1945 to 1961 was generally characterised by strong economic growth and full employment.⁵² From 1947, wages reverted to an earlier industrial award scheme, leading to a 150% increase in wages over the period, while at the same time unemployment ranged between 2 and 3.5%

with thousands of unfilled job vacancies.⁵³ Between February 1946 and June 1956, the value of primary production rose 77% and manufacturing increased by 167%, led by increased manufacture of industrial metals, machines, and conveyances, comprising 42% of the total production value and employing 28% of the workforce by 1949.⁵⁴ Meanwhile, payment of deferred military pay amounted to £30 mill. by 1948, with an additional £6 mill. in war gratuities paid in 1951, each contributing to a 70% increase in deposits to the government-owned Commonwealth Savings Bank between 1946 and 1955.⁵⁵ These economic changes resulted in an unprecedented number of low-income households finding themselves in a more secure financial position than they had ever experienced, with stable employment prospects, consistently high wages, and small sums on deposit.⁵⁶ Although more families were in a position of relative financial security, the majority were from occupations where their income was so low or variable they were unable to satisfy the exacting borrowing conditions for a loan to purchase a completed home, even if houses were available, and their limited savings were only enough to purchase inexpensive vacant land and materials for a shed or garage.⁵⁷ However, by taking advantage of this opportunity, aspiring but marginal homeowners could retain the money which would otherwise have been paid in rent and put it towards buying materials to construct their permanent house as they could afford to do so.

Availability of prematurely-developed land

Premature development of land has been defined as “the subdivision of land for residential purposes without relation to actual housing needs”.⁵⁸ In 1948, it was estimated that approximately 250,000 prematurely-developed and still un-serviced vacant residential allotments existed in the immediate environs of Sydney, having been subdivided for their investment potential during seventy years of unregulated and haphazard suburban expansion.⁵⁹ Of these, just over half were situated in or close to areas which already had amenities installed and so were regarded as viable building sites.⁶⁰ The remainder, comprising almost 120,000 lots, were so remote that newly-installed county planners considered it impossible to provide utilities within a reasonable period, if at all.⁶¹ Consequently, a few allotments were usually taken up on subdivision but vast tracts remained vacant, still without basic amenities and held mainly as consolidated holdings until demand for building land caught up with this long-standing over-supply during the early post-war years.

A limited amount of vacant land was put on the market from 1945, however, the majority was withheld from sale until Commonwealth control of land prices was allowed to lapse in September 1948, after which the number of lots available for purchase more than doubled within six months.⁶² Much of the land was in outer suburbs and remained without amenities or public infrastructure with little prospect of provision in the foreseeable future, however it was both readily available and affordable to the marginal purchaser, being already subdivided into residential allotments with individual title and offered at prices considerably lower than developed land closer to local amenities and places of employment.

Government control of utilities and public infrastructure

In post-war Australia, the provision of utilities and related public infrastructure was the responsibility of government-owned or government-regulated entities, therefore, in NSW all utilities except gas supply were under the direct control of the State. The Metropolitan Water, Sewerage & Drainage Board installed, maintained and operated water and waste water infrastructure; Sydney County Council generated electricity which was distributed through its own network or, until 1958, sold in bulk to local Councils who then distributed it using council-owned infrastructure; while local Councils managed garbage and night-soil services, street lighting, and construction of local roads. Gas was provided by AGL, a public company that owned and operated all gas infrastructure, and had accepted government control of prices and dividends in return for a market monopoly.⁶³ During this period, with much of the still un-serviced land being settled, and materials and labour in very short supply, connection of all utilities and amenities was only considered once a subdivision had reached 25% occupancy.⁶⁴ However, installation costs were not borne entirely by the new homeowners as each utility provider charged a uniform rate across the metropolitan area, relying on high demand in more-developed areas to subsidise installation of essential services for localities which could not otherwise be served due to high costs per property or insufficient population to cover expenditure.⁶⁵ Local Councils also utilised provisions in the LG Act 1919 permitting them either to guarantee providers against income deficiencies arising from utility extensions, or to pay the full cost out of the General Fund which would then be recouped incrementally via a general rate levied for a number of years on all improved land throughout the municipality.⁶⁶

Where the local Council was responsible for electricity infrastructure i.e. poles and wires, electricity installation commenced once “loan money and materials [were] available”, and was also postponed if the particular area had

too few customers for revenue to cover expenditure.⁶⁷ Roads and footpaths were constructed and maintained by Councils from their General Fund supplemented by grants from the Lands Department and Department of Main Roads, with narrow central strips of bitumen and pre-formed concrete slab footpaths laid when resources were available, while locally-quarried sandstone was provided for residents to construct their own kerbing and guttering along frontages.⁶⁸ Thus, the financial load of installing utilities and public infrastructure was reduced for the individual home-owner as prices and levies were tightly-regulated and underwritten by the state government, while communal repayment strategies and community effort shared the cost of servicing undeveloped suburbs across the entire customer base.

Conclusion

Contrary to experiences of informal urbanism in the majority of international contexts, post-war temporary dwellings in the outer suburbs of Sydney can be seen as a primarily successful model of suburban development. This success was underpinned by four exceptional events. Firstly, removal of State support for enforcement of enacted housing ordinances meant Councils had accept the existence of sub-standard dwellings and the responsibility for ensuring the dwellings provided a tolerable standard of living. Secondly, the stable and expanding national economy brought guaranteed employment and high wages to all workers, supplemented in many cases by extraordinary lump sum payments, and so providing historically-marginal households sufficient financial resources to own land and construct basic accommodation while saving to achieve a complying house.⁶⁹ Thirdly, a large number of residential allotments became available at prices affordable even to these low-income wage earners. Finally, public ownership or regulation of essential utilities and infrastructure ensured timely and affordable installation of basic amenities, while communal funding for their provision reduced the financial burden on households in newly-developing areas.

Thus, the unprecedented social, political and economic environment outlined above enabled low-income wage-earners in Sydney to purchase an allotment of inexpensive residential land, acquire the building materials necessary for construction of a temporary dwelling, and have affordable access to basic amenities while they saved to complete a conventional home. During this time, local authorities also modified their expectations and acted to support the occupation of non-complying dwellings until a complying house was achieved. In this way, the vast majority of families who experienced informal suburban development on the outer fringes of Sydney successfully transitioned to a formal and complying urban mode.

Plan of Seoul Olympic games facilities and the execution of the plans of green area and road network of Seoul city planning

Kwanghyun Park (Kagoshima University)

This study aims to outline the changes of the plan of Seoul Olympic Games facilities and the related roads, to identify their locations in Seoul city planning, especially the green area in the zoning of Seoul city planning and the road network of Seoul master plan, to reveal the urban transformation of Seoul triggered by the Seoul Olympic Games.

In the original plans of Seoul Olympic Games of 1980, sport facilities were located in the north of Han River(Old city district), the south of Han River(Jamsil district), the northeast of Seoul City(Taenung district) and the northwest of Seoul City(Sungsari district). In the actual plans of 1988, some new facilities were located along the Jungnang-cheon the branch of Han River in the east of Seoul and some venues were constructed in the south of Seoul, particularly along the Nambusunhwan-ro (arterial road) which connects Gimpo International Airport to Jamsil district. Most of the sport facilities for the Olympic games were built in and around the green areas in the zoning of Seoul city planning. Especially Olympic park and Jamsil sports complex were located adjacent to the green area of Sungnae-cheon and Tan-cheon the branch of Han River in the east of Seoul. Since then, large sports parks constructed in Seoul like the World Cup Stadium were located in the green area of branch of Han River.

In 1980s, the roads around old city area were extended as an urban redevelopment which promoted by Olympic Games, and new roads for the housing development based on the Housing Site Development and Promotion Act, which was legislated in 1980, were constructed in the development districts like the Gaepo district(1981) and the Mokdong district(1983) along the branch of Han River. Especially, the roads like the Olympic-daero(olympic expressway), Noryang bridge, Dongjak bridge, Dongho bridge, Dongho-ro(arterial road), Olympic bridge, Nambusunhwan-ro (arterial road,), were expanded and constructed for preparing Olympic Games.

It is concluded that almost facilities for the Olympic games were built in and around the green areas in the zoning of Seoul city planning. The 1988' s plan of Seoul Olympic Games facilities was laid out in the east of Seoul City more compactly than the 1980' s plan. The broad highways and road-rail bridges planned in Seoul city planning were executed for the Olympic Games.

Critical junctures and city development: a brief retrospect of Chongqing's planning history, 1949-2010

Min Jiang (The University of Tokyo)

Southwest China' s Chongqing is a city with unique development history which experienced critical junctures. This study collected and organized political, economic and cultural events in Chongqing during 1949 to 2010, and then analysed how its city planning responded to those critical junctures, and evaluate whether it was successful or not; furthermore, it traced the evolution of motive forces in Chongqing. The analysis has led us to the conclusion that critical junctures constituted pivotal motive forces in Chongqing' s urbanization; generally, each version of Master Plans responded them effectively and timely, especially by giving the priority to natural geography and continually developing the polycentric structure at different scale. The result of this study shows that Chongqing has built a comprehensive development framework for settlement hierarchy structure, transportation, economy and ecology. For the future, it should pay more attention to improve its infrastructure, conserve its historic heritage, strengthen its identity as a city of mountain and river, and achieve more sustainable development both ecologically and socially. Moreover, besides making sure that politic and economic forces fulfil their role, decision makers should also value social forces, make multiple objectives, exercise public participation and achieve social justice in the policy making and implementing process.

Designing the Chinese modern capitals in correspondence of political chances. A comparative analysis of planning proposals for the post-Imperial capitals of Nanjing and Beijing

Domenica Bona (Università degli Studi Roma Tre)

With a historical and morphological approach, this paper marks the correlation between the critical junctures occurred in China from 1911 to 1958 and the new planning proposals for the modern capital cities rebuilt at that time, Nanjing and Beijing. This paper assumes that the modern breaking points of Chinese history have the key role in reshaping the urban landscape as in the past. From this perspective, the research assumes an 'interpretative morphological approach' based on the comparison of the case studies. Stressing the attention on the planning features of each proposal, it is possible to highlight, firstly, the way new plans reproduce the classic patterns and override them in accordance with the political ideals and propaganda meanings that architecture and urbanism are supposed to embody; secondly, a constant application of traditional forms and urban patterns, by citation and reinterpretation. These two orders of results could eventually prove that reactionary and revolutionary political forces are influenced by the same atavistic rhetorical frameworks when they come to draw the spatial palimpsest of their power. Thus, each critical juncture is a new testing ground for the resistance of those recurring planning features in the present days as in the past.

Rethinking Southern Africa's Purpose-Built Cities: Instruments for National Identity Formation

James De Mott (Grinnell College)

This is an undergraduate thesis which adopts a historical process tracing approach to analyze the connection between elite-driven national identity movements and the built environment of purpose-built capital cities. The paper investigates three national contexts: Botswana, Malawi, and Tanzania. The research question seeks to access what, if any, connections can be drawn between the incentive structures created by particular elite-driven national identity movements and the placement, design, and success of these capitals in becoming functional administrative centers. The paper argues that purpose-built capital cities were not simply exercises in statism, but rather were intended to satisfy the demands implicit in specific nationalist identity movements.

James De Mott is an undergraduate student at Grinnell College, Iowa where he majors in Political Science with a concentration in Global Development Studies. His interest in the history of urban planning was the impetus for a year abroad which focused on the questions of comparative urban planning and colonial legacies, first at his college's campus in London and then at the University of Botswana.

Plan of Seoul Olympic games facilities and the execution of the plans of green area and road network of Seoul City Planning

Kwanghyun Park

** PhD, Department of Architecture & Architectural Engineering, Kagoshima University,
park@aae.kagoshima-u.ac.jp*

By analyzing the changes in planning for facilities for the 1988 Seoul Olympic Games, focusing especially on green areas and road networks, this study aims to reveal the transformation of Seoul City, sparked by the Seoul Olympic Games. Most of the new competition venues for the Olympic games were built in the green areas in the Jamsil District and the Taenung District. In particular, the Jamsil District was able to support the development of two main Olympic venues by reclaiming land through the reclamation of the Han River. The river was the defining feature for Seoul City Planning's Olympic development plans, dictating the paths of the broad highways and bridges which follow and span its waters.

Keywords: Seoul, Olympic, Competition Venues, City Planning, Green Area, Road Network.

Introduction

This research clarifies the arrangement plan of the Seoul Olympic sports facilities and the development and expansion of infrastructure related to the Olympic Games. It also considers the relation between the facilities, infrastructure construction and Seoul City Planning.

The 24th Seoul Olympic Games (1988) was an international sports event showcased for the high economic growth of the Republic of Korea since it had been established in 1948¹. It can also be said that through the Olympic Games, the urban transformation of Seoul was done mainly in 1970s-1980s. For a large-scale international event like the Olympic Games, the related facilities such as various competition venues, athletic villages, parks and the transportation infrastructure are planned and completed according to Seoul City Planning. In some cases, the city plans are changed due to the needs of the actual construction.

There are many discussions from social and economic standpoints on the economic effects and changes in citizen consciousness brought about by the Seoul Olympic Games, however, there are few studies which analyze the transportation infrastructure and large-scale athletic parks developed for the Olympics². In addition, the correlation between these and Seoul City Planning in the same period have not been sufficiently examined.

This paper, therefore, will clarify the transition of the arrangement plan for the Olympic Games facilities from the time of the hosting application to the time the Games were held, and describes the relation between the location of the competition venues and the green area of Seoul City Planning. Subsequently, I will review the transition of the road networks of Seoul City Planning before and after the Olympic Games, focusing in particular on the construction and expansion of roads and bridges directly related to the competition venues, and examine the relation between these and the road networks of the Seoul Master Plan.

Background of the application for the hosting of the Olympic Games

The hosting of the 24th Olympic Games in Seoul was in part of a political bid to abate the public's criticism against the dictatorship of President Park Chung-Hee in the 1970s³. Seoul City announced that it would apply to host the Games as a government initiative on Oct 8, 1979, but immediately after that, the hosting campaign met trouble due to the assassination of President Park, who had made to final decision to bid to host the Olympic Games. In the political turmoil caused by the President's death, the KOC (Korean Olympic Committee), which actively promoted the bidding, and Seoul City, which was reluctant to bid due to the poor financial situation and lack of facilities, came into conflict, and the hosting campaign was ceased temporarily. This impasse was broken by President Chun Doo-Hwan who took office in September 1980. On his initiative⁴, The KOC conveyed the intention to host the Olympic Games to the IOC, and then on Dec. 4, 1980, the IOC announced that Seoul, the capital city of the Republic of Korea, would be the fourth city to apply for the right to host the Olympic Games after Melbourne, Australia; Nagoya, Japan; and Athens, Greece. There were many hurdles at high-level government meetings for

the Olympic bid, even after the KOC and Seoul City submitted their response to the IOC questionnaire about the hosting capacity on Feb. 26, 1981. This was due to the objection of Seoul City and the Economic Planning Board on the grounds that the financial situation for the Olympic Games was insufficient. At the 3rd meeting, however, it was resolved to proactively promote the hosting campaign⁵. Then finally on Sep. 30, 1981, Seoul was chosen to host the 24th Olympic Games from Sept. 17th to Oct. 2nd 1988, at the IOC General Assembly held in Baden-Baden, Germany.

Change of the Olympic Games venues plan (Table 1)

The arrangement plan of the Seoul Olympic Games venues evolved from the time of application to host the Games to the time when they were held. Here we compare the arrangement plans of the competition venues in 1981 and 1988 (Figure 1).

The competition venues at the time of the hosting application (Feb. 1981) were mainly located in the Jamsil District on the south bank of the Han River, in the surroundings of the old town at the center of Seoul, and in the Taenung District in the northeast part of the city. There were two main competition venues; the National Sports Complex (newly constructed) and the Seoul Sports Complex (under construction) in the Jamsil District. The main stadium (athletics, football), the archery field, the velodrome, the fencing hall, the gymnasium, the hockey pitches, and the indoor swimming pool were planned for the National Sports Complex, and the student gymnasium (boxing), the indoor gymnasium (handball, volleyball), the indoor swimming pool were planned for the Seoul Sports Complex.

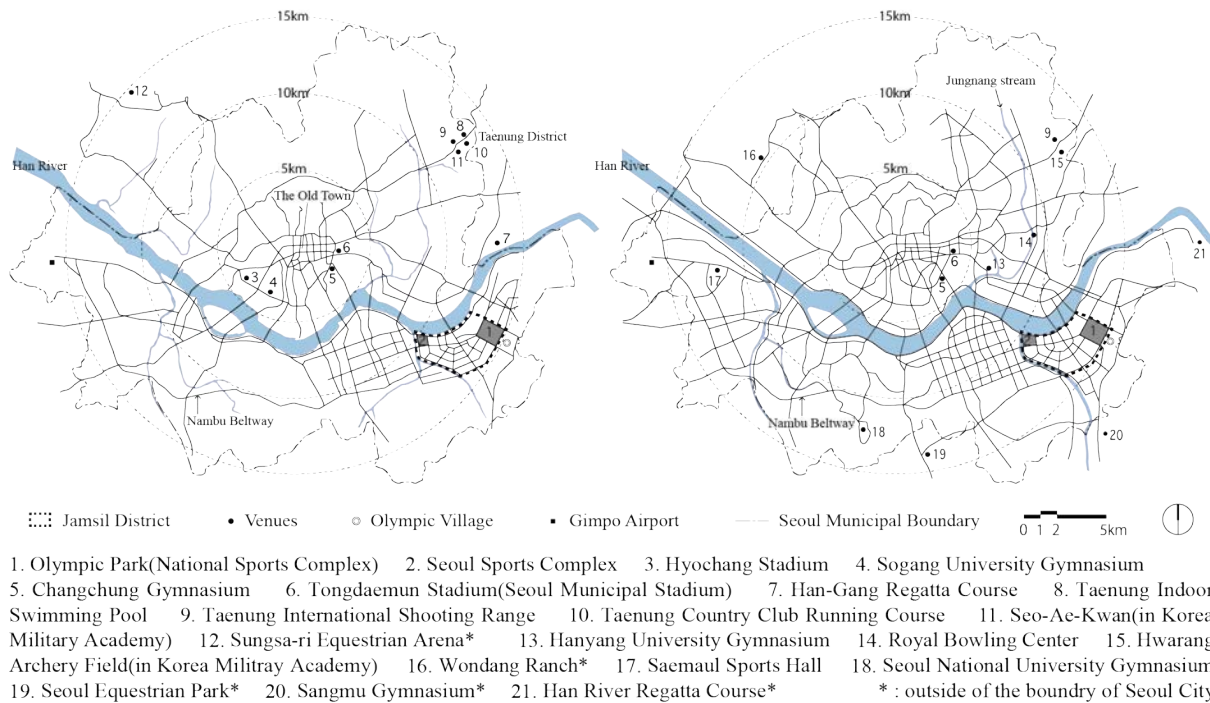

Figure 1 Comparison of the arrangement plan of the competition venues : plan at the time of application in 1981(left) and holding in 1988(right)

Four existing sports facilities in the vicinity of the old town were selected as competition venues: Hyochang Stadium (football) and Sogang University Gymnasium (judo) were located in the southwest of the old town; Changchung Gymnasium (basketball) and Seoul Municipal Stadium (football) were located in the east of the old town. In northeast area of the city (Taenung District), Taenung Indoor Swimming Pool, Taenung International Shooting Range, Taenung Country Club Running Course (cross-country) located in the Taenung Village; and Seo-Ae-Kwan (wrestling) which was located in the Korea Military Academy, were selected as competition venues.

Comparing the venue placement plans at the time of application (Sep. 1988) with those at the time of the Games, the two main competition venues located in the Jamsil District on the south bank of the Han River were used as planned. In the National Sports Complex which was now known as “Olympic Park”, the construction of the main stadium was discontinued, and the Olympic Velodrome, Olympic Fencing Gymnasium, Olympic Gymnastics Hall (gymnastics, handball), Mongchontoseong Cross-country Course, Olympic Indoor Swimming Pool, Olympic Tennis Courts and Olympic Weightlifting Gymnasium were newly planned and constructed. In the Seoul Sports Complex, the main stadium (athletics, equestrian sports, football), Jamsil Student Gymnasium (former student gymnasium : boxing), Jamsil Gymnasium (former indoor gymnasium: basketball, volleyball), and Jamsil Baseball Stadium were built. Among the competition venues in the surroundings of the old town, only Changchung Gymnasium (judo, taekwondo) and Dongdaemun Stadium (former Seoul Municipal Stadium : football) in the east, were used as planned at the time of the application, and Hanyang University Gymnasium (volleyball) and Royal Bowling Center along the Jungnang Stream were newly selected as venues. In the Taenung District, Taenung International Shooting Range was used as planned, and Hwarang Archery Field in the Korea Military Academy was newly selected as a venue. In addition, Seoul National University Gymnasium (table tennis, badminton) and Saemaul Sports Hall (volleyball) were newly selected as competition venues and could be accessed directly from the Nambu Beltway which connect the Jamsil District to Gimpo Airport.

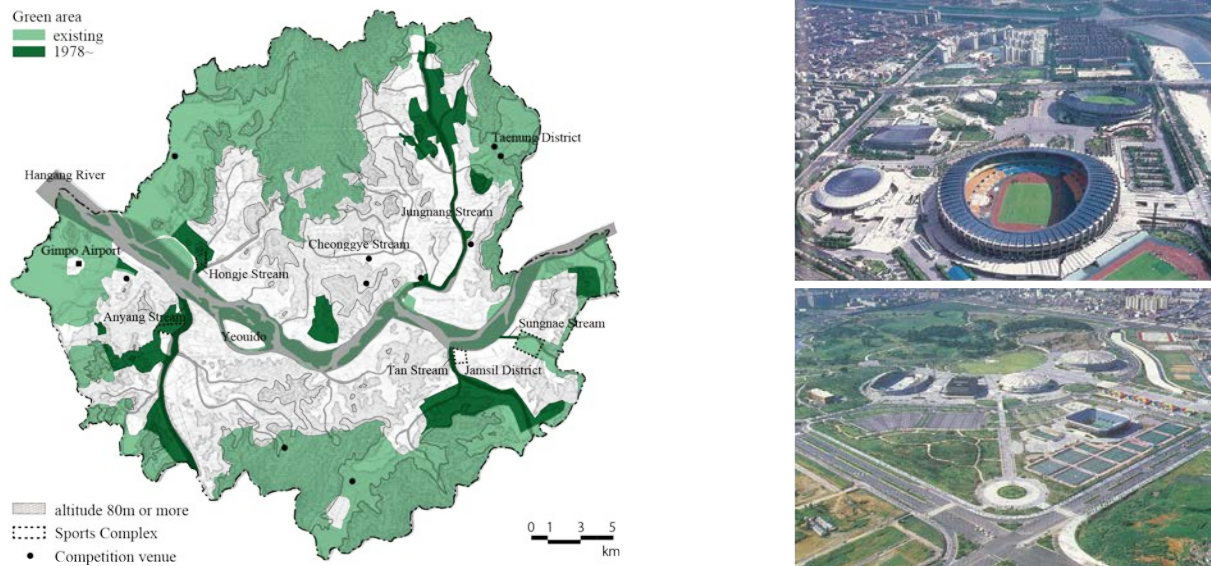

Figure 2 Positioning of the competition venues on the Green area : Seoul Sports Complex (top right), Olympic Park (bottom right)

Positioning of the competition venues in the green area of the zoning of Seoul City Planning

There is a significant relationship between the zoned green areas in the plans for Seoul, and the location of the Olympic Park and the Seoul Sports Complex.

The green areas of the 1972 Seoul City Planning consisted of a ring shaped green area along the periphery of the city, located in the surrounding mountains, and a linear green area along the Han River which traverses Seoul⁶, but since 1978, green areas both in the mountains and along the river have been connected as a result of newly designated green areas along the tributaries of the Han River⁷ (Figure 2).

Of the two main competition venues for the Olympic Games, the Olympic Park was constructed in a green area along the Sungnae Stream, and the Seoul Sports Complex was constructed adjacent to the green area along the Tan Stream. In this way, the green area along the tributaries of the Han River began to be developed as a park and a sports complex. After the Olympic Games, the Mokdong Sports Complex (1989) and the Seoul World Cup Park (2002) were constructed along two tributaries of the Han River; the Anyang Stream and the Hongje Stream. Also, the banks of the Han River were developed as a public park in accordance with the *'Comprehensive Development Plan of the Han River (1982-1986)'* during the Olympic preparation period. The green area newly created by the revetment of the Han River and its tributaries was utilized as a city park. It can be said that the waterfront of Seoul began to develop in earnest with the Olympic Games.

Transition of the Road Network of Seoul City Planning and Related Roads of Olympic Games

Comparing the road networks of Seoul City Planning at the closest time before the application to host the Olympic Games (Dec. 1976) and after the Olympic Games (Feb. 1989), we can see that the roads were mainly constructed around the old town, the Han River and its tributaries (Figure 3). Of these, I will look in detail at the Olympic Dae-ro ('Dae-ro' means a highway in Korean), Noryang Bridge, Dongjak Bridge, Dongho Bridge, Dongho-ro ('ro' means a road in Korean), the Olympic Bridge, the Nambu Beltway, which were directly involved with transport for the Olympic Games.

The Olympic Dae-ro was opened to traffic as a motor road in May 1986 (Figure 4). There was originally a road (Gangnam-ro) along the southern bank of the Han River which had been constructed in accordance with Notification No. 268 of Seoul Metropolitan Government (Nov. 26, 1972). This had several sections: Gangnam 1-ro (from the east boundary of Seoul to Jamsil Bridge), Gangnam 2-ro (from the Jamsil Bridge to Hannam Bridge),

Figure 3 Comparing the road networks of Seoul City Planning in 1976 and 1989

Figure 4 Bridges of the Han River and Olympic Dae-ro

Gangnam 3-ro (from the Hannam Bridge to Hangang Bridge), Gangnam 4-ro (from the Hangang Bridge to Yanghwa Bridge), Gangnam 5-ro (from the Yanghwa Bridge to the west boundary of Seoul). In preparation for the Olympic Games, these roads were repaired and expanded in three sections. In section 1 (from Cheonho Bridge to Dongjak Bridge), there were the existing roads with 4 lanes: Gangnam 1-ro, Gangnam 2-ro and Gangnam 3-ro (partly). These roads were widened into one two-way road with 8 lanes; 4 lanes being added to the river side. In section 2 (from the Dongjak Bridge to Seongsan Bridge), because the expansion of the existing Gangnam-ro was difficult due to topographical problems, a new two-way road with 4 lanes was constructed next to the riverside parallel to the existing Gangnam 4-ro which was then excluded from the Olympic Dae-ro. In section 3 (from the Seongsan Bridge to Haengju Bridge), a new embankment was extended along Gangnam 5-ro which had not been yet fully constructed (only the section from the Yanghwa Bridge to the Seongsan Bridge was completed), then a new two-way road with 6 lanes was opened along the entire route of the Gangnam 5-ro. This Olympic Dae-ro which extends 36 kilometers between Haengju Bridge and Cheonho Bridge, connected to existing trunk roads in Seoul with 5 bridges and 11 overpasses, and Gimpo Airport and the Olympic Stadium were also directly connected.

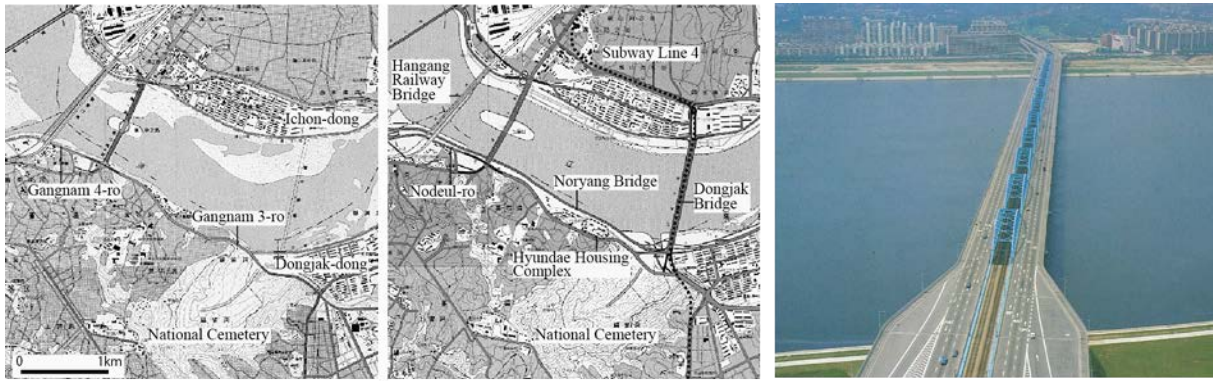

Figure 5 Comparison the topographic map of 1981 and 1987 around the Dongjak Bridge (right)

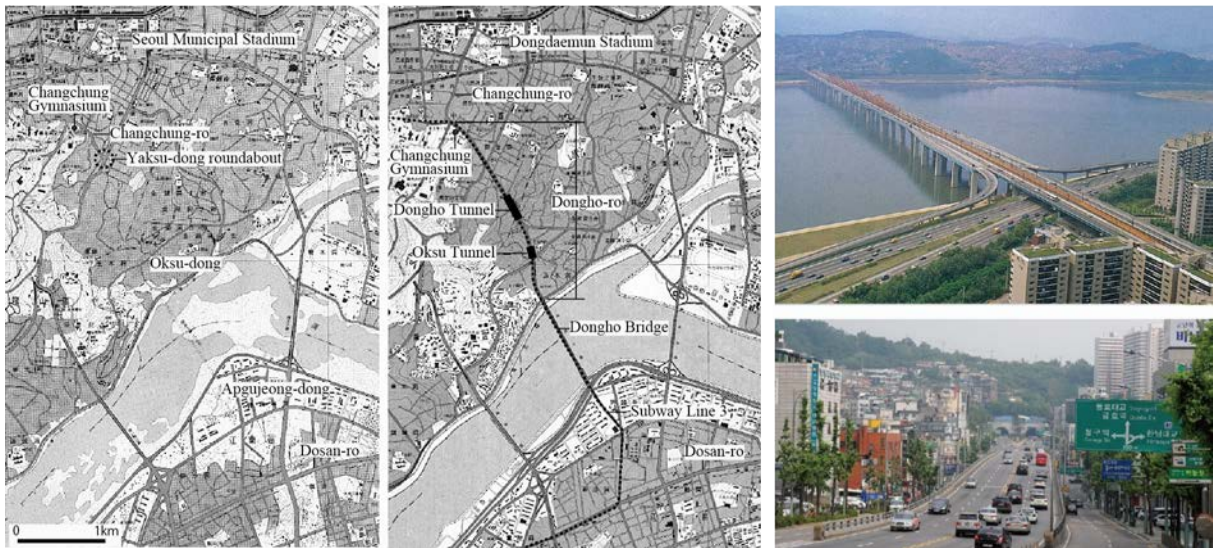

Figure 6 Comparison the topographic map of 1981 and 1987 around the Dongho Bridge (top right), the Dongho-ro (bottom right)

The Noryang Bridge (road width 21.4 m, total length 2,070 m, completed in Dec. 1987) is parallel to the Han River and also part of the Olympic Dea-ro (from Hangang Railway Bridge to the Dongjak Bridge), and was constructed separately from the revetment of the Han River (Figure 5).

The Dongjak Bridge (road width 28.6m, railway width 11.4m, total length 1,330m, completed in Dec. 1984) is the first bridge on the Han River to combine roadway with railway, and connects Ichon-dong (north bank of the Han River,) to Dongjak-dong (south bank of the Han River) ('dong' means an administrative district in Korean.) This made it possible to have quick access from Seoul Station to the Nambu Beltway (connecting at Sadang Station) via Seoul Subway Line 4 (Figure 5).

The Dongho Bridge (road width 20.4m, subway width 11m, total length 1,220m, completed in Feb. 1985) also combines road with railway (Seoul Subway Line 3), and connects Oksu-dong (north bank of the Han River) to Apgujeong-dong (south bank of the Han River). Dongho-ro (road width 28.6m, 8 lanes, constructed in Dec. 1984) runs from the north end of the Dongho Bridge to the Changchung Gymnasium. The section from the north end of the Dongho Bridge to Yaksu-dong Roundabout at the south end of Changchung-ro was repaired, and two tunnels - the Oksu Tunnel and the Dongho Tunnel- were constructed in this section. Another section from Yaksu-dong Roundabout to the north of the Changchung Gymnasium was originally part of Changchung-ro, but it was transferred to Dongho-ro. The Dongho Bridge and Dongho-ro connected Dosan-ro (south bank of the Han River) to the Changchung Gymnasium and the Dongdaemun Stadium about 1 km to the north. This gave quick access from the Jamsil District to competition venues around the old town (Figure 6).

Figure 7 Comparison of the topographic map of 1981 and 1987 around the Olympic Bridge (right)

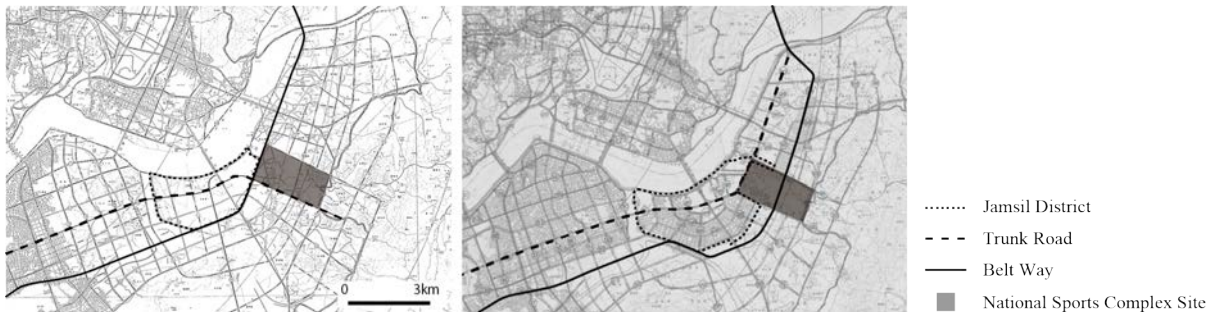

Figure 8 Change of the Seoul City Planning Road around the Jamsil District

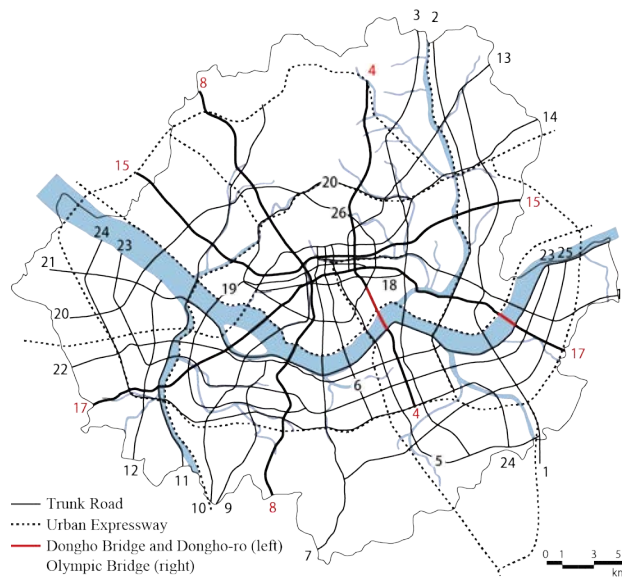

Figure 9 The road network of Seoul Master Plan in 1980

The Olympic Bridge (road width 32m, total length 1,225m, completed in Jun. 1990, between the Jamsil Railway Bridge and the Cheonho Bridge) was constructed in preparation for an increase in traffic volume in the southeast part of Seoul, including the Jamsil District, and was named in commemoration of the Olympics. It connected Guui-dong (north bank of the Han River) and Pungnap-dong (south bank of the Han River) and was linked to Gwangnaru-ro at the north end and Gangdong Dae-ro (adjacent to the northeast side of the Olympic Park) at the south end. It connects the old town at the city center to Seoul's southeast part which was developed for the Olympics Games (Figure 7). Especially the Jamsil District, bracketed by the Olympic Park and the Seoul Sports Complex, was reclaimed in the 1970s, and developed as a subcenter after the Seoul Olympics⁸.

The Nambu Beltway was a part of the 4th ring road of Seoul, and connects the east and west part of Seoul in the south. In 1970, it formed the south boundary of the Jamsil District and passed the north side of the National Sports Complex site (later Olympic Park). Its route was altered in 1974. It curved at the southwest of the Jamsil District and was laid along the south of the Jamsil District, and then divided the National Sports Complex site. Gimpo Airport and the Olympic Park (including the Athletes Village) were directly connected by this road (Figure 8).

Positioning of Roads Related to the Olympic Games in the road network of Seoul Master Plan

The road network of the 1980 Seoul Master Plan was a basis for the Seoul City Planning Road in 1980s. It was conceived as an integration of the previous two patterns - the ring-radial pattern of the 1966 Seoul Master Plan and the grid pattern of the 1978 Seoul Master Plan - and characterized by a cross of hyperbola-shaped roads consisting of 4th, 8th, 15th and 17th trunk roads⁹ (Figure 9). Of these, part of the 4th trunk road (from the south bank of the Han River to the old town) was completed by the construction of the the Dongho Bridge and the Donghvo-ro, and part of the 17th trunk road (the crossing of Han River) was completed by the construction of the Olympic Bridge respectively. In other words, the roads which formed the frame of the road network of the 1980 Seoul Master Plan were completed with the construction of roads and bridges related to the Olympic Games around the Han River crossing sections.

Conclusion

When the Olympic Games was held in 1988, the competition venues were compactly placed in the eastern part of Seoul, as the existing sports facilities located in the west of the old town ceased to be used as competition venues. Two sports complexes in the Jamsil District were used as planned at first, but the layout of the facilities in the Olympic Park (former National Sports Complex) was changed : the main stadium and facilities for archery and hockey were excluded, and a cross-country course for the modern pentathlon was included. Except for the competition venues near the old town, almost all venues were located in the green area of the Seoul City Planning. In particular, the two sports complexes were located in the newly designated green areas along the tributaries of the Han River. After that, the green areas along the tributaries which flowed through the west part of Seoul, were utilized for the new sports complexes. Furthermore, the highway was constructed along the Han River during its revetment, and the bridges crossed the Han River connecting the trunk roads of the 1980 Seoul Master Plan. It can be said that the Seoul City Planning Roads which were planned around the Han River, were constructed while preparing the Olympic Games.

Critical junctures and city development: a brief retrospect of Chongqing's planning history, 1949-2010

Min Jiang*

* Ph.D. Student, Department of Urban Engineering, Graduate School of Engineering, the University of Tokyo, m.jiang@ud.t.u-tokyo.ac.jp

Southwest China's Chongqing is a city with unique development history which experienced critical junctures. This study collected and organized political, economic and cultural events in Chongqing from 1949 to 2010, and then analysed how its city planning responded to those critical junctures, and evaluate whether it was successful or not; furthermore, it traced the evolution of motive forces in Chongqing. The analysis has led us to the conclusion that critical junctures constituted pivotal motive forces in Chongqing's urbanization; generally, each version of Master Plans responded them effectively and timely, especially by giving the priority to natural geography and continually developing the polycentric structure at different scale. The result of this study shows that Chongqing has built a comprehensive development framework for settlement hierarchy structure, transportation, economy and ecology. For the future, it should pay more attention to improve its infrastructure, conserve its historic heritage, strengthen its identity as a city of mountain and river, and achieve more sustainable development both ecologically and socially. Moreover, besides making sure that politic and economic forces fulfil their role, decision makers should also value social forces, make multiple objectives, exercise public participation and achieve social justice in the policy making and implementing process.

Keywords: planning history, critical juncture, motive force, China

Introduction

Chongqing, located in southwest China, is not only a beautiful city shaped by rivers and mountains, but also a famous historic city nourished by the long history of 3000 years. Presently, it is one of the 4 Municipalities directly under the Central Government (MCG)¹, and also one of the first generation of National Central Cities², playing an increasingly important role in China's development. In 2017, its GDP grew by 9.3 percent, hitting 1.95 trillion yuan, and constantly led the GDP growth nationwide since 2014.

Critical junctures have been considered to be one of the most important motive forces for modern Chongqing's development especially after 1890s. In this paper, critical junctures refer to major events happened in politic, economic, social and cultural areas, which shift cities' development and bring both negative and positive influence as one kind of motive forces. This study collected diverse critical junctures in Chongqing's development history mainly after 1949, then analysed how city planning responded to them. Finally, it went further to see the characteristics of motive forces for city development in Chongqing.

Historical development before 1949

Chongqing's history can date back to 1000 BC when it was dominated by Ba Kingdom; the Ba people established Jiangzhou as their capital. Jiangzhou Castel, in present Jiangbei District, was built in 316 BC, while Liyan Castel, in present top of Yuzhong Peninsula, was built in Shuhan Dynasty 226 AD. Thereafter, Chongqing experienced a 2-castel period for more than 500 years till Tang Dynasty. Jiangzhou was renamed for many times; the current name Chongqing, literally meaning double celebrations, was given in 1189, during the Southern Song Dynasty³. In Ming Dynasty, city walls and 17 city gates based on Daoism culture were built in Yuzhong Peninsula. As the population grew, the Jiangzhou castle gradually collected more and more residents and became active again. In Qing Dynasty, the government center moved to Jiangzhou castle; therefore, the once lost 2-castle pattern officially turned back again.

Till now, Chongqing had been continuing to experience stable development, especially relying on its convenient location for water transportation. In 1890, Chongqing was forced to open up to foreign countries by *Sino-British Yantai Treaty* and became the gateway to enter inland China. This accelerated its urbanization and the development of manufacturing. Between 1900 and 1905, Chongqing's textile production contributed one third of the total produced in China. In 1928, Chongqing city was formally established (Figure 1).

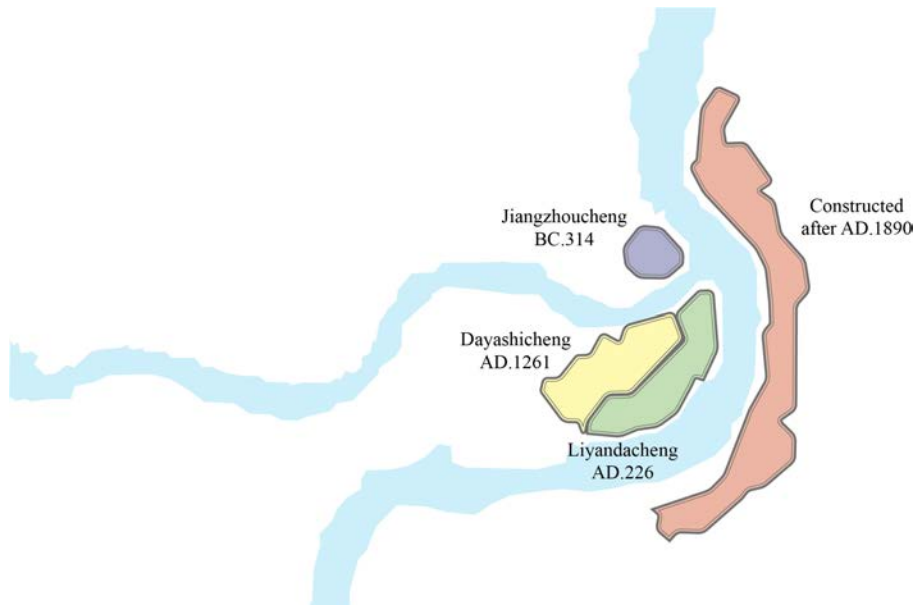

Figure 1: The development of Chongqing city from the ancient time

Figure 2: The development of Chongqing city from the ancient time

In 1937, after Nanjing was occupied by the Japanese, the Kuomintang (KMT) government moved to Chongqing and designated it as its wartime capital. Many factories were moved there from Shanghai, Wuhan and Tianjin; therefore, Chongqing jumped into a modern industrial city and played a pivotal role nationwide in policy, economy and manufacturing during the 1940s. In 1946, the KMT government released *Draft of Ten-Year Planning on the Construction of the Alternate Capital*. This was the first comprehensive city master plan of Chongqing, and also one of the most important representatives of the post-war city planning document. It was strongly influenced by western city theories and showed the characteristics of Modern Rationalism. Although it was not implemented due to historic reasons, many of its idea, especially Satellite Town, profoundly influenced following master plans in Chongqing (Figure 2).

1949-1977: frustration and stagnation

After the foundation of the People's Republic of China in 1949, the nation experienced an initial phase of city planning for the first 8 years until 1957, during which China experienced the significant Socialist transformation.

One of the urgent missions then was to recover the economy. Later from 1958 to 1960, it experienced the Great Leap and People's Commune; the whole nation tried to achieve a rapid economy improvement however the result proved to be unsatisfactory. The the nation announced *no city planning for 3 years* in 1960 due to complicated international and national situations, thereafter city planning fell into stagnation.

However, Chongqing's development accelerated in the 1960s because of *Third Front Construction* policy carried out by the central government, although its city level was degraded from a municipality to a city under the jurisdiction of Sichuan provincial government in 1954. The policy invited a large number of defence-related state-owned enterprises to establish factories in and around Chongqing. With 46,000 workers migrating to the city and 200 key projects being established, the policy helped Chongqing build up its infrastructure and economic structure, and jump into the biggest industrial base in southwest China. Today, many of these military enterprises have converted to civil use, continuing to enhance Chongqing's industrial strength.

In terms of city planning, the government proposed *Chongqing Primary Plan* in 1960, concentrating on industrial distribution and improvement of transportation system, however, since the center government decided to stop the city plan as well as the following events, it was not implemented. In 1964, the *Third Front Construction Plan in Chongqing*, in response to *Third Front Construction*, helped Chongqing build up the hierarchic system of cities and towns (Figure 3). Nevertheless, as a large number of factories and workers moved in within a very short time, the construction was quite rapid; consequently, the urban distribution was found disorganized in the late 1970s. While the core urban area was too crowded as industrial and residential areas were mixed and restricted each other's development, new urban areas were dispersed and lacked of infrastructure for a long time. Moreover, the improper location made some factories yield poor economic output and resulted in severe pollution.

During these 30 years, stimulated by political, military and social forces, Chongqing dramatically shifted from a commercial center along Yangtze River to an important heavy industry base. It indeed brought prosperity, whereas it also relatively weakened other aspects of the city being a commercial center. Accordingly, those once formed superior functions such as transportation system, financial system, cultural accumulation did not have chance to perform better.

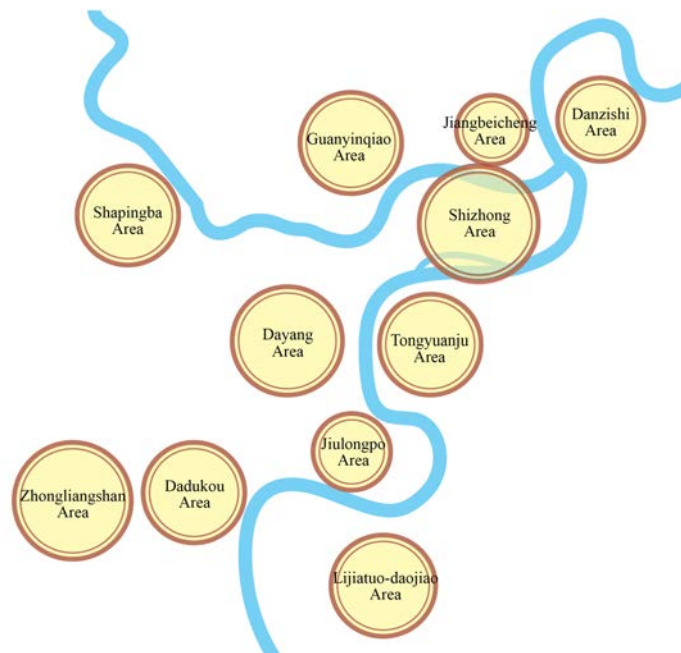

Figure 3: Dispersed Compact Groups, 1960

1978-1999: recovery and development

In 1978, Chinese government implemented the policy of Reform and Opening up, which later brought China rapid development. Significant system reforms concerning land system, household registration system, state-owned enterprise, etc., profoundly influenced the city development. As the city's pivotal role for economy development was gradually recognized and widely accepted, city construction received greater attention; after a 20-year stagnation, city planning work was finally picked up. In 1991, the urban housing system reform again greatly

promoted the city development by stimulating the real estate market and consumption; the housing sector became a significant part of economic activity and provided a sizable tax base.

In these 20 years, Chongqing also experienced an eventful history. In 1980, it was designated as one of the port cities opened for international trade along Yangtze River. In 1983, it became one of the comprehensive economy system reform pilot city. In 1984, it was listed as a separate unit under the state economic development plan so that Chongqing was able to enjoy the provincial-level right of economy management. In 1992, according to Comrade Deng Xiaoping's South Talk, Chongqing officially became a city of open economy. Hereafter, Chongqing gradually regained its importance and influence as being one of the commercial centers as well as a transportation hub along Yangtze River and southwest areas. Later in 1997, Chongqing was designated as the forth MCG with its area growing fourfold. The new municipality faced with 2 very tough problems, Three Gorges Dam project and the task to make center metropolitan areas drive the development of larger countryside areas. Therefore, although Chongqing did achieve significant achievement in metropolitan areas, with large undeveloped areas the general situation was soon found left behind coastal cities like Shanghai, Guangzhou, Shenzhen.

After the National City Planning Conference in 1980, the Chongqing government finished *The Master Plan* in 1983 and made some adjustment later in 1990. After an overall analysis, *The Master Plan (1983)* deemed that Chongqing is a commercial center in upper reaches of the Yangtze River, a water and land transportation hub and trade port, and an industrial city with both light and heavy industry (The adjustment in 1990 added that Chongqing is one of the National Famous Historical and Cultural Cities and an International Trade Port.); it has convenient transportation location, abundant natural resources and promising market for economy development.

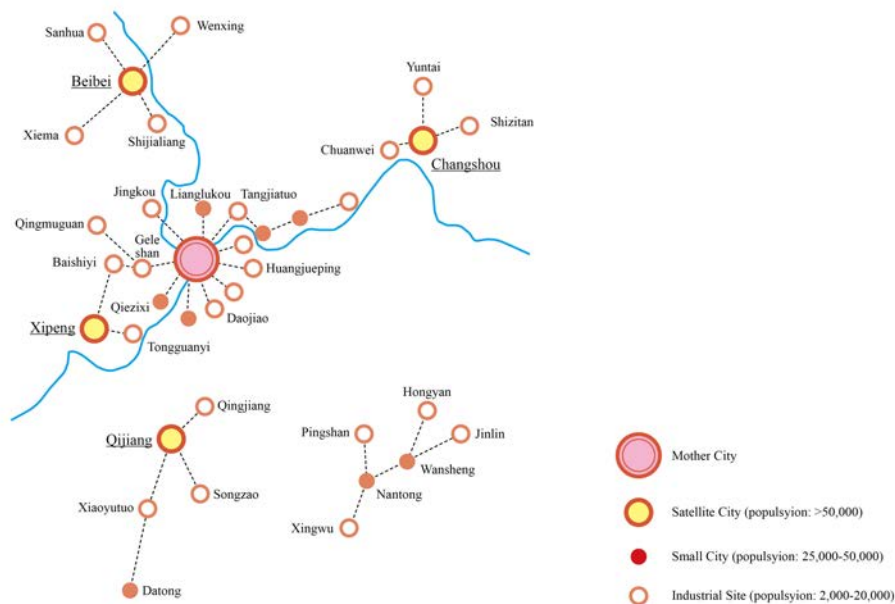

Figure 4: The Constellation-like Urban System Structure Plan, 1983

Moreover, in response to the natural geography, the plan valued the current urban morphology which was generally dispersed with compact groups, and further decided to develop a polycentric structure with 14 groups. Each group should be as possible as compact, offer both working and residential places, and be divided with river, green belt, slopes and cliffs, and farmland. The Shizhong District (presently Yuzhong District) was the center for policy, business and finance, meanwhile it was planned to build 4 other sub-centers, focusing on business, technology, culture and relocation site for enterprises and institutions, respectively, to relieve the stress of the center area. Around 100 km away from the old city was planned to construct 4 satellite cities, 8 small towns, and more than 20 smaller industrial areas, forming a constellation-like urban system structure (Figure 4). This structure was very unique since it was different from common layout of satellite town in metropolitan areas, or the layout of high-density cities on big-medium size; it stemmed from Chongqing's unique natural geographical environment, long-term history and current social-economic conditions.

As Chongqing became a municipality in 1997 and the old version master plan failed to adapt new situation, a new master plan was released soon in 1998. Firstly, the new plan modified Chongqing's status to the biggest center for

economy, technology, culture and education in upper reaches of the Yangtze River and southwest areas, a national transportation and communication hub, and an important industrial city, showing that Chongqing had developed into a more comprehensive city with greater competitiveness.

Moreover, the municipality greatly changed Chongqing’s administrative regions from 23,114 km² to 82,403 km², as well as the structure of its system of cities. Before municipality in the 1990s, in Bayu region, there was a big gap in the city scale in terms of population; the first-level city had the population over 1.6 million, while the second-level city’s population just dropped to only 0.25 million approximately. To deal with this situation, the *Master Plan 1996-2020 (1998)* proposed a new structure for system of cities according to the industrial distribution; this structure took metropolitan area as the center and the main transportation corridors as the development axis. It was planned to develop 3 regional central cities and create a networking system. In detail, there were 5 scales of cities, consisting of 1 megacity, 2 big cities, 9 medium cities, 33 small cities, 192 center towns and 517 general towns (Table 1). The plan divided Chongqing MCG into 4 big regions, consisting of center city and its surrounding dense areas, Wanzhou city group, Fuling city group and Qianjiang city group; the 5 city levels included center city of Chongqing MCG, center city of region and of county, center town and general town.

	Scale (10,000 people)	Amount	Population (10,000 people)
1	Megacity >100	1	500
2	Big City 50-100	2	52.5
3	Medium City 20-50	9	28.57
4	Small City 10-20	12	14.29
	5-10	21	5.75
5	Towns 1-5	192	1.30
	<1	517	0.38

Table 1: Structure for System of Cities in *Master Plan (1996-2020)*, 1983

From 1978 to 1990, Chongqing’s development was relatively steady because during this period, it did not get as much attention from the central government as before. *The Master Plan (1983)* proved to be successful especially by abiding and creatively developing the polycentric structure for Chongqing. After 1990, Chongqing gradually recovered its influence especially in economy as being designated as a city of open economy along Yangtze River, and later peaked as being designated as municipality, performing dramatic growth in GDP.

2000-2010: rebuilding and transition

Major progress has been registered in reform and opening up. After entering the 21th century, the industrialization and urbanization significantly accelerated. However, along with the fast urbanization emerged many issues. For instance, the growing gap between urban and rural areas, the deterioration of the ecological environment, uncoordinated development between urban and regional areas, etc. Moreover, as the reform and opening-up mainly focused on eastern coastal regions, the west has remarkably fallen behind the east. Accordingly, the *Great Western Development Strategy (GWDS)* was implemented in 2000 to enhance the economic and social development in the western region and consolidate the national defence by using superfluous capacity of economic development in the east coast areas. Later *the 11th Five-year Plan (2006-2010)* proposed the target to improve the environment, adjust industry structure and increase the tertiary industry, resulting a large scale of factories relocation from inner city to suburban areas.

Being as one of the most important cities in this policy, Chongqing got greater attention and enjoyed more preferential policies to develop into a growth pole in the Three Gorges area and southwest China. In 2005, Chongqing was designated as one of the national central cities along with other 4 cities⁴. Besides the positive influence of *GWDS*, Chongqing established Liangjiang New Area as the pilot area for urban-rural comprehensive reform in 2010. The different issue with Shanghai’s Pudong New Area and Tianjin’s Binhai New Area was that Liangjiang New Area need to build a better relationship between urban and rural areas. Moreover, as an industrial city, there were 31 state-owned industrial enterprises moved out of main urban areas, leaving lots of urban land with great potential to redevelopment.

Under this circumstance, the city planning objectives were to achieve urban-rural and regional integration, social justice, and maintain public benefit. It should practice urbanization in Chinese contexts, and develop a balanced settlement hierarchy from large cities to small villages. As some goals in 1998’s *Master Plan* had been achieved ahead of time, Chongqing released a new *Master Plan 2007-2020* in 2007. To improve the integration of urban and rural areas, the plan firstly specified the system of cities to 1 megacity, 6 big cities, 25 medium and small cities, 95 center towns and around 400 general towns. Secondly, an important concept for regional space structure, *One*

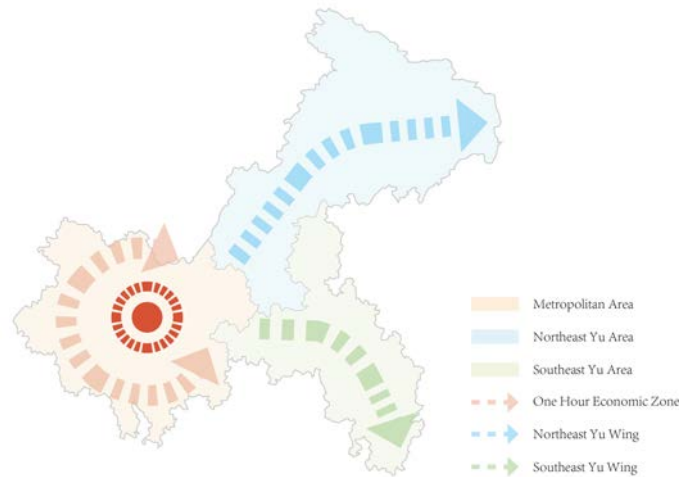

Figure 5: The One Center and Two Wings Structure, 2007

Center and Two Wings, was proposed; one center meant the one-hour economic center, consisting of 23 networking districts and counties, covering 2.87 km² and connected by diverse ways of transportation, including water transportation, railway, highway and air transportation; two wings consisted of 2 linear regions, Northeast Yu Wing centering on Wanzhou district and Southeast Yu Wing centering on Qianjiang District (Figure 5). These 3 regions have different development directions based on their own advantages; the center region should fulfil its leading role and make efforts to narrow the gap among cities and towns, while the other two regions should fulfil the duty of ecological migration and accelerate to transfer superfluous labour.

During these 10 years, Chongqing was able to build a relatively rational system of cities, explore the approach to build metropolitan areas and drive the development in rural areas.

Year	Planning	Strategic Positioning	Key Points	Major Influence
1946	<i>Draft of Ten-Year Planning on the Construction of the Alternate Capital</i>	the permanent alternate capital after the war; future center for policy, economy, military and culture in southwestern areas	satellite town; economy; transportation system; health facilities	not implemented
1960	<i>Chongqing Primary Plan</i>	a comprehensive and modern industrial city specializing in steel, machine, transport tool, heavy chemical industry	satellite town; industrial distribution; transportation system	not implemented
1964	<i>Third Front Construction Plan</i>	/	industry development	rapid growth in population and industry; poor economic output; severe pollution

Table 2: Summary of Important City Plans

Summary

That the city development history of Chongqing is unique is not only resulted from its special landscape with rivers and mountains, but also because of those critical junctures, especially after it was forced to open up to Western countries in 1890s when its dramatic leapfrog development started. Since 1890s, Chongqing gradually started its urbanization and become the commercial center because it was the only opened port city in inland China. After the KMT government moved to Chongqing and designated it as the wartime capital, Chongqing reached its peak of political status, jumping to the national political, military and commercial center and experiencing the wartime prosperity with a 10-time increase of population from 1936 to 1946; this is also the period when Chongqing first got its heavy industry development.

After the foundation of Republic of China in 1949, Chongqing achieved significant success during the difficult time because of the *Third Front Construction Policy*, which greatly enhanced its heavy industry foundation and grow into one of the most important industrial bases nationwide. Then in 1978, along with *Reform and Opening Up*, the whole nation experienced significant change and so did Chongqing. However, since the *Reform and Opening Up* mainly focused on eastern coastal cities, Chongqing's development was soon found left behind after 1978. Therefore, in order to minimize the gap and strike a balance, the central government designated Chongqing as the fourth MCG in 1997 and released *Great Western Development Strategy* in 2000, helping Chongqing develop into a growth pole in the Three Gorges area and southwest China.

Driven by political power, social organization and economy development, Chongqing's area, population and Per Capita GDP greatly increased from 1949 to 2010. Among these forces, political ones contributed most especially by changing the administration area of Chongqing, continuously practicing and developing the idea of dispersed and compact groups (Table 3).

Period	Critical Junctures	City Index			Main Motive Forces
		Area (km ²)	Population (10,000 persons)	Per Capita GDP (yuan)	
1949-1957	The Great Leap	7692 (1959)	2005.18	132.45	political power; social organization
1957-1977	Third Front Construction	9848 (1978)	2724.89	221.00	political power; social organization; economy development
1978-1990	Reform and Opening-up	23114 (1983)	2920.90	1122.09	social organization; economy development
1991-1996	Designation of City of Open Economy along Yangtze River;		3042.92	4350.71	political power; social organization; economy development
1997-2010	MCG ; Three Gorges Dam Project; The Great Western Development	82403 (1997)	3303.45	26127.28	political power; social organization; economy development

Table 3: Summary of Critical junctures, City Index and Main Motive Forces

Concluding comments

This study reviewed the city development and planning history of Chongqing from 1949 to 2010, finding that critical junctures, usually followed by significant policies and strategies, constituted a crucial motive forces for its development. Generally, Chinese cities are motivated by comprehensive forces in regard of policy, economy and society, however in Chongqing, especially in modern period, political power, instead of social and economic accumulation, played a crucial role and stimulated its development rapidly.

Meanwhile, in response to these continuing policy shifting, the city planning proved to be reasonable and successful, particularly concerning the city structure. Based on its own geography and profoundly influenced by the organic decentralization theory which was widely spread in the Modern China, the idea to develop Chongqing into a polycentric city with dispersed compact groups remained and its implication kept being specified and grew. Developing from the late 19th century as a city with one single center, Chongqing's urban morphology gradually grew bigger and more comprehensive. During the wartime, its urban areas began to disperse and primarily formed the quincunx structure. The *Third Front Construction* in 1960s brought about a rapid development of small cities and towns; as the city planning came back on track in the 1980s, city development became more rational and the constellation-like structure began to emerge. Later after its municipality, the administrative area greatly grew and the polycentric structure at a bigger scale formed.

After around the 30-year development after the first city planning document was released, Chongqing has already built a comprehensive development framework in system of cities, transportation and economy. Along with the history, the political environment and national strategies kept changing, and so did the direction of Chongqing's development. Therefore, city planning in Chongqing generally stayed on macro level and did not go further. As

the nation is developing into a new stage, Chongqing is also embracing its new chance and challenge now; this study provided suggestions that it is time for Chongqing to adjust the development objectives from macro structure building to micro quality improving. First, it is pivotal to continue the environment-friendly polycentric structure development according to the natural geography. This will also strengthen Chongqing's identity as mountain and river city and help build residents' identity which can transfer to the competitiveness of the city. Moreover, Chongqing still needs to improve its livability and sustainability both ecologically and socially, which particularly require attention on human scale and everyday life. To address this, it should try to improve the quality of urban environment, create more livable communities, provide more public spaces with diverse uses, as well as conserve its historic heritage. Finally, there are already increasing urban redevelopment projects where traditional planning theory finds difficult to deal with. Urban redevelopment requires new knowledge including economy, property law, management, and so on. Public participation will be critical to guarantee the justice during the process, that is to say, besides making sure that politic and economic forces can fulfil their role, decision makers should also pay attention to social forces, making multiple objectives, exercising public participation and achieving social justice in policy making and implementing process.

Acknowledgements

I would like to express my gratitude to all those who have helped me during the writing of this thesis. I gratefully acknowledge the help of my supervisor Professor Nakajima Naoto. I do appreciate his patience, encouragement, and professional instructions during my paper writing. Also, I would like to thank Professor Lu Feng, Doctor Chen Liran and Doctor Zhou Xiang, who kindly offered lots of help and suggestion for this paper. Last but not the least, my gratitude also extends to The China Scholarship Council who supported my Ph.D. study.

Designing the Chinese post-Imperial capitals in correspondence of political chances. A comparative analysis of planning proposals for Nanjing in the Thirties and Beijing in the Fifties

Domenica Bona*

* *Università degli Studi Roma Tre, domenica.bona@gmail.com*

With a historical and morphological approach, this paper marks the correlation between the critical junctures occurred in China from 1911 to 1958 and the new planning proposals for the modern capital cities rebuilt at that time, Nanjing and Beijing. This paper assumes that the modern breaking points of Chinese history have the key role in reshaping the urban landscape as in the past. From this perspective, the research assumes an 'interpretative morphological approach' based on the comparison of the case studies. Stressing the attention on the planning features of each proposal, it is possible to highlight, firstly, the way new plans reproduce the classic patterns and override them in accordance with the political ideals and propaganda meanings that architecture and urbanism are supposed to embody; secondly, a constant application of traditional forms and urban patterns, by citation and reinterpretation. These two orders of results could eventually prove that reactionary and revolutionary political forces are influenced by the same atavistic rhetorical frameworks when they come to draw the spatial palimpsest of their power. Thus, each critical juncture is a new testing ground for the resistance of those recurring planning features in the present days as in the past.

Keywords: Beijing, China, colonial history, East-Asia, morphology, Nanjing, planning, planning history, planning legacy, urban history, westernization

Introduction

As claimed by Andrew Boyd and Arnold Pacey concerning the Chinese pre-industrial era, historical breaking points used to represent the conjuncture of the rise of new dynasties, foundation of new cities, construction of great infrastructures and boost to arts and technologies. At the same time, they represent the fall of old dynasties, famines, civil wars, and the destruction of former symbols of power.¹

This paper assumes Pacey and Boyd's theory and claims the possibility that the modern breaking points of Chinese history have had the same role in reshaping the urban landscape, specifically the one of new capitals, as in the Imperial era. In the framework of the author's PhD thesis in which this research was developed, the morphological analysis of the proposals of development of the Chinese post-imperial capital cities of Nanjing and Beijing was fundamental in understanding the elements of analogy and continuity between them and the Chinese history of planning.

Nanjing had been the capital during the first Chinese Republic led by Sun Yat-sen's nationalist Kuomintang Party (1912-49). Later, Beijing returned to be the capital during the People's Republic of China led by Chinese Communist Party of Mao Zedong (1949-76). If we consider the continuity that organs of state have had and still have in China and if we assume the existence of socio-cultural factors that have allowed historical-political factors to determine in the urban planning of these two capitals as in the past also in the present, then it is possible to look to the governments of the post-imperial period as to 'modern dynasties' which in turn have marked moments of break, ascending phases of development and descending phases of decay.

Methodology

From a planning perspective that brings together the complex multiplicity of instances from architecture, history and human geography, this paper demonstrates the existence of invariants in the Chinese city and in its urban facts across the centuries and up recent days.² The method applied for this purpose is based on the morphological interpretation of the cities in a historical perspective. This approach was introduced in the framework of the Italian school of urban studies of the second half of the twentieth century when the typo-morphological method was developed in studying the Italian and European cities.³

In the framework of this research, the method required to collect the original documentation (e.g. maps, master plans, descriptions, etc.) of several case studies from their foundation up today. In a second phase, a selected series of case studies were redrawn, at the same scale and by using the same criteria in terms of contents and graphic.

The 18th International Planning History Society Conference - Yokohama, July 2018

These redrawn maps synthesize the elements of the urban structure and allow to compare in their diachronic evolution the different stage of development of each city also with the unbuilt planning proposals. Indeed, the confrontation of these morphological comparative maps picks out similarities and correspondences under various aspects (e.g. structural, dimensional, formal and visual) that do not end in the physical description of urban data but refer to a vocabulary that is more than ever symbolic and rooted in the Chinese urban culture.

First case study. The nationalist capital of Nanjing

With the fall of the Chinese Empire after the Xinhai Rebellion in 1911, Sun Yat-sen⁴ led the founding of the first Chinese Republic and the relocation of the capital to Nanjing.⁵ During the Thirties, a decade remembered as the 'Nanjing decade', the city became a symbol of modern Republican China. Indeed, in a pro-western climate the KMT involved many experts in the re-construction of Nanjing, among which Chinese and foreign technicians and politicians affiliated to the party, many of the young educated abroad, and entrepreneurs active in the Treaty Ports interested in participating in the construction of the Post-Imperial Modern China.⁶

Already capital in the medieval period, the original urban structure is that of a double city. Dated back to the tenth century, the first settlement has a rectangular shape and is located near the Yangtze River. Subsequently, new walls were built to include a larger area to the north-west of the city, between the river and Xuan Lake, and the imperial palace built *extra moenia* in 1368 under the Ming dynasty (1368-1644).⁷

Nanjing was an important commercial city but the proximity to Shanghai contributed to its decay. This did not favour urban growth so much that the structure, the footprint and the built fabrics remained mostly unchanged from the Middle Ages until the stipulation of the Treaty of Nanjing (1842) when the establishment of the foreign commercial companies contributed to build the railway, strengthen the port, and found numerous activities related to overseas trade.

The state of decadence and the possibility of building freely on the still predominantly agricultural land made Nanjing the ideal place to settle the capital of the Republic of China as Sun Yat-sen already proposed in the first decade of the twentieth century. In 1925, important works were started to improve the road network and build new buildings;⁸ in the same year, the competition for the construction of the Sun Yat-sen Mausoleum was launched and won by Lu Yanzhi.⁹ It was the first Nanjing building designed to consecrate the new Republican political power,¹⁰ on the southern side of Mount Zijin east of the Ming Tombs, Lu proposes an elegant and majestic adaptive architecture that reflects the aims of the tender and the principles of the 'Chinese form movement' (trad. 中國固有形式, Zhōngguó gùyǒu xíngshì), combining classic architectural forms with modern construction technologies.¹¹ The construction of the mausoleum was crucial to enable Nanjing to become the capital of the Republic, with the consent of the entire KMT; the southern position made Nanjing well placed, safe enough and far from the north occupied by Japanese and Communists.

For the leader of KMT Chiang Kai-shek, the development of the city was a priority so that in 1928 the 'National Capital Reconstruction Planning Committee, guesting Chinese and American designers including Ernest Goodrich and Henry Murphy.¹² The committee soon launched the competition for the 'Capital Plan' (trad. 首都计划, Shǒudū jìhuà) proposing an unprecedented program whose objective was the creation of a new *capitolium*. This was to turn into a project that would glorify China rebirth, in continuity with the past, and KTM rise to world power. As in the case of the mausoleum, the competition brief gave precise indications on the aesthetics of the project, that is a classical Chinese style with explicit sober monumental elements reworked in a modern key and contaminated by new types and construction technologies. Wide boulevards, long-laced straight-lines, tree-lined avenues, public gardens, grand buildings, and triumphal monuments are the elements that can be found in all the proposals.

In fact, all the projects took inspiration from the *beaux-arts* plans of Washington, New Delhi, Canberra and Paris, adapting the classical features of Chinese urbanism, such as the symmetry along the longitudinal axis, the partition into sectors and the horizontality of the built skyline. Among the many projects presented, two are those that best represent the positions and variations suggested by the design teams, that by Henry Murphy and the winner by Wong Yook Yee and S. Howard Jee.¹³

Murphy planned a 'Capitol Hill' outside the walls south of the Sun Yat-sen Mausoleum. With a second doubling of the city, Murphy proposes a continuation of the longitudinal axis of the memorial on which to graft monumental urban settlement that would have collected the governmental, administrative, cultural, and residential functions of the new capital.¹⁴ The winning project by Wong Yook Yee and S. Howard Jee proposed another *beaux-arts* urban layout and overlapped the eastern part of the city, thus foreseeing the demolition of the imperial palace and the eastern city walls. With large orthogonal straights and diagonal vaults, the urban grid is permeated with marked citations of the cosmological city, eventually, making architectural choices and setting itself in the wake of the *adaptive* style in vogue.

The 18th International Planning History Society Conference - Yokohama, July 2018

However, the winning project of Wong and Zhu was criticized because it was too expensive and complex to carry out. The Planning Committee then opted for a less onerous proposal, eventually not wither realised, that plans to raze the eastern *intra-moenia* area of the Ming Palace. The layout is based on an orthogonal grid with an irregular perimeter that follows the pre-existing form of the city. The central north-south axis is conceived as a large tree-lined boulevard interrupted in the middle by two monumental buildings surrounded by squares and gardens, which ends in the north at the railway station on which converges a new section of the railway that winds the city up at the banks of the river. The core area along the main axes is intended for large public functions, the peripheral blocks are intended for high to low-income residential areas, and the whole settlement would have featured a broad and coherent range of *adaptive* architectural designs.¹⁵

Second case study. The communist capital of Beijing

Beijing has had the fortune of never having been dismissed from its role of capital until the fall of the Empire.¹⁶ Founded by the Mongol Kublai Khan in 1271 adjacent to a pre-existing Chinese city dating back to 221 BC, Beijing may be considered the most sacred city in Chinese history for its precise adherence to the cosmological model of the 'magic square'.¹⁷ With the abdication of Emperor Puyi in 1911, however, the decline of Beijing begins. The city changed its name to Beiping, was dismissed from the role of capital and fell under Japanese control between 1937 and 1945.¹⁸

In 1949, right after the founding of the People's Republic of China, the Communist intelligentsia brought back the capital to Beijing and started an apologetic-glorifying program that led to the definition of political symbols, cults and, the image of the new Chinese proletarian era. These interventions can be grouped into two macro-phases.¹⁹ The first phase (1950-53) contributed defining the image of the state with the projects for the National Emblem (1950), the Monument to the People's Heroes (1952) and the urban expansion plan of Beijing (1949-53). They respond, in fact, to the immediate needs to make the identity of the Party recognizable and concretely demonstrate the political purposes that led to Mao's seizure of power. The second phase (1954-59) instead represents a theoretical and practical climax during which the dominant cultural positions were defined. During that time, the expansion plan for the capital was done (1954-58) and a new capitolium was created with the so-called 'Ten Great Buildings' and Tiananmen Square (1959).

When in 1949 the Beijing Municipal Government announced the design competition for urban expansion in Beijing, that was the first Chinese experience of urban planning since the Nanjing days. The debate was fervent and the ideas were inspired by what had already been done in Russia. The attitude was basically explorative and the main proposals were three, very different from each other: (1) the conservative one by Liang Sicheng and Chen Zhangxian and known as the 'Liang-Chen Plan' which proposes an urban doubling and the conservation of the historical fabric,²⁰ (2) that of the Soviet technicians coordinated by M.G. Barannikov redefining the historical core and urban growth on the Muscovite model, and (3) that of the Planning Committee headed by Hua Nankui, Zhu Zhaoxue, and Zhao Dongri which mediates the positions of the other two proposals.²¹

The 'Liang-Chen Plan' applied the principle of organic decentralization proposed by Eliel Saarinen in the plan for Helsinki (1917) and applied by Abercrombie to London (1944).²² It proposed the preservation of the built fabric of Beijing and the construction of a new core of expansion to the west outside the historical city.²³ Preserving the walls, the monuments, and the *hutong*, the plan thus concentrated the new functions outside the walls. The administrative centre was placed along a longitudinal axis parallel and dimensionally analogue to the one of the Forbidden City which was taken as a reference for proportions and typological layout. The result was meant to create a double city with the historical low-dense built fabric and a new modern settlement built by a set of monumental pavilions for public functions and skyscrapers for apartments and offices.²⁴ However, Liang's foresight found a weak endorsement by the Party and the 'Liang-Chen Plan' was considered excessively conservative.

On the contrary, the 'Proposal on the improvement of the Beijing Municipal Administration' draft by the Soviet group was based on the idea that Beijing should become the industrial centre capable of leading the modernization of the new China by abandoning its traditional political and cultural vocation. In general, the plan contained elements already tested in the construction of Soviet industrial cities and in the redesign of Moscow and Stalingrad. The historic centre was meant to host the central administrative and civic district, on the site of the future Tiananmen Square and Chang'an Road. The program also proposed the construction of social-housing neighbourhoods and greenbelts separating them from the historic city centre where the main public, military and administrative functions should have converged. In fact, the plan denied the monocentric structure of Beijing, transforming the city in a polycentric system with a core and several new towns, every one characterized by a functional vocation and high levels of independence.

Assuming to the Soviet proposal, in 1953 the Planning Committee elaborated a Party-internal project, the so-called 'Chang-guan-lou Plan', and in 1954 the final version was published as the 'Master Plan for the Construction of

The 18th International Planning History Society Conference - Yokohama, July 2018

Beijing',²⁵ the first definitive urban project for Beijing further revised in 1958. The plan thus clarifies the dual role of Beijing as an industrial metropolis and political, institutional and cultural reference core of the country. It outlined a twenty-year development based on the principle of 'control urban area and develop the far suburb'.²⁶ From a planning perspective, the plan proposed the reversal of the traditional north-south axis and the strengthening of Chang'an Road, an east-west boulevard appointed to be the 'axis of modernization'.²⁷ Indeed, by changing the logic of the original layout, this new plan deeply upset the classical structure of the consolidated city, creating an unseen **double axiality**, like a *cardo* and *decuman* system.

On the basis of the 'Chang-guan-lou Plan', Beijing Municipal Government in parallel carried on the architectural for Tiananmen Square and the 'Ten Great Buildings'.²⁸ The design of the square and these buildings was entrusted to various groups of architects and engineers in order to favour the typological-stylistic variety that the Party intended to pursue. Despite the modern technologies applied in the construction, in fact, the whole composition of the facades or just details evoke the Chinese identity that has its roots in history. Indeed, all the buildings were endowed with decorative elements of the classical tradition (e.g. architraves, shelves, and stairways), the essence of the 'National Style' that would be developed from then on.²⁹

Comparing the two case studies

The analysis of the planning proposals and the urban development of the case studies briefly presented was conducted by applying a comparative morphological method. Specifically, Nanjing was analysed in seven drawings, mapping the urban development in 1912, 1927, 1941, and 1974, and the three planning proposals of the 'Capital Plan' (1929) by Henry Murphy and the winner by Wong Yook Yee and S. Howard Jee and Nanking Planning Committee. Beijing was analysed in seven drawings too, mapping the urban development in 1911, 1940, 1959, and 1974 and the unbuilt planning proposals by the Japanese (1937), Liang Si Cheng and the M.G. Barannikov (1953). By reading the evolution of each city and then comparing the two, it came to evidence the presence to analogous patterns in terms of design tools, planning features, political context and cultural background, despite the apparent diverse historical frameworks.

Grafts and doublings

Planning history of China has shown two different attitudes towards expansion tools that were detected also in the proposals for Nanjing and Beijing. On one hand, the 'urban graft' overwhelms the order of things by destroying the existent built fabrics and super-impress a new settlement. It is a practice that would imply a clear intention of creating a new palimpsest in contrast with the past. On the other, the 'urban doubling' allow building a new settlement by juxtaposition rather than. It is a consolidated practice that can be observed in the most ancient Chinese cities, as in the nineteenth-century Nanjing and in the early twentieth-century. The will to not cancel the traces of established settlements tells us about a dual purpose: to build on symbolically uncontaminated foundations and construct in a regime of rapidity and economy of efforts.³⁰

In pre-modern times when Kublai Khan establishes the Tartar capital in Beijing, instead of occupying the pre-existing Chinese city, he founded his own one *ex-novo* based on the cosmological model, whose walls were graft on the northern side of those of the ancient settlement. The same happens in many other cities where the rise of new rulers creates the conditions for expanding, reorganizing and re-imagining the structure of existing cities. Nanjing makes no exceptions since the Ming doubled the urban structure when they built the new imperial palace *extra-moenia*, side by side of the original walled city.

This *modus operandi* was later reinterpreted functionally by the foreigners who 'colonized' China in the Nineteenth century, in the transition period between the pre-modern and modern age, and by the Chinese *intelligentsia* in the post-imperial time. This is demonstrated by the planning proposals draft at the competitions for Nanjing (1929) and later for Beijing, with the doubling project by the Japanese (1941) and the Liang-Chen Plan (1949). In all these projects, the doubling theme becomes functional to the definition of an urban plan of great impact and to the safeguard of the historical settlements from the devastation that an urban graft would have produced. However, although the theme of the double city has been revised frequently and has found a broad consensus, none of the doubling projects has been brought to realization. Eventually, in Nanjing the fall of the KMT blocked the process of urban re-foundation and, even more striking, in Beijing the urban structure remained still strongly monocentric, despite the attempts to shift the centre of gravity to areas other than the Forbidden City.

The axis of urban symmetry

Modern plans for the capitals show that the monumental axis is one of the most frequent figures of reinterpretation of the cosmological urban model. As in the pre-modern age, the axis is a planning tool capable to set the urban

The 18th International Planning History Society Conference - Yokohama, July 2018

structure of settlements and put into relation the practical issues of design with the spiritual symbology of religion (e.g. North-South as god-man) and the celebratory issues politics.

In Nanjing, all the projects developed during the Nanjing Decade were based on a symmetrical development supported by a longitudinal axis that connects the city with the surrounding environment (e.g. the mountains to the north, the water to the south). Associated with the use of classical architectural typologies (e.g. pavilion buildings with pagoda roof), those projects all introduced modern western themes such as that of public space, extroversion, verticality, and therefore a panoptic vision of the axis which dominates the entire array of buildings surrounding the great open space along the axis. The axiality, in fact, is reiterated by the design of built fabrics that generates a series of typified blocks aligned from north to south, which surround the public space and the special blocks leaning against the axis. In Beijing, instead, Tiananmen Square is located south of the Forbidden City along the existing axis of symmetry to the south up to Qianmen. By symbolically extending the pavilions of the Forbidden City outside its walls along the edges and in the middle of the square, the axis intercepts a series of buildings that double the system of the imperial compound, made up of interrupted central perspectives and paths that, never straight, oblige to cross or turn around these large buildings. At the same time, the consistency of the architectural artefacts accentuates the long perspective and dominance of a horizontal landscape, devoid of spatial references outside the square itself.

Indeed, the figure of the axis returns to the most relevant urban projects through the past to the twentieth century. On the one hand, it preserves the formal characteristics of the physical urban layout based on rigour, symmetry, and a ratiocination. On the other, it embodies the values and uses proper of the institutions in place.

In the ancient time already, the triumphal road used to connect the southern gate of the imperial palace to corresponding one of the city walls, with a straight line along which stand a series of temples and altars marking the obligatory stages of solemn processions conducted by the emperor. In the twentieth century the transfer of the power of the hands of the emperor first, the KMT then, and the CCP later has meant the shift of institutions from one capital to another. In this process, in both Nanjing and Beijing the characters of the axis change and the functions evolved and the instances of the modern city were added to the traditional celebratory values. In fact, the monumental axis is transformed into in an **equipped linear urban space**, reminiscent of the market street, characterised by a dense agglomeration of civic venues, government headquarters, and business centres attractive at the urban at mostly national scale.

Conclusions

As emperors of 'modern dynasties', Chang Kai-shek and Mao Zedong have sealed the beginning of their power through the construction of modern capitals inspired more or less explicitly to the Chinese classical model. In fact, in both moments the change in the geography of power has pushed the *intelligentsia* to redesign the capital city, so to embody new values and objectives in a city as much as in the nation. This fact eventually proves that reactionary and revolutionary political forces were influenced by the same atavistic rhetorical frameworks when they came to draw the spatial palimpsest of their power. Thus, urban planning continues to have in itself a strong political connotation and, we could say, the anti-democratic characteristics that belong to the feudal culture of the past period. As commonly known, the Chinese political model has historically been heavily subjected to hierarchical mechanisms of control that left little room for the debate and participatory policies. In this sense, the exceptional nature of the two cases is confirmed by the way in which the urban planning process was carried out. The **competition of ideas**, in fact, is an uncommon tool for the Chinese context, both in terms of architectural and urban design, as it implies a level of democracy and cultural openness that *de facto* do not belong to the Chinese cultural mind set. Nevertheless, in both cases, the winners of the tenders had been disregarded and the project re-entrusted to a design institute, a direct expression of the government.

To conclude, similarities emerged between the urban and architectural proposals for Nanjing and Beijing. From the urban perspective, all the projects envisaged significant interventions on the urban structure, monumental and necessary for the construction of the new centralities and the expansion of the existing urban fabric. From the architectural point of view, in Nanjing the *adaptive* architecture combines classical forms with modern construction techniques, while in Beijing the scientific principles of socialist functionalism imported from Russia were applied for the first time and gave birth to the *National Style*. Therefore, both proposals do not end within the urban scale but develop the composition of the architectural objects and their typological, constructive, and decorative characters so that each competition is an occasion of a choral work on multiple design scales.

As a result, Nanjing and Beijing represent the modern *continuum* of that tradition of urban renewal contextual to the advent of new political powers; at the same time, they show how urban planning and architecture are conditioned by the political power. Despite the differences in the political climate that characterizes the two historical moments of the Chinese modern history, in both, we see analogous celebratory intentions for which the urban project becomes an opportunity to transfer the symbols of power in the physical space of the city.

² 'Urban facts' is a locution introduced by Aldo Rossi to define the architectural elements determining the geography of the city and its internal tensions in opposition to the residential built fabrics. See: Aldo Rossi, *L'architettura Della Città* (Padova: Marsilio, 1966).

³ Gianfranco Caniggia applied the typo-morphological method to several cases by comparison, demonstrating the general rules behind the evolution of urban fabrics in the medieval European cities. For example, in the case Como, he could determine the historical evolution of the city from the roman time and date the current urban fabrics. The same work was conducted by Saverio Muratori who applied the method to Venice and Rome, discovering the logic behind their urban development and the typological evolution of their architecture. See: Gianfranco Caniggia, *Lettura Dell'edilizia Di Base* (Venezia: Marsilio, 1981); Saverio Muratori, *Studi Per Una Operante Storia Urbana Di Venezia* (Roma: Istituto Poligrafico dello Stato, 1960); *Per Una Operante Storia Urbana Di Roma* (Roma: CNR, 1963).

⁴ Considered as the father of modern China, Sun Yat-sen (1866-1925) first proposed a modernization program for the country. See: Yat-sen Sun, *The International Development of China* (New York: The Nickerbocker Press, 1922).

⁵ The new capital was made official only in 1927 under the control of Chang Kai-shek (1887-1975), the general of the Kuomintang.

⁶ The transfer of the government from Beijing to Nanjing gave the KMT the opportunity to symbolically and physically break with the past and the feudal setting of the imperial society and institutions. The new Nanjing capital, in fact, changed the barycentric roles within the Chinese territory. As the North became part of the area under Japanese control, central-southern China became the forge of the country's first political, cultural, and technical modernization. Along the Blue River and the coasts of the Yellow Sea, the Treaty Ports were still open and these foreign outposts played an important role in creating international contacts and circulating ideas from outside.

⁷ Peter G. Rowe and Seng Kuan, *Architectural Encounters with Essence and Form in Modern China* (Cambridge: MIT Press, 2004).

⁸ Between 1925 and 1948, Nanshan Road became the showcase of the most modern architecture in the city. Banks, insurance companies, hotels, theaters, department stores, government, and commercial offices concentrated on two sides of the street. In fact, concurrent with the drafting of the 'Capital Plan', the Planning Committee commissioned the projects for many public buildings and required to ascribe them all within the main currents in which the *adaptive* architecture was declining: revivalism, neoclassicism and *déco*. Among the architects in charge of these designs, there are Allied Architects, Henry Murphy, Li Huibo, Xi Fuquan, Yang Tingbao, and Xu Jingzhi.

⁹ Lu won another competition in 1925, the one for the Sun Yat-sen Memorial Hall in Guangzhou, the hometown of the leader. Graduated from Tsinghua University in Beijing and Cornell University in the United States, Lu Yanzhi (1894-1929) worked as an architect with Henry Murphy in New York. Lu was one of the most important architects of the first generation educated abroad. In 1921, he founded one of the first private architectural offices in Shanghai, the Southeastern Architectural & Engineering Company (Dongnan jianzhu gongsi).

¹⁰ Qian Yao and Bing Gu, *Sun Yat-Sen Mausoleum* (Beijing: Cultural Relics Pub., 1981).

¹¹ Among the compositional references adopted by Lu, there are certainly the Tomb of Napoleon at the Invalides in Paris and the Pan American Union in Washington. See: Rowe and Kuan, *Architectural Encounters with Essence and Form in Modern China*.

¹² Foreign participation is a double meaning. On the one hand, it was useful to legitimize the Republican process in the eyes of the other foreign powers and, on the other, it allowed to challenge the professional and political relations between Nationalist China and the western countries within a capitalist, bourgeois, and anti-communist framework.

¹³ Architect, Wong Yook Yee (1902-1942) graduated from MIT in 1925 and was an assistant architect in the Nanjing Planning Bureau. Zhu Shenkang (as known as Shinn-hong Howard Jee) graduated from the University of Michigan in 1923.

¹⁵ Min-Chien T.Z. Tyau, *Two Years of Nationalist China* (Shanghai: Kelly & Walsh, 1930).

¹⁶ Originally named Dadu, Beijing is the only capital not founded by the Han Chinese but by the Mongolian Yuan dynasty (1279-1368).

¹⁷ Alfred Schinz, *The Magic Square: Cities in Ancient China* (Fellbach: Edition Axel Menges, 1996).

¹⁸ Beiping (trad. 北平, Běipíng) is the ancient name of the city and means 'peace of the North'. It was restored by the KMT in 1929, when the capital was moved to Nanjing and remained in use until 1949.

¹⁹ Jianfei Zhu, *Architecture of Modern China: A Historical Critique* (Abingdon-on-Thames: Routledge, 2009).

²⁰ Considered the father of modern Chinese architecture, Liang Sicheng (1901-72) was an architect and scholar who first studied the classic typologies and constructive technologies of the Chinese architecture. Urbanist, Chen Zhangxian was a member of the team group with whom Patrick Abercrombie elaborated the plan for the Greater London in 1944.

²¹ Dongquan Li, "Policy, Space and Governance: Lessons from Beijing," *Business and Public Administration Studies* 8, no. 1 (2014).

²² Liang Sicheng met Saarinen during a trip to the United States in 1947. In the following years, Liang had a large collection of foreign texts, including the writings of Saarinen. See: Eliel Saarinen, *The City: Its Growth, Its Decay, Its Future* (Cambridge: MIT Press, 1943).

The 18th International Planning History Society Conference - Yokohama, July 2018

²³ A similar idea had already been proposed by the Japanese in 1941 when they drew the 'Beiping Urban Plan'. See: Yuezhe Ming, *The Manchukuo Capital Planning* [伪满洲国首都规划: Wěi mǎnzhōu guó shǒudū guīhuà] (Beijing: Social Science Literature Publishing House, 2011).

²⁴ Si Cheng Liang, *Complete Works* [梁思成全集], vol. 5 (Beijing: China Construction Industry Press, 2004).

²⁵ The plan was widely implemented and remained valid until 1973.

²⁶ BICP, "Preliminary Master Plan for Construction of Beijing City in the Years of 1957 -1958," Beijing Municipal Institute of City Planning & Design, <http://www.bjghy.com.cn/ghyEng/ghyEng3develop.aspx>.

²⁷ Shuishan Yu, *Chang'an Avenue and the Modernization of Chinese Architecture* (Washington: University of Washington Press, 2013).

²⁸ The so-called 'Ten Great Buildings' were majestic and heterogeneous for layout and decoration. Some were placed around Tiananmen Square and others along Chang'an Avenue or in strategic points identified by the urban expansion plan. Around the Tiananmen Square, there are the Great Hall of the People and the National Museum of China, the Monument to the People's Heroes designed by Liang in 1952, and the Mausoleum of Mao built in 1976.

Along the western section of Chang'an Avenue, there are the Cultural Palace of Nationalities, the Minzu Hotel, the Chinese People's Revolutionary Military Museum, and the Diaoyutai State Guesthouse. In the eastern sector of the historical city, the Beijing Railway Station was built close to the south-eastern walls of the Tartar city and the Overseas Chinese Hotel in the Wangfujing district. The Workers Stadium and the National Agriculture Exhibition Hall were located outside the walls in the Dongzhimen area. Among them, four buildings reproduced the traditional pagoda roofs, two others used the element of the colonnade of western neo-classical matrix, another referred to Soviet monumentalism and three others, finally, were attributable to modern rationalism.

²⁹ Zhu, *Architecture of Modern China*; Rowe and Kuan, *Architectural Encounters with Essence and Form in Modern China*.

³⁰ In pragmatic terms, it is cheaper to build on mackerel soils than 'demolish and build' where there is already a liveable and at most modifiable city. Nevertheless, the concept of 'demolish and build' [trad. 拆迁, *chāiqiān*] is at the base of great part of the contemporary urbanization which has been conducted through this kind of operations. The whole Taoist philosophy is based on the balance of a binary system of things defining every dimension of the tangible and intangible world (e.g. *yin* and *yang*, humans and gods, nature and artefacts, square and circle). See: Lao-Tzu, *Tao Te Ching*, ed. D. C. Lau (Penguin Classics, 1964).

Possibility of Planning History as Local Heritage in Mature Small Local City: Case of Ishikari City, Japan

Takashi Tsutsumi (Tokyo Institute of Technology)

After over 150 years of modernization, Japan has begun to change its form of society. The number of residents in many cities has begun to decline and paradigm of urban planning has been changed and diversified as to correspond to the situation. In many cities, they had been encouraged to build urban infrastructures, residences, transportations, urban facilities, and so on especially after the WWII, and the issues concerning to urban planning was "How to develop a city?". However, for many Japanese cities, their proposition more important now is "How to use a city?", and the citizens are trying to evaluate the value of urban environment established by urban planning and to preserve and promote them.

This study discusses if "Planning History" and "Planning Heritage", i.e. the real urban space as its result, can be "Local Heritage" in a small city through a case study in Ishikari city, Hokkaido, Japan. As for "Planning Heritage", Freestone (2010) published a comprehensive research book on Australia's planning heritage and proposed "a preliminary list of Australia's major sites of planning heritage". This work was done by specialists of planning history and the project had related to Australia's national heritage system. On the other hand, the aim of this study is to discuss the value of urban planning for locals who are living there. Thus, the detailed research subjects are: 1) clarifying the history of urban planning in Ishikari city and its characteristics and 2) revealing the position of "Planning Heritage" among the inscribed properties of "Local Heritage".

Ishikari's development had begun from Meiji era. Early settler in Ishikari broke ground to use the land as farm, and they established windbreak forest network by remaining some of natural forests. This network still works up to the present. The next opportunity of development was the planning of large port to load materials produced in Hokkaido in 1940's, but the plan was failed in incompleteness due to WWII. In 1960's, according to the growth of Sapporo city, next to Ishikari, its newtown development had started to provide residences for increasing population. 40 years later, the number of population got started to decline in spite of its proximity to Sapporo with a population of 1.9 million.

In 2013, a group of locals was established and it started to study and evaluate about local history, culture, natural resources, and their lifestyle. Its recent objective is to disseminate the value of "Ishikari Heritage" to all the citizens to preserve and promote the local assets. The heritage is not an official or administrative cultural asset management system, but it is conducted by the locals. In the list of property candidates for nomination of heritage, some planning history and heritage are included as an asset that explains how the place of local's life had been built. This study indicates the difference between "Planning Heritage" and the other properties of "Ishikari Heritage", mentions the local's perception for "Planning History" and "Planning Heritage", and considers the possibility of "Planning History" as a local heritage.

An Investigation on China's NGOs in Urban Heritage Preservation: Taking the Grassroots NGO of Tianjin Memory as a Case

Qiuyin Xu (School of Architecture, Tianjin University, China), Tianjie Zhang (School of Architecture, Tianjin University, China) and Yuwei Zhang (School of Architecture, Tianjin University, China)

As for China's urban heritage preservation, the official cultural relics bureaus and urban construction departments have played crucial roles. Besides these top-down actors, some non-governmental organizations (NGOs) have emerged, and started to play increasingly noticeable parts. Their participation makes the actors in this field more diversified. At the same time, however, these NGOs have encountered considerable problems, due to the lack of administration experience, policy guarantee and supervision mechanisms. Accordingly, how indeed do these NGOs work? Facing China's increasingly pluralistic situation in urban heritage preservation, what kinds of roles do they play? How do the multiple stakeholders interact?

In this vein, the paper selects Tianjin Memory (former Tianjin Architectural Heritage Preservation Volunteer Team) as a specific case, and carries out empirically based and theoretically informed studies. Via literature research, in-depth interviews and internet big data analyses, the research elucidates Tianjin Memory's developments and transformations from 2006 to the present. Informed by internal ecological relationship and influence evaluation for NGOs in sociology, the paper divides its development process into four main stages: start, rapid development, parasitic disruption, differentiation and reorganization. Each stage is examined from six domains, including human resources, structure and management, finance, social resources, products and achievements. The advantages, problems and difficulties will be identified, and reasons behind will be uncovered.

Based on above analyses, this paper will further make comparisons among Tianjin Memory, the other two influential urban heritage preservation NGOs in China, and the similar NGOs in the West. The main limitations and challenges for Tianjin Memory will be identified and construed, including the lack of professional knowledge, unclear management structure, poor funding management, relatively backward-looking activities, antitheses to the local government, etc. Informed by the thinking about Pluralistic Urbanism, this paper intends to bring forwards some suggestions for a healthy and sustainable future of Tianjin memory and other similar NGOs in China.

Conservation of Memory Heritage through the artwork “Sea Present” painted by Shigeru AOKI

Ilji Cheong (Prefectural University of Kumamoto)

The scope of cultural heritage is beginning to extend to the modern era and holistically covers buildings and lifestyle. Using memory has become to be applied as one of the methods for conservation while it is usually used in short duration or just for one heritage. It is hardly ever extended to urban planning. In this paper, I proposed the memory project in Mera village and considered the collaboration among five sectors through three memories. The memory project became virtuous circle to produce community initiatives and new memories at the same time. And, I determined memory heritages through the changes of the relationship between the memories and the spaces. There was a possibility for memory urbanism too. Finally, I revealed the interaction and mediation among five sectors for the conservation of the museum of “Sea Present” . It said that the importance of realistic and balanced viewpoints with authenticity.

Mapping and placemaking from the perspective of cultural field the three historic sites of the western Han Dynasty in Hanzhong

Chao Chen (Xi’an University of Architecture and Technology) and Yunying Ren (Xi’an University of Architecture and Technology)

Recently, in the context of China's policy of vigorously developing the assertive culture confidence, the value of traditional culture has been re-recognized by the whole society. However, due to the unbalanced development of China's eastern and western regions, the value of cultural heritage is not valued in the western region. Hanzhong district in Shaanxi province, belonging to the intersection of the south and north, has its own unique natural and cultural environment. The three historic sites of the western Han Dynasty are located in the city centre of Hanzhong, and as the historical heritage of Han culture, it has been hesitant between protection and development for many years. On the one hand, this paper tries to introduce the concept of "field" into the protection of cultural heritage, by constructing the cultural field model and using the cultural field to explore the question of historical heritage activation. This article, on the other hand, by expanding the mapping function, using the method of mapping defined the three historic sites of the western Han dynasty culture field research scope and the elements, combing extracted place identity, controlling the space boundary of place and for placemaking, and proposing an operable strategy and approach. The conclusion is that: firstly, the cultural field model can be directly and succinctly plotted historical block boundaries from the point of cultural; Second, creating cultural field for historical heritage contributes to the value recognition of heritage itself; Third, Mapping as a research heritage of technology strategy research tools, not only can create the cultural field, can also be determined by extracting cultural information more objective place identity, and through placemaking rebuild new cultural links. This article expounds the theory and practice of historic helps overcome cultural heritage value cognitive impairment, effectively strengthen cultural inheritance and innovation, for placemaking of historic blocks to build a positive practical significance.

An Investigation on China's NGOs in Urban Heritage Preservation: Taking the Grassroots NGO of *Tianjin Memory* as a Case

Qiuyin XU*, Tianjie ZHANG**, Yuwei ZHANG***

* Postgraduate Student, School of Architecture, Tianjin University, China, qiuyin_xu@126.com

** Associate Professor, School of Architecture, Tianjin University, China, arch_tj@126.com

*** Postgraduate Student, School of Architecture, Tianjin University, China, 549057232@qq.com

As for China's urban heritage preservation, besides the top-down actors, some non-governmental organizations have emerged and started to play increasingly noticeable parts. The paper accordingly explores China's increasingly pluralistic situation in urban heritage preservation, and reveals the roles of these non-governmental players. The paper selects *Tianjin Memory* as a specific case, and elucidates its developments and transformations from 2006 to the present via documental research, in-depth interviews and internet big data analyses. Informed by internal ecological relationship analyses, the paper divides its development process into four main stages: start, rapid development, differentiation and reorganization. Each stage is examined from six factors, i.e. human resources, structure and management, finance, social resources, products and achievements, based on NGOs' influence evaluation in sociology. The research further identifies the main limitations and challenges for *Tianjin Memory*. As a part of the discussions about China's current pluralistic urbanism, this paper brings forwards some suggestions for a healthy and sustainable future of *Tianjin Memory* and other similar NGOs in China.

Keywords: NGOs in China's urban heritage preservation, *Tianjin Memory*, Multiple Stakeholders, Pluralistic Urbanism

Introduction

In the field of urban heritage preservation in China, the government and related management departments had an overwhelming advantage in the decision-making of heritage protection due to the public ownership of land¹. At the same time, with the introduction of public participation policy and the growing public awareness of heritage preservation, many NGOs² that gathered civil power emerged and have made a lot of effort³. Actually, their participation makes the actors in China's urban heritage preservation more diversified. However, the development of China's NGOs in urban heritage preservation is not mature at present. Lacking administration experience, policy guarantee and supervision mechanisms, these NGOs have encountered many difficulties in their development. How indeed do these NGOs work? Facing China's increasingly pluralistic situation in urban heritage preservation, what kinds of roles do they play? How do the multiple stakeholders interact?

Tianjin Memory is taken as a case in this paper to discuss the above issues. This NGO is one of the most representative and influential organizations

Figure 1: logo of *Tianjin Memory*

¹ Haichao She, "近十年我国城市遗产保护中公众参与研究综述 Jin Shi Nian Wo Guo Chneg Shi Yi Chan Bao Hu Zhong Gong Zhong Can Yu Yan Jiu Zong Shu (A Review of Public Rarticipation in Rrban Heritage Conservation in China in the Last Decade)," *Chongqing Architecture*, no.8 (2014): 12.

² Non-Governmental Organizations. The United Nations defines NGOs as non-profit voluntary civic organizations organized at the local, national or international level. In China, the definition of NGO is relatively more general. Professor Wang Ming of Tsinghua University defines NGO in China as a social organization that is not for profit, has a formal organizational form, and belongs to a non-governmental organization system. They have certain autonomy, voluntariness, commonweal or reciprocity. But this is not comprehensive and need objective and dynamic observation and understanding.

³ Yaxi Gong, Yingyu Gao, "苏州城市遗产保护中的公众参与机制研究 Su Shou Cheng Shi Yi Chan Bao Hu Zhong de Gong Zhong Can Yu Ji Zhi Yan jiu (Study on Public Participation Mechanism in Suzhou's Heritage Preservation)," *Chinese & Overseas Architecture*, no.10 (2016): 46-48.

in Tianjin⁴. It has protected many valuable historical buildings by recording, supervising and textual researching, and won many national heritage protection awards. Since its inception in 2006, it has undergone three changes of name and differentiation, and the backbone has developed into today's *Tianjin Memory*. It has not yet registered as a formal NGO and belongs to the grassroots organization category. Investigation on this NGO can provide rich experience on the operation of similar NGOs and their own limitations in multi subject participation.

1.A brief review of existed stuiess on NGOs

Researches on China's NGOs in urban heritage preservation is in the ascendant. Many NGOs in developed countries, such as *Society for the Protection of Ancient Building* in the UK⁵, and *Historic Savannah Foundation* in the USA⁶, play their roles in different ways to protect urban heritage. Their institutes pattern, sources of found, operation of projects and relationship with the government can be used for reference⁷. It is also concluded that the NGOs in China are facing problems such as the low level of social charity, the imperfect law, the restriction of taxation policies, the blankness of supervision system and poor management⁸. Related studies mainly focus on introducing the experience in developed countries, analysing the plight of China's NGOs in urban heritage preservation and giving some macroscopic suggestions, which provide the basis for the follow-up study of specific case in China.

Compared with the studies in the field of architecture, more in-depth analyses of the internal factors of NGOs have been made in the field of sociological. Moral self-discipline⁹, value orientation¹⁰ and so on provide us new perspectives and basis to study the emergence of internal problems in China's NGOs in urban heritage preservation. An evaluation system, including products, structure and management, governance, human resources, finance and marketing, has been set up to map the level of development of grassroots NPOs in China¹¹. Considering the short history of Chinese grassroots NPOs and the

hazardous environment, this evaluation system is relatively suitable. Based on the characteristics of the NGOs in China's urban heritage preservation, this paper proposes an evaluation system based on six factors (table 1).

2.The development of *Tianjin Memory*

Tianjin Memory is a grassroots NGO growing up from network BBS. Since its establishment in 2006, it has undergone three renaming and reorganization, and the backbone has developed into today's *Tianjin Memory*.

Finger 2: the development of *Tianjin Memory*

2.1. the Stage of Start: from Individuals to an Organization (2006.8-2008.3)

Table 2: Memorabilia of *Tianjin Memory* (2006.8-2008.3)

Time	Main events
2006.6.9	China Memory Network and China Memory Forum were created.
2006.8.23	Tianjin section of China Memory Forum opened.
2006.11.11	<i>Tianjin Shooting and Recording Team</i> was set up.
2007.6.9	The organization held a collective shot event and a forum to commemorate.
2007.8.-2008.4.	The organization conducted a carpet survey of the former Italian Concession and Austrian concession and reconfirmed the identity of more than 30 historic buildings.
2007.9.-11	The organization conducted four thorough investigations of the Xigu area of Tianjin and found a number of important historical buildings.
2007	The organization protected the old residence of Zheng Shiqi.
2008.2.22	The organization held the annual meeting and exchange meeting for Tianjin residents.

Individuals were brought together by the establishment of *Tianjin Shooting and Recording Team*, and began carrying out larger and more systematic protection. The members of the organization were the core members of the Tianjin section of China Memory Forum. They are non-governmental individuals¹² and their division of work is basically clear. It can be seen that all the major members have a relatively high educational background and belong to the intellectuals. Of the core members, Qiang Zhang has retired, Zhenliang Wang and Chunjing Han have stable jobs and incomes, Sen Mu and Qipeng Zhu are still young and at the start of their careers.

Finger 3: photo of the members of Tianjin section of China Memory Forum (December 9, 2006)

The organization was relatively loose in management. At the beginning of its establishment, meetings were hoped to hold regularly, but actually they were not. Members need to spend their own money to hold activities. Much communication have been done with the experts in Beijing and other places. Organization activities are mainly based on filming and meetings. In terms of heritage preservation, the organization has also made some achievements.

¹² Zhenliang Wang, Chunjing Han, Lei Fu, "The situation of Tianjin Memory," interview by Tianjie Zhang, Yuwei Zhang, Jiaqi Wu, Qiuyin Xu, Haoran Zhang, May 23, 2017.

Table 3: Situation of the Core Members

Name	Gender	Age	Profession	Education	Division
Qiang Zhang	Male	About 70	Retired, used to be a senior researcher of coating institute	unknown	Related work on cultural relics and law
Zhengliang Wang	Male	About 35	Editor of the Newspaper	Master of Chinese Department	Text composition and oral group leader
Sen Mu	Male	About 25	Drama film creation and research	Drama Major	Organization convener, daily management of the organization
Chunjin Han	Female	About 35	Accountant	Department of Finance	Accounts, outdoor photography, and outreach work
Qipeng Zhu	Male	About 25	Student	Postgraduate student in Architecture	Professional writing

2.2 the Stage of Rapid Development: Cooperation and Reciprocity (2008.3.-2009.6.)

Table 4: Memorabilia of Tianjin Memory (2008.3-2009.6)

Time	Main events
2008.3.19	The organization changed its name to <i>Tianjin Architectural Heritage Preservation Volunteer Team</i> in preparation for the first Pass the Flame ¹³ .
2008.4	The organization conducted five surveys about the excellent historical building in Tianjin Financial City area and proposed a list of over 40 buildings that need preservation.
2008.5.27	The City Express newspaper in Tianjin published a newsletter about the organization.
2008.6.12	The organization was awarded in Pass the Flame. They also initiated and signed Beijing Proposal ¹⁴ with Ms. Zeng Yizhi.
2008.6.18	Beijing Proposal was published on China Cultural Relics News.
2008.8.3	Internal communication material Tianjin Memory came out.
2008.8.5	The director of the State Administration of Cultural Heritage, Jixiang Shan, gave an instruction on the appeal proposed by the organization and affirmed the organization.
2008.8.25	Tianjin TV broadcasted a film about the organization.
2008.10.19-23	An exhibition about the achievements made by the Tianjin residents in heritage preservation was held.
2008.11.1	The first China Cultural Heritage Protection Tianjin Forum was initiated and hosted.
2008.12.9	The weekly edited Tianjin Memory column was published in the Jinwan Economic Weekly.

At this stage, the organization formed ‘five-person core’ composed of Sen Mu, Qiang Zhang, Zhenliang Wang, Chunjing Han and Qipeng Zhu, and they were responsible for different works. Members recalled that the

¹³ A selection activity initiated and hosted by the China Heritage Conservation Foundation. The whole name is Pass the Flame — Outstanding Person of the Year for the Protection of Chinese Cultural Heritage (薪火相传——寻找文化遗产守护者年度杰出人物).

¹⁴ The Proposal to Strengthen the Preservation of Cultural Heritage.

organizational structure of this period was the clearest during the development¹⁵. The organization renamed for the award under the guidance of the new moderator Sen Mu, and it can be seen that the organization members have a tendency to change from the initial “self-transcendence” to “self-improvement”. In one event, Mu refused to let un-core members pick the experts and called the experts’ addresses ‘resources’, raising questions from members. The distrust among the organization's backbone accumulated slowly, and the ecological relationship of mutual cooperation began to break gradually. However, under the atmosphere of the organization's spurt, these were difficult to notice. And because of ‘unregistered, informal’ status, members thought it seems inappropriate for strict formal management. In a word, the formal management framework was not established at that time, foreshadowing the later contradictions.

The first written statement¹⁶ was issued, which stipulates the organization’s purpose, qualifications, restrictions and duties. According to it, all members were not required to pay any fees, and the organization didn't accept any gifts, funding, and sponsorship. It can be speculated that the organization does not have a stable source of collective funds. Actually, organization members still have to spend their own money and the organization's funding situation was not transparent. Due to firm intransigence, their relationship with the relevant government departments once entered a rigid phase. In terms of products, the internal publication, Tianjin Memory, came out and the organization brand ‘Tianjin Memory’ was initially established. The location of filming was more diversified, and the organization try to hold the exchange conference about Tianjin heritage preservation, which promoted the communication between scholars in the historical and cultural heritage preservation of Tianjin.

Finger 4: cover of the internal publication Tianjin Memory

This stage is the ascending period of the organization, which coincides with the rapid urban construction of Tianjin. It is likely for government to overlook the value of urban heritages at that time and the glory of Tianjin's memory organization is also created by the times.

2.3. the Stage of Differentiation: Parasitic and broken (2009.6.-2011.6.)

Table 5: Memorabilia of Tianjin Memory (2009.6-2011.6)

Time	Main events
2009.6.14	Sen Mu was awarded on the second Pass the Flam,.
2009.11.7	The organization held the second Tianjin Forum.
2011.1.22	Together with Tianjin Old City Website and Tianjin Old City Museum, the organization organized Association between Neighbors in Tianjin Old City successfully.
2011.6.-12.	Three issues of Tianjin Warm Neighborhood Association were organized by the organization, Tianjin Radio Traffic Channel and Hummingbird Tianjin Station successfully.
2011.6.11	Sen Mu, Qipeng Zhu and Qiang Zhang recorded program at Tianjin Traffic Station without permission from ‘five-person core’. Most of the members could not stand it and quitted from the volunteer organization.

When Sen Mu was promoted as the nominee, the conflicts within the organization began to be exposed. Text infringement and decision-making dictatorship further intensified the problem, and most of the members chose to withdraw from the organization. Sen Mu and Qipeng Zhu, two younger people of the ‘five-person core’, belong to the self-elevating type, while the other older cores belong to the self-transcendence type. Different values will inevitably lead to differences in the development concept. Sen Mu, who called himself the liaison, and Qipeng Zhu, who has architectural background, could hardly convince others with the professional knowledge. Instead, they used the resources accumulated by the organization as a self-developing capital and made profits for themselves, leading to the breakdown of the organization.

In the early stage, regular meeting, financial disclosure and prohibition of single line contact was concluded. However, these were not kept during this period, and many members thought that their trust was consumed and

¹⁵ Wang, interview.

¹⁶ Tianjin Architectural Heritage Preservation Volunteer Team Statement

had been feuding for a long time. Although there was no clear system, it is a psychological contract to support the operation of the NGO between intellectuals. This kind of psychological contract is subtle and implicit, which may not be recorded in words, and may not even be expressed verbally. Once a member or an outsider breaks the psychological contract intentionally or unintentionally, the consequences can be devastating.

With the expansion of influence, its activities were also richer. Cooperation with other organizations, more times of filming, conference and heritage protection incidents were organized. The organization got national award and was reported by powerful media.

Finger 5: organization photo in 2010

Finger 6: photo of the second China Cultural Heritage Protection Tianjin Forum

3.Current situation of Tianjin Memory: Reorganization (2011.6 to the present)

In recent years, there is a decline in organization activities, and its combination with the market has also been frustrated. For various reasons, the organization has not yet registered as an official NGO.

Table 6: Memorabilia of Tianjin Memory (2011.6-present)

Time	Main events
2011.6	The members who left the volunteer organization sum up their previous experiences and announced the formation of the <i>Tianjin Memory Cultural Heritage Preservation Team</i> (<i>Tianjin Memory</i> for short).
2014.3.23	The first filming event in 2014, followed by once a month.
2014.12.20	<i>Tianjin Memory</i> organized a lecture about the buildings in Japanese concession with other organizations.
2015.1.17	On the 7th Pass the Flame, <i>Tianjin Memory</i> won the title of Distinguished Team.
2015.6.15	Photo Exhibition of Huang Garden was held.
2016.3.16	Archives Culture Lecture Hall in Tianjin archives began in March.
2016.9.1	Crowdfunding plan of Gleaning Study lunched.
2016.10.16	The first hiking event: Tianjin memory, historical traversing
2016.11.4	Communication Between Cyborg and <i>Tianjin Memory</i> .
2016.11.5	<i>Tianjin Memory</i> attend the first Social Power Participation in Heritage Conservation Forum.
2017.4.29	Sharon about the protection of buildings in Japanese concession was held in Gleaning Study.

The re-established organization has made obvious changes in two aspects¹⁷. First, the attitude toward heritage preservation tended to be more moderate, and more attention will be paid to the intangible cultural heritage. They found that confronting with government was not effective. Therefore, *Tianjin Memory* wanted uncover the value of the distinctive culture in Tianjin, improve the general cultural awareness and stimulate civil concept of urban

¹⁷ Wang, interview.

The 18th International Planning History Society Conference - Yokohama, July 2018

heritage preservation. The second is that as a volunteer organization, they were often considered as cheap labor in the past. So the organization did not use the word ‘volunteer’ this time.

After the reorganization, Chunjing Han and Zhenliang Wang are still important organization members. Other members are also more diversified. However, it has to say that the management system has not been improved significantly.

The organization has realized the importance of stable funds and adopted a more open-minded attitude. Crowdfunding plans and business cooperation with enterprises were measures taken by the organization. In Gleaning Study project, through donations, salon activities, book transfers, and the customization and sale of handicrafts, profit is earned as finance. And the name of donators and the use of funds was publicized.

Tianjin Archives proposed cooperation with *Tianjin Memory* about Archives Culture Lecture Hall. A total of nine Tianjin cultural history scholars gave the lecture and more than 1,000 audience attended. It is the first time that audio and video broadcast software was used, nearly 4,000 people watched the live broadcast. From then on, *Tianjin Memory* had a larger platform to introduce their research.

Finger 7: photo of Hike in the City

Finger 8: photo of Archives Culture Lecture Hall

Figure 9: pageview of *Tianjin Memory* WeChat platform

Figure 10: thumb up quantity of *Tianjin Memory* WeChat platform

With the popularity of Weibo¹⁸ and WeChat¹⁹, the organization's platforms have also been established in 2011 and 2014. Its network power has transferred from the forum to the two platforms. By data statistics about its WeChat platform, it is found that there has been a trend of declining in the platform profile recently, which may be related to the decline of the platform's topicality and the solidification of the model. As the off line activities, the organization intended to establish a neighborhood group, a book and an exhibition for every historical block. However, only neighborhood group for Huang Garden was set up successfully. With different backgrounds of other historical blocks, *Tianjin Memory* encountered different problems in actual promotion.

Finger 11、 12: photo of Huang Garden exhibition and the message left by visitor(The message says:The Huang garden in memory.My wonderful childhood.)

Tianjin Memory strives to find a link unit and hopes to become an officially registered organization, but it has not yet registered as a formal organization. Its combination with the market is facing many problems, such as blindly giving and a serious violation of intellectual property rights.

4.Evaluation of Organization Capability

Table 7:Summary of the six factors in four stages

Stage \ Domain	Start	Rapid development	Differentiation	Rreorganization
Human resources	↑↑	↑	↓↓	↑
Structure and management	↑	↑	↓↓	↑
Finance	--	↑	↓	↑↑
Social resources	↑↑	↑	↓	↑
Products	↑	↑↑	↓	↑
Achievements	↑	↑↑	↑	↓
↑↑ rapidly rise ↑ rise -- essentially unchange ↓ fall ↓↓ rapidly fall				

It can be seen that in the different stages of development, different factors are more prominent. In the start stage, great importance was attached to the acquisition of resources(both in huaman resources and social resources) and the construction of the organization. It gathers the volunteers quickly and preliminarily determines the leadership core and organizational framework of the organization. At the same time, the organization strengthened the communication with the social experts to improve professional communication. In the stage of rapid development, the gains in products and achievements are enormous. The organization held many activities and established its own cultural brand. At the same time, the protection results are obvious and the influence is much higher. In the differentiation phase, the most obvious is the disintegration of the management and supervision system. Due to the lack of an effective management oversight mechanism, the spiritual contract between the members was broken, and the distrust between them slowly accumulated. At the same time, the opacity of funds has also led to further intensification of conflicts.In the reorganization period, the organization improved its management system and

¹⁸ Official Weibo of *Tianjin Memory*: https://weibo.com/tianjinjiyi?refer_flag=1005055014_&is_hot=1

¹⁹ WeChat Official Account: tianjinjiyi

human resources allocation. However, the organization's achievements plummeted, indicating that the organization's brand was scattered and its influence was not as great as before. Without timely transformation or adjustment, there would be a crisis of extinction.

Some particular deficiencies affect the capacity of *Tianjin Memory*. In terms of human resources, the leader shifted to the young Sen Mu in the fast growing period. But, his qualifications and experience were not rich enough to convince others, which led to the intensification of organization conflicts. Then, it is regrettable to say that a mature organization will focus on improving stability, control and efficiency at rapid development. Competent organizations tend to have effective management systems and regular development plans. Although the organization has begun to formulate some management systems, it basically remained in writing. This may be an important reason for its subsequent development to decline. At the same time, the lack of money management has increased the tension among the members. Meagre funds have also limited their operations. In terms of products, because of the lack of new ideas, the product's appeal has declined somewhat. Due to infringement and other issues, volunteers have been paying and it seems that there is no return. The cultural brand of *Tianjin Memory* was also damaged.

Figure 13: management system of *Tianjin Memory*

5. Conclusion

In view of the operation of *Tianjin Memory*, the author proposes the following strategies. Firstly, members should strengthen the knowledge about heritage preservation. Secondly, pay attention to the signing of regulations in the early stage of the establishment to protect the intellectual property rights and guarantee the brand identity. Advanced concepts of modern management should be used to restrain members. Thirdly, NGOs need to strive for a multi-channel source of funding and strengthen the management of funds. Fourthly, it is still necessary to strengthen exchanges with other urban heritage preservation NGOs. Fifthly, bring forth new ideas on activities to inspire people's enthusiasm in urban heritage preservation. Sixthly, try to cooperate with other organizations to carry out the research results and heritage protection ideas into the design and construction work.

Conservation of Memory Heritage through the artwork “Sea Present” painted by Shigeru AOKI

Ilji CHEONG*

* PhD, Prefectural University of Kumamoto, ilji00.asian@gmail.com

The scope of cultural heritage is beginning to extend to the modern era and holistically covers buildings and lifestyle. Using memory has become to be applied as one of the methods for conservation while it is usually used in short duration or just for one heritage. It is hardly ever extended to urban planning. In this paper, I proposed the memory project in Mera village and considered the collaboration among five sectors through three memories. The memory project became virtuous circle to produce community initiatives and new memories at the same time. And, I determined memory heritages through the changes of the relationship between the memories and the spaces. There was a possibility for memory urbanism too. Finally, I revealed the interaction and mediation among five sectors for the conservation of the museum of “Sea Present”. It said that the importance of realistic and balanced viewpoints with authenticity.

Keywords: Conservation, Memory Heritage, “Sea Present”, Shigeru AOKI, Community Initiatives

1. Background and purpose of the Paper

The scope of cultural heritage is beginning to extend to the modern era and holistically covers buildings and lifestyle. At same time, the evaluation and the conservation methods are becoming increasingly difficult. Usually, as conservation method, community initiative was used well. Cultural building and community have been a kind of package for it. On the other hand, using memory has become to be applied for conservation nowadays. Especially, to designate separated buildings as cultural heritage, memory is important to interpret plural histories and regard them as one layered area. For example, remnants of evacuation capital Busan have added to the tentative list for UNESCO World Heritage Sites in 2018 even some heritages are separated and intangible.

In the field of urban design, Dolores Hayden is a pioneer of memory project¹. She conducted creation of urban landscape through minority memory. Haruhiko GOTO conducted memory project through community initiatives². Aya KUBOTA determined the mechanism of memory concerned with heritage³. I will call memory heritage which a space is conserved with a memory (fig. 1).

On the other hand, the memory projects were usually used in short duration or just for one heritage. It was hardly ever extended to urban planning almost. In this paper, I focus on mechanism of memory project for the conservation of memory heritage. And, I also determine the potential of this method as memory urbanism.

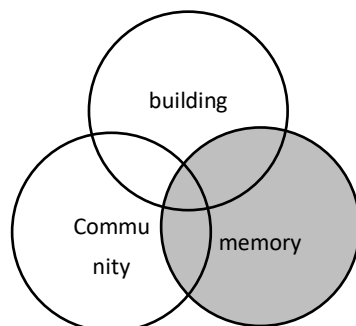

Figure 1: A scope of memory history which started from coloured zone

This paper focuses on the conservation project of the historic building through artist Shigeru AOKI and his artwork “Sea Present” in Mera village in Japan, which has been in progress since 2005 (fig. 2). It explores the process of the memory project for conservation of heritage and revitalization. The thesis is based on interview and reports of three organizations: NPO Museum, NPO Sea Present and NPO Awa.

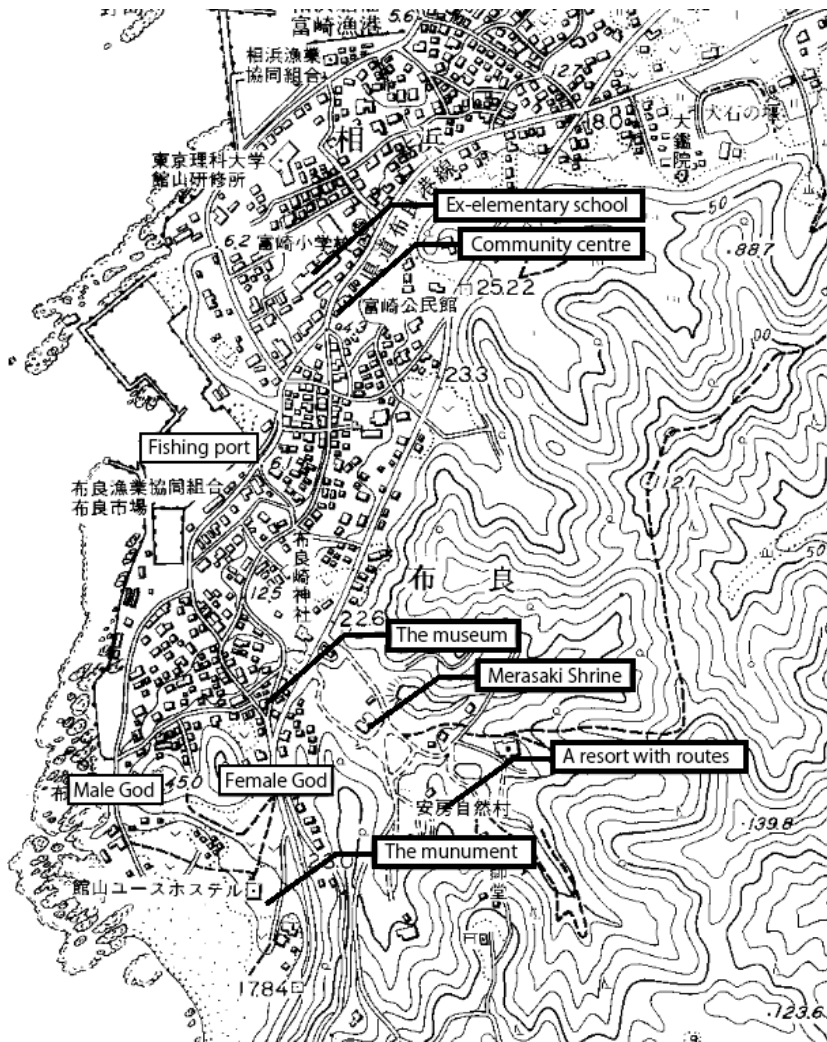

Figure 2: A map of Mera village

2. Introduction of Tomisaki village and organizations background

2-1. Introduction of Tomisaki village

The artwork “Sea Present” painted by Shigeru AOKI, has become the first tangible cultural property of western style. Shigeru AOKI visited Mera, a fishing village, in 1904 at the time of the Russo-Japanese War. AOKI was inspired by Japanese myths. Mera has been holy land of myths in local region. During his stay in a fishing house in the village, he drew “Sea Present”, which contains the mythical and scenic elements of the village. In 2016, the house became the Museum of “Sea Present”.

In 1962, 50 years after Shigeru AOKI’s death, the monument was built by artists, the mayor and the officers of Tateyama City with local residents. The Ishibashi financial group, which came to possess almost all of AOKI’s artworks, also donated 2500 dollars for the construction of the monument which was costed 6000 dollars⁴.

In 1998, the monument was almost torn down because it was situated on a national site. The residents of Mera initiated a campaign to conserve it. The owner of the house, where “Sea Present” was created, also joined the campaign. As a result of the campaign, Tateyama City started to pay a rental fee to the government and, thus, the conflict was resolved. The monument stayed on with the help of the residents.

2-2. Background of the conservation and initiative

Even Mera was big fish village, they could not fish anymore, because the temperature of the sea water became too warm. The population of the village has decreased to 1000 people, which is one-third the number during the Meiji era. The aging percentage is 47% in 2010s. When a kindergarten was closed down owing to a fewer number of children, two residents went to the NPO Awa Cultural Heritage Forum (NPO Awa) to seek counsel. One of the residents was a member of NPO Awa. At the time, NPO Awa had been involved in the campaigns for the conservation of War Heritage and Castle Heritage since the 1980s. With the support NPO Awa, the community revitalization of Mera began.

The exhibition of AOKI commenced in 2014 in the Bridgestone Museum of the Ishibashi financial group. The organizers of the project felt the potential of the “Sea Present” and the moment of it. In 2015, exactly 100 years after the birth of the “Sea Present”, a forum was held to celebrate and discuss the method of using monuments for revitalization of the village. At the forum, the owner of the house proposed the use of his house for the village. As a result, the scope of the project expanded to the house, too.

	Completion	1961 (Meiji36)
	Background	The monument was built by the mayor of Tateyama City along with artists and residents, 50 years after Shigeru AOKI died. This was done to boost tourism and revitalize the village.

Figure 3: NPO Museum, and NPO Awa. *The Monument of "Sea Present": The report for the conservation and the use of the museum of "Sea Present"*. [Tateyama: 2016]

	Completion	1860(Edo) and 1889 (Meiji22) after Kanto Earthquake
	Roof style	Hip roof, pantile roofing
	Floor area	92.7m ²
	Background	The house owners have been fishermen since Edo era. They were important leaders of the village. After the Kanto Earthquake, the house was rebuilt in 1889. In 1904, AOKI created the “Sea Present” during his one-month stay in the house. The plan of the early building included a dirt floor, which was the usual style in the village.
Open as museum	The museum was opened in 2016 and it opens on weekends.	

Figure 4: NPO Museum, and NPO Awa. *The Museum of "Sea Present": The report for the conservation and the use of the museum of "Sea Present"*. [Tateyama: 2016]

2-3. Background and activity of 2 organizations and Tateyama City

The organizers held many studies and events in order to persuade the residents of the village. In 2008, the NPO Conservation organization for the museum of "Sea Present" and the monument (NPO Museum) was established. This was constituted with the help of residents, artists, art critics, curators, and the Ishibashi financial group. The organization covers (1) the conservation of the museum and the monument, (2) PR activities, (3) community initiatives, and (4) the setting up of a conservation fund. NPO Awa, which assumes office, assigned a name to the house, giving it the title Tateyama Heritage in 2009.

Since the 2000s, two artists, who valued the “Sea Present” and Mera village so much that they often visited the house, proposed to sell it to them. The organizers of NPO museum were concerned about this as community initiatives would suffer if the house was sold to the artists. Therefore, they persuaded the artists to wait and divide roles among themselves, as a result of which, the artists established the organization: NPO Organization for “Sea Present” of Shigeru AOKI (NPO Sea Present) in 2010, the next year of the establishment of the community group, NPO Museum. They mainly collected funds for repairing the house and raised these funds through donations from another artist organization.

After 3.11 earthquake in 2011, it was difficult to collect funds. In order to raise funds, a homage exhibit of AOKI was held 13 times since 2012. NPO Museum and NPO awa also helped with the exhibit when it was opened in Tateyama.

Furthermore, the city exempted the museum from tax under the “Furusato local tax payment” system. The four organizations and Tateyama City made arrangements with the owner to discuss the conflicts among them. The five sectors include the local organization, the artist organization, the intermediary organization, the government and the owner.

Eventually, in 2012, the museum was repaired and opened.

	NPO Conservation organization for the museum of “Sea Present” and the monument (NPO Museum)	NPO Awa Cultural Heritage Forum (NPO Awa)	NPO Organization for "Sea Present" of Shigeru AOKI (NPO Sea Present)
Establishment	September, 2008	January, 2004	January, 2010
Members	It comprises representatives of the community, NPO Awa, and artists.	It comprises researchers and citizen activists.	It comprises artists and critics.
Action	Management of the museum and monument; Community initiatives; Generating funds; and Researching local culture	Conservation campaign; Community initiatives; and Tourist guilds	Collecting funds for museum repairs

3. Community initiatives with the memory

3-1. In the community

The residents did not believe in NPO Awa, who were from the next town, the owner of the house was not interested in the village revitalization at the time. Furthermore, the artists who valued "Sea Present" attempted to buy the house. Therefore, it was very important to consider the community and persuade them above all things.

In the 2005 forum, the organizers filled the panel with more residents than professionals (Chart 1). The pamphlet displayed the words “Sea Present, the pride of the village” and “local heritage to be passed to the children”. It is said that the organizers tried to cultivate the pride of the village and interest in the local heritage. Just after the forum, the owner of the house had a change of heart and decided to use his house for the village even without discussing it with his family.

The 18th International Planning History Society Conference - Yokohama, July 2018

In 2013, a forum on AOKI was held with professionals and residents. They discussed the origin and the characters' activity in the artwork. The residents claimed differently from the professionals. For example, the residents claimed that AOKI drew inspiration from the local festival, Merasaki Shrine, because of the artwork angle, whereas the researchers pointed that he was inspired by Awa shrine festival. The residents could suggest it because they knew full well about their village.

Chart 1: NPO Awa, *The member list of the 2015 forum panel: the pamphlet of the forum.* [Tateyama: 2005]

The representative of NPO Awa
The owner of the museum
The representative of Mera village and ex-captain of one ship
The local carpenter of ship
The local relieveo artist
The local essayist of Mera village

At the same time, many studies and events were conducted to enhance the understanding of the problems and potential in the village. The studies not only covered Medical problem, but also covered the local heritage such as AOKI, local food, and local song. For example, the participants made proposals for community revitalization by using local culture and AOKI. They learned their local food and local songs.

On the other hand, the son of the museum became the curator of the museum. He started to study his family history to interpret "Sea Present" (Fig. 8). He delved into his ancestral history. He revealed that his ancestors played a big role for modern fish industry, and he claimed that the fish illustration, presented by the principal of fishing university gave idea to AOKI. With NPO Awa, he also determined village history, that the village head made commune fund for the village and made an elementary school. He claimed the stable situation of the village for AOKI's stay and the birth of his artwork.

Furthermore, NPO Museum started a tour guide on AOKI and local culture in the village. Even the older bashful women of the village started to perform their traditional dance. They created a garden with a fence and the planted trees to reproduce the scenery seen in the artworks. Based on residents' suggestion of reusing the ex-elementary school, the lifelong education centre and the theatre were opened there.

Guide	- guide for tourists
Management of the museum	- display and guide of the museum - cleaning and gardening the site

Figure 8: The curator of the museum

Figure 9: The interpretation of the artwork and local festival

3-2. Outside of the community

There was a model of the AOKI museum. The house in which AOKI was born in Kurume was the first museum before the one in Mera opened. Kurume City bought the house and commissioned it to the community. In 2011, the members of the NPO Museum interacted with Kurume group and procured information. They attended events of Kurume and also asked for the funds.

NPO Museum and NPO Sea Present also interacted each other with the supports. They also tried to interact with the Ishibashi fund group consistently.

3-3. Three memories for memory project

There were three memories which have been used for the memory project. I will consider the methods and the effect of community initiatives with the memories.

First memory was AOKI's one. Organizers focused on AOKI memory with his artwork during his visit in Mera village. They tried to determine AOKI's interest and his characters to deepen the memory of his artwork, "Sea Present". They tried to interpret why AOKI came to the village, what he thought about the village, what point of the village gave him ideas for the artwork. Furthermore, the AOKI memory helped residents to have interests in the village memory and gain confidence with the village. It also helped artists to participate and collect funds. That is why putting the memory on a local textbook was proposed.

Second memory became village's one. They tried to pick up local scenery and culture of fish, food and festival to reveal what AOKI saw during his visit. At the same time, they revealed village history at that time. For community initiatives, the organizers paid attention that the representatives of the village became the main members of the project rather than the artists too. They also divided the roles between the residents and the artists. Through the participation of the residents, the interpretation of the memories became various and detailed. The residents picked out local points from the artwork and produced new points. These were possible as they became to have interest in their village memories.

Third memory was family history of the museum. The curator of the museum revealed how his ancestor could support AOKI for one month stay. The curator of the museum drew the family tree, which shows the three generations between the curator and the ancestor when AOKI visited the museum. Through these process, the owner of the museum got pride to study and to display family history such as certification, family tree and traditional doll.

4. Memory heritage

4-1. Relationship between memory and space

According to KUBOTA, there are four types of relationship between memory and space as (1) destroyed type, (2) survived type, (3) succeed type and (4) united type⁵. Survived one means the case which only the space remains. Succeed one means the case which only the memory remains. And united one means the case which both memory and space remains.

Only (2) survived type and (4) united type usually become designated heritage. However, (3) succeed type can provide the factor for conservation of the space. On the other hand, if there is not any memory, the space can be easily destroyed. Memory is an important factor for conservation and community initiatives.

Before the memory project in Mera village, the fish industry with the fish culture declined. These were (1) destroyed type (Chart 2). The closed kindergarten and elementary school were (2) survived type. The monument of "Sea Present" was also thrown away with weeds as (2) type. Even the food culture of fishing village was succeeded as (3) type, it was only succeeded by each family. There was not any cooking school at that time. Only the shrine has been used and conserved with village myths and local festival as (4) united one. On the other hand, the AOKI museum was a usual house at that time. The family has lived there for generations, so it was (4) union type. However, it was not memory heritage because no body tried to revive the house memory.

4-2. After community initiatives through memory

The organizers tried to think village memory and reuse empty buildings during memory project. As a result, not only the house was used for open museum, but also the elementary school was reused for lifelong education centre

and theatre (Chart 3). The community centre became to be used for cooking school of local food. Furthermore, one resort in Mera made memory route around hotel based on AOKI and one famous diver. I would call these cases as plurally united types. In the chart 3, (4) and (5) are memory heritages because they have both memory and space.

I verified that promoting village memory with community initiatives helped to reuse or use heritage with different program. These “memory heritage” were born, when the interpreted memories combined with existing spaces. Furthermore, these memory heritages show the potential as memory urbanism.

Chart 3: Relationship between memory and space

(1) destroyed type	(2) survived type	(3) succeed type	(4) united one
- the fish industry - the fish culture	- kindergarten closed and elementary school	- the food culture of each family.	- the Shrine - the house - the community centre

(1) destroyed type	(2) survived type	(3) succeed type	(4) united type	(5) plurally united type
-	- closed kindergarten	-	- the Shrine - the elementary school	- the museum - the community centre

5. Conservation of the museum

5-1. Designation of Tateyama Heritage

After the owner dedicated his house, its conservation campaign began with the monument. Keeping community initiatives in mind, the NPO Museum and the NPO Awa applied for the designation as Tateyama Heritage in order to cooperate with the city. The residents also asked for the designation and the conservation of the house. In 2009, the museum was designated as city heritage. In the city comment concerned with designation, the value of the house is not written about; only the academic aspect and the story of AOKI and the artwork “Sea Present” are mentioned.

5-2. Furusato local tax payment

NPO Museum and NPO Awa asked the city to support the conservation of the museum and treat it as city heritage. As a result, the City exempted the museum under the “Furusato local tax payment” system. Almost all the funds were donated in “Furusato local tax payment”.

However, there were some problems. The repair fee for a new house was not included in the corner of tax exemption. It was also necessary to collect funds for a new house, because the museum was too small for living and exhibit space. As a result, living space was excluded from the museum. In addition, there were no funds to repair the two buildings, the museum and the house. NPO Museum and NPO Sea Present determined to collect funds for the new house too.

5-3. Collecting the funds

NPO Museum and NPO Sea Present have tried to collect funds through a variety of ways. First, they tried to obtain funds through donations from the members of NPOs and citizens. Second, they tried to collect funds from the Kurume organization and the Ishibashi fund group through steady interactions with them. Third, they held events to collect funds. NPO Museum sold roof tiles and all the profits was donated to the conservation. In addition, with the help of a Korean Japanese collector, they made five copper relievos and put them in front of the museum of

"Sea Present", Kurume museum and three Korean museums. This also helps to collect funds. NPO Awa coordinated between the collector and relief artist.

NPO Sea Present has held a homage exhibit for 13 times. The artists created homages of the AOKI's artworks. The events were hold in galleries in big city. Only the exhibit in Tateyama was hold in small city and the residents also participated in it. One third of the profits was donated as funds. A sketch tour was also launched in Mera with the artists.

Finally, they were able to collect 280,000 dollars for the museum and 150,000 dollars for the house. The NPO Museum collected 76,000 dollars and the NPO Sea Present collected 154,000 dollars. Other artists donated 146,000 dollars. Tateyama City also supported the design fee. Alternatively, the NPO Museum used 200,000 dollars for community initiatives.

However, after the opening the museum, NPO Sea Present was dismantled and some of the members became the members of NPO Museum, which took over the management of the museum. In 2017, the Awa fund was established.

5-4. Repair and management of the museum

There were many discussions among five sectors: NPO Museum, NPO Sea Present, the owner of the museum, Tateyama city and NPO Awa. Formal discussion was hold by nine times⁶. One of the discussions titled "discussion of four sectors" except NPO Awa. However, NPO Awa also participated in these discussions as it intermediated the four sectors along with the office of NPO Museum. Therefore, they have been retained as one of the sectors. In this session, the discussions mainly focused on the repair and the management of the museum.

The main issue was about retaining an authenticity within limited cost. Because the museum was repaired extensively in 1889, just after Kanto Earthquake, the period of repair and restoration was big issue for them. The professionals and the city, wanted to restore the museum to what it was in 1860, when the museum was built with a characteristic dirt floor⁷. The middle plan of figure 11 shows the trace of the old style. However, there was not enough evidence and money for restoration. Furthermore, the spare was required for exhibits. As a result, it was repaired to the second period which the museum was rebuilt in 1889. It was referred in the middle and bottom plan of figure 11. Even the facade of the museum was considered important, only the facing wall was covered with square tiles and raised plaster because of the budget problem. At the same time, the possibility to restore to the first period later on was considered. For example, the base of the dirt floor was remained.

There were many discussions on the subject of display and management too. The biggest issue was maintaining a balance between museum's use of space for an exhibit and preserving it as it were at the time AOKI visited. Artists of NPO Sea Present wanted to retain the look and feel at the time of AOKI's visit. Hoewever, NPO museum wanted it to function more for exhibits. Eventually, only for the wall for exhibits were cleaned and if it is not necessary to repair or to rebuild, the wall and the post were remained.

The museum had exhibits of AOKI and "Sea Present" memory, family memory such as traditional dolls, and village memory such as sea map for fishing which were found out in the house (Fig. 10). It shows that the museum was not only for "Sea Present" but also for the owners and the residents.

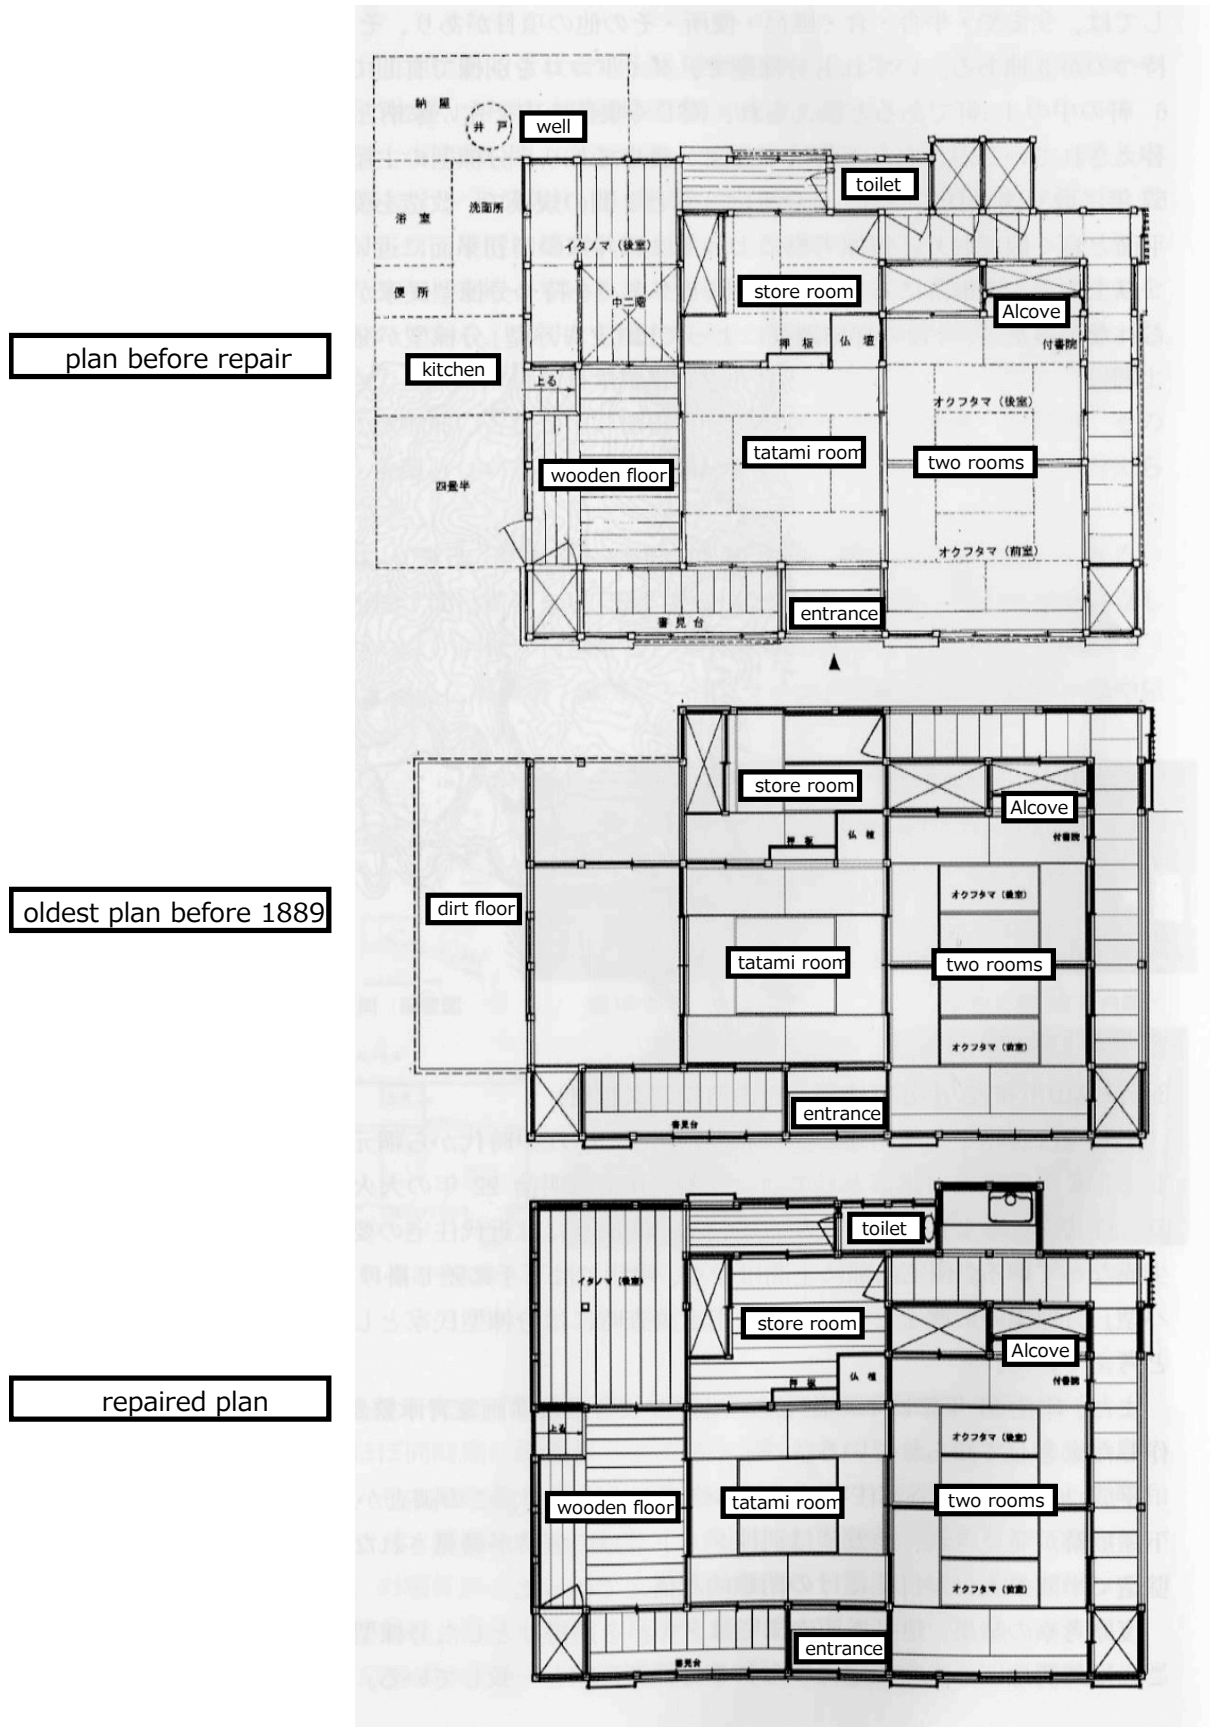

Figure 11: NPO museum and NPO Awa. *The plans of the museum: The report for the conservation and the use of the museum of "Sea Present".* [Tateyama: 2016]

6. Conclusion

I proposed the memory project in Mera village and considered the collaboration among five sectors through three memories. And, I determined memory heritages through the changes of the relationship between the memories and the spaces especially about the museum of "Sea Present".

6-1. Community initiatives with the memory

I considered the methods and the effects of community initiatives with the three memories: AOKI memory, village memory and the family memory of the museum. Memory helped residents to get confidence and interest in another memory. Finally, the memories became various and deep. The memory project became virtuous circle to produce community initiatives and new memories at the same time.

6-2. Memory Heritage

Through the memory project, various memory heritages were produced. Before the project, there were four types of the relationship between memory and space. There were only three cases which the memory and the space were united as memory heritages. After the project, three others were produced as another memory heritages. Sometimes, through the union between new memory, the existing facilities changed to plurally united one. Furthermore, memory routes were conducted with memory heritage. This shows the potential as memory urbanism. To conduct memory urbanism, it is better to consider an area plan during memory project.

6-3. Conservation of the museum

There was hot controversy over the conservation of the museum between five sectors. I considered how five sectors cooperated and mediated each other. Each sector claimed their own opinions. NPO Awa interacted and mediated them through impartial and realistic viewpoints on the problems: collecting the funds, repair and the management of the museum. This role of arbitration gives hint for the conservation of cultural heritage. It says that the importance of realistic and balanced viewpoints with authenticity.

Mapping and placemaking from the perspective of cultural field: the three historic sites of the western Han Dynasty in Hanzhong

Chao Chen*, Yunying Ren**

* *Lecturer of urban and rural planning department, Xi'an University of Architecture and Technology, 513114738@qq.com*

** *PhD, Professor and director of urban and rural planning department, Xi'an University of Architecture and Technology, renyunying@hotmail.com*

Recently, in the context of China's policy of vigorously developing the assertive culture confidence, the value of traditional culture has been re-recognized by the whole society. However, due to the unbalanced development of China's eastern and western regions, the value of cultural heritage is not valued in the western region. Hanzhong district in Shaanxi province, belonging to the intersection of the south and north, has its own unique natural and cultural environment. The three historic sites of the western Han Dynasty are located in the city centre of Hanzhong, and as the historical heritage of Han culture, it has been hesitant between protection and development for many years. On the one hand, this paper tries to introduce the concept of "field" into the protection of cultural heritage, by constructing the cultural field model and using the cultural field to explore the question of historical heritage activation. This article, on the other hand, by expanding the mapping function, using the method of mapping defined the three historic sites of the western Han dynasty culture field research scope and the elements, combing extracted place identity, controlling the space boundary of place and for placemaking, and proposing an operable strategy and approach.

Key words: Cultural field; place identity; mapping; placemaking; the three historic sites of the western Han dynasty

1. Background

Lewis Mumford commented that "a city is a concrete and authentic record of human culture." A city is the symbol of histories and culture of a place, so it has distinct feature of regional culture. Redevelopment an old city by respecting history is supposed to be basic rules to be observed in the course of urban planning and construction¹. Today, as China government make a firm cultural confidence, the values of traditional culture are gradually recognized by the whole society. However, as a result of development imbalance existing between the east and the west of China, west areas generally neglect historic and cultural values of cities. Even worse, some people consider traditional historic blocks or even cultural relics and historic sites as a barrier in economic and urban development. In the course of urban renewal, those ancient urban areas with cultural characteristics and hundreds of years' history vanish after a thorough transformation, or difficult to sustain. This leads to imbalance between cultural development and urban development of local places, mismatch and imbalance between urban cultural supply and demand and similar problems. Such problems are mainly reflected in participants' inadequate recognition of the values of historical and cultural heritages, fragmented memory of local cultures and complicated definition of boundary. The reason lies in the participants' unclear cultural identity toward historical and cultural heritage, which leads to lack of place identity, loss of local features and senses.

2. Construct Model of Cultural Field

According to the theory of field, every behavior of participants is affected by the field where the behavior occurs. A cultural field is a collection of movements of cultural factors. In a cultural field where cultural heritages occur, participants' physical behaviors become a factor that cannot be ignored and their psychological behaviors are also affected by many factors. In this paper, the author tried to introduce the concept of "field" in the protection of cultural heritage, construct a model of cultural field (Table 1) and discuss about how to achieve flexible use of historical and cultural heritage of urban from the perspective of the cultural field.

2.1. The Concept and Theory of Field

Based on the objective structure of society, French sociologist Pierre Bourdieu put forward the concept of “field”, which means “a social space that works as per unique rules”ⁱⁱ and studied social cultural activities through three interconnected concepts, i.e. field, capital and habitus. A field is relatively independent and defines its boundary through its unique rules. “Capitals” mentioned by Bourdieu is classified into three categories, namely economic capitals, cultural capitals and social capitals. While habitus is pertaining to individuals in the social structures, i.e. behaviors of participants. The participants perceive and grasp social conventions and internalize them into their minds and behaviors, and the mind and behavior settings in turn affect the field where the participants are.

Meanwhile, a field exists objectively. Stan Allen¹ pointed out in his paper *Field Conditions* that “field gives a form to things but it lays particular stress on the form between things instead of the form of things themselves” and that “a field condition could be a matrix of any form or space and the matrix can contain various different elements and respect their respective characteristics”. And, a field is “defined by complicated and concrete connections”ⁱⁱⁱ. Which shows that a “field” is a structure without a clear boundary freely organized internally but orderly connected, and a “field condition” manifests characteristics of the field. Historical and cultural heritage is mainly a urban context of “field condition”.

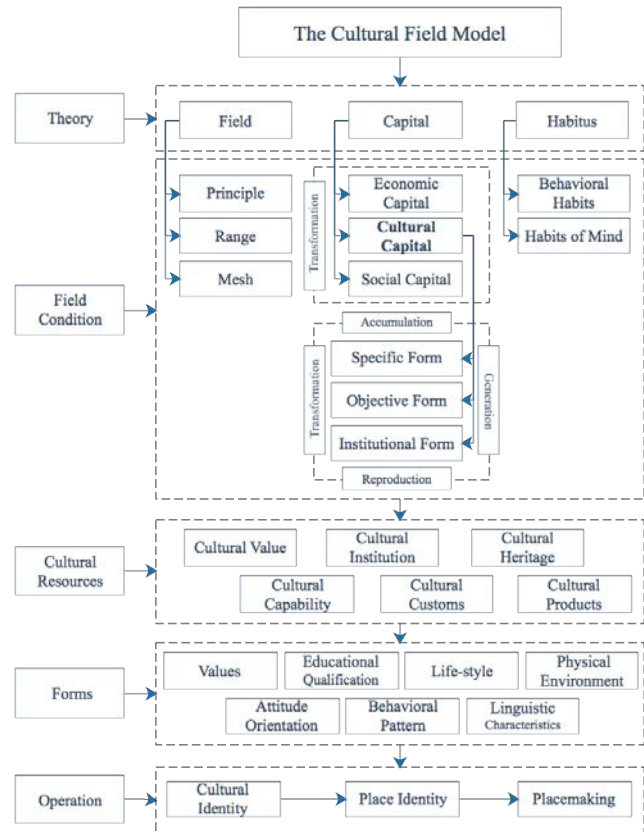

Table 1: The cultural field model

2.2. Cultural Field Condition

Every kind of culture has its own cultural field, which is composed of a series of values, ideas, attitude orientations, behavioral patterns and life-styles. A cultural field is open without definitive boundaries and forms in the course of interaction with other fields. It absorbs nutrients beneficial to its development from other cultural fields and makes them a part of it. In a cultural field, economic capitals refer to economic power of the cultural field; social capitals relate to population, the form of social organization and the like; cultural capitals refer to the attraction of perceptions, beliefs, values and cultural patterns. Cultural capitals are accumulated with time and labors and are manifested in physical, concrete and institutional forms; besides, they have a potential to earn productive profits and can realize reproduction of it^{iv}.

2.3. Cultural Resources and Forms

Bourdieu believes that, “cultural capitals is a sum of all cultural resources, including cultural customs, cultural capabilities, cultural institutions and cultural products and is reflected in forms of people’s educational qualification, behavioral pattern, linguistic characteristics and life-style.” Each city is an organic regional society and a specific cultural cluster. Culture of a city is characterized in both diversity and coherence. In the cultural field model, cultural resources include cultural values, cultural institutions, cultural heritage, cultural capabilities, cultural customs, cultural products, etc. Cultural forms include values, educational qualification, life-style physical environment,

¹Stan Allen, Dean of School of Architecture of Princeton University

attitude orientation, behavioral pattern and linguistic characteristics. As a symbolic system, urban physical environment has complicated and diversified senses. Cultural heritages, as historic physical environment, constantly convey rich historical and cultural connotations to people.

3. Operation Method

Field has inherent characteristics of a global concept formed by individual collections. The simplest field state is numerous existence of juxtaposition. In urban and architectural design, the numerous “existence” gives a spiritual shock, and symbols formed by field imply a certain context. We need to pay attention to large amounts of information about field, and the most essential physical information includes soil, bed rock, hydrology, historical value, animal and plant. This information not only provides cultural symbols which stimulate inspiration but also is used for architectural and urban development, from which we obtain inspiration and benefits. Based on the cultural field model, this paper researches the cultural elements through mapping with regard to historical and cultural heritage, and summarizes field characteristics from cultural identity to place identity, and placemaking.

3.1. Cultural Identity

Under globalization, culture transformation presents two distinct trends: non-territorial culture expansion and local cultural reconstruction^v. Culture is not only a local symbol but also the historical origin and base for identity formation of the individuals and ethnic groups. Identity is the premise of existence. Cultural identity refers to ethnic group identity. Historical and cultural heritage is one of important resources which the cultural field relies on, and is embodied by habitus in participants’ bodies, thoughts and life. It is evitable that one cultural field which affects or threatens cultural existence will affect and threat cultural identity of group members in the fields. Culture is a capital which can be converted into more economic capitals in practice so as to guarantee self-growth and continuity. Hence, it is very necessary to determine the concept of capital within the context of historical cultural heritage resources so that we can further recognize surface meanings of local traditional culture and form self-awareness for development and utilization. Cultural identity actually refers to local context summarization.

3.2. Place Identity

In 1983, Roshansky et al. introduced the concept of identity into environmental psychology and thought that it corresponded to social identity. Place identity^{vi} (Table 2) may be extended to object, thing, space and place, and refer to interaction of the individuals or groups in the places. This type of special socialization includes feelings, perception, cognition and other complex processes. Based on this process, the individuals and groups are defined as a

	Characteristic	Representation
Place identity	Cultural identity	Historical context, historical event, figure, protection and inheritance of local culture and cultural landscape, folk custom and local culture of festival
	Environment identity	Geographic location, natural environment, climate, life convenience, perfection of amenities, folk custom, social order and residential satisfaction
	Distinguishing	Resident’s sense of honor and superiority, local characteristics, identification and place memory
	Place dependence	Sense of belonging, psychological meaning, location and emotional attachment
	Self-efficacy	Individual life, daily demand, sense of security, stability and relaxation
	Commitment	Contact and relevance between people and place

Table 2: Characteristic of place identity

part of a certain place^{vii}, so as to establish the position and role in the society depending on place^{viii}. Under this context, place is no longer just a physical background for human activities, but a part of self-identity^{ix}. In other word, place identity is a part of self-identity and is developed from the nature of unique element and interaction between people and place^x. However, place is interpreted as site in a narrow sense and as land or context in a broad sense. So, place identity is sometimes called urban character, neighborhood character or local character. Place identity refers to a general item of elements of a certain place, and is the origin and vitality of place formation, continuation and development. These elements are formed through long-term evolution and combination, including region, path, building, space, fabric and other physical elements and possibly including human elements such as certain type of population or certain behavior or activity. The fundamental of planning and design is to explore the stable and orderly structure among these elements^{xi}.

3.3. Mapping

“Mapping” is originated from surveying and mapping, and expresses the concepts of drawing, mapping and plotting. James Conner created the operation system of “mapping” in landscape design^{xii}, and more emphasized that “mapping” is a design method appropriate for regeneration. Within the range of cultural field, the original intention of planning and design is to discover and guide actual usage requirements for the fields. Usually, field characteristics cannot be rapidly and effectively captured through traditional field survey in general. In any physical environment, discrepancies may exist between the intent of its design and how it is actually used. Behavioral mapping can be useful to help identify underlying patterns of participant movement and behavior within a given environment. It helps the planners and designers to discover current inherent laws and form place identity which achieves common cognition, effectively improve the current space during planning and design, promote overall design from bottom to top. It can be extended that mapping is an effective way of information visualization. For a field of a larger scale, we may carry out visualized research with big data to conduct objective data verification.

3.4. Placemaking

Based on cultural context and regional characteristics, the planners and designers establish the relationship between people and field, between behavior and space and between nature and artificial environment through analysis on building, site and environment elements. In general, it is impossible for us to fully understand the status quo in a short time by using traditional work methods, and we only superficially analyze current problems and internal relations, which leads to that design is disconnected from the reality. In addition, the place-making method is a set of logical methodologies of “observation-discovery-analysis-resolution”.

Specific analysis methods include people-oriented analysis, multi-scale and multi-level analysis and comprehensive sensitivity analysis. Specific steps for place-making include: construction and analysis of basic network, expectation and perception description, mapping analysis, questionnaire analysis, composite mapping overlay analysis, identity image, comprehensive layout and design interference measure.

Placemaking is a multi-faceted approach to the planning, design and management of public spaces, such as cultural heritage sites. Placemaking capitalizes on a local community's assets, inspiration, and potential, with the intention of creating public spaces that promote people's health, happiness, and wellbeing. It is political due to the nature of place identity. Placemaking is both a process

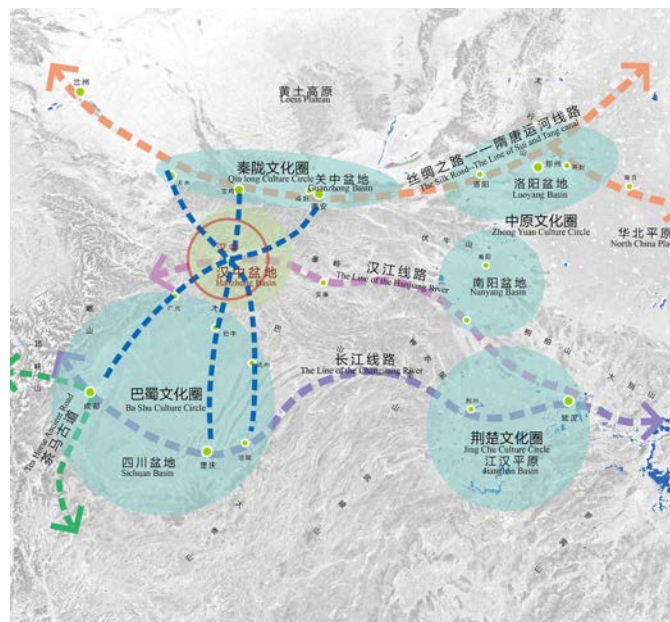

Figure 1: Cultural location map of Hanzhong

and a philosophy.^{xiii}The target of placemaking is to establish or rebuild place spirits^{xiv}.

4. A plan of the three historic sites of the western Han Dynasty in Hanzhong

Between the Qinling mountains and the Bashan mountains, Hanzhong district in shaanxi province is located in the west of China, belonging to the intersection of the south and north, has its own unique natural scenery and cultural history environment (Figure 1) . The three historic sites of the western Han Dynasty are located in the center of Hanzhong, and as the historical heritage of Han culture, it has been hesitant between protection and development for many years.

According to the model of cultural field, the author assimilated local culture of Hanzhong to an organic cultural field with the method of analogy. Specifically, psychological behaviors of participants are habitus; influencing factors of habitus are capitals of the field; such physical environments as historical blocks and architectures of the three historic sites are the core capitals of the cultural field; habitus and capitals interact with each other and jointly make the field work. The author introduced basic concept and working mode of cultural field and investigated current situation of the three historic sites, expecting to find out influencing factors for flexible use of the historic sites, make coherence of environmental image, ecological greening, physical and psychological behaviors, and make the classical theory of people-orientation and spirits of place the basis of placemaking.

4.1. Situation

The three historic sites mainly include Guhan Altar, Baijiang Altar, Yinma Pool and their surrounding areas, It covers an area of about 80 hectares.Using big data and mapping methods,such as average population density in Hanzhong city (Figure 2),it is clear that although the three historic sites are located in the city center, the vitality is very low.Furthermore, Guhan Altar is a provincial cultural relic protection site, which covers an area of approximately 1.37 hectares. It is now a local comprehensive history museum which starts to take shape with diversified styles of architectures after several repairs. Baijiang Altar is also a provincial culture relic protection site, which covers an area of approximately 0.73 hectare.It occupies a large area and is separated from surrounding areas by fences, so it is

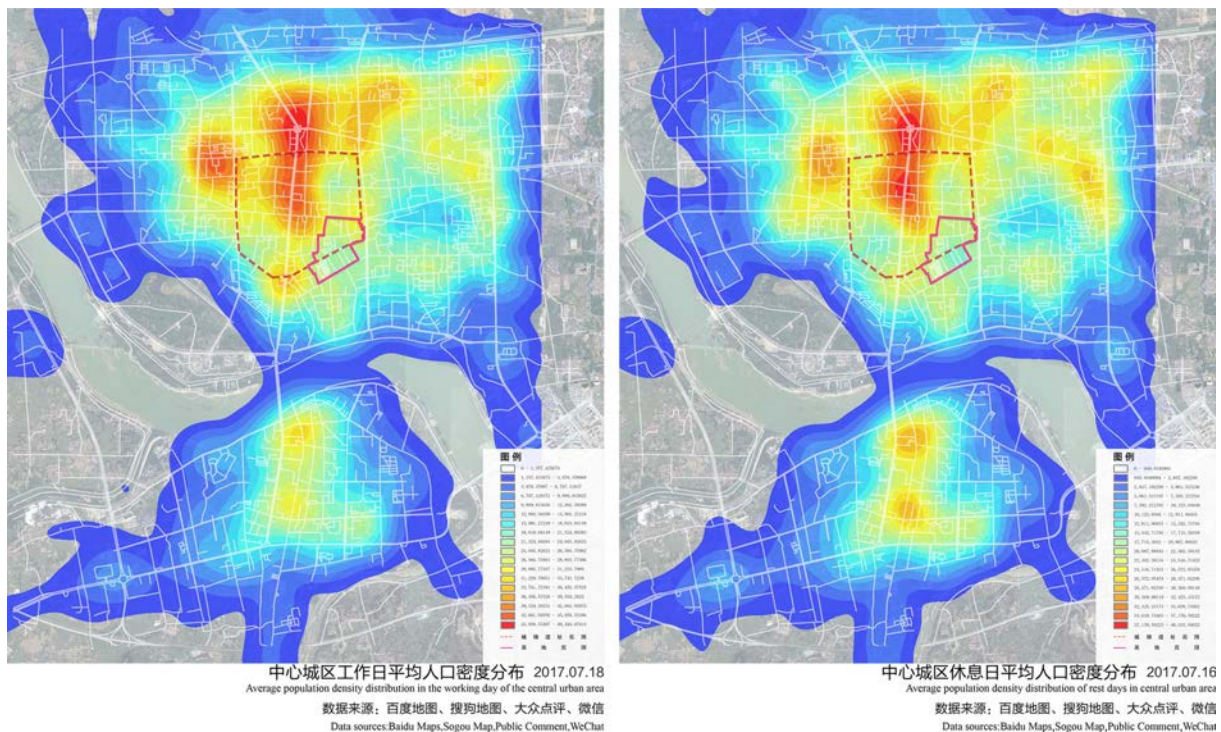

Figure 2: Mapping of average population density in Hanzhong city

generally enclosed. Yinma Pool is a municipal culture relic protection site, which covers an area of approximately 1.21 hectares. It is generally well-conditioned, but ancient city walls, Santai Pavilion and Longshen Temple disappeared, surrounding architectures and environment need to be improved. There isn't an open landscape vision. As historic and cultural blocks, their surrounding area cover a area of about 6.78 hectares, a protection area of about 31.64 hectares and a supporting area of about 40.44 hectares. It can be seen that the boundary relationship between the three sites is complex, and it is difficult to determine a reasonable research scope (Figure 3).

Figure 3: The boundary of the three historic sites of the Han Dynasty

With the city wall site of the Ming Dynasty was discovered, cultural resources and information cross with each other in the whole area, it's hard to distinguish the primary and secondary cultural resources and information. Through behavior mapping of current participants, it found that the three historic sites work independently at present without any connection in terms of functions and transportation. As a museum, Guhan Altars relatively enclosed with independent functions; as an enclosed park, Baijiang Altar is not adequately lively; Yinma Pool remains in resting status; the T-shaped historic streets lacks adequate protection generally and traditional folk business activities declines day after day; position of city walls of the Ming Dynasty in Hanzhong is clear and distinguishable, as some multi-floor buildings were built orderly on the demolition position in 1980s, which is different from

surrounding area with low buildings. After mapping existing condition of the three historic sites, we made the following conclusions: ① slow-moving traffic system is missing, transportation system is not perfect; ② There are not adequate public service facilities, public places and open spaces; ③ Continuity of local culture is still weak; ④ Quality of physical environment is inferior. It is necessary to repair the spatial texture.

surrounding area with low buildings. After mapping existing condition of the three historic sites, we made the following conclusions: ① slow-moving traffic system is missing, transportation system is not perfect; ② There are not adequate public service facilities, public places and open spaces; ③ Continuity of local culture is still weak; ④ Quality of physical environment is inferior. It is necessary to repair the spatial texture.

4.2. Identity

Hanzhong area has its unique local culture in long-time social and historical practices, which is an important distinguishing characteristic. Historic city that remains in Hanzhong is a special mark of it, and is also what local culture survives on. This kind of local culture can be classed as cultural capital according to classification of field capitals proposed by Bourdieu. A collection of local historical and cultural heritages are special cultural capitals of Hanzhong area. In certain conditions, they could be converted into economic capitals and social capitals. To tap the potential, they must be connected with a certain field and form a special cultural field. In other words, it is necessary to construct a structure of historic city area of Hanzhong centered in the three historic sites and connected with the city wall

Figure 4: The structure of the historic district of Hanzhong city

ruins of the Ming Dynasty (Figure 4). In this process, we sorted local cultural elements of Hanzhong with mapping method. As an important resource in the cultural field and a physical environment of the city, traditional historical culture commercialize cultural resources in the cultural field through spatial production behaviors; connected with consumption, they initiate consumption behaviors and bring economic benefits, in which way, conversion between different kinds of capitals are finished.

As the core of ritual thought, the LI-YUE system originates from the Zhou Dynasty, and flourished in the Han Dynasty, together with the political and legal system forms the whole social system of ancient China and has a great impact to the politics, culture and arts afterward. And that is why China is called the Country of LIYUE. After studying local culture and cultural inheritance, it's not difficult to find that in the local cultural field of Hanzhong, the three historic sites of the Han Dynasty and surrounding areas are the most representative local cultural resources and physical environment. Guhan Altar and Baijiang Altar are both spaces constructed under the influence of traditional ritual system. As time passes, special folk liveness forms in surrounding T-shaped streets; however, it declined day after day in recent years as a result of lack of protection measures. Hence, we believe cultural identity of the place should be defined as ritual and liveness. Ritual represents the classical elite culture with sense of order and sense of ceremony, while liveness represents harmonious, natural grass-roots culture. The place identity may be defined as LI-YUE symbiosis. The three historic sites of the Han Dynasty, as a cultural center of the city, take both tourism and city life into consideration. It a center where people may experience diversified local cultures.

4.3. The strategy of placemaking

Based on the place identity of LI-YUE symbiosis, we put forward the strategy of placemaking: all parts are connected with each other and greenways are designed based on natural conditions; establish the axis LI and axis YUE, it is well protected and modern life is well guaranteed.

All parts are connected with each other and greenways are designed based on natural conditions. First of all, a large ring of local cultures – a recreation system around the main urban area – could be built. Hantai District is positioned as an experience center of Hanzhong culture. Various cultural resources of the city radiate from the center of Hantai District, in which way, cultural development of surrounding districts and counties is driven efficiently and comprehensively. The city highway ring serves rapid traffic, and national highway ring serve slow traffic and tour. Secondly, a middle ring of traditional culture is built. Specifically, it is suggested that a heritage park should be built on the position of city walls of the Ming and Qing Dynasties, the city and rivers should be well connected and a demonstration urban reaction and slow traffic system should be constructed. By building up a city wall heritage park, connecting cultural relics inside and outside of the ancient city and creating a slow traffic system for the purpose of ancient city experience, it is able to recover and highlight pattr of ancient city, expand public spaces of the city and improve people's identity and experience. Last of all, a small ring for local culture experience is built. The three historic sites are connected to maintain liveness of the city; a slow traffic system is

Figure 5: The small ring of the three historic sites

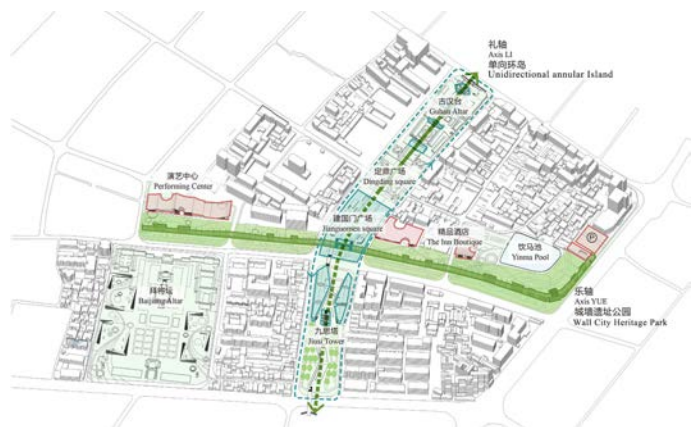

Figure 6: The LI-YUE axis of the three historic sites

built to connect main spatial nodes and public buildings; activities with local features are devised to create liveness experience(Figure 5).

Establish the axis LI and axis YUE, it is well protected and modern life is well guaranteed(Figure 6). Firstly, we should uphold traditional Chinese rituals and facilitate tourism. It is suggested that ritual architectures of Guhan Altar should be repaired and the traditional axis should be maintained; fences should be demolished to reshape background and foreground spaces of Baijiang Altar; the landscape of Yinma Pool is expected to be repaired and Santai Tower is to be recovered roughly to create an open space for the portal of the area. Secondly, the ancient city and city walls should be recovered. We should express pattern of the city walls and recover spatial pattern of the city walls of the Ming Dynasty in structure. It is suggested to devise display spaces, experience spaces and recreation spaces by taking the demonstration section of middle ring – the heritage park of city walls of the Ming and Qing Dynasties – as a carrier. Thirdly, roads need to be upgraded and cycle tracks should be offered. Roads are criss-crossed, graded and made denser; cycle tracks and footpaths are offered to create a slow-traffic system. Finally, heritages and liveness of daily life should be well protected. We should protect intangible cultural heritage successors and create a space where people live harmoniously; we should also make up daily life circles and activate occasional life circles.

5. Conclusions

“Field” originates from the idea of “social space” proposed by Pierre Bourdieu. It is a network in which there are objective relationships between all positions. Its nature depends on social position of each person and living functions of the space^{xv}. Without the sense of history and the attribute of culture of “cultural context”, it represents natural daily life. Being different from “environment” we usually care about, it stresses on the relationship between individuals in built environment or even milieu which is broader and more active. Basing on the naturalness of life represented by the “field”, planners and designers well explain sociality that they care about, space-time makes sense, people are valuable and splendid stories are told in the cultural field. The author drew the following conclusions: firstly, cultural field model can mark boundaries of historic blocks intuitively and concretely from a cultural perspective; secondly, to create a culture field for historical heritages makes for value identity and field identity of heritages; thirdly, as a technical and strategic research tool for research of historical heritages, mapping can not only help to find out internal connections between elements within the cultural field, but determine place identity in a more objective way by extracting cultural information and rebuild cultural connections through placemaking. Theories and practices discussed in this paper can help us to well know values of cultural heritages in historic areas, effectively enhance cultural inheritance and innovation and have positive significance in placemaking of historic blocks. There are still some troubles to be discussed. As a “public product”, historical cultural heritage needs involvement of stakeholders, but it’s hard to find a way out of the dilemma between protection of private equity and protection of public interest; protection of historical cultural heritages is a responsibility of both local residents and citywide citizens; to protect historical cultural heritages is to protect public interests, so high-level culture identity should act as main impetus for involvement of citizens, in addition to property right protection; as a deep-level variable, local culture has an impact on behavioral selection of the relation “government – market - society” and has the functions of building up social values, reconcile social conflicts and guide social development.

Acknowledgements

The writer wishes to express his most sincere appreciation to Prof. Zhang Pei, who read the manuscript carefully and gave valuable advice. Tremendous thanks are owed to Ms. Fang Minjie and Wu Hanru for helping me with the figure sort out. The writer is also indebted to BA studio for offering the case.

Disclosure Statement

No potential conflict of interest was reported by the author.

Notes on contributor(s)

The first author is, PHD student of Urban design and history, visiting scholar at the international art city in Paris, lecturer of Xi'an University of Architecture and Technology, core teacher, deputy director urban planning section,urban and rural planning department. He is mainly engaged in urban and rural planning history and cultural

heritage protection, urban design and regional architecture research. His research fields included development and planning history, urban regeneration, space justice. Since work, He has published over 10 academic papers, presided and participated in more than 10 research projects and 40 project of the planning and design, and won more than about 15 award in scientific research, teaching and working.

Second author, PHD of history, national registered planner in China, professor and director of Xi'an University of Architecture and Technology, academic leader, chairman of urban and rural planning department. She is mainly engaged in urban and rural planning history and cultural heritage protection, urban planning and design, ancient Chinese city studies, historical urban geography, urban morphology and other research. She is the managing director of Chinese ancient capital society and member of the China branch of international morphological society. Since work, she has edited and participated 11 books, more than 70 academic papers, presided and participated in more than 20 research projects and 70 project of the planning and design, and won more than about 10 award in scientific research, teaching and working.

Thousand-Hectare Metropolitan Playground: Visions for Johannesburg's Gold Mining Belt

Dorothy Tang (MIT)

Throughout the history of Johannesburg, the gold mining belt that spans the heart of the city has been depicted as an empty swath of land. However, the ownership structure of the mining lands obscured underlying forms of urbanization related to mining activity, including industrial complexes, employee villages, and miners' compounds. Johannesburg's economic reliance on gold extraction has left a legacy of racial conflict and environmental crisis, and apartheid-era planning practices used the mining belt as a buffer for racial segregation and reinforced spatial disparity of the city. With the decline in gold reserves since the 1960s, mining operations have ceased, leaving behind a vast industrial brownfield site ripe for redevelopment. A socially progressive design collective at Rand Mine Properties led by Ivor Prinsloo from 1968-1971 conceived of a vision to convert this landscape into a large site for recreation—a playground for Johannesburg. As a former assistant to the Smithsons and later Candilis-Josic-Woods, Prinsloo believed that the mining belt should be a site of reconciliation and social integration rather than separation. He assembled an inter-disciplinary and multinational team of architects, engineers, landscape architects, and planners to address the complex challenges of the mining landscape. His hope was that it would emerge from the stigma of dereliction to one of health and wellbeing, and entertainment and recreation. While never fully realized and despite the appropriation of certain projects for commercial interests, this vision for the mining belt persists in the planning imaginary of Johannesburg today.

This paper traces the genesis and legacy of Prinsloo's utopian vision in the conversion of the mining industrial complexes into a heterogeneous urban mosaic of leisure, housing, infrastructure, and industry. In particular, Gold Reef City and Shareworld, both amusement park complexes, demonstrate how the vision of a playground is used selectively to legitimize conflicting political claims and planning endeavors. This landscape embodies the paradoxical interests of neoliberal urban governance and the mandate for racial justice in post-apartheid Johannesburg.

Imagining a Meshwork of Urban Nature – Lawrence Halprin and Panhandle Parkway in the San Francisco

Meng-Tsun Su (National Chiao Tung University)

The concept of mobility conveys two important aspects of the cultural landscape – the ability to move and the condition of displacement. Through the lens of mobility I will investigate Lawrence Halprin's involvement with the San Francisco urban freeways between 1962 and 1964. I will argue that these urban freeway projects demonstrate Halprin's first attempts to mediate between the discrepancy in rootedness and drift, preservation and development, and the ordinary and the extraordinary. Halprin believed in the civic value of large-scale urban design. Freeways could act as catalysts in the transportation system not only to channel traffic flows but also to cultivate a lively, occupiable urban environment.

Halprin saw urban freeways as socially significant and integral to the urban fabric and thus pushed for an urban redevelopment that was integrated with the structure of highway. Despite the San Franciscans' revolt against highways, he proposed various solutions—elevated, suppressed, and tunneled roadways together with layered multi-use developments of parks and apartments—to “mesh the highway with the city.” The urban spaces created by existing highways could be transformed from marginal sites to performative venues. These were strategies and tactics to invest urban freeways with social and political purposes beyond engineering and transportation.

Halprin believed in facilitating and accommodating social mobility of the postwar San Francisco through transportation infrastructure. Many redevelopment sites where he and his colleagues involved with, however, were blamed for the large-scale clearance and dislocation of minority residents. Highway construction that were consciously linked to these sites was highly contested and subject to vehement opposition. The social drama have furthered his theoretical emphasis on participation, community, and collective creativity in the late 1960s. While the caveats of the redevelopment efforts add dimension to the lessons of mobility, these open strategies suggest alternative ways of building, occupying, and moving through cities.

Contesting Urban Authenticity on a Global Scale: Heritage, Regeneration and Redevelopment in Singapore and Tokyo

Jiewon Song (National University of Singapore)

In our urban century, cities are more and more connected. Correspondingly, urban ideas and strategies have traveled as well as shared across borders not limited to nations but cities. Cities in Asia are no exception as they are connected to the circuits of global capital and cultural circulation. At the same time, there are super-national heritage policies developed by international institutions, i.e., ICOMOS and UNESCO that tend to turn the local heritage conservation praxis into their playing field. Urban redevelopment is increasingly inviting the conservation and management of heritage as a vector of place identity to distinguish one place from another place that is now a global phenomenon, known as heritage-led regeneration. It brings the combined effect of global urban and cultural strategies into the ground of urban redevelopment. Here, economic globalization is a key driver, which has changed the roles of heritage conservation and expanded it in an unprecedented way into urban political economic spheres.

This study, therefore, focuses heritage-led regeneration, which is an urban renewal effort designed to revitalize urban places by adopting the conservation of heritage properties, especially in two cities in Asia: Singapore and Tokyo. While the former is a centralized, unitary city-state so that urban policies are made at a national level without having a separate layer of local government, the latter has put effort into the decentralization of planning power, but the national government still plays a larger role in urban redevelopment projects. In line with this, the study looks into an urban district from each city that is Tanjong Pagar (Singapore) and Marunouchi (Tokyo)

The urban history of Tanjong Pagar began as a fishing village, whilst that of Marunouchi started as a trading port town. These districts have played a critical role not only as cradles for national development but also as financial centers for global city status. In this process, the government of Singapore and of Tokyo attempt to create their own formula of urban policy and practice for heritage conservation and urban redevelopment to win the premier league of the global city. However, their recipes for making authentic urban places to stand out from competitors absurdly turn out to be same. They invite private sector participation under the scheme of the public-private partnership and put the priority on the economic return of urban redevelopment. More importantly, there are national narratives weaved into those heritage-led regeneration efforts. As a consequence, the study argues that these components turn authenticity into a singular entity leading to the homogenization of urban places.

Given these backgrounds, this study critically untangles the construction of authenticity of urban places within the context of heritage-led regeneration driven by global city making. It attempts to examine socio-economic and political factors; mechanisms to connect local and national into the circuits of global capital and cultural circulation; and their socio-spatial consequences in contemporary urban places. In this fashion, this study can nurture the global history of urban renewal by providing an insight into Asian global cities.

Remaking Hong Kong Heritage and Identity: Post-Colonial Urban Renewal Planning and Heritage Policy Agenda

Yeung Yeung Fok (University of Leicester)

Heritage is not simply inherited from the past, but socially and culturally constructed for both present and future purposes. Through an examination of recent changes in the Hong Kong heritage landscape, I argue that the city is undergoing a process of heritage creation and (re) construction, embedded in discourses of post-colonialism, identity and globalization.

In the first two decades of the 21st century, major Asian cities, including Hong Kong and Singapore, have experienced a radical and fast process of urban redevelopment. The mega-competition for attaining global city status among Asian cities is no longer based only on economic achievement, but also on urban cultural landmarks and creativity.

Among the cities participating in this global mega-competition, Hong Kong stands out as one of the key players. In the last two decades, the Special Administrative Region (SAR) government has introduced new mega-projects of cultural infrastructure such as the West Kowloon Cultural District and urban redevelopment projects including the 'revitalization' of the former Central Police Station and Blue House Cluster, to reconstruct and regulate urban heritage space and to help re-branding Hong Kong as an Asian cultural hub.

This paper addresses three questions with reference to two case studies of Hong Kong, namely, the former Central Police Station and Blue House Cluster: (a) how major Asian mega-cities (such as Hong Kong) are regulating their urban heritage to establish new cultural notions of the city; (b) what power relations exist behind these urban renewal and heritage projects, and their implications for people's everyday participation; (c) what the role of the urban renewal and heritage policy agenda is, in terms of the complex process of creating Hong Kong's post-colonial identity. Additionally, this paper analyses the role of the SAR government's urban renewal planning. While the government attempts to re-brand the colonial past of the city as part of Hong Kong's cultural capital, this also generates feelings of nostalgia for the colonial period. Its history of colonialism has given Hong Kong a so-called 'Westernized' and 'internationalized' image which set it apart from the rest of mainland China, and gave it an advantage in the competition for global city status. However, it also places Hong Kong in a challenging position within the larger Chinese national project.

As the cultural competition between Asian cities is turning fiercer, it is important to explore these issues in the specific context of Hong Kong.

Imagining a Meshwork of Urban Nature – Lawrence Halprin and Panhandle Parkway in the San Francisco

Meng-Tsun Su*

* *PhD Candidate, Graduate Institute of Architecture mtsu72@gmail.com*

The unbuilt project of Panhandle Freeway in San Francisco from the early 1960s is a unique case in the politics of design during the heyday of urban renewal in the United States in the early 1960s. The close collaboration between highway engineers and landscape architect Lawrence Halprin on this project also exemplifies cross-disciplinary thinking in redefining natural processes in the city. While Halprin emphasized the visual and visceral experience of moving through the highways integrated with parks and residential apartments, the civic function of urban freeway clashed with the local communities that would be displaced by the construction. The aesthetics of mobility eulogized a regional vision shared by Halprin and his friends informed their active involvement with the infrastructural design of the Bay Area. It presents an alternative to the criticism of the urban renewal of the 1960s. Nevertheless, the residents worked with the city council on the successful revolt against Panhandle Freeway, and none of the alternative routes was constructed, leaving the gap between southern San Francisco and Golden Gate Bridge to local traffic. While some critics see Halprin's freeway design as an ameliorative disguise, his schemes open up a dialogue between social and aesthetic aspects of the mobility. In doing so, his interweaving of urban ecology and infrastructure marked the evolution of scenic parkways to urban freeway in landscape architectural practices. The lesson of Panhandle Freeway is not only a matter of coexistence, it also foreshadowed the open-ended methodology in planning and design.

Keywords: urban freeway, landscape urbanism, urban renewal, Lawrence Halprin

Introduction

Geographer Tim Cresswell pondered two different ideas of mobility in the cities – the aesthetic experience of movement and the condition of social change. Both senses are favorable to their adherents. Aesthetic mobility invigorated modern arts and architecture, and larger capital and social mobility is key to viable economics. The unobstructed flow of people and businesses often displaced of the local community.ⁱ Landscape Architect Lawrence Halprin's design for the Panhandle Freeway addresses both senses of mobility. At its best, he proposed a series of sensitive interventions that address the imposing large-scale construction. Furthermore, he experimented with representation techniques to analyze the visual and visceral experiences of movements on the freeway.

The downtown businesses of San Francisco were eager to revive the declining central business district of San Francisco in the postwar years. In a way, they continued the desire to integrate the city into the larger bay area after the construction of the Golden Gate Bridge and the Bay Bridge during the 1930s. Like other major cities in America, San Francisco faced serious traffic congestion during the peak hours of driving. The Chamber of Commerce worked with planners and city officials, hoping an unobstructed freeway system would attract more consumers and residents to the city.ⁱⁱ Various plans had been proposed, and the planning of the Bay Area Rapid Transit District (BARTD) was begun in the 1950s as well to facilitate the journey across the bay.

With the passing of a series of federal housing and highway acts and the booming populations after the World War II, the financing provided by the federal government spurred the construction of subsidized housings and statewide highway networks that often led to large-scale clearance of the "slum" areas. In addition to housing developments in Fillmore, South Market, and Embarcadero, the highway and the BART system constructions in the Bay Area included some of the most disastrous episodes, including the mostly black and lower income communities of West Oakland.ⁱⁱⁱ Planners and theorists proposed policy with different ramifications. Planners and theorists proposed policy with different ramifications. Many observers fault the protests and riots on the

suburbanization of jobs and the lack of minority mobility. Furthermore, the demonstrators further valued stability and homeownership and pointed to the cult of mobility as the problem.^{iv} Catherine Bauer Wurster, the prominent advocate for public housing, urged for more choices in housing and higher mobility among residents to remedy the increasing distance between housing and employment locales due to demographic and industrial shifts.^v

The freeway revolt in San Francisco is one of the early successful counter actions to urban redevelopments that owes its success to the mostly middle-class based constituency. A strong network of Neighborhood associations organized a series of successful protests that pressured the San Francisco Board of Supervisors to vote in 1959 in opposition to state plans for freeway projects around the city. The extension of the elevated, double-deck Embarcadero Freeway, which had marred the vista of the landmark Ferry Building, was halted due to this

opposition (Figure 1).^{vi}

Figure 1. Embarcadero Freeway, San Francisco, early 1960s.

To connect the Bay Bridge and the existing Southern and Central Freeways to the Golden Gate Bridge, the State Highway Division sought alternative routes: one through the Panhandle area east to the Golden Gate Park, and another through the area north of the City Hall.^{vii} These three legislative routes all together are named Panhandle Parkway and Cross-town Tunnel Corridors, often dubbed as the Panhandle Freeway. At the request of the City, the State hired Halprin to “ensure incorporation of the highest aesthetic qualities of landscaping and special design.”^{viii} Halprin was concerned with the civic value of infrastructure based on the regional vision of his colleagues, mainly the loosely organized planners, architects, and landscape architects in the Bay Area called *Telesis*.^{ix} More recently, architect DeMars and landscape architect Theodore Osmundson had served on the Design Committee of the Ferry Building Park in the mid-1950s and had proposed several alternatives to address the impact of the Embarcadero Freeway.^x Upon accepting the commission of the Panhandle Freeway, Halprin wrote to Kevin Lynch, the renowned urban planner and theorist at the Massachusetts Institute of Technology, requesting a draft of his forthcoming book, *The View from the Road*.^{xi} Lynch responded with enthusiasm, saying that “You have been given a marvelous task! I envy you, and will be very much interested to see the results that come of it.”^{xii}

Mediating Two Kinds of Mobilities

The urban freeways of the early 1960s facilitated the dynamic spatial organization and movement among the emerging regional complexes. Like the comprehensive highway systems developed among American cities during the interwar era, they also served the desired political and economic continuum.^{xiii} Halprin’s collaboration with engineers of the California Department of Transportation on Panhandle Freeway reacted to the previous highway revolts. The aesthetics of an urban freeway he promised fulfilled the need of drivers, pedestrians, and

the community on both regional and bodily scales. As a daily automobile commuter between Marin County and downtown San Francisco office via the Golden Gate Bridge, he described the dual identity of city dweller cum car driver as a “Dr. Jekyll and Mr. Hyde contrast.”^{xiv} Valuing experience for its function in unifying the varied scales of the freeway and the city, he also contended that “the pedestrians and automobile should be friends.”^{xv}

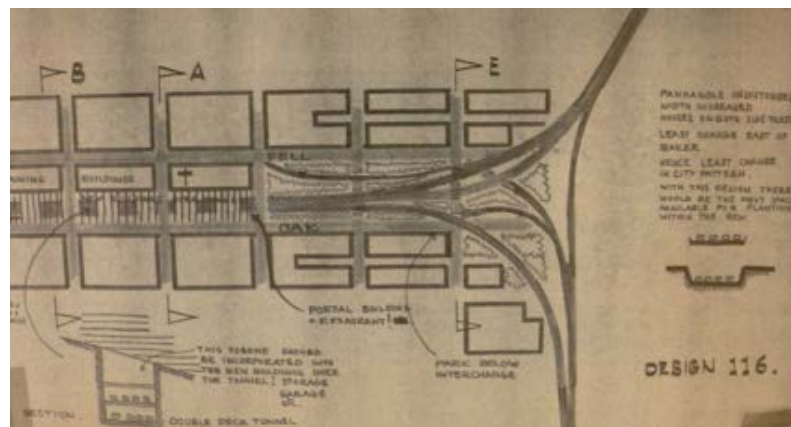

The beginning of the 1960s witnessed a sea change in the discourse of urban design, when influential writings by Jane Jacobs and Herbert Gans eroded the faith in total design of the city as a system and fomented an ensuing disillusionment of the grand manner.^{xvi} Despite their different positions on suburban culture but common to the sociological wisdom of Jacobs and Gans, is the limited role of the physical environment in the formation of collective and individual experiences, and, therefore, a call to relinquish total control over design in order to enable social processes to take place. In the American Institute of Planners conference in December 1961, Halprin scribbled down his thought on “How do we achieve visual heterogeneity” in six points: leave holes for building to be done some years later; get various hands at work – architects; encourage naïve design – builders [and] people; allow for chance occurrences. . . the unpredictable; multiple use zoning; and do away with architectural commissions which tend to standardize things.^{xvii} These immediate concerns were echoed in his freeway projects.

Seeing the city as both a system as well as experiences also defines Halprin’s approaches to urban freeway. For Halprin, who commuted from Marin County to his downtown San Francisco office for work, via the Golden Gate Bridge, the dual identity of city dweller cum car driver is a “Dr. Jekyll and Mr. Hyde contrast.” Valuing experience for its function in unifying the varied scales of the freeway and the city, he also contended that “the pedestrians and automobile should be friends.”^{xviii} As automobile circulation shapes the armature of the city, Halprin’s open strategies for urban design depends on the mapping of planar relations of the urban elements. On the pedestrian side, he appropriated the ground condition at a smaller scale and engaged the boundaries of urban infrastructure.

After a more general *Report on the Aesthetics of Urban Freeways*,^{xix} Halprin went on to explore the site-specific issues of topography, local streets, and the neighborhoods (Figure 4). The first comments on the set of road geometries passed from the State office were based on three aspects: community, pedestrians, and drivers. Many of his favorite alternative devices appear as depressed, tunneled, and double-deck roadways interspersed with lush plantings. For example, the eight-lane, two-level road geometry of no. 116 caused less impact because “after construction there would be more space for buffer planting and other coordinated redevelopment which would speed the integration of the freeway.” Its pedestrian experience was preferred, for the freeway was blended “into its surroundings, so helping the pedestrian and the community in the immediate vicinity.” The driving experience was pleasant because of the “varied interesting route.”^{xx} The route was developed into

Alternative L3 where one sees a separated circulation of highway lanes, local streets, and pedestrian walkways

(Figure 2, 3).

Figure 2. Working drawing of road geometry no. 116, Panhandle Freeways, c. 1963.

Figure 3. Proposal for a redevelopment area integrated with the freeway based on the concept of staging in road geometry no. 116, c.1964

Concentration is another strategy found in Halprin's proposal that would reduce the footprints of an urban freeway. Contrary to the prevailing wisdom of parkway designers who seek to achieve picturesque effects, Halprin criticized a wide right-of-way as unfit in urban areas. As a result, he preferred devices of multiple-decking and tunneling as mentioned above. The interchanges that served as connections between the freeway and urban systems are also significant. Halprin suggested a lower speed design to reduce the radii of the ramp. He also studied the movement of traffic in order to eliminate unnecessary interchange roadways.^{xxi} The no. 118 road geometry shows a compressed interchange at the Civic Center, contained by a tunnel entrance with a "park below structure (Figure 4)." At the interchange at Park Presidio, Halprin considered "the situation of the

remaining houses could be improved by detail design of the spaces between narrow roads and ramps,” such as “earth mounds, retaining walls, planting.”^{xxii}

Figure 4. Proposed Interchange at the Civic Center, Lawrence Halprin and Associates, 1964.

On the pedestrians’ human scale, Panhandle Freeway benefit from the spontaneous cultivation of body and its engagement with the urban environment as found. Halprin’s latter book *Freeway* shows Anna holding a kerchief, sometimes standing and posing, sometimes dancing, shuttling around and between the buttresses underneath an elevated highway.^{xxiii} The matrix of photos resembles Edward Muybridge’s motion study photographs. Both break down continuous actions into still frames which imply a sense of time. Just as Anna’s spontaneous approach invites a give-and-take between the body and the environment, Halprin sees urban design as an “inclusive” rather than “compulsive” practice.^{xxiv}

Representing Urban Freeways

Halprin’s work on the San Francisco freeway project coincides with the formulation of his scoring system in landscape design.^{xxv} The *Program of Phase I Study* of the Panhandle Freeway indicates an attempt to develop a “continuous ‘strip’ technique” for graphics presentation,^{xxvi} by which Halprin referred to the notational system as he used in representing the experience of walking at the Capitol Tower Apartments.^{xxvii} Here the objects in the space are projected in relation to the moving body rather than a three-dimensional Cartesian coordination. His course assignment for students at the University of California at Berkeley, “Recording of Actual and Perceptual Events,” attempted to negotiate the conflict between “what is seen” and “what is felt.”^{xxviii} The students’ collective work appeared as a score depicting the travel from north San Francisco to Sausalito via the Golden Gate Bridge.^{xxix} This notational system evolved into a combination of image matrices and strip symbols,

together with a plan indicating the trail of the movement. When Halprin published his article “Motation” in

1965, he included a graphic of a driving experience on the Embarcadero Freeway as an example (Figure 5).^{xxx}

Figure 5. Embarcadero Freeway “Motation” score, Lawrence Halprin and Associates, 1965.

Halprin’s representation of moving through the urban streets and freeways was paradoxical. The bodily experience of urban infrastructure and its non-perspective representations in his investigations are at once ameliorative veneer and progressive proposal. On the one hand, these drawings worked as the aestheticized mask of the ruthless urban clearance. The combination of section and perspective drawings of the San Francisco freeway, as well as the many conceptual renderings made by Denis Wilkinson, the firm’s draftsman, have their political intention to persuade the public in the face of their opposition. After all, the vocabulary of “plant buffer” and “landscaping” was prevalent in the newspaper and design documents. On the other hand, the national system also worked as the mediator, or even the embodiment, of the automobile movement through the city. The various physical and intangible connections in Halprin’s freeway design testify to his ideas to extend the civic function of infrastructures. He saw aesthetic elegance in the freeway structures’ expression of movement, like an “action painting,”^{xxxix} within which one can literally participate and experience “the sensation of motion through space.”^{xxxii}

In a way, the delineation of overpasses and bridges in the drawings manifests Halprin’s aim in connecting the body to the act of seeing. A photograph in Halprin’s *Freeway* shows the unfinished end of the elevated Embarcadero Freeway, which became a spot overlooking the city’s port. The idea climaxed into a whimsical ventilation tower above the tunnel that also serves as a belvedere. The reclining figures and the passing cars depicted in some of the freeway drawings imply an interpenetration of sight-seers, some static, some moving, on different elevations of highway, local streets, and walkways (Figure 6). These site-specific appropriations of the

city negotiate the visual (what is seen) and visceral (what is felt), aspects that Halprin intended to mediate across

different scales in experiencing the city.

Figure 6. The Franklin D. Roosevelt East River Drive, Manhattan, 1937-1942.

Through the Panhandle Freeway, Halprin argued for a different type of road from that which was prevalent in parkway discourse. Frederick Law Olmsted had defined the civic function of urban roads in his writing on the concept of “park ways.”^{xxxiii} In fact, the Panhandle area, called “the Avenue” in the nineteenth century, reflects Olmsted’s unrealized Promenade that would connect different parts of the city to his proposed Rural Ground for San Francisco (Figure 13).^{xxxiv} This dialogue between Halprin and Olmsted reinforces Jacqueline Tatom’s summary of the formal and functional evolution of urban roads from boulevard to parkway to urban freeway which is also echoed in Halprin’s favorite contrast between the Henry Hudson Parkway and East River Drive on two sides of the Manhattan waterfront.^{xxxv} Since the nineteenth century, the theory of parkway design had been inculcated by apologists of technological modernism. For Sigfried Giedion, the parkway represents a new design genre expressive of the new space-time conception. Using the Henry Hudson Parkway in Manhattan as an example, Giedion declared an ultimatum for the city which was to be bulldozed for parks along the way:

The use of a new and larger scale in town planning which would coincide with the scale already being used in the parkway system is an imperative necessity for the salvation of the city. This scale must permeate all urban projects.^{xxxvi}

Similarly, according to socio-economic perspective, an urban freeway design manual published by American Association of State Highway Officials (AASHO). One of its telling paragraphs maintains:

Expressways developed to desirable standards, with emphasis on ample right-of-way and landscape features, provide a park-like atmosphere and thereby enhance the value of adjoining property and the general area served by the arterial improvement.^{xxxvii}

The dilemma in assessing this technological aesthetics has been best summarized in urban historian Matthew Gandy’s assessment of the parkway system as established by Robert Moses and Gilmer Clarke in New York State. Gandy maintains that it is difficult to separate Moses’ “aesthetic dimensions to his infrastructural projects”

from “the wider social and economic dynamics of urban change underpinned by their construction.”^{xxxviii} This separation is most salient in the catastrophic destructions caused by the urban freeways Moses had built in his later years, such as the Cross Bronx Expressway. His proposal for the Mid-Manhattan Expressway was even illustrated in AASHO’s design manual.^{xxxix}

The freeway is a two-way lane that holds up and drains the urban economy and culture at the same time. In retrospect, whether San Francisco needs a limited-access highway from downtown to the Golden Gate Bridge is still debatable. Here Halprin’s contribution lies in his ability to reify the transitional quality of the urban freeway while diminishing its footprints within the city. As Halprin imagined it, a good urban road embodies his view of cities as process and change.^{xl} Therefore, his design for the Panhandle Freeway is not only a lesson of coexistence between the outsider drivers and insider dwellers, but one that encourages the crossing over of permanent as well as intangible boundaries. Like many modernist architects and planners of his time, Halprin viewed physical design as an instrument of social change. Moreover, his social sensitivity was augmented by his keen observation and willingness to tackle the realities of urban problems. For cultural historian Marshall Berman, the separation of political and aesthetic messages after World War II, the so-called depoliticization of art, ceases to produce a dialogue between the modernization of the environment and modernist art and thoughts. In the Panhandle Freeway project, Halprin has embodied Berman’s call for the necessity to imagine and engage the present in the life of the postwar cities and societies.^{xli}

38 **Historicizing the Global City / GUHP***

How to create a global city? Tokyo's modern development (1860-1930) as a possible case of reference.

Beate Loeffler (University of Duisburg-Essen)

During the latter half of the nineteenth century, Japan was forced by the western hegemonies to end its isolationist policy and to take part in the trial of strength in East Asia. The government tried to avoid colonisation by initiating a complex process of modernization. It introduced the western administrative machinery, as well as technological and cultural knowledge from the West, dispatched students to renowned educational institutions abroad and hired experts from Europe and North America as advisers and teachers.

In a matter of years, Tokyo, the new capital, underwent a radical change. Both social and physical space became reformed and redefined along the western ideas of modernity and progress. While the centrally located castle retained its symbolic function as centre of power, the real estate surrounding the castle was re-allocated and rebuilt with public institutions such as ministries, diplomatic missions and the National Diet Building, thus completely renegotiating road infrastructure and size ratio of the downtown areas. Some decades later, central Tokyo resembled the image of a modern 'western' city. But what did/does this mean in terms of perception and narrative strategies of identity building? Did Tokyo become a global city?

The paper sketches arguments for/against the notion of Tokyo as a global city and deconstructs some of the intricate workings of conceptually competing narrative strategies in the creation of its urban imaginaries. It shows the juxtaposition of a 'modern' public built environment with 'traditional' neighbourhoods on the physical level of space, overlaid with a meshing of narrative ideas of 'global' urban innovation on one hand and of 'real Japanese' cultural tradition on the other hand. This parallel examination allows to sharpen the concept of a 'global city' as a means of ranking and comparison on a worldwide scale and to gain insight into historical processes of 'city branding'.

In result, the modern development of Tokyo becomes perceivable as an interlinked construction of two narratively conflicting elements: The historical process of Japanese modern self-empowerment towards a capital city as a beacon of technology and civilisation on one hand and the subtext of a Japanese urban 'otherness' that grew from Western myth-making interacting with the Japanese creation of a modern national cultural identity.

The paper questions either/or categorisations of observed phenomena and calls for a complex and multi-layered analysis of developments across all levels of physical, social and symbolical urban space.

An Early Modern Caribbean: Havana

Guadalupe Garcia (Tulane University)

Once one of the most important port cities in the New World, colonial Havana became a model of Spanish imperial rule and an example for the planning and construction of Spanish American colonial cities. Through a close examination of the planning and early growth of the seventeenth-century city, this paper focuses on the multifaceted role that the urban, early modern Caribbean played in transatlantic commerce, the growth of capitalism, and the establishment of colonial rule and governance in the early Americas.

The literature on Latin American urban history has largely focused on mainland and contemporary cities. This is despite the economic importance of colonial cities (and port cities especially), and the roles that they played in establishing transatlantic and imperial processes. A close look at Havana reveals that its foundations were similar to that of port cities around the globe. Its planning and early growth challenges the theoretical margins of Latin American urban history, with its tendencies to view the early modern Caribbean as a tabula rasa for European colonization. Specifically, this paper explores the ways in which administrators were forced to reimagine the "blank" or "uncivilized" areas outside of European maps. It traces the ways in which the city was imagined through maps and urban plans and argues that space, race, and blackness were foundational elements of empire. It further suggests the ways in which these were intimately connected to centuries-long processes of urban change. The paper explores the enduring nature of these foundational elements by also discussing the ways in which these processes have been inscribed in the modern-day topography of the city. By doing so, the author seeks to move beyond an analysis of the early planning history of Havana to interrogate the epistemologies within which the field is bound and which have set the Caribbean outside of the trajectory of urban history as a field.

A Perspective of “Diversity Creation” and “Expandability”: Another Interpretation on Spanish Colonial Town Planning

Akihiro Kashima (Setsunan University)

There has been a great accumulation of research on the uniform town planning philosophy since the 16th century in the Spanish colonies and now its impact on modern urban planning is an important contemporary aspect on this theme. The planning techniques of grid pattern for rational administrative management and missionary work were carefully literalized by the Laws of the Indies to create a large number of urban spaces with highly physical homogeneity. Symbolizing this planning philosophy is the Ordinances of Philip II promulgated in 1573. However, almost no towns were built in perfect accordance with this code, and rather the process of real town construction and its transformation have been the subject of many researches. On the other hand, in view with the specific planning techniques described in the Ordinances of Philip II, there is some intentional operation that is difficult to explain clearly from the viewpoint of the planning philosophy of homogeneity. This paper is to review the Ordinances of Philip II as an accumulation of the concrete town planning techniques for the Spanish colonial town construction and to verify the perspective of "diversity creation" and "response to city extensibility".

As a result, the following interpretation was derived from the discussions in this consideration. First, the concept of creating town cores is obviously recognized. In other words, this is the idea of establishing both the urban core with the highest centrality and the other urban cores with somewhat weak centrality. This suggests an idea of creating a multi-centred urban structure. Secondly, there are planning ideas considering "urban growth". This is the idea that urban space expands with time toward the periphery as its population grows. Therefore, the viewpoint of expanding the town space is admitted while keeping the spatial order already established in the layout of streets and blocks. Thirdly, there is a concept of "giving hierarchy to streets and plazas". Streets are categorized into main street and ordinary street, and the plazas into main plaza and small plaza as well. Urban facilities are categorized in this way, and as a result, the idea of effectively giving rich functionality to urban space is recognized. Fourthly, we can point out the idea of "dispersion of urban facilities". This can be interpreted as a planning method to create different districts with different characteristics in the town by collecting religious facilities and small plazas and planning them in a distributed manner in the town. In other words, this can be understood as the intention to create "distinctive neighbourhoods" in the town. As a result, the planning methodology of the Spanish colonial town planning is not necessarily interpreted by a viewpoint of homogeneous creation of town space, but an attitude to create various town cores with different characteristics by dispersing small plazas and public facilities throughout the town. This research shows that the perspective on "diversity creation" and "growth in urban space" is considered very important in the planning historiography of the Spanish colonies.

A Perspective of "Diversity Creation" and "Expandability": Another Interpretation on Spanish Colonial Town Planning

Akihiro Kashima*

* Professor, Department of Architecture, Setsunan University, kashima@arc.setsunan.ac.jp

1. Introduction

Spain has a long history of grid town planning including the well-known Barcelona's city expansion plan of 1859 by Ildefonso Cerdá as well as the pre-modern grid town planning extensively practiced at home and abroad. Spain is, as it were, a grid city planning power. A perspective on the grid of modern urban planning has accumulated a lot of research, and there are sufficient and diverse interpretations. On the other hand, in relation with the viewpoint of the pre-modern grid, there are some studies focusing its the continuity with the modern urban planning, but the viewpoint of order for the pre-modern grid town planning is dominant. Therefore this research aims to introduce a new viewpoint to the grid town planning history of the Spanish Early Modern. Historically the greatest significance of the grid was fair conditions on military, administrative, space utilization, or health. The grid is an urban structure observed not only in the planning history in the Spanish colonial period but also in many urban planning histories in Western Europe, such as the Roman city planning, the planning philosophy of Eiximenis in the Spanish Middle Ages, the Bastide in French Middle Ages, and the Ideal City planning and the architectural treatises of Italian Renaissance, etc. The grid city or the idea of orderly planning is an old tradition and it can be understood that the Spanish colonial city is also on that extension. In the Spanish early modern town planning, as the planning techniques to create order in town space has developed vigorously, the systematization of planning regulations and methods were improved. In particular, after discovering the new route to the Americas, Spain developed a town planning code under a national strategy and built a number of colonial towns while expanding colonial territory. There is a large accumulation of research on the urban structure of the Spanish colonial towns where a homogeneous grid pattern develops around the main plaza. Its representative planning system of the Spanish colonies is *the Ordinances of Philip II* or called *the Laws of the Indies*, which were issued in 1573 by the King, Philip II, and was actually the basis for creating many Spanish colonial towns of grid patterns. However, judging from the fact that these planning norms incorporated norms from various viewpoints for the construction of urban society, not only military intentions but also premises on building relations with indigenous peoples, it is recognized that the Ordinances of Philip II was a code of an essential ideal planning philosophy that aimed a town making with "religious significance and the lives of residents".

In addition, there were few towns which were completely satisfying the conditions stated in the planning regulations of a grid pattern planning as literally. For example, in some colonial towns, there were various plazas other than the central plaza since the town's foundation. From that point, once again looking at the planning regulations of the "Ordinances of Philip II", it is understandable that the planning regulations of the Spanish colonial towns have some important aspects that cannot be easily explained by a concept of rationality and homogeneity which has been a well-studied key concept of town planning. Therefore, specifically, in this research, we verify a viewpoint of creating "diversity", a different aspect from homogeneous planning, also an attitude toward a future change of the town, that is, an intention to correspond to the growth of the town.

Regarding the town planning approach of the Spanish colonies, the architectural historian, Spiro Kostof mentions

that uniform and functional planning with administrative control superiority did not consider distinctions between individual towns. But at the same time, he points out that the grid is not planned as originally boring, and the matrix is intended to make richness and diversity for human beings over time¹. This paper verifies the viewpoint of such diversity and town's expandability in the Spanish colonial urban planning law.

2. Method of research

The Spanish colonial town planning law is an indication of the planning philosophy of the Spanish colonies. The most notable is the Law of the Indies issued in 1680 by the King, Charles II². In addition to the detailed provision of urban planning, this code consisting of 6447 articles was a compilation of laws of all fields concerning colonial management. However, we can tell from the information described in the Laws of the Indies that most of the planning regulations derive from the regulations described in the prior code in the 16th century, *the Ordinances of Philip II* ("Ordinances of discoveries, settlements and pacifications") which were issued in 1573 by the King, Philip II³ (Figure 1). The Ordinances of Philip II consist of a preface, 148 articles divided into three parts and they provide general regulations on town making as well as a model of town planning. No explanations with appendices, index, or charts are added. These urban planning norms had strong influence, and it is said that about 330 Spanish cities were already formed by 1630 in Spanish America. There is no doubt that the compilation of urban planning law contributed to the commonality in the construction of many colonial cities.

In this research, from the *Ordinances of Philip II*, I extract some important provisions suggesting ideas on diversity creation and expandability of a town and examine their planning philosophy (Table 1).

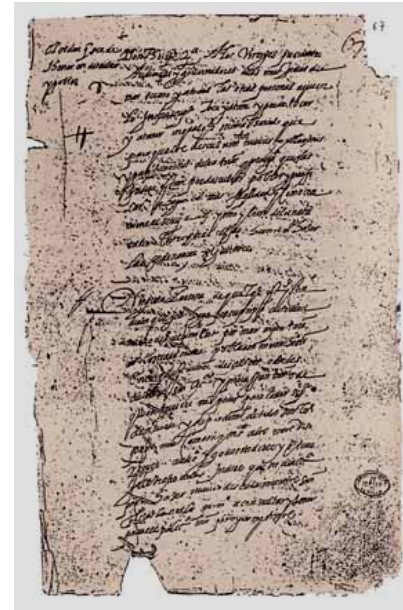

Figure 1: The first page of the *Ordinances of Philip II* issued in 1573.

3. A perspective on the expandability of a town

3-1. Creating a grid: parallel arrangement of blocks and streets

Here we examine to what extent "the Ordinances of Philip II" were concrete as planning regulation. "*The Ordinances of Philip II*" do not clearly state the morphology of grid. However, rough layout patterns can be led from provisions concerning the construction of roads and blocks. Since the whole arrangement of the layout is also mentioned, it is possible to guide the image of city planning in a certain direction from the articles such as the Articles 111, 112, and 114.

Firstly, the plan of the rectangular Main Square [*Plaza Mayor*] which is the most important space of the city is regarded as the starting point of urban planning as stated in the code [Articles 111, 112]. Four principal streets extend from the middle point of each side of the *Plaza Mayor*. Eight regular streets (narrow streets) are extended, at right angles, two by two from four each corner of the *Plaza Mayor* as well [Article 114]. The street layout method is clearly based on the idea that the rectangle of the Main Square is the standard of whole planning. The direction of

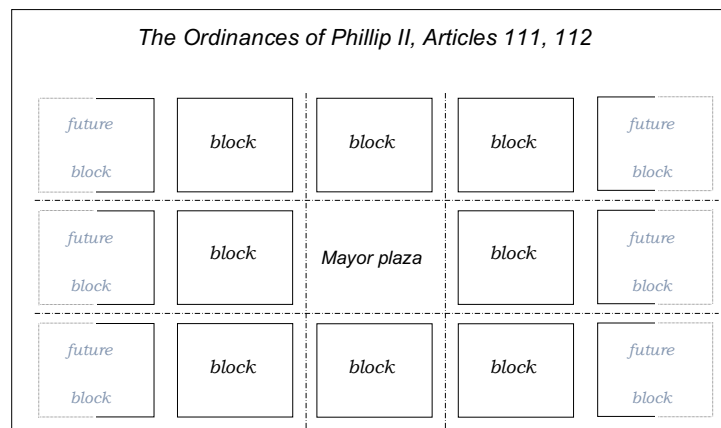

Figure 2: Arrangement of streets and blocks according to *the Ordinances of Philip II*

each side, that is, the orthogonal X-Y axis direction is first fixed. Here, the direction of the X-Y axis is determined so as to sandwich the strong wind blowing direction in the middle, that is, a 45-degree difference. Streets extending from the rectangular Mayor Square will be laid parallel or at right angles to the X-Y axis direction. It does not mention about the distance between streets parallel to each four side of the Main Square, that is, the street pitch nor street width. What "The Ordinances of Philip II" require is simply a linear arrangement of streets, squares, and blocks in the city, in short, a "sequential" and "orderly" arrangement these elements [Articles.111, 117].

Table 1: Articles (extract) of the *Ordinances of Philip II* on Diversity Creation and Expandability of a town

Articles and its points	Extracts from the provisions
Article 111 Regular layout in order of central square, streets, residential lots / securing open spaces around the town	<i>The plan of the place, with its squares [plaza], streets [calle], and building lots[solar] is to be outlined by means of measuring by cord and ruler, beginning with the main square from which streets are to run to the gates [puerta] and principal roads and leaving sufficient open space so that even if the town grows it can always spread in a symmetrical manner. (Omission)</i>
Article 112 Placement and morphology (ratio) of the Main square in coastal cities and inland towns / rectangular main square as the starting point of planning	<i>In the case of a sea-coast town the Main square [Plaza mayor] which is to be the starting point for the building of the town, is to be situated near the landing place of the port. In inland towns the main plaza should be in the centre of the town and of an oblong shape, its length being equal to at least one and half times its width, as this proportion is the best for festivals in which horses are used and any other celebrations which have to be held.</i>
Article 113 Basic concept for calculating the size and size of the plaza	<i>The size of the plaza shall be in proportion to the number of residents, heed being given to the fact that towns of the natives, being new are bound to grow and it is intended that they shall do so. Therefore the plaza is to be planned with reference to the possible growth of the town. It shall not be smaller than two hundred "pie" wide and three hundred "pie" long nor larger than eight hundred "pie" long and five hundred thirty-two "pie" wide. A well proportionated medium size plaza is one six hundred "pie" long and four hundred "pie" wide.</i>
Article 114 Detailed plan of town nucleus	<i>From the plaza the four principal streets [calle principal] are to diverge, one from the middle of each of its sides and two streets [calle] are to meet at each of its corners...</i>
Article 115 Function and structure of the Plaza Mayor	<i>The whole plaza and the four main streets diverging from it shall have arcades, for these are a great convenience for those who resort thither for trade. The eight streets which run into the plaza at its four corners are to do so freely without being obstructed by the arcades of the plaza. The arcades are to end at the corners in such a way that the sidewalks of the streets can evenly join those of the plaza.</i>
Article 117 Planning idea for streets and plazas in town's expansion	<i>The other streets laid out consecutively around the plaza are to be so planned that even if the town should increase considerably in size it would meet with no obstruction which might disfigure what had already been built or be a detriment to the defense of convenience of the town.</i>
Article 118 Creation and function of small plazas	<i>At certain distances in the town, small plazas [plazas menores] are to be laid out on which the temples [templo] such as the main church [iglesia mayor], the parish church [parroquia] or monastery [monasterio] shall be built so that the teaching of religious doctrine may be evenly distributed.</i>
Article 121 Perspective on hygienic arrangement of hospital facilities	<i>(Omission)</i> <i>The hospital for the poor and sick of non contagious diseases shall be built next to the church forming its cloister.</i>
Article 122 Placement of production facilities where garbage emerges / hygienic and commercial point of view	<i>The lots and sites for slaughter houses, fisheries, tanneries, and such like productive of garbage shall be so situated that the latter can be easily disposed of.</i>
Article 123 Prohibition on windward placement of unsanitary garbage facilities / hygienic point of view	<i>It would be of great advantage if inland towns, at a distance from ports were built on the banks of a navigable river, in which case an endeavor should be made to build on the northern river bank, all occupations producing garbage being relegated to the river bank or sea situated below the town.</i>
Article 126 Land utilization around the plaza / creation of distinctive zones	<i>No building lots surrounding the main plaza are to be given to private individuals for these are to be reserved for the church, Royal and Town house, also shops and dwelling for the merchants, which are to be the first erected. (Omission)</i>

The article 117 states that the streets should be extended from the Main Square and they are further extended. This prevents inconveniences such as inducing ugly rebuilding, or impairing the defense and comfort of the city, even if the town grows expanded. In other words, the urban layout indicated by the "Ordinances of Philip II" is structured based on the rectangular central block serving as an urban core, and principal streets and ordinary streets orthogonal to it. This central block is regarded as a public space or a public square, that is, a plaza, and the general residential blocks are set in parallel repeatedly (Art. 111, 112). This way the basis of the grid pattern is formed (Figure 2). This implies a town planning methodology that leads to firstly establish the central urban core surrounding the Main square [Plaza mayor], then to layout streets [calle], and building lots [solar] which extend from the center towards the periphery of a town. From this interpretation, although there is no direct expression pointing to the grid pattern, the street layout is intended to be a grid across the entire city.

3-2. The centre and periphery: A spatial composition of a town

The Ordinances of Philip II pay special attention to the spatial composition of the urban core (Plaza Mayor). In common with Vitruvius and Alberti, the Ordinances establish detailed criteria to construct the urban core by establishing the building standards of the facades facing the square and related facilities in the surrounding area. However, there is also clear singular point in the Ordinances of Philip II. The Ordinances holds a concept that a city consists of a special fixed central core and various different surroundings. In other words, the indicated urban core is a special central city district and at the same time the startpoint of the town layout. This central urban area is given the function of a central square, it is designed as a rectangular Plaza Mayor with a proportion of length:width = 1.5:1. The Plaza Mayor is positioned as the urban core, so to speak, the starting point for the planning of the whole town [Art. 112] (Figure 3) and the porticoes are constructed around the Plaza Mayor [Art. 115] (Figure 4), thus the Plaza Mayor becomes a special urban core. Although the planning method of the plaza is very similar, the viewpoint in the Ordinances that size and form of the Main Plaza composing the urban core affects the whole city layout, can not be seen in either Vitruvius nor Alberti. Also, as in the case of Vitruvius ["Ten Books on Architecture" by Vitruvius, Book V, Chapter 1, Section 2], the Ordinances of Philip II require the scale calculation of the Plaza Mayor according to the number of inhabitants. Furthermore, the Ordinances of Philip II provide an ideal square model by instructing the specific size and form of the square [Arts. 112, 113]⁵).

The ideal square planned at the center of the city with a special architectural composition is a so-called urban core, and it is assumed the Ordinances of Philip II holds a strong intention to build a centrality in the town. This is the idea that a strong center of town functions sustainably even if the town is expanded and the town's area spreads toward the surrounding area.

3-3. Growth of a town

The Ordinances of Philip II were the planning standard that describe the urban core and surroundings of a new city as mentioned above. However, although referring to the composition of the urban core, the Ordinances do not

Figure 4: Urban core plan suggested by the Ordinances of Philip II

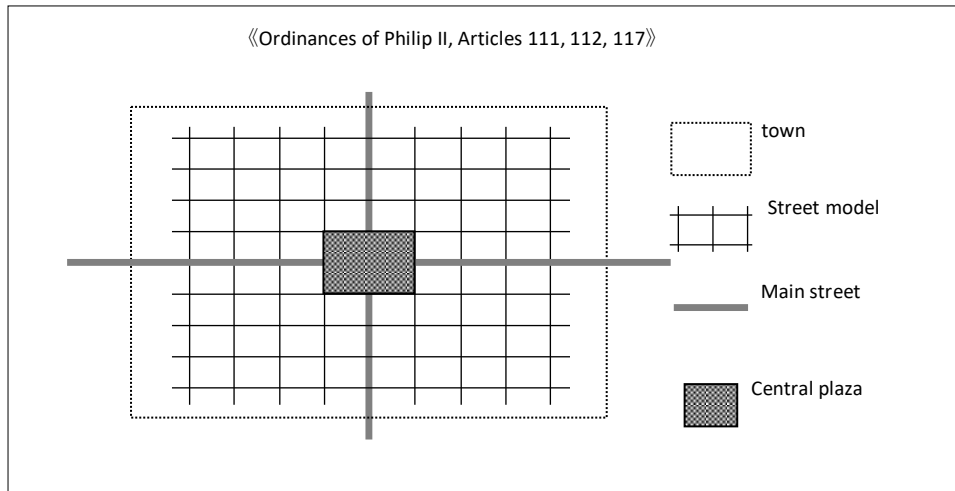

Figure 3: Street layout according to the *Ordinances of Philip II*

mention a town's spatial extent and its boundary such as concrete scale of the entire city or the construction of the city wall. It was possibly based on a trade city, but in reality, the cities with walls were not so uncommon. In practice in the colonial cities without walls, apart from the central urban area, there is an open space outwards the urban area, and it is clear that there is no fixed viewpoint of deciding the urban territory. Moreover, it is clear that the Ordinances have a viewpoint to secure vacant land as a reserve space outside urban areas. The explanation of the road in the Article 111 means a planning where the Main Square which becomes the town's core is connected to the outskirts of the town by the main road (Table 1). In addition, the Ordinances show the idea that a vacant land should be secured around the town from the beginning for future expansion of the town. Clearly, this is an idea of dealing with urban expansion maintaining the order of the block layout. This is a concept that anticipates the growth of the city.

4. Viewpoint of diversity creation in urban space

Here we analyze how the Ordinances of Philip II was intending to utilize the urban space and its planning method to give various characters and functions to urban space.

4-1. Hierarchy of streets

As referenced in the Article 114 of the Ordinances, the streets can be categorized into two types, *main street [calle principal]* and *ordinary street [calle]*. It is speculated that the difference is in the width of the road, but it is obvious that we are categorizing the roads. The main street [*calle principal*] in the Ordinances seems to correspond to the main street referred in the Article 111 which is to reach the city gate [*puerta*]. It is a way of thinking to raise town's function by street planning according to the function of a street (see also Figure 4). Furthermore, the Article 118 clearly establishes a category for plaza, called "plaza menor", which is different in scale from Plaza mayor. In actual Spanish colonial towns, a small plaza, *Plaza menor*, which obviously is different from the Plaza Mayor, is very common.

4-2. Placement of Public Facilities and Region Creation

- Urban facility planning -

The Ordinances have a strong interest in planning facilities and their layout planning. Here we analyze them from the viewpoint of zoning and area's feature creation. The Ordinances of Philip II list churches, royalty facilities, other public facilities, shops and merchant houses as facilities around the Main Plaza. [Article 118, 126] As an urban facilities planning around the Plaza Mayor, the Ordinances of Philip II demand building standards with construction of the porticoes, considering flow planning for merchants [Article 115] as an appropriate planning for the town's core. In addition to the urban facilities around the plazas, placement restrictions from a sanitary viewpoint are suggested for public facilities planning such as religious facilities, customs, arsenals, and hospitals [Article 121], and commercial facilities (butchers, fish stores, leather places) where garbage problems are feared [Articles 122, 123]. Also, there is no detailed building standard, but like Alberti's opinions, the ordinances divide the hospital for infectious disease patients and the others, and states norms on their placement [Article 121]. These regulations on arrangement of urban facilities from such sanitary viewpoints and rational viewpoints suggest a standpoint of multi-

functionality of a town which is linked to the zoning visions in the modern urban planning.

- Plaza menor (Small plaza) -

As mentioned above, the Ordinances of Philip II provide two categories of the plazas as well as the streets. The Articles 118 and 126 of the Ordinances of Philip II also show an idea to disperse small plazas and increase various plazas in conjunction with religious facilities in the vicinity. It establishes “a small plaza [*plaza menor*]” different from the central Main Plaza and it insists that these arrangements are necessary elements of a town [Articles 118, 126]. Apart from the central Main Plaza which are mentioned above with the details of planning regulations, this small plaza [*plaza menor*] is indicated as another urban facility. In the Ordinances, the idea of categorizing the plaza develops into the idea of urban facilities distribution. Here we can recognize a way of thinking to disperse small plazas on the regularly arranged blocks of grid patterns. At the same time, this also suggests an idea of dispersing layout of temples [*templo*] such as the principal church [*iglesia mayor*], parish church [*parroquia*], monastery [*monasterio*] in conjunction with the small plaza (Article 118). We confirmed that the Ordinances do not explain concretely the relationship between the small square and the urban core, such as the central square and its surrounding streets, and the temples and small plazas. But the Ordinances at least provide a way of thinking to combine the plazas and temples. This is an attitude of incorporating a religious role into the town planning. Here we can see the image of homogeneously arranges of the urban facilities in the grid city layout as shown in the Figure 5. It is physically homogeneous, but in reality, it is understood that this is a structure that actually produces various areas in the town.

Let's see a similar perspective about small plaza by Alberti. In his treatise, “*De re aedificatoria*”, he shows a viewpoint to grasp an intersection almost equally with a plaza because it is also a place where the streets combine and intersect [“*De re aedificatoria*” by Alberti, *Book VIII, Chapter vi*].

“*The crossroad and the forum differ only in size. In fact the crossroad is but a small forum.*” (6) Alberti seeks for elegant decoration in this plaza space and recommends to construct porticoes as a means for that (7).

Furthermore, Alberti describes that it is better to incorporate a store in the urban houses and those should be in front of a crossroad and a plaza [V.18]. This is regarded as a viewpoint in which shops of different genres exist depending on each plaza, creating vicinities with different characteristics in different places. Therefore it is estimated that plazas of different characteristics are dispersed in the town.

It has been pointed out that the Ordinances were influenced by Alberti, but the Ordinances show the idea of applying Alberti's thought to distribute diverse religious facilities and small plazas as a group. Since the Main Square was an urban core in the planning vision of the Ordinances, small plazas can be understood as small cores. In other words, here we can point out that a characteristic “town's small cores” with various religious facilities are distributed in a dispersed manner on the grid urban space.

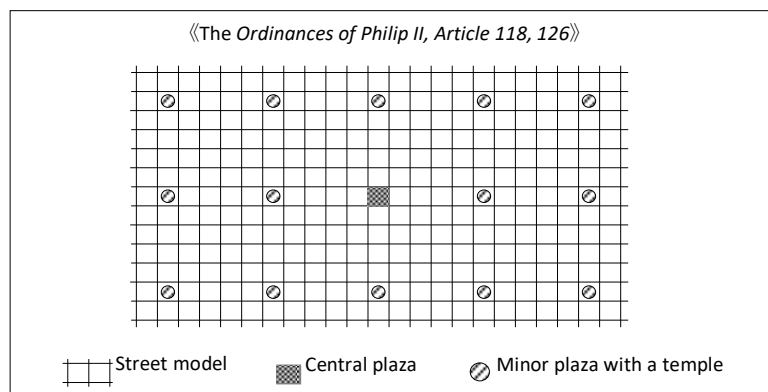

Figure 5: Concept of dispersive distribution of small plazas and temples

5. Conclusion: Planning concept assuming change of town

Based on the above verification, it can be seen that the Ordinances of Philip II did not merely intend a homogeneous space by a grid urban pattern. First, the concept of creating town cores is obviously recognized. In other words, this is the idea of establishing both the urban core with the highest centrality and the urban cores with a somewhat weak centrality. This can be regarded as a way of thinking similar to a multi-centred urban structure. Secondly, the concept

of "urban growth" can be considered. This is the idea that urban space grows toward the periphery with population growth while setting urban nucleus as the center. For that reason, the viewpoint of considering ways to expand cities is recognized. Thirdly, there is a concept of "giving hierarchy to streets and plazas". Streets are categorized into main street and ordinary street, and the plazas into main plaza and small plaza as well. Thus, equivalent urban facilities are categorized in this way, and as a result, the idea of effectively giving rich functionality to urban space is recognized. Fourthly, we can point out the idea of "dispersion of urban facilities".

This can be interpreted as a planning method to encourage different districts with different characteristics to be born in town by dispersing different urban facilities. In particular, it can be interpreted as a planning method to encourage different districts with different characteristics to be created in town by dispersing small plazas always arranged with religious facilities there. In other words, this can be understood as the intention to create "distinctive neighborhoods" in urban space. As many previous studies show, the Ordinances of Philip II provided a planning guideline that physically leads the urban space composition by a strong grid pattern. However, what lies there is not necessarily a viewpoint of homogeneous creation of town space, but an attitude to create a functional town core with high centrality, and make small town cores with various features around the town as the town grows. This research shows that the perspective on "diversity creation" and "growth in urban space" is considered very important in the planning historiography of the Spanish colonies.

2 This code was originally named "Recopilación de las Leyes de los Reynos de Indias". "Indias" originally means the whole territories of Spanish colonies. Therefore "Laws of the Indies" refer to the laws promulgated not only to the Latin American territories but also to the other parts of the world like the Philippines. Although the *Laws of Charles II* had some imperfection and defectiveness, they were no more re-compiled until the independence of the hispanoamerican countries from the beginning of the 19th century on. This Code is also being reprinted today. PAREDES, J.(ed.). *Recopilación de leyes de los reynos de las Indias*, Tomo I, II, III, IV. Madrid:Ediciones Cultura Hispánica, 1973.

3 Originally named "*Ordenanzas de descubrimiento, nueva población y pacificación*" in Spanish. This code was issued by the King, Philip II in Segovia on the thirteenth of July, 1573. This document is preserved in the Archivo General de Indias (A.G.I.) in Seville, Spain, the Document code: Indiferente General, legajo 427, libro 29, folios 67-93; the Document title: Ordenanzas de descubrimiento, nueva población y pacificación. This is a manuscript document written in the sixteenth century Castilian language, which extends for 27 pages of almost A4 size on both sides. It was issued on July 13th, 1573 by the King, Philip II. This code consists of 149 articles in all widely about three themes on the colonization of the Indies; discovery (search for the territories for colonization), the population, and the pacification (the Christian missionary work), each of which respectively comprises a chapter. The documents about the code referred to in this study are the followings: Centro de Estudios Políticos y Constitucionales y el Boletín Oficial del Estado, 1998, and ICAZA DUFOR, 1987.

4 A pie is an old Castilian unit of length utilized in sixteenth-century Spain, and was equal to 278.33 mm. Converting pie into meters, the size of the Plaza Mayor described in the Ordinances of Philip II is about (83.5 m, 55.7 m) < (X, Y) < (222.7 m, 148.1 m), and the ideal size: (X, Y) = (167.0 m, 111.3 m). The unit conversion of pie and meter is according to the following study by Doursther (1965 Reprinting of the 1840 ed.)

5 Article 113 of the *Ordenanzas* suggests an ideal size for a plaza; "The main plaza should be larger than 200 'pies' in width and 300 'pies' in length and smaller than 800 'pies' in length and 530 'pies' in width and the medium size is 600 'pies' in length and 400 'pies' in width." A pie is a unit of length utilized in 16th century Spain, and was equal to 278.33 mm. Converting pie into meters, it is about (83.5 m, 55.7 m) < (X, Y) < (222.7 m, 148.1 m), and the ideal size: (X, Y) = (167.0 m, 111.3 m). X: long side, Y: short side. The unit conversion of pie and meter is according to the following study: DOURSTHER, H.: *Dictionnaire Universel des Poids et Mesures anciens et modernes*, (Amsterdam, 1965 [repr. of the 1840 ed.]

Social Housing and the Emerging of Greater London: the case of Becontree Estate

Weifang Lu (Shanghai Normal University)

London was the pioneer of social housing in UK that started from inner city slum clearance in the latter half of the 19th century, to suburban estate building at the turn of the century, finally to out-county estate development in the first half of the 20th century, which provided some valuable experience for other cities and towns, even for the later urbanized countries today. The plan and construction of Becontree Estate formed a part of the shaping process of the Greater London. London County Council(LCC) began to develop its own social housing from the end of 19th century onwards which included the clearing the sites of overcrowded areas and buildings and built the housing estate within the London County boundary and purchased new land outside of county boundary. The Becontree Estate is one of the great examples of large housing estates in Greater London today which has approximately 4 square miles (10 km²) in the contemporary London borough of Barking and Dagenham which located 11 miles (17.7 km) east-northeast of Charing Cross and was constructed in the interwar period as the largest public housing estate in the world at the time and ‘the crown jewel of the London County Council’ s vast housing empire and the world’ s largest public housing development’ outside of London County boundary which unintentionally marked the circum of the later administrative Greater London County Unit. The Housing Act 1919 permitted the LCC to build housing outside the County of London and Becontree was constructed between 1921 and 1935 to cottage estate principles in Essex and added an additional 1,000 houses later. The estate initially was a pure bedroom town and had no industrial and very little commercial development. Later on other community function added. The Becontree Estate was only one of the large social housing estates built by LCC and pushed unintentionally the county boundary further away into the Home Counties. The fact that Becontree areas transferred from Essex to Greater London in 1965 itself showed how much essential the out-county estates were for the being of Greater London. The estate became part of Greater London in 1965 when the Barking section was combined with Dagenham, and has been within a single London borough since the Ilford section was transferred to Barking and Dagenham in 1994. The paper deals with the situation of London housing problems and slum in London from the start. Then it goes on to discuss the decision making of out-county housing develop in the early 20th century. Finally it considers the process of Becontree Estate formation and the consequence of the Becontree Estate and the emerging of Greater London. It reaches the conclusion that out-county housing estates in part helped the being of Greater London in a way.

The Chinese people were imagined in the eighteenth century London: on the study of Oliver Goldsmith’s “Citizen of the World or letters from a Chinese philosopher, residing in London, to his friends in the east”

Weiliang Zhang (Hangzhou Normal University)

In the early era of globalization, intercontinental exchanges brought a new foreign cultural horizon and imagination, but the barrier of time and space created the strange sense and the exotic imagination. The Citizen of the World published in the middle of the eighteenth century has not aroused the sensation as Montesquieu’s The Persian Letters, but its text narration also attracted the public concerns, and became another example of the exotic imagination of that time. All is always with the imprint of the times in The Citizen of the World, which were constructed by the missionaries and East India Company. The porcelain, tea, Chinese traditional thoughts and Chinese philosophers are very popular in that time, Goldsmith’ s desire to going to India has not been realized, and the East is always his dream. This article will focus on the study of the text of The Citizen of the World, and expound the following viewpoints: First, London is becoming the center of intercontinental exchanges with the growth of ocean trades and exchanges in the early globalization, and London means ‘the world’ which has nurtured a large number of new literary works. Second, the letter from a Chinese philosopher is Goldsmith’ s Chinese imagination by the expression of literature, and his The Citizen of the World involves the broad geographical space of the known world, reflecting a global vision. Last, the narrative aroused the exotic enthusiasm of the public, and its popularity has promoted the process of globalization in a certain degree.

Milan-Madrid-Mexico: Global Urban network and cities in Spanish Empire

Ming Zhu (East China Normal University)

In recent years, the global history has been pushing forward the connected history studies, urban history focus on the production of urban space and its political significance. Further, much attention has been paid to the network and interaction inside global empire. The colonial city is an important analytical category to rethink center and periphery, East and West in world history.

Under the reign of Spanish Empire, Milan, Madrid, Mexico City underwent similar morphological change in terms of urban space, such as spatial form, structural layout and monumental landscape. On the one hand, the spectacular rectangular square became the center of the city, making the whole city develop around it; on the other hand, the checkerboard layout with the right angle intersecting dominated, making the urban space more regular and symmetrical. Behind such transformation, the motive is the urban planning idea, which was regarded as a tool to justify the legitimacy of Empire. It is usually considered that this urban change originated in the idea of Italian urban planner such as Alberti, Firalette, however, these ideas were not only and initially achieved in Europe but also in early 16th century's America. The square-centered checkerboard pattern could be even date back to late medieval America, viz. Azteca Empire and Inca Empire. They impacted upon European cities, this phenomenon appeared just because the Spanish Empire afforded a network, in which the people, techniques, ideas could circulated freely, which brought the reciprocal impacts and promoted similar urban changes. Besides, both Renaissance urban planning ideas and American medieval urban mode mattered in the Empire, the European factor is not always dominating, the non-western factor sometimes played an even more important part, European urban development in the early global times subjected to a certain degree of external influence.

This study highlights the diversity and counter-flow in the frame of Empire through the transformation of urban space, which will represent a connected and shared history.

40 **Discussing the Teaching and Design of Planning History Courses / Round Table**

Tue. July 17, 2018

Session 4 (9:15AM-11:00AM)

Room 7, Yokohama Port Opening Hall

Moderators:

Ian Morley, Associate Professor, Chinese University of Hong Kong, Hong Kong SAR
Carola Hein, Professor, Delft University of Technology, The Netherlands

Participants:

Chris Silver, Professor, University of Florida, USA
Richard Hu, Associate Professor, University of Canberra, Australia
Renato Leão Rego Professor, Universidade Estadual de Maringa, Brazil
Mo Sedighi, Delft University of Technology, The Netherlands

A well-designed curriculum bestows learners a coherent series of intellectual experiences. But to successfully design a syllabus the teacher must not only rationally compose a variety of learning situations he/she must also be acquainted with internal and external influences. As such instructors as a matter of course when designing learning activities need to not only pay attention to departmental and institutional teaching assessment strategies but moreover professional accreditation requirements and broad debates within academic communities about what thematically is/is not relevant to learners today.

In this roundtable, designed principally for graduate students, dialogue is to be tendered on current issues associated with Planning History curriculum design. Scholars from a range of academic fields will not only introduce their approaches to designing curricula but moreover will identify what they see as key contemporary and future issues in the design and teaching of Planning History courses. Topics such as eLearning, interdisciplinary schooling and Planning History' s role and relevance, planning design paradigms, urban environmental transformations plus pedagogical shifts within higher education and the impact of the evolving planning marketplace will be discussed.

41 History of Regional Planning

A History of Regional Planning in Queensland, Australia: From Voluntary Collaboration to Statutory Planning.

Aysin Dedekorkut-Howes (Griffith University) and Michael Howes (Griffith University)

There are a series of problems and issues planners face that are best dealt with at a regional scale such as air quality, water quality, habitat protection, transportation planning, urban sprawl (land use and growth management), economic development and social equity. However, regional planning is easier said than done. Planning usually occurs within administrative boundaries but economic development and environmental systems transcend administrative boundaries. Most of the time political boundaries do not reflect an economically, ecologically and socially functional region. When the region is ill-defined planning may not achieve its goals. Planning powers and authority are usually fragmented among competing local governments and agencies with different missions. This paper focuses on answering the question “How do we make regional planning efforts effective?” through the case study of Australia’s state of Queensland.

Queensland has been one of the fastest growing states in Australia for several decades. This growth has brought with it many opportunities as well as challenges. The most urbanized part of Queensland, the Southeast corner has been feeling the consequences most intensively. Initial response to these pressures took the form of collaborative regional frameworks for growth management in the 1990s which subsequently transformed into the statutory regional plans in the following three decades. Eleven statutory regional plans now cover most of the state and more are in preparation.

This paper examines regional planning in the state of Queensland contextualizing it in regional planning in Australia to provide some answers to the research question. It first studies the emergence of the initiative, then traces its transformation from its voluntary, collaborative roots to its current statutory state. It also overviews the reviews of the various South East Queensland (SEQ) regional plans including the early voluntary regional frameworks for growth management and the two predecessors of the current statutory plan Shaping SEQ: South East Queensland Regional Plan 2017 and evaluates them against regional planning principles such as appropriate designation of planning region boundaries; involvement of all organizations with authority in the defined region in the planning process; horizontal and vertical consistency between lower and higher level plans; timing of the planning process; adherence to the planning hierarchy and public engagement. It also considers the consequences of the statutory vs. advisory nature of the plans and mandatory vs. collaborative and voluntary nature of the processes. The findings will help identify what needs to be done differently to make regional planning more effective.

Greater Istanbul Metropolitan Area Planning Experience (1965-1980): Approaches, Models and Strategies

S. Güven Bilsel (KTO Karatay University Department of Architecture) and F. Cana Bilsel (Middle East Technical University Department of Architecture)

Following the enforcement of the Urban Development Act in 1956 and the foundation of the Ministry of Reconstruction and Settlement in 1958, the first regional plan was developed for the Eastern Marmara Region in Turkey. The regional plan, which was prepared by the Ministry of Reconstruction and Settlement, in collaboration with the State Planning Office aimed at directing the industrial developments, the distribution of the industrial population and defining the hierarchy of urban settlements in the region respectively. The Regional Plan proposed an urban and regional infrastructure and a linear settlement development model for the Greater Istanbul area for the first time. The cities in Turkey were subject to a rapid urbanization due to a continuous flow of population from rural areas to the cities, which accelerated after 1950s. As a result, a multiplicity of new municipalities outside the existing limits of the major cities were formed, which necessitated a holistic planning in metropolitan scale. With this objective, three metropolitan planning offices were established for the major cities, Istanbul, Ankara and Izmir under the Ministry of Reconstruction and Settlement.

In continuity with the principal decisions of the East Marmara Regional Plan, the planning studies for the Greater Metropolitan Area of Istanbul started with the foundation of Greater Istanbul Metropolitan Planning Office in 1965. The distribution of population between European and Asian sides of Istanbul metropolitan area was studied, and a linear pattern of settlement units separated by green areas was adopted in line with the regional plan. A strategic planning model was adopted in the last stage of the metropolitan planning. Based on an extensive survey, the demands of different sectors were defined. Alternative development strategies and scenarios were proposed with regard to the demands of the sectors. Beginning with the regional planning scale, the distribution of the residential and working areas, different strategies were tested with respect to their performances in achieving the initial development objectives. Based on an extensive data, projections, and regional development strategies updated, a plan that could guide the urban development policies was achieved. The metropolitan plan was completed and approved by the Ministry in July 1980.

The Metropolitan Plan of Greater Istanbul constituted the first metropolitan plan, in Turkey, where the strategic planning approach was applied by comparing alternative development strategies. However, it could not be implemented properly as the planning authority was transferred to the Greater Municipality. Yet, with its holistic approach, this metropolitan plan that defined strategies of urban development and natural and urban conservation in metropolitan scale, could have prevented unplanned, piecemeal operations if it could be implemented. In the present paper, the metropolitan planning experience of Greater Istanbul is studied with a focus on the 1980 master plan. The role of the planning decisions in the urban development of the metropolitan city will be discussed at the end of the paper.

Warren Manning and the origins of environmental planning in the United States

Carlton Basmajian (Iowa State University)

Mel Scott (1969), Peter Hall (1988), and Jon Peterson (2003) situate the origins of city planning in the United States at the beginning of the 20th century, a reaction to the congested and polluted industrial cities of the day. As a result of their work, a handful of early practitioners have become enshrined in the annals of the field. Others, perhaps equally significant, remain outside the pantheon. Warren H. Manning is one such case. An early 20th century landscape architect/city planner, Manning shared much with his more famous contemporaries - Burnham, Olmsted Jr., Nolen, and Bartholomew - yet his vision for what planning could achieve was distinct, both in its conception of scale and in its privileging of environmental information. Pioneering the use of map overlay techniques to gauge the carrying capacity of different landscapes (Steinitz, Parker, Jordan, 1976), Manning combined extensive environmental data with social and economic information to develop what has been called "a foretaste of modern environmentally-based planning" (Neckar, 1989)

Though his innovative use of environmental data is today rarely discussed among planning historians, Manning's activities during the 1900s and 1910s saw the development of an innovative model of city planning. Using transparent map overlays as an analytic device, Manning had by the late 1910s developed a series of increasingly ambitious city, regional, and state plans. His magnum opus came in the form of a 900-page national plan for the United States, drafted in 1919. Manning's national plan used data analysis to re-imagine the continental US as a set of distinct environmental regions. The plan brought the broad conservation-style planning advocated by John Wesley Powell down to the level of landscape design. Yet Manning's work was compromised by his embrace of the racist undertones common to many early environmentalists (Purdy, 2015) By the mid-1930s, Manning's work had been mostly forgotten, as the social scientists who dominated Franklin Roosevelt's New Deal agencies and later assumed prominent positions in post-war US planning education popularized a style of planning more concerned with economic and social policy than land conservation (Alanen and Bjorkman, 2008)

Not until the late 1950s did the practice of using environmental data re-appear, and not until Ian McHarg's 'Design With Nature' did it become widely known amongst US planners (Collins, Steiner, Rushman, 2001)

In this paper I excavate Manning's 1919 national plan, arguing that his conception of planning forms a missing link between the conservation movement of the late 19th century and the city planning movement of the early 20th century, and represents an overlooked piece of the history of planning in the United States. With increasing interest in the structuring role of the environment in the history of city planning (Steinberg, 2002; Daniels, 2008), Manning's environmental plans captured a fleeting moment when perceptions of a natural world of "unspoiled moral order" were giving way to a mechanical world of mass production and consumption (Worster, 1973)

Manning's plans suggested a data driven environmental approach to regional design, a practice that modern digital infrastructure has finally made possible.

Chiang Ching-kuo and the Regional Planning of Kanhsien, Kiangsi Under the Influence of Soviet Model (1941-1948) ——The Planning Practice of Socialist Ideological Trend in Modern China

Zhao Li (School of Architecture, Southeast University) and Baihao Li (School of Architecture, Southeast University)

After World War I and the Great Depression, regional planning theory was spread into China in the early 1940s. Practice of regional planning began to rise in many regions. Affected by the socialist ideological trend, there had been many regional planning under planned economy system in China such as Guangxi and Jiangxi. Gannan Reform dominated by Chiang Ching-kuo was an important experiment and clearly marked by socialist ideology from the Soviet-Russia. Chiang Ching-kuo studying in Moscow was deeply influenced by socialist ideology and command economic system during the period of the first "Five-Years Plan" (1928-1933) in 1930s. Served as governor of Jiangxi Province after his returning to China, Chiang Ching-kuo formulated the regional development path of "first social construction and post physical planning" according to the social conditions of Gannan in 1940. As a proponent of Confucianism, he combined the Soviet experience with the traditional Confucian urban-rural governance rules of ancient China. Promoted by Chiang, the government formulated two regional plans in 1941 and 1943, The First Three-year Plan of New Gannan (1941-1943) and The Second Five-year plan of New Gannan (1944-1948)

From 1941 to 1945, under planned economy system, government developed public and cooperative undertakings to construct agriculture, industry, commerce, transportation and other ten systems which can allocate population, industry and resources reasonable, to eliminate urban-rural gap. Taking Kanhsien City as the center, Chiang built Gannan into a model state as an example for new China, attracted the attention of world. The plan was similar to the Five-Years Plan of Soviet and P.R. China, and had an obvious socialist character. Its annual plan and ten systems were also similar to Chiang's Four-year Plan and Top Ten Construction in Taiwan in late twentieth century. Based on historical archives, research has focused on Chiang Ching-uo and Gannan Reform, explained that how the reform can combine the Soviet-experience, planned economy, Confucian experience with regional planning under the leadership of such a heroic figure as Chiang, as the earliest regional planning in modern China in 1940s. It's an extremely important issue that has not been excavated.

Greater Istanbul Metropolitan Area Planning Experience (1965-1980): Implementation of a Strategic Planning Approach

S. Güven Bilsel*, F. Candaş Bilsel**

* Prof. Dr., KTO Karatay University, Turkey, guvenbilsel@gmail.com

** Prof. Dr. Middle East Technical University, Department of Architecture, bilsel@metu.edu.tr

Following the enforcement of the Urban Development Act in 1956 and the foundation of the Ministry of Reconstruction and Settlement in 1958, the first regional plan was developed for the Eastern Marmara Region in Turkey. The regional plan, which was prepared by the Ministry of Reconstruction and Settlement, in collaboration with the State Planning Office aimed at directing the industrial developments, the distribution of the industrial population and defining the hierarchy of urban settlements in the region respectively. The Regional Plan proposed an urban and regional infrastructure and a linear settlement development model for the Greater Istanbul area for the first time. The cities in Turkey were subject to a rapid urbanization due to a continuous flow of population from rural areas to the cities, which accelerated after 1950s. In the present paper, the metropolitan planning experience of Greater Istanbul is studied with a focus on the 1980 master plan. The role of the planning decisions in the urban development of the metropolitan city will be discussed at the end of the paper.

Keywords: Concept and methodology of Global/World Planning History, Metropolitan Planning, Strategic Planning

Introduction

The city of Istanbul, which was the capital of two empires due to its location on the maritime route that connects the Black Sea to the Mediterranean, and forming a bridge between two continents, continues to have a strategic importance in the Eurasian geography. It is a unique city with its outstanding topography, distinct microclimate and vegetation as well as its historical identity and World heritage monuments. In spite of the fact that it has grown and extended rapidly, and exceeded its natural thresholds since the second half of the twentieth century, the city could conserve its historical silhouette and townscape values as a result of its original location, geographic and topographical properties.

The planning experience of Istanbul in modern terms started with the planning competition organised by the Municipality of Istanbul in 1933. Three planners from Germany and France were invited to submit their planning proposals for the future development of the old capital city, which had lost its status of being the capital, yet remained the most important city of Turkey, with its population and its economic activity. Following this first attempt, the French architect-planner Henri Prost was invited as planning consultant to the Municipality of Istanbul. He prepared the Master Plan of Istanbul European Side in 1937, the Plan of the Asian Side in 1939, a regional plan in 1943 and a number of development plans for different sectors of the city including the shores of Bosphorus.¹ After Henri Prost left Istanbul in 1951, a commission formed of Turkish architects and planners took over the planning of the city. This transition period was interrupted by large-scale urban operations undertaken by the Prime Minister of the period.²

While the planning works of the early Republican period perceived the city within the limits of the historical settlement, the irregular process of urbanization resulted from the massive immigration flow from rural areas to the principal cities of the country that began in 1950s, necessitated approaching the city from an upper scale. In this period, the population of Istanbul reached almost 2 million inhabitants (1.4 million in 1960 and 2.1 million in 1970), the capital Ankara and the port city of Izmir were also subject to a rapid urban development and change.³ In order to cope with this process, the Metropolitan Master Plan Offices were founded under the Ministry of Reconstruction and Settlement, with the decision of the Board of Ministers and National Security Council in 1965.⁴

The present paper focuses on the works of the Greater Istanbul Metropolitan Planning Office, created in this context. Following an overview of its initial activities, the strategic planning method applied to the planning of Istanbul in late 1970s, is presented and discussed within the limits of this paper. Despite the Greater Istanbul Metropolitan Area Master Plan was approved in July 1980, it could not be implemented as it was planned, due to the changing governmental policies and decentralization of the planning authority in the early 1980s. However, this paper argues that the 1980 Master Plan of Greater Istanbul, which was the first metropolitan planning process conducted with a strategic planning approach in Turkey, was influential on the later planning works and deserves to be examined more in detail.⁵

The First Regional Plan and the Beginning of Metropolitan Planning

Following the period from 1950 to 1960 when liberal political discourse prevailed, the policy of planned development was adopted in the 1960s. The “Development Plans for Five Years” started to be prepared after the State Planning Organization (DPT) was founded. This organization initiated the studies to define the “hierarchy of urban settlements” and “regions of investment priority” in response to the problem of unbalanced development in the scale of the country.

The Directory of Regional Planning created under the Ministry of Reconstruction and Settlement founded in 1958, completed the studies of inventorying and collaborated with the State Planning Office to prevent the unbalanced development in between regions. This directory conducted the “Growth Pole Policy” studies and regional development strategies on which metropolitan planning works depended in the metropolitan areas later.

The first regional plan developed by the Ministry was the “Eastern Marmara Regional Plan,” which was the outcome of the studies held between 1960 and 1964. The Regional Plan that comprised the metropolitan area of Istanbul, adopted the premise that the growth of Istanbul was inevitable and its development had to be supported; it also predicted “Istanbul would influence the urban settlements in its surroundings and thus would contribute to their development.”⁶

Greater Istanbul Planning Office, founded in 1966 started its studies for Istanbul Metropolitan Area that was defined as an area that comprised the whole province of Istanbul, including Gebze from the neighbouring province of Izmit. The metropolitan area was composed of the integrity of urban settlements that extended from Silivri to Ereğli on Marmara in the West. In addition to the series of urban settlements that extended linearly along the coast of Marmara Sea, the metropolitan area of Istanbul contained valuable agricultural lands, water sources protection areas, the Northern Forests, “the lungs of Istanbul” that extended to the coasts of the Black Sea and the coastal strip to be conserved with its “outstanding natural beauties,” covering also a number of semi-rural settlement areas.

The Metropolitan Planning Office pursued its studies with an outstanding leading staff and an interdisciplinary group of experts who conducted the surveys, analyses, synthesis and evaluation studies based on a comprehensive study of inventorying. From its creation to 1970s, the Office developed metropolitan planning proposals in 1/25.000 scale and opened different development strategies to discussion.⁷

In 1970s, new models of planning were searched besides the necessity of updating the data with the ever changing conditions in the Greater Metropolitan City that was rapidly crowded with a new migratory flow, grew in an irregular manner and its building density increased drastically resulting in the loss of the vernacular architecture and the green character of the city, being increasingly polluted due to uncontrolled industrial developments and wrong heating methods, and faced with the problems of transportation and accessibility because of the increasing commuting between working and living areas at the two sides of Bosphorus.

However, an incremental attitude started to prevail in the implementation instead of a holistic approach that comprehended the integrity of the metropolitan area in late 1970s. Given the urging necessity to develop principal decisions of a holistic macro plan, a higher council was created by the Ministry for the monitoring of the planning works in Istanbul. Following the reorganization of the Office, a “decision making board” in which the planners responsible from each sector actively participated was constituted.⁸

Strategic Spatial Planning Approach in the Metropolitan Planning of Istanbul (1978-1980)

In this stage of the studies, the “Strategic Spatial Planning Approach” was adopted both by the higher council and the Greater Istanbul Metropolitan Planning Office. The Strategic Spatial Planning, which began to be discussed and implemented in the metropolitan planning of cities worldwide in this period, was adapted and further developed for the greater city of Istanbul by the higher council and the decision making board of the Istanbul Metropolitan Planning Office.

In this context, based on the trends of development, the planning team defined the thresholds and limits of urban development and the problems and potentials, and developed “the urban and metropolitan development scenario” for the target year of 1995. The decision making committee formed from the team of planners of the Metropolitan Planning Office developed a set of “strategic development objectives” in line with the main goal of planning and the scenario of development defined. The aim of the planning was defined with one single sentence, in accordance with a strategic spatial planning approach and stated as: “increasing the international significance of metropolitan Istanbul for the benefit of the country, without losing the city’s particular values nationally and internationally renown.”⁹

Amongst the strategic development objectives defined in the Greater Istanbul Metropolitan Area Master Plan, the following planning principles amongst the principles listed on the master plan document are to be emphasized in particular;

- *“Integration of Istanbul metropolitan area with Marmara Region and the development plan of the country,*
- *Meticulous protection of the water sources of Istanbul by the conservation belts determined,*
- *Conservation of natural, historical and cultural values and resources,*
- *Benefitting from the energy resources at an optimum level together with the consideration of the principle of not to create environmental problems,*
- *Programming the provision of housing in consideration with real needs and demands determined,*

- *Being selective among different sectors in the working sectors in the metropolitan area in accordance with the employment program of the country,*
- *Planning of industrial areas in consideration with the balanced distribution of working areas, the location and functional pollution,*
- *Provision of the balanced distribution of the main central business district (CBD) and sub-centres in the whole metropolitan area,*
- *Balanced distribution of the recreation potential, proportionately to the population; excluding Northern Forests as the lungs of the metropolis, from settlement tendencies and meticulous protection of the ecological balance in these areas,*
- *Decreasing the cost of working oriented trips to the society, maximizing the means of railway and maritime transportation in the whole metropolitan area and increasing the means of public transportation.”¹⁰*

It is interesting to observe that in this plan, no alternative development strategy that included the Second Bridge on the Bosphorus was proposed despite the increasing daily trips between Asian and European sides. The first Bosphorus Bridge was constructed between 1970-1973, while the metropolitan planning studies continued and functioned with its connections, as the main transportation channel between the two sides. The metropolitan plan adopted this connection as the main transportation structure that served the whole metropolitan city

Increasing the number of crossings between the two sides of Bosphorus, either by a bridge or a tunnel, was not among the principal decisions of 1980 Metropolitan Plan. In addition to the assumption that the connections to be provided by the construction of such big structures would further increase the amount of the transportation demands, damaging the calm of the settlements on the Bosphorus, negative effects on the maritime transportation, and more important than these, stimulating the urban development towards North, harming the invaluable water sources and the extinction of the ecological corridors were enumerated as important inconveniences.¹¹

In order to test the level of success of each alternative development strategy, the team of planners did the evaluation by using the goals achievement matrix. A set of measurable criteria were defined and used in the evaluation of the alternative development strategies, produced in the previous phase of the planning process.

In this process, the principal decisions of the regional planning at the upper level were taken as determining in the metropolitan planning studies. Therefore, the decisions of the Eastern Marmara Regional Plan were revised in consideration with the developments that occurred in the past fifteen years.¹² The decision of the Regional Plan to support the urban development of Istanbul metropolitan area in line with the existing tendencies, and to sustain the urban growth with the assumption that it would have a positive impact on the development of the surrounding settlements was reconsidered, and the decision to redistribute the population working in the industries was maintained.

In the stage of defining alternative development strategies, the planning team applied a method in stages. The method, which was further developed by the members of the decision making committee, was based on the diversification of the alternative development strategies in regional scale that were found successful, by further developing them in the scale of the whole metropolitan area. The study groups were asked to develop the sectorial master plan schemas that highlighted the development goals of the sectors that they studied in addition to the urban and regional land uses and preferences of location, based on the inventories in which the socio-economic, cultural, natural and environmental data and information on the conservation and utilization equilibrium were updated.

Among the alternative regional development strategies, the strategies, which limited the metropolitan development and predicted population transfer outside the metropolitan area, and those that foresaw the development in satellite settlements were discussed. In metropolitan scale, searching different means of benefiting from the existing potential enabled developing different alternatives; the cost dimension became determining the level of surpassing the thresholds that were defined.

Among the alternative strategies that were defined according to the sectorial weight, the industrial development oriented strategy, and the alternative that aimed at benefiting from the services at the utmost level and the conservation-recreation oriented alternatives prevailed. In the transportation-accessibility oriented strategy, the

alternatives that aimed at benefiting from the urban and metropolitan public transportation and the railway came to the fore.

In the last stage of evaluation in achieving the development strategy to be selected in urban scale, alternative urban development models in which different weights were given to the western or eastern sides of the city were discussed. The rights acquired and tendencies of development were considered in the evaluation of different alternatives. The metropolitan development strategy that was achieved at the end, is a mixed strategy which was obtained from the synthesis of the outstanding features of the development alternatives that were selected at the last stage.

Evaluation of the Greater Istanbul Metropolitan Area Master Plan (1980)

It can be argued that Greater Istanbul Metropolitan Area Master Plan is the first plan prepared for directing sustainable development and growth of Greater Istanbul in metropolitan scale. In this upper scale plan, the approach for a “sustainable urban development” that looks out for the conservation and utilization equilibrium was particularly emphasized. The conservation of northern forests, fresh-water basins and surrounding agricultural lands was adopted as one of the fundamental principles of the plan. Besides forests and water sources, the protection of the ecological system and ecological corridors from the possible impacts of urban growth and expansion was particularly emphasized. This principle was set as one of the criteria that had the highest weight in the evaluation of the alternative development strategies. As a result, a linear urban growth model in east-west direction was adopted in the strategy selected¹³ in order to prevent urban sprawl and expansion towards the northern forests and other protection areas including agricultural lands and pastures. This was also the main reason of the absence of the second bridge that crosses Bosphorus on this plan. (Figure 1)

Balanced distribution of the population was one of the most significant concerns of the Greater Istanbul Metropolitan Planning. The distribution of the working areas including the sub-centres and industrial areas were decided according to the evaluation of the different development strategies and scenarios set. The distribution of

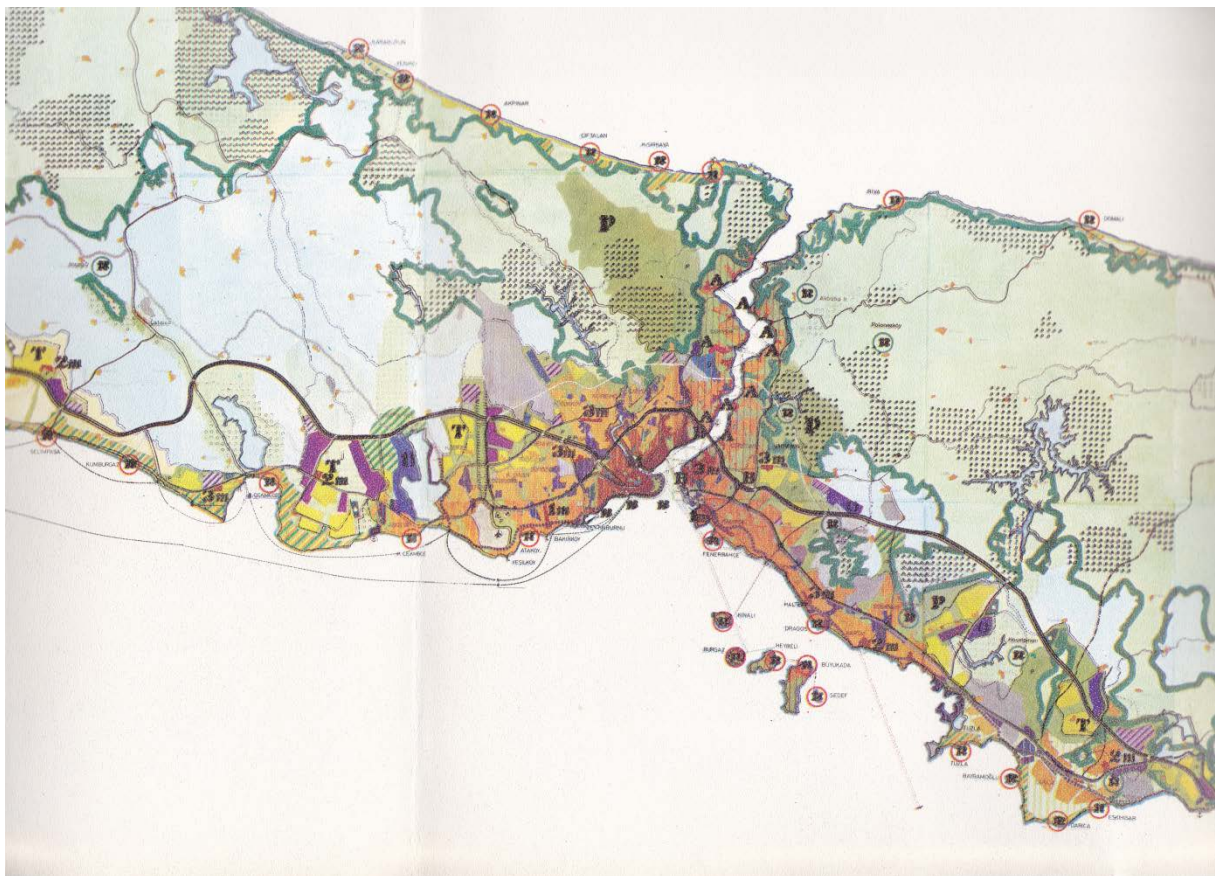

Figure 1. Istanbul Metropolitan Area Master Plan, Istanbul Metropolitan Area Planning Office (Istanbul, 1980)

residential areas were defined in consideration with the distribution of the working areas. The distribution of the population on both sides of Bosphorus was decided in consideration with the environmental assets to be preserved, besides the consideration of existing tendencies and priorities of the development strategy selected.

In this plan, the population living in the whole metropolitan area, which was 3.7 million in 1975, was projected to reach 7.1 million in 1995. This population was distributed between the two sides of the city according to the development strategy adopted. In the western side, the population that was 2,7 millions in 1975 was projected to increase to 4.7 millions, and in the eastern side, the population that was 1.0 million was projected to reach 2.4 million inhabitants. It is important to note that, in the distribution of the new urban population foreseen for the end of the planning term, different alternative strategies were developed depending on the prediction of the quantity of trips between home and work. The weight of the population predicted in the western side can be explained by the existence of a relatively higher population in this side, and by the consideration of the existing tendencies. The evaluation of the environmental assets to be conserved and the thresholds that can be surpassed were also factors that played in the distribution of the population in both sides. It is to note here that additional restrictions need to be brought for the definition of settlement areas according to the micro-zone geological studies conducted after the 1999 earthquake.

The Implementation of the Istanbul Metropolitan Master Plan

In the program proposed for the implementation of the planning decisions of the master plan approved in July 1980, it was aimed to start the action area planning and action programming in the Strategic Priority Areas. In this context, in line with the objective to prevent irregular settlements, settlement areas for mass housing were selected in ten priority areas of the first and second degree defined by the metropolitan area master plan. In the first stage, Halkalı and Beylikdüzü in the west, and Kurtköy, Maltepe and Gebze in the east were selected; detailed spatial arrangements and the actions of expropriation and infrastructure development were initiated starting from 1981.

The transition to the new local government model of “Metropolitan Municipality” in Turkey dates back to 1984.¹⁴ Yet, substantial changes in the administrative system could only be made with a series of legislative regulations in the years 2000. During the studies of Istanbul Metropolitan Area Master Plan, there were 34 settlements of different sizes having the status of municipality within the metropolitan area, including the Municipality of Istanbul. A number of these local governments founded outside the municipal borders of the city of Istanbul, were the municipalities of the old settlements formed around the stations of the railway lines extending on both sides. These settlements extended in time and subject to structural change. Many other new settlements, which emerged as a result of the massive immigration to the city that gained impetus after 1950, were settlements formed spontaneously without plan.

During the preparation of the master plan, according to the current legislation, the authority of preparing, making prepare, approving and revising plans was given to the related Ministry in the name of the central government, however, it was considered necessary for a democratic process to have the decision of the municipal council regarding the preparation of a plan, appropriateness of the plan to the local needs, before the approval of the Ministry. This centralist governmental polity that defined the mandate of control in planning and the implementation of the plan, has changed with the liberalization policies after 1985; the Ministry of Settlement and Reconstruction was closed down, mechanisms of central control were abolished and the municipalities were accorded the liberty to prepare, make prepare and approve plans and to direct the implementation of the plans.

Before these changes were put into effect, the Office of Neighbouring Municipalities was founded in Istanbul by the Bank of Provinces, with the objective to coordinate the preparation of urban development plans of the settlements surrounding Istanbul, with the studies of the Metropolitan Area Master Planning Office.

After the Metropolitan Area Master Plan was approved, this Office of the Bank of Provinces, continued to prepare and make prepare implementation plans for the neighbouring municipalities, in accordance with the principal decisions of the master plan.

Epilogue

When the growth of the urban population in Istanbul is examined, it is observed that Istanbul was the “primary city” of Turkey, with its population that exceeded 1 million in 1950s. In this period, one twentieth of the

country's population lived in Istanbul. It is to note that the urban population was only 24 % of the country's population, whereas today this ratio increased to 92 %, and the metropolitan city of Istanbul, with 15 million inhabitants, shelters one fifth of the country's population. Today, it is predicted that the urbanization of the metropolitan city, which has exceeded all the natural thresholds and reached the saturation level, will finally slow down, and the population size foreseen for 2050 will remain around 17 million.

Among the predictions of Istanbul Metropolitan Area Master Plan, it is stated, "The metropolis of Istanbul will continue to maintain its property of being the biggest city of the country and of Marmara Region."¹⁵ In addition to that, in the studies on Marmara Regional Plan, it was foreseen that in the Eastern Marmara Region in which Istanbul was included, the dynamics of development of the metropolitan Istanbul, would affect the other growth poles of the region such as Bursa and Izmit, and in line with the policy of redistribution of the industrial population, new urban development poles would be created such as Bozüyük-İnönü development axis.

Based on the selected regional development strategy, and in consideration with the population projections made by the Metropolitan Planning Office in 1970s, in which the lowest limit was defined as 6.7 million and the upper limit as 9.2 millions, the population of Istanbul metropolitan area was accepted to reach 7.1 million in 1995, in conformity with the renewed goal and strategic objectives of the metropolitan development. When the population growth of Greater Istanbul at the end of the term of the 1980 Metropolitan Area Master Plan is studied, it is seen that it reached 6.6 million people in 1990 and approximately 10 million in 2000. It can be argued that this Master Plan aimed primarily at the conservation of the environment and to provide a healthy environment for a healthy urban life by the "belts of protection" that it brought to restrict the urban expansion, was based on a relatively accurate prediction of population growth.

However, today the main problem in Istanbul metropolitan area is the urban expansion and sprawl in every direction rather than the population growth. This process is accelerated with the incremental decisions such as the third bridge constructed on the very north of Bosphorus in the heart of Northern Forest, and the new international airport being built on a wetland near important water resources on the Black Sea coast. The continuing urban expansion threatens the Northern Forests, which were qualified as "the lungs of Istanbul," ecological corridors, agricultural fields, pastures and water resources, in contrary to the planning principles set in the Greater Istanbul Metropolitan Area Plan almost four decades ago.

Disclosure Statement

No potential conflict of interest was reported by the author.

Notes on contributors

Prof. Dr. S. Güven Bilsel was born in Istanbul and graduated from Istanbul Technical University Faculty of Architecture in 1960. He participated in the program held by the Senator of Re- construction and Settlement in Berlin in 1967. He continued his graduate studies in the Master Program of Town and Regional Planning at the University of Sheffield between 1972-74 and received his Master degree (MA.TRP.) from this university with his thesis study on "Piecemeal Urban Re-development." He worked in the Ministry of Reconstruction and Settlement in different positions, actively participated in the Metropolitan Planning of Istanbul, Izmir and Bursa and awarded with high honour certificates. He presented papers in international meetings and symposia, and headed the Turkish National Committee in the Urban Renaissance Campaign of the European Council in Strasbourg in 1980.

Prof. Dr. Güven Bilsel received his PhD degree from Gazi University in 1987 with his thesis entitled "Planning for Strategic Priority Areas." He taught graduate and undergraduate courses at the Department of City and Regional Planning at Gazi University in Ankara. He was invited to found the City and Regional Planning Department at Erciyes University in Kayseri, where he was appointed as a full professor in 1999. He continues his teaching activity at the Department of Architecture of KTO Karatay University in Konya. He is a member of RITP Urban Design Network and the Urbanization Architecture and Town Planning Committee of the Chamber of Architects of Turkey.

Prof. Dr. F. Candaş Bilsel received B.Arch (1987) and M.Arch (1989) degrees in Architecture from the Middle

East Technical University in Ankara. She continued her post-graduate studies in Sociology and Urban Geography at the Université de Paris X – Nanterre, and in Architecture and Urban Design at the École d'Architecture de Paris-Belleville. She obtained her Ph.D. degree in Space Planning and Urbanism at the Université de Paris X – Nanterre in 1996. Her Ph.D. dissertation is entitled “Cultures and Functionalities: Urban Morphological Evolution of the City of Izmir from the beginning of the 19th to the beginning of 20th century.” She published several articles and chapters in books, on the history of cities, urbanism and urban design. She was one of the curators of the exhibition From the Imperial Capital to the Republican Modern City: Henri Prost's Planning of Istanbul, held by Istanbul Research Institute Foundation in 2009.

Cânâ Bilsel is a professor of architecture at METU where she has been teaching architectural design studio and urban design courses in the undergraduate and graduate programs of the Department of Architecture since 1996. She is currently teaching at METU where she is the Chair of the Department.

Chiang Ching-kuo and the Regional Planning of Gannan under the Influence of Soviet Experience (1941-1945)

--The Planning Practice of Socialist Ideological Trend in Modern China

Li Zhao*, Li Baihao**

* *PhD, School of Architecture in Southeast University, archilz0706@gmail.com*

** *Professor, School of Architecture in Southeast University, libaihaowh@sina.com*

In the early 1940s, regional planning theory and practice spread into China. Gannan Reform dominated by Chiang Ching-kuo was an important experiment and marked by socialist ideology from the Soviet-Russia. In Jiangxi Province, Chiang Ching-kuo formulated the regional development path of first social construction and post physical planning. As a proponent of Confucianism, he combined the Soviet-experience with traditional Confucian urban-rural governance rules of ancient China. Promoted by Chiang, the government formulated two five-year plans (1941-1949) in 1941 and 1943. Under planned economy system, government developed public and cooperative undertakings to construct various industries and built a model state as an example for China which attracted the attention of world. The plan was similar to the Five-Years Plan of Soviet and P.R. China, and had an obvious socialist character. Its annual plan and ten-systems were also similar to Chiang's Four-year Plan and Top Ten Construction in Taiwan in 1970s. Based on historical archives, research has focused on Chiang Ching-uo and Gannan Reform and explained that how the reform can combined the Soviet-experience, planned economy, Confucian experience with regional planning as the earliest regional planning in modern China in 1940s. It's an extremely important issue that has not been excavated.

Keywords: Chiang Ching-kuo, Gannan Reform, Soviet-experience, regional planning.

Introduction

Origin of Research

China began to be integrated into world in the middle of 19th century in Qing Dynasty. The material civilization and values created by Industrial Revolution exerted enormous impact on Chinese traditional ethics and way of life.

The entry of West did not only weaken Qing government's fiscal capacity of engineering construction, but also shattered its control over city management. Areas that were not under direct control of China sprang up and were expanded, such as concessions, treaty ports and settlements¹. In new urban districts that were far away from old one, westerners set up urban authorities, introduced municipal management measures, built structures of consulates, custom office and infrastructure including streets and parks, reshaping the urban space different from that in Chinese traditional society.

In the end of 19th century, Chinese people began to make urban planning, which started from the imitation of concession and focused on urban facilities construction such as building streets. Planning during this period mainly consisted of detailed plans such as road planning, residential planning and reconstruction planning. In 1920s, the urban planning theory of modern cities in West was introduced to China, since when China changed the old city reconstruction focusing on streets and municipal construction into comprehensive urban planning. Starting from the *THE CITY PLAN OF NANKING* drawn up by Henry K. Murphy, cities in China began to make general plan.

After World War I and Great Depression in 1930s, it was urgent to carry out post-war reconstruction and boost regional economy nationwide, which triggered off the rudiment of regional development planning system. China was influenced by the regional planning and combined it with experience accumulated in local area². From 1930s to 1940s, regional planning sprang up in many areas, with the trend of combined urban and rural planning becoming the mainstream. Meanwhile, influenced by socialist thought and the First Five-Year Plan of USSR, regional planning of planned economy mode came into being, such as Guangxi Planned Economy Experiment conducted by Qiu Zhizhong and Movement of Establishing New Hubei advocated by Chen Cheng. Led by Chiang Ching-kuo, Gannan Reform greatly impacted by USSR experience was an important practice.

Research Significance and Status

Studies on the development of planning will contribute to our understanding on the evolution of planning in modern China, so that we can explore the pattern of planning localization. In addition, to summarize the origin and development of regional planning will also be of great significance to the trend of provincial planning and coordinated regional development in China currently.

At present, studies on planning in modern China mainly concentrates on special cities including concessions, trading ports and metropolis such as Shanghai, Peking, Canton, Hankow, Nanking and Tientsin, while studies on small and medium-sized cities are also gradually increasing such Amoy, Lanchow, Ningpo and Suchow. Due to separation administration of city and country in China, 90% of planning history research focused on city-centred planning, while there were relatively few studies on provincial and regional planning such as Guangxi. Therefore, practice in Gannan, Jiangxi Province conducted by Chiang Ching-kuo in 1940s is regarded as the object of this study, supplement of which will be conducive to our understanding of evolutionary planning development in modern Chinese cities from “point” to “surface”.

Object of Research: Chiang Ching-kuo and Gannan Reform

As the son of Chiang Kai-shek, chairman of the Committee of Government of the Republic of China (GRC), Chiang Ching-kuo³ (Figure 1-1) studied in the Soviet Union in his youth, returned at the age of 27, and participated in political activities from Jiangxi, one of the three model provinces of GRC⁴.

Gannan, abbreviation of southern Jiangxi Province, is adjacent to Hunan, Guangdong and Fujian Provinces, accounting for one-fourth of the total area of Jiangxi. (Figure 1-2)

During his work, Chiang Ching-kuo reformed local construction and planning in Gannan. Within 6 years, great changes have taken place, which was praised as a political miracle during wartime. It was known as Gannan Reform.

Figure 1-1: Chiang Ching-kuo in Gannan period; Figure 1-2: Location of Gannan in Jiangxi Province.

Ideological Source: Soviet Planned Economic Experiment

Reviewing the Gannan Reform, we can find that government intervention in urban and rural construction and governance robustly featured planned economy. Featuring more or less USSR socialism, these measures combine collectivism, Confucianism and Fascism. Chiang Ching-kuo declared that he would turn Gannan into the model area of Three Principles of the People raised by Sun Yat-sen, which actually resembled a small socialist Soviet Union. His thought originated from his study in the Soviet Union in the early years as well as the conception of socialism.

Studying in the Soviet Union

In 1925, Chiang Ching-kuo went to Soviet Union at 15, studying in Moscow Sun Yat-sen University and learning from K. Radek, president of the university and Trotsky's loyal supporters⁵. Aspiring to disseminate the idea of socialist revolution around the world, Radek viewed the son of Chiang Kai-shek as the leader of Chinese

revolution and even the leader of the world revolution, so he taught everything he knew to Chiang. After graduation, Chiang Ching-kuo pursued advanced studies in Central Tolmatchev Military and Political Institute in Leningrad.

Soviet Planned Economy Experiment

In the administration era of Stalin, the Soviet Union abandoned new economic policies in the era of Lenin. The period from 1928 to 1932 marked the First Five-Year Plan in the Soviet Union. Under the highly centralized planned economy system, political intervention boosted national industrialization, turning a large agricultural country into a planned economy aiming at large-scale industry. The theory on socialist urban construction and planning were also conceived in the process of implementation of the plan, and later developed and improved in the period of the second and third Five-Year Plan. During this time, Chiang Ching-kuo was studying in Moscow, greatly influenced by those thoughts. After graduation, Chiang once worked as an intern in Dynamo Power Plant and held a post as chief editor of *Worker's Daily* as well as factory director of heavy machinery shop, witnessing the urban construction under socialist system⁶.

Returning and Serving

In 1937, 27-year-old Chiang Ching-kuo finally returned after spending 12 hard years in Soviet Union. In the first meet with his father Chiang Kai-shek, Chiang Ching-kuo put forward his aspiration to advance progress in spite of hardships⁷. However, Chiang Kai-shek declined his proposal due to his lack of experience. Upon returning to his hometown Xikou in Zhejiang Province, Chiang Ching-kuo studied classics of Confucianism and works written by Sun Yat-sen including *General Plan for National Reconstruction*, learning the theory of New Confucianism and Three Principles of the People.

In 1938, suggested by Xiong Shihui, president of Jiangxi Province, Chiang Kai-shek appointed Chiang Ching-kuo to take office in Nanchang. In March 1939 when Japanese forces were about to invade Nanchang, Xiong Shihui moved the government to Kanhshien, a city in south of Jiangxi (Gannan Area). Chiang Ching-kuo was appointed as the supervisor of Gannan.

In August 1939, Stalin signed non-aggression treaty with Hitler. Abandoning its invasion in Russia, Japan coveted Southeast Asian colonies that were plunged into European battlefield, attempting to establish new order in East Asia. With the ending of war in China, Japanese troops no longer occupied new area and stopped its military action of occupying Jiangxi. In China at that time, major cities including Shanghai, Guangzhou, Wuhan, and Nanchang had fell into enemy's hands. Changes of situation enabled Gannan to become a crucial place in terms of geography, which linked south and north. Chiang Ching-kuo once asserted that Gannan was a suitable place for resistance against aggression and the founding of the nation⁸. As a temporary safe place, Gannan offered sound conditions for the reform.

Chiang Ching-kuo and Gannan Reform (1939-1945)

Gannan Overview

Located in the upper reaches of Ganjiang River, Gannan bordered Baiyue to the south and Henan Province to the north. It was at the centre of five ridges and crucial to the development of Jiangxi, Fujian, Guangdong and Hunan⁹. Surrounded by hills and mountains, Gannan was a relatively independent area, crossed by Zhang River and Gong River, which flowed westwards into Yangtze River.

Administrating 11 cities and counties including Gan County, Dayu, Nankang, Xinfeng, Longnan, Dingnan, Qiannan, Shangyou, Chongyi, Anyuan and Xunwu, the district covered an area of 23,000 km² and had the total population of over 2 million, with its administrative office in Kanhsien. (Figure 2) Founded in 201 BC, Kanhsien city relocated many times due to chaos caused by war and flood. Consequently, it was located between Zhang River and Gong River in 552 AD, the history of which lasted for 1400 years. Kanhsien was high in the middle and low in surrounding areas, known as the city of tortoise because of its shape.(Figure 3) With the opening of Dayuling thoroughfare, an important regional trade thoroughfare, continuous progress was made in commerce and transportation in Kanhsien. Developing into the transportation crux of south eastern China, Kanhsien was known as a pass to four provinces. However, after the Opium War, coastal trade achieved development, hinterland shrunk, leading to the decline of Yulin thoroughfare and Kanhsien¹⁰.

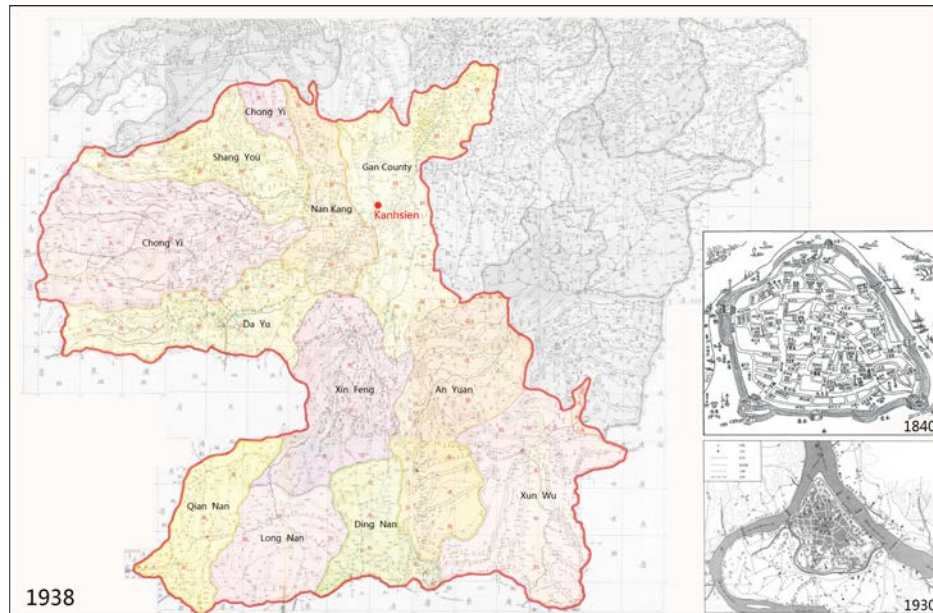

Figure 2: The 11 regions of Gannan and the ancient Kanhsien city in history.

Despite the fact that China experienced 10 golden-years for construction (1927-1937), there were powerful enemies outside and bandits and warlords at home, which left refugees destitute and homeless. In 1939 when Gannan was controlled by warlord and local bandits in Guangxi and Guangdong provinces, destitution, poverty, cultural backwardness and misery prevailed everywhere.

Social Governance Centered on Economy and Culture

Upon taking the office, Chiang Ching-kuo was so ambitious and positive that he put forward the slogan that building Gannan means building Jiangxi Province and even building new China. He also aspired to establish a Communism paradise without Communist Party. In view of status of Gannan, Chiang drafted the regional development path featuring socialist construction first and material planning second, attaching great importance to the socialist construction in economy, propaganda, organization and spirit.

(1)Economy

In view of the devaluation of paper currency and inflation, people live in great misery. Chiang Ching-kuo first stabilized national economy, adopted controlling economic policies and set up Gannan cooperative and transaction stores, controlling the sale of commodities, oil and rice, so that he could crack down on profiteers and eliminate the threat of soaring prices.

(2)Propaganda

Chiang Ching-kuo prioritized the importance of psychological warfare due to his studying in Soviet Union, so he spared no effort to apply media tools. At that time, under the call of “going to Yan’an”, a great number of young people rushed to Yan’an in northern Shanxi Province, where Communist Party and MAO Zedong were stationed, meanwhile some of them also went to Gannan under the call of Chiang Ching-kuo. Chiang started Integrity Daily, news agency, New Gannan press and New Gannan Bookstore, drawing the attention of talents and supporting him.

(3)Organization

Chiang Ching-kuo applied the Komsomolsk mode into Jiangxi Province, and told his father that youngsters in today's China were so passionate but lack of working methods and correct political line. He set up young cadre training class, advocating that youth organization should mainly consist of farmers, workers, students, teachers, freelancers, merchants and capitalists. Talents cultivated in this organization later became the pillar of the implementation of various policies in Gannan Reform.

(4)Spirit

Born in the same place with Wang Yangming (1472-1529), the representative of Confucianism in Ming Dynasty, Chiang Kai-shek and Chiang Ching-kuo were all advocators of new Confucianism. In 1520s, when Wang Yangming took charge of Gannan, he drawn up *Local Rules and Regulation of Gannan* so as to improve social

morality. Combined with Bao and Jia household registration system of old China, the county regulation system became the ruling mode ensuring the stability of Gannan for 400 years. Chiang Ching-kuo imitated Local Rules and Regulation of Gannan and issued *New Gannan Rules*, promoting ideological and cultural construction in local area. To regulate people's daily life through Chinese traditional virtues and standard of conduct as well as spiritual education, bad custom in people's daily life was changed and openness in culture was also advanced. Through one year effort, fresh progress has been made in Gannan.

After conquering all these hardships, Gannan area gradually achieved social stability, and Chiang Ching-kuo also promoted his conception step by step. Since then to 1945, he began to developed economy, education and carried out reform and planning.

Two Regional Planning

Through what Chiang Ching-kuo had written in letters, it could be found that he always hoped to have the opportunity to transplant a soviet social mode in China. However, under the ideology and administration system of GRC, he had no chance to carry out his ideas, still less could he implement the soviet planned economy. He tried his best to utilize the slogan of building Three Principles of the People demonstration zone, protecting his dream of building a socialist Soviet¹¹. Two regional planning from 1940 are examples to show that.

The First Three-year Plan of New Gannan

In the Executive Meeting of Ganan held in November 1940, Chiang Ching-kuo put forward that he wanted to establish economic system of Three Principles of the People. He believed that “the reason why our economic system was different from the capitalist economic system was that we had plans.” Chiang launched Gannan Reform in Kanhsien, aspiring to turn Gannan into a demonstration area of Three Principles of the People. Under his effort, Establishing the First Three-Year Plan of New Gannan formulated at the meeting advocated that a long-term goals should be achieved¹², namely, turning poor and old Gannan into an advanced and prosperous new Gannan with high happy index¹³.

Maybe influenced by The General plan for National Reconstruction by Sun Yat-sen, many planning in the Republic of China era featured industrial and regional planning, among which Gannan Reform was no exception. The Three-year Plan consisted of ten industries including agriculture, forestry, industry, commerce, mining, transportation, education, culture, health and relief. (Table 1)

Projets	Measures				
Agriculture	Land reclamation	The building of farms	Promote cooperative organizations	Repairing and renovating irrigation and water conservation	Opening orchards
	Establishing new villages in rural areas				
Forestry	Forest resources protection	Building new Gannan	Expanding nursery	Tree planting competition	Control on timber sale
Industry	Setting up guiding institution of handicraft industry	Promote cooperative industries	Set up various factories	Rewarding industrial investment	Promote small family factories
Commerce	Building state stores	Setting up consumer cooperatives	practising small loan		
Mining industry	Exploiting mineral resources	Improving exploitation methods	Rewarding privately operated mine sites		
Transportation	Building roads and bridges	Regulating traffic order	Building telephone communication network	Building post communication network	Opening up county main road
	Improving road network	Building freight transport network	Dredging and realignment of rivers		
Education	Building middle schools	Building vocational schools	Building county and village schools	Building national schools	Setting up educational fund
	Building schoolhouses	Building libraries	Building stadiums	Building kindergartens	Rewarding donation to build schools
Culture	Circulating newspaper	Building bookstores	Building printshops	Publishing popular books	Building parks

	Advocating academic research	Building theatres			
Health	Building health centers	Setting up tuberculosis sanatorium	Building leprosarium	Improving environmental sanitation	Building public restrooms
Relief	Setting up almshouses	Setting up relief factories	Setting up orphanage	Setting up residence for people	Setting up woman factories
	Setting up relief fund				
Urban construction	Building food markets				

Table 1: Specific measures in *the Three-year Plan*

In the plan, it was required that 331 factories, 314 rural villages, 2,900 demonstration zones, 3,000 cooperatives, 6,043 water conservancy projects, 321 orchards and 3,000 new schoolhouses would be built and 1.33 km² barren land cultivated¹⁴. The core goal was not material construction, but to inspire people through material construction. Chiang Ching-kuo attracted coastal investment to Gannan to open factories through his personal influence. After the outbreak of Anti-Japanese War, a great number of coastal universities and colleges as well as enterprises moved to Kanhsien offering abundant human and industrial resources to the implementation of Three-Year Plan.

Before Chiang's coming, Guangdong warlord established government office in Kanhsien, carried out improvement in municipal administration, and drafted General plan of Municipal Administration Planning of Kanhsien, which was the first reform planning in its history. Imitating the municipal construction of Canton, the planning involved the building of arcades, parks, roads, markets and fire-fighting devices, so Kanhsien was also known as small Canton. Large-scale construction was once made in urban roads. From 1933 to 1935, 15 roads were open to the public, and the city wall no longer limited the development of cities. Connected with Ganyu highway and Gansui highway and distributed in the shape of net, these roads enjoyed 6.53 km and covered a construction area of 10,000 m². Because of turmoil and chaos during war from 1935 to 1941, the government failed to build new city roads.

After issuing the Three-Year Plan, city roads construction in Kanhsien reached the climax from 1941 to 1947. (Figure 3) From 1941 to 1945, 6 roads were built with total length of 2.18 km and total road area of 25,500m², and 6 bridges including Zhongzheng bridge, new Gannan bridge and Zhongxiao bridge. After Chiang Ching-kuo resigned, Yang Ming took the office and continued administrative policy advocated by Chiang. From 1946 to 1947, 8 roads have been opened, with the total length of 5.1 km and total area of 44,200 m². These roads made up structural framework of roads in Kanhsien up till now. (Table 2) In the process of expanding roads, the way of dismantling city walls to build roads was not adopted. Instead, followed the *THE CITY PLAN OF NANKING*, all city walls and city gates were preserved.

Figure 3: Road construction in the reign of Chiang Ching-kuo.

Name	Completion Time
New Gannan Road	1941
Sports Road	1941
Wenqing Road	1941-1947
Lianxi Road	1941
Zhanggong Road	1943
Dagong Road	1946
Healthy Road	1946
Bajing Road	1946
Houde Road	1947
Peace Road	1947
Big Huaxing Road	1947
Small Huaxing Road	1947

Table 2: Road built in 1941-1947

Gannan Reform and Three-Year Plan aimed at improving the city landscape and people's livelihood, so a number of buildings catering to people's living and war were set up, such as children village, Jiangxi Nursery, Zhengqi Middle School and Xinren factory. (Figure 4)

Figure 4: New buildings and street view in new Kanhsien, Gannan.

When the Three-Year Plan was about to finish in 1944, 2,800 schools, 657 farms, 1,996 water conservancy projects, 17,000 km of roads, over 5,000 bridges were built. The number of the unemployed decreased by 3 times compared with that of 1938, boosting economic development in Gannan, and Kanhsien became one of the 14 largest cities in the country at the time ¹⁵.

The Second Five-year Plan of New Gannan

In January 1943 when the First Three-Year Plan was about to finish, Chiang Ching-kuo issued The Outline of New Gannan Construction, preparing for the Second Five-Year Plan. In the same year, Gannan of Jiangxi Province enacted the Second Five-Year Plan of New Gannan, attaching the implementation schedule. In the Five-Year Plan, national defence was regarded as the key due to the need in wartime, and economic plan should be drafted on the basis of military demand.

Since Gannan had relatively weak industrial basis, Chiang Ching-kuo had clear understanding on what had been achieved in the First Three-Year Plan and high expectation of the Second Five-Year Plan. He believed that the Three-Year Plan can only finish the basis of construction. Other important tasks was about to be done in the Second Five-Year Plan.

In terms of the industry, the Five-Year Plan put forward learn soviet model, established heavy industrial base, developed agricultural industrialization and carried out agrarian reform so as to achieve industrial mechanization. To solve the problem of concentration of landholding in Gannan, Chiang Ching-kuo put forward the Executive plan of land Administration in new Gannan, established demonstration area, cooperative farms, rural new villages and enabled land-to-the-tiller through adopting yeomenry equalization of landownership policies of Three Principles of the People. In Anti-Japanese war, only 4 counties set up 6 yeomenry demonstration areas, levying 7.2 km² land and 1,116 yeomenries ¹⁶. The relatively mild land reform policies were first tested in Gannan, and were popularized in Taiwan after initial progress was achieved.

At the same time, the Five-Year Plan also attached great importance to education and spared no efforts to set up public educational buildings to train professionals and talents for region, such as library, science building, art building, kindergartens and schools.

Different from the Three-Year Plan, the Five-Year Plan set clear construction goals of population size, urban and rural area under administration and construction sequence, featuring initial modern city planning.

Modern city construction was put forward in the plan, namely, achieving city modernization and village urbanization and creating new living environment. Main roads including Dagong road, Ganjiang road and Wenqing road were built in Kanhsien at their centre. Various counties in Gannan were turned into modern standard cities and small commercial centres such as Yulu, Jiangkou and Shadi were rebuilt into modern cities. Satellite town of Kanhsien was thus formed and the population plan of Kanhsien was also enlarged to 500,000. (Figure 5)

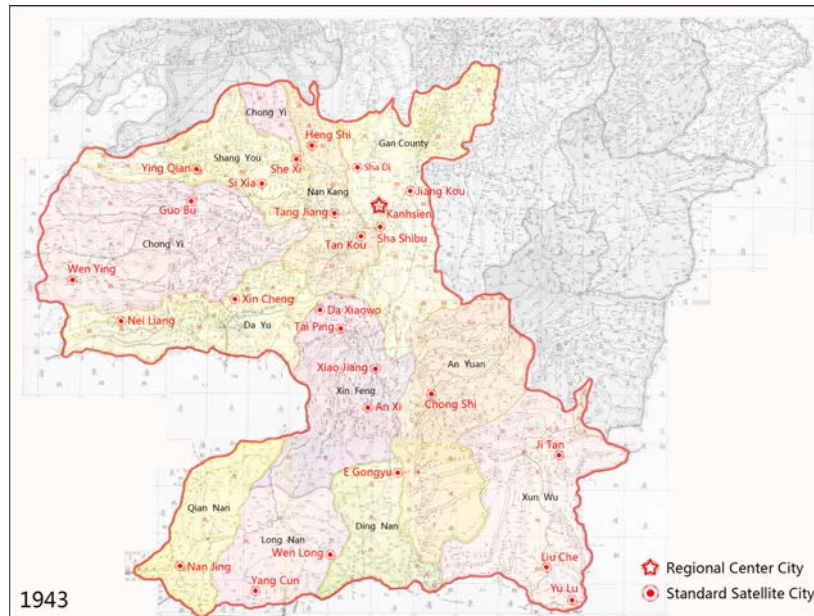

Figure 5: Concept of satellite towns.

11 counties administrated by Gannan regarded Dayu, Chongyi and Shangyou as NO.1 heavy industrial centre, Gan county, Nankang and Xinfeng as NO.2 heavy industrial centre, Longnan, Dingnan and Qiannan as light industrial centre and Xunwu, Anyuan as handicraft industrial centre. Counties set up astronomical observatory, broadcasting stations, and Niedu was renovated into a scenic spot. Recuperation village was built, and travel agencies were built in Longnan and Xinfeng. (Figure 6) It is proposed that Gannan would be turned into a paradise for people who worked within 5 years.

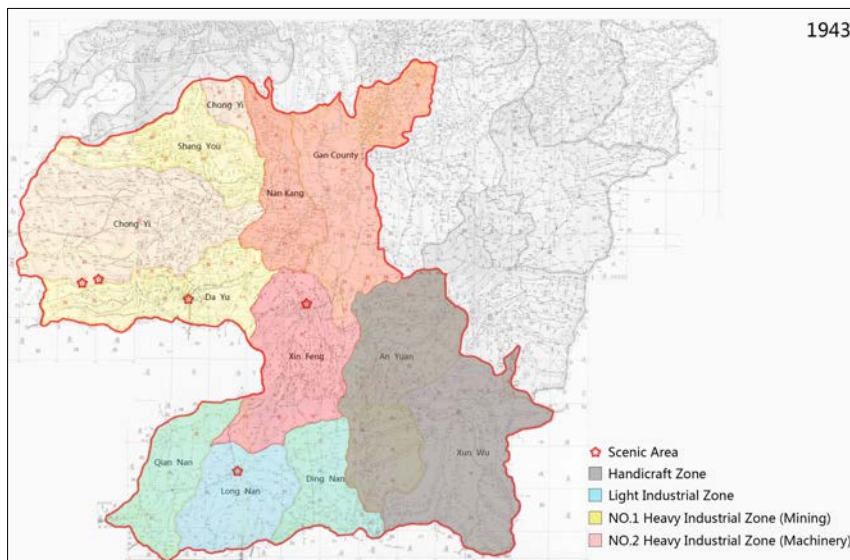

Figure 6: Layout of industrial space.

Evaluation of Gannan Reform

Remarkable achievement has been made since Chiang Ching-kuo took charge of Gannan, which was called as Gannan Model and won praise by others. There was even a saying that Gannan had great influence in post-war politics. Chiang Kai-shek was satisfied with the achievement made by his son, and he praised in the telegraph, "It has been 3 years since my son served as the administration commissioner, and I felt so pleased that he won people's love and respect for his achievement in social construction."

Compared with the governance of government in other areas, reform conducted by Chiang Ching-kuo was quite unique and drawn the attention of China and even the world. In particular, it was quite obvious when foreign visitors compared the backward Gannan with other areas in China. In July 1943, *Collier* took the lead to publish the article *Gissimo is Building a Model State as an Example for New China* so that Chiang Ching-kuo and New Gannan were known overseas¹⁷. Atkinson, journalist of New York Times, interviewed people in Gannan and published the article *Kanhsien Sets Aim for People's Rule*, in which he said that insightful personages in China preferred to talk about Chinese modernization, however, only Gannan was advancing it¹⁸. From the perspective of Atkinson, Kanhsien was the most modern and cleanest city in China.

Ta Kung Pao in Chongqing also reported it, showcasing that the progress of top-down reform in new Gannan was obvious. Certainly, achievement should also be attributed to the effort made by the authority. These changes were only a small fraction of changes in new Gannan¹⁹.

Since 1945, Chiang Ching-kuo resigned and worked in the central government, but he still frequently commuted Chongqing and Gannan. In spite of this, he cared about the Gannan reform and promoted the implementation of the Second Five-Year Plan.

Unfortunately, Japan launched war in January, 1944 and occupied Kanhsien on February 5. Jiangxi Province was occupied by Japan, so the unfinished plan of Gannan Reform was postponed.

Conclusion: Characteristics and Influences

The Combination of Pluralistic Thought and ideology

As a legendary politician who integrates Chinese Confucianism, Soviet Communism, American democratic value, and Taiwan experience, Chiang Ching-kuo was a complicated governor. His attitude towards life originated from Chinese culture and his life experience in the underclass of Soviet Union. Like his father Chiang Kai-shek, Chiang Ching-kuo was also a vindicator of Chinese traditional culture and the disciple of Three Principles of the People of Sun Yat-sen. However, China's political situation has made it necessary for him to become a warlord-style local consul, and it is precisely because of the nature of the warlords that it can effectively implement similar reforms. Urban planning of western modern cities, capitalism, soviet planned economy model, cosmopolitanism of Chinese tradition and socialism were all mixed and utilized in Chiang's practice, cantering on the goal of developing industry, building cities and forming unique administrative model, which was different from Chongqing of Kuomintang and Yan'an of Communist party. It was the most distinctive feature of Gannan Reform.

The Critical Continuation of Traditional China in Modern Times

Critical inheritance of Chinese traditional thought was also a feature of this reform. Before Chiang's practice, whether the country governance made by Wang Yangming through Local Rules and Regulation of Gannan or the new village movement advocated by Yan Xishan, Yan Yangchu and Liang Shumin in Zouping, Dingxian and Jiangning were focused on education, economy and culture but substantive rural and urban planning. On the basis of their experience, Chiang Ching-kuo issued and implemented the regional development path of 'featuring socialist construction first and material planning second'. Through this path, he accurately grasped the social status quo in the Gannan region and stabilized economic and industrial in a short period, which inspired a greatly improvement in rural and urban landscape and people's living standards.

Continuation of the Reform in Taiwan

When concluding the experience of Gannan Reform, Chiang once said that this experience should be respected and thought about how to be used in the future.²⁰ During the Taiwan period, the administration style of Chiang was still well-received by people like in Gannan time. When Chiang Kai-shek resigned, Chiang Ching-kuo governed Taiwan and drafted a series of Four-year plan and Six-year Economic plan, and advanced ten constructions. The influence of his administration in Gannan to his politics career could be dimly reflected by what he had done in this period.

Ten industries of Gannan Reform and ten constructions carried out when Chiang Ching-kuo took charge of Taiwan had much in common. Ten constructions, featuring obvious planned economy, was more Taiwan version of Stalin planned economy than new deal of Roosevelt. Therefore, Chiang's administration in Gannan was an important period for individual political development. It could be said that the achievements in Gannan period to some extent led to the development of Taiwan's economy, which also laid a solid foundation for Chiang's administration and rapid economic soar.

Epilogue

Gannan Reform resembled the local autonomy, which was a top-bottom reform based on government. Under the leadership of such a heroic figure as Chiang Ching-kuo, through strong government administrative intervention and self-development in a planned economy model is the establishment of self-government outside the national power structure. Though progress had been made in a short period, for instance, economic modernization was first advanced in provincial area and contribution was made to the modernization of Gannan, dissimilation of system was an obstacle impeding the development of Gannan local autonomy. This problem was solved after Chiang Ching-kuo took charge of Taiwan, and then local autonomy became indispensable part of power structure of the country, which could create benign interaction. Despite of various challenges, the Gannan Reform, as an exploratory regional planning practice, was influenced by western philosophy and kept distinctive Chinese tradition at the same time. This process is also the evolution of local planning in modern China.

Acknowledgements

I wish to acknowledge the considerable contribution that Xu Hao, a Ph.D. candidate student in Southeast University, gave a lot of inspiration in the initial stages of the article. And thanks also to my ex-girlfriend, who has supported me for the last 5 years. I wish you happiness.

43 Garden City and Modern City Planning Movement

A Republic of Garden City-states on Which the Sun Never Sets: Auguste Comte and Richard Congreve's Urban-regional Vision for the British Empire

Matthew Wilson (Ball State University)

By the early twentieth century, Britain had forged a congeries of colonial outposts comprised of some 57 million people within a territory of 95 million square kilometres. Britons hailed it as the 'empire on which the sun never sets'. Historians of political thought have suggested that there were few if any critics of the British Empire until the end of the nineteenth century. Yet it has been recently shown that a little-known group of citizen-sociologists represented a cogent, polemical force against British aggression abroad. Along these lines this essay seeks to show that these citizen-sociologists in fact sought to systematically break up the British Empire and, in turn, create a network of idyllic real places – deliberative eutopias – which were to take the form of Garden City-states. These citizen-sociologists were the followers of the French philosopher Auguste Comte. The former secretary of the 'utopian socialist' Henri de Saint-Simon, Comte was once considered the most well-known thinker of the nineteenth century. He introduced the modern science of sociology and the republican Religion of Humanity in association with a vision he called the 'Republic of the West'. After setting out the socio-spatial character and qualities of the sovereign republics nested within the 'Republic of the West', this essay will show that from the 1850s Comte's British followers, led by the Oxford don and ex-Anglican minister Richard Congreve, implemented a controversial practice of applied sociology and the Religion of Humanity with the aim to create his global network of utopian city-states or republics. Using an intellectual history method, this essay will show that through to the interwar period Congreve's affiliates – Frederic Harrison, Charles Booth, Patrick Geddes and Victor Branford – attempted to realise Comte's vision. With scarcely used source material it will present the Positivists as an organised resistance to imperialism, industrial exploitation, poverty and despondency. Much to the consternation of the church, state and landed aristocracy they organised urban interventions, led ad hoc sociological surveys and published programmes for realising idyllic city-communities. Effectively this essay contributes to our understanding of how Positivism can be understood as a utopian spatial design praxis.

Gailiang Dushi: The Garden City, Urban Improvement, and Visions of Modernization in Early 20th Century China

Cecilia Chu (The University of Hong Kong)

Recent research in planning history has significantly expanded the understanding of the international dissemination of the garden city idea in the 20th century. These works have helped to direct attention away from the more researched cities in Europe and North America to 'non-Western' contexts, including colonial and semi-colonial territories that served as experimental grounds for ambitious modern planning projects. This paper builds on this scholarship by examining how the garden city idea was first introduced to China via Japan in the early 20th century and subsequently utilized by various urban reformers and development agents as a means to promote urban improvement, economic development and nation-building. It will begin by tracing Chinese writings on the subject that first appeared in academic journals and mass-market texts in the mid 1910s. While the basic descriptions of the forms and organization of the garden city differed little from those in foreign language texts, they tended to highlight the urgency to adopt a 'Western' planning model by criticizing the backwardness of China's development which lagged behind those of more advanced nations. These critiques were also grounded on a growing faith that modern planning based on scientific principles could provide solutions to all urban problems and help revive the declining rural economy in the countryside. By the mid 1920s, the idea of creating entirely new garden cities away from existing metropolises became seen to be increasingly feasible with the rapid construction of motor roads and other infrastructures. The optimism associated with the arrival of new transportation technologies further increased the anticipation for decentralization, industrial development and agricultural reform across the nation. These ideas were elaborated in a growing number of articles in specialist journals and 'general knowledge' books series focusing on urban planning and administration. Although Howard's original radical vision, which was predicated on voluntary cooperation and associative democracy, was not the central tenet in these texts, the underlying polemics of creating a more perfect city and harmonious society retained a lasting appeal to promoters of the garden city concept. The idea also attracted the attention of many ordinary urbanites who looked to the garden city not so much as an ideological instrument for nation building, but more as an idealistic image that fostered their aspirations to live a better life by becoming owners of a suburban property in a safe and healthy environment.

By examining the multiple, and sometimes conflicting interpretations of the garden city in this period, this paper will provide a better understanding not only of the dissemination of a key foreign planning concept in the Chinese context, but also some of the specific ways in which it interacted with existing discourses about the city, the countryside and the roles of the state and citizens in constructing competing visions of the urban future. The study also hopes to prompt critical reflections on contemporary reappraisals of the theory and how particular assumptions about the urban-rural relationship are being reformulated to support nationalist development in the present.

A Comparative Study of Two Hotels from the Perspective of “Altruism”-Development Plans of the Koshien Area in the 1920’s

Tomoko Kuroda (Mukogawa Women’s University)

Koshien” was the name given to an area between the Eda and Saru Rivers in 1928 (Fig. 1)

This area had been purchased by Hanshin Electric Railway Co., Ltd. (HER) in 1922 from the Hyogo Prefectural Government for 4.1 million yen. The 6.8 hectares of land was to be the largest development area for HER.

In 1924, HER opened the Koshien Baseball Stadium where two rivers branched as the core of the leisure area to the south of the HER railroad (Fig. 1)

In 1930, the company opened Koshien Hotel designed by Arata Endo (1889-1951) at the spot where the Eda River branched from the Muko River, as the core of the residential area to the north of the railway.

This paper compares Koshien Hotel of Endo with the proposed hotel in the Koshien Kaen City Plan of Reijo Oya (1890-1934) from the perspective of “altruism.” Endo was a free architect who had served as the chief assistant under Frank Lloyd Wright (1867-1959) for the construction of the Imperial Hotel, well known as Wright’ s masterpiece and a representative of modern Japan. The hotel was completed by Endo in 1923. After Endo became independent, the first hotel he designed was Koshien Hotel. It has both Japanese and Western suites not only for guests and dignitaries from Japan and abroad but also for Japanese families to enjoy.

Oya served the Osaka Prefectural Government as a landscape architect designing gardens and parks. From 1921 to 1922, he inspected Garden Cities and suburbs in England, Germany and America including Letchworth and Welwyn planned by Ebenezer Howard (1850-1928), whom he revered for attempting to solve the problem of overcrowded cities. After returning to Japan, Oya theorized his own Kaen City (Garden City) and proposed the Koshien Kaen City where citizens could enjoy gardening. At what would become the site of Endo’ s Koshien Hotel, Oya proposed a horticulture area, where the residents could learn how to grow vegetables and fruits in their own gardens (Fig. 2)

I will compare the two hotels from the viewpoint of the customer target and the possible activities related to the features of the architecture.

Next, I examine them from the viewpoint of the relationship between the hotel and the surrounding environment. The two sites are in such contrast to each other with Oya’ s site at the south, facing the bright spacious ocean, while Endo’ s hotel stands in a dense pine forest facing a clear pond (Fig. 3)

In Oya’ s plans, this would have been the water resource for the area (Fig. 2)

In conclusion, while Oya considered the pine forest area as a residential one with those living there to be engaged in gardening, Endo planned his hotel based on the character of the site and the surrounding area. Endo rarely expressed his views in writing but seems to have considered the pond when planning the shape and design of Koshien Hotel.

Chilean pioneers and the crystallization of “urbanismo”. Records in journals and professional bulletins (1872-1929)

Macarena Ibarra Alonso (Pontificia Universidad Católica de Chile)

When crystallization of “urbanismo” took place as a professional activity, after the creation of the Sección de Urbanismo (depending on the Ministry of Foment), the promulgation of a national urban regulation in 1929, and the beginning of the teaching of the discipline a year before, already existed -in the national context- a corpus of knowledge led by professional pioneers. This paper looks at their contribution, by examining journals and professional bulletins of the physicians, engineers and architects. Their publications exhibit the discussion of key themes of the new discipline while permit to grasp into the main traditions that conformed an early disciplinary language. Apart from focusing on the urban fabric and the circulation problems, the issues of urban health and social housing were crucial on these debates. For instance, while Revista Médica declared that looking after scientific knowledge and diffusing the sanitary state of the country was its essential mission, the Anales del Instituto de Ingenieros confirmed the public role of its engineers and Revista de la Habitación, led by the circle of architects, focused on private constructions, particularly on social housing. Thus, while associations and professional circles consolidated their own disciplines, their scope of action was shaped by urgent issues of urban environments.

Even though they put emphasis on different dimensions, these publications show the debates that individuals, professional circles and associations were leading, and their role in the formation of a new discipline as a professional and public activity. To sum up, journals and professional bulletins show the discussion that shaped the “urbanismo’ s” eve; a discussion that showed how the mission of the discipline moved from a diagnosis about urban conditions towards the proposals of the first public policies. This latter, gradually, materialized in a new legislation and institutionality that marked the formative period of the discipline.

A republic of garden city-states on which the sun never sets: Auguste Comte and Richard Congreve's urban-regional vision

Matthew Wilson*

* Ball State University, MRWilson@BSU.edu

From the mid 1850s and into the interwar period a little-known group of citizen-sociologists attempted to break up the British Empire and establish a proto- garden-city-state network. These actors were the followers of the French Positivist philosopher Auguste Comte and his British acolyte Richard Congreve. Comte introduced the modern science of sociology, the Religion of Humanity, and the utopia called the Occidental Republic. After setting out the socio-spatial character of this utopia, this study will argue that from the 1850s the former Oxford don and ex-Anglican minister Richard Congreve advocated Comte's principles as British international and national policy. I will contend that Congreve's affiliates formed an organised resistance to imperialism, exploitation, poverty, and despondency. They created urban interventions or Positivist institutes, led ad hoc sociological surveys, and published programmes for realising regional republics. This essay contributes to our understanding of how Positivist sociology was a eutopian spatial design practice rooted in creating a comprehensive and participatory moral, cultural and intellectual network for the life virtuous. If we require some alternative to religious fanaticism, political lethargy, provincialism, fake news and right-wing reaction, the praxis explored herein might serve as a precedent for ethical, political and collectivist spatial agency.

Keywords: urban visions, comprehensive planning, sociology, positivism, garden cities, humanism

Introduction

By the early twentieth century, Britain had forged a congeries of colonial outposts comprising 57 million people within a territory of 95 million square kilometres. It was hailed as the "empire on which the sun never sets." Historians of political thought have suggested that there were few if any critics of the British Empire until the end of the nineteenth century.¹ Yet from the mid 1850s a little-known group of citizen-sociologists emerged as a cogent polemical force against aggression abroad. These actors, I argue, sought to break up the British Empire and, in turn, establish idyllic real regions or utopias. They were the followers of the French philosopher Auguste Comte, the Positivist thinker who introduced the modern science of sociology and the republican² Religion of Humanity. Together this science and religion served as the basis for a utopia called the Occidental Republic, which, I contend, was akin to the establishment of a global network of garden city-states. After setting out the socio-spatial character and qualities of the sovereign republics nested within this utopia, it will be shown that from the 1850s Comte's British followers, who were led by the Oxford don and ex-Anglican minister Richard Congreve, implemented a sociological practice for reconstructing international, national and regional affairs.

Using an intellectual history method, this essay will argue that through to the interwar period Congreve's followers — Frederic Harrison, Charles Booth, Patrick Geddes, and Victor Branford — made a cogent attempt to realise Comte's vision. Much to the consternation of the church, state, and landed aristocracy they polemicised against imperialism, industrial exploitation, poverty, and despondency. They built on Comte and Congreve's historical-geographical surveys by leading industrial, social, civic, and rustic types of surveys to evaluate the nature of social life. They organised urban interventions (Positivist schools, lecture halls, churches, and civic societies) as educational nodes and community-action centres, where they fleshed out programmes and manifestos offering systematic counsel for transforming chaotic conurbations into independent, eutopian communities. For these Positivists, planning was not a bureaucratic, materialist practice of setting out plots, roads, trees, and pavements. It was a human-centred and process-focused practice seeking to create a comprehensive political, cultural, and intellectual network for the life virtuous.

Recent studies by Scott and Bromley, Young and Clavel, Bowie, Egbert, and others have covered the radical and socialist tradition of British sociology and planning but, barring accounts of Geddes and Branford, organised Positivism has remained neglected.³ Notwithstanding the system of thought captured the imagination of well-regarded social reformers, physicians, scientists, philosophers, literary savants, and trade unionists.⁴ The emergence of the modern metropolis was the result of the coordinated contributions of such actors. The urbanist Edward Soja has argued that Comte's long-forgotten utopian "manifesto" spurred this activity. It forecast how the cooperation of various practitioners led to the realisation of a vast number of metropolises, which were "elaborated, diffused and reinvented all over the world" during the nineteenth and twentieth centuries.⁵ The basic template

here, arguably, was the garden city as a self-sufficient unit.⁶ The Positivists were central to preparing and furthering this discourse for the small planned state through their political polemics, sociological surveys and programmes for eutopian social reorganisation.

International policy for republics or city-states

In their age of revolution, empire and capital the Positivists believed that modern civilisation was on the cusp of radical change. Modern humanism opens with the founding father of social democracy and Positivism, Henri de Saint-Simon (1760–1825). He envisioned several transnational urban infrastructural projects and the emergence of a “meritocratic, managerial, free-market society.”⁷ While he was the secretary to Saint-Simon, Comte developed historical sociological surveys of western society which pointed to the rise of this “positive era.” They traced the withering-away of monotheistic and monarchic powers since the medieval period; science and industry, they proclaimed, were the new “spiritual and temporal” power structures of modernity. A “Newtonian elite” of scientists could assume the role of the “papal and theological” power. What was needed, however, was a “positive doctrine” based on a hierarchical classification of the human and natural “sciences of observation.”⁸ With such a doctrine, this scientific elite could coordinate the activities of moral, social and political affairs. What was missing was the positive science of society, which Saint-Simon outlined under the rubric “social physiology.” Along this vein, in the wake of the July Revolution, Comte introduced in his famous *Cours de Philosophie Positive* (1830–6) the “master-science” of sociology.⁹ Sociology, alongside morality, would constitute the two premier disciplines within his classification of the sciences.¹⁰ By the 1848 Revolution, Comte had established the Positivist Society and the Religion of Humanity. Positivist sociologists, Comte declared, could spur a “moral revolution” to answer the “question of modern times,” the “incorporation of Woman and the Proletariate [sic] into Modern Culture.”¹¹

Comte’s magnum opus, the *System of Positive Polity* (1851–1854), detailed a utopia-planning manifesto called the Occidental Republic. It included a new calendar, cultural festivals, regional currencies, banking system, ethical codes, and a flag system, which the British Positivists would emulate. This utopia would come to fruition beginning with an international peace pact in which all nations agree to return their colonial exploits. Each nation would install a dictatorship of the proletariat, which would be counselled by the Positivist Society; the society would serve as the critical-regional spatial agency for the Positive Era by creating a network of Positivist halls in town and country. Such urban interventions would coordinate the organisation of public life in the modern city-region. As the hub of the local community and catalyst for structured social change, each intervention was to act as a centre for regional sociology, institute of humanist scholarship, and republican hall of social activism. Part of the activities here would include social investigations for regional place-making, in which the people determine the look, feel and function of the built environment.¹² These community-centres would thus offer a gamut of educational and cultural activities to establish in each region the Positivist mentality. The national dictatorship, meanwhile, would dissolve after the emergence of a new generation of “moral capitalists”; from this generation, newly-formed regional city-states would form and elect their commerce, manufacturing, and agriculture chiefs. Only the “spiritual” Positivist societies would link together the separate republics as an Occidental Republic.

Comte wildly believed that the Occidental Republic would comprise, within a century’s time, five-hundred modern, peaceful, greenbelt city-communities. Each republic would have the character of a small salubrious region with a clear distinction but tight interrelationships between the urban and the rural. With a land area comparable to Belgium, each republic would contain around two million people.¹³ For the Positivists, the utopian “spirit of devotion to the public welfare” could only be kindled in republics of such a limited spatial scale. It would facilitate a particular type of private and public life with places that, in the Aristotelian sense, enable all to live the good life.¹⁴ To encourage participatory forms of spatial production, Comte suggested that different architectural types signalled social power for ruling in turn. Here, two “spiritual types” called “Intellectuals” (i.e. sociologists, physicians, philosophers) and “Emotionals” (artists, teachers, mothers) would hold social power within universities, schools, hospitals, salons, and homes.¹⁵ Two “temporal types” called “Chiefs” (bankers, barristers, industrialists) and “People” (unionised masons, crafters, factoryworkers) would maintain obligations to business and politics in spaces such as banks, factories, fields, workshops, and union halls. All citizens as such would hold functionally differentiated roles in the cooperative process of producing the urban social fabric of the republic, as a form of “positivist republicanism.”¹⁶ (Comte also maintained that together the community would decide the unique look and feel of the city, where Positivist institutions would stand at the centre of civic life.)

The key protagonist who presented Positivism in this light was the Aristotelian scholar, Richard Congreve (1818–99). He established organised Positivism in Britain and was the first to promote Comte’s utopia as a critique of British foreign policy. Without his efforts, organised British Positivism would not exist and would not have treated Comte’s ideas as “spatial formulae” for a “realisable utopia.”¹⁷ It was on seeing Comte’s *Catechism of Positive Religion* (1852) that Congreve, then an Oxford don and Anglican minister, decided to abandon “everything, for the sake of the truth.”¹⁸ He produced sociological surveys rooted in historical-geographical analyses that tested Comte’s sociological laws about the rise and fall of empires and the “spiritual powers” of

Europe. (He promoted the use of a “map without names” to diagnose and treat international relations, and he balked at the study of “English History from a purely national point of view.”¹⁹) Like Saint-Simon and Comte, Congreve’s early works praised the “admirable utopias” of the sixteenth and seventeenth centuries, namely Henry IV’s plan for a Christian republic and the Abbé de Saint-Pierre’s Project for Perpetual Peace.²⁰ Henry IV’s plan, he noted, captured the sympathy of Elizabeth, the queen of England. It aimed at “ordering the states of Europe in one great federal system, the Republic of the West [Occidental Republic], a modification of the policy of Charlemagne.”²¹ Congreve proceeded to suggest that France and England, then allied in the Crimean War, should act as the “spiritual” leaders of Europe. Like Comte, he demanded they return their colonial exploits, refrain from conflict and uricide, and devolve their nation-states into sets of regional city-states.²² Congreve clarified that sociology was to serve as the “guide or type for the *re-organisation of society*”; it was an applied ethical science for urban-social planning.²³ Sociology, as such, was of “direct political interest” to Victorian life, for the re-organisation of empires into “complete” regions.²⁴

Congreve established the British Positivist Society in London in 1859, just two years after he gained instant infamy by publishing a succession of polemics against British affairs in Gibraltar and India. By establishing Chapel Street hall, he was following Comte’s vision for creating idyllic communities via urban intervention. From here he went on to defend the Paris commune, the Boers, the Afghans, the Jamaicans, and the Ugandans against foreign aggression. As Britain continued to annex various territories, he published a programme called “Systematic Policy.”²⁵ Based on his historical-geographical surveys, the programme proposed a guardianship of nations to facilitate pan-European devolution.²⁶ Positivist societies, which sprouted up across Britain, would also lead surveys for town and country improvements towards home rule. They would offer free secular education, civic rites of passage following the Religion of Humanity, art lessons, concerts, and festivals. Congreve’s Policy sought to moderate the powerful individualistic forces driving imperialism while establishing a collective sense of regional identity.²⁷ One of his primary agendas here was to unite trade unions, to approximate the “temporal” power of Comte’s utopia. Comte considered trade unionism as *the* “systematic connection with the socialist movement towards internal regeneration.”²⁸

Surveying national and social life

From the 1860s to the 1900s the barrister and Positivist sociologist, Frederic Harrison (1831–1923), sought to unite, vindicate, and coordinate workers under the banner of Positivism.²⁹ Harrison was introduced to the Positivist view of trade unions and the reconstruction of the city-region while assisting Congreve, his former Oxford tutor, with his recent sociological surveys. Whereas sociologists were the urban-regional planners and “spiritual power” of modernity, it was trade unionists that were to serve as the political core of “temporal power” of Comte’s utopia. For Comte and Harrison, trade unions were the modern equivalent of medieval guilds.³⁰ Guided by the medieval clergy, guilds provided the “constant sense of each citizen having his place in a complex whole.” Harrison praised Comte’s aim to establish a similar Positivist sociability with city-spaces replete with “centres of moral and spiritual education.”³¹

Yet, during Victorian times trade unions were considered a menace to society. During the 1860s “social war” between capital and labour Harrison, at Congreve’s urging for “social action,” set out on national industrial surveys. He documented working conditions, hours and wages, education, pastimes, beliefs, and living circumstances of trade unionists.³² Publishing his findings in political newspapers and scientific and literary journals, Harrison aimed to legitimise, systematise and strengthen the institution of trade unionism.³³ In 1867, he was appointed to the Royal Commission on Trades Unionism, which questioned the legality of unions, their misuse of funds and affiliation to acts of violence.³⁴ Harrison contributed to the Minority Report which redeemed trade unions from criminal activities and made them independent and legally binding entities.³⁵ His recommendations, though not without modification, were the basis for trade union law from 1868 to 1906. For the next forty years in the very least, trade union leaders, notably George Potter, George Howell, and George Shipton, were known to seek out the Positivists’ counsel.³⁶ Like the relationship between the medieval clergy and guilds, the Positivists’ positioned themselves as independent intellectuals, and their advice was not always implemented.³⁷

Owing to their support, the London Trades’ Council invited Harrison, Congreve and Beesly to deliver lectures at their meetings. Here, Harrison prompted trade unionists to re-orient the focus of the aristocracy away from offshore exploits to a civilising mission at home.³⁸ In response to the conservative “New Social Movement” of the 1870s, Harrison thereafter published a planning vision entitled “Our Social Programme.”³⁹ He recommended devolving England into a network of planned, regional industrial republics. Based on Congreve’s suggestions, Harrison’s remedy for national social problems was regional sociological investigations, followed by the national municipalisation of industry, the creation of a secular-humanist public education system, and regional cultural programmes.⁴⁰ The municipalisation of factories, post office and rail, road, bridge, harbour, pier, dock, and lighthouse were of paramount importance. A unionised workforce would furnish the capital to expedite urban

renovations; strike funds would finance mid-rise, mixed-use housing blocks, transport links, neighbourhood educational facilities, playgrounds, and civic spaces.⁴¹ Harrison's social programme promoted regional reconstruction and "Home Rule All Around." He celebrated the Local Government Act of 1888 by producing writings that envisioned "Ideal London."⁴² The London County Council soon thereafter appointed Harrison to design the Kingsway Boulevard, which permitted trade unionists to begin rebuilding the city. This was the first major urban intervention in London since Regent Street in 1820.⁴³ The scheme and its budget were an impetus to Ebenezer Howard's garden city vision.⁴⁴

Meanwhile, the urban cartography of the Positivist sociologist Charles Booth (1840–1916) proved indispensable to various London improvement schemes, including Kingsway Boulevard. Booth's survey of London – covering poverty, industry, and religion – was a momentous extension of the Positivists' studies of spiritual and temporal powers. Under the influence of Congreve, Harrison, Vernon Lushington, and his cousins, Booth converted to Positivism.⁴⁵ As early as the 1870s, Booth was infatuated with Comte's scientific system of "benevolent intervention," and he and his cousins, Albert and Henry Crompton, were continually talking with Congreve about the Positivist utopia.⁴⁶ Booth wrote a little-known confession of adherence to the Religion of Humanity as well as a "Positivist Prayer," but more broadly he also published articles in defence of Comte's ideas in *The Colony*, his family's home journal.⁴⁷

During the calamities of the 1880s, Harrison urged Booth to contribute to the social investigations of the Mansion House Committee. Witnessing severe distress, he sought to repay his "debt to humanity."⁴⁸ The successful steamship company chief became a "scientific sociologist" or Positivist Intellectual. Booth determined to use his resources to diagnose and treat the conditions of the "bitter outcast," the sick, elderly and the idle. His urban-regional social survey of London drew on the ideas of Comte as well as the empirical methods of the Saint-Simonian social scientist, Frédéric Le Play, and the industrial surveys of Harrison. From the 1880s to the 1900s, Booth and his team compiled regional studies on "urbanisms in embryo" and figures on housing conditions, redundancy, and old age, in attempts to form a complete picture of the urban-regional condition.⁴⁹ Although it is little-acknowledged, Booth's survey findings showed that overcrowding was the "evil," "the great cause of degeneracy," in London. And there were few means of escape. Overcrowding was the "source for demoralization" within the body politic. This "moral weakness" in the urban fabric, wrote Booth, "is the prolific, if not the main source of unemployment."⁵⁰

From the 1890s through to the 1900s Booth sought to shape public consensus on a comprehensive programme of proposals called "Limited Socialism," which was a phrase he introduced in the first volumes of his London survey. First, Booth proposed the government set out a system of home colonies or new towns to decongest urban areas, to provide education and to encourage family life.⁵¹ Next, and building on Harrison's efforts, he promoted "new unionism" for unifying skilled and unskilled labour; his Positivist colleagues celebrated this "socialist unionism" as a step in the direction of the true industrial "temporal power" of Positivism.⁵² Similar to the ideas of Comte and Le Play, Booth thereafter proposed a system of old age pensions as a social safety net.⁵³ Lastly, his programme for Limited Socialism advocated for a new policy of infrastructural urbanism which, he imagined, would be managed by a new land development authority and would to attenuate speculative slum-building.⁵⁴ Effectively, Limited Socialism aimed to address the ethics of poor industrial, financial and urban land management.

Regional and civic visions

The Scottish polymath Patrick Geddes (1854–1932) developed a regional survey method that addressed the severed links between town and country life. While a student of the evolutionary biologist Thomas Huxley, Geddes sought out Congreve at the Positivist Society in London.⁵⁵ He recalled Congreve's impact on him as a "revelation"; under Congreve's direction Geddes' early essays discussed the links between biology, community and economics.⁵⁶ Here Geddes suggested that the laws of biology provided the basis for establishing ethical regional communities. Collecting biological and social facts about the environment would enable one to index "natural wealth" and set out planning forecasts.⁵⁷

Along these lines during the 1880s, Geddes led an "almost Positivist" Summer School in Edinburgh. It offered the "sociologic teaching" of outdoor education by way of regional surveys.⁵⁸ Students documented the lives of civic and rustic types of people, as outlined in Comte's and Le Play's works.⁵⁹ Following Comte and Congreve, Geddes held that Spiritual types, Emotionals and Intellectuals, would hold providence over educational and cultural spaces, as mentioned above; meanwhile, temporal types, or Chiefs and People, would maintain obligations to business and politics. The Positivists depicted Comte's civic types of the city as complementary to Le Play's rustic types of the countryside: miners, woodsmen, hunters, shepherds, peasants, farmers, and fishermen. These spiritual and temporal types would rule in turn in relation to their respective spaces within the city-region.

By the 1890s Geddes opened his Outlook Tower in Edinburgh. Here, Geddes exhibited the "sociological facts" collected during regional surveys. He called this exhibit an "Encyclopedia Civica," and it explained the past and

present of the people and their region. Its purpose was to inform planning schemes for harmonising individuals, institutions and the environment.⁶⁰ He held that a network of institutes like the Outlook Tower could plan regional wholes, foster inclusive public government and initiate imperial devolution. Along these lines Geddes employed this sociology before planning approach in response to the dilapidated dens of the Edinburgh Old Town as well as the refugee crisis in Cyprus.⁶¹ Geddes also used the method and Positivist ideas about a “Church of the People”⁶² for a scheme to transform the Scottish town of Dunfermline into a garden city-state.⁶³ Such projects rallied support for the Town Planning Act of 1909.⁶⁴

Central to this discussion was Geddes’ idea of a sociological centre for “concrete politics” concerned with creating the city-region anew.⁶⁵ The primary purpose and significance of the Outlook Tower, Geddes reiterated at the Royal Institute of British Architects first Town Planning conference, was to operate as an *urban intervention*, a “civic observatory.”⁶⁶ A global network of such Civic Societies, or “Civicentre(s) for sociologist and citizen,” would energise and engage the public. It would exhibit the efforts of Howard as well as international planning innovators such as Josef Stübben, Camillo Sitte and Daniel Burnham; organise transnational tours of urban redevelopment projects; and praise foreign planning advances in the local press. These centres would lead regional surveys, publish investigations on human-ecological alienation and exploitation and, also, implement planning programmes—just as Congreve, Harrison, Booth and other Positivist society affiliates had.⁶⁷

From the late 1890s Geddes’ partner Victor Branford (1863–1930) disseminated applied sociology for planning regional city-states throughout the British empire. He was the initiator of the first intellectual institution in Britain with the word “sociology” in its name, the Sociological Society.⁶⁸ Founded in 1904 the organisation furthered sociology as a modern academic discipline in association with the University of London, which was offering the first-ever sociology seminars in Britain. The society served as the meeting ground for economists, geographers, politicians, philosophers, and writers.⁶⁹ Here parties of eugenicists, town planners and ethical evolutionaries debated the meanings and methods of sociology. Scholars have attributed the immediate origins of the first party to the sociological works of Charles Darwin and Francis Galton (eugenicists), the second to Booth and Geddes (town planners) and the third to Herbert Spencer and Hobhouse (ethical evolutionaries).⁷⁰

Branford and Positivist supporters were the leading advocates of the eutopian “town planning school” of sociology.⁷¹ From the early 1900s to the 1920s Branford expounded a discipline called “City Design,” which he described as an “art of polity-making” that put ultimate emphasis on the unselfish-self as the sociological agent for social transformation. It called for something of a religious conversion, where idealists would employ civic sociology towards consensus-based place making.⁷² Such ideas took shape with Branford’s explorations of the works of Comte, Ernest Mach and James Ward, which spurred him to consider ways in which to link science, faith and citizenship.⁷³ He later presented Geddes’ regional survey method as *the link — the “sacred way” — the process for self-actualisation and living the “good life” in an ideal city.*⁷⁴ As an ethical entrepreneur, Branford employed the regional survey for planning agricultural and industrial schemes in various South American outposts. Fixated on creating small states with the character of the Positive Era, his business ventures connected telephone, rail, road, waterway hubs, housing, and industries to cultural centres. Synthesising the ideas of Comte, Geddes, Thorstein Veblen and William MacDonald,⁷⁵ Branford suggested that City Design addressed the two competing psychologies of formalism and idealism. He controversially claimed that the Sociological Society was the omphalos of idealism and applied sociology.

During the great unrest of the 1910s, Branford encouraged idealists to form a “Religion of Idealism” and to promote the consolidation of cooperative-economics schemes to realise garden city projects. He and Geddes incorporated these ideas into their post-war reconstruction programme called the “Third Alternative.” Here the Bank of England and cooperative societies would finance the total reconstruction of the nation as the “moral equivalent of war” in which case moralised “banker-statesmen” could facilitate the “central concept of realisable ideals as regional Utopias.”⁷⁶ Like other Positivists he claimed that the post-war neotechnic era would comprise the government of women, where science and industry operate on the basis of the spirit of decentralised self-reliance and civic responsibility.⁷⁷

Inspired by the American activist Charles Ferguson, Branford and Geddes proposed that “university militants,” could lead citizen-groups in regional surveys and propose, like Positivists before them, a “Policy of Culture” to resolve such problems as housing deficiencies, industrial gridlock, rural decline, and despondency to create a regional eutopia.⁷⁸ Like Comte’s Occidental Republic, they held that each region would also establish its own architectural language, currency, festivals, and thus provide an enhanced individual and social life suited to each locale.⁷⁹ The Third Alternative, in fact, offered a schema for the devolution of the British empire into an Occidental network of garden city-states. Here a worldwide regional university system, would provide practical education to craft guilds, thus making “City Design” initiatives possible. Thus, instead of a “Positivist Society” taking the lead, it was now the modern university. Its academics, they imagined, would arbitrate international and domestic affairs relating to industry and public life.⁸⁰ This vision of post-war reconstruction, Branford and Geddes

acknowledged, drew on Comte's "practical treatise," the *System of Positive Polity* and its utopia, the Occidental Republic.⁸¹

Conclusion

In promoting the notion of creating self-sufficient, small republics the Positivists offered support for the concept of the town and country as a planned regional unit. Through their intellectual and cultural interventions, they upheld the notion that the school is the nucleus of community sociability and the means for broader social transformation. As such they held that the city-community is defined by its public spaces and civic institutes; and by promoting social action and civic duty via different types of sociological surveys for place-making, they introduced the notion of design-research as a form of activism in the creation of caring and socially-responsible citizens. Thus, seeking an alternative form of regional life, Comte and Congreve's followers used applied sociology to examine nested social problems, from the international level to the locality. Their work, as such, stands as an example of planning politics, where citizen-groups acted as an intellectual and practical alternative to imperialism and urbicide.

Tables and Figures

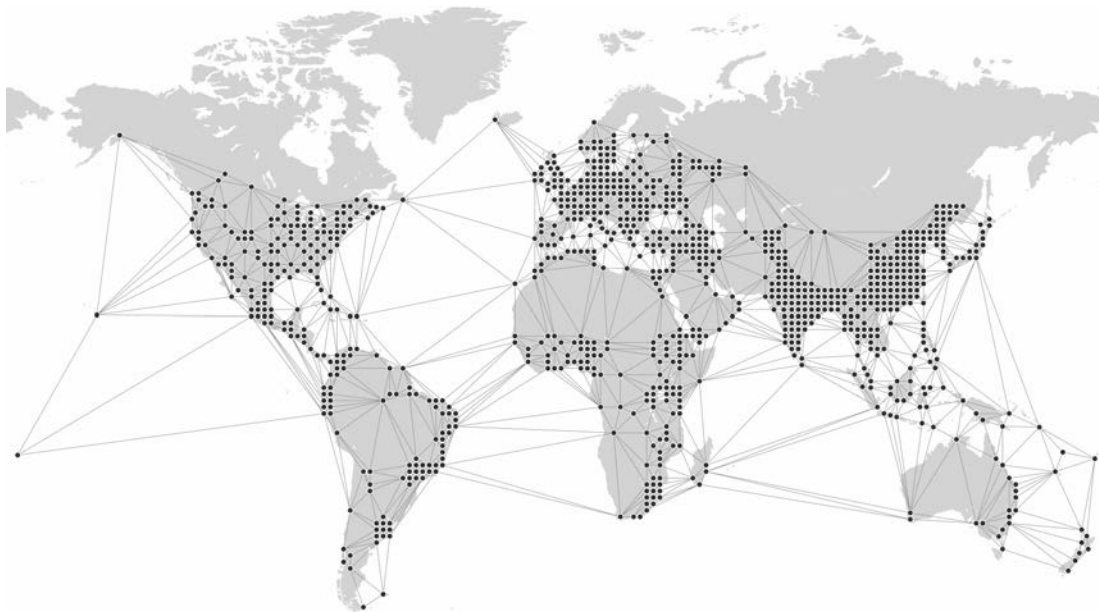

Figure 1: Speculative sketch of Comte's Occidental Republic, a garden city-state network. Here each circle contains the land area he prescribed. Rather than 500 circles as he envisioned, we see here 1000 circles arranged in relation to contemporary population densities of more than seventy people per square kilometre.

Figure 2: Positivist interventions. Chapel Street Hall, London (upper left); Newton Hall, London (upper right); and Church of Humanity, Newcastle (lower left) BLPES-LPS, 5/4; St. Pius X Church, formerly the Liverpool Church of Humanity (lower right).

Endnotes

¹ See, for instance, L.T. Hobhouse, *Liberalism* (Oxford: Oxford University Press, 1964); Porter, Bernard. *Critics of Empire* (London: Macmillan, 1968); Claeys, Gregory. *Imperial Sceptics* (Cambridge: Cambridge University Press, 2010).

² Auguste Comte, *System of Positive Polity*, 4 vols. Vol. I (London: Longmans, Green) 123–4; Henri Gouhier, *La Jeunesse d'Auguste Comte*, 3 vols. Vol. II (Paris: Vrin) 58–61; *ibid.*, III, 407. Within the *System*, Comte called the “true principle of republicanism,” a state where “all forces ... work together for the common good.” The proclamation of a republic, he maintained, meant that each citizen devotes “all his faculties” to “the public welfare.” The primary means through which he aimed to achieve this mode of republicanism was through the cultural celebrations of the Religion of Humanity. Henri Gouhier argues the Religion of Humanity was based on the secular religions of the French Revolution, which aimed to establish a new republican culture.

³ John Scott and Ray Bromley, *Envisioning Sociology* (Albany: State University of New York Press, 2013); Duncan Bowie, *The Radical and Socialist Tradition in British Planning* (London: Routledge, 2017); Robert Young and Pierre Clavel, eds. “Planning living cities: Patrick Geddes’ legacy in the new millennium.” Special issue, *Landscape and Urban Planning*; Peter Eisenman, “Post-Functionalism,” in *Theorizing a New Agenda for Architecture*, ed. Kate Nesbitt (New York: Princeton Architectural Press, 1996). All of these studies largely neglect the Comtean impact on planning, but Eisenman presents Positivism as a movement of “ethical functionalism.” This paper draws on important connexions in the Eric Paul Mumford’s *The CIAM Discourse on Urbanism, 1928–1960*, Donald Drew Egbert’s *Social Radicalism*

and the Arts, and Konstanze Sylva Domhardt's "The Garden City Idea in the CIAM discourse on Urbanism." These works show how Saint-Simon's and Ebenezer Howard's ideas influenced the global planning and design movement, Congrès internationaux d'Architecture Moderne (CIAM). The chief British intermediaries, I argue here, were Congreve's Positivists, who were attempting to approximate Comte's Occidental Republic. Egbert situates Congreve as central to the Positivist network theory of planning and the medieval revival in Victorian architecture. Aspects of Positivism, as a eutopian theory and sociological practice, served as the impetus to and the activities of Sybella Gurney, H.V. Lanchester, Patrick Abercrombie, Lewis Mumford and Le Corbusier. It percolated into the efforts of the Sociological Society Cities Committee, the Le Play House, the Regional Planning Association of America and, as mentioned, CIAM.

Vol. III (Cambridge: Cambridge University Press, 2009) 10; Thomas Dixon, *The Invention of Altruism* (Oxford: Oxford University Press, 2008); T.R. Wright, *The Religion of Humanity* (Cambridge: Cambridge University Press, 1986), 66, 110, 219, 55; Edward R. Pease, *The History of the Fabian Society* (New York: Dutton, 1916), 18. Victorians found Positivism alluring because it upheld a "belief in universal regeneration to be brought about by the new "master-science" of sociology." This belief was expressed in terms of "an international level opposition to imperialism, and on a national scale raising the dignity of labour" via trade unionism. Comte's ardent follower, the polymath Frederic Harrison, claimed that Positivism was "at once a scheme of Education, a form of Religion, a school of Philosophy, a method of Government, and a phase of Socialism" founded on sociology. This essay uses this definition of Positivism.

The Bank of England would consolidate disparate cooperative initiatives, notably the Co-partnership Tenants Limited, Agricultural Organisation Society and Urban Banks Association. Shopkeepers, artisans and craftspeople could receive loan disbursements, which were previously available only to industrial chiefs. Here Branford claimed that the unification of the nation's financial system mirrored Comte's vision: "The concentration of selective control, which we are to-day witnessing in the Governor's Court of the Bank of England," he wrote, "is suggestive of the 'triumvirate of bankers,' which Comte foresaw at the apex of the temporal power in the modern state." Idealist financiers, he imagined, could act as civic functionaries – a "hieratic craft" of "social selection" – "directing and controlling communitary life and welfare."

Planning*

44 Superblock and Neighbourhood Unit

Superblocks, neighbourhood units and residential islands as fragments of the collage city. Housing estates in Italy and Spain in the 1960s.

Carmen Díez Medina (Department of Architecture, School of Ingeneering and Architecture, University of Zaragoza), Javier Monclús (Department of Architecture, School of Ingeneering and Architecture, University of Zaragoza), Isabel Ezquerro (Department of Architecture, School of Ingeneering and Architecture, University of Zaragoza) and Sergio García-Pérez (Department of Architecture, School of Ingeneering and Architecture, University of Zaragoza)

In the intense debate that surrounds modernist housing estates in Europe there is a common argument: the contrast between the high quality of urban spaces in the compact traditional city and the low quality of new mass housing developments. In our opinion, the comparison should be made not with the traditional city but with the remaining peripheral landscape. The question is: do those 'fragments' of the modern 'collage city' that float between infrastructures and urban voids have greater or worse urban quality than the so-called 'ordinary peripheries'? In this regard, determining the level of isolation from or integration into the immediate urban tissue is a key issue.

In this paper we consider what Anthony Sutcliffe called a 'specifically Latin culture of urbanisme', in particular we focus on eight case studies located in four Southern European cities (Madrid, Barcelona, Rome and Milan). The selected housing estates – that could be extended to many other cases – are paradigmatic examples of 'modernist housing estates' and represent a good sample of this relevant episode for the history of functionalist urbanism. The purpose of this analysis is to determine how these 'fragments' developed in regard to their immediate urban context: whether today, fifty years after their construction, they are still isolated 'fragments' and whether the quality of their urban spaces is better or worse than the quality of the 'ordinary peripheries' that developed in parallel. The eight analysed case studies provide a sufficiently representative sample of locations in the urban structure of each city which allows to comment different ways of integration or isolation regarding the surrounding urban tissue. How were they designed and with what specific features, compared to their European counterparts? What role and impact did urban planning and projects have in their fragmentary development? What conclusions can we draw comparing these *quartieri* and *polígonos* fifty years later? What are the values and weaknesses of those 'fragments' in comparison with the urban tissues of the surrounding 'ordinary peripheries'?

Occasionally, these housing estates served to qualify the anodyne peripheries by endowing them with recognisable elements. In other cases, the often obsessive attempt to create 'self-sufficient' and 'clearly separated' complexes affected their excessive isolation from the urban environment, hindering their subsequent integration. The objective of this analysis is to overcome 'generic stories' and go more in depth in urban planning and design cultures.

Neighbourhood unit in Brazilian new towns: foreign idea and local urban life

Renato Rego (Universidade Estadual de Maringá)

New towns were created in twentieth-century Brazil in line with governmental nation-building discourse and planning agenda, be it a democratic or a dictatorial regime. Urbanization was thought to be a path to modernization and new towns were an instrument of development in the hinterland agricultural frontiers. As a sign of progress, contemporary European and North-American planning ideas were implemented and the North-American neighbourhood unit became a recurrent feature of innovative urban settings, which were to establish new urban practices and change social behaviour as part of the country's modernization process. This paper examines how the new urban settings were appropriated. Did new towns and innovative urban forms really result in new living patterns? Was the neighbourhood unit straightforwardly accepted as a new urban condition? Did it meet passive compliance or strong opposition? Worldwide, the transnational diffusion of planning theory has shown that foreign ideas have been selectively adopted and conveniently adapted in various contexts and different historical times, thus revealing assimilation, resistance, and recreation; local planners have contributed to the transformation and contextualization of alien ideas. Drawing upon the Americanization of Brazilian society and bearing in mind that cultural products are not faithfully copied, but rather reproduced through a complex cultural process, this paper explores the transfer, interpretation and, particularly, the appropriation of the neighbourhood unit in Brazil. As a case study, the paper includes a range of towns, comprising new capital cities and agricultural-settlement towns, planned during different periods of the country's history, in accordance with early twentieth-century academicist urbanism or post-war functionalist planning. The original layouts and present situations of neighbourhood units in the cities of Goiânia (1933-36), Angélica (1954), Brasília (1957), Rurópolis (1972) and Palmas (1988) are analysed. As a result, the paper exposes contradictions and conflicts between the universally valid idea, the planners' visions, and the cultural and social appropriation and use of the urban forms - in short, mismatches between how they were imagined and how they were lived. Due to physical inadequacy and cultural incompatibility, neighbourhood units were either considerably transformed or rejected and replaced by more traditional, conventional urban configurations, for a foreign planning idea is truly incorporated only when it makes sense in the cultural realm that has adopted it.

The Global Migration of Modernist Affordable Housing: Repeated Architectural Mistakes or Resilient Urban Transformation?

Lawrence Vale (Massachusetts Institute of Technology) and Laura Wainer (Massachusetts Institute of Technology)

Over the last century, the troubled Euro-American experiment with high modernist social housing has traveled widely across the global South, most obviously in terms of stark architectural forms and superblock urbanism. Across the planet, planners have duly embarked on repeated efforts to clear places labeled as “slums” and to replace them with modern alternatives. Yet, it has rarely been easy to pair high standards of housing with low incomes of people. Given these circumstances, what are the identifiable patterns of housing knowledge that crossed geographies, political-economic scenarios and time? And, how did international housing knowledge and expertise impact local practices and populations in both the South and North?

This paper begins by examining the forms and agendas behind American public housing, with its modernist superblocks and initial social selectivity. We then consider how these same architectural and social questions have been engaged in cities of the global South. The effort here is less to document direct formal or policy transfer. Rather, we seek to analyze the assumptions and priorities that come packaged with ideas about housing policy and ideals of architectural modernism: the ways that social housing has been as much about the “social” as it has been about the “housing.” The ultimate goal of this paper is to raise questions about the nature of the affordable housing challenge by demonstrating its connection to more holistic efforts that engage livelihoods, environmental quality, security, and communal governance.

The paper concludes with two case studies illustrating different processes of adaptation of Euro-American modernism that also reveal the adoption of local, holistic processes that engage the “social” with the “housing.” First is the Joe Slovo informal settlement in Cape Town, South Africa. Its phased housing redevelopment since 2004 exemplifies the evolution of modernist post-apartheid housing policy. The project, which started as any other top-down housing intervention, has been transformed into an inclusive experience of community empowerment through the realization of housing rights. The second case, Ciudad del Bicentenario in Cartagena, Colombia, is a typical modern, large-scale, low-density housing project implemented by Fundación Mario Santo Domingo, a non-profit organization that has made significant efforts to introduce their Integrated Development for Sustainable Communities model—driven by the objective of “building communities, not just housing.”

Findings indicate that in the field of affordable housing, forms and norms travel together. The most important part of the North-South transfer of ‘social housing’ has been the social engineering part rather than the housing. As the examples from Cape Town and Cartagena suggest, however, sometimes there can be complex learning, especially from multi-phase projects. Once it is agreed that affordable housing in itself means little unless accompanied by a more holistic approach economic well-being, environmental protection, personal security, and inclusive governance, it becomes possible to see that exemplary projects in the global South may have much to teach their northern progenitors. This paper reveals that at very least, it should be clear that any learning is multi-directional and at two scales: between the North and South, and between governments and communities.

Can physical neighbourhoods be sustainable? The influence of the designed physical environment and personality traits on the ability of residents in Geelong Australia to sustainably meet their basic human needs

Ross Wissing (Deakin University), David Jones (Deakin University) and Anna Klas (Deakin University)

Australia is often called the first suburban nation. This low-density form of living was enshrined to enable early settlers to meet their basic needs themselves around their homes as most European colonisers did not believe that there was an existing infrastructure to meet these needs. Australia was Terra Nullius- ‘nobody’ s land’ .

Suburbs are comprised of neighbourhoods. A neighbourhood is ‘...a collection of people who share services and some level of cohesion in a geographically bound place’ . Four levels of neighbourhood are now recognised - face-block, residential, institutional and community. Western society sees neighbourhoods as being a modern phenomenon, mostly through Howard’ s ‘Garden City’ and then Perry’ s ‘Neighbourhood Unit’ . However, recent scholarship demonstrates that neighbourhoods have been a central part of non-Western urban societies over time. Consequently neighbourhood organisation is of fundamental importance in human societies and are probably universal.

Perry offered the Neighbourhood Unit as an instrument for addressing social problems including alienation, youth delinquency, and lack of civic participation through enhancing the physical design of the community. Since the 1960s there have been ongoing debates about the ‘negative’ societal impacts of the ‘Neighbourhood Unit’ and the subsequent detrimental effects of physical determinism on social processes and capital formation in urban areas. Such criticisms of ‘social engineering’ have increasingly been refuted with the rationale behind the physical design of the neighbourhood unit being only to create opportunities for interaction between individuals and groups rather than determining the nature of those interactions.

What is not recognised in these critiques and discussions is that design of any place, and the broader cultural landscape in which it sits, has both a physical and social deterministic impact. Thus, a key question is not whether there are impacts, but whether these impacts can be sustainably absorbed within the capacity of the urban ecosystem, and their functions and processes, that sustain the ecosystem. These are key elements being investigated in a major assessment of the human impact on the environment, entitled the Millennium Ecosystem Assessment (MEA), launched by the United Nations Secretary-General Kofi Annan in 2000.

Within this social and policy context, this paper investigates the influence of personalisation and physical design since European colonisation of Australia on the ability of residents to sustainably meet their basic needs from their private backyards at the face-block neighbourhood scale within the underlying ecological processes. The study venue, Geelong, is the second least sustainable of Australia’ s 20 largest cities. The research considers four distinct urban design periods in Geelong enabling a temporal assessment.

Superblocks, neighbourhood units and residential islands as fragments of the collage city. Housing estates in Italy and Spain in the 1960s.

Carmen Diez*, Javier Monclús**, Isabel Ezquerro***, Sergio García***

In the intense debate that surrounds modernist housing estates in Europe there is a common argument: the contrast between the high quality of urban spaces in the compact traditional city and the low quality of new mass housing developments. In our opinion, the comparison should be made not with the traditional city but with the remaining peripheral landscape. The question is: do those ‘fragments’ of the modern ‘collage city’ that float between infrastructures and urban voids have greater or worse urban quality than the so-called ‘ordinary peripheries’? In this regard, determining the level of isolation from or integration into the immediate urban tissue is a key issue. The aim of this paper is to study eight housing estates in four cities (Rome, Milan, Madrid, Barcelona) and analyse how these ‘fragments’ developed in regard to their immediate urban context. How were they designed and with what specific features, compared to their European counterparts? What role and impact did urban planning and projects have in their fragmentary development? What conclusions can we draw comparing these *quartieri* and *polígonos* fifty years later? What are the values and weaknesses of those ‘fragments’ in comparison with the urban tissues of the surrounding ‘ordinary peripheries’?

Keywords: modernist housing estates, *polígonos*, *quartieri*, neighbourhood units, superblocks, ordinary peripheries, Italy, Spain, urban forms, mapping urbanism, modernist legacy, urban design

“Together, these two conceptions of the city may be seen as the alternative readings of a figure-ground or solid-void relationship; the one, a city of isolated solids in a continuous void, the other, a condition of defined voids (streets, squares, etc.) contained within a virtually continuous built solid”¹.

Fred Koetter and Colin Rowe

Introduction

Koetter and Rowe’s Collage City approach has sometimes been used to demonstrate the loss in urban quality of modern developments which shaped the peripheries of European cities in the 1960s and 1970s. The acceptance of a piecemeal development led Rowe to coin the concept of the ‘city as a collage’, as an ‘aggregate of discontinuous fragments’ that rejects the utopian dream of modernist urban planning. From this perspective, housing estates can be seen as fragments that played an important role in the shaping of modern peripheries.

In the intense debate that surrounds modernist housing estates in Europe, and despite the variety of their urban locations, there is a common argument: the contrast between the high quality of urban spaces in the compact traditional city and the low quality of new mass housing developments. In our opinion, the comparison should be made not with the traditional city but with the remaining peripheral landscape. The question is: do those ‘fragments’ of the modern ‘collage city’ that float between infrastructures and urban voids have greater or worse urban quality than the so-called ‘ordinary peripheries’?

In this regard, determining the level of isolation from or integration into the immediate urban tissue is a key issue. The aim of this paper is to study eight case studies and analyse how these ‘fragments’ — superblocks, neighborhood units, or residential islands — have developed in regard to their immediate urban context fifty years after their construction.

1. Housing in post-war urban planning: neighbourhood units and superblocks

During the first two decades after the Second World War — with a time lag of 20-30 years — European cities began to implement the modernist principles of the Athens Charter (1933) on a large scale. Traditional extension plans changed to ‘open urbanism’, and modernist housing estates appeared, using Koetter and Rowe’s concept, as ‘isolated solids’ (superblocks) floating in a ‘continuous void’.

There were several factors explaining why housing estates became the new ‘urban pieces’ that, to a large extent, contributed to shaping the peripheries of the modern city. The four most relevant are outlined below.

First, the new scale of developments and their growing size. Residential units grew bigger, from plots and blocks to superblocks and large housing estates². Colquhoun refers to “large pieces of real estate, each of which is financed and organised as a single entity”³. Second, the triumph of the concept of the neighbourhood unit, which consolidated during the 1930s and 1940s and became “the most important planning paradigm after 1945”⁴. Several authors see this triumph as the result of the convergence of two parallel traditions: the Garden City and Modernist urban planning⁵. Third, the adoption of the typology of ‘towers and slabs’ or serial blocks as an urban form representative of modernist mass housing⁶. Fourth, the increase of road transport and highways and the growing importance of road systems. The main idea of 20th century highway design was that roads, like railways, should have their own permanent space for uninterrupted driving.

Housing estates thus became a kind of urban laboratory that facilitated the growth of the city through modular ‘fragments’ of housing units and superblocks, often floating in the ‘continuous void’ that characterised the peripheries of European cities. In such a laboratory, the role of renovated discourses, such as the ‘modernist organicist interpretation of urban planning’ — which dominated after the Second World War — together with a growing concern for the community, the human scale, etc, was essential⁷. These views were not so new; the modernist city was initially thought of as an organic system of aggregated ‘urban cells’ shaped like superblocks, residential units, neighbourhood units or urban districts⁸. The paradigm of an ‘organic modernity’, with the idea of planned communities that would structure urban growth, was shared throughout the international urban planning culture. Several variables led to a growing autonomy of the new residential units or superblocks — whether planned that way or not — especially in the planning of neighbourhood units⁹.

We will now explore the specific case of Latin European housing estates, which grew as piecemeal developments of a modern ‘collage city’.

2. Italian and Spanish post-war urban planning and mass housing experiences: *quartieri* and *polígonos*

This article focuses on Italy and Spain, two countries with a similar and deep urban tradition¹⁰. During the 1950s, both experienced a first cycle of urban modernisation, whereas a more explosive and less controlled second cycle took place in the 1960s. In this context, housing an increasing population became a critical issue, especially in large cities such as Rome, Milan, Madrid or Barcelona. Even though both countries faced similar implementation difficulties¹¹, it was an opportunity for planning and designing modernist housing estates following the principles of CIAM. *Polígonos de viviendas*, *quartieri* and other forms of mass housing were the urban units that characterised the fragmentary growth of Italian and Spanish cities in those years.

In Italy, the ambitious, successful Piano INA Casa (National Insurance Institute) programme was defined by Samonà as “a magnificent machine for producing houses”¹². The results were, somehow, contradictory, but the experimentation was unquestionable. The drive of the INU (National Institute of Town Planning) and the new stage of the journal *Urbanistica* are evidence of the emergence of a strong social and cultural urban vision. Some architects of the cultural elite were protagonists of the new modernist ‘organicist urbanism’ developed during the 1950s and 1960s. In Italian urban planning culture, the most elaborate discourse was associated to the *Movimento Comunità* founded by the industrialist A. Olivetti, whose ideals were “an original re-interpretation of the regionalism of Lewis Mumford”¹³. The concept of ‘quartiere organico autosufficiente’ — understood as social, urban planning and an architectonic unit — was a domestic version of the urban quarter and neighbourhood unit ideology¹⁴.

In Spain, meanwhile, state institutions were created to address the housing shortage; among them, the INV (National Housing Institute), which launched plans to build hundreds of thousands housing units¹⁵. As in Italy, there were substantial continuities, but also, some important reinterpretations of the CIAM urban planning principles, with the adoption of the modernist organicist paradigm. The role played by the architect G. Alomar is a reflection of how organicist ideas were introduced in Spain, directly from L. Mumford first and then Gaston Bardet¹⁶. Special emphasis was placed on hierarchical “*estructuras nucleares*” (nuclear structures), with the ‘barrio’ as a sort of ‘town inside a town’ that should be as autonomous as possible¹⁷. Those organicist visions were included in the INV official regulations and general plans approved during the 1950, with the progressive adoption of the neighbourhood unit concept¹⁸.

The analysis of Italian and Spanish examples highlights the difficulty of their integration into peripheries characterised by piecemeal developments and a poor urbanity. This made it difficult to achieve the 'urban organism' that modern urban planning dreamed of in the post war years. On this basis, we will move on to analyse some examples.

Figure 1: Superblocks, neighbourhood units and residential islands as fragments of the collage city. Location of the eight case studies in Rome, Milan, Madrid, Barcelona (2015). Source: Maps and graphs made by the authors

3. Four cities, eight examples: Rome, Milan, Madrid, Barcelona

We will now explore some Italian and Spanish urban planning and design episodes in greater detail by contrasting eight case studies located in four Southern European cities (Madrid, Barcelona, Rome and Milan). The purpose of this analysis is to determine whether today, fifty years after their construction, they are still isolated 'fragments' and whether the quality of their urban spaces is better or worse than the quality of the immediate urban context. The selected case studies offer a significant sample that could be extended to many other cases¹⁹.

Rome: Decima²⁰. Located on the southern peripheries of Rome, it emerges as linked to the process that transforms the EUR into a directional centre. According to Tafuri, in those years the EUR represented the "only real directional pole of the capital"²¹ and its consolidation was accompanied by a policy that encouraged the construction of houses close to new jobs. Although it was a depressed area and not well communicated with the urban centre, its location was strategic, 1 km away from the new ministerial centre.

The new residential complex emerges as an island in the agricultural landscape that surrounds it. Two main roads divide it into four quadrants and ensure a connection with the city. Inside each quadrant, traffic circulation is more domestic²². The complex is created around a central void, from which blocks of four-or-five-storey curvilinear linear buildings 'grow', resulting in clean and dynamic visual perspectives. It is a 'self-sufficient' neighbourhood, a vast and 'organic' example of urban and architectural planning²³.

Over the years, the project, which radically altered the agricultural periphery landscape by 'drawing' a hierarchical system of streets and blocks, has proved its urban quality²⁴. Communication with the centre of Rome has improved considerably. However, this 'fragment' of a modern city that once 'floated' in agricultural fields is still seen today as a residential island, since the fabric used to consolidate the peripheries that surround it has not sought continuity through a connection with Decima²⁵.

Rome: Casilino²⁶. It is located on the eastern peripheries of Rome, on land that was occupied by car scrapyards, sheds and old buildings²⁷. Casilino corresponds to one of the 16 area plans from the first PEEP (Plan for Economic and Popular Construction) biennial programme. The context into which it is inscribed was no different from that of other peripheries in Rome, comprising scattered buildings that did not manage to create a recognisable area. The idea that a neighbourhood should convey the idea of belonging to the city emerged within that climate of criticism towards the contemporary city.

This new urban 'fragment' sought to radically distance itself from a periphery that has no identity, inserting itself with a 'modern' gesture recognisable from above. The planimetric scheme comprises 29 buildings of variable heights arranged in a 'fan' shape, according to directrices that converge onto four centres²⁸. The use of this dynamic geometry created perspective effects in the spaces between blocks and served as an open solution towards the adjoining areas that admitted future extensions²⁹.

Just as its architects intended, Casilino 23 stands out today as an easily identifiable city fragment, especially when compared to the chequered fabric of the neighbouring Centocelle or to the other adjacent areas of spontaneous peripheries. Its status as an enclave is made more manifest by the roads that surround it³⁰. The strength of the urban project has absorbed the variations of the architectural project³¹. Its appearance is that of a modern and functional urban complex, with wide avenues and well-maintained intermediate spaces. In the words of Quaroni himself: “In the middle of the chaos of the Casilino neighbourhood, this great island shines like a jewel”³².

Milan: Feltre³³. It is located in the northeastern periphery of Milan, next to Lambro Park, on the northern edge of the urbanised area of Lambrate. This favoured location helps it avoid taking on the same enclave character of other complexes. Although Pollini contravened the INA Casa prescriptions to build low-density neighbourhoods³⁴, Feltre is one of the most successful examples of the ‘coordinated initiatives’ policy, which in the 1950s and 1960s led to the construction of numerous ‘self-sufficient neighbourhoods’³⁵ in the Milanese periphery³⁶.

High ten-storey piecemeal blocks act as organic ‘curtains’, as a filter between the city and the park, allowing it to penetrate the housing estate thus creating three large green cores. A fourth smaller nucleus is interwoven to the West with the existing urban fabric by means of four-and-five-storey blocks that enclose semi-open spaces. The neighbourhood services, such as stores and collective facilities, are located in those spaces. Pollini sought to articulate large buildings of overtly urban character, similar to the neighbourhood of Harrar, but “with an attenuated rigidity”³⁷.

An organic integration with the park and the city (morphological, but also because the neighbourhood facilities function well) is largely responsible for the way the complex ages so well³⁸. The urban project achieves a convincing balance between the idea of the city as a compact phenomenon and the extension plans adopted by principles of modern urbanism (zoning, neighbourhood units, superblock, etc.). This is a case that serves to reinforce the thesis of the neighbourhood as a filter between the ‘community’ and the city, while subdivided into ‘neighbourhood units’³⁹.

Milan: Monte Amiata⁴⁰. Located on the northwest outskirts of Milan, it is part of the Gallarate 2 neighbourhood. In the 1940s, the mining company Monte Amiata acquired an agricultural field which the 1953 Piano Regolatore (PR) zoned as residential. For the 1956 PR, Bottoni put forward an interesting proposal for the Gallarate 2 that included those plots, but it was never developed⁴¹. The 1963 Piano di Zona of the Milan City Council zoned the area for the construction of popular affordable housing⁴².

The complex can be described as an ‘architectural artefact’ that is distinctly separated from the anonymous panorama of the surrounding periphery⁴³. It represents the expression of the discourse of the ‘autonomy of architecture’ and the strategy of designing fragments as urban pieces which could qualify the disorder peripheries of Milan and prefigure new more complex ways of life⁴⁴. Monte Amiata shows how the Italian architectural culture of the explored the link between building typology and urban morphology as an instrument of knowledge of the city and as a methodological foundation of the project⁴⁵.

This is a clear and deliberate example of a ‘residential island’. Today, perimeter fencing contrary to the project’s initial spirit of openness contributes to its isolation and the abandonment of community and commercial facilities, which were designed at a neighbourhood scale, but have lost meaning due to the complex being privately managed⁴⁶. The project, based on the hypothesis that the city is made up of ‘finite parts’, is, in Tafuri’s words, “too open to the environment (...) to really be a self-sufficient fragment while, at the same time, too ‘designed’ to become a methodological reference”⁴⁷.

Madrid: Gran San Blas (Unit F)⁴⁸. Located on the eastern outskirts of Madrid, it is one of the seven superblocks — or residential units — comprising the original Gran San Blas project; the most representative social housing complex of those years⁴⁹. Driven by the 1958 Madrid Social Emergency Plan, Gran San Blas could be considered an instance similar to Comasina in Milan⁵⁰, an example of the intense activity by official bodies created in Italy and Spain to construct social housing.

With the modest means that characterised the Spanish interventions of those years, Unit F proposes a solution that is faithful to rationalist orthodoxy. Compared with the other three Gran San Blas units, where the teams worked together to obtain a homogeneous design, the architects of Unit F shared out the design of the houses.

The result was that unit F had the most varied image, with 10 different typologies. Barbero leaves his mark with the three porticoed squares created by grouping the blocks into a helix.

Although the scale of both the buildings and the intermediate spaces is controlled, the construction and urbanisation are of very low quality. The status as an enclave has been maintained, mainly because the city grew around it with urban and architectural typologies that are different from those of the modest rationalist experiment, which was crystallised inside the perimeter road system. The life of the residential unit is concentrated in the three aforementioned squares with the presence of shops and bars that heroically resist the dominance of shopping centres⁵¹.

Madrid: Saconia⁵². In 1963, Antonio Perpiñá developed the Saconia Partial Plan for 8,000 homes in the Dehesa de la Villa in Madrid. The plots were barren and significantly sloped, with almost 50 metres difference in altitude from one end to the other.

As in the Decima *quartiere*, the streets were assigned to road traffic, defining the urban fabric of the neighbourhood. However, in this case it was hexagon-shaped, in line with the structuralist explorations of the time, which formed irregular polygons that are assimilated into neighbourhood units⁵³. These units are pedestrianised, interconnected and leave the central space free to place facilities with the aim of creating socially recognisable communities. A canonical urban centre is also proposed to serve as a community and commercial centre. The result is an architectural continuum that “evades becoming a linear block through the way the houses are grouped”⁵⁴.

As in most of the cases studied, the status as an enclave is perceived both by the limit established by the road on two of the three sides of the perimeter and by the peculiar morphological solution, which makes it an anomaly in the disordered landscape that surrounds it. Although the initiative was valued at the time for its organic quality⁵⁵, the neighbourhood presents obvious problems⁵⁶. For locals and the local government alike, the initiative of open private spaces for public use resulted in a continuous source of problems that, even today, are reflected in the lack of maintenance in some of those spaces.

Barcelona: Besós Southwest⁵⁷. It is located in the northeastern periphery of Barcelona, with a delimitation defined by the 1958 Social Emergency Plan. The partial plan was drafted by the same architects who designed the project in 1959. It was proposed as a development of provisions of the 1953 General Plan for the entire “Levante area”, a plan that responded strictly to the organicist conceptions of the period, and that included partial plans comprised in the 1956 Land Law, essential to Spanish urban legislation.

Unlike other Barcelona *polígonos*, this one is inscribed in the orthogonal grid of the *Ensanche*, projected by Cerdá in a sector that had not yet been developed or urbanised, but with an innovative planning that associated the general scale with the sector layout scale⁵⁸. The Partial Plan has a low-height construction central hub, which is surrounded and protected by taller constructions (14 storeys). The superblocks are defined by six-storey blocks and two-storey rows, combining a variety of housing typologies and configuring the intermediate spaces through educational or commercial facilities.

The subsequent urban growth processes explain the substantial changes in the relative integration of the complex with regard to the adjoining neighbourhoods, diluting those marked edges that, separately, endow the complex with an original identity. In particular, since the 1990s, the barriers that for decades represented ‘vacant’ plots or poorly developed urbanisations⁵⁹ gave way to the requalification of public spaces (with the configuration of the new road systems and pedestrian promenades (Rambla de Prim).

Barcelona: Bellvitge⁶⁰. Located in the southern peripheries of Barcelona, in the adjoining municipality of L’Hospitalet, its construction was promoted by the private company Ciudad Condal⁶¹, in delta area lands dedicated to irrigated agriculture. Its borders were road and railway infrastructure: the prolongation of the Gran Vía to the south; train tracks from the coast to the east; Bellvitge Medical Complex to the west; and an industrial estate separating Bellvitge from the centre of L’Hospitalet to the north⁶².

The order is radical rationalist, with all blocks southern-facing, very narrow and of great height⁶³. The road layout is also aggressive: a powerful central axis — the Rambla de Bellvitge — that divides it into two, and a ring road. Small sections of cul-de-sac streets that give access to the buildings emerge from this road system⁶⁴. Each unit in turn contains a commercial building on the ground floor with a tree-lined perimeter that structures the complex into a totally autonomous and recognisable urban piece⁶⁵.

The transformation processes of Bellvitge have contributed to its improvement, both due to the centrality acquired during the urban transformation experienced by the entire sector located in the vicinity of the airport and the Barcelona fair tertiary spaces, and to the improvement in public spaces⁶⁶. The incorporation of small buildings for commerce has worked very well. Although nowadays the *polígono* continues to be an enclave in first metropolitan periphery, it establishes new relationships and integrates relatively well in the city, without continuously ‘anchoring’ itself to traditional urban spaces.

These eight cases are just a sample of the hundreds that were built during the 1960s and 1970s all over Europe⁶⁷. They were all projected as ‘unitary fragments’ of a modernist city conceived as an ‘organic system’ of aggregated ‘urban cells’ and are still perceived today as ‘anomalies’, ‘islands’ and ‘enclaves’, units with their own identity, which is intrinsic to the concept of ‘neighbourhood’, ‘*barrío*’ or ‘*quartiere*’.

4. Conclusions / Epilogue. Enclaves vs. islands in an urban archipelago

How were the Italian and Spanish modernist housing estates designed and with what specific features, compared to their European counterparts? What role and impact did urban planning and projects have in the fragmentary development of those housing estates? In both countries the consolidation of urban planning occurred with some delay compared to its steady development in countries such as the United Kingdom, Holland and Germany after the Second World War. This gap meant that the attractive theories of functionalist organicism and organic urban plans — with their urban cells, superblocks and neighbourhood units — could not be implemented because of a lack of the mechanisms needed to control the processes in progress⁶⁸. The result is that these ‘urban fragments’, instead of being part of an organic plan, remained ‘floating’ in the surrounding ‘ordinary peripheries’. That does not mean that city shaping through housing estates projected and managed as units proved unsuccessful. Occasionally, they served to qualify the anodyne peripheries by endowing them with recognisable elements. In other cases, the often obsessive attempt to create ‘self-sufficient’ and ‘clearly separated’ complexes affected their excessive isolation from the urban environment, hindering their subsequent integration.

What conclusions can we draw comparing these *quartieri* and *polígonos* fifty years later? What are the values and weaknesses of those ‘fragments’ in comparison with the urban tissues of the ‘ordinary peripheries’ that gradually grew in parallel? A comparative morphological perspective can help to better understand the achievements and limits of modern urban strategies; in other words, the advantages and problems of planning a city based on fragments⁶⁹. However, this analysis must be carried out in the context of the parallel construction processes of nearby urban peripheries that make up the traditional and ‘ordinary’ fabric of the peripheries of that period. Thus, this analysis allows us to verify, on the one hand, the widespread use of open block superblocks — more or less ‘organic’ — as an urban management strategy (the Italian cases studied presented more formal, spatially dynamic and riskier geometric solutions than Spanish ones); and, on the other hand, the contrast between street and block networks that made up the traditional and ‘ordinary’ fabric of the urban peripheries of that time in different cities, even when these were consolidated after the complexes themselves did. When analysing morphological integration, we have considered both street patterns and social and functional land uses. Regarding the road systems, the situations vary considerably. In some estates, the road systems are connected to the surrounding street pattern; in others, they have remained isolated due to the boundaries of arterial roadways. ‘Ordinary peripheries’ are normally well integrated with earlier urban developments, since their growth has been gradual. With respect to social characteristics, there are not significant differences between the housing estates and the surrounding peripheries. However, there are relevant differences in the activities. In most occasions, housing estates are just residential — with few commercial facilities; in the surrounding ‘ordinary peripheries’, commerce concentrates in commercial streets.

The problems of fragmentary development evidenced by the construction of these *quartieri* or *polígonos* have been widely considered in the multiple critical views of functionalist urbanism. However, it is also possible to think, as Colin Rowe did, that there is a certain balance between the city of those constructed fragments, or ‘solids isolated in a continuous vacuum’, and the continuous city, in other words, the city of the voids contained in a continuous solid. From this perspective, certain virtues can be recognised in the method of making a city with the superblock in centre stage and the somewhat naive aspiration of setting up neighbourhoods composed of neighbourhood units. That is when the ‘modern islands’ shine like jewels in an urban archipelago. In any case, the processes undergone over the last fifty years have modified the initial situations, sometimes improving the integration with the environment and other times accentuating their condition of enclaves, which hinders reaching the virtues that are attributed to a traditional compact city where streets and blocks act as supports for intense urban life and recognised urbanity.

¹⁷ The concept of ‘nucleación orgánica’ and the role of the ‘cells’ and neighbourhood units were explained in his exceptional book *Teoría de la ciudad. Ideas fundamentales para un urbanismo humanista (Theory of the City. Key Ideas for a Humanist Urbanism)*, Madrid, in 1948.

¹⁸ An important Italian handbook on urban planning was also translated into Spanish: see Rigotti, 1947, 1952 (translation by A. Perpiñá).

¹⁹ The criteria for choosing this eight case studies are as follows: first, all of them are paradigmatic examples of ‘modernist housing estates’ and represent a good sample of this relevant episode for the history of functionalist urbanism; second, they also offer a sample of locations in the urban structure of each city which allows to comment different ways of integration or isolation regarding the surrounding urban tissue.

²⁰ INCIS *Quartiere* in Decima, 1960-62. L. Moretti (urban project); V. Cafier, I. Guidi, A. Libera, L. Moretti (architectural project). Part of the 1962 Urban Plan. Constructed between 1960 and 1966. INCIS: Istituto Nazionale per la Case degl’Impiegati Statali (National Institute for State Employee Housing).

- ²¹ Tafuri, 1986. The EUR expanded towards the South as a business district and a residential area for the upper-middle class between the 1950s and the 1960s.
- ²² The typical road scheme consists of tree-lined streets, with large parking spaces, some of them in a *cul-de-sac* form, which alternate with green spaces between two blocks.
- ²³ The project provided sufficient services and facilities to respond to the usual demands of a community (comprising mostly civil workers). Although it was not completed in its entirety, as was the case for most of these complexes, the facilities were completed over the years.
- ²⁴ In addition to the urban planning system, the quality of the architectural project, modern construction systems and building typologies are worth noting.
- ²⁵ Eight-storey *palazzine* and five-storey blocks. Neither have the projects which are requalifying the green areas of the neighbourhood.
- ²⁶ Casilino *quartiere*, 1964-65. L. Quaroni (team leader).
- ²⁷ Like the neighbouring neighbourhoods of Mandrione and Pigneto, whose physical degradation and social marginalisation were dramatically depicted by Pasolini in his films.
- ²⁸ The radial arrangement and, therefore, the increasing distance between the buildings, also determines their height: those closest to the centre vary between two and seven floors, while the furthest ones reach a maximum height of 14 floors.
- ²⁹ Together with Casal del Pazzi-Nomentano, Tor de'Cenci and Prima Porta, the Casilino was part of that first generation of projects that directly (perhaps also due to a certain formalism) included research done into town design, which, in those years, were in the focus of interest of a significant part of the Italian architectural culture. Rossi, *Roma: guida all'architettura moderna 1909-1984*. Roma, Laterza, 1991, 266.
- ³⁰ One of those roads acts as a barrier to the urban park Villa de Sanctis, in a clear contrast to the integration with green spaces achieved by the Feltrine *quartiere* in Milan.
- ³¹ The intermediate spaces are rarely frequented. The presence of a shopping centre located in the core of the northernmost fan is, as in other neighbourhoods, a reality against which small businesses in the interior of the neighbourhood cannot compete. The complex is equipped with green spaces and facilities and with a large square that aspires to become the heart of the neighbourhood. Muso, Labanca, "Spazio sociale, identità e funzione urbana. Il caso di Casilino 23", in Giuseppe Strappa (ed.), *Studi sulla periferia Est* (Milan: Franco Angeli, 2012): 75-92.
- ³² Solà Morales, M. "Entrevista a L. Quaroni", *UR* 7, 1989. In fact, Casilino has come to be called 'the Parioli of municipality VI', referring to one of the best known Roman residential areas. Strappa, 2012, 82.
- ³³ Quartiere INA Casa - INCIS Feltrine, 1957-60. Gino Pollini (main team leader), Mario Bacciocchi, Luciano Baldessari, Giancarlo De Carlo, Ignazio Gardella, Gianluigi Giordani, Angelo Mangiarotti, Mario Terzaghi, Pier Italo Trolli, Tito Varisco (team leaders).
- ³⁴ Together with the contemporary Vialba I *quartier*, it answers to the management of Milan INA Casa, an entity that in 1957 published a *Guida per l'esame dei progetti*, which included the requirement of low density in new projects. Pollini responds with a high-density solution.
- ³⁵ In Milan, the definition of a self-sufficient neighbourhood was produced through an evolution that started at the heart of the rationalist culture: from its pragmatic and reductive application in the Istituto Autonomo Case Popolari, IACP (Autonomous Institute of Popular Housing) and City Council's recent achievements, more than from the immediate anti-war projects' theoretical positions. Grandi, Pracchi, 2008, 259.

- ³⁸ In addition, the nature of unitary intervention, from the perspective of the architectural project, prevails over the individual contributions of the buildings' authors (not in vain, most of them are top-leading authors).
- ³⁹ Fabbri, 1975, 38.
- ⁴⁰ Monte Amiata residential complex, in Gallaratese 2, 1967-74. C. and M. Aymonino, A. De Rossi and S. Messaré. Promoted by the Società Mineraria per Azioni Monte Amiata (Monte Amiata Mining Company).
- ⁴¹ Following a canonical urban planning solution, which was not built, consisting of four neighbourhood units divided into neighbourhoods linked by a '*strada vitale*' as the core of the complex, around which the facilities were located. The complex hangs from via Gallaratese as a fast connection to the city centre.
- ⁴² The masterplan was commissioned by Carlo Aymonino, who directly commissioned one of the residential blocks to Aldo Rossi.
- ⁴³ A private periphery, as the authors themselves state, of natural or artificial suggestions: "(...) it has been sought, therefore, to accentuate 'the separation', resorting to a general form that is as compact and constructed as possible, which, at its limit, could almost be a single building or, better yet, a single construction". Aymonino, 1970, p. 27. However, its vocation is open, as it tries to "break the traditional conception of a 'private' building, whose only relationship with 'public' areas in the city is the entrance (...)". Aymonino, C., "Progetto architettonico e formazione della città", *Lotus* 7, 1970, 32. (Quoted in Grandi, Pracchi, 2008, 349).
- ⁴⁴ Molinari, 2014.
- ⁴⁵ Grandi, Pracchi, 2008, 348.
- ⁴⁶ The decision to fence the complex highlights the contradiction implicit in its double condition of open fragment and object/monument imposed on the periphery, exiled from the metropolis but loaded with metropolitan values, as pointed out by Tafuri (1982, 151-153). However, paradoxically, it is possible that closing off the complex probably prevented community spaces from being degraded, as is the case in other examples.
- ⁴⁷ Tafuri, 1982, 151-153.
- ⁴⁸ Plot F in the Gran San Blas neighbourhood, 1958-62. M. Barbero (team leader), V. Benlloch, F. Riestra and R. de la Joya.

⁴⁹ The Gran San Blas project is a paradigmatic example of the application of the principles of urbanism of the Modern Movement: seven large superblocks of different shapes and sizes — those of a residential nature range between eight and 23 hectares — delimited by the arterial road system, and include in its barycentre, as prescribed, a smaller piece (3.26 hectares): the community and commercial centre, which will paradoxically be the area that takes the longest to occupy and construct. Each of the superblocks was designed by a different team of architects. López de Lucio, R. “El Gran San Blas”, in Sambricio, C. (ed.). *Un siglo de vivienda social en Madrid 1903-2003*, vol. II. Madrid: Nerea, 2003, 214-215. See also Bataller, López de Lucio, Rivera, 2004/2017.

⁵⁰ The *quartiere* Comasina, located in the northwest of Milan, represents the paradigm of a ‘self-sufficient *quartiere*’, the largest intervention carried out in the 1950s in Italy by an official entity, the Istituto Autonomo Case Popolari, IACP (Autonomous Institute of Popular Housing).

⁵¹ From a design perspective, one of the most interesting singularities of the complex and also the area of highest urban quality. Díez, 2017.

⁵² Known as City of Poets or SACONIA, as a reference to the name of the property development company (Sociedad Anónima de Construcción e Industrias Auxiliares), 1965-1985. Antonio Perpiñá, Carlos de Miguel y Luis Iglesias.

⁵³ The perimeter streets are defined on a hexagonal grid. The building is projected on a 4.2-metre lattice on the side, a multiple of 30 centimetres, which corresponded to the structure’s centre line and which is signalled throughout the entire plot with a striped concrete pavement. It reinforces a dynamic image that distances it from the rigidity of the orthodox groups of blocks and towers, such as Gran San Blas’ F Unit, which clearly identifies with the principles of urbanism in the Modern Movement and largely with the open block typology.

⁵⁴ Three dwellings in a T-shape, two joined dwellings and two juxtaposed dwellings, as well as the composition of four- or five-storey buildings and eight- or twelve-storey towers. Hernández Aja, A., “SACONIA”, in Sambricio, C. (ed.), *Un siglo de vivienda social en Madrid 1903-2003*, vol. II. Madrid: Nerea, 2003, 120-121.

⁵⁵ When compared to the usual urban poverty of Spanish cities’ peripheries.

⁵⁶ The most significant of which include, accessibility difficulties in the interior to the neighbourhood units, the emergence of residual spaces between the proliferation of ramps, platforms and stairs, and the difficulty in keeping a sense of direction in the dense labyrinthine spaces.

⁵⁷ Besòs southwest *polígono*, 1959-65. Authors: Guillermo Giráldez, Pedro López Íñigo and Xavier Subías (LIGS). The LIGS team (together with E. Giralt Ortet and J. Puig Torné) presented the Besòs Southwest Partial Plan in 1958.

⁵⁸ Thus, the introduction of a new urban structure that furthered the experimentation begun in the 1930s with Le Corbusier and the GATCPAC group’s proposals for the Macià Plan and its organisation through 400 x 400 m superblocks that also correspond to the idea of a neighbourhood unit was essential to the planning of the Besòs complex. See Torres i Capell, M., *La formació de la urbanística metropolitana de Barcelona. L’urbanisme de la diversitat*. Barcelona: AMB, 1999.

⁵⁹ With infrastructure such as towers and high voltage cables... Although “at present we can see how none of the three zones that surround the settlement have followed the original Plan”. Tena, P., *Universalidad y adecuación en la obra de LIGS. 1956-1966* (Barcelona: Universidad Politècnica de Catalunya, 2010, 144.

⁶⁰ Bellvitge *polígono*, 1965-70. Author: Joan Salichs

⁶¹ The Bellvitge *polígono* was promoted as part of 1958 Barcelona *Social Emergency Plan* (which delimited the land to be occupied), although it underwent a complicated administration process. It was finally developed during the second half of the 1960s. Ferrer, 1996, 124.

⁶² An area that has undergone substantial changes in recent years. Hormias, E., Bestraten, S., “Bellvitge, 50 años después: la vivienda como proyecto de ciudad que hace barrio”, in *I Congreso Internacional de Vivienda Colectiva Sostenible*. Barcelona: Máster Laboratorio de la Vivienda Sostenible del Siglo XXI, 2014, 226-231.

⁶³ The first project for Bellvitge (1957) was created by the architect Antonio Perpiñá (1957), with the interesting initiative of a fan, although the final version was carried out by Joan Salichs. The rigidity of the outlines should not be attributed solely to the authors’ interpretation of the principles of modern orthodox urbanism, but also to the willingness of the property developers (in this case private) to simplify the construction process and the production of houses through an extreme standardisation of buildings by using industrialised systems; this case and La Mina are probably the best examples of this in the city.

⁶⁴ The introversion of the complex is reinforced by the clusters that these streets help to shape, with land reserved for parking space and pavements.

⁶⁵ The building is arranged according to a repeatable module that is supported by a central space. Ferrer, 1996, 190. The neighbourhood has 1,140 productive units with a minimum size of 50m² that allows aggregation. Hormias, Bestraten, 2014.

⁶⁹ Urban morphological approaches such as the one adopted in this paper can give some clues to better understand similar processes and specificities of housing estates and ordinary peripheries in different cities, as well as the changes taking place during the last 40 or 50 years. They focus on the different levels of integration into the surrounding urban tissue, but, of course, other aspects are also important, such as size, densities, road systems, land uses, etc. We have dealt with them in other works. Neighbourhood Units in Brazilian New Towns: foreign idea and local urban life

Renato Leão Rego*

* *Professor, Universidade Estadual de Maringá, Brazil, rlrego@uem.br*

Neighbourhood units and Brazilian new towns were an instrument of national development in line with the governmental nation-building discourse and planning agenda. Urbanisation was thought to be a path to modernisation and innovative urban settings were to establish new urban practices and change social behaviour. But could neighbourhood units really mean new living patterns? Was the neighbourhood unit straightforwardly accepted as a new urban condition? Did it meet passive compliance or strong opposition? Drawing upon the Americanisation of Brazilian society, this paper explores the transfer, interpretation and appropriation of the neighbourhood unit in Brazil through the analysis of the original layouts and present realities of neighbourhood units in the cities of Goiânia (1933-36), Angélica (1954), Brasília (1957), Rurópolis (1972) and Palmas (1988). Contradictions and conflicts are exposed between the planners' visions and the appropriation and use of the urban forms - in short, mismatches between how they were imagined and how they were lived. Due to physical inadequacy and cultural incompatibility, neighbourhood units were either considerably transformed, or rejected and replaced by more traditional, conventional urban configurations, for a foreign-planning idea is only truly incorporated when it makes sense in the cultural realm that has adopted it.

Keywords: planning ideas, international diffusion, appropriation, rejection.

Introduction

The neighbourhood unit, an idea originally formulated in 1920's America within the context of the garden-city movement, has been rebuilt throughout the world and adapted to many distinct planning proposals¹. In Brazil it has been adopted both by academicist urbanism and rationalist/functionalist planning. Be it a city-beautiful type layout or a functional-city plan, a new capital city or a colonisation-project new town, the neighbourhood unit has been constructed in modern layouts created by both federal institutions and private entrepreneurs, fostered by both democratic and authoritarian governments. The exemplary cases of Goiânia (1933-1936), Angélica (1954), Brasília (1957), Rurópolis (1972) and Palmas (1989) depict its recurrence in particular situations through the 20th century, for various purposes and with specific meanings.

As a social product – historically and culturally determined – the planning idea is transformed when transferred in space and time. Grounding in a new destination normally involves a selective process of recreation, which makes it somewhat different from its 'original version'². As noticed elsewhere, interpretations and revisions of the neighbourhood-unit schema were often conjunctural, as it has been constantly tamed into different programmes of modernisation in different times and places³. For a travelling planning idea has to be validated as sufficiently polysemic and capable of sustaining new values in order to effectively function in different contexts to its original one⁴.

Despite the planners' efforts to deal locally with transnational planning ideas, did Brazilian new towns and innovative urban forms really mean new living patterns? How was the foreign neighbourhood unit appropriated? Was it straightforwardly accepted as a new urban condition? Did it meet passive compliance or strong opposition?

The originality of this paper stems from the understanding of the reconstruction of planning ideas in diverse circumstances by different social actors, moved by various interests, with distinct purposes, conveying new values and meanings, and by also considering the reaction of the inhabitants to the new neighbourhood forms. In hindsight, and in the global and more complex panorama of the international diffusion of planning ideas⁵, this paper broadens the history of twentieth-century Brazilian new towns and brings about an assessment of the design process from a cultural viewpoint.

Drawing upon cultural studies and the Americanisation of Brazilian society, this paper's premise is that a foreign idea is only really assimilated when it makes sense in the cultural realm that adopts it⁶. New symbolic values and (invented) traditions root wherever there is fertile social and cultural soil⁷.

New towns, progressive country, modern urban life

Throughout the twentieth century, Brazilian democratic governments and dictatorships created, and fostered the creation of, new towns with the objective of occupying territory and developing the country. Brasília is certainly the epitome of this. Urbanisation was thought to be a path to modernisation and new towns were an instrument of progress⁸. Though planned in the pioneering hinterlands, under the governmental discourse of development and nation-building, Goiânia (1933-1936), Angélica (1954), Brasília (1957), Rurópolis (1972) and Palmas (1989) each belong to a particular conjuncture of the national history.

Goiânia, the new capital of Goiás state, was built in the era of Getúlio Vargas (1930-1954) and cannot be dissociated from the “march to the west”: a policy of the authoritarian, centralising, nationalistic government, which exalted past territorial occupation and imbued it with the future progress of the country to foster the development of its hinterlands⁹. The ‘*Estado Novo*’ (New State), as the period of Vargas’ dictatorship (1937-1945) was named, aimed at creating a new society as part of an urban, industrialised, modern country. Indeed, this period was an important phase for Brazilian industrial capitalism, with a shift from the agro-export economy to an urban-industrial one¹⁰. Devoted to a nationalist, modernisation process, the State then promoted contemporary architecture and urbanism as an identitarian image of the modern Brazil, for they associated modernity with tradition; international avant-garde artistic expressions with Brazilian features¹¹. It was believed that the ideology of rationalist architecture and urbanism would change society¹², and so the New State also pursued it. Grounded in a milestone, emblematic, modernist building, Vargas’ Ministry of Education and Health was concerned with the formation of a new type of man¹³. The Americanisation of Brazilian society was starting to be felt as President Franklin D. Roosevelt implemented the Good-Neighbour Policy in Latin America¹⁴. In such an atmosphere, President Vargas referred to Goiânia as having a state-of-the-art layout¹⁵, while its designer presented it as the result of capitalist expansion in a new era for the national economy¹⁶. Goiânia and its neighbourhood units portrayed the new country under construction in the 1930s.

When Angélica was planted in under-explored, agricultural Mato Grosso state in 1954, the private enterprise colonising the city advanced the march to the west of the country, and the layout for the new town depicted a radical change in urban form, replacing academicist urbanism, the picturesque ambience and the figurative town, for the functional city. The neighbourhood-unit idea had already been echoed in the European discourse on rationalist urbanism, particularly in the third CIAM (1930); Albert Mayer, and later on Le Corbusier, had already adjusted it to the layout of Chandigarh¹⁷. Angélica’s layout embodied, in the rural world, a contrasting scheme: a rationally ordered town, a uniform spatial organisation for a standardised, modern, communitarian life.

Brasília (1957) was the project of a democratic government committed to the country’s development and an internationalist nationalism, that is, an idea of cosmopolitan modernisation stripped off references to local tradition and regionalisms¹⁸, not dissimilar to the case of Angélica. With the slogan of ‘fifty years of progress in five years of government’, president Juscelino Kubitschek (1956-1961) proposed an economic model that favoured associations of Brazilian private companies with multinational and state corporations, which were successful in the short term as national rates for economic growth peaked at 10%¹⁹. Pursuing the growth of basic industry, Kubitschek’s administration undertook a vast programme of infrastructure construction, including roads, hydroelectric power plants, aeronautic projects and car manufacturing. The construction of the new federal capital embodied the democratic progress, the ‘developmentist nationalism’ and a break with the past. Representative of its moment, Brasília was to be an entirely new city: ‘international’, deprived of any pre-existent urban context²⁰.

Brasília epitomised the endeavour to transform physical environment as a manifestation of development²¹. Urban modernity in Latin America was a path to modernising development – not its natural consequence, and with this inversion, the idea of a town became a modernising agent, particularly the new capital of Brazil. Brasília depicted a new urban form that would create a new social order and foster regional progress²². By radically re-conceptualising town life, Brasília was to create a new civilisation²³.

The military regime (1964-1985) retrieved the late 1950’s economic model and the euphoria of the times of Brasília’s construction²⁴. Envisioning a ‘Great Brazil’, it promoted colossal building enterprises to stimulate economic growth and encourage regional development. The resulting economic growth rates were higher than those experienced before, and the period 1968-1973 is known as the economic-miracle years, although the 1973 oil crisis, the high inflation in the following year, massive unemployment and the following economic recession labelled the 1980s as the ‘lost decade’²⁵.

General Garrastazu Médici's tenure (1969-1974) created a series of new towns, including Rurópolis (1972), as part of a mammoth colonisation scheme along the newly open Transamazonian highway, implemented by the National Institute of Colonisation and Agrarian Reform – INCRA. Stemming fundamentally from geopolitical and economic considerations, the Amazonian colonization scheme aimed to develop the region. The craving for progress and the objectives of national integration and economic growth had directed the capitalist expansion to that region. Crossing North Brazil from the Atlantic coast to the inner forest, the road was to change the 'demographically-empty' Amazonian basin and the densely populated Northeast region, thus connecting and balancing the potentialities of the Amazonian territory with the disadvantages of the *sertão* (the arid and remote interior), while simultaneously providing an alternative to the landownership inequities in Brazil. The official discourse referred to 'the distribution of land to men without land' and the 'formation of a community, a society', a new civilisation that was being born²⁶. The layout of Rurópolis depicted an ideal urban life designed upon common standards and strict social behaviour.

The creation of Palmas (1988) coincided with the country's period of re-democratisation, when the strengthening of social movements, the general criticism of modernist architecture and town planning, and a flourish of ecological consciousness could be noticed. The 1988 Federal Constitution led to the creation of a new state, Tocantins, and its capital, Palmas. The new state was then described as rural, living in economic and social chaos, with unexploited mineral and hydro-electrical potential and partially used agricultural fertility dependent on a monoculture: cattle raising²⁷. In this post-dictatorship period of economic recession, amid local setbacks, the creation of a capital city was again seen as a potential opportunity to give rise to progress and regional development²⁸.

Goiânia, Angélica, Brasília, Rurópolis and Palmas' new urban configurations were imagined as a means to a new social order. Their layouts comprised contemporary European and North-American planning ideas as a sign of progress. The North-American neighbourhood unit, in particular, became a recurrent feature of the radically innovative urban settings, which were to establish new urban practices and change social behaviour as part of the country's modernisation process. But did this, in fact, happen?

The neighbourhood unit rejected

The idea of new towns fitted well with Brazil's agenda for development throughout the 20th century and with the planners' attempts to create a better urban environment, which supposed a forward-looking and outward-oriented vision, particularly that nurtured by the North American way of life. Like for Clarence Perry, the neighbourhood unit would improve social life and enhance the spirit of citizenship.

Figure 1: Godoy, A. A. de. *Goiânia, revised plan, 1947*. [Manso: 2001]

The neighbourhood units formulated in Goiânia, Angélica, Brasília, Rurópolis and Palmas were either part academicist-urbanism or part functionalist planning, and served the progressive objectives of democratic and dictatorial regimes. At such distinct conjunctures, the recurrent idea conveyed uncommon urban images related to modernisation and development, always endorsing the motivation for having a community life, proximity to nature, detachment from heavy city traffic, and functional zoning and rationalist separation between pedestrians and motor vehicles. However these cultural values were not fully assimilated.

Civil engineer and town planner Armando Augusto de Godoy transferred the neighbourhood-unit scheme directly from the USA to the design for the South residential area of Goiânia in 1936 when he revised the original 1933 academicist city-layout and endorsed its garden-city-like features²⁹ (Figure 1). Godoy had already established a link between Brazilian town-planners and international planning ideas and practices as an author of several papers in specialised journals about his overseas field trips; namely, 'The Garden City' in 1931 and 'Town Planning in the United States' in 1935, in which text he considered the city of Radburn³⁰.

His layout for the South Goiânia residential area reflects the Radburn model and its informal and picturesque configuration. Cul-de-sacs, enclaves, superblocks, internal parks with community facilities and hierarchical winding roads created an unfamiliar, thus modern, urban form. Local press soon reported that in that neighbourhood 'the most modern urban solution of the present moment will appear: it will be built there, for the second time in the world; the most technical solution for modern cities, which was recently built for the very first time in Redburn [sic], a XX century town, as it is known in the USA'³¹. The new residential sector occupied an area of 325 hectares with a population density of approximately 118 inhabitants per hectare. Like Radburn, the modern (and healthier, greener and bucolic) neighbourhood unconventionally located the main house-façades to the park, with their back door to the cul-de-sacs. However, this foreign layout was ultimately rejected as dwellers insisted on building the house façade to the street, and the internal parks with direct connection to the residential buildings ended up being abandoned and some other park areas were later parcelled off. (A similar rejection and layout transformation was seen in Barry Parker's Jardim América, the first Brazilian garden suburb, built in São Paulo in 1917)³².

Figure 2: Wilhelm, Jorge. *Perspective of Angélica's neighbourhood unit, 1954*. [Wilhelm: 2003]

Distinct from Goiânia's and Radburn's picturesqueness, Angélica's neighbourhood unit (Figure 2) depicts a Cartesian, regular, symmetrical, uniform, standardised layout. Its designer, young architect Jorge Wilhelm, was interested in Le Corbusier's ideas and in the CIAMs' planning discourse, while not disregarding the 'English town planning and their garden cities'³³. A small new town in a pioneering rural area, Angélica was thus organised into functional sectors and its residential neighbourhood was organised into rectangular units whose central area was longitudinally defined by a green area with various community facilities. The estimated town population was 15,000 inhabitants and each neighbourhood unit, measuring 370 x 670 meters, should house around 1,600 people (with a density of roughly 65 inhabitants per hectare). Local commerce was located on one edge of these green areas and a series of plots for single-family detached houses were arranged into orthogonal cul-de-sacs. The location of common buildings on the green area follows the modernist inversion in the town-

layout, from continuous solid to continuous void³⁴; consequently, the vitality of the multi-use street was lost, along with the interaction of pedestrians and vehicles. However, the cul-de-sacs were eventually opened-up, the continuous green area was crossed by connecting streets and commercial buildings popped-up among the houses.

Unlike Angélica, Brasília's 'neighbourhood areas' (as Lucio Costa translated and referred to his neighbourhood units) suppressed the private ownership of urban land, elevated six-story, multifamily, uniform residential buildings, and increased urban density, thus combining the Anglo-Saxon concept of neighbourhood unit with the Corbusieran pilotis and endorsing the idea of a park-city. Costa designed four squared superblocks (280 meters the length of each side) to form each neighbourhood unit, whose population should range from 10,000 to 12,000 inhabitants. The estimated density of the superblock was little more than 300 inhabitants per hectare. Thus the original idea of a walkable distance between residences and common facilities and the segregation of commerce and motor vehicles were kept. The uncommon, egalitarian, functional city was to be the image of modern Brazil. By dis-familiarising and re-conceptualising city life, the radically new urban form was to connect architectural innovation, change in individual perception and social transformation³⁵. The layout of Brasília's neighbourhood units has been preserved through mandatory heritage protection³⁶, though not without suffering a significant change: commercial buildings settled on the edge of each superblock originally faced the interior of the neighbourhood unit, with their backs to service streets, but soon this position was inverted in order to recuperate the more traditional display of corridor-streets, and some *pilotis* were closed by walls and glass panels, blocking the spatial continuity³⁷. Brasília was at the same time a city of hope and a modernist dystopia³⁸.

Figure 3: Camargo, José Geraldo da Cunha. *Plan of Rurópolis (detail of neighbourhood unit)*, 1972. [Camargo: 1973]

Rurópolis' neighbourhood unit (Figure 3) returns to a less regular layout (due to adaption to site conditions) and the private ownership of residential plots for single-family detached houses, which were arranged along parallel cul-de-sacs, perpendicularly linked to vast green areas. The estimated town population was roughly 5,000 inhabitants and its neighbourhood units considered 1,000 inhabitants to each elementary school (population density around 42 inhabitants per hectare). Commerce, services and the main public buildings were to be located on a long, continuous green area in the city centre. Architect and town planner José Geraldo da Cunha Camargo, closely related to then president Médici, believed that the town's rationalist layout would bring together its carefully selected citizens, who were to be prepared for its community life and consequential benefits. The cautious selection of citizens was intended to prevent the social segregation caused by religion, customs,

previous relationships or origin. It was hoped that all inequalities would be eliminated in the Transamazonian scheme and so new towns with uniform, indistinct, standardised houses (in the neighbourhood units) were therefore expected to create a new, unbiased urban environment³⁹. Located in the middle of the Amazonian forest, the new-town layout endorsed the bucolic image and a low urban density – a slightly different image of what progress was expected to be compared to what generally appealed in that milieu. However, like in Angélica, Rurópolis' cul-de-sacs soon disappeared with the dead-end streets being extended and their portions of the original green areas being parcelled off. The neighbourhood units simply vanished from Rurópolis layout⁴⁰ (Figure 4).

Figure 4: *Aerial view of Rurópolis*. [Google Earth: 2017]

Brasília was created in a democratic period but really thrived during the military regime, being easily related to the contemporary authoritarianism. Thus the layout of Palmas has a dual relationship with Brasília's urbanism: continuity and break. Palmas' macro-block (not superblock like in Brasília) varies its typology (by being less authoritarian and more flexible in its internal arrangement) as it follows, to a certain extent, the international criticism of functionalist planning and contextualises the recent democratisation of the country. Even so it does not totally abandon modernist ideas and certain precepts of the Charter of Athens⁴¹. Varied experiences contributed to the 'late modernism' of Palmas, including Milton Keynes New Town, then visited by the architects and town planners Luiz Fernando Cruvinel Teixeira and Walfredo Antunes de Oliveira Filho, who had lived in Goiânia, gone to college in Brasília and attended postgraduate courses in London.

In Palmas, large roads articulated by roundabouts define an orthogonal grid from which stems secondary roads that lead to residential macro-blocks, equivalent to the neighbourhood unit scheme. Macro-blocks' dimensions are 600 by 700 meters for a population raging from 8,000 to 12,000 inhabitants (roughly 285 inhabitants per hectare). Within the macro-blocks, informal, secondary streets give access to individual plots, common areas and public facilities⁴². Traditional morphological elements, e.g. streets, street corners, blocks, plots and detached houses were to be applied. Each macro-block was to be laid out differently to the others, with unique internal configurations to be designed by different architects⁴³, thereby avoiding Brasília's monotony and uniformity, though creating a resulting heterogeneous and confusing collection of neighbourhoods. Various residential-building types were to be included in it, from detached single-family residences to grouped houses to multi-story apartment buildings. Urban density was universally fixed and the existence of local commerce, schools, community centres, churches, health centres, and nurseries was envisaged⁴⁴. Due to minor urban flux, however, the internal public areas became less safe and little used. Supposedly, pedestrians would not need walk outside

the macro-blocks and cross the large main roads, as daily, ordinary necessities were to be supplied within them. Small daily commerce was to be found in the entrance of the macro-block while vicinal commercial buildings were to be located on the edge of each macro-block, facing the roads, endorsing the neighbourhood's autonomy and insulation. But it has not, in fact, functioned that way: commercial and residential buildings have been mixed in the core of the most popular macro-blocks, thus departing from the original plan.

Conclusion

The Brazilian new towns' neighbourhood units were a technical response to the quest for a modern, and supposedly better, urban way of living. They replaced a traditional spatial form of organisation for another, radically innovative one, and were supposed to shape the constitution of a new social order. They were adopted in different historical contexts to represent the modernisation of the country and its international alignment, and to reflect it physically on the urban environment at the domestic level.

The Brazilian neighbourhood unit also aimed at fostering community life. Neighbourhood units built in Goiânia (1936), Angélica (1954), Brasília (1957) and Rurópolis (1972) were scaled around the needs of children for an elementary school, echoing Perry's idea developed in the United States, while in Palmas (1989) they responded to CIAMs-influenced forms of neighbourhood organization. Brasília's neighbourhood units depicted Corbusieran residential slabs, and Palmas foresaw vertical residential buildings. Angélica, Rurópolis and Goiânia's neighbourhood units were structured upon detached single-family houses in private plots. Only Brasília's neighbourhood units remain (virtually) in their original aspects, certainly due to their mandatory heritage protection.

Brazilian neighbourhood units have depicted ever-contrasting layouts, distinct from established patterns of city living and oblivious to local preferences, and ended up being considerably transformed, many of them rejected and erased from town layouts. People's lives were ultimately not influenced by their physical environments, which, in turn, ended up being substantially transformed. Without passive compliance, residents, developers and public municipal administrations all participated in the transformations that mainly occurred in the neighbourhoods' structures (like in Angélica, Rurópolis and Palmas) but can also be noticed at the housing-level (like in Goiânia). These transformations – including a complete erasure of the neighbourhood unit – adapted the planned urban environment to the citizens' practical needs and cultural preferences.

The foreign neighbourhood unit embodied not only an unfamiliar urban arrangement but also new social and cultural values. Historians have shown that such a relationship between urban layout and resident may stem from acts of will, but its acceptance depends on its capacity of adherence, of establishing connections either with the pre-existing imagery or the collective aspirations for a new imagery.

These innovative urban forms, which endorsed the simplification of urban complexity, segregation of urban functions and social transformation through the reforming ambitions of modernist planning, were not accepted as a new urban condition. The populations who came to inhabit these new towns were not compliant and did not subject themselves to their neighbourhood-units' configurations and, therefore, transformed them into more traditional urban forms because of their physical inadequacies and cultural incompatibilities. This paper has thus exposed contradictions and conflicts between the planners' visions and the cities' appropriation by their inhabitants, whose knowledge might help us to grow more contextual planning histories.

Transition of Planning Concept in Tsukuba Science City

Shin Nakajima (Tokyo City Univ.)

How is the concept of planned city realized and will it change afterwards? This research analyzes the planning concept and the subsequent transformation of Tsukuba Science City planned for suppressing growth in metropolitan areas in Tokyo.

In 1963, the Japanese government accepted the Cabinet meeting with the Tsukuba area as the construction site of the Science city. The law for Construction of Tsukuba Science City came into force in 1970. The planned cities planted by the huge national project called the science city had declared distributed arrangement for deterring overcrowding in the Tokyo metropolitan area. Tsukuba city was planned as self-sustaining rural city. This plan resulted in mass transfer of government research institutions from Tokyo. The characteristic of Tsukuba City is "the official residence city" - a collection of colonists with unique single attributes. Many researchers and students with high liquidity lived in the official residences prepared by the government.

Because there is only bus transportation connection with the metropolitan area, Tsukuba Science City became a solitary island by the concept of a self-sustaining city. The plan of Tsukuba Science City is designed mainly based on automobile. The pedestrian is located in the center of the city, and it is a thorough car isolation structure. Immigration of new residents is socially incorporated as a new layer in urban infrastructure improvement by the construction of new town - road and block system and the location of official residents. It was planned commercial functions necessary for daily life in the center area.

In the 21st century, the planning concept of Tsukuba city undergoes major transformation. By the location of a suburban shopping mall in the 2000s, the hollowing out of the center gradually advanced. Due to the opening of the new railway in 2005, it was dramatically improved the convenience of transport between Tokyo and Tsukuba by a high speed bus so far. At Tsukuba University, the number of students who came from Tokyo without living in Tsukuba city increased. The city office moved to the vicinity of the newly constructed station, and the center of gravity shift occurred due to the development of the new railway line. At the same time, the government promoted the obsolete plan to abolish the official residence in the central district. Furthermore, this plan was accelerated to secure reconstruction finance for the Great East Japan Earthquake. Residents who lived in government offices moved to residential areas in the new suburbs of the city. Due to progress of bed town formation and expansion of urban areas to the suburbs, the planning concept of independent city of Tsukuba City at the time of construction was dismantled. The concept of rural city residential is creating a new lifestyle in the suburbs in a manner different from the plan intention. Drastic space and social change and reorganization are forced by the disappearance and change of the idea of the city made with the conventional plan intention.

Re-inventing Copycat Cities: Shanghai's "One City and Nine Towns" Revisited

Zhongjie Lin (UNC Charlotte)

In 2001, the municipal government of Shanghai announced an ambitious plan of "One City and Nine Towns", calling for creating ten satellite towns to decentralize overcrowded Shanghai, each housing a half to a million. The controversial part of this program was the demand that each town should be built in a uniform architectural style, and townscapes should be introduced from the Western cultures. Within just several years, the plans of these new towns were carried out to construction, resulting in a series of copycat cities including a Thames Town, a German Town, an Italian Canal Town, and a Dutch Town among others themes. All of them were built to be photogenic, although many have remained underpopulated. Despite various issues these projects encountered, they have inspired town planners and builders across China as the country engaged in urbanization at an unprecedented scale, which has created numerous cities from scratch during the last two decades.

This paper revisits the One City and Nine Towns projects fifteen years after the inauguration of the program to examine their post-occupation effects and social impacts in a wider context. The idea of the One City and Nine Towns stemmed from the concern that new towns had tended to be built like generic places and without character, so signature Western townscapes was introduced as remedy in a superficial way. While the same issue had plagued the postwar British new towns and was part of the criticism of New Urbanism, the dilemmas that the Chinese themed towns have faced reflect the intensified interaction and contradiction between the global forces and the local conditions in the current age. The author's on-site investigations of these Chinese copycat towns in the recent years, however, have reveal additional challenges of these districts beyond the issue of cultural hybridity. They concern the lack of access to public transit, inadequacy of employment, and difficulty of attracting retail, as well as monotony of housing products that has to do with both the fixed design vocabulary and the market-driven approach. As a result, several of the towns have undergone substantial revision of their original plans and adopted new development strategies. The analysis of these towns' re-adaptation in the changing context of China's urbanization shed new lights on studies of new town planning in the world in terms of both physical forms and social challenges, and provide hint to possible solutions of their dilemma in development.

Narratives of Sustainability in Treasure Island's Planning History, 1993-2011

Tanu Sankalia (University of San Francisco)

When it was built in 1937, Treasure Island was considered to be one of the largest manmade islands in the world. Located in the middle of San Francisco Bay, the 400-acre island was constructed out of dredged bay mud in a remarkable feat of Depression-era civil engineering by the US Army Corps of Engineers. It was built concurrently with the San Francisco-Oakland Bay Bridge and the Golden Gate Bridge to serve as San Francisco's airport at a time of major transportation infrastructure expansion. Between 1939-1940, the island hosted the Golden Gate International Exposition (GGIE), which shifted the focus of world's fairs as venues of science and industry to representations of international unity exemplified in the idea of a Pacific Rim interconnected through commerce and trade. World War II scuttled this utopian imagination, and in early 1942 Treasure Island was converted into an active naval base. After World War II, Naval Station Treasure Island focused on training and distribution activities until it was officially closed in 1997.

In 2011, the City and County of San Francisco Board of Supervisors approved the Treasure Island Development Project (TIDP)—a redevelopment plan for a new sustainable city of 19,000 residents. The Treasure Island Development Project consists of 8000 units of housing, two hotels, about 500,000 SF of commercial space, a ferry terminal, and 300 acres of parkland with organic urban farming and manmade wetlands. Critics and commentators have described the plan as an antidote to urban sprawl, as utopian "eco-urbanism," and as a model for future cities.

In this paper, I trace the two-decade long planning history of the Treasure Island Development Project. Since 1993, following the federal mandate to begin the process of transfer of Treasure Island from the US Navy to the City of San Francisco, the island has been through five different scenarios for development ranging from modest urban design solutions to its most recent grand vision. As I document the project through its various transformations, I show how Treasure Island, as a disconnected island site, was considered exceptional to the norm and therefore subjected to special planning processes and state control. Further, I argue that it is within this structure of exceptionalism, and other political economic contingencies, that the project took a turn towards sustainability and the use of spectacular form. As sustainability and the promise of an ecotopia are used to promote the project, this paper examines what these concepts mean for urban planning and design. The paper shows how past planning legacies of the airport, world's fair site, and military base, further complicate urban visions of sustainable futures.

Interpreting the contemporary Chinese planning history from the "new towns" perspective. The case studies of Pujiang and Kilamba

Domenica Bona (Università degli Studi Roma Tre)

The new millennium has been a time for a great change in the Chinese planning history. Planning has become a professional practice able to manage the construction of thousands of new urban settlements and urbanization has driven deep transformations in the economic structure of China and in its society. This paper proposes a critical interpretation of the "new towns" by analysing two case studies, Pujiang and Kilamba. Pujiang is a new town near Shanghai designed by the Italian firm Gregotti Associati with the local Highpower-OCT Investment; Kilamba was designed by the Chinese CITIC in the outskirts of Luanda, Angola. From a planning perspective, this paper tries to analyse the phenomenal and formal aspects related to plans of two case studies. Applying a typo-morphological approach, the physical structure of both plans are analysed and compared so to highlight the structural elements of analogy between them. The aim is to reveal the current attempts by planners to transfer cultural issues into the built environment. Thus, this will allow to find out the possible commonalities and define the terms of correspondences of these contemporary layouts with the historical Chinese planning wisdom.

Interpreting the contemporary Chinese planning from the “new towns” perspective. The case studies of Pujiang and Kilamba

The new millennium has been a time for a great change in the Chinese planning history. Planning has become a professional practice able to manage the construction of thousands of new urban settlements and urbanization has driven deep transformations in the economic structure of China and in its society. This paper proposes a critical interpretation of the “new towns” by analysing two case studies, Pujiang and Kilamba. Pujiang is a new town near Shanghai designed by the Italian firm Gregotti Associati with the local Highpower-OCT Investment; Kilamba was designed by the Chinese CITIC in the outskirt of Luanda, Angola. From a planning perspective, this paper tries to analyse the phenomenal and formal aspects related to plans of two case studies. Applying a typo-morphological approach, the physical structure of both plans are analysed and compared so to highlight the structural elements of analogy between them. The aim is to reveal the current attempts by planners to transfer cultural issues into the built environment. Thus, this will allow to find out the possible commonalities and define the terms of correspondences of these contemporary layouts with the historical Chinese planning wisdom.

Keywords: Africa, China, Chinese cities, contemporary cities, East-Asia, Kilamba, morphology, New town, Pujiang, planning, planning history, planning legacy, urban history

Introduction

The phenomenon of the new towns presents for China a series of causal and consequential issues intertwined with the economic, socio-demographic, geographic, and political history of the country and its relations with foreign countries. On the wave of urbanization that has involved China since 1978, hundreds of cities have been built *ex novo* to which must be added countless new districts in the suburbs of existing cities. Major metropolises and minor cities have carried out continuous urban additions, so that new neighbourhoods, industrial districts, business centres, residential complexes, and university campuses have grown around the consolidated cities and within. In this panorama, today planning practice is closely related to the oligarchical choices of a few political administrators and entrepreneurs who see the building industry as the main economic engine pulling the country despite the global downturns of finance and foreign interference. Moreover, as long as real estate and town planning have become almost a solely economical affair, most of the planning projects lack a theoretical conception capable to go beyond the pragmatism of technical issues, do better than applying dreary prototypes, and work as a bridge between past and present urban identities.

Acknowledging the phenomenon of the “new towns” as primarily characterizing contemporary Chinese planning, this paper reports the attempt to analyse the morphological characters of the Chinese new towns built in the 2000s. It proposes a critical interpretation of the contemporary Chinese planning history by analysing two apparently antithetical case studies, the new towns of Pujiang and Kilamba from a morphological perspective. Pujiang is a new town of Shanghai municipality, designed in 2001 by the Italian firm Gregotti Associati International and Kilamba is a new town in the outskirt of Luanda, Angola planned by the Chinese company CITIC in 2008.

The two cases represent two ends of the “new town phenomenon”; on the one hand, the importation of foreign planners to design new towns in mainland China and, on the other hand, the exportation of Chinese planners to develop urban plans abroad. By comparing them, this paper suggests similarities and diversities, in terms of general planning conditions, related to their foundation. Besides, the morphological analysis of their plans address the comparison highlighting a series of analogies in terms of structure, physical dimensions and urban facts that could eventually allow to claim the translation of historical planning features into contemporary Chinese planning practice.

Background and methodology

The research underlying this paper was developed in the framework of the author’s PhD thesis and is based on two levels of analysis: a phenomenal one, to understand the context in which an urban plan to be drawn and realized; a morphological one to define the structural elements of the planning projects guiding the construction of the new towns under study and identify points of correspondence between them. The analysis required to collect the historical documents about the planning process of each case study (e.g. maps, master plans, descriptions, etc.)

and redraw the data into a series of maps comparable in scale, criteria, contents, and graphics. As a result, the confrontation of the cartographic reconstructions picks out similarities and correspondences under various aspects (e.g. structural, dimensional, formal and visual) that, eventually, do not end in the physical description of urban data but refer to a typological vocabulary that could be identified as symbolic and rooted in the Chinese urban culture.

The historicising interpretation of contemporary town planning is a new perspective for the Chinese case that the literature tends to describe as western-oriented and regardless of its own past. As a matter of fact, the interest of academia was limited and the one of media focused on the socio-economic aspects related to the foundation of these new towns, mostly in critical terms. Indeed, the literature about Pujiang and Kilamba mainly reports the condition of “ghost cities” that both experienced right after the delivery of the urban projects for relatively long periods. Besides, as most of the new towns, their clear urban boundary contrasts with the unbuilt surrounds and increase the sense of “cathedrals in the desert” that the emptiness conveys alone, especially in the time when the towns are waiting to be inhabited.

If compared with the literature and research produced around the topic of this paper, the typo-morphological perspective has been applied in a limited number of cases to the Chinese context. On one side, the typological approach, developed in Italy to study the Italian and European historical cities during the second half of the twentieth century, was mostly abandoned because judged ineffective in the analysis of the contemporary cities.¹ On the other side, the morphological approach, developed in the same decades by Anglo-German school of urban morphology, found some application as an analytic tool for urban heritage regeneration.² In recent years, the attempts to define hybrid typo-morphological method found some application in the study of specific urban phenomena characterizing contemporary urban China (e.g. informal urban villages, hyper dense neighbours, etc.); nevertheless, the focus of these application refer to small-scale part of the built environment and lack of interest in understanding city plans at large scale and the structural logic underlying them.³

First case study. Pujiang, one of the Shanghai new towns

In the 1990s, the Shanghai municipality promoted the design of new satellite cities around the metropolitan area. With the slogan "One City Nine Towns" and financed in the five-year plan 2001-2005, nine new cities and few smaller suburbia made up the puzzle of settlements gravitating around Shanghai. This operation would have catalysed urban development away from the centre, along with the road network connecting downtown to the deltaic periphery; in fact, they were meant to absorb part of the new upper-middle-class population, tending to leave the centre to move into modern and less chaotic residential neighbourhoods. A curious new concept characterising the plan was to have given a thematic connotation to the new towns; dedicated each to a foreign nation, they were meant to reproduce its salient features in approximate terms of style and aesthetics.

Most of the master plans were designed by local design institutes and the outcome is mostly of the kind of a “pastiche”; for example, the English-themed Thames Town is a mix of rustic and regency style buildings, back dropping red telephone booths and guardians dressed as royal guards. Few other projects were instead entrusted to foreign well-known designers, who could better prefigure the image of these contemporary cities; Gregotti Associati International designed the Italian-themed town while the German firm GMP designed the German Anting and the Central European New Harbour City.

In 2001, Gregotti Associati won the international competition for the Italian-themed new town Breeza City of Pujiang.⁴ Differently from every other new town around Shanghai, the idea that the promoters, designers, and municipality have tried to convey through the project was the cultural proximity between the two-thousand-year-old cultures of China and Italy. In this framework, Pujiang was to be built on a *tabula rasa* fairly close to the centre of Shanghai, just 16 km southern and well connected by a metro line.

Gregotti project envisaged the construction of a 15 km² neighbourhood surrounded by 60 km² of a protected park (Figure 1). Here the municipality planned to relocate the 50,000 residents of the core area occupied for Expo 2010 and, since relocating the population was a priority for the municipality, his issue prevented the project to undergo to consistent changes and let the Gregotti plan be realized with few modification, though a reduction of area including the main waterfront public space.

Founded on a rigid orthogonal grid, the city has a longitudinal development organized in two sectors symmetrically divided by a north-south axis (Figure 2). A triple grid supports and differentiates the network system of pedestrian paths, roads, and water channels. The northern part of the town was developed as the “ecological quarter” by the company Highpower-OCT Investment and designed by Gregotti and other Italian architects who developed the single buildings defined by the general masterplan; it presents a slightly dense fabric, a sort of garden city with single and terraced villas, a central core with a square, a vernacular bell tower, and an “Italian style” town-hall *replica*. The central part of the town is the “Top Grade neighbourhood”, located around an equipped median axis

on which the main public functions, malls, and public space converge. The southern part reflects more Gregotti architecture and the urban scale of Pujiang; here the fabric is high-dense, the type of buildings recalls the ones he realized in the Bicocca area of Milan, and the public space is designed by sober elements and linear geometries. In the whole Pujiang, the blocks of 300 per 300 meters generate closed units conceived like *xiaoqu* for 1000 people. The buildings do not exceed four floors and maintain a rather low skyline that does not impact the context violently. Blocks are enclosed by straight streets and river channels that cross the city and connect to the rural water network. Well-kept gardens and lush vegetation complete the landscape of the modern and rationalist city that Gregotti has imagined as an emblem of Italian exportable architecture.⁵

Second case study. Kilamba and the Chinese new towns in Africa

A different case is that of "exporting urbanization" out of China. At the beginning of the new century, the Chinese government saw the opportunity to establish relations in Africa. Several North-African and sub-Saharan countries were interested in developing their infrastructural networks, increasing urbanization and life conditions of the population but in need of financial investments. As known, the Chinese interest on Africa is not a new phenomenon and, as early as in the Sixties, already Mao Zedong promoted an anti-colonial solidarity by investing in the construction of important infrastructures like the Tanzam railway. Foreseeing business opportunities in a new capitalistic perspective, since 2005 China has entered into agreements with nations like Kenya, Algeria, and Angola.⁶ The formula was usually based on non-monetary terms; in fact, in exchange for Chinese products, medical assistance, education programs in Chinese universities, know-how useful for the development infrastructures, and building works, China takes oil and raw materials necessary for running domestic industry. Within a few years, those African countries have been launching infrastructural modernization projects that otherwise would not have had the chance to be realized under such favourable conditions, in terms of allocated funds, work management, project quality, and political support. Doing so, in the last decade the most relevant construction sites of Africa have been run or supported by Chinese companies and government, which opened branches there and moved conspicuous groups of designers, engineers and workers on site from China thanks to whom it was inevitable to graft some Chinese urban prototypes in the African constructed landscape.

Among the urban projects of new towns, the Nova Cidade de Kilamba is the most emblematic of the cities built by Chinese companies in Africa. Aimed to give a house to 160,000 people, it stands on an area of 502 km² in the south of Luanda, the capital of Angola (Figure 3). After the end of the civil war in 2002, the Angolan government managed to finance the construction of public housing for low-income population and modern housing for the urban bourgeoisie of Luanda thanks to an agreement signed with the Chinese government. According to this deal, the China International Trust and Investment Corporation (CITIC) would have completed the Kilamba project by offering a USD 3.5 billion credit line to the Angolan government in exchange for supplies of oil and raw materials.

The design was drawn up by CITIC and overseen by Pierson Capital, an international company of engineering and finance. The realization was carried out in all 4 years, using Angolan materials and local and Chinese workers supervised directly by Chinese project managers.⁷ The urban layout based on a *tabula rasa* and framed as a rectangle developed longitudinally in a 1:2 proportion. It is structured on an orthogonal grid of wide roads and divided symmetrically into 4 sectors by a main north-south axis and a secondary east-west one (Figure 4). The main axis works as urban promenade lining up most of the public functions and the larger stripe of public green. In the four sectors, the blocks are occupied by about 750 residential buildings ranging from 5 to 11 storeys for total 20,000 apartments, a hundred commercial businesses, forty schools, and several sports facilities. Different colours make the built fabrics recognizable and mitigate the anonymous landscape of prototyped housing blocks.

Phenomenal level of comparison

The two case studies were designed and developed in different ways and under different conditions. On one side, Pujiang is the outcome an urban plan designed by an Italian firm for a small community of 50,000 people in the outskirts of Shanghai; on the other side, Kilamba is totally a product of the Chinese planning practice intended to create the most modern settlement for 160,000 medium-class citizens of Luanda.

Their functional programs are similar and differ just in terms of quality and quantities. Nevertheless, apart from the geographical contexts, the most evident difference is related to the roles of the actors in charge of the design because, in the case of Pujiang, a foreign designer was asked to imagine a foreign modern city that eventually could adapt to a Chinese program and, in the second case, the Chinese were themselves the foreigners bringing to Angola their own idea for a modern and healthy city. The two conditions of exporting and importing urban plans was translated into the two cases in different ways. On the one hand, Pujiang was the chance for the Italians to experiment the translation of their planning culture into that *tabula rasa* not practicable anymore in Italy because of its dense built environment; Gregotti created the chance to dialogue with the historical identity of the context and tried to intertwine the formal elements of the traditional urban landscape into the high-end project of the new

town. On the other hand, in Kilamba the cultural joint seems to be absent and the town comes to be a true reproduction of the quick and tiresome urbanization occurred in China, with the difference that Kilamba masterplan transfer the symbolism of its power into the structural elements of the built space establishing a sense of order in the physical environment, regardless to the people and the place, and demonstrating sort a post-colonial attitude.

Morphological level of comparison

On the physical level, the analytic study of the two master plans and the comparison of the two with other city plans of modern and ancient times demonstrate that both Pujiang and Kilamba share some planning principles that put potentially them in continuity with the traditional forms of the ancient urban China in terms of design, proportions, dimensional ratio and, with the due differences, of functions (Figure 5, 6). In terms of formal concept, both towns show the presence the dominant elements of the tradition: an orthogonal grid, the main axis of symmetry, and a cellular structure of plots.⁸

In there, the main axis fixes the symmetry of the entire urban organism and it assumes the connotations of the big boulevard characterized by a central linear park around which the primary viability flows and the main public functions are attested (e.g. schools, civic centres, sports facilities, etc.). However, in urban contexts predominantly residential and relatively small like Pujiang and Kilamba, the axis lacks any monumental connotation.

Moreover, the two cases share approximately the same area and a similar rhythm of the grid lines.⁹ This makes, eventually, the geometry of the two settlements almost superimposable; the ideal rectangles defining the urban area have similar proportion and dimension, despite the irregular shape generated by stretching one of them. The orientation of the settlements is the same with the short side aligned in direction north-south and the layout is determined by the orthogonal grid defining the infrastructural layers of the settlements.

The rhythm of the grids shows that modules and dimensions repeat in identical or overturned or reduced sequences, however demonstrating their recursion. The vertical scan tends to differ from the horizontal one, generating a square mesh of rectangular plots of land. Among the modules identified in the comparison, the pair "A · B" and the sequences "B · A | A · B" and "A · B | B · A" along the axis of longitudinal symmetry configure the principal urban space of the public functions, as like as in the classic city plans (e.g. Chang'an and Beijing). The study reveals also that the grid tends to split between a main grid and a secondary one generated by the submultiples of the basic modules (e.g. B/2 and B/3 instead of B). The first grid defines a higher hierarchical level of infrastructure and a macroscopic partition of neighbourhoods and quarters, which refer to a metropolitan and territorial rather than local scale. The second one marks the networks of roads and channels and the partition of plots. Indeed, the vertical main and secondary grid lines of Pujiang and Kilamba can be composed as:

$$\begin{aligned} (P_{v1}) & \qquad \qquad \qquad B \cdot A | A \cdot B \\ (P_{v2}) & \qquad (B/3 \cdot B/3 \cdot B/3) \cdot (B/2 \cdot E \cdot B/2) | (B/2 \cdot E \cdot B/2) \cdot (B/3 \cdot B/3 \cdot B/3) \\ (K_{v1}) & \qquad \qquad \qquad B \cdot A | C/2 | A \cdot B \\ (K_{v2}) & \qquad \qquad \qquad B \cdot (A/2 \cdot A/2) | C/2 | (A/2 \cdot A/2) \cdot B \end{aligned}$$

Eventually, the analysis of grid lines dimension shows a series of constant ratios recurring in the Chinese urban grids with no exception for Pujiang and Kilamba.

Conclusion

In general terms, the Pujiang town recalled the cosmopolitan and hybrid character of Shanghai despite the inversion of roles; in fact, as the past the grafting of Western architecture was a gesture of arrogance towards the local culture, today it was a collaboration that the city promotes with strong commitment. Kilamba shows instead the straightforwardness of Chinese actors in developing its one vision of the urbanization, mostly regardless the cultural implications related to importing urban types and plans, and the consequent living models.

Besides, from the morphological perspective Pujiang and Kilamba demonstrated to be two favourable contemporary testing grounds for applying a method commonly limited to the historical case studies. In fact, the analytical approach demonstrated that the current planning experiences are able to create a trans-geographic continuity between themselves and the past. Eventually, this means that Chinese contemporary planning principles, even when stereotyped, reinterpreted or prototyped, could still be coherent with the urban history and shared in a wider global urban culture.

¹ First to develop the typological method, Gianfranco Caniggia applied it to several cases, by comparison, demonstrating the general rules behind the evolution of urban fabrics in the medieval time and determining the evolution process of historical architectural types. Focusing on the case Como, he could determine the historical evolution of the city from the Roman time and date the current urban fabrics. The same work was conducted by Saverio Muratori to study the evolution of Venice and Rome, discovering the logic behind the urban development and the typological evolution of their architecture. Later, Aldo Rossi's work of the "analogous city" was an attempt to move the typological research to the urban scale, considering some urban elements as typological in force of their form, function, and symbolism. See: Gianfranco Caniggia, *Lettura Dell'edilizia Di Base* (Venezia: Marsilio, 1981); Saverio Muratori, *Studi Per Una Operante Storia Urbana Di Venezia* (Roma: Istituto Poligrafico dello Stato, 1960); Aldo Rossi, *L'architettura Della Città* (Padova: Marsilio, 1966).

² The geographer Michael Robert Günter Conzen was main scholar who foresaw the possibility to research the geography of settlements by focusing on the ground plan of a town or a part of it and determining a scalar logic underlying the hierarchical structure of the built environment. 46 **Planning Practice Between the Late 19th Century and the Early 20th Century**

Learning from Berlin: How to create a dense urban area

Michael Locher (Berne University of Applied Sciences)

In the specialist literature, the Berlin tenement (Berliner Mietskasernen) is considered as the epitome of speculative overuse of the residential block on the eve of the Modern period. This view misses the fact that at the turn of the 19th century, several urban districts in Berlin were built for an emerging middle class that are of outstanding urban quality. The entrepreneur Georg Haberland (Berlinische Boden-Gesellschaft) developed entire neighborhoods that contributed greatly to the history of urban development at the beginning of the 20th century – a contribution seriously underestimated. In addition to the Anglo-Saxon way of suburbanization of the middle class and the French way of urbanization of the bourgeoisie within the existing town – which are commented on extensively – the urban interventions of Haberland are a little-documented third way in the history of city expansions. In this paper, first, I address the question of the urban qualities of the Bavarian District (Bayerisches Viertel), drawing on previously unpublished historical sources. And second, I propose a thesis how to place Haberland's undervalued contribution in the wider context of Berlin's planning history and beyond. Planning urban settlements from scratch is a current and crucial topic particularly in the US and in East Asia. Corresponding current projects – often designed by European planners – can be found especially in China.

Practice and thoughts of Guangxi Early-modern Old City renovation(1925-1936): Typical of Chinese Provincial-level Military Control Planning

Li Ji (Wuhan University of Technology, Guilin University of Technology)

Aiming at the old cities renovation planning practice by Guangxi Government with their military and political power from the 1920s to the 1930s, who were local warlords before and formed the New Kwai Clique ruling with Three People's Principles and Material Development Planning under the guidance of Sun Zhongshan, the paper analyzes the evolution Characteristics of urban form in the four major cities, which was Wuzhou, Liuzhou, Nanning and Guilin, includes that demolishing the walls, constructing ring roads at the original sites, straightening streets of cities, expanding and changing them to roads, then building arcades on both sides to escape the rain and the sun, and finally adding the public facilities with drainage, docks, water and power supply, and so on, that could be considered as existed old city reconstruction with gradual developments. And it also shows that planning criss-cross roads network in a new district outside the old cities of the jumping rhythm by with new urban core. Either the former or the latter were both applying western planning theories for the purpose of improving and beautifying the urban environment. While presenting different urban forms, it could be sum up that the pattern went to the style "Streets City → Arcades City → Roads City", with which presented the modernization appearance by the way to "Streets → Roads → Roads Net", that Presenting a new look of the Roadism characteristics of urban renewal planning, and which had important significance and influence on its subsequent urban planning. Investigate the reasons of urban changes, on which it has an important impact the dominant ideologies of the government leaders to mobilize the social forces and achieve modernization quickly, belongs to the subjective consciousness of municipal decision-makers, just the "City will", which has a special effect in changes for functions, space and pattern of cities, participated in urban planning management and led the development trend.

Negotiations between Progress, Privilege and Tradition: Building Riverfront Avenue and Dragon King (longwang) Park in Hankou, China, 1929-1937

Tianjie Zhang (Tianjin university Associate professor) and Rui Guan (Tianjin university Postgraduate student)

The paper examines the conceptualization and materialization of Riverfront Avenue (yanjiang malu) in Hankou during 1927-1937, a great treaty port of central China. The Riverfront Avenue was the first parkway built by the newly-established Hankou government, connecting the existed Bund in foreign concessions along the Yangtze River. In an astonishing resolution and dispatch, the Hankou technocrats cleared away thousands of shanty houses, godowns and other obstacles, and constructed the 40m-wide parkway and over 20m-high embankment in a most scientific way. The parkway was also the most influential one, changing the whole appearance of the Chinese riverfront. It remains to be a symbol of the city's former glory admired by many Hankou residents today. Noteworthy, the Avenue was never built smoothly, nor was it completely actualized in conformity with the initial plan. The paper accordingly articulates the negotiations between progress, privilege and tradition, against the background of Hankou's wider agenda of urban reform, and broader efforts to remake Chinese cities in the wake of the foreign encroachment in early twentieth-century China.

Via archival research and in-deep interviews, the paper elucidates the planning ideas of the Riverfront Avenue. The main planner Wu Guobing was ever educated in London in late 1910s and interned in Belgium. He tried his hands to transplant the European modernity into Hankou, including not only physical environments but also social lives. Besides Wu, the research also reveals the intentions and desires of multiple stakeholders, including local government, related planners and engineers, urban elites, foreign privilegers, indigenous residents, grassroots sojourners, etc. Some of them brought a variety of obstacles and interventions to the Riverfront Avenue project.

The paper will further examines the obstacles, and identify the mechanism behind. One of the most serious challenges came from the Dragon King, who was the bringer of rain, controller of water, and arch-criminal of flood and drought. In the imperial days, there had erected thousands of temples in the Dragon King's honor. In 1931, Hankou government unhesitatingly demolished the Dragon King Temple in the way. Hankou's planners and engineers thought the deity of the Dragon King, the temple and rituals in his honor were unexceptionally superstitious. However, the newly-raised Riverfront Avenue along did not withstand an immediate dreadful flood that year. The result was the inundation of almost the entire Hankou with devastation and destruction never before equaled in the century. In the wake of the catastrophic flood, more and more local people deemed that the recent dismantlement of the Dragon King Temple enraged the Dragon King. To all the criticisms and petitions, the government had to take actions to pacify the popular consensus. Via bottom-up perspectives, the paper will reveal some indigenous thoughts within Hankou's hydraulic society.

In general, the paper construes the planning and construction process of Hankou's Riverfront Avenue, and explores the spatial expressions and the social relations which informed its production and use.

The conceiving of a New Street and its building practices in Regency London.

Noemi Mafri (Politecnico di Torino)

In 1813, an ambitious plan by the architect John Nash 'to make a more convenient communication between Marylebone Park and Charing Cross' was approved and immediately carried on. Regent Street was only one of the several 'Plans of New Streets' conceived during the London Metropolitan Improvements, some of which realised and some other not. After a brief analysis of the previous proposals, the paper analyses some particulars from the challenge for the design of Regent Street. It also illustrates which was the practice of the building site for the execution of a new street passing through Crown properties and private lands. The contribution aims also to understand how the street building machine was set up and how it worked, pointing out problems and goals of the formation of the street. The paper discusses part of an ongoing research regarding the transformations of this famous street also through the study of unpublished documents.

Learning from Berlin: How to create a dense urban area - Haberland's Bavarian District

Michael Locher

Berne University of Applied Sciences, michael.locher@bfh.ch

In the specialist literature, the Berlin tenement (*Berliner Mietskaserne*) is considered as the epitome of speculative overuse of the residential block on the eve of the Modern period. This view misses the fact that at the turn of the 19th century, several urban districts in Berlin were built for an emerging middle class that are of outstanding urban quality. The entrepreneur Georg Haberland (*Berlinische Boden-Gesellschaft*) developed entire neighborhoods that contributed greatly to the history of urban development at the beginning of the 20th century – a contribution seriously underestimated. In addition to the Anglo-Saxon way of suburbanization of the middle class and the French way of urbanization of the bourgeoisie within the existing town – which are commented on extensively – the urban interventions of Haberland are a little-documented third way in the history of city expansions. In this paper, first, I address the question of the urban qualities of the Bavarian District (*Bayerisches Viertel*), drawing on previously unpublished historical sources. And second, I propose a thesis how to place Haberland's undervalued contribution in the wider context of Berlin's planning history and beyond. Planning urban settlements from scratch is a current and crucial topic particularly in the US and in East Asia. Corresponding current projects – often designed by European planners – can be found especially in China.

Keywords: urbanization, urban density, urban form, planning legacy

Introduction

This paper revisits urban development in Berlin in the first decade of the 20th century in theory and practice, seeking to exemplify 'urban qualities' by investigating the Bavarian District in Schöneberg. Much historical research has been published on the history of European cities at the end of the 19th century. The literature focuses on Paris, London, Vienna or Barcelona, while Berlin is often considered to be a poor example of urban development.¹ With regard to Modern urban development, however, it is important to state that successful examples of urbanism in Berlin at the turn of the last century do exist. They are just neglected in current urban research about the beginning of the Modern period. I claim that one of the most important and most successful example of this is the urbanism of Georg Haberland and his company, the Berlinische Boden-Gesellschaft. This was one of the dominant land companies (Terrain-Gesellschaft) in Berlin that managed the rapid growth of the population at the turn of the century. To this day the company does not receive the due scientific attention.²

To understand the value of Haberland's contribution it is important to explain the urban issue of Berlin at the end of the 19th century. At that time, Berlin was well-known for its *Mietskaserne*³, literally 'military barracks for renting'. These tenement buildings consisted of dark apartments situated around very narrow courts. To get to your apartment you often had to pass other dark courts, and the apartments had no direct access to the street. This confusing urban situation caused a number of social and hygienic problems. That is why Berlin was – at the time as well as later – generally considered an urban settlement with a very low living standard.⁴ Contemporaries criticized the situation sharply and from different angles. On the one hand, the overuse of the city for financial speculation was pointed out. In a book published in 1907, Rudolph Eberstadt – an economist and urban planner at the local university – described the urban fabric of Berlin as a highly inconvenient structure for urban living, evoking speculative economic development.⁵ Generally, Berlin was analyzed as the epitome of speculative overuse⁶ at the beginning of the Modern period. On the other hand, a formal critique of this kind of capitalist urbanism was formulated. Werner Hegemann – an urban planner from Berlin and professor in New York – described the residential block in 1930 as 'a hopeless fortress in a ridiculous baroque or renaissance façade'⁷. For Hegemann and his Modernist colleagues, Modern urbanism was the true formal answer to urban problems. As an example, Hegemann cites the *Hufeisensiedlung*⁸ designed by the architect Bruno Taut. This housing is of course a very valuable contribution to solving of urban problems, which is nowadays even found on the list of World Heritage sites. But Hegemann's indiscriminate enthusiasm for Modern urbanism ignored the fact that there were other alternatives to the so-called *Mietskaserne* – the tenement building – in Berlin. A nuanced view of pre-Modern urbanism shows there were urban solutions that have advantages over Modern concepts and that could

moreover serve as a paradigm to this day. I claim that the so-called *Bayerisches Viertel* in Berlin, the Bavarian District (cf. figure 1) is a powerful pre-Modern urban strategy. In the following I will seek to lay out why Eberstadt and Hegemann's critique is not adequately applicable to this district. I claim that the Bavarian District is an undervalued contribution to the history of urbanism.

Figure 1: Berlin, Bavarian District – Victoria-Luise-Square, 1903.

Historical classification

The Bavarian District was founded and developed by Georg Haberland. For Modern critics he was the embodiment of the evil financial speculator⁹, getting rich at the expense of the tenants. On the one hand, there is no doubt about it: With his company – the Berlinische Boden-Gesellschaft – he gained wealth at the turn of the last century, because he was one of the most active entrepreneurs in Berlin.¹⁰ But on the other hand, he managed to develop a large agricultural area into an urban structure of high quality within a few years. To this day Haberland's district is very popular and in demand. The heart of the Bavarian District – the Victoria-Luise-Square – is at present one of the squares with the highest living quality in Berlin. This can be proved by the following: The quality of life in Berlin, broken down to each street, is measured by the government of Berlin on a scientific basis, applying different criteria.¹¹ The following map (cf. figure 2) shows a detailed view of the qualities of life; evidently, the areas in the southwest are of better quality than the rest of Berlin. The map thus shows that the urban developments of Georg Haberland constitute areas of high living quality in Berlin. Haberland must have done something differently and – in the long run – he must have done it better in comparison with the other so-called Berlin tenements. I will explain this claim by beginning with a broader view.

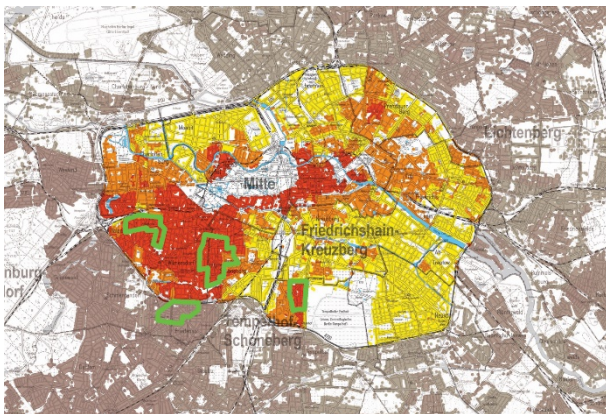

Figure 2: Wohnlagenkarte Berlin, 2018 (red areas: high living qualities, green lines: areas built by Georg Haberland, flagged by the author)

In the mid-19th century important plans were designed for many European cities. Most of these plans are well-known in the history of urbanism, and all of them determine the urban fabric to the present day. Haussmann – for example – transformed Paris fundamentally with many urban interventions in the historic city. The most important aspect of this plan was the improvement of the existing urban fabric by introducing new streets into

the old urban structure.¹² A completely different strategy was suggested by Cerda for Barcelona. He planned the city expansions without reacting to the historic part of Barcelona. Although he was an engineer, he designed a plan with a very formal approach. The main axes – of which only one was finally realized – establish an independent urban structure.¹³ So, in contrast to Haussmann, he planned alongside the existing city. Another important example is the plan for the Ringstrasse in Vienna that reacts again in a different manner and was the result of a competition.¹⁴ It treats the free areas that had been created by the removal of the medieval fortification. The plan suggests a circle around the old town that establishes a sequence of public buildings and squares. This interspace connects the inner city with the city expansions in an artistic and convincing way. And finally Berlin has its contemporaneous transformation plan too, but it is far less known in the history of city planning. It is the so-called Hobrecht Plan of 1862.

As in Paris, Barcelona and Vienna, the plan dating in the mid 18th century is one of the main reasons why the city of Berlin looks the way it does today, because it determined the urban structure in a fundamental way for the last 150 years. James Hobrecht – also an engineer – designed an urban structure that operates like a combination of the plans for Vienna and Barcelona. He suggested a large ring of residential buildings connecting the historic city with the new extra-mural areas by evolving the city expansions out of the existing urban structure (cf. figure 3). The plan was in fact just an alignment plan structured by large blocks and an important sequence of squares. The plan did not impose regulations on the blocks itself. It only described a grid that could be filled according to the existing building code.¹⁵ The regulations however were not adapted to the new plan. This fact allowed a density that was far too high and led to the speculative overuse mentioned above. Despite this fact, the red structure given by Hobrecht's plan was built very fast and completed by the First World War. At first glance, surprisingly, Haberland did not want to be part of this boom.

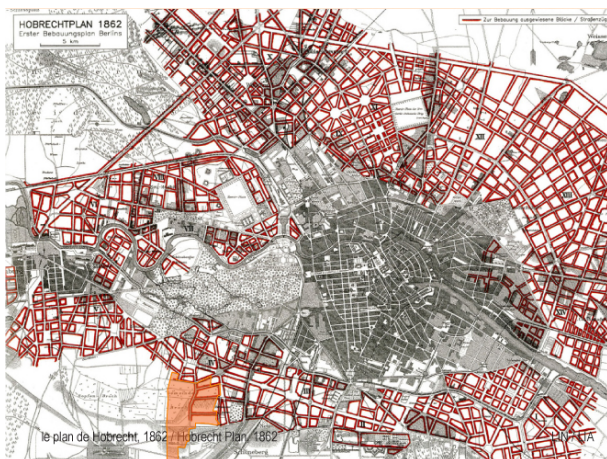

Figure 3: James Hobrecht, Plan for Berlin, 1862, Haberland's property in 1898 (orange lines, future Bavarian District, flagged by the author).

Haberland decided not to work within the alignments of Hobrecht's plan. He began to focus on the southwest of Berlin – at the time worthless farmland around a little village called Schöneberg.¹⁶ There he followed his own strategy of development. He began to persuade the farmers to sell him their farmland at a time when nobody was interested in these parcels of land, so he could buy it at a low price.¹⁷ Although he was self-taught urbanist and architect – he did an apprenticeship as a merchant – he already seemed to anticipate the problems that arose due to the high density within Hobrecht's urban concept.¹⁸ Within a few years Haberland owned a large part of the cheap agricultural area in Schöneberg.¹⁹ There he planned the future Bavarian District, the largest and most important area he would ever develop. In 1898 the streets of Hobrecht's plan still led to nowhere (cf. figure 3), and Haberland understood that he had to adapt to the Hobrecht plan while doing it better. In collaboration with the community of Schöneberg, he designed the alignment plan and defined the parcels of land.²⁰ Haberland's company started to build the streets and the squares, financing the implementation on its own.²¹ Only afterwards did he sell the parcels of land to private owners and, by lending money, Haberland encouraged them to build their own apartment buildings. He even provided the architect to control at least partially the formal expression of the new buildings. If there was no purchaser, he constructed the buildings on his own account and sold them for great profit after completion.²² So the company acted as a partner of the municipal authority as well as urban planner, land surveyor, architect, real estate seller, bank and builder at the same time what led to a very efficient construction process.

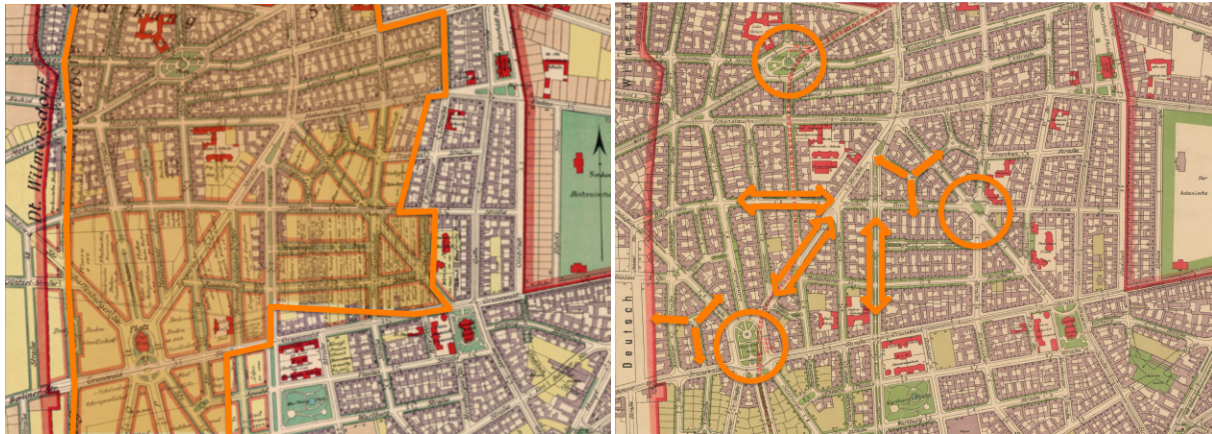

Figure 4.1: Plan of Schöneberg, detail, 1904 (orange area, Bavarian District, flagged by the author).

Figure 4.2: Plan of Schöneberg, detail, 1909 (flagged by the author)

A closer look at the plan of Schöneberg in 1904 explains Haberland's impressive way of producing an urban structure (cf. figure 4.1). The process of urban production started in the northern part where the first buildings were already completed and where they connected the new city expansion with the existing urban structure of Hobrecht's plan. In the southern part, only the streets and squares were built. The plots of the farmers are still visible; they are overlaid by the new urban structure in a steady process that developed the quarter from north to south. The plan is a fascinating historical document because it demonstrates the entire process of developing a city from farmland to dense urban structure. As such, the technical process of developing a city seems quite simple: You buy farmland, establish a master plan, build streets and squares, sell the parcels of land and let them be built. Of course, this description does not take into account the complex political and social processes Haberland had to deal with. But on a formal level Haberland's urban strategy allowed the city to grow in a predictable way and can thus be analyzed and described precisely. In this respect the crucial question is how urban quality was achieved during this process.

Analytical classification

As shown above, contemporary urban planners as well as later experts considered Berlin in general to be of poor urban quality. Yet, Haberland imposed an urban structure that was different from the contemporaneous city expansions in many respects and led to new qualities for different reasons. An analysis of the Bavarian District points out its specific urban elements (cf. figure 4.2) that are unique in this combination for Berlin and beyond. Haberland's area is structured by three squares arranged in a triangle. These squares are connected by a system of perpendicular and diagonal streets. With this arrangement he follows the contemporary literature²³ that he probably knew. But the decisive difference to the conventional urban planning in Berlin was that Haberland treated the resulting blocks in a different manner. He invented a new kind of Y- or T-shaped intersection by connecting 3 residential streets. In order to achieve a more differentiated urban structure he segmented the common building block by this innovative intersection. The combination of these elements – squares, system of streets and intersections – lead to the specific urban structure that is fundamental for the following urban qualities:

Figure 5: Berlin, aerial view of the Bavarian District, 1935.

First, Haberland distributes the squares within a walkable distance. Mixed use is concentrated in these three squares. The squares are shaped so as to get as many corner buildings as possible. In these corner buildings – and only there – shops and restaurants are allowed. In this respect the squares function as centers and meeting-points for the district. Second, Haberland's urban plan imposes a clear and detailed concept for private and public traffic. There is a clear distinction between traffic roads and residential streets with regard to sectional profile and connectivity to neighboring quarters. The residential streets are marked by small front gardens that narrow the traffic areas. The Y- and T-intersections are only planned for the residential streets and provide a local sub-center for the neighborhood in addition to the squares. The public transport system was also important for Haberland's urban strategy. He fought hard with the local authorities to get a connection to the city center by tramways.²⁴ After he had realized that the tramways were too slow, he even financed a subway line. The Bavarian district was about to be finished when Haberland - together with the local authorities - decided to reopen the main streets to get a subway for his district that connected the new squares with the existing public transport system.²⁵ This fact demonstrates the power and financial potential of Haberland's development company. And third, the system of perpendicular and diagonal streets creates small urban blocks with many corner buildings. In contrast to the blocks of Hobrecht's plan this arrangement of rather narrow buildings allows many apartments to be well-exposed. Moreover, the acute-angled intersections give views in different directions along the street. The apartments are not just oriented towards the block across the street. Consequently, this urban structure allowed Haberland to sell the parcels of land at a much higher price because of the good orientation of the buildings. And finally, Haberland managed to create residential streets of high quality. The blocks are small, and a hierarchy of streets and small intersections support orientation within the neighborhood. The small Y-shaped intersections are highlighted by a tree, and front gardens were implemented along all the residential streets (cf. figure 6). These elements, introduced by Haberland and unique in Berlin, were not even common in Europe. For these reasons Haberland's combination of urban elements in his plan is of outstanding quality and seems to be his very own invention.

Figure 6: Berlin, Lindauer Street, 2017.

The combination of these urban elements as they are realized in the Bavarian District is not found in German literature on urbanism at the time. Neither Baumeister²⁶ in 1876, nor Sitte²⁷ in 1889 or Stübgen²⁸ in 1890 – the founders of the discipline of Modern urban construction (*Städtebau*) – proposed similar solutions. The most influential book on urbanism at the end of the 19th century, Camillo Sitte's *City Planning According to Artistic Principles*, champions a picturesque urbanism based on an irregular structure.²⁹ Although he must have known Sitte's ideas, Haberland designs his plan for the Bavarian District in 1898 in the opposite way, by imposing a regular geometrical structure of streets and squares that are point symmetrically organized. He ignores Sitte's claim that planning squares with irregularity 'increases naturalness, stimulates our interest and intensifies the picturesque.'³⁰ Besides the work of Sitte, there was another important German publication on urban planning: Stübgen's instruction manual on urbanism. Stübgen cites examples from Belgium and reproduces plans of Liège, Antwerp and Brussels³¹ that show certain similarities with the urban design for the Bavarian district. Among others, Stübgen refers to an example in Verviers that is very similar to the Viktoria-Luise Square³². Haberland may have been influenced by Stübgen's work, but there is no evidence. Georg Haberland was Jewish and his remains were completely destroyed during the Nazi-Regime. Even his printed legacy gives no evidence of

influencing predecessors. On the contrary, in his books he ignores the questions of design. He published several small books where he only focuses on the economic preconditions for urban planning³³ and describes his planning practice simply as a result of the imagination of his company, the *Berlinische Boden-Gesellschaft*.³⁴ Although various examples cited by Stübben may have influenced Haberland, in particular for the layout of the squares, the combination of urban elements in the Bavarian District can be qualified as a genuine invention of the commercially trained autodidact.

Conclusions

The combination of the main reasons for the urban qualities of the Bavarian District explains why these blocks are in demand as residential areas to this day. Haberland's Bavarian District is a unique contribution to the history of planning and shows a convincing example of urbanity. 'Urban density' in combination with 'social and cultural heterogeneity'³⁵ are preconditions for urbanity and lead to urban qualities that obviously remain popular. Soon after its completion, the Bavarian District became an immediate attraction for the middle class in Berlin with an ensuing vibrant social life.³⁶ Moreover, until 1933, the district was the heart of Jewish social life in Berlin and was called the 'industrial area of intelligence'³⁷. At the same time, the Victoria-Luise-Square was a 'microcosm for Russian immigrants'³⁸. After Shoah and World War II the district has not yet fully recovered even to this day. But Haberland's urban development turned into a social and cultural melting pot, representing an urbanity of high quality soon after construction and until the outbreak of the war. A comparison between the Bavarian District and the conventional contemporaneous urban structures in Berlin shows how uniquely Haberland handled urban density.

The technical aspects of urban planning – as it was defined by Joseph Stübben – is about establishing a street hierarchy, defining parcels of land, fixing the uses and providing a public transport system.³⁹ That is exactly what Haberland did by planning the Bavarian District. But in addition, his example shows that urban qualities basically depend on the relationship between street and building (cf. figure 7) or – in other words – depend on urban density. As Hartmut Häussermann puts it, it is 'the urban density' that generates urban qualities.⁴⁰ This means that urban planning is also about dealing with the ratio of built and unbuilt surfaces or the ratio of built and void volumes. Haberland's example – in contrast to the criticized urbanism in Berlin – shows how to manage this ratio in order to effect heterogeneity and density that are preconditions for urbanity. It is a matter of a fragile equilibrium that cannot be achieved by simple rules but can be exemplified. 'Urban quality emerges and proves itself in individual cases.'⁴¹

Figure 7: Berlin, Bavarian District, Speyerer Street / Bavarian Square, 1925.

As part of this text I can only briefly indicate in a very general way what was the historical value of Haberland's example in comparison to urban planning processes in other European cities. A comparison with contemporaneous city expansions in Paris and London underlines the uniqueness of Haberland's proposal. In the first decade of the 20th century the urban development of Paris was characterized by a densification within the urban fabric.⁴² After Haussmann's plan was realized in the 19th century, there was no more master plan to follow. At that time – during the so-called Belle Epoque – architects in Paris were supposed to finalize Haussmann's ideas and to merely develop the existing streets, with interventions only in specific places.⁴³ Within the dense

urban pattern, architects sought to introduce an urban quality that led to a completely different result in comparison to Berlin. So, in contrast to Berlin, the urbanization of the bourgeoisie in Paris was an intra-mural process consisting in a consolidation of the historically grown urban structure. During the same decade the urbanization of the middle-class in London led again to a completely different solution. London's suburbs "are located on outskirts of, but remain part of the city, with an urban geography intermediate between town and country, and (...) depend upon urban centers for employment, goods and services."⁴⁴ So far this description fits to the Bavarian District. Contemporary with Haberland and driven by the same forces and needs, the solution to the urbanization however is completely different. In London the urban development around 1900 is characterized by low density and can be summarized as "residential, middle-class, owner-occupied suburbs (...) of small detached and semi-detached houses."⁴⁵ The suburbanization in London points already to the future Garden Cities and is the complete opposite of Haberland's strategy of urbanizing the middle-class in Berlin in a structure of high density.

In conclusion, the literature on the history of urbanism in European cities describes two methods of urban development at the dawn of Modern period⁴⁶: On the one hand, there is the Anglo-Saxon way of suburbanizing the middle-class, exemplified by London, Brooklyn or San Francisco. On the other hand, there is the French way of urbanizing the middle-class within the existing urban fabric, which signifies an intra-mural urban process. In contrast, the development in Berlin is generally considered a misleading path both by contemporaries and later observers: a path that leads to a narrow and badly exposed urban structure driven by the speculative overuse of the building land and followed by heavy social problems. This historiography misses the fact that Haberland built a dense urban area with qualities that are greatly undervalued. His urban plan achieved a social and cultural heterogeneity and a density that balances compactness and free space in a multifunctional and walkable city structure. I suggest that in the history of urbanism, the contribution of Haberland's *Berlinische Boden-Gesellschaft* needs a reassessment. The Bavarian District could serve as a model for a third way of urbanizing the middle class, even in the current context of rapidly growing cities in Europe, Asia and elsewhere.

Urban Renewal Planning Practice and Form in Early-modern Guangxi (1925-1936)

LI Ji*

** Doctoral candidate, Wuhan University of Technology, School of Civil Engineering and Architecture; Lecturer, College of Civil Engineering and Architecture, Guilin University of Technology, candygug007@163.com*

Aiming at the old cities renovation planning practice by Guangxi Government with their military and political power from the 1920s to the 1930s, who were local warlords before and formed the New Kwai Clique ruling with Three People's Principles and Material Development Planning under the guidance of Sun Zhongshan, the paper analyzes the evolution Characteristics of urban form in the four major cities, which was Wuzhou, Liuzhou, Nanning and Guilin, includes that demolishing the walls, constructing ring roads at the original sites, straightening streets of cities, expanding and changing them to roads, then building arcades on both sides to escape the rain and the sun, and finally adding the public facilities with drainage, docks, water and power supply, and so on, that could be considered as existed old city reconstruction with gradual developments. And it also shows that planning criss-cross roads network in a new district outside the old cities of the jumping rhythm by with new urban core. Either the former or the latter were both applying western planning theories for the purpose of improving and beautifying the urban environment. While presenting different urban forms, it could be sum up that the pattern went to the style "Streets City → Arcades City → Roads City", with which presented the modernization appearance by the way to "Streets → Roads → Roads Net", that Presenting a new look of the Roadism characteristics of urban renewal planning, and which had important significance and influence on its subsequent urban planning. Investigate the reasons of urban changes, on which it has an important impact the dominant ideologies of the government leaders to mobilize the social forces and achieve modernization quickly, belongs to the subjective consciousness of municipal decision-makers, just the "City will", which has a special effect in changes for functions, space and pattern of cities, participated in urban planning management and led the development trend.

Keywords: Chinese early-modern city planning, Guangxi, city renewal, new city planning, the New Kwai Clique

Introduction

On November 7, 1911, Guangxi, a province of China was independence. Lu Rongting, the leader of the Old Kwai Clique, established Guangxi Military Government, and moved the provincial capital from Guilin City to Nanning, on which the political power sphere formed centering. Although Office of Demolishing Walls and Building Roads was set up in in 1917, which brought an initial development for Nanning, but the construction emphasis was still on the army's reorganization. Untill March 1925, Li Zongren, Huang Shaohong and Bai Chongxi, who defeated the Old Kwai Clique by wars, and teamed the warlords group too, the New Kwai Clique, and established the new military provincial government affiliated to Guangzhou National Government, and began a comprehensive construction practice in the fields of politics, military, economic and culture. They founded the Guangxi Military

Political Council and Guangxi Kuomintang Political Army Joint Conference for making decisions on the important civil affairs, formed a semi-autonomous local regime confronting with Jiang Jieshi's dictatorship of Nanjing National Government until October 1936, when and which the Guangxi Provincial Government Committee replaced and belonged to became the most influential provincial government. During the period, they responded to Sun Zhongshan's calling to carry out industrial construction, and made the first task to cities construction at the same time. With the rapid growth of commercial ports trade and population, the pattern of the existed traditional urban had become cramped because of space expansion, walls sealing and dense streets, the traditional urban form changed greatly. This paper would focus on the urban renovation planning and practice from 1925 to 1936 in major cities of Guangxi Province with the intent to discuss the evolution characteristics of modern urban planning under the role of local administrative subject in China.

Ruling Ideas of Guangxi Military Government and Practice of Early-modern City Planning in Guangxi

1. Ruling Ideas of Guangxi Military Government

In January 1923, after sending troops against Chen Jiongmeng, who was one of the warlords in Guangdong Province, Sun Zhongshan returned to took the oath as generalissimo in Guangzhou, pointed out the political slogan "Unifying Guangxi and Northern Expeditions" as the action mission. And through a second war wage in Guangdong and Guangxi Provinces, the forces of the warlords outside were removed successfully, especially Shen Hongying, Lu Rongting's former ministry, and TANG Jiyao, the warlord in Yunnan Province. In the period of February to July in 1925, the remnants of the Old Kwai Clique were eradicated completely. The New Kwai Clique was supported to control the whole territory of Guangxi Province by Sun Zhongshan. And Guangxi Provincial Civil Affairs Bureau was established subordinate to Guangzhou National Government. And then the military and civil administration authorities were both controlled by the commander-in-chief, Li Zongren, after which Guangxi Provincial Government was set up according to *Unified Plan of Guangdong and Guangxi* voted through the Kuomintang Central Political Conference in June 1926, the unification was finally officially realized. But due to Sun Zhongshan's will, Li Zongren and Bai Chongxi must be sent to the northern expedition, had no attention to provincial affairs. So Huang Shaohong, the representative of Kuomintang Army VII and the 15th Military Commander of the National Revolutionary Army previously, had replaced him to be the chairman of the government, managing civil affairs as a soldier. The military and political rule in Guangxi was revealed.

In June 1928, Bai Chongxi brought the Gui Army to occupy Beijing and overthrow the Beiyang Government, the northern expedition won, and the national was reunified, which threatening the ruling power of Nanjing National Government directly established by Jiang Jieshi on April 18, 1927. The sharp contradiction led to the War Jiang & Kwai between March and May in 1929, ending with the failure and division of the New Kwai Clique. Then Huang Shaohong went separate ways from Li Zongren and Bai Chongxi. Also owing to the event of Hu Hanmin under house arrest of, who was a patriarch of the Kuomintang, and occurrence of the *Draft Law of the Democratic Republic of China* adopted at the National Assembly, an extraordinary session in the Central Committee of the Kuomintang was held, Guangzhou National Government was founded against Jiang Jieshi on 28 May once again. The army of the New Kwai Clique was reorganized as the 4th Army of the National Revolutionary

Army, and the Provincial Government rebuilt in Nanning on July 1, 1931, so kept being semi-independent from the state of Nanjing National Government consistently.

However, not long after the New Kwai Clique formed, under the introduction of Liao Zhongkai, the member of the Kuomintang Reshuffle and Interim Central Executive Committee, Huang Shaohong, Li Zongren and Bai Chongxi had contacted with Sun Zhongshan and joined the Kuomintang in August 1923 successively, given away two books, *Three People's Principles* and *Easy to Know* by Sun Zhongshan, emphasizing that the revolution and its spirit were the sources of all the Kuomintang motivation, in which the mission of sticking at the end of the revolution and rebuilding new Guangxi encouraged and the theories foundation for the new Guangxi government laid. Therefore, influenced by Sun Zhongshan's thoughts, by 1932, the Policies of "New Civil Society", "Triune Brain", "Three-self" and "Three Fable"¹ containing local characteristics were put forward, to be ruling ideology of the provincial government.

Until 1936, *Agreement of Salvation* was signed by the New Kwai Clique with Jiang Jieshi represent the Nanjing National Government, said that the Central Government must stop its forces and maintain the existed provincial regime of Guangxi, with a slogan that "stopping civil wars and organizing a broad national united front against for Japanese invaders". Because of the appointment of Li Zongren to be the director of Appeasement Government and Bai Chongxi to be a standing committee of the Military Commission in Guangxi accept orders from Nanjing National Government on September 6 of the same year, they must conduct military operations in war zones and central government, Huang Xuchu had been recommend to be the chairman of Guangxi Provincial Government, who was the new member of the New Kwai Clique after War Jiang & Kwai. They moved the provincial capital back to Guilin City, which was also the hometown of Li Zongren and Bai Chongxi. At the same time, being the highest public decision-making body, the military nature of the of Guangxi Provincial administrative subject was ending and towards civil affairs². That is to say, it had truly achieved the governance of Nanjing National Government.

2. Urban Renovation Planning and Construction Practice in early-modern Guangxi

On December 7, 1921, when leading Northern Expedition, Sun Zhongshan gave a speech on the welcome reception of the 76th Military Government Groups in Guilin, had suggested to study and improve the streets style in Guangzhou with building running roads and enhance land value. On October 8 of the same year, Wuzhou City Hall established, which was the second city after Guangzhou in China, and Dai Ensai as the mayor, who was Sun Zhongshan's son-in-law. But the initial form of the municipal system was short-lived. In 1922, the Municipal Engineering of Wuzhou sut up and started the urban construction, to be the first city in early-modern Guangxi. In July 1923, Li Jishen was appointed to be the Supervision for Subsequent Affairs in Xijiang river system by Sun Zhongshan. In order to improve the congestions and walls barrier of Wuzhou City, he proposed to learn from Guangzhou for a city reconstruction planning with which the redevelopment model was building new roads on the site of the demolition of ancient walls, and streets pattern and building specifications were imitated through widening streets to roads and building the arcades on both sides, the new roads net network was emerging, and continued (Figure 1). With the promotion of Wuzhou's municipal

construction, Municipal Preparatory Offices in Nanning and Liuzhou were both set up in 1927 by the provincial government of the New Kwai Clique. The city construction of Nanning started from the transformation of existed urban areas, there were 7 streets broadened in the 1920s, excluding Minsheng Road, Delin Road, Xingning Road and Minquan Road and so on, but the demolition of walls had been slow, which was completed until 1951. However, because of having a good geographical location, the construction of Liuzhou began at a new urban planning in 1928 located in the Da Longling area near the southwest bank of Liu River³, according to Huang Shaohong's proposition of moving the provincial capital from Nanning to Liuzhou, where the economic construction and the practice of "industrial center" were actively carried out, and the old urban streets on the same as the new district side was promoted too. But the plan had met with a lot of opposition in the provincial administration, Forcing Huang Shaohong to take another detour to order Guangxi Provincial Construction Department to go ahead with the construction of Guangxi Products Exhibition firstly preparing for the relocation of the provincial capital. The previous venue was to plan the new administrative centre of Guangxi Province in the future. Relatively later, Guilin Municipal Office was established in 1932, which the city streets were widened by 8 to 30m wide standard, the south of city walls was broken to expand combining with mountains and rivers outward, the landscape pattern of mountains, waters, and urban formed. On May 26, 1940, Guilin Municipal Government was officially established, it also the only one city in Guangxi Province before liberation in 1949.

Evolution and Characteristics of Urban Form of Major Cities in Early-modern Guangxi

Through the analysis of the planning and practicing process of the four major early-modern cities (Table 1), Nanning, Liuzhou, Wuzhou and Guilin, it can be concluded that the evolution process of modern urban form generally included the following two characteristics:

City	Key Time	Major Planning and Construction Activities	Description of Urban Form Evolution
Nanning	1917	Office of Demolishing Walls and Building Roads set up, West Gate and West Street Opened, East Gate demolished	Initial expansion of urban space
	1920	Municipal Agency set up, Zhongshan Road Opened	
	1926-1927	Guangxi Provincial Government set up, Municipal Agency established, Zhongshan Park and Commercial Port Park opened, Cangxi Gate and South Gate demolished, Great Road opened outside the city	Urban streets renovation, Extending along the edge of the city town
	1931-1934	Municipal Works Bureau set up, area of Guangxi Provincial Government Offices built, Minquan, Delin, Minsheng, Gonghe, Minzu and Taoyuan Roads opened, residential and racecourse in Taoyuan Area and Ting Zixu Road in south of Yong Raver	
Liuzhou	1917	The path outside the city expanded to be Wenhui Road, South Gate opened	Breaking through the core of old town, Roads Planning with Baroque and Grid methods
	1926.7	The First Executive Council Meeting of Liuzhou and Qingyuan held and Peixin Road opened,	
	1927	Municipal Preparatory Office set up, Jiahe Road opened	
	1928-1929	Construction Affairs Office after Fire set up, Plan of new town and streets drawn, Yufeng and Gubu Roads opened	Initial expansion of urban space, Renovation of traditional interior streets
	1930-1933	Liujiang County restored, and construction bureau established, North Gate demolished, Beida, Dongda, Qingyun, Yingshan, Luoichi and Xingren Roads opened	
1933-1936	Municipal construction committee set up, Liuyin Road and Sha Street opened, South Gate, Small South and West Gate demolished, South Xiaonan and Xida Road		
Guilin	1932-1936	Municipal Engineering Office and instead of Works Bureau set up, Ningyaun Gate, Bell and drum towers demolished, destroy the bluestone streets, western-style buildings rebuilt, Beiji, Guibei, Zhongbei, Zhongnan, Guinan, Nanxun, Guidong, Guixi, Huanhu, Dongzhen, Diecai, Furong, Fengbei, Xihua, Donghua, Zhonghua, Lequn and Taiping Roads and so on, Remove illegal buildings, Provincial Government moved back	Urban streets renovation, Extending along the edge of the city town
Wuzhou	1921.10.8	Wuzhou City Hall set up	Town center area expanded
	1922-1926	Wuzhou Municipal Engineering Department set up, Urban Renewal Programme by LI Jishen, North Mountain Park and Zhongshan Memorial Hall opened, Arcade Building Regulations formulated	
	1927-1933	Wuzhou Municipal Government and Works Bureau set up, Wufang, Jiufang, Sifang, Guilin, Zhu'an, East Great, Juren, Changsha, Hedi, Pingle, Dazhong, West Great, Danan and Xiaonan Roads Widened, the docks Transformed and planned, HeBin park	Urban streets renovation, Extending along the edge of the city town

Table 1: Reform Planning Practice and Urban Morphology Evolution of Modern Cities in Guangxi.

1. Gradual Breakthrough of Traditional Urban Contour and Existed Old City Reconstruction

The Sino-French War broke out in 1883. The imperialist powers entered Guangxi. The commerce ports of Longzhou, Wuzhou, and Nanning were opened up in 1887, 1897 and 1901 respectively. France and the United Kingdom successively set up the consulates to carry out foreign trade, resulting in the gradual disintegration of the self-sufficient natural economy. In 1901, Zhang Mingqi, Guangxi Provincial governor of the Qing dynasty responded positively to the “New Policy” of the Qing Government, by means of developing economy, setting up education, and strengthening local rule. It promoted the rapid development of industry and commerce, which made the drawbacks of the ancient towns in major cities of Guangxi had gradually revealed. Walls had become an obstacle to the development of urban space, the abuse of narrow streets was hit by the emergence of early-modern advanced transportation so in the 1920s and 1930s, the renovation of the old city planning and practice in major cities of Guangxi was launching, which shows removing walls and building new roads firstly. It was going on opening new city gates, even the demolition of the city walls, and the construction of roads around or outside the city to realize the modernization of the cities’ image preliminary. And then, after the establishing of municipal administration, it was continued for achieving the modernization of city’s functions at the same time to widen and straighten the streets into roads, pull down residential buildings and construct arcade blocks. Finally, to demonstrate the modernization of the urban landscape fully, it was finished up with the expansion of urban space, district planning, and roads group construction.

From Table 1, it could be seen that the spatial forms of the major cities in Guangxi were separating in and out once because of the walls. Through the transformation from gates to large area of the city walls gradually, and the closed space of the existed old cities had been opened up step by step. Simultaneously, the streets of inner cities had also expanded increasingly, which strengthened the connection between the inner and external traffic. Where occupied a large area of walls base former had been lied new roads, the space was saved, and the openness of the cities was immediately apparent, with which the urban land utilization rate was improved, and established material foundation for promoting to modernization entirely. In the process of removing walls, the traditional urban structure centred on political and religious architectures serving the feudal regime was played down steadily, and the nature and layout of urban lands had been adjusted. Among them, there were modern transportation buildings such as stations and wharfs appeared, and the basic facilities planning of bridges, water supply, drainage, public transportation and street lamps system and so on, which drove the development of surrounding commercial areas, also changed the lands use of cities and improved the quality of urban lives significantly. The new urban extension axis gradually was framing, and instead of which the urbanized public spaces were replaced. In addition to the original commercial streets, the recreational, entertainment, educational and cultural activities areas in urban space were transformed and planned one by one, for examples, Zhongshan Park, Botanical Garden, Library and Theatre constructed in Nanning City, adding to Guangxi University and Beishan Park built in Wuzhou City etc., which made the required functional structure of modern cities was completed gradually, it could be comprehended to a gradual breakthrough reconstruction of Existed Urban Contour.

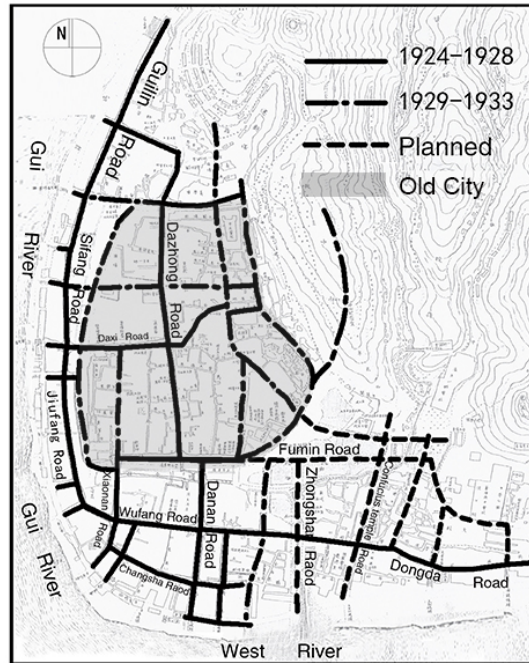

Figure 1: Map of Early-modern Roads Planning and Construction.

2. Connotation Reconstruction of Urban Spatial Structure and Planning New Additional District

According to the analysis of the urban form by the reconstruction planning of early-modern cities in Guangxi, there were two main forms and methods for the urban space expansion by the governments, that were updating inward and jumping outward respectively. Under the regulation of urban land market, the former emphasized the growth of the interior transformation, which was based on the constant external outline and urban form through the adjustment of the city's internal function structure, to improve the spatial distribution and economic benefits of urban development, and make the edge of urban space expanded along the original urban contour steadily, by which the internal modification of old cities was doing step by step for the basic purpose of progressive urban renewal ultimately, just like the Wuzhou City, because of the commercial superiority of old town in the east of Gui River, the urban form expanded gradually around the old city, and the city quality had been improved too (Figure 1).

Contrast with the latter, jumping outward often keeping a certain distance far from the city town, often showed to be on edge-like or enclave-type gathering, and also generally grouped. It often accompanied by a faster contact path, that resulting in the dual core of urban space structure, which could promote the rationalization by guaranteeing good environmental quality in a certain area, and accomplish the basic purpose of extensional urbanization rapidly, such as the Guilin City (Figure 2), due to the late start of planning, which construction was slow, the form of city jumped, but showed a slow expansion. And also the Nanning City (Figure 3), the Commercial Area was developed itself earlier in QING Dynasty was redeveloped in 1933, the outline of the city expanded gradually too. Not quite like them, because of the construction of province removal, new district plan of Liuzhou City was more prominent (Figure 4), the form was expanded outside the existed urban area. And across the Liu River to the south bank, there were roads planned and reconstructed in blocks with the administrative centre region project, which was draw up by the typical baroque classicalism planning concept, had earned its first pattern.

On the other hand, neither the former city reconstruction nor the latter new area planning, in detail, Guangxi Provincial Government had made the reconstruction plan for widening and straightening the inner streets, focusing on building the old street into a road in the form of a central lane and sidewalks on both sides, which style could protect you from the sun, wind and rain, called arcade road, paving the material of asphalt, triads or cement to improve the road conditions, for examples, Zhongshan Road planning in Wuzhou (Figure 5), still in the drawing stage, the arcades and the sewers below the streets were both designed, and Yufeng Road built in Liuzhou, which was the widest road in Guangxi(Figure 6). Like this method planning and constructing the streets from a street to a road, could be constituted a coherent “Arcade City”, that was the one character. Through the “arcade-style” transformation of the streets in cities, supplemented by modern municipal facilities, the businesses, banks, entertainments and other new material factors were gathered with the capitalist nature, and formed the embryo of the “central business district” of modern cities in it. And the centre of “arcade city” continued to spread and renewed, showing the progressive expansion of urban planning characterization.

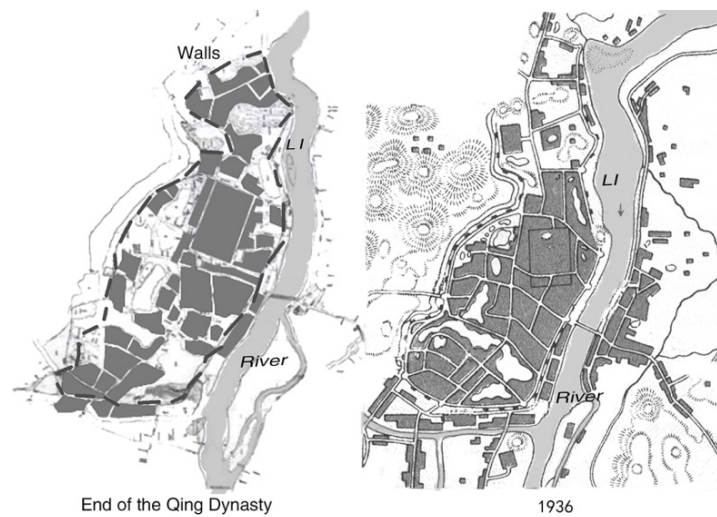

Figure 2: Evolution of Modern Urban Morphology in Guilin.

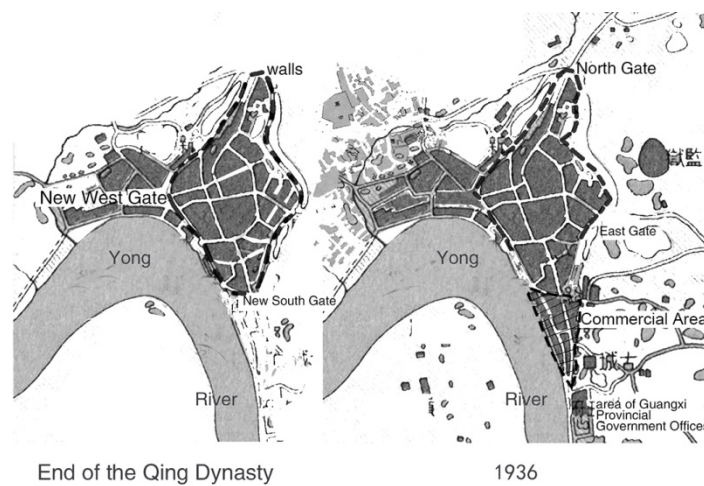

Figure 3: Evolution of Modern Urban Morphology in Nanning.

Figure 4: Evolution of Modern Urban Morphology in Liuzhou.

Figure 5: Section of Zhongshan Road Designed by Wuzhou Works Bureau in 1928.

Figure 6: Yufeng Road of Liuzhou Built in 1930.

In this way, the mess in the old business district could be solved to promote the prosperity of commerce. In addition, the goal of the government to build and improve roads, and carry out unified transformation planning in existed urban areas, could be achieved, which emphasized the nationalism cultural connotation. By contrast, the planning layout of jumping outward selected a wider area as a new urban area, avoiding the existed old urban areas, relatively small cities, and then built new infrastructures and social service facilities, thus constituted a new city skeleton, which Urban spatial planning characteristics reflected. With this approach, it was feasible to reduce the difficulty of urban redeveloping while increase the overall sense of the cities and improve the stability of the layout and

the efficiency of planning implementation and construction. It was more advantageous to the opening formation of new urban spatial structure.

Conclusion and Implications

In urban construction, the modernization goal of government leader, the ruling regime and the cultural construction constituted subjective factors to dominate construction, it could be not ignored. On the contrary, the functions, space, and pattern of the city could reflect the “City Will” of the municipal decision-makers, which played a special guiding role in the development direction of urban forms. The leaders of the New Kwai Clique, with a solid idea of Chinese Development thoughts to establish the modernization cities by Sun Zhongshan, had obvious influence on the overall construction of early-modern cities in Guangxi. They made the key measures for improving the physical construction of Guangxi using of political power infused by western planning thoughts and technologies, especially the changes of urban material environment with their subjective for consciousness roads reconstruction and “Arcade City” appearance.

In view of the practice to planning and construction in major cities of Guangxi, could mainly manifested two ways. First, through the removal of walls and roads construction around the cities, the interior of the old towns was refined with function and decoration, the edge was extended along the contour line of the old cities, which can be summed up as “updating inwards” with a transformation of “streets to roads”. But homochromous, due to the diversity of functional requirements new urban areas were designated and developed far away from the old towns, and the new cities expanding outward leapingly, which was summarized as “jumping outward” with a larger scales planning of “a road to roads network”. In a word, the traditional urban form had been renewed fundamentally in the way to “Streets→Roads→Roads Net”, and the appearance presented went to the style “Streets City→Arcades City→Roads City” for modernization, which the Roadism⁴ characteristics of urban renewal planning were, and had important significance and influence on its subsequent urban planning.

The development and construction of cities cannot be separated from culture. The old city is just the product of historical accumulation and urban development, although whose function couldn’t adapt to the new basic material needs, the context of its features and value wouldn’t not disappear. The early-modern renewal of the old cities in Guangxi proved its certain historical limitations for lack of historical and cultural preservation by the removal of old walls, gates, buildings and other heritages. But objectively speaking, the city reformations were performed mainly by respecting for the texture of the old cities and maintaining the traditional street pattern for the infrastructure. The reconstruction of the arcade blocks brought changes in the urban landscape and enhanced urban pedestrian functions, which were left to the present day, how valuable the traditional urban culture implied and the regional characteristics of adaptability reflected for modern cities. Therefore, the old city renewal planning should analyze the location conditions and historical context, to protect old landscapes and create the urban features.

Urban renewal in Finland: case of the workers district Kallio

Mika Mäkelä (University of Helsinki)

The modernist Finnish architecture and architects have been noticed worldwide the most famous examples being the individual works of Alvar Aalto. However, the practiced modernistic city planning and urban renewal in Finland have been less researched.

In my paper, I explore the modernistic city planning and urban renewal that has taken place in the district of Kallio in Helsinki, the capital of Finland. Why was the old timber house residential area demolished and rebuilt? Who were the key actors in the renewal process? In retrospective, was the process carried out successfully and what is there to learn from this case?

The events related to the renewal of Kallio took place between the 1930s and 1980s, but the practical implementation happened after the Second World War. The city planning ideals were sought from abroad – Sweden, Denmark, Germany, Britain and after the Second World War, also from the United States.

The justified objective of the renewal was to largen the centre of Helsinki to Kallio working-class district in building large modernistic public buildings onto the city' s owned land. The second objective was to replace the mostly privately-owned timber houses with a modern, open space urban structure.

The renewal was carried out thoroughly, as almost all of the small scale residential houses were replaced with either large public buildings or multi-storey dwelling houses. The renewal was a combined project of local town planning authorities, such as politicians, architects and private owned construction companies. For example, the renewal of the residential area was planned mainly by the city planning department of Helsinki, but the actual implementation was done mainly by private developers and organisations. The leading Finnish modernist architects, such as Aalto, were also partly involved in the design process.

The key point of the paper is to explain the stages of the Kallio renewal process from planning to the implementation as well as the role of various town planning and construction actors.

Mass-schooling in post-war Italy: a spatial issue. Two case studies from Turin and Venice metropolitan areas (1960s-70s)

Cristina Renzoni (DAStU-Politecnico di Milano)

The welfare state efforts in providing facilities such as schools, sports and cultural centres, public parks and playgrounds strongly characterized the accelerated process of expansion of Italian cities during the second half of the twentieth century.

This paper in particular focuses on the role played by public services and facilities such as public schools (3-5 years; 6-10; 11-13; 14-18) in driving the urbanisation process in Italian cities and territories in the years of the spread equipment of post-war Italy: 1960-1980.

Planning and architectural choices concerning schools had a relevant impact on the spatial organisation of Italian cities. Often built in connection with public libraries, parks, playgrounds, and sports facilities, public schools contributed to shape peripheral areas and new urban sectors. They played a role in defining the borders of medium-sized cities and the configuration of micro-interventions inside the historical inner areas. Finally, they contributed to drive dispersed processes of urbanisation of rural areas or in the outskirts of metropolitan areas.

After an overview on the relationship between public facilities and the urbanization processes in Italian cities and territories during the second half of the 20th-century, the paper will focus on two case studies in two different metropolitan areas in Northern Italy. The first one is localized in the outskirts of the city of Turin, in a moment of great metropolitan expansion inside and outside the city limits. The second one is localized within the polycentric network of small-sized cities and villages of the città diffusa in the Venice metropolitan area.

The purpose is to privilege an intermediate scale — one centred on spaces of urban proximity — that has mostly been neglected by recent researches on public facilities and welfare state legacies, mostly focused on the small scale of the architectural and design/typological aspects on the one hand, or on the wider scale of the discourses on the other hand. This intermediate perspective would make it possible to look at school areas in the relationship they established with their surroundings, focusing both on models/regulations /policies, and on actors/implementation/ place-making practices. Such an approach through “biographies” of urban fragments (made of schools and neighbourhood) could cast a new light on the Italian urbanization process, while providing a different narrative for the production of post-war cities and their legacy.

Creating Cities in the Post World War II American Southwest: The Arlington, Texas and Mesa, Arizona Experiences

Robert Fairbanks (University of Texas at Arlington)

Although historians have well documented the rapid growth of established cities in the Southwestern United States after World War II, they have failed to recognize that this era marked the emergence of new cities either from very small towns or from initial suburbs. Because these places often do not look like traditional cities they are often seen as simply large suburbs. Even those recognizing their urban status often dismiss them as “accidental cities.” This paper takes a different approach and argues that these communities were indeed intentional cities taking advantage of their place within the new metropolitan region to attract businesses, industry as well as population to become the new cities of the late 20th century. Just as city boosters of the 19th century had played a critical role in their communities’ growth and success, a new generation of city boosters emerged after World War II to create a new type of city that preserved what they saw as the best of the old and brought new aspects to make city living even more attractive.

No two cities demonstrate this better than Mesa, Arizona, the 36th largest “city” in the United States and Arlington, Texas, the 48th largest city in the country. Today, Mesa, a rural community initially settled by Mormons, is larger than Atlanta or Miami while Arlington, a small college town and collecting point for cotton, is now larger than New Orleans. Of the 100 largest cities in the United States, 16 of those emerged as significant cities only after World War II including five from Arizona and four from Texas.

This paper explores the efforts of civic leaders as well as the important role of city planners to remake these small communities into big cities. Both Mesa and Arlington took advantage of the creation of large airports nearby and also benefited from the development of a well-developed highway system that lined them to the metropolitan region. Both secured significant professional sporting venues; Arlington secured the Texas Rangers baseball team in 1972 and the city officials later lured the Dallas Cowboys football team away from nearby Irving in 2006. Mesa developed spring training facilities for several major league baseball teams including the popular Chicago Cubs who now have access to a massive new baseball facility funded by the city. Both particularly benefited from state annexation laws that allowed them to secure significant territory on which to expand their new cities. This paper explores the efforts of urban boosters and city planners to take advantage of their communities’ setting within growing Metropolitan areas and their effort to move away from a suburban identity and embrace an urban vision to become a new type of city.

Evolution of spatial planning strategies at Australian university campuses 1949-2017

Robert Freestone (The University of New South Wales) and Nicola Pullan (The University of New South Wales)

The design of university campuses is often seen as a microcosm of broader city planning trends where comparable issues of accommodating growth, dealing with traffic, allocating land uses, and architectural, landscape and urban design excellence are played out across the norms of the day. Over time, campuses have assumed diverse typologies in response to different economic, cultural, institutional and design drivers. At mid-twentieth century, campuses were legacy sites embodying design fashions from the past and awaited the exponential growth in demand for tertiary education which came in the post-war period when completely new campuses were also developed. A benchmark paradigm in campus and city planning from the late 1940s was master planning, denoting comprehensive, all-of-a-piece integrated blueprints. While the idea of holistic spatial strategies has not completely lapsed, campus planning processes have become more fluid, targeted and opportunistic, just as city planning similarly has become more creative and flexible in dealing with faster rates of economic, social, technological, environmental and educational change.

The university is now a global institution but this paper specifically explores the response of Australian university campus planning to several decades of change. Shaped by a succession of shifting socio-economic environments, tertiary education policies, and evolving cultural, educational and design practices, the meaning and mission of post-war Australian universities has changed. We identify at least five eras from the late 1940s: driving national technological development; public good; contributor to national wealth; driver of international competitiveness; and marketable commodity. In turn, campus plans and the campus planning process have evolved across these eras. Assuming some license for generalisation, foundational single-sheet architectural site-plans initially depicted the campus as a finite design. This gave way to more explicitly multi-factorial systematic master-planning reports, a planning tool that became increasingly comprehensive and complex over time. But contrasting with the earlier prescriptive approach, current models are conceived as selective interventions intended to be achieved incrementally over periods of up to a decade. They are frequently designated development plans or strategies, guided by overarching university objectives. As the campus planning model has evolved, the profession of campus planners and their role in campus development also changed, from state-appointed government architects through university staff architects, then university-based architect-planners designing with input invited from planning consultants, to a reliance on consultant planning firms charged with delivering the final product but working in partnership with university planning and facilities management teams.

The paper concludes by suggesting that current campus design trends increasingly solidify the connections and convergences between the planning of campuses and the cities and regions in which they are embedded with increased emphasis on urbanistic solutions. In this setting the heroic comprehensive, static master plan has become obsolete. The modern campus as a vehicle for increasingly entrepreneurial, competitive institutions is now shaped by a multiplicity of plans, strategies, initiatives and works programs. Within that environment, integrative and responsive planning “frameworks” and design moves are becoming established as the new norm.

Evolution of spatial planning strategies at Australian university campuses 1945-2017

Robert Freestone*, Nicola Pullan**

* Professor, Faculty of Built Environment, UNSW Sydney, r.freestone@unsw.edu.au

** PhD student, Faculty of Built Environment, UNSW Sydney, n.pullan@unsw.edu.au

The design of the university campus is often seen as a microcosm of broader city planning trends. The university is now a global institution but this paper specifically explores trends in Australian university campus planning across several decades of political, institutional, economic, social and environmental change since the late 1940s. At mid-twentieth century campuses were legacy sites embodying design fashions from the past and awaited the exponential growth in demand for tertiary education which came in the post-war period when completely new campuses were also developed. A benchmark paradigm in campus and city planning from the late 1940s was master planning, denoting comprehensive, all-of-a-piece integrated blueprints. While the idea of holistic spatial strategies has not completely lapsed, campus planning processes have become more fluid, targeted and opportunistic, just as city planning generally has become more creative and flexible in dealing with faster rates of economic, social, technological, environmental and educational change. Our brief survey covers the major phase of post-war university development, a parallel and intersecting set of design epochs, and identification of some of the leading designers of the boom period through and on either side of the 1960s.

Keywords: Australian university campus, campus design, master planning, strategic planning

Introduction

The design of the university campus is often seen as a microcosm of broader city planning trends, where comparable issues of accommodating growth, dealing with traffic, allocating land uses, and architectural, landscape and design quality are played out across the norms of the day. In the post-World War 2 environment, what has been dubbed 'search for perfection' intersected with both the unprecedented expansion of tertiary systems and the end of certainty in planning.¹ Campus design has threaded its way through planning history largely as a specialised realm of civic and urban design. Coulson et al. concentrate on key episodes and themes within university design from medieval models to the present; Turner assesses the American university plan against the 'utopian social visions' of the wider community; and more comparable to our time frame, Muthesius surveys the relationship between the underlying ideals of the institution and the design of the campus during the post-war expansionist period.²

Our focus is on the Australian experience and the making of the campus against the backdrop of a succession of shifting socio-economic environments, tertiary education policies, and evolving cultural, educational and design practices. The analysis draws on both primary and secondary sources such as archival records, annual reports, monographs, plans and accessible publications, supplement by oral recollections that have expanded and clarified the written record. The approach is synoptic and the paper is structured in three parts. The first discusses the institutional context in which the changing design of the campus played out, and we identify at least five eras from the late 1940s. The second considers the evolution of the planning process and the progression of campus plans which eventuated. The third section develops our focus on key design principles through a discussion of four planners who influenced the shape of the university campus during the years of greatest growth.

Institutional Epochs

The overall environment for evolving campus design can be best understood in the context of broader changes in Australian higher education, government policy, and cultural change.

Driving national technological development 1945 -1963

After an initial phase of austerity after World War 2, an economic 'long boom' unfurled as Australia experienced unprecedented commercial and industrial expansion. The post-war university was seen as a vocationally-oriented nation-building institution needed 'to provide the engineers, scientists, technologists, lawyers... and others without whom our civilization could not develop or even be maintained'.³ It was also

recognised that ‘countries which were most successful... and with the highest living standards were those where a large proportion of the population could easily access a good university education’.⁴ This period saw the commencement of the Australian National University, two additional capital city universities and the expansion of pre-war legacy campuses. However, all universities found themselves facing severe problems financing the capital works programs needed, as revealed by the 1957 Murray Report, until additional funds were provided by the federal government from 1959 under the auspices of the new Australian Universities Commission (AUC).⁵ The centrally-managed growth phase accelerated but by the early 1960s universities were feeling the strain.⁶

Universities as a public good 1964 -1979

In 1965, a major public enquiry was held into the future development of tertiary education.⁷ The Martin Report identified a need to promote through education those values inherent to ‘a free, democratic and cultured society’, proposed that the scale of social change required could only be provided by continued economic growth, and emphasised that the quality of the educational output was dependent on the quality of the institution.⁸ Under this philosophy, six new universities were funded, but with growing awareness that financing sufficient full research universities to cater for student demand was not economically or educationally sustainable.⁹ The solution was to establish a binary system, comprising universities and colleges of advanced education (CAEs), enabling Australia to continue to satisfy a greater spectrum of individual educational aspirations.¹⁰ From January 1974, the Commonwealth assumed full responsibility for funding higher education (HE).¹¹ However, by 1976 the effects of the global economic crisis soon forced the government to apply strict funding constraints. Recurrent funding was reduced, research funding curtailed, and full-fee paying places for international students more than doubled. Universities re-entered ‘austerity’ mode.

Contributor to national wealth 1979-1988

From 1979, the focus of HE in Australia changed, responding both to the concept that ‘economic recovery depends on adding more value to the things we do produce, and learning to export knowledge-based goods and services’, and to criticism that the nation was historically deficient in intellectual skills and disengaged from new ‘knowledge-based’ industries.¹² In line with recommendations articulated in another key government report in 1979, the Australian HE system was effectively reconceived as a producer of national wealth and extended to educate an even larger proportion of school-leavers and increased numbers of international students to global standards at a lower cost.¹³ However, federal funding still failed to cover operating costs and remained a critical issue.¹⁴

Universities as drivers of international competitiveness 1988-2002

From 1988, a succession of reviews commencing with the catalytic Dawkins Report shaped the university environment into a less systemic, more demand-driven, user-pays institutional framework in line with an emerging neo-liberal political-economic consensus.¹⁵ The reforms focused on ‘growth and quality enhancement’ were couched in terms of increasing access, enhancing international competitiveness, and retaining the best and brightest, while proposing economic liberalisation of university education and the introduction of free market forces. The national future of the university now became increasingly dependent on its position in the global marketplace.¹⁶ Compulsory contributions were introduced for domestic students while full-fee paying places for international students more than doubled. Additionally, allocation of a single federal block grant was instituted giving universities greater discretion over strategic capital works.¹⁷ Most dramatically, the binary HE system was unified, halving the number of institutions, some through amalgamations, but overall significantly increasing the number of universities by the 1990s.

Education as a marketable commodity 2002 – present

In 2002, a further review recommended per-student funding with each university setting their own level of student contributions. Commonwealth funds were increased and linked to ‘workplace productivity’, national governance protocols and equity programs. In 2008, transition to demand-driven funding and the introduction of ‘mission-based’ compacts with universities was recommended. The student visa program was re-assessed, as were conditions for undergraduate and post-graduate places. In 2012, the Behrendt Review recommended strategies to increase Indigenous & Torres Strait Islander (TSI) participation.¹⁸ Two further government reviews decisively shaped new institutional strategies.¹⁹ The first of these determined that since higher education directly benefited the individual through improved employment prospects and incomes, a lower proportion of the costs of HE should be borne by the government, with public investment in research directed to national priority areas.²⁰ The second review recommended ensuring the survival of the demand-driven system through fiscal sustainability, improved operation, and greater competition.²¹ These new funding arrangements represented a significant shift from the earlier post-war commitment to centralised control and funding, making for a far more entrepreneurial and competitive environment.

Planning process and plans

Entwined narratives in national government policies and educational ethos have decisively influenced the form of the campus master plan, planning strategies and, ultimately, the design of the post-war university campus.

First post-war campus models 1945 -1958

The first post-war campus plans typically took the form of large-format, single sheet architectural site plans depicting the layout of the campus as a 'finished composition', adopted an identifiable style of nationalistic landscape design, relied primarily on aesthetic judgements, and were usually attributed to a single architect consultant. Architect-planners continued to favour the popular pre-war City Beautiful/Beaux Arts style, featuring symmetrical architectural compositions on formal lines, with strong vistas and diagonals, usually oriented towards a large central green. The campus was conceived as a site of 'quiet, seclusion, separation and retreat'.²² New campuses commenced according to these principles were the Australian National University (ANU; Brian Lewis, designer), the University of New South Wales (UNSW; NSW Government Architect), University of New England (UNE; NSW Government Architect), and Monash University (Bates Smart and McCutcheon).

Located in the federal capital of Canberra, ANU was a research-orientated institution whose novel remit was matched by a unique low density 'parkland campus' set within an external framework informed by Walter Burley Griffin's 1912 City Beautiful-inspired city plan. UNSW commenced construction in 1949 on a constricted site which then grew incrementally and was distinguished not by a lack of planning but a rapid succession of tactical moves in response to changing circumstances. UNE focused on an existing rural homestead and developed into a scattered parkland campus inspired by the design of Aarhus University in Denmark.²³ In 1958, Monash University was the first of the Australian post-war universities to be underpinned by a comprehensive long-term plan before construction, and was conceived along the lines of an 'academical village' with a central court open to the north and two ranges of buildings which terminated at students' residences.²⁴ At the time of their establishment, these new universities were not expected to experience any significant and unpredictable long-term changes in student numbers or needs, however, both the planning format and design styles were quickly found to be unsuited as planning was not sufficiently comprehensive and the predetermined composition could not be satisfactorily extended to accommodate the growth and change which eventuated.²⁵

More adaptable physical planning 1958-1974

By the mid-1960s the comprehensive master plan ruled.²⁶ However, the form and techniques changed markedly from the late 1950s, moving away from architectonic set-pieces to more adaptable strategies. William Wurster's 1956 Long Range Development Plan for the University of California (UC) Berkeley was an important and influential trailblazer, employing systematic assessment and full planning documentation, and emphasising flexibility and regular revision.²⁷ Additionally, the plan was reviewed to a ten-year time frame, ensuring it could be 'changed... as needs may appear different from those anticipated today'.²⁸ This model was essentially adopted for Australian university campuses for at least the next twenty years, with the parallel appointment of powerful architect-planners reporting directly to the Vice-Chancellor or Registrar.²⁹ The planning process became more complex throughout the 1960s as the AUC imposed progressively more detailed planning requirements onto universities and 'exercised a much closer and detailed control over the approval of building plans... staff teaching loads... and the manner in which the revenue votes generally are expended within the universities'.³⁰

The seminal planning report in this mode was architect-planner Gordon Stephenson's 1959 modification of his first 1955 University of Western Australia (UWA) master plan, to be followed by reports guiding the extension of five other established universities and seven of the eight new greenfield campuses.³¹ With inherited processes in place for campus planning, older established universities were generally slower to develop a systematic and documented master plan for their main campus. Although Stephenson documented the UWA planning process from 1959 and a similar methodology was used by the University of Sydney architects, Walter Abraham and Max Jackson for the 1964 report on the Redevelopment of the University Extension Area, it was not until 1976 that UNSW campus architect Noel Wright could present a fully-documented master plan, despite a campus planner being appointed from 1958.³²

This era of campus planning was strongly influenced by Clarence Stein's Radburn model for urban development with its spatial segregation of pedestrians from vehicles. Stephenson's UWA plan was the first to adopt the model with central academic and residential precincts reserved for pedestrians, elements placed according to topography and additional design philosophies, and the whole encircled by a ring-road relegating traffic and car-parking to the periphery.³³ Additional to Stein's Radburn principles, campus design was influenced by the 1960

University of Leeds Developmental Plan described as a ‘deliberate attempt to implement the insights of modern urban theorists’ and bring New Town principles, scientific rigour, and empirical justification to the university environment.³⁴ At a time of relatively high population growth, expansive metropolitan planning scenarios and acceptance of car-dependency, the accent was on flexible planning for continuous growth. As Roy Simpson said of his La Trobe University master plan: ‘the plan should be devised not as an inflexible mould but rather as a guide to the fulfilment of a concept within which adjustments could be made to accommodate evolving needs’.³⁵ Modernism reigned but the typologies were still diverse, ranging from a form of bushland campus (e.g. Newcastle) to more compact ‘constructivist’ campuses exploring different models of public space (e.g. Macquarie), but all responding in their way to Australian vernacular design traditions.

Both new and extended campuses were designed to encourage ‘urban’ types of interactions between students and staff, within a larger, more dispersed, increasingly complex, and somewhat impersonal setting.³⁶ Most plans included a central quadrangle, court or great hall as a central focus. With contemporary social-pedagogic theories seeing learning as being both formal and informal, occurring inside and outside the classroom, close physical relationships between related faculties were increasingly structured to facilitate interaction and cross-fertilization of ideas between staff and students, all within an overall open-ended design philosophy which stressed extension and adaptation to suit future unknown building needs and changes in building purpose.

The new CAEs were established at this time. Located on either greenfields or repurposed teacher’s college sites, they were specifically designed to suit a limited range of vocational courses offerings; catered for local student populations; and were intended for staged expansion of what was seen as a fairly static institution.³⁷ Planned during an era of intense academic interest in sociology, social interaction and urbanism, a typical exemplar but atypical built environment was Ku-ring-gai CAE in Sydney- a suburban brutalist conception designed to emulate a self-sufficient ‘hill-top town’ within which particular activities were allocated to separate ‘laneways’ and precincts within a monolithic megastructure, with students and staff brought together in a central ‘street’ for social and communal activities.³⁸

Improving the campus environment in a no-growth era 1974-1989

Between 1976 and 1989, HE capital works funding was limited and university development entered a ‘steady state situation’.³⁹ During this period, campus planners concentrated on maintaining and reviewing current master plans for future activation.⁴⁰ As with ANU, where the 1976 Site Plan was the last to be developed until the 1992 Development Policy was prepared, most campuses were simply modified as the budget allowed, with the very few new buildings usually funded from external sources.

Architect-planner Geoff Harrison advised that during this time of austerity existing facilities needed to be ‘husbanded, efficient, and recyclable to meet new needs’ and emphasised the need for any campus plans to consider continuous growth, walkability and disabled access.⁴¹ Development across all universities re-focused on the campus environment, usually to good effect, with a continued emphasis on pedestrian movement and open space, and increased investment in landscaping and garden sculpture to enhance the outdoor experience, itself increasingly opened up to the surrounding community. At the same time, the design of the campus was also responding to greater public awareness of environmental and social issues.

Consultation, urban design and sustainability 1988-2002

As noted earlier, Commonwealth funding of capital works recommenced in 1988 and universities began to develop new campus plans which, once again, differed markedly from previous models as the wider planning environment experienced ideological and methodological advances and became institutionally more complex. Primarily designated master plans, they were guided by university goals and drew on planning, design, legislative and marketing knowledge held by specialised planning/design firms, with the university architect/planner involved in co-ordinating the assessment process and diverse planning inputs. The planning process increasingly involved contributions solicited from the university community, development advisory groups, steering committees, property departments and architecture faculties.⁴²

As with previous ‘systematic’ plans from the expansionist period of the 1960s, a variety of issues were addressed through recurrent development principles. These prioritised campus layout and image, including location of activities; land use, siting and design; circulation of people and vehicles; landscape and siteworks; and implementation. Additional aspects of campus planning included interactions with the community and the need to plan for multiple campuses as the CAE system merged with universities.⁴³ Some universities established satellite campuses while others launched international campuses, primarily in Malaysia and Singapore.⁴⁴ Private universities also made their first appearance. The 1990 Talloires Declaration saw university Vice-Chancellors globally committing to environmentally sustainable institutional practices, and Australasian Campuses Towards

Sustainability (ACTS) was formalised. These ideas would filter through into campus design. From 1992, the University of Newcastle Callaghan campus Senior Architect/Planner, Philip Pollard was associated with key environmental design initiatives.⁴⁵ Comparable green innovations for architectural, site and landscape design were adopted at other universities.

Urban design and public domain planning also featured more prominently as a means of stitching campuses together holistically, with coherence sought through building placement and relationships, urban forms, landscape, colours and materials. Designing for personal safety following CPTED (crime prevention through environmental design) principles also became major themes. Most campuses edged towards becoming predominantly pedestrian precincts and there was renewed focus on the concept of a central core designed to increase the possibilities for human interaction, surrounded by and linked to defined precincts within 10 minutes walking distance of each other.⁴⁶ In the style of Jefferson's 'academical village' at the University of Virginia, there was enthusiasm for formal gateway statements and signature buildings as marketing showpieces.⁴⁷ In S-E Queensland, Bond University and the University of the Sunshine Coast as the only two new greenfield campuses from the late 1980s embodied these ideas, a fusion of flexible planning and post-modern architecture, and both conceived within even more comprehensive integrated property development ventures.

Placemaking, design excellence and urban buzz 2002-today

Starting early this century, the campus has become central to university marketing strategies. Increasingly cut adrift from central government micro-management and targeted capital funding, Australian universities were now regarded as business enterprises which needed to be seen as leaders in the educational field, and whose 'capacity to draw notice [had] become a valuable marketing tool within an increasingly competitive and crowded higher education marketplace'.⁴⁸ As the 'shop window', the campus became linked to overall strategies. Campus master plans were now integrated into university strategy documents and given titles such as 'Infrastructure Development Plan' (Australian Catholic University in Melbourne). Plans were required to account for a raft of inclusions: landmark buildings, heritage, environment, sustainability, occupational health and safety, accessibility, student engagement, contribution to the community, technological change, new learning environments, reconciliation and indigenous support initiatives, visual impact requirements, research hubs and research parks, and alternative modes of transport, among other innovations. Invariably the campus master plan was outsourced to professional planning firms with the requisite skills and contacts to address the myriad issues involved, and the role of the university architect or architect/planner morphed into facilities managers and strategists.

Dramatically changed philosophies of learning and teaching emphasising collaborative, inter-disciplinary and digital interactions have also shaped universities' responses in the current era, and, in turn, the nature of master planning has evolved to being variously even more strategic, flexible, and design-driven. The integration of university and city has become a 'headline theme' for master planning which is also evident in many other countries, including the US where some regional institutions have struggled, and universities have established central city footholds to attract both quality staff and students.⁴⁹ One pervasive idea is that of the 'sticky' campus, aiming to keep students longer within the university environment by providing an enhanced student experience. Newly constructed student service 'hubs' have been inserted into central locations on campus; existing facilities have been modified to provide informal learning spaces necessary for connected and collegiate learning; and on-campus residential precincts are now being integrated into traditional academic zones.⁵⁰ Some suburban campuses have struggled through inaccessibility, others have received urbanistic makeovers, prominent new central city sites have been procured for research and teaching activities, adaptive re-use of historic buildings has been prominent (e.g. Notre Dame, Fremantle and Sydney; Deakin, Geelong waterfront), while longer-standing city institutions have been well placed to connect with the new 'univer-cities' rubric highlighting the nexus between universities and their host city's economic, social and cultural development.⁵¹ The new interplay between town and gown is physically manifested in the re-imagining of CBD campuses like Melbourne's RMIT University and Sydney's UTS as monolithic enclaves into more permeable central city precincts. The placement of QUT's Creative Industry faculty within the Kelvin Grove urban village redevelopment on the fringe of central Brisbane constituted a new typology of a mixed-use main-street precinct integrating retailing, office, high school, recreational, community, and residential uses within an armature of public space. This award-winning master-planned development is founded on a government/university partnership and has won numerous urban planning, landscape architecture, and sustainable environment awards.⁵²

In physical planning terms, in Australia as overseas, the idea of an identifiable symbolic focus to the campus became important and universities have started to rebuild distinctive identities to project an image of innovation to potential students, promote philanthropic donations, and transform 'drab, neglected' parts of their estates into

‘architectural showgrounds’.⁵³ While conceived earlier on the Stanford-Palo Alto model, research parks were more decisively linked to campuses in an effort to build stronger, potentially more lucrative partnerships, underpinned by aspirations for revenue-generating property development. Examples include Macquarie, Latrobe, Monash, Ballarat/Federation University and Wollongong. Industry-partnered premises and innovation precincts are now taking this into a new era. With a growing proportion of international students, universities have expanded the supply of well-designed modern on-campus accommodation often supplementing increased off-site student accommodation from private providers. Environmental concerns, sustainability and resilience have continued to influence design with larger student numbers forcing planners to address overall environmental footprint, investment in ‘greenstar’ buildings, improved public and active transport connectivity, and privileging of a quality public realm.

Planners and plans

Post-war campus planning has attracted an impressive cast of designers who have imparted their distinctive creative responses within the imperatives and accepted approaches of their times. Leaving aside the design of individual structures, from the 1950s to the 2010s, campus master plans have been shaped by leading practitioners including Brian Lewis (ANU, Melbourne), Denis Winston (ANU), Roger Johnson (Griffith), Michael Dysart (UTS), Daryl Jackson (Bond, Charles Darwin), Giurgola Mitchell Thorpe (Sunshine Coast) and Peter Elliot (RMIT). Below we briefly comment on four central figures most active and influential in the 1950s-1960s.

Gordon Stephenson

Liverpool-trained architect-planner Gordon Stephenson was arguably the most influential designer of universities from the 1950s to the early 1970s.⁵⁴ Stephenson drew from Stein’s philosophy of privileging the needs of the pedestrian; and Wurster’s technique of building densely for current needs; and used these concepts, combined with courts and precincts, as the basis for four key design principles: design major buildings for future expansion; ensure convenient physical relationships between faculties and amenities; orient buildings towards tranquil enclosed spaces; and reserve the inner campus for pedestrians.⁵⁵ These four criteria were later expanded to include: encouraging flexibility in design; restricting the palette of colour and materials; and ensuring that the physical plan expressed academic policy.⁵⁶ These basic principles were applied at UWA and in the many consultative roles Stephenson was invited to fill, singly and in collaboration with colleagues such as Gus Ferguson, James Birrell and Geoffrey Harrison.

Geoffrey Harrison

Of Stephenson’s contemporaries in Australia, Harrison, an Australian-trained architect, was perhaps the most prolific campus planner.⁵⁷ Appointed staff-architect for the new Flinders University in Adelaide, he collaborated with Stephenson on the initial site planning report, and then co-ordinated development of the site.⁵⁸ Harrison and Stephenson consciously employed the Radburn concept of a ring-road and separation of vehicle routes from pedestrian precincts, and referenced Stephenson’s four design principles as much as was practicable on a topographically challenging site.⁵⁹ Harrison also incorporated elements which would feature strongly in his subsequent campus developments, including the introduction of an expansive open court as a campus core situated between the library and student union building, oriented and sheltered to suit climatic conditions, and designed to become a central meeting place facilitating communication between students and staff.⁶⁰ Additionally, Harrison aimed for flexible, extendable, and adaptable elements; planned for ‘low-profile, strongly-horizontal’ buildings that would not overwhelm the individual; incorporated elevated walkways stretching between otherwise distant precincts; and attempted, somewhat unsuccessfully, to avoid faculty-specific ‘silos’.⁶¹ He left a tangible imprint at several universities in the 1960s and 1970s including James Cook, Ballarat, Adelaide and Deakin at Waurn Ponds.

Walter Abraham

Abraham was a senior architect-planner for the University of Sydney when he was invited to fill a similar role at the newly-established Macquarie University.⁶² On his appointment, Abraham made two trips to the US to investigate campus planning and, on his return, engineered integration of his office within Macquarie’s administrative structure, a model taken from MIT and the University of Colorado.⁶³ A formal developmental planning report was regarded as superfluous to this innovative management structure, but Abraham consciously relied on Stein’s Radburn principles to give structure to the plans for the central building group. He also drew on a sophisticated phalanx of additional ideas and principles for design direction, including the concept of imperfect knowledge of the future which underpinned an influential 1957 report for the University of Birmingham, John Weekes’ ‘indeterminate architecture’, social science frameworks from UC Berkeley, David Bell’s aesthetics of incompleteness, the concept of ‘Templum’ or ‘space bounded by the ground, horizon and sky’, and the Roman surveyor’s model of ‘decumanus maximus’, as well as historic quadrangular forms.⁶⁴ The

campus which eventuated was conceived as an urban institution within a quasi-rural context. The overall layout includes a strongly-articulated interior grid creating a compact academic core, with a straight one-kilometre central spine serving as the primary pedestrian circulation.⁶⁵ The centre of the campus is concentrated on a large, formal, open-cornered quadrangle surrounded by communal buildings in the brutalist style.

Roy Simpson

In 1964, Roy Simpson of Yuncken Freeman Architects was appointed to undertake the master planning of La Trobe University, a new university on the northern outskirts of Melbourne.⁶⁶ Plans were commenced following a study tour to investigate ‘outstanding new universities’ in the UK, US and Canada.⁶⁷ As with the campus designers discussed previously, Simpson adopted and modified Stephenson’s four principles to suit the brief, the finance available, and the site. He also introduced his own design philosophies, particularly his view that the ‘precinct is more important than the buildings, the city is more important than the precinct, the total scene is more important than the individual project’.⁶⁸ Simpson held that ‘most buildings should be in the background to permit the occasional special one to exert its proper emphasis in the group composition’ and understood ‘the need to learn humility in order to design buildings subserviently’.⁶⁹ These precepts were challenged through early university decision-making but addressed through a series of planning and design moves stressing the horizontality of development; modular integrated buildings; an ‘affinity of design between all buildings, and between buildings and landscape’ with ‘individual virtuosity... subordinate to the interests of overall cohesion’.⁷⁰ The university which evolved as a solution to these precepts is perhaps one of the most innovative in Australia. Following his appointment at La Trobe, Simpson also collaborated on a revision of ANU’s ever-evolving site plan.⁷¹

Conclusion

In the post-World War 2 period in Australia, there has been a general evolution in the form of the physical campus master plan, the principles which governed the plan, and the planning process itself. As enrolments increased, governance systems evolved, and community values shifted, planning needed to take account of an ever-increasing number of administrative and legislative requirements as well as the expectations of a growing number of stakeholders. As a result, campus plans gradually became more comprehensive and increasingly complex. Among other things, planners were increasingly required to take account of, plan for, and then to document, the estimated and approved costs of proposed developments, contracted completion times, floor-space allocations and space utilisation, vehicle movements and provision for parking, heritage and environmental protection legislation, technological advances, and academic and non-academic facilities expected by users and funding bodies.

The planning process was progressively accepted as the purview of a specialised sub-profession, with the planners involved changing from government and public service architects through university-based staff architects, to university architect-planners who designed with input from planning consultants, to a reliance on consultant planning firms charged with delivering the final product but working in partnership with the university architect or facilities management staff.

Consequently, campuses have assumed diverse typologies in response to these different economic, cultural, institutional and design drivers, evolving from finite compositions demonstrating a recognised landscape style, through townscapes and academic villages grounded in theories of social interaction and urbanism, followed by open and accessible campuses displaying a commitment to landscape improvements and environmental responsibility and, most recently, student-centred and visitor-conscious venues frequently displaying flamboyant design features but underpinned by ecologically-sustainable practices.

In this setting, the heroic comprehensive, static master plan has become obsolete as has the heroic architect-planner. The modern campus as a vehicle for increasingly entrepreneurial, competitive institutions is now shaped by a multiplicity of plans, strategies, initiatives and works programs. Although the legacy of modernism and its advocates such as Gordon Stephenson and others remains evident, within the contemporary environment, integrative and responsive planning ‘frameworks’ and design moves are becoming established as the new norm.

48 Disaster and Resiliency

Collaborative Planning for Post-Disaster Reconstruction in Italy: Community Participation in four Small Towns, Focusing on Novi di Modena.

Tomoyuki Mashiko (Waseda University), Monia Guarino (PRINCIPI ATTIVI), Gianfranco Franz (University of Ferrara) and Shigeru Satoh (Waseda University)

Community participation after a disaster is widely acknowledged to be crucial for both mitigation and reconstruction planning. In this regard, Berke and Campanella (2006, p.193) indicate that through the involvement of and consultation with residents during all planning phases, pre-disaster recovery planning can create knowledgeable constituency. Moreover, the collaborative process of reconstruction planning can help 'build the necessary momentum to keep the community moving forward' (Schwab, 2014, p.120)

Nevertheless, to date, little research has been conducted on collaborative planning in post-disaster contexts and, therefore, this paper addresses the issue of collaborative planning for post-disaster reconstruction aiming to effectively facilitate participatory processes in the community and identifies key factors in successful collaboration gleaned from past Italian reconstruction planning.

First, through a literature survey and field interviews, we surveyed the characteristics of community participation in post-disaster reconstruction in Italy, particularly examining three cases of reconstruction: the Friuli earthquake in 1976, the Abruzzo earthquake in 2009 and the Emilia-Romagna earthquake in 2012. Consequently, we classified the reviewed community participation into five types on the basis of three criteria: objective/goal, main actors and period.

Second, we outlined the legislative framework and specific rules for reconstruction in the Emilia-Romagna region.

Third, we compared community participation and the formulation of reconstruction plans in four local administrations: Novi di Modena, San Felice sul Panaro, Concordia sulla Secchia and Mirandola. Results reveal that the development of participatory action in three towns-San Felice, Concordia and Mirandola-has discontinuously proceeded and that only Novi's development progressed in a single continuous fashion through all stages of the participatory process.

Last, we verified the dynamic mechanism of Novi di Modena's reconstruction planning by using an evaluation framework with two axes: the stage of the planning process and the level of community participation. To define this framework, some established frameworks were reviewed, such as Sherry R. Arstein's 'A Ladder of Citizen Participation' (1969)

Consequently, we specifically visualised the significant gradations of community participation in Novi di Modena and verified the impacts of the participatory paths reflecting three types of outcomes.

To conclude, we identified three key factors encouraging collaborative planning for reconstruction from the planning process of Novi di Modena.

First, the timing of the participatory process must be well managed. Second, the participatory proposals shared with citizens must be considered the guiding documents for local development. Third, regeneration scenarios for the whole territory considering different periods must be defined, in addition to the implementation strategies and tactics for each urban core. Because of the lack of these three factors in the three towns, continuous community participation was impossible. Although reconstruction in Novi di Modena was delayed for the first three years, Novi di Modena was able to accomplish a greater degree of qualitative reconstruction than the other towns.

A study on the slum clearance redevelopment project and the community design project for disaster in Koto-delta

Motoki Fujisaki (The University of Chiba), Joseph Thomas Rayes (The University of Chiba) and Saikaku Toyokawa (The University of Chiba)

The paper puts its focus on the activities of university researchers to organize the top-down urban planning and bottom-up community design with the theme of disaster in Koto-delta. Moreover, comparative analysis of statistical data of Koto-delta for half a century show the necessary conditions for considering the disaster prevention planning. Koto-delta is the most dangerous area for disaster in Tokyo. Takayama presented the Koto Cross Disaster Prevention Belt Conception, after studying his laboratory, became the foundation of the current planning. While disaster prevention bases and public facilities have increased the disaster prevention performance of the area, the aging and unused facilities are now a problem. Otani and Sato aimed to improve the community by cooperative rebuilding of residents, but the discussion was difficult, and maintenance did not proceed. The statistical data shows that the safety of the area improved, but in addition to the failure of social mix due to large-scale development, the loss of regional landscape and diversity due to the promotion of detached rebuilding, the resilience is decreasing.

The Influence that the Legacy of Urban Planning Gave to Current Sanriku Coastal Villages

Kentaro Okamura (The University of Tokyo)

After the Great East Japan Earthquake in 2011, it has widely been recognized that the place called “Fukkochi” exists in a number of Sanriku coastal villages. “Fukkochi” refers to a high altitude settlement where displaced people moved after the Showa Sanriku Tsunami in 1933. It was developed as a project by the Ministry of Home Affairs using public funds. “Fukkochi” was planned at about 100 villages in total (40 villages in Iwate Prefecture and 60 villages in Miyagi prefecture)

It was one of the first projects that urban planning bureaucrats were involved in rural disaster reconstruction. Recent studies by Akihito Aoi have revealed that it was also related to the social policy of rural village economic rehabilitation movement at that time.

In recent years, case studies on individual “Fukkochi” have increased. However, the overall picture is not necessarily clarified. In some studies, the difference between plan and actual situation is ignored. In our previous works in several villages revealed that the position and the scale of “Fukkochi” are different from the plan drawing by the Ministry of Home Affairs. It is impossible to evaluate the policy without grasping how the plan was realized.

Therefore, the purpose of this research is to clarify how reconstruction planned in about 40 places in Iwate prefecture was realized. Specifically, by investigating cadastre and field survey, the location and scale of “Fukkochi” are specified and it is analyzed how it differs from the plan.

According to previous studies, the location and scale of 30 villages out of about about 40 villages were found out. In one of the remaining villages (Taro), rebuilding in the former residence was chosen instead of a tall relocation. For the rest of the villages, it is considered to have not been realized. In addition, it is clarified whether each “Fukkochi” was damaged by the Great East Japan Earthquake by map analysis and field survey.

A study about formation of community base outside administrative district in Fukushima after Nuclear Disaster

Keisuke Sugano (Delft University of Technology)

Due to the disastrous incident broke out in the First Nuclear Power Plant of Tokyo (TEPCO) in Fukushima, the entire Namie town population were compelled to leave their means for livings and evacuated themselves to other districts in Japan.

As of March 2015 this moment, four years since this disaster, the entire town people have sought refuges elsewhere, evacuated themselves and settled down in new communities built around the Namie outskirts or in several host cities. For the time being before the assurance of returning to Namie town, their private life in the refuges must be ensured for safety and stability, spiritually and materially.

As a member of Waseda University Institute of Urban and Regional Studies and Shigeru Satoh Laboratory, the author practiced the project for supporting Namie community reconstruction from autumn of 2011. We presented a concrete image of “Namie outer communities in host city” that forms a community base outside Namie administrative district, and got approval from many citizens, mayor and staff of town government office at the symposium held on March 2013. After April 2013, we proposed “Cooperative Community Development for Rehabilitation” to realize Namie outer communities, which contribute to the regional revitalization of the host city. The author worked together with citizens and governments of Namie and host cities until March 2015.

This paper describes the process of Cooperative Community Development for Rehabilitation, focusing following three contents; (1) institutional problems for forming the community base outside administrative district, (2) organization established to request institutional improvement, (3) the method of realizing the model case of outer community.

(1) There was insufficient system to support land acquisition outside the administrative district and fund procurement for living reconstruction. There were only two host cities, Kohri and Motomiya, concluded an agreement with Namie Town for developing public housing, which supports evacuees of Namie in the host city.

(2) Community Development Committee was established by a temporary Chairman of autonomy to request institutionalization for supporting Cooperative Community Development for Rehabilitation to national, prefectural government and Namie Town. In addition, Community Development forum was held to share the vision of it with entire autonomous communities struck by the Nuclear Power Plant Disaster and whole host city in Fukushima prefecture.

(3) In the neighboring land of the temporary housing complex which is located in Adachi district of Nihonmatsu City, Namie outer communities headed for realization in collaboration with the development of public housing by Fukushima Prefecture and housing development by private sector. In the public housing, clinic, living support center, meeting place organized by Namie Town will also be established, and a base of community for Namie citizens will be formed.

Community participation after a disaster is widely acknowledged to be crucial in both mitigation and reconstruction planning; however, to date very little research has been done on collaborative planning in a post-disaster context. This paper addresses the issue of collaborative planning for post-disaster reconstruction to effectively facilitate community participatory processes. First, we surveyed the characteristics of community participation for post-disaster reconstruction in Italy. Second, we studied the regional legislative regulations for reconstruction in Emilia-Romagna. Third, we compared the community participation and formulation processes of reconstruction planning tools used by communities. Lastly, we verified the dynamic mechanism of the town of Novi di Modena's reconstruction planning process by using an evaluation framework with two axes: stage of planning process and community participation level. As a conclusion, we identified three key factors that encourage collaborative planning for reconstruction. The first key factor is the timing of the participatory process must be well managed. The second is a participatory proposal shared with citizens, which must be considered the guiding document for local development. The third key factor is regeneration scenarios for the whole territory considering the different periods must be defined, as well as the implementation strategies and tactics for each urban core.

Keywords: post-disaster reconstruction, collaborative planning, community participation, reconstruction planning history

INTRODUCTION

Over the last half-century, Italy has had a painful history of catastrophic natural disasters, and in particular several mega-earthquakes within these disasters have caused severe damage represented by loss of life and property in different regions (Valeriani and Bertelli, 2017). Most of the devastated areas are small, isolated rural settlements, and therefore "effort to encourage decision-making and collaboration with different actors is necessary to reconstruct such suffered areas" (Ceccarelli, 2017, p.99). Communities face difficult challenges in post-disaster reconstruction since the many actors involved have diverse socio-economic backgrounds (Ceccarelli, 2017) and since the recovery process is so complex and compressed in time (Olshansky et al., 2008; Olshansky et al., 2012). Despite such difficulties, to take advantage of strengthened community bonds after a disaster strikes, communities must give voice to their citizens as participants in the post-disaster reconstruction decision-making process (Berke and Campanella, 2006; Ceccarelli, 2017; Ganapati and Ganapati, 2008).

This paper addresses the issue of collaborative planning for post-disaster reconstruction to effectively facilitate the community participatory processes and identifies key factors in successful collaboration gleaned from past Italian reconstruction planning. Community participation, after a disaster, is widely acknowledged to be crucial in both mitigation and reconstruction planning. Berke and Campanella (2006, p.193) indicate by involving and consulting residents in all phases of planning, the pre-disaster recovery planning process can create a knowledgeable constituency. In addition, the collaborative process of reconstruction planning can help "build the necessary momentum to keep the community moving forward" (Schwab, 2014, p.120). Little research has been done on the collaborative planning process for long-term reconstruction, despite some recent focus on community participation after a disaster strikes (Chandrasekhar, 2012). Some of this research has focused on the factors and requirements of a community participatory approach to residential reconstruction projects, with researchers making qualitative inquiries such as field interviews with various stakeholders (Daly and Brassard, 2011; Ganapati and Ganapati, 2008; Sadiqi and Trigunaryah and Coffey, 2017). On the other hand, in some empirical studies and practices, the authors get involved in the collaborative planning process via a university-community partnership and then detail these processes in their work (Reardon, 2009; Satoh, 2014). This type of

collaborative study with first-hand observation illustrates the complex recovery process vividly and shows an understanding of quality outcomes as collaborative processes themselves. Approaching a theory of collaborative planning in a post-disaster context, a new evaluation framework of the reconstruction planning process should be indexed to the level of community participation by referring to some established frameworks for measuring citizen participation and also by adjusting them in a post-disaster context.

This paper attempts to reveal the dynamic mechanism of community participation in post-disaster reconstruction planning in the town of Novi di Modena in Italy's Emilia-Romagna region after a 2012 earthquake from the viewpoint of collaborative planning. First, focusing on three different quake disasters, we surveyed the characteristics of community participation in an Italian post-disaster context by conducting a literature survey and field interviews. Second, we studied the regional legislation framework and specific rules for the reconstruction in Emilia-Romagna region. Third, we surveyed the pre-existing ordinary planning at the municipal level in four different local administrations; then, we compared the community participation path with the formulation process of the reconstruction plan and programme among towns with the five defined stages of reconstruction. And lastly, focusing on the town of Novi di Modena, we estimated the impact of community participation in the reconstruction planning process with the evaluation framework.

CHARACTERISTICS OF COMMUNITY PARTICIPATION FOR POST-DISASTER RECONSTRUCTION IN ITALY

As Lazzati (2018) notes, since the 1950s, Italy has adopted case-by-case solutions to post-disaster response, and community participation has had different roles in these solutions. Based on a literature survey and field interviews, this section attempts to illustrate the characteristics of community participation in an Italian post-disaster context, taking three reconstruction cases, the Friuli earthquake in 1976, the Abruzzo earthquake in 2009 and Emilia-Romagna earthquake in 2012, and classifying them under three criteria; objective/goal, main actors and period.

In the case of reconstruction after the 1976 Friuli quake, the mayor and local administration conducted several public assemblies to share with the public as a whole the most important decisions to be made in the reconstruction.¹ From the beginning of the emergency phase, citizen groups were spontaneously organised at the areas of the evacuation tents, prefabricated settlements (Consiglio Regionale del Friuli Venezia Giulia, 2016). The objective of these groups was to attract attention from outside the devastated areas to conserve the original architecture heritage as much as possible. In short, in an attempt to avoid what happened in post-disaster Sicily in 1968, when modern structures were built where many historical buildings had stood, they tried to engage inhabitants to embrace the reconstruction principle '*dov'era,com'era* (where it was, how it was)'.²

In the second case, the 2009 Abruzzo earthquake, community participation was strongly affected by the central government's top-down approach during the first three years after the emergency: DPC (*Dipartimento Protezione Civile*) managed the provision of wooden housing units and quake proof housing complex in the periphery of L'Aquila City (Mashiko et al., 2017). Immediately after the earthquake, many citizens organised and gathered in front of the main square at the historical centre to get involved in the discussion of L'Aquila reconstruction.³ They opposed the exclusion from any decision-making of not only local people but also the Mayor of L'Aquila (Lazzati, 2018). Under the restrictions on citizen participation, INU (*Istituto Nazionale di Urbanistica*) and ANSCA (*Associazione Nazionale Centri Storici Artistici*) established the LAURAq (*Laboratorio Urbanistico L'Aquila*) organisation as an initiative to confront L'Aquila reconstruction and their priority was to recover historical centres.⁴ LAURAq held a series of workshops and public forums, in which inhabitants, citizen groups, urban planners have been engaged, to encourage the population to participate in the planning for reconstruction and to help L'Aquila's administration in the formulation of its reconstruction plan. On the other hand, during the recovery plan implementation phase, Urban Center L'Aquila (UCAQ) has allied with citizen groups and associations that emerged after the earthquake, the University of L'Aquila and the municipality of L'Aquila as a third sector (Mashiko et al., 2017). The aim of UCAQ is "to create a platform for public discussion that offers an opportunity to discuss citizen participation" (Mashiko et al., 2017, p.191).

In the third case, reconstruction after the 2012 Emilia-Romagna earthquake, different local municipalities in the devastated areas devised new customs and opportunities with the local community, encouraging citizens to participate in the reconstruction process (Guarino, 2015). The regional law recognises the importance of stakeholders' participation in enhancing the effectiveness of the reconstruction plan, thanks to both the base of an active and engaged civil society and the institutionalisation of a participatory approach at the regional governmental level (Lazzati, 2018). Relying on the participation of municipalities, the regional government launched a diverse approach to participation in different stages of the reconstruction process, including sharing information about reconstruction of the historical centre with citizens and crafting a common vision for the future of urban cores and their territories. This participatory approach to the reconstruction planning process has

encouraged the dynamic community engagement of not only the local administration, professionals and citizens but also of citizen groups and local associations established after the earthquake (Guarino, 2015).

From these three reconstruction cases we classified the reviewed community participation into five types based on three criteria; objective/goal, main actors and period. Table 1 shows the five types of community participation and how these types are corresponding to three reconstruction cases. In three cases, type 1 of Grass-roots Activity is commonly measured; on the other hand, the other four types, Local Assembly, Public Forum, Discussion Platform and Collaborative Planning, are verified in each reconstruction case. Through this classification, we grasped that type 5 of Collaborative Planning is observed only in the Emilia-Romagna case, and from the next section onwards we deeply focus on it.

Table 1: Classification of community participation in an Italian post-disaster context

	TYPE 1 Grass-roots Activity	TYPE 2 Local Assembly	TYPE 3 Public Forum	TYPE 4 Discussion Platform	TYPE 5 Collaborative Planning
Objective / Goal	- Conserving the original architecture heritage as much as possible - Getting involved in the discussion for reconstruction	- Sharing with the public as a whole the most important decisions for reconstruction	- Holding workshops involved with citizens, planners and municipality - Supporting local administration for plan formulation	- Creating a platform organization (UCAQ) for public discussion - Offering an opportunity to discuss citizen participation	- Sharing information about the reconstruction - Building a common vision for the future of urban cores and their territories
Main Actors	Citizens / Citizen Groups	Mayor / Citizens / Local Administration	National Institute of Planning / National Historical Art Association	Citizen Groups / Local Associations / University / Municipality	Citizens / Professionals / Local Administration / Citizen Group & Local Association
Period	From Emergency Period	From Emergency Period	Planning Period for Reconstruction	Implementation Period of Reconstruction Plan	From Planning Period for Reconstruction

2009 ABRUZZO	●		●	●	
2012 EMILIA-ROMAGNA	●				●

LEGISLATIVE FRAMEWORK AND SPECIFIC RULES FOR RECONSTRUCTION AFTER THE 2012 EMILIA-ROMAGNA EARTHQUAKE

In this section, we will outline the legislative framework and specific rules for reconstruction at the regional level. Thanks to the technical structure of the Special Commission for Reconstruction, over a period of four years, the regional government has accompanied the many municipalities most affected by the earthquake step by step, particularly in the execution of the reconstruction plans, the plans for public works, the drafting of the *'Programma Speciale d'Area'*, a strategic programme for the seismic crater and, finally, the definition of the *'Piano Organico'*, a special operational program for the revitalization of the historical centres. The government undertook the tremendous job of spearheading the first three years of reconstruction, after which it spun off a special agency to continue the recovery process. It has now fully outsourced the functions and operational technical offices for the reconstruction to the Regional Agency for the Recovery–Emilia 2012. This new body is a technical structure that manages all the necessary procedures while at the political level, the regional government still define rules, norms and provisions and makes strategic decisions.

It is important to emphasise the impact that the articulation of a regulatory framework has had on the success of the first phase of reconstruction and its future fulfilment. A remarkable innovation by the regional government was the enactment of the first and only regional law for the reconstruction, the *Legge Regionale* (Regional Law) n.16/2012, designed to establish consistency among reconstruction plans and ordinary urban planning tools. For the first time in the Italian legal system, governmental response to disaster and emergency was not top down but a participatory process developed in cooperation with an Institutional Committee. Since 2012, the Institutional Committee has coordinated decisions among the Special Commissioner, several regional departments, all the municipalities involved and some specific committees.

Thanks to this continuous drive for coordination, regional mayors and commissioners were able to represent the needs, desires, wishes, problems and expectations of the many local communities and citizen groups thanks to collaboration with the Institutional Committee and its specialised organisation.

COMPARISON OF THE COMMUNITY PARTICIPATION AND FORMULATION PROCESS OF RECONSTRUCTION PLAN IN FOUR TOWNS

While our previous overview of reconstruction legislation and specific rules was at the regional level, this section will compare the community participation and the formulation process of reconstruction plans of four local administrations. We selected the four towns of *Novi di Modena* (Novi), *San Felice sul Panaro* (San Felice), *Concordia sulla Secchia* (Concordia) and *Mirandola* because they met the following criteria: (a) the towns must have suffered serious physical damage and subsequently constructed a high number of prefabricated modules in an urban area; (b) the towns must have established both ‘*Piano della Ricostruzione*’, a reconstruction plan, and ‘*Piano Organico*’, an organic operational programme; (c) the towns must have applied ‘*Bando Ricostruzione*’, regional financing to support the participation process. In the analysis of the processes of community participation and plan/programme formulation, it should be noted what types of ordinary planning tools the four towns already had in place, because a reconstruction plan is an operational urban planning tool that integrates existing plans and achieves the improvement of urban quality.⁵

A review of pre-existing ordinary planning tools before the earthquake reveals, as shown in Table 2, that the four towns are mainly divided into two types: Two municipalities, San Felice and Concordia, adopted new planning procedures before the earthquake, and the two others, Novi and Mirandola, continued to use old planning procedures after the earthquake. San Felice and Concordia implemented the new ‘*Piano Strutturale Comunale*’ (PSC), which outlines the strategic choices of arrangement and development for the whole local municipality.⁶ In short, only two of the four municipalities determined territorial strategies in their administrative district before the earthquake. Because Mirandola was in the process of establishing a new planning process right before the earthquake,⁷ only Novi had the daunting task of establishing a new territorial vision and future strategy after the earthquake while at the same time forming and carrying out a physical recovery plan for damaged buildings.

Table 2: Pre-existing urban planning tools before the earthquake

	Old Procedure for town planning		New Procedure for town planning		
	Piano Integrato di Recupero [Integrated restoration plan]	Piano Regolatore Generale [General urban development plan]	Piano Strutturale Comunale [Municipal strategic plan]	Regolamento Urbanistico Edilizio [Housing planning regulation]	Piano Operativo Comunale [Municipal operational plan]
Novi di Modena	Approved with D.C.C n.120 in 29/11/1995 [Centro Storico/Frazione]	Revision of PRG was approved with Del.G.R n.448 in 31/07/2000	Not existing	Not existing	Not existing
San Felice s/P	Not existed	Transformed to PSC/RUE/POC before the earthquake 2012	Approved with D.C.C n.25 in 22/04/2009	Approved with D.C.C n.26 in 22/04/2009	Approved with D.C.C n.46 in 28/7/2011
Concordia s/S	Not existed	Transformed to PSC/RUE/POC before the earthquake 2012	Approved with D.C.C n.23 in 24/04/2009	Approved with D.C.C n.70 in 26/10/2009	Not existed, but approved with D.C.C n.87 in 23/12/2013
Mirandola	Approved with D.C.C n.146 in 23/07/2001 [Centro Storico]	Revision of PRG was approved with Del.G.R n.153 in 17/04/2001	Not existed, but approved with D.C.C n.111 in 27/07/2015	Not existed, but approved with D.C.C n.112 in 27/07/2015	Not existed, but approved with D.C.C n.111 in 27/07/2015

Figure 1 illustrates the formulation processes of reconstruction planning tools and the community participatory process in four towns, pulled from the following official documents: 1) the reconstruction plan; 2) the organic operational programme; 3) the report on regional financing for the participation process; 4) the community participation reports edited by facilitators. Moreover, to make a comparison of community participation paths, the five stages are defined as follow: 1) activation stage of understanding community problems and identifying needs and aspirations for reconstruction; 2) visioning stage of building future vision and common strategical framework for a whole territory; 3) project planning stage of discussing participatory projects for urban regeneration; 4) project realization stage of carrying out construction projects and making an agreement for management; 5) evaluation stage of organising debate opportunities to evaluate effects and impacts of the participatory process.

Comparing the towns’ timelines, two of them, Novi and San Felice, divided their reconstruction plans into two versions, the acceptance dates of these second plans being later than the dates in Concordia and Mirandola, which drafted one version only. Novi’s second reconstruction plan, for example, was accepted by the municipal council on 22 December 2014, 13 months later than Mirandola’s acceptance date, although Mirandola had modified its plan three times after regional government approval. Looking at the processes of community participation, we can observe their four characteristics as follows: Novi has launched a single continuous participatory action, ‘*Fatti il Centro Tuo!*’, with all five stages of the participatory process from activation to evaluation; San Felice has launched a single intermediate continuous participation action, ‘*PIU’ sanFELICE*’, containing the two stages of activation and visioning; Concordia has launched two short-term separate participation actions, ‘*Focus Group*’ and ‘*Dalla calamità alla calamita*’, with the two stages of activation and project planning; Mirandola has launched a single short-term participation action, ‘*Immagina Mirandola*’, twice, at the beginning of 2014 and at the end of 2017, with the activation stage and before the earthquake had organised participatory workshops with multi-stakeholders for the elaboration of PSC. The development of participatory action in three towns, San Felice, Concordia and Mirandola, has proceeded discontinuously, and only Novi’s development progressed in a single continuous fashion with all stages of the participatory process.

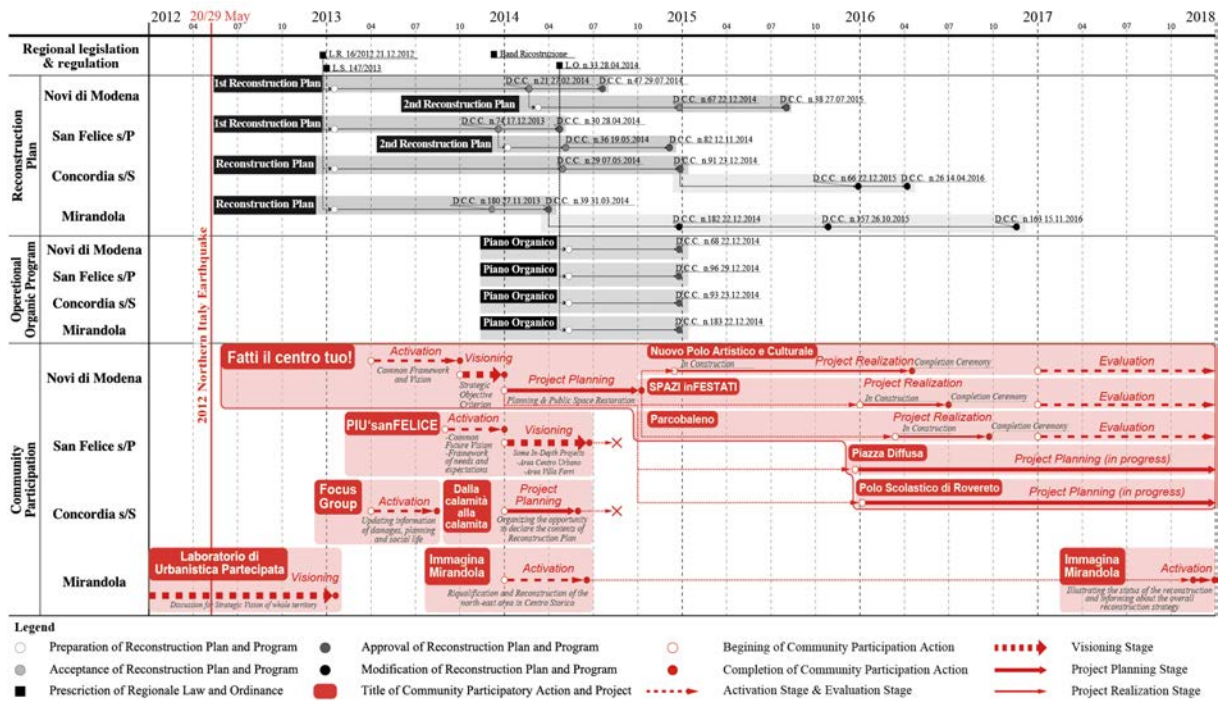

Figure 1: Processes of planning tool formulation and community participation for reconstruction

DYNAMIC MECHANISM OF THE COLLABORATIVE PLANNING PROCESS IN NOVI DI MODENA

This section covers the community participation process of Novi di Modena, which among the four towns studied had the only continuous participation action, and attempts to disclose their dynamic mechanism of collaborative planning process for the reconstruction. First, a review of community participation reports aims to discover how the ideas proposed and obtained through community participation have been integrated into planning and project implementation tools in both extraordinary and ordinary situations.

Novi's collaborative planning process is unique in that all of the involvement actions have flexibly in their decisional dynamics via a ritual of collective debate defined by careful management of the timing of participatory activities: one activity per week at first, then one every two weeks. This short-term rhythm made it possible to reconstitute the needs and aspirations of individuals into common-sense proposals. These collective ideas became the '*Documento di Proposta partecipata*' (DocPP), a participatory proposal document containing an organised synthesis of the community's proposal for the decision-making authorities to consider in their deliberations. In addition, this document represents the unique guideline and interface between the 'extraordinary' tools, such as '*Piano della Ricostruzione*' (Reconstruction Plan) and '*Piano Organico*' (Operational Organic Program), and the 'ordinary' tools, '*Programma Triennale ed Elenco Annuale delle Opere Pubbliche*' (Triennial Program and Annual List of Public Works), '*Piano urbanistico generale*' (General urban plan) and '*Accordi Operativi*' (Operational Agreements) (Figure 2). These implementation tools have helped realise participatory activities with the support of regional contributions to community participation under Regional Law n.3/2010.

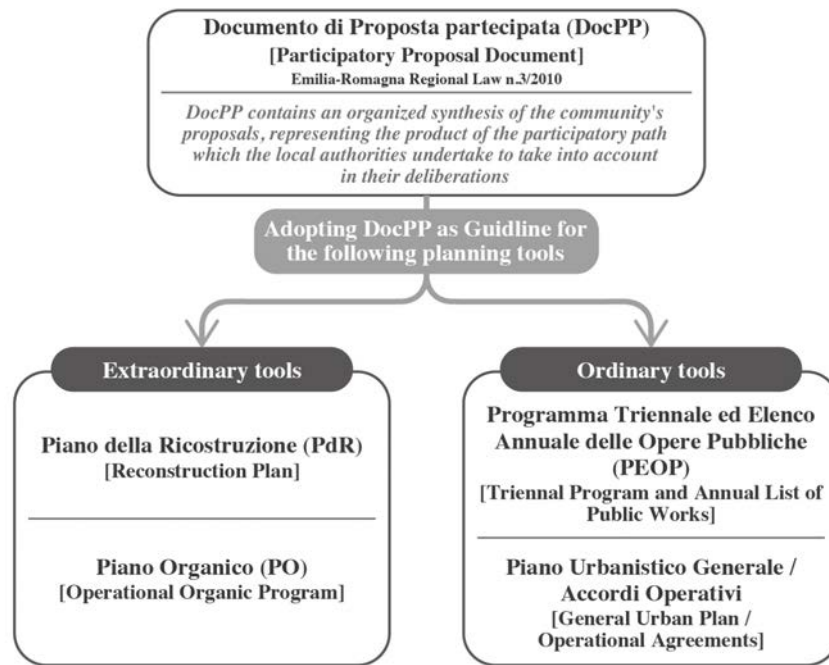

Figure 2: The relationship of outcomes through the collaborative planning process

Second, by setting two evaluation axes to categorize five different participation paths, the impacts of each path reflecting on three types of outcomes are verified. The first evaluation axis encompasses the five defined stages of the planning process discussed in the previous section. In order to define the second evaluation axis of community participation level, on the other hand, some established frameworks in an ordinary situation are reviewed. In *A Ladder Of Citizen Participation*, Sherry R. Arnstein (1969) illustrated the eight levels of citizen participation arranged in a ladder pattern; in recent years, Bratt and Reardon (2013, p.357) have offered a new theoretical understanding of the role of residents in community development, evaluated based on two planning process examples from the United States. Taking into account a peculiarity of post-disaster reconstruction, in other words, time compression (Olshansky et al., 2012), and strengthening community bonds (Ceccarelli, 2017), two of the middle three rungs, Informing and Consultation, and two of the highest three rungs, Partnership and Delegated Power, should be crucial levels for maximizing the effect of community participation in a limited period. The four levels of community participation are defined as follows: 1) Information level of sharing data, analysis and proposals to enable participants to have a voice; 2) Consultation level of asking participants' opinions based on given information; 3) Partnership level enabling participants to collaborate and negotiate in the decision-making process and 4) Empowerment level of delegating full managerial power to citizens or related citizen groups. In addition, in relation to Bratt and Reardon's three contextual variables, we are identifying three key factors to build supportive environment for community participation from catastrophic circumstances after a disaster strikes.

To measure community participation, we have used the official reports^{8,9} that are published on the website of local administration and have interviewed the programme coordinator.¹⁰ Following the evaluation framework with two axes, five participatory paths are situated as shown Table 3. This table illustrates that from STEP 1 to STEP 4, the level of community participation is gradually going up starting from 'Information', being achieved at the 'Empowerment' step and finally achieving all the levels of community participation. Subsequently, since the beginning of 2017 the participatory level of STEP 5 has been returning to the 'Information' and 'Consultation' step in order to evaluate the effects and impacts of participatory action '*Fatti il Centro Tuo!*' By measuring all participatory paths with this new framework, in other words, combining a sequence of reconstruction stages into the Arnstein Ladder framework regarding a post-disaster context carefully, we specifically visualized the significant gradation of community participation in the town of Novi di Modena.

Table 3: An evaluation framework of the participatory paths of Novi di Modena

Stages of Participatory Process		Community Participation Level			
		1. INFORMATION <i>telling data/analysis</i>	2. CONSULTATION <i>asking data/opinions</i>	3. PARTNERSHIP <i>collaborating / negotiating</i>	4. EMPOWERMENT <i>delegating</i>
1 ACTIVATION STAGE	<i>Problem & Needs</i>	STEP 1 'Fatti il centro tuo!' <i>participatory path (from April to September, 2013)</i>			
2 VISIONING STAGE	<i>Scenarios & Strategies</i>		STEP 2 'Fatti il centro tuo!' <i>participatory path (from October to December, 2013)</i>		
3 PROJECT PLANNING STAGE	<i>Project Designs</i>		STEP 3 'Fatti il centro tuo!' <i>participatory path (from January to September, 2014)</i>		
4 PROJECT REALIZATION STAGE	<i>Implementation & Management</i>			STEP 4 'Fatti il centro tuo!' <i>Parcobaleno/Spazi inFestanti/PAC</i> <i>participatory path (from 2015 to 2016)</i>	
5 EVALUATION STAGE	<i>Verification of effects and impacts</i>	STEP 5 'Fatti il centro tuo!' <i>participatory path (from 2017 in progress)</i>			

Table 4 shows how each step of the participatory path is organised with participants and activities into three types of outcomes. The impacts of each step are as follows:

In STEP 1, the critical issues and the opportunities for reconstruction are consolidated into DocPP to share basic data and analysis with participants and to gather their opinions in a common framework. For example, community needs and aspirations for the three 'frazione' (small districts) of Novi, Rovereto and Sant' Antonio can be summed up in an analytical framework.

In STEP 2, scenarios and strategies for the regeneration of the whole territory are consolidated into DocPP, collaborating and negotiating in their decision-making process based on the opinions in three different 'frazione'. For example, three vocations for the whole territory and nine common strategic measures for each 'frazione' emerged from the series of collective debates. These outcomes of the participatory processes of STEP1 and STEP 2 comprised the first version of the PdR,

In STEP 3, the priorities of intervention to encourage reconstruction are consolidated into DocPP, negotiating the concrete projects according to the given scenarios and strategies. For example, project planning was divided into 15 project conditions for 45 proposals; then, five pilot projects were considered priorities for the regeneration of the territory and the three districts. The outcomes of STEP 3 such as an urban regeneration framework, identification of project objectives and definition of interventions were included in the PO, and five pilot projects were adopted into the PEO.

In STEP 4, the collaborative agreements between the local administration and the community for the management of new common spaces were consolidated into DocPP, delegating to each community the power of participatory management of green spaces related to the project 'SPAZI inFESTATI'. According to the PEO, three participatory projects, 'Parcobaleno', 'SPAZI inFESTATI' and 'Nuovo Polo Artistico e Culturale' were completed at the end of 2016, while two projects, 'Piazza Diffusa di Novi' and 'Nuovo Polo Scolastico di Rovereto', are currently in the planning stage.

Presently, STEP 5, the evaluation stage of the effect and impact of the continuous participatory process, is a work in progress.

Table 4: The outcomes of five participatory paths

FATTI IL CENTRO TUO !		OUTCOMES		
STEP	Activities / Participants	Documento di Proposta partecipata (DocPP)	Extraordinary Tools	Ordinary Tools
STEP 1 Guiding Question: What are the critical issues to face, what are the opportunities to gather for reconstruction?	Activities Listening days : 35 Workshop : 6 Exhibition : 1 Collective Learning days : 15 Participants Citizens (adult/child) : 897 Associations / Groups : 30 Specialists : 54 University : 1	Analysis Framework: Identification of the needs and aspirations for the individual <i>frazione</i> Novi, Robereto, and Sant' Antonio	Reconstruction Plan (PdR): Plan Preparation / UMI definition / Protection of the historical-architectural heritage locating in the rural territory Considered Proposals of DocPP: Develop green-blue ecological systems and infrastructures, Improve the permeability and functionality of green spaces, Assign a structuring role to parks and river areas, Manage the coexistence of rural areas with residential functions by encouraging the multifunctionality of agriculture, Re-evaluate the agricultural areas also for tourism, Treat the territorial components that impoverish the community dimension as barriers	General Urban Planning: Being able to propose indications for the cognitive framework in the future
STEP 2 Guiding Question: What are the strategies of interventions for regeneration as a whole territory?	Activities Workshop : 19 Exhibition : 1 Collective Learning days : 12 Participants Citizens (child/teacher/merchant) : 90 Associations / Groups : 25 Categorized Associations : 3 Specialists : 31	Vision: Identification of the strategic objectives for territorial regeneration and the guidelines for project planning; 3 vocations for the whole territory and 9 strategic measures for 3 <i>frazione</i>	Reconstruction Plan (PdR): Insights and rules for redevelopment of urban areas Considered Proposals of DocPP: <ul style="list-style-type: none"> Re-qualify the center starting from neighborhood services and polarity, Strengthening the territorial links between existing structures, Enhancing community potential, Increasing the social performance of the public space through flexibility and functional mix, Introducing new concentrations of uses, Maintain in the public space a balanced presence of different social classes-age groups-cultural groups. Developing the quantity and quality of aggregation points, Exploring new ways of using public spaces, Enhancing urban fabrics with different activities that return an image of community, Acting on public space, Creating conditions for spontaneous use over time of daily life and the co-participation of structured initiatives over time, Supporting the variety of functions and widespread sociality. 	General Urban Planning: Being able to propose guidelines for urban and territorial regeneration of the territory in the future
STEP 3 Guiding Question: What are the priorities for incentive interventions for reconstruction?	Activities Group Work & Focus Group : 39 Plenary assemblies : 6 Urban Exhibition : 1 Collective Learning days : 20 Participants Citizens (adult/child/senior/teacher/merchant) : 347 Associations / Groups : 28 Categorized Associations : 3 Specialists : 34 University : 3	Priority: Identification of the pilot projects (Piazza Diffusa, Parcovaleno, Spazi in Festanti, Polo Artistico Culturale, Nuovo Polo Scolastico di Robereto); 15 projects situations for total of 45 proposals	Operational Organic Program(PO): Urban framework, identification of objectives, and definition of interventions Focus of the Plan: Definition of the interventions to qualify the reconstruction for urban cores, to regenerate public and private spaces, to revitalize social and economic functions, and to attract residents and businesses Considered Proposals of DocPP: <ul style="list-style-type: none"> Definition of urban planning and functional morphological architectural qualification of public spaces and public use in the central area, to assign an organic and recognizable urban continuity together with a more readable quality The integrated promotion of environmental and cultural heritage in support of social and economic development 	Triennial Program and Annual List of Public Works (PEOP): Piazza Diffusa: redevelop, revitalize, regenerate the urban public spaces of historical center NOVI SPAZI inFESTATI: co-project planning and co-realization equipped for the festival and conviviality for community Parcovaleno: define which urban furnitures to realize in public areas to make suitable place for young people Polo Scolastico di Robereto: design the educational spaces to complete the new school centers and community center Polo Artistico e Culturale: optimize active cultural presences by concentrating spaces, actions and visions to retain everyday life
STEP 4 Guiding Question: How to activate the community in the management of new commons?	Activities Focus Group : 3 Plenary assemblies : 1 Urban Exhibition : 2 Participants Citizens : 297 Associations / Groups : 10	Collaborative Agreement: Estimated with the collaboration agreements between local administration and community for participatory management of the green spaces, interesting with the project 'SPAZI inFESTATI	———	Triennial Program and Annual List of Public Works (PEOP): Piazza Diffusa: defined the preliminary project, and now the definitive and executive design in progress SPAZI inFESTATI: realized the interventions and defined the collaboration agreements for participatory management Parcovaleno: all the interventions have been carried out Polo Scolastico di Robereto: defined the guidelines for project planning of new educational community center in Robereto Polo Artistico e Culturale: all the interventions have been carried out
STEP 5 Guiding Question: How reconstruction is generating community and territory?	Work in progress	Work in progress	Work in progress	Work in progress

CONCLUSION

How can we effectively facilitate community participation in the planning process for post-disaster reconstruction? To answer this question, this paper examined the dynamic mechanism of Novi di Modena's reconstruction planning process via an evaluation framework with two axes: the stage of the planning process and community participation levels. From this evaluation of the participatory paths and their outcomes, we can identify three key factors for collaborative post-disaster planning as our summary findings:

The first key factor is the timing of the participatory process must be well managed: it is important to establish a rhythm for public debate activities with one activity per week at the outset then one activity every two weeks, correlating this rhythm with the timing of public decisions. Local authorities must decide quickly in the initial post-disaster recovery phase on the re-establishment of public services. They have more time to make decisions about secondary subjects including such things as community space, culture and sports. The second

key factor is the participatory proposal document, including all ideas shared with citizens must be considered the guiding document for local development, taking into account both reconstruction and urban regeneration. Ultimately, it becomes a reference tool for extraordinary and ordinary planning. In this way, the outcomes of the participatory path can be achieved gradually without losing its vision. The third key factor is in the post-event phase there is the urgent need to immediately implement individual intervention at the same time defining regeneration scenarios for the whole territory, considering the short-, medium- and long-term period of project realization. For territories to preserve their socio-economic status, each urban core must define its urban strategy and tactical plans. These are complex scenarios, strategies and tactics that take into account several thematic areas, different modes of intervention and collaboration between public and private stakeholders and communities.

Finally, this paper presents two discussions comparing Novi di Modena with the other three towns. The first discussion determines that as opposed to Novi di Modena, different conditions in the other three towns have limited or impeded the consideration of three factors identified for qualitative participation. Since they had adopted or had been revising the new municipal strategic plan, they might not draw new territorial regeneration scenarios and common vision for 'new' future after the earthquake with local community. Moreover, most of their participatory proposal documents can contain subordinate characteristic under the main planning procedure; the rhythm of their activities may be managed depending on the needed timing for the local administrations. The second discussion determines the result of reconstruction in terms of continuous community participation. The consideration of three factors has led Novi di Modena to mature the valuable process, since the different points of view have developed integrated perspective and every public debate has defined the steps to achieve a common vision. These aspects represent the greatest difference with the other three towns. The continuity of community participation has enhanced the citizen's ability to contribute to the elaboration of scenarios and to bring out the qualitative potential that only those who know their own environment of life can trace by reasoning on the desired impacts and on the future effects.

Tomoyuki MASHIKO graduated in Architecture from Waseda University (Japan) in 2017, with a specialisation in Urban Planning and Design at Shigeru Satoh's Laboratory. He was involved in several international workshops and collaborative research projects in Italy and China, and in 2015, he studied abroad at the University of Ferrara as an exchange student, where he began studying Italian reconstruction methodologies after the earthquake. Since April 2017, he has been conducting his own research as a PhD student and JSPS research fellow on post-disaster urban planning in Japan and Italy in collaboration with the University of Ferrara.

Monia GUARINO's work deals with participation issues and supply assistance for decision-making, as well as managing development processes and promoting the local area, environment and public spaces. She has several years' experience in mediation, negotiation and facilitation involving multi-interest groups within urban transformation projects characterised by various conflicts and disasters. She has managed forums and theme-based workshop for urban plans and projects using various facilitation techniques. In recent years, she has collaborated with various national public bodies, NGOs and universities in coordinating and evaluating dozens of projects involving participatory planning, public relations and public space creation and revitalisation.

Gianfranco FRANZ has been an associate professor in the Department of Economics and Management of the University of Ferrara since 2008 and also teaches Urban and Regional Planning in the Department of Architecture. Since 2013, he has been a scientific coordinator on Project 2PxE, promoted by the regional government for the reconstruction of the municipalities affected by the earthquake in Emilia-Romagna. He is director of the International Master Eco-Polis on Environmental and Regional Policies for Sustainability and Local Development, organised by the University of Ferrara in collaboration with two Italian universities, six Latin American universities and the Waseda University.

Shigeru SATOH is an emeritus professor at Waseda University and a senior researcher in Waseda Institute of Urban and Regional Studies. Among other distinctions, he was appointed president of the Architectural Institute of Japan. His core ideas on urban design and planning are deeply rooted in the analysis of cultural context and

the use of local potential. Through the study of *Joka-machi* [Japanese castle town], he established a unique research methodology that explains the evolution of urban morphology in connection to historical ecological features (mountain views, water systems, etc.), community traditional groups and other regional actors.

The paper puts its focus on the activities of university researchers to organize the top-down urban planning and bottom-up community design with the theme of disaster in Koto-delta. Moreover, comparative analysis of statistical data of Koto-delta for half a century shows the necessary conditions for considering the disaster prevention planning. Koto-delta is the most dangerous area for disaster in Tokyo. Takayama presented the Koto Cross Disaster Prevention Belt Conception, after studying his laboratory, became the foundation of the current planning. While disaster prevention bases and public facilities have increased the disaster prevention performance of the area, the aging and unused facilities are now a problem. Otani and Sato aimed to improve the community by cooperative rebuilding of residents, but the discussion was difficult, and maintenance did not proceed. The statistical data shows that the safety of the area improved, but in addition to the failure of social mix due to large-scale development, the loss of regional landscape and diversity due to the promotion of detached rebuilding, the resilience is decreasing.

Keywords: Koto-delta, disaster prevention, slum clearance redevelopment, community design.

Introduction

A century has passed since Japan enacted the City Planning Act of 1919. During the last century, Japan has suffered great damages from the frequent disaster such as earthquakes, typhoons, floods, sediment disaster, fires, volcanic eruptions and tsunamis. For example, the Great Kanto Earthquake (1923), the Typhoon Catherine (1947), the Typhoon Ise-wan (1959), the Great Hanshin-Awaji Earthquake (1995), the Great East Japan Earthquake (2011). Furthermore, there is a high probability of the Nankai Trough Earthquake and the Tokyo Inland Earthquake soon. Therefore, the disaster prevention is important issues regarding Japanese city planning.

Koto-delta is located at a close distance from the center of Tokyo, but it is known as an area where serious damage has occurred because of the Kanto Earthquake and the Tokyo Air Raid. Additionally, Tokyo Metropolitan General Risk Degree Map¹ explains that it is a region with particularly high risk still now.

To cope with such dangers, Tokyo metropolitan government has implemented a large slum clearance represented by Shirahige East district. Contrastly, the residents have practiced community design mainly with renovation in collaboration with university researchers. Koto-delta is positioned as a rare area where top-down urban planning and bottom-up community design for disaster have developed simultaneously.

In this study, the history of the disaster prevention urban planning of Koto-delta is overlooked by activities of university researchers, and the change of this area over half a century is evaluated by objective index such as population density. This aim is to obtain knowledge to think about the disaster prevention city plan suitable for the 21st century.

Organizing Previous Studies and Materials

Previous studies on planning in Koto-delta can be classified into three categories. First, it is a study to evaluate disaster risk in Koto-delta from a physical and engineering point of view. As a representative study of urban earthquake engineering, it is pointed out that earthquakes, flood disasters, fires etc. occur complexly. Thus, besides urban earthquake disaster mitigation engineering, various fields such as geology and landscape science have made proposals. From the field of urban earthquake disaster engineering, Kimiro Meguro et al. established evacuation plan when flood occurs.² From the field of geology, Iware Matsuda is conducting a verification of the vulnerability of natural disasters in Tokyo.³ From the field of landscape science, Ryosuke Shimoda studies improvement method of land use condition in block-development urban collective housing focusing on embankment and geologic columnar section of Koto-delta.⁴ These researches have played a major role in making disaster prevention city planning of the administration. For example, research on radiant heat by Shozo Uchida and Minoru Hamada in the 1950s have allowed Tokyo to determine the size of the large evacuation center in Koto-delta.

Second, it concerns community-based disaster prevention town development belonging to sociological research or action research.

Yukio Otani's district planning in Kyojima (1974) is the perfect example of sociological research. Otani investigated in detail what the residents of the Kyojima area in the non-hygienic environment (800 people / ha) live. As a consequence, Otani acknowledged the merit of the alleys in downtown and the mixed area of residence, commerce and industry. Moreover, he appealed the recovery of the residents' ownership and creativity through concrete construction proposal.⁵ Otani's research was handed over to Shigeru Sato et al, which seeks improvement of the living environment by thorough residents' participation and joint rebuilding method by the administration, experts, residents' discussion.⁶ Nevertheless, contrary to the thoughts of Otani and Sato, co-rebuilding did not progress in the Kyojiima area. The researchers of the university, are suggestive in criticizing top-down urban planning and seeking bottom-up community design through laboratory activities. However, sometimes the efforts by the Tokyo Metropolitan Government are completely denied and the risk of disasters are underestimated, as idealizing the discussion of citizens and evaluating the old community too much.

Third, it is a historical study on the disaster prevention planning which the Tokyo metropolitan conducted at Koto-delta. Akira Koshizawa's research is widely known about the disaster prevention city planning history that the Tokyo government has been working on. Koshigawa highly appreciates the Tokyo Metropolitan Government's "10-Year Wooden densely area incombustible Project " (2012),⁷ but little study has been done to study on the disaster prevention planning in Koto-delta in a bird's-eye view. In addition, Kaga conducted research on the transition of disaster prevention base planning in Shirahige East District,⁸ but it handled only part of the Koto Development Basic Concept.

This paper belongs to the field of the disaster prevention urban planning history and reveals two major items.

First, by focusing on the university researcher's activities, it would be reconstructed the history of disaster prevention city planning in Koto-delta. In general, disaster prevention city plan tends to be mentioned as a binomial confrontation between administrative and inhabitants. In this thesis, problem of Koto-delta can be explained by the viewpoint of researchers who are away from regional interests. Furthermore, it deals with survey reports in engineering fields such as Uchida and Hamada's "Investigation of the Great Earthquake Fire Damage in Tokyo" (1961) or Takayama's the Koto Cross Disaster Prevention Belt Conception (1966) and Shirahige East disaster prevention center (1972). It also takes up sociological studies, for instance Otani's "Survey report on the Kyojima district in Sumida-ku: Essay on District Planning" and Sato's "Kyojima town development, Status survey report".

Finally, in this paper, indicators such as population density that changed in Koto-delta during the half century will be organized objectively. Therefore, the problem of modern Koto-delta would be clarified. This area has the highest risk of disaster in Tokyo from 50 years ago to present, but the Preconditions for planning have changed. Thus, it is necessary to compare and analyze by statistical data.

Activities of University Researchers: Engineering simulation and slum clearance

(1) 1960's: Surveys on the Earthquake Fire Damage and the Koto Cross Disaster Prevention Belt Conception

In 1955, Yoshikazu Uchida (1885-1972), Professor of Tokyo University, served as the chairman of the Fire Prevention Committee of the Tokyo Fire Department. He and his subordinate Minoru Hamada (1902-1974), Professor of Tokyo University, studied about radiant heat and examined the earthquake fire damage at Tokyo. According to the simulation results published in 1961, if an earthquake occurred during summer noontime like the Great Kanto Earthquake, almost all fires in the direction of Yamanote can be blocked. On the other hand, in the downtown area, there are 8 cases in Koto city, 8 in Sumida city, 1 in Edogawa city, 1 in Katsushika city and 3 in Adachi city, totaling 21 of fire damages could not be blocked⁹.

In June 1964, the Niigata earthquake occurred. The mid-rise RC houses collapsed due to liquefaction phenomenon in the coastal area, also causing a large fire to the petrochemical complexes. At the Tokyo Metropolitan Assembly, which was near the holding of the Tokyo Olympic Games, there was a concern that complex disasters caused by a major earthquake could also occur in the Koto-delta region. After the Niigata earthquake, seismologist Hiroshi Kawasumi (1904-1972) presented the 69 years annual theory of the southern Kanto earthquake in the House of Representatives. He said that "If the Great Kanto Earthquake occurs again and a fire happens, it will almost be unable to save such areas as the Koto district, Mikawa island and Oku".¹⁰

Furthermore, in 1965, Eika Takayama (1910-1999), Professor of University of Tokyo, published "The search report about establishment of disaster prevention center in zero-meter area" at the request of Ministry of Construction. According to the report, most of areas in Koto-delta was destroyed by fire after the earthquake, and the survival rate is pointed out that 3% in the Mukojima and Terashima area, 45% in the entire Koto area (410,000 deaths), especially low in the northern part of the Koto-delta.¹¹

Figure 1: Open space and incombustible building, Flame spreading model and Flood area in Koto-delta researched by Takayama laboratory.

Following this situation, Takayama said, "Until now, the Olympics or the World Expo have been used as a means of urban development, but from now on, city redevelopment based on disaster prevention may be option".¹² Under this idea, he insisted on the construction of disaster prevention center.

Takayama's first plan was to construct 16 disaster prevention centers at 3 km intervals in the Koto-delta. One such disaster prevention base was a site size of at least 500 meters square, and it was intended to evacuate the residents of the Koto district there. In this case, it became a question whether residents can secure the actual evacuation route.

In 1966, He announced the Koto Cross disaster prevention belt concept. This initiative was to maintain a 500 meters wide open space which ran east-west and north-south. By guaranteeing the free operation of emergency vehicles at the time of emergency, this safety belt expected to improve the safety of urban fires greatly. Moreover, this safety belt functions not only as an evacuation site, but also collected public facilities such as schools, hospital parks for citizen recreation, and furthermore, it is necessary for the daily car traffic and commuting measures. It also became an axis of infrastructure improvement necessary for future development of cities such as water and electricity.

To bring the concept closer to commercialization, Takayama and the students of his laboratory, including Suenao Murakami (1935-) and others, further examined and the results of the examination were summarized as "Disaster prevention city construction survey report in Koto district No.1-6"

Figure 2:16 disaster prevention bases concept

Figure 3:Koto Cross Disaster Prevention Belt Conception.

(2) Progress of the disaster prevention base development in the six districts from the 1970's to the present

In 1969, Based on the plan of Takayama, the Tokyo Metropolitan Government formulated the Koto Development Basic Concept, which is the first implemented disaster prevention city plan after the war and planned to develop disaster prevention centers in six areas, Shirahige, Yotsugi, Ryogoku, Chuo, Kiba and Ojima/Komatsugawa. It is expressed about regular and emergency usage as conditions to be considered on planning the disaster prevention base as follows.¹³

In conditions of regular, first, the lives of neighbors must not be harmed and should be even more comfortable. Second, it needs to ensure smooth urban activities integral with bases and peripheral areas. Third, ensuring a satisfactory living environment in bases. Finally, Fire prevention regulations and road projects that integrate buildings and cities that allow residents to escape to disaster prevention centers are essential.

As a condition of emergency, first, the base must have strong structure and facilities that can be escaped safely by the residents of the targeted evacuation zone. second, it must have enough food, clothing, shelter and health equipment that can maintain evacuated people lives for several days. Third, it must prevent the fire expansion from outside the site as a firewall of the city. At last, it is a place where can be the base of restoration after disaster.

In 1972, the Shirahige Higashi apartment constructed under the supervision of Takayama and Murakami, which was the first project in the Koto Renovation Basic Concept strongly reflected the above-mentioned conditions.

For example, a high-rise residential building (building No. 1 to No. 18) with a height of 40 meters was placed over the 1.2 km distance to act as a firewall, and was equipped with fire shutters, water guns, and gigantic water storage tanks. in addition, 9 hectares evacuation plaza was set with stock up drinking water, food, medicines, etc. necessary for a stay of about one week to accommodate about 80 thousand people.

Murakami Suminao, who was involved in designing Shirahige Housing development, said, "Before learning from real disasters, it is necessary to raise awareness of non-flammable disaster prevention in cities by clearance development".¹⁴

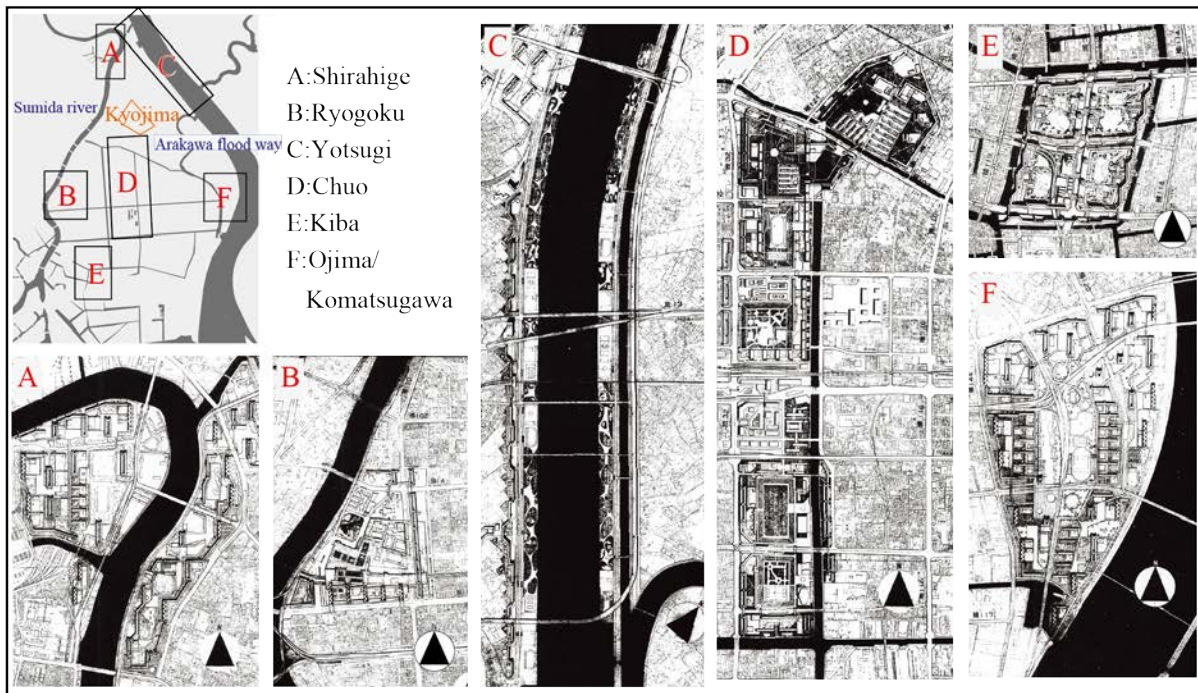

Figure 5: Conceptual Drawing of 6 Disaster Prevention Bases Made at Takayama Laboratory

Tokyo metropolitan continued the projects in other areas and public facilities and parks were located. For example, Yokokawa 5-chome apartments in Chuo district, the Ryogoku-kokugikan (1984) and the Edo-Tokyo museum (1993) in Ryogoku district and the Museum of Contemporary Art Tokyo (1995) in Kiba district. In Yotsugi district, High-standard embankment was maintained. In Ojima and Komatsugawa district, New town development have been done. Not all idea plan haven't been excuted, but some facilities and parks that have been developed take root in the area. However, they also have problems such as the aging of the building, renewal of facilities, and an increase in the number of empty shops in lower shopping streets.

Sociological Studies: Community Design and Action Research

In the Kyojima district located next to Shirahige East district, old building densely, low earthquake resistance, unsanitary living environment was formed from the process of its formation. It also featured townscapes mixed with residential, commercial and industrial sectors that continued from before the war. In 1971, Tokyo Metropolitan Housing Authority published the Kyojima district development project to reconstruct the whole district into a high-rise complexes. However, residents strongly againted the development project. Sachio Otani (1924-2013) took some surveys to find out the actual living situation there. He and his students placed importance on local community, and proposed a living environment improvement model that have less impact on people’s lifestyles. This series of research is summarized in the “Survey Report on the Kyojima Area in Sumida-ku, Essay on District Planning”(1974).

In the 1980’s, Tokyo metropolitan government came to consider that it would be hard to consult with people about redevelopment , and began supporting local residents' town planning in Kyojima. Even so, owing to the difficulty of exchanging of rights and building consensus with local residents, They did not realize rebuilding and improving incombustibility rate.

In response to this situation, Shigeru Sato (1949-) promoted cooperative rebuilding in areas with high concentration of wooden houses and actively engaged in workshops involving local residents. Such research style is considered as action research, and researchers were directly involved in the area, and aimed at improving the poor living environment by closely communicating with local residents.

However, discussion among residents for construction of cooperative houses did not go well either. Toshiya Yamamoto (1959-) mentioned the cause of not advancing collaborative rebuilding in densely built area are contiguous small scale sites, poor contact road sites, and rights relations. On the other hand, it shows that rebuilding detached houses is relatively easy even in densely built urban areas because of its low business risk, likely expected earnings, and it’s high negotiability.¹⁵

At present, the Tokyo Metropolitan Government promotes "10-Year Wooden densely area incombustible Project" from 2012. Within the noncombustible special zones, dispatched experts and subsidies heip residents to remove and rebuild old detached houses more easily, and the mentenance of urban planned roads proceed.

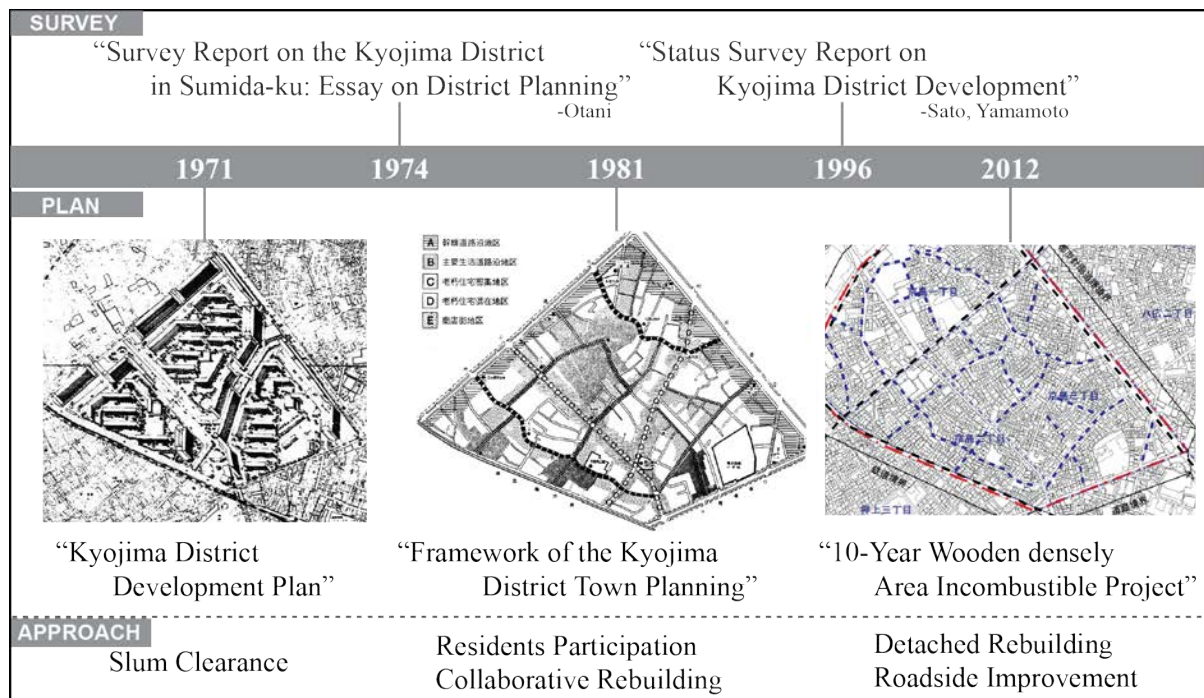

Figure 5: Transition of main plan and survey in Kyojima.

Statistical Change in Koto-delta

(1) Evaluation and analysis of indicators on slum clearance redevelopment

According to Sumida Urban Flood Hazard Map¹⁶, in case of Arakawa flood, it is estimated that the flood depth in almost all the area is under 3.0 meters (covers the ground-level roof) or under 5.0 meters (reaches the second-floor eaves). However, in terms of the disaster prevention center in the East Shirahige District, Shirahige East Park developed with an embankment such as a high standard bank is valuable as an evacuation area estimated not to be flooded. Further, the estimated evacuation population in this area is decreased from 80,000 in 1970's to 55,000 today.¹⁷ Taking it into account, a room is produced in the evacuation area.

On the other hand, focusing on high building houses in the Shirahige and Chuo district, in comparison with the aging rates of Sumida city (23.4%), the Tsutsumidori 2 (41.0%) and Yokokawa 5 (34.8%) where large apartments were built in 1970's are higher.¹⁸ The cause of high aging rate is that low-income generations moved into the high apartments at the same time. Moreover, huge buildings designed on the assumption that the population doubled prevent the area from the renewal of urban functions.

These matters indicate that, although the clearance redevelopment projects in Koto-delta make some valuable parks which can be utilized as an evacuation place and culture facilities, decreasing the population, the aged huge buildings need renewal. Furthermore, from the perspective of social mix, It is responsible for the difficulty of urban renewal that the same class generations move into an area simultaneously after clearance redevelopment projects.

(2) Evaluation and analysis of indicators on community design project

In 1960's, Kyojima district was characterized by the mixed townscape of houses, shops and workshops that continued from before the war and the high population density.

The number of office in there decreased from 1,112 in 1972 to 332 in 2014,¹⁹ in addition, regarding the percentage of a manufacturing, it decreased from 43.2% to 16.0%.²⁰ In this respect, most houses are only for living nowadays and the townscape was standardized.

From the approach of vital statistics, Kyojima has problems with the declining birth rate and aging population. The elderly population exceeded the number of children under the age of 14 before 1990, and the rate of aging is 33 percent today. Thus, there are social problems resulting from demographic change such as the retirement of the generation pursuing the community design projects with eagerness or lacking a young successor. Furthermore, due to an increase in single, elderly households to about one-fifth, it is essential to consider them in a plan.²¹

From another point of view, the state of declining to nearly one-third (587 persons/hectars in 1965 to 229 persons/hectars in 2015) of population density, and the active work of experts enable the administration to communicate with residents well.

In fact, in kyojima districts, the rate of fireproof buildings increased from 8.1% in 1980 to 52.3% in 2015.²² Owing to its comparatively favorable location in the Tokyo Metropolitan area and less friction among the neighbors, a continuous increase of rebuilding detached houses is expected. Rebuilding makes a substantial contribution for to the increasing percentages of fireproof buildings. However, owing to rebuilt highly airtight and highly heat insulating houses, former wooden townscape and emotions of a traditional working-class neighborhood have been disappearing.

Conclusion

In this study, the activities of university researchers instead of the conflict between residents and administration show the history of disaster prevention planning of Koto-delta. From the 1960's, it has widely known that Koto-delta is the most dangerous area for disaster in Tokyo. Therefore, Uchida and Hamada examined the size of the evacuation facilities based on the research on radiant heat. After that, Takayama announced the Koto Cross Disaster Prevention Belt Conception using their research, and supported the slum clearance in the Shirahige East region. Slum clearance have also developed in other areas, but after half a century passed, aging of facilities became noticeable.

By contrast, in kyojima district located next to Shirahige East district, residents objected to redevelopment, and Otani investigated the ways to sustain the community by renovation. Further, Sato promoted co-rebuilding and emphasized discussion among local residents. However, due to various reasons, joint rebuilding did not proceed, and disaster communities dreamed of by Otani and Sato haven't come true.

In addition, if statistically evaluating Koto-delta, the population density decreased compared with half a century ago, and the individual rebuilding progressed, so the risk of fire drastically decreased. On the other hand, the slum clearance caused huge housing complexes lived by many elderly people, and the community liveliness was reduced. Consequently, it can be presumed that the resilience of the region is declining compared with half a century ago.

American Public Housing Studies in China: Retrospect and Prospect

Li Li (History Department, Humanities College, Xiamen University)

American public housing productively can be used as a lens through which to filter a range of narratives about American studies in China. Chinese scholarship on the history of U.S. public housing started in the late 1990s, but began to flourish in the new century as a research hotspot in American studies. In the past two decades, the history of public housing in the United States typically has been told in one of four ways in China. The first version narrates public housing as an evolving policy, whose significant changes deeply have affected American history during the 20th century. The second line of scholarship focuses on presenting basic information about today's public housing programs in the United States. A third group of Chinese scholars have pursued case studies, which have yielded valuable insights into the local specificities of public housing projects in Chicago, St. Louis, and Boston. The fourth approach treats public housing in the United States as a foreign experience from which China can learn lessons as it constructs its own unique affordable housing plans. Although still at an early introductory stage, the four versions of American public housing research in China provides different perspectives from American research, thus offering valuable alternative prospects. This article assembles and reviews American public housing studies in China over two decades; examines the ongoing introductions, achievements and debates of this scholarship; analyzes the insights and limitations from four perspectives; and reveals significant possibilities for future research, by putting public housing in the more comprehensive context of the social-economic, political and urban history of the United States. More specifically, this essay demonstrates the value of carefully considering the multidimensional nature of complicated policy; paying more attention to the stage of maintenance of public housing after its construction and occupancy; considering more fully the formation and impact of public housing legislation and related legislation; and following the newly opened research path of transnational housing studies.

Intensifying Gated Exclusiveness of Apartment Complex Boundary Design in Seoul, Korea

Hyo Jin Kim (Seoul National University, College of Engineering, Graduate Program in Urban Design) and Soe Won Hwang (Seoul National University, Graduate School of Environmental Studies, Department of Urban and Regional Planning)

The proliferation of enclosed private residential development as gated communities is a conspicuous global phenomenon and Asian megacities are increasingly manifesting the rapid transformation of the urban form through high-rise, high-density residential complexes. Seoul also exemplifies this phenomenon with distinctive spatial and morphological characteristics throughout the urban landscape. The exclusivity of the Apartment Complexes with higher quality of internal infrastructure and its controlled access has resulted in producing stark contrast among the urban landscape and issues of urban polarization between the relationships with the existing low-rise residential fabrics. Behind this increasing exclusivity there are concerns about property values, personal safety, and communal amenities, which provoke the layering of gates and barriers to protect one's territory. Initially, the apartment complexes construction has been led by the government housing policies that pursued the mass housing supply and switched to the market-driven, middle-class-centered and private-sector-initiative stance. Since the late 1990s, luxury high-rise apartment buildings or branded apartments were constructed which reflected the increasing trend to live within a homogeneous community of socioeconomic characteristics and the proliferation of self-contained gated communities. Several scholars consider the "complex" as reason for causing segregation, because the "apartment complex" constitutes a spectrum of private infrastructures which are included in the sales price. The rationale for building apartment complex form is driven by the government's intention to secure urban infrastructure through the private sector and minimize the public investment. As the internal community infrastructure is monopolized only by the residents of the complex, the phenomenon of "collective privatization of urban space" has been intensifying.

In order to understand this intensifying exclusiveness, two concentrated area with apartment complex, which were developed under different development methods are examined in terms of complex's boundary design, visual and physical accessibility and changes in spatial characteristics. The two regions are Mok-dong, where master-planned apartment complexes were constructed simultaneously through Housing Site Development Projects in the 1980s and Geumho-dong with individual complexes are built consecutively under Residential Redevelopment Project from the 2000s to present. Fourteen complexes are selected in each region and the surrounding vertical border condition (type, height, material, length, and thickness), control of access (pedestrian, vehicle, gate) and surrounding pedestrian and road condition are analyzed. By tracing these features over time, the extent to which exclusiveness increases and publicness decreases is studied, and the various causes and consequences to the physical and social space by development methods and period, degree of public or private intervention are examined. Some of the expected results include that (i) the total length of physical barriers is gradually increasing, (ii) discrepancy in infrastructural resources between internal complex environments and their vicinity disconnects the two neighboring spatial systems and (iii) the gating and access restrictions have been progressively reinforced while the border condition has evolved into a complicated layering of various barriers. As spatial and social polarization is intensifying along with the continual agglomeration of private enclaves, it is imperative to find resolutions for building communal sustainability that conveys multiple level of congruence.

From the National Housing Bank to the Program Minha Casa Minha Vida: reproducing old obstacles in the Housing Policy in Aracaju-SE, Brazil

Sarah Franca (Universidade Federal de Sergipe) and Vera Rezende (Universidade Federal Fluminense)

This article comparatively analyzes the policies of the National Housing Bank – BNH, and the Habitation Program entitled My Home My Life, based on the locational logic of subsidized housing complexes in the city of Aracaju-SE, Brazil. In Brazil, two programs deserve special mention: BNH, created in 1964 as the financing body for the construction of social housing, producing thousands of housing units until 2002, opening up expansion fronts for the reproduction of the real estate market. In the second, the PMCMV, initiated in 2009, one of the biggest obstacles is access to urbanized land, with alternative to the occupation of scattered, devalued and deprived areas of environmental sanitation and public transportation. So, it is questioned to what extent the actions of the PMCMV, regarding the dynamics of housing production resemble or are distinguished from those undertaken by BNH? For the development of this, quantitative and qualitative information was collected in public agencies, generating tables and mapping the insertion of the enterprises in Aracaju. Thus, there are coincidences regarding the peripheral and dispersed logic of these sets, highlighting the clear socio-spatial segregation of the lower income strata, in the search for land valuation in function of public and private investments.

The Establishment of Housing Loan Corporation (1950) and GHQ (General Headquarters of the Allied Forces)'s involvement -Japan's housing policy shift during occupation era-

Kosei Hatsuda (Kogakuin University)

This study investigates the phase of the establishment of Housing Loan Corporation (1950) and GHQ (General Headquarters of the Allied Forces)'s involvement during the occupation era (1945-1952) after World War II.

The living style of urban residents in Japan has changed dramatically, from centering on private renters before the war to ownership of the detached housing in the suburbs after the war. This "Japanese-style home ownership Urbanism" was not simply that there were a large number of home owners, but that the majority of people, deeming home ownership to be something of value, pointed toward the social system in which people could aim for it. Japan took U.S.A. to be its model, but it did so selectively in response to the situation in Japan's cities and their tastes of land ownership at that time. It was realized under high economic growth, through rapid urbanization and rising middle-class. To clarify this process partially, this study focuses on the post-war reforms as the origin. The direct origin of housing policy's shift in Japan was the abolishment of Housing Corporation (Jutaku Eidan) (1949) and the establishment of Housing Loan Corporation (Jutaku Kinyu Koko) (1950) in the occupation era. Newly discovered sources from the US National Archives and Records Administration, which indicate GHQ's involvement with the abolishment of Housing Corporation and the establishment of Housing Loan Corporation will be analyzed. And the minutes of the testimony by bureaucrats of Construction Ministry at those days will be analyzed.

This is important because until now it has been argued from the viewpoint of Japan's alone housing policy from the field of economics (Hirayama, 2009) or the propagation of images of US lifestyle through TV dramas from the field of sociology (Miura, 1999; Yoshimi, 2007), but this study will clarify the US's direct effects on Japan and will be based on the newly discovered sources and those day's actual situation of cities in Japan.

Intensifying Gated Exclusiveness of Apartment Complex Boundary Design in Seoul, Korea

Hyo-Jin Kim*, Soe Won Hwang**

* First author, PhD candidate in the Graduate Program in Urban Design at the College of Engineering at Seoul National University, zinykim@gmail.com

** Corresponding author, PhD, Environmental Planning Institute, Seoul National University, soehwang@gmail.com

The proliferation of private residential development is evident worldwide. In Seoul, these developments have distinctive spatial and morphological characteristics. Originally, government housing policies drove the construction of apartment complexes to ensure massive housing supply. Over time, development shifted, becoming more market-driven, aimed at the middle class, and built by the private sector. During the late 1990s, an increase in luxury high-rise apartment complexes increased, reflecting a tendency to live in a socioeconomically homogeneous community and propelling the proliferation of self-contained gated communities. To understand the continually increasing exclusive nature of apartment complexes in Seoul, we examine two areas with apartment complexes of different periods and development methods: Mok-dong, where the 1980s 'Housing Site Development' resulted in the simultaneous construction of multiple apartment complexes according to a single master-plan, and Geumho-dong, a neighbourhood transforming by apartment complexes under 'Housing Redevelopment' from the 1980s to the present. The research focused on 28 complexes, and measured the surrounding vertical borders, pedestrian paths, and roadways, and access control. Tracing these features over time, we investigated the increasingly exclusive nature and decreasing public nature of apartment complexes, consequences of development for physical and social space during different periods, and degree of public or private intervention.

Keywords: Apartment Complex Boundary, Urban Design, Increasing Exclusiveness, Comparison in Housing Development Methods

Introduction

Neighbourhood privatisations have increased globally over the past half-decade. Scholars recognize the universally increasing gated features of settlements as a reappearance of the fortified, enclaved ancient urban forms of the late 20th century (Judd, 1991; Blakely & Snyder, 1997; Morris, 2013). Modern privatised urban development can be attributed to the neo-liberalist and capitalist emphasis on privatisation, policies that benefit private capital interests, and global citizens' desire to live a privileged lifestyle. (Blakely & Snyder, 1997; Coy, 2006; Bekleyen and Yilmaz-ay, 2016). In particular, the modernization process of urban development led by public-private partnerships or primarily driven by private companies has resulted in gated and access-restricted residential communities targeting the upper and middle class (Roitman, 2005). In addition, Grant and Mittelsteadt (2004) cite growing concerns with property values, personal safety, and communal amenities that increase the number of gates and barriers to protect one's territory.

In Seoul, which has experienced rapid urbanisation and intense development, housing supply is a vital concern, and several government policies promote the construction of extensive apartment complexes. Today, many apartment complexes are developed with high-rise, high-density buildings with distinctive configurations and clearly demarcated private boundaries. As the private construction of apartment complexes has increased, this internalisation and exclusiveness has intensified, particularly in terms of the connectivity between complexes and their surrounding urban context.

Apartment complexes are characterized as a single large parcel of land under joint ownership or control. As a large urban cell, apartment complexes equate to what Colquhoun (1969) calls a superblock. According to him, the controlling agencies—corporations, speculators, or local authority—create large pieces of land, in other words, a superblock, within the city. These superblocks and related emerging issues represent the disconnection between the urban tissue composed of individual dwellings and the superblocks that partially take over. Furthermore, the incongruity between the existing urban context and representation of the superblock break the existing continuity. Gauthier (2006) argues that rapid transformation and disruptive development resulted in fragmentary patterns and a plurality of urban configurations. Large-scale housing complexes have been

developed as a self-contained entity that contributes towards fragmenting urban contextual continuity, thus intensifying incongruity (Colquhoun, 1969).

History of Apartment Complex Proliferation in Korea

In the 1960s, traditional, detached housing dominated the housing market in Seoul; however, at the time, the construction of exclusive collective apartment buildings began. According to C. S. Park (2016), the boundary of the first apartment complex in Seoul, Mapo Apartment Complex (1962-1964) was demarcated by installing walls, and it was only approachable through the single main entrance. These attributes formed a completely different complex territory compared to the surrounding residential fabric of traditional houses. In the 1970s, the city underwent rapid urbanisation and densification. The construction of apartments intensified during this era, and by the early 1990s, this housing form dominated the urban landscape. This was aided in the 1980s by a strong political agenda that led to the creation of a large quantity of similar or identical apartment complexes. As the family structure shifted and less people lived in traditional extended families, instead living only with their nuclear families, housing demand increased, as did people's preference for apartment housing. These buildings were considered more convenient, as they included hot water and heating systems and provided community facilities, which appealed to the growing middle class (S. H. Lim, 1995; C. D. Kang et al., 1997; H. S. Chun, 2003; S. I. Jun, 2009). As more people began to prefer living in apartment complexes, construction companies began targeting upper-class families, intensifying the exclusivity of these buildings. In the 1990s, major construction companies launched branded apartment complexes that provided distinctive, upgraded features and suggested a prestige lifestyle through their exclusive marketing techniques. A high demand developed for high-quality facilities and safety measures in apartment complexes.

Several scholars suggested that the concept of apartment 'complexes' has segregated and fragmented urban social and physical life (K. M. Lee, 2002; C. S. Park, 2013; I. S. Park, 2013). While the term *apartment* refers to an individual building, *apartment complex* denotes a range of private infrastructure included in the sales price. I. S. Park (2013) contends that the rationale for the development of apartment complexes is the government's intention to ensure private development of urban infrastructure, which minimises public investment. As only residents use the internal community infrastructure of a complex, the 'collective privatisation of urban space' is intensifying (Seoul Institute, 2009: 297). S. I. Jun (2009) suggests that apartment complexes have been built so quickly and marketed primarily to the upper class because of the policies of apartment construction agencies, social status and conspicuous consumption of apartment residents, and changing domestic norms and values.

Evolving Exclusive Design of Apartment Complexes

Apartment complexes constructed earlier were developed based on the Clarence A. Perry's 'Neighborhood Unit Plan' that reinforce self-contained nature, including a school, communal facilities, and commercial programs within a single complex (Lawhon, 2009; J. E. Kim and M. J. Choi, 2012). The entire property of apartment complex was privately owned and no through traffic was allowed. The property was privately owned and no through traffic was allowed. The few points of entry and exit were only for residents, and physical barriers such as gates, walls, and/or fences marked the boundaries.

Today, expectations are increasing regarding amenities and quality-of-life services when purchasing property in an apartment complex. These amenities include access to green space, a high level of security and privacy, quality communal space, and various programs. Many complexes offer underground parking; many outdoor spaces for resting, exercising, or walking; playgrounds; and communal facilities for residents like elder welfare centres and/or childcare centres (D. H. Kim, 2003). Residents demand that apartment complexes provide multiple quality-of-life features, rather than simply being functional living spaces (G. S. Sung, 2011; Y. S. Rim & J. P. Choi, 2011). Beginning in the 1990s, construction companies have met these demands and attracted upper-class residents through prestigious marketing strategies. However, this external differentiation, which focuses on environmentally friendly design, higher security, and premium infrastructure, increases internal discrimination, leading to limited access, environmental inequality, and increasing incompatibility. However, this external differentiation that focuses on environmental friendly design, higher security, and premium infrastructure increases incompatibility within a neighbourhood environmental inequality and leading to limited access.

Since the 1990s the barriers used to differentiate the boundaries of apartment complexes have increased, and now incorporate exclusive landscaping and environmental designs along with closed-circuit video surveillance and vehicle-based security systems. Many researchers including Gelézeau (2008), note the growing sociospatial segregation that has occurred since the 1990s with the increase of gated residential developments. These gated communities strengthen residents' internal sense of belonging while relieving them of the need or obligation to

consider and connect to the surrounding environment and urban dwellers. These exclusive complexes tend to maximise separation between the classes due to intensifying capitalism and individualism and symbolise private interests such as being unapproachable to non-residents (L. J. Choi, B. Y. Shin and G. S. Oh, 2010). Marks of exclusion in gating includes gates, wall, fences, 'buffer zone' of grass and derelict lands, cul-de-sacs and adopting monitoring systems with employing security guards or CCTVs (Atkinson and Blandy, 2005). Modern apartment design in Korea represents this exclusive differentiation between, within, and outside the complex through physical demarcated boundaries and symbolic structures or specific apartment brand signage.

In this study, we examine the changes in apartment complex boundary design and degree of gated exclusiveness by comparing two regions, each with a concentration of apartment complexes built in different periods using different development methods. By tracing changes in the boundaries of apartment complexes, we could interpret the physical and social aspects of each complex, including openness, segregation, accessibility, and incompatibility, as well as the influence of public or private intervention on urban design.

Methods

Over the past 50 years, multiple development methods have influenced the construction of apartment complexes in Seoul. Of these, two of the most prominent are the Housing Site Development Project, which resulted in the construction of 'planned' apartment complexes, and the Housing Redevelopment Project, which promoted a more spontaneous process (Figure 1). Mok-dong was developed 'en bloc' in the 1980s under a public master plan, which enabled us to examine the adaption of boundary design over time. On the other hand, apartment complexes in Geumho-dong were gradually redeveloped over time (1980s to the present), allowing us to document changing trends.

The spatial territory of boundary includes urban and private space, namely borderland, centring on the physical demarcation line of the apartment complex parcel. For the purposes of our study, 'boundary design' includes boundary types, the physical condition of boundaries, access control, and condition of the surrounding pedestrian walkway and road. We investigated total of 28 complexes (14 complexes each) in two neighbourhoods—Mok-dong and Geumho-dong—focusing on boundary design, configuration, and spatial qualities. Several field surveys were conducted and street-view¹ via internet was utilized to examine the apartment complex boundary conditions of the study area. Visual representations were executed through GIS and CAD.

Study Areas

Mok-dong: Housing Site Development Project

The Housing Site Development Promotion Act was passed in 1980 to resolve housing shortages in Seoul by aiming for constructing 5 million households (LH, 1988). The law allowed private companies to purchase vacant land at government rates (Sohn, 2003), enabling public development agencies to spearhead large-scale housing development projects in undeveloped greenfield land on the city outskirts. This eventually resulted in master-planned development with inner city 'Newtown-in-towns' and more central urban 'Newtowns'. The master plans provided a strategy for land use, road networks, common facilities, and infrastructure, and provided numerous sites on which to construct apartments (C. H. Kim, 1987). In most cases, these residential blocks were sold to the private companies that built the apartments (SMG, 1990). Mok-dong is one of these planned communities near Seoul's greenfield areas. It includes multiple apartment complexes constructed according to a single master plan. Mok-dong is a 'Newtown-in-town' community, and is a result of public sector development. The community consists of repetitive apartment complexes and is one of the city's largest homogenous morphological regions.

Geumho-dong: Housing Redevelopment Project

The Urban and Residential Renewal Act resulted in the formation of several Housing Redevelopment Projects to demolish squatter settlements (K. J. Kim et al., 2001). Over time, this project evolved into the overall renewal of substandard urban areas (K. J. Kim, 1998). In 1983, joint or partnership renewals began, making this method a privatised joint venture between landowner associations and private construction companies. Unplanned areas comprised of small houses and narrow alleys with few public amenities were cleared to build high-rise apartment complexes. Seoul's government devised a comprehensive citywide redevelopment plan to designate eligible renewal areas, enabling property owners to form associations providing collective land and hire a construction

company to lead redevelopment while ensuring a profit by exceeding the number of original units for sale (K. J. Kim, 1998).

As demand for housing increased and the amount of vacant land within city limits decreased in the 1990s and early 2000s, Housing Redevelopment Projects became the major supplier of housing. Unlike Housing Site Development Projects, which were built on the city outskirts and led to urban expansion, Housing Redevelopment Projects focused on transforming the inner city. Geumho-dong is one area that has been redeveloped. It is located close to the city centre on a hill adjacent to the Han River, and numerous apartment complexes have replaced the area's original spontaneously formed residences.

Despite that a different company constructed each apartment complex in Mok-dong, the comprehensive master plan overseeing the area's urban design has ensured continuity between the boundaries (Table 1). Except for Complex M06, which has a 3-m wall partially installed, the other 13 complexes we studied have no physical wall demarcating boundaries. Nine complexes intentionally installed elevated topography along a boundary to obstruct views into the apartments. Most of the complexes have a 1-m ironwork fence and shrubs 1 m high delineating the boundaries. These low boundaries are seamlessly connected with pedestrian sidewalks that are actively used by apartment residents and other pedestrians. In addition, numerous trees have been planted along the complex boundaries and adjacent sidewalks. As such, most pedestrians remain unaware of their purpose as a territorial demarcation, and they form a pleasant public greenway. Most of the complexes have an average of 10 entrance points, which are open to residents and the public. No gateways or branded structures mark these entrances and no operating systems obstruct outside vehicular traffic (Figure 3). However, as more households have come to possess multiple vehicles and public parking space has become limited, parking shortages have become an issue; consequently, complexes M04, M07, and M10 have installed barricades and placed placards forbidding the parking of outside vehicles (Figure 2).

In Geumho-dong, boundaries are delineated through combinations of materials including fencing, concrete retaining walls, soundproof walls, and brick walls (Table2). These boundaries surround each complex, preventing through traffic and forcing people to detour around the properties. Only residents of each apartment complex are allowed to access the entrances, and there is an average of two entrances for each of the 14 complexes we studied. There is a noticeable difference between the area's earlier apartment complexes, built in the 1990s and early 2000s, and buildings constructed later in the 2010s. The earlier complexes tend to be surrounded by high walls and intentionally high landscaping, while newer buildings mark boundaries with low fences or walls and tend to avoid tall vertical elements. These buildings deliberately place other functional

buffering elements along the peripheral boundaries. Public parks or commercial businesses can be public or semi-public, while other complexes deny entry through private communal buildings or parking towers (Figure 5).

Unlike the Mok-dong complexes, which are mostly open to public pedestrians and vehicles, 12 of the complexes in Geumho-dong prohibit public access. The privacy of these complexes is ensured by intentionally placing the entrance gates on a secondary road, requiring that residents detour from the main road. This creates an explicit privatisation of public roads, which are only used by residents from the apartment complexes they lead to. In order to further control access, recent complexes have installed vehicle control systems and erected aggrandized entrance gates, prominently displaying signs of luxury living, privacy, and exclusivity.

Private and public amenity along the boundary

Gateway of specific apartment brand

Figure 4. Different boundary conditions of Geumho-dong complexes

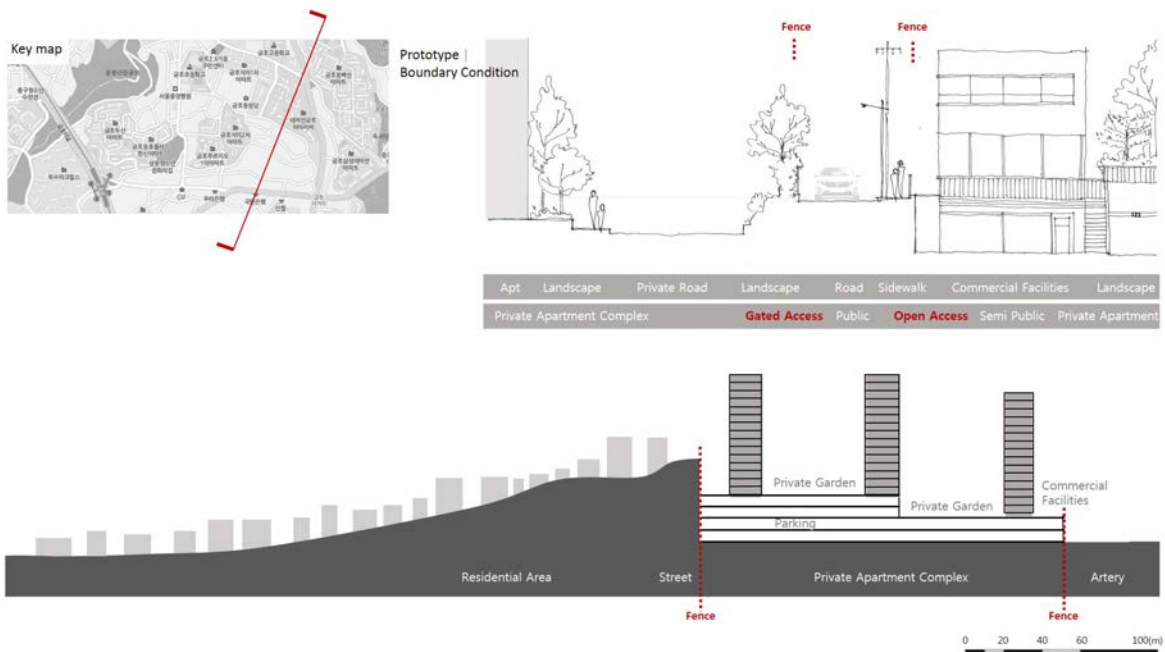

Figure 5. Diagrammatic section of apartment complex borderland and adjacent area in Geumho-dong

A comparison of the two neighbourhoods reveals that Mok-dong's master plan and unified urban design have allowed for open and connected boundaries. Low and minimum boundary elements and urban green space provide a sense of openness, consistency, and overall integrity between adjacent apartment complexes, public sidewalks, and roads. However, new elements to control pedestrian or vehicular passage are noticeable in some complexes, indicating a slow movement towards gating. On the other hand, the redevelopment plan and individual construction companies responsible for the apartment complexes in Geumho-dong reflect a more introverted configuration and self-containment. Over time, the 'apartment brand' has become more significant than the construction company, and specific brands are used as a marketing strategy to attract residents to a distinctive residential environment and luxurious lifestyle. As a result, branded apartments have dominated Geumho-dong's real estate since the 1990s. Each branded complex focuses more on enhancing its own internal infrastructure rather than considering its relation to the surrounding area. Boundaries are used to suggest exclusivity in a way that is not present in Mok-dong, through the layering of diverse boundary types, heights, and materials compressed in a relatively narrow width of borderland that generates a sense of fortification rather than blurring the division between private and public.

Discussion

Apartment complexes have become a common residential type more or less transformed into enclosed, self-contained communities that include housing, an internal road network, open spaces, and communal facilities. As privately owned land, access to internal amenities is allowed only to residents, and signs of exclusion proliferate. Segregating the area is accomplished through security gates, building boundary fences that resemble ramparts, installing closed-circuit television for video surveillance, and implementing exclusive landscapes and environmental designs. Recent research shows that the many recently built apartment complexes have been part of a public agenda to provide an enhanced infrastructure and preferred public space through private developers. However, the design of these complexes lacks careful consideration of space in terms of harmony with the existing community and urban fabric (Park, 2013b; Gelézeau, 2007). At the same time, attention has grown on the increasingly exclusive and isolated features of gated housing in terms of physical and socioeconomic aspects (Park, 2013a). This has resulted in a strong distinction between the privacy of internal dwellings and outer public territory (Rowe, 2005).

Low (1 m) fences and shrubs and abundant trees are the primary boundary elements in Mok-dong, whereas in Geumho-dong, the borders are marked by high boundaries constructed with multiple materials. This reflects the development of Mok-dong complexes en bloc in the 1980s and slow movement of the complexes towards supplementing their boundaries with gating elements like barricades to block outside vehicles. On the other hand, the complexes in Geumho-dong, which were spontaneously built by different companies, highlight their gated nature through the layering of boundary elements, limiting entry points to one or two and to residents, using symbolic structures or gateways to signify the apartment 'brand', and controlling pedestrian and vehicle access.

The housing development methods applied differ between the two areas. Mok-dong adopted a Housing Site Project with a master plan that ensured consistency in terms of the boundaries, which were conceived as a public section. In contrast, Geumho-dong lacks an overall vision of the area, where Housing Redevelopment Projects incrementally converted spontaneous squatter settlements into apartment complexes as individual entities.

The use of boundaries in Mok-dong and Geumho-dong suggests that total physical barriers have increased over time. Our results also suggest that there is a growing differentiation and discrepancy in infrastructural resources between apartment complexes and the surrounding area, which promotes a sense of incompatibility and disconnects the two neighbouring spatial systems.

Moreover, gating and access restrictions have changed over the past decade, becoming progressively more intense. In the 1970s, boundaries were usually simply marked by a low wall or fence and by placing a safety guard. However, our findings in Geumho-dong reflect the work of Gelézeau (2008), who argues that the neo-liberal transformation of Korean housing construction since the mid-1990s has led to the emergence of 'gated community-style residential environments'. Borders have evolved from a simple fence to a complicated layering of various barriers, and access control has become excessively fortified. This has ushered in a steady decline in overall public spaces and increased the number of privatised, high-quality spaces for private complex residents. Because these communities are comprised of families with similar social statuses, the private enclaves become more homogeneous and sociospatial segregation intensifies, resulting in 'spatial stratification' and urban fragmentation.

Our findings show that Mok-dong is currently wrestling with the need to pay more attention to public infrastructure. For example, the lack of public parking among the surrounding neighbourhoods means that several complexes are adding gates to prohibit outside parking that causes internal parking shortage within the apartment complex. In Geumho-dong, there is a need for an overall strategy to harmoniously situate new apartment complexes within their surroundings and provide more connection, interaction, and community with the surrounding urban context.

Conclusion

Increasing privatisation of land and housing raises complicated spatial, physical, and social issues. According to Atkinson and Blandy (2005) attempts in expressing a mark of exclusion resulted in lack of permeability with in the surrounding context, however, the broader debate involves "freedom of access to the wider city, social inclusion and territorial justice." Banjee (2001: 12) points out that the substitution of private for government participation has resulted in the 'commodification of urban space and public good' and a decline in the quality and supply of public spaces. This results in the extensive privatisation of public spaces and expansion of privately controlled spaces. This is generating socio-spatial differentiation, leading to discontinuity and fragmentation of urban spaces. Aggravating social polarisation further instigates a desire for a more homogeneous lifestyle and surrounding environment, which alleviates communal solidarity between different

social groups (Janoschka & Borsdorf, 2004). In this study, boundary design as one type of expression for demarcating gated exclusiveness has been explicitly taken to be investigated.

Since the 1990s, luxury high-rise apartment buildings and branded apartments have reflected the ‘deregulation and neo-liberal logic structuring the Korean housing production system’ (Gelézeau, 2008: 317). According to S. I. Jun (2009), branded apartments developed in the 2000s because of the increasing tendency to live in socioeconomically homogeneous communities. Many believe that the proliferation of apartment complexes is led by government housing policies aimed at supplying mass housing through private sector initiatives centred on the middle class and driven by market forces initiatives (S. H. Lim, 2005; Gelézeau, 2007; S. I. Jun, 2009; I. S. Park, 2013).

This type of living situation continues to proliferate, and the yearning to live in private, enclosed complexes does not seem likely to disappear. Land is limited, public infrastructure is insufficient, and the private sector dominates housing construction, meaning that private complexes will continue to be built. Urban issues surrounding such private enclaves are not only spatial and physical, but also most importantly social. As spatial and social polarisation intensifies along with the continual agglomeration of private enclaves, it is imperative to determine how to reconsider the isolating gated exclusiveness of apartment complexes in alternative ways to allow residents to connect while maintaining a certain degree of privacy. Since respecting the need of gated boundary for internal security and maintenance in response to rising urban crime issue cannot be equivalently overlooked (Breetzke, Landman and Cohn, 2014). To preserve the existing urban fabric, the public sector must propose a master development plan for residential areas that is not deconstructive or fragmentary, but integrated. For instance, complexes should provide well-connected passageways and various public or buffering spaces. A thicker borderline that is composed with various communal program, such as public bench, small open library or reading area, green wall and so on would be a positive proposition that not only faces but invites access along the complex boundary. Understanding the increasing exclusivity of gated communities and finding regional-based solutions for spatial and social disconnection is vital to recovering the fragmenting residential community in Seoul. In addition, efforts to understand the resident’s preference, satisfaction, and mutual perception between the internal and external community of apartment complexes should be made for further residential regeneration and preserving the sense of neighbourhood community (Bekleyen and Yilmaz-ay, 2016).

From the National Housing Bank to the My Home My Life Program: reproducing old obstacles in the Housing Policy in Aracaju-SE, Brazil

Sarah Lúcia Alves França*; Vera Lúcia F. Rezende**

* *Departamento de Arquitetura e Urbanismo, Universidade Federal de Sergipe. sarahfranca@ig.com.br*

** *Programa de Pós-Graduação em Arquitetura e Urbanismo, Universidade Federal Fluminense. vrezende1234@gmail.com*

This article comparatively analyzes the policies of the National Housing Bank – BNH, and the Habitation Program entitled My Home My Life, based on the locational logic of subsidized housing complexes in the city of Aracaju-SE, Brazil. In Brazil, two programs deserve special mention: BNH, created in 1964 as the financing body for the construction of social housing, producing thousands of housing units until 2002, opening up expansion fronts for the reproduction of the real estate market. In the second, the PMCMV, initiated in 2009, one of the biggest obstacles is access to urbanized land, with alternative to the occupation of scattered, devalued and deprived areas of environmental sanitation and public transportation. So, it is questioned to what extent the actions of the PMCMV, regarding the dynamics of housing production resemble or are distinguished from those undertaken by BNH? For the development of this, quantitative and qualitative information was collected in public agencies, generating tables and mapping the insertion of the enterprises in Aracaju. Thus, there are coincidences regarding the peripheral and dispersed logic of these sets, highlighting the clear socio-spatial segregation of the lower income strata, in the search for land valuation in function of public and private investments.

Keywords: Social Housing; State; Marketplace; National Housing Bank; My Home My Life Program.

Introduction

In Brazil, the housing policy highlights two programs that constitute the funding agencies for the construction of thousands of dwellings: the National Housing Bank [Banco Nacional de Habitação-BNH], which operates from 1964 to 1986, and the My Home My Life Program [Minha Casa Minha Vida Program –PMCMV], created in 2009.

In Aracaju, since the BNH, the housing production has been towards the periphery, and with active participation of real estate agents and effectiveness of their interests in urban expansion. The State abandoned its role of protagonist, to become a mediator and feasible of the real estate sector, especially in the choice of places of implantation of the enterprises. Making the same mistakes, the PMCMV obeys the same logic of capitalist production of social housing by the market, highlighting the clear segregation and socio-spatial exclusion.

At the same time, one of the major obstacles is access to urbanized land, with the alternative of occupying devalued areas and lacking environmental sanitation and public transportation. So, it is questioned to what extent the actions of the PMCMV, in what concerns the production of housing complexes, resemble or are distinguished from those undertaken by the extinct BNH?

Therefore, this article aims to analyze, comparatively, the policies of the BNH, and of the PMCMV, based on the locational logic of the subsidized housing complexes. Aracaju-SE, Brazil. For this, a survey was carried out on projects, visits to the site, as well as the elaboration of tables and cartograms, which reflect the urban sprawl in the process of insertion of these developments.

National Housing Bank: the peripherization of housing

The State has great responsibility in the production of Brazilian cities through the provision of housing units. From 1964, It began a new scenario of policies for low income class starts. Federal Law No. 4,380 / 64, which created the BNH and the Housing Financial System [Sistema Financeiro de Habitação – SFH], with the intention of financing housing and solving the housing deficit. Since then, it has been settled the State Housing Company [Companhia Estadual de Habitação – COHAB] and the National Institute for Guidance to Housing Cooperatives [Instituto Nacional de Orientação às Cooperativas Habitacionais – INOCOOP].

The BNH had as premise to improve the quality of the housing, due to the population increase that the industrialization had provoked. However, the Bank became a state institution that prepared the cities for the

development of the monopoly capital that was being established, because it promoted the use of resources collected by all the workers, through their savings and, also, the Guarantee Fund for Time of Service [Fundo de Garantia por Tempo de Serviço – FGTS].

In Sergipe, the COHAB and the INOCOOP, were established in 1966 and 1967 respectively, and were constituted in the main financing and housing agencies (FRANÇA, 1999). COHAB served families with income between one and three minimum wages [MW], then extending to five, while INOCOOP had attracted those whose income was from 5 to 10 minimum wages. Those who did not have a minimum monthly income, or could not prove it to them, were not considered. In Aracaju, the performance of these institutions occurred between 1968 and 2002 and resulted in the insertion of 67 remote developments, contributing to the breakdown of the urban network (Table 1).

	COHAB		INOCOOP		Total	
	Housing Developments	Housing Units	Housing Developments	Housing Units	Housing Developments	Housing Units
Total	46	20.595	20	6.333	67	26.928

Table 1: Aracaju, Production of Popular Housing COHAB and INOCOOP, 1960 to 2002 *

Source: Elaboration Sarah França, 2016. Data collected in FRANCE, (1999); CEHOP (2003); CARVALHO (2013); Field Visits; Interviews.

The COHAB has built 20,595 residential units in 47 dispersed housing complexes, contributing significantly to the urban expansion. The first sets were delivered in 1968 and 1969, outside the consolidated network and with precarious access. In the 1970s, the construction of 21 housing complexes (5,732 dwellings) was intensified, inserted in a disjointed and peripheral way.

In the 1980s, the state began to build large-scale settlements, to house a larger population, and to act as a speculator, storing land to intervene in neighboring municipalities (CARVALHO, 2013). Of this period, Gov. Augusto Franco (4,510 dwellings), in the Farolândia neighborhood, the journalist Orlando Dantas (3,656 dwellings), in the São Conrado neighborhood, and Santa Tereza, which originated the neighborhood of the airport, led the expansion to the south, because they are distant from the central nucleus. The opening of Beira Mar and Heráclito Rollemberg Avenues (main access to Augusto Franco and Orlando Dantas), in 1981, ensured the occupation of gaps between these complexes and the nearby districts. The State, compacted with the achievement of real estate profits, valuing the land to be later occupied by developments of the Sergipe construction companies (Figure 1).

From 1990 to 2002, housing production declined due to the extinction of the BNH in 1986 and the state crisis that hit the country. França (1999) recalled that the reduction of federal investments was reflected in Sergipe, with the reduction in projects financed by Caixa financing cut of several projects that were in the Caixa. During this period, federal programs focused more on granting direct credit to the population, encouraging housing self-construction and programs to improve housing conditions, such as Pro-Moradia and Habitar-Brasil.

This period was also marked by expansion outside the municipal boundaries, towards the municipalities of São Cristóvão, Nossa Senhora do Socorro and Barra dos Coqueiros, still with rural characteristics and without adequate infrastructure. The justification was the high value of the land, which made it impossible to construct sets in the urbanized network. Thus, the public power has removed the needy population from areas with infrastructure, public services and job opportunities. Subsequently, the insertion of these houses boosted the occupation in their surroundings, bringing serious obstacles in the environmental, economic and social spheres (CARVALHO, 2013).

Housing production was concentrated in neighborhoods such as Farolândia (south), which received the largest amount (5,518 dwellings), São Conrado (north) with 3,902 units produced, Santa Maria (south), with 2,509 dwellings and finally, Bugio housing 2,263 housing units. This demonstrates urban shredding, which subsequently required the expansion of the infrastructure, further enhancing the empty spaces (FRANÇA, 1999).

On the other hand, INOCOOP built 20 housing complexes with 6,333 new dwellings, attending higher income categories, contributing to the ripping of peripheral tissue, such as the Inácio Barbosa and Beira Rio developments in the Inácio Barbosa neighborhood, and the Juscelino Kubitschek and Sol Nascente developments, in the Jabotiana neighborhood. In this case, 54% of the housing units are apartments, with several blocks of up to 4 floors. Some have been designed with architectural elements such as walls, such as the Mar do Caribe and Mar Mediterrâneo, in the Estrela do Mar, others open as the Estrela do Mar, which persist in this format to the present day (FRANÇA, 2016).

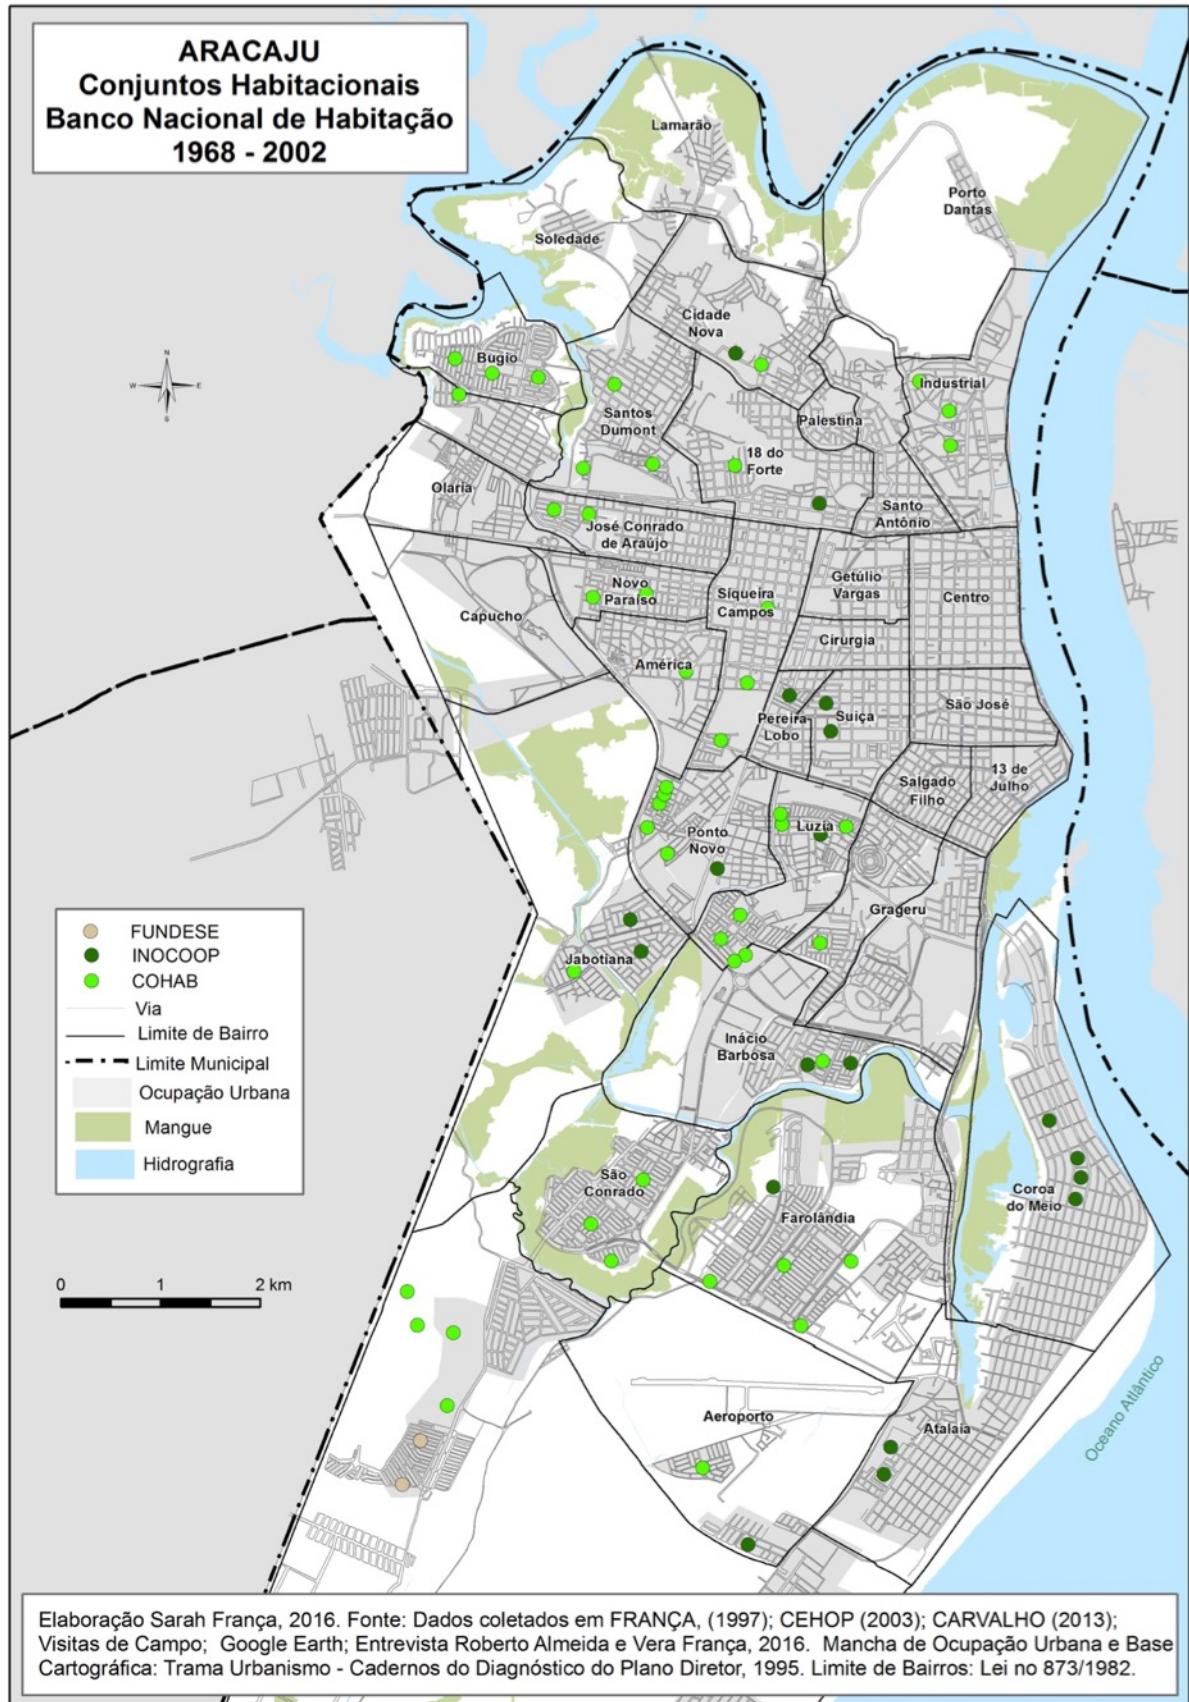

Figure 1: Aracaju, Housing Set, National Housing Bank - BNH, 1968-2002.
Source: Elaboration Sarah França, 2016.

Another form of occupation took place in the belt of housing communities, in small nuclei directed to the middle income group, in addition to vertical condominiums erected by construction companies (FRANÇA, 1997). In addition, public resources invested in infrastructure valued the land of allotments built for the middle and upper middle classes, located in the southern area.

The hope of "winning a house" brought to Aracaju a large population contingent, in the hope of allying housing and employment, which did not always occur (FRANÇA, 1999). However, those who were not contemplated, with no place to live, occupied empty land, irregular lots, and places without infrastructure. In addition, they occupied environmentally fragile areas, such as riverbanks, mangroves, floodable areas, with serious consequences.

This irregular housing, which corresponds to the spaces that are "left over", which do not interest the formal real estate market, can still be seen around housing estates, as a way of putting pressure on the government to obtain the home. These houses were built in stages, in the self-construction system, without engineering and architecture technical accompaniment, without financing and disregarding land, urban and building legislation, increasing the housing deficit (FRANÇA, 2016).

My Home My Life Program: a new housing program?

In the face of the international economic collapse that began in the United States and the Federal Government's willingness to accelerate the growth of cities, in 2009, the Residential Lease Program - PAR [Programa de Arrendamento Residencial – PAR] was replaced by the Minha Casa Minha Vida - PMCMV (Law no. 11,977 / 2009) as a strategy to guarantee access to the housing market with the objective of taking care of the families with income up to 10 minimum wages. In fact, the goal was to leverage civil construction in the midst of the economic crisis that plagued the country.

The financing of the housing takes place through the partnership between constructors and the public sector, through the Union, Caixa and City Hall. The initial goal (PMCMV 1) was to build one million houses in 2 years, the distribution of this number was due to the income levels established by the Program. In 2011, the PMCMV 2 was launched, with a doubling target for 2 million homes for the same period, in addition to presenting revised standards for service by the affiliated municipalities.

In Aracaju, the Municipality joined the PMCMV on April 30th, 2009, with the pronouncement of the then Mayor from that time, stating that "the project will contribute to reducing the housing deficit and increase investment in construction and job creation." The detail was that the construction of the houses would be through the constructors, allowing speed to the works, without limitations and bureaucracies of the public sector (FRANÇA, 2016).

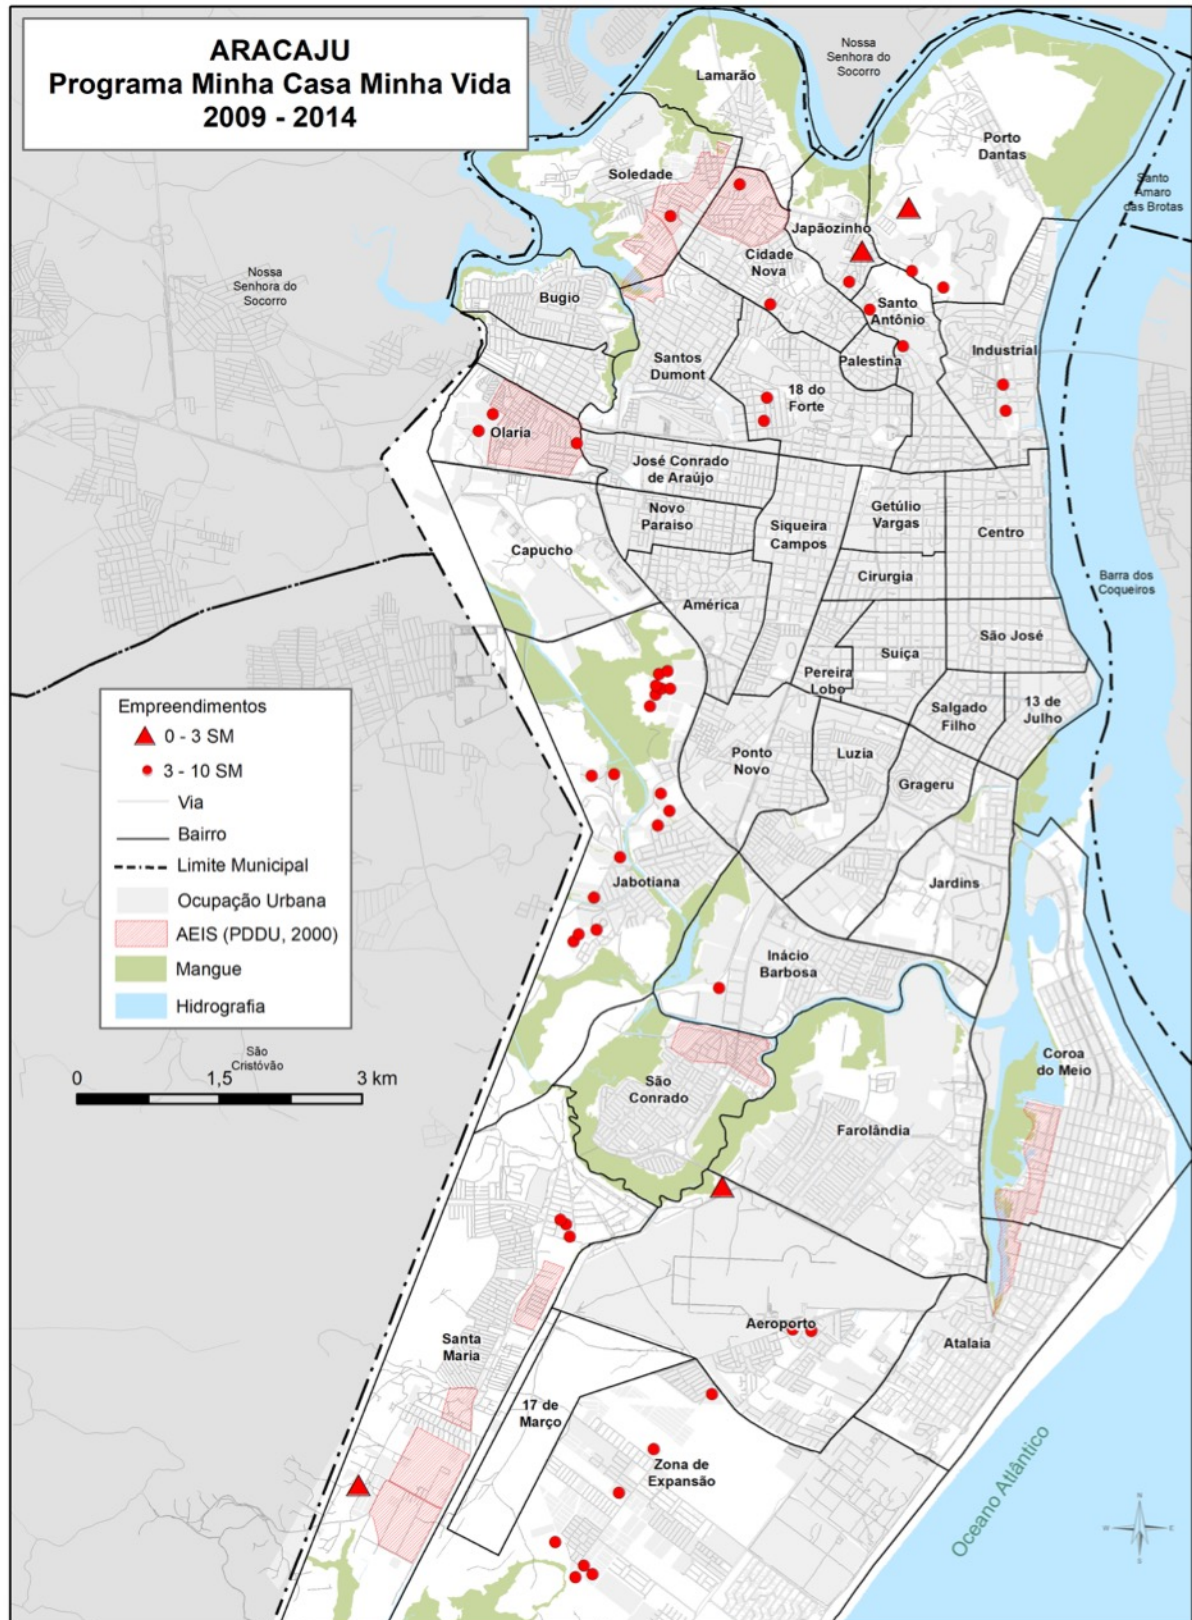

The Program is divided into two service axes: income range between 0 to 3 minimum salaries and 3 to 10 minimum salaries per family. In Aracaju, for the first axis there was a limited production of only 4 projects, located in districts that present infrastructure and public services insufficient and far from the offers of work and public transportation. These 1,262 households correspond to only 12.6% of the total produced, with a small portion of the more than 20 thousand families making up the housing deficit of 2010 (Table 2).

	Up to 3 Minimum Wages	From 3 to 10 Minimum Wages	Total
Housing Developments	4	45	49
Housing Units	1.262	8.724	9.986

Table 2: Aracaju, Programa Minha Casa Minha Vida, Distribution of Enterprises and Housing Units by Income, 2009 - 2014

Source: Elaboration Sarah França, 2016. Data provided by CAIXA (2015).

The small number of projects intended for the 0 to 3 minimum salaries range shows the difficulty in access to urbanized and cheap land to enable the social housing. Therefore, the main obstacle is the pursuit of the real estate market by greater profitability, concentrated in the products intended to the higher income classes, which requires a more incisive action of the State to attend this band (FRANÇA, 2016) (Figure 2).

Figura 1: Aracaju, Programa Minha Casa Minha Vida - PMCMV, 2009-2014.

Source: Elaboration Sarah França, 2016.

Another factor is the institutional and legislative incentives. The Municipal Law No. 93/2009 was enacted, which established flexibility criteria for the enterprises introduced in the ZEIS Special Areas of Social Interest defined in the Master Plan, although these alternatives are not enough to encourage the real estate market to operate in these areas. The lack of articulation by the government to donate public land made it difficult to implement the program in the care of lower income families. Those families that receive from 3 to 10 minimum salaries found a greater offer of housing, for the sale to be favorable to the real estate market. There are 45 housing developments in this range, resulting in 8,724 houses spread across several neighborhoods. In total, between 2009 and 2014, 49 projects were built, totaling 9,986 dwellings. The bulk of the population is located in the northern, western and southern portions of the Porto D'Antas, Jabotiana and ZEU districts, covering 6,410 households (Figure 2)

It is important to point out an advance of the projects on the municipal territory of São Cristóvão, approved by Caixa as if they were from Aracaju. Three projects are located on the banks of the São Cristóvão-Aracaju municipal boundaries, closer to the Jabotiana neighborhood, where a large number of housing units built by PMCMV are located (FRANÇA, 2016).

The guidelines established to carry out the PMCMV provided the free choice of land. However, inefficiency in the implementation of land value instruments has led to the occupation of cheap areas, without availability of infrastructure and public services, attenuating the peripherization, as occurred intensely in the district of Jabotiana and ZEU, places of higher real estate growth in last years.

In these localities, mainly in the Jabotiana neighborhood, in the west zone, the PMCMV's concentration of enterprises, in the range of 3 to 10 minimum wages, occurred continuously. Condos were built close to each other, enhancing the impacts of the transformation from rural to urban (sites were replaced by condominiums) and the predominantly horizontal residential use has given rise to vertical housing (Figure 2)

The agents involved in the PMCMV activities (landowners, developers, builders and state) show that the high value of land urbanized is a major obstacle to the progress of the program, which should be que deveria ser enfrentada... with the application of the tools to combat land speculation included in the Master Plan, especially the ZEIS, whose use by the PMCMV was later encouraged through municipal legislation (FRANÇA, 2016).

It is important to observe the effectiveness of PMCMV not only in quantitative terms, as it is exploited by the public power in the media, but especially, qualitative. The data presented here allowed to consider that the contributions of the program to the fulfillment of the right to housing and to the city are insignificant.

Production of Houses of Social Interest: direction of expansion by the State

The need for an interlocking of land, housing and infrastructure policies and road system is evident in order to guarantee access to urbanized land, allowing the enterprises to be built ZEIS and to a greater extent for those who are concentrated in the income range of 0 a 3 MW. However, Aracaju does not demonstrate this alliance of public management in the sense of providing a fair and egalitarian city.

The insertion of these ventures in places that present bigger parcels with less value was decisive factor in the choice of location. It is noticed that the concern of the management was associated to the dynamization of the economy by means of the established quantitative targets, than by the real fulfillment of the right to housing. It was observed that the programs studied have had serious impacts, even in relation to those implemented in the surrounding municipalities (FRANÇA, 2016).

The 116 housing complexes built between 1968 and 2014 were responsible for spatial fragmentation, resulting in an exclusionary and unequal city. There was no concern to engage in the implementation of other policies, such as infrastructure and mobility. In addition, it can also be noticed that the recent PMCMV ventures are more distant from the urbanized neighborhoods than the former BNH-subsidized residential buildings, re-reading the old experiences and repeating the same difficulties (Figure 3 and Table 3).

	BNH		PMCMV		Total	
	Housing Developments	Housing Units	Housing Developments	Housing Units	Housing Developments	Housing Units
Total	67	26.928	49	9986	116	36.914

Figure 3: Aracaju, Housing Production, BNH and PMCMV, 2000-2014

Source: Elaboration Sarah França, 2016.

The popular housing peripherization was very clear since the BNH period. The recent process continued the expulsion of the low-income classes, extending the occupation out of the urbanized areas and further away from the central neighborhoods than the BNH-funded settlements. The PMCMV is aligned with the same localization strategies adopted by the previous program, distancing the residents of these groups from job offers and from the city with opportunities.

The residential projects of both programs were built in the north, west and south, the latter receiving 13,843 dwellings, equivalent to 37.50% of the total, which reinforces a Santa Maria neighborhoods and Expansion Zone. Analyzing the neighborhoods that have housed the largest amount of housing, it is noted that São Conrado, Jabotiana, Farolândia and Santa Maria account for more than 46% of the total, comprising 17,051 units (FRANÇA, 2016).

As for the housing stock replenishment aspect, these programs have as discourse the reduction of the housing deficit, however, it is not what is verified. The data point to the low effectiveness of care for families with incomes lower than 3 minimum wages, due to the greater difficulty of access to formal housing. The majority of the beneficiaries are in the range of 3 to 10 minimum wages, especially PMCMV which corresponds to more than 90% of the housing offer. This proves the contradictory performance of the program, favoring the segment of higher income, with families from 0 to 3 minimum wages, still lacking the possibility of acquiring their housing. Thus, the same situation that occurred with BNH, with greater employability of resources in the INOCOOP projects, than in Aracaju, financed 67 sets, in contrast to the 47 built by COHAB.

In the speech of the federal government, the PMCMV should meet progressive goals in fulfillment of previous ones, which meant a concern only in quantity of housing, without considering important aspects such as housing quality and the place where these enterprises were inserted. Thus, the rationalization of construction occurs, above all, with the repetition of projects and the construction process, expanding scales and promoting standardization. Unlike BNH, the maximum number of dwellings per enterprise was defined by Federal Law No. 11,977 / 2009, which established a limit of 300 dwellings, in the case of closed condominiums and 500 units in allotments, which is considered an advance in normative terms in the PMCMV. However, builders easily "circumvent" this rule by subdividing projects into stages, but on contiguous land, with the same typologies, constructive solutions, and architectural designs. This practice was identified in the licensing processes, and of the 45 condominiums, 13 were approved in up to 5 stages, totalling 3,567 dwellings, most of them located in the Jabotiana neighborhood and the Expansion Zone (FRANÇA, 2016).

With regard to the quality of housing, both consider only the guarantee of housing (considering the quantity), without taking into account access to infrastructure and public services, further deepening social inequalities. The most recent program deserves severe criticism for directing poor families to peripheral and neighboring areas, deepening the process of segregation and social exclusion and distancing, contradictory to the realization of the right to the city and housing, as guaranteed by the City Statute. In this aspect the PMCMV is considered more aggressive than the BNH of the military that foresaw the removal of the poor to the periphery, but had the idea of the industries and nearby commerce, which did not happen with the recent program, that did not allow commercial activity in its enterprises. That is, a setback.

Brief reflection: is PMCMV a replicate model?

If the PMCMV, in the general scope, evolved in the normative aspect, also reached an amount of housing units *quantidade de unidades habitacionais* much larger than the BNH. In 5 years, 9,986 houses were built, corresponding to 37% of the total financed by BNH in 34 years. That is, quantitatively, the PMCMV was successful. On the other hand, it has regressed on the architectural characteristics of the dwellings and town planning of the enterprise and the environment. It is pointed out, as the main cause, the protagonism of the real estate market in the decisions. The objective of mass profit, violates the right to the city and disregards the quality of the dwellings (in the broad concept), as it applies the quantitative rationality, instead of the qualitative personification of the dwelling and the city.

In an attempt to limit the effects of the economic crisis, as occurred in the 1960s, and repeatedly in the first decade of the twenty-first century, housing policy served to warm up the civil construction sector, inserting it as a determining actor in construction of the dwelling. Considering similarities in the service delivery structure, the families from 0 to 3 minimum salaries that make up the housing deficit, were not reached as the other classes from 3 to 10 minimum salaries. In both, the premise of equating the problematic housing scenario, was not achieved, and there was a sharp chasm between discourse and practice.

The most relevant point is based on the difficulty of access to urbanized land for the implementation of residential groups facing the lower layers, an obstacle that neither the BNH nor the PMCMV were able to face effectively. In contrast, these programs have contributed to aggravate land speculation and social exclusion.

Each new housing complex built in scattered areas, with the justification of the low land value, later implementing infrastructure and road system, with state resources, stimulate land speculation. The population in need of housing, without being able to pay for more equipped areas, moves further, increasing the peripheralisation. There is no doubt that the absence of effective implementation of the instruments to combat speculative land retention and urban real estate and the democratization of access to housing established by the City Statute has contributed, contradictorily, to the rise of the real estate market, for the ineffectiveness of housing policies, and for distancing the fulfillment of the right to the city.

50 Housing Typologies

Transplanting Hong Kong High-rise Housing During the Time of Transition: Wanglongmen Residential Quarter, Chongqing, 1982-1992

Liran Chen (Faculty of Architecture, University of Hong Kong)

As a developed region with overseas identity but maintaining close relationship with mainland China, Hong Kong had profound influences on architectural and urban modernization of mainland Chinese cities in China's post-1978 economic reform era, especially during the early stage of reform. Chongqing is an inland city of China that has been receiving the influences from Hong Kong since the outset of reform, which is a significant aspect of the recent urban history of Chongqing that remains to be explored. Located on Yangtze riverfront area of Chongqing, Wanglongmen residential quarter project (1982-1992) was designed by local architects in Chongqing in the early reform, but was influenced by Hong Kong modern high-rise residential quarters in terms of its general layout, individual building design, flat type design and landscape design. However, the finalized design scheme of Wanglongmen project was significantly different from the orthodox Hong Kong high-rise housing. This paper focuses on the case study of Wanglongmen project in terms of how it was planned, designed and implemented to preliminarily explore how Chongqing learned from Hong Kong in pursuit of modernity in China's early reform era. The study finds that when the orthodox Hong Kong high-rise housing mode was transplanted to Wanglongmen project in Chongqing, such mode interacted with the legacies of China's pre-1978 planned-economy era, including small economic volume, underdeveloped housing commodification owing partly to ideological controversy, and vague building code. The interactions produced walk-up high-rise residences, and influenced building massing and landscaping. Besides, due to the inertia of China's planned economy in the early reform, the design of Wanglongmen project was not aimed primarily at serving capitalist production, so the logic behind some high-rise housing design tactics changed from pursuing commercial profit to pursuing public interest during its transplantation from Hong Kong to Chongqing. The paper argues that when China was transforming from the planned economy to the market economy in the early reform, the influences from Hong Kong were emerging but the remains of the planned-economy era still prevailed. Such inertia of China's planned-economy era hindered Chongqing architects from duplicating Hong Kong housing comprehensively in the early reform, but allowed them to transplant and reinterpret the housing modernity of Hong Kong in an idealistic and creative way.

The Special Interior Reform Plans: An instrument to improve the working class housing estates in Spain during the first years of the current democracy. The case of Valladolid

José Luis Sáinz Guerra (Universidad de Valladolid)

During the first years of the current democracy in Spain, between 1976 and 1990, a period of city government began in which there was a predominance of actions aimed at modifying the city planning of almost all Spain's cities. The city planning policies carried out by these corporations during this first period were of two kinds; on the one hand, a new General Plan was drawn up that curbed the speculative excesses of the preceding period; on the other hand, there were interventions in the peripheral housing estates that needed most doing to them and which had been forgotten by the Administration until that moment. During the periods of intense economic development in the 1960s, faced with the inability of the official city planning to provide answers to the need for housing, many suburbs were built outside the law, lacking municipal authorisations, without architects or planners. Sometimes, they originated in land grabs, irregular sales of plots and self-built slums. The objectives of these plans were to deal with the problems of these housing areas in an integral fashion, through the provision of public facilities and the improvement of both infrastructures and housing. The ideas put forward to justify these policies were: to redress the neglect of these areas by previous governments and the demand for an egalitarian city. In the case of Valladolid, the new city council that arose from the first democratic elections in 40 years selected several suburbs in which to intervene and organised a team of professionals who drew up a Special Interior Reform Plans, known as the "PERIS", with these same objectives. The "PERIS" were the base upon which were built the city planning decisions for these neglected suburbs. This policy was used in the following suburbs: España, Belén-Pilarica, Pajarillos Altos, Las Flores, San Adrián, Las Villas, La Farola, etc.

In conclusion, various operations were set up to recuperate the urban fabric of the city, opening up the field to new experiences in urban interventions; interventions which would clearly mark a renewal of the city planning instruments.

Housing Development Methods as Generator of Forming and Transforming Seoul into an 'Apartment Complex City': 1960s-present

Soe Won Hwang (Seoul National University, Graduate School of Environmental Studies, Department of Urban and Regional Planning)

Seoul has materialized a unique built form on its urban terrain through aggressive apartment building over the last half-a-century. The morphological attributes of Apartment Complex (AC) – a large-scale, single-parcel private territory in Korea – such as diversification of complex design and expansion of green-space allowed by underground parking, and higher density have been increasing. The historical formation of apartment complexes differs significantly based on elements such as the development policies in each period, development mechanisms, the degree of public control, and the extent of private engagement. The development methods as an implementation tool of public policy and city planning dictated how apartment complexes were shaped and where they were to be located. As such, aggressive conversion has resulted in the current urban landscape; Seoul now has over 3,000 apartment sites. The research will examine the consequences of the entire 'apartment complexes' which is defined as possessing more than two apartment buildings in a single complex parcel, in Seoul and their morphological characteristics, particularly affected by development methods over time.

The analysis is composed of (1) basic historical overview on planning policies and development methods that principally encouraged the apartment complex construction in the context of Seoul's urban expansion since the 1970s and (2) morphological attribute of Seoul's entire apartment complexes (2,172)

The main development that promoted apartment complex construction include the Han River Land Reclamation Project (1970s), Gangnam Development and Land Readjustment Project (1970s and 1980s), Housing Site Development Project (1980s to present), Residential Redevelopment and Reconstruction Projects (1990s to present) and other spontaneously built-up areas. The morphological attribute includes the size, shape, layout, density and other spatial aspects of physical elements that constitute apartment complex. To this objective, the formal characteristics of apartment complexes are analyzed in term of such morphological elements as plot (apartment complex as single parcel), building, street and density among others. 'Internal forces' and 'external forces' influencing the morphological characteristics is examined, where internal force refers to the interrelationship between the morphological elements and external force means the influences coming outside of the physical form itself, such as development method and development period. Evidences based on data analysis will present a grounded typological understanding of the form of apartment complexes. The morphological characteristic in relation to development method provides insights related to genesis aspects of apartment complex emergence regarding its morphological characteristics. This study aims at understanding Seoul's urban form and landscape through apartment complexes. By focusing on a morphological aspect, the study intends to examine the spatial manifestation of an aggressive apartment complex building that has formed and transformed Seoul over the modernization years.

Transplanting Hong Kong High-rise Housing During the Time of Transition: Wanglongmen Residential Quarter, Chongqing, 1982-1992

Liran Chen

* PhD Candidate, Department of Architecture, University of Hong Kong, clraaa@sina.com

Hong Kong has been influencing the urban development of Chongqing since China's post-1978 reform, which is a significant aspect of the contemporary urban history of Chongqing that remains unstudied. This case study focuses on the planning, design and implementation of Wanglongmen residential quarter project (1982-1992) to preliminarily explore how Chongqing learned from Hong Kong in pursuit of modernity in the early reform. The study finds that its planning and design were inspired by orthodox Hong Kong high-rise housing mode, but when transplanted to Chongqing, such mode interacted with the legacies of China's pre-1978 planned-economy era, including small economic volume, underdeveloped housing commodification owing partly to ideological controversy, and vague building code. The interactions produced walk-up high-rise residences, and influenced building massing and landscaping. Besides, the logic behind some design tactics changed from pursuing commercial profit to pursuing public interest during the transplantation. The paper argues that when China was transforming from planned economy to market economy in the early reform, the influences from Hong Kong were emerging but the remains of the planned-economy era still prevailed. Such interim hindered Chongqing from duplicating Hong Kong housing comprehensively, but enabled Chongqing to reproduce Hong Kong's modernity in an innocent and creative way.

Introduction

Mainland China re-opened itself to the western world since 1978 to practice economic reform, trying to receive overseas influences as a way to modernize the state. During the early reform era, the first wave of impact on mainland China was from overseas Chinese regions, including Hong Kong.¹ Hong Kong was a developed region with overseas identity but geographically adjacent to mainland, and Hong Kong residents were familiar with Chinese culture and could effectively communicate with mainland in Chinese language, which facilitated the communication and exchange between mainland and Hong Kong. Hong Kong had significant influences on the architectural and urban modernization of mainland China in the reform era. For example, in the early reform, by referring to Hong Kong, mainland was able to develop land marketization and housing marketization, and by introducing the practice of Hong Kong architects to mainland cities, mainland was able to be familiar with the modern design concepts and approaches of some building types (such as international hotel).²

As an inland major city of China, Chongqing was influenced by Hong Kong at the outset of reform as well. Wanglongmen residential quarter was among the earliest modern high-rise residential quarters of Chongqing. The project was conducted from 1982 to 1992, a period when China was transforming from the socialist planned economy system to the market economy system, and when Hong Kong high-rise housing cases were being introduced to mainland China. The general layout, individual building design, flat type design and landscape design of the project were all influenced by Hong Kong. However, the finalized design scheme was significantly different from the orthodox Hong Kong high-rise housing. The case study analyses the process of Wanglongmen residential quarter design to answer the following questions: what influences did Hong Kong have on the planning and design of Wanglongmen residential quarter? In what ways did the architect absorb such influences, and how were the ways of absorbing the influences related to the context of China's early reform? The paper attempts to contribute to the research of the influences of Hong Kong on the urban development of Chongqing during the early reform, a significant aspect of the contemporary urban history of Chongqing that remains to be explored.

Learning from Hong Kong Proactively: Designing Wanglongmen High-rise Residential Quarter

During the socialist planned-economy era before 1978, China followed the development strategy prioritizing production over consumption. Industrial development gained priority, while housing, categorized as part of social welfare and not directly productive, did not receive adequate investment. Such development mode incurred low-level housing development and housing shortage.³ During the early reform era, Chinese cities launched urban regeneration and attempted to resolve urban housing shortage.

Located on the riverfront mountainous slope of Chongqing, Wanglongmen area used to be a shanty town with poor living conditions.⁴ In 1982, the Real Estate Bureau of Chongqing (hereafter abbreviated as REBC) listed Wanglongmen area as one of the key areas for regeneration.⁵ The regeneration of Wanglongmen area was primarily aimed at resolving the housing shortage and improving the living conditions of local residents by replacing the shanty town with modern residential environment, rather than pursuing commercial profit: the commercial property market in the early 1980s of Chongqing remained to be developed.

REBC entrusted the regeneration design to the local architect Congzheng Zhang.⁶ Assisted by his colleagues, Zhang produced a design of high-rise residential quarter for Wanglongmen area in 1983.⁷ Zhang planned to set high-rise residences along the edge of the site (Figure 1), arguing that such layout could not only accommodate all the residents wishing to move back after the regeneration, but also leave adequate open space at the centre of the area.⁸ Therefore, Zhang set five high-rise buildings along the edge of the site, including Building I, II, III and V as residences and Building IV for office and commerce use.⁹ By applying high-rise housing, the number of households the site could accommodate raised: before regeneration, 494 households were to be relocated, while Wanglongmen residential quarter would provide dwelling for 901 households.¹⁰ Meanwhile, the site coverage decreased from 67% to 44%.¹¹

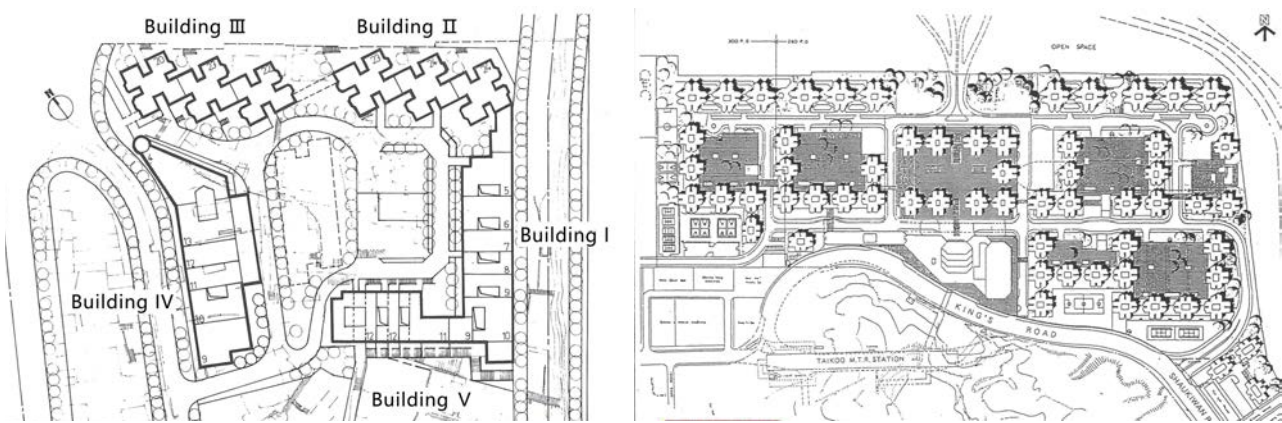

Figure 1. The Master Plan of Wanglongmen Residential Quarter in Chongqing (Left) and Taikoo Shing in Hong Kong (Right)

As Zhang recalled, in the early reform era, mainland architects were beginning to be exposed to Hong Kong high-rise housing cases.¹² In the mid-20th century, Hong Kong bore massive influx of immigrants from mainland China.¹³ In 1956, Hong Kong government released the new Building Ordinance allowing the increase of building height to accommodate the increasing population,¹⁴ which triggered the high-rise development in Hong Kong. Faced with constructive land shortage, both the public housing and commercial housing development in Hong Kong fought for every inch of land: public housing strived to increase the number of floors to provide residential space for the soaring population, while commercial housing increasingly added floors to enhance plot ratio to maximize commercial profit. Besides, both of them evolved towards modern high-rise residential quarters with integral planning and equipped with comprehensive supporting facilities. Such residential quarters as public housing appeared in the late 1950s, represented by North Point Estate (completed in 1957).¹⁵ For commercial housing, in the late 1960s, as the economy of Hong Kong started to take off, the middle class of Hong Kong emerged, and their demand for housing promoted commercial housing development, and high-rise residential quarters with superior quality started to be popularized after the commercial success of Mei Foo Sun Chuen (developed from 1965-1978).¹⁶

Since China's reform, the planning and design approaches of high-rise and high-density residential quarters in Hong Kong were widely introduced to mainland China, and "it was fashionable at that time to learn from them."¹⁷ By reviewing the available papers published in mainland architectural journals between 1978 and 1983 that involved high-rise and high-density housing development of Hong Kong,¹⁸ one can catch a glimpse of how mainland architects at that time perceived Hong Kong high-rise housing:

Firstly, on the one hand, some of such papers emphasized the capitalist nature of Hong Kong and its housing problems incurred partly by capitalism and free market, such as high housing price, scarce housing resources and uneven distribution of housing resources to different social classes; on the other hand, most papers accepted and praised Hong Kong high-rise and high-density housing design approaches, and expressed the authors' eagerness

to learn from them. This to some extent reflected an ambivalent attitude of mainland Chinese towards overseas civilization during the early reform.

Secondly, these papers frequently referred to some Hong Kong housing design approaches, including: the comprehensive planning of residential quarters; taking advantage of high-rise housing to increase residential density and decrease site coverage simultaneously; the mixed-use development of residential quarters; the emphasis on landscaping for exterior space, even if such space was very limited; the three-dimensional design mode, such as “podium & tower” mode;¹⁹ the popularity of high-rise tower, or the connection of individual high-rise towers into a slab; and the popularity of the concept of “living room” in the flat type design in Hong Kong. These Hong Kong high-rise housing design tactics had profound influences on mainland urban housing development.

The design of Wanglongmen residential quarter coincided with some of the features listed above. Firstly, as aforementioned, Zhang placed high-rise residences on the site edge and left open space in the middle to increase residential density and decrease site coverage simultaneously, and it was inspired by Hong Kong. In addition, when the concept of living room was not popularized in mainland during the early reform, in Wanglongmen residential quarter design, each household in Building II and Building III was equipped with a living room, which was also influenced by Hong Kong. Furthermore, the plans of Building II and Building III were not perpendicular to the riverbank, but were rotated to provide river view to as many households as possible. At that time, Taikoo Shing, a large scale commercial residential quarter in Hong Kong, was frequently exposed in mainland architectural journals. In this project, the edges of the plans of the 13 residential towers set closest to Victoria Bay were not parallel to its waterfront bank line. Instead, such plans were diamond-shaped to provide more households with river view,²⁰ and this inspired Zhang to rotate Building II and Building III for the same purpose. These features demonstrate the influences of Hong Kong high-rise housing on Wanglongmen residential quarter in China's early reform.²¹

The Controversies of High-rise Housing in the 1980s of China

However, when Hong Kong high-rise housing mode was being introduced to mainland in the early reform, whether high-rise housing was suitable for relieving urban housing shortage was controversial in China. The proponents argued that high-rise housing would help save land resources, improve the living condition of the residents, increase urban greening, enhance residential density, and modernize the cityscape; the opponents argued that high-rise housing would demand high investment, long duration of construction, high consumption of energy and building materials, and provide the residents with less livable environment, etc.²² Elevator was an important factor that put high-rise housing in dispute. For example, during the National Colloquium on the Economic Effects of High-rise Housing held in 1981 in Shanghai,²³ the participants pointed out that the cost of the operation and maintenance of elevators was the main source of the everyday operation cost of high-rise residences. For instance, “the total cost of elevator operation and maintenance of the high-rise in residences in Qiansanmen area in Beijing in 1980s reached 750000 yuan, while the rental income of these residences was no more than 500000 yuan, insufficient to cover the expenses incurred by elevators. In Shanghai, for the high-rise residences in such areas as Baijiudian, Beizhan, Lujiazhai and Caixibeilu, the cost generated by elevators took up 61%-98% of the rental income of high-rise residences.”²⁴

Therefore, developing high-rise housing in the early reform was a challenging option, and scarce finance was an important obstacle. It should be noted that such scarcity was not only because of the small economic volume of China in the early reform era, but also partly because of the economic system then: although the state initiated housing reform since 1979,²⁵ in the early 1980s, due to the remains of China's socialist planned economy, whether urban housing should be regarded as commodity remained ideologically controversial: some insisted on the nature of housing as welfare, while some totally denied it, or regarded its nature as the combination of welfare and commodity.²⁶ Such controversy to some extent impeded housing commodification in the early 1980s, and hindered the diversification of the sources of housing finance, which partly contributed to the shortage of housing investment as well.

However, REBC accepted Zhang's high-rise housing scheme, largely because the residences in the scheme were not equipped with elevators at all.

Localizing Hong Kong High-rise Housing: Walk-up High-rise Residences

Zhang faced two problems during the project design. Firstly, high-rise residences would request the provision, operation and maintenance of elevators, imposing significant financial pressure on the project owner and the residents, thus reducing the feasibility of project implementation. Secondly, the project was located on the riverfront mountainous slope: when the residents returned, they would have to walk down 20-38m on the slope to

the bottom floors of the residences and take elevators to ascend to their respective households; when they went out, they would have to climb 20m-38m up the slope on foot after descending to the bottom floors by elevator.

Zhang attempted to resolve the two problems simultaneously by taking advantage of mountainous topography to equip the residences with extra entrances that directly accessed the middle floors. Taking Building II and III as an example: Zhang set an elevated corridor that connected the waists of Building II and III with the top of the adjacent slope, so that the residents could directly enter the waists of Building II and III without walking down the slope, and then ascend or descend to respective floors on foot, which could significantly reduce the vertical walking distance (Figure 2). Also, by controlling the elevation of the corridor and the height of Building II and III, Zhang managed to guarantee that any resident in the buildings could access the nearest entrance by ascending or descending no more than 9 floors. In 1983, the first version of *Code for Fire Protection Design of Tall Buildings GBJ45-82 (Trial)* was put into trial. In this building code, residences with no more than 9 floors were categorized as multistory buildings.²⁷ As the earliest version of *Code for Fire Protection Design of Tall Buildings* in mainland China, the code remained to be deepened, and did not allow for the condition of building practices on mountainous topography. In other words, whether the residences in the cases such as Wanglongmen residential quarter should be considered as the high-rise or the multistory was not specified in the code. By taking advantage of the vague point of the code, Zhang argued that Building II and III could be built following the standards of multistory residences, so that the installation of elevators could be cancelled to save budget.

Figure 2. Transforming the High-rise into the Multistory with the Corridor by Taking Advantage of Mountainous Topography

As an approach without any historical precedent, the design of walk-up high-rise residences triggered controversies and doubts. To verify whether this design approach was really reasonable, by taking Building II and III as an example, Zhang compared the proposal of “walk-up high-rise residences with elevated corridor” with “high-rise residences with elevators without elevated corridor”, calculating the estimated vertical walking distance of the residents and the estimated investment in respective cases. As the result indicated, in the condition of “high-rise residences with elevators without elevated corridor”, the residents of Building II and III would have to ascend and descend on foot for a daily total height of 21.57km, while such height would be only 10.77km in the condition of “walk-up high-rise residences with elevated corridor”. In the aspect of investment, for Building II and III, the estimated cost of the construction and management of elevators was 2.097 million Chinese yuan, while it would cost only 0.3385 million Chinese yuan to build the elevated corridor.²⁸ Therefore, Zhang managed to convince different parties that the proposal of walk-up high-rise residences with elevated corridor could save both climbing distances and cost, and the proposal was finally accepted by all parties. However, Zhang still reserved the space for elevator shaft in each residential unit of Building II and III (Figure 3), in case of the future need for elevators.

Figure 3. Zhang Reserved Space for Elevator Shafts, Marked with Dotted Lines

Wanglongmen walk-up high-rise residential quarter was a variation of Hong Kong high-rise housing planning and design mode after being introduced to Chongqing. On the one hand, it was the shortage of housing investment that led to the cancellation of elevator installation; on the other hand, the vagueness of building code facilitated such adjustment. The investment shortage, as aforementioned, was not only due to the small economic volume of China during the early reform, but also because of underdeveloped housing commodification in China's early 1980s partly because of ideological controversy.²⁹ The vagueness of building code was another legacy of planned-economy era that reflected the backwardness of housing development techniques in the planned-economy period and its low starting point of development in the early reform. Therefore, Wanglongmen walk-up high-rise residential quarter was produced by the interaction between the high-rise housing mode introduced from Hong Kong and the economical, ideological and technical legacies of China's planned-economy era.

Such interaction also affected the massing of Building I along the riverbank. Compared to the other three residences, Building I could offer its households the best access to river view, which would be a significant selling point for commercial property today. However, instead of maximizing its volume, Zhang shaped it into a terraced form, which generated a void of 60 meters wide so as to "provide access to beautiful river view to around 75% of the households in the residential quarter".³⁰ In other words, by sacrificing the number of households in Building I with the best river view, Zhang created the terraced form for public interest. Since the 1990s, however, as housing commodification developed in Chongqing, commercial property projects occupied riverfront sites with maximum development intensity competing for access to river view as a selling point, and a growing number of commercial high-rise residences along the riverbanks formulated a "high-rise wall" that separated the rivers from the built areas behind the riverbanks, privatizing the river view and making it the privilege of the households closest to the riverbank (Figure 4). In contrast, for Wanglongmen residential quarter, on the one hand, the high-rise housing introduced from Hong Kong made it possible to maximize the volume (and therefore, the commercial potential) of Building I as the building with best river view resource; on the other hand, as China's socialist planned economy system remained to be fully transformed to market economy system in the early 1980s, and whether housing should be regarded as commodity remained controversial, the design of Building I was not based on the maximization of commercial profit, but was aimed at public interest. Such riverfront high-rise residence with terraced form was produced by the interaction between the high-rise housing introduced from Hong Kong and the legacies of the the planned-economy era (including the remains of planned economy system and the inertia of positioning housing as welfare).

Figure 4. The Terraced Form of Building I (Left) that was Aimed at Public Access to River View, and the “High-rise Wall” in Chongqing since the 1990s that Privatized River View (Right)

Although Zhang strived to reduce project budget via design, after the design scheme was produced, the parties concerned still could not provide sufficient funds for project implementation. Besides, the complex topography also increased the difficulty of construction. Consequently, the project was suspended for five years.³¹

1985: Visiting Hong Kong and Its Consequences

In 1985, Zhang was working for the project of The South China Oil Center, which was co-invested by the investors from mainland China and Hong Kong. The Hong Kong investor invited the project design team to pay a short visit to Hong Kong to broaden their eyesight. This influenced the design of Wanglongmen residential quarter.

As Zhang recalled, he was greatly impressed by the commercial housing properties he visited in Hong Kong, such as Taikoo Shing: “I found that some residential quarters of Hong Kong, despite limited site area, were beautified with elaborate landscape design, while we did not attach importance to landscaping at that time.”³² “Even a small segment of space was carefully decorated.”³³ This echoed the general impressions of mainland architects on Hong Kong high-rise development then: in the early reform, practicing exquisite landscaping for residential quarters was a relatively novel concept for mainland architects, and they perceived the delicate landscape elements in Hong Kong residential quarters as a representation of modernity. Inspired by the landscape he saw in Hong Kong, Zhang practiced landscape design for Wanglongmen residential quarter after returning to Chongqing, mainly in the form of roof landscaping (Figure 5). Zhang particularly hoped to enliven the terraced roof of Building I with landscaping, making it a public space accessible not only to the residents in Building I, but also to the whole residential quarter.³⁴

Figure 5. Rooftop Landscape Design for Wanglongmen Residential Quarter, Chongqing (Left), and the Landscape Elements Built in 1979 in Taikoo Shing, Hong Kong (Middle & Right)

Zhang’s reaction to the landscape design in Hong Kong exemplified how Hong Kong impressed mainland-China architects as a highly modern city and how eager mainland China was for modernity at that time. However, it

should be noted that the landscaping for the Hong Kong commercial housing properties that Zhang visited, including Taikoo Shing, was based on the logic of capitalist production: such landscaping was part of the means of stimulating the sale of property. By transplanting such landscape elements from Hong Kong to Chongqing, Zhang attempted to beautify the public space of Wanglongmen residential quarter only for public good. In other words, the logic behind such landscape elements changed during the transplantation, from pursuing capitalist profit to pursuing public interest. During the 1980s, on the one hand, China began to re-open itself to the western world, and the overseas design approaches could be introduced to China; on the other hand, the commercial housing market remained to be developed. It was this intermediate state of China's 1980s that enabled Zhang to absorb design experiences from Hong Kong commercial properties, but apply them for public good instead. Such interim nature of China's 1980s made it possible for mainland architects like Zhang to remain a pure and idealist attitude towards modernity at that time.

To improve the chance of getting the landscape design implemented, Zhang designed landscape elements with simplified form as a way to control construction cost.³⁵ Compared to the landscape elements with diverse decorative materials in Taikoo Shing, the rooftop landscape sculpture elements was covered only with the mosaic of different colors. However, during the working drawing joint review, it was still decided that the construction of rooftop landscape be cancelled.³⁶ The scarcity of housing finance, a legacy of China's planned-economy era, once again conflicted with the architect's pursuit for housing modernization inspired by Hong Kong.

The Progress of Housing Commodification and Project Implementation

In 1987, Chongqing made considerable progress on the housing reform, such as the establishment of the real estate trading center of Chongqing in April,³⁷ the release of *The Reform Plan of Chongqing Urban Housing System (Exposure Draft)* on 31st April,³⁸ the imposition of land use fee on the departments and individuals using urban land starting on 1st July,³⁹ and the organization of two Real Estate Individual Trade Fairs in September and October.⁴⁰ In this context, not only some enterprises showed their willingness to invest in Wanglongmen residential quarter project, but also REBC itself estimated that there should be an increasing number of individuals purchasing housing in the future.⁴¹ The progress in housing commodification in Chongqing gave REBC the confidence for project implementation. In the same year, REBC re-evaluated the feasibility of Wanglongmen residential quarter project, and was convinced that the project construction was financially feasible.⁴² The construction started in 1988,⁴³ and the project was completed in 1992,⁴⁴ ten years after it was initiated.

Conclusion: Housing Transplantation During the Time of Transition

As an inland city, Chongqing had less direct communication and interaction with Hong Kong than the Pearl River Delta region, and Wanglongmen residential quarter project was conducted locally without involving any Hong Kong stakeholders. However, the local architect proactively absorbed housing design experiences from Hong Kong. This reflects the strong motivation of mainland architects in the early reform to learn from overseas in pursuit of modernity, and indicates how profound and wide Hong Kong's influences had on the urban development of mainland China then.

However, the project design was conducted when mainland China was still transforming from the socialist planned economy to the market economy, and such transitional nature obstructed Chongqing from learning from Hong Kong comprehensively. When Hong Kong high-rise housing was introduced to Chongqing, it frequently conflicted with the scarcity of financial and technical resources, due to the legacies of the socialist planned-economy era: economically underdeveloped during the planned-economy era, Chongqing could not fully afford the introduced Hong Kong high-rise housing mode at the outset of reform; as whether housing should be commodified remained controversial then, housing property market remained to be developed, leading to the lack of diverse sources of housing investment, which exacerbated the scarcity of housing finance; the development strategy of mainland China during the planned-economy era that prioritized production over consumption led to low-level housing development, and resulted in the low starting point of the development of housing-related techniques in the early reform, which brought about the vagueness of building code then. These legacies of the planned-economy era combined to interact with the Hong Kong high-rise housing mode introduced to mainland China. Sometimes, the interaction hindered the implementation of some introduced design strategies, such as the landscaping for the residential quarter. Sometimes, it dramatically produced the variations of Hong Kong high-rise housing, such as walk-up high-rise residences, embodying the local architects' creativity peculiar to the early reform. Besides, due to underdeveloped housing commodification in Chongqing, when the architect was being exposed to the impact of Hong Kong commercial housing design tactics, he was able to transplant them in pursuit of public interest instead, during which he unconsciously endowed such tactics with new meaning, reflecting an innocent and idealized mentality of local architect in pursuit of modernity in the early reform. The case of Wanglongmen

residential quarter indicates the complexity and uniqueness of architectural knowledge exchange between mainland China and Hong Kong during the early reform, owing to the interim nature of this period.

⁴ Before regeneration, the rate of dilapidated housing in Wanglongmen area was 80%, and most of the extant built structures within the area were improvised column-and-tie buildings constructed in 1930s and 1940s. In 1970s, two residents in Wanglongmen area died from the collapse of dilapidated buildings. Besides, the area was also threatened by unsafe geologic conditions such as unstable rocks. In addition, the living conditions in this area was extremely crowded. For dwelling space, the residences with a total floor area of 12639m² were occupied by 494 households, namely over 2200 residents. In 95 households, two generations shared one room; in 31 households, three generations shared two houses, and for the households with extremely crowded residential space, the average floor space per capita was merely 3.16m². Seoul's Morphology as 'Apartment Complex City' Shaped by Housing Development Methods

Soe Won Hwang*

* PhD, Environmental Planning Institute, Seoul National University, soehwang@gmail.com

Seoul has materialized a unique built form on its urban terrain through aggressively constructing apartment complexes, a large-scale, single-parcel private territory, over the last half-a-century. The historical formation of apartment complexes differs significantly based on elements such as the development policies in each period, development mechanisms, the degree of public control, and the extent of private engagement. The research will examine the consequences of the entire 'apartment complexes' in Seoul and their morphological characteristics, particularly affected by development methods over time. The analysis is composed of (1) basic historical overview on planning policies and development methods that principally encouraged the apartment complex construction in the context of Seoul's urban expansion since the 1970s and (2) morphological attribute of Seoul's entire apartment complexes (2,172). The formal characteristics of apartment complexes are analysed in term of such morphological elements as plot (apartment complex as single parcel), building, street and density among others. The morphological characteristic in relation to development method provides insights related to genesis aspects of apartment complex emergence regarding its morphological characteristics. By focusing on morphological aspect, the study intends to examine the spatial manifestation of massive apartment complex building that has formed and transformed Seoul over the modernization years

Keywords: Apartment Complex Urbanism, Seoul, Housing Development Methods, Apartment Complex Morphology

Apartment Complex City as Asian Urbanism

During the past half century, Asian cities and their urban landscapes have undergone dynamic, chaotic, and contradictory evolution through the periods of colonization, modernization, urbanization, and globalization (Rowe, 2005; Lim, 2008; Watson, 2011). According to Parent et al. (World Bank, 2016), higher-income countries in East Asia demonstrate a higher degree of urbanization in terms of land and population, exemplifying the close relationship between urbanization and urban growth. In these countries, economic prosperity enables a proactive state to promote a world-class city in terms of infrastructure and reputation, resulting in similar urban environments. This is evident in the emergence of similar business districts, cultural venues, iconic towers, consumption architecture, and gated communities alongside increasing global activities (Marshall, 2003; Buck, 2006; Chang and Kim, 2016). The similarity of the Asian urban form has also been ascertained in residential environments. The limited time in which to become a prosperous world city and limited territory mean that similar high-rise and high-density apartment complex buildings have emerged in East Asian cities. Rowe (2014) explains that the 'superblock configuration' which was widely adopted in the form of mega-plots implemented with multi-unit housing with community facilities that were commonly developed in East Asian countries. In Singapore and Hong Kong, most public housing is supplied in the form of blocks, or otherwise complexes comprise mid to high-rise apartment buildings. The high-quality communal domain is grouped with diverse outdoor common spaces and facilities around tall residential towers (Rowe, 2005). Japan controls large-scale apartment complexes in the city center and channels them to the outskirts of the city. Since the early 21st century, China has strived to successively construct numerous apartment complexes. In Seoul, apartment complex buildings are regarded as the most efficient way to supply large-scale modern housing (Lim, 2008; Jun, 2009; Park I.S., 2013).

Seoul as an 'Apartment Complex City'

Seoul's apartment complex development is an extraordinary urban phenomenon in which traditional housing types were replaced with new ones over a period of half a century, and distinctive spatial and morphological attributes materialized across the urban terrain. Apartment complexes have been aggressively constructed in Seoul, primarily to address its chronic shortage of housing (Figure 1). However, the quality and standard of housing has not been guaranteed as the supply focus has been on quantity and feasibility. The consequences are

high-rise, high-density apartments everywhere irrespective of the urban landscape, enforcement of uniform or standardized living environments, and native residents who cannot afford the redeveloped environment that is oriented to development profit (Lee, 2002: 114–115). Nevertheless, how did apartments become the popular housing type preferred by the majority, and specifically the middle class? Gelézeau brings up the profit-gain alliance between the government, the private sector (explicitly Jaebol, who owns major construction companies), and the middle class that supports the massive provision of apartments (Gelézeau, 2007). The intervention of the government and housing policy have been based on a market-dominated approach, encouraging ownership rather than renting because the notion of a “house” possesses high value as an asset and high marketability (Jun, 2009: 56).

Figure 1. Annual housing constructions between 1965–2015 (left) and supply quantity by housing types in Seoul (right)

Forming and Transforming Seoul by Multiple Housing Development Methods

Seoul became an apartment city consequent to the aggressive development of apartment complexes over the last half century. Unlike the traditional infill developments on small parcels, apartments were constructed on large parcels, resulting in numerous apartment complexes. Apartment complexes are constructed individually or in a group, spontaneously or following master plans depending on the development method applied. The historical formation of apartment complexes differs significantly based on elements such as the development policies in each period, development methods, degree of public control, and the extent of private engagement. The development methods as an implementation tool of public policy and city planning dictated how apartment complexes were shaped and their location. This section overviews the planning policies and development methods that principally encouraged the construction of apartment complexes in the context of Seoul’s urban expansion since the 1970s.

As Table 1 shows, mainly seven development methods that were applied in the formation and transformation of apartment complexes in Seoul from the 1960s to 2010s. Development methods are differentiated as new development methods and redevelopment methods. The former applies to the construction of new apartment complexes on vacant sites, while the latter refers to renewal projects in existing built-up areas or apartment complexes. These development methods are supported by the planning laws institutionalized to respond to city planning issues pertaining to city growth, renewal, and housing supply at different times (Figure 2).

Table 1. Development methods and construction of apartment complexes over time

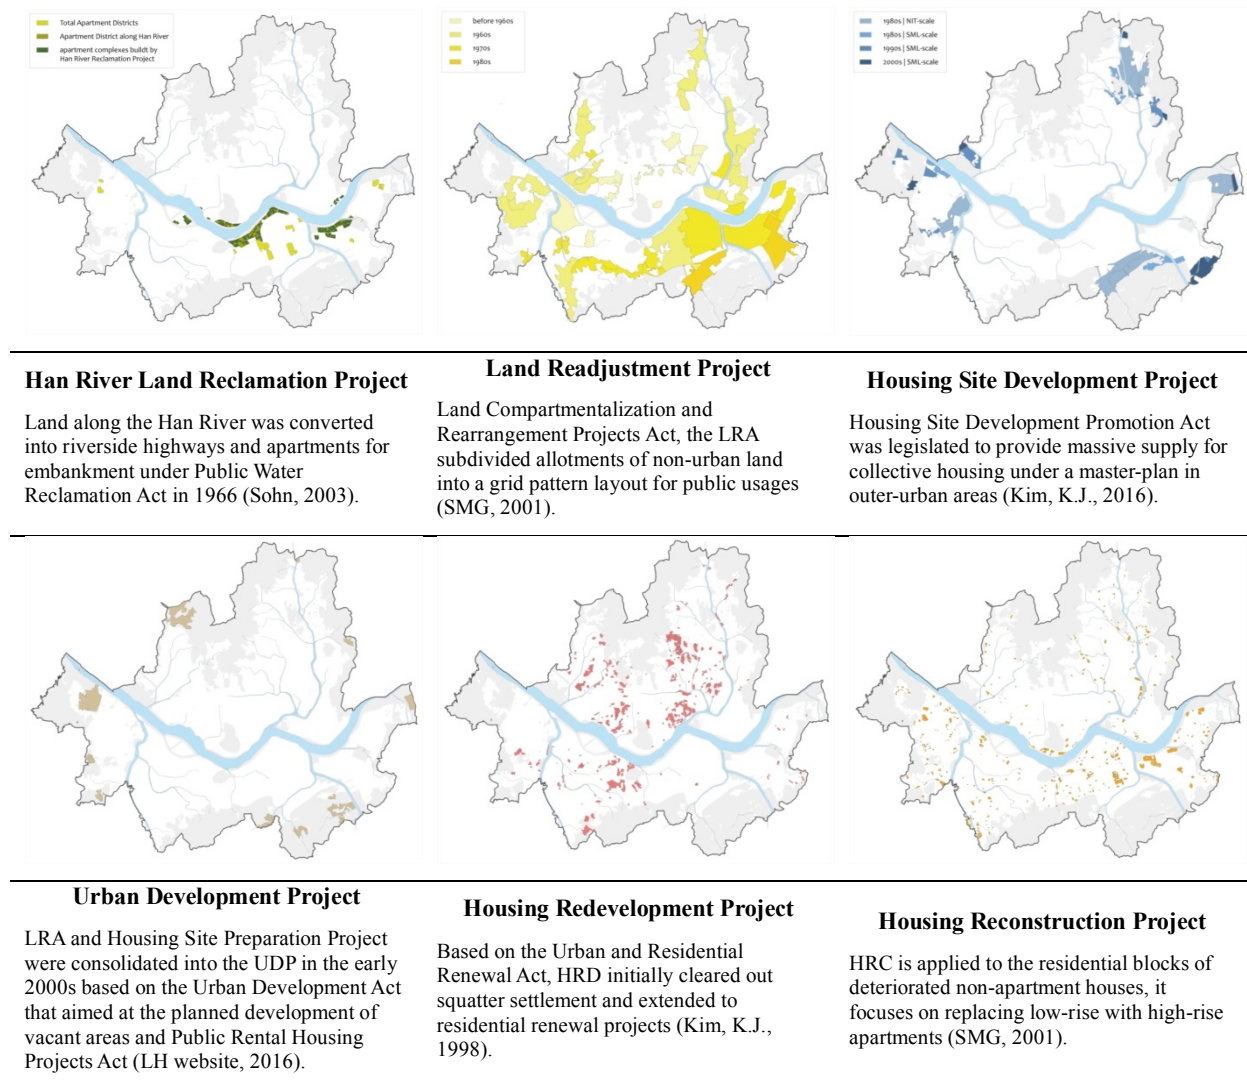

Figure 2. Multiple housing development methods promoting apartment complex construction

Method

This study is based on the premise that Seoul demonstrates unique and indigenous morphological characteristics of apartment urbanism through the ‘cumulative effects’ of different periods of development in terms of the construction of apartment complexes. Based on this intention, the study employs analysis framework from the urban morphological studies, where a parcel is the base unit of urban form, while containments within a parcel such as buildings, building use, or open space around the building are considered as urban cells (Moudon, 1994). An apartment complex is a development unit viewed as an urban cell, and simultaneously embeds the quality of the urban tissue based on a large parcel that comprises multiple buildings as well as an internal road system, broad open space for parking, and greenery. Locational and geographical siting and density is added to the traditional methodology of analysing the dimensions of parcel, building, and street (Table 2). In addition the database, which was coded by formal type for each apartment complex, enables an examination of the internal and external forces influencing the morphological characteristics. The term internal force refers to the limitations and opportunities of morphological element, whereas each dimension of the morphological elements is investigated in terms of development methods, as they reflect the specific external forces shaping the urban form. The morphological elements were statistically examined through a descriptive analysis and chi-squared test to determine the current condition according to development method.

The database on Seoul’s apartment complexes was constructed based on two resources: 1) The Seoul Metropolitan Government’s “2015 status of multi-unit housing data of Seoul,” and 2) the “2015 new address base map,” which is open data provided by the National Spatial Information Clearinghouse (NSIC), while other data information was employed to supplement these main sources (Table 3). The chronological extent of this study spans 45 years from January 1970 until December 2014, and encompasses 2,172 apartment complexes.

Morphological Characteristic by Seven Development Methods

Siting Topography

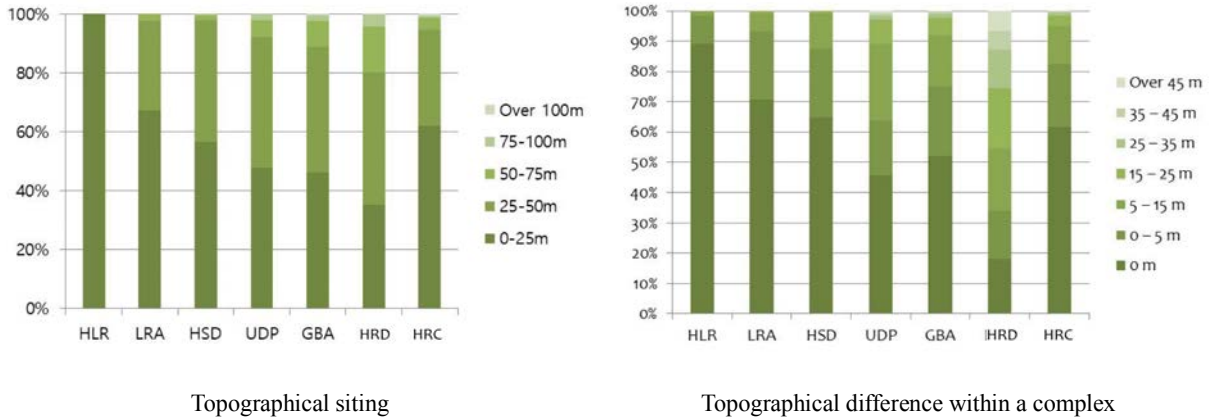

Figure 3. City-wide siting topography and topographical difference within a complex

In general, most planned apartment complexes are located at a low altitude in terms of topography. In addition, most low-level flatlands are distributed along the lower area of the Han River, namely in the Gangnam region and towards the Southwest area which has a broad flatland area lower than 5 m. Over the years, Seoul apartment complexes have become located at a higher elevation. Among those situated at an altitude higher than 50 m, more than 50% were developed in the 2000s and after, mostly through the Housing Redevelopment Project. This siting pattern sometimes exaggerates the natural topography, creating a massive enclosure of ordinary residential neighborhoods in the lower part of the city. Most apartment complexes were developed on the flatlands or slightly inclined sites under Han River Reclamation, Land Readjustment and Housing Site Development, while spontaneous and individual development method shows certain degree of topographical differences in a single complex (Figure 3)..

Parcel

Regular				Irregular		
Trilateral Right/ Acute/ Obtuse	Tetragon Square/ Rectangle/ Trapezoid/ Parallelogram	Deformed polygon Protruded/ Recessed/ Deflected (bent)	Partially curved Partially planned curve with straight lines	Partially irregular mixed with straight lines	Completely irregular over all shape 'or' meandering, crooked boundary	Extremely irregular Overall warping shape 'and' zig-zagging boundary

Reference for specific parcel shape classification

Figure 4. Parcel size and specific parcel shape by different housing development methods

A relatively high proportion for the largest type measuring more than 100,000 m² can be attributed to the population influx, which exceeded 10,000,000 people in 1988, and the government's active role in promoting the provision of large-scale complexes in policies such as the Housing Site Development Promotion Act, Housing Construction Promotion Act, and projects like the Han River Reclamation and Housing Site Development. Housing Redevelopment Projects were implemented on a smaller scale according to the Housing Redevelopment Master Plan and smaller apartment sites of less than 50,000 m² were under the developing Land Readjustment Projects and Housing Reconstruction Projects executed for smaller complexes. This was reflected in the overall decrease in parcel size in the 1990s and 2000s. However, in the 2010s, large development projects such as the Eunpyeong Newtown, Sang-am Housing Site Developments executed under the Housing Reconstruction Projects of large apartment complexes along the Han River and these reconstructions of existing apartment complexes increased the portion of parcel sizes ranging from 10,000 m² to 50,000 m².

Relational patterns emerge from the specific parcel shapes and development methods. Regarding the form of the parcel, those in the Land Readjustment and Housing Site Development Project are mostly of a square, rectangle, or protruded rectangle shape. However, in the Urban Development Project, most parcels are partially curved, which is also evident in Housing Site Development. This is related to the locational siting of the two development methods, which were planned for the hilly or mountainous outskirts areas of Seoul. There is slight difference between the General Built-up Area and Housing Redevelopment Project in terms of shape, although the extremely irregular shape dominates, as the General Built-up Area includes parcels in the polygonal and completely or partially irregular shape. Most of the Housing Redevelopment Project is composed of extremely irregularly shaped parcels. This may be the result of topographical siting differences, as the former type is likely to be located among flatlands and the latter on hilly or mountainous areas. The Housing Reconstruction Project includes parcels shaped like a square, rectangle, or deformed polygon, and a high portion of parcels is extremely irregularly shaped, as reconstruction occurs in both planned and spontaneous areas (Figure 4).

Building

Building height

Building style-general

General Shape	Specific shape	
	Classification	code
Flat-type	Row	F1
	Stepped Row	F2
	Bent (0-point)	F3
	Bent (2points)	F4

	Combined	F6
Tower-type	Compact	T1
	L/T Shape	T2
	H/X Shape	T3
	V/Y Shape	T4

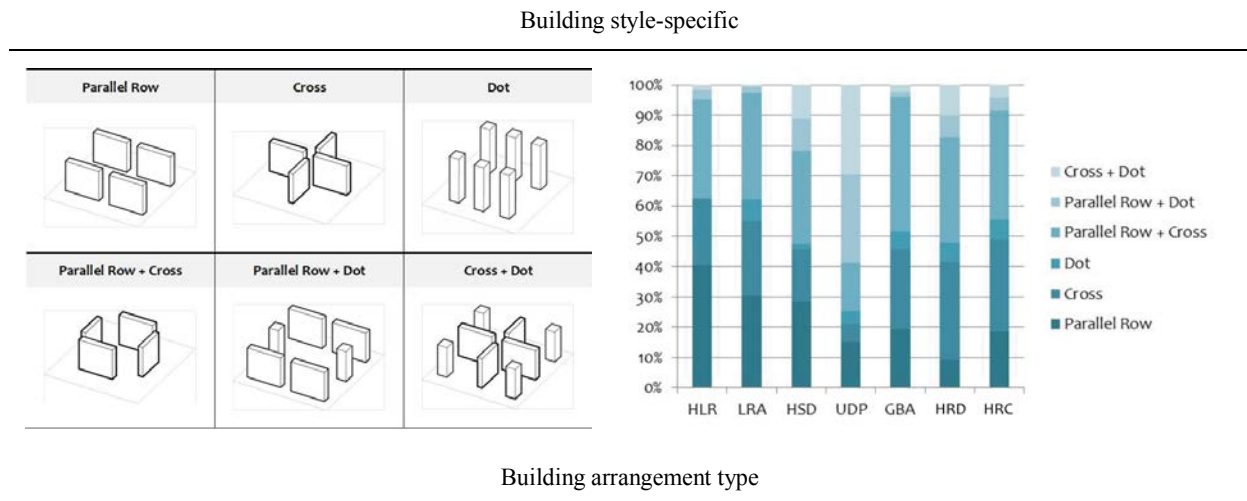

Figure 5. Building height, general/specific-style, arrangement types by different housing development methods

Large-scale apartment complexes with many buildings were developed through the Han River Reclamation Project or extremely large-scale Housing Site Development Projects in the 1970s to 1980s, followed by medium and small-sized developments through the Housing Site Development Project, Land Readjustment Project, and Housing Redevelopment Project in the 1990s to 2000s. Recently, the Residential Reconstruction Project has been implemented for the previously large block apartment complexes.

The changing patterns in building height over time are related to the development methods. Medium height apartment buildings (11 to 15 stories) were the norm in the Land Readjustment Project and Land Development Project in the 1970s and 1980s. After the 2000s, buildings constructed through the Development Project were also mostly of medium height of 11 to 15 stories. Park I.S. (2013) mentioned that the Housing Redevelopment and Reconstruction Projects elevated the average building height through the construction of extremely high buildings ranging around 30 to 40 stories. To control the ever-increasing height of apartment buildings, the Seoul Metropolitan Government’s Comprehensive Plan set a 35-story height limit for these constructions.

During the 1970s-1980s, Han River Reclamation Project, Land Readjustment Project, Housing Site Development Project, and general built-up area project were majorly built with flat-type buildings. Specific architectural style includes significant proportion of row (F1) and row and bent together (F1F3). In the 1980s and 1990s, Housing Redevelopment projects also showed flat-type as the main building style, but more recently tower-type or mixed type relatively took high portion. In the 2000s and 2010s, Urban Development Project employed mixed-type the most while flat-type building scored low. Specifically, compact and ‘V-shape’ tower building mixed turns out to be the most dominant style along with various tower and flat-type combinations of F1T4, T1T2T4, F1T1 and so on. Similarly, in general built-up area project and Housing Reconstruction Projects in recent years, there are more variation of different flat-type buildings mixed, such as F1F3, F1F2, F1F5 and F1F2F3.

This is also similarly apparent in Housing Redevelopment Projects where mixed type of F1T1 and F1F2T1 is dominant followed by combinations of tower-type, such as T1T4 and T1T2T4. All these patterns show that Seoul’s apartment buildings are getting higher, slimmer and more free-shaped in architectural style, leaving the traditional south-faced, regularly-shaped forms. This change gives Seoul a character of its own urban form.

The dominant arrangement was the “parallel row,” in which multiple rows were lined up to face the south, as seen in the Han River Reclamation Project and Land Readjustment Project. This type produced the uniformly repetitive, monolithic horizontal landscape. In the 1980s, along with parallel row, the courtyard style (parallel row + cross) emerged as the most dominant arrangement, as seen in the Housing Site Development Project. During this period, the cross arrangement became popular, involving simple variations by rotating the building’s orientation. From the 1990s, the parallel row arrangement lost steam, making way for the parallel row + cross (courtyard style) and cross arrangements. This changing pattern is related to the decreasing parcel size of apartment complexes alongside higher density development pressure in development methods including the Housing Redevelopment Project and a number of small and medium-scale Housing Site Development Projects. In the 2000s, when the tower type apartment buildings were introduced through the Housing Redevelopment Project, Housing Reconstruction Project, and Urban Development Project, the arrangement shifted towards the dot arrangement, as the linear footprint was no longer necessary. Thus, the cross arrangement became as popular

as the parallel + cross type, while the dot arrangement also increased in popularity, either in the dot form or mixed with the parallel row and cross arrangements. However, the preference for row type apartments persisted, resulting in mixed arrangements of tower and row or cross type apartments (Figure 5)

Density

BCR (left) and FAR (right) change over time period

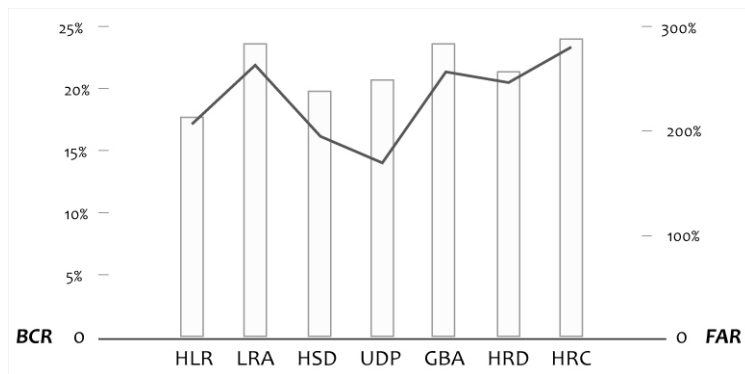

Figure 6. Density (BCR and FAR) by different housing development methods (line graph: BCR, bar graph: FAR)

The average BCR of the 2,172 apartment complexes in this study is 22.4%. During the period 1970–2015, the average BCR remained at around 20%, more or less similar despite a slight decrease to 18.6% in the 1980s . However, an examination of the BCR pattern over the 10-year period indicates a slight decrease in BCR. As seen in Figure 00, the portion of complexes with a BCR higher than 30% is decreasing, while that of complexes with a BCR less than 20% is increasing, although this is not significant. In the 1980s, the BCR pattern deviates, likely because of the Housing Site Development Projects implemented as master-planned promotion projects at the time.

The average FAR fluctuated between 186 and 278% during the period 1970–2015. In the 1970s, only 5-story walk-up apartments were constructed with FAR values of less than 100%. The average FAR during the 1980s was similar (186%), although from the 1990s, it increased significantly to more than 250%. The average FAR was 276% in the 1990s and 261% in the 2000s. This trend in terms of density can be attributed to the housing demand and market-driven housing policy that relaxed height and FAR regulations and promoted privately initiated residential renewal. At this time, in Seoul’s housing industry, most apartment constructions were based on the self-financing formula, especially in the Housing Redevelopment Projects and Housing Reconstruction Projects that supplied housing in the 1990s to 2000s (Figure 6).

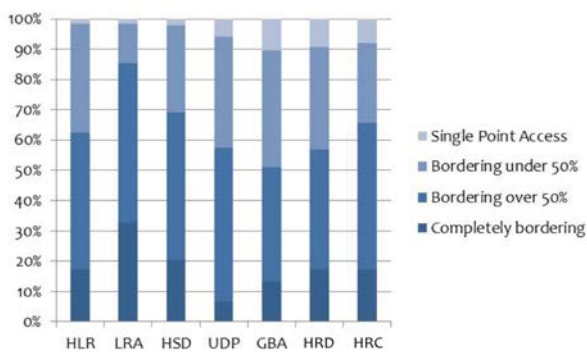

Street

Diagrammatic reference for street element

Street shape

Bordering street proportion

Bordering street hierarchy

Figure 7. Street shape, bordering proportion and bordering hierarchy by different housing development methods

Regular-shaped streets dominated, since most apartment complexes were developed on relatively flat land in a planned manner through the Housing Site Development, Land Readjustment, and Urban Development methods. The Housing Redevelopment Projects were implemented throughout the 1990s and 2000s, and numerous individual parcels were joined for redevelopment. Apartment complexes developed with grid-based road structure, such as Land Readjustment and Housing Site Development tend to be bound with more amount of street. In addition, master-planned super-block complexes are likely to border wider street hierarchy including Han River Land Reclamation Project, Housing Site Development and Urban Development Project (Figure 7).

Discussion

Urban morphology as a field of studying urban form has both descriptive and explanatory dimensions in its inquiries. this section reviews the relation of development method and the morphological characteristics of apartment complexes. As an external force, the development method is assumed to reflect public policy, residential planning, and the housing market at the time it was employed. The development methods applied to the construction of apartment complexes in Seoul can be classified into 7 categories.

The statistical correlation analysis shows if these 7 development methods demonstrate correlations with the formal character of morphological elements. Table 4 shows that except for building layout and hierarchy of the bordering road, all other formal aspects are meaningfully related with the development methods (Chi-square value <0.005). Specifically, parcel shape and street shape demonstrate a relatively strong correlation ($R > 33\%$), followed by building height and FAR. This indicates that in general, the morphological characteristics of apartment complexes are influenced by the development methods applied, although this correlation is not strong enough to have explanatory power. Yet, the relationship is strong enough to explain that parcel shape and road shape were influenced by what development methods were applied.

Table 4. Correlations between morphological elements and 7 development methods

Morphological elements	Pearson R value*	Chi-square (p-value)**
Parcel size	14%	0.000
Parcel shape	36-41.5%	0.000
Specific shape	33-40%	0.000
No. of buildings	7%	0.001

Bordering street hierarchy	1-3%	0.124

*Converted into percentage (Pearson R value * 100)

** Statistically significant when $p < 0.05$

In general, in the Land Readjustment Project produced a regularly shaped parcel in small scale. Most apartment complexes constructed using this development method in the 1970s and 1980s comprised buildings that were of the flat type, had 11 to 15 stories, an average BCR of 15–25%, and average FAR of 150–250%. The Housing Site Development projects also produced regularly shaped parcels, where most of the complexes were small or medium sized, although the projects were large in scale. Furthermore, plank type apartments with buildings 10 to 15 stories high were typical in the 1980s and 1990s. The density pattern differs slightly depending on the project scale. The Urban Development Project, a newer version of public planned development, demonstrated a pattern similar to that of Housing Site Development. It is evident that flat and tower architectural style with a taller height was dominant, while the density pattern follows the typical development of apartment complexes with an average BCR of 15–20% and average FAR of 150–200%. In the General Built-up Area projects, a less planned nature is conspicuous with irregularly shaped parcels and bordering roads abound. Most are also flat type buildings of 10–19-stories. The dominant density pattern is an average BCR of 20–25% and average FAR of 200–300%, which is typical of apartment complexes constructed in the 1990s and 2000s. Housing Redevelopment Projects as a clearance renewal of spontaneous deteriorated areas on hilly locations, an irregular parcel shape and irregular and narrow bordering roads are common. The density pattern is an average BCR of 15–25% and average FAR of 200–250%. Regarding architectural style and building height, the tower style is more common and buildings tend to have more than 20 stories, as is more common in recent developments. The Housing Reconstruction Projects showcase visually outstanding aspects in terms of super-high-rise buildings, high density, and relatively low BCR. Mostly, these have replaced former apartment complexes with newer versions. When existing apartment complexes were constructed through planned methods these are of a regular parcel and street shape, while irregular shape was more common in the housing reconstruction implemented in the general built-up area.

Conclusion

Seoul's active construction of apartment complexes was promoted through various development methods and strategies supporting the urban and housing policies of the central government and City of Seoul. The most direct spatial and morphological consequences of Seoul's apartment complex construction for the last 45 years is its ubiquity. Although the 2,172 apartment complexes occupy less than one fifth (18.4%) of the residential area, these complexes are widely scattered across the urbanized area, because the residential area (88% of the built-up area) dominates the space in which most are located. This ubiquity forms the unique visual pattern of the urban grain, spatial configuration, skylines, and general collective form. It provides Seoul with its image of an apartment city, as the clustered tall apartment buildings hide the more widespread low-rise areas, dominating the city's visual exposure.

The morphological patterns of each development method reconfirm the evolutionary process of the development of Seoul's apartment complexes. Only the shapes of the parcel and bordering street are related to the development methods, which differ in terms of public intervention and planning approaches as well as in the

topographical and local situations in which they are applied. Other elements demonstrated only a weak relationship with development methods, reflecting that they are determined by the financial feasibility of the project in the market-driven, privately initiated apartment complex construction industry in Seoul. This private sector nature of Seoul's apartment construction industry is accompanied by the weak provision of roads and other community infrastructure. In many cases, apartment complexes were poorly serviced in terms of the hierarchy and bordering portion of the roads, even though most were planned and developed through development methods for which the government provided legal foundations.

The development methods examined in this chapter demonstrate that the morphological characteristics of apartment complexes have largely been determined by the nature of the methods. Each development method has its own policy goals and subsequent land provisions that require different planning approaches and development processes. Furthermore, each method reflects the period in which it was introduced under the current socio-economic situation. As such, development methods are the window through which to understand the morphological origin of apartment complexes. Further studies would integrate various factors such as market forces, regulation changes regarding BCR and FAR, architectural style and complex design majorly determined by construction companies would also broaden the spectrum of understanding urban morphological change by apartment complexes in Seoul along within the frame of development methods.

51 European Planning Culture

European planning traditions of visualising revisited

Stefanie Dühr (University of South Australia)

Spatial planning systems in Europe have over the past years undergone significant changes in response to changing political agendas, new policy directions and in response to challenges for existing governance arrangements. The in some cases fundamental changes to the goals for, and scope of, strategic spatial planning also have implications for how spatial policy is cartographically represented. Previous scholarship has noted that while spatial policy text may undergo often rapid and profound revisions, the corresponding visualisations of spatial policy carry forward traditions of spatial planning more consistently. This can result in a considerable distance between policy goals as communicated through text versus those expressed on maps, and raises questions about the communicative power of strategic spatial plans and the messages about spatial futures planning that policy text and maps convey.

The research questions addressed in this paper are threefold against this background of significant changes to strategic spatial planning in Europe in a comparative perspective. First, how has strategic spatial planning, as expressed in policy text and policy maps, changed in national spatial planning systems over the past decade? Second, how can the changing planning traditions of visualising be characterised and conceptualised? Third, what implications for an effective communication of spatial policy goals to different user groups and for the implementation of spatial plans can be expected as a result of these changes to spatial planning systems and the cartographic representation of spatial futures?

The paper is based on a cross-national comparative analysis of national and regional spatial plans from selected European countries. The findings of the analysis allow a discussion of how strategic spatial planning and its communication instruments of policy text and maps are changing and how the effectiveness of such powerful instruments could be increased and for maps to play a greater role in planning processes. The paper concludes with a discussion of what such changes to spatial planning and the visualisation of spatial policy mean for the role of strategic spatial plans in the context of wider changes to political and socio-economic systems in European countries.

The Landscape: comparison between Italy and Russia. The general values for legislative and planning instrumentation

Olga Maximova (Sapienza University of Rome)

The paper is dedicated to the landscape planning after European Landscape Convention, in particularly to the Italian experience, demonstrates the differences of understanding the landscape related to social, linguistic, economic, environmental aspects and its interrelationship. European Landscape Convention (Florence, 2000) defined that landscape has “an important public interest role in the cultural, ecological, environmental and social fields” . These intends various possibilities for new programs, for new tools, for new process and activity in regard the city as a landscape. The research investigates the theme of landscaping planning in Italy to answer the main question of the thesis: how can the ELC's addresses be applied to the Russian case through experience of Italian landscape planning. To achieve this goal, has been verified: the process of integrating the European Landscape Convention, the Italian legislative system and landscape planning tools.

SPAIN IN THE INTERNATIONAL URBAN NETWORKS AROUND THE FIRST WORLD WAR

María Cristina García-González (Universidad Politécnica de Madrid) and Salvador Guerrero (Universidad Politécnica de Madrid)

The neutrality of Spain in the First Great War had brought with it significant economic growth. From then on, the main Spanish cities — fundamentally Madrid, Barcelona and Bilbao — faced the implementation of ambitious plans of urban extension to provide housing in healthy conditions for a growing population. The problems of the municipal regime requested the attention of thinkers, legislators and governors and the multidisciplinary and international points of view converged around the management of the city and its complex problems.

So Spain timidly joined the forums of meeting, debate and exchange, that were intensified since the Town Planning Conference in London (1910) and which had led to urban planning to cross national borders, through the courses, conferences, exhibitions, competitions, articles, technical books, manuals, essays, translations, etc. In 1913 the presence in Madrid of Alderman W. Thompson and Henry H. Aldridge, the authorities of the English National Housing and Town Planning Council, invited by the Instituto de Reformas Sociales, public institution responsible for housing service under the Labour Ministry, and the presence of foreign urban professionals, mainly Germans, who studied Spanish cities, such as Oskar Jürgens, or who participated, later on, in the debates and in the numerous public competitions for towns extension plans from the second half of the 1920s, were significant events.

The congresses of the International Garden Cities and Town Planning Association, later on International Federation of Housing and Town Planning (IFHTP), had the attendance of Salvador Crespo, one of the Vice-President of the Federation, and Federico López Valencia, from the Instituto de Reformas Sociales, and since 1923 César Cort, first Professor of urban studies at the Architecture School of Madrid, joined some of the congresses.

Cebrià de Montoliu, librarian of the Social Museum of Barcelona and editor of Civitas magazine, one of the main centers of urban reflection in Spain, Arturo Soria, promoter of Madrid Lineal City, Tomás Bilbao and Ricardo Bastida from Bilbao City Council, and Amos Salvador, from Madrid City Council, participated in the Union Internationale des Villes et Pouvoirs Locaux (IULA) first meeting held in Ghent in 1913. Arturo Soria, together with Hilarión González del Castillo, continued to disseminate the Lineal City at the international congresses that they attended.

Professor César Cort contacted La Renaissance des cites at the Paris Inter-allied Housing and Town Planning Congress held in 1919. One year later, London Inter-allied Housing and Town Planning Congress was promoted by the National Housing and Town Planning Council, of which Cort had been designated delegate in Spain. The Spanish delegation was composed of representatives of the Instituto de Reformas Sociales, Sociedad Central de Arquitectos, Bilbao City Council, Madrid City Council, and Nicolau M^a Rubió i Tudurí, successor of Cebria de Montoliu, representing the Civic Society "Ciudad Jardí" of Barcelona.

The aim of this paper is to show the contributions and networks established by the planners and technicians abroad to the consolidation of the urban science; there laid part of the foundations for the making of the modern Spanish city.

The Town Planning congresses at the Paris Universal Exhibition of 1937. Ultimate encounters

Corinne Jaquand (ENS Architecture Paris Belleville)

1937 is a correct focal point to take stock of the internationalization of urbanism and its networks on the eve of the Second World War. Indeed, the International Exhibition of Paris has hosted several congresses devoted to urban planning. We will hold two major international congresses, the International Federation for Housing and Town Planning (IFHTP), which dealt with regional planning, and the CIAM 5, "Logis, loisirs", which the pavilion, les Temps nouveaux, set by Le Corbusier inside the international exhibition, reported on.

Constitutive of the garden city movement, the IFHTP brought together experts, representatives of institutions and administrations involved in operational planning, such as social housing companies, municipalities, regional planning agencies, states. Whereas the CIAM congress consisted of individuals carrying radical research.

This contribution proposes to present the relations that the two congresses maintained between them in 1937, but also in the years which precede and which follow. Emphasis will be put more on the convergences than on the divergences of topics carried by the experts of the IFHTP and by the avant-garde architects of the CIAM. The bibliography on CIAM and the role of Le Corbusier is already well established (Mumford, 2000)

The historiography on the IFHTP congresses has demonstrated more recently the richness of the corpus (Riboldazzi, 2010, Geerste, 2012)

In our view, it is appropriate to return to the supposed divisions between the vanguard and the experts by putting in context the influence of CIAM in the years preceding the Second World War. This contribution will be based on the comparison of the networks, the topics and the methods, Le Corbusier then being inspired by the operating mode of the IFHTP.

The two events will be watched under the magnifying glass of the French political and urban context but also of the international geopolitics which had effects on both congresses. In France, the year 1934 was presented the first master plan for Greater Paris, known by its acronym PARP, while 1936 saw the electoral victory of the Popular Front and its first social laws in favor of paid holidays that foreshadowed new programs for mass recreation. The arrival of the Nazis in power in Germany had adverse effects on both congresses. Modern Germans and Austrians, on the road to exile, leave Le Corbusier the free hand in the CIAM. With its integration into the IFHTP, the International Housing Association, based in Frankfurt, gives more influence to German experts appointed by the Nazi regime.

The Paris International Exhibition of 1937 offers European urban planners the ultimate common ground, while international tensions increase with the militarization of Nazi Germany and its rivalry with the Soviet Union symbolically represented by the architecture of their two pavilions standing face to face in the perspective of the Eiffel Tower.

The Landscape: Italy and Russia. The general values for legislative and planning instrumentation.

Olga Maximova*

*PhD, olga.maximova@uniroma1.it

The paper presents the results of the PhD research of author supported by the Erasmus Mundus Action 2 Programme of the European Union.

The paper is dedicated to the landscape planning after European Landscape Convention, in particularly to the Italian experience, demonstrates the differences of understanding the landscape related to social, linguistic, economic, environmental aspects and its interrelationship. European Landscape Convention (Florence, 2000) defined that landscape has “an important public interest role in the cultural, ecological, environmental and social fields”. These intends various possibilities for new programs, for new tools, for new process and activity in regard the city as a landscape. The research investigates the theme of landscaping planning in Italy to answer the main question of the thesis: how can the ELC's addresses be applied to the Russian case through experience of Italian landscape planning. To achieve this goal, has been verified: the process of integrating the European Landscape Convention, the Italian legislative system and landscape planning tools.

Keywords: landscape planning, planning legacy, values, heritage, management

Introduction

The paper is dedicated to the landscape planning after European Landscape Convention, in particularly to the Italian experience, is concerned with the integration of the European Landscape Convention (Florence, 2000) into the Italian legal system and with development of the regional landscape planning tools, focusing on its organizational, operational structure, its legislative content, disciplinary and managerial innovations, mechanisms and procedures for the processing of the general planning instruments (landscape plan) in order to identify criteria, principles and tools to produce the base model, which can be applicable in different countries, for example, in Russia.

The main aspects for motivation of the research. The European Landscape Convention entered into force more than 17 years ago. During this period the Parties form and develop the tools to applicate the guidelines of the Convention. Italy was one of the first to sign the European Landscape Convention on 20 October 2000, 1 September 2006 the Convention entered into force on Italian territory.

During this period Italy has elaborated and continues to develop its instruments to update the guidelines of the Convention and to respond to the present problem of the intensive transformation of the contemporary landscape, taking into consideration the strongest presence of the cultural and world heritage, Italy stands at the top of the UNESCO list of World Heritage Sites in terms of the number of registered sites.

The transformation of the world economy, the mutation of trade and the migration (the United Nations Organization provides a relevant figure, between 1990 and 2013 international migration had an increase of over 50%, compared to the statistics of the years previous, about 77 million people - 'international migration stock' -), has accelerated the process of globalization. The coexistence between different cultures and traditions that arise at the border of this reality, partly inside and in partly outside these intensive changes of the territory, are the causes and consequences of catastrophic changes.

The analysis of this experience, especially in relation with cultural heritage and landscape, the research for the effectiveness of the integration process and its mechanisms, strengths and weaknesses, represents a complex scientific problem at the global and national level. The increased practical interest of research is for the possible Parties that have not signed and ratified the Convention.

Russia has not signed the European Landscape Convention and doesn't implement its guidelines, but it is a member state of the Council of Europe, therefore has the possibility to ratify the Convention and to implement its guidelines in the land management and landscape management systems. Russia is completely involved in global processes of the transformation of the territory. Has its own urban planning system, the system of ecological and environmental legislation. The framework of the Russian laws concerning territorial planning, cultural heritage and ecological legislation presents a complex system of concepts for the protection of the environment, cultural heritage, nature and natural resources, and has its own structure and contents.

The research investigates the theme of landscaping planning in Italy to answer the main question of the thesis: how can the ELC's addresses be applied as a basic model through Italian experience of landscape planning in another State, for example, in Russia.

There were identified three main research goals structured as:

1. To verify the integration process between the European Landscape Convention, the Italian legislative system and landscape planning tools;
2. Conceptual, cultural and operational comparison between Italy and Russia in planning (in the Italian case, landscape planning);
3. To Identify ways to manage the landscape transformations that can be declined to the Russian case.

To achieve this goal, has been verified: the process of integrating the European Landscape Convention, the Italian legislative system and landscape planning tools.

Methodology

The methodology of research includes complex analysis of the subject of study: collection of materials, materials analysis, full-scale survey, empirical analysis, interviewing. The research path has been organized in 3 phases:

- 1) Cognitive phase;
- 2) Evaluation phase;
- 3) Proposal phase.

The first phase represents the preliminary investigation which includes: identification of the basic concepts of landscape planning in Italy and emerging issues; definition of the legislative framework on the national / regional level, mechanisms and principles that regulate the protection and safeguard, conservation, transformation and management of the landscape values; framework of the system of planning in Russia.

The second phase represents the critical reading of significant good practices, verification of the real degree of interaction / integration between the landscape plan and principles of the ELC, identification of the critical and successful aspects; interview with Russian specialists on the theme of landscape and its management.

The third phase proposes the elaboration of a methodological path for the draft guidelines / general principles, declined to the Russian case.

Values

The transformation of the world economy, the mutation of trade and the migratory movement (the United Nations Organization provides a relevant figure, between 1990 and 2013 international migration had an increase of over 50%, compared to the statistics of the previous years, about 77 million people - 'international migration stock' -), has accelerated the process of globalization. The coexistence between different cultures and traditions that arise at the border of this reality, partly inside and in part outside these intensive changes of the territory, are the causes and consequences of catastrophic changes. Transformation and fragmentation of the landscape, that according to the ELC is 'an important part of the quality of life for people everywhere'. The Convention is an international result in the framework of the Council of Europe's co-operation.

Landscape, the visual perception of the environment around us (Fig. 1), its qualities and values, its importance for everyday life and for the future, can we have the adequate methods and instruments to manage it? The "landscape" of each other fully reflects significance of the environment around? How important is the landscape for living and everyday life? How can be define the objectives for management the landscape in the global world? Why is it necessary to preserve, protect, safeguard, enhance, manage and transform the landscape? Why we need the planning instruments for manage them?

Every Party has to think about landscape and its future as a local part of global. Such questions have to be mentioned and taken into consideration when we think about landscape and its future, when we decide to manage the landscape for purpose to create the more adequate and balanced paradigm for every work with the territory in each scale.

The legal concepts defined in the Convention are 'landscape', 'landscape policy', 'landscape quality objective', 'landscape protection', 'landscape management', 'landscape planning'. Those basic concepts form a fundamental network to move inside for the Parties. The conceptual chain:

cultural and natural heritage - landscape - identity - population,

creates a link between the landscape and the European cultural and natural heritage and the local population. This link is a legal connection. It creates a new legal object, that is 'landscape', between two other legal objects: European cultural heritage and population. The ELC recognizes that changes in the habitat, the changes of landscape transform our culture and the culture of commons.

By the 'promotion the protection, management and planning of landscapes' the Convention activates the less used areas of economy, with their involvement in active life. The landscape is represented as 'a resource favourable to economic activity' and its 'protection, management and planning can contribute to job creation', that aims to identify and to recognize the additional possible economic resources. The process of management and planning, in each case, involves the possible transformation that, from the evolutionary point of view, is the obvious process. On the one hand, it opens the possibility for rethinking the concept 'landscape', but also opens the possibility for its changes and transformation, in consequence, conduct the risks associated with the realization of programs and with the qualification of the professionals involved in the planning and management and risks related to legal procedures of territory management on the implementation and integration of the Convention, including economic risks, legal, environmental, climate, social and others.

Framework. Italy.

In Italy, the integration of the addresses of the Convention is regulate by D.Ls. 22 January 2004, n.42 – The Code of Cultural Heritage and Landscape (The Code)¹. The control functions on cultural heritage has 'The Ministry of cultural goods and activities and tourism' / Ministero dei beni culturali e delle attività culturali e del turismo (MIBACT). The Constitution of the Italian Republic has introduced the term 'landscape protection' / 'tutela del paesaggio', by the Code the term landscape has been legally recognized and has been defined. The Code is an integrated document applicable throughout Italy. The current concepts, principles and objectives, obligations and issues of the European Landscape Convention have been analysed with a comparison of the current concepts, principles and objectives, obligations and issues of the Italian Code of Cultural Heritage and Landscape (Fig.2).

By the Code are introduced the basic concepts (Fig. 3) for the activation of the process of management the cultural heritage in Italy. The cultural heritage consists of cultural values and landscape values (art. 2.1). The Republic protects and enhances cultural heritage, according to the provisions of the present Code. The protection and the enhancement are the main basic concepts for operation with cultural heritage. The enhancement is implemented in compliance with the requirements of protection (art. 131 c. 5).

The functions of protection can be defined:

- to recognize cultural values;
- to safeguard cultural values;
- to recover cultural values.

The functions of enhancement can be defined:

- to promote the development of culture;
- to requalify buildings and areas;
- public use of the landscape;
- to create the new landscape values.

It can be defined that the enhancement is the new integrated concept to safeguard the territory, to use the territory, to develop the territory, to build a new landscape and a new city, that Italy follows to be applied with the Code. The protection and enhancement all together form the principles to activate concepts of the Code in legislation and planning for the management of the Italian territory and landscape.

By that Code was introduced a new type of plan on the entire Italian territory: the landscape regional plan or urban-territorial plan with specific consideration of landscape values is mandatory on the regional level. The Code and the plan are the main tools for the multilevel governance to achieve the 'Landscape policy' (ELC) on the Italian territory. Where for 'Landscape quality objective' (ELC) have been put at the centre of conceptual level the cultural development and the memory of the national community and the territory.

¹ D.Lgs 22 gennaio 2004, n. 42 - Codice dei beni culturali e del paesaggio.

The landscape plan has priority above other types of plan, is a key tool for landscape planning. By the Code for the regional landscape plan is required to identify the landscape areas (it. 'ambiti') at the defined borders: the landscape plans, with reference to the considered territory, recognize the peculiar aspects and characters, as well as the landscape characteristics, and delimit them into the relative areas (from Art. 135 c. 2).

The criteria for identifying the landscape areas are defined by plan, that represents for each region a complex research and design problem. Identification of landscape areas with prescriptions and requirements for different use or functions with definition of the appropriate quality objectives (Art. 135 c. 3, Art. 143 c. 1, s) corresponds to an innovative tool for the landscape plan, because it is a new tool to achieve the protection and enhancement of the landscape. For scopes are defined requirements for different use and functions with attention to the specific issues, those are mentioned in the art. 135 c. 4 of the Code: conservation, rehabilitation, protection, the identification of guidelines for the urban development.

The plan can have required actions and possible actions, such measures make the plan a more flexible tool and allows for each region to create its own language for management the landscape and allow for the plan to be more independent. Each region should have their own landscape plan in their own borders. The plan should be elaborated through the protection and enhancement tools.

Basic model

A critical reading of significant good practices was developed, as a verification of the real degree of interaction / integration between the landscape plan and the principles of the ELC, identification of the elements of success and criticality for the purpose of identifying ways to manage the transformations of the landscape that can be declined to the Russian case. The current situation of Italian landscaping has been observed in the twenty regions (fig. 4). Based on this observation by case of a critical reading study, four regional landscape plans were selected: The Regional Territorial Landscape Plan (PTPR) of the Lazio Region (adopted 2007), Territorial Direction Plan with Value of the Landscape Plan (PIT) of the Tuscany Region (approved Integration Act 2015), the Regional Landscape Territorial Plan (PPTR) of the Apulia Region (approved 2015), the Regional Landscape Plan (PPR) of Piedmont (approved 2017).

There were elaborated the methodology to analyse these plans based on the 10 criteria. The plans were evaluated and analyzed on the following criteria:

- normative documents for reference;
- types of elaborated materials of plans;
- strategies and goals system of the plans;
- specific landscape quality objectives for landscape areas;
- system of territorial structures;
- areas and other territorial units / elements of the landscape;
- criteria for identifying the landscape areas;
- areas, division structure;
- typologies of schemes for landscape areas;
- programs, guidelines and other elaborates materials of the plan.

For each criterion the effective, more or less preferable model have been identified. The plans have non-homogeneous structures and types of elaborated materials. The general and / or specific objectives have been identified differently by each plan. The simplest system is the system of the general objectives of the Lazio PTPR. The most complex system is elaborated by the Piedmont PPR. In the four landscape plans analyzed the different types of structural readings of the territory have been proposed. The first is a landscape type, where the typologies of the system of the landscape areas, structured in different ways. The alternative typologies are of geographic type, regional structure or of structural reading of the territory. Each plan elaborated its own language of the interpretation the application of landscape areas, of the addresses of the European Landscape Convention and of the regulations of the Code of cultural heritage and landscape. The types of the system of landscape areas of plans are structured in various ways (Fig. 5). Effective / preferable criteria have been defined for the identification of landscape areas with approach: the historical-cultural, morphological, ecosystem and environmental, structures of settlement, perceptive.

Each plan has elaborated its own language of interpretation of the addresses of the European Landscape Convention and norms of the Code of Cultural Heritage and Landscape. The priority for all the decisions made in the plans are the protection and enhancement of cultural heritage and landscape.

The possibility of application of the ELC addresses through experience of Italian landscape planning has been evaluated. The methodology, the principles, the tools for applying the CEP guidelines through experience of Italian landscape planning have been identified. There were elaborated the basic model of application of the ELC addresses through experience of Italian landscape planning, structured in 2 actions:

1. Structure of the landscape plan with obligatory / possible actions, which makes the plan as a more flexible and adaptable instrument in different conditions:
 - a) Actions for the strategic programs and projects / recognizing the initiatives already started.
 - b) Atlas / catalog of cultural heritage and landscape values.
 - c) Landscape areas as a tool to manage the landscape.
 - d) Strategies / strategic scenarios.
 - e) Guidelines, strategic projects, integrated landscape projects and etc.
2. Method of defining the criteria for identifying the landscape unit.
 - a) Historical and geographical conformation of the Regions;
 - b) The characters of the hydro geomorphological structure;
 - c) Environmental and ecosystem characters;
 - d) Settlement types: cities, city networks, infrastructures, agricultural structures;
 - e) The articulation of perceptual identities of landscapes.
3. Methodology to work with landscape areas: analysis (systems: hydro-geomorphological, eco systemic, anthropic and cultural history etc.), territorial structures (areas), landscape quality objectives, actions / regulations for use.

Framework. Russia

The concept of landscape explored from the conceptual and cultural point of view, in the different traditions and in the ELC, also in case of Russia. The aim is to identify the analogical-related concepts and their importance, for the possible integration of the ELC. The language is a reflection of our life and culture, shows the importance of the local environment and everything around us. The concept of perception includes the different ways of human perception: visual, sensory, through taste, hearing, smell, touch, temperature, humidity, etc. That is obviously depends on surrounding conditions and characteristic of the environment and the landscape and the mode of individual and collective perception. It was made an etymological-cultural comparison of the 'landscape' concept in different cultures, making more specific attention to the Italian-Russian case, throughout the general concept, the cultural context, the practice of the planning, design, legislation, the similarities possible. It has been observed that for each country it is necessary to create its own language for the 'landscape' with the specific local tools.

The framework of the Russian laws and planning system have been analysed more specifically on the concept of 'landscape' and related concepts, to define where and how the addresses of the European Landscape Convention can be included. Within the framework of the laws related to spatial planning, cultural heritage and ecological legislation, the term 'landscape' can be found in the following laws:

- About cultural heritage [cultural heritage objects] (historical and cultural monuments) of the people of the Russian Federation;
- For the protection of the environment;
- About protected areas;
- Forestry code of the Russian Federation;
- Land code of the Russian Federation.

In the Constitution of Russian Federation, the term 'landscape' is not present. But there are alternatives and related concepts such as: historical and cultural heritage, conservation of nature and the environment and so on. In the Urban Development Code of the Russian Federation the term 'landscape' is not present. But there are also

alternative and related concepts such as: sustainable development, favourable natural conditions for life and conservation of cultural heritage, balance of environmental / ecological, economic, social factors and other factors in the execution of activities urban development, environmental protection and ecological security requirements, conservation needs of cultural heritage and protected areas, and others.

In the Federal Law "About cultural heritage [objects of cultural heritage] (historical and cultural monuments) of the people of the Russian Federation" the concept 'landscape' presents as: landscape architecture, cultural and natural landscapes, protected area of the natural landscape, historical environment landscape, landscape features. The law has its system of concepts / objects for conservation, use, promotion and protection of cultural heritage values, where also part of the landscape is included. In the Federal Law "About the protection of the environment" is defined what is a 'natural landscape'. Also, in the present laws there is a complex system of concepts / objects for the protection of the environment.

The term 'landscape' is not defined in the documents observed, but presents or as a natural landscape, or as a cultural landscape, or as a place of interest, or as a natural complex and so on. That is why it can be concluded that the framework of laws relating to spatial planning, cultural heritage and ecological legislation presents a complex system of concepts for the protection of the environment, cultural heritage, nature and resources, and has its structure and contents. connected to each other.

There were taken the interview of the Russian professionals and experts on the topic of landscape in Russia. How landscape can be considered by professionals and how they think about the role that the landscape can take in planning and what is conceptual and practical references can be appropriately adapted to the Russian case. The objective of the interview is to try to analyse how architects in the Russian Federation take the landscape theme into consideration. That is why the purposes of the interview can be structured according to the following criteria:

- concept of "landscape" in use by architects in planning and design, especially, if there are other related terms;
- importance of the landscape for the contemporary daily life;
- the objectives for landscape management, view by the architects;
- how architects and another specialist see the tendency of landscape transformation on the territory of the Russian Federation;
- importance of landscape for planning in the Russian Federation.

Additionally, to the basic model of application of the ELC addresses through experience of Italian landscape planning in Russian case there were proposed such actions (Fig. 6):

1. Transformation of the structure of the normative - hypothesis of two possible scenarios. To applicate the Italian method declined in the Russian case to illustrate the necessity to implement the addresses of the Convention:
 - through the elaboration a single code to manage all the assets, areas, objects of protection;
 - or through each document related to the environment, territory, cultural heritage and landscape and so on.
2. Definition what is the 'landscape';
3. Applicate Convention addresses to all normative documents, applying the basic concepts of the Constitution to preserve nature and the environment and to preserve the historical and cultural heritage;
4. Enhance the concept of 'landscape' for planning;
5. Develop landscape planning as a basis for spatial planning as a whole landscape;
6. Evaluate the risks, weaknesses and strengths more detailed with the possibility of advantages and benefits.

Conclusion

There were analysed the framework of the European Landscape Convention, the framework of the Italian landscape planning: the regional landscape planning tools, focusing on its organizational, operational structure, its legislative content, disciplinary and managerial innovations, mechanisms and procedures for the processing of the general planning instruments (landscape plan). The framework of the Russian laws been analysed more specifically on the concept of 'landscape' and related concepts, to assess where and how the addresses of the European Landscape Convention can be included. There were elaborated the methodology, the principles, the criteria and the tools for applying ELC guidelines. In case of Russia 4 types of actions are proposed. The results of the study

can be used as a basis for the preparation of methodological guidelines, duly declined to the Russian case, aimed at studying, planning and designing documents and documents at federal level; the guidelines will be aimed to the conservation and management of landscape values and can provide methodological and scientific support for the drafting of some urban planning instruments of the Russian Federation.

Acknowledgements

I would like to express my sincere thanks to my tutors Dr. Prof. Arch. Pier Paolo Balbo, Dr. Prof. Arch. Elio Trusiani for valuable and constructive suggestions during the planning and development of this research work.

I would like to acknowledge the support of the Erasmus Mundus Action 2 Programme of the European Union.

I would like to thank Department of Planning, Design, Technology of Architecture, University of Rome - La Sapienza.

A special thanks to Prof. F.S. Kudryavtsev (Head of the Laboratory of Urban Studies, Moscow University of Architecture), Dr. Arch. A.A. Skokan (President, Founding Member, Project Chief Architect in the Architectural Bureau Ostozhenka), Arch. A.L. Gnezdilov (First Deputy Director, Founding Member, Project Chief Architect in the Architectural Bureau Ostozhenka), Dr. A.A. Tishkov (Deputy Director of the Institute of Geography of the Russian Academy of Sciences), Dr. Prof. A.V. Khoroshev (Lomonosov Moscow State University, Faculty of Geography, Department of Physical Geography and Landscape), Prof. O.E. Druzhinina (Moscow University of Architecture).

To everybody else who accompanied me in this beautiful research.

Spain in the International Urban Networks around the First World War

María Cristina García González*, Salvador Guerrero**

*PhD, Universidad Politécnica de Madrid, mariacristina.garcia@upm.es, ORCID <http://orcid.org/0000-0001-5381-7055>

**PhD, Universidad Politécnica de Madrid, salvador.guerrero@upm.es, ORCID <http://orcid.org/0000-0001-6766-8695>

The neutrality of Spain during First World War brought with it a significant economic growth. Then, Spain timidly joined the town planning forums of meetings, debates and exchanges that took place in the post-war European era. Some Spanish public institutions as the Instituto de Reformas Sociales, responsible for the social housing policy, and the City Councils of Madrid, Barcelona and Bilbao, which tried to order their development; private institutions such as the Compañía Madrileña de Urbanización, promoter of the Madrid Linear City by Arturo Soria, and the Civic Society Ciudad Jardí in Barcelona, diffuser of the Garden City movement in Catalonia; and the first Town Planning Professor in the School of Architecture of Madrid, César Cort, attended different congresses looking for a solution to the housing problem along with the town planning extension issue. The aim of this paper is to show the Spanish town planners and technicians who participated in the international urban networks in order to consolidate the Spanish urbanism through the new technical, theoretical and legal tools that were being implemented in Europe. They also attended to proudly show some Spanish advances.

Keywords: International Federation of Housing and Town Planning (IFHTP), Inter-allied Housing and Town Planning Congresses, Union Internationale des Villes et Pouvoirs Locaux (IULA), Spain, First World War, Town Planning

Introduction

In 1920, the architect Leopoldo Torres Balbás — installed in Medina del Campo, where he had just reached the position of municipal architect — wrote a beautiful text about "the future city" where, with a sober and balanced prose, he expressed a profound "faith" in the progressive march of humanity "and focused on" the ideal of the redeemed crowds", in a world where the silhouette of the city of the future was still "distant and blurred".¹

The neutrality of Spain during the First World War brought with it a significant economic growth in the country. From then on, the Spanish cities Madrid, Barcelona and Bilbao faced the implementation of ambitious plans of town extension to provide housing in healthy conditions for a growing population. The problems of the municipal regime requested the attention of thinkers, legislators and governors. The multidisciplinary in connection to the international points of view converged around the management of the city and its complex problems.

In 1910, the Royal Institute of British Architects held an international conference dedicated to town planning. This was one of the consequences of the events that took place in 1909, the key year for the consolidation of urbanism as a new disciplinary area in the international context. That year, the first conference dedicated specifically to town planning in the United States took place in Washington. *The Plan of Chicago*, by Daniel H. Burnham and Edgard H. Bennet, was published. In the field of university teaching, a Town Planning course had been taught for the first time, within the Landscape Architecture College of Harvard University, and the Civic Department of the University of Liverpool had been founded. The English Town Planning Act had been approved that year, as a result of which, Raymond Unwin published his book *Town Planning in practice: an introduction to the art of designing cities and suburbs*. The list of participants in the London Conference of 1910 included the Spanish architects Joaquín Bassegoda and Emiliano Amann and of the Professor Manuel Rodríguez i Codolà, what evidenced the timid Spanish presence, together with Patrick Abercrombie, Stanley D. Adshead, Daniel H. Burnham, Reinhard Eberstadt, Patrick Geddes, Eugène Hénard, Ebenezer Howard, Thomas H. Mawson, Agustin Rey, C. H. Reilly, Josef Stübben and Raymond Unwin, among others.

The 18th International Planning History Society Conference - Yokohama, July 2018

At the height of 1910 the way of solving the transformation of the Spanish cities had been inherited from the interior reform operations of the nineteenth century —see the opening of the Vía Layetana in Barcelona begun in 1908 and the Gran Vía in Madrid started in 1910— and the practices of regular bourgeois expansions— Nuñez Granés Plan (1909) for Madrid and Jaussely Plan (1903) for Barcelona—. But the inability to solve the growth of cities due to the pressure of working-class housing and the new issues of mobility, public facilities or open spaces, put it in a crisis that model.

Faced with this situation and the lack of technical and legal modern tools, the new generation of Spanish professionals tackled the new problems of the city through the study of the different alternatives disseminated in the international scene through the travel to Germany, England and, lesser extent, to the United States. Most of the time, thanks to the support role assumed by the Junta para Ampliación de Estudios e Investigaciones Científicas² (Board for the Extension of Studies and Scientific Research), a public institution under the Minister of Education and Public Arts. Since 1907, the Junta para Ampliación de Estudios led some Spanish technicians to look out the new ways to achieve urbanism through the attendance to some of the most relevant international study centres at the moment, such as the Charlottenburg Seminary of the Technical School of Berlin. The Junta was inspired by the Institución Libre de Enseñanza (ILE), a Krausist cultural and pedagogical renewal project that promoted a series of reforms in the legal, educational and social fields that Spain really needed. It was created in Madrid in 1876 by a group of professors from the Universidad Central de Madrid. They were liberal and humanistic thinkers under the leadership of the pedagogue and philosopher Francisco Giner de los Ríos

The concern to lay the foundations of adequate legislation justifies the early presence of the president of the Minister Council, Segismundo Moret, one of the founders of the ILE, in the VII International Housing Congress of Liege (1905). He was one of the promoters of the Instituto de Reformas Sociales (IRS)—the public institution responsible for housing service created in 1903 under the Labour Ministry —, that was represented in the Congress by the lawyer Maluquer i Salvador. The architect Luis Cabello Lapiedra, Ángel Ramirez, representing the housing cooperative El Hogar and the civil engineers Rene Lafleur and Domingo Mendizábal also attended the Congress.³ They looked for both effective public and private initiatives to satisfy the strong demand for working-class housing in the Spanish cities. The Congress Sections focused on social housing: ways of intervention by public authorities in social housing, legislation, sanitary inspection, the garden city, housing statistics from social economic and health point of view, and aesthetics conditions in social housing and green spaces in social housing. The international public presentation of the movement of the Garden City in the aforementioned Congress was definitive for its evaluation as an alternative proposal to the problem of social housing in Europe, but its echoes would not reach Spain yet.

In these cross-relationships, the presence in Madrid and in Barcelona in 1913 of Alderman W. Thompson and Henry R. Aldridge,⁴ President and Secretary of the English National Housing and Town Planning Council respectively, was significant. They were introduced by Cebrià de Montoliu and invited by the IRS, chaired at that time by the lawyer and politic Gumersindo de Azcárate (Member of the ILE). They gave lectures on the innovative experience of the English Garden City at the Ateneo in Madrid, within a cycle about garden cities and lineal cities that also included the participation of Amós Salvador, Arturo Soria and Hilarión González del Castillo.⁵

The most active figure at the moment was, undoubtedly, the versatile Cebrià de Montoliu, with an active presence in Germany and England, where he travelled pensioned by the Junta de Ampliación de Estudios in 1910. His publications *L'activitat internacional en matèria d'habitatció y construcció cívica durant l'any 1913* is a good example of his hard work. The result was that, at the crossroads of 1914, one of the main focuses of urban reflection in Spain was linked to the creation of the Social Museum in Barcelona, where Montoliu occupied the position of librarian. The journal *Civitas*, published from 1914 to 1924, was the best exponent. However, his extraordinary work failed to respond to their many concerns, so that he left Spain to the United States in 1919. The architect Nicolau Maria Rubió i Tudurí would be the successor.

The Spanish architects Amadeo Llopart⁶ and Guillem Busquets i Vautravers, both pensioned by the Junta de Ampliación de Estudios in 1912 and 1913, also left to Berlin. The first one became responsible for the teaching of Town Planning in the School of Architecture of Barcelona. His German stay allowed him to get in touch with the great masters of the construction of cities, such as Camillo Sitte, Reinhard Baumeister, Josef Stübber and Rudolf Eberstadt. By the other hand, Guillem Busquets, architect and councillor in the Barcelona City Council, became responsible for the teaching of the urban discipline in the School of Public Employees in the Mancomunidad de Cataluña. In addition, the engineer of the City Council of Barcelona José María Lasarte, attended in 1915 the International Congress of Engineering of San Francisco, held on the occasion of the Panama-Pacific International Exposition, and translated into Spanish the conference City Planning, by the American engineer Nelson P. Lewis, which was published under the title *Urbanización*⁷ in 1917.

Adolfo Posada, a follower of Francisco Giner de los Ríos, Professor of Municipal Law of the Universidad Central de Madrid, and President of the Law Section of the IRS from 1903 to 1924, correctly located the problems of urban planning in those years, clearly showing the multidisciplinary and international points of view that converged around the management of the city and its complex problems in the following terms: “Since 1916, interest in the municipal problems of the city has not only declined, as one might think given the deep and often tragic upheavals that constantly agitate and disturb the people, but that interest has intensified, constituting the condition of cities, and the municipal regime of his life, one of the most pressing concerns of politicians of action, and technicians of many branches and professions. In these last post-war years, and for various reasons, the problem of the municipal and local regime has been soliciting the attention of thinkers, legislators and governors, promoting surveys of high value in England, causing extensive reforms in the various German states, worrying in France and in Spain to politicians and governors, while in North America, it continues to be the municipal regime of the city, the field of the richest, most daring and fruitful experiences”.⁸

The International Garden Cities and Town Planning Association as a global proposal: from housing to regional planning

In the prologue of one of the pamphlets published by the IRS Ebenezer Howard wrote: “I hope that the author of this book [Federico López Valencia] and its collaborators will get, in the beautiful Iberian Peninsula, results of the greatest importance for humanity.” This ambitious conception of the scale of housing problem as a global problem, had led him to create the International Garden Cities Association in 1913 as a tool for exchanging the different experiences.⁹ And he was right. In fact the international congresses that the association organized became a key as forums for reflection and debate on modern urbanism until the 1930s.¹⁰ Since 1920, The IRS was the most significant Spanish presence in the International Garden City Association. One of its members, Salvador Crespo, Head of the Servicio Especial de Casas Baratas (Special Service of Cheap Houses), would be named one of the Vice-President of the IFHTP, and Federico López Valencia, Head of Advertising and Statistics Section of the Servicio Especial de Casas Baratas, would be named Board member by 1920. Because of the pamphlets about all the conferences Federico López Valencia attended, the IRS became one of the most active diffuser of the IFHTP in Spain.

The Congress of the International Garden Cities and Town Planning Association in London (14, 15 and 16 March 1922) reunited 160 delegates. Luis de Ponte and Federico López Valencia represented the IRS. There, López Valencia met Edith Elmer Wood, the first American *houser*. She had already written the article “The Spanish Linear City”, in the *Journal of the American Institute of Architects* (1921) and after this meeting, she published *Housing Progress in Western Europe* (1923), with the appendix “The Spanish Housing Laws of 1911 and 1921”. Both interesting articles represent one of the first international critic analyses of Spanish proposals about town planning.

Figure 1: *Housing Progress in Western Europe* (1923), by Edith Elmer Wood included an appendix about the Spanish housing law: *Ley de Casas Baratas*. What is a cheap house?, pamphlet by the Instituto de Casas Baratas for explaining the concept of *casa barata*.

The congress held in the Swedish city of Gothenburg in 1923 was the one with the strongest Spanish presence. This Congress consolidated housing as a State responsibility. The Spaniards Salvador Crespo and Federico López Valencia, Juan García Cascales and José Cabestany from the Madrid Town Council, and Town Planning Professor César Cort¹¹, introduced the Spanish advances among a cast that included the names of Werner Hegemann, Clarence S. Stein, John Nolen, Eliel Saarinen and Charles Benjamin Purdom.

Besides the IRS, César Cort, first Professor of Town Planning at the Architecture School of Madrid since 1918 —In 1914 a subject about town planning was incorporated for the first time to the Architecture studies— would be the most assiduous presence in the congresses since 1923. In this Congress César Cort met John Nolen, and in 1928, in one of his letters, he told about two of the main values for him: the concern about the diffusion and the conception of the knowledge as a net:

“Dear Sir [John Nolen];

Perhaps you may recall myself when thinking in Town Planning Conference held at Gothenburg, where I have had the pleasure of knowing you, and I remember even the trip we had together in Sweden. I beg to remark these details as I want to address yourself begging for your cooperation for a Review I am just about to publish under the name URBANOLOGIA [Urbanology].

I want to get the collaboration of the most important town planners in the world, and of course yours is a very precious one for my Review”.¹²

The Gothenburg exhibition showed the works of the Compañía Madrileña de Urbanización, promoter of Madrid Linear City, together with historical views and maps of Spanish cities. Hilarión González el Castillo, diffuser of Arturo Soria’s Madrid Linear City, were the most representative Spanish presence in the urban networks in the first 20s. César Cort introduced the Town Planning teaching of the School of Architecture of Madrid with the exhibition of the drawings and maps for the extension and interior reform of Elche elaborated by the students.¹³ The civic survey, including aerial photographs, showed the importance of the identity of the site as a new principle.

Figure 2: Translation and resume into Spanish of the proceedings of the IFHTP Congress (1923) and images of the students’ work about Elche exposed in the Gothenburg Exhibition.

l'Union Internationale des Villes et Pouvoirs Locaux (IULA) and the first exchanges: The triumph of the Spanish Linear City

Another focus of interest was l'Union Internationale des Villes,¹⁴ founded in Ghent in 1913. The original idea was to create an international association for the development of the cities covering the two-fold aspect of what

they called Civic Construction, with the Belgian architect Paul Saintenoy as responsible, and the organisation of City Life, dealing by Emile Vinck. Paul Otlet, General Secretary of the Union of the International Association was responsible of Cities Exhibition.¹⁵

The origin of the IULA was in the Premier Congrès International et Exposition Comparée des Villes, that took place in July during the Ghent Universal and Industrial Exhibition (26 April-3 November); it was considered by Patrick Abercrombie as “the first professedly international one on municipal activities”. The Congress reflects how global the town planning was in 1913 and how was critically linked to the reformist movements of the time and product of the peace movement in that pre-war time. The event was the first step to the international and comparative study of cities and local authorities. Patrick Abercrombie, Patrick Geddes, Augustin Rey, Josef Stübben, and Raymond Unwin attended the first meeting.¹⁶ The Spanish presence was: Bilbao City Council, represented by Tomás Bilbao and Ricardo Bastida, Sociedad Central de Arquitectos (Central Society of Architects), represented by its President Amos Salvador, IRS, Cità Jardí, represented by Cebrià de Montoliu, Compañía Madrileña de Urbanización, represented by Hilarión González del Castillo, and Professor José Gascó Marín, of the Universidad de Saragossa.

The lawyer and Professor José Gasco Marín was the only Spanish member of the General Provisional Council of the Association.¹⁷ In the question of the unifications and associations of municipalities “a place of honour belonged to Spain”. Gascó Marín made a concise and clear explanation of the municipal law of 1877, which regulates not only the annexes but also the aggregations and municipal associations, adding some remarks about the state of affairs of this issue in Spain and the reform projects, as the local Government.¹⁸

The two problems that were posed in the Congress: the depopulation of the countryside due to the harsh living conditions and the agglomerations in the city had a solution in the Spanish Linear City. Hilarión González del Castillo, advisor of the Compañía Madrileña de Urbanización (Madrid Urbanization Company), promoter of the Madrid Linear City, that was conceived in 1882 by Arturo Soria, and delegate of the Sociedad Ciudad Jardín (Garden City Society), presented in the Civic Construction Section “La Ciudad Lineal, como arquitectura nueva de ciudades: Memoria presentada por la Compañía Madrileña de Urbanización en el primer congreso internacional del Arte de Construir Ciudades y Organización de la Vida Municipal de Gante.” Because of Saintenoy and specially Emile Vinck interest, the report was translated into French by Georges Benoit-Levy, who was thus introduced to the movement which he was later to promote with such enthusiasm. Certain revisions were made in the course of preparing the French edition, which was entitled “La Cite Lineaire, nouvelle architecture de villes”. In the Reconstruction Exhibitions in Brussels in 1919, Hilarión González del Castillo presented the Brussels Linear City Project. The organization was very active in its scientific meetings and city exhibitions and soon joined the International Garden Cities and Town Planning Association.

Inter-allied Housing and Town Planning Congresses: from La Renaissance des Cités to “Homes fit for heroes”

In 1919 (11, 12 and 13 June) took place the Paris the Inter-allied Housing and Town Planning Congress. This was a significant milestone. The Sociedad Central de Arquitectos sent the Town Planning Professor César Cort¹⁹, probably due to his command of French and English, as well as for the teaching activity that he was carrying out at the School of Architecture of Madrid. The extensive program of the Congress, attended by representatives of France, England, the United States, Belgium, Holland, Switzerland, Norway, Poland and Spain, was held at the Musée Social in Paris and at the École Supérieure d'Art Public, an entity created at the behest of the Belgian refugees. The chronicles of the Congress and the Exhibitions, as the reconstruction of Chauny by La Renaissance des Cités, were published by the bulletin of the Sociedad Central de Arquitectos and the journal *Architecture*, created a year before and nowadays celebrating its centennial.

La Renaissance des Cités, subtitled as “Oeuvre d'entre aide sociale” (Work of welfare), had been founded in 1916. The American Red Cross with the experts of the Rockefeller Foundation, contributed directly to the reconstruction of the devastated regions in France and Belgium through La Renaissance des Cités. The association established an office of cooperation, information and documentation in the works of the economic, social and architectural reconstruction of the post-war period.²⁰ The fundamental principle on which the efficient and practical organization has been built up is that of co-operation with local authorities in the ultimate solution of the problems with which they have to deal. Since 1919, George B. Ford, was City Planning Adviser,²¹ and became one of the most active diffuser. A curious testimony of the town planning reconstruction was shown in an exhibition that took place in United States: “These plans show how local engineers, in order to improve traffic conditions, had planned to straighten the street lines on the familiar American gridiron plan. La Renaissance des Cites has been able to substitute another method of widening the streets for new traffic requirements by cutting back as a general rule only on one side and on the other retaining the picturesque irregular house fronts.”²² After the Spanish Civil War (1936-1939), Professor César Cort, proposed to the new dictatorship the instauration of a Spanish Renaissance des Cités for the reconstruction, but he failed. Without dismay, he created the Federación Nacional de Urbanismo y Vivienda de la Hispanidad inspired in the IFHTP under the Spanish Dictatorship.

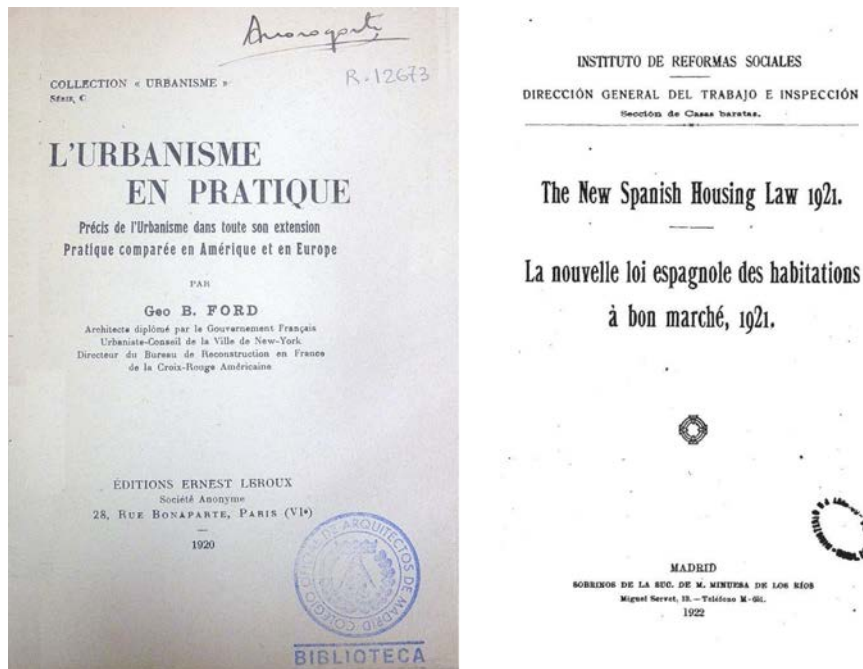

Figure 4: Book (1920) by George B. Ford belonging to the Spanish architect Teodoro Anasagasti and pamphlet in English and French explaining the Law of Casas Baratas (1923)

The Inter-Allied Congress adopted a resolution demanding a minimum standard of comfort in homes. With reference to town planning, a resolution was adopted advocating to definite limitation of dwellings per acre, not to exceed ten, so defending the single housing, and defended the decentralisation of industries, considered one of the most dangerous aspects.

The 18th International Planning History Society Conference - Yokohama, July 2018

In this Congress, César Cort contacted George B. Ford, the sociology Henry R. Aldridge and Alfred Agache, secretary of the Musée Social and the Société Française des Urbanistes, organiser of the Congress. Because of Agache, Cort attended the Congrès International d'Urbanisme et d'Hygiène Municipale in Strasbourg (1923) and a meeting in the Soviet Union organised by *L'Architecture d'Aujourd'hui* (1932). Ford influenced in Cort ideas considering the aspect of the *scientific city*; Aldridge's book *The Case for Town Planning. A Practical Manual for the Use of Councillors, Officers and Others Engaged in the Preparation of Town Planning Schemes*, inspired Cort to write his book *Murcia. Un ejemplo sencillo de trazado urbano* (1932), as a manual for Spanish town planners and a syllabus of his teaching. Cort was very anglophile, and so, he was named Honorary Member of the Royal Institute of British Architects in 1925.

The National Housing and Town Planning Council was the promoter of the London Inter-allied Housing and Town Planning Congress. From June 3 to 11 1920, the Congress brought together eight hundred congressmen of which seventeen were Spaniards.²³ The Congress was “destined to summary of the policy of the room and of the urban and rural plan that the current situation of the world demands”²⁴. César Cort had been appointed delegate in Spain of the National Housing and Town Planning Council and he disseminated the Congress in Spain. The Spanish delegation consisted of Federico López Valencia and Salvador Crespo, and Rafael Vélaz de Medrano, regional inspector of Labour, as delegates of the Ministry of Labour; Ricardo Bastida and Ramón de Belausteguigoitia representing the City Council of Bilbao; Nicolau M^a Rubió i Tudurí, representing the Civic Society Ciutat Jardí of Barcelona; and the architect José Salaberry and the engineer José Casuso representing the Madrid City Council, among others.

Figure 5. Pamphlet about Berlin Exhibition (1910) and journal *Civitas* edited by Societat Jardí. First, under the direction of Cebriá de Montoliu (Cipriano Montoliu) and later on, under Nicolau M. Tudurí. This is the first issue edited by Tudurí, with an article about the London Inter-allied Congress (1920).

The real objective for most of the Spanish delegates was to analyze and evaluate the solutions for the problems derived from the very strong demand for new homes that, in Great Britain, meant the construction of 500,000 houses in a very short period of time.²⁵ In fact, in August, Salvador Crespo, gathering the ideas expressed in the Congress, elaborated a renewal of the Casas Baratas Law (1911) —named cheap housing instead of social housing—. In the proposal, the modern housing doctrine is contained, based on the limitation of the number of buildings per hectare, the scientific layout of populations and the creation of city gardens, and represents the biggest advance made to date in the solution of the housing problem in Spain, although the complexity and contradictions in the regulations limited a lot the success of Casas Baratas Law (1921).

The Casas Baratas Law (1921), administrated by the IRS, established which houses may be legally termed cheap houses —houses for the working classes and middle–low income classes—, putting some limitations on the proportion of global investment including land purchase plus construction, and the income of the tenant or owner.

The law also set hygienic and building standards to which they must submit, as long as they were part of a housing scheme, gardens, parks, gymnasia, bath, schools, co operative stores, will be legally assimilated to the houses. The law had different features as exemption from taxes, direct grants and rent guaranty for the poorer classes. Provincial and local authorities were empowered to lease, rent or sell land and preference was given to building cooperative societies and trade-unions had preference.²⁶ Continuing with the effort of diffusion, the IRS issued a number of useful pamphlets, which included translation into English and French, explaining the law and its workings.

About the singular German exchanges

This situation of openness also caused the presence of some Germans town planners and architects, mainly, to study our cities and their urban morphologies or to participate directly in the debates, if not in the numerous public competitions for town extension plans from the second half of the 1920s, as Josef Stübben, Hermann Jansen and Otto Bunz. The Estatuto Municipal in 1924 forced the Spanish towns of more than 10,000 inhabitants and a growth rate of 20% in the decade of the 1910s, to have a proper urban extension plan. Josef Stübben would coincide with César Cort in the international contest of Bilbao of 1926, in which both participated separately, later to do it together in the one of Madrid of 1929, where also participated Hermann Jansen, associated with Secundino Zuazo.

Thus, reciprocally, we could assess the presence in Spain of foreign technicians and their benefit in favour of professionalizing town planning. A singular case was represented by the German Oskar Jürgens, doctor engineer and architect, collaborator of Felix Geuzmer—director of the Charlottenburg Seminary of the Technical School of Berlin—and Josef Stübben, as author of the book *Spanische Städte. Ihre bauliche Entwicklung und Ausgestaltung*, published in Hamburg in 1926.²⁷ Paradoxically, it was the remarkable diffusion reached by the book among the German technicians that led to its dissemination in Spain.

If we take as reference the treatise *Der Städtebau* by Josef Stübben, the presence of Spanish urban references in its first edition of 1890 is null. On the contrary, in the 1924 edition there is recognition of the contribution of the engineer Ildefonso Cerdá, the Barcelona plan of the French town planner Leon Jaussely of 1904 is reproduced and César Cort, Guillem Busquets and Cebrià de Montoliu are mentioned. Curiously, the Linear City of Arturo Soria was not listed.

Conclusion

The figures that tried to involve Spain in the International Urban Networks during the complicated times around the First World War, returned the knowledge they received in different ways. Cebrià de Montoliu applied the knowledge to the diffusion of Garden Cities experiences in Catalonia, but also introduced the new town planning concepts through the Social Museum and the journal *Civitas*; Federico López Valencia and Salvador Crepo applied their knowledge to housing policies through the IRS, with the result of the Casas Baratas Law (1921). Three years after, the Estatuto Municipal (1924) was passed: the first Municipal Law that involved the expansion responsibilities and can be considered the first Spanish town planning law. The Town Councils applied their technicians' knowledge in their proper urban development as the contest of Bilbao (1926), Madrid (1929) and the proposal for Barcelona (1934), with Le Corbusier and the architect Fernando García Mercadal one of the leaders of the CIAM in Spain. Hilarión González del Castillo diffused proposals for Linear and Garden Cities in many publications, and Professor César Cort introduced the Garden City theories in his teaching at the School of Architecture in Madrid with concepts as zoning, civic survey, park systems, satellite-towns, parkways, super-blocks and regional planning.

These new ways had to be adapted to the Spanish tradition. And it was really tried, until the interruption of the Spanish Civil War in 1936. That the future city find some images in the numerous urban transformation plans formulated during those years, was not an obstacle for "the people of old spirit, educated in an ancient aesthetic, attracted perhaps by the new spirit, but feeling the love of the past distance", they would find their refuge in "the separated corners that were then to contemplate a rudimentary and primitive architecture, ignorant of itself, like that of our current poor villages", as Torres Balbás finished his meditation on the future city, in a reflection that did not eliminate the inheritance left in its physical trace by the civilizations of the past.²⁸

The Town Planning congresses at the Paris International Exhibition of 1937. Ultimate encounters.

Corinne Jaquand

PhD, Ecole nationale supérieure d'Architecture Paris-Belleville ENSAPB, Ipraus-UMR Ausser,
corinne.jaquand@paris-belleville.archi.fr

1937 is an excellent focal point to look at the international planning movement on the eve of the Second World War. Indeed, the International Exhibition of Paris has hosted several congresses devoted to urban planning in the world. Dealing with regional planning, the International Federation for Housing and Town Planning (IFHTP) held its 15th congress, while the CIAM 5, dedicated to “*Logis et loisirs*” (Dwelling, recreation) was organised by Le Corbusier in connection with an exhibition at the Pavillon les Temps nouveaux. This contribution proposes to present the relations between both congresses in the thirties. Emphasis will be put more on the convergences than on the divergences of topics carried out by the experts of the IFHTP and by the avant-garde architects of the CIAM, at a time when planning and politics were challenged by the rise of fascism and the threat of a world conflict.

Keywords: world planning history, cross-cultural exchanges, city planning and politics

Figure 1: International Exhibition “Arts et Techniques”, Paris 1937. Postcard showing Speer Pavillon (Germany) facing Iofan Pavillon (UdSSR) [*Promenades à travers l'exposition. 20 cartes détachables. Série 3 (Boulogne-sur-Seine, M. Chipault), 1937, Front cover*]

Introduction

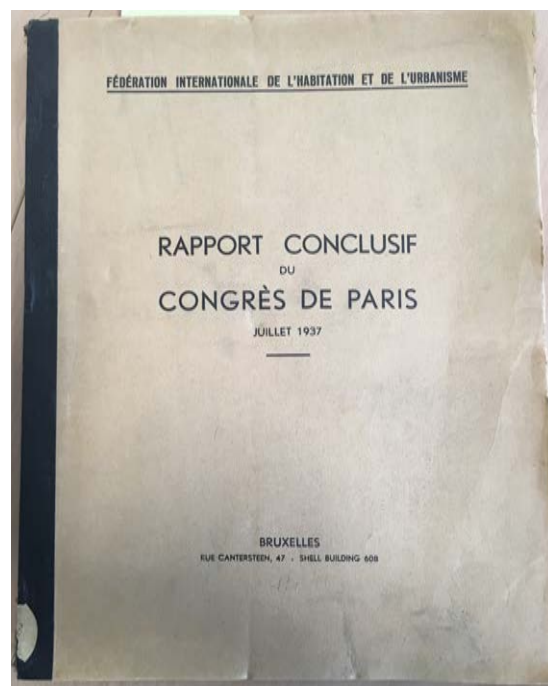

The Paris International Exhibition of 1937, dedicated to the “Arts et Techniques appliqués à la Vie moderne”, took place in a geopolitical climate of rising tensions. Standing face to face in the axis of the Eiffel Tower, the pavilions of Soviet Union and Nazi Germany (built respectively by Boris Iofan and Albert Speer) were a harbinger of the world war to come (Figure 1)¹.

This exhibition is an excellent focal point to look at the international planning movement on the late thirties. From July 4th to 8th, the International Federation for Housing and Town Planning (IFHTP) holds its 15th congress, merging this year with the International Housing Association (*Internationaler Verband Für Wohnungswesen*) (IHA). The joint congress is dealing with housing for the poorest, high-rise construction, national and regional planning. From July 8th to 13th, the Study Group of the Underground Urban Center (GECUS) held its first congress (*Congrès de l'Urbanisme souterrain*). French and foreign experts sail from one conference to another,

joining for visits and attending the garden party on the 14th July². Two weeks before from June 28th to July 2nd, CIAM gathered for their 5th congress dedicated to “*Logis et loisirs*” (Dwelling, Recreation)³. Under the rule of Le Corbusier, the Pavillon des Temps nouveaux opens on the Porte Maillot site of the International Exhibition.

The interferences between the IFHTP and the CIAMs deserve to be highlighted in order to go back on the assumed cleavages between avant-garde and operational planners (Figure 2 and 2 bis). If the historiography on CIAM is well established (Mumford, 2002), that on the IFHTP has recently opened a rich corpus (Riboldazzi, 2010, 2011, 2015, Geerste, 2012, 2016, Graham, 2011, Wagner, 2016). In the inter-war period, IFHTP proceedings and thematic bulletins provide a precise apparatus, as the association expands its networks to America, Asia, Australia and Pacific countries. A brief survey of the CIAM’s link to other ‘big’ international congresses still exists (Somer, 2007) but needs to be detailed. By crossing the chronology of the meetings of the CIAM and its organizing committee CIRPAC with that of the IFHTP, we notice temporal coincidences in Berlin 1931 and Paris 1937. Besides some characters are part of both institutions, such as the German Ernst May and the Polish Tadeusz Tolwinski. The comparison of calendars, the crossing of lists, themes and methods, thus show even more convergences. Moreover, it is important to compare how IFHTP and CIAM react to the political tensions of their time.

Figures 2–2 bis: Front covers of the CIAM 5 Report and of the IFHTP congress Report. [*Logis et Loisirs. 5^e congrès CIAM Paris 1937*. Boulogne-sur-Seine: Editions de l’Architecture d’Aujourd’hui, 1938 ; Fédération internationale de l’habitation et de l’urbanisme. *Rapport conclusif du congrès de Paris, juillet 1937*, typed. Brussels: IFHTP, 1937]

IFHTP 1937 and CIAM 5 in international and French context

Founded in 1913 in Paris, the IFHTP is rooted in the garden city movement and brings together officials engaged in operational planning within social housing companies, municipalities, regional planning agencies, public ministries. For their part, the CIAM, organized from 1928 around the nucleus of Siegfried Giedion, Le Corbusier and Hélène de Mandrot, bring together architects mostly without institutional affiliation but sharing a common opposition to academicism.

The two conferences deserve to be watched under the magnifying glass of the French context as well. The year before, in 1936, the Popular Front government came to power bringing social laws in favor of paid holidays that foreshadow new programs for cultural and outdoor recreation. The International Exhibition of 1937 hosted a section at the new Musée d’Art moderne (section 17) showing extension plans for French medium-sized towns as required by the Cornudet law (1919-1924)⁴, and also the Paris Regional Development Plan (*Plan d’aménagement de la région parisienne*) (PARP) which has been formalized in May 1934⁵. The PARP has been outlined by the architect Henri Prost who designed superb perspectives showing landscaped highways to be built in the outskirts

of Paris and a so-called 'Route des parcs' linking Versailles to other historical parks West of Paris. The GECUS exhibition on "The Underground World" (section 17 TER) shows a large electrified model of Paris underground with the metropolitan, sewers, pipelines, geological strata (Figure 3)⁶. Following the IFHTP and GECUS congresses, many visits are taking place in Paris and its suburbs, including new tunnels built along the the ring road and the highway already under construction between Marly and Versailles.

Figure 3: Exhibition of the GECUS "Le Monde souterrain", section 17 TER of the main Exhibition Arts et Techniques at the Musée d'Art moderne [Le Monde souterrain, no.15-16-17 (November 1937): 161].

IFHTP assuming political neutrality of town and regional planning

With its headquarters in London and its presidency entrusted to Raymond Unwin and George L. Pepler, the IFHTP is dominated by the British who favour satellite cities, green belts and industrial decentralization. By changing name in its beginnings the association switches from garden city to large scale urban planning⁷.

The congress process is then reorganized by introducing two different sessions dedicated to housing and urban development. Rapporteurs and session chairs follow a strict protocol inspired by supranational institutions set up after the First World War, like the International Labor Organization. Before each congress, written contributions are gathered in a first book which is sent to the participants who have to register to make comments on the spot. Statements are transcribed in a second volume which appears after the congress as well as a third which summarizes the course of the sessions, the speeches and the visits. The result of the congresses can lead to a list of resolutions, such as in Amsterdam (1924) and New York (1925), respectively on regional and urban planning and on traffic reorganization in metropolitan areas.

The whole is translated quite accurately in at least three languages, English, French, German. In addition, booklets issues open up the horizon on urban planning in many countries. A glossary of urbanism in several languages French, English, German, Italian, Spanish is published in 1932. From 1938, a quarterly magazine and the minutes of the Federation meetings is published in Germany⁸. Since the Vienna Congress (1926) there is talk of establishing an "international quotation that should be used in the development of [all] civic surveys and city plans"⁹. Looking for a similar standard mapping, CIAM does not seem to have succeeded either.

The 18th International Planning History Society Conference - Yokohama, July 2018

The life of the IFHTP is ritualized by banquets and visits scheduled the days following the congress. Ministers and sometimes the heads of state include these international meetings in their diplomatic agenda. Since the mid-twenties, congress attendance often exceeds 1,000 people.

The original English and French nucleus is rapidly expanding to a second circle of personalities from a dozen countries. The Presidency, Vice Presidency and Treasurer are relatively stable over the period. The elected Council and the appointed Executive Committee, in charge of the next congress to be held, evolve according to geographical transplants inside and outside Europe¹⁰. Thus one crosses in the council representatives from Scandinavian, Central and South Europe. Finally, UdSSR, Japan, Latin America, Australia, New Zealand and, episodically, Zionist Palestine, make their appearance in the mid-twenties¹¹.

The project of a merger with IHA, based in Frankfurt am Main, follows the Berlin Congress of 1931. However, the coming to power of the Nazis leads to a negative missive of the IFHTP in April 1933, confirmed at the London Congress in 1935¹². Then the discussions resume and lead to a memorandum presented at the Paris Congress in 1937. The establishment of a seat in Brussels is planned for the following year with a joint secretariat: Donald C.L. Murray from IFHTP and assistant Paula Schäffer from IHA. The merged body take over the name of the IFHTP. From October 1938, the mayor of Stuttgart, Karl Strölin, will assume the presidency, succeeding the English George L. Pepler.

What happened to the Federation to change its mind? Probably the ousting of German Social Democrat and Jewish colleagues first shocked, especially that of Robert Schmidt, member of the Executive Committee, Vice President and Treasurer of the IFHTP. A valued pioneer in regional planning, Robert Schmidt has been managing the *Siedlungsverband Ruhrgebiet* (SVR) since 1920, the regional planning agency of the industrial Ruhr area. In 1933, he is dismissed and dies in 1934. The renewal of the actors in Germany is a result of aryanization and political purges. In 1933 Karl Strölin takes the helm of the IHA and is appointed mayor of Stuttgart by the Nazi party. It is likely that after the death of Schmidt, the relations of the IFHTP with the new German leaders gradually resume. Supporting good planning practice must go beyond political resentment.

Until the end of 1941, Strölin aims to keep the town planning movement a political neutrality. Despite the narrowing of delegations, he does not cease to operate the IFHTP effectively with colleagues whose countries have been subjected to the German occupation. He is receiving valuable assistance from Paula Schäfer, alone at the IFHTP secretariat in Brussels since the death of Murray. Under her supervision, the trilingual quarterly journal will not have to suffer from the war, nor the bi-weekly newsletter whose bibliography is thickening including information on the Chinese city of Hsinking, the capital of Manchukuo state, then ruled by Japan¹³.

NSDAP member since 1923, Strölin is one of those few Nazi notables for whom Hitler betrayed the interests of Germany. In 1944, he plotted with Rommel and was worried after the failed attack against Hitler in July 1945. Excluded from the party, he remains mayor of Stuttgart and takes contact with the allies for a peaceful surrender of his town. Despite his responsibility for the deportation of Jews from Stuttgart, he is little worried by the denazification commissions, unlike another member of the IFHTP, Guido Harbers, who was director of urban planning and housing in Munich and remains three years in jail.

The French within the IFHTP

What is the implication of the French within the IFHTP before the Second World War? It can thus be summarized as follows: they occupy permanent places in the bodies¹⁴, but they contribute weakly in the writings of the federation. At the Paris 1928 and 1937 congresses, they represent less than 20% of the attenders, whereas those of the country concerned are normally the majority¹⁵.

The French random presence in the IFHTP is reflecting a certain backwardness inside the international movement for urban planning. Thus the Minister of Labor and Hygiene, Louis Loucheur, author of a law bearing his name for the improvement of defective suburbs (1928), introduced the IFHTP Paris congress of 1928 in these terms: "It is necessary that in these international meetings [...] you bring us your thoughts, your ideas and very often your lights. Alas, apart from some remarkable efforts made in France in recent years, we may not have enough to show you beautiful things [...]"¹⁶. Even if Beaux-Arts planners export their know-how abroad (Jaussely in Barcelona, Prost in Antwerp, Gréber in Philadelphia, Agache in Rio de Janeiro and Le Forestier in Argentina), the debates is not very international comparing to Germany, Holland and Great Britain. Some people are exceptions like Henri Sellier who disseminates plenty of informations on foreign countries in the journal *La Vie urbaine*¹⁷. Senator of the Seine, Minister of Public Health under the government of the Popular Front, and Mayor of Suresnes, Sellier is a major figure in the debate on Greater Paris. As director of the OPHBM of the Seine (Public office for social housing), he initiated the garden cities built around the capital city. The magazine *Urbanism*, created in 1932 by the French Society of Planners (SFU), give accounts on the IFHTP congresses in Berlin 1931 and Paris¹⁸. Other

newspapers are quite indifferent to foreign references with the exception of *L'Architecture d'Aujourd'hui* appearing in 1930.

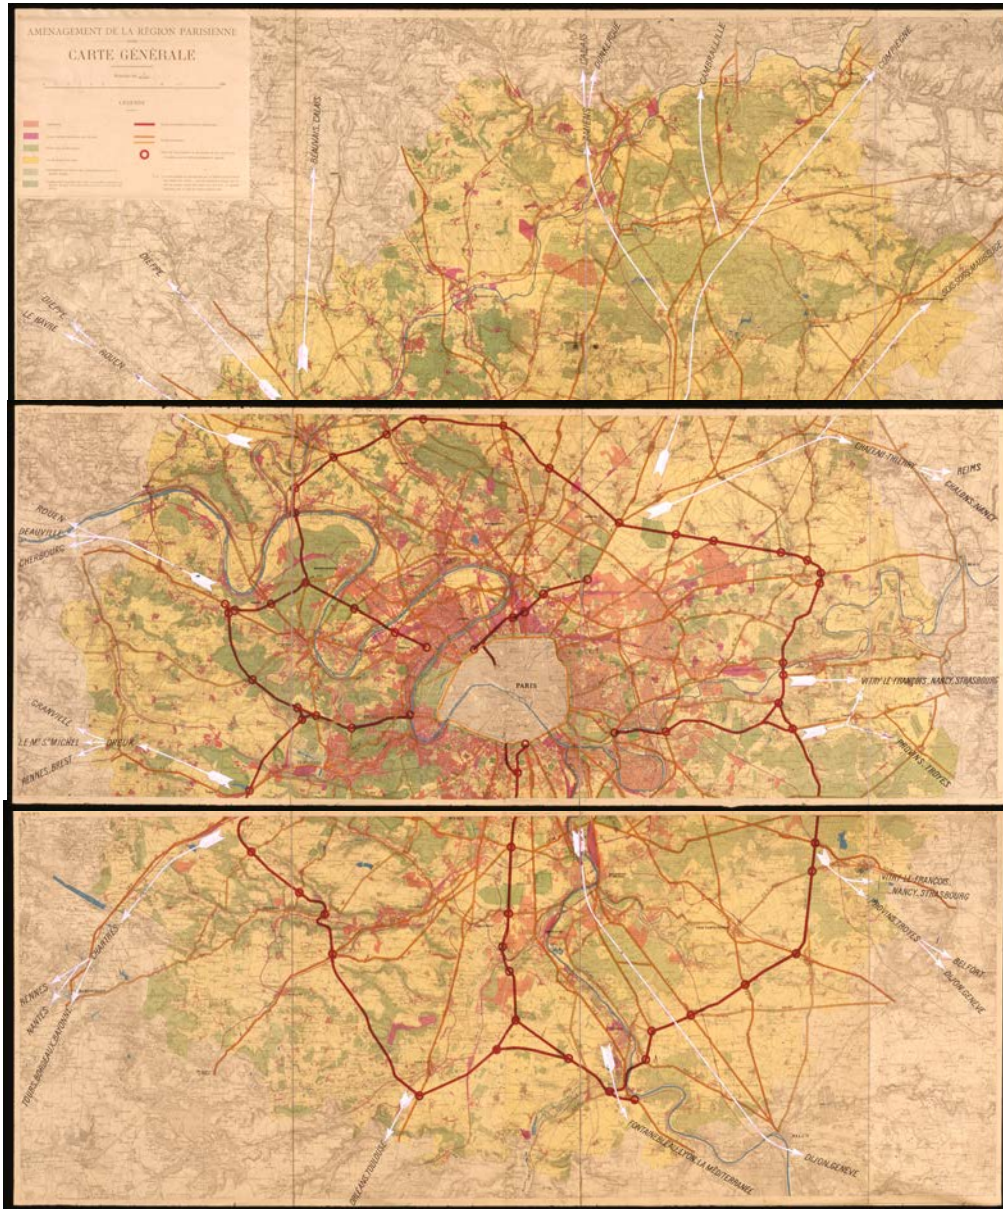

Figure 4: *Plan d'aménagement de la région parisienne PARP*, May 14, 1934, original scale 1:50 000 [Archives d'architecture du XX^e siècle. Fonds Henri Prost, 343 AA: HP-DES-002-04-01, -02, -03]

The discussion on the Paris Regional Development Plan (PARP) (Figure 4) was expected to occupy an important place in the congress of 1937. The Berlage extension plan, studies for New York and its environs, Regulatory Plan of Rome, Berlin Plan of 1929, were respectively at the heart of the IFHTP congresses of Amsterdam (1924), New York (1925), Rome (1929) and Berlin (1931). On the contrary, French planners do not seem to seize this international opportunity to give a broader echo to the PARP. In London (1935), Henri Prost gave a general statement on “The development plan of the Paris region currently in the process of approval”. In 1937, he is retained in Turkey for his first studies on Istanbul¹⁹. Some statements are delivered by his assistants, Jean Royer and Pierre Remaury, and by Georges Sébille another expert. The Greater Paris paradigm is based on the densification of the suburbs and the improvement of road traffic by the construction of landscaped motorways. Projects of satellite towns have been abandoned due to land expropriation difficulties and financial uncertainty. In 1941, the master plan will be applied by the French State to a set of heterogeneous municipalities without a single metropolitan governance²⁰.

In 1937, French participants seem to have mobilized more for the first Congress of Underground Urban Planning which deals with road infrastructures but also passive defense against air attacks, for which Germany appears at the forefront. There will be referred to a Goebbels speech on measures listed by the National Air Defense League (*Reichsluftschutzbund*)²¹.

After WWII the life of the IFHTP/IFHP resumes with a very active participation of French delegations as their country embraces the culture of voluntary planning as headline for the national reconstruction.

The handling of CIAM 5 by Le Corbusier

This lack of international challenge highlights the originality of LC on the French scene. The native Swissman is close to Germanic avant-gardes that manipulates slogans and manifestos. LC knows how to combine French inductive thinking with German propaganda efficiency.

After the CIAM 4 of Athens, the researches on the “Functional City” had to be continued, but the next congress is several times postponed. Le Corbusier explicitly reinforces the preparations of CIAM 5 and is careful to publish the conference report just after. In the same way as IFHTP congress, the topics are introduced and moderated by rapporteurs and chairmen. The main session deals with the functionalist mantra “Living, recreating, working, transporting”²².

Figure 5: Le Corbusier, Pavillon des Temps nouveaux, Exhibition *Habiter, Recréer, Travailler Transporter* [Photo: Albin Salaün © FLC/ADAG]

The second part of the congress is a mix of themes, none of which predominates such as: “Spatial organization of recreation”, “Urbanism and rural architecture”²³, “Urbanism and aerial threat” with a statement of Colonel Vauthier, expert at the GECUS²⁴. High-rise buildings and land issues are also discussed, but rather superficially if compared to the IFHTP.

Le Corbusier introduces a questionnaire sent in advance and commented during the meeting. Thus the French Quétant is given an investigation on “Settlement and the high-rise building”. Le Corbusier entrusted also Norbert Bézard with a memorandum on “Villages coopératifs” and “Agrarian unity”. Presented as a ‘corresponding specialist, agricultural worker’, Bézard had published in 1934 together with Le Corbusier *La Ferme Radieuse*. By inviting Bézard and Dr. Pierre Winter to CIAM 5, Le Corbusier shows acquaintances with French fascist groups²⁵.

The book of CIAM 5, *Logis, Loisirs* (Dwelling, Recreation), is remarkable for its graphic and the exhibition presented at the Pavillon des Temps Nouveaux for its innovative scenography (Figure 5). With an abundance of

slogans, plans, drawings and large photos, the subject is somewhat scattered but is a pleasure to the eye²⁶. However, two major themes emerge: rural urbanism and a project of LC for Paris which completes his Plan Voisin of 1925.

CIAM's narrative of resistance to the conformity reaches its limits. If, Le Corbusier still shows a certain disregard for the 'phynance [sic]²⁷, the German and Dutch members of CIAM are then engaged in large social housing programs such as Ernst May in Frankfurt and JJP Oud in Rotterdam. In La Murette-Drancy (1935), Marcel Lods, member of CIAM France (then associated with Eugène Beaudouin) has just experienced large-scale prefabrication in what is considered the first French 'grand ensemble'. Besides, in peripheral European countries avant-garde and city architects are part of the same patriotic elite, like in Poland where the CIAM section includes both the radical Simon Syrkus and Tadeusz Tolwinski who has been in charge with the master plan of Warsaw.

Figure 6: Front cover of Le Corbusier's book, *Des Canons, des munitions ? Merci! Des logis... s.v.p.* Boulogne-sur-Seine: Editions de l'Architecture d'Aujourd'hui, 1938.

Conclusion: City planning or war ?

In the 1930s, the arrival of the Nazis in power thwarts the equilibrium at the CIAM and IFHTP. Once leftist and Jewish Germans and Austrians gone into exile, Le Corbusier got the way free to take the CIAM direction. The integration of IHA into the IFHTP in 1937-1938 insures the influence of German experts appointed by the Nazi regime. Towards UdSSR, the CIAM testify sympathy – in spite the cancellation of the Moscow congress – and the IFHTP shows a benevolent opening – at the previous London congress of 1935, the Soviet delegation was numerous but for any reason absent from Paris in 1937. Whether in the CIAM or the IFHTP, the Fascist Italian regime is perceived favourably. The IFHTP Congress in Rome in 1929 is a success. In 1937 rural settlement programs of Pontine Marshes are widely discussed within IFHTP and CIAM. In France, the book of Gaston Bardet on the Rome of Mussolini comes out well in 1937²⁸.

Pleading for peace by urban planning seem absurd with historical distance, but it was not so at that time. Planning is presumed to smooth social tensions and to contribute to peace between nations.

This is evidenced by the polite exchanges of Karl Strölin with his French hosts on July 4th, 1937: Strölin: "Social discontent can, as you know from history, easily influence foreign policy. I see [...] in the sanitation of the housing conditions of the working class, an essential means for the stabilization of world peace, in general. [...] All our work must strive for this goal and we Germans want to work hard to solve this problem."²⁹ Then Jean Royer replying: "Henri Sellier told us yesterday that congresses, such as ours, were a striking example of international solidarity and that there should no longer be national borders when considering such questions."³⁰

"Et maintenant, préfères-tu faire la guerre?"³¹. Le Corbusier takes up the same plea vehemently in his book, *Des canons des munitions ? Non des logis s.v.p.*, issued in 1938 as the exhibition catalogue of the Pavillon des Temps nouveaux (Figure 6). Everyone is preparing for hostilities, but the enemy is not named.

Notes on contributor(s)

Corinne Jaquand is lecturer at the ENSA-Paris-Belleville and researcher at the IPRAUS. She has worked as urban planner for the city of Paris, the Senate of Berlin and for private investors. She earned a PhD at the EHESS, dealing with the metropolization of Greater Berlin at the beginning of the 20th century and received a grant from the CCA Montréal to research on regional planning and landscape urbanism overseas. She is co-editor of the website www.inventerlegrandparis.fr which provides the proceedings of conferences on the history of Greater Paris, comparing international planning cultures up to the present.

Endnotes

¹ The 1937 International Exhibition has left on the site two buildings in neo-classical style : the Palais de Chaillot, transformed by the architects Jacques Carlu, Louis-Hyppolite Boileau and Léon Azéma, and the new Musée d'Art moderne/Palais de Tokyo, built by Jean-Claude Dondel, André Aubert, Paul Viard et Marcel Dastugue.

For the lay-out, pavillons and light scenographies at night, see: Emile Labbé. *Exposition internationale des Arts et Techniques dans la vie moderne 1937* (Paris: Ministère du Commerce et de l'Industrie, 1937) ; Bertrand Lemoine (ed.), *Paris 1937: cinquantenaire de l'Exposition internationale*, exhibition catalogue (Paris: IFA, 1987).

² IFHTP and GECUS congresses take place in the "International Fortnight of Housing and Town Planning", from 5-17 July 1937 at the Maison de la Chimie, rue Saint-Dominique. The Fortnight will also host the conference of the Brussels-based International Union of Cities, as well as other national conferences, such as the Congress of Social Housing Societies (OPHBM). This Fortnight was inaugurated by the President of the French Republic, Albert Lebrun, and is held under the patronage of the French Government, the City of Paris and the General Council of the Department of the Seine. "Les congrès de la Quinzaine internationale des administrations publiques, de l'urbanisme et de l'habitation", *Urbanisme*, no. 58 (1937): 204-sq.

³ CIAM 5 is held at the Palais d'Iéna, recently completed by architect Auguste Perret. LC obtained the patronage of four Ministers: Foreign Affairs, National Education and Fine Arts, Agriculture, Public Works; of the Under-Secretary of Sports and Recreation, of the Director General of Beaux-Arts school.

Stenger: 1937). 2 vol.; "Exposition Universelle : Classe 17 l'Aménagement des villes et des campagnes", *Paris et la région capitale*, no. 1 (May 1937): 32 ; "L'Urbanisme à l'exposition", *L'Architecture*, no.12 (December 15, 1937): 415-426; *Urbanisme*, no.56 (June-July, 1937).

⁵ The Cornudet law requires the establishment of PAEE (development and extension plans and embellishments) to cities with more than 10,000 inhabitants. The PARP follows the Cornudet law and concerns Paris, the department of Seine and part of the departments of Seine-et-Oise, Seine-et-Marne and the Oise, within a radius of 35 km from Notre-Dame. The studies began in 1928 and were headed by the Higher Planning and Organization Committee of the Paris region (CSAORP) under the auspices of the Ministry of the Interior and the Seine Department. Following the law of May 14, 1932, the architect Henri Prost, assisted by Pierre Remaury and Jean Royer, receives order to establish the plan to 1: 10.000, jointly with the National Railways Cie, the geographical service of the army and the bureau of Extension of the City of Paris. Presented in May 1934, it has since been submitted to a public inquiry. The plan finally approved in 1941, then revised in 1956.

⁶ "Exposition Universelle: Classe 17 TER urbanisme souterrain", *Paris et la région capitale*, no. 1 (May 1937): 32; *Le Monde souterrain*, no.15-16-17 (November 1937). The passive defense shelter was built by: The Society of Government-Certified Architects (SADG); the aeronautical group [students] of the School of Beaux-Arts (GAEDBA); the Association of Veteran Architects (AAAC) and the Underground Urban Center Study Group (GECUS). Besides the GECUS had since 1933 a magazine: *L'Urbanisme souterrain*, under the direction of Edouard Utudjian and Gaston Bardet as editor. On the GECUS see: Catherine Blain. "La ville épaisse d'Édouard Utudjian. Un concept et ses ramifications", *Dossiers du Lacth #2, La ville souterraine: représentations et conception. La part de l'invisible* (December 2017): 55-60.

⁷ Designations of IFHTP: 1913 (1st Congress, Paris): *The International Garden Cities and Town Planning Association* (IGCTPA); 1922 (6th Congress Paris): *International Garden Cities & Town Planning Federation*; 1923 (7th Congress Göteborg): *International Federation for Town & Country Planning and Garden Cities*; 1926 (10th Congress, Vienne): *International Federation for Housing and Town Planning* (IFHTP). In the post-war period the federation will take the name of: *International Federation for Housing and Planning* (IFHP) (24th Congress, 1958, Liege).

⁸ After the merger of IFHTP and IHA, is published by Julius Hoffmann (Stuttgart) the quarterly review : *Habitation et Urbanisme/Housing and Town Planning/Wohnungswesen und Städtebau*, no. I, II, III/IV (1938) ; no. II, III/IV (1939) ; no. I/II, III/IV (1940) ; no. I/II, III/IV (1941) and the bi-monthly newsletter : *Informations de la Fédération Internationale de l'Habitation et de l'Urbanisme/Notes of the International Federation for Housing and Town Planning/Mitteilungen des Internationalen Verbandes für Wohnungswesen und Städtebau*, no. 1-6 (1939) ; no. 1-5/6 (1940) ; no. 1-6 (1941).

⁹ Xth *International Housing and Town Planning Congress*, Vienna 1926, Part III. Reports (Brussels: IFHTP), 15-16.

¹⁰ Thus the important role of John Nolen at the IFHTP until his death in 1937, and for the Mexico of Carlos Contreras.

¹¹ On Japan, see "The Procedures, powers and duties. Japan, Finland", *IFHTP Bulletin*, no. 5 (1924). Japan appears in the IFHTP bodies for the Vienna Congress (1926).

¹² Decision April 28th, 1933, on the basis of a Joint Committee report. End of the discussion. A similar merger with the International Union of Cities will not happen.

¹³ “Mandchouco/Mandchukou/Madschukuo”, *Informations de la Fédération Internationale de l’Habitation et de l’urbanisme/Notes of the International Federation for Housing and Town Planning/Mitteilungen des Internationalen Verbandes für Wohnungswesen und Städtebau*, no.3 (1939): 124-125; no.5/6 (1940): 174 ; no.2/3 (194): 64-65.

¹⁴ In IFHTP’s bodies, we find since the early 1920s: Louis Bonnier (Vice-President) and Marcel Poëte, the garden city activists, Henri Sellier, George Benoit-Lévy, the economist Charles Gide, Sentenac, and the polyglot Bruggeman, depending on the year, members of the Council and of the Executive Committee. These people are linked to the Musée Social and defend a multi-disciplinary approach to urban planning that finds continuity in the teaching provided from 1919 at the Institute of Urban Planning of the University of Paris (IUUP). They revolve around the magazine *La Vie urbaine*, also founded in 1919 and chaired by Henri Sellier. Later leading architects from the Beaux Arts will enter the instances, as Jacques Gréber, Henri Prost, Jean Royer. From 1937, the young Gaston Bardet, editor-in-chief of the journal *Urbanisme*, became also active. This sphere of practicing architects draw together a pole linked to the French Society of Urban Planners (SFU).

¹⁵ Before that of 1937, two congresses of the IFHTP are held in Paris. The first for its inauguration in 1913, and the 11th in 1928, which is held at the University of La Sorbonne parallel to an exhibition of urban planning situated at the Parc des Expositions Porte de Versailles.

¹⁶ *XIth International Housing and Town Planning Congress, Paris 1928*, Part III (Brussels: IFHTP), 24.

¹⁷ Founded in 1919, in connection with the Institute of Urban Planning of the University of Paris (IUUP), *La Vie urbaine* follows the major metropolitan plans of New York (1925-1929), Berlin (1929), Greater London (studies of Unwin, then Abercrombie), the planning of the region of the Ruhr, expansion plans in the French colonies, the concept of neighborhood unit set up in Radburn.

²⁰ Indeed no supra-communal body is set up that is comparable to the London Council Council. Municipalities lack the means and the political will to expropriate. The PARP is thus the object of criticism including among the high officials like François Latour, councilman of Paris and member of the IFHTP.

²² CIAM 5, we found : “Solutions of principle” based on the four fundamental principles “Living, recreating, working, transporting”, rapporteur Le Corbusier, president Weissmann (Yugoslavia), “Application cases of cities”, J.-L.L. Sert (Spain) and Emery (France-Algeria), “Case of application of regions and countryside”, Syrkus (Poland) and Bézard (France), Limberg (Holland). In *Logis et Loisirs*, 112-119.

²³ Pollini, Figini (Milan), “Notes on Leisure Areas”; Tolwinski (Poland), “Organization of leisure in the workers’ cities”; Paul Nizan (writer), “The problem of recreation in contemporary society”. The discussion distinguishes daily, weekly, annual, bi-annual leisure activities.

Bierbauer (Hungary), “The Basics of Rural Reconstruction in Hungary”; Banfi, di Belgioso, Peressutti, Rogers, Radice-Fossati, Banfi, “Rural town planning”. Le Corbusier posits as a principle the city-countryside interaction: “The biological essence of the city and the countryside”. Cf.: D. Chenut, *CIAM 1928-1956*, 102.

²⁴ Lieutenant-colonel Vauthier, *Le Danger aérien et l’avenir du pays*. Préface de M. le maréchal Lyautey (Paris, Berger-Levrault: 1930). From 1936 up to 1939, Vauthier is chief camp of Marshal Pétain at the Ministry of War.

²⁵ Norbert Bézard (1896-1956) belonged to the movement *Faisceau*, close to Italian fascism. In 1945, he joined ASCORAL (Assembly of Architects for an Architectural Renovation). Le Corbusier had a close relationship with the doctor Pierre Winter who also intervened in CIAM 5. Since 1932 Winter participated in the magazine *Plan* before founding with Hubert Lagardelle *Prélude* (subtitled : Avant-garde of architecture and politics) to which LC contributed. Winter animated with Philippe Lamour the french Fascist Revolutionary Party. The connection of LC to fascism has been well established since its bi-century: François Chaslin, *Un Corbusier* (Paris: Seuil, 2015) ; Jean-Louis Cohen, *Le Corbusier, la planète comme chantier* (Paris: Librairie Eyrolles, 2015) ; Marc Perelmann, *Le Corbusier, une froide vision du monde* (Paris: Michalon, 2015) ; Xavier de Jarcy, *Le Corbusier, un fascisme français* (Paris: Albin Michel, 2015).

52 Open Spaces in Changing Cities

Historical Processes of Urban Form and Land Use Change at the Shwedagon Pagoda's Surrounding Area in Yangon, Myanmar.

Kuniomi Hirano (The University of Tokyo) and Makoto Yokohari (The University of Tokyo)

Myanmar is an Asian Theravada Buddhist nation. Shwedagon Pagoda (hereinafter called "the Pagoda") is located at the center of Yangon, Myanmar. It is one of the nation's most respected religious monuments. Yangon, formerly known as Rangoon, had originally started its history as a religious town under the Pagoda since the dynastic regime. The objective of this research was to identify the details of the historical processes of urban form and land-use change in the area surrounding the Pagoda in relation to political regime transition. This research also focused on the evolving processes of the Pagoda festival and its land use in the surrounding area; the festival is a typical occasion during which the relationship between the pagoda and the surrounding area is prominently visible. This research intends to identify how temporary, multi-purpose open spaces have been divided, fixed for individual land uses, and segmentalized in the area surrounding the Pagoda in the historical processes. This research involved an interview survey, newspaper review survey, field survey, mapping work, and a literature review to accomplish this research's goals. The interview and newspaper review surveys were key methods in this research since official documents have remained unpublished in Myanmar since 1964.

The Pagoda's land property and the land use of the surrounding area have undergone significant changes. This research identified that the religious use relationship between the Pagoda and the surrounding area weakened during these historical transitions. The temporary, multi-purpose open spaces of the surrounding area used to play important religious roles, especially when the festival was held during the dynastic regime. Although such roles were suspended during the colonial regime, they appeared to have somewhat resumed during the BSPP (Burma Socialist Program Party (1962-1988)) military regime. However, the roles of the surrounding area have nearly disappeared subsequent to the establishment of the SLORC (State Law and Order Restoration Council (1988-2011)) military regime. This research identified the historical processes through which temporary, multi-purpose open spaces in the area surrounding the Pagoda have been divided, fixed for individual land uses, and segmentalized according to role during the Pagoda festival. For example, this includes markets and stalls that have been altered for use as permanent shops and restaurants, entertainment and amusement facilities that were enclosed in parks, and smaller forms of lodging that have become hotels. These drastic changes occurred during the 24-year prohibition period implemented by the SLORC military regime. Thus, the roles of the Festival are no longer needed by modern citizens, except praying and donating. It is remarkable that the open spaces of the surrounding area have become modern parks through historical transitions. This adds to the understanding of urban form and the establishment and development of parks in colonial cities.

Study on Kaishochi Changes Before and After the War-Camage-Recovery Land Readjustment Programs of Nagoya City, Japanese Castle Town

Kenjiro Matsuura (Chiba University)

In the grid block in the big city, high-rise buildings are arranged to compete, and flat parking lots are scattered randomly. These are planned block districts on a per site basis and are not planned for each city block. On the other hand, in the grid block district of the castle town, which is a planned city, there is an example where the open space called kaishochi was arranged in the central part of the block systematically. It is one of the tasks for redevelopment of an attractive central urban area, after reevaluating such a historical kaishochi and planning a new kaishochi that is adapted to modern urban life.

Under the above problem consciousness, in this paper, focusing on open temple-type kaishochi (open areas ensconced in the design of urban blocks) located in the district of Nagoya City in Japan's Aichi Prefecture, we will review the effects of the war-damage-recovery land readjustment programs, through which the city has experienced a number of major transformation. In the castle town Nagoya of Edo period, there were many kaishochi within blocks. Many sites of kaishochi are temple types with temples, and in addition there are other types used as mansion or public facility, and shrine types with shrines.

Specifically, we will elucidate the actual state of such kaishochi before and after the project by examining residual trends of temple-type structures by using maps produced before and after the project implementation. Targeting 66 Edo-period kaishochi blocks in the Nagoya Castle district, we first analyzed the differences between the land usage decrease rate for the whole district and that for the targeted kaishochis. Next, we analyzed transformations of usage and form using the maps produced before and after the project implementation.

As a result of the analysis, the following three points were clarified. First, even though the number of temple-type kaishochis is decreasing, there has been little change in the area they occupy. The total number of kaishochi was 50 before enforcement, but it decreased to 40 after enforcement. From the remnant trend of Temple-type, the decrease in the number of Temple-type has occurred before the execution of the land readjustment project, and it also decreased after the project. Second, there has been little change in kaishochi usage before and after the project implementation. When looking at usage of kaishochi, many of the other types were changed from the temple types. The reason may be that the temple moved to the suburbs along with the graveyard due to the influence of the cemetery relocation that was done during the land readjustment project. Third, looking at the kaishochi forms, we can find changes from Flagpole type, no-contact type, and integrated type. In Nagoya, it was common that the site shape was maintained because of the land reorganization project based on the actual converted site. However, by integrating with the surrounding premises, it is confirmed kaishochi that changes from the Flagpole type to Integrated type did it.

Skateparks, Cultural Memory, and Redevelopment

Evangeline Linkous (University of South Florida)

TAMPA — "Squaring off on a downtown street corner Tuesday, the two sides shouted, pointed fingers and accused each other of being insensitive. One side waved signs. The other shot video. A police helicopter circled overhead. Close by, a couple officers watched. But, no, the protest had nothing to do with Trayvon Martin or George Zimmerman. The yelling was generational. The history was local. And the focus of everyone's anger was the future of a graffiti-splotched skateboard park known as the "Bro Bowl." " (Danielson, July 16, 2013)

Just two years after it was listed in the National Register of Historic Places in 2013, the landmark skateboard park known as the Bro Bowl was demolished as part of a Tampa, Florida redevelopment initiative. Prior to its demolition, the Bro Bowl was just one of four skateboard bowls built in the 1970s—skateboarding's "Golden Age"—still in existence in the United States (National Register of Historic Places, 2013). The listing of the Bro Bowl in the National Register prompted international interest in the preservation of skateboarding heritage sites. In 2014, Rom skate park in London, England became the second skatepark in the world to be listed as a historic property, followed by the Albany Skate Run in Albany, Western Australia in 2016.

This paper includes two related research paths. I first construct a history of the Bro Bowl from its conception through to its demolition and relocation as part of a redevelopment project. The Bro Bowl was relocated to make way for a public park that celebrates Tampa's black cultural history and includes exhibits showcasing black community institutions that were devastated by urban renewal. The redevelopment project pit "skaters vs. black leaders" and raised questions about the inclusion of cultural memory in redevelopment projects (Danielson, 2013). Although the redevelopment emphasizes the incorporation of cultural memory and history, the planning process had to identify and select which narratives were ultimately included (black history) or excluded (skateboarding heritage). Inspired by the work of Gordon (2008), which builds on Horkheimer and Adorno, I examine how the planning process that led to the demolition of the Bro Bowl interacted with repressed and repressing histories, ideas, and forces. The case provides insights into the ways redevelopment processes grapple with—sometimes summoning, sometimes creating, sometimes retreating from—the ghosts of cultural histories and memories. The case in particular highlights the emerging treatment of skateboarding heritage as a legitimate area of planning and public policy concern. Second, I unpack the Bro Bowl case within the context of broader research on skateboarding, planning, and public space—a literature that raises issues of race, age, and competing cultural identities in the urban landscape (Chiu, 2009; Nemeth, 2011; Stratford, 2002). I review the efforts that led to the listing of the other two skate heritage sites. Finally, I describe the recent trend of including new skateparks in contemporary urban redevelopment projects, and compare planning interventions related to new skateparks with those for heritage skateparks.

Street Art as a Way to Enhance the Vitality of Urban Public Spaces -----Inspiration Based on the Experience of Taipei

Zhang Peng (Urban planning department of the school of architecture, southeast university of Nanjing, China) and Dong Wei (Urban planning department of the school of architecture, southeast university of Nanjing, China)

Street art is a unique artistic behavior that takes place in the urban public space. Its uniqueness is not only manifested in the form of immediacy, participation, and mobility, but also has a great value to enhance space dynamism, increase human interaction, and shaping the spirit of place. In most Chinese cities, street art is often equated with "fraud", which not only hampers the development of street art, but also hinders the promotion of vitality of public space, for a livable and lively city, the public space should not be merely a purely physical space, but should be the sum of the spirit of the place and the vitality of the space. The research question of this paper is: how to reduce the external negative effects of street art and actively shape and regenerate the vitality of urban public space? Research based on literature review and the summary, first of all, review and define the concept of "street art", and carries on the classification, it is believed that street art can change from "urban problem" to "urban landscape", then, the relationship between "street art" and "urban public space vitality" is discussed, performance analysis found a busker behavior can not only enhance the vitality of the public space (one-way intervention), also can attract audience participation, through the interaction with the audience to arouse public space activity (two-way intervention)

And then from the perspectives of government, NGO and ordinary citizens, multi-dimensional detailed analysis the art management experience on the streets of Taipei, found that through the government management, system design, the multi-agent organization and the public participation to cultivate a variety of means such as, the urban public space of street art promotion activity provides effective guarantee system and management, and reduce the street art of the outer space of the city has negative effects. Based on this, the paper puts forward the spatial layout pattern of "centralized and decentralized complementarity", the behavioral restraint mechanism of "rigidity and elasticity", and the multi-agent intervention management of "organization and self-organization", "Planning for Positive Public Opinion and Strict Enforcement of Law Enforcement" and other planning strategies. This paper argues that, by using the experience of management of Taipei street artists, from space, organization, policy formulation, implementation and operation aspects improve mainland China the level of city governance, with a view to providing references for the regeneration and shaping of the vitality of urban public space in China, and to provide a useful reference for the management of street artists.

Historical Processes of Urban Form and Land-Use Change at Shwedagon Pagoda's Surrounding Area in Yangon, Myanmar

Kuniomi Hirano*, Makoto Yokohari**

* Graduate School of Engineering, The University of Tokyo, kuniomihirano@gmail.com

** Graduate School of Engineering, The University of Tokyo, myoko@k.u-tokyo.ac.jp

Shwedagon Pagoda is located at the centre of Yangon, Myanmar. It is one of the nation's most respected religious monuments. The objective of this research was to identify the details of the historical processes of urban form and land-use change in the area surrounding the pagoda in relation to political regime transition. This research also focused on the evolving processes of the pagoda festival and its land use in the surrounding area; the festival is a typical occasion during which the relationship between the pagoda and the surrounding area is prominently visible. An interview survey, newspaper review survey, field survey, mapping work, and literature review were conducted to accomplish this research's goals. The pagoda's land property and the land use of the surrounding area have undergone significant changes. This research identified the historical processes through which temporary, multi-purpose open spaces in the area surrounding the pagoda have been divided, fixed for individual land uses, and segmentalized according to role during the pagoda festival. For example, this includes markets and stalls that have been altered for use as permanent shops and restaurants, entertainment and amusement facilities that were enclosed in parks, and smaller forms of lodging that have become hotels.

1. Introduction

Research Background and Objectives

Asian Theravada Buddhist nations, Buddhism, and royal authorities were deeply connected during the dynastic period. The legitimacy of these royal authorities was guaranteed through their protection of Buddhism¹. Buddhist belief entails the accumulation of merit not only by regularly worshipping at pagodas, but also by constructing or maintaining them². Pagoda festivals are religious events that provide opportunities for large numbers of worshippers from both rural and urban areas to gather at influential pagodas³. During such festivals, temporary multi-purpose, open spaces are (were) secured and utilized in the area surrounding the pagoda. Such areas are necessary to provide facilities and spaces for markets, trading, dining, entertainment, and lodging for worshippers⁴. Through historical and political transitions including colonization and urbanization, the original land-use purposes of these open spaces as they were established during the dynastic period have changed. That is, these spaces have been altered and fixed for specific purposes.

Myanmar⁵ is an Asian Theravada Buddhist nation⁶. As such, Shwedagon Pagoda⁷ (hereinafter "the Pagoda") is situated in the city of Yangon (Figure 1). The Pagoda is one of the nation's most respected religious monuments for those of the Buddhists faith. The Pagoda is located at the centre of Yangon⁸, which was founded as the area's colonial capital. The objective of this research was to identify the details of the historical processes of urban form and land-use change (including the development of parks) in the area surrounding the Pagoda⁹ in relation to political regime transition. This research also focused on the evolving processes of the Shwedagon Pagoda Festival¹⁰ (hereinafter "the Festival") and its land use in the surrounding area; the Festival is a typical occasion during which the relationship between the Pagoda and the surrounding area is prominently visible. Since the area surrounding the Pagoda has been the most important religiously and politically centre in Yangon, the governments have made changes to land use in the area as their political intentions. Considering the urban form and land use change of Yangon, it is, therefore, meaningful to focus on the area where the political intentions remarkably appear in the historical backgrounds.

Related studies were reviewed before conducting this research. The history of Myanmar has been studied by Ma Mya Sein (1944), Noel (1993), Mya Maung (1999), Nishizawa (2000), Yamaguchi (2011), and Nemoto (2014), etc. The history and current conditions of Buddhism in Myanmar have been studied by Ikeda (1995), Kuramoto (2014), etc., while those of the Shwedagon Pagoda have been examined by Win Pe (1972), Mg Su Shin (1972),

Noel (1995), Moore (2000), Philp (2002), Penny (2006), Donald (2013), and Nay Chi Zay Ya (2015), especially in the military regime by Donald (2005). The social history and urban form of Yangon during the colonial regime have been studied by Wright (1910), Webb (1923), Pearn (1931), Osada (2013), etc. Finally, current land-use practices and changes that have recently occurred in Yangon have been studied by JICA (2013), especially in terms of parks by Hirano and Yokohari (2017).

This original research aims to develop an understanding of the historical processes involved in urban form and land-use change in the secret Buddhist area of colonial Yangon. This especially includes changes that took place under the military regime, when official documents had not yet published. This research intends to identify how temporary, multi-purpose open spaces have been divided, fixed for individual land uses, and segmentalized in the area surrounding the pagoda in the historical processes.

Figure 1: Pictures of Shwedagon Pagoda. The Pagoda stands on Singuttara Hill, which sits at an altitude of 58m. Building height is regulated in Pagoda's surrounding areas (left). Worshipers visit the Pagoda on the full-moon day of Tabaung (around March), when the Shwedagon Pagoda Festival is held (right). [Hirano: 2018]

Research Methodology

This research involved an interview survey, newspaper review survey, field survey, mapping work¹¹, and a literature review. The interview and newspaper review surveys were key methods in this research since official documents have remained unpublished in Myanmar since 1964¹². Interviews were conducted with Shwedagon Pagoda Trustees, the Ministry of Construction, Yangon City Development Committee, shop, park and hotel operators, and worshipers to understand the historical transitions of the Pagoda property, as well as its land use, religious use, park development, and activities involved in the Festival¹³. Copies of the state-owned English newspaper "The Working People's Daily"¹⁴ were reviewed on a biennial basis to investigate transitions in the Festival activities and political treatment from 1967 to 2017, as well as on and around the opening of People's Park in 1989¹⁵. Field surveys of the surrounding area were also conducted¹⁶. The Ananda Pagoda Festival in Bagan was surveyed as a point of reference and comparison. A field survey was then conducted on all 62 parks in Yangon¹⁷. Finally, this research set four historical classifications (i.e., the dynastic, colonial, military (BSPP and SLORC)¹⁸, and civilian regimes) according to key benchmarks regarding changes in politics and the status of Buddhism. In each classification, land use maps were made to visualize physical changes in land use.

2. The Dynastic Regime

Yangon was known as the secret town of the Pagoda¹⁹. Buddhism prospered as a state religion during the dynastic period²⁰. The greatest supporters of Buddhism during that time were the royal authorities, who made a number of donations to the Pagoda that included land property²¹. Donation to the Pagoda has always marked the "control of the delta" and "rule of the country" in Yangon²². This research involved the arrangement of a map indicating the Pagoda's property, and then calculated the area (Figure 2)²³. Calculations revealed that the area of owned lands covered 799 km² during the reign of Queen Shinsawbu, and 280 km² during that of King Dammazedi.

During the late-16th century, Fitch recorded the Festival as involving "the full moon of Tabaung (around March)," and that "the occasions of great religious festivals brought a great press of people"; during "the Festival, a man can hardly pass by water or by land," "they come from all places of the Kingdom," and "such festivals were normally accompanied by a great fair"²⁴. Moreover, the Festival was considered to be a cosmopolitan market

from abroad as well as from rural area²⁵. The image in Figure 3 indicates that religious events used open-spaces in the surrounding areas of the Pagoda during the dynastic regime²⁶.

The field survey of the annual Ananda Pagoda Festival in Bagan²⁷ revealed that it is an important occasion during which people that live in and around the area are able to shop for commodities and experience entertainment, even at present.

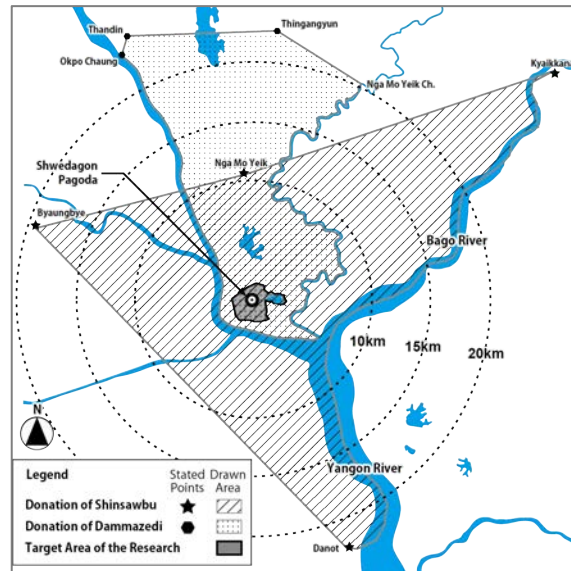

Figure 2: A map indicating the Shwedagon Pagoda's Property during the 15th Century. Pearn (1939) mentioned that Queen Shinsawbu made a land donation during the 1470s, and that King Dammazedi reduced its land boundary so as not to cross the river and canal. Fruit trees were cultivated on the donated land²⁸. [Hirano: 2018]

Figure 3: A depiction of the Elephant Event, which celebrated the Pagoda in the open-space in front of the west gate. The image's caption says that the "the surrounding area became fortress and cantonment and such event was not being performed during the colonial regime."²⁷ [Mag Su Shin: 1972]

3. The Colonial Regime

Yangon was colonized by the British in 1852²⁹, at which point Buddhism lost its status under the religious neutral policy. All land owned by the Pagoda became the property of the colonial government³⁰. Numerous small pagodas had been demolished by the 1850s, while fruit trees and related buildings had disappeared by the 1880s³¹. This research created a land-use map describing the surrounding areas, which were mainly under the control of the military as a cantonment (Figure 4). The cantonment contained two parks (described later), a golf course, and a racetrack as well as the arsenal, barracks and a parade ground³². The open-spaces left in the surrounding area depicted in a picture of Mag Su Shin (1972)³³. The Festival had declined in popularity during the early 1830s³⁴, and was fully interrupted as a result of colonization³⁵.

The colonial government established two parks³⁶. This included Cantonment Park, which was the first park in Yangon. It was constructed during the 1960s to provide amenities to cantonment residences at the cantonment

boundary. The park became crowded during band performances at night. The second was the Dalhousie Park, which was constructed during the 1890s³⁷.

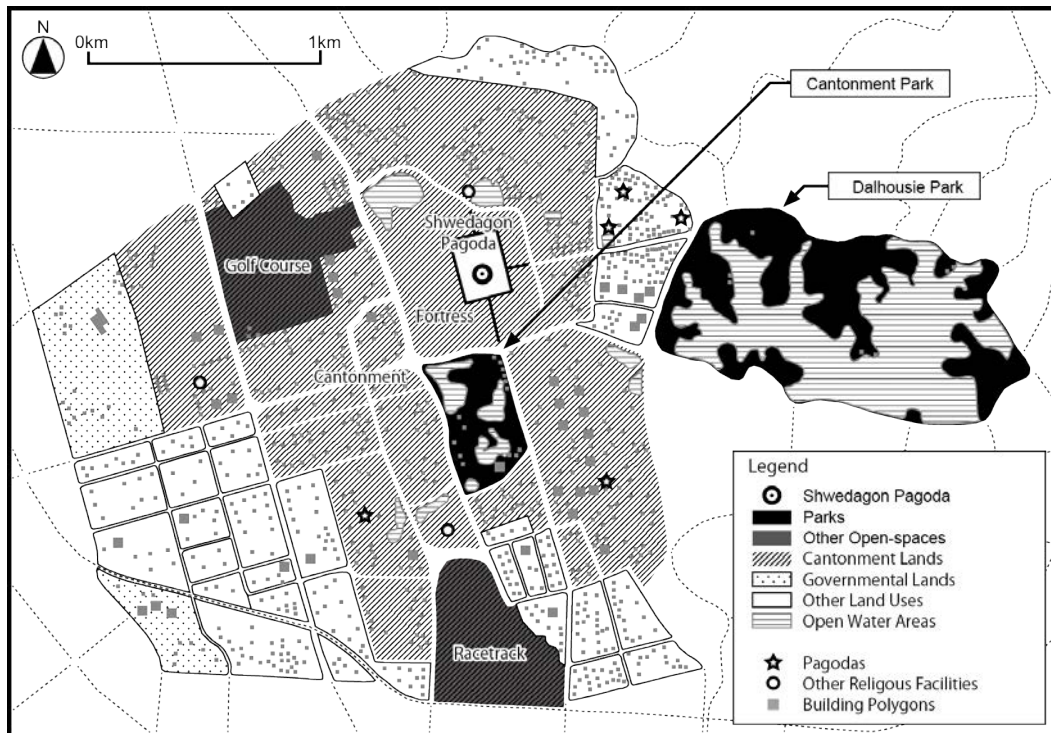

Figure 4: Land-use map of the colonial regime. The map indicates that the Pagoda was surrounded by a cantonment in which entertainment facilities (e.g., two parks, golf courses, and racetracks) were located. [Hirano: 2018]³⁸

4. After Nation's Independence and the Military Regime

After conservation movements³⁹, in 1930, the cantonment relocated to the suburbs of north Yangon, at which point the Pagoda's property was returned to an area of 44.2ha⁴⁰. The Festival also recommenced in 1930⁴¹. Performances surrounded by many worshipers were observed in the space depicted in a picture of Mag Su Shin (1972)⁴² during the Festival.

The BSPP Military Regime

The BSPP military regime adopted socialist policies that resulted in the closing of entertainment facilities and a revocation of the protection of Buddhism⁴³. This research identified situations related to the Festival through newspaper reviews, as follows: "*The Festival was crowded with many worshipers. The west gate was the centre of the Festival activities*⁴⁴." "*Worshipers visited the Festival from the suburbs*⁴⁵." "*A concert was held and lasted through night time*⁴⁶." "*Market fairs and entertainments were held with various communities' participation*⁴⁷." and "*Youths and girls look forward as seasons of birth and flirtation; long nights at the open-air theatre, feasting, and perpetual amusement, the pleasanter*⁴⁸."

This research also identified that the Festival became active on an annual basis, and that the Pagoda's land property and surrounding open spaces were used for markets, stalls, entertainment, and amusements that resulted in temporary crowds of worshipers⁴⁹. Entertainment lasted until dawn at these events⁵⁰.

The SLORC Military Regime

The SLORC military regime returned the protection of Buddhism to Myanmar⁵¹, dispersed propaganda about projects involving pagoda construction and restoration, sent high-ranking politicians to attend ceremonies, and donated to pagodas and monks in various ways⁵². In the meantime, Mahah Wizaya Pagoda, which stands at the foot of the Shwedagon Pagoda, was constructed by the SLORC military as the traditional custom of dynastic authorities⁵³. This research identified top articles in newspapers concerning high-ranking politicians who celebrated and donated to monks in addition to many pages covering the full-moon day of Tabaung (around March)⁵⁴. On the other hand, articles concerning the Festival were less common⁵⁵. This research also identified that Festival activities were limited to prayers and donations while markets, street stalls, and entertainment

activities were prohibited from 1988 to 2012⁵⁶. Shops along the access road to the east gate (these buildings are generally two-storied, reinforced concrete structures) were constructed beginning in 1989⁵⁷. The access gate shops cover a distance of about 200m, and sell treats, goods related to religious donations, and Buddha statues⁵⁸. Amusement facilities were set up in Cantonment Park during the late 1990s⁵⁹. During the same period, supermarkets and hotels opened in Yangon city⁶⁰. Thus, the commercial activities of the area's citizens underwent significant change. In addition, five parks were established in the surrounding area⁶¹. Remarkably, a top page newspaper article detailing its opening ceremony revealed that People's Park opened as the largest park in Yangon by using military land⁶². The newspaper emphasized connectivity of the park and Pagoda as *"the People's Park to link the ancient architecture at the Shwedagon Pagoda and the modern architecture of the Parliament building: creating a place for the residents of Yangon to take a rest,"* and that *"visitors can revere the Pagoda that stands in elegance"*⁶³. The four other parks, Ziwaka Park (0.7 ha, established in 1989), Blood Cleansing Lake Park (0.4 ha, established in 1990), Thirinandar Kan Park (0.8 ha), and Dagon Park (0.8 ha) were constructed during this period⁶⁴.

5. The Civilian Regime and the Present

The civilian regime established freedom of religion under a policy separating religion and politics⁶⁵. The Pagoda's property was limited to 45.6ha⁶⁶. The area contained related stupas, museums, parking lots, service facilities, a backyard, and maintained open-spaces⁶⁷. This research identified that the Festival had not been promoting activities related to markets, shop stalls, or entertainment in the surrounding area at that time. These activities were prohibited under the SLORC military regime, and remained so under the civilian regime with the exception of the access road to the east gate⁶⁸. Parks and large-scale public facilities did not conduct religious activities inside during the Festival, but the number of visitors to the amusement facilities in Cantonment Park and People's Park doubled, and that of shops tripled as usual⁶⁹. According to interviews with 30 worshipers, eight visited the Festival's amusement facilities⁷⁰. It was observed that approximately 130 shops selling commodities and foods temporarily opened on the access road between the permanent shops during the Festival⁷¹.

This research created a land-use map (Figure 5) indicating that military and government lands occupied the south and the west sides. Land use has been changing through rapid urbanization. It was observed that the number of buildings used for housing, monasteries, and commercial activities increased, with a high-density of land use mainly occurring on the north and east sides of the surrounding area. Approximately 75% of these buildings were occupied by monasteries and related buildings over the five-block area on the east side⁷². In addition, Martyr's Mausoleum Park (3.1 ha) was established on the north side in 2013⁷³. Thus, a total of eight parks have been established in the surrounding area⁷⁴.

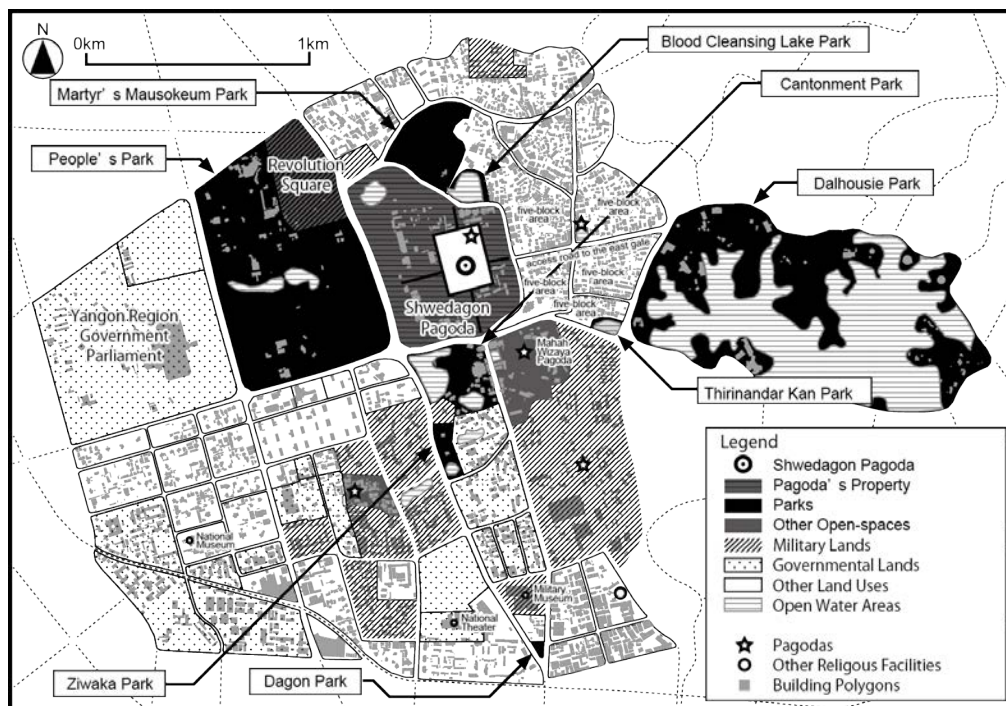

Figure 5: Land-use map of the civilian regime. The map indicates that military and government lands occupied the south and west sides. Many large-scale public facilities exist in these areas, including the Yangon Regional Government Assembly, National Museum, National Theatre, and Military Museum. [Hirano: 2018]⁷⁵

This research also conducted a park facility survey, and identified that five out of all 62 parks in Yangon city contain amusement facilities (e.g., roller coasters, merry-go-rounds)⁷⁶. Two of these parks, Cantonment Park and the People's Park, are located in the surrounding area.

6. Discussion

Pagoda-owned property reached a maximum size of 799km² during the late-15th century due to donations from the royal authorities. As Pearn (1931) pointed out that many worshipers gathered from rural areas and abroad during the Festival⁷⁷. Commodity and goods-trading markets⁷⁸, food and drink stalls, events and entertainment⁷⁹, and lodging for worshipers⁸⁰ were provided in the open spaces of the surrounding area. This research considers that there was a temporally, multi-purpose relationship involving religious use between the Pagoda and its surrounding open spaces, as it can be seen at the Ananda Pagoda Festival in Bagan in the present day.

As Philp (2002) pointed out that the ruler was well aware of the political significance of the Pagoda⁸¹. The colonial government condemned the Pagoda's property and utilized the surrounding area as a cantonment for military activities, living quarters, and ruler demonstrations. The Festival was interrupted, and was not held during the colonial regime until the 1930s. In the meantime, Yangon's first park was established in the surrounding area. The park was used as a space to hold entertainment events such as evening band performances⁸². As Hirano and Yokohari (2017) pointed out, the open spaces were used for people of the ruler's side, not for religious use⁸³. This research considers that the Pagoda was obligated to suspend its religious use activities with the surrounding area for approximately one century.

The Pagoda's property was returned in 1930 when the cantonment relocated to the suburbs. The returned property, however, was limited in regard to the surrounding area. The Pagoda's land was not as expansive as it was during the dynastic regime. The Festival activities resumed at this time, and the surrounding area was temporarily used for markets, stalls, entertainment, and amusement. This research considers that the religious use relationship between the Pagoda and the open spaces of the surrounding area was restored. This was also true regarding political circumstances; the entertainment facilities were obligated to close and commercial activities were limited under the BSPP military regime.

As Philp (2002) pointed out, the SLORC has consciously and actively appropriated Buddhism⁸⁴. Additionally, as Donald (2005) pointed out the SLORC have aggressively transformed Yangon city, and exercised control of public spaces, including the Pagoda to sever or neutralize their historical connections with revolutionary nationalism⁸⁵. On the other hand, the Festival activities involving markets, stalls, and entertainment were prohibited for a 24-year period beginning in 1988 under SLORC military policy⁸⁶. Structured shops along the access road were developed in the surrounding area, and supermarkets and hotels opened in Yangon city, which were triggered by economic policy changes. In the meantime, a total of five parks were established, starting with the opening ceremony of People's Park in the surrounding area during October 1989. Amusement facilities were later set up in Cantonment Park during the 1990s. This research considers that the Festival activities diminished, and the religious use relationship between the Pagoda and the surrounding area was nearly eliminated because areas in which former required the Festival functions took place had been repurposed for permanent shops, supermarkets, hotels, and parks.

Land use has changed to accommodate a variety of commercial, residential, and religious uses in the area surrounding the Pagoda. These changes were accelerated by rapid urbanization movements subsequent to the shift to civilian rule in 2011. Although the open space in the surrounding area contains eight parks and large-scale public facilities, the Festival activities are not conducted in these areas. This research considers that the direct religious use relationship between the Pagoda and the surrounding area was ultimately lost through historical transitions. During the Festival, shops along the access road and amusement facilities in the parks accommodated more visitors for specific land-use purposes.

7. Conclusion

As discussed regarding each of the historical classifications above, the land property and land-use of the surrounding area has changed greatly while the status of Buddhism has been destabilized through various regime transitions. This research identified that the religious use relationship between the Pagoda and the surrounding area weakened during these historical transitions (Figure 6).

The temporary, multi-purpose open spaces of the surrounding area used to play important religious roles, especially when the Festival was held during the dynastic regime. Although such roles were suspended during the colonial regime, they appeared to have somewhat resumed during the BSPP military regime. However, the roles of the surrounding area have nearly disappeared subsequent to the establishment of the SLORC military regime. Through

the development of parks and large-scale public facilities, the open spaces physically remain in the surrounding area today, but have practically changed as religious activities are no longer conducted inside.

This research identified the historical processes through which the temporary, multi-purpose open spaces of the surrounding area established during the dynastic regime were divided, fixed for individual land use, and given segmentalized roles. This occurred especially during the SLORC military regime, which was obligated to prohibit the Festival activities. This research considers that the roles previously required by the Festival worshipers and citizens have been supplemented and replaced in both the surrounding area and Yangon city. This includes the roles of markets and stalls being replaced with permanent shops and restaurants, entertainment and amusement facilities being enclosed in parks, and lodging that was altered into hotels. These drastic changes occurred during the 24-year prohibition period implemented by the SLORC military regime. Thus, the roles of the Festival are no longer needed by modern citizens, except praying and donating.

It is remarkable that the open spaces of the surrounding area have become modern parks as well as many large-scale public facilities such as Yangon Region Government Parliament, National Museum, National Theatre through historical transitions. This adds to the understanding of urban form and the establishment and development of parks in colonial cities. As Philp (2002) and Penny (2006) pointed out that the Pagoda and the Singuttara Hill is the most important religiously and politically centre area in Yangon⁸⁷, the governments have made changes to land use with their political intentions especially at this area in Yangon. It is possible that the governments (especially the SLORC military regime) aimed to establish parks and other public facilities by taking the originality and history of the area into account⁸⁸, which used to involve annual gatherings in which people enjoyed the Festival. It should be also noted that the military regime also made a regulation to control building height, which has currently been enacting, at the surrounding area to conserve the views of the Pagoda and probably to secure the status of the Pagoda. Thus, the value of the attraction and the attention it gathers⁸⁹ of the Pagoda could be used as political propaganda in the historical process of urban form and land use change in Yangon.

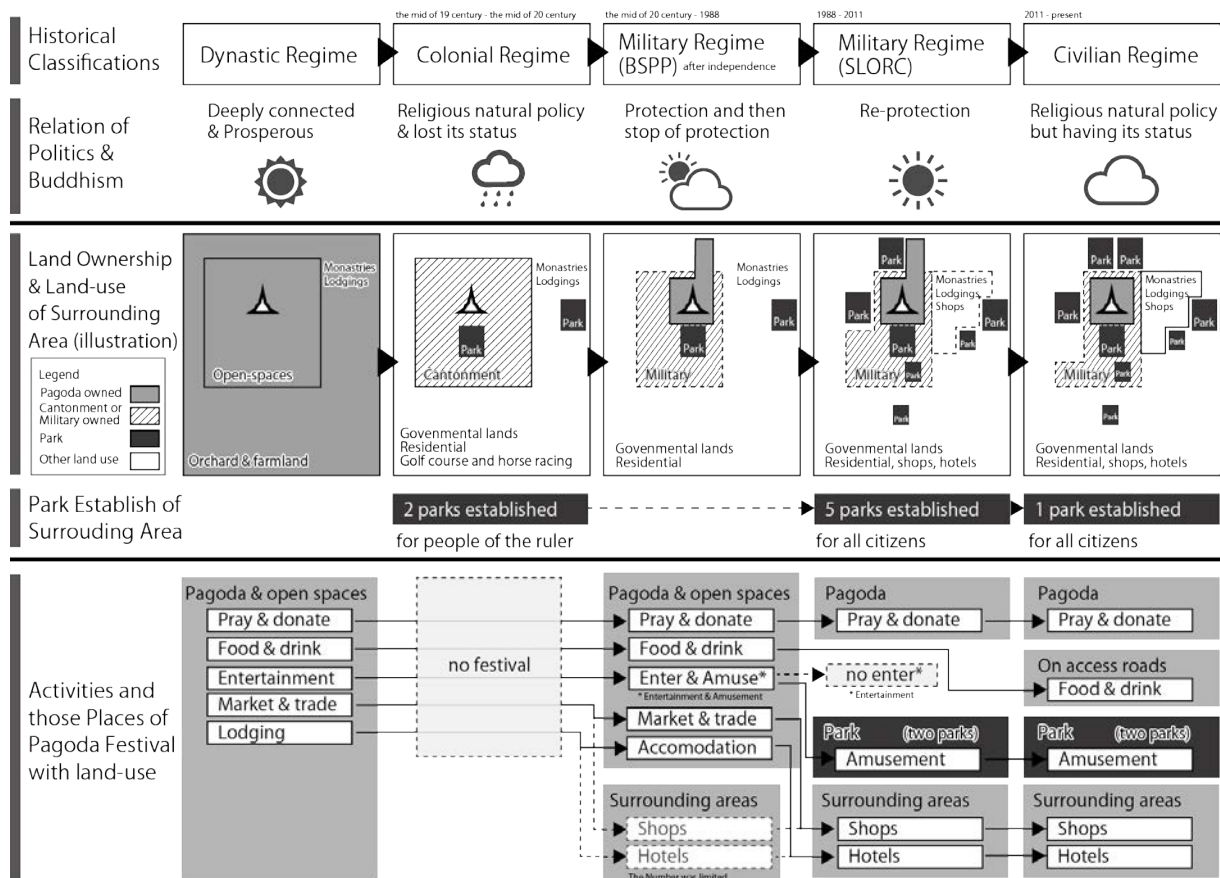

Figure 6: Diagram showing the historical processes of relation of politics and Buddhism, land ownership and land use change of the surrounding area, park establishment, and activities at the surrounding areas when the Shwedagon Pagoda Festival. The land use has changed from open spaces owned by the Pagoda to other land uses owned by British military (cantonment), military, public or individual private through historical process. The parks have been also established and accumulated in the area. The activities of the Festival were taken place in the Pagoda and the open-spaces in dynastic regime has been outspreaded to other land uses. [Hirano: 2018]

Acknowledgements

I would like to express my sincere appreciation toward Daw Aye Aye Myint, Daw Than Than Soe, and U Htin Myaing, the Ministry of Construction, U Toe Aung, Tin Tin Kyi, U Hla Win Aung, and Min Aung, Yangon City Development Committee, and U Maung Maung Win, the Shwedagon Pagoda Trustee, and all members of Yokohari Laboratory, the University of Tokyo, for their valuable advice. This research was greatly supported by Ms. Khin Thuzar, Ms. Myet Chae, and Ms. Tun Thin Zar May, my colleagues in Yangon. I would also like to thank Editage (www.editage.jp) for the English language editing; all remaining errors are my responsibility.

Endnotes

¹ Nemoto (2014), pp.39, and Kuramoto, *monk living* (2014), pp.4.

² Kuramoto, *monk dwelling* (2014), pp.81. Definitions of pagoda, temple, monastery are different in each Theravada Buddhist nations. In Myanmar it is common that pagoda and monastery are separated.

³ There are historically influential pagodas and temples in the major cities of the nations. Large cities, such as Bangkok, Phnom Penh, Vientiane, Yangon, has influential pagodas or temples. Kuramoto, *monk living* (2014), pp.21, mentioned that the larger cities tend to have more potential that pagodas or temples receive more donations.

⁴ According to interviews with Shwedagon Pagoda Trustee and Yangon City Development Committee, stalls, performances, and entertainment facilities used to be set up in open spaces (vacant lands) at the surrounding area and on streets during the Shwedagon Pagoda Festival. The details are discussed later sections.

⁵ Myanmar is located on the west side of the Indochinese Peninsula, has a land area of 676,577 km², and has a population of 51.49 million (Department of Population (2014), Census). In this research, the name of the nation is unified as "Myanmar", although it was "Union of Burma" from 1948 to 1989 after the nation's independent.

⁶ In Myanmar, currently 89% of the population is occupied by Theravada Buddhists, while the remaining 10% is composed of Christians, Muslims, Hindus, the Spiritual Belief.

⁷ Shwedagon Pagoda was said to have been built on a hill, namely Singuttara hill, to pay the holy hair brought back by the Mong Merchants who travelled India 2,500 years ago during the life of Buddha. The height from the terrace to the apex of the Pagoda is about 99m. The Singuttara hill, has been worshiped as a sacred place from the dynasty according to Pearn (1939), pp.1.

⁸ Yangon, the largest city of the nation, is located on the south side of the national land and has an area of 10,277 km² and the population is 7.36 million (Department of Population (2014), Census). It was the capital city until the transition to Ney Pyi Taw in 2006. In this research, the name of the city is unified as "Yangon", although it was "Rangoon" from 1852 to 1989 under the British colony.

⁹ The scope of the surrounding area in this research corresponds to the range of enacted regulations that building height control is being carried out. The government and citizens generally recognize the range of said regulation is the "surrounding area" of the Pagoda.

¹⁰ The Shwedagon Pagoda Festival, officially called as "Buddha Pujaniya Tabaung Festival of the Shwedagon Pagoda", is held for about a week on and before the full moon day in Tabaung that is around March based on the lunar calendar in Myanmar. The Festivals are generally held for the purpose of worship and donation. During the Festival, a ritual religious event that donates the monk robe to the Buddha statues sitting on the four sides of the Pagoda terrace is carried out, meanwhile, the monks chant Buddhist sutra. Other pagodas in the nation has their own festivals which are mainly held in the dry season and summer season (from November to May).

¹¹ Maps were created in this research in the dynastic regime and the civilian regime. Details were written in each part.

¹² The National Archives Department, Ministry of National Planning and Economic Development has not disclosed the official documents from 1963 until the present.

¹³ The interview with Shwedagon Pagoda Trustee (U Maung Maung Win, a board member) was done on 3rd Apr. and 9th Aug. 2017. That of Department of Urban and Housind Development, Ministry of Construction (Daw Aye Aye Myint, the deputy director general, Daw Than Than Soe, the former director, and U Htin Myaing, the former deputy director) was on 16th Aug. 2017 and 13th Feb. 2018. That of City Planning and Land Administration Department (U Toe Aung, the former deputy department head, Tin Tin Kyi, the deputy department head), and Parks and Playgrounds Department (U Hla Win Aung, the deputy department head, and U Min Aung, the deputy department head), Yangon City Development Committee was on 6th Nov. 2012, 26th Aug. 2016, and 24th Feb. 2017. That of shop, hotel, and park operators were done on 14th Feb. and 1st Mar. 2018. That of worshipers visiting the Festival targeting 30 samples in total were done on 1st Mar. 2018.

¹⁴ "The Working People's Daily" changed its name to "New Light of Myanmar" since 1994, and to "Global New Light of Myanmar" since 2014. All articles can be obtained at the Library of Institute of Developing Economies, JETRO.

¹⁵ The articles of the Festival were observed in the newspaper as follows (titles and dates). "At the Great Shwedagon (1967, 24th Mar.)", "Tabaung fullmoon marked (top page) (1971, 11th Mar)", "Shwedagon-scene of Tabaung Festival (top page) (1975, 26th Mar)", "Tabaung Fullmoon Day Observed (top page) (1977, 3rd Mar)", "Fullmoon Day of Tabaung observed in Rangoon (top page) (1979, 12th Mar)", "Fullmoon Day of Tabaung observed in Rangoon (top page) (1981, 20th Mar)", "Fullmoon Day of Tabaung observed (1983, 28th Mar)", "Fullmoon Day of Tabaung observed (1985, 5th Mar)", "Fullmoon Day of Tabaung observed (1987, 14th Mar)", "Shwedagon Pagoda's Tabaung Festival concludes (top page) (1989, 21th Mar)", "Buddha Pujaniya Festival held at Shwedagon (1991, 27th Feb)", "Shwedagon Pagoda Buddha Pujaniya Tabaung Festival concludes (1997, 23th Mar)", "Pagodas, monasteries crowded with Buddhist devotees on Fullmoon Day of Tabaung (1999, 1st Mar)", "Meritorious deeds performed at pagodas, religious buildings on Fullmoon Day of Tabaung (2001, 8th Mar)", "Tabaung festival held (2003, 17th Mar)", "Prime Minister cleanses Shwehtidaw of Shwedagon Pagoda (2005, 24th Mar)", "Buddhists perform meritorious deeds on Fullmoon day of Tabaung (2007, 2th Mar)", "Pagodas in Nay Pyi Taw, Yangon packed with devotees on Fullmoon Day of Tabaung (2009, 10th Mar)", "Meritorious deeds performed at religious edifices throughout nation on Fullmoon Day of Tabaung (2011, 19th Mar)".

Mar)", "Yangon religious edifices crowded with devotees (2013, 26th Mar)", and "Yangon crowded with pilgrims and holiday-makers on fullmoon day (2015, 4th Mar)". The articles of the Park were as follows (titles and dates). "The People's Square and the People's Park that will reveal history (1989, 7th Oct) and (1989, 8th Oct)", "People's Square and People's Park to be open to public (1989, 9th Oct)", "People's Square and People's Park constructed under special arrangements of SLORC, opened (1989, 11th Oct)", "To rest, recreation and reverence (1989, 12th Oct)".

¹⁶ The visit day of Shwedagon Pagoda Festival was 1st Mar. 2018 and that of Ananda Pagoda Festival in Bagan was 13th Jan. 2018. The interview with Ananda Pagoda Trustee (U San Win, a member of the trustee, and U Aung Kyi, a member of the trustee) was also done on 13th Jan. 2018. Field surveys of building uses and land uses at the surrounding area of Shwedagon Pagoda was conducted from Jun. to Aug. 2017.

¹⁷ The park field survey checking park facilities inside was conducted between Dec. 2017 and Feb. 2018.

¹⁸ In 1948, Myanmar fulfilled its independence from colonial rule. But the nation was governed by military rules, namely BSPP and SLORC, from 1962. BSPP is "Burma Socialist Program Party" started from 1962 by the military coup. SLORC is "State Law and Order Restoration Council" started from 1988 by the military coup to seize anti-government and democratization demonstration. This research set a benchmark during the period of the military regime when the ruler changed from BSPP to SLORC. In this research, the name is unified as "SLORC", although it was changed to "State Peace and Development Council (SPDC)" from 1997.

¹⁹ Osada (2013), pp.24.

²⁰ Since the Bagan dynasty beginning from the 11th century, the dynasty regime has continued until the middle of the 19th century in Myanmar.

²² Moore (2000), pp.5.

²³ The map was drawn in this research by means of GIS software according to several location names on the property boundary recorded in Pearn (1939), pp.297-299. The area calculation was done by GIS.

²⁴ Pearn (1939), pp.27-30, mentioned Fitch, Ralph visited the Pagoda in the 1580's.

²⁵ Pearn (1939), pp.72, mentioned that the great festival was held at the full-moon of Tabauing, which its cosmopolitan market to which men and women came even from China.

²⁶ Mag Su Shin (1972), pp.93.

²⁷ The field survey was conducted on 13th Jan. 2018 to visit the Ananda Pagoda Festival which is one of the largest and oldest festivals in the nation. The number of stalls was more than 1,900 which mainly treat commodities such as clothing, shoes, tableware, hardware, furniture, bedding, agricultural machineries, toys, rugs, etc according to the conducted interview with the Ananda Pagoda Trustee and field observations. Amusement facilities for kids was observed to set up. Performances on a stage were also held from 8 P.M. until 5 A.M on every other day.

²⁸ Nay Chi Zay Ya (2015) mentioned the owned lands cultivated fruit trees such as coconuts, palms, mangos and jack fruits, and about 500 workers were also donated for cultivating and harvesting.

²⁹ After the second Anglo-burmese War of 1824, Yangon was declared consolidation to British India and developed as a capital city of one state of British colony and a port city of foreign trade.

³⁰ The Singuttara hill where the Pagoda stands used to be subject to scramble as fortification due to its topographical condition during the wartimes. It was also the basement of the independence movement from the colonial ruler. As a purpose of the surrounding area being occupied as the cantonment, it is considered to secure military defence, to provide good living environment with cooler climate, and to demonstrate ruler's power to ruled. Penny (2006), pp.197, mentioned, the worshippers would be admitted to the Pagoda only through the southern entrance, all other entrances would remain closed for military use.

³¹ Noel (1995), pp.6 and pp.47.

³² Donald (2013), pp.144-145.

³³ Mag Su Shin (1972), pp.45.

³⁴ Pearn (1939), pp.134, mentioned after the first Anglo-burmese War, the trade shrank from around 1830 in Yangon, and it was recorded in 1832 that there were about 10 traders from the Shan visiting the Festival.

³⁵ Pagoda Trustee Interview (2017). Additionally, Pearn (1939), pp.30, mentioned that the fair continued to be held for centuries, until, indeed, the British period of Burmese history.

³⁶ Hirano and Yokohari (2017), pp.373-376.

³⁷ The Dalhousie Park exists at the present which is known as Kandawgyi Lake Park, but it was divided into several parks (total 23.5 ha, excluding the water surface).

³⁸ The map was drawn in this research based on Rangoon Guide Map (1930) published under the direction of Brigadier R.H.Thomas, Surveyor of India. The cantonment boundary was based on Osada (2013), pp. map1. The locations of entertainment facilities, pagodas and individual buildings were drawn based on information written in the Guide Map. Additional information of the parks were from Wright (1910) and Pearn (1939).

³⁹ Penny (2006), pp.202-205, mentioned the details of conservation movement such as the Burma Archaeological Survey (BAS) during the late colonial regime.

⁴⁰ Pagoda Trustee Interview (2017). Firstly 31.6ha was returned in 1930. Additionally, 0.3ha at the east side in 1935, 12.3ha at the west and northwest side in 1939, 0.5ha at the southwestern side in 1950, and then in 0.9ha at the east side in 1961 were returned accordingly. Donald (2013), pp.145, mentioned that the jurisdiction over 654 acres was transferred from the military to the municipal authorities in 1930.

- ⁷⁰ Worshipers Interview (2018)
- ⁷¹ Field Survey of the Festival (2018)
- ⁷² According to the Field Survey of building uses and land uses, approximately 250 buildings out of 335 of 5 blocks at the east side are monasteries or religious related buildings. Kuramoto, *monk living* (2014), pp.18 and pp.21, mentioned that monasteries tend to accumulate around influential pagoda in Myanmar
- ⁷³ The park has a memorial ceremony which is held every year on 19th July when the General Aung San and the others were assassinated. At the beginning, the mausoleum was set up by the Ministry of Religion utilizing a part of military land at the same place in 1952. Afterwards, it became the park in 2013. Hirano and Yokohari (2017), pp.375, and Donald (2005), pp.268-269.
- ⁷⁴ Apart from 8 parks, a military land which has an area of about 13ha at the north of the People's Park has been open to the public as "Revolution Square".

⁷⁵ The map was drawn in this research based on the satellite image (2012). The land use was based on the result of the Field Survey of building uses and land uses at the surrounding area which was conducted from Jun. to Aug. 2017 in this research. Parks boundary were based on data from Interview of the Parks and Playgrounds Department, and Yangon City Development Committee on 6th Nov. 2012. The boundary of military land and locations of public facilities was based on observation through the Field Survey.

⁷⁶ Park Facility Survey (2017-2018)

⁷⁷ Pearn (1939), pp.72.

⁷⁸ Pearn (1939), pp.72, mentioned that the Pagoda still continued to be a centre of pilgrimage and of trade, especially, it was noted, for the Shans (a state of Myanmar), who brought to Yangon the Pegue (dynastic name of Myanmar) ponies for export to India in the Festival.

⁷⁹ Pearn (1939), pp.38, mentioned that the governor, chief men and a greater number of the inhabitants solemnize the festival by consuming a considerable quantity of spirits; there are also performances and dances and fireworks, which are discharged at night-time based on the record from "the History of Syriam".

⁸⁰ Pearn (1989), pp.27-30, mentioned that there were many buildings for lodging of monks and worshipers and planted fruit trees along four gate ways stretching about 2 miles in length at the surrounding area based on the record by Fitch.

⁸¹ Philp (2002), pp.1602-1603, mentioned regarding Shwedagon Pagoda that the British were well aware of the political significance of religious sites and of the performance of religious act as politically meaningful.

⁸² Hirano and Yokohari (2017), pp.377.

⁸³ Hirano and Yokohari (2017), pp.379, mentioned that the established parks were for the rulers according to historical background.

⁸⁴ Philp (2002), pp.1590.

⁸⁵ Donald (2005), pp.258.

⁸⁶ It is possible that one of the background why the government intended to weaken the relationship between the Pagoda and democratic movement since the Pagoda were often used as a base for demonstration and strike by opposition to regime. Donald (2005), pp.257, mentioned the Shwedagon functioned not only as a Buddhist holy site, but also as a public space for political activism.

⁸⁷ Philp (2002), pp.1602-1603 and Penny (2006), pp.205-206.

⁸⁸ According to Mg Su Shin (1972) and Patoda Trustee Interview (2017), the Pagoda was the basement for student demonstrations in 1920, worker strikes in 1938, Pasapara speech in 1945, Aung San Suu Kyi speech in 1988, citizen demonstration in 2007, as examples of representative event.

⁸⁹ Yanagisawa (2004), pp.81, mentioned that importance of historical originality and religious status of the place as a case of Indian religious sanctuary, Varanasi, which originates as the British colony.

Study on Kaishochi Changes Before and After the War-Damage-Recovery Land Readjustment Programs of Nagoya City, Japanese Castle Town

KENJIRO MATSUURA*

* Associate Prof., Graduate School of Science and Engineering, Chiba Univ., Dr. Eng., matsuura@chiba-u.jp

In this paper, focusing on open temple-type *kaishochi* (open areas ensconced in the design of urban blocks) located in the district of Nagoya City in Japan's Aichi Prefecture, we will review the effects of the war-damage-recovery land readjustment programs, through which the city has experienced a number of major transformation. Specifically, we will elucidate the actual state of such *kaishochi* before and after the project by examining residual trends of temple-type structures by using maps produced before and after the project implementation. Targeting 66 Edo-period *kaishochi* blocks in the Nagoya Castle district, we first analyzed the differences between the land usage decrease rate for the whole district and that for the targeted *kaishochis*. Next, we analyzed transformations of usage and form using the maps produced before and after the project implementation. As a result of our analysis, the following three points were clarified. First, even though the number of temple-type *kaishochis* is decreasing, there has been little change in the area they occupy. Second, there has been little change in *kaishochi* usage before and after the project implementation. Third, looking at the *kaishochi* forms, we can find changes from Flagpole type (large inner area with narrow outside access), no-contact type (large inner area with no public access to outside roads), and integrated type (large access to outside road).

Keywords: *kaishochi*, the war-damage-recovery land readjustment programs, Nagoya, Japanese Castle town

Introduction

In the grid blocks that make up major cities, high-rise buildings commonly compete for space and parking lots are often scattered about randomly. In such districts, blocks are primarily developed on a per-site availability basis and no planning is performed for each city block. In contrast, in the planned grid block districts of Edo-period Japanese castle towns, there are numerous examples of open spaces called *kaishochi* that were deliberately and systematically arranged in the central parts of the city blocks. According to S. Ibaraki (1994), such *kaishochi* were incorporated into the planned districts of numerous Japanese cities including Tokyo, Shizuoka, Nagoya, and Kumamoto. As a result, when urban planners engage in redevelopment projects, they are often tasked with examining such historical *kaishochi* to ensure that they are incorporated into modern central urban areas in attractive and innovative ways⁽¹⁾.

Focusing on the numerous temple *kaishochi* in Nagoya City, Aichi Prefecture, this paper explores the work of the war-damage-recovery land readjustment programs, through which the city underwent a number of major transformations. Herein, we aim to elucidate the actual state of changes to *kaishochi* before and after the project completion. In the Nagoya City Edo-period castle town, many of the original *kaishochi* incorporated into the city blocks included temples, but there were also other types, including those hosting mansions, public facilities, and shrines.

The center of Nagoya City forms a grid with block sizes primarily based on three archetypes. Previous research, established that two of these had outer dimensions of 50×50 Ken (90×90 m), but in one portion of the town, the block sizes were set at 50×70 Ken (90×127 m). From an examination of Fig. 1 (Nagoya City (1999)), it appears that the first type occupies 60% of the total land. In addition, although *kaishochi* in Nagoya were most commonly the site of temples, they also hosted mansions or government facilities such as prisons, fire-watch towers, and **restaurants**. Therefore, it can be said that there were rather few *kaishochi* open to the general public (Hayashi T. (2007)).

Figure 1: Archetypes of Nagoya's Kaishochi¹⁰⁾

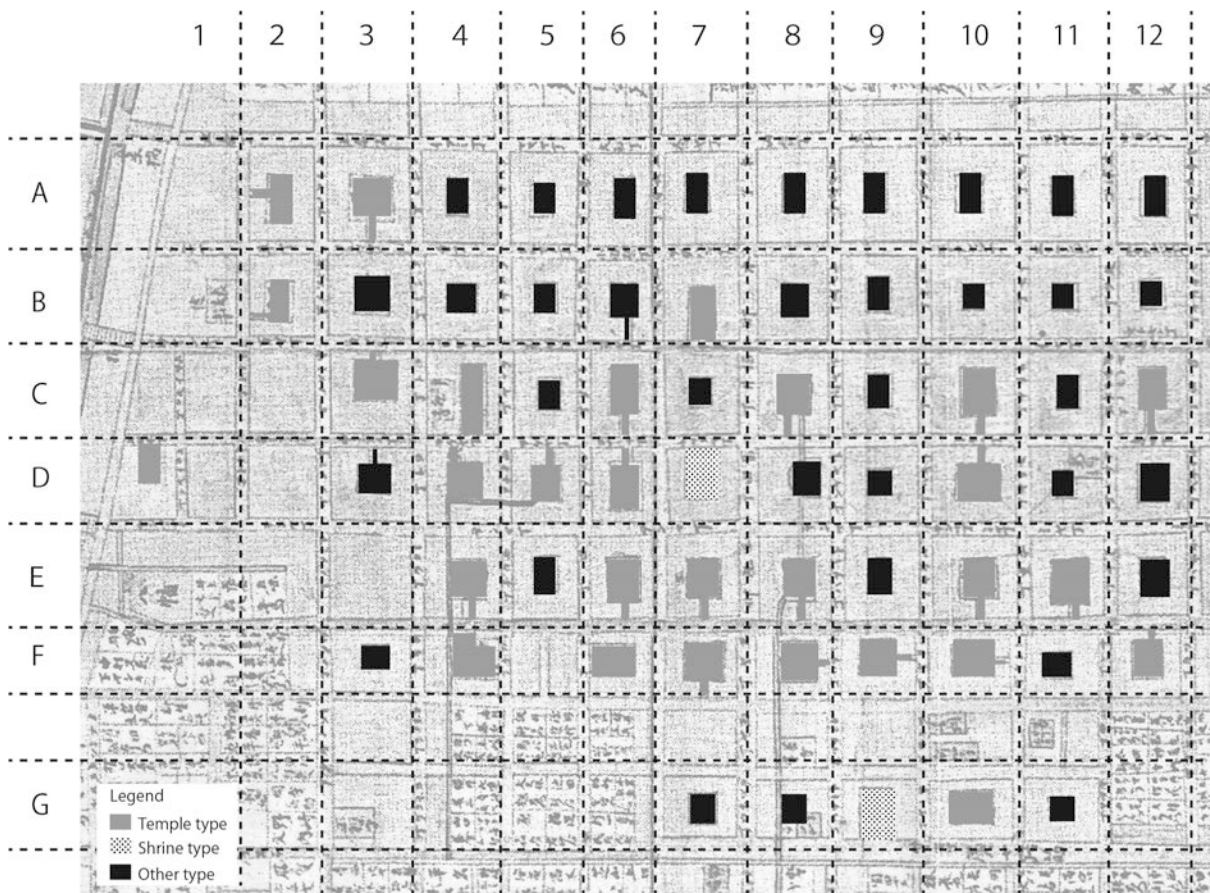

Figure 2: The location of Kaishochi to study (Categorized in Nagoya Castle Map (1746))

This research examines 66 *kaishochi* blocks that could be confirmed to exist in the “Nagoya Castle Map” created in Enpo 3 of the Edo Period (1746), as shown in Fig. 2. Note here that, in this paper, we define *kaishochi* as sites where a line drawn diagonally across a block will intersect the free space making up the center of the block, and the shortest distance between the intersection and the site boundary line is 4 m or more. Furthermore, this study designates

kaishochi based on three primary usages: temple, shrine, and other. The latter category includes office buildings, commercial buildings, residences, and multi-level parking lots.

Looking at past *kaishochi* studies focusing on the Edo period, we find that Tetsuo Tamai (1986) analyzed block sizes while Lee Soeong (2007, 2008) analyzed changes in land ownership, bankruptcies, and alleyways, and S. Ibaragi (1994) analyzed *kaishochi* by districts. As for Nagoya City *kaishochi*, Toshiji Terashima et al. (2009) analyzed their transformations and their related factors.

The differences between Terashima's research and this study can be broken down into the following six points:

1) Terashima analyzed transformations in 61 street blocks that were confirmed in 1884 cadastral register figures, while this article examines *kaishochi* from 1746, which was near the end of the Edo period.

2) This study focused on events occurring before and after land readjustment project renovations.

3) This study makes a point of analyzing the transitions to the size of the sites examined.

4) We divide *kaishochi* into types (temple, shrine, and other).

5) We point focus on site integration with connection sites.

6) *Kaishochi* archetypes are examined.

It is noted that the usage and form of *kaishochi* changes according to the era in which they were constructed. In connection with the relocation of temple cemeteries that occurred during the war-damage-recovery land readjustment programs, it was also determined that temple-type meeting places have undergone area changes that are different from the other *kaishochi* types. Based on the above, we will conduct our analysis by focusing on *kaishochi* 1) usage transformations, 2) form transformations, and 3) temple-type area transformations. We will begin our research by analyzing the influence of temple-type *kaishochi* resulting from temple cemetery relocations that were carried out as one phase of the war-damage-recovery land readjustment programs.

Because it has recently become commonplace to relocate inner-city cemeteries to suburban locations, the temple-type *kaishochi* affected by such relocations obviously experience more radical use transformations than other types. Specifically, we will examine the relics and traces of temple-type *kaishochi* using maps produced before and after the implementation of the war-damage-recovery land readjustment programs, and then analyze reduction rate differences between the entire district and the *kaishochi*. Next, after dividing *kaishochi* by type, we will analyze changes in their usage and form by using maps created before and after the project implementation.

Temple-type area transformation by cemetery relocation

Because the presence of cemeteries within the central city target blocks was considered environmentally and aesthetically unfavorable, a plan to relocate those memorial areas to a concentrated location called Nagoya *Heiwa Koen* (Peace Park), which is located on the outskirts of the western part of the city, was undertaken during the reconstruction phase of the war-damage-recovery land readjustment programs. In all, 279 temple cemeteries that were originally located within the central city project area were relocated.

After giving thoroughgoing consideration to the petitions of temples officials, the city authorities who decided on the site of the new tomb gardens established policies calling for not only the meticulous handling of the cemetery monuments being relocated but also the groundbreaking policies for the sanctuary areas located inside the temple complexes, as follows: 1) The rate of land decrease is calculated by adding 1/2 of the transferred cemetery area to the area before land readjustment. 2) The temple has a guaranteed minimum site area, the temple type is maintained despite the relocation of the cemetery to the suburbs, temple types were replaced by these incentives.

Next, an analysis of the remnants located at temple-type *kaishochi* that have existed since the Edo period (Table 1), before and after the relocation phase, was conducted. In the Edo period, when these *kaishochi* first appeared, 28 were temple-type. However, that number decreased to 14 before the project implementation, and then to eight afterwards. Furthermore, although they were not located on a *kaishochi*, we confirmed the existence of six temples within the survey area before the project implementation and two afterwards.

Changes in the number of Edo period temple-type *kaishochi* before the project implementation are considered to be caused by the fact that some temples were driven into disuse by the the anti-Buddhist movement at the beginning of the Meiji era. Additional factors related to the change in the before and after project number of temple-type *kaishochi* included: 1) temple destruction due to war damage, 2) the loss of the patronage that had economically supported the temple, and 3) the relocation of temples to *Heiwa Koen* that accompanied the project implementation.

Next, the block areas where temple remains could be found, even after the project implementation (Table 1), were examined. Looking at the increase and decrease of temple-types before and after the project implementation, we can see an increase of four and a decrease of six temple-type *kaishochis*. As a result, despite a decline in the war-damage-recovery land readjustment programs, land area was reduced, even though things increased in some areas. After conducting an interview survey with Nagoya City officials, it was clarified that some sites were changed due to relocation work difficulties involving war damaged sites and buildings that had had not been refurbished since the war. In addition, regarding areas where the number of temples decreased, when comparing the reduction rate of the block areas with the reduction of the prefecture as a whole, it became clear that the reduction rate of temples in the prefecture was lower than the reduction rate within the block areas. More specifically, at 39%, the reduction rate was particularly large in the E-11 block districts compared to just 7% for other prefectural areas. From this result, it was confirmed that the temple-type *kaishochi* were given preferential treatment over the other-type *kaishochis* when land substitution work.

***Kaishochi* use transformation before and after the project**

As mentioned above, *kaishochis* can be divided into three types: temple, shrine, and other. For each era, the use type of each *kaishochi* examined was incorporated into a survey sheet and changes in the land use pattern were determined based on the investigation sheet.

The total number of *kaishochis* decreased year by year from 66 in the Edo period, to 50 before the project implementation, and then 40 after project implementation. By use type, temple-type *kaishochis* decreased from 28 in the Edo period to 14 before the project implementation and eight after the project implementation. As for shrine-type *kaishochis*, the number decreased from three in the Edo period, to two before the project implementation, down to one after the project implementation. In contrast, the number of other-type *kaishochis*, which was 35 in the Edo period, decreased by just one to 34 before the project implementation, and then to 31 after project implementation. This change was moderate when compared to other two types (Figure 3).

Figure 3: Transition of the usage of "Kaishochi"

Figure 4: Transition of form of "Kaishochi"

Next, we analyzed blocks with "Kaishochi" in either or both before and after eNext, blocks were analyzed from the combination of the presence of kaishochis before and after the project implementation. Before and after the project implementation: presence, there are 33 blocks, before the project implementation: presences, after the project implementation: absence, are 17 blocks, before the project implementation: absence, after treatment: presence, are seven blocks, and Before and after the project implementation: absence are nine blocks. Before and after the project implementation: absence, it is understood that a kaishochi has completely disappeared from a block. Next, we analyzed kaishochi blocks where before or after the project implementation: presence, focusing on use transformations. Comparing before and after the project implementation, six blocks stayed temples, six blocks changes from temple to other, one block change from other to temple, 19 blocks stayed other, and one

blocked changed from shrine to shrine. Thus, it is found that many blocks maintained their previous uses: 26 blocks compared to seven blocks changing their uses.

The reason one designation switched from temple- to other-type *kaishochi* is that some temples were fully transferred to the suburbs along with their affiliated cemeteries during the relocation phase of the project. There was also one example of an other-type *kaishochi* that changed to a temple-type *kaishochi*. In this case, a temple that was present in the block before the project implementation was expanded to include a position within the *kaishochi* during the implementation phase. There were also cases where part of the land that was not initially part of the *kaishochi* became part of a *kaishochi* due to the implementation phase, even though the use remained the same. As for cases in which *kaishochi* disappeared due to the project, two were temple-type *kaishochis*, one was a shrine-type *kaishochi*, and 14 were other-type *kaishochis*. This indicates that a number of *kaishochi* in the city center disappeared as a result of the implementation phase.

The shrine-type *kaishochi* disappeared because the shrine itself burned down before the project implementation and the site was converted to another use. As for cases in which *kaishochis* were renewed after the project implementation, one was a temple-type *kaishochi* and six were other-type *kaishochis*. In the case of the temple-type *kaishochi*, a temple was located on the site before the project implementation and the block size remained small after the project implementation. Since the proportion of the temple in relation to the block went up, it was revived as a *kaishochi*. As for the features of the other-type *kaishochi*, although it was a temple-type *kaishochi* in the Edo period, it lost *kaishochi* status because the temple disappeared and it is thought that the land, which was originally residential, had been transformed into a *kaishochi* due to section changes imposed by the project implementation.

Changes in the *kaishochi* form before and after the project

Using survey sheets, we assembled and categorized *kaishochi* groups with similar transformations. First, we divided the meeting place form into three types: flagpole type (large inner area with narrow outside access), no-contact (large inner area with no public access to outside roads), and integrated type (large access to outside road). (See Fig. 5.)

In the Edo period, about 40% of the blocks were the flagpole type (25 blocks), about 10% were the integrated type (seven blocks), and the no-contact type comprised about 50% (34 blocks). However, prior to the project implementation, the number of integrated type blocks had increased and accounted for about 50% (23 blocks), after which the no-contact type disappeared and the integrated type accounted for about 80% (33 blocks) (Fig. 4). From this, we can see that the integrated type of *kaishochi* had become the dominant form.

Next, we analyzed the morphological change of *kaishochi* for each combination of *kaishochi* presence before and after the project implementation (Fig. 5). Comparing before and after the project implementation, three stayed flagpole type, four changed from flagpole type to integrated type, 15 stayed integrated type, three changed from no-contact type to flagpole type, and eight changed from no-contact type to integrated type, confirming five pattern of change did it. Thus, 18 blocks kept the same form, and 15 blocks changed.

As for *kaishochi* that were flagpole type both before and after the project, there was an accessway transformation in the A-3 block, and one side of the F-7 block came into contact with two renovated paths. Prior to the project implementation, the A-3 block had access to the road along the south side of the *kaishochi*, but afterwards, the main road passed along the east side, thereby requiring an accessway transformation. Before the project implementation, the F-7 block only had one corridor road, but afterwards it came to have two roads. From these two examples, we can see that changes in the contact direction and number of accessways were made during the project implementation while maintaining the flagpole type (Fig. 5).

There were numerous cases where *kaishochi* retained their integrated form after the project implementation. For example, Asahi Shrine has been present on block H-9 from the Edo period to the present day. As in B-4 and H-11, there are blocks where there are two or more accessways with an adjacent road, even though they were integrated before the project implementation. In those cases, they were transformed during the project implementation to eliminate an approach road or to make an accessway in another section. Additionally, there are blocks with different sections before and after the project implementation. In those cases, the *kaishochi* section before the project implementation was reduced in size during the arrangement adjustment, so the original site was no longer in the central part of the block, thus causing another section to become the *kaishochi* instead (Fig. 5).

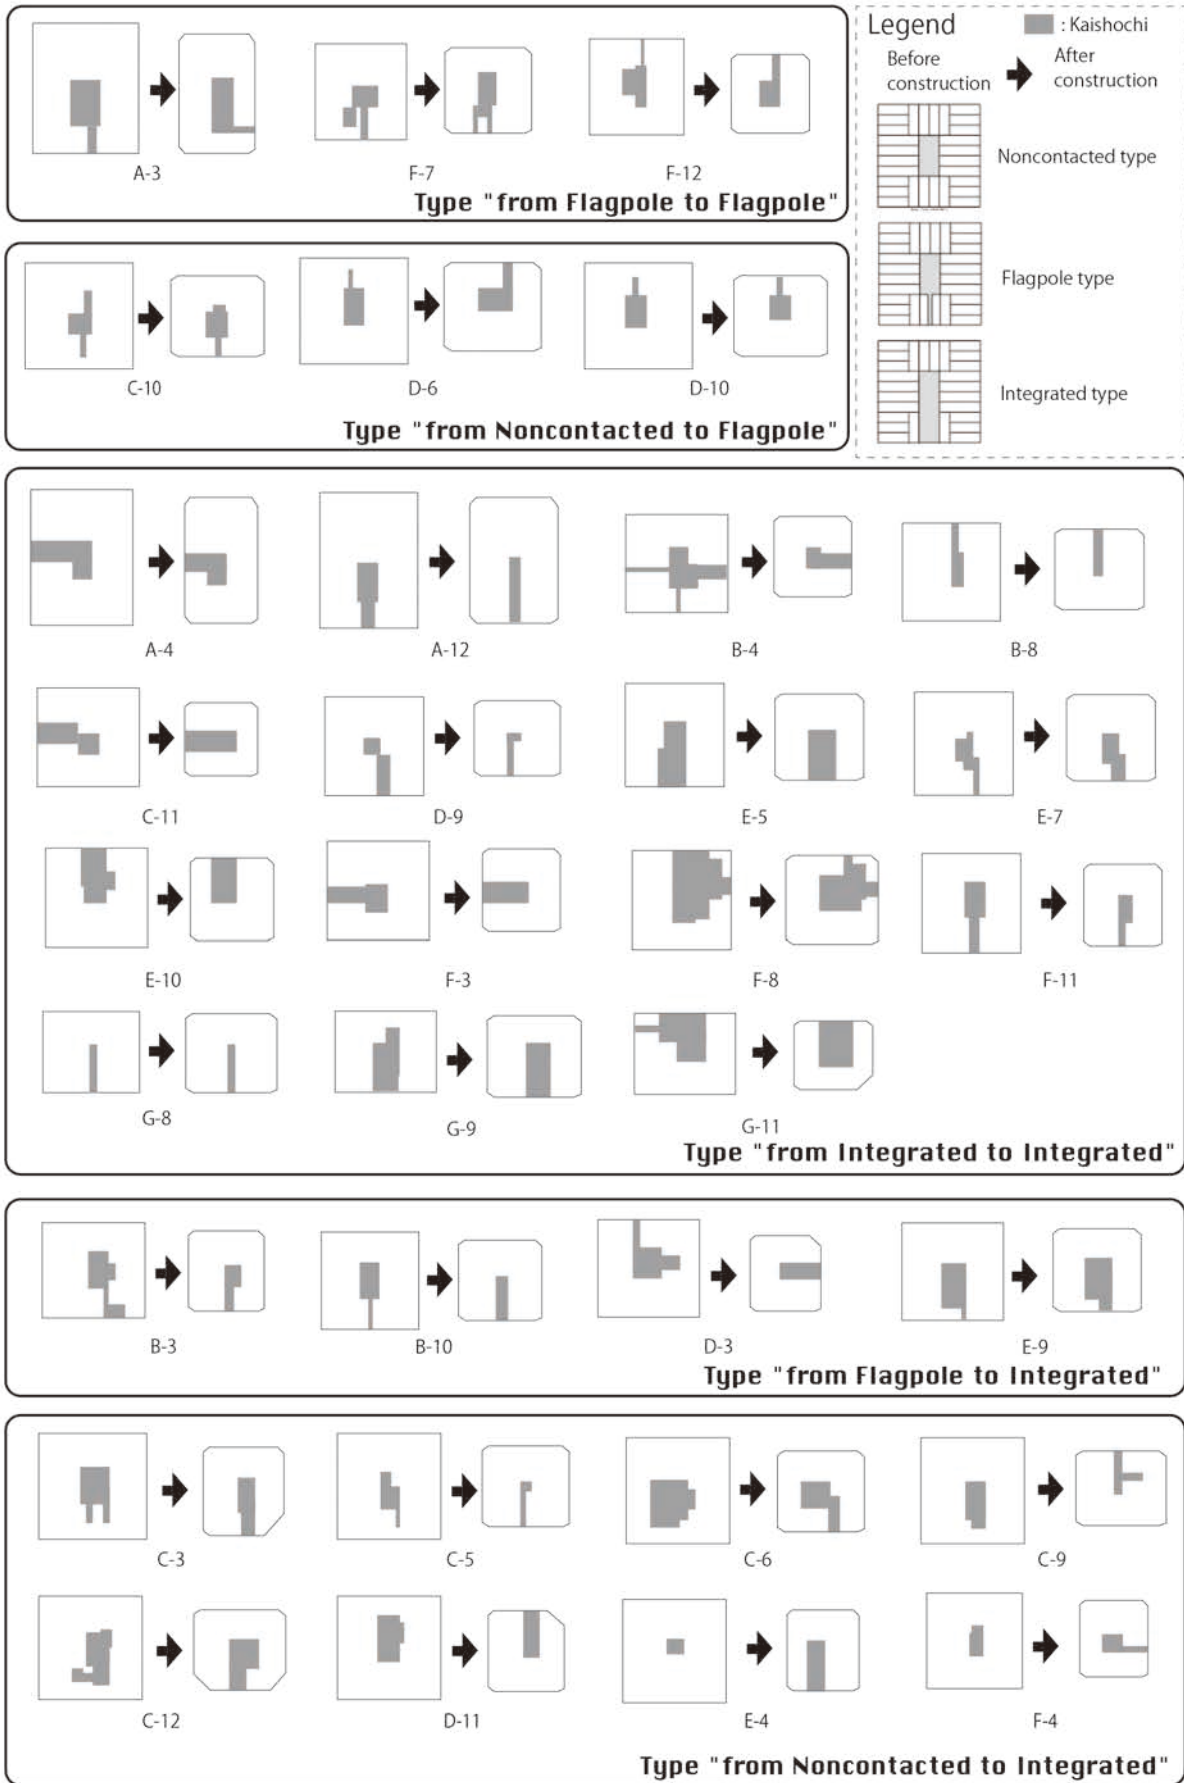

Figure 5: Transfiguration pattern of Kaishochi

As for flagpole to integrated type transformation, as seen in B-10 and E-9, the conversions were produced by expanding the approach roads that existed before the project implementation. In those cases, amplification was achieved by integrating land around the *kaishochi*. Additionally, at D-3, a main road was created on the east side, thereby changing the contact path. In that case as well, the morphology was transformed by integrating it with the sections surrounding the *kaishochi* (Fig. 5).

As for no-contact to flagpole type transformations, in cases where no accessway was seen before the project implementation, the original section was similar to the flagpole type and there was little change in the size of *kaishochi* after the project implementation. However, it became possible to access the city block, which became smaller (Fig. 5).

For no-contact to integrated type transformations, we saw that the forms before the project implementation were already close to the integrated type and that access in numerous blocks was created by integrating them with the surrounding parcels during the project implementation. In E-4, the temple that has existed on the *kaishochi* since the Edo period had declined in size before the project implementation phase and another section had been designated as the *kaishochi*, making it a no-contact type. However, due to issues that arose during project planning, the block size was reduced, whereas the temple grounds stayed the same. As a result, the temple once again occupied the central part and the *kaishochi* was designated as an integrated type (Fig. 5).

Conclusion

As a result of the analyses conducted in this study, the following three points were clarified. First, even though the number of temple-type *kaishochis* is decreasing, the resulting area changes have been small. The total number of *kaishochis* was 50 before the project implementation but decreased to 40 afterwards. From an examination of temple-type remnant trends, we find that the decrease in the number of temple-type *kaishochis* was occurring before the war-damage-recovery land readjustment programs and has continued since the project. However, since residential areas have also been decreasing step by step, it was also found that the temples remaining area after the project implementation are being maintained .

Second, there has been little change in *kaishochi* usage before and after the project, with most that had undergone transformations changed to residential land when various temples were relocated to the *Heiwa Koen* simultaneously with their affiliated cemeteries. As for other-type *kaishochis*, there are numerous offices that disappeared during arrangement adjustments, but since there were also many uses for the newly vacant areas, the numbers were maintained. When looking at *kaishochi* usage, we can also see than many of the other-type *kaishochis* had originally been temple-type *kaishochis*. The reason here might also be related to the fact that the temples originally on that land had been moved to the vicinity of *Heiwa Koen* simultaneously with their affiliated cemeteries as part of the relocations done during the war-damage-recovery land readjustment programs.

Finally, looking at *kaishochi* forms, we can see changes from flagpole and no-contact types to integrated type. In Nagoya City, site shapes were commonly maintained because of the Land Reorganization Project made decisions based on the actual converted sites. However, we confirmed that changes from flagpole to integrated type did occur by integrating a *kaishochi* with the surrounding premises. *Kaishochi* that remains a flagpole type was also a flagpole type in the Edo period. In other words, it can be said that the *kaishochi* has been maintained in the same form as when it was first created.

Notes on contributors

This research is the result of collaborative research with Yoshinori Kato. In the interview survey, I received great cooperation from administrative officials and others. I thank you for writing here.

Street Art as a Way to Enhance the Vitality of Urban Public Spaces----Inspiration Based on the Experience of Taipei

Zhang Peng*, Dong Wei**

**PhD, Urban planning department of the school of architecture, southeast university of Nanjing, China, 54507355@qq.com*

***Prof, Urban planning department of the school of architecture, southeast university of Nanjing, China, dongwx@163.com*

Street art is a unique artistic behavior that takes place in the urban public space. Its uniqueness is not only manifested in the form of immediacy, participation, and mobility, but also has a great value to enhance space dynamism, increase human interaction, and shaping the spirit of place. In most Chinese cities, street art is often equated with "fraud", which not only hampers the development of street art, but also hinders the promotion of vitality of public space, for a livable and lively city, the public space should not be merely a purely physical space, but should be the sum of the spirit of the place and the vitality of the space. The research question of this paper is: how to reduce the external negative effects of street art and actively shape and regenerate the vitality of urban public space? Research based on literature review and the summary, first of all, review and define the concept of "street art", and carries on the classification, it is believed that street art can change from "urban problem" to "urban landscape", then, the relationship between "street art" and "urban public space vitality" is discussed, performance analysis found a busker behavior can not only enhance the vitality of the public space (one-way intervention), also can attract audience participation, through the interaction with the audience to arouse public space activity (two-way intervention). And then from the perspectives of government, NGO and ordinary citizens, multi-dimensional detailed analysis the art management experience on the streets of Taipei, found that through the government management, system design, the multi-agent organization and the public participation to cultivate a variety of means such as, the urban public space of street art promotion activity provides effective guarantee system and management, and reduce the street art of the outer space of the city has negative effects. Based on this, the paper puts forward the spatial layout pattern of "centralized and decentralized complementarity", the behavioral restraint mechanism of "rigidity and elasticity", and the multi-agent intervention management of "organization and self-organization", "Planning for Positive Public Opinion and Strict Enforcement of Law Enforcement" and other planning strategies. This paper argues that, by using the experience of management of Taipei street artists, from space, organization, policy formulation, implementation and operation aspects improve mainland China the level of city governance, with a view to providing references for the regeneration and shaping of the vitality of urban public space in China, and to provide a useful reference for the management of street artists.

Introduction

The rapid development of information technology has greatly changed the way that people interact with each other. In the past, the traditional face-to-face language exchange was gradually replaced by the interaction of online platforms. What has happened with this change is the tremendous change in people's understanding of public space: urban public space gradually returns to its original meaning as a "container," so Richard Sennett asserted that "public life is dead." [1]. In this context, the vitality of urban public space has become the focus of attention. For a livable and lively city, the public space should not be merely a purely physical space, but should be the sum of the spirit of the place and the vitality of the space. Therefore, the vitality of public space should not be limited to the transformation of material space, but should also reflect the "urbanism" and spiritual nature it carries.

In recent years, art as a means and important strategy for the regeneration and revival of urban public space has begun to be used in urban and rural planning and construction. The existing focus includes the discussion of the importance of art for space from a theoretical perspective [2], the influence of artistic works on public space [3-4], and the artist's transformation of space (mainly rural and community) from a practical perspective, the research on the mechanism of action of art intervention space [5-7]. Although these theoretical and practical achievements have greatly advanced the study of "art intervention space," most of them have remained in the "static art work" for the material transformation of space, but have paid less attention to the effects of temporal and dynamic artistic behavior and space activity on the vitality of space. This article attempts to start with a special type of art-- "Street Art", and explores the way that artistic behavior of "immediateness", "liquidity", and "interactivity" to promote the vitality of urban public space, by analyzing the development experience of street art in Taipei, and at the same time propose a planning strategy to avoid negative intervention.

1. THE CONCEPT AND CLASSIFICATION OF STREET ART

1.1 The Concept of Street Art

Street art is a common phenomenon in more economically developed cities. At present, there is no strict definition of street art in mainland China. Linli An pointed out that the four characteristics of street art are "liquidity", "culturality", "spontaneity", and "aggregation". She believes that street art refers to street musicians, such as musicians, painters, and performance artists, who are dedicated to public performances in public places, including singing, oral skills, mime, musical instruments, painting, juggling, and storytelling. Diverse performance forms. She believes that street art refers to street musicians, such as musicians, painters, and performance artists, who are dedicated to public performances in public places and include a variety of performance forms such as singing, oral skills, mimes, musical instruments, and paintings. , juggling performances, storytelling, etc. [8] The street art defined in this article has three elements: location, behavior and purpose. It has three characteristics: mobility, appreciation and participation. First, the place where street art takes place is an urban public place like "street," and due to the public nature of the place, its occupation of space is usually temporary. It can be changed, so it has considerable mobility; Second, street art should be admirable, the level of performing arts is the core measure of whether or not it is called an "artist". Higher appreciation for them to attract more viewers; once again, the admiration of street art has brought about its

participatory difference from the group of vagrants, The process of attracting the attention of passers and participation is the prerequisite and basis for interaction generated.

1.2 Classification of Street Art

According to the form and content of street art performance, street art can be divided into three types of performing arts, visual arts, and creative arts [9]. Among them, performing arts is a type of street art that provides audiovisual experience as its main features. (Table 1). It can be divided into vocal music and instrumental music. The visual arts category mainly refers to street art types characterized by providing visual appreciation, which can be divided into calligraphy, painting, birds and flowers, etc.; Creative crafts refers to the types of street art that are mainly characterized by the creation of creative products and handicrafts. The types of street art can be divided into dough, clay, sugar and plastics.

Table 1. Main types, characteristics and schematics of street art. *The graphic classification is based on the author's tracking survey of street entertainers in a large Chinese city. The photos are taken taken by the author on site*

	Performing Arts	Visual Arts	Creative Crafts
Features	Mainly to provide audiovisual experience and experience as the main features;	Mainly to provide visual appreciation characteristics;	Mainly characterized by the creation of creative products and handicrafts;
Types	Drama, Mime, Ugly, Acrobatics, Reading, Vocal Music, Instrumental Music, Magic, Street Dance, Performance Art	Calligraphy, painting, graffiti, figures, photography, birds and flowers	Plastic sculptures, clay sculptures, sugar and plastics, etc.
Schematic			

According to the perspective of the relationship between Street artists and audiences, street art can be divided into two types: "composition scenes - audience separation" and "creative scenes - audience interaction". The former mainly refers to the audience can only see the artistic achievements of street performers, but can't see the creative process (such as graffiti), it is a relatively traditional, static, display-based art form; The latter refers to the artist creative process can be seen by the audience, and can participate in it. People appreciate the creative concept of the artist through appreciation of the creative process. It is an art form in which the artist interacts with the audience.

With the development of the times, the types of street art are constantly changing and developing, and some traditional forms of performance are gradually being eliminated (such as the traditional folk arts of cross-talk, storytelling, and Pingtan), and new forms of art are emerging (such as hip-hop, performance art, etc.), but in essence still fail to break away from the basic relationship dimension of "scene-audience". Therefore, the types of

street art studied in this article are mainly limited to "creative scenes - interactive audiences", while the art forms include but are not limited to the above three types.

2. THE RELATIONSHIP BETWEEN STREET ART AND THE VITALITY OF URBAN PUBLIC SPACE

2.1 Street Art Creates a Spirit of Place in Public Spaces

The characteristics of public space are not only manifested in the uniqueness of material space and environment, but more importantly, the interaction between people and the environment and the improvement of the spirit of the place brought about by people-to-person exchange ^[10]. The rich content of street art forms can not only reshape the quality of public space, but also attract more crowds and stops for specific places, and its flexible changes and flowing artistic behavior also affect the overall artistic atmosphere and cultural image of the city. The improvement of the spirit of public space places is of great value.

2.2 Street Art Promotes Human Communication in Public Space

Because of the ambiguity of public space ownership, the involvement of any individual will trigger changes in the attributes of other space owners. As a result, individuals gradually tend to retreat from self-power boundaries and consciously weaken the relationship between individuals and the built environment. ^[11]Street art can not only shape the quality of the material space environment, but also its rich art form provides a medium for the promotion of human communication in space. The artist performed live performances by moving the artwork creation scene into the public space and interacted positively with the audience through viewing, buying, selling, donating, and language exchange. (Figure 1).

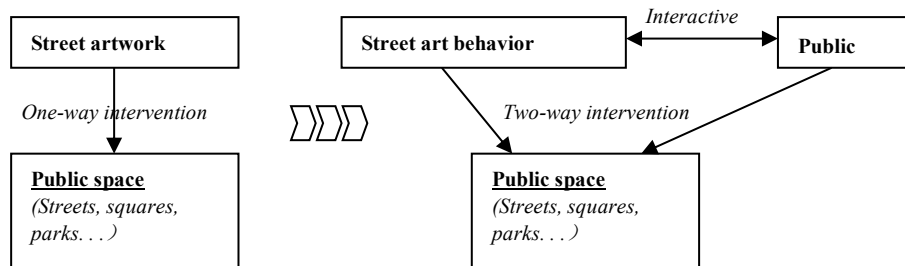

Figure 1. The influence of the interaction between street art behavior and the public on space. The data comes from the author's drawing

2.3 The "Positive and Negative Effects" of Street Art on Public Space

The narrative in public space often has two sides. With the generalization of the semantics of street art and the differentiation of the composition of street artists, many practitioners gain sympathy through bad performances in the name of art. They occupy public spaces, disrupt normal public order, and cause traffic jams and noise disturbances. The negative effects of people, fraud, and difficult governance^[12]. Looking at the domestic and overseas markets, street art is entirely possible to provide positive effects for promoting the revitalization of urban public space and creating a sense of urban environmental quality through reasonable management and

guidance. Based on this, the following analysis provides an inspiration for the management of street art in mainland cities by analyzing the experience of street art management in Taipei.

3. TAIPEI STREET ART MANAGEMENT

3.1 Taipei Street Art Development Overview

As the capital city of Taiwan Province, Taipei City is one of the cities that prioritized the development of urban public art. Taipei City is located in the Taipei Basin in the northern part of Taiwan Island. It has 12 districts under its jurisdiction with a total area of 271.8 square kilometers. In 2014, it had a total population of 2,701,600. Inspired by the overall artistic soil and cultural atmosphere in Taiwan, as early as more than 20 years ago, the Taipei City Cultural Bureau began to promote street performers to engage in the standardized management of street art performances. It is hoped that culture and arts can better integrate into people’s lives. Today, the streets of Taipei have become more and more widely acknowledged and respected by the society and have spawned a relatively complete cultural industry chain.

3.2 The Municipal Government is Responsible for the Formulation of Standardized Management Regulations

The Taipei City Government is the leading force in promoting the healthy development of street art. Since the 1990s, the Taipei City Government has successively promulgated the “Licensing Measures for in Arts Activities in Taipei City” (April, 1994), “Planning Scheme for Licensed Artists of Taipei Street Performers” (February 1997) and other related regulations. The rules and regulations on the rights and conduct of Street Performers have been meticulously stipulated, and it has been ensured that there are rules to follow in the streets. [13]. In addition, in addition to the management of the above measures, street performance activities must also be carried out under the provisions of the “Environmental Noise Control Act,” “Regulations on the Management of Traffic Safety,” and “The Law on the Maintenance of Social Order”, otherwise the law enforcement agencies has the right to withdraw or even terminate the qualifications of Street artists for street performers. (Table 2).

Table 2.Laws related to Street Art Management formulated by the Taipei City Government.*Source: Taipei city busker licensing program for arts and cultural activities*

Promulgation Time	Legal Regulations	Related Content Involving Street Performers
April 1994	"Taipei Street Artists Engage in Art and Cultural Activities Licensing Measures"	Article 1: These measures are specially formulated to encourage diversified development of arts and cultural activities in Taipei, to cultivate the spending habits of people participating in arts and cultural activities by means of payment, to enrich the cultural features of public spaces in the city, and to permit artists to engage in street arts and cultural activities. Article 2: (1) Public Space: Refers to a space such as sidewalks, squares and parkland more than eight meters wide in the city, with the consent of the administrator to provide venues for arts and cultural activities. (2) Art and cultural activities: Environmental arts, photography, and other arts that engage in fee-based drama, dance, singing, musical instruments, magic, folk arts, painting, sculpture, action art, use of non-permanent media, or water-soluble pigments. Text related to live creative activities. (3) Street artists: Refers to natural persons or groups of ten or less engaged in arts and cultural

		<p>activities in public spaces. Article 4: Street artists should apply to the competent authority to issue licenses for licensing activities before engaging in arts and cultural activities in public spaces in this Municipality. Article 6: Street performers who have obtained an activity permit may engage in arts and cultural activities in public spaces in the city. However, it should comply with the relevant laws and regulations and the management of public spaces. Article 7: When Street artists engage in arts and cultural activities, they shall reveal the activity permit at a conspicuous location on the scene and shall be subject to examination by the competent authority and public space management personnel. Article 8: When Street artists engage in arts and cultural activities, they must not cause obstacles such as pedestrian or vehicular traffic, obstruction of barrier-free facilities, building entrances and exits or fire safety equipment, and other actions that impede traffic or public safety.</p>
February 1997	<p>“Taipei Street Artists Engage in Art and Cultural Activities Permit Implementation Plan”</p>	<p>First, implement the artist's "Application System for Performing Qualifications" (see below for details);</p> <p>Second. Behavioral norms of Street artists: (1) Produce activity permits, and consciously accept inspections by competent authorities, public space managers, and other related personnel; (2) Do not cause difficulties for pedestrians or vehicles, and leave at least 3 meters of pedestrian access space. Must not obstruct building entrances or fire safety facilities; (3) The distance between individual artists is more than 4 meters, the distance between groups increases to more than 6 meters, visual arts and creative technology can use a space of 1 meter times 2 meters square or according to the regulations of the venue authorities; (4) Content needs to be created or performed on site; non-site creations must not be sold and must be marked "not for sale"; (5) fees are set by the artist and can be accepted freely Donations, rewards or pricing methods should be clearly marked on the site in advance; (6) Time of performance: from 10:00 to 22:00; (7) Compliance with other management norms and regulations in public spaces; (8) Keeping the site tidy, Immediately after the show is completed, the site will be restored to its original state and the waste generated will be cleaned up; (9) If damage is caused to the site, it shall be responsible for repairs and liability</p> <p>Third. Auditing operations: The “Inspection Management Operational Notification System” will be established by the Bureau of Culture and various space management units.</p>
December 1999	<p>Environmental Noise Control Act</p>	<p>Article 6: Noise-control zones shall not engage in acts that may cause harm to the peaceful environment of others; Article 7: The sounds of places and facilities in noise-control zones shall not exceed the noise control standards; Article 8: In designated zones The announcement by the competent authority of the Internal Control Office for the designation of a noise-prone facility is subject to the approval of the local competent authority before it can be set up.</p>
July 1987	<p>Traffic Safety Management Regulations</p>	<p>Article 81: In a railway highway station or other traffic-frequent location, guests who violate guest regulations and hinder traffic order shall be fined NT\$1,500 to NT\$3,000; Article 82: if there is one of the following circumstances, In addition to ordering the perpetrator to stop and remove the obstacles in real time, the perpetrator or his employer shall be fined NT\$1,200 but is less than 2,400 yuan: Holding a competition without permission on the road or setting up a banquet, acting, filming or other Similar actors, who set up booths in places where the announcement prohibits the establishment of a share.</p>

3.3 Institutional Design and Innovation of Street Artists Management

3.3.1 Street artist licensing system

The Taipei City Government has established a perfect licensing system for street performers. Artists need to pass a strict examination standard before they can obtain street licenses. With their licenses, they can qualify for street performances, thereby enhancing the level of street art. The certification assessment process is sponsored by the Municipal Bureau of Culture, and the applicants submit their applications on their own. The available application items include performing arts, visual arts, and creative arts. (Figure 2); Application mechanism includes deliberation body, deliberation process and deliberation procedures Three aspects (Table 3 for details).

Figure 2. Street artists licensing license application process. The data comes from the author's drawing

Table 3. Permission for applying for street artist license. Data from the summary of network data

Subject of Review	After the application is accepted, a review committee shall be convened to invite the deliberation committee and the public to participate in the voting;	Review Committee	Including 1, arts and crafts professional experts and scholars (categorized according to the attributes of street performers); 2. representative of the competent authority; 3. representative of the venue management unit; 4. representative of Street artists;
		General people	Open the scene to participate in the popular vote, if the negative votes reach 10%, then ask the deliberation committee to discuss;

Review process	The applicants were invited to explain, demonstrate or perform on the scene. After the deliberative personnel scored, the reviewers issued the licenses.		
Deliberation procedure	The review adopts the negative elimination method and is divided into two phases;	The first stage	In the first stage, the public and the deliberation committee voted at the same time. If the voter thinks that the content of the applicant's performance is not suitable for the street performance, cast a negative vote;
		The second stage	If any applicant is (1) professional, venue management representative, cultural bureau, street artist representatives cast negative votes or (2) the public cast negative votes by 10%, then enter the second phase of deliberation;

Street artists' assessment venues are usually located in the corridor of the "National Father's Memorial Hall" where there is a large number of people. Each participant only has 3 minutes of performance time. The specific assessment criteria include the maturity of artistic expression and skills, and the attraction of the performance to the audience and the environment, the effect, the artist's own packaging, the completeness of the performance, etc. [14]. Due to the high assessment standards, the pass rates are generally between 15% and 20%. Those with poor artistic skills are eliminated. There is no special treatment for assessment. People with disabilities must pass the same standards as ordinary people. Since its deliberation on Street artists in 2005, the Taipei City Government has accumulatively licensed 1,399 permits for street performers. Most of these members are professional performers, and there are also many institutional teachers. The composition of the entire group of street artists is approximately 80 percent of the professionals, 15% of retirees, 3% of students, 1% of foreigners, and other 1%. These licensees can vouch for performances at venues in Taipei City.

3.3.2 Defining a Fixed Show Venue

The street performers who qualify for the badge qualify as street performers, but it does not mean that they can perform at any location. First of all, the use of street licenses is within the scope of the area where the documents are issued, that is, the licensing permit obtained through examination in Taipei City, it is valid only for local use in Taipei City; secondly, Taipei City based on the types of street art, audience characteristics, and external interference levels, 231 spots in 82 performance venues in the city were designated as street performers' fixed performance venues^②.

3.3.3 Implementing a venue registration application system

As the level of venue flow directly affects the artist's attention and income levels, it inevitably results in competition for better venues. Based on this, the Taipei City Government created and implemented a venue registration application system. According to the gradient of the number of people registering for the venue, three methods of registration lottery, registration use and self-coordination are adopted. For venues with a large number of registered users and unable to meet the needs of all artistes in turn, the method of registration lottery determines the sequence of performers. At the government designated window to participate in the drawing to determine the venue of the day, for example at the MRT Danshui Station, a daily draw arrangement takes place at 10 o'clock in the morning, generally more than a dozen applicants compete for 8 venues; for venues with fewer registered users Self-coordinated approach. The form and timing of the performances are also stipulated. It is generally stipulated that from 10:00am to 10:00pm it is allowed to perform on the specified venues, but at the

exit of the MRT station where the flow of people is relatively large, in order to restrict street performances. The negative effect on the urban order, therefore prohibiting street performers during the rush hour; and some venues with a strong capacity to accommodate the performance of dynamic, open time control measures, such as in Ximending Pedestrian Street, weekdays The show's performance time is from 18 to 22 hours, while the holiday is from 11 to 20 hours.

3.4 Encourage Non-governmental Organizations to Participate in Management

The government provides top-down management rules to restrict street performers, while non-governmental non-government organizations also manage and organize themselves through the bottom-up approach. The folk organizations of street Street artists in Taiwan developed earlier. As early as 2003, Zhang Bowei and many artists created the first street artist development association in Taiwan^③. The functions of the association include coordinating street performers' performance venues and helping artists to safeguard their rights. Increased exchanges between artists and organized new artists team, effectively increased the social status of Street artists, and made positive contributions to promoting the organization of Street artists in Taiwan. The Street artists Development Association also actively developed online platforms and established the “Taiwan Street Artist Network” to regularly publish excellent street performers’ videos on the Internet. This has aroused more attention from the community to this group. At the same time, it also set up public donation accounts. To some extent, it solved the problem of the daily operation of the association. In addition, he is also responsible for regularly planning the “Street Arts Festival” and invites more street artists to join the association to enhance the overall performance level and popularity of Street artists.

Through the introduction of non-governmental organizations, Taipei City has achieved good results in multi-party management practices for street performers. Unlike the government’s top-down one-way control approach, the Artists Development Association provides a bottom-up feedback path for street artistes, effectively linking managers, Street artists, and the public to form a benign approach.(Figure 3).

Figure 3. The bottom-up feedback path for professional organizations. The data comes from the author's drawing

4. THE ENLIGHTENMENT OF TAIPEI STREET ART MANAGEMENT EXPERIENCE TO MAINLAND CHINA

4.1 Centralized and Scattered Complementary Spatial Layout Patterns

Street art has great dependence on urban public space, so the spatial layout of street art should closely integrate the distribution rules of urban public space. In the traditional planning model, the public space usually occupies the center of gravity of the urban space, focusing on the symbolic significance of some kind of collective activity or event. The public space that emphasizes centrality and concentration is increasingly unable to satisfy the residents' participation in space, practicality and pleasantness requirements, so it can be predicted that the function of urban public space will be divided in the future. Under this trend, street art should fully integrate the distribution and evolution of public space, strengthen the dual functions of art display and participation in terms of content form and participation methods, and adopt a centralized and decentralized complementary layout model from the perspective of spatial distribution.

4.2 Rigid and Elastic Behavioral Restraint Mechanism

In order to minimize the external negative effects of street art, it is necessary to rationally restrict its behavior. For example, the timetable for the specific land plots allowed to entertain is allowed to be allowed to entertain for free during the prescribed time period, while it is strictly forbidden for other time periods; for the performance venues and performance forms, etc., an application for appointment is submitted to the management department in advance and managed. After the screening and co-ordination, the party effectively restricts the performing behavior of Street artists.

4.3 Multi-agent Intervention Management of Organization and Self-organization

On the one hand, the government has strengthened its responsibilities, led the government's management and control through stringent laws and regulations, and on the other hand, the government has Legitimacy was confirmed, and the street performers were provided with more humane help to encourage their formal development. At present, only a handful of cities in mainland China have started implementing the "Artist Licensing System" and proposed relatively specific regulations for the management of street performers^④, but more cities still use Street artists as an urban parasite. Driven everywhere, the attitude and methods of managing Street artists in the Taipei area should serve as a model for learning in the mainland. In addition, there is still a lack of more formal artists' self-organized groups in the mainland. There is no centralized feedback channel for artists' demands.

4.4 Positive Public Opinion Guidance and Strict Law Enforcement Guarantee

Drawing on Taipei's experience in managing street performers, the government should cultivate social soil for the active development of street art, guide public appreciation of the habit of performing show-paying through public opinion, and adopt a more open and tolerant attitude towards artists; in addition, government departments should formulate detailed and transparent artist management. The rules and regulations clarify the functional boundaries of the management departments and regulate the actions of the law enforcement agencies to more targetedly improve the efficiency and level of management of Street artists.

5. CONCLUSION

This article first introduces the concept and classification of street art, and analyzes the relationship between street art and the vitality of urban public space. Then it analyzes the city's street art management in detail from four perspectives: government perspective, institutional perspective, organizational perspective, and public perspective. The experience suggests that through effective planning intervention, the existing external negative effects of street art can be reduced and their positive effects can be brought into play. Specific planning strategies include centralized and decentralized complementary spatial layout patterns, rigid and elastic combination of behavioral constraint mechanisms, organization and self-organized multi-agent intervention management and active public opinion guidance, strict law enforcement protection. It hopes to provide references for the regeneration and shaping of the vitality of urban public space in China, and provides a useful reference for the management of street artists and the healthy development of street art.

53 Getting Published / Round Table

Tue. July 17, 2018

Session 5 (11:15AM-1:00PM)

Small Meeting Room, Yokohama Information Culture Center

Moderators:

David Goldfield, Robert Lee Bailey Professor of History, UNC-Charlotte, Editor, Journal of Urban History

John R. Gold, Professor, Oxford Brookes University, United Kingdom

Margaret Gold, Senior Lecturer, London Metropolitan University, United Kingdom

The purpose of the Roundtable is to inform attendees how to publish a scholarly article in our journals and related journals. Each of us will take ten minutes to explain the mission of our journal, the editorial review process, the mechanics of “revise and resubmit,” and, most important, how to tailor the manuscript to suit the editorial criteria of the particular journal. We then open the floor for questions, and this portion of the Roundtable is often the most rewarding for the attendees. This is especially so for our junior colleagues and graduate students. It is surprising to us how little tutelage graduate students and junior faculty have had from their advisers in developing a scholarly article for publication. Our publishing Roundtables have been very well attended in the past, and we feel that word has gotten out that this is a worthwhile “nuts and bolts” session to attend.

54 What Is Happening in Contemporary Cities?

Social Inclusion or Gentrification towards Tokyo 2020; in the case of Sanya, a poor district in Tokyo

Magokoro Yoshihira (YUI Associates Inc.)

Sanya is known as a poor district in Tokyo, where day laborers congregated for construction works especially the time during mid 1950' s to 1980' s, when Japan enjoyed its high economic growth and land speculation. Although the name "Sanya" was erased from official indication of residential address, the identity – with pride and stigma – still exists in the area.

Nowadays, there are approximately 140 hostels exist in Sanya area; about 20 host tourists including businessmen and youngsters seeking for jobs and 120 accommodate mostly welfare recipients – many of them used to be day laborers. YUI Associates Inc. is a social enterprise aiming to create a socially inclusive and diverse community, Sanya. YUI runs two hostels for tourists, Hotel Meigetsu and Juyoh Hotel under hotel operating agreements with the owner. Besides, YUI manages one hostel for welfare recipients, Ariake, by renting a hostel.

YUI Associates Inc. aims for realizing social inclusion in the area through implementing the followings:

- 1) Promoting tourism in the area to cause job creation and economic revitalization in Sanya community,
- 2) Upgrading hostels for welfare recipients physically, as well as psychosocially based on the Recovery Model,
- 3) Creating ties among diverse people associated in the area to have meaningful social inclusion, and
- 4) Community development planning to realize Reappropriation of Sanya as well as avoid having unnecessary gentrification in the area.

In the presentation, recent activities 3) SANYA Cafe and 4) Community Development Plan will be explained mostly;

SANYA Cafe for diversity and social inclusion

We will open a cafe in Sanya, in the end of February, 2018; we are hoping that "SANYA Cafe" will serve as an entrance of Sanya area for everybody associated with the place. We will operate this cafe restaurant to provide meals to foreign visitors, Japanese visitors, and local residents, and also set a time frame to provide occasions for homeless individuals to take part in community activities, such as cleaning on streets in exchange of coffee and meals – as a means of realizing social inclusion of this area.

Social Inclusion or gentrification towards Tokyo 2020

Tokyo 2020 Olympics has been causing gentrification in some areas in Tokyo triggered by increase of land values and Sanya is not an exception. In meantime, facing the risk of earthquake disaster, there is a pressure for rebuilding hostels from wooden-structure to fire resistant structure as well as converting them from welfare-use to tourist oriented use. We rather propose to have seismic retrofit for wooden structured buildings for welfare-use hostels to lessen the effect of gentrification in order not to increase homeless population in the area.

Other possible solutions through urban planning methods will be discussed as well.

A Study on Urban Regeneration Policy Change in Korea

Hyunjin An (Environmental Planning Institute Seoul National University), Aeijung Song (Environmental Planning Institute Seoul National University), Hyeonyoung Park (Environmental Planning Institute Seoul National University) and Meeyoung Kim (Busan Development Institute)

Prosperity and decline are a natural phenomenon in urban growth. Therefore, all efforts to regenerate a city are not new.

After the Korean War(1950-1953), Korea had experienced rapid urbanisation from the 1960s to the 1970s, and the redevelopment projects based on the 'Urban Redevelopment Act' started in 1976. Maintenance projects have begun in 2002 with the enforcement of the 'Act on the Maintenance and Improvement of Urban Areas and Dwelling Conditions for Residents(Urban Maintenance and Improvement Act)', however, and the 'Urban Redevelopment Act' had lost its power. In 2012, the Urban Maintenance and Improvement Act was revised and the 'Special Act on Promotion and Support for Urban Regeneration' was enacted in 2013. According to those legal changes, restoration and sustainability have become the critical part for maintenance cities. Particularly the policy of 'Urban Regeneration New Deal(New Deal Policy)' of Moon Jae-in' s administration emphasised empowerment of local governments and communities participation. 50 trillion won will be invested in New Deal Policy for 5 years from 2018 and this is an unprecedented public investment. But the most important thing is that Korea have experienced compressed policy changes on urban regeneration over a short period of time.

What leads to rapid policy changes? This study suggests an analysis framework that compensated for the theoretical limits of Hogwood and Peters. Furthermore this study analysed Korea' s urban regeneration policies since the 1970s in terms of the content change(targets, special scales, and project types) and the process change(development methods, agents, and citizen participation)

As a result, this study shows that the urban regeneration policy of Korea is changing dynamically due to the combination of defects of the existing system and domestic and foreign socio-economic factors. Particularly Korea' s policy changes on urban regeneration for about 20 years are almost like what the Western cities have experienced for more than half a century.

It is significant that this study created historical records on urban regeneration policies in Korea. This approach suggests policy implications for cities that have similar processes in urban growth to Korea. We hope that this research is able to provide a steppingstone.

Nature of the city, nature within city: a few perspectives on the forms of nature.

Mireille Tchapi (National School of architecture of Strasbourg)

Urban nature is facing social and ecological challenges to target the sustainable ideal, in which nature would associate the idea of human and ecological well-being. Worldwide, are increasing the citizen ecological awareness and their participation to the shaping of urban greening, portraying nature as a powerful instrument for the regeneration or the planning of qualitative public space in urban neighbourhoods. It is the emergence of a sensitive relationship toward landscape, in which nature became a key mediator on the individual and social search for local meaning and sense of place. In the globalizing context of megacities, this relationship is extended from the urban neighbourhood to the regional scale.

Since its independence, Singapore successfully went through the tremendous challenge of accommodating its citizen in decent and affordable housing. The increase of public housing number has been the opportunity in parallel to challenge the neighbourhood landscape for more than 50 years, from monotonous typologies inherited from the two first generations of public housing neighbourhoods, toward the implementation of new prototypes more recently. In the city-state nature became a national emblem by serving both a political vision and economic interests.

The “technicizing” of nature through the prism of innovation questions its intrinsic value. Nature enslaved? Within urban contexts, the perception of nature is denatured. Whether planned or fortuitous, nature has various appearances ranging from highly manicured to informal or even “wild” forms, which reflect its socio-cultural level of acceptance and understanding.

This article will present an historical overview of the landscape typologies in the public housing of Singapore, proclaimed garden city by the former Prime Minister Lee Kuan Yew. On the new environmental paradigm spectrum, it will depict and question the evolving status of nature within public housing neighbourhoods, which is the object of diverse experimentations of the landscape of the public space, from the vertical green to the biophilic city ideal.

Balancing Environment, Economy and Equity: planning initiatives in three cities in Brazil, Mongolia and India

Swati Ramanathan (Jana Group) and Vidhu Gandhi (Extent Heritage Advisors)

By 2050, 66 per cent of the world’s population will be living in urban areas, with approximately 90 per cent of this increase occurring across Africa and Asia. While urbanisation is proving to be rewarding in terms of providing access to employment and infrastructure, its rapid pace is equally challenging to deal with as poverty, urban sprawl and environmental degradation are some outcomes of urban life that far outweigh the positives. Most often noticeable in developing countries is a trend of disproportionate distribution of population across urban areas, which in most cases has led to huge pressures on land, infrastructure, environment and economy(s) of cities. This paper seeks to examine the role of urban planning and the integration of current concerns of environment, economy and equity into master planning of three cities, on the basis that master plans can be more effective in enabling the sustainable growth of cities. The master plans of three cities – Sawai Madhopur in India, Curitiba in Brazil and Ulaanbaatar in Mongolia, are discussed in this paper with the intention of examining how these cities have dealt with rapid urbanisation and economic growth by employing master planning initiatives that seek to protect the environment, while allowing for sustainable growth in terms of the city’s landuse and its infrastructure.

A Study on Urban Regeneration Policy Change in Korea

Hyunjin, An*, Aeijung, Song**, Hyeonyong, Park***, Meeyoung, Kim****

After the physical redevelopment and reconstruction in the late 1970s, the paradigm on urban regeneration in Korea shifted from maintenance to restoration and sustainability. This study highlighted that those changes occurred rapidly and not gradually over a short period of time. This study researched diachronic changes on urban regeneration policies after the 1970s in Korea using an analysing model that compensated for the theoretical limits of Hogwood and Peters. The limitations of former policies and internal and external socio-economic factors are shown to have affected dynamic policy changes. This study's academic significance is that it suggests policy implications for cities that have similar urban growth processes to Korea.

Keywords: urban regeneration, policy change, urban regeneration paradigm, Korea's urban regeneration policy

Introduction

Globally, cities are undergoing a paradigm shift from urban development to urban regeneration. This is because prolonged low growth rates and persistent population stagnation has limited urban growth. Additionally, the decline of inner city populations, the change of the industrial structure, and the deterioration of housing are accelerating.

In Korea, after the 'Special Act on Promotion of and Support for Urban Regeneration (Urban Regeneration Act)' was enacted in 2013, urban regeneration projects are being actively pursued nationwide. As Moon Jae-in took over the government in 2017, Korea's urban regeneration policy faced a period of great change. Moon Jae-in announced the government task of the 'Urban Regeneration New Deal' policy, a large-scale public project to invest 50 trillion won for five years in 500 depressed areas nationwide. It differs from the previous policy in terms of content, such as inducing and supporting the expansion of private participation and strengthening local governments' executive power.

Korea's urban regeneration policies date back to the 1970s. In the 1960s and 1970s, indiscriminate urban development was inevitable in the process of rapid economic growth and urbanisation. Disorderless urban regeneration and ageing housing redevelopment became major tasks of the urban administration.¹ Korea's urban regeneration policy has since changed according to the nucleus environment.

This paper analyses the changing process of urban regeneration policy and the cause of policy change in Korea since the 1970s. Since this is a case study limited to Korea, there is a limit to the general theorisation of changes and development of urban regeneration policy. Nevertheless, it is a meaningful diachronic study that comprehensively analyses Korea's urban regeneration policy changes. The experiences of Korean urban regeneration have implications for the urban management of third world cities.

Theoretical Background and Analysis Framework

1. Theoretical Background

¹ Kim, Kwang-joong & Yoon, Il-Sung. "Urban Renewal and Change of the 20th Century Seoul", in The Seoul Development Institute, *Seoul, Twentieth Century: Growth & Change of the Last 100 Years*, Seoul: Seoul Development Institute(2001).

Policy change is not a singular process but happens continuously, a universal rather than exceptional phenomenon. The environment surrounding policy is constantly changing, and changes in policy objectives, direction, means, and strategies are inevitable. The policy environment includes social, economic, and political backgrounds, the nature of the policy target group, the characteristics of the policy-making body, and the interest of the general public.²

What does policy change mean specifically? Policy consists of goals, means to achieve them, and ancillary devices to ensure the policy's realisation.³ If the structure is transformed into practical and empirical standards, it can be divided into ① policy contents and ② policy process. The policy content change is a change of the major constituent elements of policy; the goals and policy content are not changed but policy procedures are changed.⁴ Generally, policy changes are based on the degree of policy change, except when the degree of change is zero. The modification or termination of the policy and all the changes occurring in the enforcement phase are included in policy changes.

Policy change is classified into four types.⁵ First, policy innovation means that the government decides on a new policy that has not yet been implemented. This refers to completely renewing a policy without an existing organisation, law, or budget. Policy innovation is the intentional intervention of governments in new fields.

Second, policy succession is the modification and adjustment of existing policies. This is policy replacement that changes policy contents to something new within the scope of the unchanging policy objective, and includes the partial termination of policies. Third, policy maintenance refers to revising detailed program adjustments and legislative amendments while maintaining macro policy objectives. Fourth, policy termination intentionally suspends a policy and does not determine other replacement policies.

Hogwood and Peters' research has some limitations. First, the criteria for distinguishing policy types are unclear. For example, if the existing characteristics of an existing policy remain unchanged, the policy's maintenance and the change or substitution of the basic characteristics is referred to as policy succession, but no standard is provided. Although based on organisational change, change in legislation, and budgetary provisions as indicators of policy change, it is difficult to distinguish the type of policy change on this basis alone. Policy change does not necessarily lead to organisational change, and mechanically limits the link between law and policy.

2. Analysis Framework

This study investigates the changes in urban regeneration policies and the causes of policy changes in Korea. We present an analytical framework that complements the limitations of Hogwood and Peters' theory. The degree of policy change is used as a criterion to distinguish the type of policy change. It is used to grasp the degree of change of the book from 0 to 1 on a continuous line, thereby flexibly applying the actual situation. If the degree of change is 'zero', it is desirable to exclude it in the policy change as an unchanged state in which no policy change occurs. When the degree of change is 'one', there can be three types of policy change: ① policy innovation, ② policy termination, and ③ policy cancellation.

This study suggests that Korea's urban regeneration policy has continued the process of partial policy change since the 1970s. The partial change in degree of change between 0 and 1 is largely typified by ① a content change and ② a process change. The content change is mainly related to what is done (targets, spatial scales, and project types), and the process change is related to how to do it (development methods, agents, and citizen participation). By reviewing the changes in the policy environment that brought about such policy changes, we can understand the causes of the changes in Korea's urban regeneration policy, the various socio-economic needs at the time of policy change, and the change of the political power group that determines the establishment or implementation of policies.

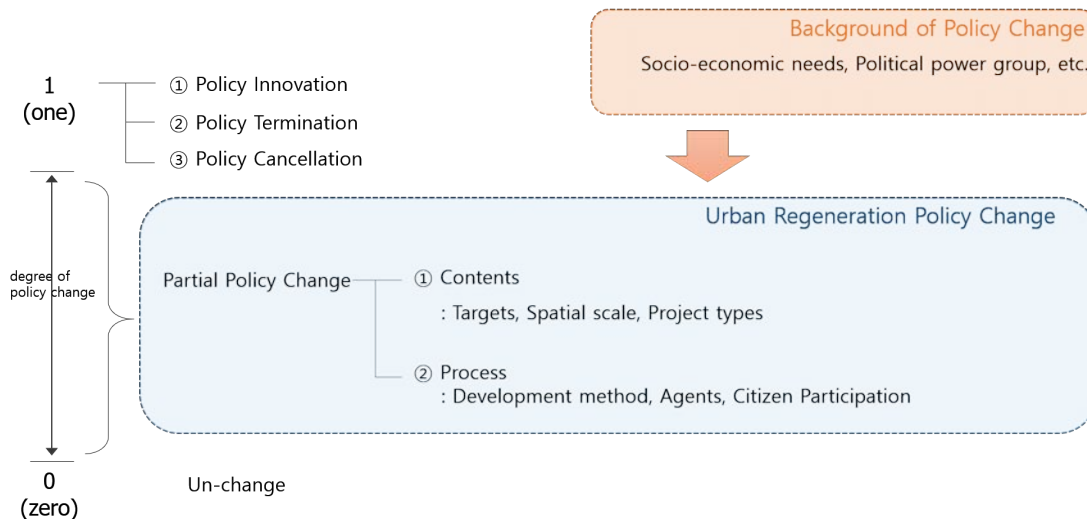

Figure 1 : Analysis Framework

The History of Korea's Urban Regeneration Policy

The history of Korea's urban regeneration policy can be divided into three periods. From the 1970s to the 1990s, large-scale clearance projects were carried out because of the rapid urban growth after the Korean War. In the 2000s, the strategy focused on the maintenance and management of cities, and the regeneration and sustainability of cities was emphasised in the early 2010s.

After the Korean War (1950~1953), urbanisation rapidly occurred in the 1960s and 1970s. With the enactment of the 'Urban Redevelopment Act' in 1976, Korea started 20 years of large-scale clearance projects. However, this led to conflicts among residents and to the dissolution of the existing community. This strategy also ignored socio-economic and local deterioration issues. The view of urban regeneration changed from redevelopment and reconstruction to maintenance and management in the 2000s.

In 2002, the 'Act on the Maintenance and Improvement of Urban Areas and Dwelling Conditions for Residents (Urban Maintenance and Improvement Act)' was enacted. This law considered the quality of housing and improvements to the physical environment. However, changes in socio-economic conditions such as the financial crisis and the real estate market depression forced the introduction of projects that assured stability. The 'Urban Maintenance and Improvement Act' was revised to emphasise small-scale projects and the participation of local residents. This law was revised and only three project types are currently being developed.

In 2005, Seoul's New Town project was promoted to improve poor housing conditions and enhance infrastructure, and the 'Special Act on the Promotion of Urban Renewal (New Town Act)' was enacted. This project was carried out based on the neighbourhood unit, but it still advanced clearance.

With the enactment of the 'Urban Regeneration Act', 'regeneration' was applied to the legal name. This law stressed that residents should be the main agents of projects. This overcame the superficial and procedural limits of the past and also noted the causes and aspects of decline in different regions. The Korean government forged ahead with leading projects in 13 areas nationwide in 2013 to induce the effects of urban regeneration projects and ended these efforts in 2017. In 2016, 33 general urban regeneration projects were started that will be completed by 2021. The National Basic Policy for Urban Regeneration created by the Ministry of Land, Infrastructure, and Transport divided urban policy into three stages: introduction (2014–2017), growth (2018–2021), and maturity (after 2022). In the introduction stage, urban regeneration projects were carried out by the central government to create a successful model by providing and supporting leading projects. In the stages of growth and maturity, projects are designed by local governments. This is because it is necessary to establish and provide a system of financial resources and agents since local governments lack the necessary knowledge and experience.

In 2017, Moon Jae-in's administration officially announced the promotion of the 'Urban Regeneration New Deal'. The New Deal Policy differs from the past in that it emphasises sustainable urban innovation led by local governments and communities. In December 2017, 68 pilot projects were selected, and 100 projects will be carried out in 2018.

Analysis on the Change of Urban Regeneration Policies in Korea

1. Content Changes

1) Target

The target of urban regeneration policy in Korea has been expanded. When the policy was introduced in the early 1970s under the name of urban redevelopment, Korea had to rebuild after the Korean War. Due to the explosive post-war population growth, urban areas were forming indiscriminately, and many unauthorised buildings were built. The country also lacked housing and commercial and business facilities for population and urban growth. The initial urban redevelopment policy was aimed at improving poor buildings and providing housing and offices⁶. Naturally, the ageing physical environment became the policy's target.

Korea's redevelopment policy, which focused only on improving the physical environment, has had negative effects. It was only concerned with the removal of poor housing, and there was insufficient consideration of the low-income inhabitants. Tenants and low-income homeowners were driven out of their homes due to the demolition. Since 1986, tenant regulations have been added to provide immigration subsidies and pre-sale rights⁷. However, this is insufficient to solve the housing problems of tenants and low-income families. After redevelopment projects, the resettlement ratio was only about 10%.⁸ Continuous policy restructuring has taken place, such as the construction of rental housing and the mandatory construction of housing below the size of national housing for low-income people.

In the early 2000s, the imbalance in urban areas emerged as an important buzzword. The Seoul Metropolitan Government tried to solve the unbalanced development of Gangnam/Gangbuk in Seoul with the New Town policy. This led to the enactment of the 'New Town Act', and the urban renewal promotion project became a representative rehabilitation project in Korea. Through improving the poor areas, Korea wanted to achieve balanced urban development.

The urban economic area was outside the scope of the Korean urban regeneration policy. Due to the decline of the first and second industries, the decline of jobs due to low growth and the shift of the industrial system, and the increase in the unemployment rate, the urban economic area has become the main object of urban regeneration policy. Therefore, an economy-based regeneration type was added to the 'Urban Regeneration Act'. According to the detailed criteria for the 'Urban Regeneration Activation Area' in the 'Urban Regeneration Act', the project target is as follows: areas where the population and the total number of businesses have decreased, and where the residential environment has deteriorated. Social, economic, and physical environmental issues have all been targeted by the policy in the form of legislation.

2) Spatial Scale

The spatial scale covered by the urban regeneration policy has fluctuated. When the policy was implemented by the early 'Urban Redevelopment Act', the project was carried out individually in local units without any specific regulations on area. When the 'Urban Maintenance and Improvement Act' was enacted, the minimum unit was specified for each project. The urban environment maintenance project did not have an area regulation, but in the case of the residential environment improvement project and the housing redevelopment project, an area of 2,000 m² or more, or more than 50 households, was designated. For housing reconstruction projects, 300 households, more than 300 residential areas, or an area of 10,000 m² or more were designated as project districts. These regulations have been removed or decreased over time, but most have been maintained.

In 2005, as the 'New Town Act' was being enacted, the scope of the policy area was expanded. The urban redevelopment project was not developed in a planned way and urban infrastructure such as roads, schools, and parks was not sufficiently installed. Therefore, it is necessary to designate a district for the new town project that

⁶ The Seoul Development Institute, Seoul, *Twentieth Century: Growth & Change of the Last 100 Years* (Seoul: The Seoul Development Institute, 2001):559.

⁷ Ibid, 575-576.

⁸ The Seoul Institute, *Key Issues and Improvements of New Town Project In Seoul*(Seoul: The Seoul Development Institute, 2008): 72.

integrates several redevelopment projects. The district for the new town project was as large as 500,000 m² or more for residential terrain.

As the urban regeneration of Seoul commenced in 2012, the scale of the policy shifted back to a smaller scale. This was because of criticism of large-scale maintenance projects such as the difficulties involved in project promotion and concerns over the destruction of local characteristics due to large-scale demolition and redevelopment. With the 2012 amendment of the ‘Urban Maintenance and Improvement Act’, a ‘block-unit housing rearrangement project’, a construction project for street houses in areas of less than 10,000 m², was newly established. In the 2013 ‘Urban Regeneration Act’, there is no specific area regulation; ‘The Special Act for the Maintenance of Empty Housing and Small-Scale Housing’ was enacted in 2017 and implemented from 2018 onwards.

3) Project Types

Housing redevelopment, reconstruction, urban environment maintenance and residential environment improvement projects under separate laws were integrated into the ‘Urban Maintenance and Improvement Act’ in 2002. From 1990 to 2008, 47,000 out of 89,000 housing units were provided as the public rental housing through the maintenance and improvement projects. Moreover, 19% and 13.3% of the infrastructure facilities in the Seoul redevelopment and reconstruction districts were expanded.⁹

In 2012, residential environment maintenance projects and block-unit housing rearrangement projects were added. The strategy was changed to focus on the maintenance and management of the residential environment by considering the quality of the housing environment beyond the limits of the physical project. This law was amended in February 2018, and housing redevelopment and reconstruction and residential environment improvement projects are now being processed. Since the ‘Urban Maintenance and Improvement Act’ had a complex legal system, the project types needed to be simplified in 2017.

It was strategically highlighted that the pattern and cause of the decline varied according to the region after the enactment of the ‘Urban Regeneration Act’ in 2013. Project types were divided into ‘economy-based’ and ‘neighbourhood-based’ regeneration, and 13 areas that urgently required urban regeneration and have high ripple effects were designated as priority areas. Urban regeneration projects were put into place in 33 regions in 2016 and are expected to be completed by 2021.

In 2017, Moon Jae-in’s administration launched the New Deal Policy under the determination that residents should lead urban regeneration projects to ensure lasting urban regeneration policy effects. It emphasised small neighbourhood restorations and expanded the project types. The amount of government financial support varied depending on the type of project, and 68 pilot projects were designated in December of 2017.

Project types have also changed in response to systematic changes, such as expansion, integration, and transfer. Although the ‘Urban Maintenance and Improvement Act’ recently simplified the types of projects, the ‘Urban Regeneration Act’ project still contains some confusion with regard to type classifications. In the past, the project in question changed large-scale physical projects to small-scale neighbourhood regeneration projects. This project will be carried out under the initiative of residents to activate and restore communities.

2. Process Changes

1) Development Method

Past Korean regeneration methods mostly took the form of clearance. As a way of redevelopment, the ‘joint redevelopment method’ was implemented in 1983. It aimed to provide land to local governments and landowners rather than having to pay for it, and the builders would charge the costs required to complete the buildings from demolition to fixing the faulty housing. The landowners found new houses in return for providing their faulty housing, while the builders took on the costs and profits from selling these houses. After 1984, this method was applied to almost all housing redevelopment projects.

⁹ Korea Planning Association & Korea Housing Institute, *the Seminar for Basic Policy on the Maintenance and Improvement of Urban Areas and Dwelling Conditions for Residents*, 2013.

In clearance-led redevelopment, the public maintains residential areas without having to provide much assistance, and it has produced many achievements. However, local communities have collapsed, indigenous people have found it difficult to resettle, and it could not be applied in small and medium cities where business demands were low or in areas requiring small renovations.

Areas were regenerated after the 2000s to overcome the limitations of maintenance and management paradigms, such as conservation, improvement, and rehabilitation. The revised 'Urban Maintenance and Improvement Act' of 2012 reflects these changes. Under that amendment, the residential environment management project was created. This project can be carried out in areas where it is necessary to improve the residential environment, but where it is difficult to remove the entire structure. With this method, the public needed to improve the infrastructure of densely populated ageing residential areas, such as single and multiplex houses, and residents could manage and improve their own houses. The block-unit housing rearrangement project led to gradual and sustainable regeneration in areas where street conditions were relatively good by maintaining the existing urban organisation and landscape, while allowing for small improvements in the residential environment.

This paradigm shift was also applied to projects that were carried out after the enactment of the 'Urban Regeneration Act', such as in priority and general areas of urban regeneration projects and pilot projects of the New Deal Policy. Those projects' purpose was also improved beyond the housing and residential environment improvements such as community revitalisation and restoration, housing welfare, social cohesion, and job creation.

2) Agents

Various agents participated in the regeneration of related policies in Korea. Regeneration policies, while seeking public interest, also affect private property. It is reasonable to expect agents to play different roles in the public and private sectors¹⁰.

At the beginning of the enactment of the 'Urban Redevelopment Act' in 1976, the public sector, especially the national government, designated the project area. Since the mid-1990s, when local governments were in control of project planning and designating areas for regeneration, the role of the national government has been reduced.

In 2002, the 'Urban Maintenance and Improvement Act' established local governments' comprehensive plans. In 2005, the 'New Town Act' expanded the project scale into super blocks to facilitate efficient housing supply and infrastructure construction. Despite these laws, the public's role was confined to suggesting guidelines, designating project districts, and approving projects.

After launching a joint redevelopment method in the 1980s, the actual projects had been focused on the redevelopment or reconstruction methods of property-owner associations, a private sector. These owner-driven projects caused conflict with residents¹¹. Only the project's profitability was considered rather than public interests, and small landlords or tenants were not taken into consideration, problematizing the resettlement of residents.

Since the 2008 global financial crisis, the profitability of redevelopment projects greatly deteriorated due to external factors. Private-led projects no longer worked. In 2012 the 'Urban Maintenance and Improvement Act' was revised. The revision strengthened the public's role by introducing new public-led methods, expanding financial support, coordinating with existing plans, and encouraging residents' participation. Establishing the 'National Basic Policy' strengthened the role of the national government. This resulted in strengthened support for bottom-up proposals, rather than public top-down regulations, and reinforced the role of the public in supporting and facilitating projects.

In 2013, the 'Urban Regeneration Act' was enacted and reflects the great transformation in the urban planning paradigm. This law seeks to restore the physical environment and to preserve socioeconomic values¹². It includes public support for communities to solve their own problems through urban regeneration projects. The new law can establish 'Urban Regeneration Support Centres(URSC)' which are middle-support organisations that strengthen the linkage between the public and the private. It supports communities in running projects to solve their own problems with the use of public finance. Until recently, it was difficult to find communities with sufficient abilities to run self-renewal projects and the public could not easily support the community in terms of efficiency and ties

with the field. It is a 'third sector', not a private sector or a public entity and its role in the success of urban regeneration will be strengthened in the future¹³. The number of URSCs has been increased since 2013, and there are 77 centres in 2017¹⁴.

3) Citizen Participation

Citizen participation is increasing in Korea's urban regeneration policy changing process. In the urban regeneration policy, devices for 'citizen participation' have been applied in a variety of ways: 'allowing residents to browse administrative documents', 'holding public hearings', 'obtaining residents' consent', and 'organising a community council'¹⁵. Through an analysis of these factors in accordance with Arnstein's (1969)¹⁶ 'Ladder of Citizen Participation' theory, the changes in the level of participation in urban regeneration in Korea will be explained.

The 1976 'Urban Redevelopment Act' allows residents to view documents related to redevelopment projects and requests residents' consent for project implementation. However, 'residents' only referred to property owners who only consider their property rights without considering the impact on those around them. Actual inhabitants were not sufficiently considered, and the resettlement rate of residents after the project was less than 20%.

The revised 'Urban Redevelopment Act' of 1995 required local governments to establish a 'Maintenance and Improvement Comprehensive Plan' and hold a public hearing as part of the proposal. The 2003 'Urban Maintenance and Improvement Act' strengthened the consideration of tenants in the 2005 revision. For some projects, the tenant's consent was included in the project execution conditions. However, the effect was negligible because the number of projects requiring tenant consideration was low in the total number of regeneration projects. Until the late 2000s, the factors of 'administrative document disclosure', 'public hearings', and 'residents' consent' amounted to mere 'tokenism' to meet the legal requirements for project implementation¹⁷.

The expansion of citizen participation was an important issue in the amended 'Urban Maintenance and Improvement Act' of 2012. After the global financial crisis, as large-scale redevelopment projects became more difficult, the amended law allowed residents to request zoning cancellation. By introducing the citizen participation-type methodology, the 'urban environment maintenance project' and the 'block-unit housing rearrangement project', residents could participate in urban regeneration projects. With the 2013 enactment of the 'Urban Regeneration Act', resident-led small-scale rehabilitation projects became possible. This strengthened the capacity of the people by supporting public-private partnerships and raised the citizen participation level to 'Citizen Power'. Although it has only been five years since the beginning of the 'Citizen Power' phase, small-scale projects led by 'resident councils' and the excavation of 'the third sector' are rapidly expanding¹⁸.

Figure 2: Urban Regeneration Policy Change in South Korea 1976~2018

3. Discussion

Policy changes related to Korean urban regeneration have occurred in stages that complemented previous systems and considered changes in socioeconomic conditions. Previous policies' cumulative adverse effects confirmed that existing policies lost their purpose and major changes occurred when the socioeconomic context was rapidly changing. In the late 1970s, the 'Urban Redevelopment Act' put a policy in place to provide space for housing and offices. In the 1990s, when the existing system was unable to show its strength due to conflicts between stakeholders and the pursuit of lasting good interests in the process of the redevelopment project for the past 20 years, the government established the 'Urban Maintenance and Improvement Act' in 2003. It stipulated spatial scales, project types, and the role of stakeholders. As unbalanced growth emerged as a social problem, the 2005 'New Town Act' was introduced to develop relatively low-growth areas into rehabilitation projects.

During the designation of the maintenance district by the 'New Town Act' and the scale of the enlargement, the existing urban development mechanism became inoperable due to the 2008 global financial crisis¹⁹. The sluggish maintenance project caused both urban and national competitive decline. The 2012 amendment of the 'Urban Maintenance and Improvement Act' and the 2013 'Urban Regeneration Act' reorganised the relevant policies. The transformation of urban regeneration policy was based on economic conditions, the response to the low growth era, and the growing demand for public services due to the growth of civil society. The related decline in population and urban industry became regeneration targets, and urban regeneration policy became an integrated policy dealing with the physical, social, and economic environment. The scale of the urban regeneration project was reduced and the project was flexibly promoted. Public and private roles were simultaneously strengthened, but the public role played a service (support) role to the private sector. A new entrant, 'the third sector', strengthened residents' participation and the governance of urban regeneration policy.

Policy changes are also related to changes in the political environment surrounding the policy²⁰, as is true for the Korean urban regeneration policy. Before 2012, policy makers tried to drive development through large-scale development projects. However, in 2011, with the election of a progressive civil society-based mayor in Seoul, the policy changed from being place-based to people-based²¹. Small-scale maintenance and citizen participation have become important policy factors. The capital's policy change affected all of Korea. As the Moon Jae-in government, whose own policies are in line with the policy trend in Seoul, took office in 2017, the 'Urban Regeneration New Deal' became the country's main policy.

Conclusion

This study attempted to explain urban regeneration policy changes and their causes in Korea. Since the 1970s, Korea's urban regeneration policy has undergone 'partial change'. This can be divided into 'contents' and 'processes'. By examining the 'contents change' of the policy, policy targets were expanded and the types and sizes of the projects varied. In terms of 'process change', the regeneration methodology was diversified, 'the third sector' was added to the 'public' and 'private' divisions, and citizen participation increased.

This study shows that the Korean urban regeneration policy is changing dynamically due to the combination of the existing system's defects and domestic and foreign socio-economic factors. The changes were rapid and a result of ground-breaking work. From the introduction of the 'comprehensive maintenance and improvement planning system' in the late 1990s to the 'national government's' 'New Deal' initiated in recent decades, policy changes in Korea took the form of a compressed process. In 20 years, Korea underwent 'the urban regeneration paradigm shift' that Western cities have experienced for over 50 years.

Particularly, this study shows that Korea's urban regeneration policy has been lack of socio-economic consideration and a comprehensive policy is needed. Urban regeneration policy should work with housing welfare policy for the low-income and the former residents. Now, Korea's 'New Deal for Urban Regeneration' includes the public rental housing. Korea's experience will provide implications for the urban maintenance and management of third world cities, which are in a similar developmental process to that of Korea in the past.

Balancing Environment, Economy and Equity: planning initiatives in three cities in Brazil, Mongolia and India

Swati Ramanathan (*Co-founder, Jana Group, India, swati.ramanathan@janagroup.org*); and Vidhu Gandhi, (*Senior Heritage Advisor, Extent Heritage, Australia, vidhugandhi@gmail.com*)

By 2050, 66 per cent of the world's population will be living in urban areas, with approximately 90 per cent of this increase occurring across Africa and Asia. While urbanisation is proving to be rewarding in terms of providing access to employment and infrastructure, its rapid pace is equally challenging to deal with as poverty, urban sprawl and environmental degradation are some outcomes of urban life that far outweigh the positives. Most often noticeable in developing countries is a trend of disproportionate distribution of population across urban areas, which in most cases has led to huge pressures on land, infrastructure, environment and economy(s) of cities. This paper seeks to examine the role of urban planning and the integration of current concerns of environment, economy and equity into master planning of three cities, on the basis that master plans can be more effective in enabling the sustainable growth of cities. The master plans of three cities – Sawai Madhopur in India, Curitiba in Brazil and Ulaanbaatar in Mongolia, are discussed in this paper with the intention of examining how these cities have dealt with rapid urbanisation and economic growth by employing master planning initiatives that seek to protect the environment, while allowing for sustainable growth in terms of the city's land use and its infrastructure.

Keywords: urban planning, sustainable urbanisation, environment, economy, equity

Introduction

Urbanisation has been increasing at a tremendous rate – in 2016, 54.5 per cent of the world's population lived in urban settlements, and by 2050 this number is expected to rise to 66 per cent. Approximately 90 per cent of urbanisation will occur in Africa and Asia up until 2050.¹ While urban areas provide greater opportunities in terms of education, health, social services, livelihood and employment, stress on existing city infrastructure along with disparities in access to public services and utilities, has resulted in fast growing urban areas often being marked by poverty, urban sprawl, pollution, and environmental degradation. This paper seeks to examine the role of urban planning in cities in developing countries, with a focus on the integration of current concerns of environment, economy and equity into master planning of cities, on the basis that master plans can be more effective in enabling the sustainable growth of cities.

Master planning or modernist urban planning as we know it today, has its origins in 19th century Western European planning and the values espoused by developed countries. Its spread through the rest of the world has occurred through “processes of colonialism, market expansion and intellectual exchange”, and through the influence of “professional bodies and international and development agencies”.² It is now widely acknowledged that the colonising imperative of ‘modernizing and civilizing’ was seen reflected in urban planning systems which sought to control urbanization processes and urbanizing populations. The legacy of modernist urban planning systems has persisted in many regions of the world, especially in developing countries like India where the “early 20th-century idea of master planning and land-use zoning, used together to promote modernist urban environments” continues to be employed.³ The result is a planning system which,

...fails to accommodate the way of life of the majority of inhabitants in rapidly growing, and largely poor and informal cities, and thus directly contributes to social and spatial marginalization or exclusion...fails to take into account the important challenges of 21st-century cities...fails to acknowledge the need to involve communities and other stakeholders in the planning and management of urban areas.⁴

In growing recognition of these issues there is a move towards urban planning initiatives which seek to make cities inclusive, safe, resilient and sustainable – this is also the basis of one of the goals of the *17 Sustainable Development Goals* (SDG) of the *2030 Agenda for Sustainable Development*.⁵ SDG 11 seeks to “enhance inclusive and sustainable urbanization and capacity for participatory, integrated and sustainable human settlement planning and management in all countries”.⁶ In fact, this is accentuated by the very idea of a sustainable city, as

achieving sustainability in an urban context requires balancing the often-competing demands of economy, environment and equity, such that “development, property and resource discourses” have equal and adequate representation in strategies that seek to make the city “more profitable, fairer and greener” for stakeholders, developers and administrators.⁷

The methodology adopted for this paper accordingly employs these three intersecting concerns of economy, environment and equity to examine the master plans of Curitiba in Brazil, Ulaanbaatar in Mongolia and Sawai Madhopur in India. These three lenses have been chosen as they broadly cover the challenges being faced by each of these cities – Ulaanbaatar’s nomadic heritage and environmentally sensitive natural environment; Sawai Madhopur’s historic city centre and environmentally sensitive natural reserve; and Curitiba’s highly applauded public transport system – each provide existing conditions of environment or equity that needs to be integrated with much needed economic growth and accompanying development. While the paper is limited in terms of a detailed examination of each of these cities, the aim is to present cases where master planning has been relatively successfully employed to provide guidelines for the development of a sustainable city.

Brazil’s ecological city – Curitiba

Curitiba recognised as one of the most sustainable cities in the world, is equally known for its master plan which has sought to integrate economy and environment into the development of the city as it faced unprecedented growth in its population in the late 1960s and early 1970s. With a current population of 1.8 million, Curitiba is Brazil’s eighth most populous city, and has a “higher per capita GDP and a lower unemployment rate than the Brazilian national average, as well as 55m² of green space per resident compared to the World Health Organization’s recommended area of 16m² per resident”.⁸ Its planning which is an economic strategy for the region has involved the following three aspects – identifying and building industry networks in the region and the country; investing in the city’s transportation; and establishing and building in the physical environment of the city and its surroundings.⁹ Four industries have been identified as being critical to the growth of Curitiba: the automotive – Curitiba being the second largest manufacturer in Brazil; communications software & information technology – second largest concentration of IT companies in Brazil; infrastructure – investments in transportation systems in and out of the city have enabled the growth of businesses in the region; and tourism – including business and leisure travellers.

Investment in the city’s transport has been one of the primary driving forces behind Curitiba’s planning – the attention to transport since 1934 saw the city’s roads being restructured into a radial system. This was subsequently replaced by a system of liner growth with the 1966 Master Plan that sought to streamline public transport and infrastructure, accompanied by appropriate zoning regulations. The objectives of the Master Plan included “strict controls on urban sprawl, a reduction of traffic in the downtown area, preservation of Curitiba’s historical sector, and building a convenient and affordable public transport system based on express buses”.¹⁰ This has resulted in a city which has limited growth in its historic centre, thereby ensuring its continued conservation, while having simultaneously encouraged commercial activities along five transport axes radiating out from the city centre.¹¹ Transport was therefore employed successfully to generate spatial growth. Critical to the provision of transportation was the idea of providing accessible and affordable public infrastructure, and this promoted the establishment of the Bus Rapid Transport system for the city and its surrounds.

Perhaps the most impressive aspect of Curitiba’s Master Plan has been the attention to sustainability and the environment since the 1970s – with early initiatives such as reservation of river and wooded areas, the city now has over 28 parks and wooded areas. The city has over 52sqm of green space per person as compared to 1970 when there was less than 1sqm per person. This has been made possible by the efforts of the city authorities and its residents who have played an equal and critical role in planting 1.5 million trees along streets and partaking in the creation of parks at neighbourhood levels – often from abandoned dumps and quarries.¹² Other environmentally sensitive initiatives have included the successful “garbage that’s not garbage” program that was started in 1980 to cater to the recycling needs of the city.¹³ An affordable alternative was floated by the government as it encouraged residents to sort their own garbage into organic and inorganic categories and has resulted in over 70% of the city’s trash being recycled by its residents.¹⁴ The establishment of the Free Open University for the Environment in 1991, which offers courses on environmental management and protection is another incentive developed to incentivise people to partake in the protection of their physical environment.

Ulaanbaatar: a smart city with Nomadic heritage

The Ulaanbaatar 2030 Master Plan for the capital city of Mongolia is a bold initiative that seeks to ensure the development of a city that is set in a unique geographical location with an equally unique nomadic heritage, and the need to meet demands of a globally competitive and technologically advanced world. The Master Plan for the

city has been prepared as a result of the increasing population which the Ulaanbaatar Capital Region – comprising of Ulaanbaatar city and a number of regional towns – has faced in recent years with migration from the surrounding provinces within the country. Currently standing at 1.38 million (2015) the population of the Ulaanbaata capital region is expected to grow to 1.76 million by 2030, forming 50.3% of the country's population.¹⁵ While the concentration of the population is largely within the boundaries of the city, the Master Plan aims to develop ten regional towns and three satellite cities within the Capital Region so as to encourage the establishment and growth of local industry and agriculture in the vicinity of the city, while ensuring that smaller settlements in the area are sustained.

Ulaanbaatar's history can be traced back to its establishment in 1639 as a nomadic Buddhist monastic centre. However, it has been the recent shift of Mongolia to a democracy and a market economy, from a formerly socialist nation, which has brought forth the need for sustainable development in the city and its surrounding areas. This transition that occurred in the 1990s, combined with a series of severe winters, resulted in large migration of many low-income families from the countryside into the city, causing issues of overcrowding, diseases, pollution of air, water, and other natural resources.¹⁶ This influx of Mongolians from other parts of the country into Ulaanbaatar continues as the city generates more than 60 percent of Mongolia's gross domestic product (GDP) and accounts for 50 percent of the total investment in the country.¹⁷ While urban planning has been in place in Mongolia since the 1950s when it was a socialist regime with Soviet-style urban planning, it has not been until 2000 – ten years after Mongolia democracy was established – that urban planning has been re-established in the county.¹⁸ The 2020 Master Plan precedes the existing one and was reworked on the basis that it lacked legislative backing in terms of implementation.

The 2030 Master Plan seeks to build on the existing city of Ulaanbaatar which was largely established between 1950s and 1980s under the Soviet-urban planning system.¹⁹ The city central area, residential blocks and districts in the inner-city areas, and apartment complexes in the areas surrounding the city, were established in the pre-democracy time period. This concentration of city central areas with centralized activities and services is being changed by the new Master Plan, as a multi-centric city model with decentralised government services, businesses and banking services is proposed to increase efficiency, reduce congestion and pollution. It includes a four-tier system of centres including two city centres, six sub-city centres, and neighbourhood based district centres and community centres. Land use zoning will also be introduced to plan and regulate new development in the city.²⁰ However, the most critical aspect of the 2030 Master Plan is that it recognises that Ulaanbaatar city and its surrounding areas cannot be considered as an independent development zone, but as part of a larger region in which surrounding regional towns and satellite cities are integrated and developed so as to alleviate population concentration in the city area.

Economic development of the Ulaanbaatar Capital Region is proposed with the aim of enabling the socio-economic growth of the surrounding ten regional towns and satellite cities, such that these areas are able to provide employment opportunities and livelihoods, thereby stemming migration to the city areas. It is proposed that each town and satellite city will have a particular focus of agriculture, or manufacturing, or logistical industry. Communications and utilities are planned to be developed in satellite cities together with the promotion of small and medium enterprises, thereby leading the development of satellite cities into integrated settlement clusters.²¹ Critical to the economic growth of this region and the county as a whole is transport infrastructure development, as Mongolia is a landlocked country, and this often results in comparatively high costs for consumers' products and transportation. Therefore, the regional development structure for Ulaanbaatar involves linking major urban activity centres to trunk roads such as the airport access, railway networks, and Asian Highway (AH)-3 connecting the country from the Chinese border to the Russian border.²²

Environment and its protection is of utmost importance to a formerly nomadic and still agrarian Mongolian culture. The Master Plan proposes that an Ulaanbaatar City green belt be introduced around the edges of the city. This green belt will include areas for agricultural uses, rural communities, summer camp areas, natural preservation areas, recreation and tourism activities, water resource protection and forest preservation, and existing restricted areas. While providing the city and its surrounds with public green space for tourism and recreation, the green belt will also function as an urban growth boundary for the city of Ulaanbaatar. In fact, land use of the city has been guided by strategies that seek to conserve the environmentally sensitive watershed forest areas and special protection areas; control development in areas unsuitable for urbanization, including steep lands and flood prone areas so as to mitigate disasters; conserve fertile lands suitable for agriculture; and maintain and improve existing biological networks of flora and fauna.²³

Sawai Madhopur: balancing equity, economy and environment

Located in the western Indian state of Rajasthan, Sawai Madhopur is a city of strategic importance for the state, given its triumvirate of national assets – a 9th Century UNESCO World Heritage site, a hill forest, and a national

park – all located within the city development region. With a current population of 133,165 which is expected to double to 234,563 by 2035, the city was identified as an ideal candidate for the preparation of a progressive, integrated master plan, that would inform the growth and development of the city for the next 20 years. Formulated in 2016 the draft Master Plan 2035 for Sawai Madhopur demonstrates the integration of concerns of environment, economy and equity into the master planning and implementation processes. To accommodate the future growth of the city, it has been proposed to increase the existing urban area of 1651 hectares to 5135 hectares so as to ensure that the city is planned for the future, and does not grow in an ad-hoc manner as is the situation with most cities in India.²⁴ Integral to the Sawai Madhopur Master Plan is the fact that the regulation of land use has been designed to conserve the assets of the city-region – heritage, forests, hills, water bodies, rural periphery – while at the same time accommodating changing economic energies and providing for the infrastructure needs of a diverse socio-economic population. Development regulations are detailed and tailored with specificity to the city’s environment notably the Ranthambore National Park, Forest hills, and Ranthambore Fort.

Tourism and agriculture as the mainstay livelihood providers, are recognised as the two key economic drivers in the Master Plan 2035. While 50 per cent of the expanded urban area is zoned for built-up urban use, the rest remains as an “urban agriculture zone” which is open, natural, and agricultural land.²⁵ This zone which along with cultivable land will encompass associated industries including food processing, cold storage, and an agricultural research institution, seeks to sustain and encourage an incentivised agricultural livelihood. Furthermore, its location within the reach of the city, will allow the urban agricultural zone to be an economically and ecologically viable model of agriculture. Environmental concerns are integral to the Master Plan 2035 with dedicated green spaces at the neighbourhood, sector and city levels. The amount of area dedicated for residential development in the Master Plan 2035 will be 36 per cent, as opposed to the existing 54 per cent. This lower gross density of the Master Plan 2035 is due to the increased allocation of recreational and green space of 22 sqm per person.²⁶

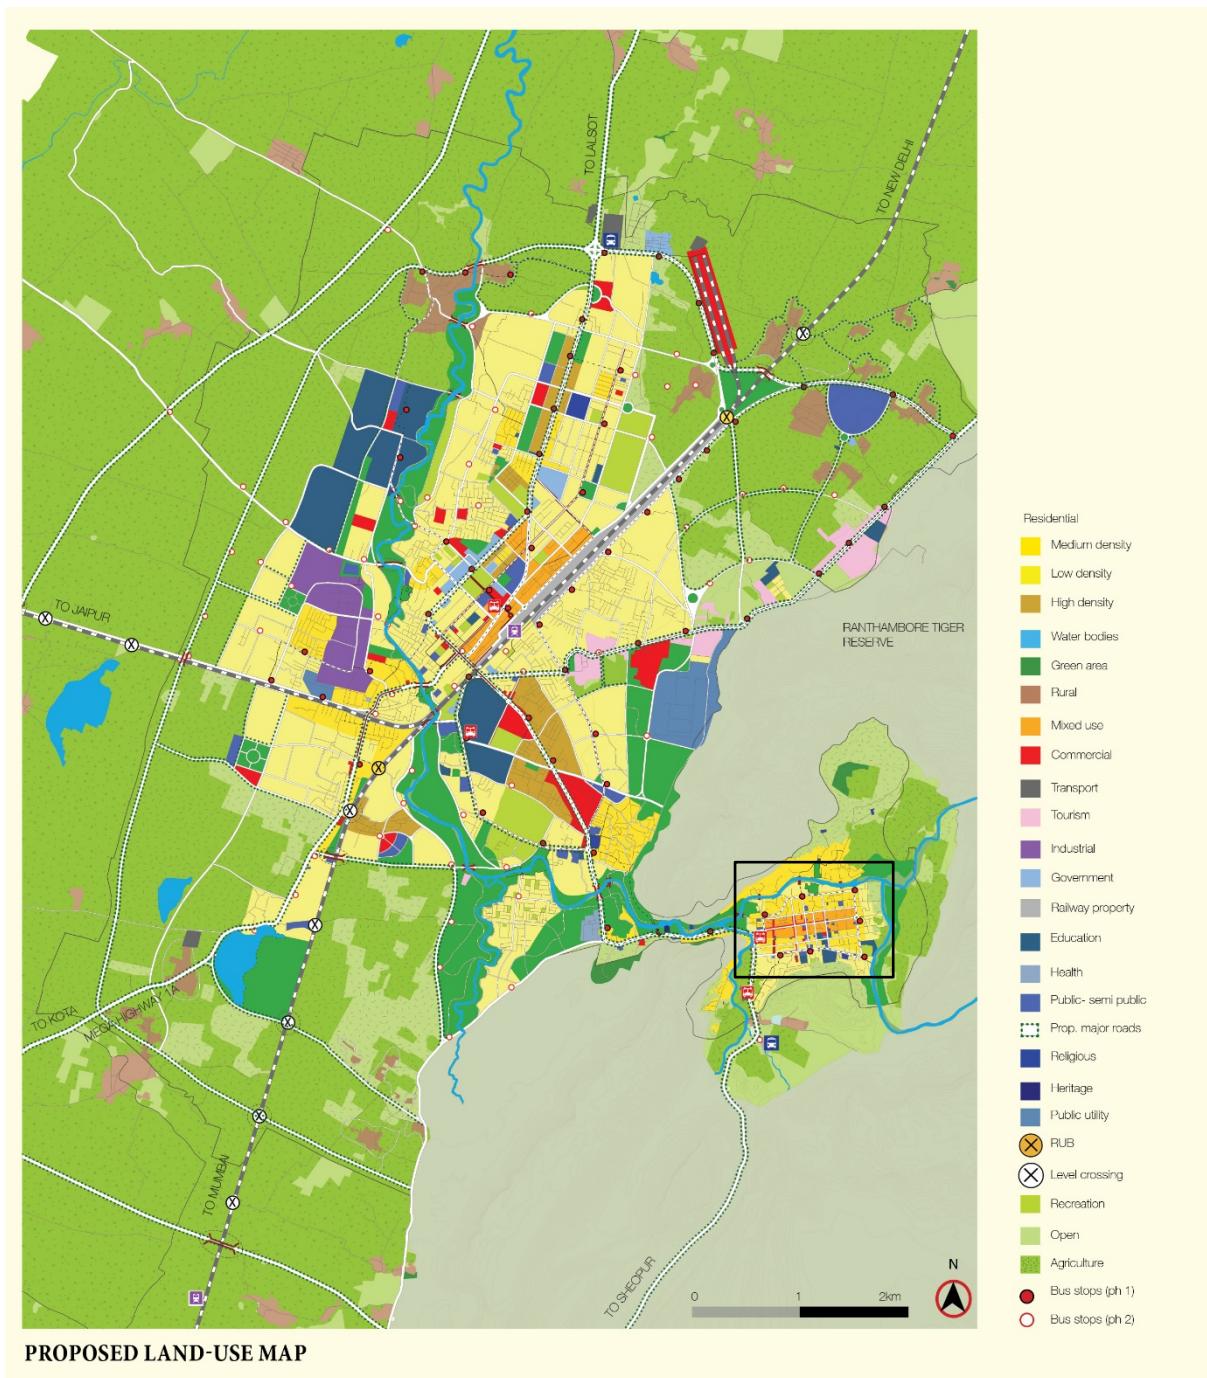

Figure 1: Jana Urban Space Foundation. *Proposed land-use map for Sawai Madhopur with the old city to the east (outlined by the box) surrounded by the Ranthambore National Park, and new development proposed to the north and west [Bangalore: 2016]*

The ecological imperatives of the agricultural zone are common with the heritage conservation measures identified in the Master Plan 2035. Ranthambore National Park, known for its large Bengal tiger populations, Ranthambore Fort as one of the Rajasthan Forts listed on the World Heritage List, and the Forest Hills form the context for the conservation initiatives for the city. Accordingly, a forest buffer of 1000 m has been zoned around the National Park, and a protective zoning for heritage is applied to 373 hectares of the urban area, which also includes The Old Town of Sawai Madhopur. A water infrastructure and landscape development project that involves the conservation, preservation and conservation of the 12.5 km long water body flowing through Sawai Madhopur is also proposed.²⁷ These conservation initiatives seek to safe-guard these ecological and heritage sensitive areas

from further development, and in doing so support the continuing growth of tourism industry in the city and its surrounds.

Figure 2: Jana Urban Space Foundation. *View of heritage listed Ranthambore Fort from inside the Ranthambore National Park* [Bangalore: 2016]

To enable the growth of economy in the area, connectivity is a primary concern that has been integrated into the Master Plan in terms of the development of a comprehensive network of roads in neighbourhoods, the city, and the surrounding rural region. A few key proposals to improve mobility, and therefore economic vitality in the city and its region, include developing a planned hierarchy of new roads, buildings roads to increase connectivity to surrounding rural settlements, provision of transport and trucking facilities at key locations, and provision of bus shelters, bridges, pedestrian pathways and parking lots. Public development projects such as civic and social infrastructure projects including a sports arena, a convention centres, a farmer’s market, a city park and festival celebration ground are also included in the Master Plan to support the local economy of the city. Other economically driven measures include redevelopment, specifically infill urban development within the existing city area of 1651 hectares, of which only 882 hectares are built up. The remaining 567 hectares are zoned for infill development so as to allow for greater density and use within the city.²⁸

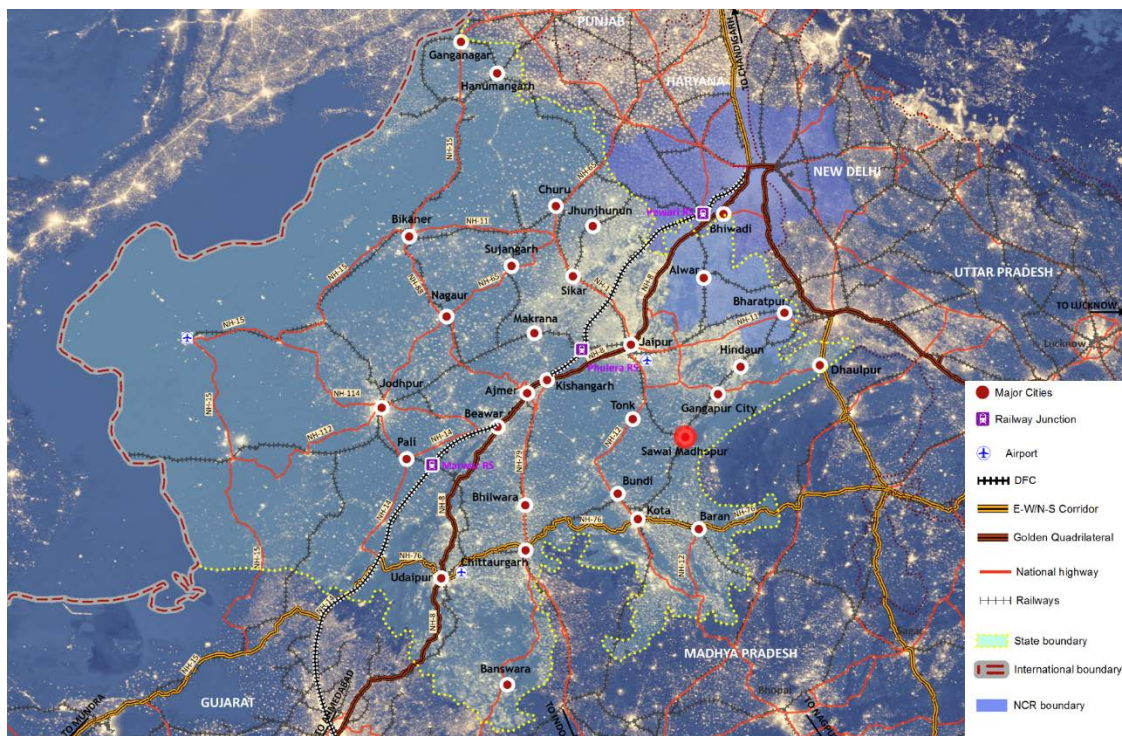

Figure 3: Jana Urban Space Foundation. *Map of Sawai Madhopur showing its location in the western Indian state of Rajasthan, and the larger regional context of the city in terms of connectivity* [Bangalore: 2016]

Central to the infill development zoning is the idea of spatial equity – the Master Plan 2035 introduces mixed income zoning, with affordability in housing for all socio income groups. Plotted and flatted residential land of varying sizes, with access to civic infrastructure and social amenities have been delineated in the Master Plan. The need for affordable housing in the city can be evidenced in terms of the number of slums in the city accounting to 45.²⁹ A total of 974 hectares of land have been reserved for residential zoning with nine categories of housing types proposed so as to cater to the housing needs of different economic groups. The idea of equity has also informed the new classification of road networks, in recognition of the hierarchy prevalent in high density lower income housing developments. For such developments, road widths have been set at between 5m to 1m, and have been classified as lanes – primary access, secondary access, and pedestrian access lanes.³⁰ It is also proposed that infrastructure networks be designed for such lanes, and zoning regulations be customized appropriately.

Other infrastructure projects proposed include water, sewage, drainage, power, and health facilities. The Master Plan 2035 encourages a “zero waste” city through the development of a comprehensive sewage and drainage network plan which will include large and smaller sewage treatment plants, and a proposed landfill site, which it is hoped will help arrest the current ad-hoc, ill-managed and polluting waste disposal processes currently in place in the city. Water supply and coverage for the Sawai Madhopur region is expected to increase from 72 per cent to 100 per cent, as a result of a state developed urban infrastructure project, and the construction of overhead water tanks and new household water connections. To counter the existing condition of 66 per cent of sewage flow into open storm water drains, a new sewage network that delivers sewage from the primary source to the sewage treatment plant is planned for the area. 35 per cent of Sawai Madhopur homes do not have toilets and the Master Plan 2035 necessitates a 100 per cent coverage. Digital connectivity is emphasised for the city to support the growth of industry and enterprise in the city and its region.³¹

Conclusion

This paper has sought to demonstrate that the modernist approach to master planning has undergone considerable changes notably in developing countries where cities are faced with rapid urbanisation, and concerns of poverty, urban sprawl, pollution, and environmental degradation. Moving towards the larger global agenda of creating cities that are sustainable, resilient, inclusive and safe, urban planning in cities like Curitiba, Ulaanbaatar, and Sawai Madhopur seeks to balance the intersecting yet competing demands of economy, environment and equity. While the master plans for Ulaanbaatar and Sawai Madhopur are very recent initiatives a few issues and concerns have emerged pertaining to the overall long-term targets of these master plans. This can be evidenced in the case of Ulaanbaatar as the master plan is seen as catering to the larger urban context but failing to address the housing shortage faced in the city, and its impacts on the surrounding traditional nomadic areas. The master plan of Curitiba best known for its transport system, is facing challenges in terms of continuing to provide affordable transport, as the city grows out towards new suburbs which are largely occupied by the urban poor. While the effectiveness of these master plans cannot be ascertained as yet, the fact that these are regionally, economically and environmentally sensitive responses to each city’s own unique set of urban circumstances, is a step in the direction of a sustainable city.

55 **The Japanese 1919 City
Planning Act System in the
World History of Planning**

The Japanese 1919 City Planning Act System in the World History of Planning: An Overview and Some Hypothetical Propositions

Shun-Ichi J. Watanabe (Tokyo University of Science)

The City Planning Act of 1919, established under the strong influence of Western modern planning, was the nation's first modern planning legislation. The planning system that the Act created formed the basic character of the Japanese planning system and is still largely discernible in current planning practice.

This paper is an attempt to position the Japanese 1919 planning system within the framework of the world history of planning. The Japanese contact with the Western modern planning in the 1910s ended up, however, as a one-way flow from the West to Japan, but is not our concern in this paper. Instead, we try to discuss some special characteristics of the 1919 system which can be seen as quite unique in contrast to the Western modern planning system.

Unlike the Western countries, the Japanese system was not created by planning professionals but by the elite bureaucrats of the central government who eventually gained a fairly high level of professional expertise. We propose the name "bureaucratic professionalism" to describe this phenomenon. This paper attempts to give a preliminary overview of this situation.

When Japan encountered Western modern planning in the 1910s there existed no word, that is, no concept, of "city planning" in Japan. There existed no planning professional nor planning expertise. What did exist was a strong central bureaucratic system. The Home Ministry, having jurisdiction over city planning, prescribed the nation-wide, pre-established, uniform standards, and asked the local government to follow them. The Home Ministry institutionalized the City Planning Local Commission in the prefectural governments as a de facto branch office of the Ministry. The Ministry regularly dispatched its elite planning bureaucrats with their assistants to its secretariat. They consisted of general administrative officers and three kinds of specialist technical officials in civil engineering, architecture, and parks. These specialists worked respectively for street plans, land-use plans, and park plans; the general administrators collated and coordinated their outputs.

According to the Act's prescription, the secretariat presented the draft proposal to the Local Commission, which deliberated and decided. Upon its conclusion, the Home Ministry officials made it the official city planning decision in the Minister's name and sent it to the Cabinet for nominal approval.

Thus, the 1919 planning system was a highly centralized one in which a small number of elite planning bureaucrats efficiently controlled the planning decisions over the entire country. They were a fairly coherent group of higher-ranking officials of administrative and technical bureaucrats. They, as a group, seem to satisfy most of the elements of professionalism in general. But the group was, in reality, a compound of administrators and three clearly separated specialists of civil engineers, architects and park people. It may be hard to say that these professional bureaucrats have established a city planning profession as a whole.

Translating the Idioms of Japanese Planning: The City Planning Act of 1919 as seen from a European and North American perspective

Carola Hein (Delft University of Technology)

Planning history is a discipline with diverse terminology, multiple interpretations and manifold applications through space and over time and the methodological and theoretical approaches towards planning history reflect that. To develop a truly global planning history, scholars need to clarify the idioms they are using, notably for cross-cultural investigation.

Planning and planning history in Japan have a long tradition and a strong engagement with Western practices, yet their integration into global narratives has happened in a somewhat haphazard way. Exploring the debates by European and American scholars of the City Planning Law of 1919, this contribution aims to gain advanced understanding of different Japanese and foreign perspective on urban planning.

Many comprehensive studies of Japanese planning as a discipline since the Meiji Restoration exist in Japanese, but are not translated. The Japanese planner and historian Ishida Yorifusa, wrote the most comprehensive history of Japanese planning by a Japanese author: *Nihon Kindai Toshikeikaku no Hyakunen* (100 Years of Modern City Planning in Japan), its expanded version including a very detailed time-line (Ishida 1980, Ishida 2004)

Several other publications provide an overview. The writings of Japanese architect-planner, Watanabe Shunichi, another key figure of Japanese planning history, have had more impact in the English-speaking world. Much of the literature, however, comes from foreign scholars, such as Andre Sorensen, who have developed their particular view on the evolution of Japanese planning system and urban form (Sorensen 2002)

The choice of terminology is particularly important in the context of Japanese planning history. As Shunichi Watanabe has pointed out, the City Planning Act of 1919, often called the Old Act, gave Japanese planning its distinct flavor. In contrast to the comprehensive planning at the root of North American and European planning, it focused on urban infrastructure, particularly streets, as the foundation for urban development. This made planning the domain of the engineer rather than the politician. It also placed the responsibility for planning at the level of the central government (Watanabe 2016a, Sorensen 2002)

As many authors have emphasized, the Old Act established the main practice of Japanese planning: land readjustment (*kukakuseiri*)—a technique to create continuous land parcels for development while sharing the project costs among landowners.

Since the very beginning of establishing city planning as a discipline in Japan in the late 19th century, the country's leaders had seen innovation not primarily as an issue of aesthetics but one of economic dominance and particularly transportation (which is why streets were important) They would go on to use this idea of planning in their own colonial endeavors, as Japanese planners and their concepts set up systems in Taiwan and Korea during the Japanese occupations from 1895 to 1945 and 1910 to 1945 respectively. Integrating Japanese colonial and later post-colonial planning into the Japanese, Asian, and global developments, and clearly defining terminology, will also provide insights in transnational planning history.

The Formation of Modern Planning Law System in China: Comparing with the Japanese 1919 Act

Shulan Fu (Zhejiang University) and Baihao Li (Southeast University)

In general, the formation of modern planning system started at the end of the 19th century, while local autonomy was promoted in China. From the establishment of a "municipal law" and the construction modern vehicle roads, the development of urban planning has gone through an early stage when planning was seen as a part of "Shi-zheng (municipal administration)". After the establishment of the Nanjing National Government in 1927, a decade of stable political environment brought about the golden age of urban planning practice, which directly contributed to the phase of national legislation in the late 1930s.

But once the discussions were held in detail, either the planning of individual cities or the legal system at the national level, it is difficult to find a clear and consistent development process, since the whole process has undergone repeated wars, separatism between the north and the south, and changes in political power. As a significant reflection, two urban planning acts were formulated in 1930s, one is the "Du Yi Ji Hua Fa (City Planning Act)" promulgated by the Puppet Manchukuo in 1936, and the other is the "Du Shi Ji Hua Fa (Urban Planning Act)" released by the Kuomintang government in Chongqing in 1939.

In order to clarify the overall process, this paper regards the urban planning act as the staged product of the earlier urban planning practice combined with the introduction of foreign experiences and techniques. Discussions about the two acts' relevant governments, law drafters, their local practice and foreign experiences will be done to sketch overall appearance of the urban planning law system in 1930s, and the comparison of different use of terms will be a key entry point for judging the source.

Reading the City Planning Law 1919 as decisive critical juncture in Japanese City Planning: Conceptual and methodological considerations

Andre Sorensen (University of Toronto)

There is no doubt that the Japanese City Planning Law of 1919 was a major watershed in Japanese planning, as the law remained in place for almost 50 years until 1968, and Japanese planning still shows many influences from the approaches it established. This paper examines the 1919 law as a major critical juncture in Japanese planning, applying a historical institutional comparative research method to its analysis. This includes careful attention to the antecedent conditions before its passage, the range of alternative approaches that were considered and dropped before it was passed, consideration of the 'cleavage' or crisis that provoked a new approach to the regulation of urban space, analysis of the timing and sequencing of its passage in relation to planning legislation elsewhere, and an examination of both the major historical causes of the development of this new approach, and the primary 'mechanisms of reproduction' that have ensured that this approach to planning remained dominant until 1968, and to considerable extent, to the present. This analysis helps to better understand the 1919 City Planning Law, and contributes to theory building in planning history.

The Japanese 1919 City Planning Act System in the World History of Planning: An Overview and Some Hypothetical Propositions on “Bureaucratic Professionalism”

Shunichi J. Watanabe *

* *Professor Emeritus, Tokyo University of Science, shun.watanabe@nifty.com*

The City Planning Act of 1919, established under the strong influence of Western modern planning, was the nation's first modern planning legislation. This paper is an attempt to position the planning system created by the 1919 Act within the framework of the world history of planning.

Unlike the Western countries, the Japanese system was created -- not by planning professionals -- by the bureaucrats of the central government, who eventually had a fairly high level of professional expertise. We name this situation "bureaucratic professionalism", which may be quite unique in contrast to the Western planning system.

The 1919 planning system was highly centralized in which small number of elite planning bureaucrats of the Home Ministry efficiently controlled the planning decisions all over the country. The Ministry prescribed the nation-wide, pre-established, uniform planning standards and asked the local government to follow. The Ministry created the City Planning Local Commission in all prefectures as its de facto branch offices and regularly dispatched its elite planning bureaucrats to the Commission's secretariat.

These bureaucrats consisted of general administrative officers and three kinds of specialist technical officials in civil engineering, architecture, and parks. They, as a group, seem to satisfy most of the elements of professionalism in general. But in reality, the group was a compound of administrators and three clearly separated specialists. It may be hard to say that these professional bureaucrats have established a city planning profession as a whole.

Keywords: City Planning Act of 1919, the 1919 planning system, Home Ministry, Western modern planning, City Planning Local Commission, Bureaucratic Professionalism

1. Introduction

The basic structure of the Japanese planning system was founded by the City Planning Act of 1919 (hereafter "the 1919 Act") which was enacted as the nation's first modern planning legislation 99 years ago. Since then, many features of the planning system have survived even the Act's drastic post-war amendment into the City Planning Act of 1968 which forms the basic core of Japan's current planning legislation. Analyzing the planning system put in place by the 1919 Act (hereafter "the 1919 (planning) system") is therefore an important research theme in understanding our past history as well as our current standing and our search for future perspectives on our current planning system.

The 1919 Act, as seen in the context of the world history of planning, was strongly influenced by the Western modern planning system, which was then being formed through the international exchange of ideas between Western Europe and North America in the late 19th and early 20th centuries. Outside of these areas, Japan was an almost exceptional case as a nation that made contact with and learned from Western modern planning ideas based on its own initiative.

This paper is an attempt to position the Japanese 1919 planning system within the framework of the world history of planning. Here, however, we face problems right away. Historical facts show us that, while these Western countries enjoyed rich mutual exchange, Japanese contact with the West resulted only in a one-sided flow from the Western countries to Japan and ended with Japan hardly contributing to the formation of the modern planning system. Understanding how the Japanese contact with the West occurred as well as its results may be an important research theme for Japanese planning history but may not be an attractive or productive theme in the world history of planning as a whole.

Here, we propose a different approach. We try to discover and discuss features of the 1919 planning system which may have been unique in comparison to the Western planning system at the time and which may still be an attractive theme in relation to the basic nature of planning systems in general. We present here a concept that we have named "bureaucratic professionalism" which obviously requires some preliminary explanations.

In Western countries, urban planning as a social technology and institution was developed by a group of private and governmental "planning professionals".⁽¹⁾ In other words, the planning institution and its professionals grew in parallel with one another. In Japan, in contrast, planning was almost entirely developed by

bureaucrats in the central government's Home Ministry. These bureaucrats eventually came to have a fairly high level of professional expertise but they identified themselves basically as bureaucrats rather than as "planning professionals". We have named this situation "bureaucratic professionalism" and the people involved "professional bureaucrats".

Having said so, the next question is what "bureaucratic professionalism" and these "professional bureaucrats" meant within the actual context of Japanese history, and what new insights can come from these concepts regarding the 1919 planning system in the context of the world history of planning.

In order to answer these questions, this paper will take the following steps: After identifying precedent research relevant to this paper the theoretical framework of professionalism will be discussed, as this framework will be used to further detail the Home Ministry's bureaucratic professionalism near the end of this paper.

After these preliminary discussions the topic will advance to the core historical discussions on the 1919 City Planning Act, the Home Ministry and the City Planning Local Commission. Based on these discussions an evaluation of the Home Ministry's bureaucratic professionalism will follow using the above framework, and finally the paper will close with some concluding remarks.

2. Precedent Research

As one of the most important elements in Japanese planning history, there has been plenty of research on and around the 1919 Act – the most famous being the general history textbook by Ishida⁽²⁾ and Watanabe's book detailing the formative process behind the 1919 Act.⁽³⁾ But when it comes to the subject of the 1919 planning system as a whole there have been relatively few results and practically none that discuss the 1919 system within the context of the world history of planning. Watanabe deals with the historical features of the Japanese planning system as a whole; identifying central bureaucracy and non-professionalism as key components.⁽⁴⁾ This paper more or less develops this earlier work, focusing more specifically upon the bureaucrats in the Home Ministry in charge of the actual technical planning around the 1910s and 1920s.

This type of research requires basic knowledge of the Home Ministry and its bureaucratic system in general and, in particular, of the City Planning Local Commission, which was where the actual planning work was carried out. The Home Ministry, as a very important research theme in the social sciences and history, has been much recorded and discussed in works such as the 4 volume book *The History of the Home Ministry*⁽⁵⁾ and recent books in social and political history.⁽⁶⁾ What we need is more works specializing in city planning. Nakamura provides a good discussion of the politics of the 1919 planning system including the City Planning Local Commission.⁽⁷⁾ This paper relies greatly on this work with, however, a slightly different view regarding planning expertise and professionalism.

Around the 1980s on, planning academics began their research and interviews with former planning bureaucrats who also began to record their memories.⁽⁸⁾ These records are another information source that this paper is based upon.

3. Professionalism

In Western countries and, in fact, much of the entire world, urban planning as a social technology is carried out by planning professionals — a fact that seems to form the fundamental basis of universal discourse on the world history of planning. The present author, however, believes that a more careful examination is necessary as far as the Japanese planning system is concerned.

In order to examine this issue theoretically, the word "professionalism" must first be defined. Let us rely upon that of Millerson, which is a rather old definition but is reliable for the purpose of our discussion.⁽⁹⁾ Millerson's definition of professionalism contains six aspects:

- (a) A profession involves a skill based on theoretical knowledge.
- (b) The skill requires training and education.
- (c) The professional must demonstrate competence by passing a test.
- (d) Integrity is maintained by adherence to a code of conduct.
- (e) The service is for the public good.
- (f) The profession is organized.

This definition gives us a fairly clear picture that planning professionals work with certain planning expertise which they obtain through training and education as well as a test, which bestows upon them a kind of status. Planning professionals also organize themselves into an identifiable group and maintain integrity through a code of conduct, working for public good.

This picture gives us the impression that the term may also be applicable to "bureaucratic professionals," because this definition allows planning professionals to work both in the private and governmental sectors. We will examine this point in depth later by using the 6 aspects mentioned above.

4. The City Planning Act of 1919

Systematic contact between Japan and Western modern planning ideas began with the "Town Planning Conference" organized by the Royal Institute of British Architects in London in 1910.⁽¹⁰⁾ At the time in Japan, there was no word for – and therefore no concept of – "town or city planning." And, more crucially, no one had the technical skills to carry it out. However, there did exist something that we can now consider the predecessor to "*toshi keikaku* (city planning)," a new term coined by Hajime Seki in 1913.⁽¹¹⁾ In this formative period of city planning, we should note both what kind of Japanese traditional soil the seeds of Western planning ideas fell onto, and, as a result, what kind of a new flower blossomed as the 1919 planning system.

The 1919 Act was born both from the influence of Western modern planning ideas and by 30 some years of experience gained through the urban program put in place by the Tokyo Urban Improvement Ordinance of 1888 (hereafter "Urban Improvement"). Urban Improvement was a program for planning and implementing a long-range construction plan for urban infrastructure, targeting the streets and parks in Tokyo's built-up areas. As for its planning system, three features should be noted as they were eventually inherited into the 1919 system.

First, Urban Improvement was defined as the central --- not local--- government's program, and was administered by the Home Ministry. Second, it institutionalized a unique system involving a "commission" with strong administrative powers. In fact, the Urban Improvement Ordinance prescribed the establishment of the Tokyo Urban Improvement Commission which was empowered to officially determine the Urban Improvement plan and report it to the Home Minister who would then receive the Cabinet's approval.⁽¹²⁾ Third, Urban Improvement, which was basically a construction program, was administered by non-technical bureaucrats with technical help from civil engineers.

The 1919 Act introduced new elements, mostly by learning from the Western modern planning model as follows:

- (1) Expanding the act's application from Tokyo to the six major cities in Japan and later to all cities;⁽¹³⁾
- (2) Establishing the City Planning Area to include areas outside the central city;
- (3) Providing new planning tools in the form of construction projects like land readjustment and land-use controls like zoning. Overall, however, construction was emphasized more than restriction. Land readjustment came to be widely used thereafter,⁽¹⁴⁾ but zoning was only accorded weaker powers and did not become a central tool in the entire planning system.

Looking back at the 1919 planning system within the background of Western planning developments at the time, we may be able to say that it was a fairly comparable system as a whole. The soil onto which the seeds of Western planning fell was rich in terms of bureaucracy but rather poor in terms of technical skills. So the next question is: how was city planning as a technical matter actually carried out in the 1919 planning system?

Before we go further, however, we must take a glance at the 1919 system's relationship to building controls. In Western countries, land-use controls occupy a central place in the planning system but not so in Japan, as discussed above. Zoning was only briefly prescribed in the 1919 Act and detailed regulations on zoning were contained in the Urban Building Act of 1919.⁽¹⁵⁾ This Act, enacted as a sister legislation to the City Planning Act, was formed to control the engineering aspects of individual buildings (materials, structure, hygiene, fire, etc.) and, at the same time, their urban aspects (use, shape, size, height, building lots, etc.). In this way, land-use controls were, in a sense, separated from the planning system.

It should be noted that, prior to the Building Act, building controls had been administered on an ad hoc basis by the prefectural police. After the Act, a new system was put in place in the prefectural government and a Building Inspector was established under the strict control of the Home Ministry. This, however, gave rise to the problem that the planning of land-use and the actual control of individual buildings were administered by different people which eventually led to a serious need for coordination.

5. The Home Ministry

5-1. The Bureaucratic System

The 1919 planning system was carried out by a variety of bureaucrats in the Home Ministry. It is therefore necessary to take a look at the central government's bureaucratic system in the prewar days.⁽¹⁶⁾

The bureaucratic system in those days was strictly designed with a focus on the elite, generalist administrative officials (*jimu-kan*). Those who had passed the special *kôbun* examination⁽¹⁷⁾ were appointed as higher officials (*kôtô-kan*). They were the top-ranking elite group of bureaucrats with 10 steps to climb during their career. The ranks of the higher officials were as follows (from high to low):

- (1) Higher officials, who were specially selected from (2) and appointed by the emperor (*shin'nin-kan*), like ministers.
- (2) Imperial appointees (*chokunin-kan*) who were bureaucrats in classes 1 and 2, like vice-ministers and bureau directors general
- (3) Senior higher officials (*sônin-kan*) who were bureaucrats in classes 3 to 10, like division directors.

Under these higher officials were (4); lower officials (*han'nin-kan*) who were the non-elite bureaucrats. Further down, there were (5); many employees who were not considered government bureaucrats.

In this system the higher officials were the true elite bureaucrats who were small in number but controlled the vast number of non-elite lower officials.⁽¹⁸⁾ They played a decisively leading role in forming national policies. City planning was no exception; the administrative officials who occupied the Ministry's central positions in city planning were all higher officials like Ikeda Hiroshi.⁽¹⁹⁾

It should be remembered that this system was basically designed for the generalist administrative officials and, in fact, most of the higher officials were graduates from the Faculty of Law at the Imperial Universities, especially Tokyo Imperial University. On the other hand, what was the system of technical officials (*gijutsu-kan*) like?

There were actually many technical officials who were employed as specialists in fields such as engineering, medicine and agriculture. There was no systematic system or examinations for them as with the administrative officials, but the above concept was roughly applied to them as well. In the Home Ministry, elite technical officials given the status of *gishi* (literally, engineer or technical teacher) were treated like higher officials (*kôtô-kan*); non-elite technical officials, or the so-called *gite* (or *gishu*, which literally means technical hand) were the equivalent of lower officials (*han'nin-kan*). In the city planning world, the *gishi* played a leading role with the help of the *gite*, which we will see in the section on the City Planning Local Commission.

5-2. The Home Ministry

The Home Ministry, established in 1873, had jurisdiction over the police (Police Affairs Bureau), local government (Local Affairs Bureau) and civil engineering (Civil Engineering Bureau) among other branches and was one of the strongest ministries in the central government.

The prefecture, which was the local government, was in many ways almost the local branch of the Home Ministry and the prefectural governor was appointed out of the Ministry's higher officials. Furthermore, the prefectural police department, which was responsible for building regulations, was controlled by the Ministry's Police Affairs Bureau. So it is crucially important to look at the relationship between the Ministry and the prefecture in order to understand how city planning was actually administered.

5-3. The City Planning Division

The City Planning Division was established in the Ministry's secretariat in 1918. Hiroshi Ikeda became the first director of the Division and began drafting the City Planning Bill. The following year, the Bill became the City Planning Act of 1919 which was enforced at the beginning of 1920.⁽²⁰⁾

Interestingly enough, the Division's successive directors were all administrative --- not technical --- officers. This situation may seem quite strange to Western planners but, as we shall discuss later, it is here that the secret nature of Japanese city planning can be found.

The City Planning Division, led by Director Ikeda, consisted of four units: general affairs, civil engineering, architecture and parks. Each was headed by a higher official of its own specialization. It should be noted here that the technical units were clearly separated into the units of civil engineering, architecture and parks. This separation, which can be traced back to the Urban Improvement days, was strictly enforced not only in the central government but also in the prefectural governments.

Hideki Sakurai, who started working in the Division after graduating from the Department of Civil Engineering at Tokyo Imperial University in 1922, witnessed everyday life in the Home Ministry as follows: "At the time, there was hardly any substantial city planning work and the newcomers like us spent much time studying and translating Western material."⁽²¹⁾

6. The City Planning Local Commission

The 1919 Act prescribed the establishment of the City Planning Commission.⁽²²⁾ There were, in fact, two kinds of commissions: central and local. The City Planning Central Commission was established in 1920 but did not function much and was abolished in 1941.

6-1. The City Planning Local Commission

In 1920, the City Planning Local Commission (hereafter "the (Local) Commission") was established first in the six major cities where the 1919 Act was applied and then in all the prefectures from 1922 on.⁽²³⁾ In terms of its status in the government structure, it was a prefectural organization but in terms of planning practice, it was a branch of the Home Ministry's City Planning Division. (Remember the prefectural government itself was a de facto branch of the Home Ministry). The Local Commission is our focus of interest as it was the place where the work of city planning was actually carried out.

The 1919 Act prescribed that all planning cases, including the designation of city plans and city planning projects, go through the following process. First, the City Planning Commission was to deliberate the

case; second, the Home Minister was to form a decision; ⁽²⁴⁾ and third, the Cabinet was to give its approval. This was a very centralized system in that even small local planning cases had to go through cabinet approval. The Home Ministry --- in other words the planning bureaucrats --- therefore wielded a great amount of power in the actual administration.

As mentioned above, the Act assigned the Minister the power to form the final decisions, however the planning bureaucrats used the Local Commission as their place to deliberate and determine planning cases. This was possible due to the fact that various interests, particularly that of the central government, were well represented within the Commission. In other words, as Nakamura points out, the Commission functioned for the planning bureaucrats to coordinate the interests of the central government's ministries. ⁽²⁵⁾

6-2. The Members

Membership in the Local Commission was prescribed in the Minister's orders. The meeting was chaired by the prefectural governor, or by the vice-minister in the case of Tokyo. The members included: the mayor of the city where city planning was to be applied, members of the city and prefectural assemblies, and, in Tokyo, the governor and superintendent general (*keishi sōkan*).

It should also be noted that the members also included higher officials from various ministries. This was the arrangement used to carry out the abovementioned process. The meeting was oftentimes attended by planning specialists from the Ministry's City Planning Division, including Director Ikeda, and this made it possible for the planning bureaucrats to assume leadership in the decision-making process in the Local Commission.

6-3. The Secretariat

The Ministry provided technical and administrative staff as the central government official to all the prefectural governments as a means of supporting their Local Commissions. In 1934 the numbers of officers stationed in the 47 prefectural governments were as follows according to rank: higher officials, consisting of 12 administrative bureaucrats (*kanji*) and 70 technical *gishi*, and lower officials, consisting of 73 administrative bureaucrats (*shoki*) and 163 technical *gite*. ⁽²⁶⁾ These officers were stationed in the prefectures' City Planning Divisions, ⁽²⁷⁾ which functioned as the secretariats of the Local Commission, together with the prefecture's own staff. The Ministry's staff members were on the prefecture's payroll but belonged to the Ministry and held themselves to be above the prefectural staff. The higher officials were appointed by the cabinet and the lower officials by each Local Commission.

In the major prefectures the City Planning Division consisted of one administration unit as well as three technical units specializing each in civil engineering, architecture and parks, with one or more *gishi* from each specialization. This clear division between the technical specializations was decisive and universal throughout the country. In short, the prefectural City Planning Divisions all over the country were exactly a miniature of the Home Ministry's City Planning Division.

The Division's director was an office assumed by an administrative --- not technical --- bureaucrat in the higher official rank. ⁽²⁸⁾ The director played a crucial role in coordinating the technical staff in the three specializations. The civil engineering staff were working in street planning, the architectural staff in land-use planning, and the park staff in park planning. In another words, the technical staff were devoted more to their own fields of specialization rather than to a comprehensive view of the city planning expertise. So the real core of comprehensive planning was in the hand of the administrative --- not technical --- staff who had rich administrative expertise but relatively poor technical planning expertise. This may explain why the entire city planning system of Japan has been heavily inclined to legal procedures rather than to planning ideas and technology as such.

6-4. The Actual Process

Finally, let us trace the actual processes taken in the Local Commission, which eventually led up to the official decision on the planning case. The first job was to prepare a draft to be submitted to the Commission. This was mainly done by the secretariat's higher official technical bureaucrats, often with the guidance of their counterparts in the same field of specialization within the Ministry. Sometimes the Ministry's planning bureaucrats took business trips to the local prefectures to teach their planning expertise to their local counterparts. ⁽²⁹⁾

At the Commission's meeting, the administrative *kanji*, who were often the Division's director, explained the purpose of the draft which was then deliberated by the Commission members. In that sense, the *kanji's* work formed the core of the Commission and, behind the curtain, he was technically supported by the technical staff in the three different specializations. As the other Commission members representing their own interests had little planning expertise, the draft was passed smoothly in most cases. The difference in knowledge in the specialized subjects allowed the secretariat to assume technical leadership.

The results of the meeting was then notified to the Ministry's City Planning Division which formed the official decision in the name of the Home Minister. The Division then obtained the Cabinet's approval and finally published the plan in the Official Gazette as the Home Ministry's Notification.

7. Concluding Remarks: "Bureaucratic Professionalism"

This paper has so far studied the activities of the Home Ministry bureaucrats who supported the 1919 planning system. Based on this, we would like to look at the characteristics of "bureaucratic professionalism" through the six elements (skill, training, competence, integrity, public good and organization) proposed by Millerson's definition on professionalism described above.

The urgent problems at the time were: how to promptly provide planning expertise to a large number of expanding cities throughout the country, and, in the absence of planning education and private professionals, how to utilize the existing central bureaucracy. The answer was the 1919 system, and the key to it was the development of professional bureaucrats.

These professional bureaucrats were adopted by the Ministry without any prior training in city planning. Afterwards, they were trained on the job in the Local Commission or by studying foreign literature on their own. They grew by demonstrating competence in their daily work and serving the public good with integrity and pride as higher official bureaucrats. They interacted well among themselves, beyond their differences in position – administrative or technical, working in the central or local workplace. They were organized in formally bureaucratic and informally personal ways. In these terms, within the framework and limitations of the bureaucracy, we can assume that they formed one city planning profession.

At the same time, we must also point out the problems with this system. It certainly looked like a single profession from the outside, but in reality, it was a compound of clearly separated elements: the administrative staff and three technical staff in the civil engineering, architecture and parks divisions. It is hard to say that a single unified city planning profession was actually formed. Another problem was the basic structure of the system in which the central bureaucrats made the decisions and the local staff followed. Although efficient, this system has left problems even up to this day.

Finally, we may say that the bureaucratic professionalism of Japan as described above is a quite different approach set in distinctly different social and historical conditions compared to the world history of planning. However, for the countries of East Asia including Japan, where there has been a weak tradition of civil society and a strong tradition of centralized bureaucracy, this system may have some degree of universality, a topic that merits further research.

- 19 Hiroshi Ikeda (1881-1939) graduated from the Faculty of Law, Imperial Kyoto University and entered the Home Ministry in 1905. The next year he passed the *kôbun* examination and soon started his elite carrier as the higher official (class 7). When promoted to the director of the Road Division, Civil Engineering Bureau in 1915, Ikeda was in class 3. Then he was promoted to class 2 in 1918 as the director of the City Planning Division, and class 1 in 1923 as the director general of the Planning Bureau, Capital Reconstruction Agency. He left the ministry as the governor of Kanagawa prefecture in 1940. For his biography, see Shun-ichi J. Watanabe and Yasuhiro Sadayuki, "Ikeda Hiroshi Denki (The Biography of Hiroshi Ikeda) in *Toshi Keikaku no Pioneer no Ayumi (The Course of Pioneers of City Planning)*, Part 2, 139-228.
- 20 The Division was upgraded to the City Planning Bureau in 1922 but was assigned back to its position as a division in the Minister's Secretariat two years later. The City Planning Division was moved to the Planning Bureau in 1937 and to the Home Ministry's National Land Bureau in 1942.

Evaluation of Urbanization Process of Galata (İstanbul) in the 19th Century Through Huber, Ostoya and Goad Maps

Merve Özbay Kınacı (İstanbul Technical University Faculty of Architecture Urban and Regional Planning PhD Programme) and Nuran Zeren Gülersoy (İstanbul Technical University Faculty of Architecture Department of Urban and Regional Planning)

Istanbul underwent great changes to its urban texture as a result of the period of westernization that took place in the 19th Century. Beyoğlu and Galata which represented the occidental and cosmopolitan face of the city, have been among the settlements most influenced from these changes. In this context, this paper focuses on spatial changes that took place in Galata, located in Beyoğlu County on the western part of Istanbul, which had been a settlement for Turks, Greeks, Jews and Galatians throughout the centuries. Galata underwent a rapid development process in the 19th century regarding urban and architectural characteristics such as the demolition of city walls, new design and planning approaches as well as regulations and precautions against fires.

This study aims to examine the spatial effects of the changes which occurred due to diverse processes, through old city maps of Beyoğlu and Galata, using the methods integrated to Geographic Information Systems (GIS)

The maps of G. D'Ostoya (1858-1860), R. Huber (1887-1891) and Charles E. Goad (1904-1906) are the documents which are used in this context. The common characteristic of these maps is the detailed depiction of urban and road patterns, buildings and open, green spaces. Moreover, there are other unique characteristics in each map about the context of urban change. For instance, the Ostoya Map reflects urban texture before the Great Fire of Beyoğlu (1870)

On the other hand, the Huber Map contains details about the urban pattern after this fire and some other small ones as well as the changing urban texture which reflected the impact of new regulations and the activities of the Sixth Municipal, the first local government. The third and last map, Goad Map, was the first chart to be used for insurance against fires and indicates the physical situation of the urban fabric at the beginning of the century.

In this regard, in the first part, a literature survey has been made about the existing situation of Galata in the 19th century which provides a fundamental starting point for the study. However for a more useful framework urban development of Galata is examined with GIS methods to explore similarities and differences on urban pattern in different time periods using old maps. The maps are coordinated with GIS software and the items such as blocks, buildings, and open spaces are transformed into vector data to make comparisons and superpositions. A general assessment has been made in the last part in light of all data obtained as a result of both a literature survey and a map analysis. Thus, the process of urbanization and the social, functional and physical transformation of urban space is revealed, and conclusions are drawn about how Galata is exposed to changes in the 19th century.

“Western Imitation” in modern China’s urban planning practice between the Late Qing Dynasty and the Early Republic of China (1860-1927)

Xiaogeng Ren (Southeast University), Baihao Li (Southeast University) and Diwen Shi (Southeast University)

At the Late Qing Dynasty and the Early Republic of China, the ancient Chinese city was gradually transformed into a form that closes to a city with modern significance in terms of nature, the concept of construction, the management system and the spatial structure. The driving force behind the transformation of Chinese cities lies in two parts: first, foreign colonialists who planned and constructed the concessions, leased territories and colonial cities; second, Chinese who promoted the improvement of the old cities, established self-opening port cities, constructed a new type of cities. Since the Western powers had previously dominated the global capital trade model and implemented the urban planning and construction paradigm, most of the modern Chinese learned and imitated the western models when they re-planned the original Chinese city areas. Especially since the Sino-Japanese War of 1894-1895, due to the change in the ideology of "Western science", the Chinese truly had recognized the modernity brought by Western urban planning and implemented urban planning practices that imitated the "Western model."

Based on relevant historical materials and existing research literature, this paper analyzes how the Chinese (government) learned and imitated the knowledge of Western urban planning at the stage of late Qing and the early Republic of China (1860-1927)

From the source of imitation, this paper tried to construct a basic framework for the history of urban planning in early-modern China: (1) The renewing planning for old urban areas and the planning for self-opening trading port, which were modeled on the treaty ports (concession); (2) Nantong, Kunming and other cities' planning which imitated Japan; (3) Guangzhou, Shantou and other cities' planning which imitated the model from Europe and the United States. Most of these planners are politicians, social reformers, intellectuals and overseas Chinese with advanced notions. Their understanding and longing for the western urban planning have laid the foundation for China's urban planning towards modernization and have become an important part of the history of modern urban planning thought.

Heritage value attribution: the case of the Alagadiço Novo Historical Site, Fortaleza, Ceará, Brazil

Marina de Castro Teixeira Maia (Federal University of Rio Grande do Sul) and Inês Martina Lersch (Federal University of Rio Grande do Sul)

This paper aims to investigate the attribution of heritage value to the Historical Site Alagadiço Novo, located in Fortaleza, capital of the state of Ceará, Brazil. The Site is protected by the National Artistic, Historical and Heritage Institute (IPHAN), Brazil's federal heritage entity. The relevance of the investigation lies on the verified gap regarding the history of the Site, its insertion in Fortaleza's urban context and its comprehension as an heritage asset, recipient of historical and cultural values. The guiding question of this study is: what legitimized the preservation of the Alagadiço Novo over time?

The Alagadiço Novo was a significant scenario to the trajectory of the Alencar, which was an important family of the local politics. The Site was bought in the beginning of the 19th century by José Martiniano de Alencar, priest, republican rebel, president of the Province of Ceará between 1834 and 1837 and also senator for the Empire. His son, José de Alencar, a great writer from the Brazilian literary Romanticism period, was born there. At that time, the region was called Messejana and consisted in an old village of Indians created by royal document in 1760. The Site also witnessed the birth of the most famous heir of José Martiniano, the writer José de Alencar, great representative of Brazilian literary Romanticism. Since 1964, the Site belongs to the Federal University of Ceará (UFC) and it houses academic and museological activities.

There is an evident connection between the Alagadiço Novo and the life of the novelist. However, the saga of the Alencar family and its relation to those lands are previous to that. The place housed other events of the family that interfered in the political narrative of the capital. In its origin, the Site was located in the suburbs of Messejana and, nowadays, it is immersed in Fortaleza's urban sprawl process, which is why it lost vertiginous portions of its original territory.

The Site currently consists of 7 ha of densely arborized land, centenary species included. The list of elements that are preserved within its limits includes: a small historical building where the novelist was born, the ruins of the first steam mill of Ceará, an administrative pavilion built by UFC in 1965 and the remnants of a pond installed by the Alencar family in the mid 19th century.

Recovering Alagadiço Novo's history is part of the comprehension of a larger process: the Fortaleza and Messejana's area transformation, and it was undertaken through the study of Urban Evolution. This paper had the purpose to understand the configuration of the territory along with the values that legitimated the heritage protection. Also, the existent link with novelist José de Alencar was taken into consideration, as the institution that today makes use of the Site's area is called Casa de José de Alencar (House of José de Alencar) - an UFC entity - and publicizes it as the author's birthplace.

Regarding the method, the historiographic path was chosen in order to better understand both the Site's configuration and insertion in the city transformation and the heritage value attribution conferred to Alagadiço Novo by the national and international preservation regulations. In addition to being historiographical, this research is also qualitative and was carried out through literature review in what it refers to the biography of the historical characters, and documentary research in what it concerns the Site's land documents.

An Evaluation of the Urbanization Process of Galata (İstanbul) in the 19th Century Through the Maps of Huber, d'Ostoya and Goad

Merve Özbay Kınacı*, Nuran Zeren Gülersoy**

* *PhD Student, Graduate School of Science, Engineering and Technology, Urban and Regional Planning PhD Program, Istanbul Technical University & 85.merv@gmail.com*

** *Faculty Member, Department of Urban and Regional Planning, Istanbul Technical University & zeren.gulersoy@gmail.com*

İstanbul underwent great changes to its urban texture as a result of the period of westernization that took place in the 19th Century. Beyoğlu and Galata, which represented the occidental and cosmopolitan face of the city, were among the settlements most influenced by these changes. This study aims to examine the spatial effects of these changes through the integration of old city maps of Beyoğlu and Galata with modern Geographic Information Systems (GIS). The maps of G. d'Ostoya (1858-1860), R. Huber (1887-1891) and Charles E. Goad (1904-1906) are the documents which are used in this context. The maps have been coordinated with GIS software and the items (such as buildings, roads, empty spaces) which they included as raster data have been transformed into vector data to make comparisons and superpositions possible within the GIS environment. Thus, the transformation of urban space can be revealed, and conclusions about how Galata was exposed to changes in the 19th Century can be drawn.

Keywords: urbanization, historic urban fabric, 19th century, geographic information systems, old city maps, İstanbul, Beyoğlu, Galata

Introduction

Urban development of İstanbul in the 19th Century was guided by social and political events such as deep-rooted administrative reforms, comprehensive urban legislation, economic and educational innovations as well as post-war agreements. During this period, the urban texture of the city also went through several essential transformations as a consequence of new regulations stemming from responses to natural disasters such as fires and earthquakes. In this context, this paper focuses on the spatial changes that took place in Galata, which is located in Beyoğlu County in the western part of İstanbul. The goal of this study is to use comparative data acquired from old maps and modern GIS methods to reveal the changes to Galata.

Methodology and the Originality of the Study

The methodology of the study includes two main steps. The first consists of a study of the literature regarding Galata's situation in the 19th Century. The second involves the process of putting forward the changes made to the urban fabric through the use of old maps. In this step, firstly, the maps of G. D'Ostoya, R. Huber and Charles E. Goad, were coordinated. Then, the elements of the urban fabric (roads, buildings, building blocks etc.) were transformed into vector data using ArcMap 4.1 software. Thus it is possible to make schemes for these three maps and to compare them with each other.

As a result of this comparison, together with the help of information provided by the literature, the spatial changes that occurred in Galata were examined under two titles: "Changes in the Road Scheme" and "Changes in the Urban Texture". Thus, conclusions can be made about the scope and dimensions of the urban change, and also the effects of different processes on these changes that took place during the 19th Century.

The difference between this study and the others which have aimed to examine changes in urban textures is that its scope includes quantitative analysis and comparisons as well as a study of the literature. Within this scope, changes in the urban space are open to inquiry via vector data on GIS databases. These inquiries can be presented with different visualization techniques, and can be examined through thematic maps (schemes).

Galata in the 19th Century

Galata had been a settlement for Turks, Greeks, Jews, and Galatians throughout the centuries. In the mid-19th Century, the western and northern borders of Galata, which were by then dense residential areas, were set by the city's ancient fortifications. However, because of the increasing population, the settlement spread beyond the walls. As the Ottoman Empire surrendered to the economic hegemony of the European States during the Westernization

Era, Galata became the first region to host western merchants and to respond their needs.¹ As a result of the commercial agreements signed with the dominant European States in 1838, mainly England, large commercial retail enterprises and banks developed in Galata, and Karaköy in particular became a lively central business district.²

Figure 1: *The existing location of Galata and its environs* [Google Earth Aerial Photo: Accessed April 15, 2018]

In the 19th Century, Galata was subject to more urban planning activities than the İstanbul Historical Peninsula, and some innovations were also first implemented there.³ For his reason, many administrative organizations were first established in Beyoğlu-Galata.⁴ Within the borders of the Ottoman Empire, the first municipality to follow a European model was the Sixth Municipality which was founded in 1857 in Galata.⁵ There were also significant investments in transportation in Galata. These include the Galata Bridge, which took its final form in 1878,⁶ and the Tunnel connecting Karaköy and Pera which was constructed between 1871-1874.⁷

The process of rapid urbanization in Galata resulted in regulations being implemented by the Sixth Municipality. These dealt with the area's urban texture and included the demolition of the Galata Walls, the removal of the cul-de-sac, the opening of broader streets and squares, and the improvement of ruined areas.⁸ Apart from the urban projects implemented by the local government, there were also significant developments regarding the area's architecture. In the 19th Century, as a result of Galata and Beyoğlu being exposed to a considerable number of Italian workers and the unemployed, the construction of the masonry building stock became the work of Italian architects, master-builders and labourers.⁹

Figure 2: Renate Schiele and Wolfgang Müller-Wiener. *A streetscape from the Rue Hendek (Büyük Hendek Street) ended with Galata Tower in the 19th century* [İstanbul: 1988]

Another situation that affected Galata in the 19th Century was its wooden housing stock and its vulnerability to the periodic fires that broke out. The biggest of these was the Beyoğlu (Pera) Fire of 1870 which caused the loss of 3000 buildings¹⁰, although the Galata region was less affected by this enormous fire than Taksim and its environs. There were several other major fires during the same period. These occurred on the outskirts of Galata Tower and Kemeraltı Street (1852), in Yüksek Kaldırım Street (1860), between Tophane and Galata (1874), on the northern sides of Galata Tower, around the Municipal building (1880s) and on the northern sides of Galata (1890s).¹¹ These fires brought about some major changes in the road scheme, urban texture and architectural features of Galata. Furthermore, the reorganization and reconstruction of the urban patterns damaged by these fires were made in accordance with new planning rules, and this contributed to the physical change and development of the Galata.¹² As a consequence, the urban texture of Galata underwent constant change throughout the century due to the impact of disasters, administrative arrangements and variations in its social structure.

Examining the Changes to Galata During the 19th Century

The method described in the first part of this paper will be used to examine the urban changes that took place in Galata in the 19th Century. In this context, the schemes obtained from the maps will be analyzed and compared with each other under two main titles: “The Changes in the Road Scheme of Galata” and “The Changes in the Urban Texture of Galata.” Thus, the arrangements and changes related to transportation can be put forward, and conclusions can be made about the changing situations of figure-ground perception and open-green space distribution.

Three maps were used in this study. Of these, the d’Ostoya and Huber Maps were drawn in the second half of the 19th Century, and the Goad Map was prepared at the beginning of the 20th century when the Ottoman Empire still provided continuity for mapping and planning activities. Particularly in the second half of the 19th Century, cadastral maps started to be prepared after questions of ownership increased in importance. Another factor regarding the increase in cartographical activity is the necessity of identifying the houses, and plots damaged by fire and those maps were beneficial in the matter of determining ownership and property lines after major conflagrations.¹³

¹⁰ Tekeli, *İstanbul’un Planlanmasının ve Gelişmesinin Öyküsü*, 47.

¹³ Kayra, *Eski İstanbul’un Eski Haritaları*, 69.

The first map is the 1:2000 scale d'Ostoya Map. It is often considered more important because it was drawn during the period before the Great Pera (Beyoğlu) Fire (1870). It shows the area between Galata and Taksim, and contains details of the blocks, buildings and building materials. The d'Ostoya Map also includes monumental buildings such as towers, mosques, churches and embassies, and furthermore one can understand the road pattern and the distribution of the open and green spaces from this map.¹⁴ According to the d'Ostoya Map, wooden buildings were concentrated on the western side of Galata Tower and were the dominant element of that part of Galata's urban pattern. It also shows dense masonry buildings on the southern side of Galata Tower and an overall urban pattern determined by the ancient walls. Moreover, the road network contains a large number of cul-de-sac, and most of the buildings have gardens. The building density decreases and the amount of open-green spaces increases further towards the western side of the Tower (Figure 3).

Figure 3: G. D'Ostoya. *Map of the Galata, Pera and Pangaltı and the detailed study area*: [İstanbul: 2017]

Towards the end of the 19th Century, the 1:1000 scale Huber Map of Beyoğlu and Galata, dated 1877, was drawn.¹⁵ It contains details of buildings, roads, monumental buildings, trees, empty spaces and plots. This map was drawn for insurance companies rather than for urban planning requirements.¹⁶ However, it shows how the urban texture was influenced by the Great Pera Fire (and several smaller fires) at the end of the century, as well as the spatial effects of the Sixth Municipality's activities. When the Huber Map is compared to the d'Ostoya Map, it can be seen that most of the cul-de-sac had been opened and the transportation network had wider streets. Furthermore, by the time of the Huber Map, the ancient walls of Galata had been demolished, and the urban pattern inside the walls had been re-designed. Moreover, large squares had been opened in Şişhane and Karaköy, the building density had increased, and the shoreline had gained a different appearance due to new arrangements (Figure 4).

¹⁶ Tekeli, "Haritalar", 559.

Figure 4: R. Huber. *Map of the Beyoğlu and Pera and the detailed study area: [İstanbul: 2017]*

The third map examined in this study is the 1:600 scale insurance map of Beyoğlu and Galata which was drawn by Goad between 1904 and 1906. This map contains details about the urban texture such as buildings, building usage, construction techniques, materials, walls, windows and roof types, and includes both public and monumental buildings.¹⁷ The Goad Map contains almost the same road scheme as the Huber Map, but the wooden building stock shown in the d'Ostoya Map has been replaced by brick and stone buildings. Furthermore, the map indicates changes to the distribution of open spaces, urban pattern and the shoreline (Figure 5).

¹⁷ *ibid*, 559.

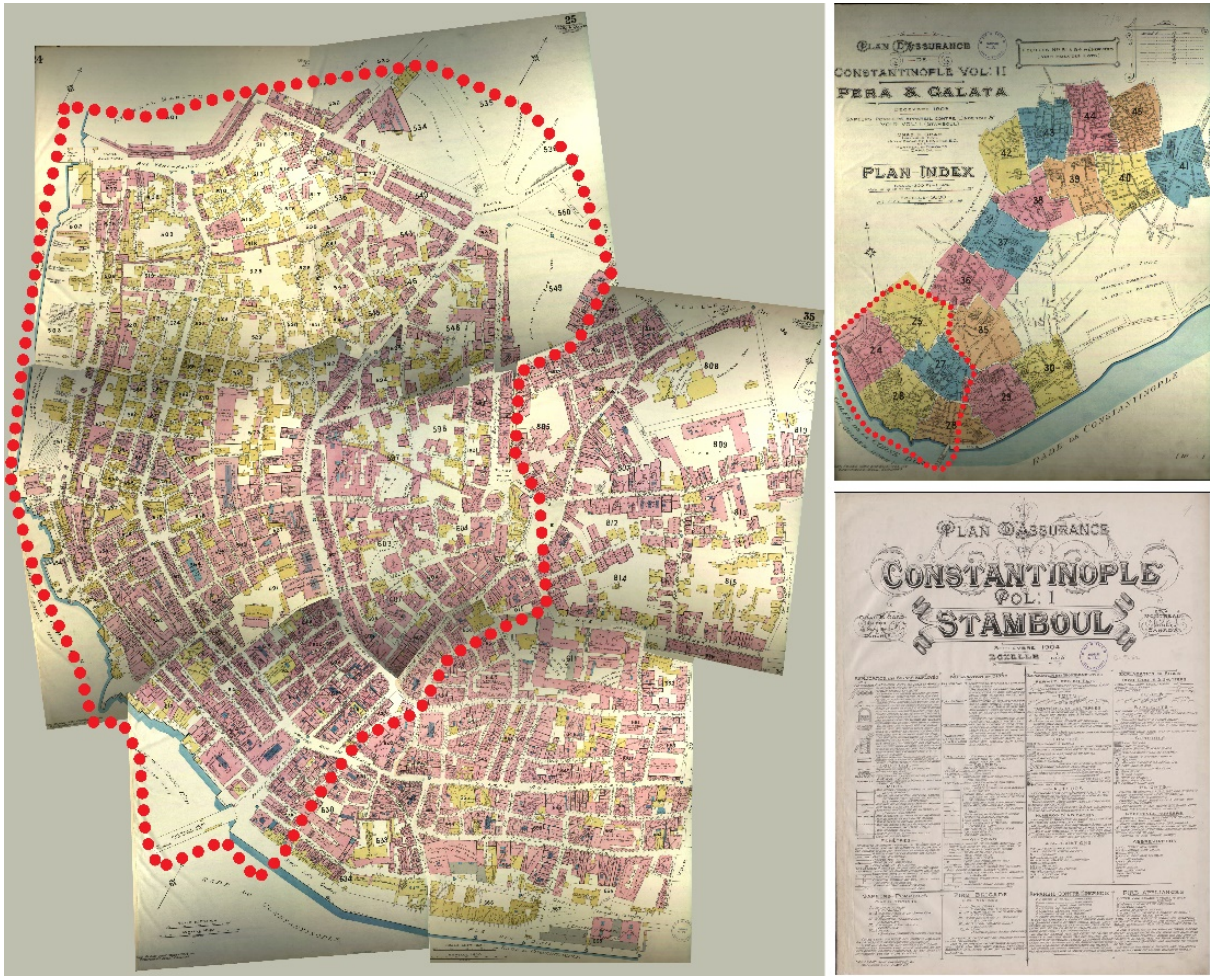

Figure 5: C. E. Goad. *Map of the Pera and Galata and the detailed study area*: [İstanbul: 2017]

The Changes in the Road Scheme of Galata

The most important and notable changes in Galata are those made to the transportation structure. The road texture in the d'Ostoya Map (Figure 6-a) is a mostly organic pattern that has lots of cul-de-sac. However, the Huber Map (Figure 6-b), has fewer cul-de-sac and shows a hierarchy regarding the road texture between main and other roads. On the other hand the Goad Map (Figure 6-c), shows a road scheme that consists of two main arteries in the east-west direction and secondary roads which are connected to them.

Due to the increased commercial activity in Galata, the need to expand the road network emerged, and investments to connect the settlement to the other side of Golden Horn were made throughout the 19th Century. During the reign of Sultan Mahmud II, two bridges were built. The first was the Unkapanı Bridge, which was built to connect Azapkapı and Unkapanı, and the other was the Galata Bridge, which was built in 1845. The original Galata Bridge was built with wood and served the citizens for 18 years. It was replaced with a wider wooden bridge in 1863 and finally in 1878, it was replaced by a permanent iron structure.¹⁸ It is possible to see the Unkapanı and Galata Bridges in the schemes of Ostoya, Huber and Goad Maps (Figure 6-a, 6-b and 6-c).

The expansion of the road network in Galata was not limited to the construction of bridges but also included projects which were implemented by the Sixth Municipality. The most radical of these was the demolition of the Galata walls and the design of new streets and settlement areas such as Yenikapı, Şişhane, Büyük Hendek, Boğazkesen and Galata Streets.¹⁹ The demolition of the walls also made it possible for the municipality to carry out some transformation projects. For instance, Mumhane Street, was one of the most dilapidated areas of Galata, but it was transformed into “one of the most beautiful streets”.²⁰ It is also possible to observe all these changes in the urban space from the maps. In the scheme of the d'Ostoya Map (Figure 6-a), the walls of Galata are still standing.

¹⁸ Çelik, 117.

¹⁹ Tekeli, 78.

²⁰ Çelik, 95.

However the walls are not present in the scheme of the Huber Map (Figure 6-b), and there are new streets and settlement areas where the city walls stood. Although according to the scheme of the Goad map (Figure 6-c), a small part of the walls still remained, when this is compared the situation in the mid-19th Century (Figure 6-a) it is clear that most of the walls have disappeared. This is a consequence of the demolition activities which began in 1864.

Figure 6: Schemes of Galata according to old maps using the methods integrated to Geographic Information Systems (ArcGIS 4.1 Software): (a) Ostoya Map, (b) Huber Map, (c) Goad Map

Another significant change affecting the road scheme and urban fabric in Galata was the design of squares which were implemented by the Sixth Municipality. The first one is Şişhane Square, a focal point located at the intersection of several main arteries which has a feel of European urban design projects, enhanced by the Sixth Municipality building which stood at its centre.²¹ Şişhane Square does not exist in the scheme of the d'Ostoya Map (Figure 6-a), but it can be seen in the scheme of the Huber Map (Figure 6-b). The final version of the square is shown in the scheme of the Goad Map (Figure 6-c).

The second square implemented by Sixth Municipality is Karaköy Square, which was created at the foot of the Galata Bridge in 1858. It was created in response to the changes in Karaköy that were due to the increasing population and commercial activities. The square was intended to prevent confluence in the area and to facilitate police inspections.²² In the scheme of the d'Ostoya Map (Figure 6-a), it is possible to see the first instance of this square. The Huber map (Figure 6-b) shows the situation of the square at the end of the century, and the nearest situation to that of the present day can be seen in the scheme of the Goad map (Figure 6-c).

²¹ *ibid*, 59.

²² *ibid*, 91-92.

The Changes in the Urban Texture of Galata

The factors that led to changes in the texture of the Galata in the 19th Century can be grouped under two headings. The first is the area's intense urbanization, and the second is the destruction caused by fires. As a result of the rapid urbanization, the empty spaces in 1840 in Galata filled up in the 1870s, and the built environment expanded to the north and north-west in the early 20th century.²³ This situation can also be seen clearly throughout the schemes in Figure 7. According to the scheme of the d'Ostoya Map (Figure 7-a), large spaces and green areas are located in the northern and western parts of Galata. However, in the scheme of the Huber Map (Figure 7-b), these green areas are replaced by buildings, and there is a visible decrease in the number of empty spaces. The situation at the beginning of the 20th century can be seen from the Goad Map (Figure 7-c). According to this scheme, the built parts are more dense, and there are fewer open and green areas.

Figure 7: Schemes of Galata in terms of built environment and green areas according to old maps using the methods integrated to Geographic Information Systems (ArcGIS 4.1 Software): (a) Ostoya Map, (b) Huber Map, (c) Goad Map

The rapid urbanization of the 19th Century also affected Galata's shoreline. In this period, the warehouses of merchants, coffee houses, boat houses and some mansions existed along the Galata coast, but the dominant factor was the commercial activities of the Greek merchants.²⁴ It is possible to see the increasing construction along the shoreline from the schemes in Figure 5. In the scheme of the d'Ostoya Map (Figure 7-a), there is a small built-up area on the west side of the seashore near the Unkapanı Bridge, and the buildings are concentrated closer to the Galata Bridge. However in the Huber Map (Figure 7-b), the built-up area sprawls along both the western and the eastern parts of the shoreline. The most remarkable form of this situation is shown in the later Goad Map (Figure 7-c).

²³ *ibid*, 35-36.

²⁴ Şehsuvaroğlu, 133.

The changes to, and developments of, the urban fabric not only occurred due to the urbanization but also because of several enormously destructive fires. Since Beyoğlu and Galata had kept their wooden urban fabric until the mid 19th Century, the urban pattern experienced large-scale change and transformation processes after each fire.

As previously stated, 3000 buildings were damaged in the 1870 Beyoğlu (Pera) Fire which was the largest fire occurred in the 19th Century.²⁵ Apart from this great fire, many others also affected Galata. Dozens of houses and offices were burned on Yüksek Kaldırım Street in 1860, and a fire which affected the whole Kemeraltı neighbourhood broke out in 1865. The Galata Fire of 1874, which actually started in Tophane, affected Galata Street as well and destroyed more than 300 buildings.²⁶ Because of these fires, the urban fabric shown in the scheme of the d'Ostoya Map (Figure 7-a) changed in terms of the transportation network, building order and figure-ground situation. The Huber Map (Figure 7-b) shows new and wider roads, and new squares and blocks with open spaces. These radical changes and designs could only be undertaken in the aftermath of these fires.

The fires that affected Galata continued throughout the 1880s. As a result of a fire in 1887, the buildings, constructed on new plots between Büyük Hendek Sokak (between the Galata Tower and Şişhane Square in the east-west direction) and the Şişhane Square Municipality building was demolished. In 1888, the buildings on Şair Ziya Paşa Street (between Galata Tower and Şişhane Square in the north-south direction) were damaged by another fire.²⁷ In order to understand what kind of changes these fires caused to the urban fabric, it is necessary to compare the schemes of the Huber Map (Figure 5-b) and the Goad Map (Figure 5-c). It is possible to determine that although the main axes remain the same, there are changes in the routes of some alleys. In addition, in some affected areas, the roads have expanded, and small squares have appeared. Moreover, according to the scheme of the Goad Map, in some parts of the urban pattern, the configuration of buildings has turned to a more discrete form when it is compared to the scheme of Huber map. Another detail of the Goad map scheme is the appearance of fire hydrants located on the main roads, representing the fire prevention measures taken at the beginning of the 20th century.

Conclusions

Beyoğlu and Galata were the areas most effected by the westernization that occurred during the 19th Century. Galata became an important commercial centre during this period, and continued to grow in parallel with the development of Beyoğlu. It lead the field regarding administrative innovations, urban development, infrastructure and transportation implementations, and these developments accelerated its urbanization process. As a consequence, the urban pattern of Galata changed and transformed. The most prominent of these changes occurred in built-up areas and transportation links. The designs of new roads, settlements and squares, the construction of bridges, the arrangements of open-green spaces and the shoreline, together with the fires which broke out periodically during the century have been the main factors responsible for shaping the urban texture of the area.

The changes that took place in Galata's urban texture during the 19th Century can be revealed by using three maps which were prepared between 1850 and 1906, and GIS. The clearest conclusion to be made in this context is that Galata was subject to rapid urbanization in which the processes of change, transformation and reconstruction were intertwined. The urbanization that took place in Galata had both negative and positive aspects. Galata, which had a reputation as a commercial centre, became the centre of contemporary urban planning and design which produced a similar infrastructure and similar social services as European cities. Despite these positive effects, as a result of the radical arrangements and urbanization process, some historical structures such as the ancient walls were almost completely destroyed due to a lack of understanding of urban conservation. On the other hand, the urban pattern which originally had a less intense built-up area with more open-green spaces, evolved into one consisting of more adjacent blocks. Thus, both positive developments, which emerged through urbanization and improved infrastructure, and negative ones, in terms of conservation and effects on the natural environment, occurred together in Galata.

At the Late Qing Dynasty and the Early Republic of China, the ancient Chinese city was gradually transformed into a form that closes to a city with modern significance in terms of nature, the concept of construction, the management system and the spatial structure. Since the Western powers had previously dominated the global capital trade model and implemented the urban planning and construction paradigm, most of the modern Chinese learned and imitated the western models when they re-planned the original Chinese city areas. From the main source of imitation, it contains three categories: the concession, Japan, Europe and the United States. From the practitioner of imitation, most of them are politicians, social reformers, intellectuals with western culture and overseas Chinese with advanced notions. Their understanding and longing for the western urban planning laid the foundation of the transformation of China's modern urban planning. Based on relevant historical materials and existing researching literature, this paper analyses the process of understanding, imitating and implementing in modern China's urban planning practice between 1860-1927 so as to make it clear that the particularity and universality in the birth and formation of modern Chinese urban planning.

Keywords: Planning history, Urban planning practice, Western imitation, The exchange of planning ideas, Modern China

Introduction

The period of Late Qing and the Early Republic of China was the transition phase from Chinese traditional cities to modern cities. After the defeat of the Opium War in 1840, China was forced to be involved in the development of the world capitalist economy and to shake the traditional Confucian values that have been formed in China for thousands of years. With the tide of China's opening to the outside world and the rise of advanced productivity, a batch of coastal and littoral port cities took the lead in developing into industrial and commercial cities and drove the rise of traffic, industrial and mineral cities as well as the transformation process of traditional cities.¹ Such a revolution has actually opened up the process of the modernization of Chinese cities, and the force for the revolution comes from two mutually opposite subjects: One is foreign settler, as forerunners, they constructed concessions and leased territories and colonized cities in order to operate Chinese market; The other is rejuvenated Chinese people, as latecomers, they have established self-operated trading ports and constructed new markets and new cities (in order) to resist the impact of foreign capital. According to historical researchers, China (Chinese people) who lack of modernization experiences was extremely puzzled when facing such a new administrative unit—Urban— especially in terms of administrative organization, planning for construction, and management system, etc. Actually, in order to construct the so-called modern city in their mind, they not only explored by themselves but observed, researched and selectively simulated the Western practices².

The modern time in China was generally begun on the Opium War of 1840³, however, for the modern urban planning of China, it actually began in 1860, and the construction of municipal facilities such as building roads in Shanghai was taken as the prototype of modern city planning in China⁴. After continuous efforts and exploration, until the establishment of the Nanjing National Government in 1927, Chinese modern urban planning has entered an institutionalized stage⁵. In this paper, the period of the late Qing Dynasty and the early Republic of China was mainly concentrated between 1860-1927. This period is not only the transition period of traditional Chinese cities and ideological concepts but also the birth and breeding period of modern city planning in China. At this stage, under the constant impact of Western material and spiritual civilization, the Chinese people continue to think and explore the mode of modernization that suits the Chinese cities themselves and has a different understanding of the West⁶.

What needs to be emphasized is that the West here is actually the West in the eyes of the Chinese people, and it is not a specific geographical concept but refers to an external, new knowledge system compared with the Eastern philosophy system. In addition, the Chinese understanding of the West in modern times was actually a dynamic

development process, and It has been constantly changing under the circumstances that were defeated by the Western invaders and the continuous infiltration of western capitalist economy and culture. From the rejection of the West in the early 19th century to the acceptance of the West in the 1920s, China has been going through a long time. Since the Opium War of 1840, “first, technologies affecting material existence; then principles concerning state and society; and finally, ideas touching the inner core of intellectual life. The Self-strengthening Movement of the T’ung-Chih [Tongzhi] period, the reform movement of 1898, and the May Fourth Movement of 1919 marked the climactic points of these three stages”⁷. As part of the influence of western culture, modern urban planning in China was continuously introduced and implemented in this historical context.

Based on relevant historical materials and existing research literature, this paper analyzes how the Chinese (government) learned and imitated the knowledge of Western urban planning at the period of late Qing and the early Republic of China(1911-1949). From the imitation perspective, this paper tries to construct a basic framework for the history of urban planning in early-modern China which could be divided into three parts: (1) Imitating Concession: The renewing planning for old urban areas and the planning for self-opening trading port; (2) Imitating Japan: Nantong, Kunming and other cities’ planning; (3) Imitating Europe or America: Guangzhou, Shantou and other cities’ planning.

Imitating Concession

After the Opium War(1840), due to the economic and trade invasion of foreign colonizers, foreigner’s residence, also being called the concession⁸, appeared in coastal areas and along rivers in China. The earliest concession was obtained in 1843 by the United Kingdom in Shanghai, and then Western countries successively established concessions in cities such as Shanghai, Xiamen, Guangzhou, Tianjin, Zhenjiang and Hankou by the time of the Boxer Rebellion (1902). These Western-style blocks have become ‘windows’ for contacting Chinese and western cities and their municipal construction techniques⁹.

In 1865, 26 roads had been built in Shanghai’s public concessions, which were designed in a chessboard layout and formed a network of urban main road. At the same time, the concession also developed road cleaning management and road public facilities, and it has become a neat, clean and advanced Western-style block, which is different from the very beginning of “a mudflat, number of huts”. The concession, with its neat and flat roads, modern carriages and streetlights, is presented to the Chinese people of Shanghai in its advanced posture, so that they think that the difference between the concession and the Chinese community is too huge and even felt “the roads to the concession are flat, while the Chinese communities are in turmoil”, and even marvels at the difference between them just as heaven and hell”¹⁰. In order to change the worse sanitary conditions, they attributed the construction advantage of concession to urban engineering and practically absorbed public works construction and public health among them¹¹.

In Shanghai, from the 1860s onwards, Shanghai taotai(道台) and Shanghai county magistrate(知县) began to imitate the concession of municipal management methods to improve the Chinese territory.¹² In the 1890s, the Chinese territory became more and more decayed, even becoming an important reason for Cross-border road construction in the concession. Therefore, it has become imperative to emulate the West and concession to improve the Chinese territory.¹³ In December 1895, the Nanshi Road Engineering Bureau was established by Qing Dynasty and began to construct the first road in Nanshi, that is Nanshi Waimalu (now Zhongshan South Road). The construction and management of Nanshi Road Engineering Bureau directly imitate Municipal Committee and Shanghai Land Regulations. In 1905, Shanghai Merchants Yu Huaizhu and Li Zhongyu established the General Engineering Bureau Inside and Outside of City. This organization was set up entirely in accordance with the concession system, and continuously improve the municipal modernization of the Shanghai Chinese territory¹⁴. At the same time, the construction of municipal projects in other regions of China continued to develop under the influence of the concession and Shanghai. In 1894, Zhang Zhidong built the first modern road in Nanjing, which is basically the same as the technical structure of the Shanghai concession road. In 1905, Zhang Zhidong set up the Hankou Road Engineering Bureau in Wuhan, which is specially used to improve the traditional street and ally in Wuhan¹⁵.

Because of the high cost and slow effect of old city renovation, the Chinese (government) began to develop new urban areas according to the Western model. After the Sino-Japanese War, in order to self-strengthen to save the country, boycott foreign colonizers, and safeguard its sovereignty, the Qing government imitated the concession to carry out the planning and construction of self-opening trade ports. In 1898, Zhang Jian set up Wusong Opening Port Engineering Bureau and begun to build the road and develop the land by imitating the operation mode of concession. In 1900, Zhang Zhidong opened a commercial port in Wuchang, established Market Bureau, hired a British engineer Murray to map and draw a full map of Wuchang commercial port(Fig. 1).¹⁷ In 1904, Jinan has opened the commercial port, the local authorities in Shandong immediately set up General Commitment of

Trade Port, which consists of Engineering Bureau, Patrol Police Bureau and Adjudication Hall. At the same time, it also elaborated *Jinan Self-opened Commercial Port Regulation*¹⁸.

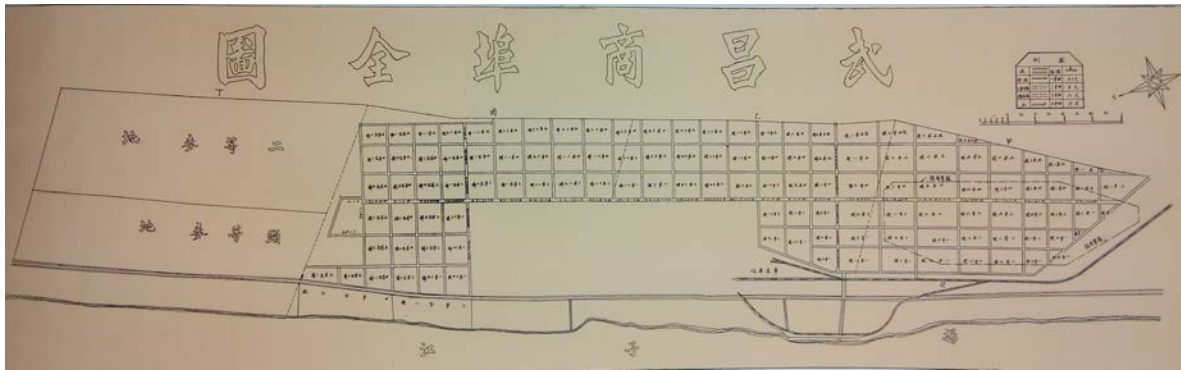

Fig.1 The New District Plan of Wuchang

It can thus be seen that the Western concession has brought about a certain demonstration effect in the construction of Chinese cities. In particular, the opening and construction of the Shanghai Concession triggered the imitation and learning of the concession by the Shanghai Chinese territory, which has led to the development of urban planning, such as road and other municipal infrastructure, and has brought modern urban civilization and urban modernity.

Imitating Japan

The modern Chinese urban autonomy movement originated from the learning and reference of the Western urban autonomy system. During this process, Japan became the most important source of imitation, and the person who accepted or contacted with western culture and education are foreigners from the West. They introduced and spread autonomy system, while the minister of the late Qing Dynasty were those who had mastered political rights to practice.¹⁹ In 1905, the five great ministers visited the United States, Europe, and Japan to inspect institutions of foreign countries and compared them with China. After returning China, they thought that some urban planning matters such as landscape, dwellings, ditch and road all belong to the task of autonomy system. They also clearly proposed to imitate Japan carrying out autonomy system and to establish modern public space gradually such as libraries, museums, zoos, and parks, etc²⁰.

In 1903, Zhang Jian travelled to Japan and conducted a 70-day inspection of Japan. He witnessed the tremendous changes that Japan's Meiji Restoration brought to Japan, including industry, education, urban planning and construction and political systems, which triggered his idea to imitate Japan and began to implement the grand vision of overall improvement in Nantong²¹. In July 1906, Zhang Jian organized a surveying and mapping class at Tongzhou Normal University, inviting Japanese teacher Miyamoto to teach courses, which contained mapping surveying, flat-panel surveying, needle surveying, levelling, practice and drawing. In 1908, Nantong established the Surveying and Mapping Office to map the entire city and carried out large-scale urban construction and planning, specifically including establishing of road construction office (1912), creating modern transportation, development urban electricity and lighting, protecting the old city and constructing new city, establishing modern communication agencies, building city parks and road, planting trees, etc. With the efforts of Zhang Jian, Nantong was eventually built into a model urban in modern times²².

In 1902, Yuan Shikai drew lessons from Western and Japanese political systems to implement the New Deal and established General Administration of Engineering imitating Dutong yamen (都统衙门), and this organization was mainly responsible for the road, river, bridge, wharf, house, land, electric light, street, trees and so on. In conjunction with the New Deal, Yuan Shikai first promoted local autonomy nationwide and compiled a plan for the construction of the Hebei New District in Tianjin. In 1903, Yuan Shikai approved the *Developing the Hebei New Market Constitution* (开发河北新市场章程十三条) which was drawn up by the General Administration of Engineering, and the field that east to the railway, west to north canal, south to the Jinzhong River and north to Xinkai River was delimited as the new area (Fig. 2). The new district built a grid-like road system and arranged government offices, schools, parks, factories houses, and also built an iron bridge to connect with the old city.²³

In addition to institutional imitation and learning, planning theories like Garden Cities were also spread to China through books, newspapers, and overseas returnees.²⁴ In 1919, Tang Jiyao, the governor of Yunnan Province, who graduated from Imperial Japanese Army Academy, set up Yunnan Municipal Government Office to govern the province and organize the province's municipal administration. In the spring of 1922, in order to realize the modernization of Kunming's construction intentions, Tang recalled Zhang Wei-han, who was studying in Japan, to

organize Kunming's municipal administration. In the spring of 1922, in order to realize the modernization of Kunming's construction intentions, Tang recalled Zhang Weihan, who was studying in Japan, to organize Kunming's municipal administration. In July, the Legal Affairs Committee composed of Zhang Weihan and others studied the construction of municipal facilities in Guangzhou, Beijing and Wuhan, and imitated the *Provisional Regulations of Guangzhou Municipality*(*广州市暂行条例*) in 1921 to draft the *Provisional Regulations of Kunming Municipal Government Office*(*昆明市政公所暂行条例*). In August, Kunming Municipal Government Office was established. The establishment of the office provided a platform for the western garden city theory that Zhang Weihan studied through Japan to develop in Kunming, and it has become the first planning practice of the application of garden city theory in modern China.²⁵

Fig. 2 Planning of Tianjin Hebei New Urban Road Network

Under the influence of the Sino-Japanese War, activists such as the rulers of the Qing dynasty and advocates of the Westernization Movement began to dispatch ministers to investigate abroad, send overseas students to Japan, employ foreign teachers from Japan and teach courses, etc., accelerating the process of modernization in China. In addition, after the 1909 *regulations of local autonomy in villages and towns*(*城镇乡地方自治章程颁布*) was promulgated, the urban construction activities had an institutionalized program, which also promoted the dissemination and practice of urban planning knowledge throughout the country, invisibly accelerated the modernization of the city and the transformation of urban space.

Imitating Europe and America

Due to the official young children studying in the United States policy in the late Qing Dynasty and the decision of repaying the boxer indemnity of the Qing Government in the Way of developing education in the United States, a large number of students went to the United States to learn Western technology and culture. By the 1920s, the latest achievements and practical experiences of European and American urban planning and planning education have gradually been introduced into China by students studying abroad and foreign experts, bringing modern European and American urban planning theories and systems to some degree.²⁶

After 1920, Guangzhou imitates the United States to establish a municipal system, promulgated the *Provisional Regulations of Guangzhou City* (广州市暂行条例), and became China's first modern city with an independent municipal government. In 1921, in order to improve the living environment of the Old City, the Guangzhou City Hall and the Works Bureau implemented the "municipal improvement" and guide the development of Guangzhou's early "garden city" and the eastern suburbs through the exemplary construction of new residential areas, building the eastern suburbs as a model residential area along the Baiyun Mountain. In November, 1923, the Guangzhou Municipal Administrative Committee passed the resolution *Opening up Guanyinshan Park and Residential Areas* (开辟观音山公园及住宅区办法), which become the first implementation plan of garden residential area in modern China. In 1927, Lin Yungai succeeded Sun Ke as mayor and continued to promote the planning of new residential areas, and Cheng Tiangu was appointed as the director of the Works Bureau. On March 33, 1928, the *Constitution of Building a Canton Model Residence Area* (筹建广州市模范住宅区章程) and design drawing (Figure 5) were promulgated and implemented by the *Committee of Building Canton Model Residence District* (筹建广州市模范住宅区委员会).²⁷ At the same time, in 1921, Sun Ke invited the American architect

Fig. 3 Map of Guangzhou City Model Residential Area

Henry K. Murphy to design the Guangzhou municipal centre and then put forward the concept of Chinese classical renaissance²⁸.

In April 1921, with reference to the Guangzhou municipal system, Guangdong provincial government set up the Shantou city hall. There were six bureaus contains finance, engineering, education, public welfare and public security. In accordance with the conditions of the seaport, the Bureau of engineering set up three sections for construction, banning and embankment, and the modernization of Shantou was carried out. In 1922, the Shantou City Hall drafted the *the New Plan of Swatow Municipality*(*汕头市政厅改造市区计划书*) and planning drawing(Fig. 4). The plan is free from the improvement plan that was mainly characterized by building roads and demolishing of the city wall, and more shows the scientific rationality of modern urban planning and has become the earliest planning text developed by Chinese (government). In order to improve the appearance of the old city, the plan consciously uses the Garden City as a guiding ideology; the zoning plan is guided by the functional zoning plan of Europe and the United States and linked urban zoning with urban industrial and commercial development.²⁹

Before the establishment of the Nanjing National Government in 1927, the practice of modern urban planning in China for European and American imitation and learning was carried out by students studying in Europe and America and foreign experts. In particular, after the establishment of the Guangzhou municipal system in 1921, the city planning management and development agencies of the Ministry of Labor and Industry were truly separated after which modern urban planning theory and practice have actually started to develop universally in China.

Fig. 4 New Plan of Swatow Municipality in 1923, approved by K.Y.Xiao.

Conclusions

Based on prior analysis, it can be seen that ancient Chinese cities had transformed into a form that close to a city with modern significance in terms of the nature, the concept of construction, the management system and the spatial structure after the construction of the period between 1860-1927. The traditional Chinese cities were used as a tool for political rights, and the urban system developed along with the national governance system. What's more, the urban planning and construction in the traditional period is essentially a tool for maintaining feudal governance services.³⁰ Therefore, the urban and urban planning in the traditional Chinese period was influenced by the thoughts of *Zhou Li*(周礼), *Guan Zi*(管子), *Feng Shui*(风水), etc. The characteristics of oriental traditional philosophy were reflected in the site selection, city planning and spatial layout, etc. and Formed a traditional urban

spatial structure symbolized by the city wall, Yamen Office(衙署), Chenghuang Temple(城隍庙) and Lifang(里坊).³¹ Since modern times, etiquette ideology has been greatly weakened in traditional Chinese culture. The increase of modern urban population, the expansion of the city scale, and the change of the nature all urgently require the improvement of the urban environment, especially the traffic conditions, the demolition of the city walls, the widening of the streets, the addition of new roads and the construction of residential buildings and industrial and commercial buildings different from traditional forms, etc. have become the main contents of the modernization process of Chinese cities. It can be said that the Chinese city, through the imitation and practice of the Western planning system and technology at the stage of the late Qing Dynasty and the early Republic of China, the urban nature of China has begun to transform from a traditional city centered on politics and military to an industrial and commercial city; The city's management system is transformed from urban and rural integration to the urban independent; The urban spatial structure changes from a closed urban ritual space to an open and orderly urban modern space.

In addition, along with the Chinese people's ideological changes in treating western cultural knowledge, as well as the influence of media such as newspapers and translation books, Chinese people's cognitive process towards Western science and technology knowledge have gone through the following process of rejection, recognition acceptance, learning and imitation and exploration. Urban planning practice of this period was more as a part of municipal construction, the Chinese (government) saw urban planning (municipality construction) more as a way to achieve prosperity, strength and self-improvement during Late Qing Dynasty and the Early Republic of China, combined with the actual conditions of Chinese cities, they have continued practicing and exploring the path to modernize the city that suits China itself.

Heritage value attribution: the case of Sítio Alagadiço Novo – Fortaleza, Ceará

Marina de Castro Teixeira Maia*, Inês Martina Lersch**

* Master student, Federal University of Rio Grande do Sul, Postgraduate Program in Urban and Regional Planning, marinactmaia@gmail.com

** PhD, Professor, Federal University of Rio Grande do Sul, Postgraduate Program in Urban and Regional Planning, martina.lersch@ufrgs.br

This work aims at retrieving the historical trajectory of *Sítio Alagadiço Novo* – Fortaleza, Ceará – birthplace of the romantic writer, José de Alencar. Having never before been considered under the yoke of a scientific investigation, *Sítio Alagadiço* is currently suffering from the lack of attention and use by the surrounding community. By assuming that the relation between cultural heritage and community is a matter of value attribution, it is essential to understand the paths which led to this conflicting situation. Therefore, we seek to retrieve the property's history since the arrival of the Alencar family up to the time it was heritage-listed by the National Historic and Artistic Heritage Institute (IPHAN). Some of the questions raised throughout the process include: is the importance of the place due to the figure of José de Alencar and his literary heritage? What are the values assigned to it? Has the idea of upgrading the property as a historical asset come from the community? These questions guide the content of this paper. We intend to pursue the valuation process within its historical context and therefore reflect upon the inconsistency perceived between such valuation and the treatment currently given to the property.

Keywords: Sítio Alagadiço Novo, Fortaleza/CE, Value Attribution, Social Imaginary, Cultural Heritage.

Introduction

This work aims at retrieving the historical trajectory of *Sítio Alagadiço Novo* (the references “ranch” and “*Sítio Alagadiço*” will be henceforth used) in Fortaleza, Ceará, Brazil. The *Sítio* was the birthplace of the romantic writer José de Alencar (1829 - 1877). Having barely been considered under the yoke of scientific investigations, *Sítio Alagadiço* is currently suffering from the lack of attention and use by a portion of the surrounding community. By assuming that the relation between cultural heritage and community is a matter of value attribution, it's essential to understand the paths, which led to this conflicting situation. Therefore, we seek to retrieve the property's history since the arrival of the Alencar family up to the time it was listed by the National Historic and Artistic Heritage Institute (IPHAN).

Concerning the organization of this work, it is divided into six sections: (I) approach to the evolution of Fortaleza as a city in order to insert the *Sítio Alagadiço* in a broader historical framework; (II) about the site; (IV) the property and its relation with the Alencar family; (V) discussion on the value attribution to assets (V) a reflection upon the *Sítio Alagadiço* embracing all these matters is proposed. It's important to say that studies about heritage value attribution on the *Alagadiço Novo* Historical Site do not exist until now. So that is knowledge gap to which this paper is addressed to.

Fortaleza: general overview of a historical evolution

The importance of going through the historical evolution of Fortaleza is justified by the inconsistency perceived between the ascension of José de Alencar as Patron of the city and the late cultural development of the community. The city history is marked by the neglect from the European settlers at first – the city did not seem to have much to offer neither visually nor financially as nothing was planted or extracted. As stated by Andrade,

until the middle of the nineteenth century, [Fortaleza] was only a small cluster, unlike Recife and Salvador, which, since the colonial period, were important urban centers, due to the economy of sugarcane. Fortaleza only became the main urban center of Ceará in the second half of the nineteenth century, thanks to its role in the commercialization of export products, especially cotton, whose appreciation in the international market rose during the War of the Secession in the United States.¹

In this way, the city has a recent history as it is conspicuous that the captaincy of Ceará was abandoned after the discovery, not having plans or considerable purposes addressed to it by the Portuguese crown. The dry climate, the hostile indigenous population, resistant to the acculturation, and the absence of ores and other natural resources delayed the urbanization of Ceará, which started only in the 1700s through the cattle breeding practice. The tracks of the cattle crossed the outback and the first urban settlements² emerged from the conjunction between these paths and watercourses. The livestock production in Ceará lasted until the late 18th century.

The 19th century was marked by great political changes at the national level – the arrival of the Portuguese crown and the independency were two of them, and for Ceará, especially for Fortaleza, they determined the beginning of a new economic cycle: the cotton production cycle. *Vila do Forte*, as Fortaleza was first known, became the capital of the province in 1810 and its port assumed the role of shipping point of the product to the international market. Nevertheless, until the mid-19th century, the city wasn't more than an incipient cluster of houses³ (Figure 1). The cotton gets to be the most exported product from 1850 to 1885⁴ but the passage to the 20th century, however, marks the decline in the exportation of the product.

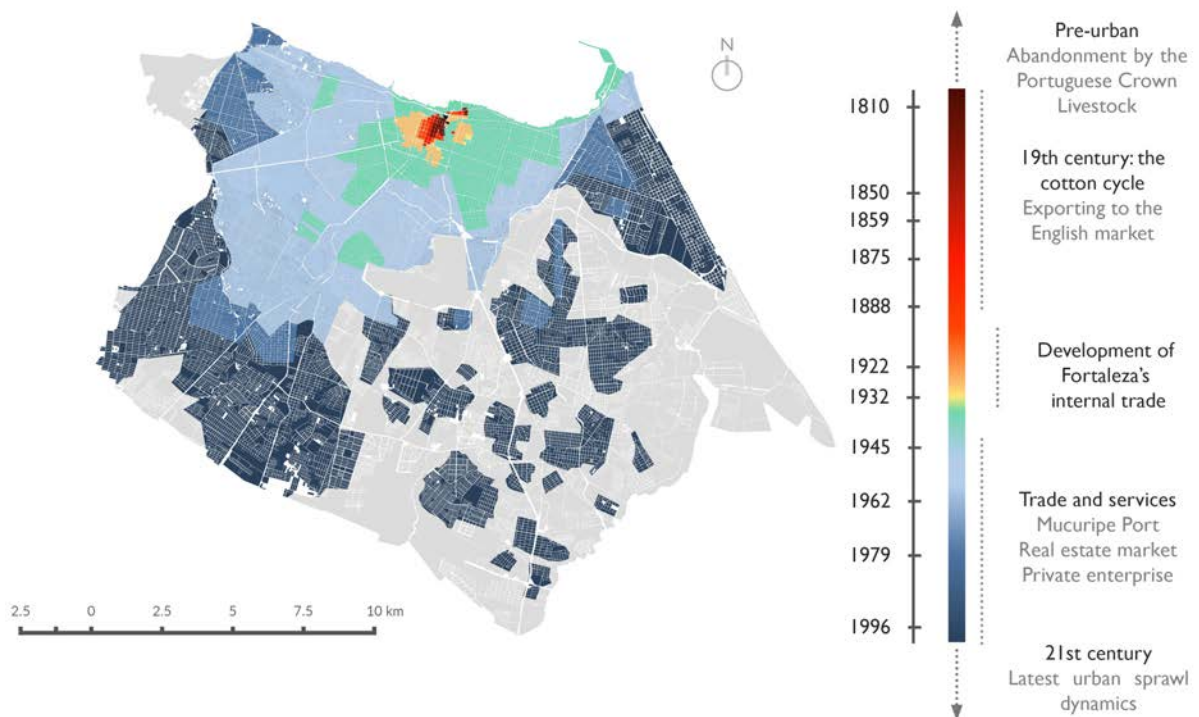

Figure 1: Map of the progressive urban occupation within the time and economic cycles. Source: Designed for the course of Geoprocessing and Urban and Regional Issues by the authors.

In the 20th century, since the 1930s, there was a faster occupation growth of the areas that today constitute the modern city, driven by private initiative. The construction of the Mucuripe port, in 1938 by decree of President Getúlio Vargas, broadens the importation processes, developing the commercial network and creating a economic cycle, which aimed at new growth vectors and the creation of centralities. The last of these processes was the occupation of the southeast sector of Fortaleza, consolidated only by the end of the 1990s, the exact location of *Sítio Alagadiço*.

Nowadays⁵ Fortaleza is considered an imposing capital, known for its tourism and having been financially developed through the commerce. But, as seen, it was not until the first decades of the 20th century that the situation started to change. Thereby, we shall ask: how would a society whose population was not higher than 80.000 inhabitants in 1920⁶ and which had always presented one of the highest illiteracy rates of the country⁷, adopt a hero of the literature such as José de Alencar?

From the facts exposed, we can already extract and emphasize that Fortaleza gets to the 20th century in need of elements which work as social cohesion connections in the community and which promote the creation of a strong identity for the city; it is possible that José de Alencar could have been chosen as one of these connections⁸, disposing his own name and characters to the toponymy of the city, taking roots in the lives of the people from Ceará; this assumption might explain the metamorphosis of *Sítio Alagadiço Novo* into the envelope of a memory created by the representative discourse of a cultural elite, what ensured its preservation. In order to better understand this process, the history of the place and its relation with Alencar - is investigated.

About the site

The *Sítio Alagadiço*, one of the last green areas open to public use of the region, has approximately seven hectares of land and is completely surrounded by urban infrastructure. It's located in the José de Alencar District – in the southeast of Fortaleza, the last region of the city to have its urbanization consolidated. The Washington Soares Avenue, an important line of urban structuring through the southeast region, surrounds the place. The distance between the property and the city growth epicenter is of approximately 12 kilometres (Figure 2 and 3).

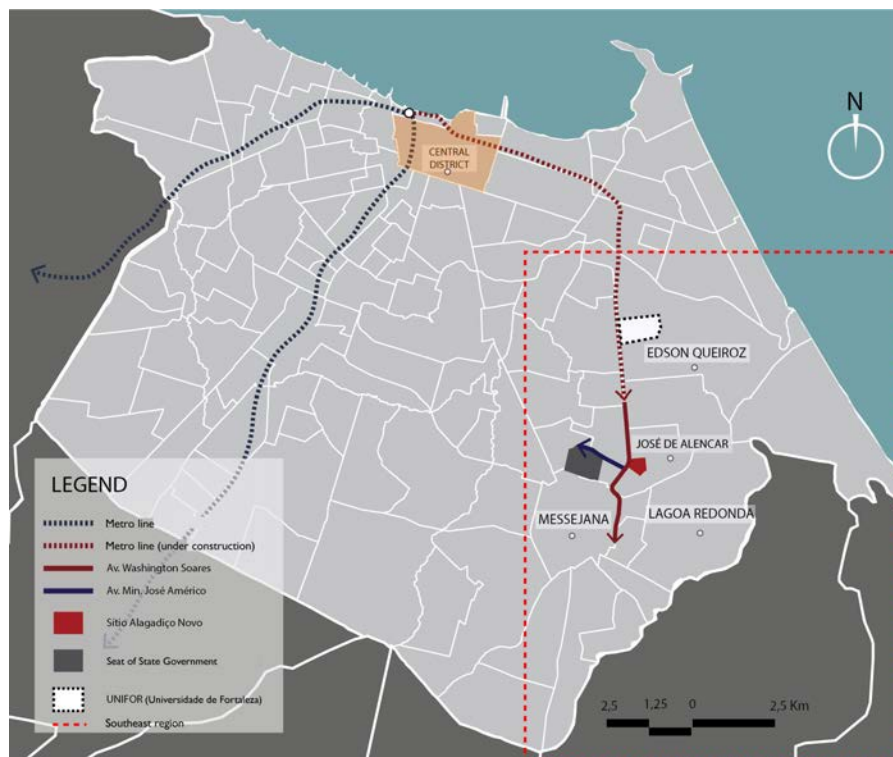

Figure 2: Location of the *Sítio Alagadiço Novo* and surrounding infrastructure [own elaboration].

Figure 3: Preserved elements from the ranch [SOURCE: Google Earth]

The set of elements marked by the Alencar family trajectory present nowadays at the location are: a small construction where the writer would have been born; the ruins of the first steam engine of Ceará State (Figure 4).

Figure 4: The historical house (left) and the ruins of the mill (right)

Besides that, there are on the site an administrative pavilion built by the Federal University of Ceará, UFC, built in 1965. The space is shared with a public school which had its lands provided by the UFC in the 1970s.

Sítio Alagadiço Novo: from the Alencar's to the heritage listing

The lands of *Sítio Alagadiço* are what remains from a larger area, acquired by José Martiniano de Alencar, priest and politician, one of the five sons of the groundbreaking Bárbara de Alencar and the José de Alencar's father⁹. Martiniano arrived in Fortaleza years after turbulent political upheavals in the city of Crato – south of the state of Ceará – three of which were spent imprisoned along with his siblings and mother – the family was part of the Alliance of Ecuador, a secession movement of republican nature. Released in 1825 by the official regime, Martiniano married Ana Josefina de Alencar. The couple established in the lands of *Sítio Alagadiço*, located at that time, in Messejana, approximately twelve kilometres away from Fortaleza.

At the time of the acquisition of the property, Messejana was called *Vila Nova Real de Messejana*¹⁰. The village, which is nowadays a district of Fortaleza, originated from the indigenous community called *São Sebastião de Paupina*, controlled by the Portuguese crown and created in 1607 with the arrival of the Jesuit priests Francisco Pinto and Luis Pernambuco¹¹. The community was led to the category of village in 1760, through Royal Letter, when it started to be called *Vila Nova Real de Messejana*. The history of *Sítio Alagadiço* is, therefore, deeply connected to the development of this region. Besides the bucolic scenery of the ranch, there are the ecosystems composed by flooded and swampy areas. This fact led the priest to name the place as *Sítio Alagadiço Novo*¹². After the family was settled, the priest began the sugar cane production within the ranch and its surroundings. Despite the short-term longevity, the product guaranteed periods of substantial wealth and allowed the construction of the first steam engine of Ceará state¹³.

On May 1st, 1829, the firstborn and heir of Alencar's family intended to fame is born: José de Alencar lived at the ranch as far as he was nine years old, when he travelled to Rio de Janeiro. At that moment, José Martiniano, the father, resumes his political career as a senator while his son commits to his studies. Meanwhile, the ranch remains under the possession of the family until the last heir of Martiniano (his daughter Joaquina Carolina). The city evolved and the urban mesh advanced. Even though the southeast region was the last one to consolidate its growth within the physical transformation process of the city, the dismemberment process of the ranch occurred long before. The *Sítio Alagadiço*, as well as other great properties of the region originated the current districts of this area of the city¹⁴.

The first initiative considering the ranch's protection is found in the exchanging of official letters between the architect José Liberal de Castro and Rodrigo Melo Franco de Andrade, in 1962, as head of the SPHAN (*Serviço de Patrimônio Histórico e Artístico Nacional*), now called IPHAN. In those letters, they discuss the possibility of making a plea on behalf of the property protection¹⁵. However, only two years after that the heritage listing process is suddenly established, that is to say, in 1964, same year in which by then President of Brazil, Humberto de Alencar Castello Branco, intermediates the expropriation of the remaining lands in the ranch by granting them to the UFC, episode described by the rector Martins Filho¹⁶. On behalf of the protection of such relic from the state of Ceará, the president proposed to the rector Martins Filho to foster it. In 1965, once the land expropriation of eight hectares was sealed, the construction of an administrative pavilion of the UFC started. The place was opened, precisely on the occasion of the centenary of the book "Iracema"¹⁷, written by José de Alencar, along with the celebration of the ten years of the Federal University.

It's possible to notice that in 1964, the heritage listing process only accepted José de Alencar's house, apart from the rest of the property, and only in 2012, in order to protect the ranch from the damages caused by the time and the lack of specialized care, the IPHAN, through process number 01458.002242/2008-98 expanded the "heritage listing process from the house to the remaining areas of the ranch where José de Alencar was born, Messejana, a municipal area of Fortaleza, state of Ceará" (OFFICIAL GAZETTE of April 20th, 2012). Therefore, the legal protection imposed by the IPHAN embraces, nowadays, the elements previously mentioned, described as it follows: the historical house, the ruins of the mill, the pavilion of the UFC and the whole area of the ranch.

Value attribution under the creation of an urban mythology

The values theory, by Alois Riegl, applied to the monuments was one of the great turning points on the refinement of the cultural heritage concept at the beginning of the 20th century. By dissociating the notions of Art and History, the author of *The Modern cult of Monuments 1903*³⁶ observed the art object not only under its aesthetic aspect or its design technique, but also under its production historical context. Riegl innovated by classifying and – in the sense of the discussion previously presented – attributing values to the monuments (he proposes the interpretation of the monuments under the following values: seniority, historical, commemorative, usefulness, artistic, innovation and the art relative value).

The *Sítio Alagadiço Novo*, based on the monuments classification proposed by Riegl, is an unintended monument: the subjective values which are assigned to it do not originate on only one author's work (e.g. the artistic values deliberately engrained on a paint by its painter) as in the case of the intended monuments. Considering the unintended ones, the values are conferred by us, individuals from today who analyze the property in the present days.³⁷

According to Castricola¹⁸, the value attribution is fundamental for the identification and preservation of the cultural heritage. Therefore, we ask: what were the values attributed to *Sítio Alagadiço* at the time of its heritage listing process? Who granted them? Going back further: What is a value? How does the value attribution process work and what is its integration within the culture based on?

The search for the essential meanings begins in the semantic sphere of "value", according to Houaiss dictionary, the word is related to quality, merit, importance, legality or legitimacy¹⁹. It's an abstraction that

qualifies an object, whether it's concrete or ideal. In the field of Philosophy, the discussion engendered by Comte-Sponville dissociates two categories: the economic values and the spiritual values which "are out of any market – with no equivalents, price or possible change"²⁰.

To Comte-Sponville, the values are created by human desire and within those, the moral and spiritual values cannot be found in the market. They are irreplaceable. The author states that evaluate "[...] is not measuring a value that existed before the evaluation; it's measuring the value that is given to what is evaluated, or to create value as we measure it"²¹. In this same terms, on his values theory, Reale also points out the creation of a "should be" by the man, that is to say an ideal quality that we assign (create) to the natural or ideal objects²². This characteristic of the "should be", as Reale's theory analyzed by Martins (2008), comes from the search for the perfectibility essential to human life, what directly involves cultural issues, namely the aspects from the scope of expressions and productions of the man, area where we find the world heritage. For Reale: "[...] the values, deeply accomplished, irradiate as they evolve through the historical cultural world."²³

It would appear, then, that there is an intimate connection between the value attribution process and the range of expressions of the man – the universe of culture. Within this process, the objects are evaluated according to the "essence" or "qualities" inferred by us, the individuals of today. At this point, according to Martins, it's important to emphasize Reale's statement, that the major experiences for the value process of a society can't be narrowed to the "prime daily experiences of this or that specific individual, but to the different understandings about the reality that ruled each historic stage or era, which will be named as 'civilizations' with its related 'axiological constellations' "²⁴. It means that there is a set of values specific to a certain age and/or society. This "axiological constellation", which is a social and historical construction, when added to the system of ideas, image representation, beliefs and symbolisms representative of this society, composes what Pesavento understand as imaginary. According to the author, the imaginary may be something more real than the actual conditions of existence and may also "organize the actions of individuals, prompt social practices and legitimate situations."²⁵

Pesavento points out that the imaginary "[...] is part of a representational area and, as an expression of thought, arises through images and discourses that intend to give the reality a definition."²⁶ As a result, it's vital for the present work, to discuss the problem of the manipulation of what becomes a value and, consequently, of what becomes imaginary for the civilizations. For Baczkó²⁷, according to Pesavento, not least because there are no doubts whatsoever in terms of the possibility of control and management over the imaginary to different extents, within this manipulation process. This is the essence of her observation:

We would be, therefore, in the face of a new ingredient: the manipulation which would play with the collective dreams and the strengths of tradition inherited from a timeless routine, recreating myths, beliefs and symbols [...]. Nonetheless, it's unquestionably important to have in mind that specific expressions and interests interfere on the creation process of the collective imaginary. It must not be forgotten that the social imaginary is one of the regulatory powers of the collective life, standardizing behaviors and guiding profiles suitable for the system.²⁸

At this point, we get to a crucial question for the study: might the creation of a mythical atmosphere within the social imaginary be able of legitimating the value creation within a given community? Can these values, on the other hand, drive the local public policies? Following this reasoning, it's important to elucidate that the term myth will be used within its historiographical meaning, scope in which, according to Cirne Lima, indicates "[...] a discourse of definition and justification" meaning to pursuit the multiplicity of the events in order to better understand them within a unit, as a history²⁹.

In his lecture of *La ville et les Mythes* (The city and the myths)³⁰ Alain Cabantous talks about the progressive creation of the image of the corsair Jean Bart as a kind of founding character for the city of Dunquerque, a hero. Cabantous declares:

If we consider that the myth is an imaginary construction (narrative, representation, ideas) related to the cosmic or social phenomena" elaborated according to the fundamental values of a community that pursues its cohesion, it's possible to quickly understand the necessity of first investigating the reasons for which the attachment process of this phenomenon was conducted.³¹

Cabantous also states that the urban mythologies are real "offspring of the crises", in the sense of being a result, most of the times, of the contexts in which there is the need of creating social cohesion bonds, they are caused by the breakdown or weakness of the local identities. The mythology would arise, thus, as a pursuit for affirmation of the city which, in this regard, draws upon "characters essential to its state and protection", that is to say, of the "heroes".

With that in mind, would it be possible to state that the figure of José de Alencar could be classified as a cohesion bond, as well as the heroic figure of Jean Bart for Dunquerque? This work draws upon to the historical context to search for principles to the value attribution to the property. It's pondered, as it follows, on the possibility of a mythic construction in the city of Fortaleza, which is believed to have become a "symbolic political appeal"³².

The myth of José de Alencar under the preservation of *Sítio Alagadiço Novo*

In the case of *Sítio Alagadiço*, it can be inferred by the contents of the historical process that led to the occasion of its heritage listing, that it's not unreasonable to say that it was especially due to the value attribution of memorial, historical and cultural nature to the property. The ranch is registered on the books of Historical and Archaeological Heritage Listing, Ethnographic and Scenic.

Therefore, it is undeniable that the instituted protection was fundamentally supported on its historical importance connected to José de Alencar. Another point that deserves attention is that, due to its odd nature, the protection claiming process of *Sítio Alagadiço* wasn't – as far as it's known – subject of popular mobilization. Hence, our hypothesis is: the protection under discussion was related to the glorification of the writer by a small part of the local elite.

Alencar, an unquestionably strong and formal character, would have been a defining element of urban identity of a community which didn't have considerable social bonds. Therefore, a collective imaginary was established and the protection of *Sítio Alagadiço* was legitimized under the designation of "José de Alencar's house". It's important to say it's not a "witch hunt" or an ideological disruption. The great importance of the character under discussion is understood, however, it's important to enquire about the paths that led to the establishment of what is today understood as collective memory and cultural heritage. For this reason, as Pesavento says:

Under no circumstances is it intended to reduce the social imaginary to ideology, nor to oppose to this set of intentions and socializations of deliberated ideas the rescuer and rebel potential of the utopia. There is no space for manicheistic positions which reduce the complexity of the social context and the diversity of representations possible that it embraces.³³

With that being said, it's important to list some facts about his insertion in the collective imaginary of Ceará, which contributed to evoke this consideration (Figure 5):

- (I) The José de Alencar theater, architectural icon of the capital, was built and named by the municipal administration in 1910;
- (II) The José de Alencar square, former Marquês de Herval square, received in 1929 a bronze statue of José de Alencar, followed by the name modification of the address years later;
- (III) Praia de Iracema district: formerly named Praia do Peixe, had its name changed in the 1930s.
- (IV) The most famous statues of Iracema in the Capital are from 1965 (statue of Mucuripe); 1996 (Iracema beach) and 2004 (Messejana lagoon);
- (V) José de Alencar district, where *Sítio Alagadiço* is located, was known as *Alagadiço Novo* up to 2007. The change occurred through a law project by the councilor Fátima Leite on December, 26th, 2007.

It's possible to notice two aspects from the facts presented: the initiative to perpetuate the writer's image as a figure intrinsically from Ceará, came from the public administration of the city and the most famous toponymy, instituted until the 1930s, contrasts with the facts presented before about the city: Until the 1930s, Fortaleza, entering less than one kilometer from the waterfront and was composed by a population, in general, of illiterates.

Figura 5: Map of Fortaleza's toponymy inspired in José de Alencar and his work. [own elaboration].

The following hypothesis is stated, thus: Fortaleza had the need, until the mid-20th century, of the creation of an identity that reinforced the bonds, created a more cohesive social unit and made its economic and administrative sedimentation possible as a city. The famous figure of Alencar would have worked perfectly as a stimulating element for the process, since both the writer and his work were emblematic enough to raise as myths in a fragile recent society. That was how the protection of *Sítio Alagadiço*, ground zero of the author's life, was legitimized.

Conclusion

This paper sought to understand the historical trajectory of *Sítio Alagadiço Novo* – Fortaleza, Ceará and to answer three important questions. Answering the first question that guided the content of this paper, it is possible to understand that the importance of the place is due to the figure of José de Alencar and his literary heritage. In light of the foregoing, the hypothesis defended proposes that the process was part of a real construction of a discourse guided by the figure of a hero, meaning that a mythic atmosphere was erected around the figure of José de Alencar, which was communicated through the creation of monuments, public tools and toponymy insertion - which was relevant to Fortaleza and connected to the name and the work of the writer. Despite of that, it was observed that his father, José Martiniano de Alencar, was also so important for the city as the writer. But the traditional history seems to have forgotten of that as Martiniano isn't even reminded in the site value attribution process.

About the second question, it can be stated that the values assigned to it are the historical and the memorial ones. The importance of José de Alencar for the literature and for the national culture is not in denial here, the present work does not aim at raising doubts on its credit and dimension. The conclusion reached here is that there is a fact inoculated on Fortaleza's imaginary, which is: José de Alencar is son of the land, hero and the great patron of Ceará state, despite the few times he actually went to his homeland.

Finally, it is verified that the idea of upgrading the property as a historical asset didn't come from the community. On the contrary, it was first a cultural interest about the small house by the institution SPHAN in 1962 and then a political interest as seen by the role played by the President Castello Branco, in 1964. It was only between 2008 and 2012 that the whole site was protected with regard to its archaeological, symbolic, touristic, architectural and landscape values through the IPHAN recognition.

In view of the foregoing, the production of this work was, hence, justified by the omission, up to the present, of the recovery of the history of *Sítio Alagadiço Novo*. For the institutions linked to its maintenance, such as UFC and IPHAN, it is believed that this work can provide knowledge to facilitate the management of the site and the exaltation of the values contained in it that has been essentially forgotten by Fortaleza's population.

Particularly to the urban planning, a field to which the knowledge of city's transformation is, or should be imperative, this work is also justified insofar as it can illuminate future interventional measures in the peculiar territory of Alagadiço Novo, territory in which forces as different as the real estate market and the safeguarding of the city's cultural heritage coexist.

⁸ It's relevant to comment that the reputation of José de Alencar in the political and cultural environment of Rio de Janeiro/São Paulo was already notorious in the mid-19th century. Known by his literary creations published in newspapers from Rio as *O Correio e Diário do Rio*, Alencar goes back to Fortaleza in 1847 for only just two months in order to endeavor his application as deputy. At the time, the writer stayed at Sítio Alagadiço, visit about which he writes on his biography entitled "How and why I am a novelist".

⁹ Bárbara de Alencar took part, along with her family of the Alliance of the Ecuador, a revolutionary, republican and separatist movement, led by her son Tristão Gonçalves Alencar Araripe. 57 **Western Planning in Asian Treaty Ports / GUHP***

Western Modernity Interwoven with Chinese Traditions: Lives and Identities of an Emerging Cosmopolitan Society in Late Nineteenth Century Shanghai

Hang Lin (Hangzhou Normal University)

Decreed by the Treaty of Nanjing, which in 1842 brought the First Opium War (1839-1842) to an end, Shanghai was designated one of the five Chinese ports to be opened to Western trade. Thanks to its position at the mouth of the Yangzi River that served a huge surrounding basin right at the center of China, Shanghai became the preferred place of residence for foreign merchants and entrepreneurs and rose to a major economic and financial center in East Asia in the mid 19th century. Shanghai's economy thrived and the people made this development possible came from various provinces of China, from the principal nations of Europe, the United States, Japan, and other Asian countries already colonized by the West. The relative importance of these communities varied from one period to another, but the barriers that separated them - languages, customs, and interests - all contributed to the fragmentation of the local society. Different practices came to be grafted onto traditional systems, modifying the way that these functioned and themselves being changed by this transplantation. Despite such fragmentation, Shanghai provided many opportunities for intercultural contacts between groups of people from vastly different backgrounds. The local society's reception of foreign novelties and the foreigners' adaption to their new place of work and living progressed more smoothly than might have been expected. This paper delves into archival documents and existing histories to examine how the unique multifaceted cultural landscape in Shanghai came into being and how daily lives of various peoples in different parts of the city - foreign concessions and the Chinese city - were shaped by this kaleidoscope. I shall demonstrate that a new cosmopolitan society, largely modeled upon the Western modernity but interwoven with traditions from various parts of China, was rapidly emerging in Shanghai in the late nineteenth century. At the same time, a distinctive Shanghai identity also began to arise in the last years of the nineteenth century. On the side of the foreigners, the pioneers of society established on the margins of the Western world gave way to longer-term expatriates who welcomed a much-improved urban environment. On the Chinese side, there were detectable signs of nascent patriotism that to a certain extent transcended them.

From Entrepot to Treaty Port: Nagasaki's Networks of Transnational Exchange and the Nineteenth Century Global Order, 1859-1899

Jessa Dahl (University of Chicago)

What happens to an international trading city when the structure of the world changes? In the mid-nineteenth century, when Japan became a semi-willing participant in the treaty port trading system expanding throughout East Asia, the city of Nagasaki went from being the central hub of international exchange in a Japan-centered international system to one of several Japanese treaty port cities in a Euro-American-centered network of exchange. While this change brought an influx of new foreign residents with a multiplicity of motivations, it also destabilized the extant systems of international exchange that had been operation for nearly two hundred years. How did Nagasaki residents, foreign and Japanese, men and women, navigate the dramatically expanding scale of international exchange during this period, and how was this transition written into the physical geography of Nagasaki itself?

This paper explores both the physical and social development of Nagasaki, and how these developments interacted with and influenced each other. Nagasaki's transition into a treaty port included the building of new foreign settlements on reclaimed land, the construction of new infrastructures throughout the city to facilitate trade, and the sometimes halting introduction of new manufacturing, communication and transportation technologies. Some of the same physical characteristics that made Nagasaki an ideal site of international exchange before the mid-nineteenth century ended up limiting its development as a modern treaty port. By combining an analysis of these physical changes with a study of contemporary social networks and transnational relationships, I will demonstrate that the changes that swept throughout the physical geography of Nagasaki had social consequences, and that the demands of transnational social mobilization on the part of Nagasaki residents in turn shaped further development of the physical space of the city. The reciprocal interplay between social and geographic space, as well as the adaption of old systems alongside the new, defined Nagasaki's identity as an international city and its engagement with a new global system well beyond its life as a treaty port.

Historical Analysis of Urban Public Transportation Development in Modern Tianjin (1902-1949)

Yili Zhao (School of Architecture, Tianjin University), Lin Feng (School of Architecture, Tianjin University), Yanchen Sun (School of Architecture, Tianjin University) and Kun Song (School of Architecture, Tianjin University)

Tianjin was the earliest city opening urban public transport lines in China. Urban public transportation had profound impacts on urban construction and on the formation of urban structure in Tianjin from 1902 to 1949. Based on the background of urban development, this paper firstly divides the evolution process of public transportation represented by tramways and buses into three periods from the perspectives of the distribution, quantity and operation status of public transportation lines. It then analyses the strong influence of public transportation on urban roads construction from the view of the increased municipal income, road widening, improvement of pavement quality, and bridges construction and maintenance. Finally, by using qualitative and quantitative analysis and superposing the related statistical data with the historical map, it analyses the relationship among public transportation line density, land value partition and basic urban structure, and certifies they were highly relative. In conclusion, the paper argues that Tianjin urban public transport network was based on trams and supplemented by buses, and not only planning ideas but also advanced municipal technologies from the West like public transportation system were also indispensable supports in the process of urban modernization in Chinese modern treaty ports.

Planning Modern Cities in China: Urban Construction Regulations of Concessions in Tianjin (1860-1945)

Yanchen Sun (Tianjin University), Carola Hein (Delft University of Technology), Kun Song (Tianjin University) and Lin Feng (Tianjin University)

Tianjin, one of the so-called Treaty Ports that opened to foreign trade under the unequal treaties was home to nine foreign concessions. In each concession, the foreign powers created urban forms and functions that mirrored practices in their respective home countries. This article explores the consecutive establishment and implementation of regulations in eight out of nine foreign concessions in Tianjin between 1860 and 1945. It firstly provides an overview of regulation types and legislative systems of the concessions. Secondly, it compares these regulations and bylaws with the ones in their home countries. Thirdly, it compares the specific cases of Tianjin concessions with each other. Finally, it places the Tianjin case in the context of other Chinese port city concessions. In conclusion, it argues that the regulations of concessions in Tianjin not only showed a strong influence from their home countries in a top-down setting, but also interacted with each other in a peer-to-peer setting. The circulation of these regulations, within Tianjin and among treaty ports in China, was promoted by governments' central control, municipal councils' intervention and individuals' movements from one place to another.

Western Modernity Interwoven with Chinese Traditions: Lives and Identities of an Emerging Cosmopolitan Society in Late Nineteenth Century Shanghai

Hang Lin*

* *PhD, College of Humanities / Institute for Hangzhou Internationalization, Hangzhou Normal University, e-mail: hang.lin@hznu.edu.cn*

As one of the first Chinese cities opened to Western trade in mid 19th century, Shanghai soon became the preferred place of residence for foreign merchants and entrepreneurs in East Asia. Shanghai's economy thrived and the people made this development possible came from various provinces of China, from the principal nations of Europe, the United States, Japan, and other Asian countries already colonised by the West. The relative importance of these communities varied from one period to another, but the barriers that separated them - languages, customs, and interests - all contributed to the fragmentation of the local society. This paper examines how different practices came to be grafted onto traditional systems and how Shanghai provided many opportunities for intercultural contacts between groups of people from vastly different backgrounds. I shall demonstrate that a new cosmopolitan society, largely modeled upon the Western modernity but interwoven with traditions from various parts of China, was rapidly emerging in Shanghai in the late nineteenth century, together with a distinctive "Shanghai identity" that shaped both Chinese and foreigners.

Keywords: Shanghai, foreign concession, urban structure, Sino-Western exchange, national identity

Introduction

When the Treaty of Nanjing designated Shanghai one of the five Chinese ports to be opened up to Western trade in 1842, the destiny of the city was sealed. Among the five ports, Shanghai rapidly affirmed its preeminence because of its position at the mouth of the Yangzi River that served a huge surrounding basin right at the center of China.¹ Within a few decades, Shanghai became the preferred place of residence for the foreign entrepreneurs who, with the aid of Chinese merchants, set up their business there. Thanks to the privileges granted by the treaty and the autonomy that the concessions acquired, the foreign residents, together with the Chinese who now settled alongside them, found themselves protected from the troubles that beset the last imperial dynasty and the fraught birth of the Republic after the 1911 Revolution.

In the late nineteenth century, almost three-quarters of Shanghai's inhabitants were not natives of the town. They had come there from the Chinese provinces, Europe, the US, and Japan. The population was fragmented into communities that had virtually no communication with each other. Provincial dialects created as many barriers between the Chinese as national languages between the Europeans. Many would describe Shanghai at this time as a patchwork or a mosaic, for the different communities and their identities changed as the economic and political circumstances did.² In the absence of a strong and unified local government, authority in such a society of largely temporary residents resided principally with organisations that represented specific regional or professional interests, chambers of commerce, clubs, guilds, secret societies, and gangs, all of which led largely autonomous lives.

This paper examines how the urban structure and multifaceted cultural landscape in Shanghai came into being and how daily lives of various peoples in different parts of the city—the Chinese city and foreign concessions—were shaped by the unique nature of the cosmopolitan society. Different practices came to be grafted onto traditional systems and the new city provided many opportunities for intercultural contacts between groups of people from vastly different backgrounds. In the mean time, a Shanghai identity also began to emerge in the last years of the nineteenth century. On the side of the foreigners, the pioneers of a society established on the margins of the Western world gave way to long-term expatriates who welcomed a much-improved urban environment. On the Chinese side, there were detectable signs of a nascent patriotism that to a certain extent transcended them.

A Town with Two Faces: The Chinese City and Concessions

Prior to the nineteenth century, Shanghai was not just "a fishing village", as one long-standing myth would have it.³ By the time of late eighteenth century, Shanghai boasted between 200,000 and 300,000 inhabitants, whose living and commercial quarters extended beyond the city wall to the Huangpu River. The inhabited area was covered with a maze of narrow streets, the most important of which, 3 to 4 metres wide, were paved with bricks

and lined by stalls. The network of streets interlaced with that of the canals, which often turned to beds of mud and rubbish periodically flushed out by floods. There was no sign of any town planning reflecting a political will or any ritual or ideologically preoccupations, as suggested by the regular grid pattern of many cities in northern China.⁴

The Nanjing Treaty signed in 1842 granted the right of residence of foreigners in Shanghai but did not make it clear where they should establish themselves.⁵ The circuit intendant (*daotai*) of Shanghai, Gong Mujiu (1788-1848), drew up the Land Regulations in 1845, which granted the British the right to install themselves in a zone measuring 832 *mu* (ca. 56 hectares), later extended to 2,820 *mu* (ca. 56 hectares) in 1848.⁶ The zone was located to the north of the walled town along the bank of the Huangpu. To the north and the south, the Suzhou River and the Yangjingbang delimited the area. To the west, the Zhoujingbang (also know as the Defence Creek) stood as the boundary.⁷ In fact, the concessions were the result of local agreements that, in the first instance, specified procedures for transferring the foreigners' land rights. Provided that an annual rent was paid to the Chinese proprietors, the foreigners could obtain perpetual rights. Thus in the course of time, those ad hoc arrangements served as the basis upon which to develop veritable colonial enclaves.

The Land Regulations explicitly expressed that no Chinese could claim ownership of land or buildings in the settlement, but they did not specify what if the buyers were Westerner but not British. The ambiguity was discovered by the French and the Americans and it soon resulted in the creation of new concessions. On April 6, 1849, a proclamation established the boundaries of the French concession: in the south it reached to the wall of the old town, in the east to the Huangpu banks, in the north the Yangjingbang, and in the west to roughly as far as the British concession. The Americans protested the creation of the French concession and they settled in large numbers in the Hongkou quarter north of the Suzhou River, which became the de facto American concession. In 1863, the American concession finally gained official recognition and a few months later it merged with the British counterpart to form the International Settlement.⁸

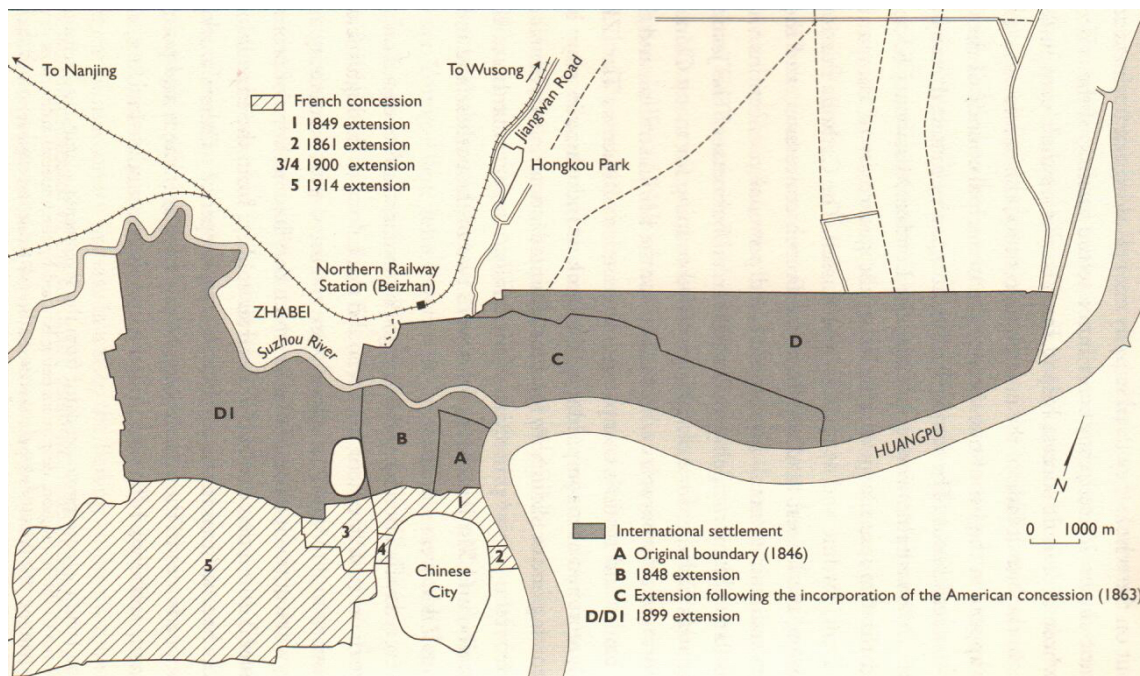

Figure 1: The foreign concession in Shanghai and their further extensions. From: Marie-Claire Bergère, *Shanghai: China's Gateway to Modernity* (Stanford: Stanford University, 2009), 90.

The quadrangular network of streets in the new quarters did not suggest any deliberate aspirations to colonial grandeur. It followed the pattern of existing waterways and paths and “reflected the preoccupations of the merchants and aimed to answer their needs.”⁹ The new quarters developed at an uneven speed, as the French and American concessions lacked far behind in infrastructure construction in the years following the opening up of the port, this land soon possessed a new looking different to the old Chinese town. The streets running from west to the east and south to north presented a stark contrast to the maze of tiny alleys in the walled town. The vast European-style residences, set in their flower-filled gardens, were erected nit far away from the cramped buildings in the old town.

Emergence of a Multicultural Community

Despite the exclusive right of foreigners to reside in the concessions, the misfortunes of the 1850s and 1860s, in particular the secret society of Small Sword (*Xiaodaohui*) and the Taiping uprising, which brought to Shanghai an unremitting series of violent disorders, looting, and repression.¹⁰ The turbulence of these days encouraged many Chinese to take refuge in the foreign concessions and soon the massive wave of immigration changed the life of foreign residents. Mansions and gardens were demolished and the concessions now mushroomed with “lane communities” (*lilong*) intended for Chinese tenants: terraced houses of one or two stories, arranged in parallel rows, with continuous built-up facade giving onto the street.¹¹ Despite the influx of Chinese residents, the concessions remained outside the imperial jurisdiction. The British, French, and American consuls shouldered the task of inventing institutions to cater to the needs of the new Sino-foreign community. From 1854 to 1864, the concessions witnessed the creation of the Shanghai Municipal Council, which later became the official governing body of all concessions, the establishment of a General Inspectorate of Maritime Customs, the merge of the American concession with the British, and the Mixed Court that adjudicated cases involving Chinese residents. A multicultural community emerged.¹²

Within this fragmented society, the major division that separated Chinese and Westerners remained. Westerners were now more numerous: about 15,000 in 1910, compared to only 250 in 1855, but they represented barely 1% of the 1.3 million inhabitants who now made up Shanghai. But their presence acted as a catalyst upon a number of social and institutional changes that would make Shanghai the first modern Chinese city. The foreign community, however, was divided by deep national, professional, and religious rifts. Although the relative importance of the British had declined, in 1910 they still made up the largest group (4,500) and also the most influential as its members still had the de facto control over the municipal institutions. Around the British establishments was an Indian community of about 1,300 individuals, most of who were employed as policemen together with some merchants from the region of Bombay.¹³ The Japanese, who began to flock in around 1900, numbered about 3,400 and they lived in isolation in the Hongkou quarter to the north of the international settlement. Next to the British, the American group was almost the same size as the French. Germans were slightly fewer, and the Russians, even fewer. The 1,500 Portuguese, mostly from Macao, formed a group apart.¹⁴ Each of these groups stressed its own cultural and religious individuality, however, the British, who were at the top of the tree and put their mark upon social relations both within the international community and with the neighboring Chinese society, set the tone. The British influence was manifest also in the daily activities, the organisation of the living environment, the development of leisure activities and sport, and the use of English as the lingua franca in the foreign communities.

Figure 4: General view of Bund, ca. 1870. Courtesy of the Getty Museum in Los Angeles [object no.: 84.XO.1356.17]. Available at: <http://www.getty.edu/art/collection/objects/208307/unknown-maker-general-view-of-bund-shanghai-about-1870/> [20 March, 2018]

The professional hierarchy reflected the national one. The most highly respected notables were the merchants and the bankers, many of them were either English or Scottish. These British businessmen had arrived as youths in Shanghai and worked as griffins before becoming bosses. The most important of them represents companies based in London or New York.¹⁵ Diplomatic staff represented a different circle of influence. Each of the fifteen or so great powers covered by the treaty system maintained a consulate-general or a representative office in Shanghai. In the last years of the empire, three consulates-general were remarkable for their competence and influence: those of Britain, France, and Russia. The small circle of professional men sometimes intersected with that of local foreign officials and, more often, with that of the missionaries. All Catholic orders and every Protestant denomination were represented in Shanghai, which was the principal center for missionaries in China. They ran many educational institutions, hospitals, printing works, and publishing houses that produced not only bibles but also translations of Western scientific works. The everyday functioning of the foreign community also depended on the presence of other Westerners, ones who did not belong to the high society of the concessions. For instance, many Portuguese were entrusted with accounting and copying work in foreign companies. Finally, the foreign community could also count on the services of several dozen prostitutes of Western origin.¹⁶

Cosmopolitan Life in the New Society

Since the mid-nineteenth century, living conditions in the foreign concessions had greatly improved. By the end of the century, the quality of the infrastructure of Shanghai equaled those of large European and American cities. The Bund was no longer a stinking towpath bordering the river but a well-constructed wharf, which now adorned banks, trading houses, and official buildings. Also cars and telephones were not rare. The British gathered in the Shanghai Club on the Bund, while the French, the German, the Irish all had their own preferred clubs.¹⁷ The British were keen on horse racing, so that a 30-hectare racecourse was built in 1861, where now is the People's Square. Theaters and balls were always celebrated by Western inhabitants.¹⁸ Those interested in literary and historical research organized themselves around the North China Branch of the Royal Asiatic Society that was set up in Shanghai in 1858.

Figure 5: The Shanghai Club in 1872. Courtesy of the Getty Museum in Los Angeles [object no.: 84.XA.614.8]. Available at: <http://www.getty.edu/art/collection/objects/141320/john-thomson-the-club-shanghai-scottish-1862-1872/> [22 March, 2018].

However, it remains a question as could it be said that the various national groups thrown together in the concessions made up a real community? For a long time, the standoffishness of the French and the national and religious particularities of other groups blocked the emergence of a wider sense of community membership and the development of a spirit of local citizenship. The Shanghai of the foreigners was from the start defined by its opposition to its Chinese environment, and this conferred upon it a negative identity. On Nov. 17 and 18, 1893, the International Settlement celebrated the fiftieth anniversary of the opening of the port. On the Bund, a streamer proclaimed “in what region of the world is Shanghai not known?”¹⁹ However, the collective memory often functioned in a somewhat patchy way. Each national group celebrated the history of Shanghai by

commemorating the part that its most distinguished nationals had played. Given the large number and the dominant position of the British, foreign Shanghai was essentially British in the general collective memory. In such circumstances, it was hard for the foreign residents of Shanghai to entertain the notion of a shared identity. The various communities continued to gear their lives to the rhythms of their respective mother countries. The French celebrated July 14; the Americans July 4. The British got together to celebrate Queen Victoria's diamond jubilee in 1897 and King Edward VII's coronation in 1901; the Germans celebrated the visit of Prince Henry of Prussia in 1898.²⁰

Closeness and complicity among the foreigners in Shanghai were forged elsewhere, in a shared sense of belonging to a pioneer community and coping with difficulties much different from in their mother countries; in the shared pleasure of freely flowing alcohol, banquets, and grand receptions. They were not ideologists, but their attachment to Shanghai and identification with it grew ever stronger as they rose to the challenges of difficult environment and created conditions for a privileged life.

The Chinese society alongside the foreign communities, on the other hand, showed another image. In the second half of the nineteenth century, Chinese population in Shanghai grew from 700,000 in 1865 to 1.3 million in 1910.²¹ The merchants from the neighboring Jiangsu and Zhejiang provinces succeeded their forerunners from Guangdong and Fujian. Landowners and scholars from Suzhou and Wuxi, bankers from Ningbo, and peasant laborers from northern Jiangsu moved into Shanghai. Most of these newcomers settled in the concessions or on their peripheries. People with the same provincial origin liked to cluster together in particular quarters and streets. In the international settlement, natives of Jiangsu made up the largest group (180,000), followed by those of Zhejiang (170,000).²² Each group was distinguished from the local population and other immigrant groups by its own dialect, its food, its rituals, and, in many cases, by its professional activities. Except for elite literate groups, very little communication took place between residents from different backgrounds. They spoke mainly, in many cases only, with their fellow countrymen from the same province or even the same district. Restaurants were classified not in terms of quality or price but according to their regional character. Regional solidarities were constructed around the native-place associations (*huiguan*). These *huiguan* protected the interests of their community, opened schools, and helped their members to find work or obtain capital.²³

“Shanghai Identity”: Combining Chinese and Western

While these multiple local cultures constituted a formidable obstacle to the formation of a Shanghai identity, a new identity was indeed emerging. At the end of the Taiping turbulence in the early 1860s, many landowners, distinguished scholars, retired officials, and powerful clan leaders arrived in Shanghai for shelter. The arrival of these elite groups, which Western historians of China often label as the gentry, tempered the dominance of the merchants, because they brought with them the prestige of their academic titles and connections, their experience as local managers, and their Confucian value. The merchants and the gentry soon found a measure of agreement, for they all indented to make the most of the economic conditions and to assume unprecedented social and political responsibilities.²⁴ Many wealthy merchants who were more exposed to contacts with the foreigners, adopted a partially Westernised lifestyle. Their horizons widened beyond China itself to encompass the outside world. Although they continued to respect Confucian precepts, they rejected some long-standing customs, such as not schooling girls and binding feet. Their culture was hybrid, as were their wardrobes, where long silk robes hang beside European-style suits.

The prestige of wealth now tended to eclipse that of education and official titles, and the pursuit of profit became more important than the practice of virtue. Major entrepreneurs gave up the idea of transforming their sons into scholars; instead, they had them educated in missionary schools or abroad to turn them into modern businessmen. Many scholars, on the other hand, combined their official tasks with entrepreneurial activities and some even abandoned public careers to devote themselves to business. The most famous case was that of Zhang Jian (1853-1926), the first in the civil service examination in 1894 who became the founder of one of the major textile factories in Shanghai.²⁵ According to the Confucian orthodoxy, scholars stood at the top of the social hierarchy and merchants at the bottom, but the two groups gradually merged together and formed a class of “gentry-merchants” (*shenshang*).²⁶ Such an integration of elite groups was not a new phenomenon, but in Shanghai this integration came about not so much on the basis of the Confucian values but on the values that merchants recognised, namely, pragmatism and modernism.

Concluding Remarks

In Shanghai, the meeting of Chinese civilisation and Western modernity took a pragmatic form. The local society's reception of foreign novelties and the foreigners' adaption to their new place of work and living progressed relatively smoothly. The adaptability and flexibility of these men injected an extraordinary dynamism

into Shanghai society. That dynamism influenced the aspirations of Chinese both inside and beyond the concessions. The existence of enclaves that eluded imperial authority offered Chinese residents the possibility of being Chinese in a new different way. It broke the monopoly over power and thought upon which Confucian orthodoxy was based and established the theoretical possibility of a dialogue between civilisations. But in reality, the communities in Shanghai were rather fragmented, in particular that of the foreigners and the Chinese. The arrogance of the foreigners and the privileges they enjoyed gave rise to the emergence of a modern Chinese nationalism that aimed to take up the Western challenge on its own terms: it aspired to economic modernisation, material prosperity, and social progress. Out of these twofold aspirations, at once modernising and nationalistic, came the initially reformist, then revolutionary movement that would eventually pull down the imperial regime in 1911.

Acknowledgements

Initial part of the paper was presented at the Third Borders & Identity Conference (BIC) held between 16th and 19th March 2015 at Humboldt University, Germany. I am grateful to Florian Riedler, Nora Lafi, and Jeanine Dagyeli for their inspiring inputs and invaluable comments on the draft of this paper. A grant from the Institute for Hangzhou Internationalization of Hangzhou Normal University (grant no.: 2017JD22) greatly facilitated the research and the writing of this paper.

Tianjin was the earliest city opening urban public transport lines in China. Urban public transportation had profound impacts on urban construction and on the formation of urban structure in Tianjin from 1902 to 1949. Based on the background of urban development, this paper firstly divides the evolution process of public transportation represented by tramways and buses into three periods from the perspectives of the distribution, quantity and operation status of public transportation lines. It then analyses the strong influence of public transportation on urban roads construction from the view of the increased municipal income, road widening, improvement of pavement quality, and bridges construction and maintenance. Finally, by using qualitative and quantitative analysis and superposing the related statistical data with the historical map, it analyses the relationship among public transportation line density, land value partition and basic urban structure, and certifies they were highly relative. In conclusion, the paper argues that Tianjin urban public transport network was based on trams and supplemented by buses, and not only planning ideas but also advanced municipal technologies from the West like public transportation system were also indispensable supports in the process of urban modernization in Chinese modern treaty ports.

Key words: Urban Public Transportation, Modern Tianjin, Tram, Roads Construction, Urban Structure

Introduction

The transformation of Chinese modern treaty ports was closely related to western planning ideas of the time. Western advanced technologies, including public transportation, also had profound impacts on urban construction. Tramcar and bus, as novel means of transportation, were introduced into China's metropolises including Tianjin successively in the early 20th century, which greatly promoted urban modernization. Tianjin was the first city opening urban public transport lines in China (Table 1). As the biggest treaty port in North China, Tianjin stepped into modern orbit with the establishment, planning and construction of concessions. To meet the expanding need on urban modernization and seek potential benefits from business, European merchants introduced tram to Tianjin. The paper explores the introduction, development and influence of public transportation represented by trams and buses in modern Tianjin (1902-1949).

First, it divides the development process of public transportation into three periods from the perspectives of the distribution, quantity and operation status of public transportation lines. The 1st period (1902-1924) started with the establishment of "Compagnie de Tramways et d'Eclairage de Tientsin" (CTDT) mainly invested by Belgian consortium (Oriental International Corporation, Overseas Bank, Second Railway Corporation, China Railway and Tram Corporation, etc.) in 1902¹. The opening of bus line set up by Chinese merchants in 1925 implied the beginning of the 2nd period (1925-1936)². And the 3rd period (1937-1949) came with Japanese takeover of tram and bus companies³. It argues that tramlines formed the basic skeleton of urban public transport network and bus lines supplemented it. Second, the article shows how public transportation promoted the development of urban road system from its contribution to municipal income, roads widening, transformation of pavement material. The foremost round of road widening in concessions was induced by the planning of tram lines and the paving of asphalt pavement also started from the road along tram route. Third, by using quantitative and qualitative analysis and superposing the related statistical data with the historical map, the paper analyses the relationship among public transportation line density, land value partition and urban spatial structure. It could be found that public transport lines greatly promoted the formation of land value partition and shift of urban centre, and the influence of trams was much deeper than that of buses.

In conclusion, the paper argues that not only planning ideas but also advanced municipal technologies from western countries like public transportation system were also indispensable supports in the process of urban modernization in Chinese modern treaty ports. The description and accurate quantitative analysis of Tianjin urban public transport demonstrates the strong influence of public transportation systems on urban construction.

The Initial Period of Public Transportation in Tianjin (1902-1924)

Tianjin was opened as a treaty port with the signing of the *Beijing Treaty*, and nine concessions were set up by western authorities successively in Tianjin. The establishment, planning and construction of concessions led to the outward expansion of urban area, the substantial increase in the quantity and length of roads, and the continuous growth of population. By 1900, the downtown area expanded by 4km², nearly equal to half of the city area in 1860, the number of roads added by 54, equal to that built during the 450 years from Ming Dynasty to 1860, the length of roads increased by 115km (measured by CAD drawings drawn by author’s team), equal to three-quarters of the city area in 1860, and the population rose more than 300,000, all of which made traditional transportation methods no longer met the needs of citizens and inspired the emerging and flourish of public transport in Tianjin⁴.

In the end of the 20th century, European and Japanese merchants tried to introduce short-distance steam railway and carriage railway into Tianjin, but both failed⁵. After seven of the members of the Eight-Nation Alliance established the Provisional Government that first used modern urban management and construction concept to manage Chinese areas (the areas governed by Chinese authorities) in 1900, European and Japanese competed to apply for the franchise of tram. “The Tramway and Electric Lightning Company” operated by Belgian Shichang Foreign Firm acquired the franchise in 1901, and then CTDI was founded one year later and inherited the business of the original company, which implied the prelude of modern public transport was officially opened⁶.

CTDI began to renegotiate with the Qing Government after the Government represented by Shikai Yuan (袁世凯) took over Tianjin in 1902, and reacquired 50-year franchise of trams and designed tramrails in Chinese areas with the signing of *Agreement for the Electric Tramways and Lighting of Tientsin* (ATLT) in 1904⁷. CTDI signed agreements with the authorities of Austria-Hungary, Italian and Russian concessions in 1905, of the French concession in 1906, and of the Japanese concession in 1907, to acquire the franchise of trams and specify tramlines in the concessions.⁸ The first tramline, “White Line”, which started from Beidaguan (北大关) and circled around the Old City (老城厢) in a clockwise direction after reaching Beiman (北门), was opened to traffic in 1906 (Figure 1)⁹. Subsequently, “Red Line”, “Blue Line”, “Yellow Line”, and “Green Line” were opened successively¹⁰.

Figure 1: *The first tram line-white line in Tianjin began in 1906.*

By 1921, there had been five tram lines (17.6km long) in Tianjin, covering the periphery of the Old City, the Japanese, French, Austria-Hungary, Italian, and part of the Russian Concessions, with four passing through the Old City and three of them passing through the French Concession, initially forming the basic structure of public transportation centering on the Old City and the French Concession (Figure 2).

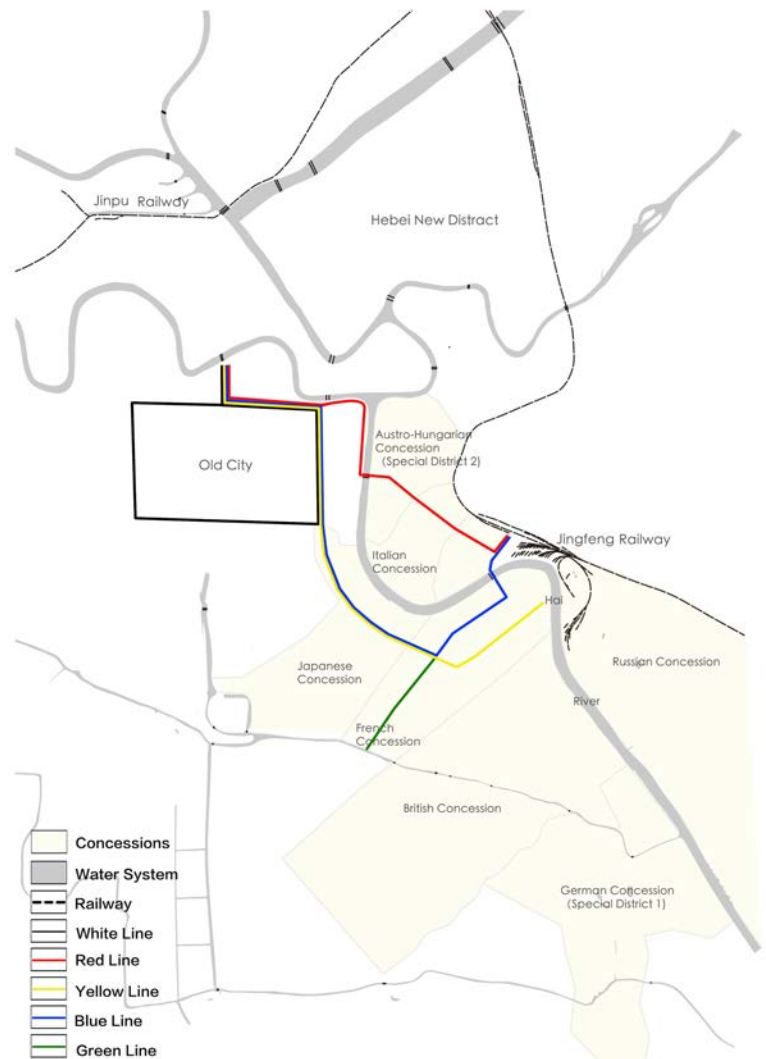

Figure 2: The distribution of tram lines in Tianjin in 1921: “White Line” (5.16km) was from Beidaguan (北大关) to Beimen (北门); “Red Line” (3.541km) was from Beidaguan to the Jintang Bridge (金汤桥), and then to East Railway Station (东站); “Yellow Line” (4.156km) was from Beidaguan to Tianjin Custom (天津海关); “Blue Line” (5.135km) was from Beidaguan to the Old Longtou Bridge (老龙头桥), and then to the East Railway Station; “Green Line” (0.969km) was from the French Church to Quanyechang. The first tram line was opened in 1906, all of the middle three lines were opened in 1908 and the last one was opened in 1921.

The Rapid Development Period of Public Transportation in Tianjin (1925-1936)

After 1925, Tianjin entered the era with two means of transportation – tramcar and bus. According to the “ATLT”, “The local authorities may buy back the whole plant after 20 years from the running of the electric tramways”. Chinese began to formally collect funds to recover CTDT from 1922 and negotiate with CTDT in 1927¹¹. Japanese growing influence on North China (华北) also made CTDT be afraid of investing in the construction of new rails (The “Flower Line” opened in 1927 was on old rails). Therefore, the most noticeable development of trams during this period (1925-1936) was the large-scale rail renovation, which began in 1927¹². The use of the new material of the track, cadmium-nickel, led to a considerable reduction in the tramcars damage rate and energy consumption, which demonstrated that tramway, as a novel kind of advanced municipal facility and technology, became more mature¹³.

The continuous expansion of the downtown and the growth of employment population made tram lines no longer meet citizen’s demand on public transportation. In the spring of 1925, the first bus line from the Old Longtou

Bridge to Dazhigu (大直沽) was opened to traffic by Tongxing Motor Company (同兴汽车公司), which was established by Chinese merchants Shutang Li and Renpu Liu, and then the second line was opened in 1929¹⁴. Afterwards, Passenger Bus Company (公共客座汽车公司), Urban Bus Company (市营公共汽车公司) and Yunlong Bus Company (云龙公共汽车公司) were founded successively¹⁵. The most influential company was Passenger Bus Company, established by Japanese businessmen, which operated three bus lines strengthening the connection between the French Concession and the British Concession.

By 1936, urban public transportation network had extended to the entire downtown area with six tram and bus lines each¹⁶. There were up to seven lines in the French Concession, which marked the formation of the urban public transportation network system centering on the French Concession. Two points can be seen from Figure 3: three of the bus lines start from tram stops and three intersect with tramlines, which implied bus lines were the extension of tramlines; and the trend of bus routes diverging from the city center to the surrounding area along the river was highly consistent with that of urban expansion, which proved that the development of bus line network was closely related to urban expansion.

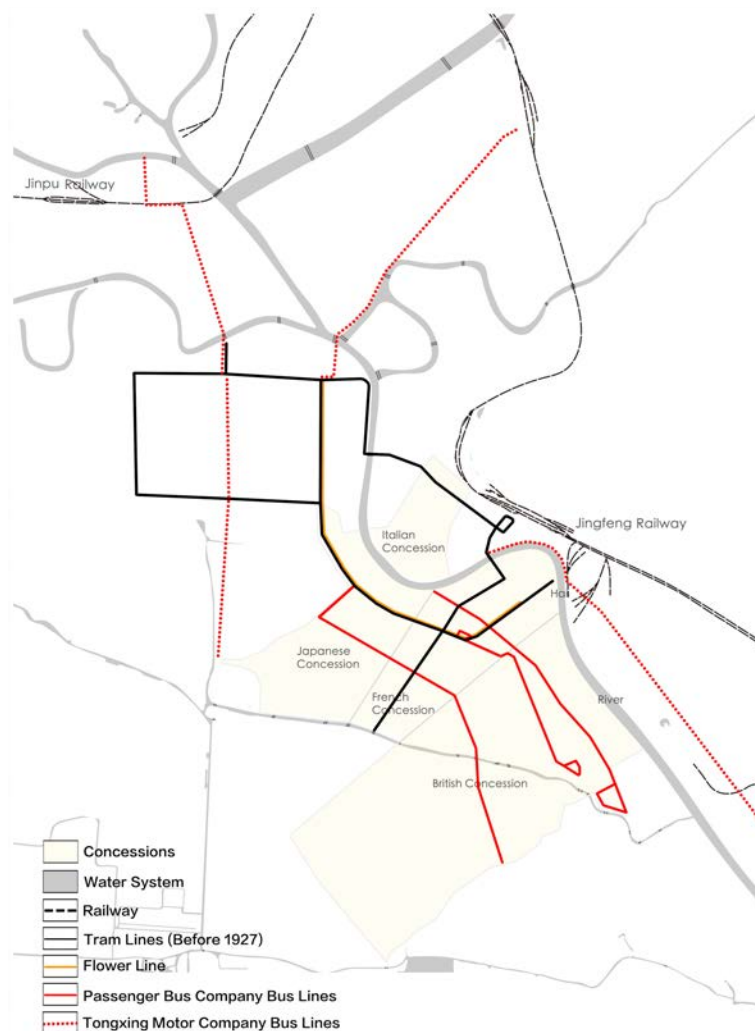

Figure 3: Distribution of public transportation lines in Tianjin in 1936: Bus lines of Tongxing Company from left to right are from Dahong Bridge (大红桥) to Haiguang Temple (海光寺), from the Northeast Corner (东北角) to the North Railway Station, and from the Old Longtou Bridge to Dazhigu; Bus lines of Passenger Bus Company from left to right are from Zhongyuan Corporation (中原公司) to Taoyuan (陶园), from National Hotel (国民饭店) to Dayingmen (大营门), and from Majiakou (马家口) to Dayingmen.

The Stagnation Period of Modern Public Transportation in Tianjin (1937-1949)

After occupying Tianjin in 1937, Japanese troops gradually took over CTDT and all bus companies. Tianjin tram business had no longer developed since Belgian businessmen lost its operation rights of tramways. By Japan's surrender (1945), almost all trams paralyzed¹⁷. Tianjin Public Bureau Tram and Bus Temporary Management

Office(天津市公用局电、汽车临时管理处) took over tram business in 1945. The Office established “Purple Line” in 1947, but tram business was still in depression and the Office suffered serious losses.¹⁸

In order to implement unified management of bus business, Japanese authorities bought all bus companies, established the Tianjin Bus Branch of the North China Automobile Company and planned 13 lines in 1938¹⁹. However, it was recorded there had been only 11 bus lines in operation at its maximum, which quickly reduced to 3 lines in 1944 due to lack of fuel and fittings, concessions blockade and serious losses, etc.²⁰ After Public Bureau Tram and Bus Temporary Management Office took over bus business, the bus operation was also poor. There were 5 lines being normally operated in May 1946²¹. Bus routes were once increased to 14 in March 1948, but most routes were quickly stopped due to gasoline deficiency and vehicles aging. On July 9 of the same year, only 5 routes were barely maintained, and 7 at its maximum after that²².

During this period, the number of public transportation lines was highly volatile for the turbulent political situation. Although occasionally increased, the duration of most lines was very short. Therefore, Tianjin urban public transport development had been almost stagnant during this period. The bus routes planned by Japanese in 1938 shows all the 13 bus lines started from tram stops (East Station Stop, Zhongyuan Corporation Stop, and French Church Stop) to urban edge areas, which proved the feature that bus lines planning was based on tramlines had become more prominent (Figure 5).

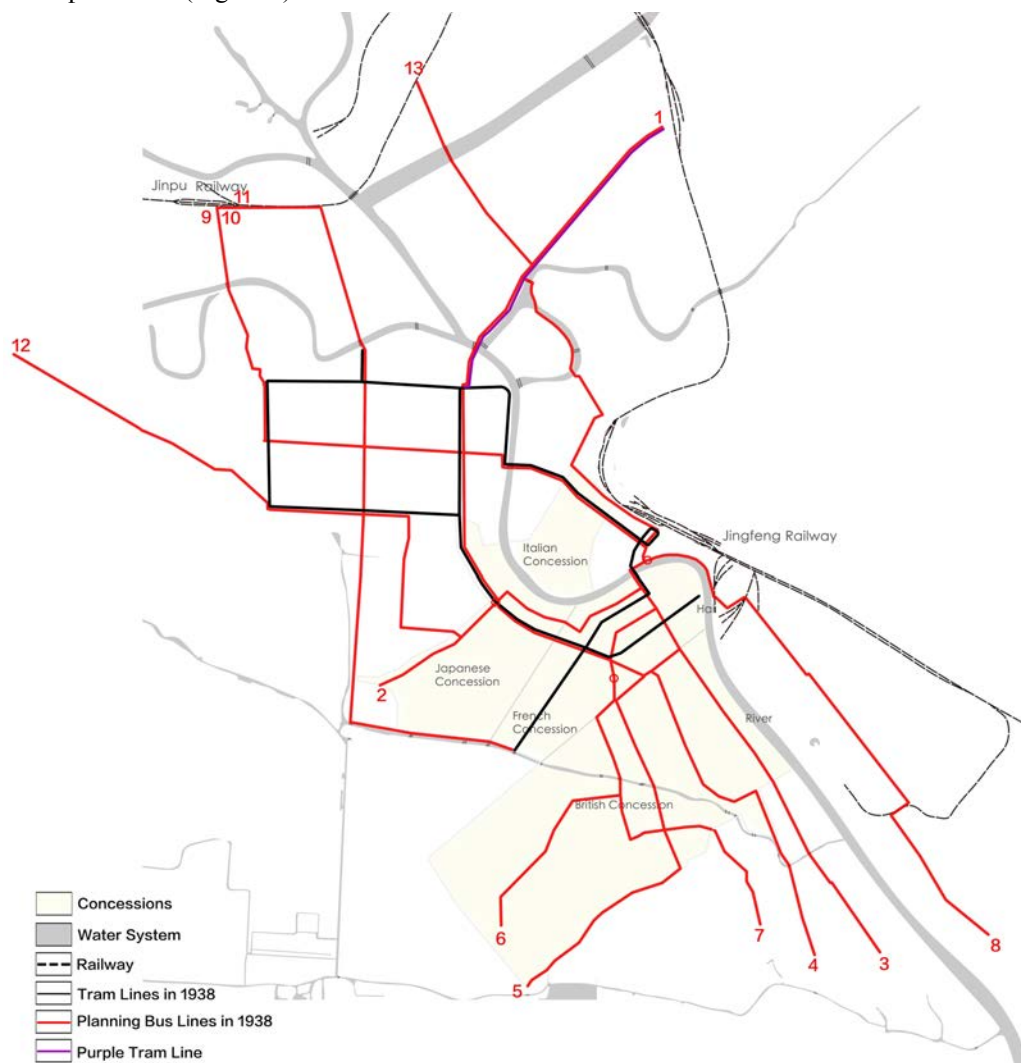

Figure 4: The distribution of tram lines in Tianjin in 1947 and the Planning Bus Lines in 1938: “Purple Line” (3.541km) was from the Northeast Corner to the North Railway Station(北站); Bus Line 1 was from the East Railway Station to the North Railway Station; Line 2 was from the East Railway Station to Haiguang Temple Street (海光寺街); Line 3 was from the East Railway Station to Xiaoliuzhuang (小刘庄); Line 4 was from Zhongyuan Corporation to Tonghuali (同华里); Line 5 was from the East Railway Station to Machangli (马场里); Line 6 was from the East Railway Station to Xiaosunzhuang (小孙庄); Line 7 was from Zhongyuan Corporation to Family Li Garden (李家花园); Line 8 was from the East Railway Station to Malu Street (马路街); Line 9 was from the East Railway Station to the West Railway Station; Line 10 was from Zhongyuan Corporation to the West Railway Station;

Line 11 was the same as above; Line 12 was from the French Church to the Hebei Third Prison (河北第三监狱); Line 13 was from the East Railway Station to Xiaoguozaung (小郭庄).

Figure 5: Quantity of public transportation lines at all phases (1902-1949): at the 1st phase there were only trams in Tianjin; at the 2nd phase bus was introduced. The number of lines continued to grow at both phases, but at the 3rd phase the number was up and down, which implied the development of public transportation was unstable.

Public Transport and Municipal Income

CTDT had paid tram tax to the Chinese and concession authorities since the tram started running. According to ATLT, “The company shall pay every year to the Local Authorities a sum equal to three and a half percent (3.5%) of the gross earnings of the undertaking before payment of working expenses, salaries or any other disbursements whatsoever”²³. Also, the concession authorities sent personnel to audit the gross earnings of CTDT every year in order to acquire the tax. It was reported that the “passing fee” paid by CTDT to the French Concession was as high as CNY 170,000 per year²⁴. Similarly, the authorities also charged the bus companies for route operation rights and taxes. For example, Passenger Bus Company paid taxes, CNY 15 every three months, to the French Concession Municipal Council in 1930²⁵. Similar to other taxes, most of tram and bus taxes were used for the maintenance and construction of roads, bridges, sewers and other public facilities.

Public Transport Development and Urban Roads Construction

The impact of public transportation on urban construction was far more than taxes. New types of vehicles had different requirements on roads because of their difference in operation method, speed and size²⁶. Therefore, the development of public transportation propelled the implementation of roads widening and improvement.

The foremost round of road widening in modern Tianjin was induced by the planning of tram lines. As the headmost roads equipped with tram in the French Concession, the original planned width of Rue du Chaylard (now Heping Road 和平路) and Rue Paron Gros (now Binjiang Road 滨江道) (the section between Rue du Chaylard and Quai Auguste Boppe) was insufficient for the implementation of the tram program. For laying rails, the French Municipal Council ordered the owners of the roadside buildings to demolish and transform the buildings to widen the roads to 16 meters in width in 1906²⁷. Rue de France (now Jiefang North Road 解放北路) and Rue de L'Amirauté (now Chifeng Road 赤峰道) were widened due to the laying of tram rails almost at the same time, but other roads without tramway laying plan had not been widened until much later. The Tianjin Map in 1912 showed that roads equipped with tram were obviously wider than others in all concessions (Figure 6). The passage of trams had also promoted the implementation of roads widening in Chinese area. The Chinese authority believed that the reason why the number of accidents increased significantly after trams were opened was the varying road width, which led to the decision of “widening the besieged roads appropriately” in 1924²⁸. Therefore, the operation of trams promoted roads widening in both the Chinese area and the Concessions.

The construction of the asphalt road started from the Italian concession, Da Ma Road along the “Red Line” in 1914, followed by Rue de France and Rue de L'Amirauté both in the French concession in 1916 and Asahi Streets (now Heping Road) in the Japanese Concession in 1919 all along tramways²⁹. The initial paving of asphalt pavement was too slow to be only paved on the roads along tramways, but the obvious advantages of asphalt pavement of low degree of wear and cost of repairs prompted Frenchmen to introduce asphalt mixing road construction technology after 1920s, which had greatly speeded up the construction of asphalt roads and further stimulated the refurbishment of other roads in the French Concession and other concessions³⁰. The construction of asphalt roads in the Chinese areas started from the East Road, where the density of public transport lines was the highest³¹. In addition, electric lights were installed leadingly on roads equipped with tram³². Therefore, the construction of trams promoted the modernization of pavement and road facilities.

Furthermore, the operation of trams was closely related to the construction and maintenance of bridges. As “Blue Line” was planned to pass through Old Longtong Bridge, CTDT took on the daily operation and maintenance costs of the bridge in exchange for its right of way and management. To lay tram tracks, Jintang Bridge was converted to a steel-beam iron bridge by CTDT, Tianjin Custom, and the Austrian Concession and the Italian Concession³³.

Figure 6: Tianjin Central District Road Network in 1912

Public Transport and Land Value Partition

The density of public transport network was closely related to land value partition. In the early 20th century, when tramlines in the French Concession was just opened to traffic, the highest price of land in the British concession was approximately 1.75 times that of the French Concession. But the highest price of land in the British Concession and the French Concession was almost the same in 1938 when tramlines had been opened for 30 years. Table 2 shows the density of public transport line in the French Concession increased much more greatly than that in the British Concession during the 30 years: the density in the French Concession was five times more than that in the British Concession by 1938. Therefore, the growth of public transport line density had positive impacts on land price. Figure 7 shows a gradually decreasing trend of urban land value from the French and British concessions to the periphery in 1938: the land price of the areas around Rue du Chaylard, Rue Paron Gros, Rue de France and Rue de L'Amirauté in the French concession, Asahi Street in the Japanese Concession, and Taku Road (now Dagu North Road 大沽北路) and Recreatin Road (now Xinhua Road 新华路) in the British Concession was the highest, followed by Nanshi Area and East Railway Station Area. According to statistical calculations, the density of public transport network was 9.2km/km² in areas, where average land price was over 1,200 yuan/acre, while the density was only 0.6149km/km² in areas where average land price was below 200 yuan/acre. It is visible that public transport network density was highly consistent with land price--the higher the density of public transport lines, the higher the land price was.

Table 3 and Figure 7 also show that the land price of areas equipped with tramlines was quite high. In contrast, the land price of areas along bus lines but without tramline (except British Concession) was relatively lower, which was led to by the differences in the introduction time, passenger flow and line stability between them: tramway was introduced at the early stage of urban development and all lines had high stability and large passenger flow under the unified operation of CTDT; differently, bus lines were opened to traffic when the urban form was almost formed and had poor stability because several bus companies were operated independently and competed intensely before Japanese occupation.

		Early 20th Century	1938
British Concession	Public Transport Line Density	0 km/km ² (in 1908)	1.07 km/km ²
	The Highest price of Land	7000 Liang/Acre	1904.28 Yuan/Acre
French concession	Public Transport Line Density	1.66 km/km ² (in 1908)	5.49 km/km ²
	The Highest price of Land	4000 Liang/Acre	2057.15 Yuan/Acre

Table 2: *Public Transport Line Density and The Highest price of Land Comparison Between the British Concession and the French Concession: Public Transportation Line Density = The Length of the Road Center Line with Public Transport / Area (Unit: km/km²).*

Public Transport and Urban Structure Evolution

The development of urban public transport had changed urban spatial structure. “The development of Tianjin was initially revolved around the old city, followed along the river, railways and then tramways from the emergence of electrical business”³⁴. Both urban population and business had tendency to flow and develop along tram routes after trams were opened. The fastest-growing piece along the tram line was the area along Asahi Street and Rue du Chaylard to Lizhan (梨棧) area equipped with the “Yellow Line”, “Blue Line”, “Flower Line” and “Green Line”³⁵. Geographically located in the center of the city, together with the intention of Japanese and French concession authorities to develop economy by taking advantages of tram lines to propel population mobility, this area became a new commercial center with 4 major shopping malls, Tianxiang (天祥), Taikang (泰康) and QuanYe (劝业) in Lizhan area and Zhongyuan Corporation in Asahi Street in the late 1920s³⁶. Statistically, there were nearly 60 theatres, restaurants and ballrooms coexisting surrounding Quanye. Rue de France also boomed and became a pivotal financial street with banks, money shops, credit companies, insurance companies, security companies and pawn companies, nearly 300, according to the statistics pre-1949³⁷. The transfer of commercial and financial centers propelled the French Concession to gradually replace the Old City and become the new economic center of Tianjin.

The soaring of land prices in the downtown area caused some residents who had to work here during daytime to move out due to their inability to afford high rents, but the development of public transport provided convenience for the daily movement of out-migrant residents. For example, as a direct link between the Old City and the concessions, Nanshi (南市) area was surrounded by many tram and bus lines, attracting a large number of real estate developers and citizens, which thus led to the development and construction of Nanshi Area and further resulted in the formation of commercial streets and residential areas here in the 1920s and 1930s³⁸.

From the above analysis, it could be found that public transportation line was highly related to land value partition and urban functional division: advanced municipal facilities represented by public transport could promote urban development, construction and economic prosperity. At that time, CTDI had recognized this view from the development process of Western cities to mediate with government to increase tram lines. Since 1911, CTDI submitted plan for the construction of tramline from the northeast corner to the West Station to Zhili Foreign Affairs Bureau (直隶交涉公署) repeatedly by using modern urban construction ideas to clarify the benefits of the line, “If convenient transportation lines could be established from the area around West Railway Station where is not well-built now to the Old City, buildings will be built one after another, which is true for foreign metropolises ... People working in the Old City or its surrounding areas could live in the good and new places, which is good for health, and also avoids row upon row of buildings in limited place. Tramlines in metropolises throughout the world were all from the distant to the downtown, so the remote areas developed for its low land and housing prices and the business of downtown boomed because residents could work in downtown during daytime and go home in the evening, which could bring about the increase of shop number and the growth of land and housing prices”³⁹. Although new line was not built due to the opposition of local businessmen, the case proved that people at that time had the idea of using the action of improving municipal facilities to promote land and housing prices, thereby facilitate urban construction and economic development⁴⁰.

Figure 8: *Bustling Lizhan Street and Tramways*

Conclusion

The outward expansion of downtown area and roads, the sharp growth of population, and the increasing production and living needs of modern metropolis stimulated the introduction and boom of urban public transport. Both

tramcars and buses were introduced to Tianjin when existing facilities could not satisfy the demands of urban development. Moreover, taking tramlines as the basic skeleton coupled with bus lines as the tool of network expansion, Tianjin formed a unique set of urban public transport network based on trams and supplemented by buses.

On the other hand, while meeting the needs of urban development, advanced municipal facilities and technologies from the West, represented by urban public transport, reacted to the city with promoting the modernization of urban social-spatial morphology and creating a nice public environment for citizens. The rapid development of the urban public transportation not only improved the municipal revenues of the authorities, but also promoted the modernization of the infrastructures and propelled the transformation of urban spatial structure. The advancing influence of modern Tianjin urban public transport development on the construction of roads and bridges and the form of urban resource development taking tramlines as the axis proved it absolutely. Public transport was the indispensable technical support in the process of modern Tianjin urban transformation and modernization. It can be said that it was precisely because of the convenient public transportation lines that Tianjin modern urban space was formed so quickly.

Tianjin, one of the so-called Treaty Ports that opened to foreign trade under the unequal treaties was home to nine foreign concessions. In each concession, the foreign powers created urban forms and functions that mirrored practices in their respective home countries. This article explores the consecutive establishment and implementation of regulations in eight out of nine foreign concessions in Tianjin between 1860 and 1945. It firstly provides an overview of regulation types and legislative systems of the concessions. Secondly, it compares these regulations and bylaws with the ones in their home countries. Thirdly, it compares the specific cases of Tianjin concessions with each other. Finally, it places the Tianjin case in the context of other Chinese port city concessions. In conclusion, it argues that the regulations of concessions in Tianjin not only showed a strong influence from their home countries in a top-down setting, but also interacted with each other in a peer-to-peer setting. The circulation of these regulations, within Tianjin and among treaty ports in China, was promoted by governments' central control, municipal councils' intervention and individuals' movements from one place to another.

Keywords: Treaty Port, Concessions, Modern Tianjin, Regulations.

Introduction

From the mid-19th century to the mid-20th century, Western powers and Japan had owned numerous concessions in the treaty ports of China. Located close to the capital, Beijing, Tianjin was particularly attractive to foreign nations, more politically than economically.¹ Mr. Reed, the American Ambassador, claimed in 1858 that if Tianjin opened, "it would be a nest of intrigue, besides affording European powers a position from which they could overawe the capital".² Tianjin was opened as a treaty port in 1860. From 1860 to 1902, nine foreign concessions (British, French, American, German, Japanese, Russian, Italian, Austro-Hungarian, and Belgian) settled in Tianjin (Figure 1, Table 1), the highest number in all of China. Ambitious countries such as Britain, France, Japan, Germany, and Russia also owned self-contained concessions in other treaty ports of China.

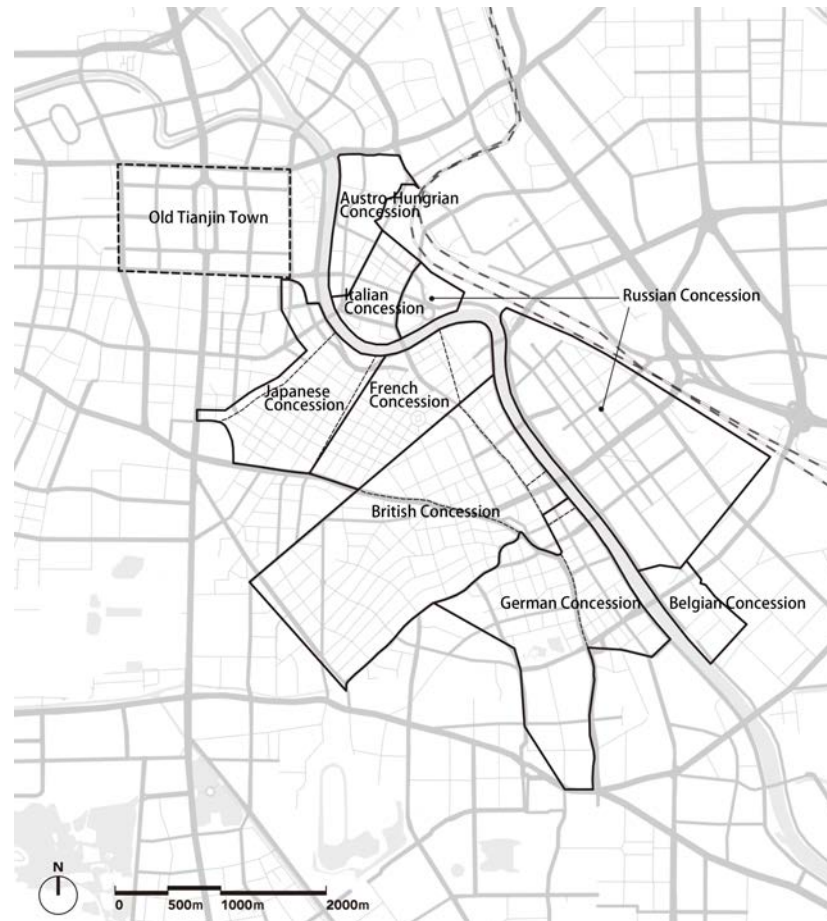

Figure 1. The old Tianjin town and nine foreign concessions on map of Tianjin. The concessions were all located outside the old Tianjin city, along Hai-Ho river (海河).

The nine foreign concessions in Tianjin were all located near the Hai-Ho river, convenient for trade and transport. Almost all of the concession areas were undeveloped at the beginning of their establishment. In the words of the editor of the *Chinese Times*, Alexander Michie, the beginning of the first two concessions, the British and the French, were “foul and noxious swamps, around them, on the dryer grounds, were the numerous graves of many generations of people”.⁴

Enjoying administrative, judicial, policing and taxation rights in the concessions, foreign powers brought new planning ideas, building forms and urban forms. According to their home countries’ experience, each of the nations planned its concession, made regulations, gradually built roads, houses, warehouses, stores, churches, hospitals, cemeteries, parks, and set up modern municipal facilities such as street lights, tramways and sewers. As it was stated in the pamphlet *Tientsin, North China* published by the Tianjin Rotary Club in 1934: “the foreign areas look for all the world like modern Western cities, with great modern Temples of Finance, massive business premises, and well-built residences”.⁵ Born in Tianjin in 1914, the American writer and journalist, John Hersey, represented the multi-layered identity of the city: “For three or four Chinese coppers, I could ride in a rickshaw from my home, in England, to Italy, Germany, Japan, or Belgium. I walked to France for violin lessons; I had to cross the river to get to Russia, and often did, because the Russians had a beautiful wooded park with a lake in it.”⁶

With each concession having its own national characters, Tianjin was thus an important hub for the import and exchange of planning ideas, and a singular case to study transnational urbanism in a single city. Despite abundant historical research on foreign concessions of Tianjin, the urban construction regulations of these concessions, which played an essential role in the transmission of Western modern planning ideas, has not been fully explored. Focusing on the regulations of foreign concessions in Tianjin, this paper provides a new perspective to interpret the transmission mechanisms of these new planning ideas among treaty ports and within Tianjin.

First, the paper illustrates different types of concession regulations, and actors involved in the legislative process. It shows how the respective ministers, consuls, municipal councillors and professionals participated in different layers of regulation formulation. Second, it shows how the foreign powers introduced their home countries planning ideas into the concession regulations, including provisions not only on land management, municipal infrastructures and urban planning, but also on private construction from design aesthetics to building technology.

Third, it explores the circulation mechanism of regulations among concessions, positioning it in a larger framework of transnational urbanism. It suggests that this peer-to-peer interaction existed among different concessions in Tianjin and between concessions belonging to a same country in different treaty ports. This circulation had various driving forces, from governmental level to professional individuals.

Making Regulations: creating new orders in concessions

Before the opening of the city and the establishment of foreign concessions, there was no modern planning nor municipal management system in Tianjin. Like many other traditional Chinese cities, the old Tianjin city was rectangular in shape surrounded by lofty walls. Public works such as road cleaning, bridge construction, fire protection was assumed by local charities and society organizations, and the local government was in charge of tax collection and security management. When the foreign powers came to Tianjin and started to construct their own areas, they also brought modern regulations.

In the book *The History of Chinese Concession* (中国租界史), Chengkang Fei highlights three types of regulations: decrees on the setting up of the concessions, basic regulations of the concessions, and municipal regulations.⁷ This classification can be mainly applied to the foreign concessions in Tianjin. Some of the concessions in Tianjin were created through agreements signed between China and respective foreign country. Others were set up according to diplomatic notes or official notices issued by both or one of the two sides.⁸ These agreements, notes and notices provided basic principles for early development of the concessions, generally clarifying boundaries of the concessions, and modes of acquiring lands and paying rents. Some of them classified land and regulated road and house construction. After the establishment of the concessions, a series of regulations emerged to meet the needs of their development (Table 2). In some concessions which were established earlier and had a relatively higher degree of construction and complete legal systems, such as the British, the French, the German and the Japanese, basic regulations and municipal regulations were promulgated separately. Regulations of the other concessions in Tianjin usually combined basic regulations and municipal regulations in one regulation document. Whatever the regulation system, in terms of urban construction, these regulations generally related to land system, land use, infrastructures (electricity, water, drainage, etc.), private construction procedure, construction details and building style.

Table 2. Partial List of Regulations of Concessions in Tianjin

Concession	Publishing Year	Regulations
British Concession	1863	Local Regulations for Tientsin

An investigation into legislative system of the concessions will help us understand how different actors got involved in the formulation of the concessions. The legislative systems of the concessions in Tianjin can be basically divided into three types. Represented by the British Concession, the first type refers to concessions that enjoyed higher degree of autonomy, in which the land-renters' meeting held certain legislative power. In the early years of the British Concession, Land Regulations were made by the British Minister to China or consul in Tianjin. From the late 19th century, the annual general meeting of land-renters had authority to appoint a committee to report on the amendment of and/or addition to Land Regulations, which had to be approved in a general meeting, and sanctioned by the British Minister to China before implementation.⁹ The municipal council, elected by annual general meeting of land-renters, had power and authority to make various bye-laws to enable them to carry out the objects of Land Regulations.¹⁰ The Russian, the German and the Austro-Hungarian Concessions had similar legislative systems. The second type refers to concessions in which the respective consul held absolute legislative powers, such as the French Concession and the Italian Concession. In these concessions, the municipal council was under the effective direction of the consul, and the land-renters meeting had no legislative power. The third type refers to the Japanese Concession, which experienced from consular managing to semi-autonomous. From 1898 to 1907, the Japanese Concession was managed by the Japanese consul in Tianjin, and the regulations were usually issued by the consul under the Ministry of Foreign Affairs. In 1907, the Residents' Association (居留民会) —not unlike the land-renters' meeting in other foreign concessions—was established in Tianjin under the Residents' Corporation Law (居留民團法) and its implementing rules issued by Japanese government.¹¹ It acted as a legislative body, but its legislative actions were under the consular orders.¹²

Professional planners have played important roles in the realms of transnational and cross-cultural urbanism and migration including in the concessions.¹³ In the case of Tianjin, professionals were also involved in the formulation

and revision of concession regulations. In 1915, the Russian Municipal Council set up a special committee to revise the existing regulations of the Russian Concession.¹⁴ Its members included representatives from the municipal council, companies in the concessions, and professionals. They are Th. de Krzywoszewski (Councillor), W. Sutton (Councillor), J. Holmberg (constructing and civil engineer, associated member of the Institute of Civil Engineers, Denmark), R. H. Maclay (merchant, previous U.S. assessor of the mixed court in Shanghai), and C. F. Kleye (clerk of the Russo-Chinese Bank).¹⁵ It is even more obvious in the formulation of building bye-laws in the British Concession. In 1917, A. Loup, architect from Loup & Young, Architects, Engineers, Land, House and Real Estate Agents, and H. McClure Anderson, architect from Cook & Anderson, Architects, Surveyors and Valuators, took on the revision work of building bye-laws.¹⁶ Similarly, five years later, the Works Committee of the British Municipal Council appointed two members of the Architects' Association, H. McClure Anderson and E. C. Young to assist the council in drafting new building regulations and generally in the improvement of street architecture.¹⁷ Trained in Western countries and opening their own business in Tianjin, these foreign professionals had experience in applying their Western planning and building knowledge into local projects. Their engagement in formulation and revision of the regulations had undoubtedly promoted the exporting of Western planning ideas in Tianjin.

Exportation of Planning Ideas from Home Countries

Foreign powers in Tianjin brought modern planning and municipal systems which had already been developed in their home countries. To develop living quarters that they were familiar with and to show the power of their countries, they used their respective home country's experience in making regulations of the concessions. This investigation excludes the Japanese Concession, because urban planning in Japan was also affected by Western ideas during the same period, the planning and construction of its concession in Tianjin was a reflection of Japan's learning from the West.

In the early years of the concessions in Tianjin, the first and most important problem that the foreign powers faced was land. We can always find in the early concession regulations that the concession authorities referenced their respective home country's regulations when dealing with land issues. For instance, feu,¹⁸ a form of land tenure originally from Scotland, was adopted by the British Municipal Council during the 1870s and 1880s, and admitted in *Land Regulations of the British Municipal Extension, Tientsin 1898*.¹⁹ Moreover, in *Règlements Municipale de la Concession Française de Tientsin 1908*, it was written that all acts of sale or any acts relating to the ownership of land situated within the French concession in Tianjin must be written in the form prescribed by French law.²⁰ Similarly, it was stipulated in *Regulations and Byelaws of the Italian Concession 1913* that all disputes arising between adjoining proprietors should be judged in accordance to Italian Law.²¹

With the development of the concessions, foreign authorities also introduced modern municipal infrastructures to the concessions in Tianjin, the planning and construction of which were confirmed in regulations and byelaws. Taking the British Concession as an example, in *Land Regulations of the British Municipal Extension, Tientsin 1898*, the British Municipal Council was empowered "to install gas, water, and electric supply; tramways, or other means of facilitating transit of wayfarers or goods, or to grant concessions to others to do so".²² In the *Draft Scheme for Amalgamation of the Four British Municipal Areas 1902*, there was a separate article, Article XXX-Drains, specifying the power of the British municipal council in constructing, improving, and demolishing sewers and drains in the concession.²³ Related provisions were continuously refined and detailed in later revised regulations and byelaws, based on which municipal infrastructures were constructed and improved in the British Concession (Figure 2). Similar provisions can also be found in regulations of other concessions. The French Concession formulated regulations on sewage system and tramways in 1912, and on electronic installations in 1930.²⁴ The German Municipal Council issued regulations on electricity supply in 1916, covering application for electricity supply, type of power supply, design and maintenance of the installation, and electricity price.²⁵ In the Russian Concession, regulations on drainage system and water supply were published in 1920.²⁶ Moreover, the Italian Concession published byelaws on sanitary installations and sewer connections in 1924.

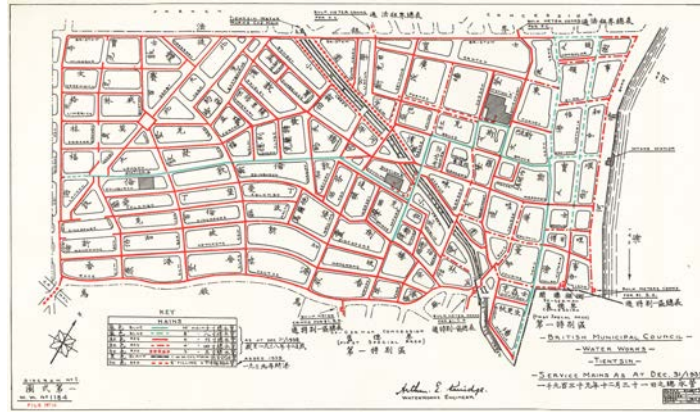

Figure 2. Drainage system of the British Concession in Tianjin, 1939.

Apart from modern municipal infrastructures, buildings with foreign styles were constructed in the concessions. Today, the former concession area of Tianjin is honoured as “International Architecture Exhibition”, which reflect its diversity in building styles, from first Romanesque to gothic, from eclecticism to postmodernism. In fact, the control of architectural style was an important part in regulations of concessions, and the European style from their motherlands was always admired and imposed in the main areas of the concessions. The British municipal council was empowered in its regulations to require the outward design of new buildings to conform the council’s standard of attractiveness.²⁷ The French Concession, the German Concession, and the Italian Concession all had stipulated in their regulations certain areas where only European style houses could be erected.²⁸ Similarly, in the byelaws of Russian Concession issued in 1915, a “Park Residential Area” was reserved as a strictly residential area for foreigners and better class Chinese. Only detached and semidetached houses of modern design shall be admitted for construction within the area.²⁹

Detailed building rules were enacted to guarantee the construction of European style or modern design buildings, which were related to building materials, height, distance, highlighting ventilation, fire protection, stability, and attractiveness. Some of these provisions could be traced back to their motherlands’ regulations. For instance, in *Règlement du Service des Travaux 1912* published in French Concession, it was specified that when dealing with protrusions such as bollards, steps and balconies which encroached the public roads, tolerance would be admitted under the conditions and bases generally adopted by Paris.³⁰ It is also worth noted that the German Concession and the British Concession both had provisions on reinforce concrete and structural steel, which were new building materials and technology to Tianjin (Figure 3).

Figure 3. Illustrations on structural steel from *British Municipal Council Building & Sanitary By-laws 1925*.

Interaction among Concessions in Tianjin

The concessions in Tianjin were established at different times from 1860 to 1902, and they had different degrees of development. The earlier established concessions, such as the British Concession, the French Concession, and the German Concession, held the leading positions in development among all the concessions in the city. Comparing the regulations of different concessions in Tianjin, it can be inferred that other foreign powers had learned from their French, British and German neighbours when making their own regulations. People who worked in a couple of different concessions, especially as municipal councillors, also promoted this process.

Using French as the official language, regulations of the Belgian Concession showed a strong influence from ones of the French Concession. A main reason was that some councillors of the Belgian Provisional Council, which was established in 1912, had close relations with the French Concession. One of the councillors was Jean O’Neill, who came to Tianjin in 1900 as a French naval officer. He was a member of the French Municipal Council in Tianjin from 1906 to 1908, and also the manager of the most important real estate company in the French Concession, *Crédit Foncier d’Extrême-Orient*.³¹ Another one was E. Rousseau, who worked in the French Municipal Council during 1908-1911 and 1919-1925.³² The work experience in the French Concession contributed

to their work in the Belgian Provisional Municipal Council. The provisional council published a handbook of municipal regulations in 1923. Most of its regulations were similar to the French ones. For instance, almost all the articles from *Règlement du Service des Travaux* in this handbook were copied from the *Recueil des Règlements Municipaux* of the French Concession published in 1916.³³

Apart from simply copying, there existed more sophisticated influence mechanism in the regulation circulation in Tianjin. Usually, the foreign powers would revise the provisions they had learned from their neighbours according to their own needs. Taking building regulations for example, the German Concession published a detailed building byelaws in 1899, which set up a model for later issued building regulations in Tianjin.³⁴ When the Italians made regulations for the Italian Concession in 1913, they improved the German provisions in their own regulations. The building regulations in the German Concession stipulated that:

The distance between separate buildings on a plot must be at least 3 meters; In the Chinese quarters, if the buildings have courtyards and do not occupy an area greater than one-third of a *mou*, the distance must be at least 1.5 meter.³⁵

In the regulations of the Italian Concession, this provision was revised as:

Adjoining houses, belonging to different owners, shall, if it is not intended to build a boundary wall between them, be erected at a distance of at least 3 meters from the common boundary line. In the Chinese quarters this distance shall not be less than 2 meters.

Houses, belonging to the same owner, shall be kept at a distance of at least 3 meters from each other. In the Chinese quarters, however, whenever buildings do not occupy more than 1/2 of a *mou* (300 m²) of land, including the back yard, this distance may be reduced to a minimum of 1.5 meters.³⁶

The relationship between concessions in Tianjin was complicated. On one hand, the foreign powers from different countries locally worked together as a body when dealing with Chinese authorities;³⁷ On the other hand, they competed in developing their concessions to attract merchants and residents, and benefit their own nationals. The regulation circulation among these concessions can be understood as a result of the sense of both cooperation and competition.

Circulation among Treaty Ports in China

Britain, France, Germany, Russia and Japan had owned more than one individual concessions in different treaty ports in China, and planning ideas in concession regulations also circulated among these concessions belonging to one same country. Leading examples were the British and French Concessions. When these two countries established concessions in Tianjin in 1860, the British Settlement (united with the American Concession to create the Shanghai International Settlement in 1863) and the French Concession in Shanghai had already been developed for more than 10 years, and they were regarded as models for other British and French concessions in China. The interaction between the British and French concessions in Shanghai and Tianjin, which can be told from their regulations, has multiple driving forces.

The interaction of regulations between the French concessions had a lot to do with the movement of the consuls between the treaty ports. As we have discussed earlier, the French consul had supreme power in the French concession. In the early days of the French concession in Tianjin, the regulations of the concession showed a strong influence of the ones in Shanghai. The *Règlements de Police et de Voirie 1894* published in the French Concession of Tianjin had similar articles with the *Règlement Municipal de Police et de Voirie Pour la Concession Française 1869* issued in Shanghai on keeping public roads clean and clear.³⁸ This influence continued under P. Claudel, who was the Consul of France in Tianjin from 1906 to 1909. During his career in the French diplomatic corps, P. Claudel was the French consul in Shanghai in 1895, where he became familiar with the regulations of the French Concession in Shanghai. This experience played an important role when P. Claudel led the revising of *Règlement Municipal de la Concession Française de Tientsin* in 1908.³⁹ In 1909, Camille Gaston Kahn, who used to work in the French Concession of Canton (1904-1906), took over as French consul in Tianjin. In this position, he participated in making *Recueil des Règlements Municipaux 1912*, in which *Règlement du Service des Travaux* was influenced by *Règlement Concernant les Voies Publiques et Constructions 1910* issued in the Shanghai French Concession in many aspects, including building application system and management of special construction projects, and based on this regulation in Shanghai, the Tianjin one added more detailed stipulations on protrusions, downpipes, smoke ducts, and measures against fire.⁴⁰ After Camille Gaston Kahn moved to Shanghai and became the new French consul of Shanghai in 1913, similar detailed regulations on eaves, protrusions, smoke ducts and firewalls were issued in the Shanghai French Concession.⁴¹ Camille Gaston Kahn had introduced his working experience in Tianjin to Shanghai, and promoted regulations there.⁴²

Different from the French Concession, the British Concessions had a higher degree of autonomy, and the respective British consul only played a supervisory role in concession affairs. Based on available sources, the circulation of regulations between the British concessions can be understood from two aspects.

First, since the regulations of all the British concessions should be made or approved by the British Minister in China according to the British government requirement,⁴³ the Minister might have a central control in this process.⁴⁴ The consistency of certain articles in *Local Land Regulations of the British Concession at Tientsin 1866* and *Land Regulations and Bye-laws for the Foreign Settlement of Shanghai, north of the Yang-king-pang 1869* was the result of central control of Sir Rutherford Alcock, the British Minister to China. The municipal council in Shanghai revised its land regulations during 1865-1866 and submitted the amendments to Sir Rutherford Alcock, who gave a reply on November 15th, 1866 with some suggestions.⁴⁵ Eleven days later, on November 26th, Sir Rutherford Alcock issued *Local Land Regulations of the British Concession at Tientsin*. These two regulations had similar articles on land management and organization of municipal council.⁴⁶

Second, the British Municipal Council of one treaty port would actively reference existing regulations of other British Concessions. With the gradual improvement of the municipal administration system of the British concession in Tianjin, the British Municipal Council took over the legislative work, in which the council always followed the model of Shanghai. In 1898, a committee was appointed by the Municipal Council of Tianjin to make new regulations for British Municipal Extension in Tianjin. As the chairman of the Municipal Council of the British Concession in Tianjin, W. W. Dickinson, reported to the consul in Tianjin, these regulations were “based on those which obtain in Shanghai and in the British Concession, and the committee made modifications and additions as past experience and present exigency seem to justify”.⁴⁷ Similarly, it was pointed out in the report of British Municipal Council in Tianjin in 1917 that the modification of building bye-laws would base on the building code in Shanghai.⁴⁸ Moreover, more than half of the articles in *Municipal Building & Sanitary By-laws 1925* enacted in the British Concession of Tianjin were borrowed from the building regulation of Shanghai International Settlement issued in 1916.⁴⁹ This building regulation in Shanghai had a combined impact of *London Building Act*, *The Building Code of the City of New York 1901*, and *The Public Health and Buildings Ordinance 1903* issued in Hong Kong.⁵⁰

From the above, a wide range of actors were involved in this transnational urbanism practice. Ministers to China, consuls in the treaty ports, municipal councillors of the concessions, representatives from important companies and professionals all participated in the formulation of regulations to a certain degree. Besides, governments’ central control, municipal councils’ active learning from each other, and political leaders’ and professionals’ movement from one concession/treaty port to another had all promoted the circulation of regulations among Chinese treaty ports and within Tianjin. This circulation furthered modern urban development of Chinese treaty ports.

Conclusion

In the late 19th century and early 20th century, foreign powers export Western planning ideas to concessions in Tianjin mainly through a series of urban construction regulations, which had strong influence from their respective home country. Stephen V. Ward has proposed a typology of international diffusion of planning ideas, which depends on a “power relationship” between importing and exporting countries.⁵¹ According to this typology, the exportation of planning ideas in foreign concessions of Tianjin can be understood as an example of the “authoritarian imposition”, characteristic of which is externally imposed planning proposals and methods of enforcement with few indigenous interests. Although, in the late periods of the concessions, it had some characteristics of the “contested imposition”, as Chinese were allowed to join the municipal councils and local circumstance got more attention by foreign authorities. Besides, Planning ideas in these regulations circulated among concessions belonging to one same country in different treaty ports in China and among different concessions within Tianjin. The “power” of the two sides in this relationship was relatively equal, and the transmission of regulations from one concession to another was selective and always accompanied by modifications according to local needs. Thus, this circulation is similar to “selective borrowing” in Ward’s typology. Thus, in the case of Tianjin, there existed both “imposition” and “borrowing” relationships in the diffusion of planning ideas.

¹⁸ Feu was previously a form of land tenure in Scotland. In feu holding there is a substantial annual payment in money or in kind in return for the enjoyment of the land. The crown is the first overlord or superior, and land is held of it by crown vassals, but they in their turn may feu their land, as it is called, to others who become their vassals, whilst they themselves are mediate overlords or superiors. In the 1870s and 1880s, the British Municipal Council bought land from locals outside the British Concession and feued the land to foreign individuals.

How Urban Spaces Remember: Memory and Transformation at Two Expo Sites.

Jennifer Minner (Cornell University) and Martin Abbott (Cornell University)

Heritage conservation can be a force of resistance to the entrepreneurial ambitions of urban growth coalitions in the restructuring of urban space. Alternatively, it can aid in revalorisation of urban real estate. Heritage conservation consists of an array of acts of urban memory and design with varying intentions and outcomes. Applications of heritage conservation are understudied aspects in the design and evolution of mega-event sites. This paper provides case studies at two former expo sites in the US and Australia into the complex and in some cases, Janus-faced nature of heritage conservation.

The first case study is at the site of Hemisfair '68 in San Antonio, Texas, USA. In preparation for the 1968 world's fair, preservationists were able to save 22 historic structures out of hundreds demolished with urban renewal funds. Thus, historic preservation challenged modernism, but also represented a precedent for incorporating preservation as an element of modernist urban design. Since then, the fair site has evolved and is subject to plans for mixed use redevelopment. Ironically, contemporary calls to preserve pavilions built in modern architectural forms for Hemisfair '68, now challenge New Urbanist visions for the future of the mega-event site.

Twenty years after Hemisfair '68, a working class neighbourhood and industrial area was cleared for Expo '88, in Brisbane, Queensland, Australia. Expo '88 was a defining moment for the city and was seen as opportunity to elevate its stature internationally. The site was later redeveloped into the South Bank Parklands. Over time, South Bank has evolved through redevelopment and master planning, public outcry, and instances of heritage conservation in and around the expo site.

Common to both cases is the conservation of parks, heritage, and artwork, outcomes of individual and collective actions to shape urban landscapes. Both sites contain important elements of collective memory and heritage as forces of transformation in urban development initiatives. This paper is illustrative of multiple heritage logics involving the retention of objects and landscapes. These may be useful in analysing a wider set of former mega-event sites, and even more broadly, in the study of urban places and public spaces over time.

Pestilence, toxicity and all the fun of the fair: brownfield sites and mega-event spaces

John Gold (Oxford Brookes University) and Margaret Gold (London Metropolitan University)

The Summer Olympic Games and the World's Fairs – the two festivals that truly deserve the title 'mega events' – share two important characteristics. First, as ambulant festivals, they need to find sizable spaces, preferably close to the city centre, for an event that is unlikely to be repeated within several generations. Secondly, the spaces of temporary congregation thus produced need to be converted for post-event use. Increasingly, in the current era, that has means redeveloping event spaces in a manner that produces positive outcomes, especially to achieve a measure of regeneration as compensation for the expense incurred in staging the event.

After briefly outlining the various options open to festival organisers when finding spaces for Exposition showgrounds or Olympic Parks, we focus on one category: the use of primarily brownfield land that is so heavily polluted that it has been shunned previously due to the costs of conversion, but where the prospect of large-scale mega-event investment opens up the possibility of rehabilitation. In this context, discussion focuses on three examples, all in potentially attractive locations for development but with significant barriers to construction due to the nature of previous land use: the showground for New York's World's Fair (1939-40) at Flushing Meadow; Homebush Bay, which provided the Olympic Park for Sydney 2000; and the Lower Lea Valley, the location for the Olympic Park for London 2012.

The first of these case studies in Queens New York, was known as the Corona Ash Dump after 1909 when the Brooklyn Ash Removal Company started depositing ashes from furnaces across New York in what had been a tidal salt marsh. The resultant landscape of ash hills and standing water immortalised by Scott Fitzgerald in the Great Gatsby as the Valley of Ashes – an eyesore and source of pollution and mosquitoes to surrounding communities. The contracts to dump ash were finally revoked in 1934 and two years later work started to reclaim the area for a parkland setting for the 1939 New York World's Fair.

In the case of Homebush Bay west of Sydney industrial change had created a brownfield site which had once housed heavy industry, brickworks, an abattoir, an armaments depot for the Navy and landfill sites for hazardous materials. The bid for the 2000 Olympic Games envisaged an Olympic Park with the main sports venues, Olympic Village and metropolitan parkland containing creating and preserving important wetland and woodland habitats.

In the case of Stratford in East London the land along the River Lea had developed into a transport and industrial corridor by the 20th century, home to railway marshalling yards and warehouses, factories, and foundries. By the 1990s a significant proportion of the railway land was derelict and many of the industrial sites redundant. The Olympic bid involved the removal of hazardous material and the decontamination of soil to allow the construction of Olympic venues, an athletes' village and parkland rich in biodiversity.

Tourism in the slums of Rio de Janeiro: An analysis of the urban impacts in informal areas caused by recent public interventions for the big sports events hosted by the city .

Sergio Fagerlande (FAU UFRJ)

The slums of Rio de Janeiro have been the stage of recent urban changes related to tourism-related activities, chiefly those linked to the large sports events such as 2014 FIFA World Cup, and the 2016 Olympic and Paralympic Games. The visiting by Brazilian and foreign people was always significant in the city, and the increase of the flow in the slums is a relevant fact, both from the perspective of accommodation for the visitors. This article seeks to put the changes in the recent urban dynamics of those areas into perspective, as caused by popular settlements in which tourism has been bringing changes about, initially related to urban mobility, in the case of the large works done by the government such as cable car systems, and lifts, as well as internal paths. These interventions brought reflexes embodied in private and community-related investments, with the opening of hostels, bars and restaurants, along with the creation of new open spaces, such as parks and ecological trails. The work has been going on, with the mapping of these activities in the slums of Rio's South Side, especially in the slum of Babilônia-Chapéu Mangueira, seeking data on their locations, and on who the entrepreneurs behind the trend are, and on how they are inserted in the tourism-in-slums' activity, and on the importance of community participation, and the relevance of public policies in the process at hand. The study also shows the relation that exists between the start of operation for the hostels and the installation of mobility equipment and the setting up of the UPPs (Peace Police Corp Units) that saw its height between 2008 and 2017, a moment in which tourism-related activities started to take roots in Rio's slums, in line with public policies aimed at creating a new image for the city, with an emphasis on tourism and the large events that soaked the city in that time frame. The tourism in slums activity had year 1992 as its starting moment, as pointed by Freire-Medeiros (2009), and its activities are found in many countries around the world, as mentioned by Frenzel, Koens, and Steinbrink (2012). The research used the references produced by Urry (2001), Judd and Fainstein (1999), and Fainstein (2007), in their studies on the city and tourism, and of other authors that study tourism in slums, such as Freire-Medeiros (2009), Morais (2010, 2013), Carvalho (2013, 2016), Frenzel, Koens and Steinbrink (2012), and Pearlman (2016). The work of research aims at the work on tourism at the basis of the community, as studied by Bartholo, Sansolo and Burzstyn (2009), apart from accounts on community participation as found in the books of Rodrigues (2014) and Silva, and of Pinto and Loureiro (2012). The study on the hostels and on mobility in the slums has been presented by Fagerlande (2016, 2017), and by Izaga and Pereira (2014) and shows how the relationship is formed between mobility, visiting, and the supply of accommodation in tourist slums.

Porous boundaries in Rio de Janeiro's favelas: Community based initiatives, urban mobility infrastructure, tourism and environmental issues in the urbanization of fringes as a socio-spatial means to reconcile the favela with the city

Fabiana Izaga (Federal University of Rio de Janeiro - Graduate Program on Urbanism), Sérgio Fagerlande (Federal University of Rio de Janeiro - Graduate Program on Urbanism) and Rachel Coutinho Marques Da Silva (Federal University of Rio de Janeiro - Graduate Program on Urbanism)

Favelas in Rio de Janeiro, Brazil, would be going through a third era of development, as a result of changes and accumulation of investments made in urban improvements. From alternative places of residence for the poor, where organized crime settled in the late twentieth century, today the slums of the South Side are places that are home to a new urban dynamics, with the rise of real estate prices, informal economy growth and increase of tourist and cultural activities. Community based initiatives have been an important way of social and spatial transformation. For the preparation of major sports events hosted by the city of Rio de Janeiro (FIFA World Cup 2014 and the 2016 Olympics) there were implemented new urban and public security projects in various slums. Our research presents the case study of the "Favela da Babilônia". This slum presents an interesting process in its borders, having on one side a large forest area and on the other a formal middle-class neighborhood. The possibilities that community processes related to environmental issues, such as reforestation and tourism – structured on government built urban mobility infrastructure – have revealed Rio de Janeiro as a city in which diversity stands out.

How Urban Spaces Remember: Memory and Transformation at Two Expo Sites

Jennifer Minner*, Martin Abbott**

** *PhD Student, Department of City and Regional Planning, Cornell University, mja273@cornell.edu*

International Expos can leave long-lasting imprints on host cities. The production and evolution of legacy public spaces from these events deserve scholarly attention. Case studies were conducted at two former expo sites in the US and Australia, focusing on the role of retention, reuse, heritage, and parks conservation in the evolution of public spaces. In preparation for Hemisfair '68, in San Antonio, Texas, conservationists saved 22 historic buildings out of hundreds demolished. Although only a small proportion of buildings were preserved, preservationists challenged a modernist urban renewal plan and the design became a precedent for incorporating heritage conservation in modern urban design. Today, the Hemisfair site is subject to new redevelopment plans. Calls to preserve remaining modernist pavilions challenge New Urbanist visions for the site. In a second case study, an industrial district was cleared and a working-class neighbourhood transformed for Expo '88, in Brisbane, Queensland. The site was later redeveloped into the South Bank Parklands. Over time, South Bank evolved through redevelopment and master planning, public outcry, and instances of conservation in and around the expo site. Common to both cases is the conservation of parks, heritage, and artwork, outcomes of individual and collective actions to shape urban landscapes.

Introduction

International expos, or world's fairs, have restructured and transformed urban spaces in host cities around the world. Former expo sites' large urban footprints, which include parks, waterfronts, civic centres, and urban precincts, represent revolutionary innovations in planning, design, and urban development. Former expo sites are also reservoirs of social memory.¹ For those who have experienced an expo first hand, there can be a deep personal connection remaining from the experience. For others, who visit a former expo site only after the event is over, meanings are crafted in interaction with what remains and how it is interpreted, as well as with the spaces that have been remade.² The leftover civic centres, precincts, and parks are often the site of shifting coalitions of public, private, and non-profit actors who seek to shape the meanings and uses of these places over time. In addition, many of these sites experience the ebbs and flows of attention and investment.

In this paper, sites in San Antonio, Texas in the USA and Brisbane, Queensland in Australia are examined as case studies of urban transformation at former mega-event sites. A focus of this research is on the role of retention, reuse, and conservation in their evolution. At Hemisfair '68 in San Antonio and Expo '88 in Brisbane, event organisers aimed to generate revenue; tout the benefits of their city as a place to live, visit, and invest; and to restructure urban space. The stages for these events were urban neighbourhoods deemed aged and blighted, on the edge of central business districts and prominent waterfronts. In both cities, on roughly equivalent areas of urban land, hundreds of buildings were levelled, and residents and businesses expelled, to make way for the expos. At both sites, a limited number of older buildings remained and were incorporated into expo site designs. Decades later, reverberations of redevelopment continue to ferment at the parklands and convention centres of each city.

While there has been historical scholarship into both expo sites, previous studies do not specifically address the conservation of buildings, structures, and artwork as aspects of the continuing evolution of the site. A main premise of this paper is that scholarship about mega-event sites should pay attention to acts of reinvestment and retention, which are often overlooked as elements of urban management. Furthermore, vignettes reveal the roles of individual actors, as well as organizations and political coalitions operating with a range of 'conservation logics,' and their mixed success.

Expo Sites and the Evolution of Urban Space

Expos often leave lasting physical imprints on host cities, but they are not static imprints. They evolve over time. The longer historical phenomenon of continuous evolution is examined only to a limited extent in existing literature.³ Historical scholarship has most often focused on the planning for and execution of the events and on

their social and cultural history. This scholarship most often concentrates on a window of time tightly bound to the origins of expositions and their immediate after effects.

Roche (2017) includes among the built legacies of mega-events not only iconic architecture, but also the site design, infrastructure, ordinary buildings, and landscape architecture from the events. He notes that mega-events leave not only a “space-filling” legacy, but also one that is “space creating.”⁴ Mega-events often result in new parklands, plazas, waterfront promenades, and civic centres. Gold and Gold (2005) write of the use of mega-events in ‘place promotion,’ and “strategies to rebrand and regenerate blighted areas.”⁵ They connect this to “urban entrepreneurialism in which the interests of the municipality and the private sector, particularly the business community converge in the act of ‘selling’ the city.”⁶ This entrepreneurial reshaping of urban space does not end immediately after the creation of a mega-event site, nor is it only new construction that plays an important role.

The retention of buildings, artwork, and parklands after a mega-event can also be indicative of collective action in the production of urban spaces. The aims of these acts of conservation can vary from entrepreneurial, market-based attempts to spur reinvestment and revalorisation of places to grassroots efforts that use conservation to resist redevelopment and commercialisation. Koziol (2003) has developed a framework for understanding preservation discourse. On one axis, the motives of an actor to preserve an object are oriented toward social associations versus the specific physical attributes of the object. On another axis, preservation is associated to a greater or lesser degree toward the market.⁷ While this framework is limited, it shows promise in articulating conservation logics. Thus the careful study of acts of conservation and their underlying logics can provide valuable information about how places are materially constructed and constituted over time and economic and social forces and power relations.

Case Study Sites

Hemisfair and South Bank are two former expo sites near to or within the central business district of each respective city. As described in Table 1, the original expo sites were roughly the same size, at 39 and 40 hectares respectively. They are both examples of restructuring older neighbourhoods into event space. Today, both sites include a mix of public parklands, convention centres, and commercial, civic, cultural and nongovernmental uses.⁸

[Table 1 about here.]

Hemisfair: Heritage and Destruction in Construction of the 1968 World’s fair

Hemisfair ‘68 was the first international expo held in the U.S. South. Its theme celebrated the confluence of North and South American cultures, which was an expression of Pan-Americanism and a local identities rooted in Spanish Colonial and Mexican cultural heritage re-packaged to appeal to tourists.⁹ By the 1950s, local business leaders had begun to dream of a world’s fair that would create a new civic centre, while elevating San Antonio’s reputation. When federal urban renewal funds were slated to demolish the Germantown neighbourhood in the mid-1960s for the fair, architect O’Neil Ford and the San Antonio Conservation Society, a local heritage organisation, rallied to protect trees and what were deemed the most historic of buildings from the neighbourhood.¹⁰ The Conservation Society embarked on an effort to save 200 structures identified as historic. Ultimately, only 22 buildings were preserved. Demolition of the neighbourhood would remove 2,239 residences and 686 businesses, forcing 1,600 people to move (see figure 1).¹¹ Twenty-four streets would be removed or realigned to create a consolidated site to stage the world’s fair.¹² Figure 2 below shows the Hemisfair site under construction. The extent of demolition can be seen along with trees and buildings that were preserved on site. Most of the preserved buildings housed restaurants in the concessions area of the world’s fair. In addition, fair plans preserved a portion of the Acequia Madre, a channel constructed in the 1720s to convey water to a nearby mission. The incorporation of these historic buildings and landscapes were praised among architectural critics; although architectural critic Ada Louise Huxtable, also lamented that more had not been preserved.¹³

[Figures 1 and 2 about here.]

New pavilions and plazas were constructed for Hemisfair ‘68 in modern architectural styles. Some of these survive to this day. The Tower of the Americas is a 190 meter (622 foot) structure and it remains a primary tourist destination in downtown San Antonio.¹⁴ A \$7.5 million United States Pavilion was constructed comprised of two buildings - Confluence Theatre and the Exhibit Pavilion. The Migration Plaza linked the two buildings and was intended to express a celebratory message about the cultural heritage of Texas emerging from the confluence of people of different races, ethnicities, and cultures. The entire complex was repurposed as a federal courthouse and judicial training centre a few years after the fair. The Institute of Texan Cultures was also designed to be a permanent structure and museum about Texas’ ethnic, racial and cultural groups and it was retained after the fair. A Woman’s Pavilion is also a fair era survivor on site.¹⁵ The ensemble of modern architectural buildings – some of them still used and others neglected and in near ruin, reflect ambivalence about how to best remember and utilize the built legacy of Hemisfair.

Questions of Preservation and Erasure Post Event

Not long after Hemisfair '68, several factors led to a state of dormancy on the former world's fair grounds.¹⁶ There were many subsequent schemes to revive what was largely perceived as a dead zone adjacent to San Antonio's most vibrant tourist area. According to one count there were more than 12 plans conceived.¹⁷ In 1988, the site was renamed HemisFair Park. While the site included a convention centre, and there were important governmental agencies, cultural institutions and nongovernmental organisations that operated on the site, city officials have often bemoaned its lack of vitality.

In 2009, the San Antonio City Council established the Hemisfair Park Area Redevelopment Corporation (HPARC), a non-profit local government corporation to manage redevelopment of the site.¹⁸ HPARC undertook a major master planning effort in 2011. The plan involved reopening streets and the creation of three new or substantially changed parks on the site.¹⁹ The Plan allocated the land under the U.S. Pavilion complex and Institute of Texas Cultures, as places for New Urbanism-inspired redevelopment with new mixed use development.

News of the Master Plan's quiet elimination of the former US Pavilion buildings and the Institute of Texas Cultures on future land use maps began to circulate among preservation advocates. The Mid Tex Mod chapter of Docomomo US, an organisation dedicated to the documentation and conservation of the modern movement, organized a local tour highlighting the modern architecture and artwork of Hemisfair.²⁰ In 2016, the Confluence Theatre was listed by the state-wide nongovernmental organisation Preservation Texas, as one of the 14 most endangered buildings in the state. That same year, the Texas Historical Commission, a state agency, determined that a portion of the Hemisfair site was eligible for listing as an historic district on the National Register of Historic Places.²¹ Eligibility or designation on the National Register of Historic Places is largely honorary, only triggering review of potential impacts if federal funds are used. In the U.S., it is up to local governments to adopt landmark designations that protect heritage properties from demolition.

Despite the local historic designation of the aforementioned Hemisfair '68 pavilions and a local historic district (see figure 3), there remains talk of the demolition of former fair pavilions by HPARC and city officials, who do not view the buildings as immediately adaptable or having uses that will generate sufficient revenue. The University of Texas at San Antonio, which still owns the Institute of Texas Cultures has issued a request for proposals for mixed use development to be built at the site of this building.²²

[figure 3 about here.]

The future of the Woman's Pavilion also remains unsettled. On its exterior are the names and handprints of the 80 woman who were involved in organizing the pavilion.²³ Over the years, the Woman's Pavilion has been neglected. A nongovernmental organisation, the Women's Pavilion at Hemisfair Park, Inc. was founded in 2007 to advocate for its rehabilitation and reuse. The organisation worked with an architect to produce plans for the pavilion and even took the plans to San Antonio's historical commission for approval. However, adaptive reuse plans have yet to be implemented.²⁴ Neither the City of San Antonio nor HPARC has committed to reuse, nor has the Hemisfair Conservancy, a non-profit organisation established to raise money for the site, committed to fundraising for rehabilitation or stabilization of this or any of the other fair structures.²⁵

While many of the 19th century and early 20th century buildings remain empty, awaiting new commercial tenants, they are still fully embraced within HPARC's master plans. Meanwhile, the modern architecture on site, even with status as either designated or eligible historic resources, are largely invisible. In this case, preservation groups advocate for their retention in shaping the future of this site. Officials from HPARC, some elected officials, and developers involved in new mixed use projects see conservation of the modern architectural legacy as an impediment to progress toward greater private sector investment on site.

Origins of Expo '88 and South Bank Parklands

Expo '88 was planned on lands along the South Brisbane River that had been transformed in the 19th century from a place of gathering for the Aboriginal Turrbal and Yuggera peoples to a precinct of wharfs and maritime businesses, commercial investment and boarding houses.²⁶ It was home and workplace to many working-class people, both of Aboriginal and European descent. By the 1970s, on the western portion of what would become the Expo '88 site, a cultural precinct was developed as part of redevelopment plans. Accomplished Australian architect Robin Gibson designed the Queensland Museum, Queensland Performing Arts Centre, and Queensland Art Gallery, which formed a complex called the Queensland Cultural Centre. A few of the 19th and early 20th century remnants of the previous neighbourhood, as well as the brutalist complex designed by Gibson, would become strongholds in the conservation of the past in South Brisbane.

In the years prior to the Expo '88, private land was resumed and consolidated with public lands. This resulted in displacement of businesses and residents through both direct demolition of buildings and increases in rents.²⁷ Many

properties were demolished to make way for the Expo development (figure 4) and rents in the area skyrocketed. The concerned citizens of the surrounding communities of South Brisbane protested that, “The rich get Expo, the poor get homeless.”²⁸ It is estimated that 600 residents were forced to leave their homes during the expo due to increasing housing costs.²⁹ According to Donna Lee Brian plans were met with “sustained campaigns of opposition from local residents and urban conservation action groups.”³⁰ Even with the strife and resistance, the Expo was overwhelmingly reported a success in the press and is widely credited for transforming Brisbane into an international destination. The event has been called “a social and cultural epiphany that put the city on the world map and brought the place to life like never before.”³¹

[Figure 4 about here.]

After Expo '88, the Queensland State Government planned to sell Expo lands for commercial development, including a casino, after the event ended. In 1987, the River City Consortium was selected as developer and a substantial amount of commercial development was planned including: “an international hotel and a second hotel; a 50-storey World Trade centre; commercial offices, retail and residential accommodation; an exhibition and convention centre; an Orbisphere science centre; the Endeavour island; a casino; and public open space.”³² In opposition to this plan, the Lord Mayor Sally Atkinson championed the retention of lands for ‘a people’s park.’³³ Atkinson convinced the state government to retain ownership for parkland as there was significant public outcry to save the site for public use. Later Brisbane City Council began to make annual payments to support the management of the parklands by the South Bank Corporation, a body of the Queensland State Government.

Post Expo '88: Objects Cherished, Moved, Hoisted, and Protected

A legacy of Expo '88 was the mobilization of support in favour of retaining of the site in public hands, as well as the retention of buildings and artwork. An example is the Nepalese Peace Pagoda. It was constructed in the Kathmandu valley by 300 carvers and artisans from 160 Nepalese families. It was the sole example of a peace pagoda outside of Nepal other than one located in Munich, Germany. In capturing the hearts and minds of the Australian public, it garnered more than 70,000 signatures of support [in a visitor’s book] during Expo 88. It was described by then Brisbane City Councillor, David Hinchliffe, in correspondence to the Australian Department of Foreign Affairs at a formative stage of the pavilion’s retention, as “one of the half dozen most popular displays” at Expo 88.³⁴

There was, however, much uncertainty as to whether the pavilion would remain in Australia. Plans were set in motion to sell the pagoda to a Japanese buyer at the close of 1988. The Friends of the Pagoda’s public fundraising appeal was initially managed by a loose group of volunteers. Early in the public campaign, the committee enlisted the support of Sir Edmund Hillary as Patron-in-Chief of the Pagoda. Hillary ventured that the pavilion was “beautifully constructed and well worth preserving,” and his acceptance of this role was viewed as the climax of the campaign to save the pagoda.³⁵ Although federal, state and local governments made financial pledges, these contributions were tied to strong public support, which they insisted be demonstrated with fifty-thousand dollars raised entirely from the general public. The task almost proved insurmountable and it was not until the campaign’s final day that a thirty-thousand-dollar donation from Frank and Myra Pitt was secured. During the evening news which had brought the campaign’s disappointing end to the attention of the public, the Pitt’s, watching from home, decided to make the donation.³⁶ Thus, the couple’s fond memories of Expo '88, or perhaps their mutual appreciation for an object so “unusual and an icon,” became tethered in place.³⁷

Less personal or emotive motives emerge in the more recent conservation of Collins Place. The Little Big House pub resides in a heritage-listed building labelled “Collins Place” in the Queensland Heritage Register.³⁸ Collins Place is one of the last remaining residential structures in the vicinity and dates back to a period of residential and commercial growth in South Brisbane that began in the 1860s.³⁹ In the 19th century it served as a boarding house and private residence. During preparations for Expo, Collins Place was resumed, despite protests by its owner, and spared demolition to become one of the few buildings retained and integrated into Expo grounds.

In 2014, the 330 tonne building was lifted via crane onto pilotis to rest nine metres in the air.⁴⁰ The building now sits atop steel and glass wrapped space housing a burger restaurant, wedged between and dwarfed by two 14 storey contemporary towers. The towers are part of the recently constructed \$600 million dollar (AU) Southpoint development. Southpoint is described in marketing literature as a “stunning mixed-use, transit-oriented development comprising commercial, residential, retail and the new flagship Emporium Hotel.”⁴¹

Collins Place and the land in proximity to it was owned by the South Bank Corporation, which sought in 2006 to invite a developer to construct a transit-oriented development in accordance with a district master plan. Conservation of the building is enforced through heritage legislation. However, its value in the valorisation of real estate seemed to have come naturally. A YouTube video shows the way it was lifted into the air, a spectacle that added to the development’s marketing campaign.⁴² In this way, the heritage building became a sculptural element

to a large development, serving the function of hosting a burger place and bar, a landmark providing wayfinding at the development's entrance, and the occasion to issue a press release celebrating the heritage prowess of its developer.

[Figure 5 about here.]

Similarly, the SkyNeedle is an object that has been saved, designed, moved and is now being incorporated into another mixed use development.⁴³ The SkyNeedle was designed to be a landmark for Expo '88. It was a popular meeting place, and at 88 meters it towered over the site. Designed by Australian artist Robert Owen, it was originally titled the "Night Companion." True to its original name it sported a "60-km radius xenon-beam laser-eye that surveilled the Expo and Brisbane horizon night skies."⁴⁴ At the time of the expo it was the "largest single art commission in Australia."⁴⁵ After the Expo, the SkyNeedle was to be sold to Disneyland Tokyo. At the last minute it was purchased by the Australian entrepreneur Stefan Ackerie and moved 600 metres away from its original location. The SkyNeedle now has a little less largesse as it becomes incorporated into a mixed use development and is surrounded in all directions by ever larger buildings. The artwork is now the centrepiece of the SkyNeedle Apartments, which promotes this transformation: "Once home to boot makers, fizzy drink factories and timber mills, the area now houses leading academies of learning, world-class cultural institutions, cool cafés, cocktail lounges and hip boutiques. Old and new sit shoulder-to-shoulder in intriguing layers of history and excitement."⁴⁶

While Collins Place and the SkyNeedle are heritage objects commodified for real estate branding purposes, the Nepalese Pagoda reifies expo memories. The Queensland Cultural Centre reflects yet another value and a different coalition of actors. The Queensland Cultural Centre was a complex of buildings built prior to Expo '88 and is situated on the edge of the South Bank Parklands. Despite the fact that it sits outside the bounds of the parklands, the complex of cultural institutions represents the force of heritage as a means of reigning in what some viewed as the potential for overdevelopment and commercialization of a cultural district. In 2014, the Australian Institute of Architects applied to list the building on the Queensland Heritage register in response to a cultural precinct plan that allowed for a 30-story commercial building to be built over the top of the performing arts centre.⁴⁷ According to the Queensland Heritage Council Chair Peter Coaldrake, there was "overwhelming community support for the application with the nomination receiving the most number of public submissions in the history of the Heritage Act—1254 in total."⁴⁸ Conservation of the brutalist complex was yet another expression of public outcry to make certain urban spaces sacrosanct from real estate pressures.

Conclusions

Both of the expo sites represent a tabula rasa form of redevelopment, in which urban land is restructured; and residents and businesses are expelled in the production of new urban spaces. These spaces were designed to facilitate the functioning and success of a mega-event. Even as sites were scraped, actors in both San Antonio and Brisbane protested and advocated for change. The impact of this advocacy was limited, but important in both cases. In San Antonio, the retention of older structures and trees was recognized as an innovation in modern design. The scattering of buildings, such as Collins Place that were retained for Expo '88 are still appreciated in a rapidly changing South Bank precinct as historical markers that tie the present urban fabric to the site's past incarnations. Meanwhile, there has been very little recognition of the Aboriginal history at these sites until very recently as resurrected in a place name at Hemisfair and an art installation and a new cultural centre planned at South Bank.⁴⁹

After the expos opened, the attending public created new memories and attachments that for some inspired great personal investment and advocacy. As people imprint onto these landscapes over time, that creates a sense of, and attachment to, place. However, what and how things are remembered at the former expo sites is not a simple function of nostalgia to a moment in time. Once cultural values become inscribed into heritage laws or animated by capitalist interests, the calculus may change. This includes the use of heritage objects in the revalorisation and reinvention of spaces. Heritage objects can also become talismans used by neighbourhood groups to invoke heritage laws that slow the rate or nature of change in a precinct.

Heritage buildings and objects also become symbols of particular development regimes. The modern pavilions that date from Hemisfair '68 are viewed as obstacles, or even made invisible, by the Hemisfair Area Redevelopment Corporation. HPARC along with other supportive developers and public agencies, seek to eliminate barriers to a New Urbanist vision of redevelopment. Meanwhile, preservation advocates seek to render these buildings visible as cultural assets. Such conflicts expound how objects attract constituencies who seek alternative visions of the future through their orientation to the past. In Brisbane, the embrace of the brutalist Queensland Cultural Centre complex speaks not only to the receptiveness of the public to appreciation for modern architecture, but a coalition between Brisbane residents who seek to protect their neighbourhoods from 'overdevelopment' and the architects who wish to preserve Robin Gibson's legacy.

Stewart Brand has eloquently written about the ways in which buildings learn through adaptation.⁵⁰ One could apply many of these scales of adaptation to former expo sites. However, it is not only in adaptation and transformation, but also in the ways in which urban spaces are made to “remember” through the retention of buildings and landscapes from the past. In exposing human attachments and means of valuing objects and spaces, we can learn more about both the built and social legacies of mega-events and their power to transform and conserve urban space.

Tables and Figures

Table 1: Comparison of sites

	Hemisfair (San Antonio)	South Bank (Brisbane)
Physical site during expo	39 hectares (96 acres)	40 hectares (99 acres)
Physical size of site at present	Dedicated parkland 19.2 acres Total site is equivalent to South Bank Parklands – Approximately 38.85 ha or 96 acres. Some sources indicate 92 acres (including parkland)	Parklands only: 17.5 hectares (43.24 acres) Parklands figure does not include the Convention Centre site or lands that have been redeveloped for mixed use development.

⁸ Research methods at both sites included archival research; analysis of news, planning documents and online medial visual observation and photo documentation and interviews. In San Antonio, the first author was involved in participant observation in the leadership of Mid Tex Mod, the central Texas chapter of Docomomo-US, a nongovernmental organization that is dedicated to the Documentation and Conservation of the Modern Movement. In addition, this author led a 2014 graduate planning workshop *Sustainable Adaptation of Large Modern Footprints* that investigated four world's fair sites from the 1960s, including Hemisfair. Partners for that workshop included the CEO of the Hemisfair Park Area Redevelopment Corporation and a representative of the San Antonio River Foundation. Subsequently interviews and archival research were conducted in San Antonio in 2016 and 2017. Interviews conducted in 2016 and 2017 included that of Andres Andujar, the CEO of the Hemisfair Park Area Redevelopment Corporation; Anne Krause, the director of the Hemisfair Conservancy; Rudi Rodriguez, a local entrepreneur and advocate for Tejano History; Sherry Wagner, one of the primary organizers for the Woman's Pavilion at Hemisfair '68; and Bonnie Ayer, the former President of the non-profit the Women's Pavilion at HemisFair Park, Inc. Archival research was conducted using UTSA's Hemisfair collections. In Brisbane, the authors conducted two site visits in 2017. The site visits included interviews and a focus group; a recorded walking tour with a volunteer Brisbane greeter attended expo 88; and archival research.

¹⁴ That is 190 meters if one does not count the antenna at the top of the structure. The Tower is also described as 750 feet tall or 229 meters when the antenna is included in the calculation.

¹⁵ There were many other temporary structures constructed for the fair. Most of those have since been demolished. A few ruins remain on the site today, including the pavilions for Kodak and Gulf Insurance. In addition, Hemisfair sported an elevated mini-monorail system and water features that offered respite from the Texas heat. Most of these features are gone. Like many other expo sites, the fairgrounds were designed as a closed pedestrian area, with streets that were closed internally, the perimeter secured, and the site surrounded by a moat of parking lots. Recent master plans seek to reopen some of the closed historic streets.

¹⁶ Some had seen the post Hemisfair event site as a logical location for the location of University of Texas at San Antonio. However, the campus was actually sited far north of the city. This was only one aspect of the rapid suburbanisation that affected downtown plans and vitality. Construction of additional federal buildings near the federal courthouse added office buildings on the south-eastern portion of the site that drew little if any tourist activity for Hemisfair. The mini-monorail system that had offered an option for internal circulation was removed and made the site seem difficult to traverse in the hot Texas sun. The small 19th and early 20th century buildings that had housed concessions lost tenants, either through circumstances or mismanagement, sapping further energy from the site.

¹⁷ Anne Krause. Personal interview by Jennifer Minner. June 2017.

¹⁸ The Hemisfair Conservancy was established a few years later to channel philanthropic funds to improve the area, which had been renamed yet again as 'Hemisfair,' with 'Park' removed from its official name.

¹⁹ The creation of 'Civic Park' involved demolition of most of the Convention Centre, which had been built for the fair and rebuilding convention centre space on the north-eastern portion of the site.

²¹ Correspondence from Mark Wolfe, State Historic Preservation Officer, Texas Historical Commission to Amy E. Dase, Prewitt & Associates. Dated September 13, 2013. The letter specifically pointed out the "exceptional significance" of the Institute of Texan Cultures;

Confluence Theatre, Exhibit Hall and Migration Plaza, which were elements of the U.S. Pavilion; the Woman's Pavilion, and the Tower of the Americas. Eligibility for an historic district is an important step for preservation, but it is not complete protection. In the United States, it is not a federal or state heritage designation that has the most strength.

²² Richard Webner, "Institute of Texan Cultures plans to move for mixed-use development" MySA, June 15, 2017, <https://www.mysanantonio.com/real-estate/article/Institute-of-Texan-Cultures-plans-to-move-for-11223800.php>

²³ In Hemisfair '68 era publicity materials, it was described as: "a blending of the old and new of this historic area." Bennett, Arthur S. Mrs. Woman's Pavilion – Hemisfair '68. Fact Sheet produced by the Publicity Office. Despite the reputation for modern architects of the period to disregard historical context, this is an indication of yet another aspect of Hemisfair '68 that was designed to be sensitive a sense of history on the site.

²⁴ When the Women's Pavilion at Hemisfair, Inc. began leasing another building on site for its office, the added expense of monthly rent began to sap the organisation of its resources. A death in the family of the organization's president and a lack of leadership to step in, meant that momentum was lost.

Tourism in the slums of Rio de Janeiro: An analysis of the urban impacts in informal areas caused by recent public interventions for the big sports events hosted by the city

Sergio Moraes Rego Fagerlande*

* *PhD, Adjunct Professor Rio de Janeiro Federal University, sfagerlande@gmail.com*

The slums of Rio de Janeiro have been the stage of recent urban changes related to tourism-related activities, chiefly those linked to the large sports events such as 2014 FIFA World Cup, and the 2016 Olympic. The visiting by Brazilian and foreign people was always significant in the city, and the increase of the flow in the slums is a relevant fact. This article seeks to put the changes in the recent urban dynamics of those areas into perspective, as caused by popular settlements in which tourism has been bringing changes about, initially related to urban mobility, in the case of the large works done by the government. These interventions brought reflexes embodied in private and community-related investments, with the opening of hostels, bars and restaurants, along with the creation of new open spaces, such as parks and ecological trails. The work has been going on, with the mapping of these activities in the slums of Rio's South Zone, especially in the slum of Babilônia-Chapéu Mangureira, seeking data on their locations, and on the importance of community participation, and the relevance of public policies in the process at hand.

keyword 1, Tourism in slums **2**, Rio de Janeiro **3**, urban mobility works.

Introduction

Rio de Janeiro is one of the largest Brazilian cities, with a population of 6,520,000 (IBGE, 2010). From the start of the 20th century it has been considered as one of the world's most important tourist destinations (Perrotta, 2015), with a strong part in the imagination of tourism in the world, on account of its beaches, celebrations such as the Carnival and New Year's Eve and its image of a wonderful, joyful, and festive city. Its attractions are generally found in its South Zone, in a scenario where the ocean meets the hills, in boroughs such as Copacabana, Ipanema and Leblon.

It is a city fraught with contradictions, significant social disparities, a portrait of a Brazil divided and unfair, where the wealth is distributed in an extremely unequal way, something that is shown in the cities and in the way the urbanisation work has been taking place.

At the same time that this tourist-activity area concentrates its many attractions, there are many poor communities, the slums, where a large number of people dwell. The city has around 23% of its population living in these poor areas (IBGE, 2010), in many types of slums scattered throughout the whole metropolitan area.

For many years these areas were kept outside of the urban processes, with only a handful of interventions made in them that could bring any improvements for their dwellers. From the 1990s on urban projects such as Favela Bairro¹ started to treat the public areas of the favelas (slums) with urbanisation projects that did not manage to reach all the communities (Sakata, 2011). This has been a continuous process, in spite of its lack of efficiency for transformation, as it was initially desired.

The city also experienced a process of degradation of its safety conditions, with the increase in drug trafficking that, from the 1980s, started to use the city as a path for that, with the exporting of drugs to consumers in Europe and in the US (Coutinho Marques da Silva, 2015). The slums moved on to be the territory used as a base for those heavily-armed groups, generating a continuous growth of the violence and lack of security in the city.

One of the moments in which there was an expectation of change to this panorama was when Brazil was chosen to host the 2014 World Football Cup, followed by the 2009 announcement of Rio as a host of the 2016 Olympic Games. These two mega sports events should produce sizeable investments in urban infrastructure and also in security for the city, a requirement of the organisers after the selection of the venue. Wilhelm (2014), when mentioning the demands made by the organisers, points to the need to increase the number of rooms, along with

¹ Slum as a Borough.

improvements to public transport as some of their main items. This way, the growth of the tourist and urban infrastructure were basic requirements to enable the hosting of those events and an undertaken was then expressed by the Governments in Brazil, central, state and city-wise, to expand the transport networks and also improve the areas of public security, which saw the implementation in 2008 of a public security policy based on the occupation of the favelas, the Police Peace Corps, or UPPs.

The slums located near the tourist areas or along the routes leading to airports were the first to receive the major infrastructure work such as cable cars, inclined platform passenger lifts, and lifts, apart from inner way and housing projects, all part of the effort to change the image of the city, an attempt to create an image of safe city, a Wonderful City, an image that had been fading away in time. The initiative linked the notion of public security to the occupation of the warring territories, usually on the hills to sizeable construction work that would truly change the face of the areas. The idea that changes to the urban domain would produce changes in the society goes after what was said by Vainer (2013), when commenting on the big urban changes made to several global cities, as related to the ideas of marketing such cities, which has been the case since the 1970s, and which Ribeiro and Olinger (2012) claim included the slums, as shown in their relation with tourism and the changes to the image of the favelas, in line with the formal city scenario.

This work shows some of these effects, as related to tourism, in the slums of Rio's South end. Due to their location near the tourist areas, an impact was found on the enterprises related to those activities such as hostels, bars, and restaurants, apart from an increase in tourist visitation, boosted by the creation of routes, ecological trails and parks, usually associated to a participation of the communities, with the so-called community-based tourism that could flower in those areas, with the possibilities of having a less invasive tourism that could really bring about change and the generation of income for these populations, along with a greater integration with the so-called formal city.

The tourism in slums activity got structured from 1992 onwards (Freire-Medeiros, 2009) and became a subject of study in Brazil and abroad, as an activity found in many countries of the Global South (Frenzel Koens, Steinbrink, 2012). In Brazil, authors such as Freire-Medeiros (2013, 2009, 2017, 2016), Moraes (2016, 2014, 2013), Fagerlande (2017a, 2017b, 2017c, 2017d, 2016a, 2016, 2015), Carvalho (Carvalho, T. L. G, 2016) and Carvalho (Carvalho, F.C., 2013a, 2013b, 2016), and Menezes (2012) have shown how tourism has affected the slums in so many aspects. The community-based tourism, as shown by Bartholo, Sansolo and Burzstyn (2009) and by Mielke and Pegas (2013) has played a relevant role to see tourism relate to the communities, which is shown by authors such as Rodrigues (2014) when talking about the Favela de Santa Marta and by Pinto, Silva and Loureiro (2012) who deal with the experience of the Museu da Favela in the Cantagalo Pavão-Pavãozinho slum. The participation of the CoopBabilônia NGO, located on the hill that goes by the same name and the Sitiê Park in Vidigal, as shown by Seldin (2017) show community-based initiatives of importance.

This article stems from a research effort that has been mapping the hostels, bars, restaurants, routes, parks, and trails, through the visitation of the sites, with interviews, photographing, and also with the research of tourism sites and social networks such as Booking (2017), Trip Advisor (2017), Brazilian Hostel World (2017), and Facebook (2017). The mapping of the hostels that has been going on since 2010 show a very significant picture of the changes, from the moment the public policies were implemented until now, at a post-Olympic time, in which the failure of the state brought the UPPs project to an end, along with a moment of change and apprehension for those involved with tourism in slum activities².

Tourism in slums: New possibilities for the poor areas

The tourism in poor areas started in England in the 19th century when the wealthier visited the more degraded areas of London in humanitarian missions, aimed at learning about these areas (Steinbrink, Frenzel, Koens, 2012). In the 20th century the poverty in the larger areas of the world saw the rise of an interest in the visitation of places such as the communities in South Africa and in Rio de Janeiro (Freire-Medeiros, 2009). There already was visitation in the 1970s of communities in Johannesburg and in Cape Town (Steinbrink, Frenzel, Koens, 2012) and the 1990s saw the tourism in slums take its present form (Freire-Medeiros, 2009). From the big meeting held in the city, namely Rio 92, the United Nations Conference on the Environment and Development (UNCED), there was great interest from its participants to visit Brazil' largest favela, Rocinha (Freire-Medeiros, 2009; Steinbrink, Frenzel, Koens, 2012). In the beginning the visits were called 'jeep-tours', taken on board

² The government announced the closure of many UPP² units in 2018, as the violence increased and they understand this program is not correspondin to the demands of society for security.

vehicles that would take the visitors up the hills, on roads that would go through the slums, with no contact with the locals. This kind of 'urban safari' was shown to be quite degrading and, although it still exists and has many people interested in it, especially foreign visitors, it is seen as offensive by the dwellers, as they feel like animals in a zoo.

Steinbrink, Frenzel e Koens (2012) state that the importance given by tourism in slums provides empowerment, income, and that it should be done with an ethical attitude, with respect for the communities and their dwellers. In that sense, the community-based tourism, as shown in the work of Bartholo, Sansolo and Burzstyn (2009), brings elements to support the notion that these activities can relate to local organisations. Public support to these policies comes from the launching in 2006 of a finance line from the Department of Tourism for actions in communities and, albeit their being aimed at the rural areas and small former slave enclaves and fishing colonies, it was soon perceived they were a path to the slums of Rio de Janeiro, being used to support action such as the *Morrinho na Favela do Pereirão* in 2008³ and the *Solidarity Tourism Weaving Hammocks Project*⁴ at the Cantagalo Slum in 2009 (Rodrigues, 2014).

The majority of the changes to these activities related to tourism in slums and to the participation of dwellers in the process, something that grew from the projects related to the big events, with new public policies aimed at construction work and security-related work in the communities. The work aimed at accessibility improved the access through inclined platform passenger lifts, lifts, cable cars and new inner ways, along with the security policies that led to the installation of the Police Peace Corps Units – UPPs - from 2008.

Figure 1: Group of visitors on Cantagalo, with Ipanema and Leblon in the background, 2014.

The first community to receive these improvement projects was the Santa Marta in 2008. Along with the first UPP the Rio Top Tour project was created in 2010 to stimulate community-based tourism, with the training of local guides, all bringing new expectations for income generation and integration of the slum with the city (Rodrigues, 2014). Other slums had urban mobility projects related to tourism such as those that introduced

³This is a community art project that reproduces the Pereirão slum, and has been exposed in many countries since 2004,

⁴ A community handicraft project, held on Cantagalo Slum, as a Community Based Project, in 2009.

cable car services to the Alemão Complex and to the Providencia Hill, apart from the Panoramic Lift System at the Cantagalo (Izaga and Pereira, 2014; Fagerlande, 2015, 2016).

The communities were already organising themselves in other slums, though co-operatives, associations or local community work organisations, and tourism appeared as an option for the generation of income such as the case of the Babilônia Co-op (Moraes, 2016, 2013), of the Museu da Favela - MUF (Pinto, Silva and Loureiro, 2012) and of the Parque Sitiê (Seldin, Vaz, 2017), in enterprises related to tourism and the environment. As regards tourism, the visitation and the accommodation have been very important elements, showing urban transformations and a greater relation with the city, with the visiting activities relying on trails and parks, and with tourist accommodation, apart from the possibility of a greater integration with the availability of bars, restaurants and party events hosted in communities where tourism reached some level of development, as in the communities of Vidigal, Cantagalo, and Babilônia Chapéu-Mangueira (Moraes, 2016; Fagerlande, 2016, 2017a, 2017b, 2017c, 2017d). The case of Rocinha, a pioneer in the work with tourism, more related to the 'Jeep Tour' visitation, shows that even amidst the severe crisis with public security the city has been going through after the bankruptcy of the security project of the UPPs, the visitation persists, attracting a great deal of interest, especially from foreign tourists.

Hostels in slums

When researching tourism in Rio's slums from 2010, it was found that, next to guided tours, enterprises were appearing, related to tourism, especially hostels. The appearance of a large number of hostels in the years prior to the big sports events seem to have a direct relation with them and with the work done in the slums to improve their urbanism features and mobility conditions.

In the slums studied in the North and central areas of the city, the Alemão Complex and the Providência Slum were shown to have no hostels, despite the fact that those slums were the object of improvement work such as cable car installation (Fagerlande, 2015), the slums located in the South End had a large number of such accommodation enterprises and, with no data available for consultation, and with only a handful of guides starting to mention the slums and some of the hostels, albeit not in a systematic way (Fagerlande, 2017a).

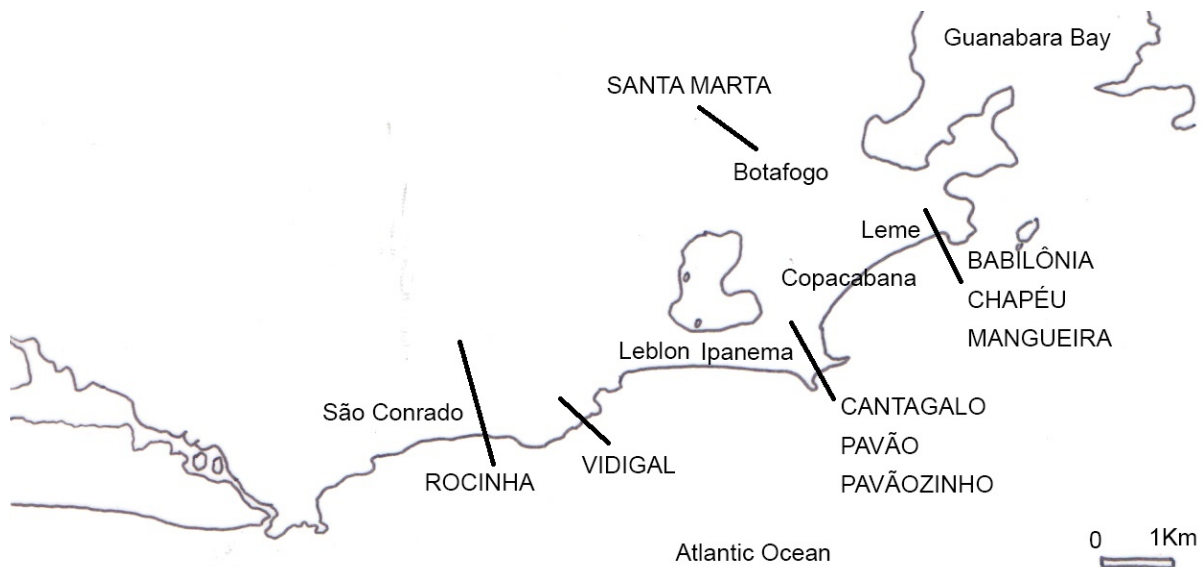

Figure 2: Location of the slums studied in Rio's South End

This way, a mapping effort was started for 5 slums in Rio's South Zone, which are close to the most tourist-friendly boroughs of the city, where, it would later be found, there was a substantial number of hostels. All of them are communities that received UPPs, and infrastructure work, usually related to the sports events the city

would host. As a result the communities in the slums of Santa Marta in the borough of Botafogo, Babilônia Chapéu-Mangueira in Leme, Cantagalo Pavão-Pavãozinho, sitting between Copacabana and Ipanema, Vidigal between Leblon and São Conrado, and Rocinha in São Conrado.

These are slums that have a panoramic view of the city and the sea below them, apart from being close to areas that have a big tourist and transport infrastructure. The access to these slums is made through streets and uphill streets of the formal city⁵, and the location of the hostels uses either the streets and the inner portion of the urban street grid around the slums themselves. When considering the areas surrounding them, the researchers saw these are considered by many as slum areas, despite their legal and formal differences.

An analysis of the graph below⁶ shows in its time line that the growth of the number of hostels in the slums occurred from 2013, possibly as a result of the imminent 2014 and 2016 sports events. The dates for the installation of the UPPs and the execution of the urban mobility works in these slums happened just before the hostels opened, showing that without these public projects there probably would have been no conditions for these enterprises to come to life. It was also possible to see that the slums have different scenarios, as regards the number of enterprises, with the Vidigal one having the highest number of hostels.

On the other hand, Santa Marta, despite being the first slum to receive an UPP and being the stage for a Government project aimed at stimulating community-based tourism, namely Rio Top Tour, conceived as a prototype of what should have been a larger project for other slums, despite the fact that it encouraged the appearance of local guides and a growth in visitation numbers, it did not boost the number of hostels, with only three until 2016, with only one in existence at this moment.

Figure 3: Relation between public works, UPPs and hostels in the slums surveyed between 2008-2017.

⁵ In this case formal city means the traditional areas of the city, in opposition of the slum areas, usually built as informal construction, without observing the legislation.

⁶ The graph shown in Figure 3 was created before 2018 when there was a reduction in the number of hostels, as shown in the Figure 4 table for 2018.

Slums	Number of hostels								
	2010	2011	2012	2013	2014	2015	2016	2017	2018

Figure 4: Hostels surveyed between 2010-2018

The location of hostels in these slums, partly inside them and partly on their fringes, brought new urban dynamics to play, where the relationship of the slum with its surroundings becomes simultaneously an example of an urban conflict whilst displaying the dynamics related to tourist-related activities as new possibilities to mitigate these very conflicts. The occupation of these areas by hostels caused a valuation of the areas surrounding the slums and allowed the occupation of buildings previously degraded and with little use, bringing a new movement of tourists and visitors, with changes that bring an improvement to the image of those areas, previously seen as very dangerous (Fagerlande, 2017d). If on one hand it is possible to see the possibility of gains and of income for the dwellers of the slums and of the areas affected by these changes, the possibility of gentrification cannot be overruled, as pointed by Pearlman (2016).

Figure 5: Casa Babilônia Hostel, Ladeira Ari Barroso, access to slum, 2016

Figure 6: Cariquinha Hostel, Morro da Babilônia Hill, inside the slum, 2016

The survey shows that the start of the installation of the hostels in these slums started from 2010 and had a peak in growth from 2013, when Rio hosted the Confederations Football Cup, a preview of the World Football Cup that would use Rio as one of its main stages and the scenario of the final match. The direct relationship of these events with a growth of the interest in hostelling in slums was found in the survey as it entailed a public consisting of foreign visitors that saw hostelling in slums as an opportunity to cut costs and also as something that many times is considered as an authentic place to stay in the city. One of the catchphrases to market these hostels was the notion of 'becoming a local', that is, a true 'carioca', as one took up accommodation in a slum. The globalisation trend brought aspects such as the standardisation of places and attractions (Urry, 1990) and the possibility of being in that which is different, local and authentic becomes appreciated.

The ease in locomotion, brought to some slums by urban mobility works such as the panoramic lift on Cantagalo[Hill], the new internal ways implemented in the Chapéu- Mangureira Babilônia Hill and the incline platform lifts installed in the Santa Marta slum, along with the aspects of acknowledgement of interest in Rocinha, a pioneer in this aspect, where the circulation of vehicles facilitates the transport of visitors, and the landscape observed from the vantage point of Vidigal, definitely the place with the closest relation with the ocean, make these slums and their hostels places of immense attraction to tourists.

There is no doubt that the feeling of security brought about by the UPPs from 2010 led the tourism-related activities in the slums to prosper, through the hands of local agencies or not, accommodation included, or just in visitation tours. Gastronomy is yet another important aspect in the tourism activity in slums. The creation of a guide specialising in popular gastronomy was published in 2012 by the Rio de Janeiro City Administration, showing the interest that tourism in the slums had in the consolidation of public policies that focused on the image of the city, as regards the big events (Bloch, 2012), and the initiatives of SEBRAE⁷ (2015) aimed at mapping the tourist slum.

⁷ Brazilian Office for the Support of Small and mid-Sized Companies, a public body set up to boost entrepreneurship.

Figure 7: Bar do David, Favela Chapéu-Mangueira [Slum], 2016

The domain of gastronomy is well represented in the Chapéu-Mangueira slum, in places such as Bar do David, which won numerous Brazilian awards and attracts a large number of patrons. Located near the main access to the slum, it is another case of success, and is easy to get to by car, which offsets the feeling one might have of being in the middle of the slum (Fagerlande, 2017d).

Conclusion

As it was chosen to host large sports events such as the 2014 World Football Cup and the 2016 Olympic and Paralympic Games, Rio de Janeiro started to prepare, as it underwent major infrastructure work and the installation of a sizeable public security project, namely the UPPs, or Peace Police Corps Units.

In the slums, the interest to bring security to those areas included a project aimed at changing their image, with policies geared for tourism, focused on income generation and the improvement of the living conditions in the communities, based on the Community-Based Tourism project of the Federal Government, and with the implementation of projects such as the Rio Top Tour, initially in the Santa Marta Slum, the first one to get an UPP in 2008. The works for urban mobility such as the lift installed in the Cantagalo community also had tourism as one of its inspirations, as the panoramic observation terrace that was built there would eventually show.

One of the results of these actions was the appearance of numerous enterprises in many of the slums, presented in this article as examples for the five communities that, from 2010 to 2017 saw the installation and growth of the hostels. The location of these hostels in the slums is also an important point for a reflection on the effects of the policies aimed stimulating tourism in slums. As one discovers that the new hostels are placed not only inside those areas, but also on the ways that give access to them and that sit on the fringes of the slums, a new dynamic was set in motion for the urban scenario, with the re-use of old buildings that no longer had any use, to produce urban vitality and income in those areas, along with a higher sense of security, as it boosted the number of visitors in areas that were previously regarded as of difficult access to those who did not live there. The possibility of a greater integration of the slum with the cities areas that are considered as formal by the travel trade is a huge advance, but one that requires more investments in security as the failure of the UPP project after the 2016 Olympic Games has led to a reduction in the number of hostels in those slums, as shown by the research data. The interest of those who live in those communities and the involvement of their associations in the communities, as they saw the visitation by tourist as a real perspective of empowerment and income generation should be an important factor to see this process continue on, even with the changes that will come about.

Favelas in Rio de Janeiro, Brazil, would be going through a third era of development, as a result of changes and accumulation of investments made in urban improvements. From alternative places of residence for the poor, where organized crime settled in the late twentieth century, today the slums of the South Side are places that are home to a new urban dynamics, with the rise of real estate prices, informal economy growth and increase of tourist and cultural activities. Community based initiatives have been an important way of social and spatial transformation. For the preparation of major sports events hosted by the city of Rio de Janeiro (FIFA World Cup 2014 and the 2016 Olympics) there were implemented new urban and public security projects in various slums. Our research presents the case study of the "Favela da Babilônia". This slum presents an interesting process in its borders, having on one side a large forest area and on the other a formal middle-class neighborhood. The possibilities that community processes related to environmental issues, such as reforestation and tourism – structured on government built urban mobility infrastructure – have revealed Rio de Janeiro as a city in which diversity stands out.

Keywords: community based initiatives, urban mobility infrastructure, environmental issues, tourism, Rio de Janeiro.

Introduction

Rio de Janeiro is a city with 11,945,532 people, consisting of 21 municipalities, where 6,520,000 (IBGE, 2010) live in the core municipality, the City of Rio de Janeiro, where 23% of its population live in precarious settlements. Amongst these are the favelas, scattered by its entire urban area (IBGE, 2010). Rio de Janeiro, along with the city of São Paulo, concentrates the two highest GNP figures of the country, adding to 25.9% of the total for the country, 8.0% of that in Rio de Janeiro. This concentration of wealth, however, leaves a significant part of the population out of it. In 2010, Rio de Janeiro had 16.41% (1,066,459 people) in a situation of vulnerability as regards poverty, with 97,000 of them exposed to extreme poverty (1.25%) (IBGE, 2017). In the slums, and despite the efforts and advances made in the last 20 years, first in urbanisation work and more recently in changes to the general guidelines adopted by Central Government to improve income distribution and public services, a scenario of social inequality persists, where urban issues are apparent, especially as regards a social and economic vulnerability, all of this enhanced by the problems with security.

The aim of this article is to discuss the various dimensions of this process, where new urban mobility infrastructure, the urbanisation of the fringe areas, environmental issues, and tourism would altogether build porous boundaries as a means to reconcile the favelas located in the city's South Side with the city as a whole. Our ongoing research has been mapping significant data on these processes that could provide input for a new urban agenda that could streamline the relations between the informal and the formal aspects of the city of Rio de Janeiro. The idea of the 'porous boundaries' of the favelas seeks to give a new dimension of integration of

these settlements with the formal city, one that is a response to the proposal made almost one decade ago, of building concrete walls to contain and arrest the growth of informality. We seek to probe some of the dynamics identified as relevant in the definition of these boundaries. Amongst them, we place special focus on those related to: (i) the connectivity of the urban grid of the favelas to the urban grid of the formal city and that of public transport; (ii) the activities that relate to tourism; and (iii) the valuation and preservation of the environment. The intent is to find out what uses and dynamics we identified as determining factors in the structure of such fringe areas which, when acted upon with efficiency, could enable the reconciliation of the formal city with the informal one. The study brings a study to the fore, on the Babilônia Chapéu Mangueira favela, where a Peace Police Corps Unit - UPP - was set up in 2009.

The results shown in this article were achieved with visits to the slums, supported by photographs and contacts with local associations and interviews we conducted. As regards the connectivity of the favelas with the formal city, we resorted to the data produced by the SABREN - Lower-Income Settlement System - of the City of Rio de Janeiro Administration and Google's Street View, a tool found in the Google Maps application. Usually, Google's Street View ends its mapping effort near the portals that give access to the favelas, operating as a marker for the transition area between the domain of the favela and that of the formal city. On the tourism perspective, and apart from the bibliographical survey, we studied tourism-related sites such as Booking (2017), Trip Advisor (2017) and social networks such as Facebook (2017).

The relation between the transport infrastructure and that of urban development has been described as complex to gauge by several authors (Izaga, 2009) where transport should support the demands of the activities produced by the diversity of the urban contexts; and the use of the land relates to the existence of certain activities in a given place, and its level of spatial accumulation (Herce, 2013; Rodrigue, 2006). In the case of mobility of the poor, authors such as Kaufman (2014), Ureta (2016), and Lindau et. al (2011) seem to agree that the analysis on mobility can help to understand the composition and the changes experienced by our society and how social exclusion interferes in the patterns of daily mobility. Other studies such as those from Motte-Beaumvol & Nassi (2012) contribute to this reflection as they warn about the aspects of unemployment and informal work as determining factors for the levels of mobility the less privileged are faced with in Rio de Janeiro. Izaga and Pereira (2014) discuss the relation that exists between the action to improve urban mobility and the investments made in the two big slum urbanisation programmes, namely the Favela-Bairro (1993) and the PAC (2007) - in Rio de Janeiro.

Based on the work of authors that study the element of tourism and the city such as Urry (1990), the research on tourism in the favelas has authors such as Freire-Medeiros (2009), Fagerlande (2017a; 2017b; 2017c; 2017d; 2016; 2015), Moraes (2016, 2014, 2013), Carvalho (Carvalho, T. L. G, 2016) and Steinbrink, Frenzel and Koens (2012). Community-based tourism has the work of Bartholo, Sansolo and Burzstyn (2009) and that of Mielke and Pegas (2013) as references. Authors such as Rodrigues (2014), Pinto, Silva and Loureiro (2012), and Carvalho (Carvalho F. C., 2006, 2013) have studied the slums of Rio and their examples of community-based action.

The City of Rio de Janeiro and the favelas

The expansion of the urban domain in Rio de Janeiro has taken place on the flat areas found between the sea and the hills, along the shoreline and the main transport lines. The favelas, on their turn, grew up by climbing the hills that separate the formal urban fabric and the hill and mountain complex, taking advantage of a prohibition set in urban occupation rules regarding the 100-level and a lack of oversight of their irregular patterns of occupation. This way, and from the mid-20th century, the slopes in Rio's South Side, the wealthiest part of the city and main tourist destination, is occupied by a series of precarious settlements that have now become boroughs with a population that can range from 7,000 to 10,000 dwellers; mid-sized ones can have from 10,000 to 1 million people; small ones have from 1,000 to 30,000 people.

Planning Area 2 (AP2) is one of the 5 set up in Rio de Janeiro Urban Plan, that which has the boroughs in what is known as the South Side, an area lying along the shore line and the beaches, the one that attracts the most tourists and where the higher-income population of the city is found. Despite its having the best laid out infrastructure and being the most affluent area, AP2 has 47 of the 635 scattered in Rio with 56,718 households formally registered, with an approximate population of 180,000 or 12% of the city's total (IBGE; SABREN, 2010) (Fig. 1). AP2 also has the largest share of isolated [stand-alone] slums, those that did not overlap others in

their growth process. Amongst the 12 largest favelas in AP2, 4 lie along the city's shoreline, that with the highest tourist appeal. All of them have UPPs and over 500 households.

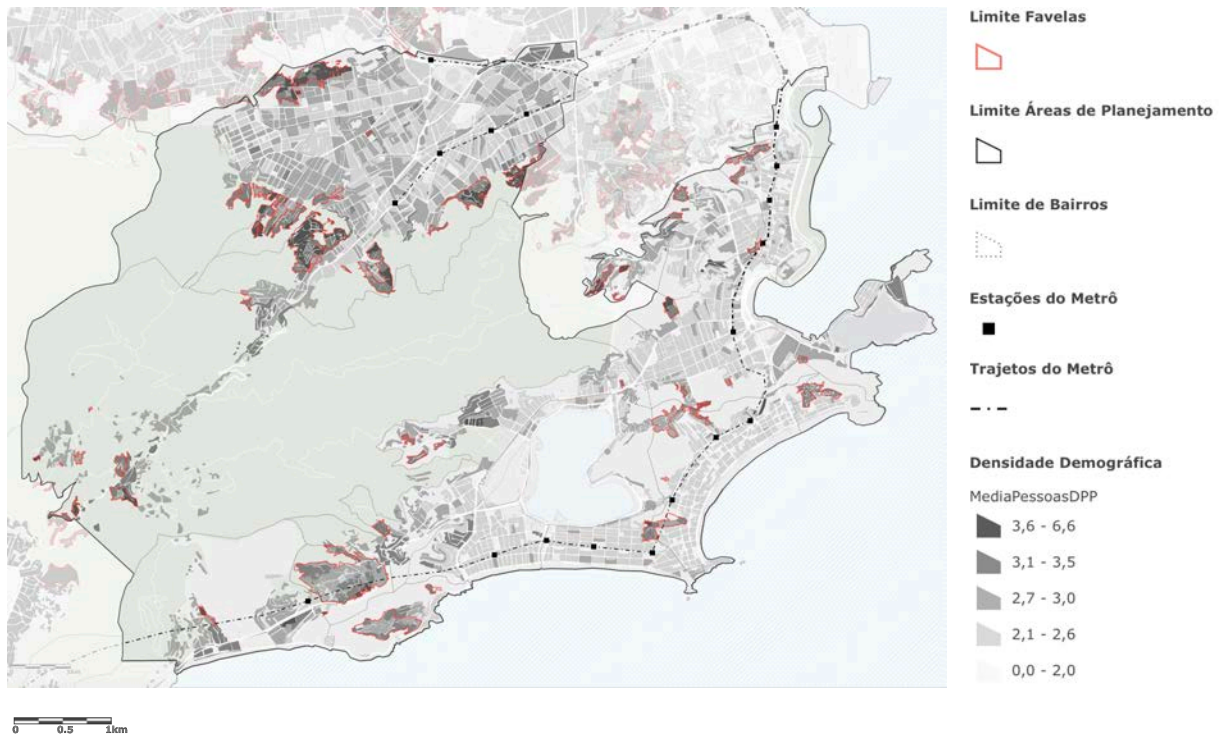

Figure 1 – Slums in Rio de Janeiro's Planning Area 2.

The city is a global tourist destination with attraction usually related to nature and to its landscape. Some boroughs concentrate these activities, usually those in the city's South Side, near the shoreline. Beaches such as Copacabana, Ipanema and Leblon are known the world over and hold the bulk of the hotel chain of the city.

Tourism has always been associated to the image of a city known as "Wonderful City", but the increase of problems related especially to violence and the growth of international drug trafficking in the 1990s when it started to use the city as a stage for its operations, contributed to the deterioration of the living conditions in the city (Coutinho Marques da Silva, 2015). The drug trafficking business is a relevant aspect in the slums, to which were added the clandestine commerce of public services, such as that for transport, communication, and of electricity, whose control gains rising value. More recently, with the appearance of armed militia, the offering of services moved on to include that of security (Izaga & Magalhães, 2013).

The decision to run for host of big world sports events in 1997 that would lead to the 2014 World Football Cup and after that the 2016 Olympic and Paralympic Games triggered a flow of large investments in the city, both as regards sports installations, directly related to sport events themselves, but also in the areas of urban mobility and public security. Along with work done in the underground train system, the implementation of the LRT (light rail train) system and other urban way work, cable car systems were built, along with incline plane lifts, and lift systems in slums, with many of the favelas also having UPPs - Peace Police Corps Units - an important part of the project for public security, implemented from 2008 onwards.

The favelas have seen a number of projects implemented, aimed at making urban interventions, such as the "Favela Bairro" one from 1993 (Sakata, 2011) on and, from 2007, the PAC - Growth Acceleration Programme - which was an important element in the group of initiatives related to the big events the city would eventually come to host.

Tourism in the slums of Rio de Janeiro

The present way for tourism in slums came to be in South Africa in the 1970s when the apartheid regime then in force there gave rise to tours, organized by NGOs, of the 'non-white' areas, with Government support (Steinbrink

Frenzel e Koens, 2012; Frenzel, 2012). At the same time these activities were being carried out in the African continent, tourism in slums also started in Brazil, when in 1992 Rio de Janeiro was the host city of a large global climate event, the United Nations Conference on Environment and Development (UNCED), when the visiting of favelas by groups of visitors started, with participants who were interested in seeing the places of exclusion of Brazilian society, starting with Rio's largest slum, Rocinha (Freire-Medeiros, 2009).

Studies on the recent development of tourism in Rio de Janeiro's favelas found a strong relation between that and the recent sports events the city hosted. The main ones were the 2014 World Football Cup and the 2016 Olympic and Paralympic Games. From the moment Brazil was chosen in 1997 to host the World Football Cup, in which Rio de Janeiro would be stage for the big final match, the city started to prepare itself, with large infrastructure work done, especially in the area of urban mobility (Izaga and Pereira, 2014; Fagerlande, 2016).

Public security issues should also be addressed and to that end the UPPs - Peace Police Corps Units - were created from 2008 onwards, in the main slums of the city, often located in Rio's South End, where the routes to the installations where the events would be held in were. The effect of the UPPs in the life of the communities was significant and, as regards the tourism activity, we were able to see its growth in several of the favelas they were implemented in.

In parallel with that work, some projects were created to stimulate tourism in those slums, such as the Rio Top Tour, set up in the first favela to have a Peace Police Corps Unit, namely the Santa Marta slum (Rodrigues, 2014). This project was related to an initiative of the Brazilian Department of Tourism that, back in 2006, had launched the TBC - Community-Based Tourism Project, aimed at boosting tourism-related activities in less privileged communities, hinged on the dwellers of such settlements, in a process to stimulate income generation linked to their local uses and customs (Rodrigues, 2014; Bartholo, Sansolo and Busztyn, 2009; Mielkas & Pegas, 2011)

One of the more apparent urban effects of the flow of tourists was the appearance of the hostels in the slums, especially those located in the South Side of the city (Fagerlande, 2017b). A study done has been mapping the activities related to tourism in five of slums, focusing especially on the hostels they now have: Santa Marta, Babilônia-Chapéu Mangueira, Cantagalo Pavão-Pavãozinho, Vidigal, and Rocinha.

The Babilônia and Chapéu Mangueira Favela

This is a slum located in Leme, a borough that is an extension of Copacabana, in Rio's South Side. It is located up on a hill that separates two boroughs, Leme and Botafogo. It overlook the ocean, with a panoramic view of Copacabana Beach that is one of its main assets.

This small favela has an intense tourist flow, and a NGO, CoopBabilônia, that works to organise the visits to the area, using an ecological path as its main attraction, which relies on the presence of some hostels. CoopBabilônia has been the main agent in the setting up of new relations between the locals with their neighbours, which includes new partnerships to do reforestation work on the woods that encircle the entire borough of Copacabana, in an important example of how the porous boundaries of the slums can contain green and developed, built-up areas.

The struggle to see the slum remaining in that area hinges especially on the organisation of the local dwellers who have gathered in associations such as CoopBabilônia. The 1980s saw the rise of environmental risks such as landslides and fires in the favela that led the locals to ask the city government to start the work of re-forestation of the woods on the upper part of the hill. At that point the highest part of the Morro da Babilônia was covered with grass, and prone to frequent fires, and the need for re-forestation was at hand (Carvalho, T.L.G., 2016). The lack of will on the part of the government authorities led the locals to organise themselves and seek a solution to the problem, which eventually happened in the shape of agreements executed with the formal neighbouring areas, through the Lauro Muller Street Dwellers Association - ALMA - and the Rio Sul Shopping Centre, both located on the other side of the hill, who were also affected by the fires. As a result the Fight for Reforestation Association was created in 1989, which gave rise to the Pro-Citizenship Front movement (Moraes, 2013).

From these events, in 1996 an APE - Environmental Protection Area - was created for the Morro da Babilônia (Moraes, 2014; Carvalho, T. L. G., 2016) which in 1997 would see the local participation be strengthened with the creation of the CoopBabilônia, Babilonia Hill Re-Forestation and General Services Workers' Cooperative LLC. With official support, and with funding that came after a legal agreement with the Rio Sul Shopping

Centre on account of issues with city legislation, the re-forestation work finally got under way, done by the dwellers, members of the Cooperative (Carvalho, T. L. G., 2016). The positive outcome would produce the continuation and expansion of the work done by the re-forestation team, under the guidance of a forestry engineer, even after the end of the effect of the legal agreement (Fagerlande, 2017d).

Figure 2: Map of the Babilônia ecological path, Chapéu Mangureira favela

Key:

1 Access to Babilônia Hill; 2 Copacabana Observation Deck; 3 Access to the Military Housing Compound; 4 Access to the Rio Sul Shopping Centre; 5 Former Explosive Stores; 6 Fortifications; 7 Rio Sul Observation Deck; 8 Telegrapher's Observation Deck; 9 Vulture Rock [Pedra do Urubu]; 10 Praia Vermelha Observation Point

The tourist use of the re-planted forest area was another positive effect in the fringe area of the favela, its visitation being organised by CoopBabilônia themselves. The acknowledgement of the area a Rio Landscape City Park in 2014 by the local Government only added recognition to the work done by the locals, producing empowerment and a sense of pride (Carvalho, T. L. G., 2016).

Apart from this area, which is located on the top part of the slum, another fringe that deserves studying is that which borders the borough of Leme. When surveying the access to the favela, only one way allows the access by car, namely the Ladeira Ari Barroso, as the second access is made through a narrow flight of steps off the Gustavo Sampaio Street.

Portals and Access Points – Connections with public transport

The Babilônia Chapéu Mangureira slum allows access to it by car and on foot, via a single way open for vehicle traffic, from the formal area, the Ladeira Ari Barroso, defining what we chose to call the 'portal' to the favela. We have used the word 'portal' as the threshold and transition from the formal city to the favela, where usually one can find the informal transport providers, along with small bars and rubbish containers. These spaces are important transition areas as it is from them, even if they come to go through formal areas, that a dominance of the favela environment is established, and where the presence of public services starts to fade. Another access point to the favela from the formal area, albeit exclusive to pedestrians, can be used via the Beco do Zé, a narrow

passageway that connects Gustavo Sampaio Street with Dr. Mauricio Bandeira Street, but that allows access only to the eastern part of the slum.

It is from the portal located in the Ladeira Ari Barroso that the main connection of the main slum area in Babilônia Chapéu Mangueira takes place with the formal city and where the informal transport providers are located, such as vans and motorcycle taxis. On the other hand, the connection with the bus service is very good, and locals can get on a transport after a nearly 400-metre walk. The entire shoreline of Rio's South End has a cycle lane that lies some 550 metres away from the portal.

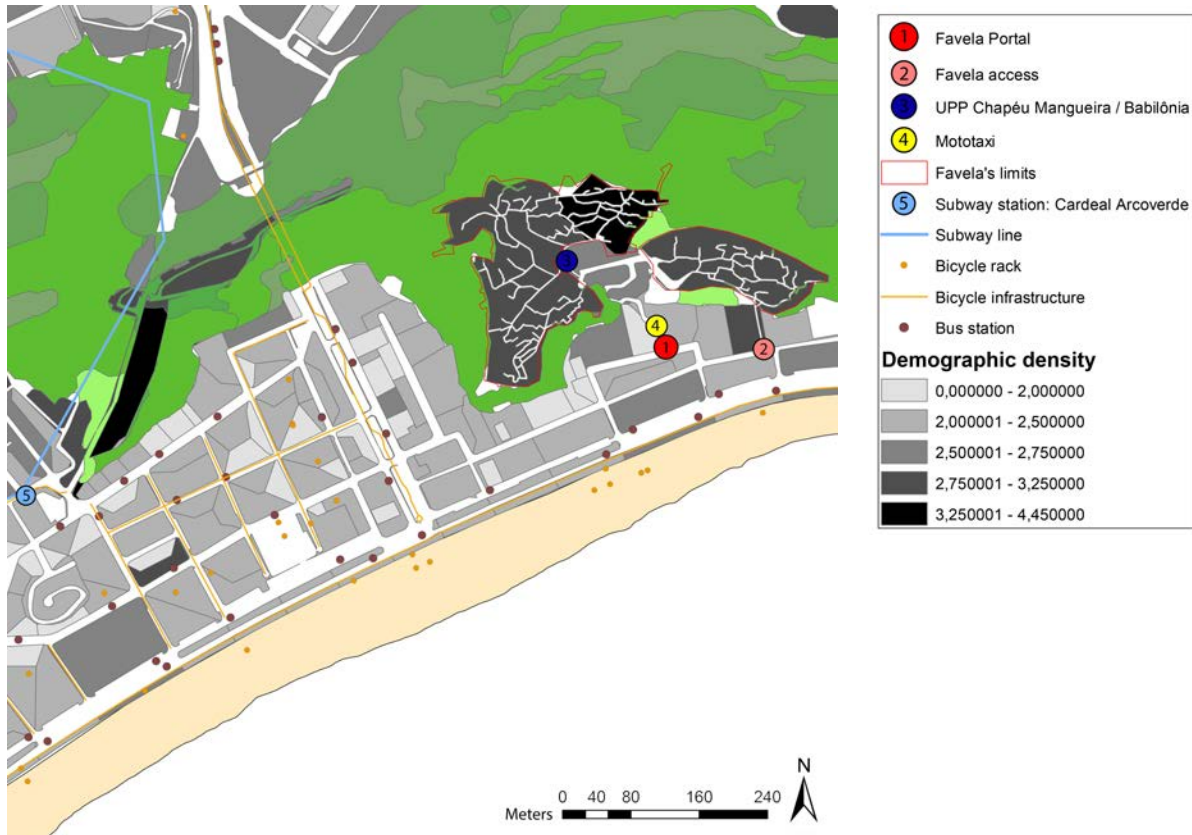

Figure 3 – Connectivity with public transport and access points of the Favela Babilônia Chapéu Mangueira.

Going up the ascent to the favela can be done in vans that leave the borough of Leme and get to the top of the slum, or on motorcycle taxis. This way, although there is no mobility equipment in the favela, such as the ones found in other slums that were given work on account of the large events hosted by the city, the mobility in the slum, especially in the areas near the inner ways that were included in recent urban work projects, have a direct relation with the appearance of hostels. Even the importance of tourist visitation places, as the exiting observation deck, is part of these projects.

The Babilônia Chapéu Mangueira slum therefore has reasonable connections with the public transport system, given that the bus is the predominant means of transport in Rio de Janeiro, covering accounting for nearly 70% of all trips. The biggest issue is no doubt the ease of access via the Ladeira Ari Barroso which has a steep gradient for some 850 metres until it reaches the slum itself and levels up, and from which the locals can get to their homes via passageways and steps. The climb, which is a trying affair, can be made on foot and that led to the appearance of the motorcycle taxis, an informal service that gained popularity in all the favelas that face the same accessibility problems.

Hostels and Lodges

The location of the hostels shows a clear divide, with some 50% of such enterprises located in the urban way structure of the favela and the other half placed on the access path, namely the Ladeira Ari Barroso. Because they are located on the ascent, the hostels took up old houses and plots of land that were previously empty, in a clear process of urban change that the tourism activity brought to these areas, previously regarded as dangerous, used only by the locals. The use of the fringe of the favela by new activities and enterprises, not only accommodation-related, but also by businesses such as Bar do David has attracted a lot of attention and many visitors to the area. Gastronomy is one of the aspects taken very much into account by visitors in the favelas, and this is a success case, acknowledged as it has been in several domestic gastronomy contests (Fagerlande, 2017).

Final considerations

The relations that exist between the favela and the formal city produce what we chose to call in this article as 'porous boundaries' in which it is possible to see new relations between less privileged areas and their neighbouring areas, in processes that came to be after PAC interventions, with an emphasis on urban mobility, in results linked to the implementation of the UPPs, with a temporary perception of safety that enabled the setting up of new tourism-related activities in these communities, with an important element of community participation that strengthens the relations between local associations, the public authorities and the private enterprise, in actions that can be alternatives for changes in the relations between these areas, and the transformations in the so-called boundaries of these areas of the city.

Through the study of aspects related to the connectivity of the elements of urban mobility between the formal areas of the city and some of its slums, it is possible to see how these relations affect the behaviour of its

¹ Some of the hostels mapped were closed in May 2017, after the end of the mapping work used in the article.

dwellers, and the importance the ways of access have to such informal areas, and how these accesses produce new fringe areas, with vital intersections for the communities, that bring new possibilities of relations about in the direction of their neighbouring areas.

Figure 5:- Bar do David, Favela Chapéu-Mangueira [Slum], 2016

Apart from providing access to the communities and to the mobility equipment they have, the location of the elements related to tourism, such as hostels and bars reinforces the relevance of the boundaries, and how this porosity brings about hues of this new relation amongst such different places which finds possibilities to connect, and of shared uses, and of dynamic in these areas that reinforce community action, bringing the visitor from outside to experience life with the dweller on the inside, as is the case in the Babilônia Chapéu Mangueira favela. The scenario found there, as with the hostels, in which this connectivity is found, shows that even with one of its boundaries being porous, that is the space for the meeting to occur and for new uses for the city to be found.

A third aspect is the relation that exists between the built-up environment and the natural realm which, in one same favela will allow the environmental recuperation of the vegetation, with clear gains both for the formal city as for the slum, and one that still relates with community-based tourism, in a case where the Babilonia Hill example brings an important example of the joint work of the local community, of the private enterprise, and of the public authority to change the city.

Based on the cases found in this community, it is possible to see the importance of a more in-depth study of new possibilities towards the construction of a new relation between the favela and its neighbours, where the 'porous boundaries' gain significant importance, showing that, rather than building up walls, we should seek connections and a wider exchange between areas that, albeit being so close to one another not always get to meet one another and live in harmony.

The Tokyo Olympics 2020 Sport Stadium Controversy: Exploring the Role of Star Architects and Global Brands

Tomoko Tamari (Goldsmiths, University of London)

Landmark architecture has often been discussed in terms of reflecting national identity and symbolizing historical narratives and memories. Architecture therefore plays an important role in realizing such complex notions in the very materiality of the building design. Hence, star architects could not just be seen as imposing their 'a global brand', but also identifying themselves as interpreters of national narratives as well. This type of architect has often been encouraged to produce 'signature' buildings for global mega events – such as the Olympics. Yet, transnational urban elites who enjoy financial and political power are now the dominant force to influence the design and concept of iconic buildings in contemporary architectural practices. This paper investigates this trend to argue that there have been significant changes in the role of iconic architects and spectacular buildings. In order to better understand such shifts, the paper focuses on the Olympic stadium as an ideal site. Rather than focusing on various critical issues such as the massive budgets for Olympic stadium that become seen as 'white elephants' and related civilian political issues, which have been extensively discussed, the paper in particular investigates the emergence of iconic Olympic stadia designed by star architects. Taking Zaha Hadid's controversial architectural design for the main Olympic stadium for the 2020 Tokyo Olympics, the paper unpacks the relationship between the material and symbolic infrastructure of iconic architecture, which involves political interests, economic capital and site-specific memories. By doing so, the paper conceptualises 'branding' as an economic and cultural system, which helps to better understand the significance of 'a new set of symbolic value' in iconic brand buildings and architecture. The paper also examines the commodification of star architects and 'personalization' of iconic architecture. The paper concludes that national grand architectural projects, such as the construction of Olympic sport stadia, cannot operate outside the regime of global and local politics, and beyond the logic of neoliberal transnational capitalism.

Extraterritoriality in the Olympic City of Exception: The Case of Rio de Janeiro 2014-2016

Anne-Marie Broudehoux (School of Design, University of Quebec at Montreal)

This paper investigates the role of sporting mega-events in the legal and spatial reconfiguration of the urban landscape. Based on Eyal Weizman's notion of "extraterritoriality" (Weizman 2005) and Giorgio Agamben's concept of the "state of exception" (Agamben 2005), the paper explores the effect of sporting mega-events on the production of a new urban territoriality, marked by the creation of spaces of exception, which are both spatially and legally located outside the "normal" urban order. It posits that the artificial crisis engineered by the urgency of the mega-sporting events' fixed deadline, the magnitude of demands made by private sporting institutions such as the Fédération Internationale de Football Association (FIFA) and the International Olympic Committee, and the scope of infrastructure projects to be undertaken for the event has given the city the license to suspend the pre-existing juridical order, to impose new rules and sanctions, and to take exceptional measures in order to reshape the city for the needs of the event and its sponsors. The paper is based on more than two decades of empirical research on the urban implications of sporting mega-events, especially in China and Brazil. It centers upon the transformation of Rio de Janeiro in the years leading to the hosting of two of the world's greatest events: the 2014 World Cup and the 2016 Olympics. The paper argues that in spite of their reputation as great social unifiers and celebrations of togetherness, mega-events spectacles are powerful instruments in concealing the growing fragmentation of the urban territory into pockets of privatized enclaves that increasingly escape local legal and spatial norms. The paper concludes that in Rio de Janeiro, the hosting of mega-events has exacerbated the pre-existing urban fragmentation by creating new territories of exception, and further isolating prior spaces of exclusion, while promoting the privatization of vast urban sectors.

Obsolescence and Transformability in London's 2012 Olympic Site

Juliet Davis (Cardiff University)

Obsolescence has been a major issue within the history of Olympic Games developments, producing 'white elephants' and waste in the wake of fleeting spectacle in cities from Sarajevo to Athens to Rio. Images of these have haunted claims of the social and economic value of mega-events for cities, bringing the very idea of legacy close to ruin. Seeking to address the threat of obsolescence, considerations of the post-Games usage of the venues and wider site of the 2012 Olympic Games formed an important aspect of planning for legacy from the time of London's bid in 2003-4. These involved designing infrastructure, venues and parklands to not only work for the Games but facilitate the evolution of the mega-event landscape into an everyday piece of mixed-use London afterwards.

Designing an Olympic Park that could undergo a substantial transformation without complete redevelopment concentrated attention, as London legacy masterplanner Bob Allies has often put it, on designing "processes" rather than just "products". Products, in these terms, are object buildings and landscapes that may reflect a given context or situation, but pay insufficient attention to how change may affect their utility. An emphasis on processes, on the other hand, involves attending to how buildings and urban fabrics exist in time —emerging, materialising and transforming— and how they might be shaped. It implies the integration of such anticipatory thinking into the design and making of buildings, through ideas of relative durability, dismantlability, temporary use, adaptability, flexibility, and the like. In the context of planning for London's legacy, such ideas informed the design of individual venues and the masterplan framework as a whole. As such, they could be seen to indicate possible new ways of evaluating the social and economic outcomes of Olympic Games, and of spectacularising urban landscapes generally. But, do they?

Five years after the Games, there is an opportunity to consider not only how legacy-focussed transformation was anticipated through the design and development of the Olympic Park, but also how it has been unfolding since. Through a history of planning for the future use of the Olympic Park since 2005 —focussing particularly on the fabric of the Games— this paper will explore relationships between transformation as anticipated and as actually realised through adaptation and reuse. The paper will show how, though London has not produced the ruins of Athens or Sarajevo, obsolescence can still be detected in the context of planning processes and adaptability has proved a challenge in many ways. This has implications not only for transformable design and architecture in the context of the Olympics, but for the sustainability of event-led urban change more broadly.

The Tokyo Olympics 2020 Sport Stadium Controversy: Exploring the Role of Star Architects and Global Brands

Tomoko Tamari

Goldsmiths, University of London t.tamari@gold.ac.uk

The Olympics is a contested site of sovereignty in terms of power balancing between the political (government), economic (global capitalism), cultural (iconic architects) entities and citizens. The paper focuses on iconic Olympic stadia designed by star architects in the era of global capitalism and explores the shifting and multifaceted identities of the iconic architects in global cultural industries. Taking the 2020 Tokyo Olympic stadium as a case study, the paper unpacks the relationship between the material and symbolic infrastructure of iconic architecture, which involves political interests, economic capitals and site-specific memories. The paper argues that the Olympic stadium is an ideal site to examine the strategically constructed images and values of iconic architects and spectacular architecture, and that reveals the narrativisation and commodification of star architects and iconic buildings necessarily make themselves into 'a global brand'. In this context, the paper concludes that national grand architectural projects, such as the construction of Olympic sport stadia, cannot operate outside the regime of global and local politics, and beyond the logic of neoliberal transnational capitalism.

Keywords: Iconic architects, Olympics Sport Stadium, Global brand, Global capitalism

Introduction

It is generally accepted that the Olympics are an assemblage comprised of a human-made spectacle, national branding, and city planning at one and the same time. It is also a contested field of sovereignty in terms of the power balance between political (government), economic (global capitalism), cultural (iconic architects) entities and citizens. The paper particularly focuses on iconic architecture and architects in the context of Olympic culture in the era of global capitalism. The Olympic stadium could be seen as one of the most noticeable Olympic facilities, since it draws a good deal of attention as an iconic building designed by star architects. Taking the 2020 Tokyo Olympic stadium as a case study, the paper unpacks the relationship between the material and symbolical infrastructure of iconic architecture, which involves political interests, economic capitals and site-specific memories.

Rather than focusing on various critical issues: such as the massive budgets for a 'white elephants' Olympic stadia; analysing architecture designs; criticising the process of the design competition; or problematising related political issues in the Japanese architectural industry, all of which has already been extensively discussed, the paper investigates the socio-cultural implications of the iconic Olympic stadium designed by globally branded star architects. By doing so, the paper conceptualises 'branding' as an economic and cultural system, which works to incorporate 'a new set of symbolic values' into iconic buildings and star architects. Although the branding system institutes a new pragmatism for star architects, the immanent

nature of brand of 'iterability and seriality' makes brand a contingent entity that swings between exclusiveness and banality. The paper concludes with an examination of Kengo Kuma's architecture language of his 2020 Tokyo Olympics stadium design.

Architects in the era of the global capitalism

Today we find that iconic architecture not only provides representations of national identity and traditional narratives, but also becomes a contested political site involving state, global capitalists, iconic architects and citizens. The expanding field of global capitalism with its flow of financial power increases the political and economic influence of iconic architecture as '*a heteronomous practice*'¹. This means that architectural practices become driven by multi-layered powerful agents and actors. Such a contested situation, therefore makes it difficult for established architects to maintain their autonomous freedom to design every detail of their buildings. Furthermore, they have to negotiate and adopt to a given local context, and at the same time cooperate with transnational economic and financial powers in the era of the global capitalism.

Hence, iconic architecture cannot be understood just as a nation-led-political device or architectural signature, but also as a site for the investment, promotion and legitimation of the social status of 'transnational urban elites'². These are, what Sklair calls, the 'Transnational Capitalist Class'. Sklair explains that 'in the pre-global era, iconic architecture tended to be driven by the state and/or religion'³, while in the era of capitalist globalization, the 'transnational capitalist class' has increasingly become the central power to 'define the times, places and audiences that make buildings, space and architecture iconic'⁴. In such circumstances, unlike many modernist giants, such as F. L. Wright or Le Corbusier, who could enjoy their relatively freedom to realize their innovative architecture design, contemporary architects have to engage in self-promotion to become favourable ones for the global financial power.

Branding iconic architects

If we accept the idea of 'the values of currency of the "famous" dominate architectural culture, and the production and *marketing* of architectural iconic buildings and signature architecture'⁵(emphasis added) come to be a central factor in contemporary architectural production, then it is important for successful architects, to not only become star architects, but to make themselves into a powerful brand. As cultural theorist and architect, Daniel Libeskind, argues this provides an interesting social recognition of 'Starchitects': First, 'they are identifiable individuals', second, '(their buildings) are often associated with striking shapes or concepts' and third, 'they have a strong capacity for self-promotion'⁶. To further the

⁶ See McNeill, Donald. *The Global Architect Firms, Fame and Urban Form*. (London: Routledge, 2009), 62.

analytical understanding of 'self-promotion', McNeill further discusses '(The Hollywood) star system' which become the major apparatus to create charismatic stars for the screens. He remarked on the similarities with the production of architectural celebrity in terms of its 'systematic, industrialized process of promoting individuals with a particular uniqueness or distinctiveness,'⁷. This suggests that iconic architects are socially constructed products. They strategically commodified themselves to become 'iconic brands'. In 1990s Frank Gehry and, his masterpiece Guggenheim Museum in Bilbao and its 'Bilbao effect' can be seen as a classic example⁸.

Zaha Hadid and a multifaceted identity

Hadid was also categorized as on the "A" list of name brand architects. She was the first female winner of the Pritzker Architecture Prize (2004) and was acknowledged as one of the 'World's Most Powerful Women' by *Forbes* and *TIME* magazine who included her in the '100 Most Influential People in the World'⁹. Her architecture has often been described as 'the utopian visions of Suprematism and Constructivism into the promised land of actual building'¹⁰. Like Frank Gehry's works, her architecture stands for striking contemporary urban spectacles. As her architectural projects caught public imagination across the globe, her own presence becomes more visible to the public.

This is not only because increasing her appearance in the media, but also understood as a result of the prominence of art museums which started to involve in making connections between art and architecture. In this trend, like other starchitects, Hadid's architectural projects have been exhibited by many leading art museums and featured as a contemporary art form. Her company Zaha Hadid Architects's projects appeared at New York's Solomon R. Guggenheim Museum in 2006, London's Design Museum in 2007 Saint Petersburg's State Hermitage Museum in 2015 and London's Serpentine Galleries in 2016¹¹. Hence, her public recognition and identity become multifaceted: architect, designer, and artist. She extended her fields to art and design which is a significant part of cultural production, as her company, Zaha Hadid Architects proclaims '[w]e are in the business of cultural production'¹².

Zaha Hadid as a successful global brand

Being recognised as an avant-garde contemporary architect, she developed her hybrid talents to contribute to collaboration between architecture, art and commerce in the contemporary cultural industries. This is because her philosophy was based on a challenge to conventional concepts and ideas of architecture and to

⁷ Ibid, 64.

⁸ An architecture critic Hal Foster, speaking about Frank Gehry in Sydney Pollack's film *Sketches of Frank Gehry*, "he's given his clients too much of what they want, a sublime space that overwhelms the viewer, a spectacular image that can circulate through the media and around the world as brand" (Rowan Moore). <https://www.theguardian.com/artanddesign/2017/oct/01/bilbao-effect-frank-gehry-guggenheim-global-craze> (accessed 29 March 2018).

provide new ‘design at all scales’ from city planning, architecture, interior, artefact, even fashion in order to propose new ways of life¹³. But this could also be seen as an important marketing strategy of self-promotion to become a new global brand. The brand provides not only various types of products and design, more importantly it creates a set of meanings, new value and narratives to integrate into images of a product, a company or a person. Hence, as the manifesto of Zaha Hadid Architects (‘[w]e are in the business of cultural production’) indicates, it is significant for contemporary architects to create not just material, but also provide immaterial values, that is ‘images’ with ‘a hermeneutic sensibility’¹⁴ - creating a set of new ideas, meanings and sensibility in the cultural industries. This is formation process of the brand. This process can also be applied to Hadid herself and the way which she became a successful brand. She had to promote herself as a brand *producer* as well as ‘as a *product* within a brand-name structure of cultural marketing’¹⁵.

Zaha Hadid and the Tokyo Olympic stadium

In order to become an ‘ideologically’ constructed global brand¹⁶, one of the most beneficial ways is to acquire a complex and ambitious grand architectural project, such as the Olympic stadium. Since it is one of the few occasions, in which architecture (therefore architects) become a matter of public interests. Particularly the issue of design of the Olympic stadium often draws a good deal of media attention. Zaha Hadid won the 2020 Tokyo Olympic Stadium competition. Her design was for an 80,000-seat and 75-meter height stadium. But the plan faced widespread criticism and intensive debate. It was oversized (8 times bigger than the Yoyogi National Stadium built in 1964). The budget (252bn yen (£1.3bn, \$2bn) was also doubled the original plan. More importantly, the plan showed little concern with the site-specific historical meanings of the memories of the Meiji Emperor. After viewing the revised stadium design, the budget was scaled down - 40% reduction in budget [from 300bn yen (1.8 bn pound) to 169bn yen (970m pounds)]. Yet, it still could not gain a satisfactory reaction from Japanese architects and the public.

One of the leading Japanese architects, Fumihiko Maki published his article on the design of the new national stadium and protested against the plan in *JIA Magazine* in 2013. This led to organizing symposiums and workshops which discussed the new national stadium; symposium, ‘reconsidering the design of new national stadium in the site-specific historical context’ with Fumihiko Maki et. al. in November 2013; public workshop ‘let’s learn about how the national stadium should be’ with Mayumi Mori et. al. in January 2014; symposium, ‘another possibility for the new national stadium’ with Toyo Ito et. al. in May 2014; international symposium ‘Aesthetics for the city and architecture: case of the new national stadium’ with Fumihiko Maki et. al. in July 2014.

¹⁶ See *Ibid*, 70-71.

Public voices in the new media

The criticism of Zaha Hadid's design for the Tokyo Olympic stadium was found in various public events and print media, but also in Internet dialogues. The dialogues are created by those who are concerned with the political conflicts of ideologies, interests from various competing groups. Such public platforms are the so-called 'blogsphere'¹⁷. An architectural critic, Takashi Moriyama started his blog 'about the debates of the new national stadium competition' in November 2013¹⁸; The custodians of the national stadium, Tokyo has started their blog in October, 2013¹⁹; a writer, broadcaster and neuroscientist, Kenichiro Mogi tweeted to support Maki's proposal in June 2015²⁰. There were also articles posted by not-well-known or unknown bloggers: such as 'Is the new national stadium Hadid's curse? Comparison of its cost with that of the other Olympics'²¹; 'Zaha Hadid "is it really true that the new national stadium will be constructed?"'²². In this movement, their negative narratives against Hadid's Olympic stadium design increasingly gained a good deal of the public attention. The collective and shared critical views of Hadid's architectural plan was gaining a strong influential impetus on the government decision process and it was cancelled in the end. This social phenomenon is what Cass Sunstein calls 'cybercascades'. He depicts '[w]ith respect to the Internet, the implication is that groups of like-minded people, engaged in discussion with one another, will end up thinking the same thing that they thought before – but in more extreme form'²³.

Even after the governmental formal cancellation had been made, Hadid's office announced their design's promotion video which obviously deliberately sought to appeal to Japanese citizens to legitimate the appropriateness of their design in August 2015. But it was too late to subvert negative public opinion and to establish proper legitimacy between Zaha Hadid Architects, the government, and citizens. Hence, we can see that the Olympic stadium is a space, which is produced by wider social-political contexts (e.g. star-architects, bureaucracy, and capitalism), but also a space mediated by public spaces, which can be reconstructed and influenced by the unprecedented degree of audience participation through broader dialogues between internet users.

The nature of brand

Yet the failure of Hadid's project cannot be understood without further considering the nature of brand, as discussed above. Frow emphasizes two aspects of brand identity. The first element is that brands have 'personalities'²⁴. The personalization of brand can be found its evidence in the way in which many celebrities ('brand characters') endorsed products. Their 'personal imaginary significance' transfers to

commodities so as to create ‘a semiotic surplus value’²⁵. The second is that brands reveals symbolic value ‘as a reflection of the buyer’s self-image’²⁶. This is a process of imaginary identification²⁷. If we follow this logic, Hadid’s super futuristic avant-garde Tokyo Olympic stadium could reflect an image of Japanese citizens themselves. This is because the Olympic stadium can play as a national symbol. It is designed to be an architectural icon so that the stadium is a showcase of Japan for the world (nation branding) as well as helping to create a positive self-image for Japanese citizens (self-esteem). Following this theory, it could be useful to explore representations of the stadium in the internet in order to illuminate associations between image of the stadium and people’s self-esteem. There are many articles on the ways which the stadium could be likened to everyday ‘objects’: ‘Could it become the Olympic stadium? *Cyclist helmet* shape of the new national stadium’ in 2012 November²⁸; ‘*Go-kart, helmet, potty?* Alternative uses for Zaha Hadid’s Olympic stadium’ in July 2015²⁹. All these negative complains can be understood as revealing the general unease with identifying the stadium as a national symbol in the public domain.

Figure 1 Zaha Hadid’s revised design of the Tokyo Olympic Stadium

Interestingly, the words, ‘shame and embarrassment’ can be also often used to evaluate the stadium design in media text: Fumihiko Maki depicted ‘(the new stadium) will be sneered at and will be an *embarrassing* construction.’³⁰; emeritus professor of Tokyo Institute of Technology, Sachihiko Harashina stated, ‘(the plan of the new national stadium) is *embarrassing*’³¹; a critic and anthropologist, Shinichi Nakazawa also mentioned ‘ (I) feel *embarrassed* with the new plan which ignored the history of Jingu resion’³². The Hadid’s design image has been described using ‘disgraceful’ metaphors (helmet, go-cart, potty) and explained as ‘something shameful or embarrassing’ in statements.

³² <https://logmi.jp/63841> accessed 28 June 2018.

It is argued that what is common to ‘shame and embarrassment’³³ is that both are regarded as self-awareness and as revealing the painful states in which ‘the individual believes she or he has failed to meet appropriate standards or conduct, and is seen to have done so in the eyes of others’³⁴. At this point, we can see psychological reflections in usage of the words. This suggests that Japanese people felt ‘shame’, because Hadid’s design failed to meet the appropriate goal. People are also ‘embarrassed’, because such failure has been seen by foreign countries. Such psychological reflections can be understood as threatening Japanese people’s self-esteem. Hence the Hadid’s new national stadium can be seen as a painful and unacceptable image of Japan. This suggests that the power of global architectural brands don’t always succeed in changing conventional values and propose something ‘different’ and the desire to create new lifestyles in transformed urban landscapes. In other words, the Hadid’s aesthetic icon which was explicitly designed for a distinctive moment in a city project, part of the 2020 Tokyo Olympics, in order to create a new socially, culturally and politically meaningful form, did failed.

Banalization of global iconic architecture

The attempt to mobilize of new aesthetics can also cause a weakening in the power of a brand. For Kaika³⁵, contemporary architects have lost their ability to pursue totalizing design ideas and ideals, and started ‘the repetition of successful architectural design forms across the world’³⁶. The point Kaika made is that star architects repeatedly reproduce their successful design forms and apply ‘the same design code to express a multiplicity of meanings in different social and geographical context’³⁷. Hence, there are always contradictions between the global brand’s transnational form and value, and the site-specific history, memory and meanings. The paradox of distinctiveness lead to ‘unspectacular spectacles’³⁸ and the gap between the various narratives, imaginaries and themes of ‘the spectacular global’, and ‘vernacular local’³⁹.

To turn to Hadid’s Tokyo Olympic stadium plan, we can consider how far her ‘signature architecture’ could encapsulate various problematic issues. As a global brand, her Tokyo Stadium designed noticeably applied her signature form in using sweeping curvy streamlines and a computer graphic rendered dynamic shape. A similar form and design code can be easily found in her many other architectural projects⁴⁰, which lead

³³ Crozier 2014:273. Crozier explains, ‘shame’ is caused by negative self-evaluation or failure to meet ideal self-goals, and ‘embarrassment’ involves a matter of social evaluation, rather than self-evaluation (Crozier 2014:270).

³⁹ Ibid, 218.

⁴⁰ For examples, London Aquatic Centre and Al Wakrah Stadium (Scheduled inauguration: 2018)

to lose features of distinctiveness, and can therefore become ‘unspectacular spectacles’. An oft found criticism of iconic buildings in general and Hadid’s Olympic stadium in particular is that it can be seen as a product of the architect’s over-self consciousness and is less concerned with the local context.

Figure 2 London Aquatic Centre designed by Zaha Hadid Architects

Figure 3 Al Wakrah Stadium designed by Zaha Hadid Architects

Furthermore, the more her signature can be found on various vernacular everyday objects; including furniture, handbags, shoes, fashion accessories, flower vases, and chandeliers, the more Hadid’s brand exclusiveness and scarcity value became weakened.

Figure 4 Melissa + Zaha Hadid = Cool Plastic Footwear

Yet this can be the immanent nature of brands, since the process of the ‘iterability and seriality’⁴¹ of appearance in brands only enable a particular product or producer to make it/he/she become ‘a brand’. In this sense, the broadly distributed Hadid’s signature and image of branded products (‘objects’ as well as ‘herself’) were always already implied in the very nature of the brand – its powerful, but inherited contingency and ephemerality. Hence, the Tokyo Olympic stadium as one of the most powerful Hadid’s signature products can be identified as the very existential archetypal case of the signature architecture, since it was the ‘branded’ stadium (therefore it can be ‘exclusive’), but it has to be accessible to everyone (therefore it can be ‘vernacular’). The stadium was promoted to blur the boundary between the value of ‘brand’ and that of mass-production. Therefore, Hadid’s global brand was not able to sustain its symbolic matrix of brand power in the context of the construction of the 2020 Tokyo Olympic stadium.

Conclusion

As discussed so far, Hadid’s Tokyo Olympic stadium plan and its trajectory was a good example to understand the shifting role and identity of iconic architects and ‘branded’ architecture in the era of global capitalism. The Olympic sport stadium as a contested juxtaposition of political power, economic interests and symbolic capital, the paper attempts to analyse branding as a concept, which helps to understand reciprocated hermeneutic relationship between material (architects and architecture) and immaterial (a set of new symbolic value and narratives). Branding architecture and creating star architects are a newly found pragmatism for surviving in competitive architectural industry. Narrativization and commodification of star architects and iconic buildings are necessitated to promote their higher public profile and making themselves as a global brand. Hadid was a star architect and the most manufactured icon. Her failure, however, suggests that the power of brand can be subject to contingency. Declining the power of brand can also be discussed in terms of its immanence nature. Brands reveal symbolic value ‘as a reflection of the buyer’s self-image’. In this logic, there was a discrepancy between the symbolic value of Hadid’s architecture and the imaginaries of Japanese self-identity. Also, the repetitive design as artistic signature of iconic building can always generate contradiction: ‘unspectacular spectacles’⁴². Furthermore, the wide diffusion of her signature in consumer goods leads to the weakening of the distinctiveness and exclusiveness of her brand image.

After Hadid’s design was cancelled, a Japanese architect Kengo Kuma took over the Tokyo Olympic stadium project.⁴³ He is not seeking to create spectacular buildings, but to ‘naturally merges with its cultural and environmental surroundings, proposing gentle, human scaled buildings --- constantly in search

⁴³ There are many critical views about his victory, since Japanese construction industry has been dominated by a few giant construction companies who have capacity to complete mega architectural projects. The second competition required short construction time and cost-down. This only makes it possible to deploy design-built systems in which an architect and construction company work together as a team. Architects have to negotiate and compromise with strong construction companies which retain advanced architectural technologies and rich resources.

of new materials to replace concrete and steel, and seeks a new approach for architecture in a post-industrial society'.⁴⁴ Wood is his preferred material. Concrete and steel can be seen as a symbol of 20th century modernity, but he uses natural wood instead. For him, wood could be the best material to reunite people and nature by creating nearly-forgotten-natural aesthetic sensitivities. Kuma's challenge as an architect in 21st century contemporary society seems to subvert the logic of modernity which is seeking alternative idea of the mass production and banality of 'distinctiveness'. The Tokyo Olympic stadium should be a singular and original entity. However, it can be very hard to avoid to be driven by the rationality of local politics and global capitalism. In hope, his architecture language for the 2020 Tokyo Olympic stadium should be accepted by sight-specific environments and could send to those outside Japan a national message about our legacy for the next generation. But this still leaves a question.

The use of high rise buildings in financial centers as real estate companies' massive weapons – the case of Mitsubishi Jisho's strategy through times

Raphael Languillon (University of Geneva)

Paper for the following panel: "Sites of Exchange: The Confluence of Global Networks and Local Interests in the Planning of Financial Centers"
Traditionally, although modern Japanese planners adopted Western urban models and standards, Japanese cities remained low until the 1980s, even regarding the planning of financial centers such as Marunouchi, in the capital. The irruption of high-rise buildings was late in comparison with American, European, or even Latin American cities. Then, two waves of fast verticalization changed the urban profile of Japanese cities, especially Tokyo: the 1980s and the Bubble period, under the government of Yasuhiro Nakasone; the 2000s and the urban renaissance policy period, under the government of Jun'ichiro Koizumi. Those two decades changed the planning of financial centers and sub-centers of Japanese cities, partially realigning it on the Western globalized model of vertical urbanism.

Nevertheless, towers and high-rise buildings are not just symbols of a globalized and a-cultural way to produce urban spaces and to mark centrality in global cities. Using the term of "massive weapon" when speaking about towers allows to put in light the geopolitical dimensions behind it. Based on the idea that towers and high-rise buildings are not only due to a globalized accumulation of capital nor a global circulation of urban models of financial centers' planning, the paper discusses the hypothesis that urban developers use towers as geopolitical investments within competitive real estate markets at local and regional scales.

Through the historical analysis of the urban strategy of Mitsubishi Jisho, the paper explores in a political economy perspective the evolution of financial centers' planning, and how does the company use high-rise building as a privileged asset to secure its dominant position in few but strategic and selective spaces. As a leader company, Mitsubishi Jisho started a strategy, which inspired other Japanese companies, such as Mitsui Fudosan.

World Trade Architecture. The Twin Towers and Global Financial Centers

Uta Leconte (Technical University of Munich)

Currently, over 300 World Trade Center's exist worldwide in more than 80 countries, functioning as nodes within a global infrastructure, dedicated to promoting global business development. However, almost fifty years since the inception of the World Trade Center Association, the denomination 'World Trade Center' remains almost exclusively designated to the World Trade Center Complex in New York, with its iconic Twin Towers functioning as representation of capital, power and global trade far beyond their destruction in 2001. The starting point of the proposed paper is the timely coincidence of the completion of the World Trade Center Complex in New York in the early 1970s and the implementation of a new interdependent global currency system, marked by the end of the Gold Standard in 1973 and the initiation of fiat money. Arguing that the specific identity and symbolism of the Twin Towers and the New York World Trade Center has since helped to stabilize an unstable global financial system, this paper asks: what are the effects of the New York Twin Towers on the planning of Financial Centers worldwide? It seeks to examine, how the specific identity of the New York World Trade Center was created, what it served, how it has been maintained over time, and what its effects are on urban planning on a local and global scale. The paper will first describe the relation between finance, architecture and the built environment as well as its sociocultural impact, taking as an example the New York Twin Towers and the concurrent implementation of a new global financial system in the early nineteen seventies. It will then focus on local effects of the Twin Towers and the World Trade Center by looking at its planning history and the urban transformation of Lower Manhattan from port and radio district to World Financial Center, including both stakeholders involved in the project as well as the cultural, political and economic urban context of Manhattan at the time. Finally, it will explore the global effects of the Twin Towers on the planning of financial centres and its urban impacts. By looking at the planning history, effect and impact of the Twin Towers on global financial centers, this paper aims to shed light on the specific agency of architecture as a symbolic object for urban planning, world trade and global connectivity.

Imperial Sediments: Planning the Urban Land Development of Hong Kong's Exchange Square (1980-84)

Sben Korsh (The University of Hong Kong)

In the heart of Central, Hong Kong stands a massive mixed-use development, the history of which reveals latent imperial planning apparatuses in the last years of British-sovereignty. As its name suggests, Exchange Square houses the Hong Kong Stock Exchange, as well as three office towers, shopping arcades, five restaurants, and a public plaza—all elevated above the Central Bus Depot. The present site originates from the early '80s, when British civil servants dominated the leadership of Hong Kong's executive, financial and legislative government bodies. In conjunction with local stock traders in 1980, the government passed regulation requiring the colony's four separate stock exchanges to merge. To accommodate the new unified exchange, in 1982 the Crown Land and Survey Office tendered a 13,000 square meter waterfront site previously reclaimed from Victoria Harbour. The site's Crown Land Lease came with terms requiring the construction of the exchange's trading floor. Hongkong Land—the largest property owner in Central and a subsidiary of one of the wealthiest and oldest colonial corporations, Jardine Matheson & Co.—bought the lease for \$800 million USD, the highest ever for the island. These early developments of the complex occurred during the colony's vast expansion in financial services, and just before the New Territories' impending lease expiration led to the Sino-British reunification agreement in 1984. Drawing on records from the Hong Kong government and stock exchange archives, this paper examines the imperial formations of power (Stoler 2013) in Exchange Square's urban land development. This entails a focus on the waning bureaucratic forms of British free-trade imperialism: from financial macro-economics to land usage and rights. By tracing such relationships in the planning of Exchange Square, this paper shows how imperial legacies shape the recent history of Hong Kong as a global financial centre.

Spatial Operations of Finance in 17th century Batavia and Amsterdam

Robert Cowherd (Wentworth Institute of Technology)

An examination of the 17th century architectural and urban expansion of Batavia (Jakarta, Indonesia) and Amsterdam suggest similarities and differences that reveal important insights into the powerful forces driving the far flung exchange practices that continue to the present. Specifically, the innovative formal-spatial-institutional arrangements of new urban forms speak to the instrumental purposes at the heart of global exchange. Beyond the exigencies of safe harbors and fortifications, the logic of minimizing the distance between boat and shophouse gave us fractal geometries of canal urbanism that expanded in both Batavia and Amsterdam. The simultaneity of explosive growth suggests that the two cities were in certain ways two unequal halves of the same urban agglomeration separated by a 20,000 kilometer trade route. Throughout, there is a dynamic interplay of forces working across purposes, at times opening opportunities to a wider (European) population, while elsewhere operating to exclude participation and establish monopoly controls on trade and the use of force.

The architecture and urban form of key infrastructures and institutions essential to the smooth operation of the Dutch East India Company included the adjacency of the quays, the Weigh House, the city-guaranteed exchange bank, and the position and formal arrangement of the Amsterdam Exchange. Of particular interest is the role played by sumptuary codes on both sides of the sea journey. The spatial conditions at the heart of Amsterdam were entwined with strictly enforced norms of decorum instrumental in producing the conditions of the "open market" price dynamics, and high levels of trust — the essential prerequisites for widespread paper-based trading practices. In Batavia, another set of sumptuary codes announced the identity and status of every person to the guards posted at every urban threshold. Batavia's strictly enforced apartheid system proved essential to securing the port city with a relatively small number of Dutch overseers. Throughout, the paper examines the question: To what extent can the urban and institutional arrangements of the first and arguably greatest multinational corporation said to be co-produced?

World Trade Architecture. The Twin Towers and Global Financial Centers.

Uta Leconte

Doctoral Candidate, Technical University of Munich, Department of Architecture, uta.leconte@tum.de

Currently, over 300 World Trade Center's exist worldwide in more than 80 countries, functioning as nodes within a global infrastructure, dedicated to promoting global business development. However, almost fifty years since the inception of the World Trade Center Association, the denomination 'World Trade Center' remains almost exclusively designated to the World Trade Center Complex in New York, with its iconic Twin Towers functioning as representation of capital, power and global trade far beyond their destruction in 2001. The starting point of the proposed paper is the timely coincidence of the completion of the World Trade Center Complex in New York in the early 1970s and the implementation of a new interdependent global currency system, marked by the end of the Gold Standard in 1973 and the initiation of fiat money. Arguing that the specific identity and symbolism of the Twin Towers and the New York World Trade Center has since helped to stabilize an unstable global financial system, this paper asks: what are the effects of the New York Twin Towers on the planning of Financial Centers worldwide? It seeks to examine, how the specific identity of the New York World Trade Center was created, what it served, how it has been maintained over time, and what its effects are on urban planning on a local and global scale. The paper will first describe the relation between finance, architecture and the built environment as well as its sociocultural impact, taking as an example the New York Twin Towers and the concurrent implementation of a new global financial system in the early nineteen seventies. It will then focus on local effects of the Twin Towers and the World Trade Center by looking at its planning history and the urban transformation of Lower Manhattan from port and radio district to World Financial Center, including both stakeholders involved in the project as well as the cultural, political and economic urban context of Manhattan at the time. Finally, it will explore the global effects of the Twin Towers on the planning of financial centres and its urban impacts. By looking at the planning history, effect and impact of the Twin Towers on global financial centers, this paper aims to shed light on the specific agency of architecture as a symbolic object for urban planning, world trade and global connectivity.

Keywords: Globalization, World Trade Center, Global Finance, Twin Towers, Representation

1. Introduction

This paper describes the Twin Towers as representation of finance and global trade and thus as an integral part of the interrelation between built and economic transformations in finance capitalism. It utilizes the case of the Twin Towers based on the following dispositions: First, their realization coincides with the shift from one global currency system to another. Second, the time of their realization marks the onset of the current globalization and its respective global trade system, and third, being the flagship buildings of the first globally visible World Trade Center, they served and still serve, after their destruction, as a symbolic object of global trade. The existence of the Twin Towers can be read along the development of a at the time newly emerging global infrastructure, one that was connected primarily by air traffic, telecommunication and data connectivity. The Twin Towers' life span can also be seen in parallel with the era of the supersonic passenger jet airliner *Concorde*, which Rem Koolhaas describes together with the Twin Towers as "modernism's apotheosis and its letdown at the same time".¹

Today, after their destruction during the terror attacks on 09/11, the Memorial on *Ground Zero* consists of two void spaces on the footprints of the former physical Twin Towers. Their symbolic presence within the global sign system beyond their destruction shows, that they are "both a physical, architectural object and a symbolic object of financial power and global economic liberalism (...) The architectural object was destroyed, but it was a symbolic object which was targeted and which it was intended to demolish".² The immense global impact of the violent destruction of the Twin Towers and the World Trade Center Complex in New York during the events of 09/11 has since been subject to extensive research and public discourse. This paper, however, intends to exclude the effects caused by the destruction, the absence or the replacement of the former Twin Towers in 2001. Instead, it will focus on the immediate local effect at the time of their realisation by looking at its planning history and the urban transformation from Lower Manhattan as port and radio district to World Financial Center as well as on the long term global effect of Minoru Yamasaki's Twin Towers. It aims to investigate, how and to what extend the

Twin Towers as a symbolic object helped establish global 'World Trade Centerness' and give some examples of their impact on the further development of global Financial Centres.

Figure 1: Stephen Brown. Concorde, The Golden Years.

2. The Twin Towers as representation of global finance

Two years prior to the Twin Towers' official opening in 1973, the end of the monetary system, referred to as 'Bretton Woods System', marked a paradigm shift in global finance with far reaching sociocultural and economic impacts. Based on fixed exchange rates and a Dollar tight to the gold standard, it has been named after the conference that took place in Bretton Woods in 1944, during which the victorious powers under the leadership of the United States had implemented the system to secure a stable post-war economic world order. In 1971, members of the *Group of 10*³ terminated the Bretton Woods System, in favour of a floating exchange rate, with the underlying intention to increase global lending ability. The new system of interdependent global currency system meant fluctuating exchange rates, hence increased instability, uncertainty, risk and speculation. Money was no longer a real asset and bound to real value (gold), but rather the promise of value exchange. The economic underlying this condition was in favour of increasing market liberalisation, privatization, competition and commodification, opposed to the economic concept of Keynesianism, the global system shaping the post-war world order. Today, one is able to analyse the global development and its economic, political and sociocultural impact over a time span of more than forty years. The global financial currency system is closely intertwined with the establishment of a global infrastructure that relies on data connectivity and the expansion of the internet. It also is strongly related to a political shift from national hegemony towards global governance and a transformation of territorial borders and boundaries on all levels. Money, as currency, and with-it business development, has been accelerated in its global spread and flow in an unimagined range over the past forty years, becoming data flow.⁴

In architecture and urban planning, this meant an increasing commodification of architecture and the emergence of real estate development⁵, an ever-growing global business sector, which had discovered architecture, once again, as a product that can be traded and speculated upon, as a financial instrument. In its ability to represent both value and meaning, architecture and the built environment could both be money (e.g. as REITs) and represent money at the same time, enabled by its ability to function as a placeholder for meaning and value and by its iconicity with effects reaching from local to a global scale. For local businesses, developers and architectural firms, the economic and strategic effects have resulted in a need to expand globally and to make themselves visible and recognizable within the global trade system. With global business opportunities growing due to increased connectivity and visibility, at the same time, the need to master contingency and to deal with uncertainty, complexity, speculation and crises, has risen over time. The effect of global financial crises since the early nineteen seventies on global business as well as on architecture and the built environment have been analysed in particular since the aftermath

of the last global crisis in 2008.⁶ In economic theory, crises in their disruptive character have shown to be systemically imminent and serve as both destructor and creator.⁷ In architecture and the built environment, this can be seen, for example, in the relation of global real estate price indexes, stock market indexes and monetary policy. Another imminent disruptor of the global system is its vulnerability to global terrorism. An icon that symbolizes the global system in its totality as did the original Twin Towers, is proven to be a desired subject of destruction. With the attack on the Twin Towers, it was not only buildings, a city or a country that were targeted, but also the global financial system.⁸

In cultural theory, effects of the global financial shift were absorbed almost immediately, starting in the late 1970s⁹: First, by postmodern Marxist theory, which explains cultural phenomena by economic conditions. Second, in postmodern theory in the semiotic tradition of poststructuralist thinking, which is concerned about the creation of signs, meaning and representation. Third, by the emergence of the latter towards a difference theory, which focuses even more on the performance character and interplay of signs; and finally, to today's predominant sociocultural approach of looking at the conditions of architecture and the built environment as a reciprocal process within actors and networks.¹⁰ How do the Twin Towers as the iconic landmark of the New York World Trade Center Complex reflect the described financial system, how do they represent global trade? What do they 'mark', as a landmark of global trade, and with what purpose? Within the sign system that helps establish, maintain and transform our knowledge and perception of the global system, the Twin Towers function as stabilizing elements within an unstable system, representing the grounded within an unstable, volatile globalism that appears intangible and abstract. In their morphology, they are solid, they are concrete; as a monolith they symbolise power and mark territory. In their twinness, a self-stabilizing morphology, they are symbolising the totality of the global: a self-referential and self-regulating system that symbolizes completeness; that dismisses diversity and difference by absorbing otherness into the unity of the global.¹¹ In its context of being the landmark of the World Financial Center, the Twin Towers can well be read in the Marxist context of Fredric Jameson or David Harvey by seeing them as the representation of finance and capital.¹² In a territorial convexity, the Twin Towers represent the World Trade Center as their urban context, they represent 'Manhattanism'¹³, they represent New York, the United States and the global system.

At the same time as the Twin Towers represent the local, they also represent the global, and hence something that is replicable, multipliable despite its singularity, or exactly because of its singularity as an icon. Towering sky-high, on airplane-level, over the city, it is, from far, visible and recognizable as a node within the global infrastructure, performing as a transmitter of meaning. The creation of meaning as building performance has been played with in many ways: The spectacle of the legendary restaurant "Windows on the World", on the top floor of the North Tower can be seen as such event (Fig. 2), another example is the legendary tightrope performance by the French high-wire artist Philippe Petit, who performed a high wire walk between the two Twin Towers in 1974.¹⁴

Figure 2: The Restaurant "Windows on the World" on the 107th floor of the North Tower. Photo: Ezra Stoller

Today, 17 years after the destruction of the 'original' Twin Towers, the two buildings are considered to be 'the' World Trade Center, despite the fact that they are two buildings of a World Trade Center complex consisting of seven buildings in total, despite the fact that they have not been the first World Trade Center since the establishment of the World Trade Center Association in 1968, despite the fact that they are currently more than 300 World Trade Centers worldwide, and despite the fact that they physically ceased to exist. Little is known about the World Trade Center Association, a not-for-profit and non-governmental organization, representing over 300 members in 91 countries,¹⁵ and which claims as a mission to "stimulates trade and investment opportunities for commercial property developers, economic development agencies, and international businesses looking to connect globally and prosper locally", and to "serve as an 'international ecosystem' of global connections."¹⁶

3. Urban transformation and local effects of the Twin Towers

Historically, global trade cities, such as New York City, have developed a significant share of their economic, political and cultural power and identity based on their ports. Being port cities, they were able to participate and profit from world trade, not only economically, but also culturally, given the vital exchange of people, ideas and goods. With global sea trade changing during the first half of the twentieth century, the formerly thriving port areas declined and urban planners needed to envision a redevelopment for their cities to remain or become visible and powerful actors within a future global trade infrastructure. In New York, efforts to redevelop the former port area and in between 'Radio Row' in Lower Manhattan in order to transform the city into a node within a global trade network, which relied on the connectivity of airplanes rather than vessels, had been underway since the 1950s. Stakeholders involved in the planning were the state governments of New York and New Jersey, the New York Mayoral Office, the City Council and the Port Authority of New York and New Jersey, which would later become the commissioner and owner of the Twin Towers.

Discussions for the urban renewal of Lower Manhattan and the planning of a new World Financial Center date back to the first half of the twentieth century. New York City with Wall Street and the Federal Reserve Bank had developed as the first major non-European financial centre and was considered the world leading financial centre by the middle of the twentieth century. Today, New York City is still taking the lead in the Global Financial Centre Index¹⁷. Looking back at the immediate era after the second world war, New York City experienced an economic boom, Wall Street was the symbol of the global economic leadership of the US, the United Nations moved its headquarter back to Manhattan and the urban development of Midtown and its international style skyscrapers strengthened the existing the identity of New York City as an international and powerful, financial hub. During this time, New York City was transforming itself from an industry-driven port city towards a city whose economy thrived mostly on finance, media, communication, tourism and the cultural industry. As a result, corporations and industries left Lower Manhattan either north towards Midtown, or left Manhattan entirely. Hence, Lower Manhattan, increasingly declined compared to its thriving Midtown neighbour.

David Rockefeller, the then chairman of the Chase Manhattan Bank, took the initiative in 1958 to establish the Downtown Lower Manhattan Association, intended to redevelop Lower Manhattan and to implement a World Financial Center in order to attract business and revitalize the neighbourhood. Mostly, he and his allies intended to create a visible symbol to the world that would substantiate New York City and the US as the global economic superpower.¹⁸ As the chairman of Chase Manhattan, one of the largest Banks in the United States with strong ties to its shareholders in the oil industry, an alliance, that derived from the corporate history of the Rockefeller dynasty, David Rockefeller's downtown agenda was not short of bias:¹⁹ Chase Manhattan had completed a new headquarter in the financial district in 1961, speculating on the urban renewal of lower Manhattan. Worrying about the success of this large real estate project, a group of developers, among them Robert Moses, suggested that a massive project such as an iconic World Trade Center would stop the decline and flight of businesses from lower Manhattan.²⁰ David Rockefeller found allies in his brother Nelson Rockefeller, then governor of New York, and the Port Authority of New York and New Jersey, the local transport agency, who would later become the commissioner and owner of the World Trade Center and would shift its business portfolio from transport infrastructure to real estate.

From there, the development of the World Trade Center and the Twin Towers becomes a complex case study of public private partnerships within global cities – including multiple stakeholders and interest groups, providing an example of the complex relation between public interest and funding on the one side and market-oriented private businesses on the other side.²¹ Another significant stakeholder in this process is public engagement and urban activism. The social climate in nineteen seventies New York City had been tense, considering the city was at the verge of bankruptcy, suffered a high crime rate and social tension such as racial riots. Even though the tendering process for the commissioning of the Twin Towers carried out by the Port Authority had as a first criterion, that the architect needed to have "great creative talent that would produce a World Trade Center of historical significance",²² and, as second criteria, that the architect needed to be "consistent in producing outstanding architectural work",²³ urban activists and architectural critics had a different opinion on the design that was

eventually presented. Louis Mumford compared the towers to a “gigantic filing cabinet”²⁴, while Ada Louise Huxtable from the *New York Times* called the Twin Towers “big, but not so bold”.²⁵ Criticism concerning design, public investment, functionalism and symbolism of the Twin Towers are numerous, the strongest critique was part of the wider debate surrounding the broad planning initiative by Robert Moses, lead famously by Jane Jacobs and others.²⁶ Measuring the Twin Towers according to their urban performance, one must note that they did not reach their goal of attracting new business tenants at least in their buildings. Struggling with high vacancy rates, the Towers were eventually mostly occupied by employees of the Port Authority and the City of New York. It can be concluded, that the Twin Towers had been built mostly for global visibility as a symbol of financial power and global trade. In addition, the development had been strongly motivated by political and corporate interests in real estate interests on an urban and state level.

Figure 3: New York Harbour, Lower Manhattan, around 1930.

4. Global effects of the Twin Towers

This paper seeks to identify selected criteria of ‘World Trade Centerness’, which, it argues, have been created as codes by the iconic Twin Towers, which globally spread as “traveling concepts”.²⁷ In this context, it is of interest, how these codes of ‘World Trade Centerness’ have worked over time and space, and to what extent they have adapted to be still valid today. These findings intend to offer explanations about the decision-making criteria of urban planners and developers, when commissioning financial districts with a global visibility and accessibility. It can be widely assumed, that the motivation behind the development of financial districts is, in general, based on criteria such as economic growth, real estate development, an increase in tourism, meeting the needs of business advocates and lobbyists, etc.

In the current globalization, ‘global cities’ are regarded as hubs within a global infrastructure, providing places of financialization as one category, that intersects with various other categories defining global cities.²⁸ It is becoming obvious that over time, places of global Financial Centres might become increasingly relevant beyond global cities, such as off-shore or as part of hinterland or infrastructure space²⁹. When asking about the global sign system and the interrelation of architecture and the built environment within the global trade infrastructure, one needs to ask: What is global trade today, how has it transformed over time since the nineteen seventies? What products are being traded, on which channels, with which currency? Looking at the entire process of the social production of space,

we need to ask: how do urban space and global trade relate to each other? Does global trade take place in financial districts, or designated World Trade Centers, or elsewhere? Are the landmarks representing global trade the same places, where trade is taking place? Do they present what they represent? After all, the tenants of the Twin Towers were mostly employees from the city as well as the local Port Authority. Minoru Yamasaki, the Architect of the New York Twin Towers, has been quoted saying: “World trade means world peace, and consequently the World Trade Center buildings in New York... had a bigger purpose than just to provide room for tenants. The Trade Center is a living symbol of man’s dedication to world peace.”³⁰ Yamasaki’s statement implies that the global significance had been prioritized over the local.

Financial Centers in global cities feature iconic buildings with the intention to make themselves visible, acting like lighthouses, nodes within the global infrastructure.³¹ As morphological objects, they are creators of meaning, image producers and city components, and at the same time, they represent meaning, they function as transmitters of global meaning into the urban space. Financial Centers lacking these signifying buildings, however, might mark their position within global finance by affiliation, such as the World Trade Center Organization. In the following, some strategies will be given as examples, of how ‘World Trade Centerness’ as a specific code, that allows financial centres as architectural objects to be recognized and understood within the global sign system, is being created. Financial districts in global cities, this paper argues, tend to being related in its signage and meaning to the Twin Towers of the New York World Trade Center, making them a World Trade Center prototype. Twinness is certainly one of the more ostensible categories of ‘World Trade Centerness’.³² It is not only represented by many of the member buildings of the World Trade Association, but also in architecture using the World Trade Center’s signage, as for example the Twin Towers of Deutsche Bank in Frankfurt’s Financial District³³, or the Casablanca Twin Center by Ricardo Bofill³⁴, which served as a landmark building for a newly developed commercial and financial district in Casablanca. Strategies of reproduction, meaning either a highly identical morphology compared to the New York Twin Towers, as for example displayed with the Dalian Dingsen Towers in China (Fig.4), or the use of a global designer and planning office, is a strategy applied with the purpose of creating ‘sameness’. An example here is the perpetual commissioning of the New York-based, globally working architectural practice Skidmore Owings and Merrill, which designed One World Trade Center in New York, the successor to the New York Towers, but also several others worldwide.³⁵

Figure 4: WTC Dalian Dingsen Towers, China, 2016. Figure 5: World Trade Center Belgrade, Serbia, 2012.

‘World Trade Centerness’ can also take the shape of refusal, for various reasons being anything but World Trade Center-like (Fig. 5). However, due to the signage and association “World Trade Center”, it represents the symbolism of the World Trade Center, without needing to display it itself.

Another example, that has emerged in particular in the aftermath of the last global financial crisis in 2008, is the strategy of symbolizing finance in architecture, without being finance. The buildings referred to here, for example the residential tower by Raphael Viñoly in New York from 2016, have been designed and planned as globally traded financial asset and seek to be visible as such.³⁶ The category of the lighthouse effect, the building as landmark and skyline, that is being seen in the world and from which the world can be seen, is exemplified with the Cosmo Tower in Osaka (Fig. 5).³⁷ Part of this World Trade Center characteristic is also the use of top floors as

public panorama platforms, bars, retail areas and restaurants. These spaces are created for performance: Seeing the world and being seen from this lighthouse position, is the symbolic marking of nodes within the global infrastructure, that help to make the abstract of the global sizeable.

Figure 5: Osaka World Trade Center Building (Cosmo Tower), Japan, 1995.

5. Conclusion

By looking at the planning history, effect and impact of the Twin Towers on global financial centers throughout and beyond its life cycle, this paper described the Twin Towers as a representation of finance and global trade and hence as an integral part of the relationship between built and economic transformations in finance capitalism. It discussed the specific agency of architecture as symbolic object for urban planning, world trade and global connectivity. It argued, that financial districts in global cities tended to being related in its signage and meaning to the Twin Towers of the New York World Trade Center. The given examples of global World Trade Architectures were designed to demonstrate, how the code of 'World Trade Centerness' is constructed and transmitted within the global system, and how it can be read and transformed despite is varying morphologies.

It can be concluded, that, in their iconicity, The Twin Towers as symbolic object exceed power, prominence and significance of the organization they represent. Moreover, none of the other World Trade Center's display a similarly strong iconicity with a similar global reach. Some of the over 300 buildings aim to represent the Twin Towers in their morphology, for example in their Twinness, while most of them cannot be distinguished from other functional office complexes, would they not be labelled 'World Trade Center'. In sharp contrast to its strong global iconicity, transporting an overall positive image, the New York Twin Towers as a part of the downtown redevelopment of the 1970s had not been a success in its sociocultural transformation of the neighbourhood. It did not fit in by its scale, it did not improve urban quality, business, infrastructure or public space. In this perspective, New York City in the 1970s provides a rich example of the intentions and effects caused by urban globalization. To provide in-depth evidence of the global effects of the Twin Towers on the planning of financial centres, a wider comparative study of the specific urban effects need to be examined over time and space.

In further research, a quantitative analysis of the development of World Trade Centers and financial centers in relation to economic, financial and socio-cultural indices, cycles and crises would provide more detailed information about the phenomenon of 'World Trade Centerness' and its global spread. A subsequent evaluation of various local effects of global 'World Trade Centerness' on the urban environment would complement this investigation. Additional further research is going to be done on the specific role of planning and development in the spread of 'World Trade Centerness', including the roles of urban planners, businesses, developers, investors and users. A study of role, impact and stakeholders involved in the World Trade Center Association will be

undertaken in order to gain a deeper understanding of function and impact of the organization behind one of the most iconic buildings for global finance.

Creative Port Cities: Transnational Spatial Practices and Cultural Exchange / Round Table

Wed. July 18, 2018

Session 7 (9:15AM-11:00AM)

Room 7, Yokohama Port Opening Hall

Moderator:

Stephen J. Ramos, Associate Professor, University of Georgia, U.S.A.

Participants:

Dirk Schubert, Professor, HafenCity University, Germany

Michael Kress, Artist, Hamburg, Germany.

Yoshie Ota, Curator, Spiral/Wacoal Art Center, Yokohama, Japan.

Jan Derk Diekema, Director, HaVik; Artist, Groningen, the Netherlands.

James A. Enos, Artist, Assistant Professor of Art, University of Georgia, U.S.A.

Port city research is a specific methodological and historiographical approach that is “multidimensional, interdisciplinary, and a networked analysis of nodes in larger networks.” The roundtable will emphasize transdisciplinary nature of port cities to explore themes of planning, the public sphere, and cross-cultural exchange among port municipalities from around the world. ZOU-NO-HANA TERRACE, the site of the port ‘s first historic quayside, now promotes multi-dimensional and sustainable mutual exchange among international artists, municipal administrators, and cultural facility staff. After an introductory discussion of contemporary challenges in port re-imagination, the panel of artists and planning historians will consider ZOU-NO-HANA TERRACE to engage in a discussion of how profound, meaningful cultural exchange can reactivate waterfronts and open broader civic engagement among global publics.

62 **Surveys and Plans for Japan's
Changing Cities: Kon Wajiro,
Nishiyama Uzo and Eika
Takayama**

Uzo Nishiyama's planning methodology based on investigations of common people's lives

Hiroshi Nakabayashi (Kobe Shoin Women's University)

Uzo Nishiyama was born in 1911 in Osaka. He is known as a founder of dwelling science in Japan. Nishiyama is also called the inventor of the dining kitchen, and he argued for establishing dining rooms separated from sleeping rooms, even in small houses. This theory, derived from substantial investigations of ordinary houses in the 1930s, led to Japan's post-war housing policy known as the nLDK system.

Nishiyama was one generation younger than the great researcher Wajiro Kon, whom he resembled in the way he enthusiastically recorded details of the lifestyle of commoners. Nishiyama considered Kon as his forerunner until his later years. Accustomed to drawing cartoons in his boyhood days, Nishiyama habitually drew sketches to record people's physical lives. He has important accomplishments not only in the field of dwelling science but also in town planning. Uzo Nishiyama holds a unique position in Japanese urban planning.

Viewpoints on urban planning that emphasize his actual life situation are as follows:

Nishiyama established methodology to analyse urban situations from compound viewpoints on social phenomena, including domestic and overseas socioeconomic conditions, infrastructure development, local government administration, community mechanisms, and the history of Japanese culture. Through inductive methodology, Nishiyama proved his rule of dwelling types. However, the theory relating to urban situations could not be derived from the inductive method alone.

In the case of urban problems, epistemology and policy theory are inseparable. Nishiyama saw that it was important to improve the planning ability of citizens to break through negative conditions in Japanese cities; therefore, it was necessary to create 'Image Planning' to serve as a platform for this. He had started to believe 'Image Planning' was the only way to establish sustainable development. Patrick Geddes (1884-1932)—called the father of town planning—put much value on the observational technique, and believed that urban areas should be planned in accordance to local lives and needs. Nishiyama's Image Planning method is very similar to Geddes's thought.

Although Nishiyama had shifted from a top-down planning approach to a more bottom-up one in the late 1960s, he continued to believe that the order of living space was brought about by the accumulation of the lives of the common people.

In particular, he had a strong interest in the development of recreation and the control of vehicular traffic. It is no exaggeration to say that today's frontline urban planning researchers have developed theories under the influence of Nishiyama's ideas, since his emphasis on the quality of life has gained a high reputation.

Nishiyama Uzō: Leading Japanese Planner and Theorist

Carola Hein (Delft University of Technology)

Japanese planning emerged in the mid-19th century, at almost the same time as planning in Europe and America and in response to similar challenges. Yet the different groups of planners did not enter into a balanced exchange. Japanese practitioners and scholars observed foreign practices, commenting on them and occasionally integrating some aspects of them into their own work, while also carefully building on long-standing Japanese traditions of urban form, and testing their knowledge in colonial and post-colonial settings. In contrast, only a few foreign practitioners observed Japanese urban planning efforts, and most of them did so with the goal of proposing their own ideas for improvement - at least until after the Second World War. During the reconstruction period in the early 1950s, foreigners paid little attention to Japanese planning, whereas European and American modernists included some Japanese architects as part of the modernist global architectural scene. Some major figures of Japanese urban planning, particularly those who had made their marks through writing, remained all but unknown outside the island nation. Among them is the architect-planner, historian-theorist, humanist and avowed Marxist Nishiyama Uzō (1911-1994)

Though his writings and projects have only barely been studied either in Japan or outside of it, Nishiyama's reading and interpretation of planning practices - historical and contemporary, in Japan and internationally - influenced Japanese urban planning theory and practice. Notably through his writings, he connected Japanese practitioners to global debates, and his analysis of traditional Japanese urban structures and housing as well as his design proposals helped shape post-World War II Japanese planning. Nishiyama was also a keen observer of the changing Japanese built environment, making an enormous number of sketches, drawings, and photos. This paper focuses on Nishiyama's urban ideas through the lens of the three articles on urban, regional and national planning. These articles document Nishiyama's particular approach to analysing planning history, international examples, and the specifics of the Japanese geography, topography, and urban form. The three texts are only a tiny section of one of the four thematic volumes, each of which was more than 600 pages long and included texts from the 1930s and several decades after. But, they are evidence of transnational and cross-cultural exchanges in conjunction with local practices and the potential role of an individual in such dialogues. They demonstrate how ideas can cross a border and stay there, even if conditions in its original home change. The presentation invites the audience to engage with a major figure in planning who is largely unknown outside Japan; to reconsider Japanese planning history; and to work towards a truly global planning history.

Urban Psychological Studies by Kon Wajiro and other architects in the early 20th century Japan

Izumi Kuroishi (Aoyama Gakuin University)

In Japan, the demographic shift from rural areas to cities has continued consistently from the end of the 19th century to the end of World War II and even to the present. The precise number of migrants changed and so did the reasons for this migration, but the population shift influenced political dynamics of regional, urban and national land planning and challenged cultural sustainability among people while they moved between these areas. Ishida Yorifusa pointed out that Japanese institutions and scholars have been unable to recognize the totality of urban planning, national land planning and regional planning, and as a result, scholars have failed to fully understand the impact of this migration onto urban form throughout the nation. In other words, scholars of Japanese urban planning were (toshi keikaku) divided from rural studies (noson keikaku) categorically, and the placement of migrant population planners have reacted by employing various theories, but the study of the problem of social and cultural change of the living conditions of rural to urban immigrants remained insufficient. Also, the insufficient implication of social studies in the engineering oriented urban and architectural studies and the absence of the field survey in these field of studies have been pointed out after the 1970s. In the light of Japan's current crisis of a rapidly aging population, extending economic and cultural gaps between rural and urban and particularly of the huge numbers of people forced to be relocated from Fukushima after 2011, it is important to reexamine the issues of demographic shift, as well as the social, cultural and psychological problems of migrants.

Based on such a consciousness, this study examines the works of urban space and planning by Okada Shinichiro, Sato Koichi and Kon Wajiro, as the earliest modern examples of Japan to clarify how they situated the migrant's social and psychological issues in urban studies by utilizing field survey methods.

Okada Shinichiro and Sato Koichi proposed the necessity to examine the social impact of urbanization from psychological aspects beyond architectural discipline. Following them, Kon Wajiro has published "The Primal Principles to remodel urban space" and "Psychological Foundation of Urban Psychology" in 1917 to construct the idea of urban study. Their works were related to the slum surveys and urban environmental studies conducted by sociologists in collaboration with the Ministry of the Interior. Along with this study, Kon conducted rural survey from 1910s, and after the disaster in 1923, studied the transformation of people's ways of life, in the name of Modernologio. From 1929, he conducted a research of a wide range of urban transformation Shinpan Dai-Tokyo Annai (New Guide book of Great Tokyo) from critical viewpoint. This study will explain how their ideas and methods prioritized the disparity and psychological issues in urban space, and what insight they propose to our current examination of urban study.

Urban planning for the Yamashiro hot spring by Eika Takayama: The history of urban planning for a tourist destination in Japan

Ryo Nishikawa (Rikkyo University)

Historically "urban planning" was developed in order to build a city in which people can safely and comfortably live. Therefore, urban planning for large cities or suburban cities are the main issues both for the academic topic or actual political works. The City Planning Act of Japan reflects these issues and divides national land into two parts: land which is controlled under the Act, and land which is not controlled under the Act. This means that city planning does not literally exist for the latter areas. Rural areas with tourist destinations (such as beach resorts, hot spring resorts and mountain resorts) are one type of area that the City Planning Act does not always cover but the necessity of it is mentioned. These tourist destinations exist for tourists to rest or play. This means that they differ from general cities both in terms of users and purposes. However, the necessity of urban planning for tourist destinations in Japan has been acknowledged by some of the professors. In order to contemplate the urban planning of tourist destinations for the future, it is necessary to review the history of planning for tourist destinations. It is also important to clarify how urban planners in Japan previously engaged with tourist destinations. Therefore, this research focuses on Eika Takayama, one of the greatest urban planners of Japan, and explores his works on tourist destinations. He was engaged with the Japan Spa Association and did three types of activities: 1) participation in the discussions held in hot spring areas; 2) a tour to hot spring resorts in Europe with members of the committee and; 3) the actual urban planning of hot spring areas. This paper mentions his relationship with the plans for the Yamashiro hot spring town. He proposed to create a new town and the detailed planning drawings were prepared. He planned a town for tourists to stay comfortably through the planning of walkways, green areas, tourist facilities and so on. The new town was built in the 1960s but the street pattern was totally modified in actual and his idea to create a new town was partly realised through the building of tourism facilities and parks. However, in terms of his contribution to the Yamashiro hot spring it was his idea to conserve the old town by creating a new town that was most important. Takayama's proposal made it possible for Yamashiro town to conserve its uniqueness, the spatial feature and the old town. Its uniqueness is a special tourist attraction today. It was the hidden and unique planning theory of Yamashiro by Takayama to meet the needs of development and to conserve the uniqueness of the town at the same time.

Uzo Nishiyama's planning methodology based on investigations of common people's lives

Hiroshi Nakabayashi*

* PhD, Kobe Shoin Women's University, baya@js6.so-net.ne.jp

Uzo Nishiyama is known as a founder of dwelling science in Japan. He argued for establishment of dining rooms separate from sleeping rooms. This theory was derived from substantial investigation of ordinary houses in the 1930s. Nishiyama also made important accomplishments in town planning, and holds a unique position in Japanese urban planning. He established methodology to analyse urban situations from compound viewpoints on social phenomena, including domestic and overseas socioeconomic conditions, infrastructure development, and local government administration. In the case of urban problems, epistemology and policy theory are inseparable. Nishiyama saw that it was important to improve the planning ability of citizens to overcome negative conditions in Japanese cities; to this end, it was necessary to create a platform of 'Image Planning'. Although Nishiyama shifted to a more bottom-up approach in the late 1960s, he continued to believe that the order of living space was brought about by the accumulation of the lives of common people. Today's frontline urban planning researchers have developed theories under the influence of Nishiyama's ideas, as his emphasis on quality of life has gained a high reputation.

Keywords: Uzo Nishiyama, Japanese Planning, Image Planning, Common People's Lives

Introduction

Uzo Nishiyama is known as the founder of dwelling science in Japan. Nishiyama is also called the inventor of the dining kitchen, and he argued for establishment of dining rooms separate from sleeping rooms, even in small houses. This theory, derived from substantial investigation of ordinary houses in the 1930s, led to Japan's post-war housing policy, known as the nLDK system (several sleeping rooms + living/dining kitchen).

Uzo Nishiyama also made important accomplishments not only in the field of dwelling science, but also in town planning. He holds a unique position in Japanese urban planning. In the 1960s, Nishiyama issued four books that consolidated his findings thus far. One of these was *Reflections on Urban, Regional and National Space (Chiiki kukan ron)*. Chapter 1, 'The Structure of the Base of Life' (1942), Chapter 9, 'An Essay on the National Structure' (1946) and Chapter 10, 'Mountain Cities' (1946) were translated into English by Professor Corolla Hain of Delft University of Technology and published in 2017. It is interesting that these three articles on planning theories still draw attention after 70 years. Calora Hain(2017) claims Nishiyama should be reviewed from a global perspective, comparable to Patrick Geddes, called the father of urban planning, and Lewis Mumford, famous for civilization criticism. However 'other major figures of Japanese urban planning, particularly those who had made their marks through writing, remained all but unknown outside the island nation. Among them is the architect-planner, historian-theorist, humanist and avowed Marxist Nishiyama Uzo (1911-1994), who had collaborated with Tange on the master plan for the 1970 Osaka World Expo. Nishiyama made his contribution mainly through his teaching and his many writings rather than his few works'.

This paper aims to summarize the history of formation of urban planning theory from a unique

viewpoint based on analysis of the lives of ordinary people.

Nishiyama's research background

The Edo era in Japan was such a peaceful era that natural and social sciences developed greatly, not only in the capital of Edo but also in local cities. Japan closed its doors to the outside world, but the world's newest scientific knowledge came to Nagasaki from the Netherlands and China. Thus, even though its industrial revolution was 100 years behind Europe's, development of natural and social sciences accelerated rapidly during the Meiji Restoration. During the stage when academic fields were undifferentiated, great intellectual figures emerged, like biologist, naturalist and ethnologist Kumagusu Minakata (1867-1941), who tried to record the entire phenomenon of nature and society; Kunio Yanagita (1875-1962); and Wajiro Kon (1888-1973). Uzo Nishiyama is a descendant of these figures in that he recorded human life in detail.

By the time Nishiyama entered the old-system high school, it had been decades since the establishment of the University of Tokyo, and differentiated academic fields were progressing in their development. The department of architecture in Kyoto University was established in 1920.

Figure 1. Nishiyama's sketch of Osaka in 1919. *His father's iron work factory extended in 1919; the European-style house at the front was their residence.*

Nishiyama was one generation younger than Wajiro Kon, whom he resembled in his enthusiastic recording of the details of commoners' lifestyle. Nishiyama considered Kon his forerunner until his later years. Having become accustomed to drawing cartoons in his boyhood days, Nishiyama habitually drew sketches to record people's physical lives.

Nishiyama (1971), in his commentary at the end of Kon's book, states the following: 'We cannot find the field of academic subjects such as "life" or "lifestyle" among the existing specialized departments. However, there is a researcher who continues to do one unique activity. Right now it is said that Kon Wajiro's "science of lifestyle" is an academic discipline to take up such a problem'.

Addressing housing problems and urban problems

Students of the Japanese old-system high school in the 1930s knew Marxism on an intimate level. Nishiyama organized an independent study group called 'DEZAM' among his high school classmates.

They studied theories associated with social progress based on historical materialism, and examined the actual situation, the survey of real issues, the solution plan proposal and the production system concept. Through such activities, Nishiyama strengthened his interest in housing problems and urban problems.

During Nishiyama's school days, the department of architecture in university had few systematic lectures on housing. However, he was influenced by two professors who were interested in housing problems at the time. These were Goichi Takeda (1872-1938), a founder of the Department of Architecture of Kyoto University who had a strong interest in housing, and Koji Fujii (1888-1938), who pioneered residential research from the viewpoint of environmental engineering.

Nishiyama began his investigation of housing in 1935. His survey was to copy the premises and housing plans stated in the housing construction notification submitted for enforcement of City Building Law. This mass survey of common households, approximately 3000 units in total in Osaka, Kyoto, and Nagoya, took two years. It was the first full-fledged research on urban housing in times when nationwide housing investigations had not yet been conducted. After his obligatory military service, Nishiyama engaged in research on wartime housing policy as a research engineer in the newly founded Housing Association's research department for about three years, from June 1941 to March 1944 (Nishiyama 1983).

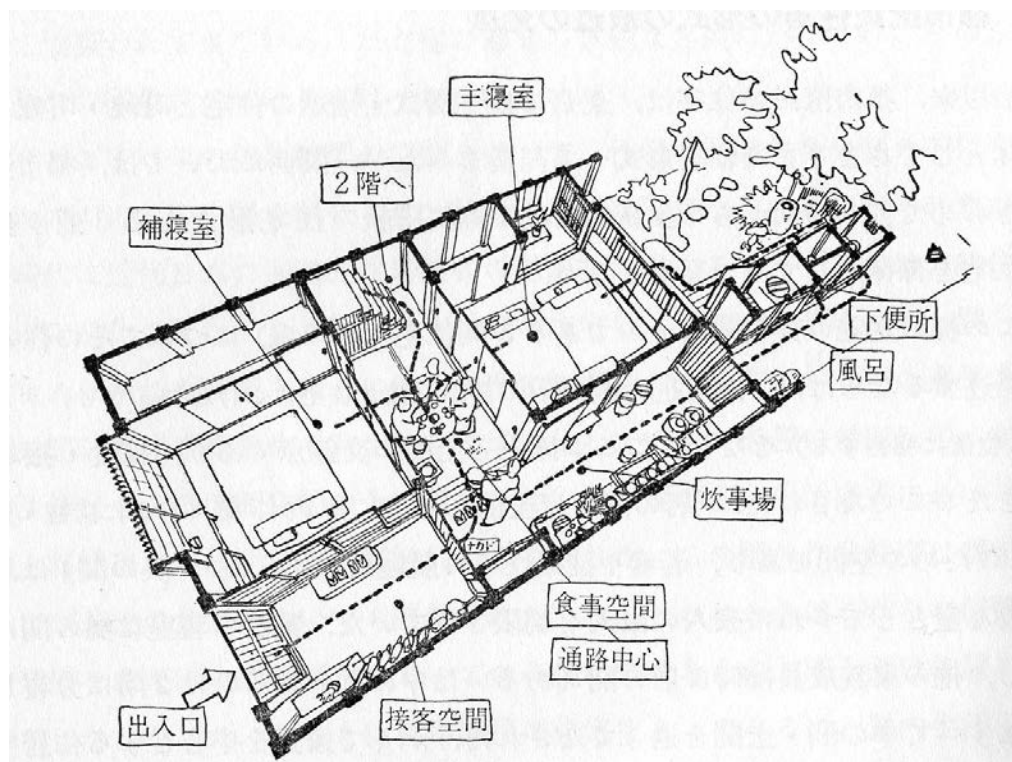

Figure 2. How to live in traditional wooden houses. *This figure is important as it shows Nishiyama's discovery that most families used the middle room as a dining room, and that it was reasonable to use the dining room as a passageway.*

Shoji Sumita (2008) and Moriaki Hirohara (2006) emphasize that the centre of Osaka, a high-density residential area of the Taisho Period, bred Nishiyama's ideological soul. Affecting the habitus nurtured by Nishikujo of Osaka, Nishiyama developed his analytical theory and created the novel methodology of the

‘survey on how to live’.

In 1938, the Ministry of Health and Welfare was separated from Ministry of Home Affairs. The Ministry established a Housing Association to stabilize people’s lives in wartime through social policy. Kazuo Okochi (1905-1984), a famous proponent of wartime social policy, was involved in this initiative. The housing policy was an important aspect of the ‘1940 regime’ that determined Japan’s post-war social structure. According to Hirohara (2006), Nishiyama had a close relationship with Okochi.

Proposal of ‘Image Planning’

Through inductive methodology, Nishiyama proved his rule of dwelling types in the area of housing. However, the theory relating to urban situations could not be derived from induction alone.

Nishiyama thus established a methodology to analyse urban situations from compound viewpoints on social phenomena, including domestic and overseas socioeconomic conditions, infrastructure development, local government administration, community mechanisms, and the history of Japanese culture.

With respect to urban problems, epistemology and policy theory are inseparable. Nishiyama saw that it was important to improve the planning ability of citizens to overcome negative conditions in Japanese cities; therefore, it was necessary to create a platform of ‘Image Planning’. He began to believe that ‘Image Planning’ was the only method by which to establish good development. But even as Nishiyama became a great scholar in the theory of housing planning, he was trying to think about the system of living space in the national land and the city. Before World War II, he studied in depth the urban planning theory of foreign countries, and developed a new urban and national theory. The typical argument was an idea that districts as small as elementary school districts each have their own characteristics and become divisional, and that large cities are organically united by these small districts. Immediately after the end of the war, Nishiyama announced the ‘mountain city’ concept of slopes for effective use of Japan’s land. He consistently defended the high-density living supported by Japan’s unique lifestyle, and in the 1960s he announced the idea of ‘Ieporis’, huge apartment houses.

The modern architectural movement in Japan has been influenced mainly by CIAM through Le Corbusier and Gropius. Hirohara (2006) emphasizes that Nishiyama may have learned the most of CIAM

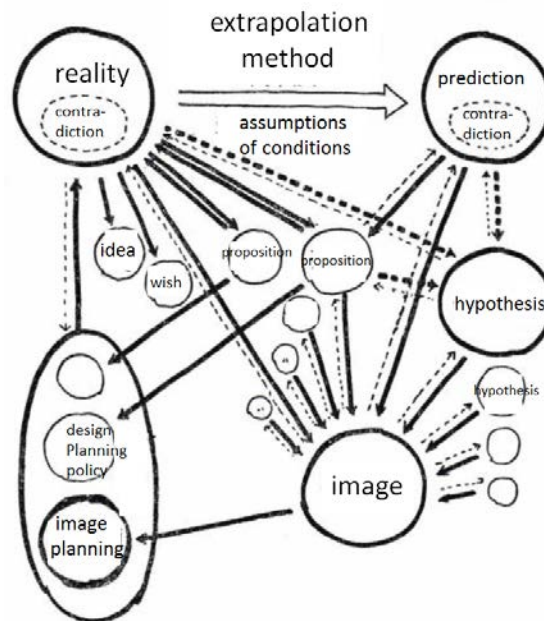

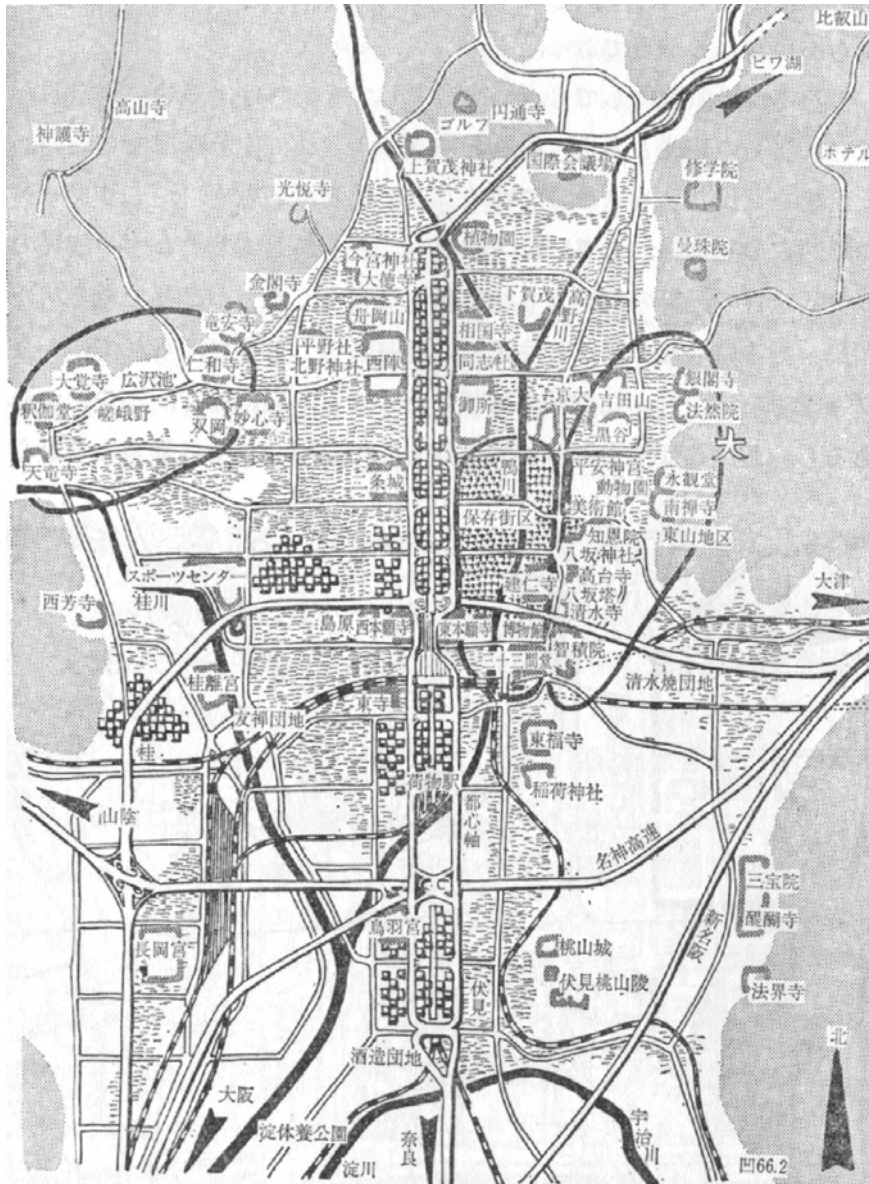

Figure 3. Relationship between prediction and planning.

through the theories of Ernst May (1886-1970), a German architect and city planner who worked on many Ziedrungs in Frankfurt am Main during the Weimar period. Nishiyama's theory was similar to his in that May consistently tried to consider housing and city planning jointly to physically express the life of a new era, and continuously pursued the ideals of the metropolitan area. Regional space consists of various elements, making it difficult to draw a simplified ideal figure for such space. Nishiyama proposed Image Planning as a method for discovering contradictions in living spaces and revealing the visual perceptions of a space. Image Planning, as used by Nishiyama, was a starting point for synthesizing the actual conditions and demands of people, and for presenting a concrete plan that visualizes the future. This

method enriches the plan and can extract further contradictions. In addition, Nishiyama believed that it was important to determine what kind of difficulty was present to paint the 'inferno', which indicates the damage caused to the environment as the development plan progresses.

Figure 4. Kyoto Plan 64.

A particularly famous work of Image Planning by Nishiyama is 'Kyoto Plan 64', which rearranges the centre axis of high-rise housing in downtown Kyoto. This proposal aimed to avoid the destruction of the cultural assets of other districts and to build a non-cluttered urban structure, independent of motorization. Various scholars and town planners have evaluated this plan. Nishiyama described it as a way to protect the mountain skyline and maintain the appearance of a historic city. Furthermore, he argued it to be half the meaning of 'inferno'. Sumita (2008) note that Nishiyama's affinity for high-density living was a result of empathy for Osaka's traditional terraced house districts, which he had seen in his childhood.

Patrick Geddes (1884-1932), called the father of town planning, placed great value on observational technique, and believed that urban areas should be planned in accordance with local lives and needs. Nishiyama's Image Planning methodology is very similar to Geddes's thought.

Criticism of motorization and emphasis on recreation and tourism

An analysis of human life is at the centre of Nishiyama's methodology when dealing with the city and region. In particular, he had a strong interest in control of vehicular traffic and development of recreation. These two points were foresights of Nishiyama's, and can be considered outstanding insights into human life.

Nishiyama was the first to develop criticism of motorization. He insisted that a lifestyle relying too heavily on the car disturbs the order of the region, resulting in poor living space. In the mid-1960s, the number of vehicles owned was less than ten percent of the current number. The concept plan 'Kyoto Plan 64', announced in 1964, shows a solution that would be like this if car traffic were kept out of a large city. In the 1970s, Nishiyama presented the idea that the street car system, which was meant to hinder automobile traffic and was abolished in various cities, was a very human form of public transit. He also headed the campaign to protect Kyoto's street car system, which would be abolished in 1978.

Figure 5. Types of tourism for metropolitan area residents. A --- daily recreation; B --- single day recreation; C/D --- overnight trip; E --- remote trip (particular district); F --- remote trip (migration route).

Another outstanding insight of Nishiyama's was how to capture human recreation. Recreation is time for self-realization in modern society. Nishiyama argued that both the region and human beings themselves would make healthy developments through recreation and sightseeing. In housing planning, evolution from the nDK to the nLDK plan --- that is, addition of a living room --- insisted on incorporating awareness of enjoying life. Likewise, Nishiyama believed that regional order was created in free time separate from controlled labour. As recreation evolved, he saw the potential for arts, research activities and volunteer activities to blossom greatly. The year following the Great Hanshin Awaji earthquake in 1995 was called 'the first year of volunteers' in Japan, but this was the year after Nishiyama's death. As early as the 1960s, Nishiyama already had the idea that volunteer activities would be incorporated into a new social structure. Nishiyama considered sightseeing a high-dimensional form of recreation and considered preservation measures for scenic sites and cultural properties with great interest. At an interdisciplinary meeting, he proposed that sightseeing was important to the future of Japan, and lamented that other researchers did not sufficiently understand its significance. Based on that idea, he criticized the fact that tourism development, which damages an area's good resources during periods of high growth, was inconsistent.

The perspective of considering development of an area based on human life was handed down to Nishiyama's disciples, such as Hiroshi Mimura, his successor at Kyoto University. They contributed in creating the foundation of tourism studies to clarify tourism methods supporting regional development, not biased toward management theory for the tourism industry.

Bottom-up planning theory

From the end of the war to the high growth period, the nation-led plan did not proceed as smoothly as Nishiyama predicted. During this time, the townscapes of historical cities such as Kyoto and Nara were damaged, and a number of pollution problems occurred across the country. Obvious wrongs emerged in various places in Japan. By 1970, Nishiyama shifted his thinking significantly to a bottom-up planning approach. But despite this shift away from a top-down planning approach in the late 1960s, he continued to believe that the order of living space was created by the accumulated lives of common people. To investigate these issues, he proposed a new course at Kyoto University. The Department of Architecture established the Regional Living Space Plan Course in 1965, the year following the Tokyo Olympic Games.

Nishiyama was constantly conscious of Kenzo Tange from the University of Tokyo. At the Osaka World Expo in 1970, he worked as a comprehensive producer with Tange, but proposed a completely different approach to the region. In a nutshell, Tange championed regional development of the large-scale, expansive type after the period of high growth, while Nishiyama aimed to enhance daily life spaces, occupational proximity, and suppression of car traffic. He sought a sustainable and compact city in the true sense.

Nishiyama demonstrated an outstanding ability to build a theory for living space, but to facilitate good regional development, steady support for the concept that residents and experts need to cooperate was required. Following the 1970s, the prospects of urban planning were seen in the grassroots movement. Nishiyama also tackled real regional problems. In his later years, his activity focused on townscape issues, such as high-rise condominium problems in large cities such as Kyoto and preservation movements concerning traditional townscapes in various places. He asserted that traditional-style houses were cultural assets with the accumulated wisdom of life and should not be destroyed.

Nishiyama was busy in the years after his retirement from Kyoto University in 1974. He completed three volumes of the great book '*Nihon no Sumai*', a full-length study of all kinds of houses in Japan in

1985. In addition, he published five books on his own history. Finally, he wrote a novel modelled after his father, a story with '*Ajigawa Monogatari*', a kind of an urban development history of the Meiji and Taisho eras in Osaka.

As an important trigger for the preservation movement concerning the townscape of Ise Kawasaki in 1979, Nishiyama participated in surveying historic townscapes of various places, such as Okayama Ashimori, Kagawa Sadamitsu, and so on. He stated that 'the local residents' movement itself is a real city plan'. He was beginning to shift his thinking toward the bottom-up approach at this time. Nishiyama ultimately made a great contribution to the preservation of traditional townscapes in various districts and the rise in popularity of tourism to such places in Japan.

Figure 6. Nishiyama's sketch of Ise Kawasaki. *The traditional townscapes on one side were removed for river improvement.*

It is noteworthy that Nishiyama took a global perspective to the issue of townscape preservation. Because the Japanese government did not readily ratify the UNESCO World Heritage Convention established in 1972, the 'Santo Shimin Forum'-a solidarity organization in Nara, Kyoto and Kamakura with Nishiyama as a representative-urged the government to ratify it and to call for direct contact with UNESCO (Nakabayashi 2008).

Nishiyama was involved in the formation of several movement organizations, and he was active as a social movement researcher. Such organizations included 'Shin Kenchikuka Gijutsusha Shudan', which focused on architectural design and urban planning for social progress; 'Santo Shimin Forum', an association of efforts to preserve the landscape of the ancient capitals of Nara, Kyoto and Kamakura; and 'Kyoto Machidukuri Shimin Kaigi', a liaison organization for the movement against destructive development in Kyoto. Furthermore, Nishiyama stood at the forefront of peaceful and democratic movements beyond the areas of housing and planning; for example, he was the first chairman of the labour union at Kyoto University.

Conclusion

With a view toward the realities of contemporary Japan, on the one hand, the traditional townscape has been eliminated from the centres of large cities, which have become non-residential areas. On the other hand, metropolitan areas have spread and suburbs are filled with empty houses in this era of population decline. Nishiyama foresaw this disaster. Although he confronted the modern situation after wartime, his

ideas are relevant even today.

To summarize, policies emphasizing large-scale development have been implemented consistently in Japan. National land and urban planning are both very immature in terms of accumulating the wisdom and creativity of the people. As mentioned above, through the experience of the 1960s, Nishiyama's urban planning attitude changed from a top-down theory, such as the proposal of Image Planning, to a bottom-up theory. His method also moved from a priori approach to an inductive approach. However, Nishiyama consistently adopted the attitude that space should be organized through the accumulation of residents' lives, both when planning a new vision and when preserving historical streets.

Nishiyama knew that the resident movements in the 1970s and 1980s had tried to protect the traditional townscapes and to create districts that controlled for car traffic. He was particularly interested in the development of recreation activities and allowances for motorization. Therefore, he reconstructed the theory of urban planning in terms of residents' movements.

The ideas of Nishiyama, which insist that residents' movements and even oppositional movements are a clue to positively creating new space, have an important meaning even today. It is no exaggeration to say that today's frontline urban planning researchers have developed theories under the influence of Nishiyama's ideas, since his emphasis on quality of life has gained a high reputation. It is necessary to re-evaluate the method presented by Nishiyama in order to create a new urban planning system built on the demands of and knowledge regarding residents' daily lives.

Urban planning for the Yamashiro hot spring by Eika Takayama: The history of urban planning for a tourist destination in Japan

Ryo Nishikawa*

* *PhD, Assistant Professor, College of Tourism, Rikkyo University, r.nishikawa@rikkyo.ac.jp*

Though the necessity of urban planning for tourist destinations in Japan has been acknowledged by some of the professors, little progress has been made so far. In order to contemplate the urban planning of tourist destinations for the future, it is necessary to review the history of planning for tourist destinations. It is also important to clarify how urban planners in Japan previously engaged with tourist destinations. Therefore, this research focuses on Eika Takayama, one of the greatest urban planners of Japan. It explores his works on tourist destinations. He was engaged with the Japan Spa Association and did three types of activities: 1) participation in the discussions held in hot spring areas; 2) a tour to hot spring resorts in Europe with members of the committee and; 3) the actual urban planning of hot spring areas. This paper mentions his relationship with the plans for the Yamashiro hot spring town. With strong demand for the development of tourism during the 1950s, he proposed to create a new town for development while conserving the historical and unique centre of Yamashiro. His idea contributes to the uniqueness of Yamashiro today.

Keywords: tourism planning, hot spring, Eika Takayama, resort

Chapter 1. Introduction

Historically “urban planning” was developed in order to build a city in which people can safely and comfortably live. Therefore, urban planning for large cities or suburban cities are the main issues both for the academic topic or actual political works. The City Planning Act of Japan reflects these issues and divides national land into two parts: land which is controlled under the Act, and land which is not controlled under the Act. This means that city planning does not literally exist for the latter areas. Examples of the latter areas include natural environments and small villages in rural areas. These areas have no city planning regulations. This character of the City Planning Act of Japan is totally different from those in Great Britain and Germany, which cover all national land. Rural areas with tourist destinations (such as beach resorts, hot spring resorts and mountain resorts) are one type of area that the City Planning Act does not always cover but the necessity of it is mentioned^{1,2}. These tourist destinations exist for tourists to rest or play. This means that they differ from general cities both in terms of users and purposes. The reason why city planning for tourist destinations is necessary is because, in Japan, most of the tourist destinations including hot spring resorts were rapidly developed by developers in the 1950s to the 1960s. As a result, special environments (such as areas of natural beauty and historical landscape) were lost, and tall and large buildings occupied tourist destinations. The problem is that the buildings developed still exist, and the landscape of the tourist destinations in Japan is not of high quality, as in Europe.

Recently, the number of foreign tourists to Japan has been growing, and redevelopment has taken place in some of the tourist destinations. There is a possibility that tourist destinations will be rapidly redeveloped in the near future, as they were in the 1960s. Therefore, it is important to discuss the city planning of tourist destinations now. It is also important for city planners to know how they should or can relate to tourist destinations. But, before discussing it, it is more important to understand the history of city planning for tourist destinations in Japan, and how city planners have previously related to tourist destinations. Indeed, history tells us the future. In this context, this paper focuses on Eika Takayama (1910-1999), historically one of the greatest city planners of Japan³. The purposes of this paper are as follows: first, it clarifies his thoughts about, and relationships with, tourist destinations through an analysis of his contribution to the Japan Spa Association. Second, it clarifies his contribution to a tourist destination by focusing on the actual planning he completed.

Previous works of research that are related to this paper include some papers on the history of city planning for tourist destinations in Japan, and some papers on the works of Takayama. The former research⁴ mainly focuses on city planning before World War II and did not pay much attention to city planning for tourist destinations after World War II. The latter research looks at his character and works for national big projects⁵, and city planning theory that he created⁶. His relationships with tourist destinations are still unclear. Document investigation is the methodology used for this research. The author found a planning document by Takayama at the Takayama archives (Takayama bunko) at the University of Tokyo.

Chapter 2. Takayama and his relationship with the Japan Spa Association (JSA)

The JSA was established in 1929 for the purposes of the academic research of hot springs, and for the support of hot spring areas. Takayama looked back on his relationship with the JSA in 1988 and said that he had a good relationship with the JSA before World War II⁷. He became a personal acquaintance of Dr. Manabe (from the medical department of the University of Tokyo, who was a member of the academic committee of JSA) when he injured his breast while playing football⁸. In the 1930s the JSA collected the architectural design of a shed for drinking hot spring water in 1934. Takayama applied two sketches of the shed to the JSA.

Takayama had a deeper relationship with the JSA after the end of World War II. Takayama, Fumiaki Irisawa, who was the vice President of JSA, and Hideo Anzai, who was the executive editor, all graduated from the same junior high school and, thanks to this common background, they gradually got to know each other⁹. From 1954, Takayama worked as a member of the academic committee of JSA and, from 1960 until he died in 1999, he worked as an executive member.

Three types of activities undertaken by Takayama can be analysed through the magazine *Onsen* (by the JSA), and his statements: 1) participation in the discussions held in hot spring areas¹⁰; 2) a tour to hot spring resorts in Europe with members of the committee¹¹; and 3) the actual urban planning of hot spring areas. Takayama was engaged in the actual planning of hot spring areas through the works of the JSA, including Asama in 1954 and Yamashiro in 1955. The planning of Asama ended in failure because the local government could not cooperate with the citizens¹². On the other hand, the planning of Yamashiro was partly achieved, and Takayama's contribution was quite considerable. Therefore, the development of the Yamashiro hot spring and Takayama's contribution will be discussed in the following chapter.

Chapter 3. The development of Yamashiro town and Takayama's plans

3.1 History of the Yamashiro hot spring town

The Yamashiro hot spring is located in the Hokuriku region in Japan. It is said that the Yamashiro hot spring was found about 1,300 years ago. A central bath called "Soyu" (総湯) and its surrounding plaza were developed, and they formed the centre of the town. A picture drawn around the 1880s shows that hotels surround the plaza. The plaza was also used as a theatre.

Figure 1: Old painting of the Yamashiro hot spring (around 1876 to 1883)¹³

Figure 2: Architecture of the Soyu¹⁴ (Left: at the end of the Meiji era; Right: at the beginning of the Showa era)

In Yamashiro town only the 18 hotels that surrounded the central bath historically had the right to use and control the hot spring water. The group of 18 hotels were called “aza jyuhachi” (字十八). Many troubles took place between aza jyuhachi and the other stakeholders, such as the local authority and the local citizens, in relation to the hot spring water. These stakeholders wanted to use the hot spring water, but aza jyuhachi denied them use of it. In the 1930s the aza jyuhachi even resisted the Japanese army, who wanted to use the hot spring water to cure injured soldiers. It can be said that the aza jyuhachi conserved their established historic interest, but this could be a shackle on town development.

However, after World War II, with the need to develop the town, the local government tried to overcome the situation. On July 1st 1953, a general assembly of the JSA was held in Kanazawa, close to Yamashiro town. In the meeting, a chairman of the Yamashiro town parliament was in attendance and requested discussing plans for Yamashiro hot spring. This was passed unanimously. It was the first time that the JSA agreed to cooperate for one hot spring area. Just two days after the general assembly, four specialists visited Yamashiro town. On July 22nd, Takayama visited Yamashiro town for the first time. He was commissioned as a specialist of urban planning from JSA through the introduction of a tourism association called “Zen Nihon Kanko Renmei” (全日本観光連盟). The field study record is found at the archives of Takayama. According to the memo, Takayama walked around the town in the afternoon and talked with the local people, including citizens and parliament. In the memo Takayama wrote: ‘It is important to fix the characteristics of this town’ and ‘relations between the new town and the old town are important’. This means that the creation of a new town was already in his mind.

Discussions in parliament had also started. On March 4th, 1954, a meeting for the development was held and in 1956 a committee for the development was launched, and Takayama was commissioned to be a member as a specialist of urban planning. On March 2nd, 1956, the town mayor Kadoya said that, in Yamashiro town, there had been many conflicts between many stakeholders which had interrupted the development of the town since before World War II. Nonetheless, the importance of development was gradually getting noticed by the citizens. Therefore, it was urgent that scientific planning by authoritative professionals was undertaken for the future development of Yamashiro.

Regarding a matter of hot spring water, with the progress of technical development, new hot spring sources were found. It was an important factor for Yamashiro to develop.

3.2 A plan by Takayama

Takayama visited Yamashiro three times and made a plan. A planning document was found at the archives of Takayama. The title of it was as follows; ‘Yamashiro model hot spring planning, October 1956, Takayama laboratory, Architecture Department, Faculty of Engineering, the University of Tokyo’ and was 60 pages long. In the introduction of the report, it says that Takayama laboratory was commissioned to make a plan and Takayama and his assistant professor Shigetugu Kojima (both from the University of Tokyo) and Kazushige Deguchi and Susumu Takahashi (both from Zen Nihon Kanko Renmei) was in charge of the report. An index of the report is as follows.

Chapter 1 Current state of Yamashiro town

1. Geographical and natural aspects

2. Social and economic aspects

- a) Increasing rate of population
- b) Industry
- c) Areal composition and residential condition
- d) City planning
- e) Current state of the development area

Chapter 2 Background of the development

1. Direction of the development of Yamashiro town
2. Characteristics of the development area in relation to the old town

Chapter 3 Planning

1. Area composition
2. Traffic planning
3. Process and land use planning
4. Facility location planning

Chapter 4 How to realise the plan

1. Establishment of Yamashiro town politics
2. Survey and statistics
3. Funding
4. Source of hot spring
5. Contact with city planning department
6. Finance and methodological issues
7. Building

Chapter 5 Conclusion

Chapter 1 is an analysis of the current state of Yamashiro. 1) Accessibility, 2) the amount of hot spring, 3) weather, 4) increase rate of population, 5) industry, 6) employment rate and number of employees, 7) labour force population, 8) area composition and residential condition, 9) city planning in the past, and 10) land owners of the development area are reported. Items one to eight were compared with towns around Yamashiro, such as Yamanaka town and Katayamazu town – both of which were also famous for hot spring resorts. Chapter 2 shows the direction of the planning based on the analysis shown in Chapter 1 and discussions with stakeholders. Yamashiro town could choose to develop as a farming town or a commercial town. Further, the report mentioned that Yamashiro town should be commercially developed by using the hot spring water more effectively. Indeed, because there is enough hot spring water, the citizens wished Yamashiro town to be a commercial town, and companies outside Yamashiro town wanted to invest for development. Yamashiro town was surrounded by famous hot spring resorts, but the report said that it was not wise to compete with them. Rather, they must make clear the differences between them, and avoid competition. Chapter 3 contains the plans. The report mentioned that the old houses around the Soyu were built by wooden architecture and needed improvements but lacked funding. Therefore, it was chosen to create a new town. The characteristics of the new town should be a recreational district with modern facilities to meet the needs of the citizens living around Yamashiro town and the west side of Japan. Chapter 4 summarises the points to realise the planning. It includes financial aspects. Chapter 5 is the conclusion.

3.3 Details of the plan

The plan is composed of four detail plans: areal planning, traffic planning, land use planning, and facility location planning.

(1) Areal planning

In the Yamashiro old town, only along with roads from the central bath to the two stations had a hot spring atmosphere in the old town and the other areas were densely built-up by wooden architecture. Thus, he planned to create a new town with a hot spring atmosphere, and to connect the old and new town by commercial zones. Furthermore, circulating commercial zones were planned for walkways. The residential areas and commercial areas were separated by a pedestrian path, which means to separate zones for residents and tourists.

(2) Traffic planning

Traffic planning was composed of regional roads and inner-city streets. The latter included streets that connect between the old city and the new city; the old city and the natural scenic area; the new city and the natural scenic area; and commercial areas and a silent pedestrian pathway.

(3) Process and land use planning

It shows a gradual process of realising the plans. It was proposed to create a park after a land readjustment project. It was planned that the new town and the park close to it would be realised during the first stage, and the residential areas during the second stage.

(4) Facility location planning

It was planned that every building would be built with uniformity. An auditorium with 1,000-2,000 seats and a recreational facility with enough public space were planned to conserve the landscape and for use as parking lots. The recreational facility had a hot spring pool and a gym. It was planned that a two or three-story building (with a library, exhibition hall or hot spring research centre) would be a community centre. They planned to have fruit farms in some areas of the new town, which intended to use the hot spring water to grow fruits. It was planned that a total of 20 accommodation facilities with 80 beds on average would gather along the river. It was planned to have 30 commercial shops, some of which were with accommodation.

From the drawing, accommodation facilities, commercial facilities, community centre, and a public bath were located along one straight road from the station to the auditorium. It was planned that the auditorium would be a symbolic building.

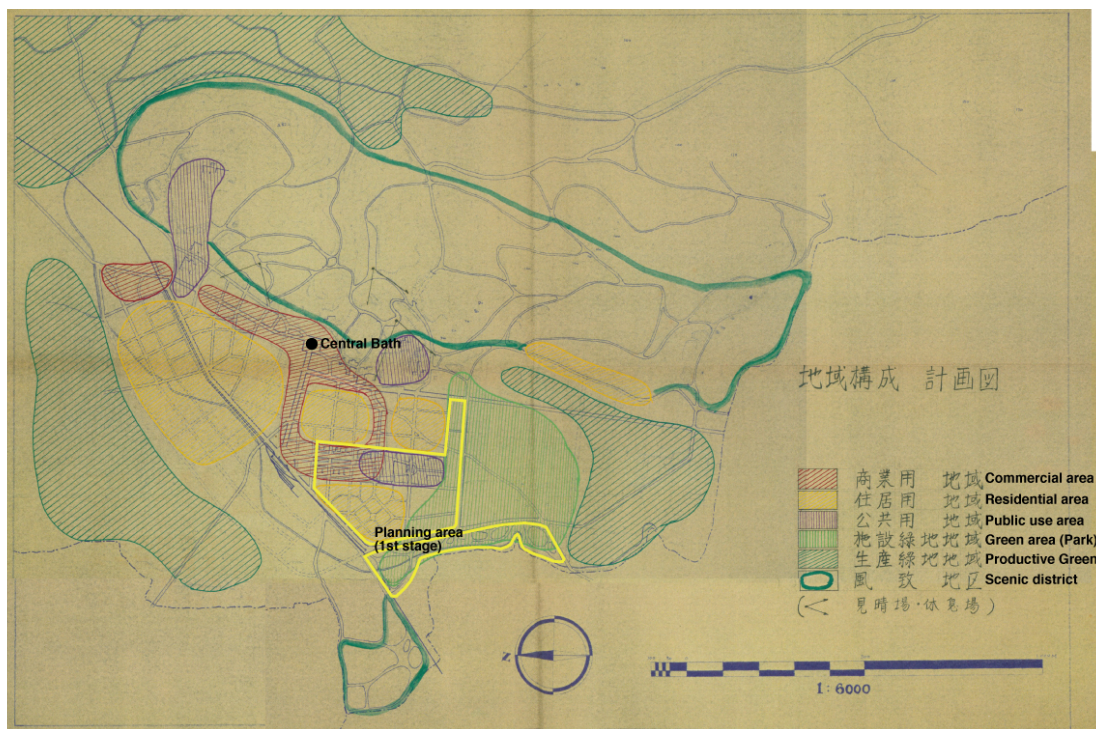

Figure 3: Areal planning

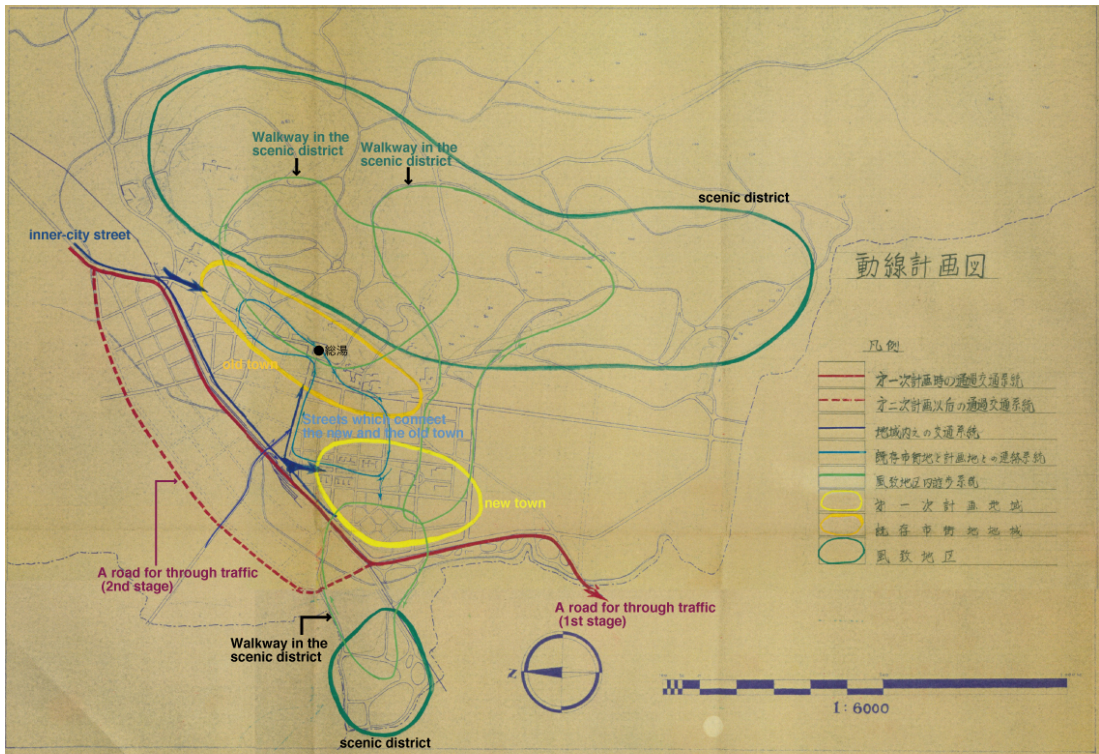

Figure 4: Traffic planning

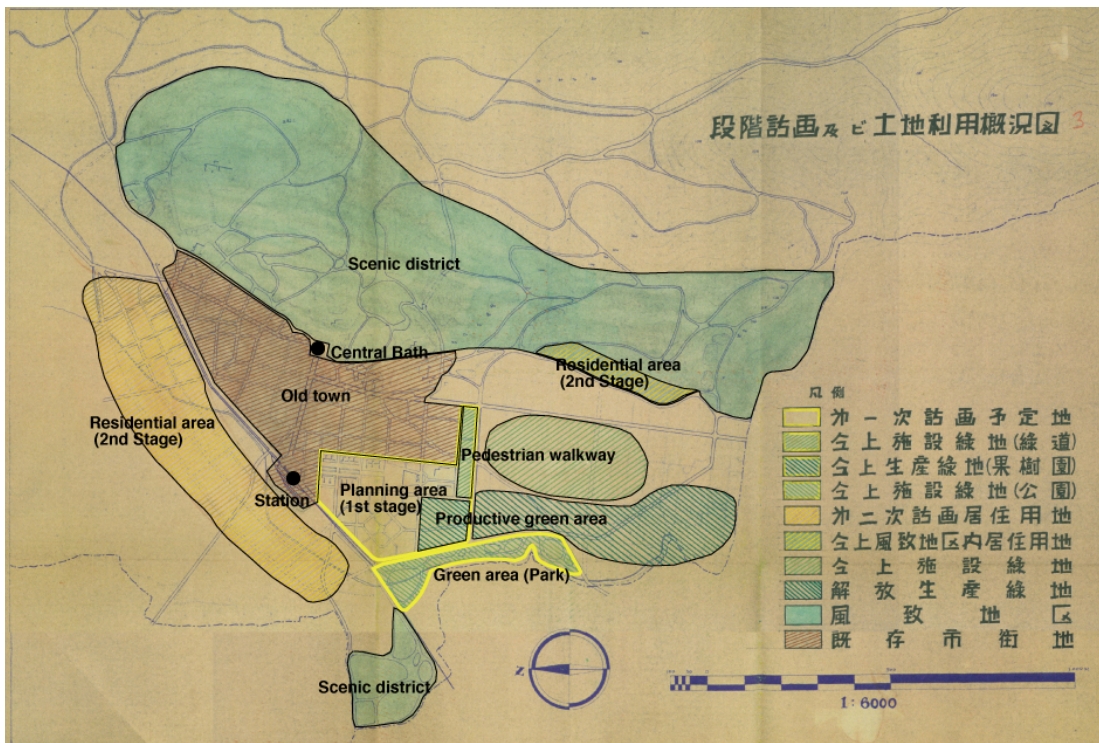

Figure 5: Land use planning

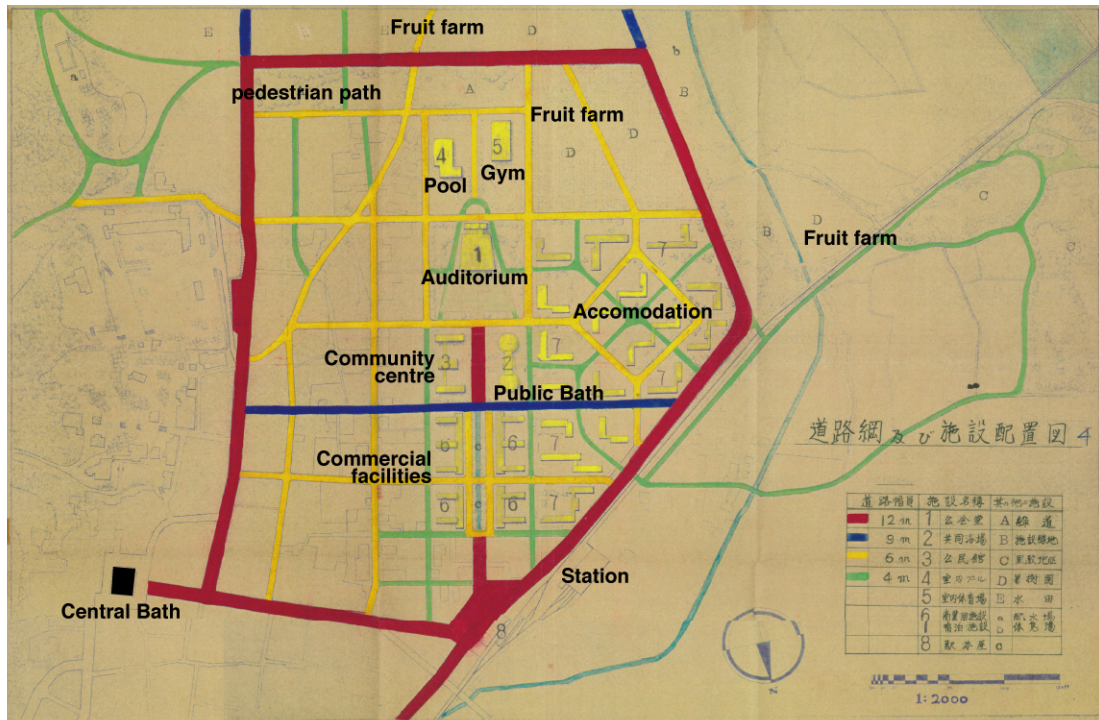

Figure 6: Facility location planning

3.4 Why was it proposed to build a new town?

As seen above, creating a new town was the core proposal in Takayama's plans. Why did Takayama propose to create a new town? In the report it was said that the old town was full of wooden architecture and needed improvement, but the lack of funding made it difficult to do so. Therefore, it was proposed to create a new and safe town.

However, from the words of Takayama himself, there seemed another reason a new town was proposed. In later years, Takayama looked back on the Yamashiro plan and said as follows¹⁵:

The old town of Yamashiro is a good town like Kyoto. When I engaged in the planning, local people wanted to modernise the town by building a dance hall and so on. I advised them that this modernised town should be located outside the old town and keep the old town as it was. As in Yamashiro, it is important to listen to the needs of younger citizens and at the same time harmonise the old and the new.

From this statement, it seems that it was Takayama's will that intended to conserve the historical old town by creating a new town. It can also be analysed that Takayama played an important role in the core idea of the plan, though there were other specialists related to the report. Other documents such as the magazine *Onsen* published by the JSA in 1953 introduced the Yamashiro plans as follows¹⁶:

The Yamashiro hot spring has a historical atmosphere and is famous for the olders, but local citizens are anxious about delaying the development when comparing with close hot spring resort as Yamanaka and Katayamaz, which were modernised. Therefore, a study of planning to balance the new and old has started.

From these facts, it can be said that the plan for the new town did not just intend to create a new town but inducing tourism development to outside the city and conserving the old town.

3.5 Implementation of plans and their influence

The land readjustment project decided to create a new town in 1957. However, the plan of the land readjustment project did not reflect Takayama's plans and the local government modified the plan to a simple grid pattern. The exact reason for that is not clear due to a lack of documents. Some facilities were implemented along with Takayama's plans. A tourism centre with pools and gyms was built in 1960, and a children's park was created in 1963, which is analysed as the implementation of the recreational facility planned by Takayama. But the front

façade of the tourism centre was different from Takayama's plan. His idea to locate a symbolic building along the street from the station was not realised.

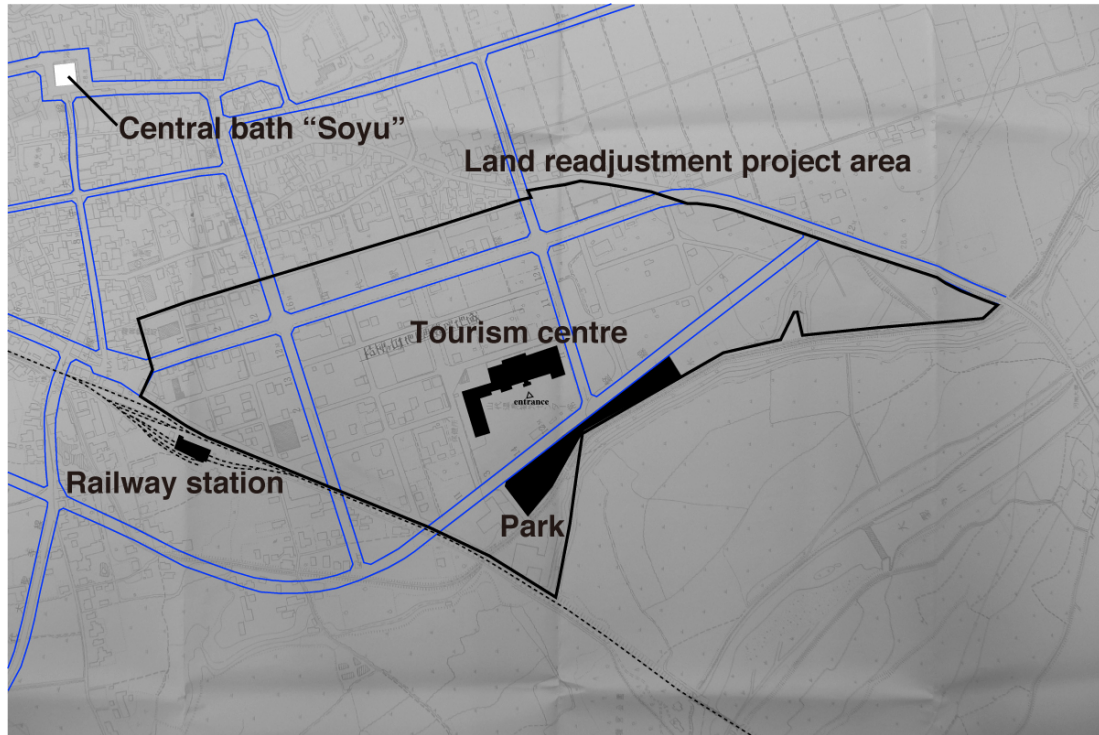

Figure 7: Land readjustment project area and practical location of facilities¹⁷

Figure 8: The process of creating the new town

Some hotels moved from the old town to the new town by the owner's option and were enlarged by the 1970s¹⁸. It means that the hotels that intended to modernise searched for new land, as Takayama advised to do. By preparing new land for development, though the old historical town and the Soyu were not declared as historical town or monument, developing the old historical town was avoided. Topographic maps show the process of the development of the new town (Figure 8).

Chapter 4. Effect and influence of the plans in the long term

What did the plans leave for Yamashiro town? This chapter analyses the effects and influences of the plans.

4.1 Development of Yamashiro town after the 1960s

A travel guidebook published in 1961 wrote that many hot spring resorts had been modernised but Yamashiro town still had a historical atmosphere¹⁹. A hot spring specialist Koji Sato wrote in 1964 that Yamashiro got a new centre, in addition to Soyu, the historical centre²⁰. A tourism research report in 1962 wrote that the plans were of great value as the tourism centre got a new attraction in Yamashiro²¹. That is to say, both the old and the new town were highly recognised and evaluated just after the development.

On the other hand, about 20 years after the development, Yamamura, who is a specialist in hot spring resorts, reported that tourists can enjoy the historical atmosphere in the old town but not so many tourists visit there²². It means most tourists went to the new town to enjoy the modernised facilities and the old town was left unvisited.

When we compare the development of Yamashiro with the surrounding hot spring resorts, the number of tourists in Yamanaka was the largest until the middle of the 1960s. There were not many tourists in Yamashiro until the 1960s, but they gradually increased, and in 1979 Yamashiro had the most tourists. This was because hotels were able to expand their businesses by using enough land, as Tsuikita pointed out²³. That is to say, Takayama's proposal to prepare new land for development to conserve the historical centre made hotels possible to expand as much as they wanted.

Figure 9: The number of tourists in Yamashiro town and the surrounding hot spring towns²⁴

4.2 Yamashiro town at present

The tourism centre finished the operation owing to changes to the tourist needs, and the site is used as a parking lot. A large hotel that was built in the new town in the 1960s closed due to worsening business conditions. In general, the new town area is of low density and the hot spring atmosphere has not remained. On the contrary, in the old town around Soyu (総湯), many improvement projects have been implemented recently, proposed by the local government and funded by the national government. From 2005 to 2009, a new central bath called "Shin-Soyu" (新総湯) was built, power lines were laid underground, a park was created, and façade of buildings along the street to Soyu were improved. In 2010, an architect Hiroshi Naito reconstructed the central bath "Soyu". Many tourists visit the old town to enjoy the historical atmosphere of Yamashiro. A group of these projects received a high evaluation and got a good design award in 2012.

Figure 10: Improved central bath (Soyu, 総湯)

Chapter 5. Conclusion

Eika Takayama, one of the famous urban planners of Japan, worked for tourist destinations through the activities of the JSA. His accomplishment as a planner of urban areas are already clarified in previous works of research; this paper clarified his work for rural tourist areas. One of his practical works for tourist destinations was the planning of the Yamashiro hot spring area. He proposed to create a new town and the detailed planning drawings were prepared. He planned a town for tourists to stay comfortably through the planning of walkways, green areas, tourist facilities and so on. Planning theories such as connecting the old and new town by commercial zones, circulating commercial zones as walkways and so on were seen in his plan. The new town was built in the 1960s but the street pattern was totally modified in actual and his idea to create a new town was partly realised through the building of tourism facilities and parks. By creating a new town, it was possible to meet the needs of business demands in the 1970s and has contributed to increase the number of tourists.

However, in terms of his contribution to the Yamashiro hot spring it was his idea to conserve the old town by creating a new town that was most important. In most of the hot spring towns in Japan, the uniqueness of the town such as natural scenic beauties and historical buildings were lost by lack of urban planning and hotel developments around the 1960s in general. But Takayama's proposal made it possible for Yamashiro town to conserve its uniqueness, the spatial feature of Soyu and the old town. Its uniqueness is a special tourist attraction today. In Japan the movement to conserve historical towns started around the beginning of the 1970s. Nevertheless, the example of the Yamashiro hot spring plan indicates that, already in the 1950s, the desire to conserve historical towns was already in the mind of a famous Japanese urban planner, Eika Takayama.

It was the hidden and unique planning theory of Yamashiro by Takayama to meet the needs of tourism development and to conserve the uniqueness of the town at the same time.

63 Diverse Planning Cultures and Traditions on the Way to a Flood Resilient City

Spatial planning and vulnerability to extreme weather in coastal cities: problem or solution?

Nikki Brand (Delft University of Technology) and Marcin D browski (Delft University of Technology)

The increasing frequency and severity of flood events in many cities across the world raises questions about the relation between urbanisation and vulnerability to flood risk and, critically, about the role of spatial planning in it, particularly in the context of climate change. While there is a growing awareness of the spatial dimension of flood risk, and a consensus on the need for interventions in the built environment to improve resilience to the increasing precipitation and sea level rise associated with climate change, there is no clarity on how planning decisions actually affect vulnerability to flooding - or what can be done about it. An example of the broadened scope of flood risk management that simultaneously aims for the reduction of the probability and loss caused by flooding is the Dutch Multi-Layered Safety (MLS) approach. MLS combines a first layer of prevention (by flood defences) with a second layer of (2) spatial adaptation of the built environment by water-robust spatial planning, and a third layer of (3) crisis management (evacuation and early warning systems). Although MLS is increasingly recognised as a promising approach to increasing urban flood risk globally, its second layer of 'spatial adaptation' remains ill-defined and ambiguous. In fact, its interpretation and operationalisation in different planning contexts across the world remains unclear. The goal of this paper is therefore to clarify the role of spatial planning in promoting resilience through spatial adaptation globally. The paper, first, takes stock and compares the different approaches to dealing with flood risk in practice in three coastal cities that represent very differentiated planning systems: Houston (Texas); Rotterdam (the Netherlands); and Guangzhou (China). Second, starting from an observation of the historical patterns in spatial planning decisions that contributed to the vulnerability of the built environment in those cities, and drawing on a range of interviews with the key experts conducted in Houston, Rotterdam and Guangzhou, the paper identifies the barriers for developing and mainstreaming spatial adaptation in differentiated planning cultures. Through the study of planning goals, tools and actors in the three cities in the current practice, the paper investigates how to unlock the potential of spatial planning to promote spatial adaptation to the growing flood risk.

Understanding the Urban Water Infrastructure as an historically hybrid construction

Fernande Hooimeijer (University of Technology Delft), Taneha Kuzniecowa Bacchin (Delft University of Technology) and Maki Ryu (University of Technology Delft)

The technosphere of the city should be considered heritage. This underground engine room that houses technical heritage has been taken for granted since technology is supposed to make every human intervention possible. The subsurface accommodates numerous vital functions in infrastructure, soil conditions and water. Current trends in urbanisation and climate change urge for another approach. This paper makes clear the relation between dealing with technical and natural water systems in the subsurface of large urban areas by tackling the question: In what way can the hybrid urban water system, being defined as the symbioses between the artificial (technosphere) and the natural water system (hydrosphere) be understood in historical context to be approached more intelligently in making it resilient?

In order to do so the paper first clarifies the historical context of the relation between the natural and artificial water system. Next, co-operation between landscape design and technology is sought for renewal of biophysical processes and water resilience in three case study cities Tokyo, Japan, Rotterdam, the Netherlands and San Paolo in Brazil. Reciprocities and trade-offs between the existing technical heritage and the new resilient approaches are assessed, and their implications and comparison discussed in this paper.

(please note that this abstract is submitted in relation to the panel proposal by Meng Meng and Marcin D browski entitled 'Diverse Planning Cultures and Traditions on the Way to a Flood Resilient City')

Exploring current constraints of land-use planning practices for governing flood risk in Taipei

Yu-Tzu Lin (Department of Urbanism, Delft University of Technology)

Recognizing that climate variety is challenging the hard measures to reduce flood consequences, the reorientation of land-use planning associated with institutional arrangement is regarded as an important instrument toward adapting to the multiple stressors of rapid urbanization, hydro-meteorological hazards and future climate events. Although climate adaptation strategies have been initiated in many Asian cities, urban flooding disasters have also increased. Based on literature review and documentary analyses, this paper uses a case study approach to explore the challenges impeding planning practices for flood adaptation, especially the causing factors: the planning culture and institutional fabric. Been characterized by floodplain and low-lying topography in a coastal zone, Taipei basin is surrounded by levees with total length of 109 kilometres constructed date traced back to around 100 years ago during the Japanese colonial period. From early 1960s, the new central government has started planning the flood control projects for Greater Taipei by hydraulic engineering approach, but could not implement the whole projects due to the enormous budget. Until 1999, the construction of the Taipei Area Flood Control Project, with item like floodway and river levees, land acquisition and improving storm water drainage system, was completed through three phases by adopting the 200-year-flood frequency as protection criteria based on safety threshold defined by past experience. In Taiwan, the flood risk management is administered by top-down process, however, the incorporation of flood control into land use planning is the responsibility of local government. Since that flood-prone areas are targeted by several types government initiatives to minimize flooding vulnerability, an effective integration into the land use planning becomes the advantage of spatial planning practice. But, as evidenced by the Taipei's flooding events, the institutional barriers embedded in planning culture are difficult to overcome. Linked with the historical transition of planning culture in Taipei's case, this paper concludes with the inflexibility of institutions as well as the unclear responsibility and minimal coordination in central and local governments gradually shape its urban planning into current limited role.

Between inertia and transition in spatial planning in the face of flood risk: a path dependence perspective

Meng Meng (TU-Delft), Marcin Dąbrowski (TU-Delft) and Dominic Stead (TU-Delft) and Faith Chain

For planning researcher and practitioners, the contribution of spatial planning to reducing flood risk in climate change is increasingly recognised. A major challenge, however, still confronts inexperienced planning systems, that is, to incorporate flood concerns in the conventional planning routines. Operating such innovations normally face the obstacles rooted in the long-established planning traditions. Based on the idea of path creation theory, this paper aims to clarify in what external context do the initiatives of an agency can contribute to the emergence of a path creation and reach a wide promotion, in the face of barriers from the established path-dependent way. It does this by tracing the history of the city's struggle against the water in a Chinese case, the city of Guangzhou, after the 1920s.

The paper distinguishes, in most cases, the conventional structural options, like dikes and pipe system, are the major claimed approaches to deal with floods yet they take effect in flood risk management; by contrast, non-structural options (useful in spatial planning) have not been fully explored, resulting in a lack of validating options for urban planners. This tradition was formulated in the 1930s and strengthened afterwards. Even though alternations, non-structural solutions, emerged during the 1950s-70s and reappeared in the early 2000s, local spatial planning system saw no big differences and a stick to structural measures. This tradition has shaped a barrier for the promotion of the latest national Sponge city Program, which claims a preference to use non-structural options to enhance urban flood resilience in spatial planning.

The empirical findings indicate social-economic environment and institutional environment factoring in creating new alternatives and deviating from original planning traditions. By contrast, natural environment, for a short-term, seemed to be a weak correlation to the innovations of flood resolving strategies in spatial planning discourse. It provides experience for policy makers and urban planners to enact a new policy to enhance urban resilience in spatial planning and reveal how old planning traditions might hinder the innovations.

An Analysis of the spatial coupling of handicraft workshops in Chinese capitals before Qin and Han dynasties

Yidan Zhang (Northwest University)

The ancient capital of China is an important materialized carrier for ancient civilizations. Nowadays, the ancient Chinese capital lacks attention to the secularized space in the capital, especially the space related to the handicraft production. This research targets different types of handicraft workshops in 18 ancient capitals from Three Dynasties (i.e. Xia, Shang and Zhou Dynasties) to Qin and Han Dynasties in China. The properties, scales, and location distribution of the workshops (including suspected relics) are carried on the statistics and integrated application of multi-analysis methods, such as architectural spatial analysis and archeological database quantitative analysis. It also explores characteristics of handicraft workshops in different industries, including the spatial composition, distribution sites, spatial coupling and spatial evolution. Meanwhile, it extracts the space land composition and attribute features, structural elements, distribution locus and the interaction process. By the covariation analysis, the relationship between the evolution of inner space structure and civilization in the ancient capitals of China is put forward. The study has found:(1) The handicraft workshops in the early Chinese capitals contain not only production space, but many other functions, such as for living, tombs, and sacrifice. With the development of the early kingdom to the empire, the coupling nature of this multidimensional space was gradually decreased with the reduction of the number of sites and tombs in the workshops and the vanishing of the sacrifice space, resulting in the number decrease of coupled space workshops.(2) The spatial coupling degrees of various industries in the workshops are different, and directly related to the importance of the workshop industries. As the “state machine” of the early capitals, the bronze casting workshops have the highest spatial coupling degree, followed by bone-making, iron smelting, and pottery workshops.(3) The unity of the “work, residence, and burial” space reflected in the capital handicraft workshops of Yin and Zhou Dynasties may be related to the patriarchal system and is one external manifestation of social governance measure.

In general, from Three Dynasties to Qin and Han Dynasties, both the means of space division and the social hierarchies of land use in the capitals are changed, which shows the evolution of the root factors, like the cosmology, religious consciousness, the state power strength, and the social governance system. In terms of research significance, a spatial quantitative analysis is based on archaeological data, and a special study on secular space in the ancient capitals is done. It is an important supplement to the current research on the space planning of the ancient capitals in China, and it has a certain enlightening significance for the issues of current urban industrial space and social spatial stratification. It can also provide the complete systematic evidence for protecting the urban heritage.

New Perspectives on the Planning of Yuan Dadu: The Yuan Measurement System, Residential Space and Nomadic Life

Zhao Chunxiao (School of Architecture, Southeast University)

Recent studies on Dadu, one of the capital cities of the Mongol Yuan dynasty, often adopt a holistic approach suited in a Eurasian background. These studies shed new light on the influence of nomadic traditions in the city planning, in addition to using Chinese urban models. Whereas most previous studies chose physical remains as their point of departure, this paper aims to understand the nomadic characteristics of Yuan Dadu by elucidating its two fundamental yet insufficiently studied planning principles. The first one is to confirm the planning of the city in accordance with the unique measurement system of Yuan, not Song Dynasty. The measurement system of the Yuan Dynasty with the length of chi(尺) in the range of 0.395 ~ 0.412 meters/chi(尺) textual was researched by historians of Metrology. The absolute length is significantly longer than the Song Dynasty's in the range of 0.308 ~ 0.315 meters/chi(尺) used in the past study of Yuan Dadu. And the measurement also significantly differs from those used by Chinese dynasties that ruled from the Central Plains. The length of chi(尺) in the range of 0.395 ~ 0.412 meters/chi(尺) is more effective in studying of Yuan Dadu. It could convert 28600 meters the date of perimeter of Dadu city obtained from an archaeological site to 57.85 ~ 60.34 li(里) which was more in accordance with the value of 60 li recorded in the Farming in Nan Village [Nan Cun Chuo Geng Lu(南村辍耕录)] (1366) than the result converted with 0.395 ~ 0.412 meters/chi(尺). Secondly, the prescribed eight-mu plot for each household in the History of the Yuan Dynasty [Yuan Shi(元史)](1370), which through the land measurement of ancient China that 15 bu(步) by 16 bu is 240 bu²(步²) equal to 1 mu(亩) – took the shape of a 32-by-60-bu(步) rectangle based on the space model of nomadic families different from the shape of a 44-by-44-bu(步) square, whose area is not 8 mu(亩) but 8.07 mu(亩), deduced in past study from the concept of land division based on the Central Plains Dynasty. I argue that the above two points can provide new perspectives on the systematic influence of nomadic way of life as seen in the planning of the Yuan Dadu as well as in the planning principle established by the Mongol regime.

The Status Change of Culture and Education in the Traditional Chinese City Landscape after the Song and Yuan Dynasty

Lumin Wang (School of Architecture and Urban Planning, Shenzhen University), Yuan Pan (Zhejiang Province Institute of Architectural Design and Research), Yiming Yuan (China Reconstruct Institute of Architectural & Urban Design co. LTD), Liang Liang (School of Architecture and Urban Planning, Shenzhen University) and Xiaoge Zhang (School of Architecture and Urban Planning, Shenzhen University)

After the Song and Yuan Dynasties, the Neo-Confucianism of the Song and Ming Dynasties was fully developed along with the institutionalization of the imperial examination system and the utilitarian expectations of the local officials. This contributed a lot to the local support for imperial examinations, culture and education. During this period, cultural and educational buildings related to imperial examination and social education have flourished in urban construction. This has resulted in a significant increase in the status of the culture and education architecture in the urban landscape. In some local cities, the urban landscape order pattern has even been dominated by cultural and educational buildings. A different urban landscape structure other than that of the Song and Yuan Dynasties came along. We attributed this change to the "The status change of culture and education". Studies revealed that during the Ming and Qing dynasties, there was a phenomenon of "The status change of culture and education" in spite of the obvious differences conditionally, including the southern Jiangxi Province, where Confucianism prevailed in the south, and Nanyang Prefecture, Henan Province, the war-suffered area in the north, and Changsha Prefecture, Hunan Province, located in the north-south direction of the Central Plains, as well as the socio-economically and culturally prosperous Jiangsu region along the rivers and sea.

Yangzhou Prefecture in the Ming and Qing Dynasties developed into a national economic and cultural center at the time. In today's Yangzhou, the old city is basically retained with the ancient city pattern dominated during the Ming and Qing Dynasties where urban historical relics are abundant. This provides a more solid spatial framework and more specific environmental details for the study. Therefore, this work takes the city of Yangzhou Prefecture as the case analysis object from the Ming and Qing dynasties, starting from the background of the development of culture and education. With an emphasis on the concrete expression of the "The status change of culture and education", the regional performance in the urban landscape of Yangzhou Prefecture is discussed.

This work finds that during the Ming and Qing Dynasties, the cultural and educational orientation of the urban landscape in the city of Yangzhou Prefecture is manifested clearly. The cultural and education architecture as a whole is widely distributed in a tendency of diversification. Cultural and educational building systems have greatly improved their position in the city and even in the regional landscape. As a strong addition, "The status change of culture and education" presents a lot of regional characteristics in Yangzhou City. For example, folk bookshops with important significance in cultural communication and mass education have been widely set up in the city; official and private library buildings have expanded their "public" function, and gradually become one of the most important ways for local culture and education to spread. The gathering of a large number of intellectual scholars and the holding of literati collection have made private garden houses an important carrier for cities to enrich social culture, leading to formation of a regional type of cultural and educational facilities.

Historical Mapping of the Urban Form and the Spatial Power Distribution in Capital Jiankang in East Jin Dynasty

Chenwei Zheng (Southeast University)

The Aristocratic Families, which had both political and economic privileges in early Imperial Ages of China with multiple generations working as government officials, had collectively become a core group of East Jin regime. As an important part of the etiquette system under central governance, the capital Jiankang served to display the legitimacy of the regime and to maintain the operational functions of both the nation's apparatus and the city itself. By using Urban Historical Mapping and Geographic Information System as the methods of the spatial power distribution analysis, this paper focuses on the distribution of core capital facilities including worship, administration, military and residence, and also the social status of their users. To conclude, the usage of capital space is a representation of the complex relationship and co-dependence among royalty, aristocratic and plebeians. The area inside the capital city wall is an outstanding space for the privileged class as well as the important representation that the aristocratic class joins the core of national powers. And the aristocrats were spatially distributed spread surrounding outside the capital city rather than congregated in one particular area, which made it easier to form their own power centers, leading to threats to the authority centralization.

Analysis of the spatial coupling of handicraft workshops in Chinese capitals before Qin and Han dynasties

Zhang Yidan

PhD, Lecturer, Department of Cultural Heritage Management, Northwest University, Xi'an, China
E-mail: dedan@126.com

The ancient capital of China is an important materialized carrier for ancient civilizations. Nowadays, the ancient Chinese capital lacks attention to the secularized space in the capital, especially the space related to the handicraft production. In addition, whether or not the space division method of the ancient urban planning land use can be measured by the spatial division theory of modern urban planning is an issue worthy of discussion. This research is based on archeological reports and the latest progress in archaeology. It targets different types of handicraft workshops in 18 ancient capitals from Three Dynasties (i.e. Xia, Shang and Zhou Dynasties) to Qin and Han Dynasties in China. The properties, scales, and location distribution of the workshops (including suspected relics) and other types of space are carried on the statistics and integrated application of multi-analysis methods, such as architectural spatial analysis and archeological database quantitative analysis. It also explores characteristics of handicraft workshops in different industries, including the spatial composition, distribution sites, spatial coupling and long-term spatial evolution. Meanwhile, it extracts the space land composition and attribute features, structural elements, distribution locus, planning methods, and the interaction process with other spaces. By the covariation analysis, the relationship between the evolution of inner space structure and civilization in the ancient capitals of China is put forward. The study has found:

(1) The handicraft workshops in the early Chinese capitals contain not only production space, but many other functions, such as for living, tombs, and sacrifice. With the development of the early kingdom to the empire, the coupling nature of this multidimensional space was gradually decreased with the reduction of the number of sites and tombs in the workshops and the vanishing of the sacrifice space, resulting in the number decrease of coupled space workshops. Along the continuous merger between workshops and markets after Qin and Han Dynasties, new spatial changes took place.

(2) The spatial coupling degrees of various industries in the workshops are different, and directly related to the importance of the workshop industries. The bronze casting workshops have the highest spatial coupling degree, followed by bone-making, iron smelting, and pottery workshops. As the "state machine" of the early capitals, the bronze casting workshop has an upper rank for a long term, which embodies that the higher spatial coupling is greatly controlled by the state power.

(3) The unity of the "work, residence, and burial" space reflected in the capital handicraft workshops of Yin and Zhou Dynasties may be related to the patriarchal system and is one external manifestation of social governance measure.

In general, from Three Dynasties to Qin and Han Dynasties, both the means of space division and the social hierarchies of land use in the capitals are changed, which shows the evolution of the root factors, like the cosmology, religious consciousness, the state power strength, and the social governance system.

In terms of research significance, a spatial quantitative analysis is based on archaeological data, and a special study on secular space in the ancient capitals is done. It is an important supplement to the current research on the space planning of the ancient capitals in China, and it has a certain enlightening significance for the issues of current urban industrial space and social spatial stratification. It can also provide the complete systematic evidence for protecting the urban heritage.

Keywords: Capital; Handicraft Workshops; Spatial Coupling

1. Introduction

Since the formation of archeology in China in the late 19th century and the early 20th century, the research on palaces and ancestral temples in ancient capital cities has been the focus. Such research tendency also influences the study of architecture and urban planning, which leads to the result that the study of handicraft production space has not received wide attention. Actually, the shape, structure, characteristics, evolution laws and planning ideology of the handicraft production space system can reflect the change of the state form and the political governance system in ancient times, and confirm the planning ideology of spaces relevant to “power”, such as palaces and ancestral temples, from another perspective.

For a long time, there is a reliance on the theory of functional districts in urban planning, and it seems that the understanding of urban spatial pattern tends to stick to the clear-out division of functional districts. In addition, due to limited archaeological data and literature, there tends to be narrow and single interpretation of the internal properties of spaces of specific types in ancient capitals. It is generally believed that the spatial division ideology of ancient capitals was beyond the common ideas of “ju” (gathering). With clear spatial boundaries and functional zones showing hierarchical differences, the spatial pattern reflected the social hierarchy and there existed a direct or indirect interaction between different types of spaces. In the Pre-Qin period, the space in capitals was divided into several types, including administration, sacrifice, production, living and market trading. In the past, the space associated with handicraft workshops was often defined as “productive space”, but currently such classification appears to be limited. In this research, based on statistics on the location, shape, structure and internal relics of handicraft workshops in capitals before Qin and Han Dynasties, it is discovered that the space in handicraft workshops in early capitals was not for the single purpose of production. Rather, inside a large number of workshops or “handicraft parks”, there were types of spaces for other purposes such as living, cemetery and sacrifice. Especially in the state-owned handicraft areas, there were usually clear and strict borders, and some areas were highly professionalized settlements consisting of workshops, houses and cemeteries. Such spatial coupling endured for a long time and the degree of coupling varied in different periods.

The study of urban spatial pattern and land use requires quantitative research. Originated from the field of natural science, the theory of “coupling” originally refers to two or more electronic components that coordinate closely and influence each other. Currently, the coupling theory is not only applied in physics, geography and economics, but also involved in the research of regional economic space, urban traffic space, urban land and open space. For the concept of coupling space, there are indicators such as the shape and pattern of the space. This research aims at investigating the phenomenon, attributes and dynamic characteristics of spatial coupling of handicraft workshops in ancient capitals. Due to the difficulty in obtaining data of land types in ancient capitals, this paper will adopt both quantitative and qualitative analyses.

2. Basic Information and Characteristics of Handicraft Workshops in Capital Cities before Qin and Han Dynasties

Through the investigation of 18 capital cities in the period from the Xia Dynasty to the Western Han Dynasty with relatively adequate archaeological data, all handicraft workshops and relics of suspected handicraft workshops are counted and the numbers of different types of handicraft workshops in each city are figured out. Statistics show that there were 50 handicraft workshops in total in capitals of the Xia and Shang dynasties, 65 in those of the Western Zhou Dynasty, 173 in those of the Spring and Autumn Period and 37 in those of the Qin and Han Dynasties. With the unbalance of archaeological data in different period of time taken into account, “a certain type of handicraft workshop in a certain area” mentioned in the archaeological reports as well as uncertain information such as “relics of a suspected handicraft workshop” is included in the statistics of this research. According to the statistics, there were 57 bronze-casting workshops, 54 bone-processing workshops, 39 iron-smelting workshops, 143 pottery workshops, 8 stone-processing workshops and 12 jade-processing workshops.

Fig. 1 Quantity statistics of handicraft workshops in the main capitals from Xia-Shang-Zhou Dynasties to Qin and Han Dynasties

Tab. 1 List of handicraft workshops containing dwellings, tombs and sacrifice space in the capitals before Qin and Han Dynasties

Cities	Handicraft Workshop	Scale (m ²)	Site Remains	Others(Tombs/Judaes)	Attributes
Taosi Site	Southwestern Stone Industry Zone YJ5	200,000 m ²	living sites and cave dwellings ; Handicraft Construction Department IIIIFJT2	Industry Zone with Trench Wall, Division Control	State-run
	Ceramic Kiln in the northeast	Two Kilns	4 Huikengs		
Erlitou Site	Kallaitite and copper-casting located on the key axis.		Partitions and closed sites as well		State-run
	Others (unknown attribute)			There are burials nearby.	
Zhengzhou Shang City Site	C5&C9workshops in the southern of the inner city	1,000 m ²		Bones and big-mouthed flat-bottom vat were the main tools for sacrifice. There may exist human skull pits.	State-run
	Ming Gong Road Pottery Workshop (the largest ceramic pottery in the city)	1,400 m ²		Six tombs were found in C11F102 and F12, as the laying foundation of ground.	
AnyangCopper Casting Workshop	There were workshops in the palace area.		There were common sites near C.		State-run
	Xiaomintun Copper-casting Workshop (No. 1-4)	50,000 m ²	Semi-Geosite Site Artisan Cemetery	Coppers' pits, sacrifice pit on the edge of the workshop	State-run
	Miaopu Northland Copper-casting Workshop (No. 1-4)	10,000 m ²	There were more premises in the west district.	There were sacrifice relics.	Royal family

The 18th International Planning History Society Conference - Yokohama, July 2018

	Dasikong Bone-processing Workshop(attached to the comprehensive workshop area)		3 pits	There were over 900 Brigade cemetery and tombs.	Tribe-run
	Beixinzhuang Bone-processing Workshop	1,380 m ²		Cattles for sacrifice	Tribe-run
Yanshi Site	Palace Inner Relics.		Annex buildings were found in west and east of the town.		State-run
	Dacheng Inner Pottery Workshop Area	45,000 m ²	Small-scale ground construction and semi-pitched architecture	Note: Most of the 160 tombs were used on the road, the rest are in the workshop.	
ZhouyuaSite	Li Copper	Thousands of m ²	Pits, premise sites, well relics		
	Qijiabei Stone-processing Workshop (Qijia Integrated Workshop Area)	20,000 m ²	Full-time craftsman	Cemeteries (M1/M5/M19) were found in Qi and Li Workshops.	Royal Family
	He, Li, Qi, Yun and Zhuang			Many tombs, premises and pits were mixed with each other. Most of tombs were small and medium-sized..	
Fenggao Site	Zhangjiapo Bones Workshop		H143、H160deep-ditch Kiln-style houses, craftsmen's houses		Tribe-run
	Fengcun Bones Workshops		A large number of tiles were the sites for production, found at 2013SFCH1		Maybe Tribe-run
	Bronze ware cellar near the residential area of Xinwang Nobility	9,000 m ²	The workmen maybe live in this area.	There were likely residences for the height class.	
Luoyang Wangcheng Site	Wangcheng XIbeiyu Pottery Kiln(in the middle and late Warring States Period)	18	Workshops, workshop gathering place with stoves	tombs	State-run
	Yijiatuan Shangyang Huaifu Pottery(in the Warring States Period)	1		tombs	State-run
	No.1 Ganxiu Pottery	2		Tombs	State-run
	Wenhenan Stone-processing	1		tombs	
Qindu Yucheng	Tofu Village Pottery Workshop(Yaojiagang Handicraft Zone)	35,000 m ²	There were rammed, separate walls. The southern district B is for craftsmen.		State-run
Lu Ancient City	Yaopu Copper-casting Site(the Western Zhou Dynasty to Late Spring and Autumn Period)	14,000 m ²	Sites	Tombs	State-run
	Linqian Village Bone-processing Workshop(the Warring States Period)	15,000 m ²	The south were residence sites.		State-run
Zhongshan Guolingsi	No.5 Copper and Iron Casting Workshop	Large-scale	Workshop management building/ residential area		State-run
Jin Xintian Ancient City	Copper-casting II & X & XII Workshop	50,000 m ²	Pottery for life uses	37 tombs	State-run
	Shigui Workshop (near copper-castingII&X&XII) The sacrificial pits XXI are in the south.	5,000 m ²	11 sites and pits	Tombs	Minister-run
	Farmers' Market Pottery Workshop	20,000 m ²	The west were pits.		

Yanxia	No.23 Copper and Iron Casting (Weapons)Workshop (the Warring States Period)		The north seemed to be residence sites	No.21& No.18 were the key concentrated distributions. The west were for the palace areas and the east are for the burial areas.	State-run
Qinlin City	Dacheng Iron-processing Workshop	40,000-400,000 m ²	Workshops, residence sites and pits are crossed distributed.		State-run
Zhao Handan City	City Museum of Copper-casting Site			tombs	
Zhengnan City	State Zheng-Wu Copper-casting Site(the Spring and Autumn to the Warring State Period) Sacrificial Vessel, Weapons and Coin.	100,000 m ²	75 pits(the Spring and Autumn)	These workshops for weapons-making and sacrificial vessels are less for Cang city, yet pits with enclosure technology are more.	
	State Zheng-Cang City Iron-processing Workshop(iron clothes)	160,000 m ²	8 pits		
	State Zheng-Dongcheng Bone-processing Workshop((the Spring and Autumn to the Warring State Period)	7,000m ²	59 pits		
	State Han-Nengren Road Pottery-processing Workshop(late Warring State Period-the Western Han Dynasty)	50,000 m ²	Sites for life use		State-run
	Dawulou Pottery-processing Workshop		Sites for life use		
	Han built a cast copper iron workshop on the basis of Zheng.(in the small town)				
Qinxianyangcheng	State-run workshops were near the palace area, yet pottery workshops were near the market.		Unknown	It may intersect with the residential area.	
Han Chang'an Ruins	State-run workshops mainly located inside the city, yet private ones are outside the market.		There was no site in the workshop, while it did as document recorded.	No record	

Notes: All the information above are collated from the latest excavation information and related archaeological reports.

The majority of the house foundations discovered near handicraft workshops were habitation sites with ash pits, and some were office buildings for governance. According to Liu Qingzhu, "around and near the palace-city in the capital of a kingdom, there were state-run handicraft workshops of bronze-casting and jade-processing". Based on statistics on handicraft workshops in capitals of kingdoms, the author found that during many periods of time, handicraft workshops existed not only around and near the palace-city, but also inside it where workshops for bronze-casting, bone-processing, jade-processing, pottery and so on appeared. The purpose of locating workshops in the palace-city was to maintain control over handicraft production as well as constraining the mobility of craftsmen.

Information about habitation sites of craftsmen is now discovered in a small number of workshops inside the place-city. For example, in Erlitou bronze and turquoise workshops, there were spaces separated by walls. Beside the bronze-casting sites in the palace-city of Yinxi and Shangcheng, there existed attached buildings or small towns. In state-run weapon workshops in the palace-city of Xiadu in the Yan State, craftsmen might have lived inside the workshops, but no low-ranking cemetery is discovered in the palace-city.

From the attached buildings found in the palace areas in the late Shang Dynasty, it can be speculated that in early capital cities, for important state-run handicraft workshops (such as bronze-casting workshops), the settlements of craftsmen often located in the palace areas. This results from the monopoly on handicraft production technology in the Bronze Age. Although there is no clear information about craftsmen's habitation sites in other types of handicraft workshops in the palace area due to the lack of archeological data, it can be speculated that there should also be craftsmen's living sites inside high-ranking workshops for bone-processing or jade-processing.

As for workshops outside the palace-city, separation of space also appeared in different kinds of workshops during different periods of time. For instance, stone-processing and pottery workshops in the Taosi period and the Yaojiagang handicraft industry area in Yongcheng, the capital of the Qin state, were surrounded with walls. Such spaces showed closure of various degrees.

3. Spatial Coupling of Handicraft Workshops and its Characteristics

(1) Characteristics of spatial evolution over a long period

As is shown in the figure, workshops with both habitation sites and cemeteries were usually of larger size. Except for the stone “gui” (an elongated pointed tablet used on ceremonial occasions) workshop of the Jin state that was 5,000 square meters, other workshops were over 10,000 square meters, and some even reached over 100,000 square meters. The size of the officially-run workshop in Lingshou of the Zhongshan State reached 600,000 square meters. Most of those workshops were run by the state and some belonged to the clans.

From a diachronic point of view, from the Xia Dynasty to the Western Han Dynasty, in the 18 capital cities there were totally 28 handicraft workshops with residence sites, 20 with cemeteries and 5 with sacrifice space. The proportion of residence sites was higher than that of cemeteries. Meanwhile, the proportion of workshops with residence, cemetery and sacrifice spaces gradually decreased. Despite the lack of archaeological data of workshops in the Qin and Han Dynasties, the proportion of workshops containing residence sites decreased from 16% in the Xia and Shang dynasties to 8.6% in the Eastern Zhou Dynasty. The proportion of workshops containing tombs reached 6% in the Xia and Shang Dynasties, peaked at 13.8% in the Western Zhou Dynasty and later decreased to 4.6% in the Eastern Zhou Dynasty. Sacrificial relics were discovered in workshops in all capitals of the Shang Dynasty, but they were not found in capitals of the Eastern Zhou Dynasty, except in Yongcheng of the Qin State. Sacrificial activities might continued in other forms, but exclusive space for them in workshops gradually disappeared.

However, it should be noted that statistics on the Zhouyuan site of the Western Zhou Dynasty are impact by limited data. Archeological reports show that residences and cemeteries in many settlements in the Zhouyuan site overlapped each other. There existed handicraft workshops in most of those settlements, for example, Licun, Qijia, Yuntang and Zhuangbai. In Fenghao, the capital of the Western Zhou Dynasty, there were many settlements that were located close to workshops. Therefore, it is speculated that in fact the combination of residence and cemetery in handicraft workshops in the Western Zhou Dynasty should be more common than what is indicated by statistics, and the proportion of workshops with residence in the Western Zhou Dynasty might approach or even exceed that in the Xia and Shang dynasties. In the archaeological reports on Xianyang of the Qin Dynasty and Chang'an of the Han Dynasty, residence sites or cemeteries inside handicraft workshops were not mentioned in detail, nor were the sacrificial relics. Although the report on residence in the market of Chang'an appeared in historical literature, the relationship between the residence and handicraft workshops was not clear. Thus, such residence is not included in the statistics of this research.

Fig 2 Ratios between workshops containing dwellings, tombs and sacrifice space and the total workshops from Xia-Shang-Zhou Dynasties to Qin and Han Dynasties

From the Xia Dynasty to the Shang Dynasty, handicraft workshops, especially those important ones run by the government, showed a high degree of spatial coupling. The space inside the workshops included production space, government office, residence sites for craftsmen, tombs for craftsmen and exclusive space for sacrifice, which was related to the institution of building officers in the early kingdoms. With the implementation of the “kin-ordered settlement system”, a population management system in the late Western Zhou Dynasty, the spatial coupling inside workshops reached its peak.

Since the Spring and Autumn period, the liveliness of the economy in capitals of the Eastern Zhou Dynasty led to obvious changes in the spatial pattern of capital cities. The living space and public space such as the tombs in handicraft workshops began to shrink gradually, and the number of workshops with a variety of space types dropped sharply. In other words, the degree of spatial coupling of the workshops decreased.

The ideas of division of urban space according to its functions issued by Guanzhong might have a great impact on the space for handicraft producers. Residence space was divided in accordance with different identities of people. For example, craftsmen lived near the government office and merchants lived near the market. Guanzhong divided Linzi, the capital of the Qi State, into 21 areas, of which 6 specialized in handicraft and business and were managed by the "three clans". This resulted from the fact that the handicraft industry was usually inherited by families from generation to generation. In the Qi State, business people and craftsmen could not easily change their career. According to the records in “Zizhang”, a chapter in The Analects of Confucius, Zixia said that craftsmen lived in their workshops next to the streets and did their business. In the late Spring and Autumn Period, the class of craftsmen (called “Baigong” in Chinese) gradually became the populace, and the originally self-enclosed workshops gradually overlapped with the market.

During the Qin and Han Dynasties, with the space of handicraft workshops gradually merging with the market, no trace of cemeteries could be found in the east and west markets of Chang'an. However, the living space still existed, attaching to the space of market trading.

Fig. 3 Schematic diagram of evolution of space composition of handicraft workshops from Xia-Shang-Zhou Dynasties to Qin and Han Dynasties

(2) Spatial coupling of workshops in different handicraft industries

In terms of different handicraft industries, the degree of spatial coupling varied among different types of workshops, which is illustrated in the following figure.

Fig. 4 Evolution of the space composition of handicraft workshops from Xia-Shang-Zhou Dynasties to Qin and Han Dynasties

According to the figure, 25% stone artifact workshops contained residence sites and another 25% contained cemeteries. The proportions were the highest, followed by those of the bronze-casting, bone-processing, iron-casting and pottery workshops. No residence was found in jade processing workshops, which might result from their higher rank and their location in the palace area.

It should be noted that there is something special about the data of stone artifact workshops. In the 18 capital cities, only 8 stone artifact workshops were found, and 2 of them, the Taosi site and the ancient capital of the Zheng and Han States, contained residential or burial space. In the Taosi site, the stone-processing workshop was located in a relatively closed stone-processing industrial park. The mid-term relics in the Taosi site showed that high-ranking residence, together with stone artifact and pottery workshops, was built on the high and smooth land in the city. Stone-processing workshops no longer appeared in the Erlitou site, which might be related to the fact that stone processing had been transferred to other professional settlements. Different families or clans had their own workshops. The stone-processing workshops in the ancient capital of the Zheng and Han State specialized in the production of stone artifacts used on ceremonial occasions.

Besides, the proportion of residential or burial sites contained in bronze-casting workshops was much higher than that of other types of handicraft workshops. In some bronze-casting workshops, there were both residence and cemeteries. Some scholars found that bone-processing workshops and bronze-casting workshops often appeared in pairs, so the proportion of bone-processing workshops with residential and burial space ranked the third. It also reflected the spatial closure of such workshops. With the advent of ironware in the Spring and Autumn Period, iron was widely used in the manufacture of weapons and production tools (but currently no sacrificial vessels made of iron was found). Because the raw material of iron was easier to obtain than bronze, the extensive production of iron required a large number of craftsmen. However, the proportion of iron-casting workshops with residence was not the highest. For example, both the Dawulou bronze-casting workshop and the Cangcheng iron-casting workshop in the capital of the Zheng and Han States existed in the same period of time and covered over 100 thousand square meters respectively. There were 75 residence sites in the Dawulou bronze-casting workshop, much more than those in the Cangcheng iron-casting workshop. The reason might lie in the fact that Dawulou produced sacrificial vessels, weapons and coins, while the Cangcheng workshop produced iron farm implements. The Dawulou workshop, with an obvious higher rank than Cangcheng workshop, satisfied the needs of the nation and guaranteed national security and governance by making a larger number of craftsmen live inside the workshop.

4. Factors Affecting the Spatial Coupling of Handicraft Workshops in the Capitals before Qin and Han Dynasties

(1) the long-term high status of bronze-casting workshops as the "state apparatus" in the early capitals

The degree of management and control over different types of workshops differed. The sacrifice and military affairs were the most important issues of a country. In the early kingdoms period, bronze ware was the symbol of the state power. Thus the authority took absolute possession of the copper mines, production technology and casting space. Bronze-casting workshops could be regarded as a part of the "state apparatus". The location of bronze workshops in the capital city was also very important. There was "exclusive" space for bronze workshops, a "space of power" like the palace and the ancestral temple. Because of the monopoly of handicraft technology in ancient China, high-tech handicraft industries such as bronze-casting were often tightly controlled. Such control was reflected not only in the location of workshops, hereditary system of technology and closure of workshop space, but also restrictions on the living place of craftsmen.

We can not regard bronze-casting workshops as a mere "productive space". The spatial coupling phenomenon where production, management, craftsmen's living space, craftsmen's cemeteries and sacrificial space were strictly controlled in a closed unit reflected the enormous power of the early kingdoms.

(2) The kin-ordered settlement system influencing the coupling of handicraft space in capitals in the Shang and Zhou Dynasties

The combination of "production, residence and cemeteries" in the handicraft workshop space was likely to be relevant to the land ownership system and the population management system, which was evident in the Shang and Zhou Dynasties. In Yinxu, the clan and settlement management system was "mixing together in general and living in compact communities in specific regions". People lived together as a clan but at the same time the population was also decentralized. With the hereditary system, the technology was controlled by professionals from one generation to the next, and was prevented from being lost. Craftsmen of the same workshop as well as some managers might live together as a clan, and with the clan there were both agricultural production and a variety of handicraft industries. Different clans formed independent units with comprehensive functions, guarding the central area of the palace. Moreover, not all the craftsmen were slaves. Based on the funeral objects discovered in the west part of Yinxu, it could be speculated that one-tenth of the tomb occupants were craftsmen. They were professional handicraft workers who fell into the class of freeman. These freemen worked and lived within the clan for a long period of time and were buried in the same area after death.

In the early Western Zhou Dynasty, the clan management system was very similar to that of the Shang Dynasty. At that time, the industry, commerce, their organization and the system of ownership were all with the characteristics of rural commune ownership. The rural commune system is a kind of political governance which can control all the relations of production. Marx and Engels argued that the organization of industry and its corresponding ownership in the ancient society were with the nature of land ownership.

In ancient times "guoren" (literally meaning "capital people") referred to people living in the capitals. Only when the conqueror thought that the conquered shared the same status and common interests with themselves, would they permit the conquered to live in the capitals. The Zhou Dynasty's governance over people of the Shang Dynasty was like that. The Zhou authority made the Shang people moved to Shaanxi in order to develop the economy. The Shang people were allowed to live and produce handicrafts in Zhouyuan, a settlement of aristocracies with family names different from that of the rulers of the Zhou Dynasty. Craftsmen coming to Zhouyuan in early times were probably professional handicraft workers rather than slaves. According to the Japanese scholar Taketoshi Sato, bronze craftsmen in the Shang and Zhou Dynasties formed professional groups with the structure of clans. These professional craftsmen were arranged in a relatively small area of handicraft workshops. They did not own land in the vicinity of Zhouyuan and could only be buried in the handicraft workshops. Through the analysis of the "pottery tube", a tool for bronze-casting, some scholars believed that in the Western Zhou Dynasty the tombs of craftsmen were inside the workshops.

The combination of spaces with different functions, influenced by the clan management system, gradually formed an "integrated space unit". The "handicraft space" could not be simply classified as "space of production" or "space of power". Production (workshops), life (residence), power (management buildings), sacred space (sacrifice) and space for public facilities (cemeteries) were coupled together. Under the clan management, the coupled space was an "integrated space for the branch of power", and its handicraft production was closely related to the state form and the state governance mechanism. The integrated space can even be considered as the

earliest "public space for the clan members " with economic attributes, a production space where clan members worked together.

(3) The changes in cosmological ideas and religious beliefs influencing the spatial demand of sacrificial activities in the workshops

The earliest relics of sacrifice in the handicraft workshops was dated back to the Yangshao period. Sacrificial activities were common in the Shang and Zhou Dynasties, and handicraft production, especially that of the ceremonial vessels, was given a mythological flavor. At present, sacrificial sites can be found in all the ancient Shang capitals unearthed. In the bronze-casting and pottery workshops in the Shang and Zhou Dynasties, there were remains of people, animals and artifacts found in pits. Such distribution of space was likely to be specially planned. The existence of the sacred space in the Shang and Zhou Dynasties indicated that the planning of such a sacrifice space could be dated back to the time of the lower layer of the Erligang site or to the Xia Dynasty.

With the changes of the objects of sacrifice and the simplification of sacrificial activities, the sacrifice space shrunk correspondingly. Although sacrificial space was found in the handicraft workshops in Yongcheng of the Qin State, it was not common in the Eastern Zhou Dynasty, and it was not yet possible to determine whether this type of space existed in workshops in other capital cities at that time. Since the Song and Yuan Dynasties, the worship of gods of different industries has become a general folk belief in the handicraft industry. However, it was difficult to distinguish the buildings for those gods from ordinary house foundations, and the god for some industry might be just a stone.

The sacrificial space in workshops in the early capital once took a very important spatial position, but as the time passed by, the original sacrificial space shrunk and disappeared. This was related to the gradual standardization of sacrificial places by the state. Although sacrificial activities and the worship of gods might have already occurred, the sacrificial space itself might be gradually reduced or disappeared in terms of size.

In general, from the Xia-Shang-Zhou Dynasties to the Qin and Han Dynasties, there was a downward trend in the degree of spatial coupling of the handicraft workshops in the capital cities, which reflected the evolution of various factors such as the state form, power intensity, social governance system, religion and so on.

New Perspectives on the Planning of Yuan Dadu: The Yuan Measurement System, Residential Space and Nomadic Life

Zhao Chunxiao*

*PhD student, School of architecture, Southeast University, zhaochunxiao1919@hotmail.com

Abstract:

Recent studies on Dadu, one of the capital cities of the Mongol Yuan dynasty, were increasingly situated in a holistic Eurasian background, shedding new light on the influence of nomadic traditions in its city planning in addition to using Chinese urban models. Whereas most of the previous studies took physical remains as their point of departure, this paper aims to understand the nomadic characteristics of Yuan Dadu through elucidating its two fundamental yet under-studied planning features: Firstly, the planning of the city in accordance with the unique measurement system of Yuan chi, whose length is significantly different from the Chinese dynasties that ruled from the Central Plains; Secondly, the prescribed eight-mu plot for each household in the History of the Yuan Dynasty, which took the shape of a 32-by-60-step rectangle based on the space model of nomadic families. I argue that the above two points can provide new perspectives on the systematic influence of nomadic way of life seen in the planning of the Yuan Dadu as well as the planning principle established by the Mongol regime.

Keywords: Yuan Dadu, Nomadic tradition, Yuan *chi* (尺), Homestead area

Introduction

Yuan Dadu was an international capital city of the Mongol Yuan dynasty. Its construction was ordered by the ruler of Mongolia, Kublai, in the 1267 at the location of today's Beijing. This is where the northern border of the Central Plains Dynasty separated the farming civilization from the nomadic civilization. The city was also referred to as "Khanbaliq" by the Western Europeans during the Middle Ages. From the day when the Dadu was established, the urban structure of Beijing in the Ming and Qing Dynasties had been laid, and even the capital of the People's Republic of China, Beijing, 700 years later. Therefore, whether we study Yuan Dadu or Beijing city of Ming and Qing Dynasties, and even contemporary Beijing, we cannot ignore Mongolian rulers' planning ideas for this capital because of their nomadic way of life. In the early twentieth century study of Yuan Dadu, most Chinese scholars in the history of planning were influenced by the ideas of a western modern nation-state or bound by the orthodox values of the Central Plains Dynasty, believed the culture of the nomadic people, who were not fixed in a city without a unified State Administration and migrating on the steppe and Gobi, did not play a decisive role in planning and construction of Dadu. Most of their studies did not reasonably and effectively evaluate the role of the Mongolian Yuan nomadic life in the planning of Dadu. They tried to interpret the image of Dadu's urban spatial form by using the planning concept of the traditional Central Plains Dynasty. The concept assumed that the regime and the culture of the Yuan dynasty was greatly influenced by the civilization of the Central Plains Dynasty. From that perspective, the analysis of materials and the research results will lead to a wrong direction. They will not be able to explore the planning ideas and methods of the Dadu comprehensively.

The “Great Mongol Empire” (Yeke Mongghul Ulus) in the period of the first four Khans, was a huge empire that spanned across the Eurasian continent. Contemporary historians have pointed out that based on its nomadic civilization, the Mongol Empire had its own political and cultural tradition instead of completely following the Han tradition. After conquering the Central Plains, the imperial power in the Yuan Dynasty had the dual rulership of the “emperor and the great Khan.” The nations of Mongolia and Han symbolize the legitimacy of the Mongol Empire ruling rights.¹ As Mr. Sugiyama Masaaki pointed out after analyzing the elements of Kublai’s construction of the great empire in *Kublai’s challenge* (2013), the Han’s (Han Zu 汉族) culture is only a “coat” required by Kublai to build an unprecedented empire. Its characteristics are obvious only in the middle and lower level administrative organizations in Han’s (Han Zu 汉族) land.² However, there is no such understanding in the research of Yuan Dadu planning as historical records about Dadu’s planning principle are unclear. Studies usually focus on surface phenomena and their symbolic meanings. They inadvertently tend to ignore specific planning methods. With regard to the study of Yuan Dadu planning, the earliest understanding of the city in the view of the nomadic life of Mongolia was Murata Jiro’s, a Japanese scholar from 1934. His paper titled “Argument of Yuan Dadu’s Plan [LuanYuan Dadu De Ping Mian Gui Hua (论元大都的城市规划)]” put forward that the practice of the palace in Dadu, which was built nearby Taiye Pond [Tai Ye chi(太液池)], was an imitation of Batu Khan’s palace, which is located in the Volga River as recorded in missionary notes³, in order to remind the successor of the rising place with plenty of water and grasslands. But the judgment made in the missionary notes has not been recognized by the academic community. In the late 90s of the past century, Pan Guxi, a Chinese scholar, made amendments to the understanding of the former Yuan Dadu’s planning research in the text of “Yuan Dadu’s Planning Not to Return to the Ancients: Re Understanding of the Construction Model of the Yuan Dadu [元大都规划并非复古之作——对元大都建城模式的再认识]”. The reason why the palace is located in the southern part of Dadu is not to conform to the statement that “palace should behind the court, in front of the market” which was the requirement of the capital layout in *Kao Gong Ji* (考工记). Just because Kublai and others were very fond of this pond [Tai Ye chi(太液池)].⁴ In recent years, Chinese scholars have explored the planning of Dadu from the perspective of nomadic life in works such as Bao Muping, “Reexplored the planning of Dadu from the Perspective of Nomadic Life: From Karakorum to the Yuan Dadu”; and Mr. Li Dongnan, “The Nomadic Ethnic Characteristics of the Capital of the Mongol Regime: Focus on the Yuan Dadu.” The exploration of the planning of Yuan Dadu from the perspective of nomadic life has become an important perspective nowadays.

However, it is not sufficient that researches simply focus on certain specific phenomena after the completion of Yuan Dadu by speculating on cultural considerations, or mutual proof among three capitals of the Yuan Dynasty. Such a study may be enlightening and in a reasonable interpretation range of the nomadic life characteristics on Dadu planing. But on the other hand, we cannot discuss the systematic influence of nomadic life on the planning of Yuan Dadu without fully understanding the fundamental principles of the absolute length of *chi* and division mothed of homestead. Therefore, based on the extant historical record, this article will explore the basic elements in planning – such as the unit length of construction and land use index – to reveal the nomadic life elements in the planning principles of Yuan Dadu.

1. Re-recognition of the *chi* used in planning of Dadu from the nomadic civilization

Before discussing the planning of Yuan Dadu, we must point out that in ancient China, the absolute value of the length units — *chi* (尺) — of urban planning and architectural design were changing throughout history. Therefore, determining the absolute length of the research object's *chi* is a necessary step for the conversion of the length dates obtained from archaeological investigation and recorded in ancient documents.

Early studies suggested that the Yuan Dynasty measurement system was inherited from the Song Dynasty.⁵ Thus in the study of the planning of Yuan Dadu, the length of one *chi* as 0.308 meters to 0.315 meters has been commonly used by researchers. However, an obvious problem here is that this length range of *chi* to convert 28600 meters perimeter of Dadu obtained by archaeology⁶ with 1 *bu* (步) = 5 *chi* (尺)⁷, 1 *li* (里) = 240 *bu* (步)⁸, to the measurement of Yuan Dynasty is 75.66 *li* (里) to 77.38 *li* (里) cannot meet the “60 *li* (里)”⁹ the perimeter of Dadu city recorded in *Jinshi Dadian* [《经世大典》] (1330) an official ordinance of Yuan dynasty excerpted in *Farming in Nan Village* [《南村辍耕录》] (1366). Most studies adhere to the correctness of the length range of *chi* (尺) and assume that the document records were incorrect. But if the difference of created background and used measure objects between nomadic and farming life is seriously considered, then studying Yuan Dadu with the *chi* (尺) of the Song Dynasty has to be reexamined.

After the 1990s, new progress has been made on the length of the Yuan Dynasty *chi* in the study of the history of Chinese metrology. Guo Zhengzhong and Qiu Guangming have shown that the length of *chi*'s daily use in the Yuan Dynasty was significantly longer than the Song's. These studies show that the length of *chi*'s daily use of the Yuan Dynasty was 0.395 meters / *chi* (尺) to 0.412 meters / *chi* (尺).¹⁰ By the converting method described above with the Yuan Dynasty's lengths of *chi* (尺), the perimeter of Dadu can be achieved at 57.85 *li* (里) to 60.34 *li* (里). This is more in accordance with the value recorded in *Jinshi Dadian* [《经世大典》] (1330) than the length of *chi* (尺) in the range of 0.308 meters/*chi* to 0.315 meters/*chi* used in previous research, for instance, Zhao Zhengzhi's use of 0.308 meters/*chi*¹¹, and Fu Xinian's use of 0.315 meters/*chi*¹². In addition to this argument, it is possible to verify the validity of this length range of *chi* on the planning of Dadu from converting the date of the ruins of Dadu like wall and road into the measurement system of Yuan Dynasty, and contrast the conversion results with the value recorded in *Rules for Construction* [《营造法式》] (1103) and *Recorder on Xijing* [《析津志》] (1360s). Data on the size of walls and roads had been obtained from archaeological findings. The dates of wall ruins include their foundation depth at 2 meters¹³ and width at 24 meters.¹⁴ Converting these two measurements with 0.395 meters / *chi* (尺) to 0.412 meters/*chi* (尺) can show the foundation depth at about 5 *chi* (尺) and width at about 58 *chi* (尺) to 60 *chi* (尺). Both of these measures are in accordance with the construction standards recorded in *Rules for Construction* [《营造法式》] (1103)¹⁵ a book about the rules and regulations for construction published in North-Song Dynasty. The archaeological data of one of the road's width is 25 meters. It can be converted to about 12 *bu* with 0.395 meters/*chi* (尺) to 0.412 meters / *chi* (尺) and 5 *chi* (尺)/*bu* (步). The numerical value of 12 *bu* (步) is in accordance with the width of one of Dadu's four kinds of roads recorded in *Recorder on Xijing* [《析津志》] (1360s) and named “Xiao Jie (小街).”¹⁶

It must be noted that the length range of the *chi* (尺) belonging to the Yuan Dynasty is much longer than in any other Chinese dynasties.¹⁷ What is the cause of that? I conjecture that this must be related to different lives with regard to their nomadic ways and farming. In *Measurement of China from Three Century to Fourteenth*

Century [三至十四世纪中国的权衡度量](1993) the author pointed out that there was a close relationship among the Yuan, Jin, and Liao Dynasty on the length of *chi* (尺). The Yuan Dynasty inherited the measurement of the Jin Dynasty by comparing the length of the daily usage of *chi* in the Jin and Yuan Dynasty.¹⁸ This can be supported by the fact that the calendar of Jin Dynasty had been adopted during the early Yuan Dynasty¹⁹. These three dynasties had a mutual origin by being established by nomadic people in the north of the Central Plains. In the long nomadic life, it is possible according to the daily needs of nomadic life to form a measurement that is different from the one used in farming. Although there is no clear evidence for the origin and development of the nomadic civilization's measures, the manner of nomadic production and life reveals that they did not need to divide the cultivated land as agricultural production. Therefore, judging from the influence of the measuring object on producing objective value, the measurement standard of nomadic life is likely to have two different systems from the Central Plains Dynasty. From this point of view, it is easy to understand that the length of *chi* (尺) used in the planning of Dadu is much longer than the one used by other dynasties.

2. Redefining the flat form of eight-mu plot for each household

The *History of the Yuan Dynasty [Yuan Shi (元史)]* (1370) recorded that the residents who moved from the old city to Dadu would be privileged and given a land at an area of 8 *mu* (亩) used to make homestead.²⁰ The area of "8 *mu* (亩)" was the basic land index used in the planning of Dadu. It determined the whole spatial pattern and road organization. But unfortunately, the area of the homestead is pointed out in the *History of the Yuan Dynasty [Yuan Shi (元史)]* (1370) without its flat form. Scholars could only imagine the space it left. The first idea of the flat form for "8 *mu* (亩)" plot of homestead was put forward in 1960s as a 44 *bu* (步)-by-44 *bu* (步) square by Zhao Zhengzhi. The author converted the distance of 67.67 meters between two extant Hutons (胡同) of the Yuan Dynasty with 0.308 meters/*chi* (尺) belonging to the Song Dynasty into 44 *bu* (步) as the north-south length of a homestead. He then supposed the east-west length of the homestead is also 44 *bu* (步) long (see fig. 1).²¹ It is worth noting that the length of east-west side was only an assumption. In this way, the homestead formed a square shape of about 8.07 *mu* (亩) through converting 1936 *bu*² (步²) with 240 *bu*² (步²)/*mu* (亩), which is the traditional Chinese conversion method. During the next half century, many Chinese and foreign scholars adopted that size and shape. But it must be pointed out that the flat mode as a square was an *a priori* hypothesis based on the traditional Chinese space model that was made up of different sizes of squares in various grades²² (see fig. 2), just like the homestead's flat mode with the flat of Dadu. The triple-walled flat mode of Dadu is most noticeable whose concentric boundaries each had a perfect or near perfect geometric form followed Chinese tradition.²³ (see fig. 3) The flat mode was such a fiction that made people forget that 1) the east-west length of the flat mode is only the product of the author's imagination; 2) The flat of Dadu is never a square but a rectangle at 14 *li* (里) x 16 *li* (里)²⁴; 3) The area of "44 *bu* (步) x 44 *bu* (步)" square is never 8 *mu* (亩) but about 8.07 *mu* (亩).

Yao Dali in *The Yuan Dynasty's imperial power*[蒙元制度与政治文化] (2011) pointed out that when Kublai “Mongolia’s political center moved to the south and Khan did not have the ability to direct control of Mongolia throughout the country. However, using the traditional Chinese political resources does not mean that the Mongolian regime will give up the symbol of political tradition originated in Mongolia.”²⁵ Dadu as the capital of the empire shows the symbolic meaning of Kublai’s adherence to the legitimacy of the Mongolian tradition. Therefore, considering that the replacement of the capital has been opposed by the Mongol nobility, in planning of Dadu, Kublai had to use the measures to construct the new capital with nomadic culture in order to win the support of the Mongolian people. In the nomadic Mongolian life, family was the most basic social organization unit. A family had formed a certain spatial organization mode to allocate yurt position according to

the camping family members. Analyzing family spatial organization of the herdsmen in Mongolia, Victhorova in “The national cultural characteristics of residential sites and houses in Mongolia [蒙古的居民点和住宅的民族文化特点]” pointed out that according to the traditional customs of the Mongolian camp, the position in the first row of the West (South) is left for yurt of the oldest and most respected member of the collective. The other Mongolia yurt of the members are orderly arranged in the back of the first. Their entrance is always toward the south. The neighborhoods of each residential unit are not surrounded by walls, and they are rectangular in flat.²⁶ (see fig. 4). It can be seen that the traditional residence organization model of the Mongolian family forms a block space model with short distance of North-South side, and long distance of East-West side. Through the nomadic family space organization mode in Mongolia, a new understanding of the “8 mu (亩)” homestead plane mode should be taken, and a new plat form will be made based on the ancient land area calculation method.

Figure 5. Diagram of the layout of homesteads in Dadu.

The types of road in this picture accord to “road system (街制)” of Dadu recorded in *Recorder on Xijing [Xi Jing Zhi (析津志)]*(1360s), and no kind of road named as Huton(胡同) mentioned in the book.

In *Nine Chapters of Arithmetic [Jiu Zhang Suan Shu (九章算术)]*(263 AD.), a book for mathematics originated in the Chinese Western Han Dynasty, the amount of 1 mu of land was $16 bu (步) \times 15 bu (步) = 240 bu^2 (步^2)$.²⁷ This practice has been used so far and the folk have retained the proverb: “long sixteen, fifteen wide, neither more nor less than one mu (亩).” It is a method for taking a plot of area of 1 mu (亩) near a square with the length and width as integers. Therefore, the area of 8 mu (亩) can be obtained by the product of a side length of $2 \times 16 bu (步)$ and another length of $4 \times 15 bu (步)$, as a rectangle of a $32 bu (步) \times 60 bu (步)$. Moreover, with the length of $0.395 \sim 0.412$ meters / chi (尺), had been verified above. the length of 67.76 meters the distance between extant tow Hutons(胡同) of Yuan dynasty, the north-South width of the homestead could be restored to about $32 \sim 34 bu (步)$, which is very close to the length value $32 bu (步)$ of one side of a flat in 2

mu (亩) as above. Without the error caused by the sampling, measurement and conversion of the Huton (胡同), the north-south length of the planned homestead can be assumed based on 32 *bu* (步), and then another side length of the homestead on the 60 *bu* (步). It is a the homestead as a rectangular of 32 *bu* (步) long in north-south and 60 *bu* (步) long in east-west (see fig. 5). From this flat we cannot only obtain an integer value area of the homestead conforming to the record in the *History of the Yuan Dynasty [Yuan Shi (元史)]*(1370), but we can also divide it into two parts : North and South, each one with the area of 4 *mu* (亩), or eight units in eight integers acres of 1 *mu*(亩). Every unit could be utilized by family members to settle in Dadu just like the family organization spatial patterns of the Mongolian Nomadic traditions on steppe.

The above analysis indicates that as principal conditions for building structures, space form and scale of Yuan Dadu, the measure length for planning and homestead plane pattern all reflect the characteristics of nomadic life. Especially the homestead plane pattern directly reflects the mode of family space organization in nomadic life. Perhaps these were only parts of the important role of the nomadic culture in the planning of Yuan Dadu. Therefore, more cultural symbols in the planning of the Yuan Dadu have to be reviewed from a new perspective.

Conclusion

All of these aspects provide us with a historical perspective from planning principle on the idea of nomadic life of Dadu. We can observe that the capital's grid-like layout was not carried out according to the Chinese traditional idea but the way of Mongolian encampment.

The thought of “what is Asia and what is Mongol-Yuan” not only impel the historians to enrich their knowledge and exploration, but also explore the possibility of re-recognizing what “China” is, and at the same time acknowledge the possibility of re-recognizing “Asia” and “the world”.²⁸ When the space of historical language transcends the boundaries of geography and administration, the capital Dadu of the “Great Mongol Empire” across the Eurasian continent in thirteenth Century opens up the space for further research. Therefore, the influence of the nomadic life of Mongol-Yuan, which is an important part of global civilization, on urban planning and the manifestation of the Dadu should not be ignored. The key issue for people failed to fundamentally realize the essential factors of Dadu during the past fifty years is not due to a lack of knowledge about the length of *chi*. They lacked the knowledge on the perspective of life. The main problem is that people do not fully realize the value of nomadic culture. Therefore, I take the display of nomadic life characteristics on the basic elements of Yuan Dadu as an opportunity to open a gap in the understanding of the Yuan Dadu with the perspective of the Central Plains Dynasty and shine the light on nomadic life. Hopefully, the paper identifies the great role of the Mongolian nomadic life in ancient China's capital planning. It also provides useful references for the perspective of study in the planning of Yuan Dadu by pointing towards an objective understanding of the topic.

22 Chinese ancient life space organization mode as “JingTian Zhi (井田制) [a system of the way to organizing wells and fields]”. Generally speaking It is the “nine squares” system (of land ownership in China's slave society) with one large square divided into 9 small ones (like the Chinese character “井”), the 8 outer ones being allocated to serfs who had to cultivate the central one for the serf owner. From the perspective of space organization, it was an idea mode with a square of land in a certain area as a unit, then in a special area increasing way, the unit continues to expand to different size of squares from small to large, as figure 1. If it is considered just the way of space organization for Dadu, the flat form of homestead of Dadu must be thought as a square.

After the Song and Yuan dynasties, the development of the imperial examination system was witnessed by the spread of the Neo-Confucianism of the Song and Ming dynasties. This was accompanied by the position of culture and education buildings in the local urban landscape system that was greatly improved, some even dominating the performance of the urban landscape. The resulted structure of the urban landscape before the Song Dynasty is described as the so-called status change of the "The Status Change of Culture and Education." Studies have shown that "The Status Change" during the Ming and Qing Dynasties could be found here and there. This work took the City of Yangzhou Prefecture in the Ming and Qing Dynasties as the research object. Starting from the background of the development of culture and education, this paper expounds the process and characteristics of such a status change during this period.

Keywords: After the Song and Yuan Dynasties, The Educational buildings, Urban landscape, The status change of culture and education, Yangzhou Prefecture

1 Introduction

Cultural and educational buildings are one of the most important building types in Chinese traditional cities. They were buildings and structures of great significance in imperial examination education, cultural communication, and social education, including the main places for imperial examinations – school, academy, and other kinds of cultural and educational facilities: such as Wenchang Pavilion, Kuixing Tower, Wenfeng Pagoda, Xizi Pagoda and the related worship temples, memorial archways and so on. In the local cities, some important carriers with universal significance in cultural communication and social education have been developed, where new cultural and educational facilities with regional characteristics have been expanded.

This paper is prepared to explore the culture and education architecture, which belongs to the study of the changes and application methods of traditional architecture type systems. It is part of the research context of China's urban construction history. At present, most scholars set their focus on the architecture of culture and education from a single architectural form, scale, and distribution, which is rarely placed under the order of the city landscape construction.

After the Song and Yuan Dynasties, the evolution of the traditional Chinese cities in terms of political systems, socio-economic development, and ideological consciousness greatly affected the development of urban culture and education, leading to the increasing recognition and attention of "culture and education". In terms of the political system, the social influence of the imperial examination system was further deepened, leading to a general and lasting study habit in the society. In addition, the imperial examinations in the Ming and Qing Dynasties combined closely with the school system, which directly stimulated the development of official studies. Ideologically, Since Song and Yuan Dynasty, Cheng-Zhu Neo-Confucianism became the official philosophies that occupied a dominant position. In this scenario, Advocating Confucianism, Emphasizing Education and Moral Education became the basic policy. In economic development, the prosperity of commodity economy formed a powerful pulling action for social culture.

Studies revealed that during the Ming and Qing dynasties, there was a phenomenon of "The status change of culture and education" in spite of the obvious conditional differences, including the southern Jiangxi Province, where Confucianism prevailed in the south, and Nanyang Prefecture, Henan Province, the war-suffered area in the north, and Changsha Prefecture, Hunan Province, located in the north-south direction of the Central Plains, as well as the socio-economically and culturally prosperous Jiangsu region along the rivers and sea.¹²³⁴ These are discussions on the change and evolution of "culture and education" in the historical development of specific cities will help further demonstrate "The Status Change of Culture and Education". It is deemed as a major event

in the history of urban construction in China that can be exact presented with its regional performance in different regions.

The high development of the Yangzhou Prefecture in the Ming and Qing dynasties in terms of economy and culture, as well as the political opportunities of the emperor's southern tour in the Qing Dynasty led to the comprehensive development of urban culture and education. At the same time, it also makes the urban landscape show a strong cultural atmosphere with local characteristics. The current situation of the old city of Yangzhou has basically preserved the ancient city pattern of the Ming and Qing Dynasties, left with the rich historical relics in the urban area. More than specific environmental details, this provides a more solid spatial framework for the study of the Status Change of Culture and Education of the urban landscape in the Ming and Qing dynasties. Therefore, this work took the Yangzhou Prefecture of Ming and Qing Dynasties as the case analysis object, with a particular focus on the "The Status Change of Culture and Education". The concrete manifestation of this event is taken as the main object of discussion, including all types of cultural and educational buildings in terms of position, quantity, and scale. Landscape elements that have undergone better and greater changes may have a significant impact on urban landscapes and thus enjoy a more prominent position in the landscape.

2 The Concrete Performance of "The Status Change of Culture and Education" in Yangzhou Prefecture

2.1 Advancement of School's Location Value and the Expansion of Its Scale

During the Ming and Qing Dynasties, the school all over the country experienced an upsurge of construction. During this process, the number of schools increased and their scales expanded. Universally, there were a number of ceremonial functions added to these schools: Wenchang Pavilion and Kuixing Tower, Chongsheng Temple; Minghuan Temples and Xiangxian Temples, Zhongxiao Temples, Jieyi Temples and Jingyi Pavilion and so on.

Take Yangzhou Prefecture as an example. Compared with the school in Song Dynasty, there were 14 main buildings in the Qing Dynasty that were added in the Ming and Qing dynasties. In terms of overall scale, it also saw a greater improvement than Song and Yuan. In quantity, from the Song Dynasty to the Ming Dynasty, the school in Yangzhou was expanded from a state level to prefecture level, including two schools in a county.

In addition, the construction of the Yangzhou School always considered from the beginning of the site choosing the selection of places where the style of literature was flourished. At the beginning of the Ming Dynasty, the Yangzhou's prefecture-level school was established on the basis of the state-level school of the Song and Yuan dynasties. The prefecture- and county- schools are close to the river channel in the city and conform to their north-south distribution. On the one hand, it can be used to explore people's expectations for the continuation of the literary tradition, the spread of the context, and the prosperity of the imperial advancement. After the Ming Dynasty, this section along the rivers was respected as a "cultural context" in the folk, which confirmed the rationality of this consideration. During the Ming and Qing Dynasties, the positions of prefecture office, county office, prefecture school, and county school remained unchanged and were distributed in close proximity to each other, which together formed the heart of the ancient city as an urban center. From the above, after the Song and Yuan dynasties, the location of the school was relatively stable, and gradually gained better location conditions in the city construction. In the subsequent Ming and Qing dynasties, the layout of the adjoining school and the prefecture office was a reflection of the relative equality of the two places.

2.2 Increase in the number and size of academies

The academy is a cultural education workshop that combines private school and official school. During the Ming and Qing Dynasties, the background of the official schooling of the academy and the tremendous impetus of the non-prefecture forces were combined to make the academies in all parts of the country achieve great development.

The Ming and Qing dynasties were the heyday of the development of Yangzhou Academy. A large number of academies were newly built. In the Ming Dynasty, four academies were added. During the Qing Dynasty, there were five academies in the city. In terms of overall scale, the scale of the academies has been continuously expanded through the expansion and reconstruction of the entire building and the additional construction of facilities. By the Qing Dynasty, the three major academies of An'ding, Meihua and Guangling in the city had developed into famous academies inside and outside the province, paralleled to Jiangning provincial capital. In targeting the site, the Qing academies were relocated to move either from outside to inside the city or from the old city to the new city, or relocated to a place close to a major road, occupying a better location in the city.

2.3 Expansion of the content of cultural and educational facilities and the generalization of settings

(1) Wenchang Pavilion and Kuixing Tower

During the Ming and Qing dynasties, localities were extensively set up as venues dedicated to worshipping Wenchang Dijun and Kuixing (Wenchang Dijun is the emperor in charge of scholars in the world. The Wenqixing and Kuixing are the two generals of Wenchang Dijun.), such as Wenchang Tower, Wenchang Pavilion, Wenchang Palace, Wenchang Temple, Kuixing Pavilion, and Kuixing Tower, etc., in hopes of opening their grand cultural fortune.

In the Ming and Qing dynasties, there were 9 places built in the Yangzhou Prefecture for the special worship of Wenchang Dijun and Kuixing. Among them, there are detailed records: One was a prefecture-school Wenchang Tower, and it was built at the 13th ruling year of Ming's Emperor Wanli on the Wenjin Bridge east across the city's river; one was Wenchang Pavilion, built by the river outside the south gate of the city in the 34th ruling year of Wanli of Ming Dynasty; still another place was the county's Kuixing Tower, which is called the Siwang Pavilion. It was built in Ming's Jiajing at his 38th ruling year. These cultural and educational buildings were built either on river bridges, or on the side of a canal, or at street intersections. After the completion in the Ming Dynasty, whether it was used as a scene in a city or as a scenic spot, the landscape value was significantly improved. Some even became a landmark in the city and a popular place for public cultural exchanges.

(2) Sacrificial Temple

As an important means for Chinese traditional countries to control local societies, rituals have gradually developed as a form of education, namely, "Education in Sacrifice". Sacrificial offerings at Confucius temple are the typical practice of this "Education in Sacrifice" strategy. During the Ming and Qing Dynasties, the cultural ritual system of "education in sacrifice" was further developed and perfected. It gradually penetrated into the grassroots of local society as a kind of educational resources.

In the City of Yangzhou Prefecture, on the one hand, the number of such ritual temples increased substantially. According to statistics, apart from the temples set up in the schools and the academies, there were another 35 special temples and joint temples, which were additionally built during the Ming and Qing dynasties. On the other hand, the ritual content has been expanded. Following the three lines of "respecting the virtuous person, retribution, and the Taoism", the township virtuous people, prestigious officials, loyal ministers, dutiful sons, high-minded men and women of chastity could all be included in the list of the rituals. For example, there are ritual temples established for famous officials, township virtuous people and sons of filial piety at prefectural school in the city. There are temples set up for famous officials, township virtuous people, and persons of loyalty, filial piety and chastity in the county-level school.

(3) Wenfeng Pagoda

The significance of the Wenfeng Pagoda was constructed to enforce the local imperial examination success by changing the landscape pattern. During the Ming and Qing Dynasties, the whole society's enthusiasm for the imperial examinations made the Wenfeng Pagoda, a product of the imperial examination system, appear in various urban and rural areas. In the prosperous areas of southern Yangtze River, the construction of the Wenfeng Pagoda was particularly welcoming.

In the 10th ruling year of Ming's Wanli period, Yangzhou Prefecture built a Wenfeng Pagoda on the east bank of the canal in the south of the city. In the 8th ruling year of Qing's Emperor Kangxi period, it was rebuilt for an increase of nearly 5 meters. Wenfeng Pagoda is a beautiful and elegant building featuring the humanistic culture in both northern and southern China. The pagoda is a loft-style, made of a brick-wood structure, seven-story and eight-sided, at a height of 44.75 meters. On the top of the tower, one can take in the view of the prefecture city to the north. It is a bustling thoroughfare on the streets with row-by-story dwellings. To the South, one can take a long view on the sky and rivers, there standing three mountains on the other side of the Yangtze River.

(4) Memorial Archway

The archway is a kind of building featured with commendation, commemorative and signage functions. During the Ming and Qing Dynasties, its contents were expanded and new uses emerged. The archways related to the imperial examination and educationism have all been incorporated into the culture and education building system, including the identification archways of the culture and education building group such as the school and the academy; the subject archway honoring the imperial examination success, such as Sanyuan Archway; the honorary archway commending the official performance or loyalty of the officials¹; the good-manner archways

honoring people who followed ethical rules or had a good morality, such as Zhenliefang, Zhenjiefang and Xiaozifang.⁵

During the Ming and Qing Dynasties, the number of archways in Yangzhou precincts increased significantly in addition to the expansion of content, and among them, the archways for the branches and the reputed officials were widely set. According to relevant statistics, more than 80% archways in the Yangzhou Prefecture in the Qing Dynasty can be summed up as archways related to culture and education. Among them, there are approximately 51 branches archways and 14 honorary archways, which were mostly built during the Ming Dynasty.

(5) Official engraving workshops and folk bookstores

One of the important aims of ancient book engraving was for the spread and development of culture. In the Ming and Qing dynasties, official and private engraving books in Yangzhou were unprecedentedly developed. There were three official engraving agencies in the Prefecture City, and the office, school, and academy also produce the official engraving books. Judging from the engraving contents, the official engraved version covered various historical and cultural classics, historical records of local chronicles, etc. On this level, the official engraving workshops were of great significance in carrying forward historical culture, inheriting cultural classics, and transmitting local literature.

In addition, there were many bookstores in the city during the Qing Dynasty. Various kinds of books were imprinted by folk bookshops. By virtue of the powerful market circulation, they had a great influence on society. The engraved books, which were mainly engraved on the contents of enlightening reading books, popular history books, and books in associated with imperial examination preparation, were of great significance in popularizing knowledge, spreading culture, and improving people's quality and conservation.

The extensive distribution and influence of these official engraving and folk engraving workshops enabled the "book-printing workshops" to become an important type of facilities for the development of culture and education in the city of Yangzhou.

(6) Official and private library

The main function of the library is to collect and store books. During the Ming and Qing Dynasties, the importance attached to the collection of books by the rulers, the development of the book engraving industry, and the atmosphere of academic development, imperial examinations, and strong academic research made the Southern Yangtze area a flourishing collection of books. The significance of official library collections and private library buildings in terms of cultural values and social functions is more prominent, mainly due to their enhanced openness. The building of this type of library has gradually become one of the carriers of local cultural and educational dissemination due to the expansion of the "publicity" function.

During the Qianlong period, Yangzhou Prefecture built the official library of Wenhui Pavilion to collect "Siku Quanshu" and Wenhui Pavilion became the symbol of Yangzhou's urban cultural status at that time. Qianlong repeatedly asked Wenhui Pavilion to open its doors to Jiangzhe (both Jiangsu and Zhejiang provinces) scholars and stressed its cultural and educational significance. In addition, there were private library buildings with prominent "public" functions in the prefecture city, such as the Brother Ma's Book Collection Building and Ruanyuan's Library Building of Selected Works in Sui Dynasty. These book collectors opened their eyes to the public, being able to circulate private books by means of borrowing and transcription. Some private library buildings were widely open to literati and even became a "borrowing station" to benefit the locals.

(7) Private Garden House

During the Ming and Qing Dynasties, Yangzhou Prefecture built a large number of gardens, especially during the prosperity of the Qing's Qianlong period. Among them, a large number of private garden houses were built to serve the needs of the owner's own life. Also, they became places for literati leisure and poetry rallies, bringing a tremendous positive impact on cultural exchanges and interactions. These garden houses gradually developed into an important carrier for enriching the society and culture at that time, expanded as a regional type of cultural and educational facilities. Many typical representatives of private garden houses in the Prefecture, which were used by literati, poets and scholars, including Xiaolinglong Mountain Pavilion, Liyuan Garden, Yihong Garden, and Jiufeng Garden.

3 Influence of "The status change of culture and education" on the Construction of Urban Landscape Space

3.1 Effect on city's internal spatial form

Since the Ming and Qing Dynasties, Yangzhou Prefecture has formed the pattern of coexistence of the adjacent old and new cities with Xiao Qin Huai River as the boundary (Figure 1).

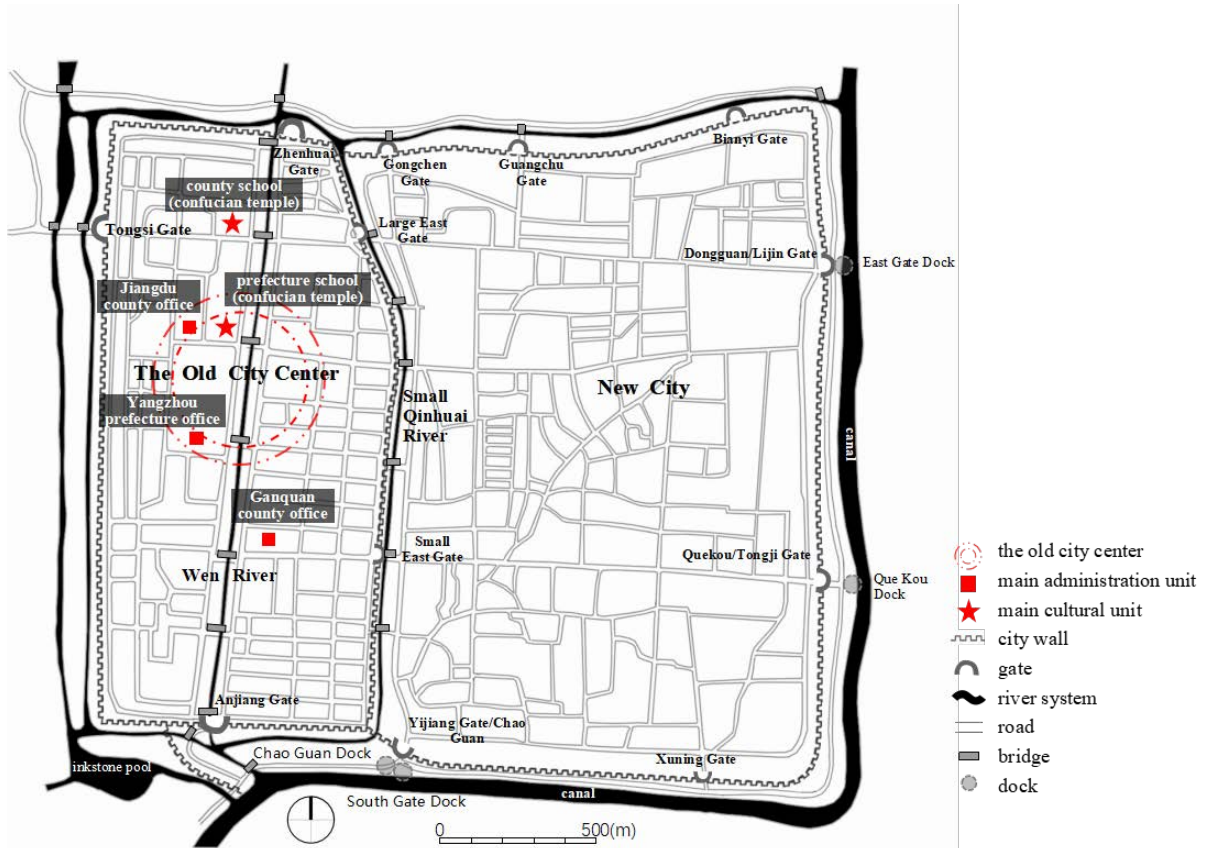

Figure 1: The distribution of the main culture and administrative units in Yangzhou Prefecture in Qing Dynasty. [painted by the author]

During this period, the rise and construction of cultural and educational buildings had an important influence on the shape and spatial pattern of urban internal space, mainly as follows:

Constructing an essential unit of urban spatial form

The cultural and educational buildings represented by the Campus (Confucian Temple), as an important functional building in ancient Chinese cities, became one of the important unit types for constructing urban spatial forms. In the Qing Dynasty, the main administrative units such as the Prefecture Office of Yangzhou City, Jiangdu County Office, and Ganquan County Office, and cultural units such as the prefecture's and the county's Confucian Temple are located near the central axis of the city formed along the Wenhe River in the old city. Cultural units and administrative units are close to each other and form the urban center together with the old city(Figure 1).

Strengthening the urban cultural landscape axis to form a cultural and educational center

Cultural and educational buildings may reinforce each other as landscape elements, echoing to form the center and axis, which enhances the cultural and educational influence of the urban landscape and shows its rise of status.

With the widening of cultural and educational buildings in the city, cultural and educational agglomerations have formed in some areas, forming cultural and educational centers in the old and new cities – the old city's collection of prefecture buildings and county campus, plus Wenchang Pavilion and Kuixing Tower, forming the cultural and educational center in the north of the city. In the west of the the new bridge, Wenchang Palace is the most solemn venue for the worship of Wenchang Dijun in the city and forms the cultural and education center in

the south of the city. The middle section of Dongguan Street in the new city is dominated by Anding Academy and Guangling Academy to form the cultural and education center in the new city. The layout of cultural and educational buildings along Wenhe River has allowed the main cultural landscape of the city to extend from the north of the city to the south of the city(Figure 2).

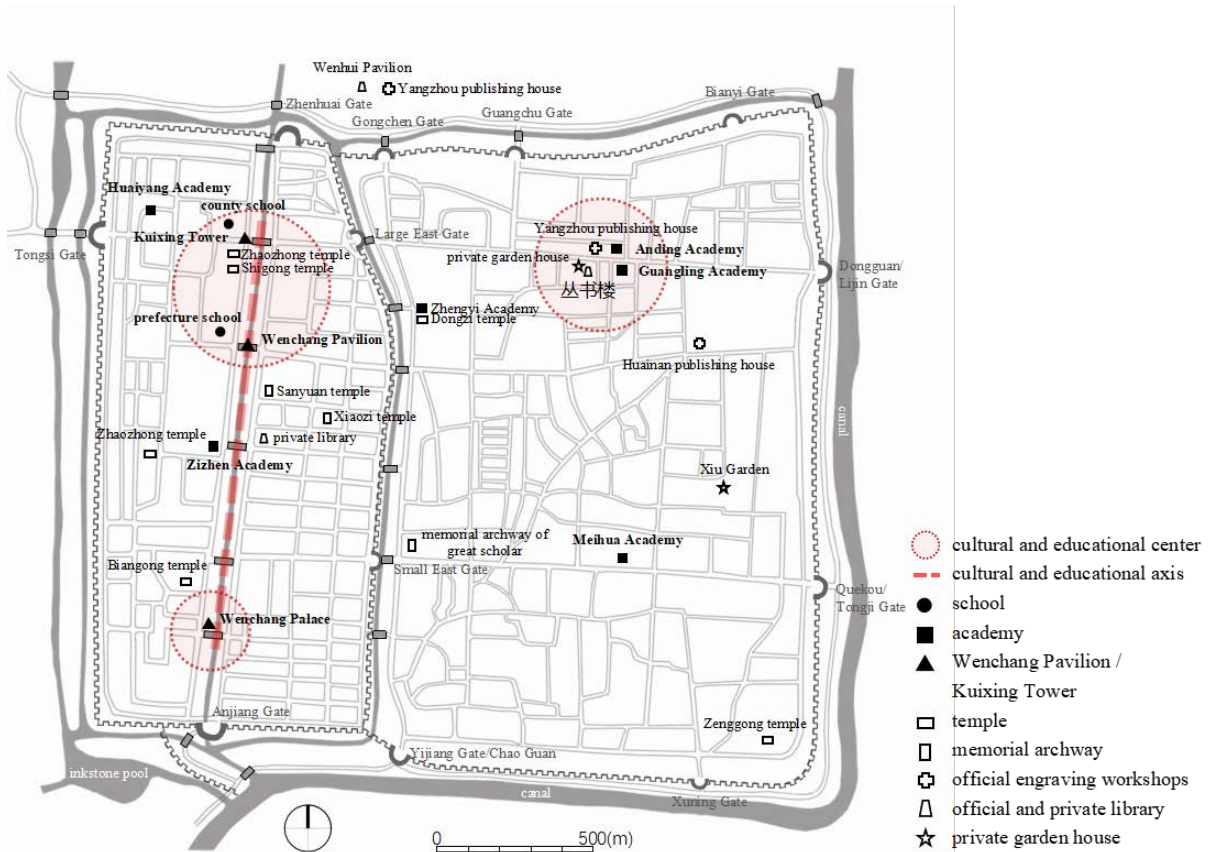

Figure 2: Distribution of main Cultural and Educational buildings and facilities in Yangzhou Prefecture in Ming and Qing dynasties. [painted by the author]

Impact of urban landmarks on the overall pattern

In the process of the extensive addition of cultural and educational buildings in Yangzhou Prefecture, many landmarks were created, affecting the layout of the city's overall nodal space. The seven major landmark building nodes within the city wall all have certain control over the spatial pattern of the city in terms of volume and height. Among them, the Wenchang Pavilion and Kuixing Tower newly built in the Ming Dynasty became the two node spaces of the old city. This, together with the large and small East Gates at the junction of the new and old cities and the three gate buildings of the new city, forms a roughly balanced distribution pattern in the central area of the city(Figure 3).

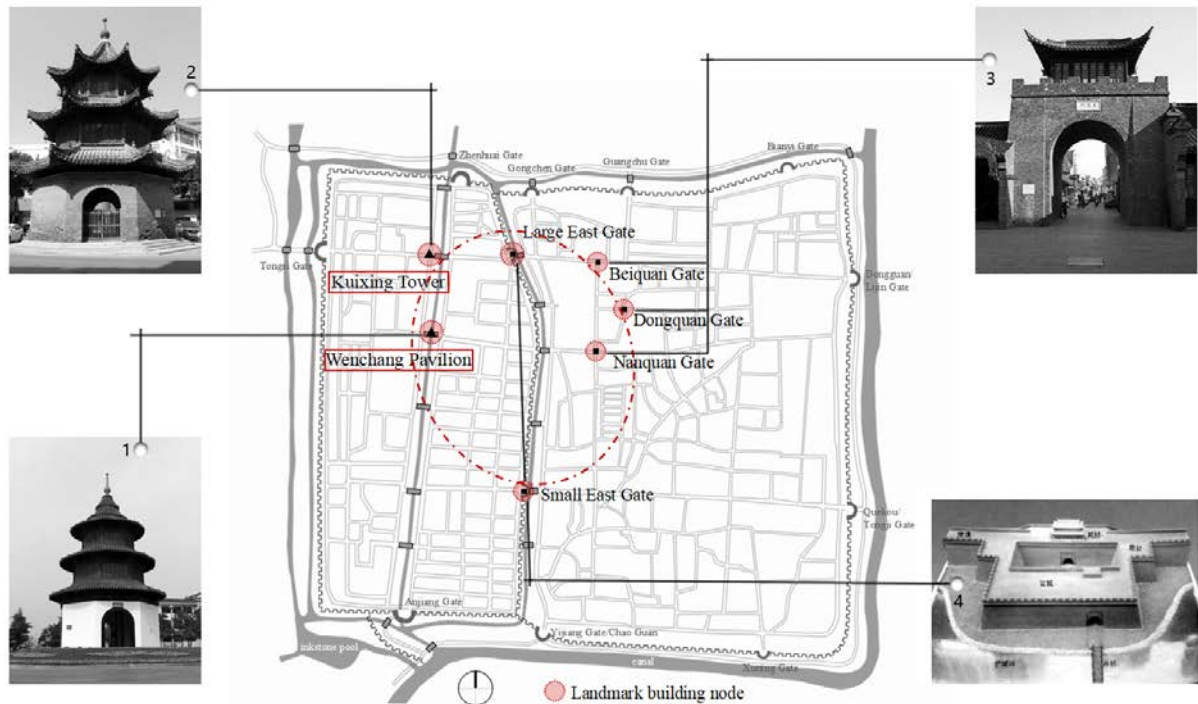

Figure 3: *Spatial distribution of the major landmark building nodes in Yangzhou Prefecture in Qing Dynasty : 1.Wenchang Pavilion. 2.Kuixing Tower. 3.Dong/Bei/Nan Quan Gate. 4.Large/Small East Gate. [painted by the author]*

3.2 Expansion of the spatial scope of the overall urban landscape pattern

The various landscape elements such as gardens, waters, and mountains in the suburbs of Yangzhou Prefecture work as a driving force to expand the overall landscape space of Prefecture to the periphery. In the landscape space that is composed of such a city and its suburbs, the ritual temple and Pingshan Hall are built on the top of the mountain in the northwest of the Lugang Mountain and the Wenfeng Pagoda is located on the east side of the south bank of the canal. Because of their location and their own height advantages, they have become elements that have a definite meaning in the landscape pattern.

In the Qing Dynasty, the landscape space of Yangzhou Prefecture and its suburbs formed a close connection under the series of water systems. The space environment distributed by culture and education buildings can be roughly divided into three regions(Figure 4):

First, in the Prefecture, the cultural and educational space is dominated by campus, academy, Wenchang Pagoda and Kuixing Tower.

Second, the suburbs of the northwestern region: cultural and educational spaces are mainly sacrificial temples and garden houses. Through the connection of water systems, the urban landscape space is expanded to the northwest. In addition, Pingshan Hall, located on the hill of Mt. Shugang, was rebuilt in the Ming's Wanli period and became an attractive spot for literati and poets. As a landscape element, it relied on the location and height of the middle peaks of Mt. Shugang, and shaped the nature of its landmarks. At the same time, it is associated with the sacrificial temple of the western peak, forming an architectural identity in the cultural and educational aspects above the level of daily life in the suburbs.

Third, Canal in the south of city: This is a cultural and educational space led by Wenfeng Pagoda and Wenchang Pavilion. The longitudinal cultural and educational landscape axis formed along the Wenhe River in the city is extended further southwards: Kuixing Tower, Wenchang Pagoda in the Prefecture City, and the Wenfeng Pagoda by the canal in the south of city, have become a visual focus of the landscape pattern in height and form, thus forming a sequence of north-south landscapes across the city walls.

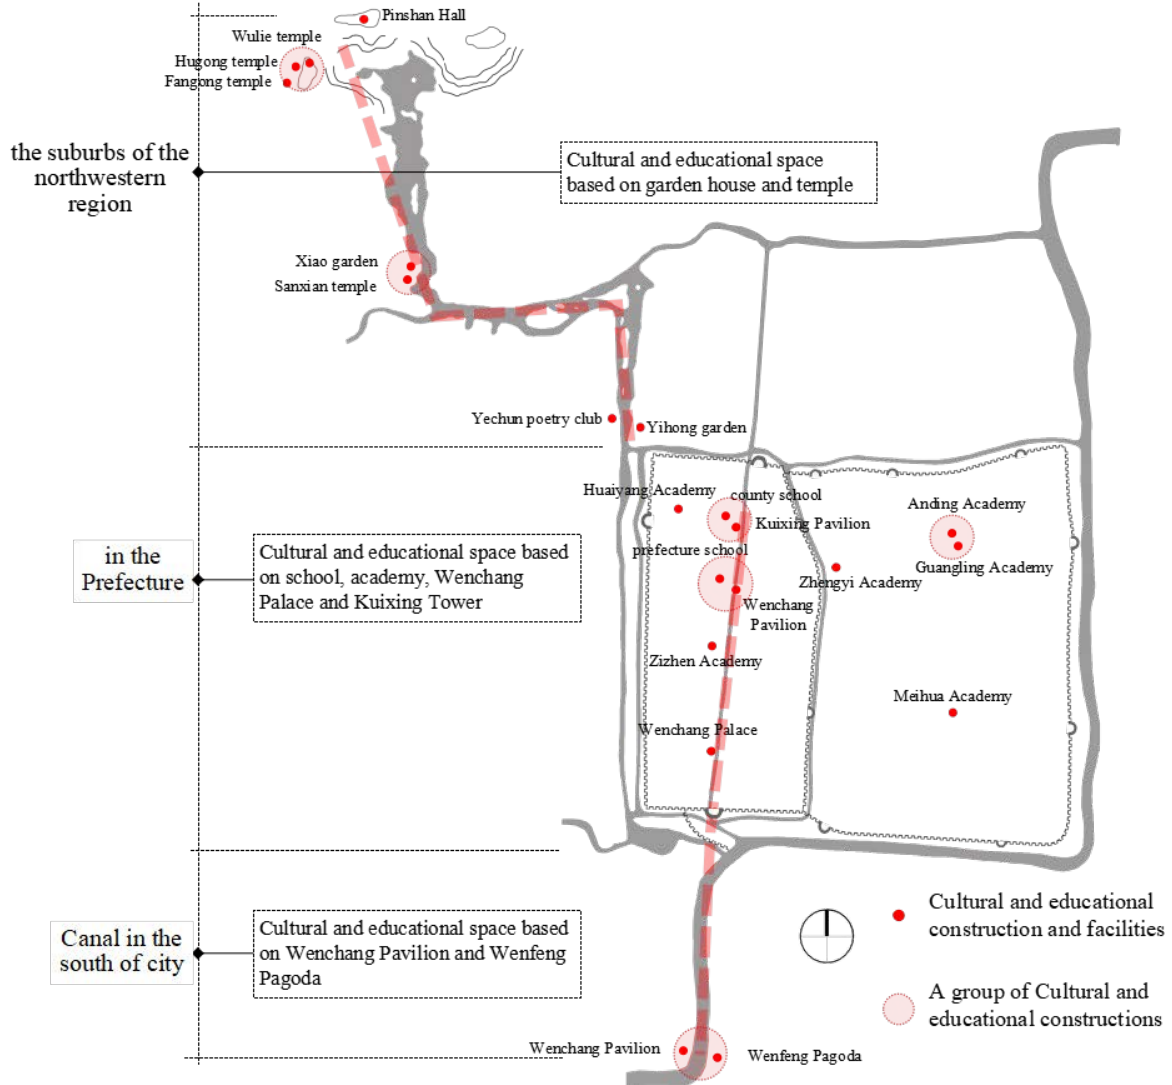

Figure 4: *Distribution of main Cultural and Educational buildings in the Yangzhou city and suburbs in Qing Dynasty.* [painted by the author]

It can be seen from the above that the cultural and educational building system has played an important role in defining the scope and the influence pattern in the construction of urban and suburban landscapes. An overall landscape structure has formed with the Prefecture as the center, extending along the water system to the surrounding suburbs.

4 Conclusion

Since the Song and Yuan Dynasties, people's recognition of emphasis on "culture and education" have continued to be intensified. Cultural and educational architecture related to imperial examination and social education was flourished in urban construction. During the Ming and Qing Dynasties, the main manifestations of the discoveries in Yangzhou prefecture: In terms of the location and its distribution, the campus occupied a superior position; and the academy was relocated to show the significance of having a better place ; other types of cultural and educational facilities were widely distributed in the city. In terms of quantity and scale: the number of campus and academies increased. This was accompanied by an expanded scale and the sacrificial content increased. There was a trend of diversification in the types and contents of cultural and educational building systems, including Wenchang Pavilion, Kuixing Tower, and Wenfeng Pagoda. In addition, new cultural and educational facilities emerged, including various types of sacrificial temple and memorial archway related to imperial examination and education; official engraving workshops and folk bookshops played an important role in the spread of culture and mass education; and some official and private bookstores exhibited more "public" functions; also, some became private garden houses that carried forward the city's rich social and cultural heritage. All these phenomena eventually led to a significant increase in the status of culture and education

buildings in urban and regional landscapes, which affected the internal spatial forms of the city and formed an extension of the spatial scope of the overall landscape. The whole city of Yangzhou presents a landscape with a strong cultural atmosphere with local characteristics.

Historical Mapping of the Urban Form and the Spatial Power Distribution in Capital Jiankang in East Jin Dynasty

ZHENG Chenwei*

* *PhD Candidate, Southeast University, Nanjing, China, zhengvivi@msn.cn*

The Aristocratic Families, which had both political and economic privileges in early Imperial Ages of China with multiple generations working as government officials, had collectively become a core group of East Jin regime. As an important part of the etiquette system under central governance, the capital Jiankang served to display the legitimacy of the regime and to maintain the operational functions of both the nation's apparatus and the city itself. By using Urban Historical Mapping and Geographic Information System as the methods of the spatial power distribution analysis, this paper focus on the distribution of core capital facilities including worship, administration, military and residence, and also the social status of their users. To conclude, the usage of capital space is a representation of the complex relationship and co-dependence among royalty, aristocratic and plebeians. The area inside the capital city wall is an outstanding space for the privileged class as well as the important representation that the aristocratic class joins the core of national powers. And the aristocrats were spatially distributed spread surrounding outside the capital city rather than congregated in one particular area, which made it easier to form their own power centers, leading to threats to the authority centralization.

Keywords: Historical Urban Form, Ancient Capital, Jiankang of East Jin Dynasty, Spatial Power Distribution, Etiquette System.

1. Background

1.1 Etiquette, Power and Capital Space

Etiquette originates from the sacrifice culture with worship for ghosts and gods in the agrarian society, and aims at "regulating the differences and orders of objects"¹. The ancient etiquette had been established to serve feudality to public's thoughts and behaviours since Zhou Dynasty, it is a symbolisation of authority and power. The continuous reorganization and reestablishment of etiquette to adapt different regimes enable it to be implemented as the framework and foundation of Chinese ancient social estate through the history.

Refer to the discussion on capital power space under the background of Chinese historical period, the core issue should be the characterization of etiquette system on physical spatial form of ancient capital. Inquiring into the spatial power distribution in ancient Chinese capital can start from the social hierarchy represented by the users of different physical space. Both mutual agglomeration and exclusion of space represent the social relationship of users. As an important constituting part of the etiquette system, the most important duty of capital is to symbolize the legal nature of divine regime, to guarantee the political functions for the operation of state machinery and maintain the social functions for city operation.

1.2 The Origin and Emigration Distribution of Aristocrats in the Period of Eastern Jin Dynasty

Shi originates from a social class under patriarchal system in ancient Chinese feudal society in the period of Shang and Zhou Dynasties. The core of the patriarchal system is primogeniture, which is featured in complete consensus of patriarchal and political hierarchy. Under such system, the feudalism society is divided into six classes including the emperor, leud, high ministers and nobles, *Shi*, plebeian and slaves. *Shi* is the aristocratic class of the lowest level, mainly consisting of retainers of high ministers and nobles. And only aristocratic children including *Shi* had the opportunity to learn knowledge. After the end of the Spring and Autumn period, *Shi* gradually became the collective name of intellectuals in the ruling class.

By the period of the Western Han Dynasty, the emperor chose Confucianism as the monopoly and established Imperial College in capital Chang'an as the highest learning institution, aiming at cultivating and training a large batch of talents who firmly established the concept of Confucianism, nation and patriarchal clan system so as to fulfill the bureaucracy of each level. The aristocratic and bureaucratic children were able to become nobles and officials due to acceptance of the best official education or were promoted to be officials through the selection

system of talents by nobles. Meanwhile, the ancestry was maintained through forbidding marriage between Shi and plebeian and such a privileged class like aristocrats gradually formed after years.

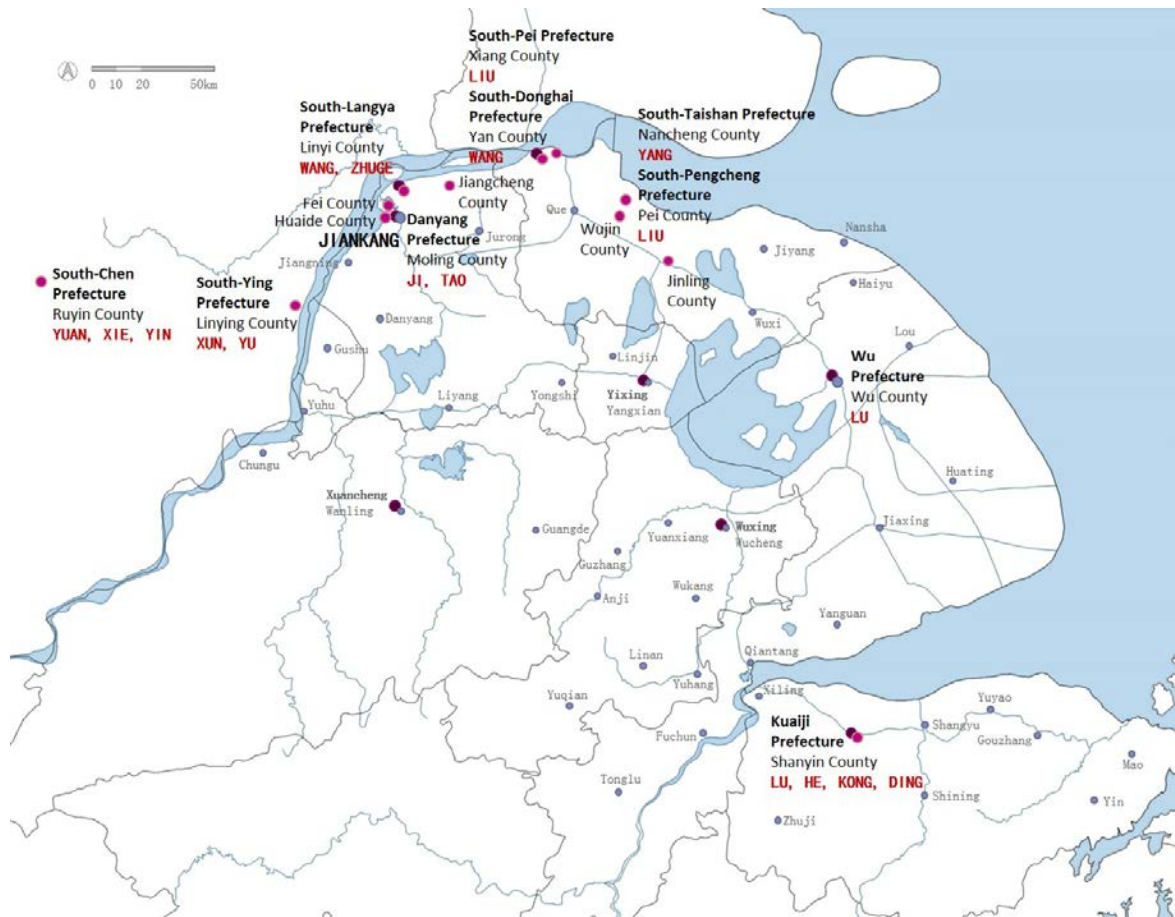

Figure 1: *Distribution of Emigration States and Counties of Aristocrats in East Jin Dynasty* [self-made]

After the imperial clan of Jin Regime gave up large part of northern territory and emigrated southward along with large amount of population, the reconstruction of central regime in Jiankang depended on the power of southward-emigrated aristocrats and local aristocrats to a great extent. Thus, the status and privileges of aristocrats reached an unprecedented height, which was represented in the dominating position in politics. There were 47 aristocratic clans with high status in East Jin Dynasty, including 9 local aristocratic clans and 38 southward-emigrated ones. And there were 84% of the southward-emigrated clans whose original households were in the area north to Mount Qingling and Huai River, majority of which is from today's Henan Province and Shandong Province. The Eastern Jin Government established Immigrant County for the immigrants' settlement. The immigrant counties of southward-emigrated aristocrats were mostly set up closer to the capital, to today's Zhenjiang and Changzhou along the Jiangnan Canal eastward and today's Hefei and Hexian areas westward. Simultaneously, the local aristocrats mainly came from Danyang, Wu and Kuaiji Commanderies. (Figure 1)

2. The Distribution of Capital Politics and Etiquette Core Area as the Representation of Divine Regime

2.1 The System and Structure of City Walls

As the southward-emigrated capital, Jiankang of East Jin Dynasty, is treated as the temporary capital in order to honor the old capital Luoyang of the West Jin Dynasty. The siting of central urban area and the construction of urban artificial water network had accomplished during the previous period of Sun Wu. In urban form, with reference to Luoyang in the Wei and Jin Dynasties, Jiankang combined the original pattern of three palaces and one garden of Sun Wu and reformed to the purer form of a single palace. In other words, the forbidden garden, the palace and the imperial street were arranged from north to south, all on the south-to-north axis of the capital. There were huge differences with the multi-palace system of northern capitals in the period of Qin and Han Dynasties,

acting as the symbolization of centralized kingship and profoundly influencing the later capital form. The axis of the capital did not apply the north-south direction required by ancient etiquette, but in the direction 25° north east, aiming at corresponding to the trends of regional mountains. The axis of the capital pointed straight through the middle line of the double peaks of Mount Niushou², which exactly represents the adaptation to local conditions of central etiquette system in Jiangnan Area.

Another important element that originated in the East Jin Dynasty was Fence Gate. Though lacking defence effects, it marked the division of outer capital city and suburbs with etiquette spatial division significance. The historical document mentioned 56 fence gates³, of which only 17 of them can be located. And these fence gates generally defined the range of capital of Jiankang into the approximate elliptical region that was longer in south-north direction and shorter in east-west direction, relatively clearly with an approximate area of 23km².

Within the range of outer capital city, with the capital city and palaces as the core, each military castle including Ye Castle, Xizhou Castle, Dongfu Castle, Danyang Commandery Castle, Yue Castle and East Ye Castle, was distributed on the either side of Qinhuai River south of the capital. Outside the outer capital city, there were Stone Castle, Baishi Fortress and Xuanwu Castle defending the nearby suburbs and Bai Castle and Jin Castle in the northeast and Xinting Fortress in the southwest in the remote suburbs, through which the defence system by multiple sub-cities of the capital was formed. (Figure 2)

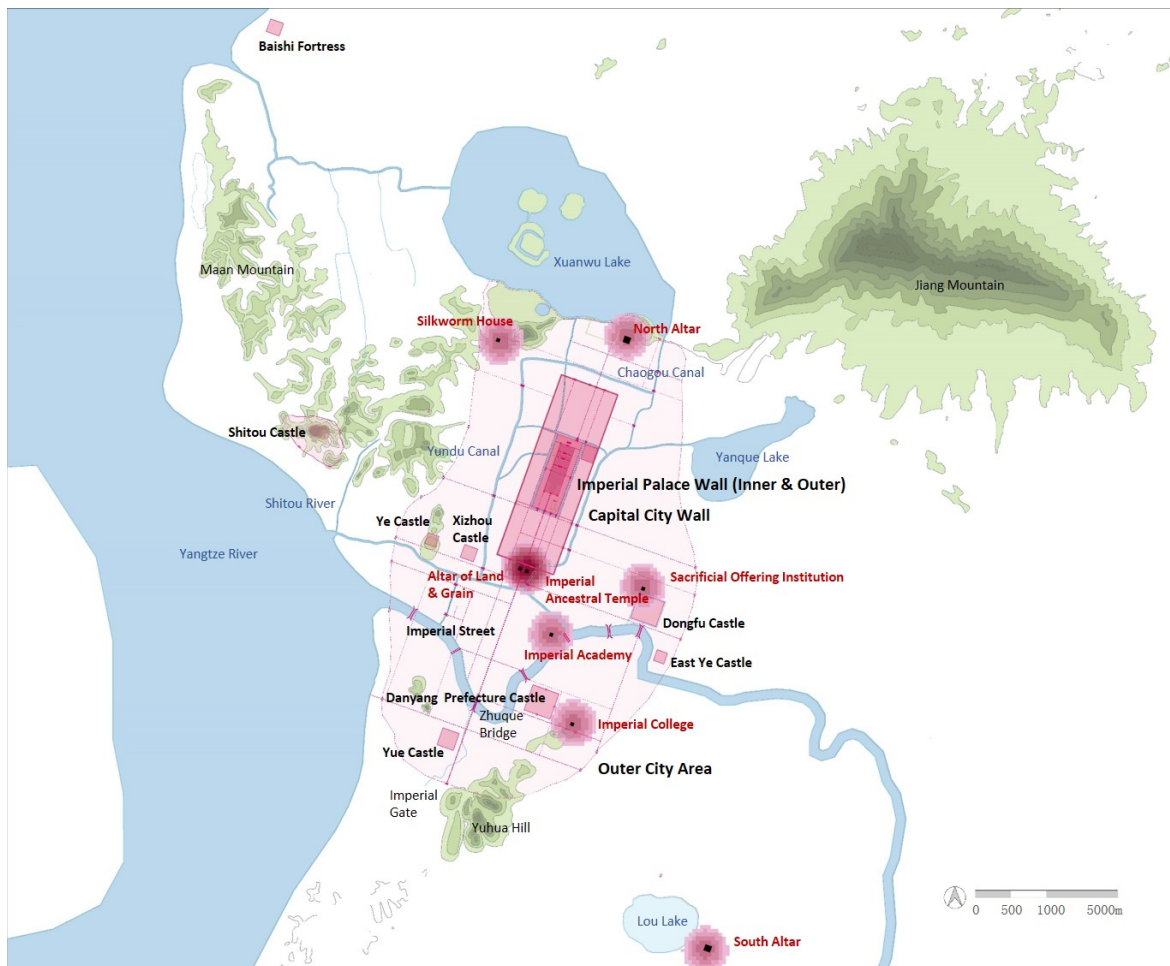

Figure 2: *Jiankang City Wall and Kernel Density of Sacrifice Facilities Distribution in East Jin Dynasty* [self-made]

2.2 National Worship Ritual

The national worship ritual originates from ancient sacrifice rituals with the nature of witchcraft. After the establishment of emperor system in Qin Dynasty and Confucianism as a ruling foundation in Han Dynasty, the worship ritual was reformed and determined to serve the purpose of stabilizing central regime⁴. It includes sacrifice to heaven and earth which represent the chief gods of traditional Chinese mythology, and ghosts sacrifice which represent the ancestor worship. The sacrifice facility symbolizes the legitimacy and divinity of the regime, serves critical etiquette functions of the capital. The main users of these facilities are the emperor and the empress.

In national sacrifice events of chief gods, the specification in West Jin Dynasty was inherited to simplify the four suburb altars (Round, Square, Heaven and Earth) into two (Southern and Northern)⁵. Such a simplified altar system exerted huge effects on the later dynasties. However, due to limited resources during East Dynasty, at first only Southern Altar was set in the southeast suburb for combined sacrifice for heaven and earth, and later Northern Altar was solely set for earth sacrifice. Secondly, The Imperial Altar and Imperial Ancestral Temple were set on east and west sides of Imperial Street outside Gate Xuanyang for land sacrifice and royal ancestor worship respectively. And according to *The Rites of Zhou*, the emperors should farm in person to honour the ancestor peasants and their empress should lead the noble women to feed silkworms in order to encourage farming and weaving. Though royal field was not implemented in East Jin Dynasty, silkworm temple was set in the south of Mount Jilong to sacrifice for the silkworm god. Besides, the Imperial College, Xuanni Temple are the symbolization of Confucianism monopoly for combination of politics and education. Additionally, Bureau of Sacrificial Offerings located in the north of Dongfu Castle.

3. The Combination of National and Urban Functions-Distribution of Capital Administrative and Military Facilities

3.1 Distribution of Administrative Facilities

(1) The Central Government Facilities and Powerful Ministers under the Pattern of Three-Department System

Since Qin Dynasty, system of Three Dukes and Nine Chamberlains was implemented in the central administrative authority. The official system based on such a basic structure developed into Three-department System in order to restrict the power of Counselor-in-chief in the period of Wei and Jin Dynasties. The Three Departments including the Department of State Affairs (*Shang-shu sheng*), Secretariat (*Chung-shu Sheng*) and Chancellery (*Men-hsia Sheng*) are established to take charge of drafting, approving and executing the imperial orders respectively. In that way, the executive and military power of the officers in Counselor-in-chief level can be decentralized by different authority structure.

According to spatial distribution, the three departments are the central political facilities with the closest connection with the main palace hall. From the perspective of specific functions, the central political facilities were divided into two parts, the inner court and the outer court through the tight combination of political discussion places of different levels and corresponding institutions of political affairs. Taiji Hall, as the absolute centre of the imperial power, is located inside the internal palace walls. Its main hall serves for grand ceremonies while its eastern and western halls serve for common audiences⁶. The Secretariat and Chancellery, the central government agencies that are the closest to the emperor, correspond to the Eastern Hall of Taiji Hall for the emperor's daily life and political discussion. These two institutions are set in the south of Taiji Hall inside the internal palace. On the other hand, the Assembly Hall as the place for officials' daily discussion is located directly inside the Department of State Affairs in the southeast part of external palace. The political affairs will firstly be discussed in outer court, and later intimate ministers go inside the internal palace to report to the emperor. Accordingly, the imperial decrees are composed with inner court and later delivered through the outer court to the subordinate departments.

The power of the original nine chamberlains have declined due to the setting of the Department of State Affairs and Chancellery. These national official institutions separately belonging to each functional department are southward distributed inside the capital city wall along the both sides of Imperial Street in front of Palace Gate Dasima⁷. Though their functional rights are weakened, their position as a central administrative facility under the Three Departments remains, which guarantees the implementation of national administrative functions of the capital.

Nevertheless, the official rank of the directors of the three departments (Palace Attendant, Minister, Director of the Secretariat) are actually as limited as the third grade and all of them occupy non-military positions. In East

Jin Dynasty, only the first grade officials are in the level of Counselor-in-chief. There were 63% officials from aristocrats and another 28% officials from the royal and noble families in the 32 first class officials. Most of these first grade officials are military officers and in the meantime hold concurrent posts of the overseers or supervisors in the Department of State Affairs and the Secretariat. Therefore, these officials are the actual powerful ministers of the highest level who hold the main powers of both military and political affairs.

Figure 3: *Kernel Density of Administrative Facilities Distribution of Jiankang in East Jin Dynasty* [self-made]

(2) Local Official Institutions and Local Governors

The local official institutions of East Jin Dynasty mainly include regional, commandery and county government. The nature and responsibilities of capital Jiankang's local official institutions are relatively special, especially in the Regional Government of Yangzhou and Commandery Government of Danyang. Yangzhou Regional Inspector, as the first-class local official who takes charge of the function of supervision, owns the higher level than other regional inspectors. Danyang Governor, as the chief who protects the capital and its environs, takes charge of military powers, civilian politics, appointment and criminal litigation. Both lead armies and take part in the state affairs. Ministers at the level of Counselor-in-chief usually hold the concurrent position of Yangzhou Regional Inspector with longer term. There was only one who came from the royal family while the others came from aristocratic families in the 15 Yangzhou Regional Inspectors in total. Yangzhou government was firstly set in the Xizhou Castle and later transferred to Dongfu Castle. Danyang Governor led eight counties in the capital and its environs with shorter terms. There were 33 governors in one dynasty, 73% of which were from aristocratic families. The government of Danyang Commandery was set in the southeast of Qinhuai River. It can be seen that these powerful ministers who held the concurrent position of Yangzhou Regional Inspector, such as Wang Dun, Wang Dao, Xie An, lived outside the core state affair area spatially but inside the sub-city defence

system around the capital with armies. As they defended the capital, they also formed their own power centres. (Figure 3)

3.2 Military Facilities

The overall structure of armies in East Jin Dynasty can be divided into the central imperial guards and local forces. The capital took the central armies as the main military power to defend the core area with assistance from local armies to maintain public security of the capital city. From the aspects of the forms and types of military facilities, the castle and the military headquarter demonstrated the highest defence level, followed by the local army institutions while ramparts and army shelters in comparison have a lower defence level.

The Commandant General and Protector General were the supreme generals of central imperial guards in East Jin Dynasty. The armies inside the capital city, the palace and the halls were led by the Commandant General. The praetorian guards who followed the emperor occupied the most central position and were stationed in Left Guard and Right Guard in the Internal Palace. The Capital City and Palaces themselves were castles with the highest defence level, located at the central position of the city area to protect the royals and national core facilities. The Protector General led the central armies stationed outside the capital walls. The mansion for Protector General was located outside the West Fence Gate together with Stone Castle. Stone Castle is the most important castle near the capital, occupying the highland next to the Qinhuai River mouth to Yangtze River, serving as the western capital entrance and the major garrison of capital navies. Its strategic position is as important as that of the capital city, and was guarded by Protector Generals concurrently⁸. There were 51 army generals in East Jin Dynasty, including 78% from aristocratic families and 4% from the royal family. There were 29 Commandant Generals, including 86% aristocratic family members and 7% royal family members. Of the 22 Protector Generals, 68% were from aristocratic families and 32% were plebeian. It is clear that the aristocratic families were in an absolute advantageous position in both the central armies and armies defending the core area of capital city and palace.

Also, the capital was in the jurisdiction of Yangzhou Regional Commander-in-chief and Inspector-in-chief. The official of Danyang Commandery also mastered the military powers of the capital and its environs, which has been demonstrated in detail in 3.1 above. As the first county of the capital, there were seven county defenders who took charge of district security inside the capital walls and eastern suburbs in Jiankang County. Additionally, White Castle, Linyi County, Jiangcheng County, Jiangning County, Hushu County in the remote suburb all served as the defence with armies for the capital. (Figure 4)

Figure 4: Kernel Density of Military Facilities Distribution of Jiankang in East Jin Dynasty [self-made]

4. Distribution of Capital Residential Neighborhoods and Celebrity Mansions

Li (Urban Neighborhood) in Jiankang is the first implementation of the *Lifang* Neighborhood System in Jiangnan Region. The majority of the residential neighborhoods of Jiankang were located inside the fence gates and showed clear tendency of dense distribution close to both banks of Qinhuai River in the southern outer-city. There is no apparent separation between the mansions for royal families and officials and the living places for plebeian in the southern outer-city. Meanwhile, there were more mansions and gardens for royal families in both east and west areas to the capital city. The only *Li* outside the fence gates was located south to Mount Jiang in the eastern suburb, serving as the proof for eastward extension of the capital. (Figure 5)

Figure 5: Kernel Density of Li (Neighborhood) and Celebrity Mansions Distribution of Jiankang in East Jin Dynasty [self-made]

5. Analysis on Power Spatial Distribution of Jiankang of East Jin Dynasty

It can be deduced from the analysis above that the aristocrats made up the majority of officials in the capital, especially on the executive level. Thus, the capital administrative facilities were regarded as the space used by the aristocrats in this paper. Each functional facility inside Jiankang of East Jin Dynasty is re-classified according to the social level of its users, from which the power space of three types including the emperor and royal members, the aristocratic officials and other plebeians, can be identified. The results of overlaying the spatial distribution kernel density analysis are as shown in Figure 6. It can be seen that the areas inside the capital walls of Jiankang of East Jin Dynasty are only for the royal family and the aristocrats. However, the palace is not the exclusive space for the royal family, except the northern living palaces in the internal palaces and royal gardens which are strictly exclusive for the emperor and his relatives. The internal palace and the southern external palace are the space for the aristocrats who serve as the close ministers for the emperor. There are differences as well as certain consistency in the distribution of use space of each class outside the capital walls and inside the range of fence gates. There is generally no facilities between north to Nanheng Street in the palace and south to Chaogou while there is space for each class distributed in the Chanlingzhu Area north to Chaogou in the southern Ye Castle and the area south to Qinhuai River. The class of plebeians were the main occupants of the southern area of Qinhuai River while more of the royal and noble families were at the royal street outside the south gate of the capital and the southern Ye Castle. The distribution of space for the aristocrat class outside the capital or even outside the range of fence gates is relatively even, scattering circularly outside the capital. (Figure 6)

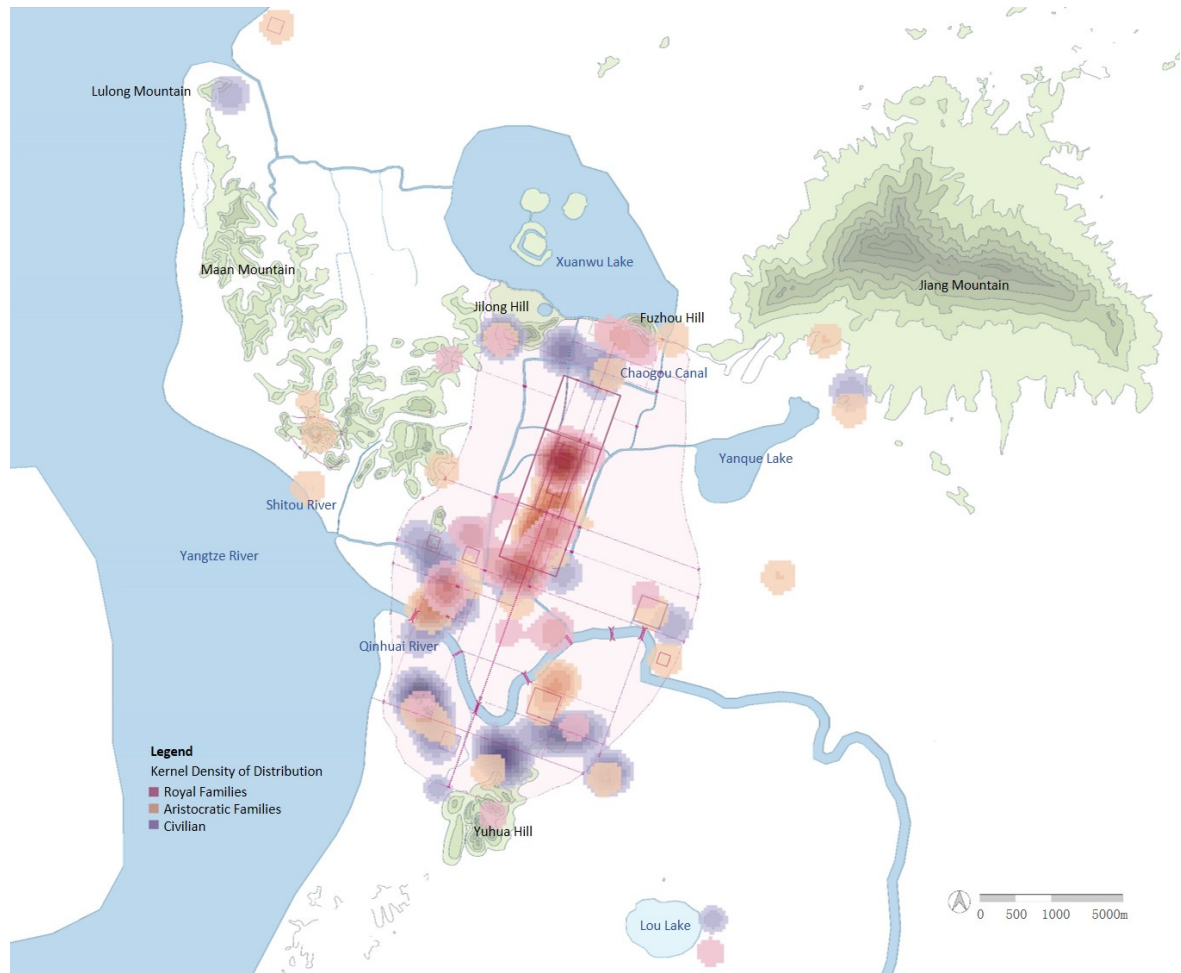

Figure 6: *Power Space Distribution of Jiankang in East Jin Dynasty* [self-made]

To conclude, the different usage of urban space by users from different social and political stratum is a representation of the complex relationship and co-dependence among the imperial family, the aristocratic families and the plebeians. The area inside the capital city wall of Jiankang stands out as the space for the privileged class as well as the important representation of the aristocratic class being part of the core national powers. As to the area outside the capital city wall, the middle axle district along Imperial Street is the space for the privileged class while there was no apparent spatial division in other areas. The class of plebeians was distributed more in the area south to Qinhuai River while the space for the aristocratic class was evenly distributed surrounding the capital, which made it easier to form their own power centers, becoming to threats to the central power.

Research on the plan forms of traditional villages located in Yangquan city of Shanxi Province in the view of mountain and river

Minghao Zhang (China University of Mining and Technology), Fang Bin Liu (China University of Mining and Technology) and Fangyu Zhang (China University of Mining and Technology)

Yangquan, a major core city is located in the east of Shanxi Province in China. Once this city had a glorious future due to the huge capacity of coal, but now it is decaying also due to the empty of coal. Recent years there were 12 villages in this city area which were ranked to the national traditional villages, that was seen as to be another opportunity for the development of this city.

Although these 12 traditional villages were located in the rural area which were very poor now, but once most of them were rich or glorious in local history. Most of them were surrounded by the mountain of Taihang and the rivers embraced the villages or be across the villages. Due to the important state of the location, some villages played an important role in local business, especially the village on the post way to outside. Meanwhile, most of villages also regenerated by itself step by step and the form of village also changed slowly with the regeneration. So the research on the village form is very important for the later development of these villages, such as the protection, reconstruction and regeneration. The author think that every one of these 12 villages was formed with its special different environment, because the ancestors of these villages would consider the whole situation of mountain and river when they built their villages in the view of traditional aspect in China. Based on the comparing the forms of these villages, this article focuses on the different characters of these forms in these villages. What's more, the author is interested in the elements which influenced the form of these village based on the whole situation of mountain and river. Finally, this article will analysis the social and economic function that change the forms of these villages.

Research on the Form of Clan-Organized Settlements in Southern China: Based on the “Space-Society” Theory

Yuanyuan Gu (Chongqing University) and Zhong Xing (Chongqing University)

The specificity, formidability and continuity of the clan-organized settlements in rural Southern China drew lots of attention from sociologists, but the research of the form study and the interaction between form and social structure haven't got acceptance from mainstream academia. The research tries to take the space-society theory as the foundation and the case study of Dongli Village and Huayao Village in Shantou City, establishes the connection between the social structure (family-clan) and the spatial form (housing-settlement): the individual dwelling of the core family → the mansion of the big family → the settlement of single clan → the co-settlement of several clans, to outline a typical path of the spatial representation of the Clan-State co-producing structure and interpret how space materializes social system. Firstly, the prototype of individual dwellings of rural Southern China shows high similarity with traditional houses of central China. However, different from the rest, the structure of the prototype extends to the level of the settlement. Next, the order embodies in the domination of ancestral hall over the settlement. Relied on the conception of ancestral worship, the community constructed a spatial hierarchy of faith → reality. Thirdly, the highly closed consanguineous bond power system results in the closeness of the space. The boundary keeps expansion both forms and functions, from wall to ditch, and supplemented by the spiritual boundary composed by a series of gods and ghosts. All the spatial representation reveals that the migration from the north always tried to emphasize the legitimacy of their identity by actively imitating the official ideology and constructing their settlement as the symbol of the state's mainstream value and keeping the members of the clan domesticated in the ideal space. Hence, the social structure and the spatial form in rural Southeastern China connected by the co-producing structure. After inducing the prototype, structure and elements of the settlements, the research keeps on inquiring into the interactive relationship between the practice of clan power and the construction of the space and the institution by virtue of power theory of Foucault, and finally, raises a hypothesis of power-time-space unity to explore the formation mechanism of clan-organized settlements and the regional reconstruction in Southern China during the dynamic procedure of state – grassroots' governance throughout a series of comparative studies.

The Cultural-Ecological Mechanism of the Urban Space Sustainable Development by the View of the Spatial Perception Logic

Yunying Ren (Xi'an University of Architecture and Technology), Xiaochen Wu (Architecture College, Xian University of Architecture and Technology) and Chao Chen (Architecture College, Xi'an University of Architecture and Technology)

With the development of globalization the conflict between with the ecological carrying capacity and growth limits, the development of urban space is in the passive circulation with the Ecological capacity -Development limit and Social technology-Decision making at present. Undoubtedly, it is the essence of the sustainable development of human settlements either to passively deal with the development or the shrewd decision of cultural self-discipline beyond reality. On the one hand, with the improvement of technology and the strengthening of control ability, human consume natural resources, break through ecological capacity or resource limit and move towards alienation, namely, the constraint mode controlled by Ecological capacity-Development limit. On the other hand, urban space adapted to different periods of cultural, institutional, spiritual and material functional needs, but also restricted by the corresponding values and cultural concepts in the process of development and Self-renewal, it shows the self-discipline mode of seeking the harmony and balance between the ecology, society and economy. Correspondingly, urban space development is under the interaction of culture and ecology, society, economy and politics, thus forming the corresponding cultural ecological system, that is, the essence of sustainable development of urban space under the culture-ecology mechanism. The investigation introduces the concept of cultural ecology based on the interdisciplinary methods of cultural ecology, system dynamics and urban-rural planning, focuses on the integration of urban space cultural elements, constructs the cultural-ecosystem of urban space, and probes into the rational decision-making mechanism under the corresponding self-discipline mode under the view of Culture-Ecosystem, which included the basic attributes of urban space, urban space value attribute, as well as the urban spatial quality attributes, according to the spatial perception logic with the spatial perceptual attribute layer based on requirement hierarchy. And then based on the characteristics of cultural-ecosystem to explore the essence of sustainable development of urban space, which is a sort of adaptive development mechanism that can be discussed with the boundary conditions, the derivative mechanism and the space-time coupling. Which can be formed the cultural-eco self-discipline system to face with the challenge of the globalization.

'Country': The Aboriginal approach to designing and living in urban Australia prior to European colonisation

Ross Wissing (Deakin University) and David Jones (Deakin University)

Mumford (1961) identifies that no single definition applies to all of a city's manifestations. Cities have been constructed in many different ways over the ages, and urban life has found a wide variety of expressions throughout history. Historically physical form has characterised a city. Today a city is more defined by its functions 'where meeting place, marketplace and traffic continue to coexist in balance, more or less'.

Until the early nineteenth century, most 'cities' were on a scale of a modern small town or village. A population of 2,000 or less was not uncommon, and one of 10,000 would be noteworthy, and cities rarely had more than 50,000 inhabitants. In 1800 up to 3% of the world's population lived in cities; the exception being in Britain and Holland where about 10% of the population lived in cities. By 1900, about 14% of the world's population lived in cities, and today, over 50% of people reside in cities.

It is widely believed that cities and civilisations emerged spontaneously some 5,500 years ago in six widely separated places around the world - Mesopotamia, India, Egypt, China, Central America and Peru. Australia is not included in this list, but studies indicate that the intensified Budj Bim landscape, home to the Gunditjmarra people in south-western Victoria, dates around 8,000 years ago and could service a population of 10,000 people. Thus, Aboriginal 'cities' are amongst the oldest and largest settlements in the non-Western world.

Indigenous intensified landscapes in Australia often hosted villages of over 500 people linked to seasonal, multi-seasonal or permanent occupancy mode and such were commonly observed by early European explorers in 1830s-1850s Victoria. Such was evident in the southwest of Victoria, in other parts of Victoria around Cape Otway, Western Port, as well as in the Murray Darling basin of New South Wales and South Australia, and in southern Western Australia. In southwest Victoria, the main exception to this pattern was the Budj Bim area that hosted over 10,000 people inhabiting an area of 20,000²km.

Geelong (Djillong = meaning 'a tongue of land' in Wadawurrung language), the second largest city in Victoria, Australia, sits on such Aboriginal villages, but it is the second least sustainable of Australia's 20 largest cities. The traditional owners of Djillong are the Wadawurrung Balug clan whom are believed to have lived in the locality for over 40,000 years. By any definition, this is sustainable. This paper explores how the concept of 'Country', the Aboriginal approach to co-habiting, designing, managing and living in urban Australia prior to European colonisation, was applied in Djillong and what teachings that has for 21st century Geelong.

The Cultural-Ecological Mechanism of the Urban Space Sustainable Development by the View of the Spatial Perception Logic

And then based on the characteristics of cultural-ecosystem to explore the essence of sustainable development of urban space, which is a sort of adaptive development mechanism that can be discussed with the boundary conditions, the derivative mechanism and the space-time coupling. Which can be formed the cultural-eco self-discipline system to face with the challenge of the globalization.

Key words: Cultural Ecosystem, spatiotemporal field, Cultural Self-discipline, Sustainable Development

Introduction

With the development of social economy, mankind faces the problem of globalization with two dimensions: Firstly, ecological carrying capacity and growth limit, such as the contradiction between population growth and food supply, water shortage, global climate greenhouse effect, serious pollution, traffic congestion, frequent disasters and other urban security problems; Secondly is the coping strategies based on the rationality of science, technology, empirical, such as Low-carbon cycle, smart Growth, resilience of cities. Therefore, the development of urban space is in the passive circulation with the Ecological capacity -Development limit and Social technology-Decision making at present. Undoubtedly, it is the essence of the path choice of the sustainable development of human settlements either to passively deal with the development or the shrewd decision of cultural self-discipline beyond reality.

There are two characteristics along with the urban space developed on the basis of science, technology and empirical rationality. On the one hand, with the improvement of technology and the strengthening of control ability, human consume natural resources, break through ecological capacity or resource limit and move towards alienation, namely, the constraint mode controlled by Ecological capacity-Development limit. On the other hand, urban space adapted to different periods of cultural, institutional, spiritual and material functional needs, but also restricted by the corresponding values and cultural concepts in the process of development and Self-renewal, it shows the self-discipline mode of seeking the harmony and balance between the ecology, society and economy.

However, because urban construction and development is always in the accumulation and agglomeration process of historical space, in the process of economic oriented growth, cultural elements as social innovation and sustainable development of the self-regulatory mechanism is often neglected, including the cultural resource value, capital value and industrial value and its driving role, and tend to the heterogeneous of development. Correspondingly, urban space development is under the interaction of culture and ecology, society, economy and politics, thus forming the corresponding cultural ecological system, that is, the essence of sustainable development of urban space under the culture-ecology mechanism.

The investigation introduces the concept of cultural ecology based on the interdisciplinary methods of cultural ecology, system dynamics and urban-rural planning, focuses on the integration of urban space cultural elements, constructs the cultural-ecosystem of urban space, and probes into the rational decision-making mechanism under the corresponding self-discipline mode. And then based on the characteristics of cultural-ecosystem to explore the essence of sustainable development of urban space.

1. The elements of urban space culture ecosystem

The urban space cultural ecosystem includes the urban space material structure, the social structure and the cultural structure, including the corresponding cultural psychology, the thinking mode, the social value and the environment idea as well as the interaction way and the intrinsic mechanism between them and the social economic elements, which constitute the essential attribute of the urban space cultural ecology.

1.1 Spatial perceptual attribute layer based on requirement hierarchy

The demand level theory of Gestalt reveals the level of human demand, and urban space is an extension of human nature as well. Therefore, the perception of human needs has corresponding spatial attributes which is the essence of urban form, there exists the

corresponding level of space value and its function, and it has the paralleled significance of satisfying human existence, belonging and self-realization (Fig. 2) .

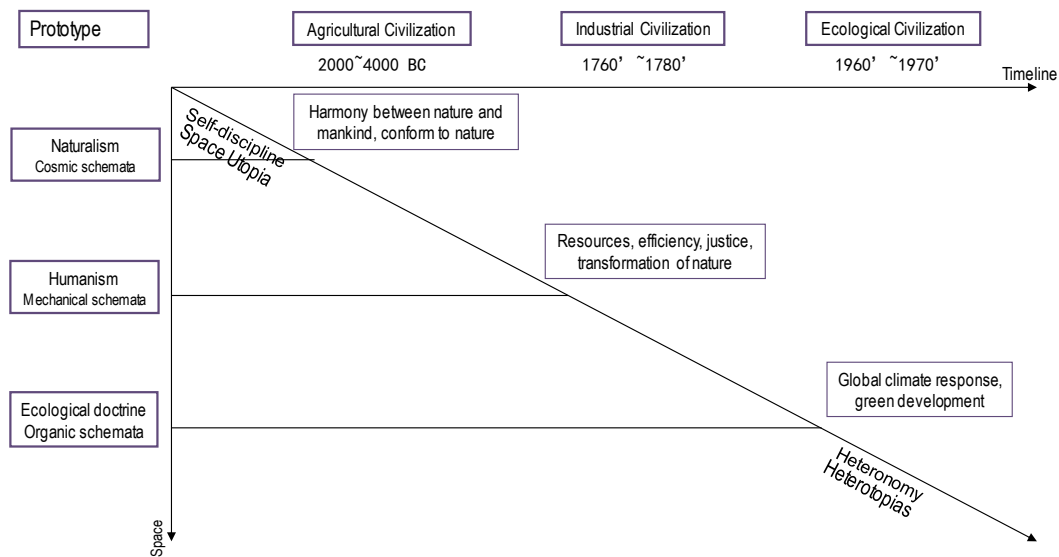

Fig. 1. Cultural-temporal-spatial coupling relationship diagram of urban civilization process. (by Author)

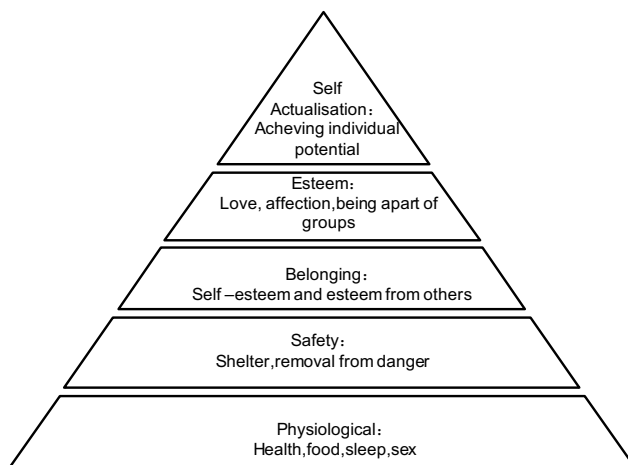

Fig. 2 the relationship between spatial attribute elements based on the requirement hierarchy.

(From https://en.wikipedia.org/wiki/Maslow%27s_hierarchy_of_needs)

Urban form means that the social system acts on the material and spirit forms of the city, it is not only the external, internal and tangible manifestation of the city, but also contains a broader cultural connotation. Urban form is the material and spiritual form that the social system acts on the city, it is not only the external, internal and tangible manifestation of the city, but also contains a broader cultural connotation.

The form is related to the hierarchy of meaning, and its specific object involves the applicable object, value object and symbolic object.

From the perspective of spatial perception, meaning is the center of understanding how the environment works. The spatial form has rich cultural connotations and embodies the spatial elements of history, gradation and perception. Therefore, the spatial perceptual level and its elements reflect the corresponding urban spatial value level.

1.2 The logical level of spatial perception

The spatial perception level should be consisted with the 5 aspects from one level to a higher one successively:

The firstly and fundamentally level is the physiological perception which was perceived from the elements of the urban form from the perspective of property rights underlying with the relationship between the factors of ecology, production and life.

The secondly and based on the first level is the psychology perception, which meets with the self-esteem, safe, comfortable, beautiful and sense of place according to the theory of

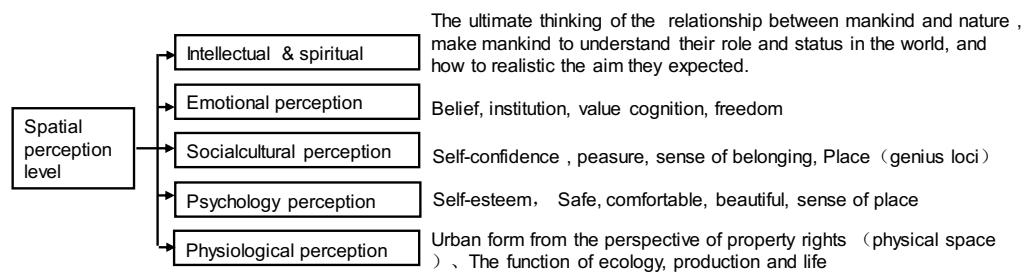

Fig. 3 schematic diagram of spatial perceptual logic. (by Author according to the Maslow's hierarchy of needs)

Maslow's hierarchy of needs.

The thirdly and homologous level is the mental perception, which match with the needs of self-confidence, pleasure, sense of belonging, as well as the place with the genius loci.

Then the fourthly and influentially level is the Cultural Perception, which make oneself to the realization or fulfilment of one's own potential or abilities with the belief, institution, value cognition and freedom.

The last and the most powerfully level is the Philosophical Perception which gathered the ultimate thinking of human-land relationship with the most powerful influence to the views of the value, universe and life of human's.

All these meanings are complex and all these meanings have composed of the net-meaning subordinated from the arrangement to the others.

1.3 Perception level, elements and their structural function

Urban space is a spatial perceptual unit composed of specific perceptual elements and perceptual boundaries, and its corresponding perceptual factors vary according to different scales of urban space, and are related to the social experience and behavior pattern of human beings. According to Gestalt psychology theory, people's perception has the threshold effect, when the space satisfies people's basic perceptual demand and the person liberates from the physiological need, it will produce a higher level of special perceptual demand, more advanced, more socialized needs, such as security needs, self-esteem and self-realization. Therefore, the space element acts on the human senses, emotion and thought can be divided into 5 perceptual levels, i.e. material environment, psychological environment, regional trait,

innovation environment and social ideal, corresponding meaning system, namely material culture, system culture, regional culture, value system, human land relation and so on.

Correspondingly, there is a mutual function between the human cultural perception and the space: cultural tradition has a defining effect on space, and space carries specific cultural information. Meanwhile, urban space is constantly updated and developed in the process of agglomeration historical information and spatial elements, and the cultural inheritance is the process and result of the game of various function elements in a particular space-time field. Therefore, the different levels of cultural information and its spatial elements in urban space are not only the basis of judging urban spatial quality, but also the basis for judging urban spatial value attribute, reflecting the cultural initiative and self-discipline of urban space.

Culture is the collection of spiritual wealth, also it is a mechanism: a self-reflective mechanism consisting of beliefs, values and scientific rationality, as well as a self-conscious and self-discipline mechanism, which is the choice of human's own cultural consciousness, make clear the demand of development and the choice of corresponding path, while pursuing high efficiency development goal, subject to the corresponding restrictions which based on cultural self-consciousness, a choice mechanism of human self-appropriate development-cultural ecological mechanism: including human behavior, value level, space mechanism in different spatial scales of the complex giant system.

2. URBAN SPACE CULTURE ECOSYSTEM

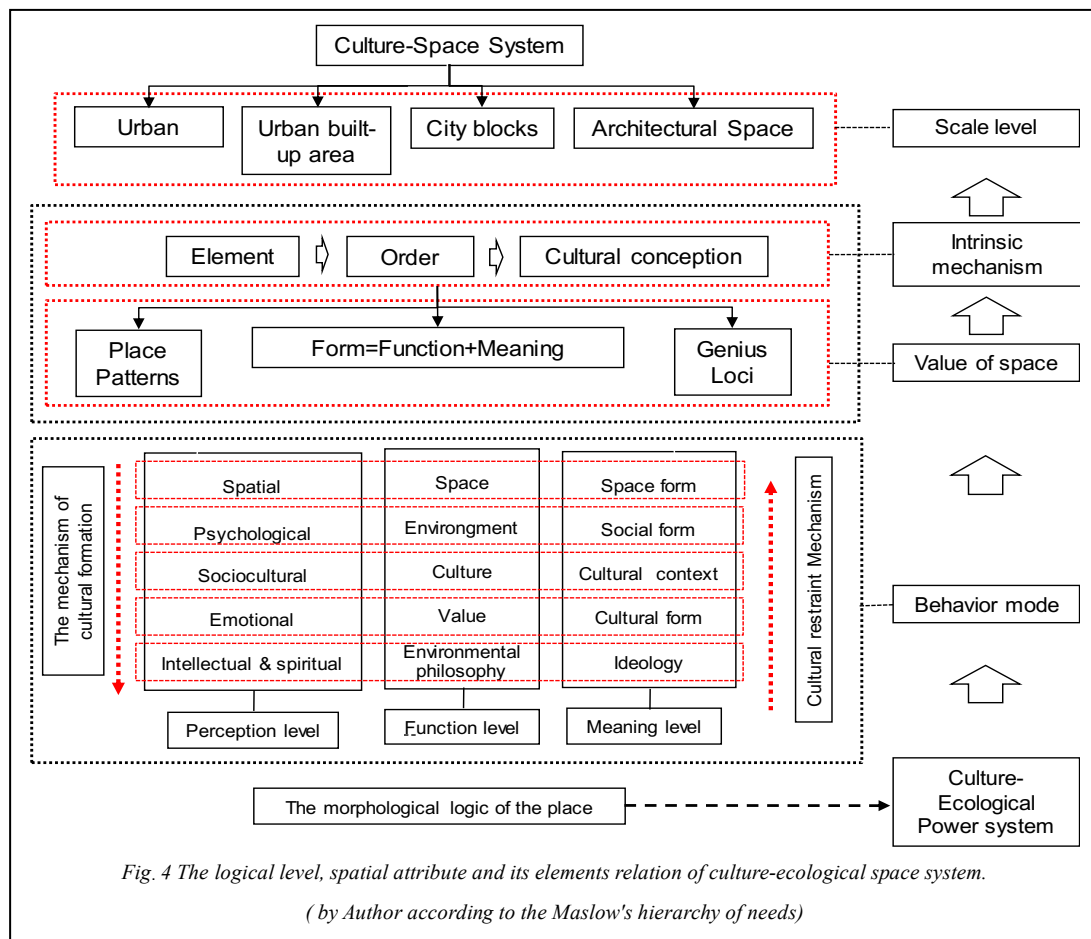

Fig. 4 The logical level, spatial attribute and its elements relation of culture-ecological space system.

(by Author according to the Maslow's hierarchy of needs)

Urban space is a form system composed of function and meaning, and it forms a specific cultural ecosystem with the process of historical agglomeration, which is a historical space field consisted by the interaction factors with ecological elements, social technology, regional culture, institutional system, value system, ideology and other factors, which including the attributes with the space, quality and value of urban, corresponding to the specific period of space elements and their perceptual level, and the formation of cultural ecological role chain. It is an important driving factor to the sustainable development of urban space, which takes the constraint and self-discipline as the feedback mechanism, which is related to the social and economic system in the evolutionary game, and forms the space-time field of the urban space culture ecosystem.

2.1 Basic attributes of urban space: spatiotemporal field, cultural ecology

The basic attributes of urban space are influenced by ecological basement, social technology, regional culture, institution system, value system and ideology, yet the above factors are based on different levels, which leads to spatial stratification.

Ecological background and social technology are the bottom line and the limit factor of urban space development, on the one hand, the bottom line of urban ecological carrying capacity is the insurmountable objective reality of sustainable development, on the other hand, the development of social technology often makes the ability of human close to the limit and become the passive control factor, therefore constitute the system of constraint elements of urban space.

Based on the limit control and the social spatial behavior, the urban spatial form is influenced by the regional culture and system, the value system and the ideology, which reflect the attribute of the quality and value of the space, and constitute the system of the cultural self-discipline elements of the urban space.

2.2 Urban Space value attribute: Bottom line factor, self-discipline system

The space quality is based on the spatial attribute, corresponding to the perceptual level of space, in which the ecological basement and social technology, determines the urban space ecological attributes and social behavior, and its social behavior and the corresponding social network, organization model, decision-making mode and self-discipline mode constitute the urban space cultural ecology and its function system. With self-feedback and self-adjustment mechanism, it forms the value attribute of urban space culture ecology.

2.3 Urban spatial quality attributes: regional characteristics, place spirit

The quality of space depends on the human needs, including five levels with the attribution of the physical, behavioral psychology, spiritual culture, innovation system and social ideal. The place intension consists of three aspects, such as place perception, place spirit and regional culture, which form organic organization, space-time coupling place, which is manifested in the space form and its cultural tradition.

The elements of the city space in Washington, for example, commemorate and symbolize the ideology of separation of powers and the values of equality for all. The capital space of

China's traditional agricultural society period is clear to the axis, symbolizing the supremacy of imperial power, orderly, the unity of man and nature, and the value of worship of nature.

In the urban renewal, the environment optimizes the urban governance (the main body pluralistic democratic process), the quality promotion (the place spirit mold and the regional culture formation), needs to realize the self-succession under the culture-ecology function system through the corresponding restraint mechanism and the self-discipline mechanism.

3. ADAPTIVE DEVELOPMENT MECHANISM

City is the carrier of civilization, because the emergence, development and evolution of the city is the process of cultural innovation and development, the city culture or remains in the cultural-ecological system with different life cycle and form. In reality, cultural protection is often regarded as a one-way process of capital investment, but in fact, because the historical and cultural pluralistic value is gradually recognized, and continuously transformed into capital, resources and urban cultural innovation industry, urban culture has become an important factor of urban space development. Therefore, when cultural development and traditional protection is not only one-way input, but cultural factors into resources, capital and industrial value, and urban space development is coupled, is redefining the history of culture, historical relics and protection and sustainable development of an important basis. The adaptive development mechanism of the cultural ecosystem involves the ecological pattern and the social technology system under the limit of the development, as well as the social order, the adaptation mode, the inheritance pattern and the conformity mode under the self-discipline of culture.

3.1 Boundary Conditions: Cultural location entropy

The agglomeration of cultural elements becomes the development of urban tourism, the development of cultural and creative industries and the concentration of cultural capital, therefore, based on the location entropy theory and the construction of cultural location entropy model, we can analyze the aggregation degree of cultural elements, related industries and their capitalization and the coupling relationship between urban space, and become an important factor affecting the urban space value. Therefore, the value of resource, industrial and capital transformation of cultural elements, its cultural inheritance and sustainable development model constitute the basis of the formation of urban spatial cultural ecosystem boundary conditions.

The cultural location entropy refers to the cultural elements in the spatial aggregation degree. It can be analyzed by the cultural location entropy model.

Location entropy is a very meaningful index in measuring the spatial distribution of a certain area factor, reflecting the specialization degree of a certain industry sector, and the position and function of a region in a high level region. In the research of industrial structure, it is mainly to analyze the situation of regional leading specialization department by using the location entropy index. The so-called entropy, is the ratio of ratio. It is a concept proposed by P. Haggett, which reflects the degree of specialization of an industry sector and the position and role of a region in a high-level region.

The calculation formula of location entropy is¹:

$$LQ_{ij} = \frac{\frac{q_{ij}}{q_j}}{\frac{q_i}{q}}$$

In this formula, LQ_{ij} is the area entropy of J Region I industry in the whole country (q_{ij} is the related indicators of I industry of J area such as output value, employment number, etc.) ; q_j is the index of all industries in J area ; q_i is the related indicators of I industry in national scope ; q it the relevant indicators for all industries in the country. the higher the value of LQ_{ij} , the higher the regional industrial agglomeration level. Generally, when $LQ_{ij} > 1$, it can be considered that the region economy of J region has the advantage in the whole country 当 $LQ_{ij} < 1$ it can be argued that the regional economy of the J region has a disadvantage in the whole country. The location entropy method is effective way which can reflect the level of industrial agglomeration at the regional level to some extent.

Therefore, we can use the location entropy theory to evaluate the spatiotemporal characteristics, including cultural industry and capital elements of urban spatial historical and cultural resources, and then construct the spatiotemporal field and its analytic model of cultural ecology combined with the coupling of urban context protection and cultural inheritance.

3.2 Derivative mechanism

Mechanism refers to the structure, function and relationship of the organism, which is the structural relationship and operation mode of each element. In sociology, its connotation can be expressed as: under the premise of facing the existence of all parts of things, coordinate the relationship between the various parts in order to play a better role of the concrete operation.

The urban cultural ecology and its spatiotemporal field are the information and energy bodies based on the spatial elements and t field function system, which are influenced by the restraint mechanism and the self-discipline mechanism. is based on the two dimensions of human technology development, that is, respect for nature or control of nature: When the goal is in line with the social value system, the self-discipline mechanism to play a role in the conscious sustainable development path; When the target deviation, across the ecological-limit bottom line, then to alienation The urban double repair and its technical regulations, is its revision mechanism, is based on the bottom line control and the self-discipline mechanism under the self-feedback behavior, is also based on the cultural self-discipline behavior.

When the target system of ideology and its value is coupled with the control of the bottom line, it is based on the control development of self-discipline, and presents the city Self-organization development under the action of complex giant system. is a measure basis for the sustainable development of urban spatial dynamics.

3.3 Space-Time coupling

¹ Location Entropy, <https://baike.baidu.com/item/%E5%8C%BA%E4%BD%8D%E5%95%86/2618883?fr=aladdin>

Urban space in the historical culture and the role of the space process, its formation of a potential order, covering six factors (Fig. 4):

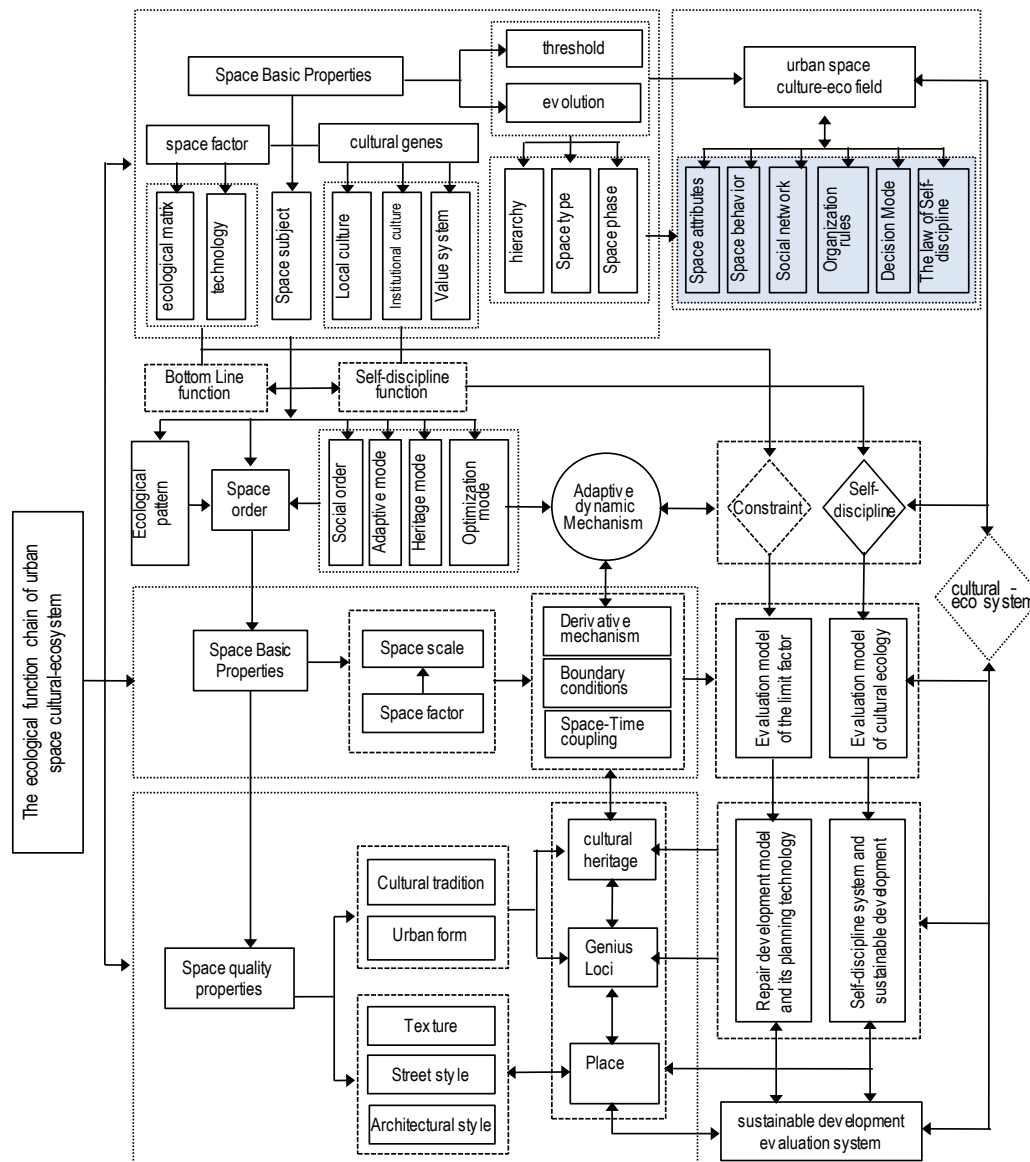

Fig. 5 relationship diagram of the ecological function chain of urban space culture (by Author)

First of all, it is the space bottom element under the condition of specific ecological basement;
 Secondly, it is the social economic life behavior mode under the support of social technology, and it is also the agent of the spatial representation of urban production and life style.

Third, the regional nature of culture originates from the historical and cultural tradition and its spatial coupling relationship. is often the basis of urban space, reflecting the multidimensional and complex relationship between people and the network;

Forth, The mode of social organization, the mode of economic operation and the market conditions under the system culture system are the dual motives of urban spatial self succession and intervention development, and have the characteristics of adapting to the

development;

Fifth, the model of social management and decision based on the function of value system and goal-oriented is the internal mechanism of cultural inheritance and innovation development.

Sixth, the self-discipline model based on ideology and survival philosophy is the ultimate mechanism of value judgment, and also the internal mechanism of urban development and spatial integration.

Generally, based on the factors such as ecological condition, social technology, regional culture, system culture, value system and ideology, the dynamic mechanism of cultural adaptability development of urban space coupled with multidimensional factors in the system is formed. This mechanism consists of its inner bottom line-limit, and the cultural self-discipline system constitutes an important influence factor of sustainable development.

It has the corresponding influence on the basic attribute, quality attribute and value attribute of urban space, and becomes the cultural ecological chain of sustainable development with dynamic balance mechanism and its space bearing system.

4. Conclusion

Firstly, The city is a complex huge system, the solution of local problem can not fundamentally solve the predicament that human development faces. Therefore, we must choose the path of development towards self-discipline. From the cultural-eco self-discipline system, find the way to live in harmony with nature, and make the city develop continuously and infinitely close to the direction we expected.

Secondly, challenge for us to strengthen the subject status, leading role and its influence of mankind on the whole world in the process of urbanization, to promote the development of the urban culture-ecological space system, to guide the cultural inheritance and innovation, and to realize the pluralistic and multi-dimensional harmonious system of human and nature.

Thirdly, In the face of the post-human era, that is, human beings must constantly reflect on and configuration, in order to make our thoughts and actions not be misled by the technology, but we ourselves through sober thinking and choose to dominate the process of technology, so as to realize the city's development with cultural wisdom: a way to meet the overall needs of people and towards self-discipline development.

66 Planning Experiences in Modern China

The Making of the Pudong CBD, Shanghai: Miracle or Mirage?

Richard Hu (University of Canberra)

The Pudong CBD in Shanghai, also known as Lujiazui Financial City, was built from scratch to be a global city centre within less than three decades. The way it has been planned and developed is unique to China, and provides a useful lens to view the largest urbanisation process in human history there. It is time to investigate the uniqueness of the approach that has made the Pudong CBD as it is today. For this purpose, this study traces and documents the genesis and process of its planning and development to unpack the drivers, actors, and mechanisms behind. It uses information collected from archival documents, memoirs of and interviews with participants and informants, and the author's observations on site. Synthesising these information, this study draws insights into the making of the Pudong CBD as a national strategy with a mission of nation building. Driven by a political will, its planning and development has been government-led and design-led, targeting a global Shanghai and a modern China through building a new CBD to integrate with the world. While successful in attracting and accommodating economic activities as planned, a physical determinism embodied in the approach created problematic transport system and accessibility, and failed to pay sufficient consideration to the social and environmental dimensions of the contemporary sustainability imperative. These findings penetrate through the grandiose urban form of the Pudong CBD, which is now a familiar imagery of Shanghai and China, to shed new lights on its rapid erection as a miracle or mirage.

Re-inventing the Socialist Tradition: Changing Meanings and Everyday Spaces of Workers' New Villages in Post-Reform Shanghai

Zhiyong Liang (The University of Hong Kong)

Workers' new villages are standardised socialist housing developed to support central economic plans and industrial development in Maoist China. Since the reform under Deng Xiaoping, these estates have been gradually replaced by a market model through extensive urban redevelopment. Shanghai, where the prototype of workers' new village was first developed in the early 1950s, has witnessed major transformations of the built environment and community life within these neighbourhoods in the past thirty years. This paper examines the tensions in this shift from socialist collectivism to the "socialist market economy" in post-reform Shanghai, with a focus on the changing narratives and everyday spatial practices of the workers' new village. Firstly, the analysis of popular narratives shows subtle changes in the perceptions of local residents and the public since the onset of reform. Due to its low standard of housing quality and association with stringent urban life, the workers' new village has been perceived as a stigma of backwardness amid a growing desire for housing improvement and the vision of middle-class life. Recently, many Shanghai residents begin to consider the workers' new village a "socialist heritage" with growing concerns about Shanghai's lost identity and teething problems of market-oriented urban development. Secondly, field research in three new villages in Shanghai elucidates how market forces have changed everyday spatial practices within these neighbourhoods. The influx of migrants and middle-class residents has reshaped street activities and boundaries between mixed developments; whilst the original administrative system that relies on long-term personal connections has been adapting itself to these new circumstances. By revealing the nuanced changes of subjective perceptions and the planning of built environment in China's historic transition to market economy, the paper argues that the workers' new village planning and its socialist collectivistic tradition have persisted in the post-reform era and actively engaged in reshaping China's contemporary urbanism.

Suzhou Industrial Park: A Case Study of Town Building based on Singapore Model

Zhongjie Lin (UNC Charlotte) and Ying Hu (University of Science & Technology of Suzhou)

In 1994, the governments of China and Singapore signed agreements to create the Suzhou Industrial Park (SIP), a national demonstration project and joint venture to introduce Singapore's experience of in city building and management to China in a wholesale manner. These two new towns are theNow there isIn two decades, the SIP not only has attracted thousands of high-tech corporations and enormous investments, but also grown into a city of more than 700,000 residents from scratch. The 1994 master plan and several ensuing plans and urban designs have played an instrumental role in laying out extensive infrastructure, implementing rigorous controls of urban form, and creating a broad network of open spaces, following Singapore's system in developing an industrial estate. The residential areas in the SIP are organized according to the principles of "neighborhood unit," a concept originating in the West yet revised in the Asian context through Singapore's adaptation. These planning and development strategies have distinguished the SIP from other new towns in China, and are emulated as part of the "Suzhou model." However, SIP has also encountered several issues that impact its development as well as that of other Chinese new towns, including super-blocks, gated communities, and growing private cars.

This paper focuses on the SIP as a case study of China's model new towns and Singapore's influence in this effort through the relationship between place making and social development. It addresses questions about the urban transformation in China: what kinds of roles do the public agencies and the private sector play in the new town development? Has the growing awareness of sustainability become a driving force for innovative design, or does it remain political rhetoric for the marketing of entrepreneurial governance? To what extent is the force of globalization embedded in the process of place making under specific local conditions? What are the benefits and compromises of the Singapore model in town building? This paper will trace the development of SIP since its inauguration in 1994. Through analyzing the urban design and development strategies of this modern new town, the case study will cut a cross-section of the ongoing massive new town movement in China and examine the role of planning in urban transformation and economic development in a global era.

Losing Intangible Heritage under the Preservation Projects of Tangible Heritage - A Case Study on a Reputed Lunar New Year Paintings Town Yangliuqing, China -Diverse Planning Culture and its Commonalities-

Bingqian Cheng (Tianjin University(Postgraduate Student)), Tianjie Zhang (Tianjin University(Associate Professor)) and Yingxiang Niu (Tianjin University(Undergraduate))

The present historical and cultural preservation of Chinese urban system is made up of the National Historical Cultural City, National Historical Cultural Town and National Historical Cultural Village. The most perfect preservation standards for National Historical Cultural City were established when the system was initially set up. Therefore, some practices in protecting National Historical Cultural Town often imitate those of Cities. Compared with National Historical Cultural City, National Historical Cultural Town has relatively backward economic development and urban construction and their ecological environment is closer to nature. And they have relatively richer historical relics and cultural environments than Village. Therefore, National Historical Cultural Town shall be protected according to their own characteristics and protection plans shall be carried out with specific targets. Although the efficient declaration and selection system has been set up, there are still many difficulties and problems in the protection of Chinese National Historical Cultural Town during the stage of rapid economic development. For example, because of unreasonable construction and tourism development, traditional spatial patterns of some towns were destroyed; because the compilation and protection systems are not sound, the plan for protecting National Historical Cultural Town imitated the compilation patterns of National Historical Cultural City and it did not take the protection of intangible cultural heritage into consideration.

This paper chooses Yangliuqing town in northern China as a specific case. In Yangliuqing, there survives many tangible relics since the Ming and Qing Dynasties, and other intangible cultural heritage like Lunar New Year Paintings, Kites and Papercutting. Among them, the Yangliuqing Lunar New Year Painting is one of the four most famous "Chinese New Year Paintings", and has been enlisted as a national intangible cultural heritage. A serious of plans were put forward during 1996-2012, and the town would be built into a folkloric culture area and tourism base. Under these plans, the ancient architectures are renovated and used as museums or art galleries. Part of the primary lanes are preserved, and surroundings are coordinate with the relics. Via preliminary fieldwork, the research finds that the preservation plans pays more attention to the physical-spatial system, and they don't realize that the inheritance of the intangible cultural heritage needs the material carrier and culture space. This caused some urban construction break the Lunar New Year Paintings' s production chain, and destroyed its organic production environment. Leading to the decline of sales and popularity. The artists of the Paintings choses to do other work instead of painting, because of the low income. And this leads to the Lunar New Year Paintings much more lack vitality. Similarly, and other folk cultures are also in this situation.

Based on these problems, via interview, POI data, etc., the research reveals the intentions and desires of multiple stakeholders, including local government, tourists and indigenous residents. In general, the paper intends to make an effective evaluation on the tangible preservation plan implementation in Yangliuqing Historical Cultural Town, and put forward preservation suggestions to the intangible culture.

Losing Intangible Heritage under the Preservation Projects of Tangible Heritage

- A Case Study on a Reputed Lunar New Year Paintings Town Yangliuqing, China

Bingqian Cheng*, Tianjie Zhang**, Yingxiang Niu***

** *Associate Professor, Tianjin University, arch_tj@126.com*

*** *Undergraduate, Tianjin University, 1317997141@qq.com*

On the basis of fully understanding the connotation and characteristics of intangible cultural heritage, this paper combed the preservation work of the Yangliuqing Town which is the National Historical Cultural Town in Tianjin, China. The author finds that preservation work had always focused on the tangible culture. And under these preservation planning, some historical sites are restored properly. And some construction improves the people's living condition. But during this process, some construction destroys the human environment inadvertently, and the development of the Lunar New Year Paintings industry also hits a bottleneck, leading to the decline of the characteristic of the "New Year pictures Town". Based on this problem, this paper puts forward the suggestions such as enriching the theme of Lunar New Year Paintings and enacting preferential tax policies.

Keywords: intangible heritage, Yangliuqing Town, cultural space

Introduction

The historical and cultural preservation of Chinese urban system is made up of the National Historical Cultural City, National Historical Cultural Town and National Historical Cultural Village. Compared with the city, the economy in towns is not as much as developed, and there is not much more urban construction in towns. So the environment in towns is more close to the nature. However, the preservations of the town has always copied the conservation paradigm of Historical and Cultural Cities, and those just focused on the tangible heritage while ignoring the intangible heritage, leading to the towns lacking spiritual culture.

With the development of regional economic integration, the richness and diversity of world culture have been greatly challenged, and the uniqueness and differences of traditional culture have disappeared or weakened rapidly. In this circumstances, the United Nations Educational, Scientific and Cultural Organization put the protection and development of the diversity of the human cultural into an important situation, and it declares that the preservation of the intangible culture is the main work to develop the diversity of the human cultural. In contemporary, many countries such as Japan, Italy, Germany, France and so on begin to start the traditional colour research, the traditional clothes to set up good country images. The Japan is the earliest country that establish laws to preserve the intangible culture¹. The South Korea takes advantages of the intangible culture to attract foreigners to experience the traditional festivals or life. In Italy, there are many ecological country tourism and delicious food culture tourism to show the characteristic traditional art. From this, we can see that the preservation of the intangible cultural heritage plays a vital role to sustain the diversity human culture².

Since China resumes the situation in the UNESCO, and signed the International Convention for the Protection of the Intangible Cultural Heritage, the preservation of the intangible cultural has become the main work to the preservation of the historical and cultural. During the long evolution process, the ancient town formed a relatively

complete traditional custom, life style, etc. Intangible culture is the sole of the ancient towns, together with the material life, they reflect the value of the social life under the special historical and cultural environment.

This paper takes Yangliuqing, which is the National Historical Cultural Town as the specific case to analyse this phenomenon. There are plenty of outstanding historical sites which were built in Ming or Qing dynasty. And there are also lots of intangible cultural heritage such as Lunar New Year Paintings, Kites and Paper-cutting³. These intangible cultural heritage reached its peak in the Ming and Qing dynasties, by now, much folk-custom is still exist. Among them, the Yangliuqing Lunar New Year Paintings is one of the four most famous "Chinese New Year Paintings"⁴. Based on these problems, the paper intends to make an effective evaluation on the tangible preservation plan implementation, and analyse the effect on the intangible culture space and the inheritance which made by the implementation.

1. The introduction of Yangliuqing

Yangliuqing (Figure 1), a famous town in northern China with a long history, located in the southwest of Tianjin. And it is one of the towns of Xiqing which is an administrative unit of Tianjin. As the Grand Canal flows from the south of the township, Yangliuqing became an important wharf during the Ming and Qing dynasties. So the cultural exchange was frequent and developed unique folk culture. Therefore, there are lots of historical relics and historic sites in this town, including two National Officially Protected Sites, five City Officially Protected Sites and ten Unmovable Cultural Relics⁵. The residential compounds in the township are the outstanding representative architecture in the local area. They are very aesthetic with the exquisite brick carving and unique architectural structure. The Peiping-Tianjin Campaign Memorial Hall is another significant historical relic, and it is the Tianjin Patriotism Education Base now. In addition, there are also many other Ming and Qing dynasties relics like the Puliang Tower and the Wenchang Pavilion. Therefore, Yangliuqing was selected as the fourth batch of National Historical and Cultural in 2008, and the Liujié village in the town was selected as the fourth batch of Traditional Village.

Figure 1 The view of the Yangliuqing downtown , the Grand Canal and the residential building

Yangliuqing formed rich characteristic intangible heritage because of frequent culture exchanging. They has typical historical, literary, art and scientific value (Figure 2, 3, 4). Yangliuqing has one National Intangible Cultural Heritage- Yangliuqing Lunar New Year Paintings. Now, 50 workshops and 700 staffs are engaged in this industry⁶. Besides, there are two City Intangible Cultural Heritage of Tianjin, which are Yangliuqing fly kites and paper-cutting. And other intangible culture such as Folk Hua-hui, brick carving and Gandaying are also attractive.

Figure 2 The Yangliuqing Lunar New Year Painting made in Qing dynamic

Figure 3 The Yangliuqing Lunar New Year Painting made in the Republic of China

Figure 4 The Yangliuqing Lunar New Year Painting made in contemporary

With the rapid development of urbanization, the government put forward a series of plans to preserve the historical culture of the town. Lacking the specific preservation norms for the National Historical Cultural Town, the government copied the conservation paradigm of National Historical Cultural City, which made different impact on the tangible heritage and intangible heritage.

2. The preservation planning of Yangliuqing

Most of the historical and cultural relics of Yangliuqing located in the township, and most of them were built in Ming or Qing dynasty. These relics suffered from nature or man-made destruction during the long history. Therefore, every plan try to put forward terms to preserve them.

The earliest planning was put forward in 1996, *The Master Planning of Yangliuqing (1996-2010)*. In this planning, Yangliuqing would be constructed as a tourist town based on its historical cultural heritage, but there were no specific preservation measures.

In *The Master Planning of Xiqing (2005-2020)*, the government would like to build Yangliuqing as the “Lunar New Year Paintings Town in China” and the “Ancient town in the west of Tianjin”. To enrich the tourism projects, the government try to show all historical culture of Xiqing in Yangliuqing township. Moreover, the planning emphasizes it would preserve the traditional streets and lanes, the spatial and the landscape of the Grand Canal, and promote the economic develop by the tourism construction. Then the government put forward detailed preservation and development measures on the tangible culture in the township, including making a regulatory detailed plan. Particularly, there are no detailed preservation measures on the intangible culture but only a programmatic goal to inherit the culture.

The Preservation Planning of Yangliuqing Historical Cultural Town was put forward in 2011. Under this plan, the township was divided into the core zone, the development control zone and the buffer zone (Figure 5). And emphasis to keep the traditional scale of the street and lanes, use the traditional brick to pave the way. Moreover, different measures such as regulation and demolition to different historical architecture and monument was put forward. According to this plan, the situation of the traditional architecture, public space, and the texture of the street improved, but there also exists some deficiencies.

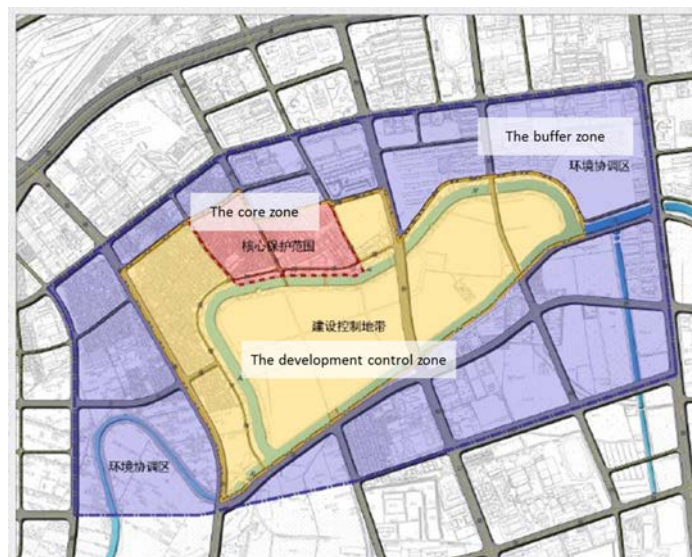

Figure 5 The different preservation scope

3. The preservation of the tangible heritage in Yangliuqing

Since every plan pays more attention on the preservation of the historical cultural heritage during the past twenty years, especially the tangible heritage. This paper will give an evaluation of the implementation on the tangible heritage.

Figure 6 The preservation consequences of the architectures and the texture in township

Figure 7 The deficiencies of the preservation

3.1 Positive preservation in architecture, negative coordination in surroundings

The core preservation zone is about 14.5 hectares, and there are lots of compounds in this zone, especially the outstanding Shi's Family Compound. The preservation planning stipulates that these officially protected sites must

be preserved and used according with *the Cultural Relics Protection Law of the People's Republic of China*, and maintain the integrity of the architecture and show the connotation of the culture. Now, the Shi's Family Compound is used as the Yangliuqing Museum, which has been a great scenic spot in the local area. The other compounds are transformed as the art gallery or study center, which improves the vitality of the historic architecture (Figure 6-1, 6-3).

The preservation planning emphasizes that the architectures surrounding the compounds should be coordinate with the compounds. In the investigation, we find that the architecture in the north of the Shi's Family Compound are mainly built with cyan brick and gray tiles, and these architecture are used as art museum or Lunar New Year Paintings workshops, etc. The architectural style and the business format are coordinate with the compounds. While along the Ruyi Street (Figure 6-2), which is an important street in the core zone, there are lots of street vendors selling low-end antique. Another important street, the snack street (Figure 6-5), there is still no merchants. In the west of the Shi's Family Compound, there are lots of business architecture copied those in Ming and Qing dynasties. Although the style of the architecture is coordinate with the surrounding historical, the business formats are clutter. There are lots of shops selling hardware, appliances, etc. And the formats reduced the quality of the historical space (Figure 7-1, 7-2).

According to the consequence of the PPGIS⁷, we can also find that most people think that the core zone is deserved to visit (Figure 8), and 70% think the streets and lanes have historical cultural value. And 75% interviewees think the Yangliuqing Lunar New Year Paintings has historical cultural value, and most of them are the local people.

Figure 8 The overall cognition of the interviewees on historical and cultural value

In the west of the core preservation zone, there are lots of common residential buildings. The Peiping-Tianjin Campaign Memorial Hall is located in this area, but because of lacking the obvious guides, it is hard to find this museum hall. Besides, the environment around the memorial hall is so dreadful that little tourists come to visit it. From the investigation, we find that only 46% interviewees realize the historical value of the memorial hall, which is far from the plan's primary target.

The development control zone is about 95.4 hectares. On the nearest east of the Shi's Family Compounds, there are lots of business buildings copied the style of Ming and Qing dynasties. In the process of the urbanization, to improve the efficiency of the land usage, the government merged lots of rural settlements located in the east of the town into different huge neighbourhoods. And many workshops engaged in Lunar New Year Paintings, fly kites and paper-cutting were demolished. To avoid the fading of historical cultural, the government plans a business street specially to provide place for the folklore artists to sell Lunar New Year Paintings and fly kites (Figure 6-6). In the west of the development control zone, it has not been developed because of the lack of capital. Neither does the Yuanbao Island on the south of the Shi's Family Compound (Figure 7).

There are many historical monuments and structures in the core zone and development control zone. But according to the investigation, most of these heritages are in the abandoned situation (Figure 9), though the time node is close to the deadline of the plan⁸. With little guide symbols, it is hard to find these heritage spots, so few tourists would like to visit them (Figure 7-4, 7-5).

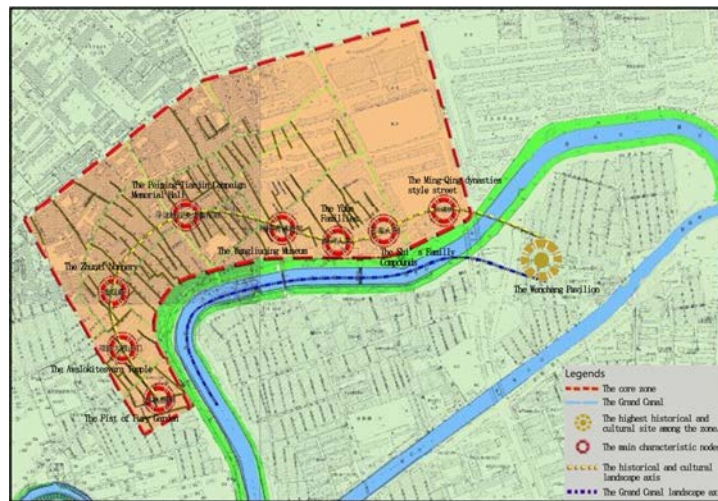

Figure 9 The tourism line and the distribution of the spots

3.2 The public space is lacking of vitality

The preservation planning of Yangliuqing put a systematically plan on the public space in the core area. According to the planning, the construction should build abundant public space, especially the folklore tourism area and the landscape space along the Grand Canal. Besides, it should improve the significant space which could show the characteristic of the town, such as the people square.

While according to the investigation, there are little public space for tourists to rest, so few tourists would like to take their spare time on the street or lanes. Moreover, the government planted plenty of willow trees along the canal to improve the walking environment and reappear the historical scene, however, it is lack of recreation facilities so there is few person staying at this place. In addition, the style of the portal space in Yangliuqing town is chaotic. Ming and Qing dynasties commercial buildings, modern residential buildings, western style pillar buildings and so on, weakened the historical and cultural characteristics of the town.

3.3 The great difference of the texture

In the preservation planning text, it is proposed to control the style in the two sides of the historic streets, and the architecture along the street should be coordinate with the northern traditional residential buildings. Moreover, it should maintain the history scale and keep the integrity of the interface. And in fact, most of the ancient texture are preserved, and they are attractive to the tourists. According to the planning, the government widen the Ruyi Street to make the space more abundant.

But the texture in the development control zone is great different from that in the core zone. It is inconceivable that there exists a 1.2 hectares park-lot next to the Shi's Family Compounds (Figure 10), which is extremely uncoordinated with the ancient texture, and the environment is unattractive because of lacking landscape design. The zone in the west of the development control zone has not been developed, there are still many common residential houses. And the interface of the street and the public space is not attractive, either.

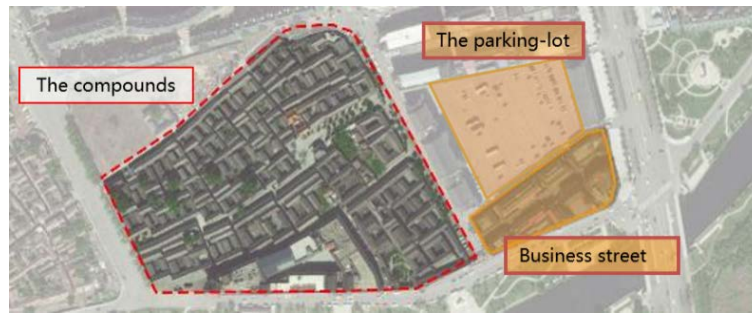

Figure 10 The incorporate texture

3.4 The weakness of the plan

According to the consequences of the PPGIS, we find that the residents think the old train station has great historical value (Figure 11, 12). Because the old train station took great convenience to the local people, and this two floors Germany building made by brick was a great grand architecture at past. This old train station occupied part of their memory, so they think this station has historical value. However, there is no preservation measures to preserve it. Moreover, another heritage the Zhunti Nunnery, which was built in Qing Dynasty, has collapsed due to the weak preservation consciousness and lacking capital, although it is one of the nodes at the tourism line planned.

According to the PPGIS interview, many interviewees put the historical and cultural signs on the Shi' Family Compound, the Peiping-Tianjin Campaign Memorial Hall, and the Yangliuqing Museum, etc. From the nuclear density analysis, we can find that the colour in this area is the deepest. This reflects that the interviewees are satisfied with the architectural relics which are repaired and took advantages of properly. But the preservation to the monuments such as the Zhunti Nunnery and the Wenchang Pavilion is need to improve. In addition, the planning should pay more attention on the local residents' memory, especially the old train station.

Figure 11 The local residents' cognition on the landscape value

Figure 12 The tourists' cognition on the landscape value

4. The preservation of the intangible culture in Yangliuqing

Except for the tangible heritage, Yangliuqing has rich intangible heritage because of the convenient transportation. Yangliuqing is rich in the birch-leaf pear, which is the necessary material to make the wood model of the Lunar New Year Paintings. So Yangliuqing was famous for its Lunar New Year Paintings in history. And the Yangliuqing Lunar New Year Paintings was listed in the first batch of intangible cultural heritage list in 2006.

In history, some families produced Lunar New Year Paintings by themselves as their avocation, they produced and sold their own products. The others are the workshops which have abundant capital. And lots of painters, wood model carvers could create new paintings together at past. The paintings are usually printed or sold in the workshops or printshops. And the whole industry chain including the production of the pigment and drawing paper, it is also including the subbranch distributing all over the country⁹.

Yangliuqing had become an important production place of Lunar New Year Paintings in Ming and Qing dynasties, and the development of the paintings got to its peak at this time. In addition, one of the Four Great Classical Novels in China- the Story of the Stone, its illustrations adopted the drawing mode of the Yangliuqing Lunar New Year Paintings. However, as the inflow of western paintings and the interruption of the Japanese Aggressive War, lots of Lunar New Year Paintings and wood painting models were destroyed, leading the decline of Lunar New Year Pictures industry. While, after the founding of the People's Republic of China, the culture administration paid great attention on the Lunar New Year Paintings and Paper-cutting industries, and many precious masterpieces were saved. However, the "Culture Revolution" caused 60% wood painting models being fired, and the Lunar New Year Pictures industry was hit seriously. After the Reform and Opening in 1978, this bad situation was improved, and more and more people collected and research the folklore art. At this time, the century-store Yuchenghao began to produce paintings again, and after 13 years' collecting and sorting out the wood painting models as well as the paintings, this store opened for business in 1993. But because of the urban construction around 2002, this old store had to be demolished. The entire village where it was located was also be demolished. The urban construction which was to promote the urbanization broke up the industrial chain of the Lunar New Year Pictures unintentionally¹⁰.

To make up for this damage and enhance the characteristic of the town to attract more tourists, the government plans an area to develop the folklore culture. There are lots of workshops selling paper-cutting, fly kites and clay figurine, especially the Lunar New Year Paintings. However, except for the well-known workshops such as the Yuchenghao and Nianhua Zhang, there are a little tourists visiting the town which caused the dull business. The reasons are from many aspects:

4.1 The Lunar New Year Paintings' theme is lacking of innovation

After having an investigation with the shop-owners, the author got that it need to carve the wood into different patterns, then print and paint it. Therefore, it will take a long time to create a new theme, and due to being shortage of staffs and creative ideas, most of the shopkeepers are not willing to create a new one. So the themes of the Lunar New Year Paintings aren't attractive to the consumers, especially the young consumers¹¹. In fact, the young man are the main consumer group, so the number of the paintings fall down due to few people would like to buy them.

4.2 The staffs do not understand the connotation of the Lunar New Year Paintings.

Most of the staffs in the workshops are from other places. These groups cannot understand the connotation of the New Year pictures, and their works usually don't match the real style of the Yangliuqing lunar New Year Pictures. In addition, it is difficult for them to create outstanding masterpieces.

4.3 The industry chain was broken

The process of the Lunar New Year Paintings includes drafting, carving the wood, painting, coloring and mounting. It need professional persons to finish one of the produce. As it is difficult to master the whole process, so the apprentices are usually engaged in one or two specific process in the whole life. And as these process are inherited

by their families, so each family has their own advantages. In history, the folk artists, wood carvers and the handicraftsmen created abundant Lunar New Year Paintings. However, with the development of the urbanization, lots of villages are demolished and merged into the large neighborhoods. In this process, many workshops were closed down. This causes them difficult to finish one bulk order¹². According to our investigation, some workshops tried to take the bulk order over, and then assigned different workshops to produce. As a result, there are many different styles in the same batch order, which left negative effect on the Lunar New Year Paintings. Therefore, the number of the Lunar New Year Paintings' products declines this years.

4.4 The products lose culture connotation

As the number of the workshops and staffs is declining, many merchants adopt-machines to print instead of the traditional wood carving. This behavior caused the loss of culture connotation of the Lunar New Year Pictures, so fewer and fewer consumers think it deserves to buy it¹³.

4.5 Lacking of advertising

As the theme of the Lunar New Year Paintings is not attractive to the consumers, and because of less dissemination, fewer and fewer consumers know about the Paintings and would like to buy them. Moreover, the groups that buy the pictures almost are the collectors, dealers and franchiser. To buy the real artwork, these people tend to buy paintings at the workshops in Yangliuqing instead of the shops in market. This has led to fewer sales of New Year pictures and fewer stores.

5. Summary and suggestions

From the analysis above, we can find that the physical space is improved under serious of preservation plannings, especially the historical architectures and the lanes in the core zone. While the texture in the development control zone needs to be transformed to be coordinate with that in the core zone. And the public space in both zone need to be improved. In addition, to build up the Historical Cultural Town, the government paid more attention on the material. While the intangible culture is not preserved and inherited properly. The urban construction led to lots of the Lunar New Year Paintings workshops being demolished. To save the Lunar New Year Paintings industry, the government planed an area for the merchants to sell paintings and paper-cutting. However, the sales and fame are declining.

As we all know, the inheritance of the culture cannot leave from the material carrier, neither of the intangible culture. The intangible culture is the living heritage, so its material carrier also has the living features. Among them, the culture space is the indispensable material carrier to exist, inherit and create. The communities, villages, religious sites and natural environment etc. are all could be the carrier to the intangible culture¹⁴. Without these carrier, it is impossible to inherit and create the culture¹⁵. Therefore, it is very important to build the culture space to preserve the intangible culture. However, the government doesn't realize this problem, and they doesn't realize that it is important to maintain the industry chain. Besides, the planning area for selling Lunar New Year Paintings is too cramped to attractive tourists. This causes the decline of the sales, and many artists had to do other work because of the low income.

Therefore, in present, in order to improve the visibility and sales of the Lunar New Year Paintings, the government should implement the funding system for the artist, so as to encourage more people to devote themselves into creating Lunar New Year Paintings. And it is important to build culture creation space. What's more, it is important to enrich the theme of the pictures combining the era backgrounds, and let more people appreciate the Lunar New

Year Paintings and buy them. This is the key sector to improve the pictures industry. Moreover, the urban construction we mentioned above caused many workshops close down, the key reason is that the unbalance between the input and output. So lots of people choose to do other work. And that leads to the breakdown of the culture space. Therefore, with the development of our life, the paintings should be incorporated with people's new demands. It is better to register a trademark or apply for patent to maintain the characteristic of the Yangliuqing Lunar New Year Paintings. Encouraging the staffs to create more gadgets with the characteristics of the Lunar New Year Paintings to make it more popular and expand the sales channels.

Moreover, it is important to let more people be able to identify the quality of the Lunar New Year Paintings, and prevent the low quality products leave a negative impact on the Paintings. The last but not least, the merchants could cooperate with the universities, museums and the exhibition centres, and the government should better to reduce the tax. By this, it could make the Yangliuqing Lunar New Year Paintings more popular and improve its sales.

67 **Circulating Knowledge in the Cold War Periphery: The Architecture of Public Housing**

Framing a New Discourse on the Notion of Habitat in Transforming Societies

Mohamad Sedighi (Delft University of Technology) and Rohan Varma (Delft University of Technology)

Shortly after the Second World War, modernist design principles, originating in the West and as discussed in various CIAM congresses, became a main source of inspiration for many architects, including those in the Developing World. In Middle Eastern countries, this situation was exacerbated during the Cold War, where oil-led geopolitics facilitated an intense import of American and Soviet models of development in the form of technical and economic aid. Through the 1960s and 1970s, this led to rapid urbanisation and the construction of several large-scale housing projects by foreign agencies, which largely ignored the specific geographical and cultural features of their local contexts. As a reaction to this, a group of young-leading Iranian architects organised, in collaboration with Iran's Ministry of Housing and Urban Development, a series of architectural events to discuss issues pertaining to local culture and the role of architecture in transforming societies.

Among these events, the Second Iran International Congress of Architects (IICA), held in Persepolis-Shiraz in 1974, attracted many of the leading architects of that time such as Josep Lluís Sert, Jacob Bakema, James Stirling, Buckminster Fuller, and Georges Candilis, among others. Along with these well-known western architects, a number of emerging architects from developing countries, such as Nader Ardalan and Kamran Diba from Iran and Balkrishna Doshi and Raj Rewal from India also came to become important participants. One of the key outcomes of this congress was the 'Habitat Bill of Rights' - a CIAM-like Charter of Habitat - submitted by the Iranian government to the first UN conference on 'Human Settlements' in 1976.

This paper reveals how both the IICA and the UN conference played an instrumental role in shaping the discourse on the notion of regionalism in the design for human habitats, especially in the developing World. This is explored in two ways. Firstly, by building upon a brief analysis of the work of Ardalan, Diba, Doshi, Rewal and Charles Correa, another major figure in architecture from India who also participated in the UN conference, the paper explores the incorporation of the ideas discussed in the Habitat Bill of Rights within their private commissions for housing schemes and master plans in their respective countries. Secondly and more crucially, the paper also argues that both these events helped bring together these architects who later, in different capacities, played significant roles as members of the Aga Khan Award for Architecture, which was fundamental in fostering - and promoting - an alternative way of adapting modernism to industrializing countries.

This abstract is part of the panel named: 'Circulating Knowledge in the Cold War Periphery: The Architecture of Public Housing', organised by Mohamad Sedighi and Nikolay Erofeev

The Americanisation of Israeli Housing Practices

Gabriel Schwake (Delft University of Technology)

The UN Assembly Resolution 181 of November 27th 1947, which called for the establishment of a Jewish state in parts of Palestine, was one of the only votes backed by both the Union of Soviet Socialist Republics (USSR) and the United States (U.S), as both superpowers saw the future state as a potential ally. Though being long affiliated with the American agenda, the young state of Israel did possess several Socialist-like characteristics such as a centralized indoctrinating state led welfare system, during the early rule of the socialist Mapai Party. One of the young state's key projects was the construction of new industrial towns and residential neighborhoods. These environments corresponded with ruling socialist ideology, as they consisted of affordable, repetitive and customized public housing estates.

The growing alliance with the US in the 1960s significantly influenced the Israeli culture and economy, as it underwent a process of "Americanisation", which included the promotion of liberal values such as privatisation, entrepreneurialism and individualism. This largely affected the local built environment, when through an intense process of privatisation the former monotonic publicly built housing estates began giving way to new privately constructed projects. Ultimately, what began as a tool of self-expression was taken over by large-scale private corporations, and the early public housing estates, first turned into private houses and later into a commodity.

This paper aims to reveal how the Israeli allegiance with the US during the Cold War, affected its local culture and economy, leading to a transformation in the system of housing production, replacing the former socialist housing approach with a market driven one. This paper focuses on three adjacent settlements: Zur Natan (1966), Kochav Yair (1986) and Zur Yitzhak (2005), located beside the Green Line and the West Bank. Through the analyses of their development, this paper shows how the growing privatisation process altered the development of housing and the built environment, throughout the 1980s and 1990s.

This abstract is part of the "Circulating Knowledge in the Cold War Periphery: The Architecture of Public Housing" Panel.

Post-War Transnational Planning Practices: Victor Gruen's Proposal for Tehran's Low-Cost Housing (1966-1969)

Elmira Jafari (Delft University of Technology)

This abstract is part of the panel entitled "Circulating Knowledge in the Cold War Periphery: The Architecture of Public Housing" . While communicating architectural/planning knowledge between core and periphery countries was intensified under the auspices of the Cold War, it brought about new challenges regarding the relation of imported ideas with the architectural culture of the host countries. The first Comprehensive Master Plan of Tehran, prepared by Victor Gruen and Abdolaziz Farmanfarmaian in the late-1960s, is a novel example of such cross-cultural influences, in particular considering the architecture of housing. This paper aims to examine how the master plan introduced new low-cost housing strategy for the city of Tehran and how it affected the physical, socio-cultural and economic situation of lower social levels. After three years of research into the urban fabric of Tehran, Gruen proposed a linear arrangement of new satellite towns in an East-West direction that could openly host the city's potentially unlimited future development. In the complex process of reformulating the city's spatial structure, the master plan scrutinized Tehran's housing shortage and policies towards public housing. After the analysis of the post-war state-led low-cost housing projects locating in the fringe areas, such as Kuy-Kan (1958) and Kuy-Nohom-Aban (1963), the master plan attempted to align low-cost housing programmes with the overarching developmental decisions for Tehran metropolitan region. Moreover, it was an endeavor to release the state from financial supports through privatizing public housing projects. This paper argues how the master plan cemented the polarized structure of the city and made the poor immobile and isolated by locating them in adjacent to southern industries. As the legacy of the master plan, Tehran is still characterized by the strong social segregation

Through a profound examination of the five volumes of Tehran Comprehensive Plan, this paper seeks to unravel the complexity in the exchange of planning ideas from Western countries to Iran. In turn, the translation of Western ideas into domestic architectural vocabularies will be examined through shifting the spotlight into local realities and the role of local mediators. As a result, Tehran's transnational history of planning can shed new light on the significance of local conditions and local actors in transnational practices of the Cold War and the emergence of an individual planning culture.

Socialist Ways of Development in Mongolia: Modes of Technical Assistance and Knowledge Circulation

Nikolay Erofeev (University of Oxford)

Mongolian People's Republic adopted a 'socialist way of development' , and became one of the major for-posts of socialist cultural investments and technical assistance. Geographically, being located between the territory of China and the USSR, Mongolia experienced a bilateral influence of those countries under the geopolitics of the Cold War, setting an important outpost for architectural exchange between architects and planners working on different aid projects. Within this international cooperation, Mongolia received 'gifts' from the Soviet in the form of economic aid and of 'technical assistance' for various developmental projects. In line with the Soviet ideology for modernisation, planners particularly exported technologies for housing delivery to Mongolia; and house-buildings factories for the continuous production of standardised collective housing disseminated across the territory of the country as 'civilising devices' .

Discussing the case of Soviet house-buildings factories export, this paper offers analyses of power distribution between various agents participating in those projects – design, construction institutes and administrative boards. Aid projects were developed within different economies, involved various modes of cooperation between foreign and local agents. Analysing the command of housing projects, resulting from gifted housebuilding factories in Ulaanbaatar, this paper various modes of production of resulting architecture. Particularly, a focus on the role of Mongolian partners and stakeholders involved in this process, as well as of a role of local construction sector will demonstrate how at a local level, cultural arguments were put forward, to offer a multilateral perspective on aid projects in Mongolia.

Framing a New Discourse on the Notion of Habitat in Transforming Societies

This paper reveals how the second Iran International Congress of Architects (IICA), held in Persepolis-Shiraz in 1974, and the first UN Habitat conference, held in Vancouver, Canada in 1976 played an instrumental role in shaping a discourse on the notion of regionalism in the design for human habitats, especially in developing countries. Building upon a brief analysis of the works of Nader Ardalan, Kamran Diba, Charles Correa, Balkrishna Vithaldas Doshi and Raj Rewal, this paper discussed the incorporation of the ideas published in the Habitat Bill of Rights within their private commissions for large scale housing schemes and master plans in their respective countries, Iran and India. More crucially, this paper argues that both events helped bring together these architects who later, in different capacities, played significant roles as members of the Aga Khan Award for Architecture in fostering and promoting an alternative way of adapting modernism to industrializing countries.

Keywords: Iran, India, Habitat Bills of Rights, Aga Khan Award for Architecture, Vernacular Modernism, Large-scale Housing Design

Introduction

Shortly after the Second World War, modernist design principles, originating in the West and as discussed in various CIAM congresses, became a main source of inspiration for many architects, including those in developing countries. In the Middle Eastern countries, this situation was exacerbated during the Cold War, where oil-led geopolitics facilitated an intense import of American and Soviet models of development in the form of technical and economic aid.¹ Through the 1960s and 1970s, this led to rapid urbanization and the construction of several large-scale housing projects by foreign agencies, which largely ignored the specific geographical and cultural features of their local contexts. As a reaction to this situation, a group of young-leading Iranian architects organized, in collaboration with Iran's Ministry of Housing and Urban Development, a series of architectural events to discuss issues pertaining to local culture and the role of architecture in the design of appropriate human habitats, particularly in transforming societies.

Among these events, the Second Iran International Congress of Architects (IICA) became a turning point. Financed by Empress Farah Diba, the former queen of Iran, the event was held in Persepolis-Shiraz in 1974, and attracted many of the leading architects of that time, such as Paul Rudolph, Oswald Ungers, Moshe Safdie, Paolo Soleri, Buckminster Fuller, Jacob Bakema, Georges Candilis, James Stirling, and Josep Lluís Sert, among others. Along with these well-known western architects, a number of emerging architects from developing countries, such as Nader Ardalan and Kamran Diba from Iran and Charles Correa, Balkrishna Doshi and Raj Rewal from India also came to become important participants. One of the key outcomes of this congress was the 'Habitat Bill of Rights' - a CIAM-like Charter of Habitat - submitted by the Iranian government to the first UN conference on 'Human Settlements' that took place in Vancouver, in 1976.

This paper reveals how both the IICA and the UN conference played an instrumental role in shaping the discourse on the notion of regionalism in the design for human habitats, especially in developing countries. This is explored in two ways. Building upon a brief analysis of the work of Ardalan, Diba, Correa, Doshi and Rewal, the paper, firstly, discussed the incorporation of the ideas published in the Habitat Bill of Rights within their private commissions for housing schemes and master plans in their respective countries. Secondly and more crucially, the paper argues that both these events helped bring together these architects who later, in different capacities, played significant roles as members of the Aga Khan Award for Architecture (AKAA), which has been fundamental in fostering and promoting an alternative way of adapting modernism to industrializing countries.

The Second Iran International Congress of Architects

As mentioned previously, the 1974 IICA brought together leading-international architects from both the Western and non-Western world. It also formed a platform for discussing the issues related to the themes of 'Continuity versus Change' in local culture and society, 'Appropriate Habitat' in transforming societies, 'Ecology and Man-made Environment' in urban development, and 'Materials of Expressions' in architecture.² Arguably, the first two themes formed the main body of the conference discussions.

- *Continuity versus Change*

The influential figure who leads and fosters discussions regarding the theme of local culture and society was Nader Ardalan. Building upon a distinction between the notion of spiritual and material worlds, Ardalan's contribution became a point of departure for discussing the issues related to the theme of continuity versus change. In the 1974 IICA, Ardalan questioned the western notion of linear progression, as manifested in the idea of time, and as understood in its threefold aspects of past, present and future representing a material world.³ Instead, by referring to the Persian-Islamic conception of time, taken from the Sufi-tradition, he proposed an alternative approach, where "commences with a specific beginning, the creation, and through a cyclical motion repeats the very act of the first creation in an ever ascending spiral which seeks transcendence and ultimate timeless union with the One."⁴ He connected, then, this notion with his concept of *Khalq-e Jadid* (the New Creation) where the word 'new' expressed "a cyclical manifestation of archetypical ideas"; for generating a timeless and spiritual architecture. This timelessness, he pinpointed, is developed "through time and form as simultaneous continuities."⁵

Ardalan's speech became a controversially talk within the context of the 1974 IICA. Western architects such as Buckminster Fuller and Georges Candilis criticized Ardalan's view on the notion of time and continuity, while non-western architects such as Balkrishna Doshi, and Hassan Fathy praised Ardalan's position on the concept of the New Creation. For instance, Candilis expressed that the idea of continuity is not just formal and spiritual, but also related to everyday practices. Similarly, Fuller challenged Ardalan's notion of spiral time. In Fuller's view, the concept of time and its linearity were essential for accumulating knowledge and human progress. According to Fuller, new technological innovations and findings proved that human achievements, to date, were very limited, and "99.9 [percent] of what is going on [in this world] is invisible." While he pinpointed that "[t]his invisible world is very much less psychic," he called for developing a new architecture based on integrity.⁶ In Fuller's view, this integrity can be achieved through learning from experiences of the past, and simultaneously, employing available technologies and new techniques.

As opposed to Fuller and Candilis, Doshi and Fathy supported Ardalan's concept of the New Creation. In his speech, Fathy pinpointed that technology and industrialization depleted the value of traditional techniques and architectural patterns that created a sense of participation among people for developing their settlements.⁷ He also argued that the application of new technologies should be limited to building materials production. This would ease, according to Fathy, the access of each member of community to the needed construction resources, and allow them to keep largely their design principles for the construction. Similarly, Doshi criticised the misuse of technology and called for a return to a human-scale architecture. According to Doshi, "[t]he pattern of change is due to the notion that all problems of development in the world are basically connected with economic affluence." Then, he argued that the purpose of industrialization is not only to achieve economic prosperity, but also "to give man increasing leisure so that his quality of work, through time and reflection, will improve." In line with Ardalan's proposal, Doshi suggested that "[w]ith today's technologies, it is easy to build a new world, which can link with the great past in terms of basic values, and with the future in terms of convenience for the larger number."⁸

Conspicuously, Ardalan and Doshi made a call for a study and in depth documentation of the adaptive architecture and technologies of traditional settlements as well as the analysis of the principles relevant today upon which the traditional architecture is based. Aside from the matter of local culture and society, the 1974 IICA extensively addressed the issues regarding the development of large-scale housing and human environment. In these discussions, Western and Japanese architects played a central role and the participants of the Team X group in the 1974 IICA led the debates on the theme of 'Appropriate Habitat'.

- *Appropriate Habitat*

In the 1974 IICA conference, the role of industrialization in developing human-scale habitat also became a main topic for the discussions, led by the two influential figures of Team X: Jacob Bakema and Georges Candilis. Interestingly, they described human habitat as a total environment where its structure is formed from a continuous string of identical fragments that would accommodate growth and change over time.⁹ In this model, as Bakema argued, the continuity of the spatial units plays a significant role. In his speech 'Continuity and Change', Bakema put emphasis on spatial, physical and visual relationship between individuals and the built environment. He claimed that the architectural elements could change, while the relationship they produce should remain permanent. To

reinforce his claim, he compared the vernacular architecture of Bazaar in Tehran with that of in Lijbaan in Rotterdam and argued that in both cases the structure of urban space forms a relationship between different spatial units, creating a continuity. Then, by introducing the idea of *architecturban form*, Bakema claimed that this big form, the total environment, can be taken in bit by bit, for developing human habitats.¹⁰

Georges Candilis further elaborated on Bakema's notion of bit-by-bit development of space. In his speech, 'Appropriate Habitat', Candilis gave an overview of his contribution to the famous PREVI Experimental Housing Project Competition of 1969 in Lima, Peru, where he along with 13 international architects such as Fumihiko Maki, James Sterling, Aldo van Eyck and Charles Correa, among others, were invited by the Government of Peru to propose ideas for low-income housing. Candilis described this project as a big failure, since each architect would have to build his/her proposal as an isolated entity; and he defined the 'real problem' of housing as "to find the direction, the method, not only by building houses, but [also] what house one must built, a total house with its environment: a habitat."¹¹ Candilis also pinpointed that architects should enable people to build their own houses and environment, and for so doing, the only technological means that designers could employ is local materials and construction techniques that are dependent on available resources.

These diverse and extensive discussions catered for the provision of the 1974 IICA resolution. Expectedly, the discussions regarding the theme of 'Continuity and Change', and 'Appropriate Habitat' formed the main body of this resolution. Notably, the resolution indicated that "through research studies, a code of human habitat should be developed with such procedures and strategies necessary to the achievement of principles essential to the creation of a wholesome, balanced and equitable habitat."¹² As noted earlier, Ardalan and Doshi urged the significance of documenting the patterns of inhabitation. In this view it comes as no surprise to see that the resolution explicitly pinpointed the importance of translating the conference discussions into spatial codes and design patterns to "form a working tool suitable for use by all decision makers involved in the shaping of human habitat in time and place," all around the world.¹³ Subsequently, within a year after the 1974 event, the discussions were drafted as a series of codes and patterns in a document known as the 'Habitat Bill of Rights', where Ardalan and Doshi played a crucial role in preparing the document.

First UN Habitat Conference & the Habitat Bills of Rights

Often referred to as 'Habitat I', the first-ever United Nations Conference on Human Settlements was held over 12 days in Vancouver, Canada in 1976. The largest UN meeting at that time, the conference was a global event that tackled the problems of adequate housing and urbanization, not just of the West but also of the Developing World. A major outcome of this event was the Vancouver Declaration – the founding document of what later can be to be known as the United Nations Human Settlements Programme (UN-Habitat) active even today¹⁴.

The conference was also unique as it attracted people across the board, from missionaries like Mother Theresa to architects such as Buckminster Fuller. Among these participants were also several of the architects who had come together at the 1974 IICA, such as Charles Correa who was invited as a Consultant to the Director-General of the conference. It was also during this event that the 'Habitat Bill of Rights' was presented.

As Iran's contribution to Habitat I, the document Habitat Bill of Rights aimed to define the qualitative issues connected with the design of houses and their grouping into new communities as a supplement to other codes and regulations developed for quantitative issues related to the construction of buildings.¹⁵ Drafted by 5 key participants of IICA, Nader Ardalan, Jose Luis Sert, Moshe Safdie, George Candilis, and Balkrishna Vithaldas Doshi, it was based on four main themes: 'Dwelling', 'Cluster', 'Pedestrian Precinct', and 'Urban Community'. Each theme was discussed world-widely, and started with a short introduction, substantiated with observations, and explained with additional photographs, diagrams and text. Indeed, this document was an attempt to identify common patterns of inhabitation in industrializing and industrialized societies, and describe problems which occur over and over again in our environment. Then the document provided the core of the solution to each problem. In other words, each solution is stated in such a way that it gives the essential field of relationships needed to solve the problem, but in a very general and abstract way.

To elaborate on these problem-based solutions, a few examples can be mentioned. For instance, in the category of Dwelling, the document defined a common issue among most large-scale housing schemes developed with industrialized methods in a short time as the rigidity of spatial layout; so this would not allow for the existing patterns of family life. As a solution, it referred to traditions of domestic architecture in each country that would provide valuable references for contemporary designs; and it proposed that "the interior and exterior layout of new dwellings should incorporate a contemporary reflection of the cultural values and living patterns of the prospective residents."¹⁶ At the community level, the document, as an example, described that the design of much new housing "no longer relates to the human scale or the environmental needs of individuals." As a solution, it stated that "the

number of dwelling units in a cluster may vary from ten to fifty depending on family size and structure, social customs and housing density”.¹⁷

Similarly, a series of issues and related solutions were described for the themes of Pedestrian Precinct and Urban community. Interestingly, most solutions emphasized the importance of developing a low-rise, high-dense, and car-free human settlements with optimum integration of communal facilities and income-generating activities to the structure of neighbourhoods. In all recommendation points, local patterns of inhabitation were described as the point of departure for designing human settlements and as a tool for the integration, arrangement and configuration of public and private urban spaces.

An Alternative Modernism

Arguably, these guidelines form a basis for fostering and promoting an alternative way of adapting modernism to industrializing countries. As mentioned earlier, along with the well-known western participants of the 1974 IICA, a number of emerging architects from developing countries, such as Nader Ardalan and Kamran Diba from Iran and Charles Correa, Balkrishna Doshi and Raj Rewal from India also came to become important participants. They incorporated the ideas discussed in the conference and those drafted in the Habitat Bill of Rights into their private commissions for housing schemes and master plans in their respective countries.

- *Nader Ardalan*

After his graduation from Harvard University in 1962, Ardalan experienced technological design at SOM in San Francisco. Upon his return to Iran in the mid-1960s, Ardalan received a generous state-funding support from Farah Pahlavi for conducting a research about the development of Islamic architecture under Iranian influences. While the general scope of this research was in line with the state-sponsored project of creating ‘cultural nostalgia’ that intended to romanticize Iran’s Islamic heritage, in his research Ardalan offered a new typological insight into the evolution of Persian architecture. Ardalan believed that timeless architecture could be achieved through an understanding of traditional forms and archetypes.¹⁸ Ardalan conducted an in-depth study about the relation of spirituality and materiality in architecture. In his seminal book ‘The Sense of Unity: The Sufi Tradition in Iranian Architecture’ published in 1973, Ardalan saw Islamic Sufi-tradition as the most direct manifestation of Iranian culture and he argued that these influences can be traced in geometric forms, spatial organization, orientation and place.¹⁹

Ardalan also offers a new interpretation of the concept of Iranian traditional house. Contrary to a common notion of public-private as a driving force for creating spatial organization in Iranian home life, Ardalan’s division was based on the notion of the material and the spiritual. In this view, the spatial organization of the built form and its materialization are to transcend the spiritual life of men. While Ardalan described gateway, garden, and room as three main elements of traditional Iranian houses, he emphasized that “the architectural conception of garden reflects the ‘sense of place’, the garden being viewed as a defined space encompassing within itself a total reflection of the cosmos.” He also defined walls as a prerequisite for defining and isolating garden, the sacred place’, “within which the soul can be sensed and its spiritual quest fulfilled.”²⁰

While Ardalan in his early works heavily relied on technological innovations to incorporate modernist design principles with the characteristics of traditional Iranian architecture such as his designs for Tehran’s Saman Apartment Towers (1968) and Central Office of Behshahr Industrial Group (1970), he employed the concept of the New Creation in his later works such as Iran Centre for Management Studies in Tehran (1974), Bu-Ali Sina University in Hamedan (1977), and Nutan Community Town in Isfahan (1978) [Figure 1].

Figure 1: Ardalan’s works before and after the 1974 IICA.

- *Kamran Diba*

While trained as an architect at Howard University, Washington, in the early-1960s, Diba has a keen commitment in asserting the phenomenon of architecture as something simultaneously universal and rooted in its circumstance. Taking inspiration from the philosophical discussions provided by his closest friend, Nader Ardalan, Diba's approach might be seen as an architectural manifestation of Ardalan's 'the New Creation'. Diba believed that critically looking at the past and adapting vernacular elements to new circumstances would upgrade the current culture of architectural design and provide a condition for moving forward. This dynamic phenomenon, according to Diba, runs parallel to the life of men, so people's everyday life and habitual practices represent their culture.²¹ In this process, Diba contends, what should not be eliminated from people's everyday life is the original local culture as the root of their society, since this authentic culture creates a foundation on which new 'things', such as a new architecture, could be built. That is why Diba believed in a 'creative reinterpretation' and 'recreation' of the vernacular elements as a condition that local culture and universal civilization would synthesize.²²

The architecture of Diba took one-step beyond the concept of the New Creation, though. While taking inspiration from local archetypes such as traditional Iranian courtyard house and the Persian gardens, Diba put more emphasis on the importance of developing a community that would accommodate growth and change and form a basis for a strong collective identity.²³ Arguably, Diba's interest in developing such a community model might be related to his critical view on the traditional structure of Iranian society. According to Diba, to a large extent, "Persian culture is individualistic, family-oriented and anti-community," so in the age of globalization that social issues and demands of urban life bring people together, new neighbourhoods cannot be constructed based on ethnic segregation and religious distinctions.²⁴ In this view, it comes as no surprise to see that the 1974 IICA's debates on the theme of 'Habitat' had a substantial impact on his later works such as the housing scheme for Shushtar-Nou. In his early architectural projects such as Tehran Museum of Contemporary Art (1968) and Jondi-Shapour University (1970), Diba literally employed formal characteristics of traditional Persian architecture such as monumental appearance and took inspiration from representative architectural elements such as Badgir (wind-catcher) and enclosed courtyards. Obviously, these features can be traced in the two mentioned projects. However, the conference discussions and the Habitat document deeply influenced Diba's later works, in particular that of Shushtar-Nou, designed in 1976. For instance, as the Habitat document recommended, "the fundamental Persian sense of place [is] based upon the concept of the container and the contained [and it] should be incorporated in all urban developments at the scale of precinct, cluster, and dwelling." To clarify this point, the document provided a series of diagrams indicating a clear spatial network "defined by houses a buildings, with a clear hierarchy, from the court of the house to the court of the cluster, to the square of the precinct, and to the city as a whole."²⁵ Interestingly, this hierarchy of ever-increasing levels of privacy and the related illustrations explicitly resembles Diba's explanatory sketches about the spatial configuration of Shushtar-Nou depicted in the 1986 Aga Khan's technical report. In this configuration, the districts, neighbourhoods, sub-neighbourhoods, and individual houses were clustered around a chain of communal outdoor spaces [Figure 2].²⁶

Figure 2: Diba's works before and after the 1974 IICA.

- *Balkrishna Vithaldas Doshi*

In a career that has spanned more than sixty years, including projects across the board, from single-family houses to townships, and institutions and cultural buildings of national importance, Balkrishna Doshi (1927) has been instrumental in shaping the discourse on architecture not just in India, but globally. As Le Corbusier's assistant for close to 7 years, first at his atelier in Paris, and then later in Chandigarh and Ahmedabad, as well as Louis Kahn's assistant for the Indian Institute of Management, also in Ahmedabad, one could argue that Doshi's early works are a synthesis of what he learnt from both Corbusier and Kahn, but tempered to reflect and suit India's culture, climate and landscape.²⁷ ATIRA Housing, his first scheme for low-income housing in Ahmedabad from 1957 makes ample

references, in both form and material expression, to Corbusier's Villa Sarabhai, also in the same city. However, by the 1970s, one can notice in Doshi's works a gradual move away from the language of his masters, and a search for an 'Indian identity' in his architecture. In his designs for the Life Insurance Corporation Colony, also in Ahmedabad, from 1973, a series of stepped terraces allow for each family to colonize and extend their homes over time - an idea inextricably linked to his observation of life in India, and the housing one can find throughout the subcontinent.

This idea that architecture must allow for growth and change over time is explored to the fullest in Doshi's Aranya Low-Cost Housing project in Indore, for which he also won the prestigious Aga Khan Award for Architecture in 1995.²⁸ But more interestingly, this project also shows more clearly the translations of the ideas co-authored by Doshi in the Habitat Bill of Rights to an actual commission.

Designed in the 1980s and funded by the World Bank, Aranya is an outcome of both the Habitat Bill of Rights as well as the ideas of 'Sites & Services' championed by John Turner in the 1960s and 1970s. Planned to eventually house a population of 60,000 people in some 6500 dwellings across 85 hectares²⁹, Doshi's master plan for Aranya included a labyrinth network of roads, pathways and open spaces, and a variety in the type and size of plots available to different income groups. The poor, for example, were given just a plinth and service core that could be expanded by them into larger houses at a later time. However, apart from providing these plots in a detailed master plan, Doshi's office was also responsible for designing and building 80 demonstration houses, with the intention that future residents of this site could learn and educate themselves about the possibilities of each of their individual plots.³⁰ Here again, like in his design for the LIC Colony in Ahmedabad, there is a strong focus on establishing the relationship between dwellings and their neighbourhood, all the way from the individual unit to the scale of the community. Today, Aranya has grown to resemble those very settlements celebrated in the Habitat Bill of Rights, where an intrinsic mix of dwellings, narrow streets and open spaces create community, and not just mere compositions [Figure 3].

Figure 3: Doshi's works before and after the 1974 IICA.

- *Charles Correa*

Educated at the University of Michigan and at MIT, Charles Correa (1930-2015) played a pivotal role in shaping modern architecture in India. Widely credited as a pioneer in low-cost architecture and affordable housing, not just in India but around the world, Correa was from the very beginning of his career interested in issues of affordable housing and planning suited to India's climate and traditions³¹. Beginning with his early experiments in the 1960s with climate responsive architecture - what he referred to as "form follows climate" - we find a series of projects that dealt with creating an energy-passive architecture that through their very shape (often linear arrangements with complex sections) created the necessary environments needed to live in a hot country like India. Projects such as the Tube House (1958), PREVI Housing (1969), and of course, Kanchanjunga Apartments (1969) are all a result of this approach and showcased Correa's brilliant ability to adapt his Western education to the context of developing countries. However, by the 1970s and especially in the 1980s, we find in his work a turn towards a more vernacular approach. Rather than the linear arrangement of the earlier typologies, Correa now drew inspiration from the layouts and silhouettes found in Indian villages, focusing instead on houses clustered around courtyards and other shared community spaces.

While Correa was not one of the co-authors of the 1976 Habitat Bill of Rights, one can draw, especially in this second phase in his work, parallels between the ideas discussed in the Habitat Bill of Rights and Correa's own theories. In fact, in his seminal book *The New Landscape*, published in 1985, Correa makes his own argument for a "Bill of Rights for housing in the developing World" which advocated the following seven principles:

Incrementality, Pluralism, Participation, Income Generation, Equity, Open-to-Sky Space and Disaggregation.³² However, it is especially in his understanding of the spatial hierarchy of urban form where one can find ample similarities with the themes of ‘Dwelling’, ‘Cluster’, ‘Pedestrian Precinct’ and ‘Community’ elaborated in the Habitat Bill of Rights with those advertised in *The New Landscape*. “The room (the cell) is only one in a whole system of spaces which a family needs” Correa wrote in the essay ‘Architecture in a Warm Climate’ “The system is usually hierarchical, starting with the private family zone and moving on to the doorstep (where you greet your neighbour), thence to the water tap or village well (the community meeting place), and finally to the great *maidan* (the principal focus of the city).³³

A built, physical expression of these ideas can be found in what is possibly his most well-known plan for affordable housing: the Incremental Housing project located at Belapur in Navi Mumbai (formerly known as New Bombay). Designed in 1983, this project brings together all the principles mentioned in *The New Landscape* in a low-rise high density neighbourhood designed for a variety of income groups. At its most basic, the scheme is characterized by a cluster of 7 dwellings grouped around a courtyard measuring 8 meters by 8 meters. These dwellings, of which there are several types, range from single room huts of 16 square meters to two-storey townhouses of 75 square meters. Designed as individual free-standing units, each of these contain crucial open-to-sky space that allow for the possibility for growth and change over time. When mirrored, rotated and repeated at the scale of the urban layout, these clusters produce complex fractal patterns that together form a neighbourhood for 600 families at a density of about a 100 dwellings per hectare along with the provision of schools, open spaces and other amenities. More akin to the layout of an Indian village, the six-hectare site showcases Correa’s skills as a site-planner and manufacturer of urban patterns concerned both with the scale of the dwelling and the city [Figure 4].

Figure 4: Correa’s works before and after the 1974 IICA.

- *Raj Rewal*

The idea of designing low-income housing that is inspired by vernacular architecture has been thoroughly explored since the 1970’s by another Indian architect who participated in 1974 Congress: Raj Rewal (1934). Educated in New Delhi and London, Rewal worked in the office of Michel Ecochard in Paris, before setting up his own practice in New Delhi.³⁴ However, unlike Doshi and Correa, whose portfolio’s show at least two distinct phases (the first more Western approach, and the second, a search for more ‘Indian’ sensibilities), Rewal has managed to develop over the last three decades a consistent *oeuvre* of housing projects all based on the idea of stacking and staggering units clustered around courtyards inspired by the vernacular architecture of India.

Rewal has also been able to apply these principles in all categories of housing; from affordable housing to housing for middle and upper-middle income groups. A clear example of his design principles can be found in the Sheikh Sarai Housing project in New Delhi from 1984 that contains apartments for different sections of society. Here, a dense pattern of low-rise high density blocks are situated around a network of collective open spaces interlinked by shaded pedestrian pathways that recall the architecture of old Indian towns such as Jaisalmer and Jodhpur.³⁵

Rewal worked on several variations of this idea of clustering and stacking, often also with stepped profiles such as in the remarkable low-income housing project for the City and Industrial Development Corporation (CIDCO) built in 1988 in New Bombay (Navi Mumbai). However, it is his design for the Asian Games village in New Delhi (1982) that best exhibit Rewal’s ideas for generating habitat. Spread over 35 acres, Rewal’s master plan included almost 500 dwellings (200 townhouses and 300 apartments) in an urban pattern that uses peripheral streets and cul-de-sacs to create a central pedestrian spine of “courts and streets” of various scales³⁶. At the scale of the dwellings themselves, there is a wide variety in the sizes of units, all choreographed and clustered ingeniously to create distinct neighborhoods, with clearly defined private and collective areas. In many ways, Rewal’s housing

schemes have a continuity in form, resembling megastructures of interlinked courtyards and passageways defined by buildings two to four stories tall often framed by gateways or *darwaza*'s, that yet again, reference the vernacular architecture found throughout North India and echo the principles published in the Habitat Bill of Rights [Figure 5].

Figure 5: Rewal's works after the 1974 IICA.

The Aga Khan Award for Architecture

The conference of 1974 and the publication of the Habitat Bills of Rights also helped bring together Ardanan, Diba, Doshi, Correa and Rewal, among others, who later in different capacities, played significant roles as members of the Aga Khan Award for Architecture (AKAA). Established in 1977 by Aga Khan IV (His Highness the Aga Khan), the AKAA aims to recognize and promote excellence in the field of architecture in Islamic societies. As an agency of the Aga Khan Development Network (AKDN), the award is presented in three year cycles to a multiple of projects with a cash prize totalling 1 million US Dollars (making it the largest architecture award in the world). However, from its very inception, the award made a conscious decision to not only cover issues related to restoration and the design of public buildings, but strove to provide a platform that looked into - and celebrated - projects that dealt with issues related to squatter housing, community improvement and other forms of development. As such, the award stands out till today in being the only major architecture award that not only looks into these varied and complex issues, but does so while also promoting often unknown architects and agencies for their work.

This has been the case from the very beginning of the AKAA. For the First Cycle of the Award (1978-80), a Steering Committee comprising of some of the most well-known western and non-western architects, including Nader Ardalan, Charles Correa, Hassan Fathy, William Porter and Sir Hugh Casson, among others, held a series of meetings and discussions along with HH the Aga Khan where they formulated the agenda and scope of the award. In addition to this, a separate Master Jury that included the likes of Giancarlo de Carlo, Kenzo Tange and Muzharul Islam reviewed and judged the numerous nominations that cut across the length and breadth of the Islamic World. Recognizing their difficult task, the report of the Master Jury praised the AKAA for venturing into previously uncharted territory, and acknowledged that "The present is a period of transition - a period when traditional heritage is being rediscovered, when new experiments are being made to combine modern technology with cultural continuity in both richer and poorer countries, and when there is urgent search for socially responsive forms of architecture for the poor majority".³⁷

The awarded projects are in themselves testament to the AKDNs broad outlook, which in the First Cycle included celebrating the design for a five-star hotel, as in the case of the Mughal Sheraton Hotel in Agra, India, as well as a government-assisted self-help community planning program, such as the Kampung Improvement Program in Jakarta, Indonesia. In many ways, this across-the-board thinking has remained the blueprint for AKAA through its many cycles, leading up to the present Fourteenth Cycle of the Award (2017-19), having now awarded over a 100 projects in countries all the way from Denmark to Burkina Faso.³⁸ Most crucially, what stands out about the AKAA is that unlike other major awards in architecture (such as the Pritzker Architecture Prize or the RIBA Gold Medal), the AKAA does not celebrate an architect's *oeuvre*, but evaluates very thoroughly, through an intense technical review process, projects that confront some of the most urgent issues that face society today.

Conclusion

It is without a doubt that the 1974 IICA played a major role in aligning western and non-western trajectories of architecture at a crossroads. As a result of the debates and deliberations that took place in Iran, and the subsequent publication of the 1976 Habitat Bill of Rights, the first UN Conference on Habitat and the formulation of the AKAA, soon after, it is clear that these events together helped broaden the discourse on architecture to include previously ignored regions. By facilitating discussions on adapting modernism to the architecture of transforming societies, one could even argue that these events had a role to play in the development of theories such as 'Critical Regionalism' - a term first coined by Alexander Tzonis and Liane Lefaivre in the late 1970s as a reaction to the placelessness of the International Style dominant at that time.

Charles Correa, for instance, often referred to as one of the prominent proponents of Critical Regionalism went on to build prolifically not just in India, but also abroad. A notable project is the very last building he built: the Aga Khan Ismaili Centre in Toronto that opened in 2014. Sharing a large 6.8 hectare site along with Aga Khan Museum, designed by the Japanese Fumihiko Maki, another participant of the 1974 Congress, the building is in many ways a monument to the ideas of modernity and identity that occupied much of Correa's work and thinking throughout his five decade long career. Perhaps, without any of these events, he may have never received the exposure necessary to acquire such international commissions. Or more recently, the "architecture's highest honor", the Pritzker Architecture Prize in 2018 may not have gone to Doshi.³⁹

But of course, the impact of these events go well beyond helping private practices. The IICA, for example, also helped set the stage for forming collaborations amongst the various participants of the Congress. In 1977, Ardalan collaborated with Candilis to design the Bua-Ali Sina University in Hamedan, Iran. Whereas, Diba sought the assistance of Rewal and some other Indian architects to help work on the design for Shushtar-Nou, partly completed in 1978. In this view, it comes as no surprise to see a strong resemblance between the works of several of these architects, most notably in the similarities between the design for Shushtar-Nou and Rewal's Sheikh Sarai Housing project in New Delhi [Figure 6].

However, it is the AKDN through its many collaborations and platforms that remains even today the most important platform for recognizing - and promoting - architecture across the world. Through its extensive documentation of projects around the world (8000 at last count), and aided as well by the establishment of the Aga Khan Program for Islamic Architecture at Harvard University and the Massachusetts Institute of Technology (MIT), the AKDN has played an unparalleled role in helping widen the discussion on architecture to include previously ignored areas in the discourse on urban development. Arguably, in the absence of platforms for discussing architectural ideals such as CIAM and Team X, the AKDN remains as the leading platform for fostering debates in architectural knowledge and production, not just in developing countries, but globally.

Notes on contributor(s)

Seyed Mohamad Ali Sedighi graduated as an architect from TU Delft, in 2009. Between 2010 and 2014, he worked as guest lecturer at and was co-founder of Architectonic-Group at the Iran University of Science and Technology (IUST). In 2013, he received an honourable mention certificate from the Ministry of Housing and Urban Development for his housing design in Abrisham Town, near Tehran. Since 2014, he has been working on his PhD research related to the design of affordable housing in Iran. He also works as guest teacher at the chair of Architecture and Dwelling, TU Delft. Recently, he awarded a MIT grant (GAHTC) for his research proposal: 'the Architecture of Public Housing in the Cold War Middle East: The Example of Iran.'

Rohan Varma graduated as an architect from the KRVA, University of Mumbai. He was awarded both the Tata and Mahindra Scholarships for higher studies abroad and received his Master's in Architecture (with honourable mention) at the Delft University of Technology. Prior to coming to the Netherlands, he worked with Charles Correa for two years. In 2015 he established IND, a cross-disciplinary firm based both in Mumbai and Amsterdam. Varma combines his work as an architect with developing his PhD 'Public Housing in India' at TU Delft and is co-curator on a travelling exhibition on the housing designs of Charles Correa.

Post-War Transnational Planning Practices: Victor Gruen's Proposal for Tehran's Low-Cost Housing (1966-1969)

Elmira Jafari*,

* PhD, Department of Architecture, TU Delft, e.jafari@tudelft.nl

Abstract

While the communication of architectural/planning knowledge between core and periphery countries was intensified during the Cold War, it brought about new challenges regarding the relationship between imported ideas and the architectural culture of the host countries. The first master plan of Tehran, prepared by Victor Gruen and Abdolaziz Farmanfarmanian in the late-1960s, is an example of such cross-cultural dialogue, in particular with reference to the design of housing. This paper aims to examine how the first master plan introduced new low-cost housing strategy for the city of Tehran and how it affected the rapid marginalisation of the urban poor in the capital. Through a short review of the emergence of low-cost housing in Tehran since the 1940s and the examination of the two phases of the master plan, this paper seeks to unravel the complexity in the exchange of planning ideas from Western countries to Iran. In turn, the translation of Western ideas into domestic architectural vocabularies is examined through the changing local situation and the role of local mediators. The paper concludes that the privatisation of housing shifted the spotlight from state-led low-cost housing into the luxuries high-rise residential complexes which changed socio-spatial structure of the city.

Keywords: Tehran's master plan, Victor Gruen, Privatisation of housing, marginalisation of the urban poor

Introduction

The social and physical structure of Tehran was extensively altered and modernised under the socio-political influences of the Cold War, particularly during the 1960s and 1970s. Iran's oil-rich reservoirs put the country at the cross-section of global influences, politically, economically and even technologically. Under such influences Tehran, the second fast growing city in the Middle East after Cairo, transformed from a small concentric Islamic town into a linear modern metropolis, and the city's population jumped from 1.7 million in 1956 to 2.7 million in the mid-1960s¹. To plan a new structure for the rapid growth of the city and to solve the acute housing shortage, many Western architects, urban planners and advisors (such as Victor Gruen and Constantinos Doxiadis) gained commission to work on the Tehran urban planning project in collaboration with Iranian joint ventures. As a result, Western architecture and urban planning initiatives, methods and techniques were exported into Tehran and were translated into local practices. In this complex process, a new physical and social structure for the future growth of the city was provided; the structure which still characterises the modern Tehran.

While during the early post-war decades, the state's endeavour was more focused on the formalisation of spontaneous settlements in the capital through the construction of several low-cost housing projects in Tehran's peripheries. There is a body of existing scholarship focusing on Tehran's state-led housing projects, including the work of Rana Habibi and Mohammad Ali Sedighi, who have analysed the emergence of early modern mass housing projects in Tehran, the complex process of their localisation and their lasting impacts on Tehran's housing form;² however, the first master plan's approach towards Tehran's acute housing problems and its socio-spatial consequences remains almost untouched, despite the significance of the plan in Tehran's urban planning history. In addition, this paper provides a framework to trace the changing strategy of low-cost housing in the Iranian post-war context.

During the 1960s and under the direction of several invited architects and urban planners from Europe and America, Tehran was planned as a modern metropolis. At that time, Tehran had an urgent need of 80,000 affordable houses.³ Understanding of how the master plan dealt with increasing housing demands necessitates a deeper study of the plan. Although the plan attempted to put low-cost housing in the same line with the future development of the whole city, this paper argues that in reality it resulted in the isolation and immobility of the urban poor by sequestering them in the south and adjacent to growing industrial areas. Through a short review of

the state-led low-cost housing projects in Tehran and thoroughly examination of two phases of the Tehran master plan, 'Concept Development' and 'Detailed Plan', the paper investigates the changing strategy of Tehran's low-cost housing during the post-war period. In addition, through a close analysis of the master plan's intentions and actual goals for low-cost housing, this paper not only aims to unravel the plan's housing strategy, but also touches upon its lasting socio-spatial impacts on modern Tehran.

The early state's endeavour to formalise Tehran's spontaneous settlements

During the post-war era, Tehran's accelerating population growth transformed the housing shortage into a housing crisis on an unprecedented scale. Tehran first became an industrial city in the 1930s, comprising 43% of the country's total industries by 1935.⁴ Becoming the country's second industrial core, after the oil region of Khuzestan, resulted in a dramatic influx of working class migrants into the capital. The hope for finding jobs and the better standard of living attracted more and more people from farther cities and villages. As a result, the population of Tehran increased from 200,000 to 2 million between 1927 and 1962.⁵ The growing population, the lack of suitable houses, and concomitant increase in housing costs, was not equally matched by an increase in the wage levels. Consequently, a large part of the population grew unable to pay for suitable housing accommodation. It was at this point that the first Seven-Year Development Plan⁶ (1949-1956) underlined that the intervention of the state is that of importance. So, the state play a significant role through "subsidising housing projects and encouraging and assisting private enterprise in building houses for those of lower income groups"⁷. In that context, progressive intellectuals in Iran concerned about the increasing housing problems in the capital. In the early 1940s, the Society of Iranian Architects endeavoured to get the answer by interpreting and criticising of Western mass housing concepts.⁸ To examine Tehran's housing problems and review Western solutions, many housing-related articles were published particularly in the journal of 'Architect' (1940-1948), a well-known Iranian architectural journal of that time. By understanding the socio-economic context of the city, Iranian architects attempted to localise the Western concept of mass housing during the Iranian post-war context.

Although the way of living in Western mass housing is in contrast with the Iranian traditional lifestyle, the importance of mass housing as a major solution in developed countries should not be overlooked in Iran. Besides, we should not simply imitate Western style mass housing. Through the localisation of Western ideas, we should make mass housing projects more compatible with the Iranian context.⁹

In his article on 'Tehran's housing problems' published in 'Architect' journal, Abbas Ajdari, one of the members of the Society of Iranian Architects, examined two different approaches towards Tehran's serious housing shortage: first, encouraging the development of empty lands within the city by controlling land speculation; second, the construction of mass housing in fringe areas with low land values, which did not interest private housing developers.¹⁰ During that period, the over-population, increasing rents and land prices in the central area of Tehran made the de-centralisation of the population necessary.¹¹ As a result, the construction of low-cost housing in Tehran's peripheries got a prominent place on the development agenda, especially after the approval of the first Seven-Year Development plan in 1948.¹² One decade later, the approval of the 'Public Land Ownership' Act in 1960 was a turning point in the history of Tehran's development; the Act was primarily oriented towards the construction of low-income housing outside the city limits rather than rehabilitation or renewal of blighted areas within the city.¹³

To mitigate severe housing problems of the capital, the second Seven-Year Development Plan (1955-1962) promoted a more active role for the government in housing provision.¹⁴ In order to finance the construction of affordable housing in Tehran's peripheries through long-term loans, the government entered into close collaboration with Mortgage Bank, Construction Bank, and Industry Bank and several public sector agencies.¹⁵ Subsequently, a number of new mass housing projects for low and middle income residents were constructed in the immediate post-war period until the early 1960s. These included: 400-unit housing (1944-1946), Kuy-e-Narmak (1956), Kuy-e-Kan (1958), Shahr Ara (1958-1959), Nazi-Abad (in the early 1960s), and Kuy-e-Nohome-Aban (1965-1966).¹⁶

As a result, mass housing projects began to mushroom around the city. The areas in which these projects were located only provided very basic services for the residents, rendering such dormitory suburbs highly dependent on the central area of Tehran.¹⁷ Furthermore, dispersed state-led mass housing projects did little to ameliorate social tensions and housing shortages in the capital.¹⁸ Those projects were unable to keep up with Tehran's incremental housing demands (by the mid-1960s, Tehran's population had reached nearly 3 million). Indeed,

housing the increasing population and regulating the rapid outward growth of the city necessitated the provision of the first master plan for the future development of the city.

The first Master Plan of Tehran and marginalisation of the urban poor

In the context of the Cold War and intimate connection between Iran and the United States, Victor Gruen, an Austrian-born émigré architect in America, gained a commission to provide the first master plan for the capital in collaboration with an Iranian joint venture, Abdolaziz Farmanfarmaian. As the first scientific urban planning in Tehran,¹⁹ Gruen brought new visions towards restructuring the city from different social, cultural and economic perspectives.

[. . .] In a near future, Tehran will be a totally different city. Its population will increase 80 percent (around 5.5 million) in 25 years. To meet the increasing demands of the population a larger area is necessary for the city. The complex process of expanding the city will put a crucial economic pressure on the government.²⁰

After three years of research into the spatial, socio-cultural and economic situation of the capital, in order to reduce the increasing pressure on the existing city the master plan recommended the de-centralisation of urban facilities and services. Gruen proposed a linear arrangement of six new satellite towns (each with a main active urban centre) in an east-west direction running perpendicular into the existing north-south direction (Figure 1). The plan thus structurally transformed Tehran from a monocentric city into a multicentre metropolis. Ensuring the westerly growth of the city, Gruen attempted to counteract the existing north-south expansion. Through the rapid development of the urban centres of distant new towns in the west, the plan aimed to attract the population and capital towards the west.

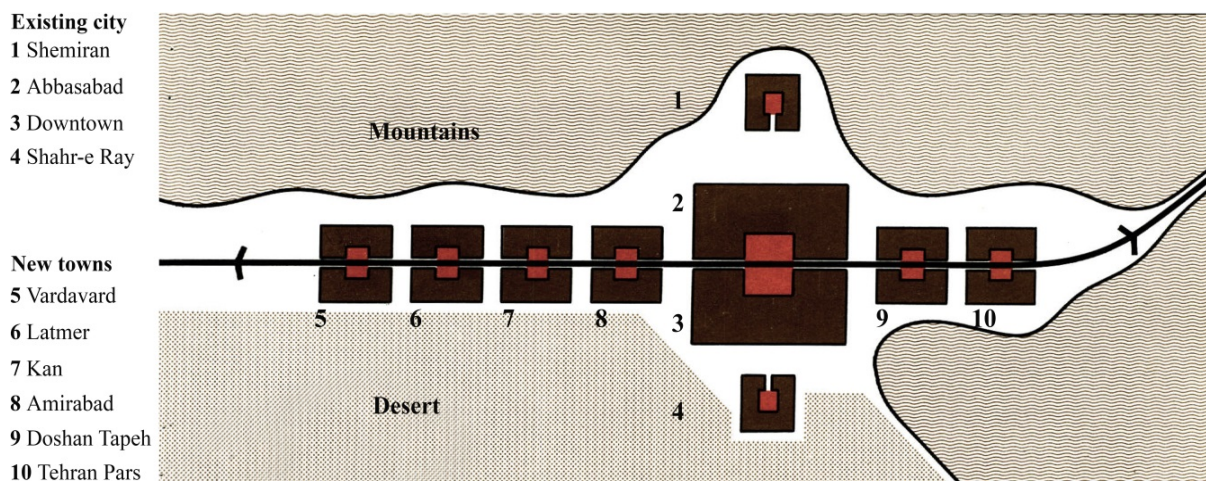

Figure 1: The preliminary diagram of Tehran's new linear structure including the existing parts and the six proposed satellite towns

Along with planning a new structure for Tehran, the provision of low-cost housing was one of the major concerns of the master plan. The urban poor acutely suffered from the housing shortage and were not able to solve it without the government's assistance.²¹ Therefore, improving the housing situation of the low-income families was of central importance. The master plan divided the problems of low-cost housing into two levels: (1) the urgent need to either re-construct or rehabilitate unsuitable houses in the old central areas which roughly estimated around 200 hectares; and (2) the rapid construction of new accommodations for both the influx of rural-urban immigrants and those who needed to be displaced by urban renewal (according to the master plan, these totalled around 600,000 people).²²

After reviewing a few cases of state-led mass housing in Tehran's peripheries, such as Kuy-e-Nohom Aban and Kuy-e-Kan, the master plan highlighted the government's disability to fully financially support the realisation of Tehran's future massive low-cost housing projects. The plan underlined the government's first obligation to support the city's development through the rapid implementation of new infrastructures rather than highly invest in housing construction. In order to solve acute housing shortage in Tehran, in terms of the location, typologies, financial policies and their integration with urban activities, Gruen put mass housing strategy in the same line with Tehran's de-centralisation and its future development. Unlike the previous strategy of the construction of mass-housing in the distant cheap-price lands, the master plan attempted to integrate the low-cost housing districts into the new linear structure of the city.

The physical re-distribution of social classes

As mentioned above, Gruen's proposal emphasised a linear development pattern. To physically re-distribute and de-centralise the population, the master plan put too much emphasis on (1) car-based mobility and (2) income levels. "Most of the master plan's analysis was based on future trends of car ownership"²³. Besides, increasing differences among social levels was that of central importance. In order to clarify the transformation of socially homogeneous structure of the old city, the master plan illustrated the huge difference between the traditional and existing social pattern of Tehran (Figure 2). By assuming that the poor could not afford a car, they were re-located in the south along with the linear structure of the city thereby positioning them closer to growing industries in the south. In fact, the plan more concentrated on the middle class –which was rapidly expanding since the Second World War– by positioning them in the middle belt of the city and in close connection with active urban centres (figure 3). Though the master plan situated the increasing urban poor nearby their possible workplaces, segregating them gave rise to their immobility, social isolation and less integration with the whole active system of the city.

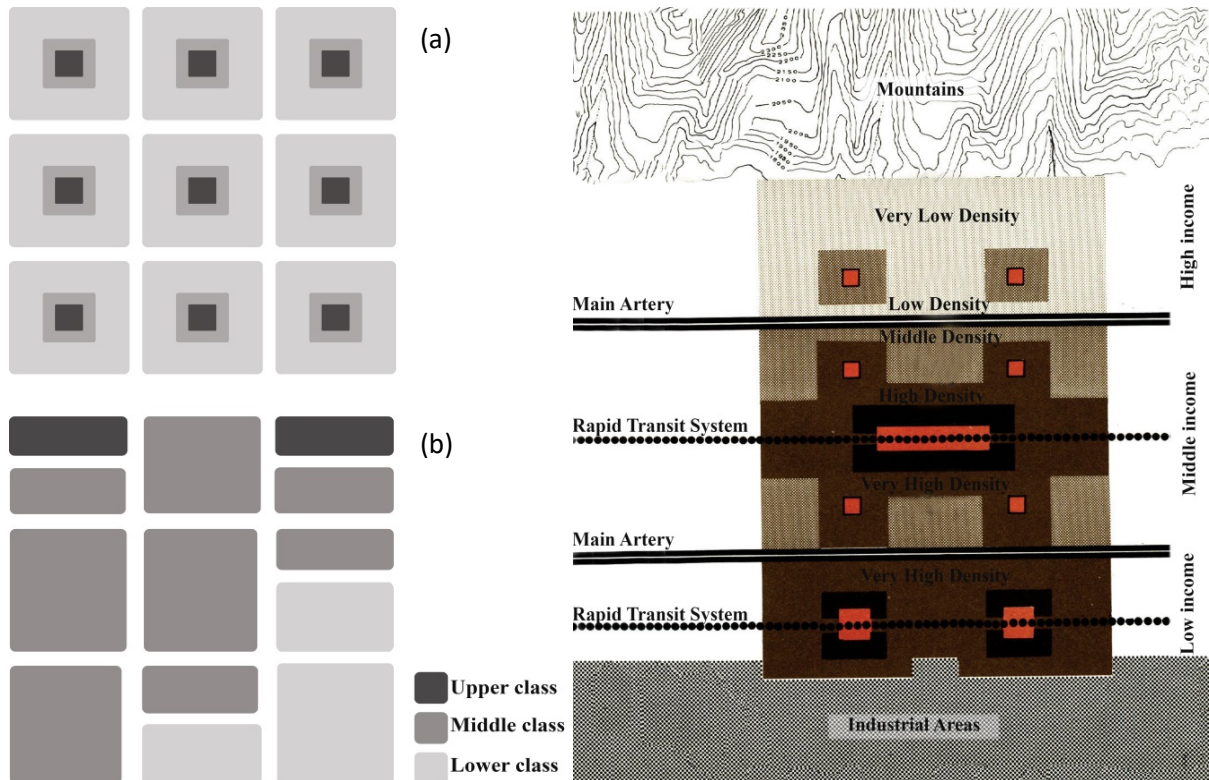

Figure 2 (Left): Diagrammatic representation of the homogeneous social structure of the traditional city of Tehran (a) compare to the social segregation in Tehran during the 1960s (b).

Figure 3 (Right): Re-distribution of social classes in the new linear structure of Tehran proposed by the first master plan.

To support the linear way of development, the master plan put emphasis on the rapid development of the farthest new satellite towns. Thus, the most strategic one, Latmer, was elaborated as the model of a modern satellite town. In detailed plans for the development of Latmer, a huge part of the town in the south (adjacent to the industries) was allocated to low-cost housing to home those who had to leave their houses in the old centre due to the urban renewal project. Because of the value of the land next to industries, the low-income district was designed based on the small plots of land with highest density (Figure 4).

Latmer's master plan

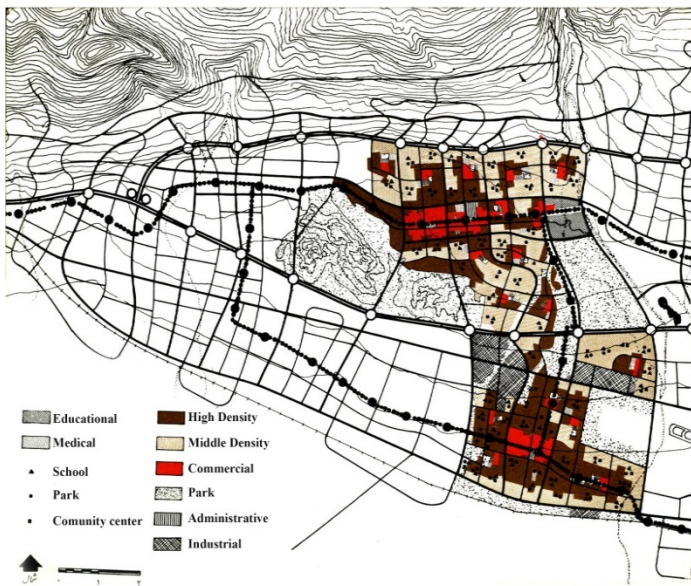

Figure 4: Detailed plans of the new satellite town of Latmer. The top image shows the position of Latmer district. The below image at the left shows detailed plan of Lamer, and the right image illustrates the planned typology for low-cost district located at the south side of Latmer.

Privatisation of low-cost housing and its socio-spatial reflection upon the city

To meet the increasing demands of the lower income residents, the master plan almost entirely relied upon free market activity through the privatisation of housing.²⁴ In contrast to early state-led attempts to alleviate Tehran's affordable housing crisis, the master plan did not indicate the need for the state to pursue the active program of low-income housing. In order to realise the privatisation of low-cost housing, the master plan emphasised the encouragement of not only private housing sectors through the state's financial support, but also private industries to provide accommodations for their workers in the south.²⁵ Both were financially supported by the state through tax exemption, long-term and low-interest loans, decrease in the price of land and such promotions.²⁶ Arguably, the master plan shifted the state-led low-cost housing strategy towards unguided private sector housing development. In the book *Privatisation and its alternatives*, William T. Gormley, thoroughly examines the controversy of privatisation: At its best, privatisation can reduce the costs of government and introduce new possibilities for better service delivery. At its worst, privatisation can raise costs and has the potential to undermine other important values, such as equity, quality, and accountability.²⁷

In the context of Tehran, the effects of the privatisation of housing were aligned with Gormley's analysis, leading to the rapid marginalisation of lower income groups. In other words, the financial facilities proposed by the government encouraged private developers to invest in high-rise and large-scale projects for privileged.²⁸ In the first master plan for Tehran, "questions of culture, class, and social discrimination were not the focal concern of the early modern planning approaches in Tehran."²⁹ As a result, public authorities chose to intervene less and less in the housing market for the disadvantaged. According to Tehran Development Council's analysis of the first master plan in 1976, "the master plan advocated a housing policy which was tailored to higher income consumption patterns"³⁰. In fact, modern housing became an apparatus to modernise the society and change their traditional form of life; transforming the social norms and values; and introducing consumer culture and new social roles for women.

Generally speaking, due to decreasing returns, private enterprise was not that much willing to provide low-cost housing. Consequently, private housing investment shifted towards luxurious high-rise buildings in outer areas, such as ASP (1969); Eskin (1972); Ekbatan (1970s); and Sharak-e Farahnaz known as Shahrak Omid (late 1970s), despite the fact that Tehran still suffered from a shortage of affordable housing (Figure 5). The master plan's strategy to solve Tehran's housing problems formed a foundation for later housing strategies. Tehran witnessed a high-rise boom during the 1970s, supported by the unprecedented Iran's oil boom, which changed the city's built form "from low-rise to high-rise and from single developments to large new towns, constituting a complex and ever-expanding metropolis"³¹. Regarding the high-rise revolution in Tehran, New York Times published an article in 1976:

During oil boom, Tehran's low-lying skyline has been sprouting modern high-rise building [. . .] The trend towards the construction of high-rise residential buildings is incompatible with the traditional needs of Iranian families [. . .] the high-rise building form could be very detrimental to the traditional aspects of Persian life.³²

Figure 5: Tehran's high-rise boom during the 1970s. The top image shows ASP residential complex built for high-middle families. The below image at left shows the King Mohamad Reza shah and his daughter, Farahnaz, visiting Farahnaz (or Omid) high-rise residential complex in 1978. The below image at right shows the construction of Farahnaz residential complex during the 1980s.

Additionally, The effect of commodification of housing resulted in land speculation and the surging price of housing to very high levels. This situation brought about a continual decline in the quality and the number of low-cost housing stock in the capital. It also had direct repercussion on the social structure of the city, creating a harsh social polarisation which continues to affect the social geography of Tehran until present. In other words, the master plan's housing strategy gave rise to social polarisation which was cemented by spatial inequality which remains as a dominant feature of the city. In short, the incapacity of the city to meet the housing demands led to the development of "squatter" housing, as an alternative way to deal with housing problems (Figure 6).³³

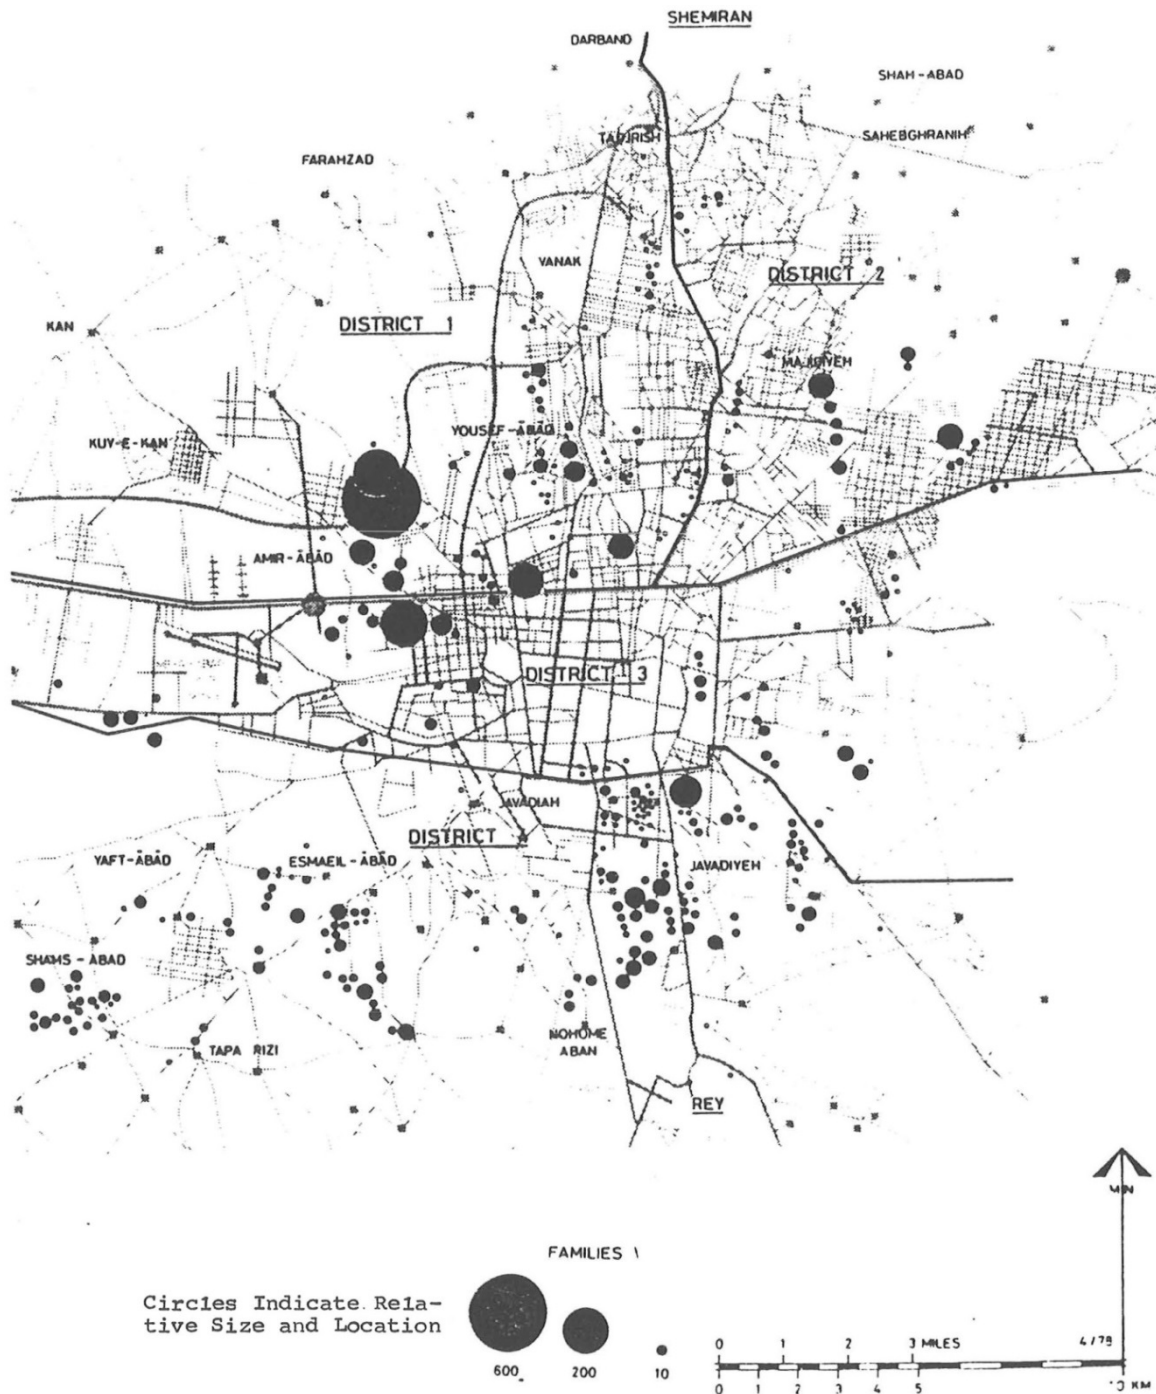

Figure 6: Size and distribution of squatter settlement in Tehran, 1972.

According to increasing problems of the city, Tehran Development Council “headed by Prime Minister Amir Abbas Hoveyda”³⁴ was formed in 1975 to evaluate the master plan and supervise the implementation of municipal plans.³⁵ Therefore, an in-depth assessment of the master plan was undertaken in 1976 to determine which parts of the plan were still viable and could continue in effect with only minor modification.³⁶ According to the analysis of the Tehran Development Council, Tehran’s master plan was a land use plan, therefore, found to be weak in the areas of social, economic and administrative programs.³⁷ Regarding housing strategies, Tehran Development Council’s report highlighted the wrong prediction of Gruen’s master plan about increase in family incomes and the probable decrease in the number of low-income families. By this assumption, the major focus of the plan was on high and middle income families, while the reality was thoroughly different. According to the Tehran Development Council’s statistics the income distribution became dramatically exacerbated between 1965 until 1972. Thus, Tehran Development Council suggested the urgent revise of the master plan to meet the needs for low-income housing and preparing public services for the poor districts of the capital.³⁸

Today, informal and spontaneous settlements are expanding in an alarming rate in the capital. The inefficacy of the official housing market to provide the urban poor with suitable houses has resulted in the fast expansion of these informal settlements.³⁹ The lack of state-sponsored housing market in Tehran can be traced back into the 1960s when the third Five-Year Development plan (1963-1967) encouraged the emergence of the private housing sector through offering tax breaks, long-term low-interest loans and such financial facilities. Thereafter, the process of privatisation of housing was further intensified by the first master plan’s housing strategy (1966-1969). As a result, the private sector investment grew to overshadow the public sector in Tehran. In this market-led system of housing, private housing firms profited from the government financial support if they built mass housing in towers of ten stories or higher.⁴⁰ They were luxurious buildings for the privileged, however, the growing numbers of the urban poor were suffering from the severe housing shortage.

Conclusion

In Iranian post-war contexts, affordable housing in Tehran underwent substantial changes, especially through a complex process of transnational practices. Tracing these changes represents a sudden shift from the dispersed affordable mass housing led by the state (during the 1940s to the early 1960s) into the privatisation of low-cost housing which intensified by the first master plan (1966-1969). The plan repeatedly highlighted the necessity of alignment of low-cost housing with the new structure of the city; however, it arguably failed to fulfil the increasing demands of affordable housing due to the promotion of privatisation of housing. Although the master plan attempted to improve the urban life of the poor, its privatisation strategy resulted in the marginalisation of the disadvantage. By ceasing the state’s endeavour to formalise spontaneous urban poor settlements, the first master plan released the government to directly take lead the low-cost housing. This market-led system of housing highly promoted by the master plan shifted the spot light from the avant-garde state-led low-cost mass housing into the luxurious high-rise residential buildings for wealthy middle-income. Additionally, the privatisation of affordable housing without any direct control and support of the government led to the noticeable reduction of the quality of their houses and in turn their urban life.

In spite of the plan’s early intention to integrate the urban poor with all socio-cultural and economic urban activities to let them freely climb the social ladder of the city, relocation of low-income families in the south and close to industrial areas made them less immobile, isolated and segregated from the whole city’s urban activities. In other words by too much focusing on car-based mobility as well as social levels, the plan almost was unsuccessful in getting the poor more involved in the active urban life of the city. It can be argued that the master plan marginalised affordable housing for the rising urban poor through the privatisation strategy and shifting the spotlight into high- and middle-class residences. To sum up, the effect of the plan’s housing policy can be divided in two levels: first, rapid reduction in quality and quantity of the low-cost housing stock; second, unprecedented residential high-rise boom and the radical transformation of building forms in the capital. In fact, the plan housing strategy resulted in a rapid top-down socio-spatial polarisation of the capital on a metropolitan scale.

68 Planning Connections through the Iron Curtain: Phases, Themes and Impacts

Planning Connections through the Iron Curtain: Contexts, Phases, Themes and Impacts

Stephen Victor Ward (Oxford Brookes University), Rosemary Wakeham (Fordham University) and Laura Kolbe (University of Helsinki)

This paper introduces the panel 'Planning connections through the Iron Curtain'. It shows how links between Western countries and the USSR evolved after the Revolution. Western interests in the new Soviet Union were initially channelled through national 'friendship societies' (created from 1923), orchestrated in Moscow by VOKS (from 1925) and Intourist (from 1929). Meanwhile the USSR actively sought Western expertise to help shape its industrial and urban development. By 1930, more Westerners, particularly from Germany and the United States were visiting or working in the USSR. Best known were the brigade of Frankfurt modernist architect-planners led by Ernst May, recruited at the time of the 1930 CIAM conference. For their part Western governments and companies increasingly sought trade and business possibilities, while (to varying degrees) remaining suspicious of the political implications of such connections.

By the later 1930s, Soviet desire to use Western expertise had dwindled although a few foreign designers remained resident. Yet Soviet authorities still attracted (largely admiring) Western visitors (and hard currency), including many architects and planners. There were some but fewer visits in the other direction. After the hiatus of the Soviet-Nazi pact, relations between the Western allies and the USSR were cemented in the common struggle against Hitler. Soviet urban planning was widely perceived as a resonant model of bold and comprehensive state-led post-war reconstruction. Meanwhile town twinning between Western and Soviet cities from 1944 enabled direct inter-urban contacts, building on the alliances or transcending the enmities of 1939-45. Yet although Western regard for Soviet planning grew, actual visits ceased in wartime.

The onset of the Cold War further inhibited Western-Soviet planning connections. With some success, Western governments sought better links with some new Soviet satellite states in Eastern Europe. However, from the mid-1950s, under Khrushchev, technical and cultural contacts with the USSR itself greatly improved with urban planning a key point of interest. This largely reflected Soviet desires to tap Western expertise in planning (especially new satellite town development) and housing (especially industrialised methods). Links improved, especially with France, Britain, the Nordic countries and West Germany. Exchange visits became relatively common, surviving even disruptions like the Hungarian invasion of 1956 and the Cuban missile crisis of 1962.

From a Western perspective, interest in the USSR was fostered by the belief during the later 1950s/early 1960s that it would soon rival or overtake the USA, particularly in view of early Soviet successes in the 'space race'. This underpinned growing scientific co-operation which included developing scientific approaches to spatial planning. Yet although this and other areas of common interest continued, the attraction became more one-sided. Active Western desires for Soviet knowledge faded as the limits of its achievements in urban planning became clearer by the 1970s. However, growing global concerns fostered a Western anxiety to encourage Soviet interest in the environment because of the international impacts of not doing so. In the wake of the Chernobyl disaster in 1986, this dominated Western concerns until the USSR collapsed in 1991.

Learning from 'the planner's paradise': The 1936 Moscow visit of Sir Ernest Simon's team and its impact on British planning thought and practice

Stephen Victor Ward (Oxford Brookes University)

In September 1936, the well-known Manchester politician, successful businessman and leading member of the British planning movement, Sir Ernest Simon led co-researchers and family members on a month-long visit to Moscow. The aim was to examine its planning and other aspects of its governance in the wake of the renowned 1935 general plan for the city's reconstruction. This paper studies that trip, which Simon described as 'the most thrilling 4 weeks of [my] life'. The research uses Simon's own extensive handwritten diary of the visit and other relevant archive papers by members of the party. It also draws on the book, *Moscow in the Making*, which Simon and his team published in 1937, together with lectures, articles and his subsequent books, particularly his 1945 work *Rebuilding Britain – A Twenty Year Plan*. It was here that he described the Soviet capital as 'the planning paradise'.

At the time of the visit, Simon was a Liberal politician (he joined Labour in 1946) and prominent member of the Fabian Society. He and his wife, Shena (a co-author of *Moscow in the Making* and already a Labour party member) were friends of leading Fabians Sidney and Beatrice Webb. The latter partly inspired the Moscow visit and helped frame the questions considered. Although not part of a formal exchange, the visit coincided with a visit by the Mossoviet, the Moscow city government, to London and Paris. Despite this, however, the Simon team interviewed many members and officials of Mossoviet, together with various other agencies involved in city affairs. The party also interviewed various members of the expatriate community in Moscow, particularly Britons and Americans but also including several central European (modernist) architect-planners who were working in the city at the time. The party also visited many sites in and around the city, including those arranged and directly orchestrated by the hosts but also as informal unaccompanied walks around the city. The 1937 book produced by the Simon team has been regarded as one of the most perceptive Western accounts of Soviet city planning and governance at a time when most such accounts were excessively 'starry-eyed'. The visit's impact is gauged from Simon's involvements in the planning movement and British government during the later 1930s and especially during the war years. It is clear that Simon's impressions of Moscow's planning were distilled into policy advice which he gave to the British government and incorporated into his lobbying of public and political opinion. His message was balanced by other lessons he drew from other foreign countries and his extensive British experience. However, his essential message, to adopt a much bolder and more comprehensive approach to urban and regional planning, based firmly on greater state control (and preferably ownership of) of land, drew directly on his Moscow experience.

The Finnish-Soviet City Twinning meetings in 1969 and 1971 as a part on new neutrality policy in Europe

Laura Kolbe (University of Helsinki)

For almost 70 years, Finnish cities and towns have been forming friendship agreements with foreign cities, allowing them to collaborate in numerous ways with their international partners. The concept of friendship towns dates to the 1940s, but during 1950s a new dimension was added: Finnish and Soviet Union cities and towns started to collaborate across borders routinely. Historically, the steps in town twinning took place in the optimistic post-war spirit of reconciliation, cooperation and companionship.

Twin town relationships were created between many Soviet and Finnish towns, following the political YYA-treaty, meaning the agreement on “friendship, cooperation and mutual assistance between Finland and the Soviet Union” in 1948. In 1953 the first official arrangement was made between the cities of Lahti and Zaporozhe. In 1969, all in 49 cities and towns had entered into a twin agreement. Now, as the national cities unions in Finland and the Soviet Union finally made an agreement in 1969, this town twinning started to have a real relevance in international Cold War scene.

My paper analyses the presentations, speeches, declarations and petitions of the two large and first Soviet-Finnish twin city conferences, held in Leningrad (1969) and Helsinki (1971). They were the first meetings in series of eight twin city conferences (Tallinn 1974, Turku 1976, Kiev 1978, Jaroslav 1981, Tampere 1983, Riga 1985, Lahti 1988). During the first meetings, the “humane urban and traffic planning” became a central agenda. The aim was to demonstrate how planning could generate “peaceful living conditions” and “ease political tensions” on both sides of iron curtain. This friendship town network became an transnational chapter in the wide-ranging integration process that took place in Europe over 1970s, trying to bridge the iron curtain. Formal ties between cities gave additional support to national policies, trying to find out ways for peaceful cooperation, where the role of nonaligned Finland was fundamental.

69 **Shrinking Planning in the Historical Planning Context / Round Table**

Wed. July 18, 2018

Session 9 (2:00PM-3:45PM)

Hall, Yokohama Information Culture Center

Moderator:

Keiro Hattori, Professor, Ryukoku University, JAPAN

Participants:

Kiyonobu Kaido, Professor, Meijo University

Tomohiko Yoshida, Professor, Ritsumeikan University, Japan

Mihoko Matsuyuki, Associate Professor, Yokohama National University, Japan

This table discusses how the idea of shrinking planning can be evaluated in a historical perspective of city planning. Is it a contemporary approach or more permanent approach that may be considered as a common way of dealing the population change of the city? This roundtable discusses how shrinking planning will be recognized in a historical planning context. It will mainly focus on Stadtumbau Program that was implemented in former GDR states in Germany and also some vacant housing and vacant land planning policy in Japan.

The scheduled participants at this moment are: Keiro Hattori (Professor, Meijigakuin University, with a knowledge of shrinking policy in Japan and East Germany), Kiyonobu Kaido (Professor, Meijo University, with a knowledge of compact city policy in Japan), Tomohiko Yoshida (Professor, Ritsumeikan University, with a knowledge of suburban shrinking problem in Japan) and Mihoko Matsuyuki (Associate Professor, Yokohama National University, with a knowledge of current planning issues).

70 Formation and Evolution of Cities

Emergence, Evolution and Mutation: Interpretation of the Orderly Distribution of pre-modern Settlement in the Great Wall zone based on Complex Adaptive System theory

Haoyan Zhang (Suzhou University of Science and Technology) and Zhongjie Lin (UNC Charlotte)

Land-Use and Land-Cover Change (LUCC) Program is an interdisciplinary research project carried out jointly by the International Geosphere-Biosphere Program (IGBP) and the International Human Dimensions Program on Global Environment (IHBP), aiming to reveal the process of interaction between the environmental system on the earth and the human development including farming, industrialization, and urbanization. The Great Wall area represents the largest area of land-use and land-cover change in China in the past 300 years, when the borders of agricultural production and settlement continued to move northward, forming the pattern of settlements we see today.

The Great Wall, a magnificent ancient military defense works, runs consistently with the 400mm-precipitation line. It is not only a geographical boundary between sub-humid and semi-arid regions, but also draws a line that presents a dynamic balance between agricultural and nomadic nationalities. Due to the lack of an authority, the farming nationalities often faced threat from nomadic tribes, and tried to establish the order to avoid military conflict. In Ming Dynasty (1368-1644), the governing entities along the border were often characterized by a combination of its military and administrative functions in order to defend the invasion by nomadic trooper and reduce the damages. In Qing Dynasty (1644-1911), the farming-pastoral area was placed under the unified management. In order to achieve effective control, the central government Qing relies on the Great Wall and implemented regulations to limit resource flows across the Great Wall. In the modern time, with the formation of the global market and realization of long distance mass goods transportations, the border areas have been gradually integrated into a market network connecting China, Russia and Central Asia. This resulted in the transformation of the Great Wall areas from a military/political settlement system to an economic development pattern. Nevertheless, both the military settlements in Ming Dynasty (1368-1644) and the towns in Qing Dynasty (1644-1911) contributed to the process of the region's transformation from disorder to order, as well as the continuous improvement of the urban structure and its abilities of adaptation and development.

This paper focuses on the urbanization process in the Great Wall zone of China in pre-modern period to examine the model of border development, namely the transformation from a military system to an urban system. Based on the Complex Adaptive System theory, it sheds new lights on the phenomenon of the urbanization in farming-pastoral zone in pre-modern China and addresses several questions: Is the settlement system in Great Wall Zone a complex adaptive system? How to understand the mechanism, process, features of the system evolution respectively in Ming and Qing dynasty from the bottom up? To what extent does the settlement system evolve spontaneously? From a complexity science and systematic perspective, it will allow this paper to contribute to the interpretation of the particularity of the transitional zone of agriculture and animal husbandry in ancient China.

Planned and unplanned urban transformations of city center (based on the example of Vilnius city)

Dalia Dijokiene (Vilnius Gediminas Technical University, Faculty of Architecture, Department of Urban Design) and Inesa Alistratovaite-Kurtinaitiene (Vilnius Gediminas Technical University, Faculty of Architecture, Research Laboratory of Urban Analysis)

Urban development is affected by various types of factors: political, economic, social, cultural, etc. During the past three decades, in the Eastern European towns the conflict between uncontrolled suburbanisation and the traditional concept of the classical or harmonious town development has become prominent. A vision of development is missing in those towns and the quality of the urban process is deteriorating: the full-fledged urban planning genre is vanishing and the liberal tolerance, in a broad sense, of unregulated development is becoming more established. The latter may be considered to be unplanned urban development, but it radically contradicts the principals of the planned urban development established in the urban development process in the second half of the 20th century. One thing is clear – the physical shape of a town is often the result of interaction between both planned and unplanned urban developments. The recent decades of the 20th and the 21st centuries are particularly strongly characterised by a very intensive alternation of these factors in towns, which in the end, of course, impacts and alters the town itself. The presentation is based on a study of transformations in Vilnius' centre. The development of Vilnius city centre may be divided into several stages: natural development until the beginning of the 19th century, long-term urban development plans of the 19th century, development proposals as well as planned and unplanned development of the territory that has taken place in the 20-21st centuries. During the natural development stage, the city's urban texture developed adapting to the natural conditions – the main streets, their built-up and cultural, confessional, administrative urban complexes were set up. In summary, the analysis of the long-term urban development plans drawn up for Vilnius in the 19th century leads to a conclusion that those plans did not cause big changes of the key urban-structure features of the central territory that existed at that time but rather complemented them by adding new elements featuring the urban planning tradition of classicism. For instance, a new avenue emphasising the axial composition was built and became a new central street. A rectangular network of streets and blocks was developed as well. In the second half of the 20th century, radical urban transformations took place in the centre of Vilnius – the administrative-commercial centre was moved to the other side of the river Neris. The most intensive constructions of the 21st century are now taking place in that central territory.

The aim of the concrete scientific research discussed in this presentation is to use professional tools of the urban planning and design genre to manage a potential impact of both planned and unplanned urban developments, caused by the globalisation era, on the central part of Lithuania's capital city.

Planning an Automated Future: Histories of Technology, Sustainability, and Labour in the Port of Rotterdam

Victor Munoz Sanz (Delft University of Technology)

The increasing use of robotization and computer algorithms in industrial processes seem to indicate that we are heading to a future of workspaces without workers. Economists and technologists are registering the phenomenon, and offer roadmaps to guide society to the new paradigm. So far, however, little research has delved into the wider transformations that the generalized adoption of automation technologies may directly or indirectly cause in the planning and design of built environments. This gap evidences a disregard of the impact of economic decisions and the organization of industrial processes in the organization of spaces and society. By looking at the recent planning history of the Maasvlakte II area in the Port of Rotterdam, this paper examines the intersections between spatial planning, technology, and sustainability around the shift from labor-intensive industries and services to capital-intensive ones by adopting digital technologies and related platforms.

Since 2015, robotic cranes and automated guided vehicles do the work in the container terminals in Maasvlakte II, the latest expansion to the west of the port of Rotterdam. For the Rotterdam Port Authority, automation technologies were a synonym of efficiency—efficient use of land, time and energy—and therefore their implementation was integrated in the planning of Maasvlakte II and strict demands were imposed on companies aspiring to get a concession to operate there. In turn, these companies have made of Maasvlakte II a model workplace of an automated future. In these terminals, the machines follow instructions of a Terminal Operating System, while being supervised by humans in control rooms. On the surrounding logistical landscape, physical barriers and security checkpoints separate the realm of human bodies from that of semi-autonomous machines.

The paper shows how any radical planning vision driven by technology comes together with new challenges—in Maasvlakte II in particular labour conflicts, and the vulnerability of these infrastructural systems to cyber attacks. In defining through planning visions how territories are managed and organized for work, new modes of spatial segregation, inclusion, and vulnerability appear, calling for developing new forms of anticipatory planning and resilience. Looking backwards to such planning processes helps in understanding the processes that brought in certain outcomes and paths to technological and spatial lock-ins; examining the road to innovation, the actors at play, their interests, values, and motivations, and their consequences in the production of space reveal themselves as an useful matter for constructing scenarios to guide future actions. This paper builds on a long-term research being developed at the Department of Urbanism at TU Delft and Het Nieuwe Instituut focused on revealing full automation's hidden spatial production.

Analyzing 'Hybridity' in the Planned Settlements of Global South: A Methodological Approach to Study Contemporary Planning History

Sanjeev Vidyarthi (University of Illinois at Chicago)

How does one study the contemporary planning history of planned places that subsequently develop in an informal manner over time? This is important because, on the one hand, extensive literature documents how planners and decision-makers imported and imposed planning ideas and design typologies over unsuspecting populations of the global south during the colonial and postcolonial period. On the other hand, recent scholarship also describes the manner in which residents and users gradually shaped and altered the envisaged urban form of formally planned settlements, per local cultural preferences and practical needs, creating new forms of urbanism (Vidyarthi 2015). Emphasizing the extra-legal and subversive nature of such acts, many scholars, however, coalesce the diverse range of constituent city-building processes under catchall terms like 'hybridity' and 'informality.' Given that archival records and updated maps in the global south are especially difficult to find, I hypothesize that employing an inventive research approach combining a mix of relevant methods can help study such places.

Illustrating the case of a formally planned neighborhood, built during the late 1960s at the Indian city of Jaipur, this presentation will explain a multi-method approach that helps study the contemporary history of unanticipated changes in the spatial form of planned places. Using four basic lines of investigation within the overall case study approach: archival research, interviews, Geographical Information System (GIS) analysis, and the neighborhood calendar technique—an adaptation of the life-event history calendar technique modified to collect a retrospective dynamic event history of "over time community level changes" (Axinn et al. 1997)—the proposed approach is particularly helpful for unraveling the role and purpose of relevant social actors and the origin and incremental development of constituent processes effecting long-term spatial change. The paper will conclude by describing both the underlying social phenomena and the actual spatial transformations in the urban form that scholars studying places in similar contexts may find particularly useful.

Emergence, Evolution and Mutation: Interpretation of the Orderly Distribution of pre-modern Settlement in the Great Wall zone based on Complex Adaptive System theory

Haoyan Zhang*

** PhD, School of Architecture and Urban Planning, Suzhou University of Science and Technology, China ,
empirez@126.com*

The Great Wall zone represents the largest area of land-use and land-cover change in China in the past 300 years, when the borders of agricultural production and settlement continued to move northward, forming the pattern of settlements we see today, realizing its transition from wartime to peacetime. Instead of focusing on the development of individual urban, how can we understand the evolution essence of settlement system, located in the transition zone between agriculture and animal husbandry, from the perspective of complex system? In this article, the distribution pattern can be considered as a spatial projection of region social order. Then, the fractal dimension of settlement distribution is calculated by GIS, so as to demonstrate the complexity of pattern. And then, characteristics and mechanisms of the settlement system in the Great Wall area during Ming and Qing Dynasties is further analyzed from 7 basic points of Complex Adaptive System. Finally, the idea of attracting basin can be used to make a further description about the process of evolution, namely structural break and non-structural evolution.

Keywords: settlement system, the Great Wall zone, generation and evolution, complex adaptive system theory.

Introduction

The area, where the Great Wall is located, lies in the transitional zone between the humid and arid regions in Northern China. Seated in the transition between farming and stockbreeding areas, the Great Wall has always been the confronting surface of different cultures, and significantly influenced the trend of the ancient geopolitical layout in Northeast Asia. Besides, the Great Wall area represents the largest area of land-use and land-cover in China in the past 300 years, when the borders of agricultural production and settlement continued to move northward, forming the pattern of settlements we see today.

Once in quiet a long period, the Great Wall was simply known as “a wall built for the defense against Tartars”, mainly linked with military management system and how military installations were distributed and constructed along the way. Lattimore, an American sinologist, put forward the idea of “Great Wall transition zone”, regarding such a mixture of economy and culture as a result from the interaction between prairie area and farming area, which went beyond the traditional concept of “boundary line” and the inherent single viewing angle of agricultural civilization. During the field visit in the area of the Great Wall, Gaubatz sensed the military settlement along the line and its influence in this area, and then distinguished the developing pattern of “conversion from military defense to civil use” in border towns from that in inland, which made the research about the Great Wall extended from its frontier history to the history of the towns and the civil society in this area.

Ming Dynasty(1368-1644) and Qing Dynasty(1644-1912), the last two ancient dynasties in China, showed the two different situations of the Great Wall area respectively in times of war and peace. The entire Ming Dynasty was involved in the sharp confrontation between farming and animal husbandry from its very beginning, while Qing Dynasty realized the regional peace by placing them two in a unified state order. Therefore, with the historical progressing of Ming and Qing dynasties, the Great Wall area actually realized its order transition from wartime to peacetime, where farming and animal husbandry were accustomed well to each other, and also to some other conditions like nature, politics, economy and military matters. Settlements are the most straight and striking landscape that human activities add to the earth. The distribution pattern formed by different settlements turned in to a spatial projection of “order” which is abstract. Obviously, the order space in the Great Wall area can be considered as a spatial settlement-system pattern related to the Great Wall, which consequently became a start point for the “spatial turn” of research on systematic relation in the Great Wall area. What’s more, the spatial projection of the order in this area was named “the-Great-Wall order belt” because of the striped distribution of the settlements in the Great Wall area.

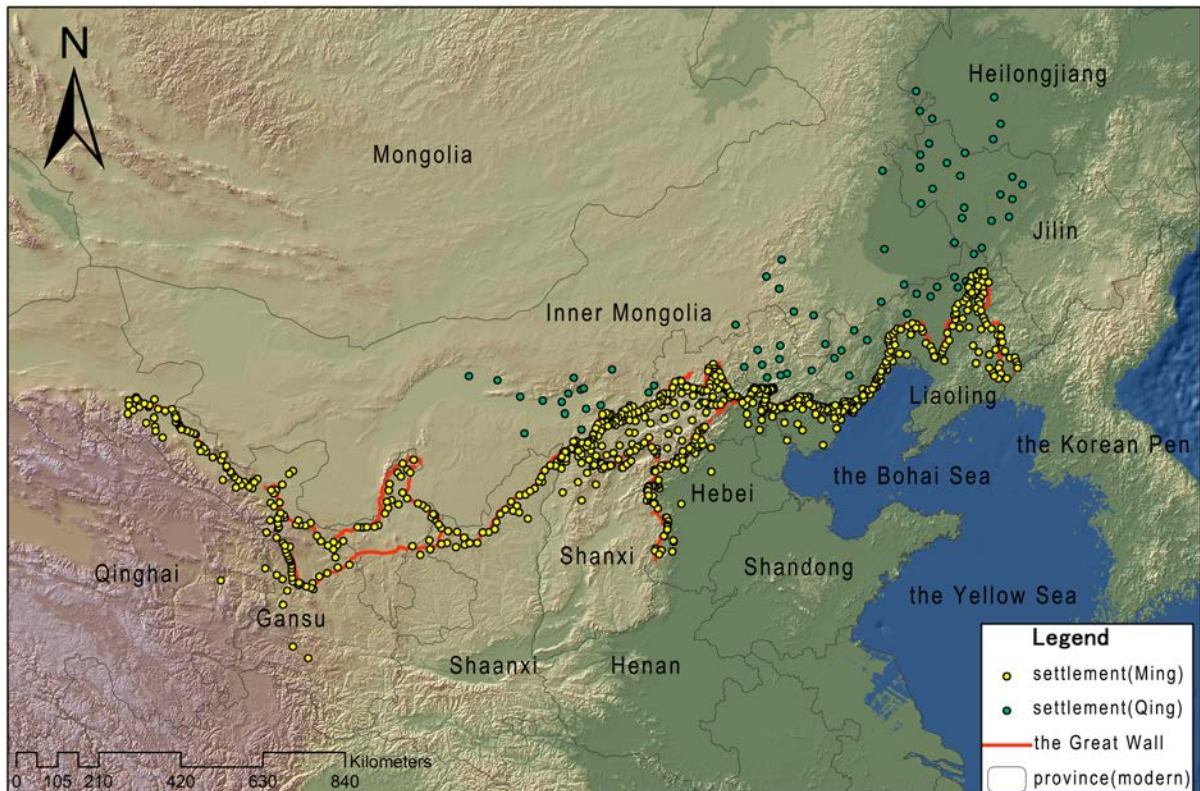

Figure 1: distribution of the Great Wall settlements in Ming and Qing Dynasties

1. Complex Adaptive System theory and the-Great-Wall order belt

1.1 Complex Adaptive System theory

Complex Adaptive Systems (CAS) was first mentioned by John H. Holland at the lecture held for the decennial of Santa Fe Institute and stated in the book named *Hidden Order* to explain the basic principle of the generation and operation mechanism of complexity. Its core concept is “adaptation builds complexity”¹. According to Holland, CAS was described as “a system that is made up of some interactive agents restricted by rules”.

Holland emphasized that adaptive agents were of active learning ability, constantly accumulating “experience” by reciprocal feedback with the outside world and accordingly adapting to external environment and other agents. An adaptive agent can pack the tested effective experience in modules and then generate the rule set (internal model) for its adaptation to the environment in the way of block stacking. A large number of agents gather according to “tags” and form the higher ranked agents (meta-agents) during interaction. Meta-agents are equipped with the specialty and structure—nonlinearity—that lower-leveled agents cannot achieve by simple addition. Also, meta-agents can continuously develop to another higher level—meta-meta-agents—by further aggregation.

1.2 The-Great-Wall order belt

The Great Wall order is the dynamic, balanced and stable state of the social organizations tied by the Great Wall, which appeared in the transitional zone between farming and animal husbandry under a specific historical circumstance, aiming to facilitate the regional structural transformation from “out of order” to “orderliness” and improve self-adaptive and self-developing abilities.

The-Great-Wall order belt spatially realized the order in the Great Wall area, reflecting on the means that the agent self-organizations took up the space. To be specific, the agent refers to the numerous individual persons. In Ming Dynasty, it meant the Ming defending warriors at the Great Wall and their family; In Qing Dynasty, it meant the Han immigrants in Mongolian land. With numerous agents gathering, settlements (meta-agent) and settlement systems (meta-meta-agent) started to emerge. Compared with agents (individuals), meta-agents (settlements) were easy to observe and analyze for the advantages of limited quantity, definite position and well-organized structure. Therefore, “the-Great-Wall order belt”, as a spatial concept, can be regarded as the settlement group distribution in the limited space under rule constraint, which also can be called the Great Wall settlement belt.

2. The spatial complexity of the -Great-Wall order belt

2.1 Method

Fractal theory, has been widely used in natural and social science fields to help understand the nonlinearity and complexity of objective things. Fractal dimensions are the parameters used to describe the irregular degree of fractals. Thereinto, grid fractal dimensions are used to describe the spatial distribution equilibrium of regional urban systems. The calculation is to cover point targets with the differently sized grids. While grid size r is varying regularly, the number $N(r)$ of the grids used to cover point targets will also vary accordingly. If the targets present fractal features in a certain scale, then: $\lg N(r) = -D \lg r + A$

D refers to the grid dimension, A is a constant, r refers to the grid size and $N(r)$ refers to the total amount of the grids whose side length is r and which are used to cover targets. The value of grid dimension is taken from 0 to 2: when $D=0$, it means towns gather together at one point; when $D=1$, it means linear distribution; when $D=2$, it means uniform distribution (Central Place Theory).

2.2 The fractal features of the-Great-Wall order belt

As the military settlement system in the Great Wall area during Ming presents the fractal characteristic in both spatial distribution and rank-size distribution³, this paper mainly worked out the grid fractal dimension for the spatial distribution of the Qing Great Wall settlement system. By ArcGIS10.3, a rectangle-shaped covering target was generated in the range of $108^\circ E \sim 128^\circ E$ and $39.5^\circ N \sim 48^\circ N$. Dividing each side into K section, the rectangular area is consist of K^2 girds, and $r=1/K$. First, the gird number N covered the points is counted, then the double logarithmic regression analysis of N and r is made. 1774, 1875, 1895 and 1911 are four nodes of immigration history in the Great Wall zone during Qing dynasty, so the grid fractal dimensions of settlement distribution corresponding to the 4 time is calculated respectively.

Table 1: Fitted Equation, R2and Grid Dimension of Grid Fractal of Global Towns during Each Time

	1774	1875	1895	1911
Fitter Equation	$\ln N_i = 0.990 \ln r + 0.752$	$\ln N_i = 1.018 \ln r + 0.689$	$\ln N_i = 1.125 \ln r + 0.545$	$\ln N_i = 1.429 \ln r + 0.217$
R ²	R ² =0.949	R ² =0.977	R ² =0.980	R ² =0.994
Grid Dimension	D=0.990	D=1.018	D=1.125	D=1.429

Figure 2: double logarithmic curve of grid dimension of the distribution of the Great Wall settlements in 1911

and bounds, having a good fitted degree. It indicates that the spatial structure of towns had taken its shape and started to get self-similarity.

It is shown as Table 1, the spatial distribution of towns presented a simple fractal characteristic. From 1744 to 1911, D was constantly increasing from 0 to 2 and R^2 was also rising, which reveals that the spatial structure was developing from integer dimension to fractal dimension through 3 major periods. ① Random period: In 1774, $D=0.990$. That shows settlements were randomly distributed with non-significant rank difference and low relative degree among them.

②Nurturing period: in 1774, $D=0.990$. In 1875, $D=1.018$ and $D \approx 1$, which shows the settlement in advantage of resources and location started to develop to greater towns and get the traffic lines between differentiation points.

③Developing period: In 1895, $D=1.125$, and in 1911, $D=1.429$. In this period, grid fractal dimension rose by leaps

3. The CAS-based cognitive framework of the-Great-Wall order belt

According to Holland, CAS has 7 basic characteristics: Aggregation, Tagging, Nonlinearity, Flows, Diversity, Internal Models and Building Blocks which are the necessary and sufficient conditions. Therefore, this paper made some further analysis on the characteristics and mechanisms of the Ming and Qing Great Wall settlement systems from these 7 points.

3.1 Stress reaction: spatial realization of the Ming Great Wall order

In Ming Dynasty (1368-1644), with Mongolians retreating to the prairie from central plains, the coexistence of mutually unrestrained multi-elements also got back to the transitional zone between agriculture and animal husbandry. One side is the northern prairie nomads represented by Mongol and Manchu, and the other side is southern agriculture-based regime of the Hans—the Ming Empire. Because of the absence of a higher ranked authority and mutual trust mechanism, the North and the South got involved in the violent competition for living resources. Compared with the self-sufficient agricultural economy, the animal husbandry economy which is single and unstable is determined to be more dependent on farm products. For that reason, the nomads seemed more proactive in such an imbalanced pursuit of mutual association. When looting replaced trading as the main means of association, it became urgent for Ming Government to build a boundary defending order, keeping the marginal agricultural region stable and reducing conflict possibility and expected loss.

For this purpose, Ming Government forcibly made the native inhabitant in the Great Wall area move out to the inland and a large number of armed forces and their families move in. Land was give away to these immigrants to make them feed themselves and guard for generations, artificially creating a buffer zone in the transitional area.

With the shared value and identity, these military immigrants formed differently sized military settlements by the rules of 5600, 1120, 112, 50 and 10 persons, and functioned respectively as guards, stationing, support and command according to their different locations and relative positions to the Great Wall. These settlements were distributed in radiate clusters approaching to the Great Wall: There were “Bao” fort, “Lu” fort and “Zhen” fort respectively at 3 different levels. The farther away from the Great Wall, the less the number and the higher the level.

Figure 3: the distribution structure of the Ming Great Wall settlements

As shown in figure3, the low-grade “Bao” forts were arranged next to the south side of Great Wall Line in the largest number. Several middle-grade “Road ” forts were located at the medium level. The high-grade “Zen” fort in each defense areas (there were totally 11 Zen foftrs along the whole line.) was located most away from the Great Wall.

The game between farming and animal husbandry was the root cause for the existence and development of the Great Wall order in Ming Dynasty, but its spatial formation was the result of the constant adaptation of agents to the environment. In the face of the natural environment , the agents adaptively selected sites and built fortifications based on the terrain or brought in external energies to support the army. To adapt to the rival, it meant that the system had to solve the question how to make the most effective and cost-optimal response to highly mobile and uncertain invasions in a wide range. Tiny negligence was bound to result in the huge and expected consequence—looting and the periodic damage caused by the climatic fluctuation in prairie.

It can be seen that the Ming Great Wall settlement pattern was the very response to the above-mentioned restraints, using the cluster pattern to make random attacks changed into the ones in relatively predictable order and making local responses by pre-planned supporting strategies.

The layered structure made defending extended in depth. On the one hand, the rear commanding settlement gained enough time to deal with the information from a wider defensive range. On the other hand, it was more difficult for the invader to get information in back-land, and the consequent information asymmetry between the two parties resulted in the one-sided military transparency. The cluster structure optimized effective defensive range on the basis of equal strength and pre-planned the optimal pattern for troop concentration: when the

prearranged supporting plan was triggered, differently graded supporting forces would intercept the invader at the expected attack points and march lines along the “branch”, so as to win the strength superiority over the invader. According to historical materials, such a military system, which seemed to be an achievement of Ming Dynasty, was actually a result of the trial-and-error process where agents “studied”, “collected experience” and constantly performed optimization, rather than a process accomplished overnight.

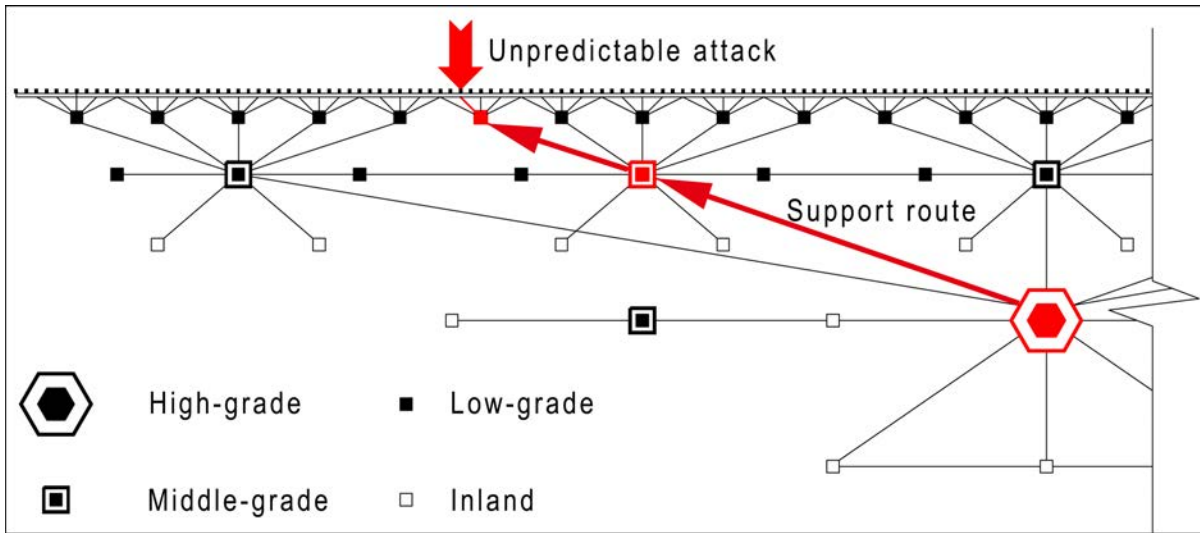

Figure 4: the stress response pattern of the Ming Great Wall settlement system

Table 2: the Characteristics of the Ming Great Wall Settlement Complex System

Number	Main Point	Key Word	Comment based on the Ming Great Wall Settlement System
1	aggregation	emergence	Because Ming warriors and their family were administratively forced to aggregate, the settlements of different sizes and functions emerged. Different settlements further aggregated and formed the defense systems in different defense area.
2	tagging	choice	Recognition of identity and subordination. Agents obediently gathered into settlements because of their identity as a military, and settlements were given different duties because of the different ranks of their commander, taking corresponding actions.
3	nonlinearity	Product effect	Spatial distribution and size-rank distribution were of fractal geometric feature. Settlement system can get a defending power more than the total number of people on its own side, for example, 3 settlements which had 1120 people in each one can successfully withdraw the attack of 3360.
4	flow	unidirectional passing	A transportation network was formed by settlement-post road, beacon tower-materials and information. The information about the enemy's situation was passed upwards by the fort closest to the Great Wall to higher graded settlements level by level, and then action directions would be passed down to relative settlements level by level. Provisions and warriors were also passed from high-leveled settlements to low-leveled ones in a unidirectional way.
5	diversity	cooperation	Settlements were different in shape, size and function. Even the settlements of the same level could have different functions and authority because of their different locations. The settlements assembled into differently functioned settlement systems according to the differences in quantity and grade.
6	internal	stress	Stress response mechanism. To resist against the uncertain attacks, the

	model		system would change from a regularly dispersed state to a regionally irregular state of aggregation.
7	blocks	fighting experience	The patterns that agents selected from plenty of practical experience were melted into the stress response mechanism, including the advantages, distribution and combinations of the settlements on different scale. For example, small fort were fit for guard; large fort were fit for dispatching; what's the proper distance for rescue; how much strength it was needed to withdraw the invasion of a certain scale; what are the possible lines for the enemy to advance or retreat.

3.2 Guide-balance: spatial realization of the Qing Great Wall order

In Qing Dynasty (1644-1912), Manchurian established a multi-ethnic country of Han, Manchu, Mongolian, Hui and Tibetan, creating favorable conditions for the development of the Great Wall area. With the realization of long-distance transportation of bulk commodities and the formation of trans-regional market, the Great Wall area turned into the transitional hinge communicating the goods from Chinese inland, Central Asia and Russia, rather than an economic marginal area, which highlighted the location advantage in this area. Therefore, in contrast to the settlement declination caused by “de-militarization” at the southern side of the Great Wall, the northern side kept on farming development and urbanization.

When the tripartite game emerged and the communication among nations was called for as an irresistible trend, it became necessary for Qing Government to construct a kind of management-and-control order in the transitional zone, so as to maintain the strength balance between them and the overwhelming superiority of Manchuria. As a result, the Great Wall, as a secret and disguised border, was playing its role of “isolation and controlling”⁴. On the one hand, the Great Wall was given full play as a hard border. Mongolia and Han were rigorously confined to the north and south of the Great Wall respectively, prohibited to cross. What's more, a depopulated zone was made out, extending dozens of kilometers wide along the Great Wall, where both farming and animal husbandry were forbidden to strengthen the isolation effect; on the other hand, the resources flowing into Mongolia were guided and managed by the controlled amount of issued passports and the appointed pass and route. As a result, although there was a thousands of miles boundary (the Great Wall) between the prairie and the inland, the elements on the two sides have to flow at an artificially higher cost.

Figure 5: evolution model in point-axes way

At that time, The-Great-Wall order belt was confronted with a problem how to realize the balance between environmental carrying capacity and immigrant population by proper distribution on the condition of the designated area open to immigrant. Compared with the Ming Dynasty, the Qing Great-Wall order belt presented the spontaneity more clearly in its building process. Starting from the assigned pass, the Han immigrants spread along the post road from the south of the Great Wall, and thus formed settlement groups and energy transportation network. With new immigrants continuously moving in, the central intensity was constantly growing in the area with

regional advantage, and the large transport corridor turned into the developing axis accelerating the further attachment of resources. While area polarization was coming to saturation, resources started their gradient transfer to the newly opened area, forming new aggregating point and extension line of connection. With that process repeating again and again, space would finally be filled in a “point-axes” way.

Table 3: the Characteristics of the Qing Great Wall Settlement Complex System

Number	Main Point	Key Word	Comment based on the Qing Great Wall Settlement System
1	aggregation	emergence	Because immigrants were induced by economic interest, settlements of different sizes emerged, such as villages, towns and cities. Different settlements further gathered into 3 different systems for politics, market and military matters.

2	tagging	choice	Immigrants aggregated at the destination because of their Han nationality and geographical relationship. Depending on whether there was a administrative governor or not and the rank of governor, different settlements were divided into central cities, prefectural cities, counties, towns and villages. The affiliation between different governors facilitated the generation of political settlement system. Besides, the different resource endowment promoted the formation of market network.
3	nonlinearity	power law distribution	The scale and spatial distribution of settlements followed the power law distribution.
4	flow	recycle	A transportation network of the system was formed by settlement-post road/ water way-personnel/information/materials. The exchange of personnel, capital, materials and information happened among the settlements within the system and also between the system and outside areas (inland and Mongolian land), which promoted the intake, conversion and metabolism of system elements and consequently advanced the formation and development of spatial aggregation.
5	diversity	plentiful	There was a variety of agent needs, settlement pattern and the settlement systems. The same settlement might have different functions in different system structures.
6	internal model	self-interest of rational individuals	Following the hypothesis of “economic man”, agents took revenue maximization and cost minimization as the motivation of their actions. By figuring out the current relation between population and environmental capacity, settlements could make a prediction about the population state in the next period, aggregation or loss, and then made some relative countermeasures.
7	blocks	Survival experience	In the practice of environmental reconstruction, agents constantly collected the experience on, for example, the appropriate size for environmental capacity. In the residential areas endowed with different resources, the settlement of different sizes were grouped into differently leveled administrative network, market network and garrison network by the group elements of central cities, prefectural cities, counties, towns and villages.

4. Structural mutation: a new perspective on the evolution of the-Great-Wall order belt

The-Great-Wall order belt in Ming and Qing Dynasty was the aggregating state of agents adapting to the specific historical environment in the transitional zone between farming and animal husbandry. This system was always staying in dynamic variation along with the changes happened in the external environment. Throughout the Ming period, when prairie power rose alternately, the Great Wall system kept on its local adjustment and optimization all the time. For example, in the early and middle Ming Dynasty, new settlements backgrounded by the war between Ming Empire and Mongolia were mainly built in the middle and western part of the Great Wall (Zhang, 2016). Latterly, in order to resist the rise of northeast Manchuria, the eastern part of the Great Wall turned into the key area to defense. In Qing Dynasty, with a different immigrating policy and national situation, settlements constantly spread in the northern area of the Great Wall. Even so, the-Great-Wall order belt in Ming and Qing Dynasty still kept their own component elements and aggregating pattern. Only at the critical moment of the transition from Ming to Qing, did the system got its structural variation—phase change, which means military immigrants→immigrants and administrative enforcement→economical inducement and defensive settlements→economical towns and cluster distribution→point-axis distribution.

Table 4: the Difference between the Great Wall Settlement System in Ming and Qing

	The Great Wall settlement system (Ming Dynasty)	The Great Wall settlement system (Qing Dynasty)
--	--	--

Order	War	Peace
Agent	Ming's soldiers and their family	Immigrant or refugee
Drive	Administrative force	Economic interest
Aggregation	Military immigrant→forts→defense system	Immigrant→towns→urban system
Function	Defense	Exploit
Mechanism	Stress response	Self-interest of rational individual
Distribution Pattern	Cluster	Point-axis

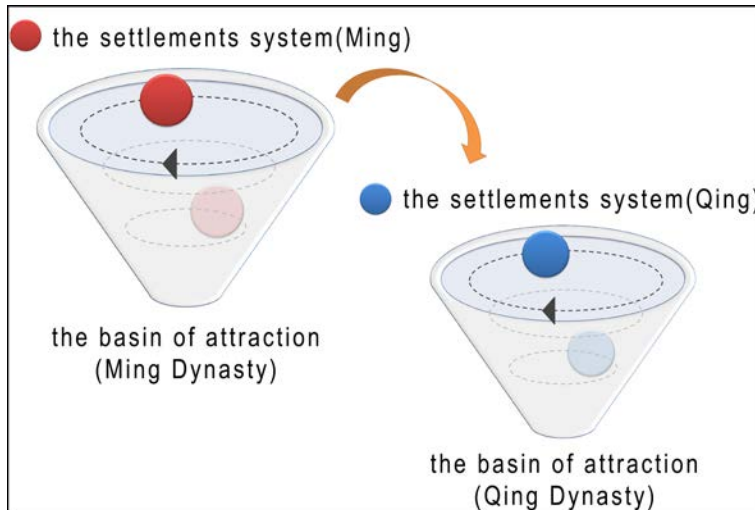

Figure 6: the evolution of settlements system in Great Wall zone in Ming and Qing Dynasties from the perspective of the attraction basin theory

The idea of “attracting basin” can be used to make a further description about this phenomenon, taking all the influential factors of the natural and cultural environment in the transition zone between farming and husbandry as a basin-shaped set of points and the settlement pattern in the Great Wall area as a small ball in this basin. Each single position where the ball stayed represents a state of agent aggregation which was adaptable to the current natural, cultural and military factor sets. With the factor content varying, the ball keeps running in the basin. However, the political ecology in Qing Dynasty was so different from that in Ming Dynasty that the factor sets in Great Wall area structurally changed into two different attracting basins. And the structural change of the Great Wall

settlement system from Ming to Qing can be regarded as the jump of the ball from the basin for Ming into the basin for Qing.

5 Conclusion

The spatial pattern of settlements across the Great Wall belt exhibited fractal geometry during pre-modern period. Especially in Qing Dynasty, with the increase of fractal dimension, the settlement system had experienced the process from random distribution to the overall self-similar, conforming to the theory and model of “Pole-Axis System”.

The order in the Great Wall area and its spatial realization respectively in Ming and Qing Dynasty represents the two different typical social situations of the transition zone between farming and animal husbandry respectively in times of war and peace, fitting the description of complex adaptive system. In Ming, military immigrants was driven by administrative force to form settlements, that further aggregated and constituted the system rely on stress mechanism. In Qing, immigrants were induced by economic interest to form villages, towns and cities spontaneously. And the settlement system maintained a dynamic balance under the influence of environmental carrying capacity.

At the moment of transition from Ming to Qing, the phase change happens. It can be seen that the system drop from a high potential energy position to a low. The direction and trend of the process may be entropy production.

**Professor Michael Hebbert
talks English-language
publication for international
readership: the challenge and
the reward / Round Table**

Wed. July 18, 2018

Session 8 (11:15AM-1:00PM)

Hall, Yokohama Information Culture Center

Coordinator:

Sadatsugu Nishiura, Professor, Meisei University

Main Speaker:

Michael Hebbert, Emeritus Professor, UCL Bartlett School of Planning

Speakers:

Fukuo Akimoto, Emeritus Professor, Kyushu University

Keiro Hattori, Professor, Ryukoku University

Kosuke Matsubara, Associate Professor, Tsukuba University

Shulan Fu, Associate Professor, Zhejiang University

Quite a few young scholars in the non-English-speaking countries feel difficulty in writing a paper in English. Their problems are not only those of translation but also those of theme setting, methodology, logical structure, writing style and so on. Japan hosts the IPHS conference for the first time in 30 years, expecting a number of participants from the non-English-speaking world including East Asia. Taking this opportunity, this roundtable session aims to encourage young scholars from the non-English-speaking world to write English-language papers for international peer-reviewed journals.

In the first half of the session, Professor Michael Hebbert, the former editor of *Planning Perspectives*, the premier international peer-reviewed journal affiliated to the International Planning History Society (IPHS), will give a lecture on how to write an English paper for the international readership on the basis of his long and rich experience as the editor, while in the latter half the audience including speakers will have question-answer dialogues with him.

Historiography Patterns in
European and International
Writings (19th-20th c.)**

The emergence of historiography in early Spanish writings on urban planning

María A. Castrillo-Romón (University of Valladolid, Spain / urbanHIST MSCA EJD)

Spanish urban planning historiography of the 19th and 20th centuries has been subject to a different investigations over the last two decades. These studies have provided diverse perspectives on the historiographical narration of the effective evolution of cities in Spain and its colonial territories, as well as on the intellectual and normative production of Spanish urbanism. As national urban historiographies of very general nature, they offer panoramic overviews in which the history of Spanish planning mostly appears amalgamated with other narratives, as for instance the history of cities or the history of urban thought.

This paper proposes to highlight the time span between the second half of the 19th and the first decades of the 20th century, which corresponds to the crucial period in which main patterns and schemes of planning historiography were set in Spain. In other words, it aims to approach an interpretation of the urban historiography developed in some main Spanish theoretical urban planning writings between 1850 and 1930 decades. The analysis will be organized along two intertwined axes. On the one hand, I will advance firstly in the identification of the main categories that have built up this historiographic frame looking closely at the more important theories on “Ensanche” (town planning) and “Reforma urbana” (urban renewal)

I will develop on a comparative study on three different works of Ildefonso Cerdá Suñer (1815-1876) (*Teoría de la construcción de ciudades aplicada al proyecto de ensanche y reforma de Barcelona, 1859*; *Teoría de la viabilidad urbana aplicada a la reforma de la de Madrid, 1861*; and the celebre *Teoría general de la urbanización, 1867*) which are fundamental for both phenomena originated in the 19th century and developed until the middle of the 20th century. I will proceed then with the works of other Spanish urban planning theoretical writings in order to introduce other different ways to see and to use past and History. In fact, I will analyse several texts on the Ciudad Lineal of Arturo Soria Mata (1844-1920) and a contribution of Santiago Esteban de la Mora (1902-1988) corresponding to the periods of development of the international Garden City phenomenon and involving the new dimensions of early 20th century urban and regional planning.

On the other hand, I will point out some clues about the influence certain factors have had on the development of this early urban planning historiography in Spanish and about interrelations between the construction of a national planning history in Spain (containing references to France and other European and Western countries) and the increasing international circulation of concepts, ideas and patterns which is evidently revealed in the influences of foreign urbanistic cultures on Spanish planning construction.

Artistic Approach and Historiography Patterns in Early German-language Town Planning Literature

Susanna Weddige (Blekinge Tekniska Högskolan, Sweden / urbanHIST MSCA EJD)

Due to the rapid growth of industrialized cities followed by over-densification and hygienic deficiency in the mid-19th century, the conditions within the cities were in urgent need of structural improvement. First critical statements on James Hobrecht's Plan for Berlin (1858) by Ernst Bruch (1870) or about overcrowded Vienna by Arminius (1874) as well as the lecture by Rudolf Eitelberger von Edelberg (1858) during the Viennese Ringstraße competition served as preceding ideas and suggestions to Reinhard Baumeister's manual on city extensions (1876), the first comprehensive book on modern urban planning. Representing the formative years of the discipline, this book rather focused on technical, legal and economical preconditions of urbanism without concerning historical inquiries. Further writings as by Camillo Sitte (1889) and Josef Stübben (1890) leaning on Baumeister but stressing the focus more on artistic and morphological issues started to use historical references to legitimize their ideal conceptions. As notable in the dispute between Stübben and Karl Henrici in the 1890s, historiographical patterns emerged increasingly with shifting the emphasis from civil engineering to civic art.

More examples to confirm this thesis are the writings of Albert Erich Brinckmann and Cornelius Gurlitt. Brinckmann published his research on the history and aesthetics of civic art 1908. Later as a professor for urban design and its history in several German universities, he approached analysing historical references to extract artistic principles for further practice. Gurlitt founded the town planning seminar in Dresden 1910 and stressed the emphasis on historical research. In his manual on town planning published in 1920, he took a pragmatic position but still referred to historic examples.

This paper focuses on early theoretical works dealing with town planning history written in German, which shaped the international discourse from the late 19th century to the interwar period and cleared the way for the formation of an academic discipline. The connection between the artistic approach of the writings authors and the historical view on urbanism seems evident in early German-language town planning literature. It is of further interest to analyse, if this historiographical pattern also appears in other national contexts or language regions to get conclusions for a comparative transnational historiography of urbanism.

Historiographical Patterns in Early Anglophone Town Planning Literature

Helene Bihlmaier (Bauhaus University Weimar, Germany / urbanHIST MSCA EJD)

After German-language publications have been dominating town planning literature in late 19th-century Europe, Ebenezer Howard's seminal book "Tomorrow. A Peaceful Path to Real Reform" (1898) set a milestone in the Anglo-Saxon debate. Together with Thomas Horsfall and Patrick Geddes ("The Improvement of Dwellings and Surroundings of the People. The Example of Germany" and "City Development", both 1904), Howard established a scientific discourse on town planning in Great Britain, which at least since Raymond Unwin and Henry Inigo Triggs ("Town Planning in Practice" and "Town Planning, Past, Present, Possible", both 1909) has pursued an independent course. Many of these early British writings deal with the past in order to solve the problems of the present and the future. By highlighting the achievements of historic cities, the authors provided their readers with successful models and concepts. Yet, besides this rather practice-related function, historiographical discourse served to embody and forge the young discipline's self-conception and identity. In the following years, the institutionalization of town planning as an academic subject, endowed with specific chairs as well as the newly founded professional journals, further stimulated the discourse and thereby improved the historical narration of town planning.

This paper investigates the emergence of historiographical schemes and patterns in early Anglophone publications on town planning. It focuses on pivotal writings published between the late 19th century, when modern urban design was established as an academic discipline, and the 1920s, when modernist urban designers cut the ties between past and present and heralded an attitude of disinterest for planning history. It argues that, even though these publications were based on cultural, political and legislative discussions within national boundaries, some include – against the background of the British imperial and colonial setting at that time as well as the growing international significance of this topic – also historical considerations on a global scale. The paper intends to give a text-based reconstruction of the specific context, in which these writings arose, dealing with the different discourse constructions and their intersections, the transmigration and permanence of concepts and the oscillating approaches between national and global planning history.

73 Immigrants, Settlements and Informal Urbanism

Negotiating Empires: Japanese American Settlement and the Japan Pavilion at the Golden Gate International Exposition

Lynne Horiuchi (Independent Scholar)

Japanese American settlement prior to World War II may be viewed as both Japanese colonial settlement and Asian American immigrant settlement. The ideological frames for these communities link their Japanese homeland to the American hostland during a time when Japan was aggressively colonizing in Southeast and East Asia and America was colonizing the Philippines and creating naval stations on Samoa, Hawai'i and Guam.

Using Japanese American settlement in the Western Addition of San Francisco as a case study, these links will be mapped out in an effort to understand how coloniality, as Lisa Lowe suggests, "operates through precisely spatialized and temporalized processes of both differentiation and connection." The Japan Pavilion and its colonizing narratives at the 1939-40 Golden Gate International Exposition will serve as an example of how the imaginative Japanese and American nationalisms of the Japanese government and Japanese American communities intersected in global and local contexts.

The U.S. Immigration Act of 1924 created clear generational breaks in Japanese settlement in America. Most Japanese immigrant settlers arrived between the late 1890s and 1924 when the majority of second generation Americans of Japanese ancestry were born and after which Japanese immigration into the US was barred. In the close quarters of segregation regulated by lack of access to American citizenship and land ownership, Japanese immigrants created self-supporting communities with their own services and institutions including retail and entertainment hubs, churches, health services, sports leagues, cultural centers, Japanese schools and bi-lingual newspapers.

Not only did young Japanese American women serve as hostesses in the Japan Pavilion, many of the programs organized for GGIE including publicity brochures were produced by the Japanese American community. Within the Japan Pavilion, the Japanese government exhibited messages of peace, unity, modernity and commerce, showcasing its Greater East Asia Co-Prosperity Sphere. Concurrently, the Japanese American community repeatedly stood in for Japanese nationals and signed visually as Japanese. These cultural celebrations of fictive nationalisms expressed the disconnections of ideological beliefs of both the Japanese government and the Japanese American community, at odds with the violence of a total war that by 1939 had already been set in motion.

These intersections between diasporic movement and urban development are beginning to be addressed as part of the growing literature on globalization but, with few exceptions, are rarely seen as historically interlinked and constitutive components of American urbanism that will be examined in this paper.

Teaching architecture and informal city in Recife (Brazil). 1959-1979

Enio Laprovitera Da Motta (Architecture School of the University of Pernambuco (BRAZIL))

In the first half of the 20th century, along with the phenomenon of metropolization, architects and urbanists consolidate their way of thinking the city as a single system where the parts are interdependent. That is how urbanistic interventions abandoned embellishment strategies of sectors of the city, in order to prioritize expansion plans that included the so-called informal settlements. This rearrangement of the city's territory corresponds to a rearrangement of the courses that allowed the spreading of modern urban planning.

During the first decade of the Architecture School of the University of Recife - founded in 1959 - the subjects inherited from the Fine Arts program were rearranged: the course "Urban Planning and Landscape Architecture" - that in part focused on the mindset of urban embellishment from the 1930's and 1940's - took the name "Urban Evolution and Planning" after the educational reform from 1963. The core of the debate then turned to the expansion of the city - including informal areas - in a metropolitan and even regional scale. It was only in 1969, with the establishment of a minimum curriculum in Brazil, that this course took its current name "Urban Planning", definitely drifting away from the old practices of urban rendering, once it was then based on mathematical indexes and on the specialization of uses of the modern zoning urban design.

Thus, a new academic course got consolidated in face of this urban reality where informal settlements mixed with the vertical modern architecture was starting to leave its original historical downtown area, moving towards new neighborhoods such as Derby, Espinheiro, Graças and Boa Viagem, and defining a metropolitan-sized urban smear.

However such debate was out of the "classroom circuit" - specially in subjects of projects, and theory and history - implying itself in the field of education through the "research circuit" and the "public contracts", particularly for the domain of urban planning. The individual contribution of architects newly graduated from the school started to stand out, once they would look for specialization programs in Europe - mainly at the Institute of Urban Planning of Paris - and in Latin America at the Centro Interamericano de Vivenda y Planeamento - CINVA from Bogota (Colombia) and at the Planning Institute of Lima (Peru) - even in the sixties and before the creation of the first graduation program in urban development here. At such institutions, the debate on the informal city already seemed to be consolidated.

From then on, and even though the debate encompassed many professions, this thinking migrated little by little from the writings of professor engineers of the architecture school to the newly graduated architects, especially after the creation of a graduation program in urban development in 1972, and the metropolitan planning agencies.

Thus, if the city landscape was divided between the mocambos and the first modernist vertical buildings, the field of education implied a split between the classroom and the research, which, last century, meant a kind of thematic detachment between undergraduate and graduate programs.

Cottage Areas: Squatter Resettlement and the Making of Self-Built Communities in Post-war Hong Kong

Carmen C. M. Tsui (City University of Hong Kong)

In contrast to the city's cosmopolitan image, Hong Kong has a long tradition of informal settlements and self-built homes. After the Second World War, a large number of war refugees from mainland China, as well as destitute locals, resorted to squatting on any deserted land they managed to find. Large squatter areas flourished everywhere and threatened the safety and sanitation of Hong Kong. In 1948, the government took action and required squatters to move to designated cottage resettlement areas where they would be less of a nuisance. There, evicted squatters could build simple cottages at their own expense. Most of the cottage resettlement areas were located on hilly sites, which made development difficult. These hillside cottage villages formed a characteristic architectural landscape unique to Hong Kong. What was daily life like in these cottage areas? How did settlers plan and build a community with scarce resources and minimal assistance from the government?

Interestingly, the cottage resettlement areas were portrayed by the government initially as a solution to the squatter problem and subsequently as a wasteful use of prime urban land. What made the government change its attitude towards the cottage resettlement areas? This study challenges the official narrative that often describes the cottage resettlement as a failed squatter resettlement strategy that was quickly replaced by a massive program to construct multi-storied resettlement estates. In fact, these multi-storied resettlement estates, introduced by the government in 1954, did not completely replace the cottage resettlement areas, in contrast to what the official narrative often described. The fact that the population of the cottage resettlement areas reached its peak in 1961, accommodating over 87,000 settlers in 15 locations, confirms that they were still an active resettlement tool used by the government even after the introduction of multi-storied resettlement estates. The continuation of cottage resettlement areas for five decades before the last one was eradicated in 2001 indicates their indispensable role in long-term housing development in Hong Kong.

The cottage resettlement areas were one of the most prevalent types of informal settlements in Hong Kong's history. They demonstrate the multiplicity in affordable housing solutions and the housing effort of the grassroots. The self-built nature of the cottage resettlement areas offers a flexible, economical, and quick approach to squatter resettlements, without which the government could never have the opportunities to develop a long-term housing program for Hong Kong. This study offers a more balanced view of Hong Kong's housing history by recognizing the efforts of the Hong Kong people, who have worked diligently to improve their living environments despite unfavorable conditions.

Reemergence of Plural Urbanism in the Age of Immigration: the Case of Sulukule

Canan Erten (Istanbul Bilgi University) and Duygu Yarimbasi (Mimar Sinan Fine Arts University)

Sulukule neighborhood of Istanbul is located right next to the Byzantine City walls that are surrounding the historical peninsula and is one of the oldest Roma settlements in the world where Roma population lived since early 15th century in the Ottoman Reign. Despite the efforts of the local habitants and several activist groups such as Sulukule Platform, between 2005-2009, this lively but poor neighborhood became the subject of state-led gentrification under the name of a large scale 'urban renewal project'. The luxurious looking wood clad villas were built in place those informal houses with hopes of conservative middle-class would move in and boost the area's economy. However, these new townhouses failed to attract Turkish renters who could afford to live here and the Roma people who wanted to keep living could not afford to stay and were pushed to the peripheries of the city.

In 2011, the times of crisis came when the civil war hit Syria. People started fleeing the war and coming to Turkey. After a while some Syrian refugees decided to move to Istanbul. As of 2017, there are 522.000 Syrian refugees registered in Istanbul out of over 3 million in Turkey. As reported by many national and international newspapers, as Syrian immigrants moved to Istanbul looking for a place to live, many landlords did not want to rent them their apartments and raised the rents so that immigrants could not afford them. But some tenants, like the ones now living in Sulukule, crammed a dozen beds into a small apartment, reminding an old laborer's tradition in Istanbul called Bedsitter dwellings ("Bekar Odasi" in Turkish)

As of today, there are app. 600 housing units where Syrian immigrants reside in (app. 4000-5000 people) Sulukule, along with middle class Turkish and Romani tenants who could manage live in the new houses.

Nonetheless, integration of Syrians to this new community was slurred over. Ten years later, this concluded in a neighborhood with two separate communities with two different languages those did not interact enough. Sulukule, formerly the liveliest neighborhood of the city with Romani dancing and singing in its streets, ended up with empty streets, street barriers and security guards looking up to avoid any kind of tension between two groups.

Former Romani housing units of Sulukule had a special plan typology where residents lived in single floor houses with shared courtyards. But the new housing typology hardly has an open common place let alone a balcony or a terrace, people started making adjustments to these sleek housing projects creating semi open spaces. Thus, while informal housing projects usually represented by former squatter like houses started to fall from favor, luxury residence built with global imagery became an 'informal' settlement. As a result, the possibility for hybrid urban situations started to reemerge and informal urbanism found its way to reproduce itself in Sulukule.

The urban transformation process of Sulukule and violation of Romani habitants' rights is much discussed in the last 10 years both on the academia and the media, but the situation of the neighborhood as of today, is not much debated. This paper analyzes the situation of Sulukule today and aims to probe migrants' and habitants' informal strategies to counter inadequate spatial qualities of the new Sulukule project.

Planning Concept and Urban Design Theory (1)

Whatever happened to biological thinking in urban planning?

Marco Amati (RMIT University)

Since 2007 the proclamation of the 'urban age' by the UN has been heralded as a critical moment in human society and history. The 'urban' has taken its place alongside the anthropocene as a new era for humanity. Its importance as a transformational moment has been underscored by scientific interest in cities. Anxiety about urbanisation was a motivator for early town planning activity in the 19th century. The tools developed by different disciplines to solve the crisis of 19th century urban development were designed around human welfare needs. With our cities forming both the origin and the solution to our planetary environmental crisis, a broader set of planning thoughts, languages and metaphors are needed that go beyond the mere human. Thinking biologically about Homo Sapiens in cities will be critical to our survival.

Planning history has a role to play in this project, drawing on the past to identify a biological lineage in urban planning and reveal what has and has not been successful. The aim of this paper is to start that identification. It forms part of a larger project to trace a lineage of biological thinking in urban planning history during the twentieth century. The paper analyses and reinterprets the use of science and biology by two influential planning visionaries: Sir Patrick Geddes (1854-1932) and Le Corbusier (Charles-Édouard Jeanneret, 1887-1965)

Among the luminaries of his age, Geddes as a biologist turned sociologist was a unique figure. He attempted to grapple with the early 20th century urban age in biological terms. Le Corbusier, also used science and biology to argue for universal rules to guide urbanism and as an aesthetic. The paper describes the biological work of these canonical planning thinkers to consider why humanism became the hegemonic frame for urban planning in the twentieth century.

Cultural Translation through Pedagogical Experiments: investigating the intermediate scale in the Southern Cone of Latin America at the turn of the 1980s

Gisela B. Souza (Federal University of Minas Gerais)

The widespread dissemination of Italian studies on type-morphology throughout Europe in the 1970s has often been characterized as a turning point in urbanism and architectural practice and theory. As Hebbert (2004) pointed out, "from 1970 onwards, urbanism meant a return to the urban spaces of street and square, with their complexity and richness of memory, and a return to the mother-discipline of architecture."

In the Latin American context, the first approaches with such studies were initiated in the late-1970s, mediated by local architects that had spent time working or studying abroad. Most of them divided their time between teaching and professional practice. Therefore, this paper focuses on the cultural translations of typo-morphological experiments that were conducted in Argentinian, Uruguayan and Chilean schools between late-1970s and mid-1980.

We intend to demonstrate that, if contact with type-morphological studies can be a clue to understanding the turning point in the recent architectural and urban culture in the Southern Cone, the teaching practice was the place to experiment with it. Through pedagogical experiments, local assumptions have been questioned and revised, and foreign ideas have been adapted to the Latin-American context. Through losses, fusions and additions, new meanings have been built into this displacement process. The level of commitment of the translators of the original typo-morphological studies was not equal: some of them sought to maintain a strong link with the European inquiries, others took a free approach to this subject. Nevertheless, despite the differences between each local approach, the intervention on the intermediate scale — the middle place "between the global concerns of the economic planner and the architectural building-as-object" (Solá-Morales, 1997)— by means of pedagogical exercises was the locus for testing those new ideas, for investigating and validating new concepts.

After an overview of the Southern Cone scenario during that period, we demonstrate, through four case studies, the relationship between investigation by means pedagogical exercises and the creation of new concepts and ideas for describing and understanding the specificities of Latin American cities. The first one is the conception of "the Urban Block Architecture" of Diaz, after a first pedagogical exercise held by Diaz, Solsona and Viñoly, in 1978, at La Escuelita—an alternative school created in Buenos Aires during the Argentinian dictatorship government. The second case is the Urban Design studio held by Manuel de Lucco at Universidad Nacional de Rosario, in 1981 (Rosario, Argentina) and the definition of "Cities of Recent Formation" in mid-80s. The third case examines the experiments conducted by Sprechmann at Architectural School at Universidad de la República (Uruguay, Motevideo) in the early-1980s and the idea of a "democratic city" in mid-80s. And the final case explores the the two studios held at the Universidad Catolica de Chile by a group of Chilean architects, named CEDLA, and the conception of the "Latin American City" identity in early 80s.

Two Initiatives for the Planning of Izmir in the mid-Twentieth Century: Le Corbusier's Proposal for a Green City (1948) and the International Planning Competition of 1951

Cana Bilsel (Middle East Technical University Department of Architecture)

The Mediterranean port city of Izmir, which is one of the three major cities of Turkey, has a pioneering place in the twentieth century planning history of the country. The first comprehensive city plan, prepared by the French planners R. Danger and H. Prost in 1924-25, was implemented partially for the reconstruction of the central districts. After the Municipalities Act was enforced in 1934, the City of Izmir searched for a new planner. The municipality addressed to Le Corbusier for the preparation of a new a master plan and signed a contract with him in 1938. Interrupted by the World War II, however, the architect handed over a master plan schema and report, in 1949, entitled "Project of Master Plan for the City of Izmir on the Theme of a Green City with a Population of 400.000." In this planning proposal, Le Corbusier applied for the first time the Grille CIAM d' Urbanisme. He proposed a new residential settlement according to his "green city" model, a civic center with cultural facilities and office towers, and a "linear green industrial city." His suggestion to transform the historic center was one of the most critical issues in Le Corbusier' s planning proposal for Izmir, which was not found feasible by the local authority.

Two years later, the Municipality organized an international competition in 1951. Sir Patrick Abercrombie was invited as the head of the jury. The brief of the "International Project Competition for the Master Plan of Izmir" was based on the prevision of a population of 400.000. It is interesting to observe that almost all the participants of this competition put forward images of a modern port city. High rise office blocks surrounded by large open spaces characterized the "civic centers" depicted in most of the projects. It can be argued that although Le Corbusier' s master plan proposal for Izmir was not implemented directly, his ideas continued to be influential in shaping the modern city image of the postwar period. Among several international entries, the planning proposal by Kemal Ahmet Arû, Emin Canpolat, and Gündüz Özdeğir, professors of city planning in the Istanbul Technical University was awarded the first prize. Neighborhood units separated by green corridors, which Arû defined as "small organic units located inside nature" characterized their planning proposal. One of the most significant contributions of this plan has been the conservation of the historical commercial center while creating a modern civic center next to it.

In this presentation, the main features of Le Corbusier' s master plan project, and significant projects selected by the jury at the International Planning Competition of Izmir will be compared with a particular focus on K. A. Arû and his team' s master plan proposal.

Whatever happened to biological thinking in urban planning?

Since 2007 the proclamation of the ‘urban age’ by the UN has been heralded as a critical moment in human society and history. The ‘urban’ has taken its place alongside the anthropocene as a new era for humanity. Its importance as a transformational moment has been underscored by scientific interest in cities. Anxiety about urbanisation was a motivator for early town planning activity in the 19th century. The tools developed by different disciplines to solve the crisis of 19th century urban development were designed around human welfare needs. With our cities forming both the origin and the solution to our planetary environmental crisis, a broader set of planning thoughts, languages and metaphors are needed that go beyond the mere human. Thinking biologically about *Homo Sapiens* in cities will be critical to our survival.

Planning history has a role to play in this project, drawing on the past to identify a biological lineage in urban planning and reveal what has and has not been successful. The aim of this paper is to start that identification. It forms part of a larger project to trace a lineage of biological thinking in urban planning history during the twentieth century. The paper analyses and reinterprets the use of science and biology by two influential planning visionaries: Sir Patrick Geddes (1854-1932) and Le Corbusier (Charles-Édouard Jeanneret, 1887-1965). Among the luminaries of his age, Geddes as a biologist turned sociologist was a unique figure. He attempted to grapple with the early 20th century urban age in biological terms. Le Corbusier, also used science and biology to argue for universal rules to guide urbanism and as an aesthetic. The paper describes the biological work of these canonical planning thinkers to consider why humanism became the hegemonic frame for urban planning in the twentieth century.

Keywords: Biological thinking, Le Corbusier, Patrick Geddes, urban metabolism, the urban age.

The age of biology meets the urban age

Since 2010 the leading journal *Nature* has featured a section on its website about cities¹. The site profiles and promotes the ‘special relationship’ between scientists and the city aiming to understand how they can bring out the ‘best in the other’. The hope is that scientists can assist cities in tackling their biggest problems. Included is an exemplar: a profile of the Nobel Chemistry Laureate Mario Molina who returned to Mexico City in 2005 to “tackle the messy world of public policy, urban planning and climate change”².

Molina is only one recent example of a scientist who has worked to apply science to city planning and management. Other important examples include the physicists Geoffrey West and Luis Bettencourt who have proposed a universal theory of cities³ also in collaboration with numerous other scientists at the Santa Fe Institute⁴. West’s ground-breaking and visionary transdisciplinary work is summarised in his popular science book ‘*Scale: The Universal Laws of Growth, Innovation, Sustainability, and the Pace of Life in Organisms, Cities, Economies, and Companies*’⁵ which proposes a ‘Grand Unified Theory of Sustainability’ (p. 411).

The interest of scientists and even physicists in cities has been a varying feature of urban planning for much of the twentieth century⁶. Much of this focus has been guided by an organic or biological conception of the city⁷. This continues a long tradition from Aristotle of likening the city to an organism, but throughout history the distinctions between the city, nature and landscape have remained fluid⁸. For Auguste Comte (1798-1857) for example, an organic metaphor of cities offered a way of understanding the construction of societies and the relationship between cities and hinterlands:

“The Fatherland establishes a relation between the soil and social order; and thus the organs of the Great Being can only be cities, the root of the word being the nucleus of the term civilisation. Cities are, in truth, themselves beings; so organically complete that, as each is capable of separate life, it instinctively aspires to become the centre of the vast organism of Humanity. In this tendency the Social organ differs radically from the organ in Biology, which has no separate completeness [...] The smallest city contains all the elements and tissues, required for the life of the Great Being, in the Families, and in the Classes or Castes, within it.”⁹

In the history of planning, the use of metaphors and a language to describe cities in terms of biology has been a persistent theme¹⁰. Biological thinking about cities and planning strongly influenced Patrick Geddes, the prototypical biologist turned planner, and various key thinkers – Jane Jacobs, Lewis Mumford and Christopher Alexander. Yet, biological thinking has remained a secondary concern for planners for much of the twentieth century or has appeared as an environmental concern¹¹, which is humanistic in origin. If it becomes necessary for planners to think and consider the ‘more than human’¹² developing and nurturing biological languages and metaphors for cities and for planning becomes necessary¹³. In other words, we should plan less for humans and more for *Homo sapiens* if we are to avoid widespread ecological destruction. Yet what further traces can we find of biological thinking in planning during the twentieth century and whatever happened to this? This paper contributes to this growing area of interest and points to some of the simple and fundamental reasons why biological thinking disappeared or was subsumed into a hegemonic humanistic discourse during the twentieth century.

A clear answer was that the engagement between planning and science in general but specifically biology has been tainted by problematic associations during the twentieth century. For example, planners were strongly influenced by the Chicago School’s Robert E. Park and Ernest Burgess’s borrowing of competition and other concepts from nineteenth century social Darwinism¹⁴. Although influential, this was shown to be flawed¹⁵. In general, the aim of science to achieve universal laws and theories ignores the particular and diverse reality of cities. Furthermore, the history of planning is problematically linked to a colonial project of progress which is supported by universalism. A watershed moment for science and planning during the post-War period was the failure to translate a systems theory of planning into pragmatic action and the eloquent criticisms of planning by Jane Jacobs in *Death and Life of Great American Cities*¹⁶ (1961).

The following selects two luminaries from planning history, illuminating their biological thinking and contributing to the path set by Batty and Marshall¹⁷. The selection is guided by their emphasis on science and their importance to the field. Sir Patrick Geddes’ biological thinking in relation to cities, is examined by drawing on secondary sources and primary material at the National Library of Scotland and the Geddes Archives at the University of Strathclyde. Also examined is the work of the Swiss-French architect Le Corbusier. Le Corbusier is of course an icon of modernist planning and committed much of his career to insisting on the need for a scientific approach to planning¹⁸. The overall aim is to examine the thinking of these two figures and how they attempted to reconcile science, biology and the complex reality of cities.

Geddes’ theory of biology and theory of life

Geddes, making a career transition from biology to social sciences in the late 1880s brought a particular set of ideas to urban history¹⁹. Firstly, borrowing from the German biologist Ernst Haeckel, he considered cities to be ontogenetic. In other words, in the same way that a developing mammalian embryo will briefly transition through a set of vestigial stages in the uterus (eg. tail, gills), Geddes believed that all cities both contain similar elements that both remain in vestigial form as traces of their development. Similarly, cities had to go through these stages as part of their development. Geddes also recognised from his travels that a variety of urban possibilities existed and understood that at various periods in history cities had died. He envisioned how this cycle of life and death could be linked in an evolutionary cycle and that cities developed and changed as though on a branching phylogenetic tree. The phylogenetic metaphor for thinking about city evolution is shown in Figures 1 and 2. The idea of a historical progression and development from one city to the next as with species is shown in Figure 1, with Hellenic cities at the lowest branch spawning various city types that became extinct, before a successful evolutionary model led to a Hellenistic city and so on through to a modern European city. The interaction was implicit in the definition of stages of urban development in the “Ui Breasail” Cities and Town Planning Exhibition in Dublin 1911 for example (Figure 2).

Figure 1: Phylogenetic classification of the history of cities (undated). Text on left reads: Hellenic, Hellenistic, Monastic (?), Med. (Medieval), Renaiss (Renaissance), Empire (Europe?). University of Strathclyde, Archives of Sir Patrick Geddes, T-GED/6/11. Compare with Figure 2.

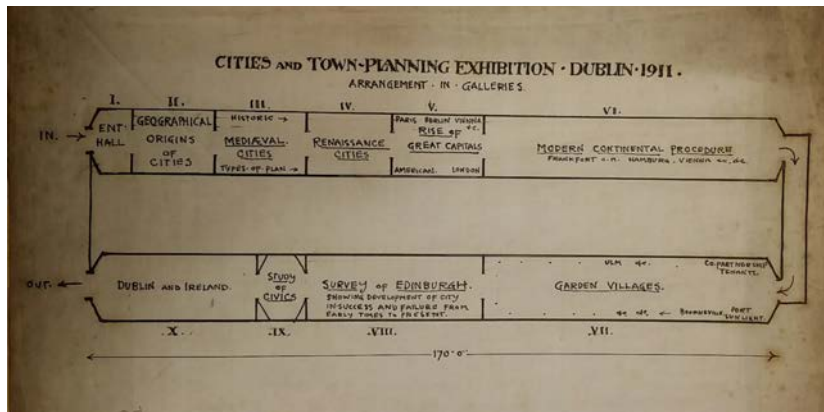

Figure 2: Layout of the Cities and Town Planning Exhibition Dublin 1911. T-GED/6/11/2.

Yet, for Geddes, city evolution, as well as being a question of genetic transfer was one of memetic or cultural transfer. In other words, the city occupied the role of a nucleus within a cell passing on the cultural inheritance of a regional civilization from one generation to the next²⁰. Permanent and travelling exhibitions represented a means of facilitating this transition²¹, as did Geddes' frequent travelling, the summer schools he organised and even the Masques or theatrical performances²².

As Helen Meller notes, Geddes was spatial thinker and for that reason he employed geometry to express his ideas rather than algebra. The two dimensions required for a flat piece of paper meant that his ideas would be limited by this medium could only be far more restricted than is needed for the increasing number of concepts he found essential use" p. 37.²³ Yet, at the same time, this limited typology forced him to bring together ideas and terms that would not normally be associated.

While Geddes' contribution is often considered in isolation his work was subsequently important to modernism in two important ways. Firstly, his enthusiasm for libraries and education through museums²⁴ found its voice through support for the 'universalism' of Paul Otlet²⁵. Secondly, through the work of the Anglo-Greek architect Jaqueline Tyrwhitt his work was translated into the post-War work of CIAM²⁶.

Le Corbusier – from the cell to the City

Geddes started his career as a scientist and then largely eschewed scientific theory and empirical testing when he applied his focus to town planning. Le Corbusier on the other hand had no formal training in science but had a firm belief in the power of science to revolutionise urbanism. As Von Moos (2009) points out²⁷, Le Corbusier's early artistic and design education in the 'Cours Supérieur d'Art et de Decoration' under Charles L'Eplattenier was embedded in the aim of creating a decorative style that was embedded in appreciating and abstracting the nature around the Jura region. Le Corbusier was motivated by a romantic engagement with nature following in the footsteps of John Ruskin. The magazine *l'Esprit Nouveau* that he co-founded and ran from 1920-1925 regularly included articles on science. In some cases, there were articles by scientist themselves, in other cases latest advances were subject to interpretation by one of the editorial team, they represent a means of illustrating the ideas of science that underpinned Le Corbusier's ideas. For example volume 9 includes an article by the engineer Paul Recht on 'Pré-adaptation' a review of the book '*Chimie et la vie*' by the biologist Georges Bohn (1868-1948). The article questions the extent to which Darwinian natural selection can be brought down to the molecular or chemical level. A key concern for Le Corbusier and his colleagues as Lopez-Duran notes²⁸, was that mechanical advances in science had made much faster progress than biological advances. Thus, the article by Recht already points to a molecular-mechanical interaction and would have been selected to show how biology was catching up with mechanics.

A major influence on the biological thinking of Le Corbusier however, was Dr Pierre Winter who wrote articles for the magazine on sport and the human body. In one article entitled "Le Corps Nouveau"²⁹ Winter describes the potential of the healthy and hygienic human body to bring about a societal revolution. After three pages of ecstatic language he describes the human body as a clean and minimal element as part of a new society: "*Le corps va réapparaître nu sous le soleil, douché, musclé, souple.*" (The body will reappear naked under the sun, showered, muscular, supple). Geddes was strongly influenced by the English philosopher and founder of eugenics Herbert Spencer (1820-1903) but never expressed or connected town planning with eugenics. While Geddes attempted to develop the theory of biology alongside town planning into a theory of life, for Le Corbusier, another means by which biology and the city came together as a eugenic project was to 'improve' man. As Lopez-Duran notes in her history of transatlantic Eugenics.³⁰

Yet Le Corbusier's biological perspective gave him an ability to see the urbanism as a problem to be tackled with the human body at the centre, although the strength of his assertion gave an impression that he alone had solved or reduced this complexity to its essentials. A clear definition of Le Corbusier's view of science comes through an analysis of his description of the functional city during the CIAM congress aboard the *SS Paris* in 1933 as Mumford notes (p. 79).³¹ Unknowingly celebrating the Anthropocene, the plans by CIAM represented no less than a 'biology of the world'. In CIAM Le Corbusier asserted that the role of the planner was to develop 'honest means of expression' to prescribe to authorities. 'Through bodily movement the three dimensions imply the notion of time, and our lives are regulated by the "solar regime" of twenty-four hours and the year, which "commands distances and heights"' (p. 79).³²

Conclusion: if the twentieth century's planning was Euclidean, the twenty first century's will be Fractal

In 1961 Jane Jacobs famously criticised planning as a 'pseudo-science' comparing it to bloodletting and labelling its 'plethora of subtle and complicated dogma' as a foundation of nonsense (p.13).³³ Since that time, planning has embraced a range of non-scientific ways of understanding. These theories are not those that would be recognisable to a physicist like Geoffrey West. In other words, a way of modelling or seeing the world that is based on first principles and has some predictive power which can be empirically tested. Instead theorising in planning is meant in part to guide practice and is in part a phenomenological project.

For both Geddes and Le Corbusier scientific understandings of cities were of course flawed from a number of perspectives. For Le Corbusier, science, rationality and standardisation were avowedly tools for prediction and analysis to derive a deeper or more fundamental understanding of cities but were also part of a suite of propaganda tools to further his own projects. For Geddes on the other hand, city planning was a spoke on a wheel in which the hub was an open-ended quest for a theory of life. Biology, geography and sociology all comprised other spokes of the wheel. His ability to jump from one spoke to another and to think laterally about a problem of city planning, particularly in a colonial context³⁴ make his ideas seem almost post-modern and contemporary.

For both, the role of science and in particular biology in city planning was an inspiration and a source of metaphor. Yet, it was not just a question of not embracing or understanding science but also that science itself wasn't up to

the task of understanding the city. Both were limited by the constraints of their Euclidean geometry. In 1967 the French mathematician Benoit Mandelbrot published a landmark study examining why the apparent length of the British coastline increases the more accurately it is mapped³⁵. This seemingly simple question gave rise to a new paradigm in mathematics and a deep understanding of fractals and their dimensions. It is the basis of the work of Michael Batty and others who work in complexity³⁶ but it also provides a way of explaining the efficiency of life forms such as trees, mammals and cities³⁷.

Table 1 is an initial and simple binary approach to the different periods during the twentieth century of thinking about the application of biology in planning. There are many further periods to detail this initial layout as part of this ongoing project.

Table 1: A binary approach to biological thinking in cities and planning

Geometric	Systems	Organic	Environmental	Ecological
Euclidean	Closed	Society as a human body	Sanitary	Location theory and social organization
Fractal	Open	City as a natural system	Sustainability	Ecological expansion and segmental growth
References				
Batty ³⁸	Berry ³⁹	Harvey ⁴⁰	Daniels ⁴¹	Morgan Grove et al ⁴²

Both Geddes and Le Corbusier while seeking to point to explanations about the city that were linear or Euclidean, had an instinctive or even artistic understanding of the relationship between fractal objects in nature and cities. In his book *Cities in Evolution* (p. 25) Geddes described a view of London that would have been unfamiliar to many at the time⁴³. He imagined looking from above on the large smoking city as though looking down on a coral reef. On his so-called 'man-reef' the buildings were the hard structures that had steadily been accreted upon over the centuries. The polyps were the humans and other life forms that existed on these.

Le Corbusier frequently used biological and fractal imagery in his designs toying with them. It can be easy to see these as providing a stark contrast with the flat and angular surfaces of some of his designs, but his writing reveals a deeper more instinctive understanding of nature. Figure 3 shows the tree growing in the middle of the patio on the Pavillon de l'Esprit Nouveau (1924). It clearly illustrates Le Corbusier's focus on light as a source of life. But there it also show the geometric contrasts of the two forms. Whereas the geometry for describing the built form was well understood that of nature was yet to be formulated. Figure 4 shows the interior of the later Pavillon Suisse 1930. A majority of the natural forms on photographs on the wall refer to the idea of natural habitation, such as animal and plant cells and honeycombs. While Le Corbusier would have been doing this to playfully and aesthetically allude to his ideas as an extension of nature the idea of bringing human and natural habitation in line with one another is a first and necessary step in thinking biologically in the city.

For contemporary planners these reflections on the historical role of science in planning should provide a way of better understanding how to embrace biological thinking in planning. The use of biology, however incompletely understood, and even as a metaphor can provide a powerful narrative to describe a vision for a new city or development. At the same time, the biology that is being advocated by West and colleagues describes a helicopter perspective on cities that seeks to propose universal rules. Yet, necessarily there are large cities and areas of the world where the data for corroborating these conclusions do not exist. A feature of the urban age is that we have very large cities, which do not reliably fall inside the ambit of reliable data gathering, let alone reliable planning control. We may never know the extent to which Bettancourt and West's laws about the city apply simply because as economies develop data gathering improves along with public welfare and cities change to resemble those of developed country cities.

For Le Corbusier a recurring theme was the human body and the idea of the city as a problem to be tackled at the human scale. While a helicopter view can offer general insights that can guide interventions about the city, science has a great deal to offer at the human scale by considering the problem of human beings as Sapiens.

75 **Planning Concept and Urban Design Theory (2)**

Defining Urban Design in the Chilean context: the contributions of Munizaga

Gisela Barcellos de Souza (Federal University of Minas Gerais) and Andre Tine Gimene (Federal University of Minas Gerais)

This paper seeks to contribute to the comprehension and retrieve of the reverberation and flow of Urban Design ideas in architectural and planning culture in Chile. To achieve that, it focuses on the trajectory and work of the Chilean architect, Gustavo Munizaga, who was responsible for having written one of the first Urban Design textbooks in Latin America.

Munizaga graduated from the Universidad Católica de Chile in 1964 and one year later attended the Harvard Graduate School of Design (HGSD) to pursue a Master's Degree in Urban Design. The Harvard course was still strongly influenced by CIAM, in its own revision held on the congress held at Hoddesdon in 1951, and the concept of Urban Design, as proposed by Sert in 1956, the dean of HGSD, was an attempt to link architecture, landscape architecture and town planning. As Eric Mumford describes, at the time this concept implied the creation or intensification of a civic centre—an urban core, fostered by the insertion of pedestrian zones, perceived as an important political and cultural urban element. Munizaga's initial understanding of Urban Design, learned from his HGSD mentor, Fumihiko Maki, and developed with his colleagues Wampler and Corea, evolved further during a period of professional practice experience at the Interdisciplinary Centre of Urban and Regional Development (CIDU) in Chile. In the 1970s, Munizaga worked as a teacher and began his leadership activity in the dissemination of Urban Design: first at the Universidad de Chile (1971-1975), and, right after the Pinochet coup in 1973, at the Universidad Católica de Chile. However, at the same time the Revision of the Modern architecture movement and the typo-morphological critics were being introduced in Chilean Architectural Culture, challenging most of his former learning, which is reflected in his publications.

This paper aims to demonstrate the oscillation of Munizaga's initial understanding of Urban Design between his Harvard learnings and the contributions of the typo-morphological approach—brought by some of his teaching assistants—through late-1970s until mid-1980s. To this end, the paper analyses Munizaga's trajectory and his Urban Design definitions in the context of International Exchanges and local context adaptations, based on the examination of two key projects, as well as his Urban Design textbooks and writings published between 1977 and 1983. The Urban Design concepts learned at Harvard GSD are partly retraced, illustrating how he incorporated them into two key projects. One is a series of megastructures combined with open-ended terminals between the Baltimore-Washington megalopolis, designed during his master's course (Monacelli and Corea, 1965)

The other is his proposal for the International Competition for the Santiago West Downtown Redevelopment, organized by the Urban Improvement Corporation (CORMU) in 1972 (Pavez, 2015)

Finally, his writings are analysed to identify his translation of the urban design concept to both the Chilean context and the contemporary architectural culture.

Windows Upon Planning History - Canberra

Karl F. Fischer (The University of New South Wales)

With its theme "Looking at the world history of planning", the Yokohama IPHS conference 2018 is the ideal context in which to open windows of understanding upon a famous statement which the urban designer Edmund Bacon made about the Plan for Canberra. Bacon rated the 1911 plan designed by Walter Burley Griffin and Marion Mahony Griffin as "a Statement of World Culture" (1968)

Bacon was referring to the way in which the plan incorporated elements of space design derived from cultural realms and traditions as wide ranging as those of Europe, the USA and Asia.

While the Griffin Plan was on the one hand eulogized, it has also been heavily criticized, condemned and ridiculed. A close look reveals that the plan and its implementation have been an object of cultural controversies that have not been resolved for over 100 years (Fischer 2013)

This observation is valid for the plan itself, its transformation into the modern and post-modern world, and the way in which planners, citizens and politicians have dealt with it in spirit and partial implementation.

Enthusiasts and opponents on many sides have dug in their heels and fought battles of uncertain outcomes.

In this situation, the paper applies the famous "Windows" metaphor created by Henry James in the preface to his novel "Portrait of a Lady" to the context of planning history. That "Windows" approach was discussed in a conference in 2013 (Altrock and Fischer 2014) and applied in an edited book with case studies from Europe, the USA and Australia (Fischer and Altrock 2018)

The approach is waiting to be extended and to be applied to a wider, in fact global context.

Henry James suggested that '

[t]he house of fiction has ... not one window, but a million... At each of them stands a figure with a pair of eyes ... He and his neighbours are watching the same show, but one seeing more where the other sees less, one seeing black where the other sees white, one seeing big where the other sees small, one seeing coarse where the other sees fine. And so on...' (James 1908: xi)

Applied to the context of planning, the purpose of the "Windows" metaphor is to open up the possibility of dealing with opposing views and with the struggle between paradigms and conflicting cultural positions in different ways – not necessarily in a linear sense, 'victorious' paradigms replacing those based on the preceding or opposing, 'wrong' interpretation of 'reality', but as potentially complementary.

The windows opened in this paper upon ideas and realities, myths and models surrounding the Griffin Plan are twofold in nature and purpose. On the one hand they may help negotiate between opposing views in the sense outlined above. On the other hand they are essentially eye-openers, windows opened from the outside, more difficult to access for local observers, who may be too close to the canvas to get the full picture.

In this sense, the windows metaphor addresses the issue of blind spots and blinkers, which we are continually confronted with individually, locally, as well as in trans-cultural and global context.

Three models and its transition of city planning concept in Le Corbusier

Tatsu Matsuda (Musasino University, Faculty of Engineering, Department of Architecture)

This paper clarifies three different principles and its process of transition of Le Corbusier / Charles-Edouard Jeanneret between 1910 to 1925 during when he had started to write “La Construction des Villes” and when he published “Urbanisme” which has boldly transformed from the former, the prototype of it.

The background of this paper includes the recent continues publication of Le Corbusier’s letters and discovery of undisclosed drafts on “La Construction des Villes” and similarly the progress of research and several publications on Werner Hegemann who influenced Le Corbusier via Berlin City Planning Exhibition in 1910 which revealed the whole picture of Hegemann’s activities once buried in history. The purpose of this paper is to clarify how the principle of City Planning in Le Corbusier especially until the 1920’s has gain the clear direction like as it known today, so as to elucidate the role of Le Corbusier in the early period of scientific City Planning also in the context of urban planning history.

Le Corbusier has been influenced by medievalism before 1910, classicism after 1910 and Taylorism since around 1915. Medievalism is mainly derived from Camillo Sitte and his followers, classicism is from Berlin City Planning Exhibition and Hegemann who organized it as well as several books focusing on French classicism in 18th century and Taylorism is from of course Frederic Taylor and various movements in France at that time that was accepting American Taylorism. This paper reveals the process of Le Corbusier’s change analyzing his letters, writing and projects etc. The fact that Le Corbusier has shifted the idea of urbanism from under the influence of classicism to under that of Taylorism is explicitly read from the slightly tense relationship between Le Corbusier and Hegemann in 1920’s, especially the negative critical response of Hegemann to the Le Corbusier’s “Ville contemporaine de trois millions d’habitants” when Le Corbusier sent it to him in 1922.

As a conclusion of this research, it can be said as below. The principle of Le Corbusier’s “city planning” has transitioned rapidly from medievalism to Taylorism via classicism. The characteristics that they emphasize can be said respectively ‘artistic’, ‘monumental’ and ‘geometric’ in concept as well as ‘curve’, ‘axis’ and ‘grid’ as visual geometric model. So that his ‘Le Voyage d’ Orient’ was the journey to recognize the origin of the classicism, while his intensive research at the French National Library in 1915 triggered his awakening to Taylorism. However, what is important is that Le Corbusier did not simply change each stage, but let these three different positions coexist within himself, which made possible to create complex, rich and diverse urban / architectural projects and its thought as a result because always his project and his writing contain a sort of ambiguity and complexity at the deep basis. Le Corbusier has evolved the City Planning concept from Sitte’s medievalism to Le Corbusier’s Taylorism while allowing its versatile variety.

Moroccan Town Planning discussed at the Colonial Exhibitions and Congresses: from national to international scene (1922-1931)

Angelo Bertoni (Aix-Marseille Université)

The history of French Protectorate in Morocco (1912-1956) is marked by important experiences in town planning and, in particular, by two great figures: Henri Prost and Michel Ecochard. A new perspective on this period is elaborated today by researchers in both sides of the Mediterranean, based on the concept of model and hybridization. The goal is to understand the role that these experiences played in debates, transnational transfer and dissemination of ideas that contributed to define town planning as knowledge and know-how.

Morocco provides an excellent opportunity to experiment the most innovative theories of town planning, following some ideas developed in Great Britain and Germany since the end of the nineteenth century and spread in France by the Musée social. This private institution was founded in Paris in 1894 and aimed to improve moral and material conditions of working classes through the definition of social reforms, particularly in relation to housing and city organisation. Some crucial elements are the importance of the plan as a tool, the city organisation by functions, a wide presence of open spaces and the garden cities as a model for urban extension. These ideas are reflected in the plans drawn up in Morocco by Henry Prost and his team composed by some members of the newly established Société Française des Architectes Urbanistes. This experience is part of a wider participation of French experts in planning activities in colonial territories and in other European or Latin American countries in the early XX century.

This paper aims to focus on elements that enabled the first stage of French experience in Morocco to become a reference on the international town planning scene during the interwar period. Colonial exhibitions and international congresses organized in Marseille (1922) and in Paris (1931) are the main research sources, enhanced by professional periodicals. These events will be studied to approach two perspectives. Firstly, the rule played by town planning in the French colonial propaganda, directed at this time both towards national public opinion and to other colonial powers. Secondly, the affirmation on the international scene of what we can call the French town planning school, capable of expressing a compromise between the hygienist approach and urban aesthetics.

Defining Urban Design in the Chilean context: the contributions of Munizaga

Gisela Barcellos de Souza*, André Tiné Gimenez**

* *PhD, professor at the Department of Urbanism at Federal University of Minas Gerais, giselabarcellos@ufmg.br*

** *Undergraduate student in architecture and urbanism at Federal University of Minas Gerais. andregimenez@gmail.com*

We intend to contribute to the understanding of the initial paths and penetration routes Urban Design and Urbanistic Project notions in the urban and architectural culture in Latin America. To this end, it focuses on the trajectory and intellectual work of a Chilean architect, Gustavo Munizaga, who was responsible for writing one of the first didactic texts on urban design in Latin America and did so contemporaneously with the first manifestations of the Modern Movement's critical revision and the typomorphological approach in Chile.

Keywords: Chilean Urban Design History, Munizaga, Circulation of ideas.

Introduction

As a practical discipline, which test its concepts in distinct contexts — and eventually tears its semantic contours through borderline situations —, Urbanism has in its history multiple examples of terms originally coined for distant geocultural situations, which ended up approaching each other when they crossed different borders. This is the case of Urban Design and Urbanistic Project, notions constructed in different temporal and cultural contexts, but that had been approached by the practice — and the constant semantic displacements that it imputed to them —, as well as by cultural translation works. Even though both are very commonly used in everyday practice, their delimitations are still imprecise¹. Sert, as it is known, proposed the first one in 1953 in the United States context and, although its institutionalization was concurrent to the critics to the American Urban Renovations after mid-1950s, it reverberated CIAM's debates of the second post-war period². The Urban Project notion, on the other hand, was gestated in Continental Europe between 1970s and 1980s — notably in France, Italy and Spain —, amid the diffusion of typomorphological studies and the critical revision of Housing Projects and New Cities Policies that prioritized Modern Movement constructions and environments³.

This article intends to contribute to the understanding of the initial paths and penetration routes of these notions in the urban and architectural culture in Latin America. To this end, it focuses on the trajectory and intellectual work of a Chilean architect, Gustavo Munizaga, who was responsible for writing one of the first didactic texts on urban design in Latin America and did so contemporaneously with the first manifestations of the Modern Movement's critical revision and the typomorphological approach in Chile. The oscillations in his comprehension of Urban Design are here examined in the context of the international exchange of ideas, of his own trajectory and of the need for adaptations to the local situation. This research is based on the analyses of two of his urban design projects and in his sequence of textbooks and articles published between 1977 and 1983.

Munizaga's trajectory and Urban Design in Chile

The history of Urban Design in Chile and the professional trajectory of Munizaga intermingle in a complex net. Munizaga graduated in architecture in the Catholic University of Chile (UC) in 1962, when, despite the existence of the Institute of Planning and Housing at this university (created between 1953 and 1954), the teaching of urbanism was limited to a few theoretical disciplines, without a practical consideration⁴. To fill this gap, he pursued his studies in a master's degree in Urban Design at Harvard University, between 1964 and 1967⁵, period that he would later recognize as fundamental in his academic formation. References of what he learned in those studies would accompany him throughout his academic and professional career.

Munizaga attended to a course in which the conception of Urban Design was not limited to large-scale architecture and its adjacent spaces. A change in the comprehension of the interfaces between Urban Design and Planning was already undergoing; contributions of Lynch, Alexander, Maki and Doxiadis were part of its cultural environment. Considering the frequency of its quotations and acknowledgement in his future texts, the ideas of Fumihiko Maki seems to have been of particularly importance for the young Chilean architect. More specifically, his writings would often mention Maki's proposition of three ways of structuring the collective form that would allow unity within the diversity: the compositional form; the megastructure — which, despite

external control, would enable a freedom of functions within it —; and the group-form, a systemic approach in which a structure provides the unity of a space by the reiteration of elements and processes in its production⁶.

His mentor's ideas were experimented during his master studies, in a studio called Intercity in which a proposition of new forms of settlements in the Baltimore-Washington conurbation was investigated. Munizaga and his team — Lozano, Corea and Wample — proposed a sequence of megastructures in which each module had its own civic and commercial centre, in addition to collective equipment. The possibility of a guided expansion was researched by the proposition of an open terminal — using the concept latter incorporated in Maki's writings — and permitted the hybridization of both ideas of megastructure and collective form.

Figure 1 and 2 – Diagram of Intercity proposal, in Monacelli and Corea (1964) and diagram illustrating Munizaga's article "Estructura y Ciudad", in ARQ n. 8 (1983).

When Munizaga came back to Chile, he encountered a cultural environment of experimentation in planning which led to the implementation of several new institutions. Under the context of the Cold War struggle to control the Latin America territory, the Ford Foundation joins the efforts started by the American Aid Program (USAID) to build financed social housing in Chile, proposing a program to Alessandri government in 1963. Two years later the cooperation program — that initially aimed to produce community facilities — was revised and expanded to handle the urban and regional planning demands of Frei's government and had John Friedman as its coordinator⁷.

The cooperation between the consultant team and the local technicians took place through new governmental institutions, such as the Ministry of Habitation (MIVU – 1965), the National Planning Office (ODEPAN - 1964), and a new research centre, the Interdisciplinary Centre of Urban and Regional Development (CIDU), made in partnership between Catholic University of Chile (UC) and Ford Foundation. Conceived as an institution of research and technicians training, the CIDU actively collaborated in its initial years with the abovementioned government agencies, remarkably with one of Ministry of Habitation's autonomous corporations, the Corporation of Urban Improvement (CORMU)⁸. Responsible for the creation of a land stock and for the formulation of urban renewal plans, the CORMU had as its characteristic feature its approach to urban planning under the viewpoint of architecture⁹. Between 1965 and 1972, this corporation executed the urban renovation of San Borja and other proposals of densification of central areas. It was in this context of intense collaboration between academic and governmental institutions that Munizaga, recently arrived from his Master in Urban Design, was integrated into CIDU, been responsible for the design of Manuel Rodríguez's Sector, developed between 1968 and 1971.

Despite the term Urban Design was not, at that moment, widely diffused in Chile — a UC professor of architecture, Hernan Riesco, would acknowledge that he had heard it for the first time in 1964¹⁰ —, its notion and practice was already circulating in the Chilean specialized field. In 1971, for example, the architect Browne, who had recently returned from his master's in City Design at MIT, criticized the lack of precision of this term and the tendency to be interpreted as a large-scale architecture. Although he recognized the necessity of fill the gap between planning and architecture, he did not believe that this role was properly performed by the notion of Urban Design¹¹. In 1972, on the other side, CORMU did not use this term in the International Competition for Remodeling of Santiago Centre program.

Though the winning design was not executed — the 1973 Military Coup interrupted the process — this competition itself, which was attended by 87 teams from 25 different nationalities, became a landmark in Chilean architectural culture. Munizaga, with his teaching assistants and a group of his students from the

University of Chile (UCHile) — where he taught between 1969 and 1975, after having left UC due to an academic conflict¹² — joined with a honourable mentioned proposal¹³. This proposition reveals itself an opportunity to attempt the adaption of his North American Urban Design learning's to the Hispano-American block. Using as a reference the existing urban plot, they reinterpreted it in a new urban layout and in the location of the new proposed buildings (residential and communitarian facilities) which configured series of central patios with pedestrian access and subdivided the block into 16 parts. The idea of open terminal was present in the proposition its execution through several stages.

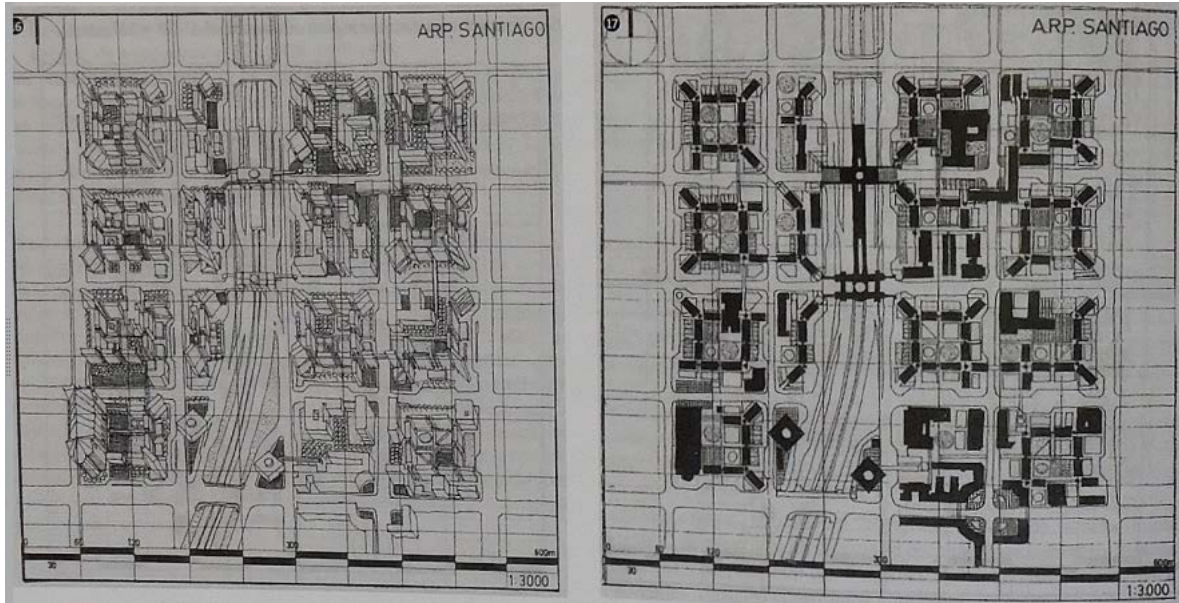

Figure 3 – Munizaga's proposal to CORMU International Competition, in Pavez (2015)

In 1974, when Riesco became Director of the UC Architecture School (EAUC), Munizaga returned to the institution as an invited teacher, receiving a tenure position in 1977. At this moment he started to work as a teacher in Urban Design studios and, due to the absence of bibliography of this subject in Spanish — few exceptions were Spreiregen (1971) and Bacon (1974) — he started to produce his own textbooks¹⁴. In those, it is possible to identify the incorporation of many of his Urban Design Master's acquaintances, to which were now added his experience with the Chilean planning institutions and his former attempts to translate these ideas to Chilean context.

There was a crescent interest in Urban Design in the EAUC that would lead, among other realizations, to a partnership with MIT in a studio to elaborate the Revitalization and Structuralizing Project for Santiago Centre (1978-1979). Coordinated by Riesco, this cooperation allowed the contribution of Halasz, from MIT, as a visiting professor and included Munizaga as participant¹⁵.

When Munizaga became a professor of Urban Design at UC, critical reviews of the Modern Movement Urbanism were starting to resonate in Chile. In the 1st Biennale of Architecture in Chile (1977), a newly created collective named CEDLA — whose architects had just returned from London — brought up the debate about the importance of historical urban fabrics and defended the typomorphological critic to Modern Movement environments. Beyond those new ideas, this collective claimed their polemic role in architectural culture through the presentation in that exhibition of an Urbanistic Project as a counterproposal to those highlighted by the CORMU competition of 1972. The CEDLA design aimed to reinterpret the built heritage and the public spaces of the existing urban fabric¹⁶. Munizaga reacted to this polemic project by publishing a letter in the newspaper *El Mercurio* criticizing its excessive formalism¹⁷.

If at first Munizaga was reticent about CEDLA's proposal, soon the distance between both would be reduced. It is important to remind that one of CEDLA founders, Humberto Eliash, had been a former assistant of Munizaga in his studio at UChile, between 1970 and 1975. On the other hand, in the same year of the 1st Biennale, José Rosas — who was interested in typomorphological contributions and in 1982 would initiate his doctorate studies under Sola-Morales's guidance — started to work as Munizaga's teaching assistant in UC. A shift in pedagogical approaches of Munizaga at UC can be noticed between 1977 and 1983: the architectural studios added the word typology to its titles, and the Urban Design ones focused on the study of Santiago through theoretical subjects — Urban Structure, in 1978; Model and Project, in 1979; Perception and Metaphor in 1980¹⁸. When Munizaga

became director of EAUC, he invited CEDLA architects to lead studios at this school: Boza, Duval and Moreno in 1980, and Murtinho and Eliash in 1981. To the young generation of students, the difference between CEDLA's studios and those of Munizaga and Rosas was not clear. In fact, both would be perceived as the main reference for an antagonistic group of students organized in UC in early 1980s: the *Contrapropuestas*¹⁹.

It is important to point that the interest for Urban Design and for the typomorphological discussion was not restricted to UC at that time. Its motivation, however, was less related to a critical review to urban planning — as it was observed in Brazil and in Argentina in the 1980s — than to seek an alternative way to incorporate urbanism contents into architecture courses in a national context of dismantling of planning institutions. On one hand, the National Policy of Urban Development (1979) transposed to the urban space the neoliberal principles, abdicating of the State control over urbanization²⁰. On the other hand, at the same moment, there was a continuing staff reduction in public and private planning research and teaching institutions²¹. In 1983, for example, in UChile under military intervention since 1976, the departmental structure of School of Architecture was abolished, and a single Urban Design chair replaced all urbanism contents of the former study program²².

Urban Design by Munizaga

To verify oscillations of Munizaga's notions of Urban Design, we did a longitudinal content analysis of four of his writings between 1978 and 1983. The first two publications, edited in 1978 and 1980, continued a work he started at CIDU in 1968, and were linked to his experience as a teacher. Both were conceived as didactic supports that aimed to guide the practice in his studios at UC. Therefore, he acknowledged these texts did not intend to present original contents, their goal was rather to "reorganize an intellectual universe that presents itself in an indeterminate and confused way"²³. The third text, from 1983, assumes a hybrid character. Although it continues the previous work, it is organized within the framework of an investigation on the notions of structure and design and to that includes contributions from his teaching practice. The last text, also from 1983, is the first one published as a book and presents reflections systematized over five years.

The analysis of this corpus was guided by two aspects: one relative to the structure of the texts — observing both the continuities and the variations of themes —, and another concerned with the bibliography presented at the end of them. Despite these references had not always had the same relevance in the central argument of Munizaga's texts, the bibliography reveals itself as a carefully and constantly remade list. In each new publication, new items are included, and others discarded, in a flow that reveals its contributions in Munizaga's understanding of Urban Design. In the graphs below, it is possible to note the progressive incorporation of references deriving of neo-rationalists and a decrease of those linked with Modern Movement Urban Design partially learned at Harvard. The structure analysis, as we will discuss on following paragraphs, reveals the change in references was accompanied by the rise of new themes.

Figure 4: Percentage of the bibliography categorized according to the context of the publication. Produced by the authors.

The texts “Urban Design: Fundamentals and Processes” and “Three texts about Urban Design”, regardless of their differences in some contents and in the level of its development — the first one was uncompleted —, have both a similar structure of four parts. They begin with a delimitation of the problem and the definition of the concepts of planning, urban architecture, urbanism, urban design, city. After that, they present specific issues of urban design in the context of the “Mondial Macropolis” — the tendency of total urbanization — or the Ecumenopolis, as defined by Doxiadis. Their third part presents the urban design as a process, in which the author’s argument is supported by a historical perspective from industrial revolution to late 1970s, and by a set of models or strategies to guide urban proposals. The fourth part exposes the products and components of Urban Design, pointing what Munizaga defined at that moment as seven basic strategies: Capital cities, Satellites cities, New Cities, Specialized Functional Sectors, Regulatory plans, Central Areas Renewal and Urban Systems. As attachment to both texts, there is a chronology of urban interventions.

In his attempt to organize and categorize the writings about the theme, Munizaga seeks not to link himself directly to a single theory or body of knowledge. Thus Munizaga even recognizes the diversity in his bases for a design method: the conceptual fundament, the unit and elements from the Ekistics Theory; the variables and organization of elements of Alexander, the notions of behaviour and aggregation of Fuller; the analytical categories of Lynch and Noberg-Schultz; part of functionalism criticism of Rossi, typology of urban form of Lynch; notions of open terminals and subsystems from Maki; ideas of urban grid of Bacon and the connectors and articulators concepts of Halasz²⁴.

In this reunion of such different contributions, however, Munizaga does not always distinguish properly the authors; neither tries to contextualize them nor to condense the essence of their arguments. Instead, he undertakes the work of recombining varied origins resources to affirm convergences where it would be hardly verifiable. For example, in writing about Urban Sector and Neighbourhood Unit, and recognizing them as the fundament of CIAM’s urbanism, Munizaga²⁵ approaches them to Rossi’s Residential Areas, suppressing the key argument of the Italian architect. From late-1970s the notion of typology used in his texts is not rooted in the Italian debate, but in the classification made by Lynch in 1961.

The third publication, “Model, Structure and Project” from 1983, differs from the previous ones by its attempt to operationalize former didactic experiences as research on notions of typology, metaphors, systems and structures. To do so, it initially presents the basis of the precedent didactic experiences. After that, the pedagogical activities carried out by him and his assistants — among them Jose Rosas, in the UC, and Humberto Eliash, at the UChile — are illustrated, with brief reports of the disciplines developed between 1970 and 1983. Finally, two chapters expose theoretical reflections and possible methods used in the operationalization of two binomials: “type and typology”, and “analogy and metaphor”.

Contrary to what was pointed in the two previous publications, in the third one the notion of type is clearly supported by typomorphology studies, using as main references Rossi, Argan, Moneo, Colquhoun and Quincy. In fact, as Munizaga²⁶ explains it, this notion was experienced in his disciplines between the second half of 1982 and the first half of 1983, shortly after the workshops given by members of the CEDLA group.

If in previous works collaborators are only named in the introduction and in the report of didactic experiences, in the book “Structure and City”, from the same year, they assume the role of co-authors. Edited by Munizaga, in this book he is the author of only three of its seven chapters — having Jose Rosas as co-author in one of them. Notions that were experienced in didactic exercises in previous five years are exposed and deepened in each chapter. A common framework that would allow the reduction the dissonances between different notions and would insert them within the same operation is sought through this edition. In this sense, the Structure — understood as an ontological order and as a morphological, functional and semiological reference — was proposed and analysed through notions of configurations, systems, types and metaphors. Despite the thematic displacements noticed through Munizaga’s writings, it should be pointed that in the proposal developed for the central area of Santiago, presented in its last chapter, the megaforms and semiological structures learned at Harvard were still present, but now hybridized with the new contributions of typomorphology.

Conclusions

The exposition made throughout this text made explicit the key role of Munizaga in the cultural translation of Urban Design to the Chilean context. This is confirmed not only by being part of the first generations of students graduated from the Harvard master course, but also by the fact that he became directly involved with planning institutions and teaching activity since his return to Chile.

If, in a first moment, he assumed the position of cultural translator of his Urban Design acquaintances from the North American context, latter he would produce new notions by hybridization. His continuous conflict with local contingencies, whether through the practical experiences, pedagogical experiments, advisory or planning, and his continuous contacts with academics from other countries, enabled him to perform a hybridism between the ideas of the Modern Movement and its critical review.

Windows Upon Planning History - Canberra

Karl Friedhelm Fischer*

*Faculty of Built Environment, University of New South Wales, email address: k.fischer@unsw.edu.au

Abstract

The conference theme ‘Looking at the world history of planning’ is echoed in a statement by U.S. urban designer Edmund Bacon on the 1911 Plan for Canberra, which he eulogized as ‘a Statement of World Culture’.¹ Bacon was referring to the way in which the Griffins’ plan incorporated elements of space design derived from cultural realms as wide-ranging as those of Europe, the Americas, and Asia. However, the plan and its transformation in modern and post-modern times have also been objects of fundamental cultural controversies.² Enthusiasts and opponents have dug in their heels and fought battles of uncertain outcomes. The core **research question** here is how to deal with the complex and controversial nature of these perspectives.

In this situation, the paper applies the famous ‘Windows’ metaphor from the preface of Henry James’ novel ‘Portrait of a Lady’ as a **narrative device** to the context of planning history.³ It **concludes** that the windows opened upon ideas and realities, myths and models surrounding the Canberra Plan and its transformations may help negotiate between opposing views, different paradigms and conflicting cultural positions as potentially complementary and at least enlightening.

Introduction – Canberra and ‘the World History of Planning’

As one of the great planned capitals created in the twentieth century, Canberra has a recognized place in ‘the world history of planning’ quasi by default, just as it does in countless textbooks in our field. Locally torn between advocates of the capital and Canberra ‘bashers’⁴ the city has won great international acclaim as an exemplary model of planning history. Founded in 1913 on the basis of the plan submitted at the international competition for the capital by Chicago architects Walter Burley Griffin and his wife Marion Mahoney Griffin Canberra is a city of today 400,000 (2018).

Fig 1 Plan View of City and Environs and View from Summit of Mount Ainslie, 1911.

The ‘Griffin Plan’: the prize winning scheme conceived by Walter Burley Griffin and Marion Mahony Griffin⁵

Already the original ‘Griffin Plan’ plan met with very different reactions between utmost admiration in the international realm and a surprising mix of responses in Australia. Local assessments have been ranging from perspicacious appreciation and complex interpretative approaches via crude exploitation as a branding tool to outright contempt. While the US urban designer Edmund Bacon eulogised it as ‘a statement of world culture’⁶, the (then) local Minister for Planning more recently (2010) derided the plan as a scheme reminiscent of the small town of Springfield in the Simpsons’ comedy series.⁷

TALE OF TWO CITY ELDERS	
 <p>JEBEDIAH SPRINGFIELD (BORN HANS SPRUNGFELD), UNKNOWN -1795 Famous for: Leading a band of wagons westward from Maryland to found the fictional town of Springfield, wrestling a bear with his bare hands, running across six states to avoid creditors. Most quoted: ♣ A noble spirit embiggens the smallest man. ♣</p>	 <p>WALTER BURLEY GRIFFIN, 1876 - 1937 Famous for: Designing Canberra, Australia's capital city, credited with the development of the L-shaped floor plan, the carport and the first use of reinforced concrete. Most quoted: ♣ I have planned an ideal city – a city that meets my ideal of the city of the future. ♣</p>
 <p>SIR WALTER BURLEY GRIFFIN</p> <p>STOCKLANDS PRESENTS THE MOST PRESTIGIOUS ADDRESS EVER TO GRACE CANBERRA'S LANDSCAPE. CASTING A GRAND REFLECTION ON THE WATERS THAT LAP AT ITS DOOR, THIS BREATHTAKING MASTERPIECE SHINES AS THE ONLY WATERFRONT DEVELOPMENT ON LAKE BURLEY GRIFFIN. IT IS A STUNNING EXPRESSION OF SIR WALTER BURLEY GRIFFIN'S VISION. EXPERIENCE THE INFINITE INDULGENCE...</p>	

Ways of seeing: Fig. 2

Fig. 3

Griffin as the ‘Jebediah Springfield’ of Canberra. ‘Sir’ Walter Burley Griffin as crude advertising gimmick

Beyond the Griffin Plan, judgments on the actual development of Canberra as a 'regional city' of New Towns⁸ over the last 105 years have been similarly divided. While Canberra shared the image of being soulless and sterile with many new towns and post-war developments internationally, the city was identified by Peter Hall as having 'achieved the difficult feat of being one of the last Cities Beautiful, and also the world's biggest Garden City'.⁹

Also from the angle of our conference theme, we can justifiably choose between opposite views. As a kind of government company town that remained without self-government until 1989, Canberra might be seen as a 'white elephant' with limited relevance for planning elsewhere. The view from a different perspective, however, reveals that due to precisely the exceptionally favourable planning conditions which Canberra enjoyed during much of its history, the city developed as a 'perfectionist manifestation of ideal concepts in planning' and can be seen as a 'laboratory' and testing ground of planning models,¹⁰ which is of considerable interest for planning and 'the world history of planning'.¹¹

In order to deal with conflicting positions such as those addressed above, this paper deploys the metaphor of 'windows' through which we are looking at cities and at the processes that shape them. It looks at a selection of situations and planning conflicts that have been objects of controversial discussions since the founding days of Canberra.

The 'Windows' Metaphor

The metaphor is taken from a famous key passage of modern literature. In the preface to *The Portrait of a Lady*, Henry James suggested that '[t]he house of fiction has ... not one window, but a million... At each of them stands a figure with a pair of eyes ... He and his neighbours are watching the same show, but one seeing more where the other sees less, one seeing black where the other sees white, one seeing big where the other sees small, one seeing coarse where the other sees fine. And so on...'.¹²

While for the author of fiction, the important message is that there is no limit to the number of windows upon 'reality' that can be opened, this is different for planners, architects and other activists. They have to be able to develop strategies and contribute to making the city. When they open new windows, they are guided by a pragmatic interest. Each newly opened window may lead to a better understanding of the whole enabling them to hopefully act more efficiently, or to act in a more just, a more sustainable way, depending on the cognitive interest, the *Erkenntnis-Interesse*. Nietzsche described it in a similar way:

'The more eyes, different eyes, we can use to observe one thing, the more complete will our 'concept' of this thing, our 'objectivity', be.'¹³

The hope is that the new insight will allow us to act more efficiently, or to act in a more just, a more sustainable way. The metaphor can be extended. If 'the house of fiction' were part of a perimeter block with a 'rear window'¹⁴ providing views into an imaginary inner courtyard, this could allow us to see the rear of objects that were otherwise invisible.

Fig. 4 'The House of Fiction' – Flyer for Conference 'Windows Upon Planning History', Kassel University 2013

It could also help us discover what may be hiding 'behind the bush', as a German idiom puts it. In this sense, the house metaphor is more versatile than the metaphor of putting on different spectacles. Glasses could not achieve this. It is even more obvious that the newly gained perspectives are much more than whims, curiosities or personal views. The 'stereoscopic' or multi-faceted view from two or more windows is by no means an

expression of postmodern arbitrariness¹⁵ of a tendency towards 'alternative facts'. On the contrary, its purpose is to achieve a more detailed view that allows us to take decisions from a better substantiated position. That has also been the intention of turns as different as the communicative turn,¹⁶ the linguistic turn¹⁷ and the transnational turn in urban history.¹⁸ Opening new windows may reveal blind spots, blinkers and 'tunnel vision'; the new windows may reveal what has been consciously hidden by particular interests; they may reveal myths as lies; they may expose the selective 'histories of the winners' and open the path to writing 'insurgent planning histories', 'making the invisible visible'.¹⁹

Figure 5. Myth and reality. Capitalist profiteering in the cloak of the non-profit housing association Neue Heimat (1986)

The radically different views can be as clear-cut as in the Copernican case. But they can also be almost as complementary yet difficult to reconcile as the interpretation of light as either waves or particles. Often, they are associated with the formation of factions and with professional controversies, for instance between modern and traditional positions or the roles of architecture, planning and other disciplines. Sometimes such conflicts stand in the way of interdisciplinary cooperation between architects and planners. The windows metaphor opens up the possibility of dealing with the struggle between paradigms in different ways – not necessarily in a linear sense, 'victorious' paradigms replacing those based on the preceding 'wrong' interpretation of 'reality', but as potentially complementary. The purpose of the metaphor does not, however, lie in blurring the differences between different positions or to avoid judgment. On the contrary, it may serve to accentuate the differences and to demonstrate that we have a choice of deciding to which view we want to subscribe and to point out the consequences of that choice.

Windows on Canberra – contrasting perspectives on an exceptional city

In the case of Canberra, this is particularly relevant, because – more than many other cities – its fate and sometimes the question of the very necessity of its existence have been dependent on the way cultural controversies have been fought out – especially when the windows opened by dominant agents of the discourse have been deployed with a strategic interest. Thus the interest behind the local planning minister's denigration of the Griffin Plan as a 'Simpsons Family' small town plan lay in pushing a high-rise agenda²⁰ and in counteracting the theme of a low to medium-rise 'city in the landscape' supported by parts of the local community.

But let us look at a selection of such discourses and the contrasting windows in detail. Following a broad survey of major cultural controversies that have been influencing debate and practice of Canberra's development the paper addresses a different window in a particularly important area - the Griffin Plan - and what has been discovered and understood, forgotten and remembered.

Planning History and Cultural Controversies

While no city can really be understood without a grasp of its history and the cultural controversies that shape it, this is valid in a particular way for Canberra as an internationally renowned model city – 'one of the treasures not only of Australia, but of the entire urban world' as the eminent US planning historian John Reps classified it.²¹ Over the years, Canberra has been described by planning historians from different viewpoints including its symbolic role²² and its role as a capital²³ in comparison with other planned capitals.²⁴ A number of overlapping cultural local discourses have emphasized specific aspects contributing to the identity of Canberra as a garden city;²⁵ as the 'bush capital';²⁶ 'a city in the landscape';²⁷ and a city of 'democratic symbolism'.²⁸ At the height of the decentralization debate in Australia in the 1970s, it was also seen as 'an exemplar for many decentralised Australian cities'.²⁹ Windows opened by the author of this paper have included Canberra as an 'open air museum

of planning³⁰ as the ‘perfectionist garden city metropolis’³¹ and as a ‘sensitive barometer of the political climate in Australia’.³²

None of these windows exclude the other, although there may be tensions between the views. Some require more explanation (e.g. ‘a statement of World Culture’) than others. Even the conflicting positions between whether Canberra might be ‘the most un-Australian city’³³ – whatever the merit of such a debate may be – or whether it is utterly Australian can be reconciled quite easily. Features such as the clear delineation of the borders between urban and rural lands and in particular the uniform, strict application of standards of design, infrastructure and hierarchical planning in Canberra’s suburban landscape established during much of the 20th century distinguish Canberra from most other Australian cities; and more than that, the principles of axial planning in the centre have motivated the use of the label ‘un-Australian’;³⁴ but the faithful translation of Australian middle-class values centred around the ideal concepts³⁵ of bungalow, quarter-acre block and motor car make it an outstanding manifestation of the Australian suburban dream. Both views can co-exist peacefully next to each other and with little consequence for development on the ground.

We are, however, confronted with quite a different situation when we look at the conflicting views and patterns of appreciation for Canberra as a federal capital, be it at the time of its conception or in the 21st century. On the one hand, Canberra was to become the prestigious symbol of a young federation, ‘the finest capital city in the world – the pride of time’, as the Minister for Home Affairs, King O’Malley, postulated in 1910.³⁶ On the other hand, its very creation was influenced by the ‘haggling of provincialisms’³⁷, and its physical construction was hampered right from the start by ‘the hostility by certain officers... to Mr. Griffin and his design’. Even the Chief Architect proclaimed that he would like to see [the Federal Capital] strangled for a hundred years’.³⁸ These windows are difficult to reconcile.

Nevertheless, this existential dialectic has been a characteristic phenomenon persisting over long periods. During the 21st century, affirmations of the national commitment to the capital culminating in the centennial celebrations in 2013 have contrasted with crippling budget cuts, political statements and gestures of disdain and eventually with plans for the transfer of national agency staff to provincial cities located in the electoral seats of the relevant minister.³⁹

1988 and 1989 were the crucial years of the turnaround for Canberra. In 1988, an enquiry⁴⁰ into the future of the planning arrangements in Canberra argued that the planning authority, the NCDC had ‘virtually completed its task of building the city’ and with ‘the completion of the new Parliament House’ the ‘national building program was now almost complete’.⁴¹ The belated introduction of self-government in the following year was not only conforming to long-established global standards of planning culture. In fact self-government had been opposed in two referenda by the citizens of Canberra, who knew that their share of contributing to the cost of Canberra would rise.

The windows of neo-liberalism and ‘normalization’

The major drivers were the desire of the Federal (Commonwealth) Government to divest itself of financial responsibility for the city beyond core national capital functions; and this was embedded within the rising tide of neoliberal ideology and practice that had begun in the preceding decades.⁴² The change was seen as accelerating a process of ‘normalization’ of urban development for city and territory.⁴³

Seen through one window, these developments put an end to that phase which was shaped by ‘a continuous series of planning models, for the most part realised with uncompromising perfection; new models supplanting the old ones as time went by’ (Fischer 1989:156). Through another window, and with a certain ironic slant, we might also come to the opposite conclusion. We might say that Canberra’s basic approach of following the mainstream trends in urban policy and development did not end but in fact continued – in the sense that it was taking the city into the phase where the neo-liberal application of ‘rigorous private sector principles’ demanded ‘a severe pruning of its ... planning functions’.⁴⁴ And once more, Canberra was hard to beat in its rigour.

The abolition of the Commission (NCDC) that had guided the city’s growth by integrated planning and development between 1957 and 1988 meant that architects, planners and urban designers were successively replaced by economists, lawyers and administrative staff.⁴⁵ Seen from a normative window of the planning discipline, we might address this as the phenomenon of de-professionalisation as experienced world-wide, or in more neutral terms, as a shift in the professional profile in the interest of lean government.

Closing windows - Loss of corporate memory with lethal consequences

This development was associated with a loss of corporate memory and knowledge that accelerated after 1988, but had already begun earlier. Already this author’s first publication on Canberra had pointed to the problematic

of ‘a lack of an interest in corporate memory..’, which had led the authorities ‘to throw away books and reports’ and to the fact that ‘my lucky presence helped me’ to preserve copies ‘that were otherwise unobtainable on the market’.⁴⁶ Locally this was interpreted as the sarcasm of ‘the acerbic Karl Fischer ☺’.⁴⁷ The question was also raised whether quoting from the material discarded – but also provided by the NCDC – wasn’t tantamount to ‘biting the hand that fed’.⁴⁸ Clearly, opening windows of knowledge is not always appreciated.

The dissipation of the NCDC’s library continued after its transfer to the NCA – much to the shock and despair of some and to the delight of collectors of rare documents. Again, as with the phenomenon of deprofessionalization, the dissipation of libraries or parts thereof is widespread between Sydney and Kassel, Germany, where I just discovered that much of the university’s planning library I had built up over 20 years has been shredded, including first editions by Raymond Unwin and other classics!

In Canberra, the loss of corporate knowledge – equivalent to the closing of windows – has had various palpable consequences. The strategies of ‘small government’ and the associated problematic practices of outsourcing without adequate control, in combination with the dissipation of planning knowledge and corporate memory, led to a demonstrable loss in the quality of buildings and urban design.⁴⁹ An extreme case can be seen in the failed implosion of Canberra Hospital in 1997 with lethal consequences due to failed practices of outsourcing. As the coroner’s enquiry confirmed ‘none of those persons possessed any knowledge or experience in the implosion technique and [they] were unqualified to prepare a true risk assessment of the demolition. The so-called risk assessment plan was a failure.’⁵⁰ In the aftermath of the catastrophe, the view from a window that focused on the search for individual scapegoats directed attention away from recognizing the failure as being systemic, in fact as constitutive features of neoliberalism.

The loss of professionalism in planning, uncontrolled outsourcing and loss of corporate, public and professional memory through myopic market-orientation resulting in catastrophic consequences, are problematic features to be observed all around the world and could be written up through the window of a rather sad ‘world history of planning’. The loss of knowledge has, however, also infiltrated the local planning debate. A characteristic case is the widespread confusion of Lord Holford’s proposals for the central area of Canberra in 1958⁵¹ with the ‘Y-Plan’⁵², the metropolitan development plan elaborated from 1967 on. ‘Lord Holford’s Y-Plan’ is a reference found in the press⁵³ and even among architects who once worked in the planning agencies.⁵⁴

Fig. 6. 2010 Drawing by local architect confusing the Y-Plan (1970) with Lord Holford's Recommendations (1958)

Confronted with the misnomer nature of ‘Lord Holford’s Y-Plan’, University colleagues talking about it at conferences – not planning historians, though – have sometimes raised an astonished eyebrow while others dismissed the observation as pusillanimous pedantry. The loss of historic memory however, and the resulting impoverished and cock-eyed view of the potential of the plans and projects that have shaped Canberra has been of considerable consequence for the city. The following paragraphs open some windows on the history of forgetting and remembering the Griffin Plan.

The Griffin Plan – windows shut and opened

Just what a treasure the Griffin Plan was had escaped general attention up to the mid-1950s. The windows on the qualities of the plan dropped shut with World War I, just as those on the entire capital city project. Canberra fell into a big sleep, from which it was shaken up decades later by the Second World War. That War opened a number of new windows. It changed the nation's whole outlook from that of a collection of colonies to a consciousness of national identity, for which the capital could serve as a nucleus⁵⁵; but it was the military-political crises of the mid-1950s that motivated Conservative Prime Minister Menzies to bring what had thus far

been an aborted capital city project to completion. As has often been described, Menzies established the National Capital Development Commission (NCDC), an exceptionally powerful and well-resourced organization which was in charge of the planning and development of Canberra between 1957 and 1989.

In this context, new windows were opened from the mid-1950s on by Peter Harrison, the NCDC's Chief Planner from 1957 to 1972. Harrison re-discovered the importance of Canberra's landscape setting, but also confirmed the shift of the balance away from City Beautiful concepts to a modernist and overall suburban interpretation of a city of bungalows and automobiles. Almost logically, the window opened by Lord Holford's recommendations in 1957 was that of the automobile windscreen looking out to a city of highways in the landscape. Peter Harrison and later US historian Mark Peisch⁵⁶ were the first to elaborate on the synthesis of Garden City and City Beautiful elements in the Griffin Plan; a discovery that Peter Hall extended to his statement that Canberra had 'achieved the difficult feat of being one of the last Cities Beautiful, and also the world's biggest Garden City'.⁵⁷ While this statement is by nature a classification rather than a clear praise, one of Griffin's biographers emphasized how amazingly advanced Griffin's concepts were in terms of professional planning. In 1963, James Birrell pointed out: 'No major concept in town planning has been put forward in the (then) 40 years since the city was designed that is not incorporated in the original scheme'.⁵⁸

Far ahead of the conventional planning of the early 20th century, the plan incorporates a whole catalogue of ideal concepts of planning⁵⁹ that are up-to-date even a hundred years later – right through to what has to be classified as sustainable planning.⁶⁰ Features of the plan included: neighbourhood units (explicitly named as such in 1911) and diversified urban sub-centres connected by a tramway system 'borne at public expense'; principles of water recycling, decentralised sewerage treatment and urban gardening; reduction of pollution through hydro power; principles of functional and social mix and ideas on the public goods function of residential land.

The plan also adopted a long-term perspective. The competition conditions had suggested an initial population size of 25,000 with a potential to grow up to 75,000 within a foreseeable time span.⁶¹ But the plan was looking further ahead. 'Any arrangement looking forward one hundred years has to be elastic,' Griffin said, and yet had to define an urban design structure and a functional disposition of districts 'in their right relationship to the city in its later development... 'We must not plan for a village... This is done where town planning is not practiced.'

To this end, Griffin anchored the design principles of his concept on the ground in such a way that they would provide long-term guidance for the city's development right from the start, using the existing landscape features as cornerstones of his design. Set within the frame of hills, ridges and lake, only a few points of architectural accentuation, maybe even a mere stone pyramid or pennant on a hill, are needed to establish a spatial design interpretation of the natural landscape. Axes or other lines in space can thus be made visible 'almost without the assistance of man's handiwork' to delineate a spatial setting for the future city.⁶² It was the parallels between his kind of space design and those found in Asian cultures and other references to 'the longest-lived civilizations' that support Edmund Bacon's judgment on Canberra as 'a statement of world culture'.

At the same time, the whole city and in particular 'the great triangle, inscribed across the central basin was conceived as a living expression of democratic governance, its axial geometries generated from the salient points in the landscape and its disposition of city functions generated from an inspired reading of the Constitutional provisions for Australian parliamentary democracy.'⁶³ This is how in the 1980s Professor of Landscape Planning James Weirick elaborated on the qualities of the Canberra Plan as a manifestation of 'democratic symbolism'.

The reasons why so few of the design principles in the central area have materialized are complex. They have been described in 'Myths and Models' through the window of semantic impoverishment and also with reference to one of the big cultural controversies of our time, the verdict and the legacy of Modernism. Seen through one window, we are confronted with the "spiritless modernism of contemporary Canberra and the official culture that has produced it"⁶⁴ – a shallow Modernism that would best be transcended if possible. The view from another window admonishes us to consider the manifestations of post-war modernism as an important layer, in particular since the "Modernist parklands encircling the lake, for instance, are not without heritage value."⁶⁵

The Windows approach suggests discussing both perspectives. The same goes for other controversial contexts such as e.g. the position on the new and permanent Parliament House, attacked in one of the best critical pieces ever written on the subject as the source of almost all evil in the capital⁶⁶, which Myths and Models praised as a most interesting and successful building, albeit expressive of the contradictory characteristics of the society in which it is embedded.

Concluding remark

The paper has used the windows metaphor as a vehicle to explain basic conflicts in the development of Canberra. In some of the cases, alternative views can be reconciled easily, in others, the windows perspective could prove

fruitful to facilitate a dialogue that might go beyond mere confrontation. The work on the development of a ‘windows theory continues’.

Disclosure Statement

No potential conflict of interest was reported by the author.

Notes on contributor

Karl Friedhelm Fischer studied urban design and worked at the universities of Aachen, Berkeley and Canberra. He also has as a degree in English/American Literature (Aachen). At the HafenCity University, Hamburg, he was a professor for ‘History and Culture of the Metropolis’, and at the University of Kassel, he taught planning history and urban regeneration. In 2013, he took up a position as professor and acting director of the MUDD program (Master of Urban Development and Design) at the University of New South Wales, Sydney, where he is now a visiting professor. Professional affiliations include Progress in Planning (editorial board), AESOP (Council of Representatives while in Europe) and elected member of German Werkbund. Following the publication of his PhD thesis ‘Canberra – Myths & Models’ the majority of his publications have been in the field of planning history.

⁴⁷ Headon 2003

⁴⁸ Birtles 1987

⁴⁹ Fischer 2009. Features such as spot development responding to market opportunities rather than long-term planning principles, the introduction of unsolicited bids as a new instrument, and the development of a 'free enterprise zone' with 'potentially unfettered commercial development opportunity' (JSCNET, 2008: 98–103) with offices, large-scale retailing and Factory Outlet Centres at the airport (Freestone and Wiesel, 2015) are signs of a trend towards the 'normalization' of urban development for city and territory (Freestone, 2009; Brown, 2014; Fischer and Weirick 2017). Large tracts of the recent suburban development including the low-standard housing at the edges of town in north, south and west, with McMansions on small lots trying to save space by replacing traditional eaves and 'verandahs' by more air conditioning certainly do not earn the 'best practice seal of approval'. The shonky quality of craftsmanship in Canberra's building industry has recently reached the point at which it became the object of a government enquiry.

Soviet Post-WWII urban ideas and space exploration: 1960s-1980s

Olga Zinovieva (Lomonosov Moscow State University)

The main goal of the paper is to research of how the Soviet science and space program, in particular, affected urban planning and architectural design in Moscow of the 1960-1980s. The Soviet urban concepts of 1920s -1950s mirrored technological progress and aviation in its own way. Airfields and other aviation facilities appeared on the Moscow landscape. The 1935 Stalin' s Master Plan of Moscow Development broadened the main streets not only for the growing traffic but also for some emergency airplane landings. The themes of skies, embodied in stucco, marble, brass or mosaics pictures decorated the Underground Metro stations, residential houses, public and educational buildings. Images of pilots and paratroopers, offered a great life path for the Soviet people to follow.

The research based on the Soviet urban plans, photos, professional papers and media reflections showd that the space exploration had a tremendous role in the Soviet urban space in terms of planning, architectural design, new facilities, images, street names and monuments. On October 4, 1957, the era of space exploration has begun, when the first Soviet sputnik was launched into the Earth orbit. In 1961, Yury Gagarin became the first man in the history of humanity to enter the space. It also coincided with the change of the political power from Stalin to Khrushchev, who officially proclaimed the advent of simplicity in urban design and the deny of Stalinist excessiveness in architecture in 1955. Later on the Khrushchev style of the post-WWII modernity transformed into Brezhnev' s aesthetics. It resulted in scientific approaches to zoning in urban planning, which combined monotonous residential areas, supported by the infrastructure and imposing geometric constructions of prefabricated units as public buildings. Looking like spaceships or satellites, they were supposed to bring accents to the unified quarters. Space science required new R&D buildings and corporate towns around them. The post-WWII Moscow city plans provided spacious streets and squares, as if inviting interplanetary stations to land. In 1963, Mikhail Posokhin built his wide Kalinin Avue through the old medieval city. The Council for the Mutual Assistance with a glass NLO, sitting in front of it played the role of the main accent there.

The House of Pioneers on the Lenin Hills (1963, Victor Egerev and others) was located in the middle of the square, which looked like a spaceport. Space exploration was perceived as conquest. New street names and memorials reflected this idea, such as the Obelisk to the Space Conquerors (1964, A. Faidish-Krandievsky, A. Kolchin and others). The Obelisk is the landmark of the area, which includes Alley of Cosmonauts (1967), Memorial Museum of Astronautics, Hotel Cosmos and others.

Many monuments, including the statue of Yury Gagarin (1980, Pavel Bondarenko), dedicated to space victories were erected in the city, causing noticeable changes in urban design. Monumental art in different forms presented allusions to the weightlessness.

Contemporary Russian urban planning and design uses citations of that time. However, commercial urban development ignores the ideas of zoning and well-balanced residential areas.

The protection and utilization of the historical and cultural district in southern zhejiang province of China based on the social status quo ----- Take the reconstruction of the historic and cultural district in Songyang county as an example

Wen Jiang (Traditional Architecture Design Instiute of Zhejiang Province), Lu Zhang (Traditional Architecture Design Institute of Zhejiang Province), Bing Yang (Traditional Architecture Design Institute of Zhejiang Province) and Fangfang Xiao (Traditional Architecture Design Institute of Zhejiang Province)

The effective protection and rational utilization of historic cultural district is an important part of historical and cultural city . There is an obvious advantage in historic cultural district which is it's rich cultural heritage resources . But there are also some problems such as run-down buildings/ lack of attraction/ inhospitable and so on . Then , it is not realistic to protect and utilize the whole block , firstly , it is difficult for the government to implement it because of the large number of residents/land and houses involved , secondly , it is difficult to make money . In this social reality , we consider revitalizing the entire block and even the ancient city through the revitalization of the district nodes with points , the specific techniques include the following aspects . First , combining the architecture and its cultural background to add more green space, then improving the comfort of living , Second , the aesthetic value and sensory experience of space are shaped by small then fine, small then beautiful landscape , Third , making in-depth analysis of each space, and show it in the way of landscape design , what we want to achieve is "tell the story , remember the homesickness ." Fourth , through the design of public communication space , we want to make a a place of daily life and communication for the local residents , we also want to make a platform for outsiders to understand the local human history.

From Western Experience to Soviet model: the Paradigm Shift of China Planning thoughts (1949-1952)

**Hao Xu (Department of Urban Planning, School of Architecture, Southeast University (Nanjing)),
Baihao Li (Department of Urban Planning, School of Architecture, Southeast University (Nanjing))
and Xiaoqiang Fu (Department of Urban Planning, School of Architecture, Southeast University (Nanjing))**

1949 is a special historical node in Chinese history. Before this, early modern Chinese urban planning respected European and American experience. After that, the Socialist China followed the Soviet Union planning model. The study focused on the paradigm shift of Chinese planning ideas from western experience to Soviet model in the 1949-1952.

In the three years, the western experience and the Soviet model formed a contradictory situation. On the one hand, the government led the initial intervention of the Soviet model, including planning practice in the northeast of china, and the introduction of quota index system. On the other hand, there is a continuation of the western planning ideas, which is mainly embodied in the knowledge production by Chinese planning experts who have been educated in Europe or the United States.

In the face of this opposition, the new central government adopted radical way in the criticism of Western planning thoughts while highlight the superiority of the Soviet Socialist planning. Thus regards of planning thought governance, three parallel paths are carried out from the perspective of national strategy, industry policy and individual.

Firstly, Take the Soviet Union as a teacher and transform it into a part of the national development system. Secondly, various urban planning conferences were hold in order to intervene the pro-Western ideological. At last, ideological transformation Ideological reform was also carried out by planning experts who were educated in the West. They were asked to publish article in Public media to identify the Soviet planning ideas. Through the setting of above three paths and the corresponding social practice, the collective turn of Chinese urban planning industry in 1953 was finally achieved.

PLANNING FOR MEGA EVENTS, DUAL DEDICATIONS OF LEGACY AND DELIVERY

Niloufar Vadiati (HafenCity University Hamburg)

Mega-events, including the Olympics, as 'hallmark event' are considered as a means of image building, and catalyst for economic regeneration and urban development through strategies of attracting global investment, high employment multipliers and local tax revenues. Critics, however, emphasise that running a 'spectacle' and achieving local regeneration are tasks which are not easily reconciled; Since the consumers of the spectacle are mainly middle-class, and the ultimate consequences of city renewal by means of sport/consumption-led regeneration will be gentrification, prising-out and displace local small businesses and the disadvantaged populations.

The present paper seeks to address these controversial dynamisms as the inherent to the planning of the large-scale event. Its focus is Olympic Games, and it examine the different planning measures that affects the outcome of the Games. The study has been materialised through comprehensive literature review, that on the one hand locate the Mega Events amid the planning paradigms and critical urban theories, and on the other hand consider it as an organisational project.

The examination suggests that there have been common dynamics behind the controversy of hosting the Olympic Games which could be plagued almost everywhere in the world to a greater or lesser degree, as the contradiction between two concurrent and tacit conceptions of the Mega Events. Delivery: the notion that understands the games as a project that should get done on time and perfect alongside, and as the counterpoint, legacy, which conceives Mega Event as a tool of redistributing the benefits to the citizens. The combination of legacy and delivery or public-sector (gift) and private-sector (profit) in one phrase seems awkward at best and an outright oxymoron at worst, while can be only explained by the market base city development.

Therefore, the paper set a versatile analytical tool and conceptual groundwork for an empirical work that focus on the project and urban dimensions of Mega Events.

Commons in participatory planning: exchanges between Italian participation and Japanese “machizukuri” practice in academic spheres

Alba Victoria Zamarbide Urdaniz (Waseda University), Tomoyuki Mashiko (Waseda University) and Armelle Le Mouëllic (Grenoble National School of Architecture)

Nowadays, a new interest has grown on participatory policies supported by the institutionalization of this process. For example, at global levels, institutions like UNESCO are insisting in the importance of integration of communities in planning and heritage preservation. Participatory process had been discussed by architects, urban designers and academics since the early 60' s. Ideas that had previously originated in the West are now re-discovered through Asian examples/practice.

In Japan, a specific methodology called “machizukuri” has been developed in the last decades and gradually successfully integrated into governmental planning systems (Watanabe, 2016)

It can apply to diverse scenarios, like pre and post disaster planning, territorial revitalization or place branding among others. This methodology is being exported to other Asian countries. Taiwan and South Korea for example are trying to adapt the approach to their local conditions. Besides, Japan has tried to flagship Asian heritage visions and actively participated in diverse international cooperation projects, especially in South-East Asian countries, where the bottom up community approach has been applied (e.g. Cordillera terraces, Philippines, Nguyen Royal Tombs in Hue Province, Vietnam)

In Europe, recent earthquakes occurred in Italy (L' Aquila in 2009 & Emilia Romagna in 2012) have underlined the gaps of top down systems and the need for better integration of local communities in the creation of reconstruction tool and awareness rising. Though Urban Centres, created in the 60s as the application of social ideals in urban planning, are spread all over Italy, the model is lagging behind actual needs. This has motivated exchanges. Italy-Japan at academic and governmental levels and has positioned “machizukuri” as a reference methodology that could be adapted to European cases as well.

Inside this context, the research tracks the origins of “machizukuri” in the academic exchanges between East-West, focusing specially in the cases of Japan and Italy. It studies the influence of expert and academics networks in the actual definition of the participatory methodology.

In order to do so, the research first looks at some exchanges and debates fostered by program as International Laboratory of Architecture and Urban Design.

From 1974 to 2004, every year, Giancarlo de Carlo reunited academics and students from north-america, europe and asia in order to work on a determined territory. Those experimentations were published accompanied by some theoretical works in which we can see definitions of participatory planning methodology. ILAUD was also an opportunity for many researchers to connect and elaborates common theory. The study will focus on the links between Waseda University (Japan) and Ferrara University (Italy)

It shows the creation of specific exchange through academics activities and urban projects. The connections between post disaster projects in the Tohoku area by Waseda University(Satoh lab.) and the efforts made by Italian academic institutions to adapt National post-disaster action models in Emilia Romagna and L Aquila are studied. These cases serve as an example of the exchanges of knowledge and the use of “machizukuri” as a reference model. Besides, a considerable number of research works on the Italian case have also been produced by researches in Waseda University, which portray the approach taken by Japanese on the Italian scenario.

On the other hand, cooperation projects and activities developed jointly by both Italian and Japanese parties portray the creation of agreed methodologies.

The research bases on bibliographical data, the direct involvement of the three authors in “machizukuri” practice since 2010, project data and interviews with key persons. The final objective is to analyze the capacity of the methodology to adapt and re-invent itself and its future tendencies.

The inheritance and development of participatory urban design methods under the background of “Internet-plus” era

Yiran Xu (Southeast University, Urbanisation and Urban Rural Planning Research Center of Jiangsu)

In the context of ‘Internet+’ , the new environment of network data and media brings more possibilities to the expansion of urban design participation approach, on which basis the author launches a study on the inheritance and development of participatory urban design methods. This paper begins with a review of the theories, methods and practices of participatory urban design both at home and abroad, and points out the lack of cognitive height, breadth of application and practical depth for public participation in China’ s urban design. At the same time, it also reveals the necessity of introducing multi-stakeholder participation in urban design under the trend towards shifting focus from increment to inventory of urban construction in China. Through the in-depth analysis of the various stakeholders, design phases and project scales, a framework of application conditions for urban design is built. The multiple stakeholders mainly include government agencies, local residents, design teams, developers and builders, expert advisors and commonweal organizations; the whole design process is chiefly divided into earlier survey, mid-term research and later decision-making phases; the diverse project scales basically cover regional-city level, district level and land parcel level. Then, the research sums up three types urban design participation, namely ‘Information and data collection, Urban environment simulation and Interactive communication platform’ , including nine inherent and six ‘Internet+’ methods, namely ‘Information and data collection, Urban environment simulation and Interactive communication platform’ ,with a total of fifteen kinds of urban design participation methods. Based on the nine traditional methods including ‘questionnaire, interview, participant observation, cognitive map, visioning card, layout game, open house, public meeting and thematic event ’ , the author expands six emerging approaches with the “Internet+” concept, which consists of ‘web data mining, mobile terminal tracking, virtual reality, digital city, social media and public participation GIS’ . Each method is elaborated in conjunction with empirical cases, and summarized its applicability and limitation. Finally, the author designs a ‘participatory urban design toolbox’ as a selection reference for different scenarios of urban design. As an extension of thinking, the author reviews the values of participatory design for project practices and makes recommendations on the participatory processes of future urban design.

Crossing Histories; Brazilian Planners of São Paulo and their Transnational References (1910-1930)

Jose Geraldo Simoes Junior (Universidade Presbiteriana Mackenzie) and Heliana Angotti Salgueiro (FAU-Universidade Presbiteriana Mackenzie)

This paper examines how some pioneering planners in the Brazilian state of São Paulo, Victor Freire, Prestes Maia, Ulhoa Cintra, and Anhaia Mello disseminated and appropriated the dominant principles of international urbanism in the period 1910-1930. The education in city planning is directly associated with the repertoire of engineering courses and professional associations. In this environment, where public debates on urban issues were intense, it is worth noting the presence of English urbanist Barry Parker, who lived for two years in São Paulo, implementing innovative projects and debating with local planners. The access to urban planning manuals and reviews, and the presence of these Brazilian professionals in international seminars, led to the dissemination of the international ideals and some resulting essays on the way these ideals could be applied in many fields: urban regulations, projects in downtown areas, housing, sanitation, town extension plans, city management, zoning, among others. In the library of the Polytechnic School, as well as in the personal collections of Anhaia Mello and Prestes Maia, there are precious references to be deeply studied – interests us to analyze critically how these pioneers urbanists read the books of British authors such as Raymond Unwin, Ebenezer Howard and Patrick Geddes, the Austrian Camillo Sitte, the Germans Joseph Stübben, R. Baumeister, A. Brinckmann and Werner Hegemann, the French authors Eugène Hénart, Pierre Lavedan, Gaston Bardet and Le Corbusier, the North Americans Charles Mulford Robinson, Nelson Lewis, Harland Bartholomew, Lewis Mumford, W.B. Ford and others, choosing different paradigms to guide the plans for the metropolis of São Paulo. Contradictions among practices, actors and references are requesting a conceptual and methodological effort attentive to historical dimension of the “circulation” of ideals or their limits of intelligibility and reception in other scales of time and place, such as the one proposed in this paper.

Urban planning in early modern Suzhou (1895-1937)

Wenjuan Gao (Southeast University)

As the dominant commercial, manufacturing, and cultural urban center with merchants of great wealth during the last thousand years of the Imperial China, Suzhou's economic position was rapidly replaced by Shanghai after the first concession area established there in 1843. Although the private trade and other connections with Japan quite likely predate the historical record, Suzhou demanded be opened as a treaty port officially until the 1895 when Japan's victory over the Qing. Starting from this, western urban planning was introduced to transform the physical and intellectual urban spaces, which mean to restore the economic and cultural position of its past.

This paper is a study of the urban planning in Suzhou under the influence of foreign-originated urbanist technologies and practices from 1895 to 1937. First, it analyzes the spatial transformation due to the transport changes, the first horse-road was constructed (1897) between the concession and inner city and foreign shipping companies were established (1898-1907)

Second, this paper explore how Japanese government documents, books and advertising manuals (1910s-1920s) introduced Suzhou's cityscape to their people. In order to highlight what Suzhou was in the cross-cultural dialogue. At last, this paper examines the first master plan of Suzhou (1927) that presented by Japan-trained Chinese architects. Analysing the historical reasons for remaking the city as modern by building roads and urban garden system in this project.

Living Heritage Conservation: from commodity-oriented renewal to culture-oriented and people-centred revival

Yiran Xu (Southeast University, Urbanisation and Urban Rural Planning Research Center of Jiangsu)

Identity, structure and meaning are three components of an environmental image according to the theory created by Kevin Lynch. In reality, the levels of identification of a certain object (city landmark) and its meanings are relatively easy to obtain through questionnaires or interviews with citizens when investigating the public cognition towards the city image, while spatial or pattern relation between different objects (structure) can only be vaguely described. This study aims to provide a new perspective and approach based on webometrics, in which city image can be analysed both quantitatively and qualitatively. The first step is to list as many keywords as possible, including different categories of city elements like roads, streets, rivers, lakes, mountains, parks, plazas, historical sites, skyscrapers and other landmarks. The second step is to do batch operations to fetch quantity data (such as numbers of entries, word frequency, search volume and click-through rate) of selected keywords from internet search engine. Programs can be written to retrieve and correct multiple times on different web search engines to reduce transient data errors. The last step is to sort the data, graphically illustrate the level of cognition of each city element under the same measurement standard, and compare the imageability of different elements. Spatial data visualization can be applied here to generate an intuitionistic map for easy and clear observation. Moreover, the author also collects the quantity data of the intersection between each two keywords to speculate the potential correlation among city elements. This web-metric analysis approach has been utilized in two urban design practices in China (Nanjing and Wuhu), and showed its objectivity and accuracy in discerning the city image structure. Especially at the macro level, it not only judges the overall structure of the city from a more objective cognitive perspective, but also can clearly define the urban axis and corridors, clusters of important buildings, and popular landscape areas.

Adherence and Negotiation: Italian Planning Ideas in the Chinese Port of Tianjin 1902-1943

Penglin Zhu (Delft University of Technology) and Yin Wu (Beijing City University)

The presence of Western nations in Chinese treaty ports changed Chinese urbanization, as the foreign powers introduced modern urban form and architecture. Among them, Italian planning ideas were unique in terms of the specific balance between the country's own planning culture and the Chinese built environment. Comparing to the other concessions, the particular Italian vision of building a 'proletarian' colonial neighborhood allowed the Chinese people to own estate property and even to join the Municipal Council. The Italian concession in the Chinese port of Tianjin was established in 1901 as the latest of the nine countries that established unequal treaties. The settlement area, already occupied by Chinese quarters, cemeteries, and wetlands, was considered as unpromising. Collaborating with Italian urban planners, architects, and engineers, the Colonial Municipality successfully transformed an existing, difficult Chinese area into a highly urbanized Italian neighborhood. Sino-Italian historians and scholars of the Italian concession of Tianjin have so far paid little attention to the architecture or urban form of the settlement. This paper aims to fill that gap by examining how the exchanging ideas and designs influenced the process of Chinese urbanization and people's everyday life.

The paper explores the manner and the extent to which the Italian government and colonial authority included Italian planning ideas in the development of the Chinese port of Tianjin. Specifically, it examines how the Italian planners and architects adopted Italian planning concepts and tools to respond to the cultural, social, and technological needs in China based on historical documents from the Italian government and colonial municipality, and old maps. The paper highlights three specific aspects that are particular to the Italian settlement.

- First, the paper explores in which manner and to what extent the Italian Colonial Municipality took a particular planning approach to solving the problem of insufficient financial support from the Italian government? It will use the discourse analysis to study the documents of the colonial municipality and Italian government.
- Second, in terms of architectural design, it explores how the Italian architecture movements between 1900-1940 reflected in the urban plans and architectures in the concession. The Tianjin settlement features a range of urban spaces, such as open space, military building, public architectures, and private villas that reflect consecutive designs patterns in Italy since the 1900s. For instance, the Palace of Italian Culture 'Forum' built in 1927—a simple symmetric structure made of limestone—resembled a typical piece of Fascist architecture.
- Third, it explores how Chinese people perceived and conceived of architecture and the built environment in Italian concession. It explores how the Italian urban form and architecture shaped the Chinese people's cognition of the modern urban life through the local's diaries and narratives. Moreover, it studies how the Chinese people changed the built environment as the owner of the estate property.

In conclusion, this paper aims to be a firsthand document to comprehend the influence of the foreign planning ideas for the Chinese built environment. Moreover, it brings urban form and architectures into the existed research field of Sino-Italian cultural exchange

Planning for Megaevents, dual dedications of Legacy and Delivery

Niloufar Vadiati

PhD, HafenCity University Hamburg, niloufar.vadiati@hcu-hamburg.de

Mega-events as 'hallmark event' (Essex&Chalkley 1998) are considered as a means of image building, and catalyst for urban economic regeneration and development through strategies of attracting global investment, high employment multipliers and local tax revenues (Owen 2002). Critics, however, emphasise that running a 'spectacle' and achieving local regeneration are tasks which are not easily reconciled (Eisinger 2000), since the consumers of the spectacle are mainly middle-class (Gornostaeva 2011), and the ultimate consequences of city renewal by means of sport/consumption-led regeneration will be gentrification, prising-out and displace local small businesses and the disadvantaged populations (Vigor, Mean et al. 2004, Cohen& Watt 2017).

I suggest that there are common dynamics behind the controversy of hosting the Mega Events which has plagued almost everywhere in the world to a greater or lesser degree, as the contradiction between two concurrent and tacit conceptions of the Mega Events. Delivery: the conception that understands the games as a project that should get done on time and perfect alongside, and as the counterpoint, legacy, which conceives Mega Event as a tool of redistributing the benefits to the citizens. The combination of legacy and delivery or public-sector (gift) and private-sector (profit) in one phrase seems awkward at best and an outright oxymoron at worst, while can be only explained by the market base city development. Therefore, the aim of this paper presentation is to review and analyse the whole process of Mega Event planning and legacy building which has been set to deliver the whole event and engage the locals to the benefits, while reflecting them on recent urban discourses, and the theories embedded them.

Keywords: Mega Event, delivery, legacy, city planning, project management

Introduction

In recent years, cities have focused great attention on leveraging the global resources offered through hosting mega-events such as the World Cup and the Olympic Games (Müller 2015). Mega-events can be defined as one-time occasions with a fixed duration that attract large numbers of visitors and have worldwide reputations (Horn 2007; Hall 2006; Gold and Gold 2008). They can also be regarded as major infrastructure provision opportunities and are accompanied by substantial 'drama' (Roche 2000, 1) and a high level of international scrutiny (Flyvbjerg 2013). The drama and media exposure of these 'hallmark events' (Essex and Chalkley 1998), causes them to be considered as a chance for placemaking, a process which includes both shaping the image of host cities, and acting as a catalyst for urban economic regeneration and development through attracting global investment (Gratton Shibli and Coleman 2005; Hall 2006; Smith and Fox 2007). However, the idea of utilising a mega-event to pursue mass intervention by the state has been opposed by some scholars, who criticise the negative effects of such strategies on the trajectories of urban development and policy-making processes. Their concerns relate to the record of cost overruns, schedule slips, oversized infrastructures, and 'over-promising' about the benefits and optimistic futures for host cities (for example, Müller 2015; Boykoff 2014; Cottle 2011; Gaffney 2010; Hayes and Horne, 2011; Shin and Li 2013). In addition, there is some evidence suggesting a triggering effect of mega-events on social polarisation and the displacement of existing working-class populations by middle-class residents (Bound 1996; Hiller 2000; Horne 2007; Watt 2017). Consequently, the mega-event issue has also become a worldwide platform for opponents who call attention to the destructive dimensions of strategies related to place making through mega-events, in terms of the erosion of democratic accountability and the overlooking of marginalised groups (Gruneau and Horne 2015). These critics have produced a great deal of debate about the legitimacy of hosting mega-events and their ultimate benefits.

The goal of this paper is to provide a fresh understanding of the Olympic Games through clarifying the dilemma caused by the dual nature of mega-events, in terms of projects and urban leverage. I suggest that there are common dynamics behind the controversies attaching to the hosting of mega-events which plague almost every location worldwide to a greater or lesser degree. I call this the contradiction between the dual requisites of legacy and delivery. In these two concurrent and tacit conceptions of mega-events, delivery is the notion that understands the Games as a project that should be completed perfectly and on time; it exists alongside the counterpointing requisite of legacy, which conceives a mega-event as a tool for distributing and redistributing benefits to citizens. The

combination of legacy and delivery as being an issue of 'public sector (goods) and private sector (profit)', covered by this one phrase, seems awkward at best and an outright oxymoron at worst, when only explained by the market base of city development. On the one hand, there is the desire and intention to create the greatest possible spectacle, and to put forward the best possible image of the city to the world; on another is the commitment actors have towards environmental, social and economic benefit for cities and their citizens. This duality results in the forming of two characteristics – the two-fold nature of mega-events – and each of these (delivery and legacy) should be examined according to recent narratives and the theories embedded in them.

The legacy aspect of mega-events

Despite numerous attempts to define the concept of legacy within the recent literature on mega-events (MacRury 2008; Agha et al. 2012; Chappelet 2012; Malfas et al. 2004), the term is still complex, ambiguous and multi-faceted. Preuss (2004) conceptualises legacy as a three-dimensional concept, and this is a useful tool for developing a plural understanding of this complicated construct. He suggests that legacies can be planned or unplanned, positive or negative, and tangible or intangible. Although most pre-event studies focus only on planned, positive and tangible dimensions, the same legacy may be viewed positively or negatively, depending on who is making the assessment. Being focused on legacy in terms of all and any outcomes, Cashman (2013) argues that legacy is what remains when the Games have finished and can be interpreted as 'aftermath'. In other words, legacy is "all that may be considered as consequences of the event in its environment" (Chappelet 2012, 77).

Officially, the IOC provides a list of broad meanings of Olympic legacies that it recognises and indeed promotes in order to help bid cities to frame their strategies. These include: a) economic impacts of the Games on host cities over time; b) cultural impacts connected to social values which host cities may wish to highlight, such as multi-cultural inclusivity; c) social debate created in the context of the development and reuse of Games infrastructure; d) political legacies arising through efforts to promote 'peaceful', skilled and fair sporting contests; e) education relating to the Olympic mission; and f) 'sustainable development' (IOC Olympic studies 2013, 2–4). These categories suggest a wide range of possible outcomes, not all of which may figure to equivalent extents in cities' bids. The IOC points out that although some of these Olympic Games legacies may be 'tangible' or quantifiable, such as Olympic Village infrastructure or numbers of volunteers, others may be 'intangible', for example, the value of inspiration to athletes or a sense of belonging accruing through participation. The requirement for cities to deliver more than simply physical change is clearly important both for the IOC and citizens.

Within the city context, legacy could be considered as a process of passing on through the generations – the handing down of a 'gift', or the inheritance of knowledge, property or particular attitudes. This goes beyond the definition of the term 'legacy'; rather, it offers a narrative of a "prescribed set of outcomes as a means for thinking and linking past, present and future trajectories of a city in its developmental path" (MacRury and Poynter 2008, 17). While it is critical to track those potentialities of legacy which go beyond planned outcomes, it is also critical to recognise that different sorts of outcome may have different durations and geographies of impact within cities' developmental trajectories (Gaffney 2010). For instance, one of the immediate aftermaths of an Olympic Games could be increased levels of tourism for a host city; however, such increases may prove difficult to sustain. The 1992 Barcelona Olympic Games is considered the first and only Olympics to have generated long-term tourism legacies (Li and Blake 2009). Benefits such as a boosted construction industry may be felt at the level of the city, but simultaneously, costs may be borne by localities in terms of rising property values, for example. Local people may additionally experience disadvantages through being dispossessed of their homes and livelihoods in order to make way for the scale of development that hosting a Games has come to imply. These facts raise important questions about the temporality of legacy and who is in a position to benefit.

In light of the record of cost overruns of previous mega-events (Flyvbjerg and Stewart 2012), and the impression that host cities can be disadvantaged by holding a mega-event, the issue of use of public funds creates considerable controversy. This controversy focuses on whether huge investments of this type return the money spent to citizens through delivering the claims and promises made. During the last decade, therefore, the idea of harnessing a mega-event to a broader urban agenda that moves beyond the interest of finance, developers, inner-city reclamation and the tourist industry has emerged in the mega-event literature (Hiller 2014). Critical writing on the subject conceives legacy not just as a set of predicted outcomes to be capitalised upon, but rather as a narrative of unfolding and continuing multifarious achievements. These achievements are seen as generative and driven by a momentum born of economic stimuli, infrastructure development and the elaboration of 'soft' factors and affirmed values of communities and other stakeholders in the life of the city.

Thus, legacy has become even more contested, being perceived as a symbol of the tension between pro-growth factions and locals who feel excluded from the benefits of the event. In order to untie this 'knot', MacRury and Poynter (2008) categorised the current concepts and practice of legacy as two different and contrasting narratives: legacy as 'commodity' and legacy as a 'gift'. The concept of legacy as a commodity can be located in the wider

perspective of organisational assumptions underpinning the physical aspects of mega-events, which in the context of cost-benefit planning is a supplementary part of mega-event delivery (to be further explained in the next section). Here, it is enough to say that the legacy agenda, used as the legitimisation 'story' attached to the whole setting-up mission, focuses on manifesting the benefits of mega-events as being the city's benefits, by building new transportation infrastructure, parks and facilities. On the other hand, legacy as 'gift' is a necessarily tacit discourse defined from the city planning/urban sociology perspective. It is not just about the outcomes, positive or negative, of mega-events that 'happen' to citizens, but should respond to the demands, that are made by people for their share of an event. The ideology behind legacy as 'gift' (MacRury and Poynter 2008), which can be more accurately stated as the 'right of the citizen to the event', is based on equal distribution of the benefits of legacy and on bottom-up development of the legacy agenda. This idea of the 'right of the citizen to the event' behind the concept of legacy is based on the theoretical framework of 'right to the city' discourses which, in order to apply them in my analysis, I outline in this chapter.

Legacy building based on the 'right to the city'

The importance of legacy as an intentional positive benefit for the public is an official requirement of both the IOC and host cities' national governments. This necessity can be explained through diverse but relevant discourses presented in the 'right to the city' concept. Although, Lefebvre's concept of "the right to the city" (1996, 147–151) was initially considered rather a revolutionary concept and a plea for a new and radical kind of urban politics, it is now widely accepted and used in reformist agendas. The application of this model presents an analytical tool for rationalising the importance of preserving public interests, such as legacy, within all the hosting processes of mega-events, including specifically the Olympic Games.

Lefebvre claims that the city should be created by its citizens through their acts of participation or "appropriation"; that is, through everyday routines and capacities used to realise their social needs, and not only through using "dominant strategies and ideologies" (1996, 174 and 154). Lefebvre suggests that 'right' in this context pertains to 'the interests of the whole society', but would be intended to privilege 'those who inhabit'. It can be regarded as a form of ownership, but one which, at least in philosophical terms, is differentiated from the processes of legally acquiring land and property by exchange.

Along similar lines, Amin and Thrift argue that the 'right to the city' is "the right to citizenship for all, the right to shape and influence" (1995, 154). The focus of their work is on how to apply this principle in practical terms. The 'right to the city', they argue, "cannot draw on the politics of urban design and public encounter alone, but also requires rights-based and other institutionalized actions at national and urban levels to build capacity and capability across the social spectrum" (Amin and Thrift 1995, 154). In other words, it is not enough to allow people to participate in decision-making processes; people's existing capacities and their "capabilities" – defined in terms of the opportunity to realise the things they value (Sen 2009, 231) – also need to be developed so they can perform their citizen roles more effectively. The solution they propose, and which they refer to as a 'politics of the commons', does not begin with formalised rules of engagement, but rather with the recognition that the different interests people have and contributions they can make constitute valid practices of citizenship, and that these are what a mature democracy should seek to support and cultivate.

Agreeing on Legacy

To sum up, rather than accepting one of these definitions of legacy as a 'best-fit', or producing a composite definition, legacy has assumed a complex range of meanings in the discourse of the sports mega-event and in the evaluation of its implications for urban regeneration and economic development. It is not to be confused with the 'narrower' evaluation which uses rigid statistics of socio-economic impacts and whose focus is primarily on the costs and benefits of the mega-event itself. The focus here is to combine direct Games-related impacts with a broader examination of the additional or indirect contributions to the economic and social context of the host city. In this sense, 'hard' and 'soft', 'tangible' and 'intangible' legacies are interwoven. The effort here is to distinguish a 'commodity' concept of legacy, understood as a series of concrete outcomes planned and developed by the state, from a more thorough reality of legacy which encompasses generated mobilisation among citizens and the extent to which impacts are shared and negotiated, and which reflects the more normative discourses of the 'right to the city' by defining the right of people to the legacy of the event.

The delivery aspect of mega-events

Hosting a mega-event means embarking on large-scale programmes that require delivering a set of transportation, venue and accommodation projects on time and integrating a diversity of resources with efficiency. The delivery mission is a powerful force in practice in mega-events, and it usually follows a different orientation from the legacy agenda. The public–private aspect, regulation, budget complexity, the immovable timeframe and exceptional public visibility creates a 'state of emergency' and 'action-generating capacity' temperament (Grabher and Thiel

2014). The former is a tactic used to overcome the multiple milestones that could emerge out of routine local political and administrative procedures, and the latter is the strategy which develops to facilitate swift adaptation to the challenges imposed to the city (Grabher and Thiel 2014). However, to understand better the delivery-derived dynamic, we first need to consider a mega-event as a particular type of major project, so that its management concerns can be positioned within the relevant literature of temporary organisations, project management and the major project.

Temporary organisation

The notion of organisation can be defined as the "social units of people that have been structured and managed to meet a need or to pursue collective goals" (Business Dictionary, 2016). The relations between these units of people are concrete enough to be characterised as 'organisation' rather than 'community', and the theory of organisation attempts to explain organisational structures, relationships of organisations with the external environment, and the ways that "an organisation can cope with rapid change" (Perrow 1991, 134). The theory of organisation offers a variety of paradigms used to analyse the organisational structure of mega-events. One defines these structures as temporary, complex collections of firms, institutions and occupational groups and a second can be used to characterise the conjugations and interdependencies among people and organisations.

One of the main organisational attributes of mega-events is their temporality as a linkage node between the private sector and public bodies. The main responsibilities and operations of a mega-event exist as an 'organisation with institutional termination' (Lundin and Söderholm 1995; Grabehr 2002). This particular form of administrative body enables mega-events to follow an organised (collective) course of action aimed at evoking a non-routine process while relying on longer-term structures and permanent organisations. It includes temporary contacts between 'permanent' systems creating inter-organisational temporary organisations with perceived time limits as a form of a functional organisation and as an agency for managing uncertainty (Turner and Müller 2003; Grabher and Thile 2015).

Project

The considerable need for speed and flexibility of a project alters the classical notion of organisation towards a specific fluid form that is more responsive to rapid technological changes and the global market. Therefore, a project, as a one-off venture of a temporary organisation (Hobday 2000; Grabher 2002; Grabher 2004), is usually a special task, programmed by a committee or action group(s), appointed to address a problem or handle a requested action (Lundin and Söderholm, 1995) and constrained by specific time and budget (Hobday 2000; Grabher 2002). The usual concept of a project, which certainly applies to the case of a mega-event, is as a plannable and unique task, limited in time, complex in implementation and subject to evaluation. The Olympic Games is one of the best examples of a spectacle project (Lundin and Söderholm 1995), and is run by the project-based organisation of the IOC and awarded as an opportunity to each host city. As a permanent body, the host city handles the high risk and uncertainty of delivering the Olympic Games on time through assigning to it a temporary organisation responsible for delivery.

In going beyond the basic notion of a project, it is essential to consider events such as the Olympic Games as inherently risky, with the risk resulting from long planning horizons and complex interfaces (Flyvbjerg 2003) which are critical sources of vulnerability for delivery. While the public perception is focused on the single event, the practitioners involved are well aware that the record of mega-events has largely been written as a chronicle of planning failures, financial disasters, reputational damage and infrastructural ruin which have led to significant operational and organisational risks (Grabher and Thiel 2014). Therefore, as an organisation, the practitioners involved in delivery need to integrate the necessary skills, knowledge and networks for dealing with non-routine tasks and limitations in costs and time. Within the project ecology of mega-events, the risks of misleading forecasts of demand and cost for the development and management of transportation infrastructure projects and venues are considered very high. Additionally, the "hyperpoliticisation" (Jennings and Lodge 2010, 165) of global events heightens the risk that even small disturbances can cause lasting reputational damage (Grabher and Thiel 2014).

Therefore, being involved in managing at such high risk project, significant career fame and prominent position in labour market (Grabher and Thiel 2015). To understand how the human resources (carrying the necessary knowledge and skills) of mega-events are mobilised, we should understand their 'project ecology' (Grabher 2002). The term 'relational space' of mega-events refers to the systematic ecology between the permanent contexts of institutions, corporate ties and the personal networks within the dedicated organisations (Grabher Thiel 2014). It denotes the effect of career lift of new comers on reshuffling the elite structure.

Within this project ecology, risk management becomes the primary concern of the whole event in terms of predicting the cost of all manner of possible eventualities. The massive risk burden of staging a mega-event has

resulted in the development of a widely held belief that state actors are unable to deliver the same levels of efficiency as those found in the private sector (Giddens 2009; Raco 2014). This inexorably leads to a process “in which experts participate in creating their markets by identifying new risks ever to manage their expertise” (Cutler 2010, 178). This necessarily involves a sorting process, as only a small number of major multinational developers have the capacity and the proven track record to be able to take on major development contracts (Raco 2014). The role of private developers as organisers and managers of increasingly complex assemblages of specialist consultants becomes normalised, and there is a strong belief among both public and private-sector bodies that skilled and well-resourced experts can act as guarantors of quality and efficiency in development practices (Raco 2016).

Therefore, assigning the project part of a mega-event to private sector project management consultants means the mobilisation and concentration of qualified professionals into single-project organisations, and these recruits mainly via particular channels, namely predecessor projects, personal networks and permanent organisations, to both increase speed and reduce uncertainty (Grabher and Thiel 2015). The small number of people with mega “project capabilities” (Grabher 2004, p3) could be the likely explanation for the realities of the mega-project labour market, which comprises a transnational elite circle, usually very different from the policy rhetoric of 'inclusive' and 'devolved' planning that is found in many mega-event strategies and plans. Event-induced gentrification contributes to elite capture and is a phenomenon that has become a familiar sight in most of the mega-event host cities that harness such events for urban regeneration, from Atlanta (Rutheiser 1997) and Sydney to Vancouver (Lenskyj 2008), London (Watt 2013) and Rio (Gaffney 2010). In Stratford in East London, where the Olympic Park is located, the Olympic Games accelerated gentrification and the displacement of existing residents (Watt 2013, 2017).

Conclusion: the dilemma of legacy commitment versus delivery concerns

The whole process of Olympic planning and legacy building are about both delivering the event and engaging locals in its benefits. This critical review has concentrated on the paradoxical nature of mega-events, giving different narratives of the two-fold intentions of mega-events: the direct benefits (actual legacy) of host citizens on the one hand and delivery on the other. Although there is some analysis which puts forward the paradoxical features of mega-events, for example within the literature on legacy in terms of ‘gift’ versus ‘profit’ (MacRury 2008), and within the literature of major projects in terms of decision rationality versus action rationality (Ibert 2015), other literature typically concentrates on either legacy or delivery, but not both. There is, therefore, a lack of dialogue between those who emphasise the benefits that attend successful Olympic delivery and those who work on its aftermath.

The legacy assessment literature looks at mega-events within the context of an urban process and the way that the legacy agenda is formulated and practised for the indirect benefit of local citizens. The concept of this analysis and the views of its critics are rooted in the paradigm of the ‘right to the city’. The literature mostly indicates the differences between the rhetoric of legacy and the facts, pointing to the values and priorities that alter in relation to the conflict between locals and corporate interests. The other strand of literature is dedicated to the project-management aspect of mega-events, and there is much attention paid to the delivery process in terms of the innovation and learning, network expansion and reconfiguration potential that would take place in the particular platform of the project organisation of mega-events. While, the implications of considering mega-events as a chance to show how to be successful in delivering (under the conditions of complexity, risk, time pressure, and media exposure) has created a particular mechanism of “to-do management initiative and high expert arrangement based on preventing any meddlers defined as those who have limited knowledge of 'reality' of planning process. Therefore, elite capture curtails public oversight and participation” (Müller 2015, 11). At the same time, planning for mega-events turns into a technocratic process of delivery. Thus, it seems that democratic demands become risks that threaten to delay the planning and construction process of the event (Raco 2014; see also Andranovich et al. 2001; Hiller 2000).

Therefore, it can be hypothesised that when a mega event awarded to a city, the global sensitivity and delivery commitment of event became critical, and the whole Olympic Games agenda gravitated towards the delivery aspect. In contrast, legacy promises were framed as a limited part of the project’s goals for delivery. Therefore, in reality, Mega Events are very incline to prioritise 'delivery' over 'legacy', which means highlighting the benefit of some stakeholders over the many of locals in host cities.

Crossing Histories: Brazilian Planners of São Paulo and their transnational references (1910-1930)

José Geraldo Simões Junior*, Heliana Angotti-Salgueiro**

* *PhD, Prof. FAU, Mackenzie Presbyterian University, josegeraldo, simoes@mackenzie.br*

** *PhD, Post-Doctoral Studies, Mackenzie Presbyterian University, angotti@usp.br*

This paper examines how some pioneering planners in the Brazilian state of São Paulo, Victor Freire, Prestes Maia, Ulhoa Cintra, and Anhaia Mello disseminated and appropriated the dominant principles of international urbanism in the period 1910-1930. The education in city planning is directly associated with the repertoire of engineering courses and professional associations. In this environment, where public debates on urban issues were intense, it is worth noting the presence of English urbanist Barry Parker, who lived for two years in São Paulo, implementing innovative projects and debating with local planners. The access to urban planning manuals and reviews, and the presence of these Brazilian professionals in international seminars, led to the dissemination of the international ideals and some resulting essays on the way these ideals could be applied in many fields: urban regulations, projects in downtown areas, housing, sanitation, town extension plans, city management, zoning, among others. Contradictions among practices, actors and references are requesting a conceptual and methodological effort attentive to historical dimension of the “circulation” of ideals or their limits of intelligibility and reception in other scales of time and place, such as the one proposed in this paper.

Keywords: Brazilian planners, international dissemination, city plan ideals.

Introduction

São Paulo is Latin America’s largest metropolis. However, its rapid growth started less than a century ago and, if at the local level the historiography of urban design has been developed over recent decades¹, in the international literature little is recorded about the men who reflected on and wrote about this city during its growing process. Most of the theorists or city planners were engineers from the Polytechnic School of the University of São Paulo, and also professors seldom involved in urban management issues. They were acquainted with several international city planning proposals thanks to the dissemination of books and periodicals, and to the meetings that brought them together in the first decades of the twentieth century.

Today a global perspective is methodological consensus in several fields of knowledge. However, some particulars of the histories of these urban planners remain absent from the standard widespread bibliography. In this sense, although everybody identifies “the top” authors, the professionals who practiced the discipline in European and North American countries, along with their theoretical essays, and their planning practices, there is still a vast field to study more deeply and investigate how South-American urban planners have appropriated this material².

We all know that urban and architectural designs travel a lot and their propagation and international character dates from previous centuries, but at this panel, we will focus on the pioneers of the early twentieth-century in the city of São Paulo. Historians consider this period as the founding moment of city planning as a discipline. Methodologically speaking, we know that the case studies and analyses of the trajectories (ideas and designs) of these authors who have adopted reference works and models, have been used as the tenets for historical studies since the 1980s, when *cultural transfers* became part of the analyses, attentive to the possibilities of local contexts, or specific understanding of the countries that were importing these ideas³.

Therefore, we will present here some aspects of the trajectories of the Brazilian city planners who worked in the urban environment of the city of São Paulo between 1910 and 1930, one of the most important periods of the history of Brazilian urban planning⁴. We quote topics discussed in their publications, the projects and interventions proposed for this metropolis which was then in full development. Crossing histories and intellectual references of some professionals, their role in the urbanization of the city debate and in founding the urban planning discipline, will certainly help bring to light some new facets of the thinking of Latin America's pioneers.

City Planners of São Paulo and their Transnational References

São Paulo's astounding growth between 1870 and 1930 was a significant factor in introducing urban science into the remodeling proposals that emerged in that period. Over this sixty-year period, the city underwent a strong economic and population increase as a result of the coffee production peak, intense immigration and well ahead, industrialization. Around 24,000 inhabitants lived in the city in 1870; 240,000 in 1900, and a million thirty years later. A one thousand percent increase in the first interval, and over four-hundred percent in the second. The impact of this accelerated expansion process devoid of any urban planning left deep marks that hinder city management up to the present day.

Other factors favoured the process of modernization which was impending since the nineteenth century. The main factor was the onset of the Republican regime in the country (1889), which organized the municipal sectors of public works and gave them greater autonomy. In the case of São Paulo, the creation of the Polytechnic School in 1894 provided training for civil-engineers and engineer-architects to deal with urban management. These professionals joined the city public administration, contributing to the dissemination and use of many principles and paradigms from the science of urbanism which was then being developed in several countries.

In the early twentieth century, São Paulo's city government faced big urban problems related to three areas: sanitation, road system, and architectural esthetics. Engineers proposed plans and projects based on their professional practice referencing other contexts. These projects were supposed to regulate aspects such as the decongestion of the central area, installation of infrastructure systems (sanitation, lighting, electricity, gas, transport.) the esthetic and technical modernization of built heritage, road connections between the residential districts and downtown, control of urban sprawl, salubrity of private dwellings and public housing, the quality of public spaces (urban furniture, green spaces).

Engineer Victor da Silva Freire stood out in this scenario, not only for his political role but also as the main name in planning international references. He was Director of Public Works for São Paulo for 26 years (1899-1925), and was a professor at the Polytechnic School of Engineering. The Portuguese Freire studied at the Polytechnic School in Lisbon and at the *École des Ponts et Chaussées* de Paris. Starting in 1905, he frequently attended international city planning conferences⁵, and received the proceedings of congresses held in Europe and the United States, adopting/appropriating these texts and attempting to apply them to the reality of the city of São Paulo.

The library of the Polytechnic School was another source for important references, in special books, urban planning manuals, and specialized periodicals that were consulted by the generation of the pioneer city planners.⁶ While he worked as Director of Public Works and a professor, Victor Freire mentored the first São Paulo city planners, and some of them became his assistants in the city government. Worthy of note are engineers João Florence de Ulhoa Cintra, Arthur Saboya, Francisco Prestes Maia, and Luiz Ignacio Romeiro de Anhaia Mello. All of them could be considered, along

with the public health engineer Francisco Saturnino Rodrigues de Brito, born in Rio de Janeiro, the main pioneers of city planning in São Paulo.

The main questions discussed and proposed by these pioneers are presented below, focusing on improvements of the central area, controlling the urban sprawl, modeling the city's growth and disseminating the anti-metropolis ideas.

Improvements in the Central Area (1911)

Victor da Silva Freire was behind some important projects for São Paulo, embracing Camillo Sitte's perspective by maintaining the morphology of the historical central area. For the expansion areas he preferred the British "garden-city" standard. For the central area of the city he proposed a plan called "*Os Melhoramentos de São Paulo*" (Improvements for São Paulo), in 1911, to solve the urban congestion and the connections between that zone and the up-and-coming residential districts. This pioneer document is an example to analyze the transfers from international city planning ideas. Recuperating the bibliographical references Freire quoted four works: Sitte's book *L'Art de construire les villes*, (ed 1902), Eugène Hénard, *Études sur les transformations de Paris (1907)*, Charles Mulford Robinson *The improvement of Towns and Cities or the Practical Basis of Civic Aesthetics (1901)*, Charles Buls *Esthétique des Villes*, 1909.

In addition to these five books, Victor Freire also used the plans and specifications studied by French city planner Joseph-Antoine Bouvard to intervene in the city of Buenos Aires in 1907. Bouvard was a consultant in São Paulo in 1911 and offered his opinion on the stalemate of the proposed projects. After validating Freire's plan, he proposed to expand it and also joined the City of São Paulo Improvements and Freehold Land Company Ltd. (City Company) which would initiate new ways of land division for housing.

Figure 1. Plan Bouvard, proposed for São Paulo, adopting Sitte's premises and of respect for the preservation of the historical center. (1911).

Controlling the Urban Expansion Areas (1913-1923)

The rapid expansion of the urbanized area demanded a great amount of effort by city government to control the approval process of new streets and neighborhoods. Until the 1920s, legislation was inappropriate for the site of the city, whose topography was very irregular, marked by valleys and

slopes. The old rules of 1886 recommended that all streets should be straight and 16-meter wide. That would mean an orthogonal road grid for the whole city, which would be a solution for flat areas, but not for São Paulo. Beginning in 1910, Victor Freire conducted the revision of these regulations, and was later supported by British urban planner Barry Parker, who lived in the city for two years to implement the new districts of a real-state company, the above-mentioned City Company.

Freire's technical argumentation was based on the ideas of German Joseph Stübben and those of British city planner Raymond Unwin from the Garden City movement. It resulted in the approval of new modern street network regulations in 1923. Stübben's essay, "*Practical and Aesthetic Principles for the Laying out of Cities*" had been presented in Chicago, at the Colombian Exhibition, in 1893, guiding principles for new road system networks in expansion areas. In summary, it proposed a general conception of road design based on the radial-concentric model, that is, a central nucleus and radial roads connecting it to the peripheral zones, thus defining different urban sectors. The sectors were subdivided by concentric or ring-shaped roads, and within each of these trapezoidal-shaped subsectors, local lanes would show an orthogonal outline and a diagonal street. The whole system was conceived for traffic flow efficiency.

The profile of the streets should promote drainage and never consider large movements of land. Discrete curvatures were recommended along the street layout, avoiding very long straight lines. The width of the streets should always be designed according to the volume of traffic and circulation. Health would depend on a suitable width, good implementation of the construction on the lot, the existence of open spaces for squares, and green areas along the roads and inside the lots. These principles presented by Stübben and then also recommended in Unwin's work (*Town Planning in Practice*) improved the city planning rules in São Paulo and permitted occupying large steep areas with a proper road system, as well as savings in paving and drainage works. These principles were put into effect under the new street plan law, n°. 2611 of 1923, which the engineer Luiz de Anhaia Mello greatly influenced.

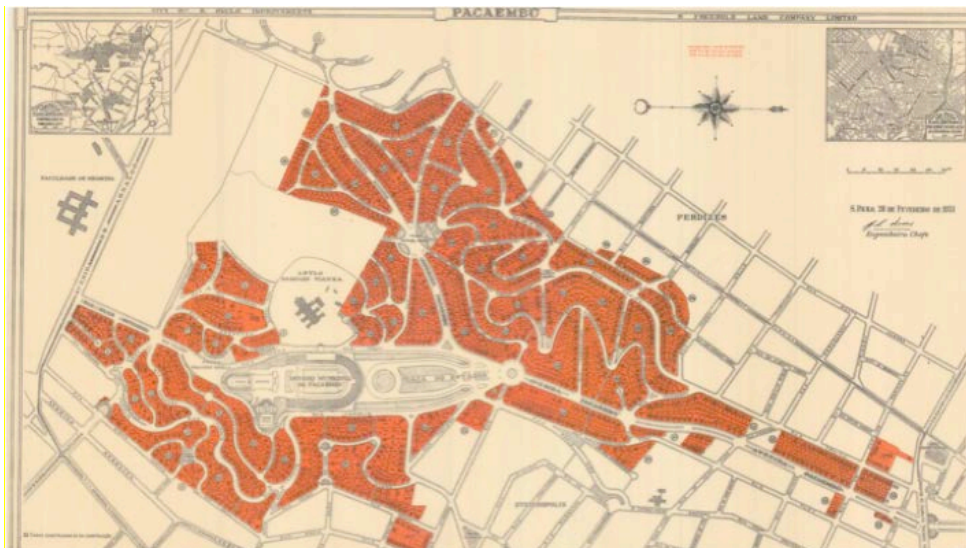

Figure 2 . Plan of urbanization for the district of Pacaembú, with reference to the ideas of the English garden-suburbs and Raymond Unwin. Implemented by City Company, based on the modifications allowed by the law n° 2311 (1923).

Adapting the City Growth to a New Urban Model (1922-1930)

During the 1920s, other city planners stood out in the city: Francisco Prestes Maia, João Florence de Ulhoa Cintra and Luiz Ignacio Romeiro de Anhaia Mello, all of them professors at the Polytechnic School, where they graduated. Maia and Cintra worked together in municipal public works. Between 1922 and 1924, they published a study that would forever mark the city's future configuration. The study was based on the works of French city planner Eugène Hénard, already mentioned, *Études sur les transformations de Paris*, and proposed that São Paulo should adopt the radial-concentric models, from the concept of "perimètre de rayonnement". Based on the idea that structuring the future metropolises followed this pattern, according to the four schemes presented by Hénard for London, Paris, Moscow, and Berlin, engineers Prestes Maia and Cintra developed the *Plano de Avenidas* (Plan of Avenues) for the city of São Paulo, projecting radial and perimetral avenues including the two main rivers of the city to help arrange this model. The plan, illustrated with photos and watercolours was published in 1930 and had a deep impact, given its graphic quality and the large number of references to German, British, North American, and French city planners. This plan was only carried out during Prestes Maia's terms as mayor of the city (1938-45 and 1961-65) - when the main structural avenues system of the city was implemented - but not without a criticism from a group of city planners who followed other lines of thinking, such as Luiz de Anhaia Mello.

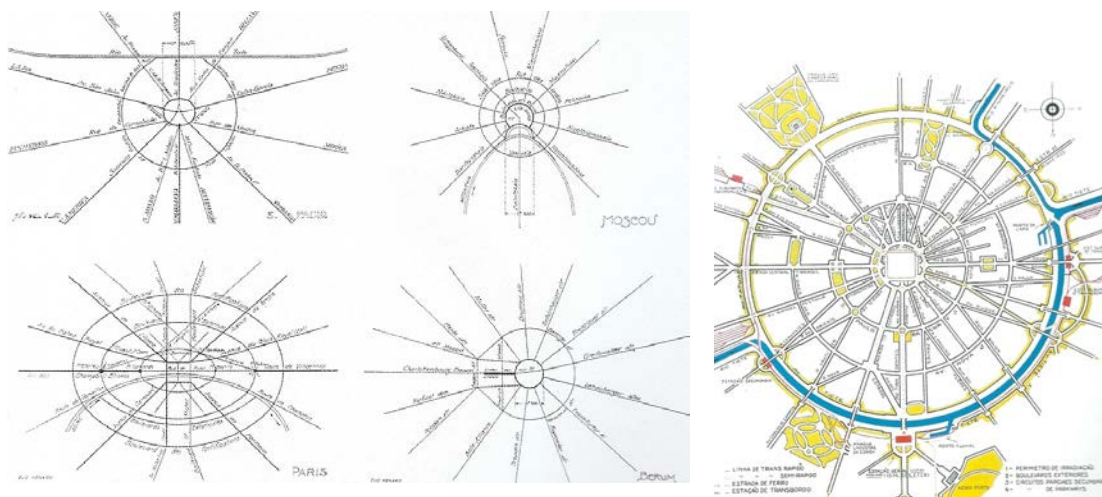

Figure 3. Models of urban structuring conceived by Hénard and the adaptation proposed by Prestes Maia for the Plan of Avenues for São Paulo 1930.

The Anti-Urban Idea. A Comprehensive and Humanistic Urban Thought

Engineer-architect Luiz de Anhaia Mello, professor of the Polytechnic School from the 1920s to the 1960s and a member of the intellectual elite of São Paulo, was the most important theorist in the urban planning field in São Paulo. He considered himself an "urbanist" throughout his career, with the "mission" of sensitizing "public opinion" and promoting education for town planning. In this sense, he defended the creation of civic associations according to the North American model, in which society would participate of urban improvements.

Around 1925, Anhaia Mello conceived a *City Plan Commission*, quoting models such as the *Regional Planning Association of America* (he owned all the volumes of the *Regional Plan of New York*) and was a reader of Thomas Adams as well as others international authors on this subject. However, it wasn't until the 1950s that a master plan would only be widely discussed in São Paulo. In addition to being the executive director of the Engineering Institute, creating some controversies and briefly

participating in city politics, Anhaia Mello founded the SAC - *Sociedade de Amigos da Cidade* (City Friends Society) in 1945: in his opinion, professional circles, councils, and planning committees had to be independent from interference by public government, which generated conflicts with his peers, who as we saw, had been proposing plans for the city following various lines of thought, since the 1910s.

He created regular courses on city planning (called “Aesthetics, General Composition and Urbanism”) at the Polytechnic School around 1926, and in 1948 he founded the School of Architecture and Urbanism at the University of São Paulo, to distinguish engineers from architects, and connect the latter group with city planners and social scientists. Throughout his entire life he was involved in disseminating the principles of an ideal city under a humanistic and civic urbanism, through an active pedagogical series of public conferences (at the Rotary Club and the Engineers’ Institute, for instance). His speeches and numerous articles were published in periodicals of professional associations, such as the *Boletim do Instituto de Engenharia*, among others, and in books, such as his first, *Problemas de Urbanismo*, in 1929. His ideals are represented on “The Urbanism Tree”, image published in this book: the roots are “public opinion” to be formed by propaganda; the trunk represents the “committees” for planning the city; the tree canopy is “legislation” which resulted in the shade that represents “urban progress”.

Figure 4. “The Urbanism Tree”, adapted by Luiz de Anhaia Mello, who introduced notable changes in the original image of Harland Bartholomew, a diagram from the Evansville, Indiana Comprehensive Plan of 1922.

In fact, Anhaia disapproved of the then current boastful slogan which said, “São Paulo cannot stop”. He was against skyscrapers and automobiles, and his main fight was to contain the growth of the tentacular city, introduce regional planning, and reaffirm statements by foreign authors, ranging from the Belgian poet Emile Verhaeren (*Les Villes tentaculaires*, 1895) to Patrick Geddes and his disciple Lewis Mumford, in the genesis of anti-urban critique, which culminated in reading Oswald Spengler on the decline of the machine civilization.

Figure 5: Some of Anhaia Mello's reference books, now at the library of Architectural School (FAU-USP) in São Paulo.

Anhaia Mello's personal library is our main source of study and a relevant evidence of his international knowledge and education, as he quoted numerous authors in his three books and more than seventy texts. He left no personal archives, nor confidential autobiographical notes, so our research strategy was to study his texts and the marginal notes left in the more than one thousand books that belonged to him and today are part of the library of the School of Architecture and Urbanism at USP. His library has classics of city planning history and related fields. The books quoted in his articles reveal how he accepted the view of the authors he read, mainly North Americans, although he also quoted French authors even in his last texts in the 1960s⁷. This approach is part of a cultural history of reading practices, in consonance with an intellectual biography, involving studies and institutional programmes of that time⁸.

Some images of the book *The City Plan of Memphis, Tennessee*, by Harland Bartholomew, published in 1924, can be taken as guidelines to summarize the main directions of Anhaia Mello's reflections, which were also subjects of his courses at the Polytechnic School, supported by international references. These images are inscribed in the holistic view of a "*comprehensive plan*". They are: *Civic Art*, which can evoke the aesthetics committees he wanted to create to control the "general composition" of the overall "urban architecture". This expression can be attributed to Pierre Lavedan, whom Anhaia invoked when he recalled the need for a "*esprit d'urbanisme*" in the city, in addition to the remodeling and "beautification" defended by Victor Freire. The latter had already introduced the overall view where esthetics elements should be aggregated to the plans for sanitation and road system.⁹ Another Bartholomew's topic is "*streets*": Anhaia passed laws for organizing the road network and its relation to the built spaces, since he considered streets as dangerous places, even citing traffic death statistics from American books and periodicals. Instead he defended the green *superquadras* (superblocks), or the separation of pedestrians and cars. Another central theme in his criticism coming from Bartholomew is "*transit*". Anhaia Mello referred to the "chaos" caused by vehicles, writing articles on traffic control and regulation; in this case he also wrote about improvement of mass transportation; in this sense he is contrary to the "old circulatory urbanism" of Prestes Maia's *Plano de Avenidas* (Plan of Great Avenues) that would permanently mark the urban site of São Paulo.

Regarding "*Public Recreation*" principle he defended a general system of parks with activities, or *an active and organized recreation* in play-lots, playgrounds, playfields – then "*rus in urbe*", the city/nature connection by the parkways. Multi-centered urban decentralization and salubrious dwellings were also paramount topics for Anhaia Mello who organized the I Housing Congress in 1931, when he was mayor of São Paulo, showing his interest in housing and zoning policies. Denouncing the blighted areas was inseparable from his criticism of urban density, or overcrowding,

to be solved by the garden cities, satellite towns, *neighborhood unit cells* – revealing in all these themes his readings of authors such as Ebenezer Howard, Raymond Unwin (in the French translation of Jausseley, 1926), F. L. Olmsted, Jean Lebreton, John Nolen, E. Gutkind, F. J. Osborn, Lewis Mumford, James Dahir, Clarence Perry and Clarence Stein. Anhaia Mello always referred to the concept of public spaces connected to city planning and the quest for communitarian relationships among citizens, defended by North American urban sociologists, such as Robert Park and Ernest Burgess. These readings confirm his persistent humanist view of an organic city and the basic functions of common well-being: *inhabit, work, amuse body and soul, and circulate*, recalling the Athens' Charter.

Likewise, Anhaia Mello also marked the “zoning” regulations in ~~several passages of~~ Harland Bartholomew's book (p. 117) and transcribed them in his own 1929's book; on this matter he was also a reader of Edward Basset and George B. Ford. Anhaia Mello illustrated the topic in his book by translating the ironic image of a pamphlet in Evansville, Indiana: “Zoning Will Prevent This”. The zoning law Anhaia Mello proposed in the late 1930s and the master plan for São Paulo and outskirts, although debated in the following years, would only materialize decades later, but in a very distant version from the “new models of urban composition” and regional planning he wanted, as the city had not avoided disorderly growth and the extension of urban occupation, Anhaia Mello's major battles.

Figure 6. A cartoon from a zoning campaign in Evansville, Indiana, before 1920, exactly translated to Portuguese by Anhaia Mello for his book.

Conclusion

Divergent urban models coexisted in São Paulo where technical, academic, and institutional circles debated the problems of the rapidly growing modernizing city which was booming thanks to agro-export trade, immigration, and then industrialization. In the first decades of the twentieth century, the projects of those urbanism pioneers in São Paulo, mostly teachers at ~~from the~~ Polytechnic School and familiar with works of international authors, began to include German, English and North American ideas - while some of their compatriots¹⁰ and urban-engineers in other Brazilian cities were still using Parisian references. An example is the Pereira Passos's previous reform highlighting grand avenues, such as the *Avenida Central*, in Rio de Janeiro still carrying the symbolic weight of Haussmann's

works in Paris. The abandonment of the traditional orthogonal and geometric layouts, characteristic of the conceptions in force in the nineteenth century, started to be questioned by Victor da Silva Freire, among others, who proposed new improvements paradigms for São Paulo from 1911 on. These emerged not only thanks to the readings of Camillo Sitte's and Joseph Stübben's books but also to British references that defended plans more adapted to the irregularities of the local topography, in addition to creating green spaces. These came through Raymond Unwin and the experience of the *garden-cities*, soon adopted by real-estate companies such as *City Improvements* that profited from the growing demand for housing caused by the expressive urban expansion and population increase.

Starting in the 1920s, new actors came onto the stage and foreign references increased with the dissemination of titles in the bibliography of periodicals such as the *Boletim do Instituto de Engenharia* that had contact with several overseas publishers, especially from the United States. Also, there was the possibility of obtaining classic and recent works on city planning in local bookstores, as shown by the private libraries such as those of Luiz de Anhaia Mello and Francisco Prestes Maia, whose positions on the remodeling of the city were totally opposed. Prestes Maia and Ulhoa Cintra's Plan of Great Avenues prioritized circulation of vehicles, leaving aside social and housing projects that are basic principles of modern urbanism.

Luiz de Anhaia Mello, in turn, in his texts and courses at the Polytechnic School was aware of those times, i.e., the irreversible transformation of the city into a metropolis. He sought to regulate this progress, defending anti-urban ideas and a comprehensive plan against most of the engineers who were conceiving São Paulo with selective, partial and expansionist plans, limited to a road system, as is the case of Prestes Maia. Anhaia Mello was portrayed as a dissident¹¹, in fact a theoretical militant of the metropolitan "*décroissance*"¹². His forecast about the capital's tentacular conurbation worsened after the 1950s, to the detriment of an organic humanistic urbanity and the general regulatory planning he had idealized.

The engineers mentioned here, and many others who took part in the urban management educated generations of professionals, left unfinished projects, speeches, acts, and partially applied laws, but on the other hand, they wrote a large number of articles and books. These sources, along with the private and institutional libraries they consulted, still wait for new investigations, as for example: editorial lines of periodicals, intersections between intellectual trajectories of local and foreign authors, and even appropriations of divergent adoptions of the same author's ideas. ~~to guarantee divergent ideas.~~ Adoptions of transnational references may imply contradictions, different temporalities, partial coherence and limits of understandable application in each country, ~~and they~~ demanding constant review and deeper research.
